### November Exports of Track Material

Exports of spikes in November exceeded in weight and value the totals for any other month in 1920 with the exception of March. Exports of rails and miscellaneous track material were well above the totals for any other month in 1920. The weight of the spikes exported was 3,979,631 lb. and their value \$175,459. The rail shipments totaled 67,708 tons valued at \$4,088,626. The value of the miscellaneous track material shipped was \$1,279,047. The detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce follow:

Country	Spikes		Steel rails		Switches, frogs, splice bars, etc.
	Pounds	Dollars	Tons	Dollars	Dollars
Belgium			375	25,517	3,383

## Equipment and Supplies

### Locomotives

THE CUBA RAILROAD is having 10, 10-wheel locomotives rebuilt at the Eddystone plant of the Baldwin Locomotive Works.

THE COLUMBIAN NORTHERN (South America) is inquiring, through the locomotive builders, for 1 or 2, 2-3-2 type locomotives.

THE BELGIAN STATE RAILWAYS are inquiring, through the locomotive builders, for 100 Consolidation type locomotives.

THE ALABAMA & VICKSBURG is contemplating the purchase of new motive power, including 2 Pacific, 4 Santa Fe and some Mikado and switching locomotives.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA has ordered six Mikado type locomotives and four 6-wheel switching locomotives from the American Locomotive Company.

### Freight Cars

THE LOUISVILLE & NASHVILLE is inquiring for 100 caboose cars.

THE NORFOLK & WESTERN is having 600 gondola cars rebuilt at the shops of the Ralston Steel Car Company.

THE CHINESE GOVERNMENT RAILROADS are inquiring, through the car builders, for from 500 to 1,500 freight cars.

THE BERTHA COAL COMPANY, Pittsburgh, Pa., is inquiring for 100, 55-ton steel high side gondola cars and for 100, 55-ton hopper cars.

THE TIENSIN-PUKOW will be in the market soon, through a New York Japanese export house, for 300 gondola cars of 40 tons capacity.

### Passenger Cars

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for 6 second-hand passenger coaches, to be used in workmen's train.

### Iron and Steel

THE TOLEDO, ST. LOUIS & WESTERN has ordered 2,000 tons of rail from the United States Steel Corporation.

### Miscellaneous

SUZUKI & COMPANY, 220 Broadway, New York, has ordered 1,000 tons of track accessories consisting of splice bars, bolts and nuts, also spikes, from the U. S. Steel Products Company, for use on the South Manchurian Railway.

## Supply Trade News

The Chipman Chemical Engineering Company, Inc., has removed its offices from 95 Liberty to 136 Liberty street, New York.

Ralph Lane has been appointed manager of the eastern office, at 3636 Grand Central Terminal building, New York, of the Mummert Lumber & Tie Company, Chicago.

The Atlas Valve Company, Newark, N. J., has secured the sole patents and rights to manufacture the Ideal automatic pump governor, by purchase from the Ideal Automatic Manufacturing Company, New York.

Robert M. Eames, export manager of the Bryant Electric Company, Bridgeport, Conn., has been appointed general sales manager, with headquarters at Bridgeport, succeeding Frank V. Burton, resigned.

The Roller-Smith Company, New York, has appointed the J. E. Dilworth Company, 493 South Main street, Memphis, Tenn., as its representative in the western half of Tennessee, the eastern half of Arkansas and the northern half of Mississippi.

Frank Conrad, consulting engineer of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has been appointed assistant chief engineer. Mr. Conrad has been connected with the Westinghouse Company for almost 30 years, having joined the company when it was in its first location at Garrison Alley. He began with laboratory work in connection with measuring instruments and became associated with arc lamp design. While working on alternating-current measuring instruments a feeding mechanism requirement for an a-c arc lamp led Mr. Conrad to the idea of using an induction type or eddy current operated disk for an arc lamp feed. This led directly

to the original conception of the disk type induction indicating a-c voltmeters and ammeters and subsequently to the original round type Westinghouse watt-hour meter, which he designed and brought out in 1897. The radio apparatus developed by Mr. Conrad during the war was a great factor in the success of the activities of the Navy and War departments.

Albert M. Wolf and Lawrence M. Harper have become associated under the firm name of Wolf & Harper, Engineers, in order to conduct a general engineering business with offices at 7 W. Madison street, Chicago. Mr. Wolf has, for the past 10 years, been connected with the Condron Company, Engineers, Chicago, as principal assistant engineer in charge of design for five years and as engineer and secretary of the company for two years. He has also served in the engineering department of the Chicago, Milwaukee & St. Paul and the Wisconsin Central. Mr. Harper has been engaged in mechanical and structural engineering for the past 12 years, having in that time served as mechanical engineer for the Condron Company, the Arnold Company and the Northwestern Engineering Company; as engineer in charge of construction with the Foundation Company; and as structural engineer for Herman J. Esser, architects, Milwaukee, Wis.

F. Conrad

The new firm will specialize in the complete design of commercial and industrial buildings and structures, power plants, the valuation and appraisal of properties, and the preparation of engineering reports.

### George A. Post

George A. Post, whose retirement from the presidency of the Standard Coupler Company, New York, on January 31, was announced in the *Railway Age* of January 14, was elected president of the Hudson River Bridge Corporation on January 21. This corporation has been organized by a large number of prominent citizens of New York City and New Jersey, to promote the building of a bridge across the Hudson river from Fifty-Seventh street, New York City, to the high ground in New Jersey west of Weehawken, and to establish certain related improvements for passenger and freight traffic at the port of New York. The advocates of the project feel that with the growth of automobile traffic and the rapid increase of population and industry, the need of a bridge grows daily more apparent.

The offices of the Bridge company will be established at 5 and 7 Dey street, New York. Mr. Post will retain his connections with the railway supply business, with which he has been so long identified through the George A. Post Company, in which his son, George A. Post, Jr., will be associated with him. This company will deal in a selected line of railway materials and supplies, with offices in New York.

George A. Post was born at Cuba, N. Y., on September 1, 1854. He was educated in the public schools and the academy and normal school at Oswego, N. Y. He served with the freight department of the Erie Railroad and in 1872 was assistant to the superintendent of motive power. Mr. Post studied law at night and was admitted to the bar. He was in editorial work for about eight years, from 1883 to 1891. In 1894 he became president of the Standard Coupler Company, New York, from which position he has just resigned. In 1904, he served as chairman of the executive committee of the Railway Supply Manufacturers, and was chairman of the American Railway Appliance Exhibition held in connection with the International Railway Congress in Washington, D. C., in 1905. He organized the Railway Business Association of the United States and served as president of that association from its organization, in 1909, to 1918.

Mr. Post resigned from the Railway Business Association early in 1918, and the *Railway Age*, in its issue of April 12, 1918, in commenting editorially on the work of Mr. Post as head of the association, said the following:

"Mr. Post was the father of the association. He has been president of it ever since its organization. Its principal purpose in the past has been to promote good relations between the railways and the railway supply companies, and to educate public opinion and public officials regarding the railway question. For the leadership of the association, while seeking to accomplish these purposes, Mr. Post has shown that he possesses an excellent equipment. He is a public speaker of rare ability. He is a diplomatist of consummate tact. While always willing to lead, he has always been equally willing, and even anxious, to take counsel with and be guided by the judgment of his associates. The association, under his presidency, has done well the things it set out to do. Recently new conditions have developed in both the railway and railway supply business. The railway supply business has been

G. A. Post

confronted by entirely new problems. Mr. Post has never rendered such able and valuable service to it as he has within recent weeks in presenting the point of view, the rights and the problems of its members, to Director General McAdoo, and other officers of the Railroad Administration at Washington."

He is chairman of the Railway Committee, Chamber of Commerce of the United States, and has devoted much time to this service in connection with the Esch-Cummins bill, having furnished a large amount of information to the Congressional committees. He served as a member of Congress from the Fifteenth district of Pennsylvania, from 1883 to 1885.

### Edison Storage Battery Company

Frank D. Fagan has been elected vice-president and general manager of the Edison Storage Battery Company, Orange, N. J., and E. M. Cutting, has been appointed assistant to general manager, both with headquarters at Orange.

F. D. Fagan

Mr. Fagan was born in California and was in the electrical business in San Francisco for a number of years. He then served as manager of the lamp department of the General Electric Company on the Pacific coast, with headquarters at San Francisco, Cal., for over 12 years and now becomes vice-president and general manager of the Edison Storage Battery Company.

Mr. Cutting began railway work in 1888, in the signal department

of the Southern Pacific. In 1898, he was appointed supervisor of signals for the Western division and in 1902, in addition to his duties in the signal department, he was given charge of electric train lighting. In 1908, he became engineer of train lighting, heating and ventilation, resigning in

1912 to become Pacific coast manager for the Edison Storage Battery Company, with headquarters at San Francisco, Cal. He remained in that position until September, 1919, when he was appointed manager of the railroad department, with office at Orange, N. J., from which position he subsequently resigned, and now returns to the service of the Edison Storage Battery Company as assistant to general manager, as above noted.

E. M. Cutting

A. D. Graves, manager trade sales of Pratt & Lambert, Inc., Buffalo, N. Y., has been appointed general manager of the company. This position was formerly held by President J. H. McNulty. C. D. Sproule, sales manager, western division, at Chicago, has been appointed resident manager with office at Chicago; J. R. Mickle, railway sales representative at New York, has been appointed sales manager at New York, and H. M. Guisey, assistant resident manager at Buffalo, has been appointed assistant sales manager at New York. The company held a convention from January 10 to

13 in a publicity building recently completed by the company, in Buffalo, N. Y. At this meeting there were a number of interesting addresses made by officers of the company and many papers were presented by the salesmen.

### Obituary

John J. Flynn, district manager of the railway sales department, at Chicago, of the Texas Company, Houston, Texas, died suddenly at Rochester, Minn., on January 3. Mr. Flynn was born at Paducah, Ky., on June 16, 1866. He began railroad work on the Illinois Central in 1884, and subsequently served consecutively as clerk, yardmaster, and trainmaster, until 1902, when he was appointed superintendent. From 1907 to 1909, he was superintendent on the Trinity & Brazos Valley, at Teague, Texas, and then to 1915 was general manager of the Houston Belt & Terminal Railroad, at Houston, Texas. Since 1916 he has served as district manager of the railway sales department for the Texas Company, at Chicago.

Joseph E. Nelson, president of Joseph E. Nelson & Sons, railroad contractors, with offices in Chicago and Kansas City, died suddenly on Friday, January 14, while making a final

J. E. Nelson

inspection of the freight and passenger terminal of the Illinois Central at Centralia, Ill. Mr. Nelson was born in New Jersey on January 17, 1857, and came to Chicago in 1869 and grew up in that city. He entered railroad and building construction as a young man and was actively engaged in this work throughout his entire life. In the early eighties he was engaged as construction superintendent on the extension of the Chicago & North Western in Nebraska. In 1889 he served as general superintendent on the

construction of the first buildings for the University of Chicago and later served as superintendent for the William Grace Company on the construction of World's Fair buildings in Chicago. Following the completion of this work in 1893, he entered general building contracting on his own account and a year later began specializing in railroad structures. During the late nineties he was engaged in extensive work on the Chicago & Alton and the Atchison, Topeka & Santa Fe and during the last 20 years carried on building construction for practically all of the middle western railroads. In 1908 he organized the contracting firm of Joseph E. Nelson & Sons, and was actively engaged in the management of this contracting firm up to the time of his death.

### Trade Publications

TRAIN OPERATION BY SIGNAL INDICATION.—Bulletin No. 3 of the series bearing this title has been issued by Henry M. Sperry, 347 Madison avenue, New York City. It contains the two articles by Mr. Sperry, published in the *Railway Age* of June 4 and June 11, comparing the time interval method with the space interval method of running trains, and giving numerous historical notes on train despatching and various schemes for economizing train time and facilitating the dispatcher's work. Bulletin No. 1, of this series, described the practice on the Susquehanna division of the Erie, and No. 2 gave data on the saving in time accomplished by the use of automatic block signals. These bulletins are issued in the interest of the four principal signal manufacturing companies—the Union Switch & Signal Company; the General Railway Signal Company, the Federal Signal Company and the Hall Switch & Signal Company.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company is accepting bids for the construction of a frame blacksmith shop with dimensions 40 ft. by 72 ft. at Newton, Kan., to cost about \$10,000.

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was noted in the *Railway Age* of December 14 (page 218), as accepting bids for the construction of a one-story brick addition to its machine shop at Argentine, Kan., has awarded the contract for this work to Jerome Moss, Chicago, at an approximate cost of \$45,000. The dimensions of the addition will be 102 ft. by 115 ft., and the improvements to be undertaken include the construction of an office, tool room, engine pits and drop pits.

**CHICAGO & ALTON.**—This company contemplates the construction of a roundhouse at Ridgely Yards, Springfield, Ill.

**CHICAGO UNION STATION.**—This company is accepting bids and plans to begin operations about February 2 on the work of wrecking the old Chicago & Alton freight house at Harrison street and the Chicago river, Chicago. This work will form the first step toward the construction of the new Chicago mail terminal on which the Union Station Company plans to begin work this spring.

**COON BAYOU & ARKANSAS CITY.**—The Interstate Commerce Commission has denied this company's application for a certificate authorizing the construction and operation of a line two miles in length from a connection with the Missouri Pacific in McArthur, Ark., to lease an existing line about 1.3 miles in length, and to acquire trackage rights over the Missouri Pacific for a distance of 23.6 miles.

**DELAWARE, LACKAWANNA & WESTERN.**—This company will, according to present indications, undertake within the next few months separation of grades at East Orange, N. J., to cost in the neighborhood of \$4,500,000.

**GREAT NORTHERN.**—This company is accepting bids for the erection of a 500-ton frame coaling station at Troy, Montana.

**GULF COAST LINES.**—This company will build a new freight depot at McAllen, Tex., at a cost of approximately \$20,000, and will make track rearrangements necessary to serve the new station properly.

**KANSAS & OKLAHOMA.**—This company has awarded a contract to Strickland & Smedley, Forgan, Okla., for the construction of a line between Forgan, and Liberal, Kan., a distance of 25½ miles, at a cost of approximately \$300,000. The company contemplates extending its line to Trinidad, Colo., and has voted a bond issue to help defray the cost of this work.

**LOUISVILLE & NASHVILLE.**—This company is building yard facilities near Typo, Ky., which will be called Crawford Yard. The company is also constructing approximately 5 miles of second track on the Cumberland Valley division.

**UINTAH RAILWAY.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of four branch lines in Uintah County, Utah, respectively 19.36, 3.01, 1.4 and 1.19 miles in length.

**TWENTY-FIVE CARS OF EGGS,** from Japan and China, started from Vancouver, B. C., on January 8 for the Atlantic Coast. The eggs, with the exception of 1,500 cases for London, England, and 1,000 cases for Montreal, were all consigned to New York, which took approximately 17,500 cases of 30 and 36 dozen each, or about 6,500,000; more than an egg for every man, woman and child in the city.

**CASTING LOCOMOTIVE FRAMES IN SMALL UNITS.**—In order to overcome the difficulties of casting locomotive frames of unusual length and other long sections, the Metal & Thermit Corporation, New York, recommends that these be cast in shorter units and these units Thermit welded together. By using this method small foundries can undertake the work. The number of parts to be welded will depend on the size of the foundry and available mold and pattern facilities.

## Railway Financial News

**ALABAMA, TENNESSEE & NORTHERN.**—This company has applied to the Interstate Commerce Commission for a loan of \$290,000 for five years from the revolving fund, of which \$90,000 is to meet pressing maturities and \$200,000 is to pay 40 per cent of the cost of 200 freight cars and 7 locomotives which it is proposed to purchase through a car trust.

**BALTIMORE & OHIO.**—This company has been authorized by the Interstate Commerce Commission to issue \$3,000,000 of refunding and general mortgage bonds, series B, to exchange them for an equivalent amount of refunding and general mortgage bonds, series A, and to pledge \$3,000,000 of the series A bonds and \$10,000,000 of series B bonds with the director general of railroads as security for its promissory note for \$9,000,000, representing a general balance of \$9,000,000 due to the United States, growing out of federal control, to be funded for 10 years.

This company has applied to the Interstate Commerce Commission for authority to pledge from time to time certain securities now held in its treasury, nominally issued, as security for short-term notes permitted to be made by the law without the assent of the commission.

**CENTRAL OF GEORGIA.**—The Interstate Commerce Commission has approved a loan of \$237,900 to this company to aid the carrier in providing itself with locomotives. The applicant itself is required to finance about \$238,000 to meet the loan of the government.

The commission had previously approved a loan of \$815,000 to this company which was not perfected because of the requirement that it finance the balance of its requirements at not exceeding 7 per cent. The company at that time had ordered 7 mountain type locomotives and 17 passenger cars and was negotiating for 800 freight cars. The company now states that it does not contemplate the purchase of new equipment, except the 7 locomotives and the 17 passenger cars, which it proposes to finance by an issue of \$650,000 of equipment trust certificates and the loan of \$237,900, which it asks the commission to substitute for the original loan.

The Central of Georgia has been authorized by the Interstate Commerce Commission to procure the authentication and delivery of \$998,000 of its refunding and general mortgage 6 per cent bonds and to pledge or repledge from time to time part or all of the bonds as security for advances under section 209 of the transportation act, or for loans under section 210, or for notes.

**CHICAGO, MILWAUKEE & ST. PAUL.**—John D. Ryan, president of the Anaconda Copper Mining Company, has resigned as a director of this road. Mr. Ryan's resignation was in compliance with Section 10 of the Clayton Act, prohibiting interlocking directorates. He is a director and a large stockholder of the Montana Power Company, which supplies power to the Chicago, Milwaukee & St. Paul.

**CHICAGO & WESTERN INDIANA.**—This company has applied to the Interstate Commerce Commission for authority to issue \$329,000 of its 4 per cent consolidated mortgage bonds for the purpose of retiring and refunding a like amount of general mortgage bonds.

**HUNTINGTON & BROAD TOP RAILROAD & COAL COMPANY.**—The directors have declared a dividend of 75 cents per share (1½ per cent) on the preferred stock, payable February 15 to holders of record February 1. This is the first dividend paid on the preferred stock since January 25, 1908, when a distribution of 3½ per cent was made. President Carl M. Gage says: "The earnings are exceptionally good. We are getting along very comfortably and have a considerable surplus. There is no unpaid indebtedness outside of funded debt, and altogether the company is in a much better position than for several years."

**INDIANA HARBOR BELT.**—This company has applied to the Interstate Commerce Commission for authority to issue a one-year

promissory note at 6 per cent for \$23,020 to Walter E. Meyn in connection with the purchase of some land; also for authority to assume liability in respect of \$354,000 of 7 per cent equipment trust certificates.

**LEHIGH VALLEY.**—The segregation of this company's coal properties has caused the withdrawal of E. E. Loomis, president of the railroad; E. T. Stotesbury, D. G. Reid and W. H. Moore, as directors of the Lehigh Valley Coal Company. The board of the latter now comprises: F. M. Chase, president; F. W. Wheaton, vice-president; E. D. Kenna, W. H. Conningham, Theodore S. Barber and Samuel McCraen.

Harry E. Trexler, of Allentown, Pa., has been elected a director of the Lehigh Valley Railroad, succeeding Dr. Henry S. Drinker.

**MISSOURI PACIFIC.**—The Interstate Commerce Commission has approved a loan of \$1,200,000 to this company to aid it in acquiring 25 Mikado freight locomotives, and 15 six-wheel switching locomotives at a total estimated cost of about \$2,400,000. The company itself is required to finance about \$1,800,000, including the entire cost of five Mountain type and five Pacific type passenger locomotives, at a total estimated cost of about \$680,000.

This company has applied to the Interstate Commerce Commission for authority to issue \$1,836,000 of 6½ per cent equipment trust certificates representing 60 per cent of the cost of 50 locomotives, the balance to be financed from the loan of \$1,200,000, which has been approved by the commission. The certificates have been subscribed for by Kuhn, Loeb & Co. at 96.

**PENNSYLVANIA.**—Requests for proxies for the annual meeting of the stockholders, which will be held in Philadelphia on March 8, were mailed on January 25. Accompanying each proxy is a circular letter from President Samuel Rea, with reference to the subjects to be acted upon at the meeting. As previously noted in this column, January 14, these include:

(a) Ratification of long-term leases of 16 railroad properties now constituting portions of the Pennsylvania System and controlled through ownership of all or practically all of their capital stock—the most important being the Pittsburgh, Cincinnati, Chicago & St. Louis (the "Panhandle"), the Grand Rapids & Indiana, and the New York, Philadelphia & Norfolk.

(b) Authorization of an increase in the company's indebtedness of \$100,000,000.

(c) Changes in the dates of the annual meeting and the annual election, which are now held, respectively, on the second and fourth Tuesdays of March, so that they will be held hereafter on the second and fourth Tuesdays in April.

In his letter, President Rea says concerning the financial matters:

"Authority to increase the indebtedness of the Pennsylvania Railroad Company to the extent of \$100,000,000 is, in the judgment of your management, necessary; for while a balance of \$64,000,000 of former authority remains unused, your management must be in a position to assist its subsidiaries in their financing, especially as a large part of this year's maturing obligations are those of the Pennsylvania Company. In order, therefore, that your company may be able, in its own behalf, and to assist its subsidiaries, should assistance be found necessary, to provide for maturing obligations; the settlement of accounts with the United States Government for expenditures upon the property and for equipment during federal control; and for such additional equipment and facilities as may be essential to further promote the development and economical management of the property; you will be asked to authorize the above increase to be made in such amount, and at such times as your board of directors may deem necessary, through the issue of bonds or other evidences of indebtedness, in such form as may be found best for the interests of the company."

As a two-thirds vote of the stockholders, now numbering over 133,000, is required by various state laws on the proposals relating to the leases and the changes in dates of the annual meeting and election, unusual efforts will be made this year to obtain the necessary proxies. For this reason Mr. Rea, in his circular letter, urges all stockholders who are unable to attend the meeting in person not to fail to send in their proxies.

**SOUTHERN.**—The Interstate Commerce Commission has approved a loan of \$3,625,000 to this company to aid the carrier in providing itself with new equipment. The applicant itself is required to finance \$8,925,000 to meet the loan of the government.

#### DIVIDENDS DECLARED

Bellefonte Central—50 cents, payable February 15 to holders of record January 25.

Chicago, St. Paul, Minneapolis & Omaha—Common, 2½ per cent semi-annually; preferred 3½ per cent semi-annually; payable February 21 to holders of record February 1.

New Orleans, Texas & Mexico—Common, 1½ per cent, quarterly, payable March 1 to holders of record February 18.

Fulton Company—\$2, quarterly, payable February 15 to holders of record January 31.

Reading Company—Preferred, 1 per cent, quarterly, payable March 10 to holders of record February 18.

## Railway Officers

### Executive

**W. M. Wardrop**, general superintendent on the Pennsylvania, with headquarters at Grand Rapids, Mich., has been elected vice-president of the Grand Rapids & Indiana, with the same headquarters, effective January 18. Mr. Wardrop will retain his former duties as general superintendent.

**C. D. Mackay**, assistant to the vice-president of the High Point, Randleman, Asheboro & Southern, Yadkin, Carolina & Northwestern, Tallulah Falls, Hartwell, Danville & Western and Blue Ridge (all subsidiaries of the Southern), has been appointed vice-president of these lines and general agent for the receiver of the Hawkinsville & Florida Southern.

### Financial, Legal and Accounting

**E. F. Morgan** has been appointed assistant auditor on the Chicago, Burlington & Quincy, with headquarters at Chicago, effective January 1. He will have jurisdiction over valuation accounts.

**W. H. Burns**, general auditor of the Chicago, Rock Island & Pacific, has been placed in charge of the accounting department following the resignation of F. Nay, vice-president and comptroller.

**A. L. Parmelee**, general division accountant on the Pennsylvania, with headquarters at Grand Rapids, Mich., has been appointed secretary and auditor of the Grand Rapids & Indiana, with the same headquarters, effective January 18. Mr. Parmelee will retain his former duties as general division accountant.

### Operating

**W. C. Barnwell**, chief dispatcher of the Southern at Macon, Ga., has been promoted to trainmaster with headquarters at Valdosta, Ga.

**A. E. Marsh**, trainmaster on the Southern, with headquarters at Macon, Ga., has been promoted to superintendent of the Jacksonville terminal.

**A. McFatrige**, freight claim adjuster of the Southern, has been appointed chief dispatcher of the St. Louis division with headquarters at Princeton, Ind.

**F. S. Rossiter** has been appointed assistant superintendent of the Chapeau division of the Canadian Pacific, with headquarters at Chapeau, Ont., effective January 16, succeeding W. R. Boucher, resigned.

**George Masten**, superintendent of the Norfolk & Portsmouth Belt Line, has been appointed superintendent of the Norfolk division of the Virginian with headquarters at Victoria, Va., succeeding W. A. Gore, who has been transferred to Princeton, W. Va., as superintendent of the New River division.

**J. K. McNeillie**, superintendent of the Susquehanna division of the Delaware & Hudson with headquarters at Oneonta, N. Y., has been detailed to the office of the general manager at Albany, N. Y., effective January 15. **M. F. Leamy**, superintendent of the Champlain division, with headquarters at Plattsburg, N. Y., has succeeded Mr. McNeillie at Oneonta. **H. M. Gargan** has succeeded Mr. Leamy as superintendent of the Champlain division.

**J. G. Clements**, who has been appointed superintendent of the Southern with headquarters at Somerset, Ky., was born at Decatur, Ill., December 13, 1879. He entered the service of the Wabash in 1894 as a brakeman and switchman and resigned the following year to become a brakeman on the

Chicago & Alton. He went to the Illinois Central in 1896 as a brakeman and served subsequently as a switchman, yardmaster and conductor. In 1906 he entered the service of the Cincinnati, New Orleans and Texas Pacific as a conductor. The same year he was appointed general yardmaster of the Chattanooga terminal. The following year he was appointed trainmaster, which position he held until his appointment as superintendent of the Cincinnati, New Orleans & Texas Pacific division of the Southern.

### Traffic

**T. W. Brahan** has been appointed commercial agent on the Southern, with headquarters at Hattiesburg, Miss.

**L. W. Gent** has been appointed commercial agent on the Louisiana & Arkansas, with headquarters at Kansas City, Mo.

**M. P. Cunningham** has been appointed commercial agent of the Grand Trunk with headquarters at New Haven, Conn., effective January 17.

**A. M. Farrell** has been appointed general freight and passenger agent of the Chicago, Ottawa & Peoria, with headquarters at Joliet, Ill.

**H. E. Dickinson** has been appointed general agent on the San Francisco-Sacramento, with headquarters at Chicago, effective January 15.

**T. B. Montgomery** has been appointed general freight agent of the Northern Pacific, with headquarters at St. Paul, Minn., effective January 1.

**D. W. Vaughan** has been appointed northwestern traffic agent of the Central of Georgia with headquarters at Chicago, Ill., effective January 20.

**L. J. Trexler** has been appointed general freight and passenger agent of the Kalamazoo, Lake Shore & Chicago, with headquarters at Lawton, Mich., effective January 1.

**E. M. Lane**, assistant to the general freight agent of the Southern with headquarters at Cincinnati, Ohio, has been appointed assistant to the freight traffic manager with the same headquarters.

**W. C. Cathcart** has been appointed general freight and passenger agent of the Maryland & Pennsylvania, with headquarters at Baltimore, Md., succeeding W. A. Johnson, resigned to accept service elsewhere.

### Mechanical

**J. W. Sasser**, superintendent of motive power of the Norfolk Southern, has resigned to become superintendent of motive power of the Virginian with headquarters at Princeton, W. Va., effective January 1, succeeding R. E. Jackson, resigned.

**A. Sturrock**, whose promotion to assistant superintendent of motive power on the Canadian Pacific, with headquarters at Winnipeg, Man., was announced in the *Railway Age* of January 7 (page 174), was born on July 27, 1883, at Dundas, Ont. He entered railway service in 1901 as a machinist in the Stratford, Ont., shops of the Grand Trunk. After a year's service with the Grand Trunk, Mr. Sturrock came to the United States and was employed as a machinist, first on the Atchison, Topeka & Santa Fe, and later on the Denver & Rio Grande. His service with the Canadian Pacific began in July, 1904, when he was employed as a machinist in the company's shops at Winnipeg. He was promoted to locomotive foreman in 1911, with headquarters at Fort William, Ont., a position which he held until 1913, when he was transferred to Vancouver, B. C. In April, 1914, he was again promoted, being made general locomotive foreman of the shops of the Canadian Pacific at Ogdén, Alta. A year and a half later Mr. Sturrock was made division master mechanic, with headquarters at Cranbrook, B. C., and in January, 1915, he was promoted to general master mechanic of the Alberta district, with headquarters at Calgary, Alta. At the time of

his recent promotion he was serving as general master mechanic of the British Columbia district, with headquarters at Vancouver, where he had been transferred in April, 1913.

### Engineering, Maintenance of Way and Signaling

**C. Duckworth**, who was appointed division engineer on the eastern division of the Western Pacific, with headquarters at Elko, Nev., has resumed his position as roadmaster, with the same headquarters, effective January 1, the position of division engineer having been abolished throughout the Western Pacific system.

**H. F. McFarland, Jr.**, whose appointment as chief engineer of the Wichita Falls & Southern, with headquarters at Graham, Tex., was announced in the *Railway Age* of December 10 (page 1048), was born on April 2, 1885, at Corsicana, Tex. He was educated at Washington University and entered railway service in 1908 as an inspector of bridge and masonry construction on the St. Louis & San Francisco. In July, 1909, he was made senior draftsman in the office of the engineer of bridges, and in December, 1912, he was promoted to assistant engineer with jurisdiction over the general design of steel and concrete structures. Mr. McFarland enlisted in the army in June, 1918, being commissioned lieutenant and assigned to the Twelfth Engineers. He was later promoted to captain and served in France until June, 1919. In July, 1919, upon his return to civil life, Mr. McFarland accepted an appointment as chief engineer of the Wichita Falls, Ranger & Fort Worth, taking direct charge of the location and construction of that road from Dublin, Tex., to Breckinridge. His recent appointment has given him supervision of the construction of the Wichita Falls & Southern from Newcastle, Tex., to Breckinridge.

### Purchasing and Stores

**J. E. Wharton**, division storekeeper on the Pennsylvania, with headquarters at Toledo, O., has been appointed storekeeper, maintenance of equipment department, with the same headquarters, effective January 15. The position of division storekeeper has been abolished.

### Obituary

**Henry F. Houghton**, formerly general manager of the Cleveland, Cincinnati, Chicago & St. Louis, died at Indianapolis, on January 10.

**Benjamin Thomas**, at one time general manager and president of the Chicago & Western Indiana and for a long time chairman of the General Managers' Association, died at his home in Chicago, on January 6.

**William M. Coleman**, general counsel of the Hudson & Manhattan, committed suicide at Washington on January 21 by jumping from a tenth-story window of the hotel across the street from the Interstate Commerce Commission.

**Sydney Williams**, formerly assistant to vice-president in charge of purchases of the Union Pacific System, at New York, previous to 1918, died on January 9, at the home of his daughter in Montclair, N. J., at the age of 55. Mr. Williams graduated from the Massachusetts Institute of Technology in 1887, with the degree of civil engineer. From 1895 to 1903 he was controller and general superintendent of the Pennsylvania Coal Company and in the latter year became associated as assistant to W. V. S. Thorne, then director of purchases for the Southern Pacific System, Union Pacific System and other allied Harriman lines. After the separation of the Southern Pacific System and the Union Pacific System in 1913, Mr. Thorne remained with the Union Pacific System and Mr. Williams was retained as his assistant until 1914, when Mr. Thorne resigned. Mr. Williams then became assistant to vice-president in charge of purchases, and he continued in this position for some time after federal control, resigning in December, 1918, to engage in other activities. He did not return to the railroad field at the conclusion of federal control.

In considering plans for reductions in wage scales the railroads should consider very carefully before making any drastic reductions in the rates paid to the foremen of the maintenance of way department. Owing to the isolation of these men along the line, they are placed on their own resources

### Take Care of the Foreman

much more than the men holding corresponding positions in the other departments. It is physically impossible for the supervisor to observe their work in detail more than a few minutes each day or two. Consequently, the efficiency and effectiveness of the work performed under the direction of these foremen depends to a greater extent on their qualities of leadership, individual responsibility, industry and intelligence, than is the case with men who are almost constantly under the eye of the supervisory officer. That the railroads have experienced trouble in obtaining an adequate supply of track foremen with qualifications measuring up to these requirements is evidenced by frequent reference to this subject at meetings of the supervisors. There has been too great a contrast between the section foremen of the past, who commanded the respect of all railway employees, excited the ambition of the young men of communities along the line, and the section foremen of the present whose sons aspire to go "braking" or "firing" rather than to follow the footsteps of their father. Advances in rates to these men during the past three years have served to improve this situation. Therefore any adjustment of the scales of compensation now under consideration should be made in such a way as to leave the position of section foreman one that is sufficiently attractive to draw to it men of sufficient calibre to meet the growing responsibilities imposed.

What has happened to the freight traffic of the railways is strikingly indicated by statistics regarding the loading of freight cars within recent weeks. In

### Tremendous Decline of Freight

October the number of carloads of freight loaded averaged about one million a week. In the four weeks ending January 22 the average number of cars loaded weekly was 679,551. This represents a decline since the peak was reached in October of almost exactly one-third. As a result of this decline of business the railroads on January 23 had a car surplus of 301,000 cars and this has been steadily increasing. The statistics regarding earnings and expenses in January are not available but the reduction of both total and net earnings which occurred coincidentally with this decline of one-third in freight movement will be shown when the statistics are available to have been very large. The statistics regarding car loadings show clearly that the country is not very generally taking advantage of the surplus railway capacity available to "ship now." For a period of many months there were loud complaints that shippers could not get sufficient cars in which to ship their goods. The railroads might now with equal pertinence complain loudly that they cannot get enough freight with which to load their cars. Car shortages cause heavy losses to the business concerns that cannot ship goods when they want to, but car surpluses likewise cause heavy losses to railroads when they cannot get freight to haul in their cars.

When there is another large shortage of cars, as in course of time there will be, it is to be hoped that those who could cause the shipment of freight now, but who are not doing so because prices or other conditions are unsatisfactory to them, will not forget the present period during which the railways are suffering tremendous losses because of the failure of those who could "ship now" to do so.

A substantial majority of maintenance officers are inclined to consider a maintenance cost and work system, including diagrammatical or charted representation, too complicated and difficult to keep up to date and, therefore, of little value. The truth is that the subject has not been studied sufficiently.

### Proof of the Pudding in the Eating

While one plan in all its details will not fit all the conditions on all roads, the underlying principle of the plan is entirely applicable in nine cases out of ten. It is not strange that some maintenance officers consider not only complicated but even unwieldy the comprehensive plan which one road has worked out and put into operation. Yet if the plan has proved successful, it is good proof that the fault is not in the system itself. One large eastern road now has in successful use a method whereby an accurate check is kept on the progress of its foremen, supervisors and division engineers by means of charts made up by the foremen and supervisors and consolidated by the division engineer. These are forwarded at regular intervals to the engineer maintenance of way, who is thus able to know accurately just what has been done on the track, what is being done and what is the best future sequence for the work. The office charts are then brought up to date and the original returned with the comment, criticism or instructions. The time actually consumed is small, for the men concerned are thoroughly familiar with the method and the changes or additions are made promptly. It is the experience on this road that the objections as to complication and time lost are of little importance—the time wasted in searching out and co-ordinating the data for one item or one detail of the work is usually sufficient to keep an entire system to standard for a month. The problem hinges entirely upon the development of a method which is sufficiently simple, comprehensive and applicable, a condition not always easy to meet but certainly worth the effort.

In last week's issue of the *Railway Age* there was some brief comment concerning the hearings before the Interstate Commerce Commission on the application of the El Paso & Southwestern Company to issue stock of no par value.

### Feasibility of No Par Value

No attempt was made to discuss the feasibility of the idea. Voice was given to the expectation, however, that the proposal would attract no small amount of attention. It would appear that the idea of issuing of stock without par value has much merit. It would take a four-page article to discuss the advantages and disadvantages in detail and it is intended here to discuss but one small angle of the problem. One of the major faults in railway financing in recent years has been the predominance of bonded indebtedness as compared with the raising

of capital through issues of stock. The opinion has been expressed that the working out of the provisions of the Transportation Act may encourage this tendency, particular reference being made to the manner in which the Interstate Commerce Commission has assisted carriers in meeting maturing indebtedness by means of the \$300,000,000 loan fund. Of course, there can be no criticism of such a commendable use of the revolving fund as that. The difficulty is the lack of ability to use stock issues more than they have been used in recent years. Not the least of the difficulties attendant upon the issuance of stock is the fact that it is hardly feasible to put out such issues at less than par value. This is an objection that does not hold in the case of stock of no par value. Having no par value issues of it may be made at or near the current market value. The argument therefore is that having stock of no par value will permit of raising capital through stock issues where it possibly could not be raised with stock with a par value. The question is not one, of course, that can be decided easily. Nevertheless, it will be borne in mind that one of the chief objections—namely that of inflation—has been removed by the provisions of the Transportation Act giving control over security issues to the Interstate Commerce Commission.

In reducing the personnel under present conditions, mechanical department officers are confronted with a serious dilemma.

#### Discrimination Needed in Reducing Forces

The amount of work in the average terminal does not fall off in proportion to the decrease in traffic and with the present restrictions on the work of the various crafts, a heavy cut in roundhouse forces will often make it impossible to handle the work properly. On the other hand, the proportion of equipment in need of repairs is very large and the shops should be turning out more locomotives and cars than are needed to care for the present traffic in order to be prepared for an increase in business. The situation calls for sound judgment and the mechanical officer should be left free to keep the proper balance between the two branches of the department. When a situation arises, such as exists at present, there is too often a tendency to reduce the roundhouse forces beyond the economical limit. The operating officer has no accurate index of the results being obtained by the mechanical department and nearly always attaches too much importance to the equipment condition report. If the per cent of bad-order equipment is given undue weight, the shop work is likely to receive more attention than the handling of engines in the terminal. The true function of the mechanical department is not merely to repair equipment. The maintenance of the locomotive at the terminal has a marked effect on its efficiency as an operating machine. There are many large expenses incident to conducting transportation over which the operating department has no control; they are determined entirely by the character of the maintenance of the equipment. Whatever reductions are made in the mechanical department, the roundhouse forces should not be reduced to such an extent that the efficiency of the motive power as an operating machine is impaired. The hidden losses due to poor maintenance may be in many cases greater than the savings made by laying off men. Regardless of the extent to which expenses must be cut, enough men should be kept at the terminals to see that every important part of the locomotive is kept in efficient condition, that boiler tubes and superheaters are cleaned and tight, that the valves are square, that there are no bad pounds in the machinery and no leaks to waste steam. These are absolute essentials that should receive attention even before consideration is given to reducing the number of bad-order locomotives and cars.

It is to be presumed that the Interstate Commerce Commission now has under consideration the decision it will be called upon to make eventually as to the working out of the so-called recapture clause of the Transportation Act. This term is given to the provision relating to the treatment of excess net railway operating income over 6 per cent. It is contained in paragraph 6 of section 15a of the Interstate Commerce Act, or of section 422 of the Transportation Act, and reads in part as follows:

(6) If, under the provisions of this section, any carrier receives for any year a net railway operating income in excess of 6 per centum of the value of the railway property held for and used by it in the service of transportation, one-half of such excess shall be placed in a reserve fund established and maintained by such carrier, and the remaining one-half thereof shall, within the first four months following the close of the period for which such computation is made, be recoverable by and paid to the commission for the purpose of establishing and maintaining a general railroad contingent fund as hereinafter described.

There are many problems which may be expected to arise in the administration of these provisions. One of them is the term to which the clause is to be made to apply. The commission may apparently in its discretion choose the year from September 1, 1920, to August 31, 1921, or it may find it more advisable to take the four months from September 1, 1920, to December 31, 1920, and henceforth to follow the regular calendar and fiscal year. It is certainly to be hoped that it will adopt the latter method. For one thing it will be somewhat confusing and certainly uneconomical to have an overlapping period as would be the case if the September 1 to August 30 period is taken. That it would certainly be much better to have a single accounting period is self-evident. Other questions will arise, no doubt, as to the working out of the clause. It would appear to be most advisable to have them settled at once and not dragged over for nearly another additional eight months or a year. There will be enough uncertainties in the railway business in 1921 without including this particular problem among them.

## Will the Labor Board Rise to the Emergency?

THE LABOR COMMITTEE of the Association of Railway Executives, speaking through its chairman, General W. W. Atterbury of the Pennsylvania Railroad, suggested to the Railroad Labor Board on Monday that to meet a great emergency it should set aside at once all rules and working conditions imposed upon the railways since December 31, 1917.

The emergency to meet which it was suggested that this be done is that presented by the present financial condition of the railroads. In the first three months during which the present freight and passenger rates were in effect the railroads handled a record-breaking business. Nevertheless, in these months they earned a net return at the rate of four per cent, and not of six per cent, as estimated by the Interstate Commerce Commission.

Since then there has been a tremendous decline of traffic. The amount of freight being moved has declined one-third since October, and the number of idle freight cars on January 3 was 301,000. This contrasts with a car shortage of about 140,000 cars on September 1.

With earnings inadequate when the traffic was large, and with traffic and earnings declining at the rate these figures indicate, it is idle for spokesmen of railway employees' organizations to answer, as some have, that there is no crisis in the railroad field demanding immediate attention.

The railroad payroll constitutes 60 per cent of railroad earnings. Economies in the use of and in the prices paid for materials and fuel are by no means exhausted, but are

being made energetically every day. But all the other economies that could be effected on many railroads would not save them from disaster under present conditions without a sharp reduction in their payrolls. Many men already have been laid off, but very little study of the statistics regarding current earnings and expenses is necessary to show that all the economies made are not sufficient. The managers of the railroads are, therefore, confronted with the indubitable fact that one of the three following developments must occur:

*First:* A great increase in the efficiency of employees and a consequent reduction in the number of them to be paid without any general reduction of wages;

*Second:* A general reduction of wages;

*Third:* Many railroad bankruptcies.

The railway executives' obligations, not merely to their security owners, but to the public, forbade them to sit by and watch the enormous payroll drive many railroads into bankruptcy. Many hundreds of millions of dollars of the securities of railroads are owned by savings and other banks, by life insurance and other similar fiduciary institutions. Widespread insolvency of the railroads would largely destroy the value of these securities and pull down many of the banks and other institutions which own them. The probable result would be a financial panic and a serious deepening and prolongation of the business depression from which the country already is suffering so greatly.

It was not deemed desirable to demand a general reduction of wages at this time, although the fact that ultimately a reduction of railway wages must come was clearly recognized in General Aterbury's statement.

The only way out left was that suggested to the Railroad Labor Board, namely, the setting aside of the many restrictive rules and working conditions adopted under government control which have been making efficient and economical operation of the railways impossible.

It has been charged that the suggestion made to the Labor Board that it immediately approve the setting aside of all rules and working conditions established since December 31, 1917, was an irregular proceeding and practically asked the Railroad Labor Board to disregard the law which created it. As a matter of fact, the continuance since September 1 of these rules and working conditions has been irregular and not required by the Transportation Act. The Transportation Act specifically required the railroads to continue these rules and working conditions in effect until September 1. Any and every railroad in the country could have legally discontinued them on that date.

Why was this not done? Because the Railroad Labor Board in its decision in the wage case last July asked that the rules and working conditions established under government control should be continued until hearings regarding them could be held. It was because of this request of the Board that they have been kept in effect up to the present time. The Board has exactly the same right to ask the employees at this time to return to the rules and working conditions of December 31, 1917, that it had last July to ask the companies to continue to observe the rules and working conditions established under government control.

What would have happened if on September 1 the companies had restored the rules and working conditions of 1917? The employees undoubtedly would have strenuously objected. If developments had then taken the course obviously contemplated by the Transportation Act, negotiations regarding the matter would have been carried on by representatives of the companies and the employees. If these negotiations had developed into a controversy which threatened to cause an interruption of transportation, it would have been necessary in order to comply with the Transportation Act to have submitted the controversy to the Railroad Labor Board. Meantime, however, the rules and working

conditions of 1917 would have been in effect. The law does not give the Railroad Labor Board actual jurisdiction over any question arising between a railway and its employees until there have been negotiations between them regarding these questions out of which negotiations there has developed a controversy which might lead to an interruption of transportation.

If the Board should now approve the suggestion made by the Labor Committee, it would in effect be merely asking the employees to accept these rules and working conditions of 1917, as last July it asked the railway companies to continue to operate under the rules and working conditions established by the Railroad Administration. Its action in respect to this matter now, like its action in respect to the same matter last July, would be extra-legal. Perhaps the result would be a controversy which would threaten an interruption of transportation. In that event, the whole question would have to be brought before the Board again, but meantime the rules and working conditions in effect would be those of 1917.

Altogether aside from the legal aspects of the questions involved, what the railways have really presented to the Labor Board and the employees is the alternative of a reduction in railroad expenses by a restoration of the rules and working conditions of 1917 or by a general reduction of wages. The restoration of the rules and working conditions of 1917 would enable the railways to make large savings by reducing the number of men they employ, and by eliminating the payment of many millions of dollars a year for work that is not done. If this plan is not adopted, a general reduction of wages will have to be speedily made. The plan the companies have offered would be better in the long run for the companies, the public and the employees than the general and sharp reduction of wages which is the only alternative.

The *Railway Age* repeatedly has pointed out to railroad labor leaders that the only way railway employees could hope to establish a claim to a continuance of the present high wages is by increased efficiency in their work. The labor leaders have done nothing to stimulate increased efficiency of work by the employees. They have devoted themselves to trying to perpetuate rules and conditions of work which make efficiency and economy in operation impossible, and which, by making it impossible, have been rapidly making impossible a continuance of the present scale of wages. The result is the deplorable condition which now exists in the railroad field. Unless the Labor Board promptly approves either drastic changes in working conditions or a sharp reduction of wages it will have to assume a heavy responsibility for very serious consequences.

## New Books

*The Engineering Index for 1919.* Published by the American Society of Mechanical Engineers, 29 West 39th street, New York. 527 pages, 6 in. by 9 in., bound in cloth.

The purpose of the Engineering Index is to provide a convenient and satisfactory guide to engineering literature. The 1919 edition of this index is the most complete and comprehensive work of its kind ever published. It contains over 12,000 references to articles published during the year 1919 in nearly 700 engineering and allied technical publications. The compilation of this index is based upon a review of approximately 1,100 periodicals, reports, and other publications by the engineering staff of the American Society of Mechanical Engineers. These publications are printed in ten different languages and comprise what is probably the most complete collection of scientific and engineering publications in

the world. All of the publications referred to in this index are now a part of the Engineering Societies Library in New York.

*The Making, Shaping and Treating of Steel*, by J. M. Comp and C. B. Francis, Bureau of Instruction, Carnegie Steel Co. 600 pages, illustrated, 5 in. x 8 in. Bound in cloth. Published by J. M. Comp, Carnegie Building, Pittsburgh, Pa.

The scope included by the title of this work naturally suggests a voluminous treatise. However, the authors have covered the comprehensive subject very well in a book of 600 pages by eliminating all non-essential matter. The book is frankly a description of the steel industry as it exists; it is not written from the viewpoint of the steel expert and comparatively little is said about the future development of the industry. For that reason, any one thoroughly versed in the manufacture of steel might find little that is new in the book. For the railroad officer who desires a thorough knowledge of the steel industry and its most important products, the book is extremely valuable. Designed as a course of instruction for salesmen, this work necessarily includes practically all the information required by those who buy or use steel in any form.

The book is strictly non-technical and opens with a discussion of the fundamentals of physics and chemistry as applied to steel making. The entire process from the ore to the finished product is then outlined in a systematic manner. The various ores, refractories, fuels, fluxes and slags are discussed and the manufacture of coke by the beehive and by-product process is described. In the discussion of the making of pig iron, the construction and operation of the blast furnace and the chemistry of the process are covered. The Bessemer and open-hearth processes are treated in a similar manner, a short history of their development being included. Another chapter is devoted to the manufacture of steel in electric furnaces which is followed by a description of the duplex and triplex processes. The section on the shaping of steel discusses chemical properties, describes the rolling mill and covers in some detail the rolling of blooms, billets, plates, rails and rail joints, the strip and merchant mill products, rolled steel wheels and axles.

The third part of the work treats of the constitution, heat treatment and composition of steel. The solution theory of steel is explained and the theory and practice of heat treatment are discussed with this as a basis. The concluding chapters are devoted to the effect of the common elements on the mechanical properties of carbon steel and a short description of the more usual types of alloy steel.

*Ocean Steamship Traffic Management*. By G. C. Huebner, 273 pages, 6 in. by 9 in., bound in cloth. Published by D. Appleton & Company, New York.

This book is so written as to be easily intelligible to a student who is entirely unfamiliar with the subject, and yet it is complete enough to be of value to those in the ocean traffic business who wish to learn some of the details of all phases of the work. Shippers, too, and any one whose business calls for contact with steamship traffic departments, will find this work of value. The book covers the entire field thoroughly and includes general descriptions of the various classes of concerns which provide overseas transportation service, the organization of the traffic departments, the classification and duties of the personnel, the fixing of rates, the traffic documents and papers and the classification of commodities. This book is supplementary to a work called "Principles of Ocean Transportation," written by Dr. Huebner in conjunction with Dr. Emory R. Johnson, which appeared in 1918 and which, also, was published by D. Appleton & Co.

## Letters to the Editor

### Mine Ratings and Car Supply

#### TO THE EDITOR:

On page 48 of the "Buy Now and Ship Now" issue of the *Railway Age*, January 7, there is this statement: "Viewed from the broad economic standpoint, the proposal to continue rationing cars is indefensible. Studies made in the bituminous coal mining industry show that when the car supply is 75 per cent of the requirements, the cost of production is 16 per cent greater than when all demands for cars are met. If the car supply is one-half normal, the cost of coal is increased 40 per cent."

I can easily appreciate how the writer of this statement may have been misled into making it by the chart which is shown on page 34, but there is an error in the statement which, to my mind, does some injustice to the railroads. To illustrate, let me say that the requirements at the mines for coal cars in time of extreme car shortage are frequently much in excess of their actual ability to load coal. There are some extreme cases where requirements, based, to be sure, on established ratings, are more than 50 per cent above producing and loading ability. It is going pretty far to say that when the railroads furnish but 75 per cent of such highly excessive requirements, the result is an increase of 16 per cent in the mine cost of production. And it is equally erroneous to charge that a 50 per cent car supply, based on mine requirements, would increase production costs 40 per cent.

I understand that the chart which is shown on page 34 was originally published by the Fuel Administration and has more recently been given circulation by the Geological Survey. My understanding, gained from discussion with representatives of the Survey, is that what the chart is really intended to show is the extent to which mining costs are increased by loss of full time operation from any cause whatsoever—transportation disability, mining disability, or anything else. It may be admitted that with a fairly constant overhead expense, mining costs are bound to increase as the percentage of full time operated decreases. The great error is in the assumption that full time operation is represented by the maximum requirements for coal cars when that maximum figure is, as is generally admitted, greatly beyond the current producing and loading ability of the mines.

A. G. GUTHEIM,

Manager Public Relations Section, Car Service Division, American Railway Association.

SIR ROBERT HADFIELD, inventor of manganese steel and a leader in the British steel industry, has been awarded the John Fritz gold medal for notable scientific and industrial achievement. Manganese steel, non-magnetic, was used in the manufacture of millions of helmets worn during the war by American, British and Belgian soldiers. Award of the medal was voted unanimously by the sixteen members of the committee representing the American organizations of civil, mechanical, mining, metallurgical and electrical engineers.

JOHN S. MACDONALD, dining car inspector of the Pennsylvania Railroad at New York City, has received from King Albert of Belgium, an award of the Silver Medal of the Order of Leopold II in recognition of the services rendered to the royal party during the tour of the United States made by King Albert last year. Mr. MacDonald accompanied the royal party on the tour. He has been with the Pennsylvania for 20 years and has had charge of similar trips for President McKinley, President Wilson, the Prince of Wales and other notables.

# Container Car in Express Service on N.Y.C. Lines

## American Railway Express Company Operates Experimental Car Between New York and Chicago

THE CONTAINER SYSTEM of transporting materials has been given much attention in the past and considerable progress has been made in development work. These experiments have, however, been made only in freight service in an attempt to relieve the congestion of traffic due to delays in loading or unloading the present type of freight car, particularly when handling less-carload shipments. Many of the same difficulties and delays are also encountered in handling express matter and this has led to the application of the container idea to the railway express service.

A container car designed especially for express service has been placed in operation on the New York Central between New York and Chicago. This car left New York recently in an American Railway Express train and after delivering its cargo of merchandise for leading Chicago department stores at the South Water street terminal of the Michigan

center sill which is supplemented by the construction of the car sides. The superstructure consists of a low steel side framing—about 30 in. high—having side plates of steel which stiffen the car frame and also serve to prevent any sidewise movement of the containers. The sides are connected at each end of the car to a cast steel anti-telescoping end-frame which is approximately the same height and width as a passenger car, having much the same appearance as a blind-end baggage car.

The containers are designed so that they may readily be removed from the car and loaded upon automobile trucks. They are 9 ft. long by 6 ft. wide inside, have an inside clear height of 7 ft. 4 in. and a capacity of 6,000 lb. They are substantially built of structural steel and being entirely of metal will eliminate the losses due to damage from fire. A door is provided in one side of each container through which

New York Central Container Car Designed for Handling Express Matter, Equipped with Passenger Trucks and Buffers and with Air, Steam, and Signal Line for Passenger Train Operation

Central Railroad, was reloaded and made a return trip to New York.

### A Nine-Section Express Car

The car is a nine-section express car, its sectional cargo space consisting of nine separate containers or steel boxes firmly secured on the car to prevent shifting during train movement. Each container is removable so that it may be transported by motor truck between stores or factories and the railroad.

This new equipment was built by The Merchants Despatch Transportation Company of East Rochester, N. Y. It consists of a modified low-side gondola car carrying nine containers which may be lifted on or off the car by means of a crane or other type of hoisting apparatus. The car is constructed along the lines of the New York Central standard 60 ft. baggage car and is mounted on two four-wheel trucks of the passenger type. It is equipped with passenger buffers and with air, steam, and signal line connections so that it may be operated in passenger train service. The underframe is of steel construction throughout having a deep

the material is loaded and the door then locked and sealed. The container is then placed upon the car where the side of the car which projects above the base of the door gives additional security to the contents as the door cannot be opened until the container is raised above the top of the side frame. This feature makes the pilfering of goods—now so prevalent—practically impossible. Besides the facility with which the container and its contents may be handled, this method of transportation is expected to eliminate much of the delay caused by the detailed billing and re-checking of small shipments.

On the initial trip of this express car, the handling of the loaded containers was accomplished with surprising speed. With no special station equipment—only a locomotive crane being available—the containers were transferred from motor trucks to their positions on the car in from 30 seconds to two minutes each. Under existing conditions, this nine-section express car could therefore be unloaded and reloaded ready to proceed within 40 minutes. No crew of handlers equipped with trucks could possibly equal this performance.

In addition to the nine-section steel container car now in

passenger train express service, there are at the present time under construction at the plant of the Merchants Despatch Transportation Company other container cars for use in freight train service. These cars, which are 46 ft. long, are provided with steel underframe, wooden sills and floors, and steel sides and ends about 24 inches high for holding the containers in place. The cars will be equipped with standard freight car trucks and will be in every way suited for regular freight train service. The containers now under construction for use with these cars in freight service are 15 ft. long, and 3 containers will be used on each car. They are constructed with steel sides, ends, roofs and floor frames, wooden floors and sheathing and doors in one end only.

#### Other Container Cars Under Construction

It is expected that this container car system will be expanded by the New York Central to completely co-ordinate the steam railroad, the motor truck and the electric railway.

Empty Container Showing Interior and Door Construction

If it proves to be successful in actual service it will bring about a new system of handling less-carload freight and express matter between large centers of population. The New York Central primarily seeks greater security for shipments in transit, the losses to the railroads through the theft and damage of goods having increased alarmingly in recent years—the aggregate annual loss and damage claims paid by American railroads in 1920 having been increased about 300 per cent since 1914. Several other points of improvement in service are expected from the container car system of transportation. This system provides that the portable containers shall be loaded and locked on the shippers' premises and then conveyed by motor truck and lifted aboard the car. At destination the locked container is carried by motor truck direct to the consignee. All of the intermediate handling and checking processes are done away with.

Another advantage of the new system which is expected to prove most valuable is greatly increased use of rolling stock in actual service. This is particularly important when traffic expands to its "peak" and the prime need is to shorten lay-overs of cars in yards and stations for loading and unloading, and to limit their idleness through misuse for storage purposes. With ample supplies of the removable containers,

which in their several classes will be of uniform size and interchangeable, one carload of the containers may be removed and sent with their loads to consignees, and another set immediately hoisted to their places and the car be ready to proceed within a matter of minutes. The containers may remain on station platforms or on the premises of shippers

Loaded Container Being Lifted from Motor Truck

for loading or unloading at convenience, without tying up rolling stock at points where track capacity is limited.

One of the difficulties that will be encountered in the operation of this system will be the lack of adequate lifting apparatus on the premises of many shippers, which will necessitate the tie-up of a motor truck while the container is unloaded and reloaded. Other difficulties that must be overcome are: the possibility of scattering the containers over

Locomotive Crane Placing a Loaded Container on the Car

too wide a territory and the probable lack of sufficient suitable traffic in one direction. These objections to such a system are, however, vastly outweighed by the advantages.

The performance of this first car in express service will be followed closely and it is expected that in a future issue, the readers of the *Railway Age* will be given some very interesting operating data.

# National Agreements Must Be Abrogated At Once

General W. W. Atterbury Predicts Disaster Unless Labor Board  
Ends Present Working Rules

THE IMMEDIATE ABROGATION of all national agreements, the remanding of the question of rules and working conditions to negotiation between each carrier and its own employees, the re-establishment of the agreements, rules and working conditions in effect on December 31, 1917, and the right to pay unskilled labor not less than the prevailing rate of wages in the various territories served by any carrier, were requested of the Railroad Labor Board on January 31 by General W. W. Atterbury, vice-president of the Pennsylvania and chairman of the Labor Committee of the Association of Railway Executives. The request was accompanied by a vigorous statement of the present precarious financial position of many of the carriers, General Atterbury predicting bankruptcy for many and a resulting financial panic unless steps are taken immediately to cut needlessly huge wage payments and thus bring operating expenses into proper relation to the operating revenues now accruing under increased freight and passenger rates.

## General Atterbury's Statement

The complete text of General Atterbury's statement to the Board follows:

"I have come under a strong sense of duty to lay before you an acute situation. Unless this Board takes prompt action many of the railways of the United States may be forced into insolvency. Many railroads are not now earning, and with present operating costs and traffic have no prospect of earning, even their bare operating expenses, leaving them without any net return and unable to meet their fixed charges. The emergency presented can be met either by an advance in freight and passenger rates, or by a reduction in operating expenses. With declining prices and wages in industry and agriculture the country demands that the solvency of the railroads must be assured by a reduction in operating expenses, and not by a further advance of rates.

"The national agreements, rules and working conditions forced on the railroads as war measures cause gross waste and inefficiency. I estimate that the elimination of this waste would reduce railway operating expenses at least \$300,000,000 per annum. It would be far better to save this sum by restoring conditions of efficient and economical operation than to reduce wages. We believe that as the wages of railroad employees were the last to go up, they should also be the last to come down, but we do insist that for an ample wage, an honest day's work shall be given.

"The public has the right to insist that this must be obtained. The public has also the right to expect that the railway executives, with the co-operation of the regulatory bodies and the employees, will as rapidly as possible reduce the cost of railway operation so as to eventually insure a reduction in rates. Ultimately a readjustment of basic wages will be required. Meantime it is to the interests of all concerned, including labor, that the rules and working conditions shall be made conducive to the highest efficiency in output per man.

"Mr. Whiter and his committee have far from exhausted their evidence on this subject and if required to will of course proceed. But it will be dangerous to continue the consideration of these agreements rule by rule. If the Board follows its present procedure, months will elapse before it can render its decision.

"The urgent financial necessities of the railroads will not permit them to wait any such length of time for relief. Long before the present detailed hearings are concluded the Board

will be flooded by appeals from individual railroads from all parts of the country for reductions in basic wages. It will be impossible for the Board to hear and dispose of these separate cases upon their merits in time to avoid numerous receiverships and the possibility of a national panic.

"When wages have been too low, the harm done has been offset by retroactive increases. Losses of railway net operating income are irreparable. You cannot make retroactive tomorrow the savings that should have been made today. Your Board cannot possibly write the rules and working conditions of every railroad in this country and adjust them equitably to varying geographical, operating and social conditions. It rests entirely with your Board to determine within the next few days whether this whole situation shall drift into chaos and orderly procedure become impossible except at the price of railroad bankruptcy, financial shock and still wider unemployment.

"The Labor Board can prevent this catastrophe by declaring that the national agreements, rules and working conditions coming over from the war period are terminated at once; that the question of reasonable and economical rules and working conditions shall be remanded to negotiation between each carrier and its own employees; and that as the basis for such negotiations, the agreements, rules and working conditions in effect on each railroad as of December 31, 1917, shall be re-established.

"If the Board will do this, the Labor Committee of the Association of Railway Executives will urge upon every railroad company a party to Decision No. 2, that no proposal for the reduction of basic wages shall be made within the next succeeding 90 days. This will afford an opportunity to gauge the economies which can be accomplished through more efficient rules and working conditions.

"It also will afford additional time in which to realize the benefits of a further decline in the cost of living. The course which we are recommending is not only imperative but equitable. When President Wilson issued his proclamation on December 26, 1917, assuming government control of the railroads, he said: 'Investors in railway securities may rest assured that their rights and interests will be as scrupulously looked after as they would be by the directors of the several railway systems.'

"In his address to Congress on January 4, 1918, President Wilson said: 'The common administration will be carried on with as little disturbance of the present operating organizations and personnel of the railways as possible.'

"The War Labor Board declared that the war period was an interregnum to be used by neither the employer nor the employee for the purpose of bettering or impairing the position of either.

"To perpetuate as the normal rules and working conditions on the railroads, the extraordinary provisions of the war period is a distinct violation of all the foregoing promises. The war has now been over more than two years. The time has come when, if the railways are to be efficiently and economically operated, in accordance with the provisions of the Transportation Act, normal conditions of employment and of working conditions must be restored and increased efficiency of labor be secured.

"If your Board adopts the foregoing suggestion, there is but one aspect of the wage question on which we ask immediate action. The basic rates now established by your Board for unskilled labor are from 39 to 48½ cents per hour. Since your decision was made on July 20, 1920, these rates

have fallen materially throughout the United States. For your Board to require the railroads to continue to pay wages to unskilled labor far in excess of those paid by other industries is unfair to those industries, and bears with grave injustice upon the great body of our farmers. Within the next month or six weeks practically all of the railways of the country must recruit their unskilled labor forces. It is desirable that a large part of the work for which these men are necessary be concentrated in periods when the same labor is not needed in harvesting the crops. We therefore ask the immediate permission of your Board to pay for unskilled labor not less than the prevailing rate of wages in the various territories served by any carrier, in accordance with Section 307 of the Transportation Act.

"I regret the urgency of the foregoing presentation. Its informality does not indicate any intention on the part of the railway companies to violate the principle of orderly procedure in such matters. But to sit by and see this situation develop without bringing it promptly and strongly to the attention of this Board would be to sacrifice both the spirit and the letter of the Transportation Act.

"In our judgment, unless the proposed measures be taken promptly by your Board, a situation will shortly develop in which orderly procedure will become entirely impossible. Your Board will be faced with the gravest responsibilities, which it could not possibly successfully perform, in a condition of national confusion, if not of chaos."

At the close of General Atterbury's statement, H. T. Hunt, a member of the public group on the Board, and Judge R. M. Barton, chairman of the Board, suggested that representatives of the railroads and the employees meet to formulate means, if possible, to avert the disaster predicted by General Atterbury. To this suggestion the latter replied that negotiation would be futile because of the dissimilarity of the views of the executives and of the employees and because of the necessity for immediate action.

Chairman Barton then stated that the requests made by General Atterbury would have to be considered in executive session but, in reply to a question of B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, he said that representatives of the employees would be heard before any action was taken by the Board. Mr. Jewell and other representatives of the employees present at the hearing declined to reply to Mr. Atterbury's requests or to make any statement at that time. Mr. Jewell, however, stated that he would prepare a reply on behalf of the employees which would be presented to the Board later.

General Atterbury's statement was made after the Labor Committee of the Association of Railway Executives had been in session at Chicago for three days discussing the present labor situation and formulating plans for the restoration of conditions under which an honest day's work for an honest day's pay might be rendered by railway labor.

At the close of the afternoon session of the same day, J. G. Luhrsen, president of the American Train Dispatchers' Association, replied on behalf of his organization to General Atterbury's remarks.

As a representative of the American Train Dispatchers' Association he entered formal protest against the Labor Board's granting General Atterbury's requests. In his protest he stated that the Transportation Act would be violated by permitting carriers to bring before this Board mere theories without following the requirements of the law governing the manner of bringing matters before the Board. He protested the statement of the carriers asking that immediate action be taken by the Board in line with their requests and took issue with the statement that national agreements were forcing the carriers to compensate employees without obtaining from them effective performance of duties. He

charged railway managements with deceptive and inefficient operation and stated that analysis of the operating records of the carriers, particularly the train sheets, would disclose operating inefficiency which if corrected would produce a saving greatly in excess of the waste of \$300,000,000 alleged by General Atterbury as resulting from the national agreements. He stated that the desire of the carriers to reopen negotiations concerning certain agreements with all employees were false, misleading and wholly without merit. He further stated that if the Board is flooded with requests by the railroads for immediate reduction in wages such action will be considered propaganda to interfere with the orderly procedure of the Board.

The right of Mr. Luhrsen to discuss national agreements before the Board was immediately questioned by E. T. Whiter, chairman of the Conference Committee of Managers of the Association of Railway Executives, who stated that Mr. Luhrsen's organization is not a party to such an agreement. Mr. Luhrsen replied that his organization did have a national agreement with the carriers. Mr. Whiter in turn denied this assertion and asked that Mr. Luhrsen's remarks regarding national agreements be stricken from the Board's record. No ruling was made on this request and the Board was adjourned for the day.

### Carriers' Opposition to Hourly Wage Summarized

The progress of the hearings on the demand of employees for the continuation of the national agreements formed during federal control has been reported in the *Railway Age* of January 14 (page 199), of January 21 (page 243) and of January 28 (page 297). The railroads' testimony regarding the detrimental effects of the abolition of piece work and the substitution thereof of the hourly wage system of pay was completed on January 25. The following day, Mr. Whiter summarized the carriers' opposition to the hourly system by denouncing the "restrictive rules fastened upon the railroads under government control by the United States Railroad Administration" as productive of great inefficiency and waste in operation. He then requested that the Board "permit the reintroduction into railroad work of methods of paying employees that will offer proper incentive to increased effort and give proper and adequate recognition to skill and industry.

"The public," he said, "pays in freight and passenger rates all the expenses incurred by the railways. The railways, under the Transportation Act, are required to be operated as economically as practicable so that the public will not have to pay excessive rates. The evidence we have introduced regarding the effects of the abolition of piece work in the shops of railways in every section of the country shows that in every case where the system of piece work—that is, the system of paying employees in proportion to the amount of work that they individually do—was abolished, and the system of guaranteeing day wages substituted, there has been a reduction in the average amount of output per employee per hour, and in most cases these reductions have been from 25 to 50 per cent. We have presented detailed studies showing actual results on the Baltimore & Ohio, the New York Central and the Pennsylvania in the east; on the Chesapeake & Ohio, the Louisville & Nashville, the Norfolk & Western in the southeast; on the Chicago & North Western and the Union Pacific in the west. An analysis of these studies comparing the efficiency of employees paid on the merit or piece work basis in 1917 and 1918, and the efficiency of the work done by the same men since then on the day wage basis, conclusively shows serious loss of production in the shops of the railroads when working on day wages as compared with piece work wages, resulting in excessive costs to the railroads and consequently to the public. The abolition of piece work has not only reduced the efficiency

of employees, but has also reduced the amount of output the companies can secure from their shops.

"We submit that this is merely a proof in detail of what practically every man knows from his own daily experience and from common knowledge of human nature. It does not require any figures to prove to any of us that the average man under normal conditions, day in and day out, will exert himself more in production if his work is rewarded in proportion to his efforts, than if he receives a flat daily wage no matter how little work he does.

"When the railways were returned to private operation the public expected an increase in their efficiency and economy of operation. We are seeking the abolition of restrictive rules imposed under government control, such as this one prohibiting piece work, because unless rules and working conditions can be adopted which tend to promote efficiency the managements of the railways cannot secure the increases in efficiency and economy of operation which are necessary to protect the public from excessive costs of transportation, and excessive freight and passenger rates."

### Railroads Oppose New Agreement for

#### Maintenance of Way Workers

On January 31, following General Atterbury's statement, Mr. Whiter, at the request of Chairman Barton, resumed his presentation on behalf of the carriers, discussing their opposition to the national agreement requested by the United Brotherhood of Maintenance of Way Workers and Railway Shop Laborers. In his testimony Mr. Whiter first pointed out that this organization, unlike the Shop Crafts, has asked the Board to sanction a new and more restrictive national agreement instead of asking for the continuation of the one now in effect. The opposition of the railroads against the proposed agreement is based, according to Mr. Whiter's testimony, on seven specific objections. These objections are:

"(1) The proposed rules extend their scope to classes of employees not heretofore represented by this organization; to many who are not employed in the maintenance of way department by all railroads.

"(2) The proposed rules are intended to be applied to officers; or to men who may be represented by other organizations.

"(3) There are vague and conflicting rules.

"(4) Some of the proposed rules are impracticable of application or contain requirements which involve unnecessary work.

"(5) The proposed rules will result in a reduction of efficiency and productivity of the employees.

"(6) The proposed rules would prevent the giving to incapacitated employees employment suited to their capacity.

"(7) The proposed rules effect a further increase in earnings for work performed; also pay for time in which no work is performed."

### Atlanta, Birmingham & Atlantic

#### Asks Wage Reduction

The serious situation outlined by General Atterbury was first disclosed when the Atlanta, Birmingham & Atlantic, through its president, B. L. Bugg, petitioned the Board on January 25 for authority to reduce wages "to a level that would enable the property to keep out of a receiver's hands." Mr. Bugg declared that the road is losing \$100,000 a month despite the fact that its working force has been reduced to the lowest possible point.

Chairman Barton agreed with Mr. Bugg that the case was pressing and after the Board had considered the case in executive session the following order was issued on January 27:

RESOLVED, In case of disputes which have arisen between the Atlanta, Birmingham & Atlantic and its employees by reason of the carrier having given 30 days' notice to employees in the various classes of its service of

certain reductions in their rates of pay, which would be made effective February 1, 1921:

That objection having been made by the employees, and a dispute having arisen in regard to the proposed reduction, and the matter having been brought before the Board, the Board decides that no change of any kind shall be made except by agreement between the parties until the dispute is heard and opportunity given for the board to decide.

The Board will proceed with the further hearing and consideration of the case, and sets February 10 as the date for such further presentation of evidence or argument as the parties may desire to offer.

In the meantime the Board suggests further conference between the parties and an effort on their part to agree on a settlement.

On February 2 and 3 Mr. Whiter continued his presentation on behalf of the carriers, taking up in turn their opposition to the continuation of the national agreements with the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, the Brotherhood of Railway Signalmen of America, the International Brotherhood of Stationary Firemen and Oilers, and the Order of Railroad Telegraphers. The testimony regarding these agreements was in general similar to that which has already been presented in regard to the shop crafts agreement. The character of this testimony has been outlined in previous issues of the *Railway Age*.

Various of the "independent" railway organizations have been fighting since the beginning of the present hearings for the right to present their views regarding national agreements independently. On February 2 the Board's decision on their petitions was made public, representatives of these organizations being granted the right to be heard in the present case despite the opposition of the larger brotherhoods who have maintained that the members of the independent organizations are adequately represented by them.

## Withholding of Guaranty Declared Injury to Nation's Economic Structure

URGING THAT IMMEDIATE ACTION be taken on pending legislation to authorize the secretary of the treasury to make partial payments on the \$340,000,000 due to the railways from the government, John S. Drum, of San Francisco, president of the American Bankers Association, has presented a memorial to Congress, in which he points out the great injustice of the present situation and indicates how it reacts to the detriment of agriculture, commerce and trade.

Copies of the memorial have been forwarded to Chairman Esch, of the House Interstate and Foreign Commerce Committee, to Senator Cummins, chairman of the Senate Interstate Commerce Committee.

"The American Bankers Association," says the memorial, "urges upon you the immediate need of legislation that will authorize partial payments of amounts due to the carriers from the government under the guaranty provisions of the Transportation Act of 1920 as those amounts are ascertained and certified from time to time by the Interstate Commerce Commission. The Economic Policy Commission of the American Bankers Association, of which Paul M. Warburg, of New York, is chairman, has investigated the situation thoroughly and adopted recently the following resolution:

"That it is the sense of this commission that legislation be urged which would make immediately available the funds which are held by the government for the railroads without the necessity of filing their complete claims."

"Serious injury is being done to the entire banking situation in the United States and therefore to the entire economic structure of the country by reason of the decision of the comptroller of the treasury (which has been sustained by the Supreme Court of the District of Columbia) that under the Transportation Act, as at present constituted, the secretary of the treasury cannot make any payments to the carriers before their entire claims for compensation shall have been audited

and certified to the secretary of the treasury by the Interstate Commerce Commission.

"The refusal of the treasury department, based purely on a technical construction of the Transportation Act, to make partial payments as amounts due to the carriers are certified by the Interstate Commerce Commission from time to time has rendered the railways unable to meet their current obligations from their own funds. They have therefore either been forced to borrow money from the banks to meet these obligations, or by foregoing payment to creditors have forced these creditors to borrow from the banks the money necessary to operate their own business. In either case banking credit in the United States is forced to bear, in addition to the extraordinary demands of business generally, a further burden of about \$340,000,000 which, according to the secretary of the treasury, is the amount due to the railways under the Government guaranty.

"This great burden has put a further strain on banking credit already heavily taxed, and increases their difficulties in supplying facilities urgently required by agriculture, commerce and trade. The purpose of Congress in enacting those provisions of the Transportation Act which provide for compensation to the carriers for deficits incurred under federal control, was to render aid to the railways so that in the interests of the people as a whole, during this period of readjustment, the carriers might as speedily as possible make the additions and betterments necessary to meet properly the requirements of the nation. That purpose is wholly nullified if the carriers are deprived of the use of the money due them until their entire claims have been audited and certified to the treasury department for payment.

"Legislation that would remedy this serious situation, by expressly declaring it to be the intent of Congress to permit partial payments to the carriers as the amounts due them are certified from time to time, has been introduced in Congress. Realizing as it does the disastrous consequences flowing from the wholly avoidable tieup of credit facilities involving hundreds of millions of dollars, the American Bankers Association urges upon you, with all the earnestness it is capable of expressing, to act immediately and favorably upon this legislation for the strength that will be given to the country's credit structure, by the prompt release of this huge sum that is due to the railroads."

## Santa Fe Coast Lines

### Car Loading Campaign

**L**AUNCHING ITS CAMPAIGN to promote heavier car-loading and the conservation of equipment with the slogan, "The Gospel of a Good Load," the Coast Lines of the Atchison, Topeka & Santa Fe inaugurated an interesting and comprehensive plan to stimulate action in this important subject on June 1, 1918. The results have been so gratifying that the plan might well be used by other lines.

In the campaign, instructive material and data have been compiled and presented in pamphlet form. The method has been to express by percentages the loading record—a capacity load representing 100 per cent—at the various stations for specific commodities, together with a table setting forth the general standing. The pamphlet is published monthly and every five months a consolidated statement is prepared. Thus from month to month a given station can trace its record and standing while the general progress can be determined from the consolidated tables. Progress or failure, together with reasons therefor, are pointed out by comment and comparison. Each station can find by examination of the detailed statements just where it stands in respect to the records of the others; in other words, "detailed statements, showing the performance by stations and commodities are given so that each agent and other employee or officer interested can familiarize himself with the tonnage moved, compare one station with another and determine in his own mind the best method to adopt to bring the loading of any commodity up to the highest percentage possible." The goal of 100 per cent is maximum tonnage and the records from month to month present in figures the loading history and results obtained.

J. R. Hitchcock, assistant general manager of the Coast Lines, under whose signature the pamphlet is sent to the employees, in concluding his instructions in one of the pamphlets presents the keynote of the campaign in the following statement: "The extent to which we can make full use of such equipment as we are able to secure for loading will be measured by the enthusiasm and energy displayed by our agents and others in preaching the Gospel of a Good Load and getting the loaders to practice it."

# Wood Preservers' Association Meets in San Francisco

## Annual Convention Afforded Opportunity to Study Timber Production and Treatment Developments

THE AMERICAN WOOD PRESERVERS' ASSOCIATION met in its seventeenth annual convention at the St. Francis Hotel, San Francisco, on January 25-27, inclusive, with over 125 members and guests in attendance. As this was the first meeting of this organization west of the Mississippi river, unusual interest was manifested in the opportunity to study the timber resources of the west and to witness the methods of manufacturing the lumber, which is now coming onto the eastern roads in large quantities.

The officers of the association for the past year were: President, A. R. Joyce, Joyce-Watkins Co., Chicago; first vice-president, C. M. Taylor, Supt. Port Reading Creosoting Plant, C. R. R. of N. J.-P. & R., Port Reading, N. J.; second vice-president, E. B. Fulks, consulting engineer, Chicago; secretary-treasurer, F. J. Angier, Supt. timber preservation, B. & O., Baltimore, Md.

The convention was called to order at 10:30 Tuesday morning. Hon. James Rolfe, mayor of San Francisco, welcomed the organization to the city. The report of the secretary-treasurer showed the election of 81 new members during the year and a total membership of 373 on December 31, 1920, of which 97 are in railway service on 40 different roads.

In his opening address, President Joyce emphasized the widespread interest now being exhibited in the treatment of timber and predicted that the industry is now on the eve of a tremendous expansion in railway work and elsewhere.

### Report of Committee on Preservatives

The major portion of the report consisted of a discussion of the physical and chemical properties of zinc chloride, methods of handling and of analysis, specific gravity tables, etc.

Three papers bearing on the effect of zinc chloride treatment on the strength of wood were also included as follows:

"Experiments on the Strength of Treated Timber," by W. K. Hatt.

"The Effect of the Zinc Chloride Process of Preservation on the Strength of Structural Timber," by H. B. Luther.

"Results of Some Tests of the Effect of Zinc Chloride on the Strength of Wood," by T. R. C. Wilson and Ernest Bateman.

The first of these papers described experiments planned by Dr. Hermann von Schrenk and Dr. W. K. Hatt, and published in 1906 under the authorship of the latter. The second paper was an original contribution by Prof. H. B. Luther, of the Massachusetts Institute of Technology, and the third was an original paper by Messrs. Wilson and Bateman of the Forest Service, describing tests made by them at the Madison laboratory. The three papers taken together seem to indicate that:

(1) The treatment of wood with the usual strength of zinc chloride solutions seems to have but little permanent effect upon the strength of wood in bending even 5 years after treatment, provided the temperature of the wood during that time is not excessively high.

(2) There seems to be a slight permanent decrease in the resistance of zinc-treated wood to shock even at the normal temperatures. This decrease seems to be greater with greater absorptions of zinc chloride.

(3) At temperatures somewhat higher than the normal there may be a considerable reduction in all strength values.

The report also included information concerning vertical-retort tar. At the present time there is of vertical installations of all kinds a production of between 9,000,000 gal.

and 10,000,000 gal. per year of vertical-retort tar. With the existing high cost of gas oil, and the probability that it will continue high for a number of years, a very considerable number of plants are considering the installation of more coal gas capacity, and plans are drawn for the installation of 85,000,000 cu. ft. of vertical retorts. This will bring up the production to between 40,000,000 gal. and 50,000,000 gal. of tar per year. Coke-oven tar in its general characteristics resembles on one hand coke-oven tar and on the other, blast-furnace tar. Vertical-retort tar is more fluid than coke-oven tar, and is comparatively low in free carbon. Naphthalene is practically absent. Its tar acid content and sulphonation residue are high. Creosote oil made from vertical-retort tar on fractionation yields fractions which fall below the specific gravity requirements of the A. W.-P. A. specifications, but in general are well above the specific gravity range of oil derived from water-gas tar. Certain vertical-retort tars yield oils having gravities of fractions as low as water-gas oil. The latter tars are unusual, however, and are produced in limited quantities.

### Water Gas Tar

A paper on water-gas tar, by W. H. Fulweiler, was also presented as a part of the report of the committee in which it was pointed out that the production for 1920 was 80,000,000 gal. As a result of practical experience it has been found that water-gas tar derivatives whether refined tar, distillates or mixtures, appear to give very satisfactory penetration. They have been used commercially in the full-cell, Rueping and Card processes with entirely satisfactory operating results.

The water-gas tar derivatives have been used in practically every branch of the wood-preserving industry. Its authenticated commercial use in treatment of railroad ties began in 1910, when the Public Service Railway Company of New Jersey began to use it in a regular 10-lb. treatment on their ties. They probably have in track 500,000 ties treated with water-gas tar. Its use by steam roads began in 1914. The Baltimore & Ohio has treated approximately 5,000,000 cross-ties with the Card process, using  $\frac{1}{2}$ -lb. zinc chloride with 3 lb. water-gas tar. The Chicago, Burlington & Quincy has treated about 171,000 ties with water-gas tar and zinc chloride solution. The Philadelphia & Reading and the Pennsylvania have used water-gas tar in admixtures with coal-tar products in varying percentages from 10 per cent up to straight water-gas tar.

### Report on Economics of Non-Pressure Treatments

As a general rule pressure treatment is more thorough, gives a longer life to the wood, and is more economical than non-pressure treatment. The penetration obtained by pressure is deeper, more uniform, and more subject to the control of the operator. Furthermore, the amount of preservative injected to obtain a given penetration may be varied to suit different requirements. This results in economical use of preservatives. It is possible also by pressure equipment and processes to treat green timber, when seasoned timber is unobtainable, whereas non-pressure processes require thoroughly seasoned wood.

On the other hand, there are innumerable cases where

pressure treatment is for some reason either impossible or inadvisable and the wood must be either treated by a non-pressure process, used without treatment of any kind, or replaced by some other structural material.

There are three principal methods by which wood can be treated without the use of artificial pressure, namely: (1) Surface treatments, (a) Spraying, (b) Brushing, (c) Dipping; (2) Hot and cold bath treatment; (3) Steeping treatment.

With methods (1) and (2) coal-tar oil and similar oil should be used.

With method (3) water-soluble preservatives, such as zinc chloride, sodium fluoride, and mercuric chloride should be used.

Non-pressure treatment should be adopted only when it is apparent that the added life which might be obtained by pressure treatment is not sufficient to offset the additional cost of the treatment, or when it is practically impossible to obtain pressure-treated timber. Specific cases in which non-pressure treatments are most likely to be advisable are as follows:

(1) For treating timbers and lumber used in building and car construction and repair work which must be framed at the building site, or which are used in such small quantities that it is impracticable to send them away for pressure treatment. Of the various non-pressure treatments possible, hot and cold bath treatment with creosote will generally be most effective. When apparatus for this process is not available, surface treatments may be used. For places where the odor or color of creosote would be objectionable, water-soluble preservatives applied by the steeping process may be desirable. These preservatives are, of course, not suitable where the wood is likely to be wet frequently.

(2) For timbers used in interior construction where the ends are placed on concrete, brick, or stone foundations, and only the ends are subject to decay, and for any other timbers where only points of contact with wood or other material are likely to decay prematurely, surface treatments are usually the only methods which can be used in such places, but great benefit at little expense can be expected.

(3) For fence posts under conditions which make pressure treatment out of the question, hot and cold bath creosote treatment of the butts is recommended, together with a hot or cold bath treatment of the tops. Surface treatments are not as effective as hot and cold bath treatment, and their use on posts is seldom to be recommended.

(4) For telegraph and telephone poles of durable species, from which experience has demonstrated good service may be expected when butt treated, the hot and cold bath treatment is recommended. Surface treating the butts of poles of durable species with creosote is usually also sufficiently effective to more than pay for the cost of treatment and may be used to good advantage where conditions prevent more thorough treatment.

Poles of non-durable species, especially for use in the southern states should be treated throughout their entire length by a pressure process.

(5) In general, the hot and cold bath treatment is the nearest substitute for pressure treatment, and is to be recommended in preference to the more superficial treatments. Dipping, spraying, and brush treatments are more superficial than the hot and cold bath process and generally result in only a slight penetration of oil. They are, therefore, most suitable for timbers not subjected to mechanical wear or serious checking. The steeping process due to the long soaking period approaches the hot and cold bath process in the matter of penetration. Since water-soluble preservatives are used, the treated wood has the limitations and advantages common to these preservatives.

## Service Tests of Ties

The committee submitted detailed progress reports of the service secured from treated ties on the A. T. & S. F., the B. & O., the C. I. & L., the C. R. I. & P. and the St. L.-S. F. W. H. Kirkbride (S. P.) described a test installation of 90 creosoted ties, 65 of which were still in the track after 20 years' service. S. D. Cooper (A. T. & S. F.) described the practice adopted on that road three years ago whereby all ties taken out of track are inspected by representatives from the office of the superintendent of timber preservation before destruction, as a result of which the number of ties taken out prematurely has been reduced greatly.

The committee on ties described a series of tests of punctured ties which have been undertaken at the plant of the St. Helena Creosoting Company to ascertain the effect of perforating on the seasoning, penetration of creosote and the physical properties of fir ties and timbers. These pieces have been perforated and treated and are now under examination.

## Closing Business

The following officers were elected for the next year: President, C. M. Taylor, superintendent, Port Reading Treating Plant, C. R. R. of N. J.-P. & R., Port Reading, N. J.; first vice-president, F. J. Angier, superintendent timber preservation, B. & O., Baltimore, Md.; second vice-president, H. S. Valentine, superintendent, Eppinger & Russell Co., New York City; secretary-treasurer, Geo. M. Hunt, chemist, Forest Products Laboratory, Madison, Wis. Directors: R. J. Calder, secretary-treasurer, International Creosoting & Construction Co., Galveston, Tex., and H. S. Sackett, assistant purchasing agent, C. M. & St. P., Chicago. It was voted to hold the next annual convention in Chicago.

TUSCALOOSA (ALA.) IS TO HAVE A TRAFFIC BUREAU, and the transportation committee of the Tuscaloosa Chamber of Commerce has gone so far as to entertain applications of various experts to manage it. Tuscaloosa could take no more forward step than this. A well-conducted traffic bureau is a great economy, continually active in the interest of each merchant member on the payment of one small annual fee. The Birmingham Traffic Bureau has collected \$150,000 for its clients in the past year, and that is just one item of its service. It has caused the suspension of threatened freight advances and maintained a general watchfulness over the shipping problems of the district.—*Birmingham Age-Herald*.

## Electric Motive Power in Freight Train Service\*

One C. M. & St. P. Locomotive Handles 2,800-Ton Trains on  
0.7 to 1 Per Cent Ascending Grades

By W. S. H. Hamilton

Railway Equipment Department, General Electric Company

**H**EVY TONNAGE freight trains are not only the most numerous on mountain railroads, but are also the most important and difficult from a train handling point of view. Previous to the electrification of the Chicago, Milwaukee & St. Paul, there were no roads electrified in this country where heavy trains of ordinary merchandise were handled on mountain grades. (The Great Northern electrification at Cascade Tunnel and that of the Baltimore & Ohio at Baltimore are not considered because steam engines are used to assist in starting.) Roads carrying ore or coal entirely have an immense advantage in that the cars are nearly always uniform and usually are all-steel equipment which can withstand rough treatment without injury. On the C. M. & St. P., the cars are of all kinds and descriptions and in rush seasons are often loaded beyond their normal capacity. While an effort is made to keep the weakest cars at the rear of the train, still there are many cars in service which were not designed to transmit the drawbar pull required in modern heavy freight service.

The majority of freight trains do not run on a schedule. True there is a schedule, but it is mostly used for convenience in dispatching and trains are not expected to adhere to it closely. To handle freight most effectively, the locomotives should be able to get the trains over the division in about eight hours and yet be able to handle the maximum tonnage possible. To do this they should be able to take advantage of the profile and speed up wherever possible, consistent with safety. On mountain grades it is most economical to use helpers and this usually allows the same train weight to be handled over the entire division.

On mountain grades ascending, the maximum speed permitted by the desirable power input to one train with two locomotives will usually be 15-20 m.p.h. (16 m.p.h. on C.M.

& St. P.). When operating on lighter grades, ascending, the locomotive should be able to go faster. The maximum safe speed is probably about 25-30 m.p.h. but again this speed may be limited by the desirable power input to a single train. The maximum safe speed on the level or "water" grades is somewhere between 35 and 45 m.p.h. but this varies considerably depending upon the track.

In descending mountain grades the maximum safe speed is about 15-20 m.p.h. and on the lighter grades 25-30 m.p.h.

The C. M. & St. P. freight locomotives are of the geared motor type shown in one of the illustrations. The full load speed is 16 m.p.h. at 3,000 volts and the maximum operating speed for the gear ratio is 30 m.p.h. The control provides three running speeds, two full field and one shunted. These are shown on the chart together with the speed curves on accelerating resistances. Two regenerating connections are provided, one giving a speed range from about 17-30 m.p.h. and the other about 9-15 m.p.h. The first (parallel) speed is the one generally used. Motor driven exciters are used to obtain the necessary field excitation during regeneration.

### Freight Train Handling

The couplers of a freight car are not rigidly fastened to it, but are connected through a friction or spring arrangement or both, which means there is considerable stretch in them when transmitting a large drawbar pull. This is called "slack" and for practical purposes is taken as 1 foot per car. If an 80-car train is started with all the slack "bunched" at the start the locomotive will move 80 ft. before the caboose starts. Those who have ridden freight trains much can best testify to the shock produced if any attempt is made to speed up the locomotive until after the caboose has been started. This "slack" represents the most difficult problem in freight train handling and the first, last and most important rule in freight train handling is to "properly control the slack."

Let us consider as the first problem in heavy freight train

\*This is the second of a series of three articles on this subject. The first (*Railway Age*, January 21, 1921) dealt with passenger service requirements and passenger train operation and the third will deal with the use of helpers in freight service. The author acted as an instructor to engineers on the locomotives used on the Chicago, Milwaukee & St. Paul, from December, 1915, to August, 1917, and from December, 1919, to April, 1920.

handling, starting a train on an ascending grade of not over .7 per cent with a single locomotive. On such a grade the train will not start back down the grade by simply releasing the brakes. On the C. M. & St. P. one locomotive handles a maximum train of 2,800 tons, about 60 cars, on grades of .7 to 1 per cent. On the Missoula division between St. Regis and Deer Lodge a maximum train of 110 cars, or nearly 5,500 tons, has been handled by one locomotive against a maximum grade of .4 per cent. The first start at a terminal is made after the brakes on the train have been tested. Usually when coupling onto the train, it is pulled out as much as possible before testing the brakes in order to see if it is all coupled and also to detect any short air hoses. These frequently give trouble because of excessive slack in the drawbars and at times a short extension coupler has to be put between cars in the hose line.

### Starting a Train on an Ascending

#### Grade Without a Helper

When ready to start, the locomotive is backed against the train enough to bunch the head third of the train and is then started ahead. In starting extreme care must be taken not to get the head portion of the train moving too fast before starting the rear portion as this is liable to set up shocks severe enough to pull out a drawbar. Since the drawbar pull required to start a car from rest is much more than that required to keep it just barely moving, a long freight train has almost to be started car by car and the problem is to keep the locomotive just barely moving until the entire train has been started. If the locomotive is allowed to "stall" while doing this it is usually necessary to start over again.

The engineer, therefore, in starting brings the controller to the first notch and off again once or twice before leaving it there. (This does not mean that the first notch on these locomotives gives too much tractive effort as it provides only enough to just about move the locomotive alone, but if the controller were left in that notch in the beginning the locomotive would speed up too much and pull the slack out of the head cars too quickly.) As the locomotive moves, car after car is started and the engineer watches the ground carefully and also the ammeter and when the locomotive seems to be on the point of stalling brings the controller out another notch. Considerable experience is required to be able to judge just the proper instant, as for best results the controller must be moved just as the locomotive seems to be stalling without actually allowing it to do so. As soon as the locomotive has traveled a distance equal to the amount of slack in the train, the acceleration may be increased to any desired amount which is usually as near the wheel slipping point as it is desirable to go.

In first starting a freight train, especially in cold weather, it is necessary to run it slowly for the first three or four miles out of the terminal in order to warm up the journal boxes gradually. If this is not done hot boxes will result. This is accomplished by accelerating to the series running position of the controller and allowing the locomotive to run there for several miles before going on into the parallel positions. This same precaution must be taken after a train has been standing for some time in cold weather.

In making an ordinary stop where there is no necessity for stopping very quickly, the controller is eased off a notch or two at a time until the 1st or 2nd notch is reached, where it is left until the train stops. The independent brakes are then applied on the locomotive and the controller is shut off. This stops the train without shock and without any interchange of slack. In starting again it is usually necessary to take slack but quite often an attempt is made to start without taking the slack; while this may be successful, it requires a higher value of current. If there are any weak cars ("soft shells") near the head end of the train, this practice should be avoided.

In starting or stopping on an ascending mountain grade with only one locomotive, about the same procedure is followed as on the lighter grade with the exception that it is very difficult to take any slack without excessive shock to the train. However, in such cases the trains are not very long and can usually be started without taking the slack. In one case that the writer is familiar with it was necessary to set a few hand brakes at the rear of the train in order to be able to take enough slack and release them by whistle signal after the locomotive had the train started again.

### Comparison of Steam and Electric Operation

Before considering operation down grade, a comparison may be made between steam and electric locomotives as regards their ability to start a heavy train. The electric locomotive is superior because in the first place the torque on a steam engine is not constant, but varies depending on the position of the cranks. In the second place it is difficult to judge exactly the drawbar pull being developed by a steam engine during the time that the slack is being taken in the

A C. M. & St. P. Freight Locomotive with a 100-Car, 5,000-Ton Train, Eastbound at Thelma on the Missoula Division

train and after the train has just started. Undoubtedly an experienced engineer can tell from the sound of the exhaust how much drawbar pull is being developed by the engine after it is in motion, even at fairly slow speeds, nearly as well as can be told by the ammeter indications on an electric locomotive. During the times referred to, however, the exhausts are so few and far between that they cannot be used as a guide. The effect of the expansion of the steam in the cylinders is variable and difficult to judge while moving very slowly. This point is brought out clearly in wrecking operations where it is desired oftentimes to move a locomotive only a few inches at a time. In such cases it was found to be much easier to do this with an electric locomotive than with a steam engine. The ammeter indication on the electric locomotives is at all times a measure of the drawbar pull being developed and the engineer can tell just how close the locomotive is to the wheel slipping point and thereby judge whether to move the controller another notch or not.

After the train is in motion there is practically no difference between the steam and electric locomotives until speeds of 6-8 m.p.h. for Mallets and 10-12 m.p.h. for simple engines are reached. Here the steam engine begins to lose torque in gaining speed while on the other hand the torque of the electric locomotive can be held at full value until speeds beyond 16 m.p.h. are reached. This results in considerable saving in time in starting a train.

Before taking up down-grade operation with electric loco-

motives, it is well to consider this operation with steam engines and air brakes. When a train arrives at the top of a mountain grade it is stopped and a test of the air brakes is made by applying the brakes and noting that they apply properly on all cars, or at least noting that the gage in the caboose shows a reduction. After this the brakemen go over the train and turn up the retainers on all cars.

The train is then started and as soon as the speed reaches, say, 6-8 m.p.h. a fairly heavy application of the brakes is made. This applies the brakes on all cars. This is held for a few seconds and then the brake pipe is recharged. The next and succeeding applications are lighter (about 10 lb. reductions in the brake pipe pressure), being only sufficient to move the triple valves and insure a fresh supply of air each time to the reservoirs on the cars. The cycle of operations between successive applications requires about 1 minute and is divided about as follows: full release 20 seconds, running position 10 seconds, application 20 seconds, lap 10

part first, or at least at the same time as the rear end. Failure to make this final application often causes trains to break-in-two.

When the train is stopped, the brake pipe is recharged and the independent brakes are applied on the engine to hold the train. As the brakes on the different cars leak off the train gradually bunches against the head end and the locomotive, but since this does not occur on all cars at the same time, the cars with the brakes set retard this bunching and thus prevent excessive shocks in the train. This is another very desirable feature secured by the use of retainers and will be referred to again.

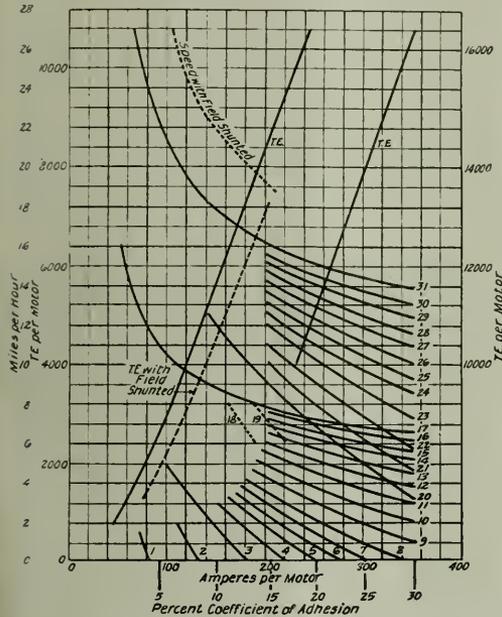

With the electric locomotives regeneration is used to control the speed and braking effort on descending mountain grades. On the freight locomotives used by the C. M. & St. P., the controller is so arranged that it is necessary to bring the main handle to either the full series or full parallel running position before the braking handle can be moved to the positions to apply and regulate the amount of regeneration. This makes the application of regeneration when "tipping over" the summit of a grade very easy, as the controller can simply be left on and the braking controller brought on as the speed increases. The regeneration starts gradually and the train bunches as each car in turn passes over the summit. However, when starting on a down-grade the application is not so easy, because of the motoring pulling out of the train slack before regeneration is applied.

The trains stop for an air brake test at the summit; this is done by making a 10 lb. reduction in the brake pipe pressure at the locomotive and noting whether this shows on the gage in the caboose. The conductor then makes a 10 lb. reduction by means of the valve in the caboose and the engineer sees it by means of the brake pipe gage in the locomotive. It is the usual practice to turn up retainers on 25 to 30 per cent of the cars, all at the head end of the train. These assist in controlling the slack in case a stop is made on the grade as previously described.

**Starting a Train on a Descending Grade**

The train is then started and if it is not all on the down-grade the regeneration is applied as described above. This same method is used on all grades of 1 per cent or less. If, however, the start is made from rest on a grade of 1.5 per cent or over, then the train is started and allowed to run, checking it a little at first by means of the independent brakes on the locomotive. This bunches most of the slack gradually. When a speed of about 17-19 m.p.h. is reached a light application (about 8-10 lb. reduction) of the automatic brakes is made, the independent brakes on the locomotive being allowed to apply. When this application becomes effective the main handle is brought out quickly to the parallel running position and the braking controller is brought on several notches. The independent brakes are released as soon as regeneration commences and the automatic brakes as soon as it has built up to the proper value. This procedure keeps the train bunched while regeneration is being applied and the cars with retainers assist in this, but they soon leak off and do not assist in holding the train after a few minutes.

Frequently one of these locomotives has to take a greater tonnage down a grade than it can hold by regeneration alone. To do this the air brakes have to be used to help hold the train. This condition occurs most often on the 2 per cent grade between Donald and Piedmont. One locomotive can hold back about 2,200 tons, whereas the tonnage down this grade is usually 2,800-3,000 tons. Under these circumstances more retainers are turned up though never on more than on 40-50 per cent of the cars (all at the head end) and after regeneration has commenced additional applications of the air brakes are made

**Speed-Tractive Effort Curves on Resistance for C. M. & St. P. Freight Locomotives**

seconds. Of course these times are only approximate and are varied by the engineer, depending on how the train is holding and the speed. The train crew in the meantime are watching the cars carefully and the retainers are cut out for a few minutes at a time on any cars which show signs of wheels overheating. Stops are made as required to cool the wheels. The brakes on the locomotive driving wheels are kept off during the descent to keep from overheating the tires.

When making a stop a full service application of the brakes is made, the engine driver brakes are allowed to apply, and just before the train comes to rest an additional application is made which is quite necessary. When the first application is made preparatory to stopping and is held on, leakage in the brake pipe throughout the train gradually causes the brakes to apply hardest at the rear of the train and this part of the train has a tendency to stop first and stretch the train out. By making an application just before the train stops, it has the greatest effect on the head end and stops that

from time to time to control the speed, the driver brakes on the locomotive being kept released. The applications are all light (10 lb. or less), being just enough to work the triple valves on the cars, and most of the work is done by the brakes on the cars with retainers up. These, however, do not heat up their wheels enough to bother. This method is entirely successful in operation, but is greatly facilitated by the arrangement provided on the bipolar passenger locomotives, whereby the brakes on the locomotive are automatically kept released while the locomotive is regenerating.

In stopping the train, the regeneration is reduced by moving the brake handle back a couple of notches and a light service application of the brakes is made, the driver brakes being allowed to apply. When the speed has decreased enough so that regeneration has practically ceased, both handles are shut off and such additional applications of the brakes are made as are necessary to stop the train.

## Railroad Guaranty Bill Before Congress

WASHINGTON, D. C.

THE WINSLOW BILL, to specifically direct the Secretary of the Treasury to honor certificates of the Interstate Commerce Commission for partial payments to the railroads on account of their six months' guaranty, was favorably reported to the Senate on January 31 by unanimous action of the Senate committee on interstate commerce, after a brief hearing at which Chairman Clark of the Interstate Commerce Commission approved the purpose of the bill. The committee had had an opportunity to study the record of testimony on the bill before the House committee.

As briefly noted in last week's issue, a favorable report on the Winslow bill was filed in the House on January 26 by Representative Winslow. The report said in part:

Regardless of the question whether or not the ruling of the comptroller and the decision of the supreme court of the District of Columbia are in accordance with the terms of the law, there is no question in the minds of your committee (which held full hearings on the subject, at which were heard representatives of the carriers and of the Interstate Commerce Commission, and various individuals representing business interests) that the transportation act should be so amended as clearly to authorize the commission to make certificates in partial payment. If the commission definitely ascertains that a certain amount is due under existing law, no reason is apparent why the payment of such amount should be deferred until a final settlement of all disputed items is arrived at.

Accordingly the bill, the passage of which the committee now recommends, provides that the commission, if not at the time able finally to determine the whole amount due under section 204 or section 209, may make its certificate for any amount definitely ascertained to be due and may thereafter in the same manner make further certificates until the whole amount due has been certified. In order to clarify the bookkeeping processes involved in this payment the bill provides for the allocation among the appropriations already made by these sections of the transportation act of the partial payment warrants authorized by this bill.

The bill also authorizes the commission whenever in its judgment practicable to make a reasonable estimate of the net effect of any deferred debits and credits which can not at the time be definitely determined. When agreed to by the claimant such estimates may be used as a definitely ascertained amount which the commission is authorized to certify for payment, but such estimates so agreed upon are to be binding in final settlement. The principal class of cases covered by this provision are items for loss and damage claims and overcharge claims, which it is impossible to compute with exactness until the courts have settled the liability of the parties.

The testimony of witnesses before the committee represented very generally the railroads, the American Railway Express Company, and miscellaneous railway supply houses.

They all emphasized most forcibly the absolute need for such legislation as is proposed in this bill. They made it very clear that not only were their institutions unable to meet their proper running expenses and maintenance charges, to say nothing of pay-

ing their bills, long overdue, or undertaking to make necessary repairs or to provide for any development in order that they may keep up with the need for transportation facilities. It was testified generally that they were unable either to sell new securities or to borrow money temporarily, because of the already too great extension of their credit, on account of which banks and other creditors are demanding payments which the carriers are unable to make. Not only is this condition of affairs working against their day-to-day efficiency, but it is also resulting in the unemployment of tens of thousands of operatives who might, if the government would make payments on account, be immediately and wisely set to work.

The situation is so apparently unbusinesslike as to demand a correction of the present government method of paying its indebtedness to the carriers, etc.

In connection with the report, Mr. Winslow submitted a letter from Chairman Clark of the Interstate Commerce Commission saying that the commission is in full sympathy with the purpose of the bill and is of opinion that conditions and the financial situation are such as to make it highly desirable that the carriers shall have as promptly as possible the amounts due them under the guaranty provisions. It is physically impossible, he said, within a reasonably short time to make final certificates for all the carriers, and in the meantime it seems appropriate that partial payments should be made in so far as the same can be properly certified.

Representative Sims filed a minority report opposing the passage of the bill, both on technical grounds and on the ground that the guaranty was in the nature of a "gratuity" which the railroads are not entitled to ask for in advance of the final ascertainment of the amounts. Mr. Sims said in part:

No property right exists in favor of the carriers, as they were not required to perform any service of any character, or make any sacrifice, or incur any expense in behalf of the government in consideration of the guaranty. This guaranty provision of the transportation act can be repealed; and if repealed, no carrier would have any legal or enforceable cause of action against the government on account of such repeal.

At the time the transportation act was passed and government operation of the railroads ceased every product of the farm was double in market value that it is now. Thus the burden of this guaranty has been doubled. But, notwithstanding this fact, the carriers now ask Congress to amend the law advancing the date of payment of this guaranty so as to require it to be paid at a time when it is impossible for the farmers and producers of the Nation to receive even the out-of-pocket costs to them of their products, which will have to be sold at any price in order to pay the taxes necessary to be paid in order to comply with the unjust provisions of this bill.

The government has already paid during the guaranty period to the applying carriers by way of advances provided for under paragraph (h) of section 209, the sum total of \$260,431,874. This vast sum far exceeds the amount that any member of the House or Senate or anyone else supposed or believed would have to be paid the carriers to cover or make good any deficit that would or could possibly be incurred during the guaranty period under honest and efficient management. But we are now confronted with the astounding claim that the deficit for the six months exceeds \$600,000,000. That such a deficit could arise during six months (all spring and summer months) with no strikes, no floods, no fires, no let-up in traffic, is so astonishing as to challenge our credulity. This sum is so stupendous that duty to the public demands a congressional investigation and report by a committee of the House of Representatives before another dollar is paid on the guaranty claims of the carriers.

THE RAILROADS are desperately in need of funds. There are already considerable sums due from the government. Why, then, should it be necessary to wait until the last book is balanced before making payments? The Treasury can surely be well protected by a suitable margin. This remedial legislation is advocated by the Interstate Commerce Commission, which recognizes the necessities of the railroads, and has been willing to make certifications on account of the government guarantee. It is a matter in which common sense ought to prevail.—*N. Y. Commercial.*

# Hearing on Divisions for New England Roads

## Testimony of Trunk Lines Opposing That Presented by New England Roads Heard by Examiner

WASHINGTON, D. C.

HEARINGS BEFORE Examine. Gerry of the Interstate Commerce Commission on the application of the New England lines for larger divisions of the through rates into and out of New England were adjourned on January 31 after the railroads west of the Hudson river had completed the presentation of their testimony in opposition to that which had been presented by the New England lines during December. Adjournment was taken until February 7, at which time it was expected that rebuttal evidence would be presented on behalf of the New England lines, unless the case was terminated meanwhile as a result of the meeting of railway executives in New York to consider the proposals for affording the New England lines some relief by another method than that of changing the divisions.

After the representatives of the trunk lines had given testimony in support of their contention that the divisions accorded the New England lines are already liberal, representatives of the Central Freight Association lines gave testimony to show that many of the eastern roads west of the Hudson river are in as much need of relief as the New England lines and that they cannot afford to give up any of their revenue for the benefit of the latter.

C. E. Hildum, comptroller of the Lehigh Valley, presented a series of exhibits to controvert the claim of the New England lines that the eastern lines generally had received \$25,000,000 additional revenue from the rate advance by the inclusion of the New England lines in the eastern group. He said the exhibits used in connection with the rate case showed that the eastern roads, excluding New England, needed an increase of 32.71 per cent in their total earnings to produce a 6 per cent return, while the eastern group as a whole including New England needed 33.28 per cent or only .57 per cent more than if the New England lines had been excluded. This difference, he said, represented a difference of only \$13,000,000 instead of the \$25,000,000 which the New England lines claimed based on a percentage of the freight earnings only. On the other hand, he said, the inclusion of the Pennsylvania System increased the amount which the eastern group needed by \$32,000,000 and that the inclusion of the lines of the Pocahontas region in the eastern group brought down their percentage as much as the New England lines increased it. Mr. Hildum also said that in 10 months of 1920 the operating ratio of the eastern lines outside of New England was only a fraction less than that of the New England lines and it was higher than that of the New Haven. The latter's operating ratio was 99.99 while that of the Pennsylvania was 107.12. Mr. Hildum also said that many of the roads in the eastern group did not receive the 40 per cent advance because so large a part of their traffic was interterritorial and under the commission's order took an advance of only 33 1/3 per cent. On beginning the cross-examination, Charles F. Choate, counsel for the New England lines, expressed surprise that Mr. Hildum had not made up an exhibit to show that the New England lines owe the trunk lines money. Mr. Hildum said he could readily do so.

### Michigan Lines Meet Same Unfavorable Influences

F. H. Alfred, president of the Pere Marquette, testified that the Michigan lines have been subject to the same unfavorable influences that have adversely affected the New England lines and that it would be unfair to require them to give up part of their revenues. The Michigan lines he

said, have been affected in the same way as the New England lines by the change of car rentals from a mileage to a per diem basis and the increase in the per diem rate, the standardization of wages and the increase in fuel costs resulting from the increased freight rates on the coal hauled from outside. The Michigan lines have always had large per diem balances against them which have increased as the rate has been increased, and the Pere Marquette had voted against the recent increase in the rate from 90 cents to \$1.00 per car per day, while he understood the New England lines had voted for it. The Michigan lines also have to get their coal from outside, and the Pere Marquette now pays about \$1.55 a ton to get its fuel coal to its own gateways.

Formerly, Mr. Alfred said, many of the Michigan lines paid a lower scale of wages on branch lines. Approximately half of the Pere Marquette mileage is branch line. The standardization of wages, therefore, resulted in a great increase in operating expenses. When the roads were taken over the Pere Marquette had agreements as to wages and working conditions with six of the railroad labor organizations, but when this road was returned there were agreements with 16 classes of employees and the same wages had to be paid on the branch lines of light traffic as on the most congested portion of a busy single track line.

"All roads have been made to suffer and their cost of operation has been increased by the standardization of wages and unbearable working conditions," Mr. Alfred said, "and I believe these conditions have as much to do with the troubles of the New England lines as anything. I assume the New England lines are as well operated as railroads anywhere, but all roads are suffering from the onerous conditions thrust upon us."

In connection with the subject of per diem, Mr. Alfred said he had always believed that the car rental should be based on a combination of mileage and per diem that would recognize the use to which the car is put as well as the time. He suggested that instead of the present rate of \$1.00 a day, the rates should be 40 cents a day plus 2 cents a mile. Assuming an average of 30 miles per car per day, this would equal the present rate on the average, but would not penalize the originating or delivering line that necessarily has a slower movement than a purely intermediate road.

### W. H. Williams a Witness

W. H. Williams, chairman of the Wabash, occupied the witness stand for an entire day, presenting an elaborate series of exhibits analyzing the situation on the New England lines in support of his contention that their remedy does not lie in a readjustment of the divisions and that their proposal to redistribute the earnings of the eastern lines proposes to take without compensation from other lines in the eastern group that are in as needy a condition as the New England lines. Many of the conditions existing in New England, he said, are closely paralleled elsewhere, and if especially unfavorable conditions exist in New England they relate particularly to the rates and expenses pertaining to local traffic rather than to the interline traffic which, he said, is handled under the same conditions as exist elsewhere. He said the application of the New England lines does not suggest a separate grouping of those lines which would allow them to be accorded separate treatment in accordance with their peculiar needs.

Mr. Williams outlined some of the earlier negotiations be-

tween the trunk lines and the New England lines which were handled by the special committee of executives, of which he is chairman, which had been called into conference on January 24 by Chairman Clark of the Interstate Commerce Commission for the purpose of making another effort to reach a solution. He said that he and President Rea of the Pennsylvania and President Maher of the Norfolk & Western, representing the lines west of the Hudson, had previously conferred with President Pearson of the New Haven, President Hustis of the Boston & Maine and Mr. Choate and had asked them what would be the attitude of the New England lines if they would recommend to the other eastern lines a plan, subject to the approval of the Interstate Commerce Commission, for raising a sum of \$12,000,000 to be paid by the other eastern lines to the New England lines for one year. This proposition was not received favorably by the New England lines, and the representatives of the two groups of roads reported back to the committee that they had been unable to reach an agreement. This proposal, Mr. Williams said, was made with the understanding that it represented no concession of legal right, that the trunk lines considered the divisions of the New England lines not only reasonable and just, but liberal, and the proposal was made with a view to protecting the credit situation and to afford the New England lines a year in which either to readjust their rates or their expenses. On cross-examination Mr. Choate said that the \$12,000,000 had been declined because it would not enable the New England lines to meet their fixed charges. He said the record ought to show that the New England lines had made a counter proposition offering to accept a sum raised by making an assessment of 1.1 per cent of the freight revenues against the eastern lines west of the Hudson, which he said would represent about \$18,000,000 or \$20,000,000 instead of the \$25,000,000 the New England lines need. This proposal was rejected by the trunk lines. Mr. Williams said that one of the great difficulties was that the New England lines and the trunk lines could never agree on the figures in the case.

W. C. Maxwell, vice-president of the Wabash, also gave testimony to show that the C. F. A. lines have no money to spare to the New England roads. He presented one exhibit which showed the percentage of net operating income earned by the C. F. A. lines and the New England lines over a series of years, which showed that during the test period 1915 to 1917 the C. F. A. lines earned only 4.77 per cent, while five New England lines earned 5.6 per cent. During the long period of years during which the New England lines were far more prosperous than the C. F. A. lines, which were in a generally bankrupt condition, he said, no complaint was made by the New England lines that the divisions were unfair. The C. F. A. rates were advanced in 1917, but the companies received no benefit until after September 1, 1920, because their guaranty was based on the earnings for the three years ending June 30, 1917. It would now only intensify the situation to transfer the troubles of the New England lines to the C. F. A. lines. He also presented an exhibit to show that in the four states of Michigan, Ohio, Indiana and Illinois, the C. F. A. lines had been losing at the rate of \$18,000,000 a year, due to their inability to collect on intrastate traffic the increased rates authorized by the Interstate Commerce Commission for interstate traffic. However, he said, the commission had decided the Ohio and Illinois cases since this exhibit was made up. Mr. Maxwell also said that since 1914 the rates from C. F. A. territory to New York had advanced more than they had to New England. This was to show that the New England lines had sacrificed a part of their revenue by extending New York rates to the more distant New England points. For example, he showed that the first class rate from Chicago to New York had advanced 110 per cent, while the

rate to New England had advanced only 101 per cent; also, he said, the Railroad Administration had put in rates much lower than those of the Anderson scale between New England and trunk line territory. If it had put in the scale rates as a minimum it would have been a big help to both New England and the trunk lines.

On January 31 E. J. Pearson, president of the New York, New Haven & Hartford, took the stand to offer rebuttal testimony to statements made by Mr. Williams, which he said reflected on the management of the New England lines. Mr. Pearson said that passenger traffic in New England paid better than freight and that the deficiency in earnings regarding which the New England lines are complaining results largely from the freight traffic. He pointed out improvements made by the New England lines which had not been noted by Mr. Williams in his exhibits.

#### Letter Ballot Proposed After New York Conference

A joint conference of the New England, trunk line and C. F. A. railroad executives was held in New York on Tuesday. It is understood that the conference discussed a proposal to give to the New England lines the sum of \$15,000,000 to be pro-rated and raised from the C. F. A. and trunk line carriers.

W. H. Williams of the Wabash, chairman of the joint conference, said after the meeting that nothing had been finally decided and refused to hazard a guess as to what the final outcome would be. He said that several of the important roads were not represented at the meeting, and that therefore it was decided to secure a vote by letter on the final proposals.

It is understood that the proposal for the \$15,000,000 pool is not to interfere with the hearings on the matter of divisions now going on at Washington.

The recommendation of the committee of executives, which was discussed at a meeting in New York on Tuesday, was that a fund of \$15,600,000 be raised by an assessment of a percentage of the earnings of the eastern roads west of the Hudson, to be distributed among the New England roads, for the period from January 1, 1921, to February 28, 1922. On that date the two-year period for which the transportation act fixed the percentage of fair return at 5½ or 6 per cent will expire. The percentage after that time is to be fixed by the Interstate Commerce Commission and the proposed pool is intended to afford the New England lines some temporary relief with a view to a readjustment at that time.

# The Functions of a Railway Employment Service

## Hiring and Following Up of New Employees of Vital Importance and Should Receive Expert Attention

By J. C. Clark

Assistant to General Manager, Oregon Short Line Railroad Company

THE HIRING AND FIRING of employees has been considered by a great many railroad officers as a small and insignificant part of the day's work. While the head of the department very frequently permits or instructs some subordinate to attend to the hiring, he takes care of the firing himself. As a matter of fact, hiring and firing employees are two very essential and very important duties of any supervising officer. In most cases, the hiring is done by each department, and is not handled systematically. Comparatively few railroad officers appreciate the extent to which the selection and placing of employees can be systemized. Furthermore, most railroad officers who have the responsibility of employing men are unable to develop their labor supply properly. As a consequence the ranks are filled up by men who have been rejected from other industries instead of by men who have been selected because they are the best there is.

### The Employment Service

In an article in the *Railway Age* of June 18, 1920, I dealt briefly with the subject of employment. It is likewise impossible to discuss this subject fully in the present article, but I shall endeavor to bring out some of the main features. As stated in the previous article, in order to function properly the employment service must be familiar with the requirements of the organization it is to serve, both as to quantity and quality of labor.

Considering first the quantity of labor required. A system of labor turnover reports such as outlined in a former article (*Railway Age* of December 31, 1920), would be of great help after it had been well established, because it would reflect more or less accurately the changes in personnel, due to seasonal work. By comparing the labor turnover figures with the locomotive mileage, it would also be possible roughly to determine the requirements due to increased traffic. When it comes to supplying the daily needs of each department, the employment service can be made most effective. The superintendent of employment should have on his desk every morning a wire report from every department and division, showing not only the labor shortage, but any surplus that may exist. With this information, he can distribute the available supply of labor to the points where it is most needed, and also transfer certain classes of labor from one department or division to another, either temporarily or permanently.

This work of distribution can only be accomplished through a central office, where the superintendent in charge, by consultation with the general manager, can get a broad survey of the requirements of each department or division and make the necessary distribution impartially. Under our present system, it is often the case that the department or division that needs labor most has the smallest supply, while some other department or division has plenty. This may be due to a large number of causes such as different rates of pay, different working conditions, better organization and better treatment in one department than in another, or the difference in geographical location or climate, but a considerable part of this trouble is due to the failure of various employing officers to co-operate by exchanging men as conditions require. This is not surprising, since the management has provided no

systematic method of exchanging information. However, better results can be obtained through a "clearing house for labor" than by a mere exchange of information between employing officers.

### Supplying Unskilled Labor

In addition to having a system of reports that will keep the superintendent of employment advised as to the quantity of labor required from day to day and from month to month, it is absolutely necessary to know the quality of labor required. We will consider first unskilled labor. In discussing this question, there are several features to be considered. The first is nationality. The superintendent of employment should have on file a record of the nationality of every gang on the road, so that if a division engineer shows on his daily report a shortage of labor in Gang No. 1, for example, the superintendent of employment will know at once the kind of men to send out to that particular gang.

The employment service must also know the kind of work each gang is doing and when the work of any particular gang is changed it should be advised fully of the change. Most common laborers have a preference for a particular kind of work, and it is always advisable to give such preferences consideration in sending out labor. Another important thing is the steadiness of the employment. Some laborers would be willing to go out for only a short time, while other laborers would not care to go unless the work was steady. In so far as it is possible to do so, the employment service should consider the preferences and desires of the men it employs, and in this way it can build up a reputation for consideration and fair-dealing that will make it much easier to secure labor.

Another big thing to be considered is the opportunities for promotion. While there is a large body of common labor that does not give much consideration to this feature, there is a considerable amount of labor in some sections of the country that would prefer to go to work on a job where there is some chance for advancement.

### Employing Skilled Labor

The next question to be considered is that of supplying skilled labor. Before discussing the methods to be used, it is well to discuss briefly the question of supplying men for training schools. Nearly all railroads have a fairly well organized system of apprentice schools in the mechanical department. Some roads conduct training schools for operators, brakemen, firemen, and other classes of employees. It is of the utmost importance that the proper selections be made for these training schools. At the present time, certain educational standards are required, and the applicant is also required to give references. It is doubtful whether or not such references have any real value. A better method is to develop a system of rating each man who enters the service, and determine by observation whether or not he is a desirable employee.

Under the present system of employing skilled labor each foreman or superintendent employs his own men and is familiar with the requirements of each job. It is manifestly impossible for an employment officer to be familiar personally with each job on the railroad. It would therefore be neces-

sary to analyze each job or class of jobs and draw up a specification for each, giving each specification a number or symbol. I will treat this subject of job analysis and specification in a future article.

The discussion so far has covered only the basis or ground work for an employment service and it is apparent that a great deal of preliminary work will be necessary. When it comes to analyzing jobs, as referred to in the previous paragraph, I imagine various foremen and superintendents will discover a good many methods of doing work that they did not know existed and it may be necessary to change present practices in a good many respects. When the officer charged with installing the employment service has completed the ground work referred to, he will no doubt have been able to select men to be used as employment officers.

### Functions of the Employment Service

To go back now to the functions of an employment service. These might be stated as follows: first, finding the labor supply; second, selecting from the available supply the right man for the right job; third, introducing each new employee to his foreman, his fellow employees, and to his work; and fourth, following up each new employee to see that he is engaged in the work for which he is best suited, with a view to making desirable changes and transfers, and also as a check on the selection made by the employment office.

Advertising at once suggests itself as a means of getting in touch with labor and it will produce good results if properly directed. As a rule, employers do not resort to advertising until the labor shortage becomes acute. Advertising, however, should be carried on with a view of getting in touch with the most desirable class of labor and inducing this class to enter railroad service. To accomplish this, the advertisement should state in effect that the railroad employs a large amount of labor and give a list of all the most important classified jobs. It should state the opportunities for advancement and should appeal to those interested to write direct to the superintendent of employment or apply to the nearest agent for an application blank.

Every agent or office of the railroad should be supplied with these application blanks. The blank should contain a fairly complete list of the most important jobs and the applicant should be required to check off at least three of the jobs which he would prefer. There should also be space on this blank for the applicant to state his age, nationality, previous experience and give references. This application blank should be mailed direct to the superintendent of employment, either by the applicant himself or by the agent.

When an application of this kind is received, it should be acknowledged at once and if no position is open in the class as checked off by the applicant, he should be so advised. If there are other jobs open that would seem to be suited to him, the applicant should be advised of that fact. If no job at all is open, the applicant should be requested to communicate further at a stated time, one month, two months or three months, in the future. If the applicant does communicate further at the time stated, it is an indication that he is desirous of getting into the railroad service and if there is still no position open, he should be placed on the preferred list and also be put on the mailing list for any railroad magazines or any other literature sent out by the railroad that would maintain his interest in railroad work. By consistently following up a system of this kind, a very much better class of labor can be secured.

There is another part of this work that should not be overlooked. Representatives of the employment service should visit high schools, academies, and colleges along the line and give talks to interest students in railroad work. These talks should be given with the idea of explaining various features of railroad organization and operation and in such a way as to interest not only the students, but the general

public. Such talks will create a better understanding between the public and the railroads and also draw a considerable amount of very desirable material into railroad service.

### Selecting the Best Men

The next feature of the employment service is the selection of the best men from the available supply and placing each applicant where he is most likely to succeed or "make good." The process of selection in the first place is one of elimination. The first step is to have each applicant interviewed by a representative of the employment service at the point most convenient for the applicant. After the interview, the employment representative should investigate the references given by the applicant. This will eliminate the obviously undesirable without the necessity of the applicant appearing in person at the nearest employment office. It goes without saying that the employment representative should be a man of wide railroad experience and he should not summarily reject any applicant without some very good reasons and these reasons should be stated in his report to his chief.

The next step is the physical examination. In the interest of public safety all applicants having contagious or venereal diseases must be eliminated at once. However, such physical examinations are well understood and no comment is necessary here.

If the applicant is recommended by the travelling representative of the employment service, and is physically fit, he should be sent to the nearest employment office, where he should be given an interview by men trained for that purpose. Instead of being given an application blank and told to go and fill it out and bring it back again, he is taken into a private room and seated comfortably with the interviewer. The interviewer asks the questions and fills out the application blank. During the conversation, which is carried on in a very friendly manner, the interviewer draws out as much of the family history and experience of the applicant as possible. He also takes pains to explain the policies of the company with regard to promotions, pensions, insurance, or anything else that directly affects the welfare or contentment of the employee. He also explains the necessity for safety, and service to the public.

At the end of the interview, the interviewer should make a brief but lucid statement of his estimate of the applicant's qualifications and abilities. It may be difficult to secure competent interviewers in the beginning, but, by systematic effort, a sufficient number of interviewers can be developed and of course the employment office should always contain men who are in the process of training for this very important work.

Psychologists, phrenologists, and other types of character analysts have devised a large number of tests for which they make various claims. There is no doubt that some of these may be a distinct aid in selecting employees, but they will have to be developed very slowly and it will be impossible to make practical application of these tests at the present time. I would favor, however, the placing of expert psychologists on the staff of the employment superintendent for the purpose of assisting in the training of interviewers, who must be practical men, and in suggesting methods of selection. After all, the chief object to be attained is to place the applicant where he will do the best work and where he will be happy in his employment. The best guide in doing this is the applicant's preferences. It is impossible to build up a perfect organization if any considerable number of the individual employees are discontented. A great many applicants may not know what kind of work they want; others may think they know, but because of lack of experience find that they did not know their own preferences. For this reason, it is necessary to follow the man up after he has entered the service, and see that he is placed where he can do the best work and where he is contented.

Following Up New Employees

First impressions are too important to be left to hit-or-miss methods. When the new employee is ready to go to work, he should be introduced to his immediate superior officer by a representative of the employment service. He also should be introduced to some of his fellow workmen if possible. He should be told what equipment he will need and where he can get it, the practice with regard to pay days, and any other items of information that will help him in the first few days of his employment.

The following up of employees by the employment service after they have actually entered the service is very important, and should be handled systematically. There should be enough representatives of the employment service so that every new employee can be interviewed by one of them within a week. A second interview should take place within three weeks of the date of entering the service. These interviews should develop any misunderstanding the employee may have and will impress upon him the fact that the company is vitally interested in his success and welfare. These interviews should also develop whether or not the employee is satisfied with his work and whether the foreman or supervising officer is satisfied with the new employee. If dissatisfaction does exist, the employment service should take the necessary steps to investigate further and make transfers, or take any other steps to promote harmony and satisfaction.

It will be seen from the foregoing, that the hiring of employees is a specialized subject requiring special study. It is necessary to study the characteristics of each job to be filled and from this information determine what qualifications a satisfactory workman should have for each job. It is also necessary to study methods of getting in touch with desirable men, and devise methods of selecting applicants. At present, employing officers lack the time necessary to make these studies. Interviewing applicants alone requires more time than the employing officers are able or willing to give.

have been chosen because of their knowledge of the work to be done, rather than upon their ability to judge men. Experience in sizing up men and interviewing is an important factor in securing good results, and interviewing is an art requiring both natural ability and careful cultivation. It is practically impossible for the employing officer under present conditions to acquire the experience and get the results that a trained interviewer could.

When it comes to promotions, vacancies can often best be filled by men already employed in some other department. Heads of departments at present are not in a position to know the abilities and qualifications of men in other departments, but a centralized employment service could and should keep a list of likely men in all departments, with a view to filling any vacancy that may occur. Under present conditions department heads might object to releasing a good man to some other department, even though it is a promotion for the man involved. An employment service that had watched the matter closely and kept the proper records, would take into consideration the advantage to the organization as a whole, and the transfer could be effected without friction.

All things taken into consideration, an employment department, organized with the view of giving real service to all departments, is a great aid to the departments and to the organization as a whole.

Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight during the week ending January 22 showed a slight further decline, to 703,115, as compared with 804,866 in the corresponding week of 1920, 734,293 for 1919 and 668,941 for 1918. The weekly report compiled by the Car Service Division of the American Railroad Association is summarized as follows:

REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts. Comparison of Totals, This Year, Last Year, Two Years Ago, for Week Ended Saturday, January 22, 1921.

Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mdse. L. C. L.	Miscellaneous	Total revenue freight loaded			Received from connections		
										This year	Corresponding year	Corresponding year	This year	Corresponding year	Corresponding year

L. C. L. merchandise loading figures for 1921 and 1920 are not comparable, as some roads are not able to separate their L. C. L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

January 15, 1921	36,191	36,191	183,228	10,483	45,241	9,590	173,500	207,806	799,888	804,524	750,609	509,708	627,293	609,260

As explained before, all promising applicants should be carefully interviewed whether vacancies exist or not, in order to build up a waiting list of desirable applicants. In most cases, under present practice, applicants are not interviewed unless a vacancy exists.

Sizing up men is to a large extent a matter of subconscious impression. Some men are good judges of character, while others are not, and I believe that most railroad officers today

The freight car surplus for the week ending January 23 was 301,997 as compared with 288,115 the previous week and 258,678 during the week ending January 7. For the same week there were scattering shortages amounting to 1,328.

The percentage of freight cars on home roads on January 15 had reached 52.2, or within three-fifths of 1 per cent of the percentage for May 1, 1917.

## Operating Statistics for November

The Interstate Commerce Commission has issued a summary of operating statistics for the month of No-

vember, 1920, of roads having annual operating revenues in excess of \$25,000,000, of which the principal items are as follows (including mixed and special train service):

Region and name of road	Freight-service train-miles (thousands)		Net ton-miles (millions)		Net ton-miles per loaded freight-car-mile		Car-miles per car-day		Net ton-miles per car-day

rail to destruction, the deflection was measured by each blow, the elongation for each inch over 6 in. and the total elongation was noted. The drop-test piece was taken from near the top of the ingot and in each case was the first five-foot length of rail immediately after reaching physically sound steel, i. e., free from pipe, and in the case of the rails from sink-head ingots also below the bottom of the sink-head. Of the 14 comparison rails none broke under four or five blows (six rails were nicked and broken after the fourth or fifth blow) while for the 35 Hadfield rails the range was two to seven blows, there being nine of four blows and four of three blows; only 22 or 63 per cent of the rails from sink-head ingots withstood four or more blows. The ductility as measured by the deflection and elongation is also somewhat greater and more uniform for the comparison rails.

The greater ductility and more uniform behavior under the drop test of the steel from the comparison ingots would appear to be due more to the chemical composition and especially to the nickel and chromium content of the Mayari steel than to any factor traceable to manufacture.

The Pennsylvania system through Mr. Gibbs submitted a report on the rails from this and earlier investigations from which the conclusion was reached that—"There is evidently no economy in the Hadfield process as regards wear, and it would require a much more extended trial to determine the relative freedom from failure."

It would appear, however, to be unfair to draw any general conclusions as to performance in service from so few rails as this investigation furnished, although it would not be expected that the Hadfield type of sink-head ingots would furnish any rails showing structural defects. While it is not claimed that the use of the sink-head process for the manufacture of ingots will solve all rail problems, it is maintained that its adoption would be a step in the direction of the elimination of rail failures.

## I. C. C. Orders Increase in Illinois Freight Rates

WASHINGTON, D. C.

THE FIRST DECISION rendered by the Interstate Commerce Commission ordering advances in intrastate freight rates to correspond with those which it had authorized for interstate traffic in Ex Parte 74 was handed down by the Interstate Commerce Commission on January 28 in the Illinois case. It had previously ordered increases in state passenger fares in Illinois and several other states, but that part of the Illinois case relating to freight rates was reserved for separate decision. For interstate traffic in Illinois the Interstate Commerce Commission had applied the 35 per cent advance allowed to the western roads in some instances and the 40 per cent advance to the eastern district in others. The Illinois Public Utilities Commission had prescribed for intrastate traffic a scale of rates which it stated would result in increases not exceeding 35 per cent, but which the carriers asserted would yield less than 33½ per cent. The commission finds, however, that the state rates are unduly preferential of intrastate traffic and prejudicial to interstate traffic and increases corresponding to the interstate increases were ordered to be made effective on or before March 7 upon not less than five days' notice. The report by Commissioner McChord, after a general discussion of the conditions, said in part:

All the Illinois carriers involved are engaged in the handling of both state and interstate traffic. Generally the same train and often the same car that carries the intrastate traffic carries the interstate traffic.

When individual manufacturers, jobbers, and dealers in these cities outside the state draw their coal, for instance, from Illinois

mines they must pay relatively greater increases than their competitors just across the border in Illinois, and in shipping their goods into Illinois they must pay relatively more than the Illinois distributors. Thus, a double rate disadvantage is put upon the interstate shipper and his locality. As every business man knows, a competitor must often, if not generally, absorb the difference in freight rates against him or withdraw from the field. That such differences are prejudicial is a matter of common knowledge.

One of the most important instances of discrimination is found in the Chicago industrial district, which includes not only territory in Illinois in and about the city of Chicago, but reaches across the state line into Indiana, embracing such points as Gary, Indiana Harbor, and Hammond, with their great steel mills and other industries. These industries, when they located in these outlying districts, did so with the distinct understanding that they would forever be treated, from a rate standpoint, like all other points in the Chicago district, as though they were located within the city of Chicago. That is, Chicago rates were to apply to and from the entire industrial district. This arrangement had been adhered to in good faith for many years, but on August 26, 1920, the date on which the increases were made effective on both state and interstate traffic, the long-standing parity was destroyed, so far as traffic to and from points in Illinois was concerned, by the carriers increasing the rates between the Indiana points in the Chicago district and all stations in Illinois 40 per cent, under our finding, and between the Illinois points in that district and all stations in Illinois a lower percentage, under the Illinois commission's finding. That this treatment of the Indiana cities puts a cloud on their prospects and injures the ability of their industries to do business in Illinois against competitors favored by lower rates intrastate can not be denied.

St. Louis, Mo., and East St. Louis, Ill., are practically one community, yet the former's rates to and from points in Illinois have been increased 40 per cent and the latter's materially less. The effect, of course, is similar to that in the Chicago district. For instance, prior to August 26 the rates on coal from the Illinois mines to St. Louis were but 20 cents per ton higher than to East St. Louis, but since that date they have been 34 cents higher, not because of any change in conditions of transportation, but because the Illinois commission's judgment as to what was a reasonable increase happened to be different from ours.

Situations such as above described can be found at various points around the borders of the state.

Disparities between Illinois intrastate rates to and from Chicago and interstate rates between Illinois points and St. Louis were the subject of litigation in *Business Men's League of St. Louis v. A. T. & S. F. Ry. Co.*, 44 I. C. C., 308, wherein we found that the then existing adjustment was unduly prejudicial to St. Louis. The present rates present a similar situation.

In *Illinois Classification*, supra, it appeared that Indiana jobbers were shipping into Illinois in competition with Illinois shippers, but were confronted with relatively higher rates than were paid by their Illinois competitors to points in the same state. Except as to commodity rates in general, the situation was remedied as explained earlier in this report, but a similar difficulty has now been created.

Certain routes from Illinois coal mines to Illinois destinations are interstate while others are intrastate. Prior to August 26 the rates in most instances were the same via the different routes, but since that date the interstate rates from a given mine or group of mines are higher than the intrastate rates. The result is that interstate traffic has been practically destroyed by the coal being diverted to the intrastate routes. In other words, the intrastate business increases while the interstate traffic decreases. By the same token the intrastate rates jeopardize the interstate rates in that the interstate carriers must make the intrastate rates the measure of their interstate rates in order to secure part of the business.

The various rate situations hereinbefore described are cited as examples. Others of the same general character are shown by the record, and many others could be found. The contention is made by the Illinois interests that we should limit any finding of undue prejudice to the localities specifically shown to be affected. To our views upon the law of the case as expressed in our previous report herein and in *Rates, Fares and Charges of N. Y. C. R. R. Co.*, 59 I. C. C., 290, we may add that the instances pointed out are merely typical of a condition that is general. The rates to and from the various points on any given commodity, both state and interstate, local and joint, are closely related and interrelated, and the creation of material differences between them is subversive of established and sound economic and commercial conditions, resulting in a situation which could not reasonably be approved.

The Illinois commission points out that there are some instances where individual intrastate rates in that state, even with the lesser increases allowed by it, happen to be as high as or

higher than those applicable interstate for equal distances; but it is not claimed that this is true of the general body of rates. The application of lower rates intrastate in Illinois than for similar hauls interstate in the Illinois district and central territory is general, and even with increases in the amounts allowed by us in *Increased Rates, 1920*, and *Authority to Increase Rates, supra*, the intrastate rates on most of the important articles of traffic in Illinois would still be lower than the interstate rates in central territory. The differences are due in large part to the failure of the Illinois commission to grant the same increases in recent years as have been authorized by us.

Evidence was offered by the Illinois commission as to traffic density, showing that the western and southern lines have a density in Illinois much greater than the average on their entire systems and greater than the eastern lines have in Illinois. The figures for Illinois do not represent merely intrastate traffic, but all traffic that moves within, into, out of, or through the state. The traffic density on the eastern lines in Illinois is, in general, much less than on their entire systems, and the figures do not indicate to us that Illinois should have a lower basis of rates than obtains in the territory east thereof.

The Illinois commission also points out situations arising from the 40 per cent increase in the Illinois district as compared with the 35 per cent increase between Illinois and points in western territory and the 33½ per cent increase between Illinois and southern territory, pursuant to *Increased Rates, 1920*. The rate from Chicago to Davenport, involving a haul entirely within the Illinois district, takes an increase of 40 per cent, whereas, from Chicago to points in Iowa, just west of Davenport, and in competition with it, the increase has been but 35 per cent, thus lessening the rate difference that formerly existed in favor of Davenport. Rates on coal from Kentucky fields to Illinois points, involving hauls from the southern territory into the eastern territory, were increased 33½ per cent, as against the increase of 40 per cent sought within Illinois. These situations are considered by that commission as justifying an intermediate percentage increase intrastate in Illinois as a border state. Situations of the kind cited are, of course, general and can be found at all points along the northern, western and southern borders of the Illinois district and, in fact, at any place in the country where any two of the rate groups fixed in *Increased Rates, 1920, supra*, adjoin. The difficulty could have been avoided only by a horizontal increase for the entire country. This was recognized in our report.

Some readjustments may be appropriate in individual instances where substantial injury results. An approval of the Illinois commission's rates would mean the approval of lower rates in Illinois, and, indirectly, lower rates perhaps west of the Mississippi River, than in official classification territory. Such inequalities as call for readjustment may be brought to our attention in the appropriate way and dealt with as occasion requires.

After the Illinois commission's first order was issued the Public Service Commission of Indiana rendered its report on an application for increases to the extent authorized by us. The Indiana commission declined to grant such increases and expressly indicated in its report that it was controlled by the action of the Illinois commission and by the existence of lower intrastate rates in Illinois than in Indiana. In other words, the Indiana commission felt that in justice to the citizens of Indiana it could not permit higher rates within that state than applied within the state of Illinois. It requires no stretch of the imagination to realize what would be the situation if every state in the Union would take similar action, savoring of reprisal and retaliation, thus requiring the imposition upon interstate traffic of unreasonably disproportionate increases in order to insure the prescribed return. It was just such a situation that Congress sought to prevent when it enacted the statutory provisions with which we are here concerned.

Upon this record we find no conditions within Illinois so different from those affecting interstate traffic as to justify the present differences in rates. Illinois intrastate traffic is not contributing its just proportion of the revenues of the carriers, measured by the statutory rate of return "upon the aggregate value of the railway property of such carriers held for and used in the service of transportation." The record establishes that the present intrastate charges for freight services and for the transportation of milk and cream by the steam railroads subject to our jurisdiction and by the Chicago, Lake Shore & South Bend and the receiver of the Aurora, Elgin & Chicago on the third-rail division of that line, in Illinois, lower than the just and reasonable corresponding interstate rates and charges authorized in and established in the eastern group, including the Illinois district, pursuant to Ex Parte 74, afford intrastate traffic and shippers and localities within the state undue preference and subject interstate traffic and shippers and localities outside the state to undue prejudice, and unduly, unjustly and unreasonably discriminate against interstate commerce.

We are of opinion and find that to remove the unlawful prefer-

ence, prejudice and discrimination found to exist, charges for freight services and rates for the transportation of milk and cream intrastate in Illinois, in effect August 25, 1920, should be increased in amounts corresponding to those authorized in *Increased Rates, 1920*, and *Authority to Increase Rates, supra*, with respect to the interstate rates and charges in the eastern group and including the Illinois district. These findings shall not, however, be construed as prohibiting the restoration or establishment of proper differentials as between coal mines in Illinois and Indiana.

Commissioners Hall, Eastman and Potter dissented but did not file a dissenting opinion.

## Highway Constructors Supply Cars to Railroads for Hauling Stone

THE CURTAILMENT of road construction as a consequence of car shortage and the restriction placed on the use of open-top cars resulted in the adoption of an interesting expedient by two Arkansas highway districts. Rather than hold up the work or attempt the use of motor trucks over a long road haul, the two road districts bought some air-dump cars which they furnished to the railroad for hauling the road materials in regular revenue service.

Crittenden county, Ark. (opposite Memphis, Tenn.) has

The Cars Were Handled in Solid Trains

undertaken a very extensive road building program at an estimated cost of several million dollars, covering the construction of between 200 and 300 miles of gravel roads. The supply of gravel being at Chaffee, Mo., 175 miles away, the problem of transportation became vital and the car shortage threatened to interrupt the work. In this emergency 105 Western air dump cars of 20-cu. yd. capacity and conforming to M.C.B. requirements were purchased from the United States War department and by arrangement with the St. Louis-San Francisco, these side dump cars are being operated

Storage Piles Were Built at a Dozen Convenient Places

in solid trains of about 35 each, between the gravel pit and the work, a distance of 175 miles. The railroad receives the regular tariff rates for the material hauled but allows 0.6 cents per mile for the use of the equipment. The plan was to build up storage piles of gravel in about a dozen places convenient to the roads from which the material could be taken to the work in motor trucks. These storage piles were about 800 ft. long and were built to heights of 20 to 30 ft. at the extreme end. This required the building of about

1,200 ft. of sidings at each pile, the expense of which was entirely justified by the results.

One advantageous feature of this experiment, from a railroad point of view, is the speed with which the trains of dump cars are being moved, a round trip of 350 miles, including the time consumed in loading and unloading, being made in three days. The train of gravel leaves the pit in the evening and arrives at its destination at about noon of the following day.

One of the problems to be solved was the manner of forming the fill so that the dump cars could operate most effectively from an elevation. It was planned at first to build up a fill to a height of several feet from which the cars could be dumped in the ordinary way. This was found to be unnecessary. At each storage pile the siding was laid on the natural ground surface and the cars were dumped from that. This gravel then was worked under the ties and the track gradually jacked-up until the proper elevation was secured. The fill then was widened in the usual way to the full width planned for the pile at the base. This having been accomplished, another lift was made at that point and then widened back to the other side, where the operation was repeated, and so on. This work could be expedited by the use of a spreader car on the fill.

The use of dump cars for hauling has proved satisfactory in every way. The road district is getting a constant supply of material and the railroad is getting a profitable business without diverting a single car from the necessary coal hauling service. In analyzing this problem with a view to its application to other projects, it should be assumed that 30-cu. yd. dump cars are being employed. In the case in point, the 20-cu. yd. cars were used for the simple reason that they were available when needed. It is obvious, however, that larger cars could be operated with greater economy. Allowance can also be made for some reduction in the cost of the material by the quarry or gravel men in consideration of the regular car loading schedule made possible by the use of the privately owned equipment. In view of the frequent suggestion for the use of highway motor trucks for the hauling of road materials in lieu of regular railway transportation, the results secured by the Arkansas road districts are worthy of careful consideration.

## Railway Business Association Annual Dinner on March 31

**P**RESIDENT ALBA B. JOHNSON announces that the annual meeting and dinner of the Railway Business Association will be held at the Waldorf-Astoria Hotel, New York, on March 31. The speaking program for the dinner will consist of addresses by Daniel Willard, chairman of the American Railway Association for the railways and Edgar E. Clark, chairman of the Interstate Commerce Commission, for the government.

Mr. Johnson in his announcement says:

"Events current and to come in the world of railway transportation are vividly reflected in the distinctive features which mark the 1921 program for our annual meeting. We have always proclaimed that the primary aim of the Railway Business Association, while identical with the public interest, was the welfare and prosperity of the industry and trade which are cognate to railway operation and development. Both at our business sessions and at our dinner this policy of enlightened selfishness will be more clearly defined than in any previous year.

"Formerly the business sessions were restricted to an account of stewardship and election of officers. Conditions have complicated our work and our convention. In 1921 the members will discuss reports of several standing com-

mittees, each of which has for several months been conducting a labor of research, conference and discussion in a field essential to the preservation of the railway supply guild as a strong and progressive arm of rail transportation.

"Since our last dinner it has become evident that during the next three or four years the people of the United States will determine whether they are to be served with transportation through individual initiative of citizens or through a government agency. The answer will depend upon the satisfaction or dissatisfaction of the public with the service given them by the railway corporations under the Transportation Act of 1920. A vital fact in public satisfaction or dissatisfaction with service will be the operating economies through which net income may be made and kept adequate. The railway supply world is on the one hand a source from which a large part of such economies must come through mechanical advance. Our industry on the other hand is certain to dwindle and vanish as a constructive force if the railways themselves fall under the deadening hand of the government. In such a juncture our dinner platform will be occupied by the two men whose official position is that of leadership in solving the problem.

"Daniel Willard, president of the Baltimore & Ohio, is chairman of the advisory committee of the Association of Railway Executives, and chairman of the American Railway Association. He embodies the contact of the railways as a whole with the public and with the government. He is to define the problem from the point of view of the carriers: what must they do, what must they have, to be preserved?

"Edgar E. Clark is chairman of the Interstate Commerce Commission, whose function under the Transportation Act is to fix such rates, if management be honest, efficient and economical, as will as near as may be yield to each railway group a net railway operating income of 5½ per cent to 6 per cent upon the value of railway property devoted to transportation; and after March 1, 1922, to determine also what rate of income is requisite to afford service and increase of facilities adequate to the public need. Mr. Clark is to set forth the difficulties with which the commission is beset and the responsibilities of all concerned as he views them. "These addresses will go to the heart of the railway supply guild's problems."

In order to reduce the unwieldy size of the assemblage and promote the comfort and satisfaction of the diners, a limit is placed upon the number of seats which will be allowed to any subscriber. Each member company is entitled to subscribe for not exceeding 10 seats plus one additional seat for each "plural" member. Since the number of memberships which a member company may carry is limited by the by-laws to five (four "plural"), the maximum dinner subscription is for 14.

## Valuation Hearing

**H**EARINGS on the bill to amend the valuation act to eliminate the requirement that the Interstate Commerce Commission shall ascertain the cost of acquisition of land were resumed before the House Committee on Interstate and Foreign Commerce on January 28. W. G. Brantley, representing the President's Conference Committee on Valuation, opposed the bill on the ground that a railroad must pay more than the acreage value of land whether it is acquired by purchase or by condemnation. The carriers are not contending, he said, for an excess value of their lands; all they want is the present value. The controversy comes up over what constitutes present value. The acreage value of adjacent lands, he said, is not the value of railroad lands. Never yet has a railroad been able to buy a strip out of a farm at the acre-

age value. The act as it now stands directs the commission in the determination of land values to ascertain what they cost the railroad and what it would cost today to acquire them if they did not have them, and then to determine their present value. Instead of expediting the valuation, Mr. Brantley said, the passage of this bill would delay it, because if Congress shall assume judicial functions and undertake to prepare the formula by which railroads shall be valued and determine to omit the cost of reproducing the land property, and if valuations are made under that formula and the courts continue to adhere to what they have been repeatedly deciding, the valuation will all come back to be remade. To authorize the commission not to assemble all the facts relating to the cost of reproduction of railroad property, he said, would be to inject an entire new theory of valuation into the proceedings.

Representative Dennison of Illinois said that in his state a large part of the cost of acquiring railroad right of way is represented by the damages it is necessary to pay to the owners of adjacent land, and asked if this cost would be excluded by the provisions of the bill. "Every dollar of it," said Mr. Brantley. "That is the purpose of the bill."

In reply to the statement by Chief Counsel Farrell of the Interstate Commerce Commission that the commission would undoubtedly allow as much as the railroads had ever paid for their land, Mr. Brantley said that the commission has served 55 tentative valuations and three so-called final valuations, and in not a single instance has it allowed for anything but the mere acreage value of adjacent land. It has also tendered to the carriers many separate land reports which do not make any allowance for the cost of acquisition. Mr. Farrell had objected that the commission could do nothing but estimate the cost of acquisition, and that it would be a farcical procedure. Mr. Brantley said that such an assertion is "grotesque" because it amounts to saying that the commission, with all its experience and its expert organization, cannot do what petit jurors are doing every day all over the land in condemnation proceedings. He said the commission's report as to the present value of adjacent land is only an estimate based on the consideration of all the available information and that to report the additional cost of acquisition would require no more of an estimate.

Samuel W. Moore, general counsel of the Kansas City Southern, made a similar argument on behalf of the Association of Railway Executives, saying that the purpose of this bill is to halt the proceedings now in progress before the commission to ascertain the cost of acquisition and damages. Its passage would be a specific direction to the commission to eliminate from the valuation all evidence on condemnation and damages and give no consideration whatever to that factor. It costs two or three times the value of adjacent land to acquire railroad right of way because of the damages to adjacent land. The commission in its valuation thus far has ignored the cost of acquisition and assigned to railway right of way only the value of adjacent land.

John E. Benton, general solicitor for the National Association of Railway and Utilities Commissioners, advocated the passage of the bill, saying that railroad rates have reached the limit of what the traffic will bear, and any further advances in order to pay returns on increased values which would be created by the inclusion of fictitious elements would result in disaster to the commerce of the country. He claimed that the inclusion of an estimate of the present cost of condemnation and damages in excess of the original cost or present value in the rate value of railroads would increase the aggregate value on which the return under the Esch-Cummins bill would have to be earned by several billion dollars, and would be a gross

injustice to the public. This valuation, he said, ought to be made in such a manner that it will command the confidence of the country and settle the question of what the railroad properties are worth. Generally speaking, in spite of the conspicuous examples the other way, he said, he thought the carriers will be found to have properties which will sustain their capital accounts. If this be true, it will be to their lasting interest to settle that fact to the satisfaction of the country. That cannot be done by any valuation which includes estimates in excess of present value based upon a fiction that the roads are non-existent and their lands would have to be obtained by condemnation today.

## Substitute for Clayton Law Reported

WASHINGTON, D. C.

THE SENATE COMMITTEE on interstate commerce on January 28 reported favorably the bill proposed as a substitute for Section 10 of the Clayton law, as amended in accordance with the suggestions of the Interstate Commerce Commission. The bill was based on the one originally introduced by Senator Frelinghuysen, by request, which was drafted by the Association of Railway Executives, but was reintroduced with the amendments by Senator Townsend as a new bill, S. 4933. The Townsend bill provides as follows:

*"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled.* That the Interstate Commerce Act be, and the same hereby is, amended by adding thereto a new section, numbered 20b, which shall read as follows:

"Sec. 20b. (1) That as used in this section the term 'carrier' means a common carrier by railroad which is subject to this Act, or any corporation organized for the purpose of engaging in transportation by railroad subject to this Act or any owner of a railroad engaged in interstate commerce as defined in this Act.

"(2) After sixty days from the date when this section becomes effective no carrier shall have any dealings in materials, supplies, or other articles of commerce, or shall make any contracts, or have any contracts made, after December 31, 1920, for construction or maintenance of any kind, to the amount of more than \$100,000 in the aggregate in any calendar year with another corporation, firm, partnership, or association not a common carrier, railroad company, terminal company, or joint facility company that is subject to section 20 of this Act when said carrier shall have as a director, president, manager, purchasing or selling officer, or agent in the transaction, any person who is at the same time a director, manager, purchasing or selling officer, or agent in the transaction of, or who has any substantial interest in, such other corporation, firm, partnership, or association unless and except such dealings or contracts shall be with the bidder whose bid is the most favorable to such carrier, to be ascertained by competitive bidding under regulations from time to time prescribed by rule or otherwise by the commission.

"(3) No carrier shall, when it has upon its board of directors, or as its president or manager, any person who is at the same time a director, president, or manager of another carrier, charge such other carrier for materials, supplies, or other articles of commerce a price in excess of that at which such articles are concurrently charged out by it for its own use, with the addition thereto of proper transportation charges.

"(4) No bid shall be considered unless the name and address of the bidder or the names and addresses of the officers, directors, and managers thereof, if the bidder be a corporation, or of the members, if the bidder be a partnership, firm, or association, be given with the bid.

"(5) Any person who shall, directly or indirectly, do or attempt to do anything to prevent anyone from bidding, or who shall do any act to prevent free and fair competition among the bidders or those desiring to bid, shall be punished as prescribed in this section in the case of an officer or director.

"(6) Every carrier having any such dealings or making any such contracts required hereby to be made by competitive bidding shall, within thirty days after making the same, file with the commission a full and detailed statement of the transaction, showing the manner of the competitive bidding, who were the bidders, their names and addresses, and the names and addresses of the directors and officers of the corporations and the members

of the firms or partnerships bidding; and whenever the commission shall, after investigation or hearing, have reason to believe that the law has been violated in and about the said transactions, it shall transmit all papers and documents and its own views or findings regarding the transactions to the Attorney General.

"(7) After this section takes effect, it shall be unlawful for any officer, director or agent of a carrier to receive, directly or indirectly, any benefit or profit or any money or thing of value in respect to the negotiation, hypothecation, purchase, or sale by the carrier of any stocks, bonds, or other evidences of interest or indebtedness issued by a carrier or noncarrier corporation.

"(8) After this section takes effect every carrier that is a party to the hypothecation, purchase, or sale of or other dealing in any stocks or bonds issued by a carrier or noncarrier corporation shall within twenty days after such hypothecation, purchase, sale, or other dealing report to the commission in such form and detail as the commission may require the particulars of the transaction.

"(9) If any carrier shall violate this section, it shall be fined not exceeding \$25,000; and every director, agent, manager, or officer thereof who shall have knowingly voted for or directed the act constituting such violation, or who shall have knowingly aided or abetted in such violation, shall be deemed guilty of a misdemeanor and shall be fined not exceeding \$5,000, or confined in jail not exceeding one year, or both, in the discretion of the court.

"Sec. 2. That section 10 of an Act entitled 'An Act to supplement existing laws against unlawful restraints and monopolies, and for other purposes,' approved October 15, 1914, be, and it is hereby, amended by adding thereto a new paragraph, which shall read as follows:

"The provisions of this section shall not apply to carriers, corporations, or owners of railroads that are subject to section 20b of the Interstate Commerce Act."

## Heavy Switching Locomotives for the Grand Trunk

THE CANADIAN Locomotive Company, Limited, of Kingston, Ontario, have recently completed and delivered an order for ten heavy type eight-wheel switching locomotives for the Grand Trunk system. These engines were designed for the heavy switching service at Toronto and

and the latest type of butterfly fire door have been applied.

The weight of these locomotives is 242,750 lb., the factor of adhesion is 4.64 and the maximum tractive effort is 52,300 lb. The cylinder and valve chambers are bushed with Hunt-Spiller gun iron; also, the piston packing and valve rings are of the same material. The steam distribution is controlled by a 12-in. piston valve of the railway company's standard type, used in connection with the Young valve gear, which has proven very successful on this railway. The Ragonet type B power reverse gear is also applied.

The main frames are 6 inches wide and each cast in one piece, in accordance with the McNaughton process. The main axle is equipped with the Robb-McGarvey extended driving box journal 20 in. long, and all driving boxes are fitted with Franklin adjustable wedges; also Smith's adjustable hub liners are fitted to all driving wheels. Henry automatic grease cups are applied to all rods. Franklin radial buffers and unit safety draw bars are used between engine and tender. Barco flexible joints on air pump piping and Barco flexible connections between engine and tender are applied.

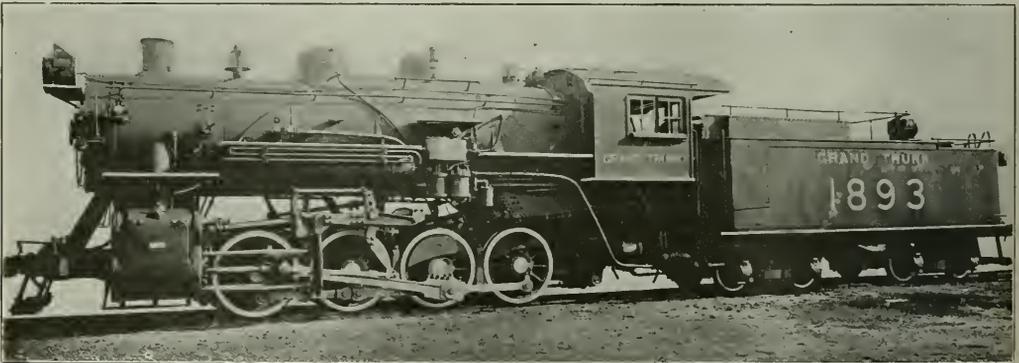

The tender is of the Grand Trunk railway standard type with a Commonwealth cast steel frame. The trucks are of the railway company's four wheeled outside equalized type with cast steel bolsters, Miner class A18 draft gear and Buffalo tender brake beams. All the material of which these locomotives are built conforms to the Grand Trunk railway standard specification. Further particulars are given in the table of dimensions.

### General Data

Gage .....	4 ft. 8½ in.
Service .....	Switching
Fuel .....	Bituminous coal
Tractive effort .....	52,300 lb.
Weight in working order .....	242,750 lb.
Weight of engine and tender in working order .....	406,700 lb.
Wheel base .....	15 ft. 6 in.
Wheel base, engine and tender .....	53 ft. 4½ in.

### Ratios

Weight on drivers ÷ tractive effort .....	4.64
Tractive effort × diam. drivers ÷ equivalent heating surface* .....	840.0
Equivalent heating surface* ÷ grate area .....	61.8

An Efficient Locomotive for Heavy Switching Service

Buffalo and at intermediate points. They are probably the heaviest engines in Canada of their type.

The boiler is equipped with the Locomotive Superheater Company's latest type A superheater with 32 units and is designed to carry a working pressure of 190 lb. per sq. in. It is radially stayed and flexible staybolts are used in the breaking zones in the sides, back and throat of firebox. The firebox is equipped with a smoke consumer having combustion tubes on each side; it also contains a brick arch supported on four 3-in. tubes. The O'Connor fire door flange

Firebox heating surface ÷ equivalent heating surface*, per cent. ....	5.7

Water capacity	9,000 U. S. gal.
Coal capacity	10 tons

\*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

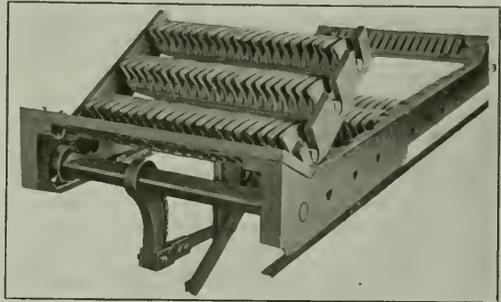

and the other dropped into a slot in the center frame. When assembled the slot in the center frame is closed by the front tie bar.

To permit the three finger bars in the lifting frame to be shaken with the remainder of the bars in the front section of the grate, the shaker arms of the bars in the lifting frame and those in the remainder of the section are connected independently, the two systems being united through a second connecting rod with one connection to each system. In order that the movement of the lifting frame may not interfere with the operation of the shaker rigging, the rod connecting the three finger bars in the lifting frame is extended forward so that when the finger bars are in their normal position its end is directly under the lifting shaft. The operating connection is made at this point so that when the lifting grate is open, the finger bars retain positions parallel to each other

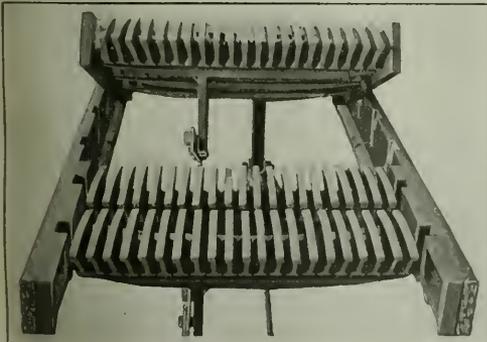

## The Hulson Shaking Dump Grate

THE DUMP GRATE has always been a necessary evil in the locomotive firebox, necessary to provide for the removal of clinkers when cleaning fires at terminals, and an evil because of the "dead" surface of the dump or drop grate from which it is impossible to remove the accumulation of ash while the locomotive is in operation between terminals. The effective grate area is, therefore, practically reduced by the area of the dump grate.

In order that the entire area of the grate may be made uniformly effective, the Hulson Grate Company, Keokuk,

Front End of the Grate Showing the Operating Shaft and Lifting Frames

Hulson Locomotive Grate with the Lifting Grate Open

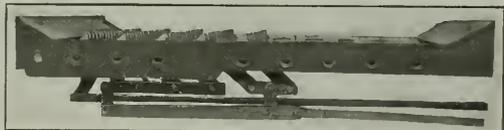

Iowa, has designed a locomotive grate in which the drop grate is replaced by three finger bars in a frame which may be swung upward about a shaft journaled at the front end of the grate frames. Standard finger bars are used in the lifting frame and they are shaken as a part of the front section of the grate.

The construction of the device is simple and will readily be understood by reference to the illustration. It will be seen that the side and center frames are recessed at the front ends, the length of the recess being sufficient to take in the cast steel lifting frames of rectangular cross-section with trunnion bearings for the three standard finger bars. Square holes are cored through the ends of the lifting frames which are reinforced with hubs to provide ample strength, and the frames are mounted on a 2-in. square wrought iron staff. This staff, with the lifting frames and a cast steel lifting arm mounted on it, is placed in the stationary grate frames, one end being slipped into a circular hole cored in the side frame

and to the grates in the remainder of the section but change their angular position relative to the lifting frame itself. Either with the lifting frame open or closed, there is no interference with the shaking of the grates in the entire section.

The lifting grate is designed to swing through an angle of over 30 deg. and provides a vertical opening between the grate and the raised fingers of about 18 in. with a considerably larger horizontal opening under the lifting frame.

The operation of the Hulson finger grates, with their freedom from slicing action on the fire, tends to reduce the amount of clinkers to be removed at terminals and the design of the fingers is such that the grates dump much more freely when the bars are moved to the full extent of the

Side View of the Grate Showing the Operating Connections

shaking movement than is possible with the usual type of finger grates. Should heavy clinker accumulate, however, the lifting section provides a means of clearing the grate with the least possible amount of effort. After all ash and clinker which will pass through the grate has been removed by shaking, the surface of the lifting section is cleared with a hoe, the material being drawn back towards the center of the firebox. It is then raised and all material remaining on the grates is pushed forward and dropped into the ash pan. The ledges at the bottom of the recesses in the grate frames are chamfered for practically their entire length, three short lugs being left to support the lifting frames when in

the closed position. Any accumulation of clinker or ash on the ledges is thus prevented and the lifting grate will always freely drop back into place.

The lifting grate is operated from the cab, its normal position being closed, and a lock is provided to hold the operating lever in the open position when the lifting grates are raised. The possibility of the grate dropping while the locomotive is in operation is thus eliminated.

The usual location for the dump grate is at the front end of the firebox and the Hulson lifting section is designed for location at that point. Should lack of clearance under the arch in locomotives with shallow fireboxes interfere with this location it may be placed at the rear of the firebox, in which case it swings up from the rear end, under the door.

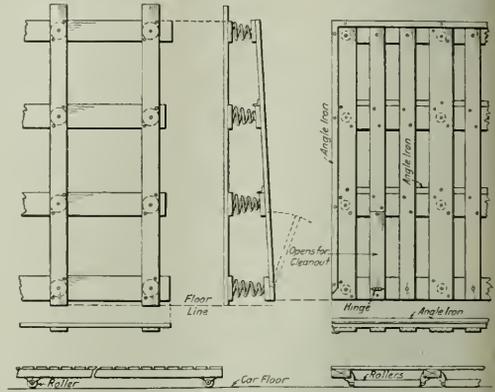

The device is simple and requires no expensive parts. The only special parts are the two cast steel lifting side frames, the square wrought iron shaft and the cast steel lifting arm. The only machine work required is the turning of the short journals on the ends of the shaft. A patent has been applied for.

## Shock Absorber for Refrigerator Cars

**I**N 1914, a device known as the Cutler-Monesmith shock absorber was developed by George E. Cutler, New York, and B. L. Monesmith, Cresco, Iowa, for the purpose of reducing egg breakage in shipment. The device was adapted for refrigerator cars or sheathed freight cars and could be used for shipping other products than eggs. The original arrangement consisted of a loose floor racking supported on pieces of 2-in. pipe with spring buffers at either end of the car to absorb the shock. This arrangement was somewhat crude and recent developments are shown in the illustrations.

The principle of the improved shock absorber is the same as that of the first device, namely, the load is held as a unit within the car on a movable floor, the shock being absorbed

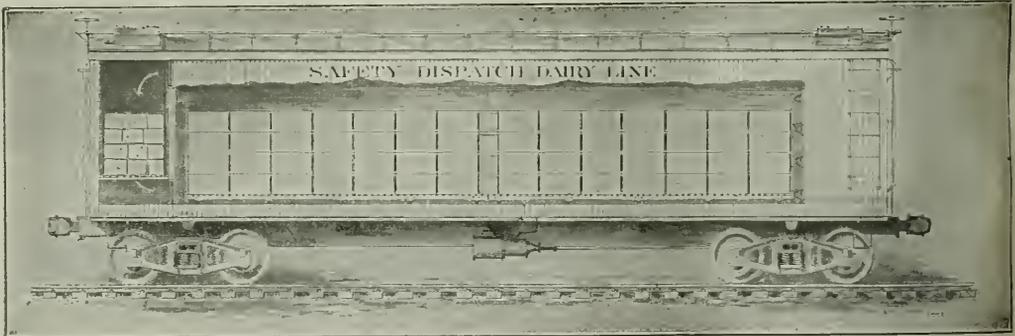

floor section is made such as to cause the front racks or buffers to stand in a vertical position. The width of the buffer is  $\frac{3}{4}$  in. less than the interior width of the car. The buffers are ordinarily 5 ft. 8 in. above the floor of the car and  $1\frac{1}{2}$  in. less than the width of the car. All buffers and

Details of Buffer Construction

floor racks receive one coat of linseed oil, well rubbed in. The metal work is treated with an anti-rust process.

The rollers shown are made of extra heavy  $1\frac{7}{8}$  in. pipe, the journals being welded into each end of a steel plug  $1\frac{1}{4}$  in. long. The journals are  $\frac{3}{4}$  in. in diameter. The bearings are ordinarily made of malleable steel castings designed to support the load with a generous factor of safety. The springs are made of spring steel wire, oil tempered and carefully coiled to correct form and dimensions. Each end of

Phantom View of Cutler-Monesmith Device Applied to Refrigerator Car

by spring buffers at either end. There must be no projections on the interior of the car sides to interfere with lateral movement of the load. The correctness of the principle involved was amply demonstrated by the results obtained in service which have vindicated the contention of the inventors that the load must be made rigid within the confines of the movable carriage and be sufficiently separated from the car sides to permit forward and backward oscillation without contact.

The floor racks are made of 1-in. by 4-in. slats and 2-in. by 4-in. stringers. It will be noticed in the line drawing that the lowest spring is greater in free length than the highest one. This gives a greater spring compression at the bottom of the buffer, where it is most needed. The length of the

the buffer is provided with two clean-cut openings of sufficient size so that the ice bunkers may be readily cleaned. They have a hinge at the bottom and lag screws at the top.

Another important advantage of this device is the fact that the load rests a few inches above the floor of the car and there can be no damage due to water. The device is adaptable to use for other merchandise and food products, being by no means limited to the transportation of eggs. In case heavier material is to be shipped, it would only be necessary to furnish springs of greater tension and possibly insert two extra springs in the bottom row. The ideal spring tension would be one sufficient to gradually return the load to its central position after a shock, and thus have it ready for the next.

# General News Department

The piece-work system has been restored in two departments of the foundry of the Pennsylvania Railroad at Altoona—the cleaning room and the wheel foundry.

A bill to provide that all meetings of the Federal Reserve Board and of the Interstate Commerce Commission shall be open to the public has been introduced in Congress by Representative McLaughlin, of Nebraska.

By a fire at the Pullman repair works at One Hundred and Eighth street and Langley avenue, Chicago, on the morning of January 27, a freight car shop was destroyed at a loss of about \$450,000. Seven new refrigerator cars and 12 Pullman sleepers were also destroyed. The fire was the result of spontaneous combustion in one of the tool rooms.

The Post Office Department has finally got around to asking for an appropriation for the amount it owes the Railroad Administration for the retroactive increase in mail rates for the period of federal control. The Treasury Department on Wednesday submitted to Congress an estimate for deficiency appropriation for the Department of \$65,575,832, which has been agreed upon as the amount due for the 26 months.

Thomas DeWitt Cuyler, chairman of the Association of Railway Executives, has written a letter to Chairman Esch of the House committee on interstate and foreign commerce regarding the statement made in his recent testimony before the committee, that he understood that the Southern Railway was contemplating a suit for \$84,000,000 against the government growing out of claims to that amount accruing under federal control. Mr. Cuyler says that he has been advised by President Harrison of the Southern Railway that such is not the fact and that the statement is not justified. He, therefore, asks that the record be corrected in this respect.

R. V. Massey, chairman of the newly organized joint reviewing committee of the Pennsylvania Railroad, says that the committee already has successfully disposed of, to the satisfaction of both sides, eight controversies which have been pending a long time, one of them since 1914. To emphasize the fact that the committee is a united non-partisan body for the judicial and impartial settlement of differences and not a mere conference between representatives of opposing sides, it has been decided that at the meetings no two representatives of the management or of the employees shall be seated together, but that they shall be alternated around the table. Mr. Massey is "confident that every member of the committee, whether representing the men or the management, is keenly alive to the responsibility resting upon him; and equally confident that not one of the committee has the slightest doubt of the ability of this body to adjust on a fair and friendly basis any differences which may arise affecting the employees represented."

## Executive Committee Meeting of

### C. I. C. I. & C. F. Association

The Executive Committee of the Chief Interchange Car Inspectors' and Car Foremen's Association of America will meet at the Hotel Sherman, Chicago, on Thursday and Friday, March 3 and 4. The entire membership is invited to this meeting to suggest changes in the A. R. A. Rules of Interchange.

## End of Eight Years' Litigation

The Federal District Court in Kentucky, Judge Evans, has ordered the Western Union Telegraph Company by November 1 to remove its poles and wires from the right of way of the Louisville & Nashville Railroad. This, apparently, settles the suits which have been in the courts since 1912, as the present

order has been made in compliance with the order of the Circuit Court of Appeals, which decided in favor of the railroad company and directed the lower court to dissolve the injunction which had been entered forbidding the railroad company to interfere with the property of the telegraph company. The telegraph company made an appeal to the United States Supreme Court, but that court refused to interfere with the ruling of the lower tribunal.

## Members of Construction Division, U. S. A., to Meet

Members of the Construction Division of the Army, including the commissioned and enlisted personnel, as well as those who served in civilian capacity and who live in or near New York City, will get together at the Aldine Club, 200 Fifth avenue, New York, at 6:30 o'clock on the evening of February 12.

The reunion will be a preliminary to the trip which many of them will make to Chicago on February 25, to attend the annual reunion of the Construction Division Association, and will consist of a banquet, in connection with which there will be sufficient entertainment to carry out the "get together" spirit of the occasion. Vance W. Torbert, 200 Fifth avenue, New York, is chairman of the banquet committee.

## Operating Statistics for November

The Interstate Commerce Commission's monthly summary of operating statistics for large steam roads for the month of November shows a total net ton mileage of 37,194,000,000, which was an increase of 14½ per cent as compared with November, 1919. The average tonnage per train was 710 as compared with 681. The percentage of loaded to total freight car miles was 63.2 as compared with 71.2. The percentage of unserviceable cars was 7.4 as compared with 6.3. The average car mileage per day was 26.8 as compared with 23.4. The net ton miles per car day were 517 as compared with 437, and the average load per car 30.6 tons as compared with 26.3. The average cost per freight train mile, selected accounts, was \$2.26 as compared with \$1.70 in 1919. For the 11 months ending with November the average was \$2.01 as compared with \$1.62.

## Eight Years for Stealing Baggage

For stealing baggage from the Pennsylvania Railroad, two men were sentenced in court at New York City on January 26, to eight years and three years six months imprisonment, respectively.

The prosecuting attorney said that thefts from baggage at New York City terminals during the past year had amounted to over \$3,000,000. From the Pennsylvania Station alone, he said, \$34,000 worth of baggage was stolen from August 23 to the end of 1920. Organized gangs operate at all the terminals. The scheme mainly used, he outlined, was to have an "outside man" check a small parcel for some nearby point. The "inside man" would transfer the check of the small parcel to some big box or trunk apparently filled with merchandise, and a third man would obtain the box or trunk at destination. One of the culprits was formerly a porter in the Pennsylvania Station.

## Reductions in Wages and Work

The Erie Railroad has reduced the wages of unskilled laborers from 48½ cents an hour to 35, 33 and 30 cents. This is understood to apply to large numbers of trackmen and freight-house men. Complaint was made, on behalf of employees, to R. S. Parsons, general manager, who replied that the company intended to pay a fair differential above going rates of labor in the vicinity in which it is employed. "This action is only taken as a last extremity, and was avoided as long as possible. I do not see how

we can make any change in it at the present time, and sincerely trust that the whole question can be speedily settled to the satisfaction of all concerned."

In the Erie shops at Hornell, N. Y., most of the employees have been ordered to report for duty on only four days a week.

The Louisville & Nashville has reduced shop forces 10 per cent. The Delaware, Lackawanna & Western has taken similar action at Scranton, Pa.

The Southern Pacific has laid off 1,200 of its shopmen at Sacramento, Cal.

The Union Pacific has ordered the five-day week for shopmen and trackmen.

### Punctuality Records on the Katy

The Missouri, Kansas & Texas, of Texas, reports that freight and passenger trains are being run with a higher percentage of punctuality than ever before in the history of the railroad, indicating that employees are not only trying but are actually rendering more efficient service than ever before. During December 92 per cent of all passenger trains were on time, and 85 per cent of all freight was moved on schedule.

General Manager H. E. McGee, in a circular to the public, says that with his harmonious and efficient organization, "We expect to continue, if not improve, this record. . . . To run one passenger train on time across the great state of Texas, it is necessary that approximately one thousand men, directly or indirectly connected with its operation, perform their duties efficiently." The company solicits constructive criticism, and would like to have passengers commend the men when they render unusual service or particular acts of courtesy.

### The Pony Express and the Air Mail

Arguments have been advanced against the air mail service on the ground that it is too dangerous. But there have been comparatively few casualties. It is interesting to note that the same objection was advanced in 1860 at the opening of the "Pony Express" from Omaha to Sacramento. The continuous breakneck speed required of the riders, together with the perils of the wilderness trails made the enterprise appear foolhardy in the view of many.

Nevertheless, the "Pony Express" was started and performed a service of great benefit until supplanted by the telegraph. Each rider covered from 75 to 125 miles a day, largely on a dead run; horses were changed at relay stations, 10 to 15 miles apart. The schedule was 10 days in summer, 12 in winter, for the 2,000-mile trip. This was afterwards reduced to 8 and 10 days. The service commenced with 80 riders and 420 ponies and continued for 16 months. Only one mail pouch was lost during that period and only one rider was killed outright by Indians, although there were many attacks and hair-breadth escapes.

On December 17 Mail Pilot Moore completed a round trip by aeroplane between Cheyenne and Salt Lake City, between dawn and darkness. Pilot Moore left the Cheyenne field at 5:42 a. m., delivered 400 lb. of mail in Salt Lake City and was back in Cheyenne at 4:44 p. m. He had flown 800 miles, crossed the Rockies twice and made two stops. At times he attained an altitude of 13,000 feet.—*Union Pacific Bulletin*.

### Brotherhoods Refusing to Submit Claims to U. S. R. A.

Representatives of the railroad labor organizations have sent a telegram to the director general of railroads protesting against his action in abolishing the three boards of adjustment created by the Railroad Administration and appointing to finish up their work a staff officer and two assistants who, they claim, are "unqualified because of their past and anticipated future affiliations as representatives of the railroad management." The boards, which were composed of an equal number of representatives of the employees and of the managements, have been passing on a large number of cases involving disputes as to working conditions and interpretations of wage orders arising during the period of federal control. The objection is that the staff officer, J. D.

Code, and his assistants, R. J. Turnbull and C. T. O'Neill, are not "bi-partisan." "If our understanding is correct," the letter says, "this will serve to advise you that we hereby withdraw every claim submitted to and now before the Railroad Administration . . . which have not been decided by Board of Adjustment 2 and 3, and you will further understand by the above notice that there are no claims which are properly before the Railroad Administration which require or permit any further handling by you as director general or your representatives."

To this Director General Payne replied, saying in part: "You do not make it clear whether you have any objection to Messrs. Code, Turnbull and O'Neill beyond the fact that they may—when they leave the service of the Railroad Administration—seek employment from railroads. This is entirely immaterial as I see it, because the railroads have no earthly interest in the claims of the employees now pending. The decision is expressly limited to the period of federal control. If these men are honest, liberal-minded, just men, I see no reason for any change. If they are not, I will be very glad to have you give me in confidence any facts which you may think pertinent."

The labor leaders then advised Mr. Payne that they had nothing further to submit and that they were making necessary arrangements and would request the return of the files in each of the claims.

### Marine Equipment Manufacturers and Shipbuilders Organize

At a meeting held January 28, at the Biltmore Hotel, New York, representatives of 47 shipbuilding companies, manufacturers of marine equipment and dealers in marine supplies formed an association for the following purposes: To advance the interests of its members; to promote good-will between those who buy and those who sell marine equipment and supplies; to promote and supervise exhibits; and to co-operate with other associations in the marine field to the end that their efforts for the advancement of the designing, building and operation of ships shall be most productive.

It is proposed that membership in the Marine Equipment Manufacturers' Association shall be limited to those who build and repair ships, or make or sell equipment or supplies; manufacturers of or dealers in machinery or appliances for building, repairing or loading ships; marine insurance companies or brokers, and publishers of regularly issued periodicals devoted to marine subjects. It would not be limited to those who exhibit; but to exhibit, one must first be a member of the association.

The Marine Equipment Manufacturers' Association as planned will closely parallel the Railway Supply Manufacturers' Association in the steam railway field. The latter is organized on a permanent business basis and conducts its own exhibit in connection with the annual convention of Division 5, Mechanical, of the American Railway Association. In the marine field, one show has already been held in New York, a second is scheduled for Philadelphia in March and others are being planned for Chicago, New Orleans, San Francisco, Baltimore and Boston. While the New York show was held under the auspices of the National Marine League, it was managed by an exhibition company, with a pecuniary interest only, and the space cost more than six times per square foot what the exhibitors paid at the Atlantic City convention of the American Railway Association in June last. Further, and what is even more important, 90 per cent of the visitors at the Atlantic City exhibit were buyers, while at the marine show in New York probably less than five per cent were buyers. The Marine Equipment Manufacturers' Association expects to hold one show a year only and in conjunction with one or more of the associations in the marine field comparable with Division 5, Mechanical, of the American Railway Association—for example, the Society of Naval Architects and Marine Engineers. It is believed that when a comprehensive co-operative plan is laid before the several important societies in the marine field they will gladly arrange to meet simultaneously with the Marine Equipment Manufacturers' Association.

The temporary officers of the association are Colonel E. A. Simmons, acting president, *Marine Engineering*, Woolworth building, New York; K. L. Ames, Jr., acting secretary, American Steel Foundries, 332 South Michigan avenue, Chicago, Ill.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

**AIR BRAKE ASSOCIATION.**—F. M. Nellis, Room 3014, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.

**AIR BRAKE APPLIANCE ASSOCIATION.**—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.

**AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Poulos, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

**AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.**—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa.

**AMERICAN ASSOCIATION OF FREIGHT AGENTS.**—R. O. Wells, Illinois Central, Chicago. Next meeting June 20, 1921.

**AMERICAN ASSOCIATION OF FREIGHT BAGGAGE AGENTS.**—E. L. Duncan, C. & E. I. R. R., 332 South Michigan Ave., Chicago. Next meeting, June, 1921. Quebec, Can.

**AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.**—C. K. Hope, C. & N. W. Ry., 143 Liberty St., New York.

**AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next Convention, August 24-26, 1921, Kansas City, Mo.

**AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Burritt, 8 W. 40th St., New York.

**AMERICAN RAILROAD MASTER TINKERS, COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.**—C. Borcherdt, 202 North Hamlin Ave., Chicago, Ill. Next convention September 12-14, Hotel Sherman, Chicago.

**AMERICAN RAILWAY ASSOCIATION.**—E. Fairbank, 75 Church St., New York. Next regular meeting, November, 1921.

Division 1, Operating (including former activities of Association of Railway Telegraph Superintendents).—W. J. Fripp (chairman), General Manager, N. Y. C. R. R., New York, N. Y.

Division 2, Telegraph and Telephone Section.—H. Hulst (chairman), Manager of Telegraphs, Grand Trunk Exhibit by Railway Telegraph and Telephone Appliance Association.

Division 2, Transportation (including former activities of Association of Transportation and Car Accounting Officers).—E. J. Pearson (chairman), President, N. Y., N. H. & H. R. R., New Haven, Conn.

Division 3, Traffic.—Robert C. Wright (chairman), General Traffic Manager, P. R. R., Philadelphia, Pa.

Division 4, Engineering.—E. H. Fritch, 431 South Dearborn St., Chicago. Next annual meeting, March 15-17, 1921, Chicago.

Construction and Maintenance Section.—E. H. Fritch, secretary.

Electrical Section.—George Gibbs (chairman), Chief Engineer of Electric Traction, Long Island Railroad, New York, N. Y.

Signal Section.—E. S. Bisset, 75 Church St., New York. Exhibit by Signal Appliance Association.

Division 5, Mechanical (including former activities of Master Car Builders' and Master Mechanics' Association).—V. K. Hawthorne, 431 South Dearborn St., Chicago. Next convention June 15-22, Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.

Equipment Painting Section.—V. R. Hawthorne, secretary.

Division 6, Purchases and Stores (including former activities of Railway Storekeepers' Association).—J. P. Murphy, General Storekeeper, N. Y. C. R. R., Collinwood, Ohio. Second annual meeting, June 20-22, 1921, Atlantic City, N. J.

Division 7, Freight Claims (including former activities of the Freight Claim Association).—Lews Pilcher, 431 South Dearborn St., Chicago.

Division 8, Perishable Freight.—E. F. McPike (chairman), 431 South Dearborn St., Chicago.

**AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.**—C. A. Lichty, C. & N. W. Ry., 49 Ave., Austin Station, Chicago. Next convention, October 18-20, 1921, New York City. Exhibit by Bridge and Building Supply Men's Association.

**AMERICAN RAILWAY ENGINEERING ASSOCIATION.**—(Works in cooperation with the American Railroad Association, Section 11.) E. H. Fritch, 431 South Dearborn St., Chicago. Next annual meeting, March 15-17, 1921, Congress Hotel, Chicago. Exhibit by National Railway Appliance Association.

**AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.**—(See American Railway Association, Division 5.)

**AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

**AMERICAN SHORT LINE RAILROAD ASSOCIATION.**—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.

**AMERICAN SOCIETY FOR TESTING MATERIALS.**—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

**AMERICAN SOCIETY OF CIVIL ENGINEERS.**—Col. H. S. Crocker (acting secretary), Engineering Societies Building, 33 W. 39th St., New York. Next convention, April 27, 1921, Houston, Texas. Regular meetings, 1st and 3d Wednesday in month, except July and August, 33 W. 39th St., New York.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—Calvin W. Rice, 29 W. 39th St., New York.

**AMERICAN STEEL TRAPPERS' SOCIETY.**—W. H. Eiseaman, 154 East Erie St., Chicago.

**AMERICAN TRAIN DISPATCHERS' ASSOCIATION.**—C. L. Darling, Northern Pacific Ry., Spokane, Wash. Next convention, June 20, 1921, Kansas City, Mo.

**AMERICAN WOOD PRESERVERS' ASSOCIATION.** F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md.

**ASSOCIATION OF FREIGHT AGENTS.**—Willis H. Failing, C. & N. W. Ry., N. J. Jersey City, N. J. Next meeting at St. Louis, Mo.

**ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.**—Jos. A. Andreucetti, C. & N. W. Ry., Room 411, C. & N. W. Sta., Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.

**ASSOCIATION OF RAILWAY EXECUTIVES.**—Thomas De Witt Taylor (chairman), 61 Broadway, New York, N. Y.

**ASSOCIATION OF RAILWAY SUPPLY MEN.**—C. L. Mellor, 212 W. Illinois St., Chicago. Meeting with International Railway General Foremen's Association.

**ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.**—(See American Railway Association, Division 1.)

**ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.**—(See American Railway Association, Division 2.)

**BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.**—A. J. Filkins, Paul Dickinson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.

**CANADIAN RAILWAY CRAFTSMEN'S ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' Association. Next meeting, December 14.

**CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Anton Klinc, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, West Morrison Hotel, Chicago.

**CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.**—Thomas B. Koeneke, Federal Reserve Bank Bldg., St. Louis, Mo. Meetings first Tuesday in month at the American Hotel Annex, St. Louis.

**CENTRAL RAILWAY CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

**CHIEF INTERCHANGING CAR INSPECTORS AND CAR FOREMEN'S ASSOCIATION.**—J. C. Archer, General Car Inspector, Wabash R. R., Decatur, Ill.

**CHIEF INTERCHANGING CAR INSPECTORS AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—W. P. Elliott, Terminal R. R. Ass'n of St. L., East St. Louis, Mo. Next convention, September 15-17, Hotel Sherman, Chicago.

**CINCINNATI RAILWAY CLUB.**—H. Boutet, 101 Carew Bldg., Cincinnati, Ohio.

**EASTERN RAILROAD ASSOCIATION.**—E. N. Bessling, 614 F St., N. W., Washington, D. C.

**FREIGHT CLAIM ASSOCIATION.**—(See American Railway Association, Division 7.)

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month. Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Next convention, August 16-18, 1921, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1921, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn. Next convention, September 12-15, Hotel Sherman, Chicago. Exhibit by Association of Railway Supply Men.

**MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.**—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention October 4-6, 1921, Buffalo, N. Y.

**MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York. Next convention, May 23-26, 1921, Planters' Hotel, St. Louis, Mo.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—(See American Railway Association, Division 5, Equipment Painting Section.)

**MASTER CAR BUILDERS' ASSOCIATION.**—(See American Railway Association, Division 5.)

**NATIONAL ASSOCIATION OF RAILROAD TOOL PRODUCERS.**—E. E. Pershall, T. J. Moss Fe Co., 220 Security Bldg., St. Louis, Mo.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.**—James R. Walker, 49 Lafayette St., New York.

**NATIONAL FOREIGN TRUCK COUNCIL.**—O. K. Davis, 1 Hanover Square, New York.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago. Meeting with American Railway Engineering Association.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting 2d Thursday in month, alternately in San Francisco and Oakland.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson. Next annual meeting, June 8, 1921, Hotel Traymore, Atlantic City, N. J.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Naxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, American Club House, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—D. C. Welly, Missouri Pacific R. R., Little Rock, Ark.

**RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scriber, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Meeting with Traveling Engineers' Association.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

**RAILWAY REAL ESTATE ASSOCIATION.**—R. H. Morrison, C. & O. Ry., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION.**—(See American Railway Association, Division 4, Signal Section.)

**RAILWAY STOREKEEPERS' ASSOCIATION.**—(See American Railway Association, Division 6.)

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with American Railway Association, Division 5.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, Westbury Battery Co., 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Chicago. Exhibit by Track Supply Assoc. ion.

**ST. LOUIS RAILWAY CLUB.**—W. F. Frouden, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, Schroeder Headlight & Generator Co., New York City. Meeting with American Railway Association, Signal Section.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. McFfill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. M. Rubin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn N. Y. Meets with Roadmasters' and Manufacturers of Way Association.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' Association.

## Traffic News

The production of soft coal during the week of January 22 declined sharply for the sixth week in succession. The total output is estimated by the Geological Survey at 9,139,000 net tons.

Canadian express companies have been authorized by the Board of Railway Commissioners to advance transportation rates from 20 to 35 per cent. The companies had asked leave to make a general increase of 40 per cent.

Interchangeable tickets for use on either the Pennsylvania or the Baltimore & Ohio, between Philadelphia, Baltimore and Washington are not to be honored after February 7. Re-establishment of normal pre-war train service by each road is given as the reason for changing from the practice inaugurated during federal control.

The Senate committee on interstate commerce has submitted a favorable report to the Senate on the bill recommended by the Interstate Commerce Commission, which has been passed by the House, proposing to amend the existing law relating to the transportation of explosives by including within its provision certain high explosives which are now omitted.

The Long Island Railroad on January 29 made a general advance of 20 per cent in passenger fares, excepting commutation tickets. This action followed the decision of the Appellate Division of the Supreme Court of the State, on the 28th, vacating the injunction which had restrained the railroad from complying with the order of the Interstate Commerce Commission requiring the advance in rates. The Appellate Division holds that the constitutionality of the Transportation Act of 1920 cannot be attacked in the State Court. The Staten Island Rapid Transit Company, which had been enjoined at the same time, also made the advance.

The Chicago, Milwaukee & St. Paul has put home-seekers' rates into effect at slightly over two cents a mile from Chicago to points in its territory as far west as within about 125 miles of the Pacific Coast. The tickets are for first class transportation for the entire distance. The company will sell the home-seekers' tickets from St. Paul, Minneapolis, Sioux City, Iowa, and tributary territory, as well as from Chicago. They will be on sale on the first and third Tuesdays of each month and will be good for 21 days. In addition to the new low rate for western home-seekers, the company will sell at Chicago and Milwaukee tickets good for ten days to prospective home-seekers going to points in northern Wisconsin and Michigan.

### Committees to Confer With Shippers

The executive committee of the National Industrial Traffic League met in Chicago on January 25, to follow up and complete the arrangements for co-operation between shippers and carriers, which were made at the joint meeting with representatives of 17 trunk line railroads, held in New York last November. The Traffic League has appointed committees to work with groups representing the carriers. The committee which will represent the Traffic League in Official Classification territory has as its members W. H. Chandler, manager of the Transportation Bureau, Boston Chamber of Commerce, Boston, Mass., who is general chairman; N. D. Chapin, traffic manager, Syracuse Chamber of Commerce, Syracuse, N. Y.; L. C. Bihler, traffic manager, Carnegie Steel Company, Pittsburgh, Pa.; Paul M. Ripley, traffic manager, American Sugar Refining Company, New York City; George A. Blair, general traffic manager, Wilson & Co., Chicago. The league will be represented in western territory by a committee composed of H. C. Barlow, traffic director, Chicago Association of Commerce, Chicago, who is regional chairman; C. D. Mowen, commissioner, Ft. Smith Traffic Bureau, Ft. Smith, Ark.; Harry Dickinson, commissioner, Denver Transportation Bureau, Denver,

Colo.; J. P. Haynes, commissioner, Traffic Bureau, Chamber of Commerce, Sioux City, Ia.; Herman Mueller, traffic director, St. Paul Association, St. Paul, Minn. The committee for the southern territory has as its members W. C. Creighton, traffic manager, Charlotte Shippers' & Manufacturers' Association, Charlotte, N. C., who is regional chairman; C. S. Hoskins, president, Southern Traffic League, Tampa, Fla.; T. M. Henderson, commissioner, Traffic Bureau of Nashville, Nashville, Tenn.; Paul Giessow, general manager, New Orleans Joint Traffic Bureau, New Orleans, La.; T. A. Bosley, assistant traffic manager, Southern Cotton Oil Company, Richmond, Va.

The carriers have also selected representatives corresponding to and co-operating with the Traffic League's committees. To represent the railroads in Official Classification territory, a committee has been chosen whose members are G. H. Ingalls, vice-president, New York Central, New York City, who is general chairman; George D. Dixon, vice-president in charge of traffic, Pennsylvania System, Philadelphia, Pa.; T. C. Powell, vice-president, Erie, New York City; W. C. Maxwell, vice-president in charge of traffic, Wabash, St. Louis, Mo.; B. Campbell, vice-president, New York, New Haven & Hartford, Boston, Mass. The carriers' committee for western territory includes R. M. Calkins, vice-president, Chicago, Milwaukee & St. Paul, Chicago; Edward Chambers, vice-president, Atchison, Topeka & Santa Fe, Chicago; L. J. Spence, director of traffic, Southern Pacific, New York City; C. E. Spens, vice-president, Chicago, Burlington & Quincy, Chicago; C. Haile, vice-president, Missouri, Kansas & Texas, St. Louis, Mo. The members of the committee for the southern territory are C. T. Airey, vice-president and traffic manager, Central of Georgia, Savannah, Ga.; F. B. Bowes, vice-president, Illinois Central, Chicago; A. R. Smith, vice-president, Louisville & Nashville, Louisville, Ky.; C. R. Capps, first vice-president, Seaboard Air Line, Norfolk, Va.; and Lincoln Green, vice-president, Southern Railway, Washington, D. C.

### The Broad Street Station Telegraph Office

The largest railroad telegraph office on the Pennsylvania system is in the general office at Philadelphia, known as "PO." It handles about 15,000 telegrams and reports daily, and requires the services of a chief operator, with five assistants; 41 Morse operators, two telephone message operators, 12 printer operators, and 33 messengers. The office has a switchboard accommodating 200 wires. There are 24 Morse sets, 12 duplex sets, two repeater sets, five Morkrum duplex printers, two telephone message desks, and a time repeater, which is used to send standard time from the Allegheny Observatory, to all of the telegraph offices on the system, at 2 a. m. and 2 p. m. daily. Between Philadelphia and Pittsburgh, by means of coils and condensers which divert the telegraph and telephone messages into separate paths, three telephone circuits are worked on four wires and each separate wire is used as a telegraph circuit. These separate telegraph circuits are duplexed so that by this means eight channels are secured for Morse operation from these four wires. The printers are also duplexed and operated over telephone circuits without the slightest interference with the telephone conversation.

In 1912 J. C. Johnson, then superintendent of telegraph, and now general superintendent of transportation, started what is known as the P. R. R. Educational Course, and this is conducted by correspondence. It includes courses in Electrical Engineering, Mathematics, Mechanical Drawing, Storage Batteries, Signal Engineering, Stenography, Italian-English and Spanish-English. This has enabled all employees to secure technical education without cost, thereby fitting them for more responsible positions in the service.

One of the requirements of employment of messengers in the telegraph service is that they must take up some course of study to fit them for promotion when they become too old for messenger service, and many of these former messengers now occupy positions of trust and responsibility in the various departments.—*The Mutual Magazine.*

**MAKING THE RAILROADS WAIT.**—The roads are not prospering under the higher freight and passenger rates granted last summer. This is an anxious period for them. The least Congress can do in all fairness is to direct the Treasury to continue paying installments on the balances run up against them through the Administration's short-sighted railroad policy.—*N. Y. Tribune.*

## Commission and Court News

### Interstate Commerce Commission

The commission has issued an amendment to its regulations governing passes so as to require each carrier to file with the commission a list of the names and titles of officers having authority to issue free transportation and of those having authority to request free transportation of other carriers.

The Interstate Commerce Commission has suspended until June 3, 1921, the operation of schedules which propose to reduce the rates on certain commodities from New York, N. Y., to Galveston, Texas, via the Southern Pacific Co.-Atlantic S. S. Lines (Morgan Line) applicable both as port to port rates and as proportional rates on traffic from seaboard interior points, also proportional rates via the Mallory line.

The commission has suspended until June 1 the operation of proposed through class rates from Albany, N. Y., Cumberland, Md., Elkins, W. Va., Richwood, W. Va., Scranton, Pa., Syracuse, N. Y., Williamsport, Pa., and points taking same rates to Green Bay, Wis., and other points in Wisconsin and Michigan located on west side of Lake Michigan via Manitowoc, Wisconsin.

The commission has ordered an investigation on the petition of the Steubenville, East Liverpool & Beaver Valley Traction Company that because of various franchise ordinances and regulations imposed by state and municipal authorities of Ohio, and of Pennsylvania, the company is unable to increase its rates for intrastate traffic by the amounts authorized by the commission for interstate traffic and under its recent order also for intrastate traffic in Ohio.

The commission has suspended until June 1 the operation of certain tariffs which propose to transfer El Paso, Tex., from the eastern boundary of the Mountain-Pacific territory, taking a 25 per cent increase under Ex Parte 74 decision, to the western group, making applicable instead the interterritorial percentage increase of 33½ per cent, and to transfer 33¼ per cent Group J points in Colorado, Nebraska, New Mexico, South Dakota and Wyoming to Group G basis on transcontinental class and commodity rates to the Pacific Northwest.

### State Commissions

The Virginia Corporation Commission has received a petition from the Chesapeake Western asking permission to discontinue the operation of passenger trains, this because the improved highways lying parallel to the railroad have led to the increasing use of automobiles, thus taking away from the railroad enough passengers to make the trains unprofitable. This road is 50 miles long, from Elkton, Va., westward to Stokesville.

### Court News

#### Hours of Service Act at Small Telegraph Stations

In an action for violations of the Hours of Service Act the charges were that telegraphers were employed more than nine hours in stations which were "continuously operated night and day." The question was whether the stations, Arlington, Mass., and Amherst, Mass., were of that character. The Arlington station was kept open continuously from 5:45 a. m. to 9 p. m., and Amherst from 6 a. m. to 9 p. m. The District Court for the district of Massachusetts holds that the mere keeping open of a station after 6 p. m. does not bring it within the nine-hour class. What constitutes night operation is a question of fact. The statute apparently refers to the divisions of the business day, 9 o'clock in the evening is apparently on the border line. In doubtful cases, said the court, the purpose for which the office is kept open is held the decisive factor. If kept open primarily for the

convenience of the public, it would not be "operated at night," within the statute. "Operated" means more than "kept open." Too severe limitation on hours of service at small stations would result in their being closed, thereby inconveniencing the public without any corresponding advantage. As the agreed statement of the parties threw no light on the purpose for which the stations were kept open during the evening nor on the sort of work then done at them; there could be no recovery of the penalties.—United States v. Boston & Maine, 265 Fed. 800.

The provisions of the Hours of Service Act on which this case turns are contained in the proviso of the second section, viz., that no train-order operators "shall be required or permitted to remain on duty for a longer period than nine hours in 24, in stations continuously operated night and day, nor for a longer period than 13 hours in stations operated only during the daytime." The question, therefore, was whether these stations were daytime stations, allowing operators to work 13 hours, or day and night stations allowing only nine-hour periods. Unless a station is operated in the night, as well as during the day, the nine-hour limitation does not apply.

The courts have pointed out several times that the statute is far from clear, and that, giving the language its ordinary meaning, it is evident there are places operated longer than "during the daytime," but which are not "continuously operated night and day." It is settled that the expression "continuously operated night and day" is to be understood as including stations which are closed part of the night, if they are operated during the daytime and a substantial part of the night. U. S. v. Atchison, 220 U. S. 37.

The point in this case, therefore, was practically, Is 9 p. m. too late to keep a day station open? And does that make it a day and night station?—U. S. v. B. & M., 265 Fed. 800.

#### Careless Loading by Shipper

The employees of the owners of a traction engine ran the engine on to a railroad's loading platform to load it on a car, and although they saw that the car was lower than the platform they attempted to run the engine on to the car without the use of blocks, which were at hand. The Iowa Supreme Court holds that the railroad was not liable to the owner of the engine for damages due to its falling to the ground.—Fidelity Thresher Co. v. Chicago, M. & St. P. (Iowa), 176 N. W. 615.

#### Crossing Bell Out of Order

In a crossing accident case, the New Jersey Supreme Court holds that an instruction to the jury that the railroad having installed an automatic bell at a highway crossing, it was the company's duty to use reasonable care to keep the bell in order and notify the public when it was out of use was erroneous. The statute defining the use of the bell merely absolves a traveler where the bell is installed from the consequences that would otherwise follow from his failure to stop, look and listen, and does not increase the obligations of the railroad.—Johnson v. C. N. J. (N. J.), 109 Atl. 359.

### United States Supreme Court

#### Delivery Without Surrender of Bill of Lading

##### Does Not Necessarily Render Carrier Liable

In a case under the federal Uniform Bills of Lading Act, the main questions presented to the Supreme Court were, whether, upon the facts, there was a delivery to one in possession of the bill, and, if so, whether the delivery exonerated the carrier, it having been made without requiring surrender of the bill of lading.

In 1917 J. F. French & Co. shipped a carload of potatoes from Bailey, Mich., to Louisville, Ky., over the Pere Marquette and the C. C. C. & St. L. to their own order, notifying Marshall & Kelsey, Camp Taylor. The shipper attached the bill of lading to a draft for the purchase price and sold and delivered both, duly endorsed in blank, to a bank at Grand Rapids. This bank transmitted the paper to an Indianapolis bank, which, without obtaining payment of the draft, detached the bill of lading and wrongfully delivered it to Marshall & Kelsey. The car having reached Louisville, it was

delivered on request of one Bindner to the Southern Railway to be forwarded to Dumesnil, without requiring surrender of the bill of lading. The endorsed bill of lading had been left by Marshall & Kelsey with Bindner, an employee of the Southern, for safe-keeping. Later, upon the refusal of Marshall & Kelsey to accept the potatoes and honor the draft, possession of the car and bill of lading was returned to the shippers, who accepted them under protest and, without waiving any rights they might have, proceeded to dispose of the potatoes elsewhere in order to make the damage as light as possible for all concerned. The shippers then sued the Pere Marquette for compensation, contending that the carrier, by delivering the car upon request without requiring surrender of the bill of lading, had become liable for conversion of the potatoes. The shippers recovered judgment, which was affirmed by the State Supreme Court, 204 Mich. 578.

The railroad defended on the ground that there was a delivery at Louisville which exonerated it under Section 9 of the Federal Uniform Bill of Lading Act. Was the carrier liable for misdelivery, because the car was sent from Louisville to Dumesnil upon Bindner's request without surrender of the bill of lading?

First, The United States Supreme Court holds that having brought the goods to the destination named in the bill of lading the railroad's only duty under its contract was to make a delivery at that place; and it could make that delivery by turning the goods over to another carrier for further carriage. The fact that in forwarding the car the Big Four (C. C. & St. L.) used the original waybill, striking out the word "Louisville" under the "destination" and substituting "Dumesnil, Ky. So. R. R.," is held of no significance. The shipment from Louisville to Dumesnil was a wholly new transaction. In turning over the car for this new shipment the railroad made a disposal of it in assumed discharge of its obligations, which was, in legal contemplation, a delivery. Second, the delivery at Bindner's order was one which the carrier was justified in making under the provisions of section 9 of the act. The Big Four had no information, and there was nothing in the circumstances which should have led it to doubt that Bindner was lawfully entitled to request that the car be shipped to Dumesnil.

Finally, did such a delivery exonerate the carrier upon suit by the shipper when it failed to require surrender of the bill of lading as provided in that instrument? In the Supreme Court's opinion there is no exoneration where loss to shipper or subsequent purchaser of the bill results from such a failure; but where the loss suffered is not the result of the failure to take up the bill, mere failure to take it up does not defeat the exoneration.

There is nothing in the act which imposes upon the carrier a specific duty to the shipper to take up the bill of lading. Under section 8 the carrier is not obliged to make delivery except upon production and surrender of the bill of lading; but it is not prohibited from doing so. If instead of insisting upon production and surrender of the bill it chooses to deliver in reliance upon the assurance that the deliverer has it, so far as the duty of the shipper is concerned the only risk it runs is that the person who says that he has the bill may not have it. If such proves to be the case the carrier is liable for conversion and must of course indemnify the shipper for any loss. Such liability arises not from the statute but from the obligation which the carrier assumes under the bill of lading.

In this case the real cause of the loss was the wrongful surrender of the bill by the Indianapolis bank to Marshall & Kelsey by means of which the car was taken to Camp Taylor and the shipper deprived of the Louisville market. The shippers deliberately assumed the loss by their voluntary act in taking back the draft and bill which they had sold to the Grand Rapids bank. The delivery was made to one in possession of the bill of lading who could, and doubtless would, have surrendered it had he not been prevented by distance from doing so. To hold a carrier liable under such circumstances would seriously interfere with the convenience and the practice of business. For these reasons the judgment of the state court was reversed.—Pere Marquette v. French & Co. Decided January 17, 1921. Opinion by Mr. Justice Brandeis.

## Foreign Railway News

### Roumania Gets Credits for Purchase of Locomotives

LONDON.

It is reported that the banks of Roumania have granted important credits to the government to enable it to make substantial increases to the motive power of the Roumanian railways.

### Mexico to Purchase Equipment

The Minister of Finance of Mexico has arranged with American firms for a credit of \$5,000,000, the proceeds of which are to be devoted to the purchase of equipment for the Mexican railways, according to cable advices from commercial attache Jackson at Mexico City.

### Chinese Line to Purchase Passenger Cars

The Tientsin-Pukow Railway will purchase, according to information received by commercial attache Julian Arnold, 11 all steel passenger trains of 5 cars each. The company is also inquiring for ferries, with the view of establishing a train ferry across the Yantze river between Pukow and Nanking, in order to establish a through train service from Peking to Shanghai.

### Chilean Road to Electrify

The Chilean government is asking for bids, to be opened in April, for the electrification of the government line from Valparaiso to Santiago, according to reports received by the Guaranty Trust Company. Bids are also asked for quantities of rails, switches and track accessories, for use on the government roads in the northern and central parts of the country according to reports.

### Exports of Car Wheels and Axles in November

Car wheels and axles valued at \$738,825 were exported in November. This figure shows a substantial improvement over the similar total, \$543,753, for October. The largest shipment of this material, valued at \$309,683, was sent to France. Cuba comes next on the list with exports valued at \$131,483. The detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Dollars	Countries	Dollars
France .....	309,683	Argentina .....	1,354
Spain .....	56,248	Brazil .....	19,451
England .....	103	Chile .....	5,455
Canada .....	30,477	Colombia .....	3,929
Costa Rica .....	5,494	Peru .....	4,650
Honduras .....	32	Uruguay .....	1,127
Panama .....	2,277	Venezuela .....	2,134
Salvador .....	239	British India .....	13,229
Mexico .....	50,197	Dutch East Indies .....	60,506
Newfoundland and Labrador .....	1,035	Japan .....	10,987
Trinidad and Tobago .....	2,242	Turkey in Asia .....	272
Other British West Indies .....	155	Australia .....	279
Cuba .....	131,483	Philippine Islands .....	20,749
Virgin Islands .....	328		
Dominican Republic .....	4,686	Total .....	738,825

### Lack of Locomotives Hampers Serbia

Commerce in Serbia is almost at a standstill, because of the lack of locomotives, according to Col. W. G. Atwood, technical adviser of the government of the Serbs, Croats and Slovenes, who has just returned to America after an absence of several years. With the assistance of several American engineers, 500 miles of railway were rebuilt last year. In spite of this, however, one million tons of grain are awaiting export, impossible because of inadequate railway facilities. Col. Atwood has made several reconnaissance trips over the mountains between Belgrade and the Adriatic and finds that railways can be built connecting the rich interior with the sea with comparatively easy grades and at a moderate cost.

A great help in rehabilitating the Serbian railways, according to Col. Atwood, is the entire absence of labor unrest in that country.

### Progress Made by Mexican Lines

According to press reports from Houston, Tex., the director general of the National Railways of Mexico, F. Perez, has been in Texas conferring with officers of some of the Texas lines and has succeeded in securing the loan of a number of locomotives for use temporarily on the Mexican government lines to clear up the traffic congestion. W. G. McAdoo, formerly director general of railroads in the United States, has been selected to take charge of the Mexican roads for the time being, according to despatches from Mexico City. Mr. McAdoo is now in Mexico City.

### English Railway Rate Committee Reports

LONDON.  
The Rates Advisory Committee which was appointed by Sir Eric Geddes, minister of transport, for the railways of Great Britain during the fall of 1919, has recently made its report on the general revision of railway rates and charges for the railways of Great Britain in a document of over 60,000 words.

This committee was charged to report on: (1) the principles which should govern the fixing of freight and passenger rates, (2) the classification of merchandise traffic, and (3) the rates to be charged for parcels, perishable merchandise and other traffic conveyed by passenger train.

The committee was made up of a chairman, F. Gore-Browne, king's counsel, nominated by the Lord Chancellor, and of four other members as follows: Walter W. Berry, representing agriculture, nominated by the Board of Trade; W. J. Davis, representing labor, nominated by the Minister of Labor; W. A. Jepson, representing transportation and nominated by the Minister of Transport, and L. A. Martin, representing trade, nominated by the Board of Trade. W. M. Acworth, a prominent railway economist, also served on the committee in a consulting capacity at the suggestion of the Minister of Transport.

Two fundamental principles were recommended by the committee as governing all questions in the establishment of rates. These were: (1) Such charges must in no case be less than the cost to the railway companies of rendering the required services; (2) they must in no case be more than the value of the services to the shippers.

The committee proposed the establishment of a permanent rate tribunal consisting of three permanent paid members giving their whole time to the work, one being a person experienced in railway business, a second being a person experienced in commercial affairs, and the chairman being an experienced lawyer having no connection with railway or trading concerns and not holding judicial office. In addition to this tribunal, the committee recommended two panels, one to be called the shippers' panel, to be nominated by the Ministry of Transport in collusion with such associations, federations and chambers of commerce and agriculture as he shall consider best to represent the shippers' interests; the other panel to be called the railway panel and to be nominated by the Ministry of Transport in consultation with the Railway Companies' Association. These panels are to work with the rate tribunal as the latter sees fit, and in the event of a permanent member of the tribunal, other than the chairman, being unable to attend on any hearing, a member of the panel selected by the minister of transport would be authorized to take his place with all the power and duties of the permanent member.

The functions of the new tribunal would be to classify freight and fix freight rates, except in cases provided for by law, and to fix passenger fares.

The committee recommends the establishment of uniform rates, depending on distance, and the separation of terminal and cartage charges from conveyance rates. At present the rates on various railways for transportation of the same commodities over the same distance vary up to 35 per cent. The law provides for the maintenance of the existing rate structure until February, 1923, and it is not proposed that new rates should be established until that time.

## Equipment and Supplies

### Locomotives

THE TURNBULL CLIFFS FURNACE COMPANY, Cleveland, Ohio, has ordered 2 locomotives from the American Locomotive Company.

### Freight Cars

THE TENNESSEE COAL, IRON & RAILROAD COMPANY has ordered 157, 70-ton gondola cars from the Chickasaw Shipbuilding Company, Birmingham, Ala.

THE TIENTSIN-PUKOW, reported in the *Railway Age* of January 28, as contemplating coming in the market soon for 300 gondola cars, is now in the market for this equipment, also for 200 box cars.

THE LOUISVILLE & NASHVILLE, reported in the *Railway Age* of January 14 as inquiring for 2,700 freight cars, has ordered this equipment as follows: 1,500 box cars, and 100, 40-ton stock cars from the American Car & Foundry Company; 500 box cars from the Mt. Vernon Car Manufacturing Company; 300, 40-ton coke cars, and 300, 55-ton gondola cars from the Chickasaw Shipbuilding Company.

### Passenger Cars

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for a second-hand 200 hp. McKeen or Hall-Scot all steel gasoline motor car, having smoking, passenger and baggage compartments.

### Iron and Steel

THE UNION PACIFIC has ordered 10,000 tons of rails from the Illinois Steel Company.

### Miscellaneous

CARR BROTHERS, INC., 65 Broadway, New York, has placed an order for 450 axles to be used on locomotives and cars on the Mexican railroads.

THE BOARD OF DIRECTORS OF THE UTAH-IDAHO CENTRAL, operating the electric line between Ogden, Utah, and Preston, Idaho, has authorized the issuance of \$300,000 in notes for the purpose of purchasing equipment and rolling stock and making improvements. It is said the greater part of the money will be used in the purchase of freight cars.

### Signaling

THE RICHMOND, FREDERICKSBURG & POTOMAC has contracted with the Union Switch & Signal Company for an electro-pneumatic interlocking, 28 working levers, to be installed at A F block station, near Alexandria, Va., the junction with the Chesapeake & Ohio and the Southern. This apparatus will take the place of a 60-lever mechanical machine. The tower, of brick, is now under construction.

BOOK PAPER FROM SOUTHERN PINE AND RED GUM.—The U. S. Forest Products Laboratory announces that it has demonstrated the feasibility of making high grade book paper from these woods. One cord each of loblolly pine and red gum will make one ton of paper at a cost which will allow of a good margin of profit at prevailing prices. Additional information and samples of paper can be obtained from the Forest Products Laboratory, Madison, Wis., on request.

## Supply Trade News

**J. D. Shaver** has been made sales manager of the Cleveland Crane & Engineering Company of Wickliffe, Ohio.

**W. F. Warden**, president of the Burt Manufacturing Company, Akron, Ohio, died of heart trouble at Deland, Fla., on January 19.

**George E. Pratt**, who is interested in the **Simplex Safety Apparell Company**, Chicago, has been appointed sales engineer of this company.

**John Hyland**, formerly manufacturers' agent at Atlanta, Ga., is now in the sales department of **The Lehon Company**, with headquarters at Chicago.

**L. A. Lenhart**, plant manager of the General American Tank Car Corporation, East Chicago, Ind., has resigned to become vice-president of the Youngstown Steel Car Company, Niles, Ohio.

**James W. White** has joined the sales organization in the New York office of the **Okonite Company**, Passaic, N. J. Mr. White was formerly in the service of the General Railway Signal Company and remained there for four years and was then with the Union Switch & Signal Company for about five years.

**The Black & Decker Manufacturing Company**, Baltimore, Md., will open a new branch office and service station at 75 Fremont street, San Francisco, Cal., on February 1. This office will have jurisdiction of the company's affairs over the entire Pacific Coast territory and will be in charge of **F. A. Johnson**.

**Harry M. Evans**, eastern sales manager of the **Franklin Railway Supply Company, Inc.**, has been elected vice-president of the company, with offices at 30 Church street, New York. Mr. Evans was born at Meadville, Pa., and was educated in the public schools at that place. He began railroad work as a call boy on the Erie, and served in various positions in the mechanical, transportation and traffic departments of that road. He entered the mechanical department of the Franklin Railway Supply Company in October, 1908, as traveling representative. In August, 1916, he became assistant western sales manager, and in January, 1917, was appointed eastern sales manager, which position he was holding at the time of his recent election as noted above.

**J. L. Jackson** has been appointed manager of the West Coast department of the **Mummet Lumber & Tile Company**, with headquarters at Chicago, effective January 20. Previous to his present connection, Mr. Jackson was with the **Duncan Lumber Company**, of Portland, Ore., which company he had joined in 1913, after two years' service with the **Douglas Fir Sales Company**, of Portland.

**Louis B. Rhodes**, southeastern sales representative of the **Vapor Car Heating Company, Inc.**, with headquarters at Richmond, Va., died of heart failure on January 25, at Nash-

ville, Tenn. Mr. Rhodes was formerly master mechanic on the Georgia Southern & Florida and had served as superintendent of motive power of the Virginian. Later he was with the **Ward Equipment Company**. He was in the service of the **Standard Heat & Ventilation Company** at the time when the latter company was consolidated with the **Chicago Car Heating Company** in the organization of the **Vapor Car Heating Company**.

**A. T. Kuehner** has been appointed mechanical engineer of the **Standard Stoker Company, Inc.**, New York. Mr. Kuehner is the inventor of the **Keener journal box** for locomotive drivers and trucks. This device will be manufactured and placed on the market by the **Standard Stoker Company**. Mr. Kuehner, until his recent appointment, was on the staff of **C. A. Gill**, superintendent of motive power of the **Baltimore & Ohio**.

## Obituary

**Edmund M. Blake**, production engineer for **Chas. R. McCormick & Co.**, San Francisco, Cal., and president of the **Railroad Tie Producers Association**, whose death on January 12, at San Francisco, was noted in the *Railway Age* of January 14 (page 216), was born at Taunton, Mass., on August 13, 1874. Mr. Blake was educated at Amherst College and Harvard University, graduating from the former institution in the class of 1897 and completing his studies at the **Lawrence Scientific School** at Harvard in 1899. Upon leaving college, he entered the service of his father, **Percy M. Blake**, a consulting hydraulic engineer, and since this time has had a wide and varied experience,

E. M. Blake

both in this country and abroad. During the first few years of his professional career, he served as a designer with the **Eastern Bridge & Structural Company**, Worcester, Mass., was assistant engineer for the **New York Rapid Transit Commission** and was a designer with the **Brown Hoisting Machinery Company** at Cleveland, Ohio. In 1902, he returned to the employ of **Percy M. Blake** as principal assistant engineer and during the next four years had charge of steam and water piping for a number of waterworks systems. From 1906 to 1908, he was in private practice in Boston, Mass., and had charge of the design and installation of waterworks and hydraulic systems at Wareham, Wrenham, Westford and at Provincetown, Mass. In 1909, after a year's service as manager of the **Idaho Irrigation Company**, he entered private practice in Boise, Idaho, which practice he left two years later to become engineer in charge of the improvement of the **Neponset river**, undertaken by the **Massachusetts State Department of Health**. In May, 1916, he entered the employ of the **Holbrook, Cabot & Rollins Corporation**, as engineer on drydock work at South Boston, Mass. From October, 1917, to December, 1918, when he became associated as production engineer with **Chas. R. McCormick & Co.**, he fulfilled a number of war commissions with credit to himself. Mr. Blake, in 1905, was sent abroad by the **United States Department of Agriculture** to investigate and report on drainage and irrigation in Italy. While abroad he also inspected and reported on the **Paris subways** and the **London tunnels**. At the time of his death he was president of the **National Association of Railroad Tie Producers**, his death occurring shortly before the opening of the convention of this association at San Francisco, to which he had given so much of his time.

Harry M. Evans

### S. W. Dudley Leaves Westinghouse Organization

S. W. Dudley, widely known authority on matters pertaining to train and traction control, retired on February 1 as chief engineer of the Westinghouse Air Brake Company, Wilmerding, Pa., to accept a professorship of mechanical engineering at Yale University.

S. W. Dudley

Mr. Dudley has been associated with the air brake company for 17 years. Starting as a special apprentice in 1903, he spent the summer of that year and the next in the plant, returning to school to complete a postgraduate course during the other seasons. When he established permanent connections with the organization in 1905, he was attached to the office of the late Walter V. Turner, then mechanical engineer of the Westinghouse Air Brake Company. Here he was assigned as a member of the party in charge of the first road tests of the Type R triple valve between Pittsburgh and Fairhance, on the Pennsylvania Railroad, later acting as engineer's assistant during a series of important demonstrations of the ET equipment and the Type R passenger triple valve on the New York Central. He was charged with the responsibility of compiling much of the data relating to these demonstrations, which resulted in the development of the high emergency retained features which were added to the Type R triple valve to complete the Type L, later adopted for the motor cars of the New York Central's electrified zone.

In 1906, Mr. Dudley was assigned to the New York office to follow the installation, operation and maintenance of new air brake equipment that was placed in service on electric locomotives and motor cars during the inauguration of the New York Central's terminal electrification. A year later he was called back to Wilmerding to take charge of the air brake publicity department, where he remained until 1909, when he was appointed assistant mechanical engineer. In 1910 he became assistant chief engineer (in charge of operation), and in 1914 he was advanced to the position of chief engineer, which title he retained up to the time of his resignation.

Mr. Dudley graduated from Yale University, to which he now returns, with the class of 1900, completing thereafter a post-graduate course which qualified him for his M.E. degree.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company will build a complete ice plant at Hobart Station, Cal., which will cost approximately \$500,000 and will include a 500-ft. icing dock, an office building, and a cooling tower. The company also contemplates rearrangements of its facilities at Calwa, Cal., to make space for an addition to the existing ice plant, which will cost \$90,000. The Santa Fe will install a 120-ft. turntable at Clovis, N. M., at a cost of \$46,000.

**ATCHISON, TOPEKA & SANTA FE.**—This company contemplates an 11-stall addition to its roundhouse at Newton, Kan.

**ATLANTIC COAST LINE.**—This company will build a reinforced concrete bridge including a draw span at Moore Haven, Fla. The work will be done by company forces.

**CAROLINA, CLINCHFIELD & OHIO.**—This company will make improvements and additions to its passenger station at Johnson City, Tenn., at a cost of about \$7,500. The work will be handled by company forces.

**CHICAGO, BURLINGTON & QUINCY.**—This company is accepting bids for the construction of a hotel and restaurant at Cody, Wyo.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.**—This company is improving its yard facilities at Jeffersonville, Ind., by extending 7 yard tracks at a cost of approximately \$143,000. The company contemplates other terminal improvements at Jeffersonville in the future.

**GREAT NORTHERN.**—This company contemplates the construction of car shops at Minot, N. D.

**MISSOURI, KANSAS & TEXAS.**—Proposals have been requested for the construction of a reinforced concrete inbound freight-house, 50 ft. by 600 ft., with second-story office, 50 ft. by 100 ft., and platform, 8 ft. by 600 ft. and 58 ft. by 100 ft., replacing the present brick and frame station at Jefferson street and Ross avenue, Dallas, Tex.

**WESTERN MARYLAND.**—This company has awarded a contract to the Wellman Seaver Morgan Company, Cleveland, Ohio, for the erection of a ship coal handling device of steel construction at Port Covington, Baltimore, Md.

THE AMERICAN ELECTRIC RAILWAY ASSOCIATION, in a report on the condition of the electric railway industry throughout the country for the past year finds indications of a gradual and steady approach to a stable basis. Regulatory bodies, recognizing that fair rates of return are essential to the maintenance of good service, have steadily ordered relief throughout the country; and, also, they recognize that rehabilitation of lines will be a slow process and that at least the present advanced rates must be maintained for some time even if falling costs, anticipated but not realized as yet, should come. Badly needed improvements have been deferred by virtually every company.

The report shows that 548 cities, representing more than 90 per cent of the riding population in cities, are paying fares ranging from five cents with a one-cent charge for transfers, to a flat rate of ten cents. One hundred and twelve cities pay a ten-cent fare. Electric railway receiverships are not so numerous. There were only 16 in 1920, representing a total capital stock of \$25,313,655, as compared with 48 receiverships, representing a capital stock of \$21,259,354, in 1919. During the year 450 miles of track were dismantled and 308 miles of track abandoned.

From every part of the United States the reports show not only regulatory bodies but car riders generally as taking the greatest interest in the restoration of companies to a healthy state. The inclination to prevent companies from receiving sufficient return to maintain good service is believed to be confined to a small number of persons.

## Railway Financial News

**ALABAMA & VICKSBURG.**—This company has applied to the Interstate Commerce Commission for authority to issue notes to the United States for loans from the revolving fund, for the refunding of part of its mortgage debt and for the purchase of locomotives. It is proposed to give notes to the government for \$1,394,000 for a loan and other notes to the amount of \$542,900, and to take up the entire issue of \$1,936,000 of mortgage bonds, exchanging the \$542,900 of notes for a part of the outstanding bonds. Authority is also asked for another note to the United States for a loan of \$170,000 for the purchase of locomotives, and it is proposed to issue \$4,000,000 of first mortgage bonds under a new mortgage which will be used as collateral for the various notes. The bonds will bear interest at 6 per cent, dated April 1, 1921, and maturing April 1, 1951.

**ALABAMA, TENNESSEE & NORTHERN.**—The Interstate Commerce Commission has approved a loan of \$90,000 to this company to aid it in meeting its maturing indebtedness.

**ATCHISON, TOPEKA & SANTA FE.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing it to undertake the operation of the leased line of the Buffalo & Northwestern.

**BALTIMORE & OHIO.**—This company has been authorized by the Interstate Commerce Commission to nominally issue and hold in its treasury \$2,744,000 of its refunding and general mortgage bonds, series B. In the same order authority was granted to subsidiaries of the Baltimore & Ohio to issue and deliver their bonds to its nominees in payment for additions, improvements and betterments to the amount of \$1,860,000.

This company has applied to the Interstate Commerce Commission for authority to assume rental payments amounting to \$617,769 under an equipment trust agreement of December 1, 1917, between the Seaboard Air Line and the Commercial Trust Company, trustee.

**BIRMINGHAM, SELMA & MOBILE.**—This company has applied to the Interstate Commerce Commission for a loan of \$25,000 for 10 years to assist it in completing an extension of its line.

**BUFFALO, ROCHESTER & PITTSBURGH.**—This company has declared a semi-annual dividend of \$3 on the common stock, and the regular semi-annual dividend of \$3 on the preferred stock, both payable February 15 to stock of record February 10. Previously the company had been paying dividends of \$2 a share on the common semi-annually.

**CENTRAL OF GEORGIA.**—This company has been authorized by the Interstate Commerce Commission to enter into a proposed equipment trust agreement for the issuance of \$650,000 of equipment trust certificates, for the purchase of 7 locomotives, 13 passenger cars and 4 express cars at an estimated total cost of \$1,088,835.

**CENTRAL & GULF.**—This company has applied to the Interstate Commerce Commission for a loan of \$500,000 for 15 years to assist the company in the purchase of equipment and in completing an extension of 30 miles to Pine Bluff, Ark.

**CENTRAL WISCONSIN.**—The Interstate Commerce Commission has issued a certificate authorizing this company to acquire and operate the railroad owned by the Fairchild & Northeastern, extending from Cleghorn to Owen, Wis., 65 miles.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.**—The Interstate Commerce Commission has approved a loan of \$115,000 to this company to aid the company in providing itself with additional motive power consisting of 5 Mikado freight locomotives at a total estimated cost of about \$340,000. The carrier itself is required to finance about \$225,000 to meet the loan of the government.

**CHICAGO, MILWAUKEE & ST. PAUL.**—Samuel McRoberts has been elected a director to succeed John D. Ryan, who has resigned because of Section 10 of the Clayton Act.

**CHESAPEAKE & OHIO.**—This company has been authorized by the Interstate Commerce Commission to issue \$50,225,000 of common capital stock from time to time in exchange for its 5 per cent convertible 30-year secured gold bonds at certain rates specified in the order.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.**—This company has been authorized by the Interstate Commerce Commission to guarantee a promissory note of the Louisville & Jeffersonville Bridge & Railroad Company for \$108,000 to the United States government.

**DENVER & RIO GRANDE.**—Affidavits alleging that fraudulent transactions by interlocking directorates led to the receivership sale of this road were filed by J. L. Webster, an attorney for the stockholders' committee, on January 28, at St. Louis, Mo., with Federal Judges Walter H. Sanborn and Robert E. Lewis. The court gave the defendants in the suit 30 days in which to file a counter petition. Mr. Webster asserted that the physical property of the road was valued at \$225,000,000, although it was sold for \$5,000,000, and the securities held by the road were worth \$9,722,000 alone. Mr. Webster announced that after the briefs had been filed he would institute proceedings at Denver to have the sale set aside.

**ELBERTON & EASTERN.**—This company has applied to the Interstate Commerce Commission for authority to issue \$12,050 of first mortgage 5 per cent gold bonds held in its treasury.

**FLEMINGSBURG & NORTHERN.**—This company has applied to the Interstate Commerce Commission for a loan from the revolving fund of \$10,000 for three years to enable it to retire floating indebtedness.

**FORT SMITH & WESTERN RAILWAY.**—This company has applied to the Interstate Commerce Commission for authority to issue 62,400 shares of a total of 70,000 shares authorized, of no par value, common stock, \$1,500,000 of a total authorized issue of \$3,500,000 of 7 per cent first mortgage bonds and \$3,744,000 of a total authorized issue of \$10,000,000 of 6 per cent second mortgage bonds, in connection with its reorganization of the Fort Smith & Western Railroad. The new securities are to be exchanged for \$7,000,000 of first mortgage bonds of the railroad company.

**GEORGIA NORTHERN.**—This company has applied to the Interstate Commerce Commission for a loan of \$200,000 for 15 years to assist it in the purchase of rolling stock.

**GREENE COUNTY.**—This company has applied to the Interstate Commerce Commission for a loan of \$60,000 from the revolving fund to retire various items of indebtedness.

**HOCKING VALLEY.**—The Interstate Commerce Commission has approved a loan of \$1,665,000 to this company to enable the company to provide itself with additions and betterments to equipment and to way and structures.

**ILLINOIS CENTRAL.**—This company has applied to the Interstate Commerce Commission for authority to issue \$3,564,000 of equipment trust certificates, series G, on the Philadelphia plan, to finance 60 per cent of the cost of 75 locomotives. It is proposed to sell the certificates to Kuhn, Loeb & Co. at 96 per cent of par or on a basis of 7.15 per cent.

**INDIANA HARBOR BELT.**—The Interstate Commerce Commission has issued an order extending the time within which this company was authorized to issue \$2,200,000 of promissory notes from 60 days to six months after November 6, 1920.

**INTERNATIONAL & GREAT NORTHERN.**—At a meeting of the note-holders' protective committee on January 21, Frederick Strauss, vice-chairman, was elected chairman to succeed Alexander J. Hemphill, and Winslow S. Pierce was elected a member of the committee.

**MARION & RYE VALLEY.**—This company has been authorized by the Interstate Commerce Commission to guarantee a note of the Virginia Southern to the Secretary of the Treasury for \$38,000.

**NEW YORK CENTRAL.**—A. T. Hardin, vice-president in charge of operation, has been elected a director to succeed William K. Vanderbilt, deceased.

**NORFOLK & WESTERN.**—The Interstate Commerce Commission has issued a certificate authorizing the acquisition and operation by this company of feeder lines owned by the Tug River & Kentucky and the Williamson & Pond Creek.

**NORTHERN PACIFIC.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing it to acquire the property of the Billings & Central Montana.

**NORTHERN PACIFIC.**—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon a branch line, 1.8 miles, with 1.75 miles of spur track, in Richard County, N. D.

**NORTHERN PACIFIC.**—Frank L. Polk, formerly Acting Secretary of State, E. M. Willis and A. H. Gillard, have been elected directors succeeding J. P. Morgan, Lewis Cass Ledyard and Payne Whitney, who resigned in compliance with Section 10 of the Clayton Act.

**OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.**—This company has been authorized by the Interstate Commerce Commission to issue first and refunding mortgage bonds payable in dollars in exchange for not exceeding £3,782,400 of similar bonds which may be surrendered by the holders as provided in the company's first and refunding mortgage dated January 3, 1911.

**PANHANDLE & SANTA FE.**—This company has applied to the Interstate Commerce Commission for a certificate to operate the leased line of the North Texas & Santa Fe.

**PENNSYLVANIA.**—Kuhn, Loeb & Co. and other bankers have sold an issue of \$60,000,000, 15-year, 6½ per cent bonds, due February 1, 1936. The bonds were sold at 99¼ and interest, to yield about 6.58. They are to be secured by \$60,000,000 Pennsylvania Railroad general mortgage 6 per cent gold bonds, series "C," due April 1, 1970, and \$6,000,000 Philadelphia, Baltimore & Washington Railroad general mortgage 6 per cent gold bonds, series "A," due April 1, 1960.

**PEORIA & PEKIN UNION.**—The Interstate Commerce Commission has approved a loan of \$1,799,000 to this company, for the purpose of aiding the company in meeting the maturity, February 1, 1921, of its bonded indebtedness in an aggregate principal amount of \$2,994,000. The carrier itself is required to finance \$1,195,000 to meet the loan of the government. The company has also been authorized to extend the time of maturity of its first and second mortgage bonds for five years from February 1, 1921, to increase the interest rate on the first mortgage bonds from 6 per cent to 7 per cent and on the second mortgage bonds from 4½ to 7 per cent.

The Lake Erie & Western has applied to the Interstate Commerce Commission for authority to guarantee a 6 per cent 5-year promissory note of the Peoria & Pekin Union for \$181,000. The Illinois Central has similarly applied for authority to guarantee 25 per cent of a proposed loan of \$1,861,000 to the Peoria & Pekin Union, and the Peoria & Eastern for authority to guarantee a 6 per cent, 5-year promissory note of the Peoria & Pekin Union for \$226,250. The notes are to the United States Government.

**PHILADELPHIA & READING.**—This company has applied to the Interstate Commerce Commission for a loan of \$1,185,625 for 15 years, to enable the company to pay approximately 20 per cent cash for the purchase of 25 consolidation freight locomotives at \$75,450 each, 5 switching locomotives at \$36,000, 5 passenger locomotives at \$61,000. The company proposes to issue or join in the issue of equipment trust certificates for the balance, 50 per cent of the amount of the certificates to be applied as security for the loan and the balance to be sold on the best available terms.

**PORTLAND, ASTORIA & PACIFIC.**—The Interstate Commerce Commission has issued a certificate authorizing the acquisition and operation by this company of the line owned by the United Railways Company from Wilkesboro to Linnton, Oregon, 18.64 miles, and another certificate authorizing the United Railways Company to abandon operation of the line.

**RARITAN RIVER.**—This company has applied to the Interstate Commerce Commission for authority to issue \$100,000 of promissory

notes at 6 per cent to reimburse the treasury for money expended out of income for investment.

**RICHMOND TERMINAL.**—This company has been authorized by the Interstate Commerce Commission to issue 35 promissory notes aggregating \$3,100,000, with interest at 6 per cent. The notes are payable to the Richmond, Fredericksburg & Potomac and the Atlantic Coast Line.

**UNION PACIFIC.**—This company has been authorized by the Interstate Commerce Commission to issue first lien and refunding mortgage bonds payable in dollars in exchange for not exceeding \$771,600 of similar bonds which may be surrendered by the holders as provided in the company's mortgage dated June 1, 1908.

**VALDOSTA, MOULTRIE & WESTERN.**—Special Master J. W. Talbert will offer this road for sale on February 22 at Valdosta, Ga., at the upset price of \$165,000.

**VIRGINIA SOUTHERN.**—The Interstate Commerce Commission has approved a loan of \$38,000 to this company to aid the carrier in meeting its maturing indebtedness. The carrier itself is required to finance \$37,000 to meet the loan of the government.

The Virginia Southern has applied to the Interstate Commerce Commission for a loan of \$75,000 for 10 years to enable it to take up a bank loan.

**WESTERN ALLEGHENY.**—This company has applied to the Interstate Commerce Commission for authority to issue demand notes to the amount of \$100,000.

**WESTERN MARYLAND.**—This company has been authorized by the Interstate Commerce Commission to issue \$225,000 of 6 per cent marine equipment gold notes under a proposed agreement of conditional sale for the purchase of a car float and to sell the notes at not less than par and accrued interest.

This company has applied to the Interstate Commerce Commission for authority to issue \$3,000,000 of equipment gold notes, consisting of \$1,500,000 of a preferred series at 7 per cent which have been sold at par and \$1,500,000 of a junior series at 6 per cent, which it is proposed to pledge as collateral with the Secretary of the Treasury. The notes are for the purchase of 40 consolidation freight locomotives, and they are to be paid off at the rate of \$100,000 a year for each series from 1922 to 1936.

**WICHITA FALLS & NORTHWESTERN.**—This company has applied to the Interstate Commerce Commission for an order authorizing the issue of a series of 10-year, 6 per cent receivers' certificates, to be pledged as collateral for the amounts found to be due the director general of railroads.

**WISCONSIN & NORTHERN.**—This company has been authorized by the Interstate Commerce Commission to issue \$49,400 of first mortgage 6 per cent gold bonds and to sell them at not less than 90 per cent of par. The company had applied for authority to sell them at not less than 75.

## Dividends Declared

**BUFFALO, ROCHESTER & PITTSBURGH.**—Common, \$3 semi-annually preferred, \$3, semi-annually; both payable February 15 to holders of record February 10.

**DELAWARE & HUDSON.**—2¼ per cent, quarterly, payable March 21 to holders of record February 26.

**ILLINOIS CENTRAL.**—1¾ per cent, quarterly, payable March 1 to holders of record February 4.

**NORFOLK & WESTERN.**—Common, 1¾ per cent, quarterly, payable March 19 to holders of record February 28.

**PENNSYLVANIA.**—1½ per cent, quarterly, payable February 28 to holders of record February 1.

THE ILLINOIS CENTRAL, by advertising in the newspapers throughout the territory served by its lines, is calling attention to the highway crossing problem. The advertisement states that it is the "safe" crossing which is the most dangerous; and that electric bells, watchmen, and signs at crossings should warn the driver to be constantly on the alert. During the four years ended December 31, 1920, 4,350 persons were killed and 12,750 injured in automobile grade-crossing accidents in the United States, and for the same period 158 were killed and 659 injured in that class of accidents on the Illinois Central System.

## Railway Officers

### Executive

**C. D. Mackay**, whose appointment as vice-president of the High Point, Randleman, Asheboro & Southern, Yadkin, Carolina & Northwestern, Tallulah Falls, Hartwell, Danville & Western and Blue Ridge (all subsidiaries of the Southern), was announced in the *Railway Age* of January 28 (page 309), was born September 22, 1884, at Durham, N. C. He was educated in the public schools and entered railway service in 1902 as a clerk in the local freight office of the Southern at Raleigh, N. C. From March to December, 1903, he served as a stenographer in the office of the master mechanic of the Seaboard Air Line at Raleigh. On the latter date he became a clerk in the office of the first vice-president of the Southern. From September, 1908, to April, 1915, he was secretary to the first vice-president. On the latter date he was made secretary of the Southern's subsidiary companies. In 1919 he was promoted to assistant to vice-president of those companies, and was serving in that capacity at the time of his recent promotion.

### Financial, Legal and Accounting

**L. M. Bradish** has been appointed assistant general auditor in charge of receipts of the Pullman Company. **H. R. Holmgren** has been appointed assistant general auditor. **B. C. H. Olson** has been appointed auditor of disbursements and **H. J. England** auditor of valuation. These appointments were effective January 1.

**William H. Burns**, general auditor of the Chicago, Rock Island & Pacific, whose election to succeed Frank Nay as head of the accounting department of the Rock Island, was announced in the *Railway Age* of January 28 (page 309), was born in Chicago on April 23, 1865. He entered railway service in 1880 as clerk to the storekeeper on the Rock Island, but left the service of the company shortly to complete his education. He returned to the employment of the Rock Island in 1882, being engaged in clerical work under the roadmaster. In January, 1883, he was transferred to the office of the freight auditor where he served until June, 1898. On the latter date he was promoted to freight auditor, a position which he held until July, 1902, when he was made auditor of freight traffic. In October, 1905, another promotion made him assistant general auditor, and in 1909 he became general auditor of the Rock Island. During the period of federal control, Mr. Burns was federal auditor, resuming his former duties as general auditor when government control ceased. Mr. Burns retains his former title of general auditor, but has been given also the duties of the former controller.

**W. H. Anderson** has been appointed paymaster on the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, succeeding Garner Ranney, who has been assigned to other duties. **W. W. Scannel** has been appointed auditor of station accounts, succeeding Mr. Anderson. **E. F. Hoy** has been appointed car accountant, succeeding Mr. Scannel, and **J. Dewar** has been appointed assistant car accountant. The appointments and changes are effective January 15.

W. H. Burns

### Operating

**H. Hulatt**, consulting manager of telegraphs of the Grand Trunk, has been appointed manager of telegraphs, Western Lines, with headquarters at Montreal, effective February 1. The position of consulting manager of telegraphs has been abolished.

**H. M. Gargan**, whose promotion to superintendent of the Champlain division of the Delaware & Hudson was announced in the *Railway Age* of January 28 (page 309), was born December 12, 1886, in New York City. He attended the public schools in that city and Fordham Preparatory School and was graduated from Fordham University in 1909 with the degree of bachelor of science. Mr. Gargan first entered railway service on January 1, 1914, as a yard clerk at Wilkes-Barre, Pa. On March 1 of the same year he was promoted to chief clerk to the general yardmaster and served in that capacity until April 15, when he was promoted to assistant night yardmaster. On June 1 he became night yardmaster of the Hudson yard. On April 15, 1915, he was promoted to general yardmaster of the same yard and on March 1, 1916, was transferred in the same capacity to Wilkes-Barre. He was promoted to assistant trainmaster of the Susquehanna division on May 1, 1916, and became trainmaster of the same division on May 15 of the following year. On May 15, 1920, he was detailed to the office of the general manager without change of title. He was serving in that capacity at the time of his recent promotion.

### Traffic

**D. F. Lindsay** has been appointed general western passenger agent of the Lehigh Valley, with headquarters at Chicago, effective February 1, succeeding A. B. Hill, deceased.

**G. Williams** has been appointed general freight agent of the Denver & Rio Grande, with headquarters at Denver, Colo., succeeding W. M. Lampton whose death was announced in the *Railway Age* of December 31 (page 1184).

**C. D. Chancellor**, whose promotion to assistant general freight agent of the Central of Georgia was announced in the *Railway Age* of January 21 (page 263), was born at Okolona, Miss., on December 11, 1884, and was educated in the public schools. He entered the employ of the Central of Georgia in 1897 at the age of 12, as a mimeographer in the freight traffic department. He served subsequently in many positions throughout the department, including the following: correspondence mail clerk, tariff mail clerk, tariff index clerk, correspondence file clerk, quotation clerk, rate clerk, executive rate clerk and chief clerk of the rate department. He was serving as chief clerk at the time of his recent promotion.

### Engineering, Maintenance of Way and Signaling

**C. S. Knapp** has been appointed engineer of valuation of the Pullman Company, effective January 1.

**Paul Sterling**, maintenance engineer of the New York, New Haven & Hartford, Lines West, has been appointed assistant to engineer, maintenance of way with headquarters at New Haven, Conn., effective February 1. **R. L. Pearson**, division engineer of the New Haven and New London divisions, has succeeded Mr. Sterling as maintenance engineer, Lines West. **E. E. Oviatt**, division engineer of the Danbury division and the Central New England, has succeeded Mr. Pearson and **C. D. Perkins** has succeeded Mr. Oviatt.

### Obituary

**W. J. Moule**, assistant comptroller of the Canadian Pacific, died January 28, at Montreal.

**James Buckley**, general eastern passenger agent of the Erie, died at New York on January 28.

**H. G. Haugan**, at one time controller of the Chicago, Milwaukee & St. Paul, died on January 31, at Pasadena, Cal. Mr. Haugan retired from active railroad service 10 years ago after 40 consecutive years of service with the St. Paul.

## Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

Autogenous welders receive five cents an hour above the standard rate paid machinists at the point employed. This is quite fitting and proper as autogenous welding is work that requires special knowledge and special skill.

### A Bonus for Quality

Unfortunately it is a flat wage rate and unfortunately, too, speed in welding is a desirable factor. These two facts are apt to cause trouble, as the quality of the weld is of primary importance. Because of the five cents an hour higher wage and because he has the privilege, a machinist may decide that he wants to do autogenous welding even though he has had no previous experience in this line of work and may not be a man who is capable of becoming a first-class welder. This, of course, means a lot of time spent in training and may mean many bad welds with possibly a failure that will give all autogenous welding a black eye. Speed in welding is, of course, desirable, but it should never be obtained at the sacrifice of quality. Conscientious and skillful work coupled with careful and intelligent supervision provides the only sure road to successful welding. Generally speaking, it is not difficult to tell the difference between a good and a bad weld and payment for welding should be in proportion to the ability of the operator and the quality of the work he turns out. A five cent higher basic rate of pay can not be called a bonus, but if a bonus were given it ought to be on a quality rather than a quantity basis. Companies outside of railroads are considering this form of payment, and in all probability it will eventually find its way into railroad practice.

The most important work of the trainmaster at the present time (on many roads) is the mastering of trains. Included in his duties, now as at all times, he

### The Trainmaster's Most Useful Function

finds a great variety of functions, and, of course, no useful duty is to be neglected without formulating very convincing reasons for such neglect; but with the shadow of a lay-off, because of lack of work, which now hovers over many brakemen (and over conductors and other trainmen as well), the propensity to waste time at the company's expense is observable with increasing frequency. Unless your freight train crews are actuated *and known to be actuated* by the highest sense of honor, you may expect them to prolong in any and every possible way the hours for which they will receive wages. Pay-and-one-half for overtime is a plum that does not grow on every bush, and the plums must be harvested while they are within reach. On one division of a prominent road, last month, a new (and temporary) trainmaster reduced train operating expenses for a month at the rate of about fifty dollars a day, simply by seeing that a lot of average trainmen stepped out of the "average" class and did as well as they knew how. The words which we have italicized are intended as a suggestion to the preoccupied superintendent who, in connection with trainmen's ambition to do good work, takes too much for granted. Those words cannot safely be predicated of the average trainman. The idea of a temporary trainmaster is also a good suggestion. You need one or more additional

regular trainmasters, without doubt. There are not many divisions where this is not true. But, feeling doubtful about your ability to show in definite figures the profitableness of another man every month in the year, you hesitate to ask for an appropriation. Why not pick out a good man to do some of this work, just for one or two months?

David Van Alstyne, who recently returned from a 17 months' trip around the world in which he gave special attention to railway and railway supply conditions, briefly summed up his impressions as to the possibilities of the sale of American railway supplies abroad in an address before the executive committee of the Railway Business Association. This we are printing elsewhere in this issue. Mr. Van Alstyne has the faculty of "getting to the bottom of things" and of subjecting problems which he tackles to a most thorough and exhaustive analysis. He is not likely to be carried away by fads and fancies. The suggestions which he makes as to how American railway supply manufacturers can increase their sales and prestige abroad are therefore worthy of the most careful consideration. American railway supply manufacturers generally have not specialized upon selling their wares abroad and do not recognize the amount of painstaking work which must be done to break down prejudices and to get the foreigner fully to appreciate the necessity of using the latest and best appliances and equipment. To do this properly will require a highly specialized organization such as comparatively few, if any, manufacturers can afford to maintain. Obviously, therefore, it will be advisable for the manufacturers as a group to pool their interests in creating a market for American railway supplies and in seeing that the equipment when furnished is rightly used.

Men employed in railroad repair shops are a factor, and probably the most important factor, in shop production. It

### The Morale of Shop Forces

is true that without adequate machinery and proper routing methods shop output is greatly limited, but without men proud of their work and earnestly striving for results, the possibilities of economy in shop operation *will never be realized*. Present shop efficiency on a man-hour basis is too low and recent reductions in shop forces make it doubly important to increase by every possible means the morale of men now employed. Careful consideration of local grievances, fancied or real, at each shop and the prompt removal of just cause for complaint will do much to inspire confidence in the fairness of the managements. In fact, any mutual exchange of viewpoints between managements and men, followed by the fair settlement of a disputed question, is bound to have beneficial effects. In a larger way, however, the morale of shop forces can never be increased satisfactorily under present conditions and as long as the national agreements are in effect. These agreements, by maintaining seniority rights and a standard guaranteed daily wage irrespective of output, offer impassable obstacles to increasing the morale of shop

forces. Seniority rights prevent a foreman from showing partiality in advancing men under his supervision, but in practice few foremen need such a check on their authority. In any case, seniority rules have a most deadening effect on the efficiency of workmen. How can a man be proud of his work or take unusual interest in it when that interest fails to secure his advancement over a "don't care" neighbor with a few months' longer service? It is absolutely essential that the proper incentive be provided to secure even an average shop output. A man cannot be expected to work earnestly and enthusiastically with an eye always open to short cuts and easier ways of accomplishing results when his extra effort brings no greater financial reward than does the indifferent, careless attitude of a fellow workman. An important step toward increasing the morale of railroad shop forces will be taken at Chicago when the Railroad Labor Board declares the national agreements void.

Reports from Mexico are increasingly encouraging. By the payment of claims for American cars lost during the years of revolution, the National Railways of Mexico had restored to them on January 1—after a period of two years of suspension—the interchange privileges of the American Railway Association under the per diem rules. Last week news came of the completion of negotiations by the Mexican government and American bankers for a loan of \$5,000,000 to be used for the purchase of supplies and equipment, especially locomotives, to rehabilitate the National Railways. The announcement is now made that Francisco Perez, the director general of the National Railways, who for the past few weeks has been visiting the executive offices of some of our southwestern roads, has made arrangements for the leasing of 10 locomotives from the St. Louis-Southwestern, 9 from the Illinois Central, 8 from the Missouri, Kansas & Texas and 3 from the Gulf Coast Lines. In addition various companies have leased to the National Railways 200 tank cars of 10,000 gal. capacity. This borrowed equipment, it is understood, will be used principally in the northern part of the country to relieve the widespread congestion of traffic in that section. The borrowing of this equipment by the National Railways is encouraging, because, with the other forward steps taken by the administration, it gives promise of an early return of normal transportation conditions in Mexico, and is also indicative of the renewed co-operation of the Mexican lines with the carriers on this side of the border—a mutual agreement which will without doubt benefit all parties concerned.

### Good News from Mexico

Under present conditions, when serviceable engines are being stored on nearly all roads, the operating department is afforded the opportunity for exercising some discrimination in the selection of power. When every engine is needed for service, it is sometimes impossible to apply the principles of efficient operation in assigning locomotives but this is one handicap that does not exist now. Nevertheless, there are numerous cases where the power that would do the work most economically is not used and often it seems that the selection of engines to be put in white lead is based on considerations of convenience rather than economy. Perhaps some of the mistakes are due to a misconception regarding the efficient range of operation of the same locomotive. The opinion seems to be quite generally held that locomotives are most efficient at the maximum rates and the use of heavier engines on trains of less than the full tonnage is wasteful. Working on this

### What Engines Should Be Stored

the need for more shops, better shop tools, more housing capacity and better facilities at engine terminals, as well as greater development of other transportation facilities that affect the amount of service which may be obtained from a locomotive in a given time, in a general way has been recognized by railway officers for some time. This recognition has not, however, been taken a sufficiently practical form. Measures for increasing the carrying capacity of the roads have been confined largely to increasing the supply and capacity of rolling equipment. In an article appearing in this issue facts are presented which show a marked and consistent decrease in the number of trains handled per year by the average freight locomotive during the decade just prior to the war. Furthermore, it appears that all the emergency measures taken as a result of the war stress have only been successful in holding the 1913 average during the years of heaviest traffic since that time, and then at the expense of a considerable accumulation of deferred maintenance. In considering these facts, it should be clearly understood at the outset that they are in no sense an indictment of the efficiency with which the existing transportation plants have been operated. Indeed, the facts presented show a marked improvement in operating efficiency. Not only have the tons of revenue freight per train increased steadily, but they have increased at a greater rate than the potential hauling capacity of the locomotive unit. What the facts do point to, however, is a material waste of capital as a result of the present unbalanced development of railroad facilities, and they suggest the question, How shall the expenditure of new capital be balanced so that the greatest average return may be obtained from every dollar invested? This is a question which ought to be more carefully considered than it generally has been during the past 20 years. Its more careful consideration undoubtedly would result in greater provision being made for getting the best and greatest possible service for that all-important part of the railway plant, the locomotive.

large engines are often stored and lighter power kept in service; yet, in most cases, this is not conducive to economy. The most economical rating, considering all items of expense, is in general about 10 or 15 per cent less than the maximum that the engine can haul. As between different types of locomotives, the most powerful will obviously produce the lowest cost of wages per ton-mile if hauling full tonnage. Therefore, so long as the traffic is sufficient to permit of loading the heaviest power to its normal rating, this power should be kept in service. However, in case the full tonnage cannot be maintained, would it be economical to substitute the lighter engine? If the tonnage per train is the same in either case, there would be no difference in the wage cost and the decision would depend on the relative cost of fuel and repairs. With modern locomotives, the fuel consumption on the basis of horsepower is lowest at moderate rates of work. A superheated steam locomotive that consumes about 4 lb. per horsepower hour at maximum power uses only about 2½ lb. when working at half the maximum rate. This saving of 37 per cent would be reduced in actual service by an increase in the proportion of standby losses. But it is evident that the low rates of working result in marked economy in the use of fuel. Repairs also are minimized when the engine is not forced and the expense of upkeep would probably be reduced sufficiently to prevent any increase in the cost per ton-mile. The result would be that the large locomotive hauling less than full load would be more economical than the smaller engine loaded to its full capacity.

### Time to Restore the Balance

The need for more shops, better shop tools, more housing capacity and better facilities at engine terminals, as well as greater development of other transportation facilities that affect the amount of service which may be obtained from a locomotive in a given time, in a general way has been recognized by railway officers for some time. This recognition has not, however, been taken a sufficiently practical form. Measures for increasing the carrying capacity of the roads have been confined largely to increasing the supply and capacity of rolling equipment. In an article appearing in this issue facts are presented which show a marked and consistent decrease in the number of trains handled per year by the average freight locomotive during the decade just prior to the war. Furthermore, it appears that all the emergency measures taken as a result of the war stress have only been successful in holding the 1913 average during the years of heaviest traffic since that time, and then at the expense of a considerable accumulation of deferred maintenance. In considering these facts, it should be clearly understood at the outset that they are in no sense an indictment of the efficiency with which the existing transportation plants have been operated. Indeed, the facts presented show a marked improvement in operating efficiency. Not only have the tons of revenue freight per train increased steadily, but they have increased at a greater rate than the potential hauling capacity of the locomotive unit. What the facts do point to, however, is a material waste of capital as a result of the present unbalanced development of railroad facilities, and they suggest the question, How shall the expenditure of new capital be balanced so that the greatest average return may be obtained from every dollar invested? This is a question which ought to be more carefully considered than it generally has been during the past 20 years. Its more careful consideration undoubtedly would result in greater provision being made for getting the best and greatest possible service for that all-important part of the railway plant, the locomotive.

One of the foremost objections to the National Agreement with the maintenance of way forces lies in the increased difficulty which this agreement imposes on the already difficult problem of supplying enough good track foremen. Of the class of men that has been available for track labor in recent years, there is only a relatively small proportion which offers any promise of qualifying as foremen. Therefore, it is highly desirable that the supervisory forces be afforded every possible facility in the selection of the most likely material. There is a saying among roadmasters that any track man who cannot qualify as an assistant foreman or even foreman after a year's experience as a track laborer need never be considered at any later time. This opinion is borne out by a study of the railway careers of hundreds of track supervisors and roadmasters. While many of them spent 15 to 20 years in the capacity of section and extra gang foremen before they were promoted to the supervisory position, few of them spent very many years as laborers. Recognizing the truth of this and knowing that proper material for foremen is not commonly attracted to the gangs for the mere opportunity to work as laborers, the supervisory officers have not restricted their search for foremen to the labor forces, but have looked for likely material wherever they could find it. Many of them set up what were in effect systems of apprenticeship for foremen by inducing the prospects to enter one of their gangs with a virtual promise of a trial as foreman after a certain period of training. At the last convention of the Roadmasters' Association, one of the committees submitted recommendations for an elaboration of this idea as the most feasible solution of the problem. Under the National Agreement all such plans bear the stamp of irregularity and a rigid enforcement of the provisions of the agreement imposes such restrictions on the supervisor in his endeavor to effect a rapid promotion for the most promising candidate that he is very likely to be quickly discouraged.

### Obstacles in the Recruiting of Foremen

One of the most interesting recent developments in the handling of freight has been the practical discussion of the large size portable container for use on motor trucks, railway cars or vessels. The development of the container system for handling interchange l. c. l. traffic on motor trucks at Cincinnati, has attracted country-wide attention and much favorable comment. During the war the government tested out on the Warrior river a somewhat more extensive plan in the form of large size containers for carriage on railway flat cars and river boats. In an article in last week's *Railway Age* there was shown the latest development along this line, an express container car now operated in experimental service by the American Railway Express Company over the New York Central between New York and Chicago. The containers used are of steel and have a capacity of three to five tons. Nine containers are loaded on one car and in one of the experimental trips, nine containers were transported from nine big concerns in the one city to a similar number in the other; the containers being carried between the freight station and warehouse on motor trucks. It is to be expected that the use of containers of this general type will eliminate much of the manual labor required to load or unload shipments at freight houses or transfer stations and will reduce to a minimum the clerical work required in billing and checking. One of the most important savings will undoubtedly be in the reduction of losses due to theft and damage. There are, however, many difficulties still to be overcome, particularly as to the handling of the containers at manufacturing plants,

### The Development of Containers

freight stations and warehouses. A big box of some three to five tons is not easily moved about without cranes and it does not happen that concerns dealing in such commodities are as most suitable for carriage in these containers have such cranes. The working out of feasible means of moving the containers while they are off the car or motor truck seems therefore to be the next and most important step. Nevertheless, the development of the use of the large container represents real progress and will be watched with great interest by railroad men and shippers.

In the consideration of the situation of the New England roads now before the Interstate Commerce Commission in connection with the matter of divisions, there must necessarily be in the background, at least, the question of what is to be done with these roads in the matter of consolidation. The commission is now engaged in preparing its report on this important question as provided by the Transportation Act. It has engaged the assistance of Professor William Z. Ripley of Harvard University and it is understood that he has filed his report and opinion. Dame Rumor, who has been exceedingly busy of late in starting gossip on railroad consolidations, has been quoted in the public prints as saying that various ideas have been considered as to the consolidation of the New England roads. One is that an amalgamation may be worked out looking to the establishment of one New England system. Another is that the Pennsylvania may take over the New Haven and that the New York Central may acquire the Boston & Maine or that in general the New England carriers will be absorbed by trunk line carriers west of the Hudson river. Outside of the fact that the entire question is largely in the hands of the Interstate Commerce Commission just at present, another measure of official standing has been given to the discussion by some remarks of Andrew J. Peters, mayor of Boston, in his annual message to the city council of that municipality. "The proposed consolidations of the New England railroads with the Pennsylvania Railroad and the New York Central," says Mayor Peters, "would be a most unfortunate catastrophe for all New England, especially for the people of Boston. . . . the intimate touch with local conditions so essential in this situation would be entirely lacking." There is much truth in what Mr. Peters says, but it is also evident that if the lines are consolidated into a single system the feature of competitive railway service will be eliminated from the New England industrial centers. In short, it is apparent that the working out of a scheme of consolidating the New England carriers, if such is finally deemed advisable, is far from a simple matter.

### Consolidation and the New England Roads

In the discussion of J. C. Fritts' paper before the January meeting of the Western Railway Club, it is worthy of note that officers of the car departments of two railroads advocated fixing the A. R. A. prices for labor and material used in foreign car repairs so high that they would provide a profit on repairs for which bills are rendered. Such a policy is fundamentally sound. There are two forces which affect the maintenance of freight equipment in interchange. One is the common interest of all railroads in having serviceable equipment; the other is the interest of the individual roads in keeping down their own expenses and employing their resources in the most profitable channels. Only in periods of car shortage does the first exert any appreciable influence. The other is always acting and is particularly strong

### An Economic Force Worse Than Wasted

when the greatest opportunity exists for doing constructive work in car repairs: i. e., during periods when there is a surplus of equipment. Under the existing price policy these two forces tend to oppose each other. With prices for labor and material fixed at a level intended, on the average, to cover the bare cost plus overhead the immediate interests of the individual road are not clearly served by a constructive policy of handling repairs to foreign cars, by which in effect it is donating a service from which other roads reap more immediate benefit than it can itself. If this service is worth rendering at all it is worth paying for. This is a principle which holds in all commercial and industrial transactions and the present condition of freight cars supports the contention that it holds with equal force in transactions between the railroads. Why should it not be accepted in interchange repairs, thus directing both of these two motive forces toward raising the standard of car maintenance, instead of having them oppose and neutralize each other, as they tend to do under the present price policy of the mechanical division of the American Railway Association?

## What the Railways Are Trying to Do

WHAT THE RAILWAYS ARE TRYING to do in the hearings before the Railroad Labor Board is to pave the way for the re-establishment of working rules and conditions under which they can get increased efficiency of labor. They have not suggested the reduction of any basic wages except those for unskilled labor.

Increased efficiency of labor would make it possible to handle the same amount of business with fewer men. Therefore, like a reduction of wages, it would cause a reduction of operating expenses. A reduction of expenses, through increased efficiency of labor, would be more beneficial to the railways as well as their employees than a reduction of wages. Maintenance of relatively high wages would make the railroad business a preferred source of employment and enable the railroads to get and keep the best class of men. Apparently the only alternative to an increase in the efficiency of labor is a reduction of basic wages, since the operating expenses must be greatly reduced.

Spokesmen of the railways have presented voluminous evidence to the Railroad Labor Board and the public to show how, and the extent to which, the present working rules and conditions have reduced the efficiency of labor. Spokesmen of the employees have retorted that operating expenses are being inflated by bad management. Whether this charge is true or not, the answers to it are obvious. First, mismanagement in other particulars would not justify the continuance of a policy which resulted in wastes through an excessive payroll. Secondly, the Railroad Labor Board has no jurisdiction over the general management of the railroads, but only over their relations with labor. Therefore, the charges and evidence regarding other forms of mismanagement should be presented, not to the Railroad Labor Board, but to the Interstate Commerce Commission, which is the body that has supervision over the general management. The labor leaders are merely trying to evade the question before the Railroad Labor Board when they drag before it matters over which it has no jurisdiction.

The attempts some of the labor leaders have made to divert attention from the questions actually before the Labor Board have been palpable, and in some cases ludicrous. They opened the hearings on national agreements by charging the railway companies with wasting many millions of dollars by giving repair work on locomotives and cars to outside equipment companies. They got some newspapers to publish a yarn to the effect that the railways had raised a fund of approximately \$30,000,000 for propaganda to break down

the labor unions. The climax was capped when one of the labor leaders solemnly informed press and public that under government control railway officers had taken out and buried large quantities of materials and supplies to inflate operating expenses and discredit government operation. Even the most gullible must find it difficult to imagine federal managers, general managers and other high railway officers purloining large amounts of such weighty articles as steel rails, ties, brake beams, and even perhaps cars and locomotives, carrying them out in the dark watches of the night and entombing them in ditches along the right of way! Charges such as this are enough to bring ridicule upon all the allegations made by the labor leaders against the railway managers.

It has been charged by some labor leaders that a very large part of the increase in the payrolls and in the number of employees, under government control, was made by the railway managers to discredit government operation. The facts regarding the increases in the number of just two classes of employees are sufficient to show how little basis there is for this charge. The number of employees belonging to the nine principal shop crafts increased from 302,828 to 443,774, or 47 per cent. Their annual payroll increased from \$318,000,000 in 1917 to \$890,000,000 in 1920, after the Railroad Labor Board's award, or 180 per cent. The number of road train employees in 1917 was 226,936, while when the railways were returned to private operation their number was only 225,415, an actual reduction of 1,521. Their total compensation in 1917 was \$344,865,593, while after the wage award last July it was running at the rate of about \$658,000,000, or an increase of 90 per cent.

These two general classes of employees worked under the supervision of exactly the same federal managers, general managers and other general officers. There was, however, an enormous increase in the number of shop employees, while there was no increase in the number of road train employees. If railway officers had desired to pad expenses, they would hardly have deliberately increased greatly the number of shop employees and actually reduced the number of road employees. The vast increase in the number of employees in the shops took place because the Railroad Administration, over the opposition of experienced railway officers, made changes in the working rules and conditions in the shops which these experienced officers predicted would be productive of inefficiency.

The working rules and conditions which have produced inefficiency, and the consequent great increase in the number of employees, are the very working rules and conditions which the railway managers are now trying to get rid of. Undoubtedly other and great increases in efficiency and economy must be obtained. The cost of fuel has increased from about \$400,000,000 in 1917 to about \$700,000,000 in 1920. It must be reduced. The cost of materials and supplies has increased from about \$700,000,000 in 1917 to about \$1,600,000,000 at the present time. It must be reduced. The railroad payroll is the largest item of all. In 1917 it was about \$1,704,000,000. It has increased until, according to the latest estimates, it was running before the recent large reductions of forces were made at the rate of more than \$3,700,000,000 a year. It also must be reduced.

All these items of expense must be reduced, first, to enable the railways to earn the net return they are entitled to, and which they must earn to furnish the public good and adequate service, and, secondly, to enable them in due course to make reductions in freight and passenger rates. Evidence has accumulated that many of the present freight and passenger rates are too high, and actually are destroying business. Railroad employees cannot afford to have expenses and rates kept so high that they destroy business, because reductions of railroad business destroy the source of their

employment. The interest of railroad employees is to have the railroads handle a maximum business, to employ as many men as are reasonably needed to handle this business, and to pay them the highest wages consistent with the hazards of the employment, the wages paid in other industries and the cost of living. In the long run working rules and conditions which force the railways to employ an excessive number of men will reduce railway traffic, prevent the railways from prospering and being adequately developed, and, in consequence, injure railway employees as well as the railway companies and the public.

## Freight Moving Less Than During Switchmen's Strike

THE DECLINE in the freight traffic of the railways has continued until the volume of business being handled has almost set a new low record for recent years. The total number of cars of freight loaded in the four weeks ending January 29 was 2,819,352. This was 460,043, or 14 per cent less cars than were loaded in the same weeks of 1920. It was 116,000 less cars than were loaded in the same weeks of 1919, although at that time the traffic was undergoing the heavy slump which followed the signing of the Armistice. Last April, when the switchmen's strike seriously interfered with transportation, the amount of freight moved declined to a point which it was said at the time threatened the industrial and financial welfare of the country. But even last April, when the effects of the strike were most felt, the railways moved slightly more freight than they did in January, 1921.

The complete statistics of earnings and expenses in January are not yet available but enough is known about them already to make certain that they will make a very bad showing. This bad showing will be due, first, to the tremendous and almost unprecedented decline of traffic and earnings, and, secondly, to the inability of the railways, with present costs of materials, fuel and labor, to effect the drastic economies needed. Probably the railways as a whole have laid off at least 300,000 men since September 1, but the present rules, working conditions and wages, especially those of unskilled labor, are making it necessary to pay so much to those who are kept on the payrolls as to make the labor cost excessive in proportion to the earnings. The present situation is a striking illustration of the fact that the railways are subject to the same wide fluctuations in business, and in both gross and net earnings, as other business concerns, and that therefore if they are to be enabled to earn an annual average year by year of 6 per cent their earnings and expenses must be put on a basis where they will earn at the rate of much more than 6 per cent in periods of good business to provide against the days of bad business.

## The Highway Engineers Can Help

WHATEVER THE UNCERTAINTIES of the future that may jeopardize the success of private undertakings at the present time, they can have but little influence on public projects such as highway construction in the various states. Thus, while uncertainties as to the future may constitute legitimate reasons for deferring shipments in certain commercial lines, there can be no like justification for delaying the transportation of materials used in highway construction and few realize what an immense tonnage could be given to the railroads if this work were undertaken at once in a volume commensurate with the plans outlined for the coming season.

Thus, Illinois has projects for 600 miles of new and hold-

over construction, while Pennsylvania proposes to build 700 miles. At the rate of 100 carloads of material per mile of road, the work in prospect in these two states alone represents 130,000 carloads to be handled by the railroads some time during the coming season. The plans for all this work may not all be completed, but it is true beyond any question that a very large part of it will be carried out. Therefore, the highway construction programs impose on the railroads a very definite freight business that must and will be handled some time during the present year.

Just when this business will be offered to the railroads depends on the decision of the states' highway executives. The hauling can be delayed until the summer months, when the railroads may be again pressed to the limit of their capacities, or it may be done during the present period of surplus transportation with many thousands of cars available for immediate use. This prompts the suggestion that railway officers appeal consistently to highway engineers to exercise their influence for the early letting of contracts and the movement of materials. In no field is the opportunity for prompt action more favorable. Most states now permit the payment for materials when delivered, the great bulk of paving materials are not injured in any way by storage and advanced delivery does not entail any rehandling not otherwise required. On the other hand no commodity suffers more than road material in the competition for equipment used in hauling coal.

Last year one of the great obstacles that defeated programs for highway construction was the failure of material deliveries. The one way to avoid a repetition of this is to start these deliveries now.

## New Books

*Railway Surveying and Permanent Way Work.* By S. W. Perrott and F. E. G. Badger. 303 pages, illustrated, 6 in. by 9 in. Bound in cloth. Published by Edward Arnold, London, Eng., and distributed by Longmans, Green & Co., New York.

As its title suggests, this book is in reality divided into the two main subjects of railway surveying and of maintenance of way practice, or, stated according to English phraseology, of permanent way work. The book has a joint authorship, being the product of two English engineers, S. W. Perrott and F. E. G. Badger, both with experience not only on leading English roads but in other countries as well. From their experience they have included in a part of the text a discussion of the detailed work in surveying, planning and constructing an economic railway in more or less undeveloped and tropical countries. In this section, as well as in the parts devoted to railway surveying, the subjects in question such as reconnaissance, preliminary location, location, curves and construction, etc., are handled in a fairly detailed and fundamental manner, though throughout there is assumed that the reader has an understanding of surveying to some degree or other.

With a few exceptions the discussion of the problems mentioned conforms to American terminology and practices. The permanent way or maintenance of way section, however, is more of a treatise of English methods of track preparation, construction and maintenance. While dealing in a fairly broad way with such general subjects as ties, ballast, rail and drainage, etc., the major portion covers the practical installation problems of sidings, switches, turnouts and cross-overs, etc. The book, throughout, is well illustrated with reproductions of actual field and office notes, sketches and maps for the first part as well as numerous other plans and drawings more directly concerned with the second part or permanent way section.

## Letters to the Editor

### A Safety-First Catechism

St. Louis, Mo.

TO THE EDITOR:

The instructions which a railroad superintendent gives to his subordinates will be found usually to follow a certain uniform course, from the fountain head to the point where the information is needed, or is effective. First, a rule is formulated—perhaps it was formulated forty years ago. Next, it is put into a rule book and employees are told to familiarize themselves with the contents of the book. Thirdly, there is an oral examination on the rules, and the employee commits to memory the one we have in mind, to the extent of being able to answer the question which is put to him concerning it. Fourthly, someone disobeys the rule and a circular is issued to warn employees generally to avoid the suspension or other bit of ill luck which has befallen the person who forgot or ignored the rule. This business of warning employees to take a lesson from others' mistakes is done, in many cases, with very little skill; and so we see, with increasing frequency, a fifth stage—the stage of larger and more skillfully worded circulars. This is the stage of really effective warnings—effective, that is, in as high a degree as it is possible to accomplish with nothing but paper, type, ink and a printing press. This last stage is a great improvement. Effort put forth in putting style into circulars to employees is not wasted. Large type, colored ink, ingenious features of make-up and all other beautifying elements should be employed as freely as practicable.

But I want to propose a sixth stage: get a written answer from the employee. The most impressive type, or coated paper, or illustrative photographs are useless except as they aid in impressing the desired lesson on the employee's mind; and to get information on that point the man must be induced to express his own thoughts. Oral answers are inherently unsatisfactory, 99 times out of 100, because of the lack of mental training on the part of the examinee. Enginemen and conductors are not rhetoricians. Mere memorizing may give false or deceptive evidence of knowledge; and both oral and written answers fall short in a large percentage of cases because nothing is done to induce the examinee to do any original thinking.

I have been led along this line of thought by seeing a safety-first circular issued recently by a prominent western road. So far as concerns the time-honored standard rules, the point that I have made—or am trying to make—may perhaps be looked upon as lacking in novelty; every operating officer has tried, in this field, all the experiments that he can think of, and he does not wish to think of any more. But safety-first is different. In this the problem is not to make the employee know a rule, but rather to make him more thoroughly digest a rule which he knows already.

The circular to which I refer has to do with the case of a brakeman who was riding on the side of a car while pulling out some stock cars from a stock-yard track and was struck and knocked off by the stock-yard gate, which had been left open; and he was injured. The circular was beautifully made up, on fine paper, in large type, readable some distance off. It was illustrated with a picture and it would attract attention on any bulletin board (if not buried or obscured by other papers, or by the slovenly condition of the board—which condition is frequently observable in trainmen's lobbies). It gave the name of the town, the date, and other details and said that a number of other men on that road had been injured, at other stations, from the same cause.

Continuing, it says: "These accidents can be avoided by the exercise of a little care on the part of the men who use these stock-yards, by closing and fastening the gates after using."

"Agents, section men and trainmen should see that this is done, and where gates are left open the fact should be reported before and not after someone is hurt."

"Please explain this matter to the stock shippers and secure their co-operation."

"The employee in charge of switch movement or last using the gates at stock-yards must see that they are closed and secured."

Now, that is fine, as far as it goes. But what effect will it have, except on men near the scene of the accident, or who have recently had occasion to know the details of an accident of that class? The poster might perhaps be improved by adding a half dozen other similar cases, with names and dates and a statement of hospital experiences, cost, etc.; but even then it might not be read with care by the right men. I propose a regular questionnaire on stock-yard gates. Possibly I am going too much into details; but let us try it. After long experience with circulars I have come to feel an annoying sense of unsatisfied expectation whenever I see a document like this, in which there is such a wide gulf between the potential value of the teaching set forth (the value to the man who really remembers it) and the complete and unconscious indifference of the man who ought to have heeded the lesson but did not do so and who, in consequence, got hurt. Send the circular (perhaps on a small sheet) to every brakeman; and with it a letter calling for answers to questions like the following:

Did you ever witness an accident of this kind?  
 Did you ever hear of one?  
 At what places and how many of them?  
 How long ago?  
 Who was at fault?  
 How many stock yard gates on the division where you run?  
 Do you know of any yards with gates out of repair?  
 If the carpenter or the station agent is to blame for an injury to a brakeman, how does that affect the brakeman?  
 Who should report gates which are out of order?  
 When?  
 To whom?  
 How?  
 Do you carry in your pocket some sheets of paper suitable for use in making such a report?  
 What will happen if you report a gate which ought to be reported by the station agent?

These queries ought to have some visible effect in making a brakeman sit up and take notice. If the author of the circular from which I have quoted will pardon my freedom I will suggest some general questions:

How can the section man decide whether it is he, or the agent, who should report a particular case?  
 How can a section man know that a gate has been wrongfully left open?  
 What kind of a speech, and at what length, shall an agent address to a shipper to secure his co-operation?  
 How should he co-operate?  
 Who should sign the last paragraph (*italicized*) which I have quoted above?

Does this leave any doubt as to who is responsible for fastening the gate?

Now, I do not pretend to have made a finished questionnaire; I do not warrant this as the best that can be made. Possibly it would be useful for six months but not for twelve. But I do believe that questions of this kind will arouse thought on the part of brakemen or other men who actually read the poster (and the questionnaire); and, surely, that would be a definite accomplishment.

Does someone say that a proceeding of this kind would annoy the men, and that to the extent of doing actual harm? I reply that a good many are annoyed by present safety-first activities. Let us see why this is so. Possibly the introduction of a more serious annoyance might clarify the atmosphere and lead to a general movement to diagnose and cure all annoyances.

May I not ask that you will at least find out what is the state of mind of that portion of your readers who do *not* agree with what I have here proposed? B. T. HOROUCH.

*Adequate Shop and Terminal Facilities Permit More Effective Utilization of Motive Power*

## Are Modern Locomotives Efficiently Used?

Ton-Mile Output Fell Behind, Increasing Tractive Capacity for More Than a Decade Prior to the War

**F**OR THE PAST 17 years no improvement has been made in the efficiency with which the potential hauling capacity of freight locomotives has been utilized on the railroads of the United States. During this period the average tractive effort of locomotives in freight service has increased about 58 per cent, net tons per train have increased over 100 per cent, but freight train miles per locomotive have shown a decrease of nearly 20 per cent, and apparently only the stress of war conditions has prevented a marked and steady decrease in the net results as measured by the ton miles produced per year by each 1,000 lb. available tractive effort. These statements are based on an analysis of Interstate Commerce Commission statistics from 1902 and 1903, the first years for which the necessary basic data were reported, down to the end of 1919, and are supplemented by estimates for 1920 which are sufficiently accurate to indicate the trend during that year as compared with previous years.

From 1900 to 1914, inclusive, the Interstate Commerce Commission, in its annual report, has classified the number of steam railroad locomotives according to the service to which they were assigned and has included a statement showing the average number of net ton-miles produced annually per locomotive in freight service. Beginning with the annual report for the fiscal year ending June 30, 1902, locomotives have been classified by types in addition to the service classification, the number of locomotives and aggregate tractive efforts being given in each case. By the elimination of the number of locomotives and the aggregate tractive effort for those types which quite generally are not used in freight service, it has been possible to arrive at a fair approximation of the average tractive effort of the freight locomotives in service each year. In each case the number of locomotives so determined has been found to check within a few per cent

of the number of locomotives definitely assigned to freight service elsewhere in the reports, which is sufficient indication of a reasonable degree of accuracy in the average tractive effort so determined for the purpose of determining the general trend. Other basic data are freight train miles per year and net ton-miles per train mile, which, in the absence of gross ton-mile statistics, may be used without serious error as the measure of train load. These data are given directly in the commission's reports.

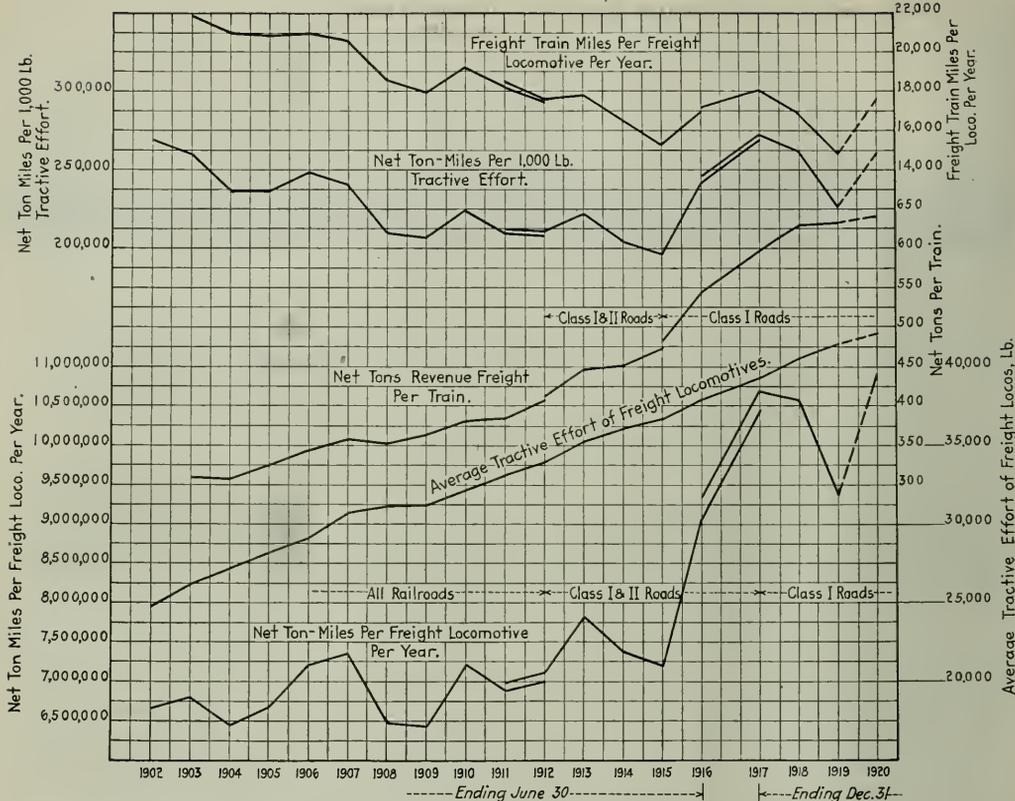

For the years following the fiscal period ending June 30, 1914, changes in the basis of locomotive classification, and the substitution of the locomotive mile for the locomotive in all ratios involving locomotive performance, have placed some difficulties in the way of a continuance of the comparison. However, the total number of locomotives and the average tractive effort of all locomotives are given, and a study of the relationships existing, respectively, between the total number of locomotives and their average tractive effort on the one hand and the number of locomotives in freight service and their average tractive effort on the other, reveals a high degree of uniformity.

For 14 years freight locomotives, according to the method of compilation employed by the Interstate Commerce Commission, have never been less than 57 per cent and have never reached 60 per cent of the total number of locomotives in service. For the latter half of this period the percentage has never been below 59. Similarly, the average tractive effort of freight locomotives has varied from 15 per cent to 21 per cent above the average tractive effort of all locomotives, and here again the range of variations from year to year have tended to smooth out during the six or seven years immediately preceding the close of the period, when 16 and 17 per cent were the prevailing ratios.

For the purpose of a general survey of the trend of loco-

**F**REIGHT train miles per locomotive have decreased 18 per cent since 1903. Does not this represent a loss of over two months' service a year for each freight locomotive, or an investment in idle locomotives of from \$100,000,000 to \$200,000,000?

Total locomotive tractive capacity has increased 2½ times since 1903. Could not this investment, if used to help keep shop and terminal facilities abreast of the increasing locomotive capacity, have earned a large return upon itself by reducing maintenance and operating costs?

Trend of Efficiency of Freight Locomotive Utilization, 1903 to 1920

\*These figures and those for the preceding years include Class III railroads. Prior to 1908, returns from switching and terminal companies are also included.  
 †These figures, and those for 1913, 1914 and 1915 are for Class I and Class II roads.  
 ‡These figures, and those for the years following, are for Class I roads.  
 §Number of locomotives shown for 1920 are based on A. R. A. Car Service Division, reports. Average tractive effort is estimated on the basis of approximately the same change as in the preceding year. Ton miles and train miles are based on Bureau of Railway Economics reports for nine months, assuming proportionately the same volume of traffic during the last three months as existed in 1919.  
 ¶Number and average tractive effort of freight locomotives for years after 1914 are estimated. The number of freight locomotives is taken as 59.9 per cent of all locomotives; their average tractive effort as 116 per cent of the average for all locomotives.  
 ††Published by the Interstate Commerce Commission up to and including 1914. Calculated for the years since 1914.  
 ‡‡Includes mixed train mileage.

motive utilization it does not seem unreasonable to assume a fairly close adherence to these relationships during the succeeding years, since there has been no marked change in types of motive power nor has there been any marked change in the distribution of locomotives to the various classes of service. Therefore, for the years following 1914, the number of freight locomotives has been assumed to be 59.9 per cent of the total number of locomotives and their average tractive effort has been assumed to be 16 per cent greater than the average of all locomotives.

Operating statistics published by the United States Rail-

Whatever objections may be raised to the accuracy of the figures given for the last few years, they do not apply to the years prior to the outbreak of the European war and it is the steady downward trend of the efficiency of locomotive utilization during those years which is the most significant fact brought out in the table and diagram.

Referring to the diagram, it will be seen that the average tractive effort of freight locomotives increased with remarkable steadiness throughout the period. Owing to wide fluctuations from year to year in the volume of traffic, as well as in the increase in the number of locomotives in service, the

A Typical Freight Locomotive of 1903

road Administration covering the years 1918 and 1919, present a service classification of locomotives which month by month shows no appreciable variation in the percentage of locomotives assigned to the various services. But this is so widely different from the distribution formerly carried by the Interstate Commerce Commission reports that the difference is evidently due to a change in method of classification, rather than in the actual distribution of the power. The classification is not believed to be comparable with that of

average net ton-miles handled by each freight locomotive showed wide variations, but the net ton-miles per 1,000 lb. tractive effort has consistently declined throughout the entire period.

The curves show a series of cycles of high and low averages and in comparing the net decrease in the efficiency of locomotive utilization over the pre-war period, consistency requires that years occupying approximately like positions in the first and last of these cycles be chosen as the basis of

A Typical Freight Locomotive of 1921

the commission and the latter has been followed consistently throughout the survey.

With the number of freight locomotives established, complete data are available for the calculation of the net ton-miles per freight locomotive, which has been thus arrived at for the years since the abandonment of that ratio by the commission.

Attention should be called to the fact that it has been necessary successively to drop from consideration switching and terminal and Class III roads, and finally the Class II roads. These changes in a measure affect the comparability of the data, but the diagrams show how small is the effect in relation to the trend of the curves.

the comparison. Partly for this reason and partly because some of the basic data first became available in that year, 1903 has been chosen for comparison with 1913.

During the decade the net ton-miles of traffic increased from 173,221,000,000 to 301,399,000,000, or 74 per cent. The number of locomotives in freight service increased from 25,400 to about 37,900 and the average tractive effort per freight locomotive increased from 26,200 lb. to 35,300 lb., or 35 per cent. This increase in the number and capacity of locomotives made it possible to handle 74 per cent more traffic with an increase of only 21 per cent in the number of freight train miles, from 557,804,000 in 1903 to 676,749,000 in 1913.

During this period much attention was given to tonnage rating and train loading for the purpose of taking the fullest advantage of the operating economies made possible by more powerful locomotives. That much in this direction was accomplished is evident from the fact that the average tons of revenue freight per train increased about 43 per cent, or about 20 per cent more than the potential capacity of the average freight locomotive. In 1903 revenue freight per train averaged 310.5 tons, while in 1913 the average was 445.4 tons.

These comparisons all attest the remarkable increase in the effectiveness of locomotives as operating factors during this decade. But the efficiency with which these locomotives were utilized as producers of ton-miles did not keep pace with the increases in capacity. This is very evident from the fact that the net ton-miles per 1,000 lb. tractive effort decreased from 260,000 in 1903, to 222,000 during the fiscal year 1913, a reduction of about 14.5 per cent. Considering the remarkable increase in the net train loads, it is evident that this loss must be accounted for by the reduction in the freight train mileage obtained from each locomotive. An average of 21,800 freight train miles was obtained from each freight locomotive in service in 1903, while in 1913 the average was only 17,800, a reduction of 18 per cent. On the basis of the results obtained in 1903, this is equivalent to a loss of more than two months' service per year for each freight locomotive in the United States.

Following the reduction in traffic during the business depression of 1914-15, traffic increased rapidly during the next two years, and reached a peak of 394,465,000,000 ton-miles in the calendar year 1917. During this interval there had been an actual decrease in the number of locomotives in service, because of the excess of retirements over locomotive purchases. But the aggregate tractive capacity had actually increased, and the average tractive effort of locomotives in freight service had increased from 36,700 lb. to 39,300 lb. This brought the ton-miles per 1,000 lb. tractive effort up to a point only slightly, if any, above that of 1903 when allowance is made for the fact that the figures for 1903 cover all railroads, including switching and terminal companies, while those represented by the higher curve for 1917 apply only to the Class I roads. This was accomplished by increasing the train loading to 597 net tons, 34 per cent above the loading in 1913. The marked increase in net ton-miles per 1,000 lb. tractive effort was due entirely to this factor, as the train mileage per locomotive in 1917 still

showed a loss equivalent to two months' service for each locomotive as compared with the mileage obtained in 1903.

The estimates for 1920 are based on the record of the nine months' traffic, assuming a volume of traffic during the last three months of the year proportionately the same as that actually handled during the last three months of 1919. Whether or not this will exactly square with the facts, it is evident from the nine months' records that such a traffic could have been handled, so far as motive power capacity is concerned, with results almost identical to those of 1917.

It is not the purpose of this article to discuss in detail all the causes for the marked decline in locomotive output up to the outbreak of the war. It is significant, however, that this decline was due entirely to the steadily decreasing train mileage per locomotive and that the marked increase in output since 1915 has not been due to improvements in this factor. The cause must therefore be looked for either in the locomotive, or in other facilities affecting the service-ability of the locomotive.

Undoubtedly, large modern locomotives require more frequent shoppings and more attention to running repairs than the motive power of 17 years ago. But it seems incredible that the motive power in service today, made up as it is of units representing every stage of development for at least 20 years, is inherently incapable of rendering in a year more than the equivalent of service that was obtained in ten months from the locomotives of 17 years ago.

May not much of this loss be attributed to the failure of shop and engine terminal facilities to keep pace either with the increasing numbers or increasing weights of locomotives?

During the period under consideration the number of locomotives has increased more than 50 per cent and the average hauling capacity between 65 per cent and 70 per cent. But neither of these increases alone is a measure of the increases which should have been made in facilities for caring for motive power. The combined effect of the two is that there is  $2\frac{1}{2}$  times as much tractive capacity to be maintained, repaired and turned as there was 17 years ago, and in some respects this capacity requires more attention per tractive effort unit than did that used at the beginning of the period.

Is it not possible that the failure to provide more than a small part of the needed shop and terminal capacity is costing the railroads the carrying charges on from \$100,000,000 to \$200,000,000 invested in idle locomotives which, had it been invested in shops and terminals, would have earned a return in reduced maintenance and operating costs?

A Southern Railway Train at Spartanburg, S. C.

# President Declines Railway Employees' Requests

Reply to Union Leaders Says Present Agencies Should Settle Differences—Employees Delay Reply

THE VIGOROUS STAND taken before the Railroad Labor Board by General W. W. Atterbury, vice-president of the Pennsylvania and chairman of the Labor Committee of the Association of Railway Executives, against the continuance of national agreements brought forth talk of general railroad strikes, charges and answers. The matter finally reached President Wilson, whom representatives of the labor organization petitioned for the presentation of the issues involved to Congress and representatives of the carriers followed with specific answers to the charges made by the labor leaders. General Atterbury went before the Labor Board on January 31 after the Labor Committee of the Association of Railway Executives had been in session at Chicago for three days. His statement at that time—one of the results of this meeting—was reported in full in the *Railway Age* of February 4 (page 317). The representatives of the employees refused to reply to his remarks immediately, requesting instead the right to be heard before the Board took action on the demands contained therein. This request was granted by Judge R. M. Barton, chairman of the Board, who later set February 7 as the employees' "day at court."

In the meantime, executives of the brotherhoods filed long telegrams to the President, declaring that they did not believe that the carriers were in the financial condition outlined by General Atterbury and attacking the latter for "violating all decent proprieties, disregarding the Transportation Act and flouting existing agencies such as the Interstate Commerce Commission and even Congress itself."

"General Atterbury's policy," the telegram charged, "is to disrupt labor unions, turn public opinion against the employees and place wages on a previous basis so that railway profits might be enhanced when prosperity returned."

In support of these contentions, the telegram reiterated the charges of mismanagement and control by a New York banking group which have been made repeatedly during the past month by various labor leaders and which are under investigation by the Interstate Commerce Commission.

## Executives State Position to President

The charges made in the employees' telegram were immediately answered by T. DeWitt Cuyler, chairman of the Association of Railway Executives, who said in a telegram to the President:

I understand from press despatches a telegram has been sent you by the heads of certain railway organizations. If correctly reported, the charges contained therein are deliberate and gross misrepresentations. They are propaganda intended to discredit private management of railroads in the interests of the Plumb Plan and to defeat efforts which are being made in good faith to abolish rules and working conditions which were adopted as war measures, the continuance of which are causing inefficiency and waste in railway operation that are costing hundreds of millions of dollars.

The charge that the railroads of the country are controlled by a single banking group in New York is untrue and is known to be untrue by every one familiar with railroad affairs.

The charge that since the resumption of private operation, inefficiency and lack of economy have been deliberately encouraged is conclusively disproved by the record of the railroads from March 1 to the end of 1920. In its annual report to Congress on December 9, 1920, the Interstate Commerce Commission stated:

Comparing August, 1920, with August, 1919, the increased mileage had the effect of increasing the car supply 287,694 cars; the increased tonnage per car had the effect of increasing the car supply approximately 104,942 cars.

During this period the railroads increased the average movement per freight car per day 6.3 miles—from 22.3 to 28.6 miles.

They increased the average load per car 1.7 tons—from 28.3 to 30 tons. They reduced the accumulation of loaded but unmovable cars from 103,237 on March 1 to practically zero on December 31.

The truth is—as every shipper and traveler knows of his own experience—that the railroads were never more efficiently operated than in the last 10 months of 1920. Never before was so much service rendered with each car, each locomotive, each mile of track and each ton of coal.

The charge that the railroads sent cars and locomotives to outside shops for repair because of any dual financial interest is entirely untrue. The Interstate Commerce Commission has already taken jurisdiction over this matter, and the railroads are prepared to fully prove before the Commission the imperative necessity for their action. They will show that the comparisons of cost given were misleading; that the repairs in question were of the heaviest character; that they frequently involved substantial rebuilding; and that so far as possible this equipment was sent to the shops at which it had originally been constructed for the obvious reason that said shops had extra parts, patterns and tools which would enable them to effect these repairs efficiently and promptly.

The major field of imperative economy at the present moment is in the labor cost of railway operation. In 1917 this was approximately \$1,700,000,000. During the greater part of 1920 it ran at the rate of approximately \$3,700,000,000. The fact is that the labor cost of railway operation grew during the war period to a point where it absorbed the entire increase in railway operating revenues and is at this moment, despite the increase in rates granted by the Interstate Commerce Commission on August 26, 1920, leaving many railroads, in the face of declining traffic, practically stripped of earning power.

When General Atterbury went before the United States Railroad Labor Board and called its attention to the fact that numerous companies cannot even earn their operating expenses under conditions of present costs and traffic, and asked for the immediate abrogation of these agreements, rules and working conditions, he was proceeding in strict conformity with both the spirit and the letter of the Transportation Act. Unless these rules and working conditions had been continued by mutual consent they would have terminated on September 1, 1920, in accordance with the Transportation Act, and would not now be in effect had not the United States Railroad Labor Board, in its wage decision of July 20, 1920, asked the railroad companies to continue them temporarily, pending a hearing.

The fact that this hearing tends to be protracted at a time when the necessity for economy grows with every hour produced a situation requiring, in our judgment, drastic and immediate action.

The suggestion that we should hold a conference with the leaders of the labor organizations offers no solution of the difficulty. Each railway company is prepared to negotiate with its employees proper rules and working conditions adapted to different conditions in various parts of this country. It is utterly impossible for the United States Railroad Labor Board to make uniform rules and working conditions for all the railroads of the country without causing abuses like the present, when, by a mere change in title, four of the employees of the Pere Marquette had to be paid over \$9,300 in back pay, without any change in character or volume of work.

It would be equally impossible for any joint conference between all railroads and all organizations of employees to draft a uniform set of rules not subject to the same abuses.

The action requested by General Atterbury on behalf of the railroad companies is the only action which, with government sanction, can free the hands of the railway executives and enable them by orderly procedure with their own men to develop appropriate rules and working conditions.

All suggestions of other investigations or of the transfer of this subject to some other body are not only not in accordance with the Transportation Act but necessarily involve that very delay, the avoidance of which was the purpose of General Atterbury's presentation.

The only rules that stand the tests of practical operation and do not involve endless controversy are rules which are negotiated between each management and its own men and have behind them a common understanding. The opportunity of securing this is requested by the railroads in the interests of that efficient and economical operation required by the Transportation Act and is not only for the purpose of enabling the railroads to achieve the

earning power contemplated under that Act, but also in the interests of an ultimate reduction in transportation rates to the public.

Last, but not least, it is in the interests of the men who work upon these railroads. As General Atterbury stated, we recognize that as the wages of railroad employees were the last to go up, they should also be the last to come down, and if by restoring the conditions necessary to efficiency and economical operation, the railroads can postpone for a reasonable period the reduction of basic wages which will ultimately be required they will be only too glad to do so in the interests of the great body of their employees.

The pressing financial necessities of the railroads are such that if denied the opportunity of initial economy through proper rules and working conditions their only other recourse must be in a reduction of basic wages.

The railway executives are proceeding in this matter with the keenest sense of obligation to the public. They feel that they are trustees of a great public interest in the reduction of railway operating expenses to a normal level. They feel that in moving in this matter they are representing, not only their own interests, but the interests of the farmer, the consumer, labor and manufacturers in other industries, and the railway employees themselves. They have every confidence that at a time when the various industries and workers of the country are each making their respective contributions to a decline in the cost of living and a return to normal conditions, the great body of railway employees themselves will certainly not refuse to make their similar contribution.

President Wilson on February 6 replied to the telegrams addressed to him by the railroad labor leaders and the railroad executives at Chicago last week, declining to interfere in any way, during the last month of his administration, in the controversy between the railroad executives and the labor leaders regarding the abrogation of the national agreements. The labor leaders had asked for a Congressional investigation of the railroad situation but the President in his reply indicated confidence that the case is now in the hands of the proper tribunal and he therefore referred the copies of the telegrams to the board and to the Interstate Commerce Commission for such action as they may deem wise. The President's action was taken on recommendations made to him by John Barton Payne, director general of railroads, to whom the telegrams were submitted on their receipt last week. The President's reply to the labor leaders, copy of which was also sent to the executives, was as follows:

I have carefully considered the several telegrams addressed to me dealing with the labor questions and railroad management now under consideration by the Railroad Labor Board in Chicago.

The transportation act, approved February 28, 1920, to a greater extent than any previous legislation places all questions dealing with finances and railroad management and necessary rates under the jurisdiction of the Interstate Commerce Commission; hence all questions involving the expense of operation, the necessities of the railroads, and the amount of money necessary to secure the successful operation thereof are now under the jurisdiction of the commission. At the same time the act placed all questions of dispute between carriers and their employees and subordinate officials under the jurisdiction of the Railroad Labor Board, now sitting in Chicago.

This board is composed of three members constituting the labor group, representing the employees and subordinate officials of the carriers; three members constituting the management group, representing the carriers, and three members constituting the public group, representing the public. So far as I am advised, the board may be relied on to give careful and intelligent consideration of all questions within its jurisdiction. To seek to influence either of these bodies upon anything which has been placed within their jurisdiction by Congress would be unwise and open to grave objection.

It would be manifestly unwise for me, therefore, to take any action which would interfere with the orderly procedure of the Interstate Commerce Commission or of the Railroad Labor Board; and all the matters mentioned in your telegram are within the jurisdiction of one or the other of these bodies, and in their action I think we may repose entire confidence.

In view of the foregoing, it does not seem wise to comply with your suggestion that the matter be submitted to the Congress, and the only action deemed necessary is to submit copies of the telegrams received from you and from the representatives of the railroad executives to the Interstate Commerce Commission and to the Railroad Labor Board for such action as these bodies may deem wise in the premises. This will be done.

## Jewell Claims Vindication in President's Reply

B. M. Jewell, president of the railroad department of the American Federation of Labor, declared that the president's message was a complete vindication of the stand taken by the unions in that it "makes it perfectly clear that the board should confine its jurisdiction strictly to the controversy as to wages and working conditions, leaving financial matters to the Interstate Commerce Commission." His statement follows:

The telegram of the president is a complete vindication of our position. I am delighted at what he has said: He has made it perfectly clear that the board should confine its jurisdiction strictly to the controversy as to wages and working conditions, leaving financial matters to the Interstate Commerce Commission.

Mr. Atterbury, therefore, made a serious mistake in applying to the board for financial assistance. We did not consider the facts warranted his prediction that the transportation industry was threatened with immediate bankruptcy. Evidently the president did not think so either. We did not feel that a financial disaster was impending, as predicted by Mr. Atterbury, but considered it our duty to call his statement to the attention of the president so that if the president considered the Atterbury statement seriously proper measures might be taken.

The president has stated unequivocally that financial appeals should be restricted to the Interstate Commerce Commission and not dragged before the Railroad Labor Board. Mr. Atterbury made a serious mistake by his ill-considered action and has placed the railroad executives in an embarrassing position. It is to be deplored that the public was temporarily deceived and that the orderly proceeding of the board was temporarily interrupted by his misguided activities.

Now that the financial aspects of the matter are clearly settled we shall have to take up in answer before the board certain other features of Mr. Atterbury's statement. He has cast aspersions upon railroad employees which we cannot permit to pass uncontroverted. We feel that it is our duty also to show that Mr. Atterbury is in reality the railroad representative of the sinister, anti-union movement which is being heavily financed under the guise of a so-called open shop campaign. We shall do this in an orderly way before the Railroad Labor Board.

Mr. Jewell again attacked General Atterbury's position the following day in a statement issued to the press in which he said:

"My criticism of Mr. Atterbury's action is that if the transportation industry is in the deplorable condition stated by Mr. Atterbury, no time should have been wasted in applying to the Labor Board, which is powerless to act, but application should at once have been made to those public agencies which could prevent the catastrophe which Mr. Atterbury predicts. Why isn't application made to the Interstate Commerce Commission? Why don't the bankers and bonding houses appear before the committees of the House and Senate? Why aren't the railroad presidents, who are now compelled by the bankers to appear before the country practically as beggars seeking public charity, put to work on this problem so that it may be adequately treated by the proper public agencies?"

## Atterbury Answers Claims

W. W. Atterbury, Chairman of the Labor Committee of the Association of Railway Executives, issued a statement on Tuesday in reply to the assertion of B. M. Jewell, representing the employees, that President Wilson's reply meant that the Board would consider only wages and working conditions, and that financial questions would be considered by the Interstate Commerce Commission.

"His hope that the financial results of existing rules and working conditions can be hidden from either the Labor Board or the public will not be realized," said Mr. Atterbury's statement.

"He would maintain indefensible waste and inefficiency even at the cost of destroying the earning power of the railroads or of compelling them to go to the Interstate Commerce Commission for still higher rates.

"The producers and consumers of the country cannot support Mr. Jewell's program. It requires no conspiracy against

union labor to explain their attitude or mine. The railroads are struggling to regain the reasonable productivity of a considerable part of their employees, now seriously impaired by the rules and working conditions coming over from the war. That conspiracy is the conspiracy of the entire country."

This reply was followed in turn by the issuance of two statements by General Atterbury in both of which he presented evidence to sustain his contentions made before the board on January 31. The first statement said:

The railroads have asked the Railroad Labor Board to approve the re-establishment of the agreements, rules and working conditions in effect on December 31, 1917, because they believe it is absolutely necessary to effect economy by reduction of the present huge railway payroll. They believe that this reduction of the payroll can be effected at this time with more justice to railway employees and the public by establishing rules and conditions of work which will make practicable a great increase in the efficiency of labor and of railway operation, than by a reduction of basic wages, except those of unskilled labor.

The labor leaders, in public statements, have sought to represent the plan proposed by the railway executives as intended, not to benefit all concerned by increasing the efficiency of operation, but to destroy rights and privileges to which the employees are entitled. No class of men, however, has any right to profit at the expense of the public by agreements, rules and working conditions which cause great inefficiency and waste, and facts regarding the present railroad payroll show that it is being enormously inflated by inefficiency and waste.

The most concrete and abundant evidence of the inefficiency and waste being caused by present rules and working conditions is afforded by the statistics regarding the payroll of the employees in the shops. Since the national shop crafts agreement is the principal one now under consideration by the Railroad Labor Board, statistics regarding the payroll in the shops are most pertinent at the present time.

In the year 1917, before government operation was adopted, the railways employed 302,828 machinists, boilermakers, blacksmiths, electricians, air brakemen, car inspectors, car repairers, other skilled shop employees, and machinists' helpers and apprentices. In 1920, when the number of locomotives and cars to be maintained was only slightly larger than in 1917, they had 443,774, an increase of 140,946, or 47 per cent. The total wages paid to those employees in 1917 was \$317,879,549, while in 1920, after the advance in wages granted by the Railroad Labor Board last July, their wages were running at the rate of approximately \$890,000,000 a year, an increase over 1917 of 180 per cent.

Another class of employees included in one of the national agreements is the clerks. In 1917 the railways employed 184,063 clerks, while in 1920, when business was normal, they were employing 238,693 clerks, an increase of 29 per cent. The total wages paid to clerks in 1917 was \$189,009,506. After the wage award made by the Railroad Labor Board the wages of the clerks were running, as near as can be estimated, at the rate of \$399,300,000 a year, an increase of 112 per cent.

Another of the classes of employees included in one of the national agreements is the maintenance of way employees. In 1917 the railways had 350,000 section men and other unskilled laborers, and in 1920, 376,000. The wages paid to them in 1917 amounted to \$220,000,000, while, after the wage award made by the Railroad Labor Board, their wages, as near as can now be estimated, were running at the rate of \$476,000,000, an increase of 112 per cent.

It requires only a glance at these figures to see that a very large part of the increase in the amount of wages paid to each of the classes of employees mentioned was due, not merely to the advances made in wages, but to an abnormal increase in the number of employees. This increase in the number of employees, in turn, was due to rules and working conditions which destroyed the efficiency of labor, reduced the output per man and rendered it necessary, if needed maintenance work on the railways was to be done, to employ a much larger number of men. The increase of over 140,000, or 47 per cent, in the number of certain classes of employees in the shops is especially significant. It has been charged that the railways turned over the repairs of large numbers of locomotives and cars to outside plants and thereby took work away from their own men. As a matter of fact, the inefficiency of labor in the shops was so great that in spite of the fact that over 50 per cent more men were on the payrolls than in 1917 it was impossible to get all the needed repairs to equipment done in the railways' own shops.

The total number of employees of the railways increased under government control by 261,000. It is a fact of the highest significance in its bearing upon the matter of agreements, rules and working conditions, whose nullification we have asked the Railroad Labor Board to approve, that of this increase 232,563 occurred

in shop employees, clerks and maintenance of way employees, with whom the Railroad Administration made the three principal national agreements. It would be difficult to cite better evidence of the deadly efficiency destroying effect of these agreements. The railways, in asking the Labor Board's approval to return to the rules and working conditions in effect at the end of 1917, are merely asking the opportunity to begin a restoration of the efficiency of labor which must be attained in order to secure efficient and economical operation of the railways. The public returned the railways to private operation in the belief that it would be more efficient and economical than government operation. The Transportation Act requires efficient and economical operation of the railways. Efficient and economical operation cannot, however, be secured without a removal of the great restrictions upon and obstacles in the way of efficient management which are set up by rules and working conditions which were adopted as war measures. The railways desire to treat their employees with entire fairness. All charges to the contrary are baseless. They cannot, however, assume the responsibility for consenting any longer to a continuance of conditions which make efficient and economical operation impossible.

General Atterbury authorized the second statement as follows:

When I went before the United States Railroad Labor Board on January 31 there was an emergency requiring prompt and energetic action by the Board. I said:

Many railroads are not now earning, and with present operating costs and traffic, have no prospect of earning even their bare operating expenses, leaving them without any net return and unable to meet their fixed charges.

Since I made the above statement I have been advised by Thomas DeWitt Cuyler, chairman of the Association of Railway Executives, of the result of a canvass of the operating results of most of the railways of the country for the month of January. It is understood, of course, that it is impossible to close the actual accounts so soon after the end of the month, and that the results of the latter part, therefore, have to be estimated.

This canvass shows that 36 railroads estimate that they failed to earn even their operating expenses for the month of January. Among these roads are: The Atlanta, Birmingham & Atlantic; the Buffalo & Susquehanna; the Central of Georgia; the Detroit, Toledo & Ironton; the Erie; the Great Northern; the Gulf & Ship Island; the Hocking Valley; the Long Island; the Minneapolis, St. Paul & Sault Ste. Marie; the Maine Central; the New York, New Haven & Hartford; the Northern Pacific; and the Philadelphia & Reading.

While earning their operating expenses, 28 additional roads estimate that they did not earn their taxes and fixed charges during the month of January. Among these are: The Arizona Eastern; the Atlantic Coast Line; the Baltimore & Ohio; the Boston & Maine; the Chicago, Indianapolis & Louisville; the Chicago, Milwaukee & St. Paul; the Chicago, Rock Island & Pacific; the Lehigh Valley; the Minneapolis & St. Louis; the Missouri Pacific; the Norfolk Southern; the Pennsylvania; the Pere Marquette; the Western Maryland; and the Wheeling & Lake Erie.

Under present traffic and operating conditions these were the results despite the fact that the 64 companies referred to—of which only a partial list is given above—have, in the aggregate, decreased their labor cost of operating by laying off approximately 200,000 employees since September 1, 1920.

These companies have a total main line mileage of more than 100,000 miles and constitute approximately 40 per cent of the railroad mileage of the country.

In addition, there are other companies of well established earning power under normal conditions which expect their earnings for January to exceed their fixed charges by only a narrow margin.

The railroads cannot believe that the United States Railroad Labor Board, which, by its wage decision of July 20, 1920, has kept these national agreements, rules and working conditions in existence since September 1, can or will deny to the railroads and to the public the relief requested.

Included in the above figures of lay-offs and mileage are a number of companies which I have not specifically mentioned, which, in previous years, have also had difficulty in approximating a fair earning power. In a developing country like the United States there always has been a number of such railways. Their economic and traffic conditions have not justified the payment of trunk line wages nor the observance of trunk line conditions of work, even when these have been far more reasonable and less costly than at present. Nevertheless, the augmentation of their difficulty only goes to illustrate that it is economically unsound, and can only be fraught with disaster, to attempt to compel all of the railroads of the country, regardless of their differing conditions, to meet precisely the same wages and the same working arrangements.

Our application to terminate immediately the war-time working

arrangements which do apply alike, regardless of these differing conditions, is simply the attempt to secure government sanction for the necessary process whereby these railroads can again fit their expenses and operating rules to the conditions of the territories whose public servants they are.

All the suggestions for laying this matter before Congress or some other public body, with the implication that if not so done the condition is not really serious, will, I am sure, mislead no one.

Congress has passed the Transportation Act. The Interstate Commerce Commission, pursuant to that Act, has fixed rates. Nevertheless, the railroads cannot achieve their earning power under continuing abnormal and inflated operating expenses, of which the labor cost is the principal item. Hence, in accordance with the letter and spirit of the Transportation Act, the railroads are before the one body which ought to grant them relief—namely, the United States Railroad Labor Board.

### Jewell Asks for More Time

While both the carriers and the employees were publicly defining their respective positions in this controversy, Mr. Jewell petitioned the Labor Board for additional time in which to prepare his reply to General Atterbury's requests. This petition was opposed by E. T. Whiter, who presented a letter on this subject written by General Atterbury and vigorously opposing any further extension of time. After consideration in executive session, however, the Board granted Mr. Jewell's request and February 10 was set as the date upon which he would be heard.

### Whiter Concludes Railroad's Presentation

Following the refusal of representatives of the labor organizations to reply to General Atterbury's testimony on January 31, Chairman Barton of the Board directed Mr. Whiter to continue with his testimony regarding the national agreements until the requests made by General Atterbury could be considered by the Board in executive session. Mr. Whiter accordingly discussed in turn the agreements and proposed agreements with the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, the Brotherhood of Railway Signalmen of America, the International Brotherhood of Stationary Firemen and Oilers, the Order of Railroad Telegraphers, the American Train Dispatchers' Association, the Masters, Mates and Pilots of America, and the International Association of Railroad Supervisors of Mechanics. In closing his presentation in the case, Mr. Whiter said:

In closing the statements of the railroads with reference to the requests under consideration in this hearing, we desire to emphasize the statements contained in our opening remarks:

First. That there is no obligation upon the individual railroads to accept and adopt these agreements, wage orders, etc., to which they were not a party; that there is no obligation in law or reason that they should be required to adopt these intricate, complicated and extensive regulations, which were applied throughout the United States, with utter disregard of conditions on the individual properties or the extraordinary, in many cases grotesque, results which followed. Further, that the necessity for specific understanding to continue these agreements was plainly recognized by the labor organizations who were parties to such agreements, as shown by their letter of March 24, 1920, which said:

During government control of railroads, general orders, supplements, addenda, national agreements and interpretations thereof were issued by the United States Railroad Administration, as result of negotiations conducted with the organizations parties to this conference.

These general orders, supplements, addenda, national agreements and interpretations thereof are continued in effect until September 1, 1920, except as amended by mutual agreement between the organizations and managements of the railroads and carriers covered by the Transportation Act of 1920.

In the interest of successful operation, it is desirable that definite agreements be had prior to September 1, 1920, providing for the preservation of the conditions of employment thereafter, and that these agreements be entered into at the earliest possible moment.

Further that the terms and provisions of the Transportation Act have not been complied with, with respect to the requirement that bona fide efforts must be made to reach agreements between the parties directly concerned before the controversies can be submitted to your Board. We hold that this is a separate and distinct phase of the problem before the Board and that this phase should be disposed of by the Board independently of the merits of the respective agreements and the individual rules contained therein.

Second. Through the wage orders, addenda, supplements, interpretations, etc., which we have brought to the attention of the Board, we feel that the Board will recognize that through the provisions of Decision No. 2 of the Labor Board that:

The board assumes as the basis of this decision the continuance in full force and effect of the rules, working conditions and agreements in force under the authority of the United States Railroad Administration. Pending the presentation, consideration and determination of the questions pertaining to the continuation or modification of such rules, conditions and agreements, no changes therein shall be made except by agreement between the carrier and employees concerned. As to all the questions with reference to the continuation or modification of such rules, working conditions and agreements, further hearings will be had at the earliest practicable date, and decision thereon will be rendered as soon as adequate consideration can be given.

Many bases of classification of service for purposes of pay, application of rules, etc., have been continued, notwithstanding that by reference to the terms of the agreements themselves, they terminated February 29, 1920; also by reference to Circular 121 of the director general it will be found that he states that decisions by the Railroad Administration, Boards of Adjustment, staff officers, etc., were not to extend beyond the termination of federal control of the railroads, viz: 12:01 A. M. March 1, 1920. These Boards of Adjustment and staff officers have continued to render decisions, and so far as known, may continue to render decisions as long as they exist, affecting the responsibility of the Railroad Administration, in cases occurring during the period of federal control. Many decisions have been rendered since the date of Decision No. 2. Some of these decisions have been incorporated in our presentation. We feel that your Board certainly did not in Decision No. 2 base your conclusions on decisions of these Boards of Adjustment which had not theretofore been rendered.

From the provisions of Decision No. 2 quoted herein, there would not appear to be any doubt of the intention of this Board to continue the bases of pay resulting from the decisions of proper authorities of the Railroad Administration, but it is very properly a question whether this Board intended to vitalize decisions which by instructions of the director general were to only apply up to the end of federal control and continue them in the same manner as it did acts of the Railroad Administration prior to the date of its decision.

These decisions have such extensive ramifications and are so utterly out of all reason in the light of practical conditions and the extravagant payments resulting, as repeatedly stated herein, that we feel the only practical way to properly dispose of these complications is by negotiation between the managements of the individual properties and the proper representatives of their employees, and that no Railroad or tribunal could justify such expenditures and expect that the patrons of the railroads should pay rates for producing revenues to be expended in such a manner.

### "Independent" Organizations Testify

Representatives of the various "independent" organizations who have been fighting since the creation of the Board for the right to be heard as organizations in the present case began the presentation of their case to the Board on February 7. J. L. Eldridge, vice-president of the Railroad Yardmasters of America, P. F. Richardson, president of the American Federation of Railway Workers, T. A. Austin, president of the Dispatchers, Telegraphers and Agents (an organization on the Pennsylvania), P. J. Coyle, president of the Brotherhood of Railroad Station Employees, E. H. Morton, president of the Order of Railroad Station Agents, M. H. Comerford, International Union of Steam and Operating Engineers, T. H. Eiland, president, Colored Railway Trainmen, and R. L. Mays and O. Long, Railwaymen's International Benevolent and Industrial Association, consecutively presented testimony for their respective organizations. In practically all cases the eight-hour day with time and a half for overtime was asked for the employees represented, instead of the monthly rates upon which the majority of these employees are now working.

### Jewell Presents Rebuttal

Mr. Jewell in the interval granted him to prepare a reply to General Atterbury repaired to New York and retained Frank P. Walsh, the labor counsel, and W. Jett Lauck, economist, and a battery of publicity men to assist in bringing a conspiracy charge before the Board. Mr. Jewell planned to ask for postponement of consideration of the question of national agreements and for a hearing upon the

evidence the unions wished to present in support of their charge that railway executives and financiers have conspired to re-establish autocratic control of the transportation industry.

Chairman Barton in opening the session on February 10 read a resolution passed by the Board which prohibited the presentation of such evidence and which pointed out that the Interstate Commerce Commission is the proper body before which to present such charges.

This action of the Board entirely disrupted Mr. Jewell's plans, and he immediately asked for a ten minute recess to formulate a new plan of attack. The Board's resolution also denied General Atterbury's requests for immediate abrogation of the National Agreements and for the right to pay unskilled labor the prevailing rate in the territory where they are employed. The resolution, after reciting the history of the present case, stated that the Board must hear all of the evidence before ruling on the National Agreements and that it was powerless to grant General Atterbury's request regarding unskilled labor because the matter has not been brought before the Board according to the procedure outlined by the Transportation Act.

After a short recess Mr. Walsh began a presentation on behalf of the employees. He confined his remarks to replies to General Atterbury, attacking the Pennsylvania and charging that his statements are misleading. That the railroads are in a precarious financial condition was denied by Mr. Walsh, although the statement was not accompanied by proof. He also asked the Board to subpoena a list of railway executives "to show that the application of the rules of the National Agreements was not wasteful." This list includes the following: R. S. Lovett, J. D. Rockefeller, Jr., W. D. DeForest, A. H. Smith, G. F. Baker, Samuel Rea, H. S. Vanderbilt, L. F. Loree, A. J. County, F. H. Davis, W. W. Atterbury, Howard Elliott, Julius Kruttschnitt, Fairfax Harrison, A. H. Harris, C. Hayden, C. Steele, J. E. Reynolds, E. T. Stotesbury, T. DeWitt Cuyler, H. Walters, M. H. Smith, A. W. Krech, E. V. R. Thayer and C. E. Ingersol.

**Colonel Bugg Explains A. B. & A. Situation**

B. L. Bugg, president of the Atlanta, Birmingham & Atlantic, in connection with the refusal of the employees of that road to accept a reduction in pay, has issued a statement in which he declared that if the people of Georgia feel that the road is of value to the commonwealth, it is for them to voice that feeling without delay. The road is now losing \$1,000,000 a year. It is out of the question to ask for increased freight or passenger rates. If they were granted people would travel over other lines, and ship their freight over the lines of competitors. Continuing, Colonel Bugg says:

"If we offered the road for sale, we couldn't even find a prospective purchaser. No one wants to buy a property that is losing \$1,000,000 annually. Our payroll has increased almost three-fold for each employee since the war began. If the reduction we ask for is granted, we can continue operation. If it is refused, right at this time, I see nothing for the owners of the property to do but get what they can out of it by scrapping the whole thing. The controversy concerns the people of Georgia to a far greater degree than merely their interest in the wage troubles. The question has already been raised at the hearing before the board at Chicago whether or not the road is of sufficient value as a public servant to justify its continuance, and if in case it should be scrapped, the necessities of the communities it serves would not be cared for by other existing roads in stronger financial condition.

"If the people of Georgia feel that this road is of value to the state and its citizens, and that it performs a public service that cannot be dispensed with without imposing

great inconvenience upon the industry of the state and loss upon its citizens calamitous in magnitude, it is time for some expression to be given and not wait until decisions and judgments have been rendered which will start this property on the way to the junk pile. Has not the state of Georgia and its citizens an interest here that is superior to that of the owners of the property or its employees?"

"Although the road has been in the courts for a long time, it has always been able to pay its operating expenses up until the time it was taken over by the federal government. Since the establishment of our road, the tax values in the counties traversed by its lines have increased from \$50,000,000 to \$360,000,000 and a large part of that territory is served by us exclusively. The arable lands for five miles on each side of our right of way have increased \$40,000,000 in value during that same time.

"More than 1,000,000 people are served by our line exclusively. If this road should be scrapped they would be without rail transportation. And we furnish absolutely the only competition for many of our most important towns, including Fitzgerald, Douglas, Moultrie, Waycross, Thomasville, Vienna, Montezuma and LaGrange. And there's no part of the system that can be lopped off and permit the rest of the system to remain in operation. We are getting about the same returns from each of our branches."

**Railway Mileage of the World**

THE BUREAU of Railway Economics has issued the following compilation showing the railway mileage of the various countries of the world as of 1917, taken from the Archiv fur Eisenbahnwesen for July-August, 1919:

Continent and country	Miles of railway	Continent and country	Miles of railway
<b>AMERICA:</b>			
Alaska .....	655	Algeria and Tunis.....	4,220
Argentina .....	22,310	Belgian Congo.....	1,038

## Railway Funded Debt

THE BUREAU OF RAILWAY ECONOMICS has compiled a table showing the railway funded debt actually outstanding, maturing each year from 1920 to 1949 and each 10-year period thereafter, compiled from the annual reports of the carriers to the Interstate Commerce Commission as follows:

RAILWAY FUNDED DEBT (ACTUAL) OUTSTANDING MATURING EACH YEAR FROM 1920 TO 1949, AND EACH TEN YEAR PERIOD THEREAFTER

Railways of Class I—United States					
Year of maturity	Mortgage bonds	Collateral trust bonds	Income bonds	Miscellaneous obligations	*Total
1920..	\$102,098,600	\$33,088,000	\$3,898,000	\$15,090,140	\$154,174,740
1921..	73,904,585	227,013,900	.....	21,554,288	322,472,773

\*Does not include equipment obligations amounting to \$271,161,225 and also \$11,750 receipts outstanding for funded debt. Adding these amounts to the total of \$8,795,696,142, the total funded debt actually outstanding of the railways of Class I amounted to \$9,066,869,117 on December 31, 1919, which is approximately 82 per cent of the total funded debt of all steam roads in the United States. Foregoing returns do not include data for the Pittsburgh, Shawmut & Northern R. R.

## Increasing Car Mileage\*

By L. R. Smith

Supervisor of Transportation, Southern Pacific, San Francisco

THE CAR DISTRIBUTOR and his force form the nucleus around which the fabric of increased car mileage must be built. Therefore, it is most important that the car distributor be a specialist in car handling, and that he be surrounded by a competent and sufficient force. The car distributor's bureau is a poor place to practice extreme economy. In the conduct of his office, he should have the necessary information from all sources, including a daily report from each agency station showing the number of each car on hand at that station at a given time each day, the date of receipt, whether loaded or empty, loading or unloading, an explanation of the delay, if delayed, and whether required for loading, if empty. Each

local way-freight conductor should render a report of cars on hand, set out and picked up at non-agency stations, showing loads and empties, and any other information which may be required to insure prompt disposition.

The car distributor's territory should be so restricted and his duties so limited as to afford him the time necessary to analyze the reports received, associate empty equipment with outstanding orders, and direct the attention of the proper officer to delays or improper movements.

Above all the desired results depend upon the education of those interested in car movement as to the actual value of a car day. Price lists show the values of materials and scrap. Requisitions for supplies are checked carefully, as they represent actual money on their face. Everyone knows the rate of per diem paid upon foreign cars, and to a considerable extent that figure influences prompt movement. But few realize the actual value of a car per day, or that it has an actual monetary value. "Price lists" showing the money valuation per day for each class of car for the prevailing season, placed before each employee involved in the handling of cars; the same information placed before shippers in such way as to impress upon them the effect wastage of car time has upon them will soon have everyone watching for possible leaks in car days.

## Enlist the Employee

By M. Nicholson

General Manager, C. M. & St. P., Seattle, Wash.

Increased car miles can be obtained only by interesting every employee who has an opportunity to speed up the loading, unloading or movement of a car. Employees have been over-instructed through letters, circulars, bulletins, etc., but the personal appeal to the employee to do his best is the most effective. If the car repairer responsible for the repair of the car and its movement to and from the repair track; the roundhouse organization responsible for furnishing power for the prompt movement of trains; the agent, despatcher and yard forces who have the direction of movements in hand; the track forces who have the upkeep of the tracks in their charge, are all directly interested in speeding up the movement of a car, and if the individual employee in each department sees only the one object of avoiding delay to cars, whether loaded or empty, there will be a decided improvement in the average miles per car per day, and the traffic of the country will be moved with much greater despatch than heretofore and without additional cars. Additional tracks, roundhouse facilities, and power, are essential long before any increase in the number of cars.

*The Columbia Bridge Presents an Attractive Appearance*

## New Bridge Marks Progress in Transportation

Four-Track Structure of the Philadelphia & Reading Crosses Schuylkill River at an Historic Site

By Harry B. Glisson

Assistant Engineer, Philadelphia & Reading, Philadelphia, Pa.

**O**CCUPYING THE SITE of what was one of the first large railroad bridges constructed in this country, the Columbia bridge of the Philadelphia & Reading in the Fairmount Park section of Philadelphia, Pa., is now well along towards completion. The crossing of the Schuylkill river at this point has for nearly a century carried a large

Philadelphia & Columbia Railroad, one of the earliest steam lines constructed in Pennsylvania, and, in fact, in the United States. The bridge spanned the Schuylkill river between Rockland and Belmont, in Fairmount Park, Philadelphia. It was 1,050 ft. long, with seven spans and carried both a double-track railway and a carriage way, with a total width

Turning Two Arches at One Time with Steel Centering

amount of traffic in and out of that city. It is the growth of this traffic in connection with the use of heavier power that has made it necessary to replace a double-track through-truss iron bridge, the successor of the original bridge, with a four-track reinforced concrete structure of modern design and pleasing appearance. A brief history of the operations over both the original bridge and the new, forms, in a measure, an interesting commentary on the growth of the transportation system of this country.

The original Columbia bridge was built by the canal commissioners of the state of Pennsylvania in 1834 for the

of superstructure of 48 ft. It was built of white pine timber and, owing to the careful manner in which it had been protected from the weather, the bridge when removed in August, 1886, was as good as when first constructed in 1834.

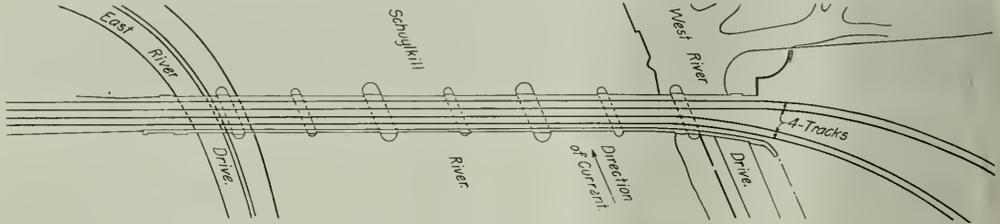

### Interesting History

This wooden structure was the first railroad bridge of any considerable size constructed in the United States, and was the oldest wooden railroad bridge in existence at the time it was dismantled and removed in 1886 to make way for an iron superstructure. The following description written about

the time of the removal of the old wooden structure in 1886 is of interest:

Strange burdens have been borne across the old bridge during its half century of usefulness. Unnumbered thousands of pedestrians have tramped its floors, and vehicles of every description have rolled along through its dark tunnel-like structure. Not only have freight and passenger trains crossed the river upon its substantial arches, but even canal boats have been trundled across and brought into the very heart of the city of Philadelphia.

Until the construction of the Pennsylvania Railroad numerous canal boats were built in detachable sections. Freight was loaded on these crafts at Pittsburgh and other points and the boats were taken by land and water to their destinations.

The Bridge Is in Full View from Drives on Either Side of the River

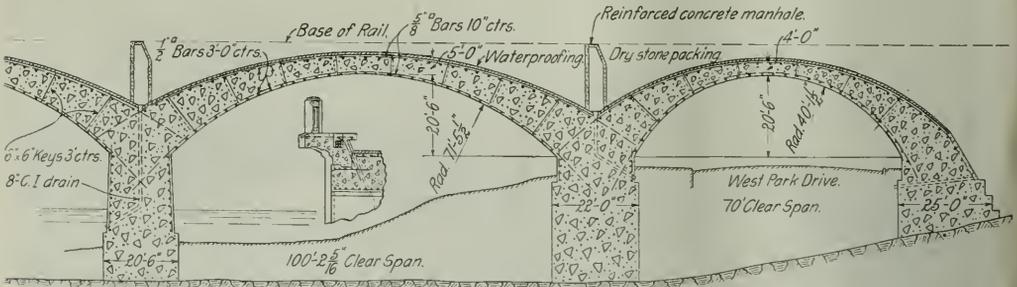

At the termination of the water routes the sections of the canal boats were detached and each run upon a truck. They were then drawn from the water and placed upon the railroad tracks over which they were conveyed to their destination. Freight loaded upon boats in Pittsburgh was often unloaded from the same vessels in the Market street warehouses of Philadelphia.

The above description refers to what was known as the State Works, embracing the western division of the Pennsylvania canal from Pittsburgh to Johnstown, the Portage Railroad with its ten inclined planes over the Allegheny mountains to Hollidaysburg, the Middle division of the

iron truss bridge. Several years ago the floor system of this bridge was strengthened and now this structure has been replaced, having become too weak to carry the present traffic safely.

#### Traffic Handled

The traffic passing this point consists of all the freight and passenger trains received from and delivered to the Baltimore & Ohio at Philadelphia; the traffic to and from the Central of New Jersey over the New York division of the Philadelphia & Reading, and a large portion of the traffic of the Reading, including that derived from the indus-

General Details of the Masonry

Pennsylvania canal, extending from Hollidaysburg to Columbia, and the Philadelphia & Columbia with its inclined plane at Columbia, ascending from the Susquehanna river, thence by locomotives to the head of the inclined plane at Belmont, descending to the Schuylkill river where the road crossed the Columbia bridge and entered the city, via Pennsylvania avenue, the route of the old Union canal to Broad street, where it then turned into Market street.

The main line of the Philadelphia & Reading was opened for traffic in 1838, between the cities of Philadelphia and Reading, and in order to reach the business center of the city of Philadelphia the railroad used a portion of the state road jointly with the state of Pennsylvania, from a point just north of the Columbia bridge and extending to its

tries along its main lines in this part of the city of Philadelphia and the Chester branch.

About 80 trains every 24 hours with an approximate average weight of 12,000 tons each are handled over this portion of the main line and in addition to this volume of traffic, numerous shifting movements are made to and from the Belmont yard located at the north end of the bridge. The through-truss bridge was not considered safe to pass the Mallet and Mikado locomotives used on the Reading and in addition the heaviest locomotives permitted to pass over the old truss bridge were not allowed to pass others of the same class while on the structure. All trains were required to reduce speed to 20 miles per hour while crossing.

Because of these conditions it was decided to replace the

double-track through-truss bridge with a modern concrete structure located at the side of the truss bridge and far enough up stream to permit of the completion of one-half of the new concrete bridge, which could then be placed in service before removing the old structure. The line of the new bridge was given a slight angle with the old in order to permit of a better alinement at the north end.

#### Plans Approved by Art Jury

The plans as approved by the Art Jury of the City of Philadelphia and the Water Supply Commission of Pennsyl-

Preparing for the Construction of the Second Section

vania and adopted by the railroad called for a four-track concrete arch bridge having eight spans and with a foot walk on the up stream side of the bridge. The eight spans consisted of two arches over the Fairmount Park driveways on each side of the river, each with a 70-ft. clear span, and six arches over the river with clear spans of 100 ft. 2 $\frac{5}{8}$  in.

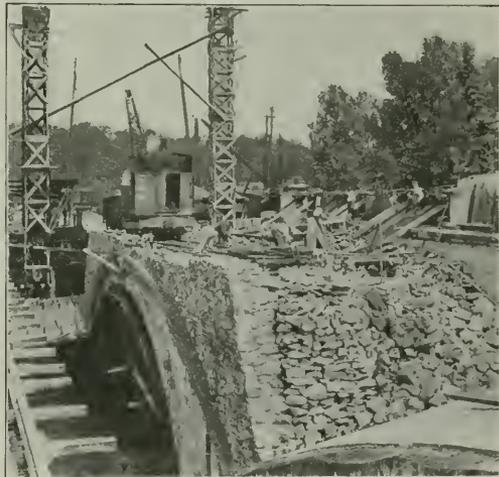

The Work on the First Section Nearing Completion

each, all measurements being taken at the spring line and at right angles to the faces of the piers. In order to provide the proper rise for the spans and the required distance from the top of rail to the extrados of the large arches it was necessary to build the tracks at an elevation about 3 ft. higher than that over the old and revise the grades both north and south of the new bridge.

#### The Design

The design provides for four tracks, 13 ft. center to center, and a foot walk on the up stream side with vitrified clay ducts in each coping for electric light, signal, telephone and telegraph wires. The center lines of the piers have been placed parallel to the direction of the current in the river and make an angle of 65 deg. 41 sec. with the center line of the bridge. The total length of the bridge between the faces of the abutments is 971 ft. 3 $\frac{7}{8}$  in. with a total width under the coping of 57 ft. 6 in.

Each arch is a segment of a true circle with a rise of 20 ft. 6 in., the radii of the large arches being 124 ft. 9 in. and 71 ft. 5 $\frac{1}{2}$  in. and the smaller 76 ft. 3 $\frac{3}{4}$  in. and 40 ft. 1 $\frac{1}{2}$  in., giving a crown thickness of 5 ft. and 4 ft., respectively. Abutment piers located in the river channel are 28 ft. wide at the spring line. The two piers at the short spans over driveways are 20 ft. wide and the three intermediate piers are 16 ft. The design permits the turning of two large arches and the removal of the steel centering in

Constructing the Masonry Wall to Retain the Stone Packing

one operation, the abutment piers providing the stability for the concrete as placed. All the piers have circular ends and are battered  $\frac{1}{2}$  in. per ft. on all faces.

Steel reinforcement was used to provide for stresses due to changes of temperatures in the piers, arch rings, spandrel walls, copings and balustrades, and was placed 3 in. back from the face of the concrete. The reinforcement in the neat work of the piers consisted of  $\frac{1}{2}$ -in. rods spaced 3 ft. vertically and 2 ft. horizontally. In the arch rings, extrados and intrados it consisted of  $\frac{5}{8}$ -in. rods spaced 10 in. center to center parallel with the center line and  $\frac{1}{2}$ -in. rods spaced 3 ft. parallel to the faces of the piers. In the back of the spandrel wall,  $\frac{3}{8}$ -in. rods were placed on 1-ft. centers. Every alternate rod extends the full height of the spandrel wall and into the arch ring for a distance of 2 ft. This arrangement provided a bond between the arch ring, the spandrel wall and the coping, the long rods also extending into the coping.

For construction purposes the large arch rings were divided into seven sections, and the small into five. The construction joints in the arch rings were carried through the spandrel wall, the coping and the balustrade, after which the top of the joint through the sidewalk and the coping was filled with waterproofing cement to prevent any water

from passing through the joint and down the face of the spandrel wall.

At the piers the construction joint was made where the post and balustrade meet and in order to prevent cracking of the balustrade No. 16 sheet zinc was placed between the joint under the balustrade and the joint between the balustrade and the post so that the balustrade concrete between these two points is free to move with changes in temperature.

Method of Construction

The work of construction was started in July, 1917. Excavation was started at the north abutment. Wood was used for all framework and sheeting. The work was carried on for two river foundations at a time and progressed from the shores toward the center of the river with the greatest depth of foundation below normal water of 23 ft. The most troublesome foundation to excavate was for Pier No. 1, the material removed being large stones, a cubic yard and greater in volume, similar to the material composing the entire area of the bank between the river and the park driveway. The water from the river reached the excavation in such volume that a puddle was necessary along the bank of the river for a distance of 300 ft. to stop the flow. The bottom of this foundation was 20 ft. below normal water level.

Wooden forms were used for all neat work concrete, the lumber being tongued and grooved, surfaced two sides, and 1 1/2 in. in thickness. Wooden centers were used for the

Contrast the Old Original Bridge with the New

70-ft. spans over the driveways, and steel centers for the larger spans, sufficient for turning two arches at a time. The forms for the umbrella sections over the piers were supported in some cases by the steel centering, and in other cases they were built up and supported from the foundation offset.

Floating derricks were used for handling the steel centers, the cofferdam construction, the excavation from the river piers and for the puddling on the outside of the cofferdams. The material for the puddle was dredged from the river channel up and down stream from the bridge site.

Most of the concrete was mixed at the north end of the bridge and transported by narrow gage cars, attached to a cable and operated by a steam hoisting engine at the same end, the movements being controlled by electric bells. The narrow gage track was placed at the side of the truss bridge and supported by the lower chord members. Two 1-yd. side dump cars were attached to the cable, and the concrete chuted from the cars through steel spouts into the forms.

The concrete mixing plant consisted of two 1-yd. mixers operated by steam and fed from an overhead storage bin by gravity. The sand and the crushed gravel were clam-shelled into the bin from storage piles. From the mixers the concrete was elevated and chuted into a hopper over the narrow gage track, that delivered it to the dump cars. All concrete was of a 1-2-4 mix. Embedded stone was used below the spring line in all foundations, piers and abutments.

All backs of arches and spandrel walls were covered with three layers of asphalt-saturated fabric attached to the concrete, fastened together and covered with melted asphalt, making a solid waterproof membrane. This was protected from injury by being covered with a layer of 1-2-4 concrete 2 1/2 in. in thickness, reinforced with No. 12 electrically welded wire cloth of 4-in. by 4-in. mesh. All filling over the arches to the height of sub-grade consisted of one and two man stone packing. Drainage was provided at each pier through an 8-in. cast iron pipe with the discharge end of the pipe placed below the normal water level of the river and a masonry manhole over the mouth of the pipe, with suitable openings in the sides of the manhole to permit the water to reach the pipe. The top of the manhole was brought up to the level of the top of the ties and covered with a cast iron cover in order that the drain pipes and the openings leading the drainage to the manholes could be cleaned.

The outlet of the drains being below the normal water surface will not be visible and it is not likely that they will be stopped up by ice forming in the pipes, except perhaps in extremely cold weather, when an extra thickness of ice forms on the river.

All of the engineering work was done by the company forces of the Philadelphia & Reading under the direction of Samuel T. Wagner, chief engineer; Clark Dillenbeck, assistant chief engineer; Edwin Chamberlain, assistant engineer, and the writer in charge of the forces at work in the field. Before the work could be placed under contract the approval of the Art Jury of Philadelphia, the Fairmount Park Commissioners, the Water Supply Commission of Pennsylvania and the Public Service Commission of Pennsylvania had to be secured. Seeds & Derham, Germantown, Pa., were the contractors for the masonry and grading.

REPRESENTATIVE MANUFACTURERS of Massachusetts and Connecticut will leave on March 12 in a train of 5 Pullman cars, a dining car and a club car for an extended trip in Mexico. The purpose of the excursion is to examine the possibilities of trade extension in that country and make friends with the business men and government officials. The party will return to this country on April 4.

From American Railroads

# Selling American Railway Supplies Abroad\*

Organization of Specialists, Intelligently Supported, Will Get Results at Reasonable Expense

By David Van Alstyne,  
American Locomotive Company

I SAILED IN MAY, 1919, for Capetown and continued for 17 months through South Africa, Rhodesia, Belgian Congo, Portuguese East Africa, British East Africa, India, Federated Malay States, Java, Australia, Philippines, China, Korea and Japan. The principal sources of information upon which I depended for railroad statistics, names and addresses of railroad officials, etc., were the American consuls and the Vacuum Oil Company. Mr. Whaley, vice president of the Vacuum Oil Company, had very kindly supplied me with letters to many of his foreign representatives, but whether I had letters to them or not, I always found them glad to give me any assistance I asked them for.

As for the American consuls general I have found them everywhere not only exceedingly well informed but anxious to be of all the assistance possible. For example, one consul general, not content with what he could give me himself, called up a banker friend and asked him to come to his office and give me more, which he did. Another took me to his club to have me meet people worth knowing; another told me that any time I would write him he would gladly interview or gather information concerning anybody we might have under consideration as agents. Still another, instead of directing me to a man I wished to meet, went with me and introduced us. I cite these incidents to show the character of the men we have representing us in our consular service which I feel we have every reason to be proud of; in fact, the treasurer general of Portuguese East Africa told me that he had served the Portuguese Government in several places throughout the world, and that in his opinion our consular service is the best in the world, though he thought the German service was superior to ours before the war.

I wish also to testify to the value and accuracy of reports, in so far as I have been able to check them, made by our trade commissioners, such as those by Frank Rhea on the railways of Australia, China and Japan.

## South African Railways

The railways of the Union of South Africa have 10,000 miles of track, 3 ft. 6 in. gage, generally well constructed with heavy rails and good ballast, but laid according to the natural contour of the ground almost without cuts or fills, going around sharp curves where the hills are too steep, or over them where the grade does not exceed 1 in 30.

A great deal has been and is still being said and written concerning the importance of changing the gage to 4 ft. 8½ in. My judgment is that the gage will never be widened because the economy to be effected will not justify the cost. South Africa, like Mexico, is a high plateau, making it necessary to climb long steep grades of 2 per cent to 3 per cent up 4,000 ft. to 6,000 ft. to get up into the country from any port on the coast. Water is scarce and irrigation expensive. Several times as much land is required to raise an equal number of cattle or sheep as in this country. The distances are great and settlement and development of the natural resources must necessarily be slow. Imports or uphill tonnage will be light in comparison with the extent of the country, while exports, comprising the heavier tonnage, such as coal, beef and some grain, is down hill.

What is vastly more needed than change of gage is reduction of curvature and grades, and this is fully recognized by the able and aggressive general manager, Sir Wm. Hoy, who is carrying out such a program as rapidly as he can afford it, besides equipping the road with locomotives and cars of large capacity. Already he is operating several thousand forty-ton coal cars and has begun the application of heavy couplers in place of the hook and link. I apprehend, also, that before very long their difficult braking conditions on mountain grades will result in the displacement of the vacuum brake by the pressure brake, though thus far there appears to be little enthusiasm for such a change.

Also I understand that as a result of a report recently made by an English electrical engineer, it is likely that the mountain grade out of Durban and perhaps the Capetown suburban service may be electrified. I very much doubt the possibility of any such economy as the report claims, but experience seems to indicate that the electrification microbe is of a variety that either we do not get the disease at all or we get a fatal case, rarely a reasonable attack.

## Ills of Government Ownership

The South African Railways are government owned and operated and subject to all the ill and evils pertaining thereto. Almost everywhere I have been, the railroads are either partly or wholly controlled by the government, and the results of government operation seem to be about the same everywhere. While the service rendered may be fairly good, it appears to be universally expensive. I have met many able railway men who would rejoice in the opportunity to produce better results, but on account of the difficulty in getting prompt or intelligent action from the government, there is more or less prevalent lack of enthusiasm and a disposition to say "we can't do any better because we are a government proposition." Also I think there is no doubt that government railway labor is more difficult to control because of the meddling of politicians, and this is particularly noticeable in South Africa and Australia.

A former chief commissioner of the Government Railways of New South Wales told me that good results on a government railway depend far more on the ability and force of the chief executive than they do on a privately owned railway, because he accomplishes his good results in spite of his superiors and not because of the support he receives from them.

It is a rare thing to hear a railway official speak in favor of government operation, and about the only good argument I have heard in its favor is that the government can better afford to build and operate at a loss in undeveloped countries than private capitalists. I should also note that labor commissions are often more interested in votes than in efficient service thereby making good discipline difficult to maintain.

## American Railway Supplies in British Colonies

South Africa has enjoyed a slow but steady growth in its imports and exports for a good many years and will continue to do so, and there is a relatively small but growing market there for American railway supplies.

Having traveled under the British flag for ten months and made the acquaintance of a large number of British railway men, I am convinced that we exaggerate their prejudice

\*An address made before the October meeting of the executive committee of the Railway Business Association.

against American goods, and that a good deal of the prejudice which does exist is justified, due to inferior goods or goods not made as they want them.

Englishmen are conservative and, I think, more than other nations disposed to think that what comes from their own country is necessarily better than that from other countries, but the Englishman is always a gentleman, always receives you cordially and is always ready to listen to what you have to say. When you can deal with such men as the large majority of those I have met, it is only a matter of time when their prejudice will be overcome.

I could cite a good many instances of unexpected courtesies I have received at the hands of British railway men. As instances showing a tendency in our favor, I might cite the case of one chief mechanical engineer who told me he was glad that now that the war is over he will not have to buy any more engines in America or Canada, but volunteered the information that he was using Baldwin engines, purchased during the war, on his hardest passenger run. Another chief mechanical engineer said he always liked to see American builders because he could get so much more worthwhile information from them than from the British. Another told me that he is adopting many American practices and designs.

In another instance, the managing director of one of the largest roads in India told me there was a growing dissatisfaction with their buying through London because their London buyers so frequently sent them what they chose to rather than what was ordered, and that sooner or later they will break away from buying through London and buy direct. Still another case is that of our consul general at Sydney, New South Wales, who told me that in a recent report the British consul at Sydney had advised British manufacturers that they had better make their packages more attractive in appearance if they wished to hold on to the little trade left them by Americans.

#### Rhodesia and Belgian Congo

Of Rhodesia and Belgian Congo there is not much to be said except that the principal industry in the Congo is copper mining and smelting belonging to British, Belgian and French capitalists, and managed by Americans.

Also a railroad is projected and partly built from Elizabethville to Lobito Bay on the coast of what was German Southwest Africa, to shorten the haul from the Congo to England, the route at present being south to Bulawayo and east to Beira in Portuguese East Africa.

To compete with the Lobito Bay Line the Rhodesian and Beira & Mashonaland railways were considering building a cut-off from Salisbury northwest to a point in the neighborhood of Livingston, which would materially shorten the distance from the Congo to Beira.

#### The Situation in East Africa

Portuguese East Africa is said by South Africans to offer the greatest opportunities of all the undeveloped countries in the world in agricultural products, timber and minerals.

The Mozambique Chartered Company, J. Gordon Brown, general manager, with office at Beira, is spending a great deal of money in various kinds of development, including building a railroad 150 miles from Beira to Chindio on the Zambesi river to connect with the Nyassa Railway.

Judging from conversations with the governor general at Beira, the treasurer general at Lorenzo Marques and others, the Portuguese are very anxious to have Americans invest in Portuguese East Africa to offset the growing influence of and control by the British, and it is common talk that it is only a question of time when Delagoa Bay, the harbor at Lorenzo Marques, will come under the control of Great Britain in payment of a loan made to Portugal.

On the other hand, it is stated that due to frequent changes in the Portuguese government, and peculiarities of Portu-

guese methods, it is difficult for foreigners to do business in Portuguese East Africa, though it is to be noted that it apparently has not seriously retarded the British. Tropical fevers are a serious handicap to white men living in the interior of Portuguese East Africa.

The treasurer general at Lorenzo Marques told me that Americans are the most timid people in the world in the matter of extending credits and the chairman of the board of probably the largest importing and exporting concern in South Africa and doing business up the east coast as far as Uganda, told me that in 25 years' experience handling British and American goods he had never represented but one American house which would accept such risks as are commonly accepted by those of other nations.

At Mombassa, British East Africa, I found quite a boom on, many discharged soldiers going into the country to take up land allotted to them by the government, though there were also a good many people coming out of the country, having had enough of it after a short trial.

Also, at Mombassa, I was told by C. D. Gun-Browne, who had charge of the transport service in the German East Africa campaign, that he had several groups of motor cars of various makers, both British and American, and that the Ford group was the most reliable of all and the least expensive in maintenance.

It is also of interest to note that Cecil Rhodes' dream of a "Cape to Cairo route" is a reality now by rail and water, except a few hundred miles, I believe, in Uganda.

#### India and Its Problems

India has 25,000 miles of railway, one-half of which is 5 ft. 6 in. gage, with the balance chiefly metre gage. The country is quite level in most parts, the railway equipment light, with light trains the rule. Clearance limits are too low and narrow to ever permit fully utilizing the possibilities of a 5-foot 6-inch gage. They use the hook coupler and vacuum brake, but have a committee at work on a heavy automatic coupler. Many of the railway shops are modern and well equipped and they build a lot of their own equipment, at a reasonable cost.

At Jamalpur on the East Indian Railway, they were making the finest looking basic open-heat castings I have ever seen, and in the iron foundry, barefooted and practically naked molders and helpers were pouring off a 100-ton heat. The Tata Iron and Steel Company at Jamshedpur rolls plates, shapes, bar and rails and employs 20,000 natives. The ownership I understand to be British and Parsee, but the management is American.

One of the most serious problems in India is that of fuel. Their high grade coal in the eastern part of the country is giving out, but there are large deposits in the western part of low grade coal which they seem to have been unable to burn successfully on a grate, and they are, therefore, much interested in finding out about burning it in pulverized or some other form. Fuel oil is said to be too expensive for all the roads, except one or two which can get it direct by water from Persia.

The ratio of natives to white people in India is about 2,000 to one, and the bulk of railway business is native third-class travel, which is very cheap and profitable. Not much attention is given to keeping a check on first-class passengers and of about 800 rupees worth of tickets I bought, I still have three-quarters unpunched and not even looked at.

#### Federated Malay States and Java

The Federated Malay States Railway, metre gage, has excellent roadbed and equipment, and runs some very fine passenger trains at uncomfortably high speed for the narrow gage. Kuala Lumpur, the railway headquarters, 250 miles north of Singapore, has government and railway buildings which would be a credit to any city. While I was at

Kuala Lumpur, 2,000 native railway shop employees returned to work after a two weeks' strike for more money.

Everywhere I have been I have observed that no matter how otherwise primitive and unsophisticated the natives may be, they are able to organize sufficiently to make demands and call strikes. In Johannesburg the native gold miners sent a committee to meet the employers and demand higher wages and better conditions. At Bulawayo I witnessed a conference between 300 striking Matabels sitting in a circle on the ground and the railway general manager standing in the centre. Many thousand Indian coolies were on strike in the Bombay jute mills, and a little later the Tata Iron and Steel Company had a prolonged strike almost forcing them to close the plant. In Hongkong the native electricians' union struck and stopped the tram cars and electric lighting. In Shanghai the dock laborers struck, and I learned that numerous unions were in process of being organized. In Japan organized labor is becoming very strong, and wages have increased a higher percentage since before the war than they have here, though, of course, the difference between Japanese wages and ours is greater than ever.

Everywhere that I have been able to make observations, output per man has been much below ours, whether from white or native labor, and ranging, I should judge, from one-half to one-fifth. Some of the difference is, of course, attributable to our better equipment. Rarely have I been able to find railway shops which had a good cost system, and railway statistics as we have them are almost unheard of. The principal exception is the Chinese Government, which issues annually an excellent report, devised by Americans.

Java has an excellent railway, 3 ft. 6 in. gage, running the length of the island—500 miles. The government is said to have a large program for railroad construction and other development in Java, Sumatra and Dutch Borneo. The Java Dutch seem to prefer to do business with Americans and are anxious to have American capital invested in the Dutch East Indies.

I was told that a great deal of American capital is being invested in rubber plantations in Sumatra and the Federated Malay States.

It was painful to see locomotives fired with teak and other hard woods which I suppose would be worth almost a dollar a foot here.

### Australia

Australia has a few more square miles than the United States and five million population. Three-fourths of the population live in six cities. It is a white man's country, and the government makes it almost impossible for any cheap Oriental labor to come in. The state governments are all more or less controlled by the labor party, and their policy seems to be to meddle with all kinds of business. Whenever the newspapers or a group of agitators can make a good case against some branch of private business, the government takes it over and makes it worse. Almost all the railway and tramway mileage is government owned and controlled.

There is little immigration and very little outside capital coming into the country. Business men claim that the governments are killing all enterprise and development, and many of them predict a revolution. The ratio of government employees to total population is said to be one to five, the highest in the world. Chinese labor, which can stand the intense heat, is much needed in Queensland on the sugar estates. The Queensland government forbids it, and the sugar industry is only half developed.

The railways skirt the coast from Fremantle on the west coast to north of Brisbane in Queensland on the east coast, there being very little mileage in the interior; in going from Fremantle to Brisbane, 3,500 miles, the gage changes five times. Three gages are in use—3 ft. 6 in.; 4 ft. 8½ in. and 5 ft. 3 in. According to three chief commissioners whom

I met, the cost of keeping idle equipment and labor for transferring goods and passengers at points where the gages change is tremendous.

All the railways have water competition and since the fertile country is along the coast and the interior is a desert, or subject to droughts, there is not likely to be very rapid railway extension into the interior.

In the matter of unifying the gage there is a good deal of jealousy between the states, but the general opinion seems to be that in the course of time they will all adopt 4 ft. 8½ in., which is the federal territory standard.

The good coal being near the southeast coast, the cost of fuel is a serious matter in south and west Australia, and since there are large deposits of low grade coal in south Australia, they are much interested in finding some way to use it, either by pulverizing or through some other process.

At Sydney I visited the Clyde Engineering Works, which has an order from the New South Wales Government Railways for 300 locomotives. The government railways of New South Wales and Victoria have fine shops and build much of their own equipment. At Newcastle there is a large steel plant locally owned but having an American manager.

In my travels I have met many Americans in business and several managing large industrial plants, but nowhere any American railroad men, except two in China, managing roads still on paper, and one in Manila. Since I left Australia, I have read in the *Railway Age* that an American named Clapp has gone out to Australia to be chief commissioner of the Victorian Government Railways.

The policy of the Australian governments is to patronize home industries as far as possible, and railways are not permitted to buy outside the country what can be had in Australia.

### The Philippines

Manila has 600 miles of 3 ft. 6 in. railway and a program for building 300 miles more. The uncertainty as to how soon the Philipinos will be given their independence retards development, and I heard Americans complain that American capital is being invested everywhere in the Orient except in the Philippines.

### China

China has 6,000 miles of railway, built and operated under many different managements which have three things in common, namely, a 4 ft. 8½ in. gage, an American vertical plane coupler and a uniform height of coupler, or nearly so.

All the railway mileage is in the eastern half of the country and undoubtedly the great extent of the country, the population of 400,000,000, and tremendous agricultural resources will call for rapid extension of the railways, whenever they can establish a stable government and put a stop to their endless civil wars. Gradually the government is taking over the control of the railways, but foreigners, especially the British, still control a considerable per cent of the mileage, and hence the buying also.

Practical railway executive talent is very scarce among the Chinese, and one of the most prominent Chinese engineers told me he hoped the foreigners would continue to manage those roads which they still manage because there are at present so few Chinese capable of doing it efficiently. Having had ample opportunity to verify this opinion, has led me to wish that Chinese students, who come to this country for a college education and expect to go into railway service in China, might first get some actual railway training which would be much appreciated by them and would carry a knowledge of American methods and equipment into China. Recently the Chinese-American Engineers' Society was organized in Peking, and I had the honor of becoming a member of it.

For the past year the Ministry of Communications has had

a Commission of Technical Advisers from several nations at work standardizing methods and equipment on the government railroads. The two principal advisers are an Englishman, T. R. Johnson, on maintenance of way and structures, and F. H. Clark, formerly of the Baltimore & Ohio on mechanical matters.

### Japan

In Shantung, Manchuria, Korea, Formosa and Japan the railway service is all under the control and management of the Japanese government and is generally very good.

The Shantung, South Manchurian, Formosan and Korean railroads buy, I presume, chiefly in the United States, but it is the policy of the Imperial Government Railways to get as much finished product as possible within the Empire.

Railway shops, locomotive works and plants exhibit exceptional energy and enterprise, but their productive efficiency, I should judge, is considerably below ours. Their production of steel is still small compared with their consumption, but with their extensive control of iron ore, coal and blast furnaces in China, they will, before long, supply practically all their requirements in steel, no doubt.

Japanese trade has suffered a very severe setback since the war, chiefly, I understand, for two reasons; one, the Chinese boycott and the other the almost universal unpopularity of the Japanese and Japanese goods. While the boycott has been more or less intermittent, sometimes feeble and other times very intense, it has on the whole been quite effective and very expensive to the Japanese. A representative of a large Japanese importing and exporting house told me the boycott had cost his firm millions of dollars, and in some places Japanese firms have been driven out of business.

The unpopularity of the Japanese seems to extend all over the Orient, and to all nationalities, being at its worst, I should say, among the British, but I am disposed to think that a great deal of it is commercial jealousy more than anything else. My personal experience with the Japanese has been exceedingly agreeable.

Japanese goods were condemned in almost every country I was in. In South Africa the complaint was that Japanese goods are never up to sample and that they will buy no more at any price. In India almost the entire freight car equipment of the country was running without power brakes because of the very inferior quality of the rubber hose, gaskets and rings they were obliged to take from Japan during the war, and in Australia there is a law excluding goods not up to the standard of Australian goods, which I was told was chiefly intended to exclude Japanese goods. It is interesting to note that the Japanese have in Korea exactly the same problem of cheap labor driving out the more expensive as we have in California.

In the railway shops in Dairen, Manchuria, and Seoul, Korea, only 25 per cent of the labor is Japanese because it costs considerably more than the native Chinese and Korean labor and is not worth the difference for most of the work.

### How to Create a Market for

#### American Railway Supplies

In all the countries I have visited, which comprise nearly all the civilized world except Europe and South America, it is to be observed that the volume of railway supply business is small in comparison with the enormous territory to be covered and that in all but China, Java and the Philippines there is more or less prejudice against American goods. Even in China there is prejudice against us on the part of the foreigners, to the extent that each nationality naturally prefers to buy of its own country.

On the other hand, all of these countries are still greatly undeveloped, but are growing, some rapidly, others slowly, and I believe that we have decided advantages over most other producing countries in that we have most highly devel-

oped the art of railroading, have the greatest productive efficiency, and superior methods and enterprise in introducing our goods. Having in mind, therefore, that our first problem is to create a market and considering all the conditions, I have been thoroughly impressed with the idea that, if practicable, American railway supply manufacturers should combine and handle their business through one or more large organizations which could afford to employ the highest class of talent.

The specialist who can convince the railway man that we offer the latest and best, who can talk the railway man's language and who can assist him in solving his difficulties by showing him how they have been solved in this country, it seems to me, is the man who will make friends for American railway equipment in countries where the best may be unknown and where there is prejudice against things foreign or different from what they are accustomed to. Steadily increasing wages and difficulty in handling labor would seem to me to help create a demand for the most efficient in railway equipment.

Such men, I should think, would come from the ranks of the first-class railway men. Being railway men they would be able to specialize in many classes of railway equipment sufficiently well for the purpose. Such men would provide the service necessary to keep customers satisfied after the goods are sold, and service is as much needed abroad as in this country.

In most countries outside the United States when you have won over the mechanical man, the job is practically done because he generally gets what he wants.

The small volume of business and the time required to enlarge it would not justify any one manufacturer in sending out the class of representatives I have in mind, but it seems to me that a group of manufacturers could well afford it and safely expect excellent results eventually.

I have heard a number of complaints from American representatives in foreign countries to the effect that we do not understand foreign trade; that we do not take proper care of it; that we are very anxious to get it when domestic business is bad but neglect it and lose all the ground previously gained, when domestic business is good.

One man told me that the intermittently hot and cold way his principals had of treating their foreign business was very discouraging; another that he expected to lose his mind trying to get his people to understand what was required in his territory; a third that a general officer of his company had not been out to study conditions in his territory for twelve years; and a fourth that when a man crosses the ocean to represent an American house, he might as well go to the moon in so far as any assistance from headquarters is concerned.

The general officer of one of our largest corporations, whom I met in Japan, said he had gone out to study conditions in the Orient, and that now his big problem was how to make the people at home understand them, which he felt would be a very difficult undertaking.

Other people are out after business also, but I doubt if any of them know as well how to get it as we do, with the possible exception of the Germans, whom I found after business in three places—Portuguese East Africa, Java and China.

Observation of the workings of the big import and export houses has not impressed me that they are the best adapted to exploit such highly technical goods as railway equipment, especially where such equipment has to be introduced into a new and prejudiced field. They have too great a variety of lines and too little specialized talent.

The problem is chiefly to create a market and having created it, to hold it. I have a firm conviction that an organization of specialists, intelligently supported would get results at reasonable expense.

# An Optimistic View of the Railway Situation\*

Favorable Public Opinion, Closer Co-operation and Wise  
Legislation Make Outlook Promising

By Julius H. Parmelee  
Director, Bureau of Railway Economics

IN DISCUSSING THE railway situation from an optimistic point of view, I am not unmindful of the depressing traffic and operating condition in which the railways find themselves at the present time. We are in the midst of a traffic slump. Revenues have declined, net earnings have been far from adequate since the rates were increased, and the labor situation is charged with dynamite. Let us, however, remove ourselves for a few minutes from present conditions and take a look into the future, which has in it, to my mind, many elements of optimism and of encouragement.

To get the perspective for such a forward look we must go back over railway history for 20 years. The period between 1900 and 1910 was of the greatest significance for the American railways. For one thing, the Interstate Commerce Commission during the decade secured what it had been demanding for years, namely, authority over interstate freight and passenger rates, with power to suspend rates, to initiate investigations with or without complaint, and to prescribe penalties for violations of its rate decisions. Total railway mileage grew about 25 per cent during the decade, whereas business grew at a much faster rate. Freight traffic increased 80 per cent, while the passenger traffic more than doubled. The general level of prices increased about 2½ per cent a year, while railway wages rose about 2 per cent annually. Although the operating ratio increased during the decade, the rate of return on investment increased from about 4½ per cent to about 5½ per cent. In other words, although the railways experienced a period of rising prices and wages, they kept ahead of the increase in cost of operation by greatly increasing their business and by introducing efficient methods that more than offset the increase in expenses. The trend was distinctly favorable to the railways.

Was there any change in this trend after the commission secured control over railway rates in 1910? The answer may be made in two ways. In the first place, railway growth virtually ceased, so far as new construction was concerned. Prices increased 25 per cent a year, or 10 times as fast as before, while wages rose about 8 per cent a year, so that by the end of 1917 the average annual earnings of railway employees were 64 per cent higher than they were in 1910, and the operating ratio had increased from 66 to more than 70 per cent. Average receipts per ton-mile, which had increased between 1900 and 1910, fell to a lower level in 1917 than in 1900. The rate of return on investment, which is the final basis for judging railroad prosperity, declined to about 5½ per cent. Taking the eight years from 1910 to 1917, inclusive, and breaking them up into two four-year periods, we find that the rate of return on investment was less during the second than during the first four-year period, despite the fact that the second four years contained the year 1916, which the heavy war traffic made one of the banner years in railway history.

In the second place, to reach an answer we may summarize the rate decisions of the Interstate Commerce Commission during the eight years from 1910 to 1917. Beginning with the two general rate petitions filed by the Eastern and Western carriers in 1910, both of which were denied by the commission, and extending through the Five Per Cent case of

1913-1914, the Western case of 1915, and the Fifteen Per Cent case of 1917, we find that the commission in every case either denied the petitions of the carriers or granted them only in part. There were long delays between the time petitions were filed and the date they were finally decided, and it cost the railways millions of dollars merely to find out whether or not the commission would grant them the desired increases.

I make no criticism of the Interstate Commerce Commission in this connection. Economic tendencies, such as the rapid rise in prices and wages, were running against the railways in this period and the commission was itself the victim of certain economic and political forces which it would indeed have taken a courageous body of men to withstand. Nor do I claim even that the commission was responsible for the unfortunate financial position into which the railways were slowly but surely drifting. Whatever the cause, the railways unquestionably found their earnings on the decline and their credit steadily on the wane. The situation during this period, while not critical, certainly carried the signs of impending crisis, were not something done to relieve the situation.

When President Taft approved the Mann-Elkins Act in 1910, which was the final step in the series of acts conferring on the commission the power to regulate rates, it was believed that the problem of railway credit was solved, at last. As a matter of fact, it was not so near solution at the close of 1917 as at the beginning of 1910.

That the problem was fraught with danger was recognized by many students of the railway problem, and no less by the railway executives themselves. In September, 1914, a committee of railway executives waited upon President Wilson and laid before him the facts with respect to the declining credit of the carriers as related to their duty to furnish efficient service to the American public. As a result of this conference, the President publicly announced his willingness to "call the attention of the country to the imperative need that railway credit be sustained and the railroads helped in every possible way, whether by private co-operative effort or by the action, wherever feasible, of government agency." He continued: "I am glad to do so, because I think the need very real."

Furthermore, the President's annual message to Congress in December, 1915, suggested the creation of a commission of inquiry, "to ascertain, by a thorough canvass of the whole question whether our laws, as at present framed and administered are as serviceable as they might be in the solution of the (railway) problem." In a later paragraph the President called the effort to solve the railway problem a step toward "national efficiency and security." "In this (he added) we are not partisans, but heralds and prophets of a new age."

In response to this recommendation Congress, in 1916, appointed a Joint Committee to make a comprehensive study of the transportation question. Partly because of the death of its chairman, Senator Newlands, and partly because of the inception of government control of the railways, no formal report was ever filed by the committee.

This very brief survey of the trend of railway affairs dur-

\*Address before the Washington, D. C., Traffic Club on February 5, 1921.

ing the periods prior to and succeeding 1910 indicates how the trend had changed, from one that was inclined upwards to one that was discernibly inclined in the opposite direction. The entry of the United States into the war, followed by government operation of the railways a few months later, represented a break in the continuity of the trend, and we may therefore skip the three years that elapsed between December, 1917, and September, 1920, and consider the prospects for the future. In doing so, let us place ourselves, to quote again from the President, "not in the attitude of partisans, but of heralds and prophets of a new age." That we have entered a new era in transportation no one will deny, however differently we may view the benefits or drawbacks of the new order.

In the first place, the railways have survived the period of government operation and have emerged stronger in public opinion than ever before. There is no question in my mind that for the present, at least, the American people have had their fill of the government in industry, and that the railways have a clear field for the development of a strong, well organized industry. This gain is one of the most important results of our entry into the great war.

In the second place, railway managements have during the past four years been learning the value of co-operation, which will mean much for operating efficiency in the future. Organization of the Railroads' War Board in 1917 as a voluntary method of forwarding the national war program was an important step. On the theory that for the time being war was the nation's business, the railway companies submergered their individual interests and unified their operations into one continental system. The beneficial effect of that forward step in railway co-operation was so great that it is difficult even to comprehend it. The period of federal control also furnished an object lesson of the value of co-operation, so that today we have the spectacle of a fine give-as-well-as-take spirit among the railway companies, without losing any of the benefits of a healthy rivalry. The resulting advantages are many and patent, affecting the railways themselves, their employees, efficiency of operation, and the attitude of the public. No one who has been an observant spectator of railway affairs for the past few years can fail to have been impressed with the growth of this fine spirit of co-operation.

In the third place, the railway managements are more sensitive to public opinion than ever before. In all their recent appearances before public bodies, the railroad representatives have been careful to emphasize their appreciation of the public's stake in transportation efficiency, and to place the public interest above that even of the railway owner and employee. I believe them to have taken this position in all sincerity, and not because they consider it the better part of expediency. Contrast this with the different attitude of many railway executives in the past, and one can see how far we have traveled toward a clearer understanding of the railway problem by the railways themselves. With a motto of "adequate and efficient transportation service the first consideration," the future of railway operations cannot but be brighter than the record of the past ten years.

In the fourth place, the railways and their employees are on terms of a better understanding of each other's point of view than for some time, perhaps better than ever before. I say this with full appreciation of the present strained situation in the railway labor world, from which I feel that both sides will emerge with a more wholesome respect for each other. Railway labor has learned several valuable lessons during the past year. The employees discovered, for example, that the public at large considers its own interests more vital than that of any one class. They are coming to realize that liquidation of industry cannot come unless they make their contribution in the shape of greater efficiency

and loyalty, forego special privileges they have acquired, and even, if necessary, accept a lower wage level to accord with lowered living costs. But the lesson has not all been labor's to learn. The managements see labor's point of view more clearly than has sometimes been the case, and are giving the interests of labor, as well as that of the general public, the most earnest consideration. This has taken various forms, such as a greater share in questions of management, as on the Pennsylvania, but whatever the form, I believe a better day is here with respect to the so-called "capital and labor" problem on the railways. What that will mean for the future efficiency and prosperity of the railways is clear without the necessity of elaboration.

Last, but by no means least, a new era in transportation was ushered in by the passage of the Transportation Act, which has now been effective for nearly a year. You are all familiar with the details of that act, and I need refer only briefly to the four principal provisions of the act which in my opinion justify optimism for the future. For the first time in history the investor in railway securities, without whose co-operation not a wheel would be turning on the railways today, has his investment safeguarded through the assurance of a definite rate of return on his investment. Second, operating efficiency is assured through the provisions giving the commission power to require honest, efficient and economical management, also the power to unify certain operations in times of emergency. Third, the interests of labor are assured through the provisions of orderly procedure in the case of wage and working disputes. Fourth, greater efficiency and economy are foreshadowed in the provisions of the act relating to consolidation of the many railway properties into a smaller number of strong, well organized systems. The Transportation Act is far from a perfect, or even a satisfactory, legal document; in some respects it has not yet commenced to function, while in other respects it is functioning only partially or at least faultily; it will doubtless be amended again and again; but as a whole it points the way to a much brighter future for the railways than they could foresee five years ago.

In spite of many serious problems still remaining to be solved, and many obstacles to be surmounted, I trust that this discussion of the broader aspects of the problem will convince you, as it has already convinced me, that the future of the railways is brighter today—taking a long look ahead—than it has been at any time during the past 10 years.

The Railway Line Which Intersects the Great Chinese Wall

# Shippers' Views on Increased Loading of Cars

## Commercial Traffic Men Offer Suggestions to This End for the Consideration of Railway Officers

**I**N THE *Railway Age* for January 28, five railway men who contributed to the contest on car loading presented their views on methods that could be instituted for improvement. Much of the matter presented concerned the part which the shipper must play in making a success of this project. With a view to the presentation of the other side of this important problem, we publish in this issue a series of papers contributed to the contest by representatives of the shippers, most of whom point out in no uncertain terms the changes of practice which could be well instituted by railways as a means of encouraging the shippers to do their part. In a measure these suggestions concern means of expediting the movement of traffic so that the shipper can see that his efforts are being appreciated. Other matters brought up concern changes in traffic arrangements, rates, etc., which would make it of pecuniary advantage to the shipper to load the cars to capacity.

### Strengthen the Right Arm of the Superintendent

By E. H. Shaughnessy

American Petroleum Institute, New York City

The gap between the actual car loading and the possible car loading is due, generally speaking, to underlying fundamentals beyond the control of those actually engaged in putting the freight into the car. Ignoring the question of merchandise car loading at freight houses, which is always troublesome and purely a matter for decision as to whether it is better to load heavy and pay many claims, or light and not pay so many claims, it seems that the reasons which cause the loading to stop short are about as follows:

(1) The customer's order is filled, (2) the car is full, (3) there has been a man failure.

Discussing these items inversely; man failure, either on the part of the railway or shipper, may be expressed as carelessness, ignorance or disobedience on the part of employees, individually or jointly, as the case may be. These things have considerable to do with inefficient carloading but, in the writer's opinion, not nearly so much as is generally supposed. Ordinarily, men loading a car will fill it unless some outside influence stops them. The only effective remedy for man failure on these counts is sufficient, competent, railway supervision. The way to get this sort of supervision is to strengthen the good right arm of the division superintendent. By this is meant closing the gap between the station agent and the train master on a fifty-fifty basis by:

- (a) Making the station agent a real man of affairs with increased authority and responsibility,
- (b) increasing the train masters' organization, if necessary,
- (c) eliminating the "inspectors" of this and that, who only muddy the water.

There is here, a most fertile field for constructive thought and endeavor. The need seems to exist right now for efficient railway officers of the new school. Recruits of the right sort and in sufficient quantities to fill vacancies are apparently not in sight. What better sort of recruitment for all around men is there than through the station forces? The writer feels constrained to say that the agents will quickly close up their 50 per cent of the gap if only given the opportunity to break away from the mass of non-essential routine stuff

they are obliged to struggle with daily and they will prevent "man failure" as no one else can.

As for the train masters' organization, it should be extensive enough to keep the entire divisional operation under personal daily observation. The train masters should be all-around men, not specialists, and responsible for practically everything that happens. The management should be eminently fair in providing enough of them so that the necessity for "touching the high spots" would be entirely done away with.

There should be no inspectors, so-called, working under general officers or department heads. They simply muddy the water. The inspecting should be done by the general officers or department heads personally, who could speak with authority on the ground, instead of sending out the betwixt and between inspector to observe and report. It stands to reason that the reports will be one-sided, therefore unfair, and, generally speaking, a source of friction in what ought to be a smooth-running machine.

Under the second item affecting light loading, "The Car Is Full," is found a very frequent cause for underloaded cars arising from one of two contingencies; (a) character of the freight, (b) character of the car. For several years past, particularly under the urge of war necessity, rapid strides have been made by shippers in condensing bulky articles so as to increase the loading per car. The incentive in reducing freight charges is taking care of this feature almost satisfactorily. The isolated cases where cars are wasted through chronic carelessness in loading bulky articles properly comes under the head of sufficient, competent supervision as covered in the first item. It seems proper to say that there ought to be a uniform method devised for rating cars so that when they are completely filled with scientifically condensed bulky freight, full tonnage will be credited to the loading station, otherwise the records are not fair in comparison.

Coming to the character of the car we find a situation that brings down the figures materially. Some time in the future, it ought to be the near future, it is to be hoped that those who really run the railroads will get together and force the issue with the car designers so that real standardization of equipment will be a fact and not a fancy.

Recognizing the fact that the odd (freakishly is too harsh a word) designed car had a mission to fulfill when it came out of the works, the thing to do is to hitch the car to its mission. In other words, if the railroads really want to increase car loading the thing to do, right away, is to get the cars back on the home roads where their eccentricities can be utilized. The way has been provided through the car service division, of the American Railway Association, and it is up to the superintendents of transportation to carry out enthusiastically and effectively the policies as outlined by that division. However, the superintendents of transportation are helpless unless there is sufficient competent divisional supervision to put these policies into effect on the ground. Unless the station agent and the train master are on top of the work and know beforehand that cars are going to be placed for loading in an intelligent manner with the idea of a full load, and keeping the cars in the home service as far as it is humanly possible to do so, everything else is wasted and idle effort.

The first reason given for reducing the average load of cars, namely, "The Customer's Order Is Filled," seems to the writer to be of first magnitude in effect. Surely those who

have come to grips with the underloaded car at close range have found this obstacle a most frequent one and the hardest to overcome. The answer is for customers to "Buy a Carload." There is nothing new in this idea and considerable progress has been made in spasmodic campaigns on the propaganda order, but the surface has only been scratched. It seems correct to say that the bulk of underloaded cars in this category are for the merchant in the small town, or the small merchant in the big town. These two classes, dealing direct with the consumer, receive a very great part of freight handled by the railroads so that their policy becomes the railroad policy, whether or no, and the policy of most merchants coming under these heads is to order goods in limited quantities without regard to car capacity, but with great regard to their own limited warehouse capacity. It is only by the closest, unselfish co-operation between railroad organizations, for the common good, that the "Buy a Carload" idea will become universal.

How is this to be brought about? Sufficient, competent divisional supervision—there is no other way. Of course statistics should be prepared showing the car loading in cars delivered to the consignees as well as those loaded by shippers, so that division officers may be accurately guided in their efforts, but statistics, circulars, moving picture exhibits, what you will, are of very little avail unless the station agent and the train master have the objective constantly in mind and strive for it persistently without any letting down in their effort whatsoever.

## What the Roads Could Do to Encourage the Shipper

By C. T. Bradford

Manager Traffic Department, International Harvester  
Company, Chicago

It should be assumed at the start that under favorable conditions the majority of shippers would utilize cars as nearly as possible to their maximum capacity. This is being done today to a liberal extent, but the carriers themselves could contribute a good deal to this end by adopting certain measures such as the following:

Recondition equipment so that it will stand this heavy loading. Our attention has been called frequently to the shifting of loads in cars which were in no condition to withstand the impact and which should have been in proper repair before such loads were put into them.

Carriers should make a study of the manner in which the switching is done. A great many damage claims undoubtedly now arise as result of rough or careless switching in hump yards or elsewhere, and this damage is naturally greater where goods are piled high in the car to reach the maximum car loading capacity.

It does not seem that the present practice of charging shippers for dunnage furnished by them is one which would encourage heavier loading. The use of dunnage is of course to protect the goods in the car and permit heavier loading, and a transportation charge on this dunnage, based on the freight rate applying on the goods which the car contains, tends to discourage rather than encourage the use of dunnage and consequent heavier loading.

There are certain kinds of freight such as import freight which carriers load themselves. It is suggested that carriers study carefully the loading of import freight to see if they themselves are not guilty of light loading.

It also must be remembered that the loading of a car is necessarily held down to some extent and in some cases by the commercial needs of the country dealer or consumer as to the quantity of goods which he can take care of at one time. This loading could be improved by the extension of

stopover arrangements, whereby a car may be stopped in transit to unload partially and sent on to an intermediate point to finish unloading, the through rate to apply from original point of shipment to final destination, plus a stop-over charge at the intermediate unloading point. Such arrangements are now in effect in the west and central freight association territory to some extent, but not in the southern or eastern trunk line territory. An extension of this privilege would enable more combination loads to be made to consignees in adjoining towns and thus bring up the average car loading.

It would be inconsistent for carriers to suggest increased demurrage rates concurrently with the heavier loading of cars. It is obvious that the length of time required for unloading and loading is in direct ratio to the weight of the carload, and an increase in demurrage rates would not seem to be an encouragement to heavier loading but rather the reverse.

## Traffic Problems Involved

By J. F. Atwater

Manager Transportation, American Hardware Corporation,  
New Britain, Conn.

While maximum loading of cars helps diminish the general congestion on the railroads, especially at terminals and points of interchange, it does have its disadvantages unless due care is used. It is not advisable to load cars 10 per cent over their maximum carrying capacity, for if cars are overloaded, it has been the writer's experience from observations that such cars are frequently crippled in transit to such an extent that it requires the carrier to transfer the loading. This seriously interrupts traffic and causes an additional expense to the carrier which could have been avoided if the proper care had been taken in loading the car at its initial point of shipment. Too heavy loading contributes to the pulling out of a great many draw bars. If proper judgment was used, maximum loading would be a great benefit to the carrier and to the shipper.

Bulk material, such as forest products, grain, and iron and steel manufactured products, should not be loaded above the marked carrying capacity of the car. Such articles as manufactured hardware, which are packed in cases, should not be loaded too heavily, regardless of how substantial the case may be, because almost invariably the lower tier of packages will be crushed, entailing claims for the carriers to adjust.

The carriers themselves can, if they would, still extend the maximum loading of commodities. Consolidated Classification No. 1 permits the mixing of various articles under what is known as Rule 10, but throughout the Classification there are hundreds of items classified with only a l.c.l. rating and under the conditions of Rule 10 a shipper cannot take the benefit of consolidation unless there is a c.l. rating on his commodity. The Classification committee in promulgating the Consolidated Classification, in establishing c.l. ratings, would only consider items that moved in carload lots. This, in my opinion, is a mistake. Regardless of whether there is a c.l. movement or not, c.l. ratings should be provided for all articles where there is a possibility of prevailing upon the shipper to forward in carload lots. In loading a car to its maximum capacity, it involves a large expense to the shipper, for it requires extra labor in stacking up packages and cases in the car. Therefore, no shipper is going to this expense when there is no carload rating and no benefits to be derived therefrom.

Articles without a carload rating are delivered through the local freight houses and on account of the various articles loaded at a local station into a car, it is not advisable to

load a car to its cubic capacity, due to the fact that there are too many light and fragile articles which are sure to be damaged from overloading if the maximum capacity is pursued.

Great advantage can be derived in the use of equipment by loading of two carload consignments in one car, when shipments are destined to points in the same direction. Such consignments are handled under two bills of lading. It is possible, in some instances, to load two carload shipments destined to two individuals located in the same town in the same car and the shipper should take advantage of this opportunity. Then, again, a large shipper having orders from two individuals in the same direction which would warrant loading to the carload minimum should arrange to load the material in the same car under two bills of lading, notifying the local agent to this effect and arrange with the local agent to consign the car to an intermediate point for the first consignee to unload his goods and, after unloading is completed, forward the car to its ultimate destination. In such cases both waybills follow the car, and the agent at the first stopping place retains the waybill until the first consignee has completed his unloading and then forwards the car to its ultimate destination on the original waybill. For some unknown reason, this practice has not been followed to any great extent, but it should be encouraged by the carrier.

Carriers should not undertake to increase the minimum weights in their classifications and tariffs but should take other methods to encourage heavy loading. There are a great many instances where cars cannot be loaded to their marked capacity, due to the fact that the consignee is not in position to buy above a reasonable classification minimum weight. Rather than increase the minimum weights, carriers should encourage the loading of two carload consignments in one car.

## The Basic Defects and Their Correction

By C. W. Hoisington  
San Francisco, California

By loading to the capacity of a car we will gain three distinctive points: (1) We will increase the earning power of the car, (2) effect a reduction in car miles and (3) effect a reduction in the number of cars to be handled.

It is a well known and proven fact that enlightenment and education are the prime factors in gaining a desired point both with the public and our employees, and in order that we may prescribe for the treatment of the prime causes responsible for the failure to load to capacity we will classify them as follows:

- (1) About 20 per cent of the nation's freight in commodities that cannot be loaded to car capacity.
- (2) Reduced capacity loading due to making local merchandise set outs.
- (3) Use of 100,000-lb. capacity cars in merchandise and light commodity service.
- (4) Lack of information to shippers on loading and ordering equipment.
- (5) Lack of efficiency in the office of the division car distributor.
- (6) Lack of efficiency in terminals, in placing cars.
- (7) Lack of efficiency in the local agent's office.

A review of the seven retarding influences bring forth some pertinent conclusions:

(1) In localities where fruit, stock, merchandise, cotton, wool, wooden ware, furniture, autos, hay and mill work are in abundance, it behooves operating officers in these localities to make a very close study to avoid the loading of high capacity cars as far as practical.

(2) In making local merchandise set out cars, unless to

a point where box cars are in demand, a close study should be made of the conditions.

(3) The practice of retaining 100,000-lb. capacity cars in local merchandise service, which should be watched, as these cars have a larger earning capacity in other classes of service.

(4) An endeavor should be made to interest commercial bodies, industries, shippers large and small on the importance of loading to capacity and ordering such equipment as will suit their needs.

(5) The local division car distributor should be thoroughly familiar with the various commodities loading in his territory and keep a close surveillance on all orders placed for equipment.

(6) The local agent can accomplish wonders by acquainting himself thoroughly with the needs of all the patrons of his station and tributary blind sidings. To stimulate interest a prize is an ideal method for showing the leading agent on loading to capacity that his efforts are noted.

(7) To improve the efficiency of yards in placing cars for loading make a systematic study of requirements of empty equipment and use just such as is suited.

## Offer the Shipper a Real Inducement

By C. E. Childe

Manager, Omaha Chamber of Commerce, Omaha, Neb.

The best, fairest and most effective way to make a shipper load cars heavily is to adjust rates so that it is profitable for him to load heavily. The classification ratings and minimum weights in effect today have been inherited for the most part from the time when 15 to 20 tons was a maximum car load. A number of important commodities, such as dry goods, for example, move at the same rates in carloads as in less than carload quantities. On a large number, if not the majority of articles of commerce listed in the classification, the difference between l.c.l and c.l. ratings is much too small to reflect the actual difference in cost of transportation in less than carload lots as compared with carloads.

Take for example small arms ammunition, the l.c.l. rating is second class and the c.l. rating (Western Classification) minimum weight 30,000 lb. is third class. This difference of only one class offers little inducement for a wholesaler or retailer to buy in carload quantities, and no inducement at all to load cars to capacity of 80,000 to 100,000 lb.

Minimum carload weights named in the classification are generally much lower than the car capacity. This is partly due to the fact that minimum weights have not been revised upward to the extent they might have been in view of the largely increased capacity of modern box cars, and partly to the fact that many shippers do not have capital or facilities necessary to handle freight in shipments loaded to the capacity of the car. Nevertheless, if lower rates were made on cars loaded to capacity than on cars loaded, let us say to half their capacity or one-third of their capacity many shippers would find it profitable to handle the capacity load instead of the small load.

The classification makers should wake up to the fact that it costs the shipping public money to handle high priced goods in units of large quantities, on account of capital invested in the large shipment, necessity of acquiring storage space, risk of deterioration and other commercial factors which discourage heavy loading of cars. Unless there is a concession made in the freight rate for the heavily loaded car of manufactured goods, it will usually be more profitable for shippers to handle such goods in l.c.l. or small c.l. units.

Permanent heavy loading of freight equipment would, therefore, be promoted by the following considerations: (1) Establish c.l. rates on all freight which may move in carload quantities; (2) Revise relationship of rates between l.c.l. and

c.l. quantities to reflect more nearly the lower cost of handling in carloads; (3) Increase c.l. minimum weights where possible to do so without imposing a hardship upon the shipping public; (4) Where commercial considerations necessitate low minimum c.l. weight, establish an alternative lower c.l. rate, applicable when the car is loaded to or approximating its capacity; (5) After accomplishing these reforms, give more consideration to furnishing cars adapted to the load for which they are ordered. Do not furnish a 100,000-lb. capacity car for loading a shipment of 60,000 lb. of freight when a lighter capacity car is available.

## The Shipper Must Be Shown

By P. W. Coyle

Traffic Commissioner, St. Louis Chamber of Commerce, St. Louis, Mo.

The shipper is just as anxious to please his customer as the carrier is to please the shipper—hence general usages of trade must be observed. Often these usages, and the commercial units thus established, do not permit the shipper to give the intensified loading he might, without the risk of displeasing and possibly losing a good customer. However, the shipping public is disposed to exert its influence towards the expansion of the trade units to correspond more consistently with the minimum weights established by the carriers on carload business. In order to stimulate this, and to encourage the shipper in any such propaganda, the carriers, as a whole, should show—by clear, specific facts—that there is concerted action on their part to furnish promptly, and through a well defined system, available cars for loading; and that well established methods are in vogue for handling loaded cars expeditiously not only in train movement but through the terminals.

A shipper loses all enthusiasm for intensified loading that can possibly be inspired by glittering generalities, with respect to improvement in service and furnishing of equipment, when he gets neither. Most shippers are "from Missouri." Again, most shippers are from and of the United States, and they are always willing and anxious to cooperate on a perfectly frank and honest reciprocal basis, to the end that our transportation facilities may be so used as to contribute their full share to the development of the commerce of the country.

The shippers should load all cars to their maximum capacity as far as it is possible to do so without material injury to their trade, and that they should educate their patrons to deal in units of quantity to as great a degree as consistent, which will enable them to give intensified loading; that they should use great care in ordering cars, so as to get those of the minimum capacity suitable for their business; that they should not order cars beyond their capacity to load within the free time; and, it goes without saying, they should load and unload promptly. Every care, every activity and every sacrifice made in this respect redounds to the interest of all concerned by increasing the circulation of empty cars throughout the country.

The carriers should pool their cars or adopt such methods of distribution as will permit the use of all available equipment, regardless of actual individual ownership. It is suggested that no cars should be assigned to any particular class of traffic, except, of course, refrigerator and tank cars; and coal cars, in emergency. Obviously, cars suitable for the traffic peculiar to any particular section of the country should be kept in as close proximity to that section as economic conditions will permit, but not to the exclusion of their use for traffic of a different character when other cars are available.

There seems to be a great deal of lost motion and a waste of equipment in the handling of l.c.l. merchandise shipments

in way freight or local service. It would seem more economical to provide cars of much smaller capacity (such as are used in England) more in keeping with the requirements for loading at the principal distributing centers to the larger points on the way division, so that such small cars loaded to their capacity might be switched at the intermediate points rather than haul a number of large capacity cars over a large percentage of the division with light loading.

The opportunity for intensified loading does not rest entirely with the shipper. In my estimation there are great opportunities in reach of the carriers in this respect. To illustrate: Often two or more lines, each operating through less carload merchandise cars to a common point, no one of which has sufficient tonnage to run a car daily, hold the cars under partial load, or the freight is accumulated in the freight house until sufficient tonnage is secured to justify sealing the car to the break bulk point. Thus, it may be that there are three roads each performing the same process of accumulating tonnage. Hence, there may be, and often is, delivered at three depots sufficient tonnage in the aggregate to justify running a daily car if it could be started from some one of these depots. Therefore, this class of traffic might well be pooled in the interest of full car loading and for the benefit of both the carrier and the shipper.

Another feature wherein the elements of conservation and intensified loading are involved, concerning which it would seem that modern facilities might be employed to good advantage: A large number of cars are used daily in transferring less carload shipments between the different depots. These hauls, in many cases, are long and through congested terminals, often consuming from one to five days in transit, and the cars are not loaded to capacity. It would seem that modern motor trucks might be used in this service to good advantage.

If the shipper does not load or unload a car promptly or fails to load to the minimum prescribed by tariff he pays for this delinquency in dollars and cents. When, however, he gives intensified loading it is a patriotic duty. In either event his record is open to immediate inspection.

The people, through proper legislation, have given the carriers rates which should yield the legally prescribed net revenue for the use of the facilities held and used by the carriers for transportation "under honest, efficient and economic management" as the law requires. The shippers are, therefore, entitled to have as specific information as can reasonably be given with respect to the furnishing of equipment and the movement of loaded cars in the several rate zones prescribed by the commission, so they may know that the required service is rendered. If this were given systematically at reasonable periods it would stimulate the spirit of co-operation.

## Mexican Railways Lease American Equipment

**F**RANCISCO PEREZ, director general of the National Railways of Mexico, returned last week to Mexico after some ten days spent in interviewing officers of some of the southwestern railroads particularly with reference to leasing locomotives and cars to relieve the congestion on the northern section of the government lines.

His trip was successful in that he secured 9 locomotives from the Illinois Central, 8 from the Missouri, Kansas & Texas, 10 from the St. Louis-Southwestern, 3 from the Gulf Coast Lines and several from the International & Great Northern. In addition 200 tank cars were leased from tank car lines at Houston, Tex. Of the locomotives leased, 20 will work between Matamoras, Saltillo and Tampico, where the traffic congestion is said to be especially acute.

Mr. Perez said that the National Railways now had 13,262 box cars in service as against 22,000 before the revolution, and that there were at present 581 locomotives in service and 161 awaiting repairs. Repairs have been held up, he said, due to the lack of materials, but with the recent placing of a \$5,000,000 loan in this country in order to finance purchases of material this large percentage of bad order equipment should soon be materially reduced.

It was announced by I. Duhart, assistant general agent of the National Railways at New York, that the following orders for motive power and rolling stock had been placed since January 1: 11 locomotives, 100 tank cars, 25 box cars, 5 refrigerator cars and 100 second-hand Pullman tourist cars.

Rumors to the effect that W. G. McAdoo, formerly director general of railroads in the United States, who has been in Mexico City, would take charge of the administration of the National Railways of Mexico have been definitely denied both by Mr. McAdoo and by Director-General Perez. Rumors still persist, however, that Mr. McAdoo's visit has to do with a reorganization of the National Railways. According to one report, the former director general is representing the minority stockholders of the lines which were amalgamated to form the National Railways. The Mexican government, it is said, owns 51 per cent of the stock of the National, but the claims of the company against the government for damages to the property during the revolution are so great and the accumulated interest on the bonded indebtedness represents such a vast sum that, it is further stated, the ownership is really outside the hands of the government. It is said that President Obregon has expressed the opinion that the roads should be returned to their real owners.

Mr. Perez was accompanied on his trip by F. P. De Hoyos, general agent of the National at New York. The reception accorded the Mexican railway men was everywhere cordial—particularly at Houston, where the Chamber of Commerce gave a banquet in their honor.

## Railroad Guaranty Bill Passed by House

WASHINGTON, D. C.

**T**HE WINSLOW BILL, providing for partial payments to the railroads on account of the \$300,000,000 to \$400,000,000 still due them on their guaranty for the six months following the termination of federal control, on certificates of the Interstate Commerce Commission, was passed by the House on February 8 with very little opposition. An effort to pass the bill on the day before under a suspension of the rules had been defeated by vote of 220 to 111. To pass a bill under suspension of the rules requires a two-thirds majority and the failure of the bill on that occasion was attributed mainly to resentment on account of the effort of the Republican steering committee to jam the bill through with very little debate and without opportunity for amendment. Chairman Esch, of the House committee on interstate and foreign commerce, had proposed a rule which would have given opportunity for a debate, but the plan was changed by the steering committee, and several representatives who said they were in favor of the bill voted against the motion to pass it under suspension of the rules. On the final passage of the bill one amendment was adopted, proposed by Representative De Walt, which provides that when the commission, as authorized by the bill, makes estimates for deferred debits and credits, on agreement with the carriers, such estimates shall be prima facie, but not conclusive, evidence of their correctness in amount. The bill provided that such estimates should be binding in final settlements.

The principal opposition to the bill came from Representative Huddleston of Alabama, who frequently acts as the

spokesman of the Plumb Plan League in the House; Representative Sims of Tennessee, who proposed an amendment that the railroads should be paid in certificates bearing 6 per cent interest instead of in cash, and Representative Blanton of Texas, who took the position that the bill would add another burden to the taxpayer on top of those that had already resulted from federal control of the railroads.

The bill as passed provides what several representatives during the debate said they thought had been provided when the transportation act was passed. It specifically authorizes the Interstate Commerce Commission, if not able finally to determine the whole amount due under Section 204 or Section 209 of the transportation act, to a carrier or the American Railway Express Company, to make its certificate for any amount definitely ascertained by it to be due, and thereafter in the same manner make further certificates until the whole amount due has been certified. The authority of and direction to the Secretary of the Treasury under such sections to draw warrants is made applicable to each such certificate. In ascertaining the several amounts payable, the commission is authorized in the case of deferred debits and credits which cannot at the time be definitely determined, to make, whenever in its judgment practicable, a reasonable estimate of the net effect of any such items and, when agreed to by the carrier or express company, to use such estimate as a definitely ascertained amount in certifying the amounts payable under either of such sections and such estimates so agreed to shall be prima facie, but not conclusive, evidence of their correctness in amount.

The bill is expected to be taken up in the Senate possibly by the end of the week and efforts will be made to expedite its passage.

In explaining the purpose of the bill, Representative Esch said that the guaranty provision was inserted in the transportation act because Congress knew that the railroads had not earned their compensation during the 26 months of federal control by hundreds of millions of dollars.

"We knew," he said, "that they had not earned it for any of the 26 months of federal control, save three. We knew that there were pending obligations with the director general of railroads for increases of wages. We knew that those applications had not been acted upon by the director general of railroads. We knew that these men had been put off from time to time on promises that their wages would be increased. We knew, further, that we had to provide for such an emergency.

"One thing we did not know, however, was that the Railroad Labor Board would not be appointed by the President for six weeks after the law became operative. We did not know that within one month after federal control there would be an unlawful strike involving from 40 to 60 per cent of the yardmen and switchmen in the great freight-producing centers of the United States. Those things we did not know, but the transportation act by guaranteeing the standard return for the six months enabled the carriers to operate notwithstanding these severe handicaps. Without it the transportation system would have failed before the six months would have expired. The \$600,000,000 required to make good the guaranty is chargeable in part to the order of the Railroad Labor Board of July 20, 1920, retroactive to the first of May, 1920, which meant that for four months of the six months of the guaranty period the railroads had to pay over \$200,000,000 additional wages. The guaranty provision is a legal obligation. This bill seeks to permit the payment of what is left unpaid of that guaranty by means of partial payments. The Interstate Commerce Commission, complying that the language of the law we had passed justified partial payments, issued certificates therefor. The comptroller of the Treasury, however, held that this could not be issued. The result will be a delay of weeks, months and, in some cases, years before settlements can be made. In the

meantime the railroads cannot pay for supplies; the supply people cannot pay their employees. As a result many institutions have cut down their working forces and some have shut down their plants because they cannot get the money which the railroads claim is due them. In this bill we simply want to give the Interstate Commerce Commission the right to issue certificates for partial payments and have them honored by the Treasury Department so that the railroads can get this money, so that unemployment can be reduced, and so that this money can be put into circulation, and so that business may be restored."

After the failure to pass the bill under suspension of the rules, the rules committee brought in a special rule providing for one hour of general debate and five minute speeches on amendments. Several of the speakers pointed out that the bill did not involve any additional expenditure, but merely provided for the prompt payment of a part of the money which had already been appropriated and which it had been assumed had already been provided for. Several amendments were proposed designed to safeguard the government by requiring a bond in case of any over-certification, but these were defeated after it had been explained that the certificates for partial payments made by the commission merely provided for such amount as cannot be reduced by further accounting or otherwise and is certainly due the railroads. Representative Bland of Indiana said that the railroads owe the coal operators of his state \$5,000,000 and in his district alone they owe \$1,849,000. Representative Goodykontz said that the representatives who were opposing the bill are what are commonly known as the "Plumb Planners" who would like to see the whole American railway system collapse.

A motion to re-commit the bill to the committee for an amendment to provide that no carrier shall declare a dividend after receiving a partial payment until it shall first make settlement of all valid judgments unpaid against it, was defeated by vote of 189 to 74.

While the bill was being debated in the House, arguments were being heard before the Court of Appeals of the District of Columbia on the petition of the Grand Trunk Western for a writ of mandamus to compel the Secretary of the Treasury to honor a partial payment certificate issued by the Interstate Commerce Commission in its favor for \$500,000. The petition had been denied by the Supreme Court of the District of Columbia which had sustained the ruling of the comptroller of the Treasury and the railroads appealed the case. Alfred P. Thom and J. Harry Covington, representing

the railroads, argued that the transportation act placed discretion as to the issuance of certificates in the hands of the Interstate Commerce Commission and that the only function of the Secretary of the Treasury in the matter was a ministerial one of drawing warrants on the commission's certificates. District Attorney Laskey argued that it was the duty of the Treasury Department to see that the certificates of the commission were in proper form as authorized by the law and that the law merely provides for one final certificate in the case of each carrier.

Senator LaFollette has offered in the Senate an amendment intended to be proposed by him to the Townsend bill, which is similar to the Winslow bill passed by the House, providing that no payment of money shall be made to any railroad company under the transportation act until it shall be determined by the Interstate Commerce Commission upon full investigation that the company has not since March 1 paid or contracted to pay unreasonable and extravagant prices for railway supplies, equipment, repairs and renewals charged to its maintenance account or that it has not paid or agreed to pay unreasonable sums as salaries to its officers or directors or that it has not otherwise managed and conducted its business in a dishonest, inefficient or uneconomical manner in violation of the terms of the transportation act.

### Freight Car Loading

WASHINGTON, D. C.

**F**REIGHT CAR LOADING continued to decrease during the week ending January 29, according to the weekly report compiled by the Car Service Division of the American Railway Association, but principally because of the continued falling off of the coal and ore movement. The loading of most other commodities has been increasing during January while the number of cars loaded with coal and ore has decreased. The total number of cars loaded with revenue freight during the week was 699,936, as compared with 703,115 for the preceding week and 803,332 for the corresponding week of last year. For the corresponding week of 1919 the loading was 718,297 and for 1918 it was 642,016. Throughout January the loading has been above that for January, 1918, when a condition of congestion prevailed and the winter weather was unusually severe. For the week ending January 30 the car surplus was 324,186 and the shortage was 810. The summary of the report follows:

#### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. FOR WEEK ENDED SATURDAY, JANUARY 29, 1921

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mlse. L. C. L.	Miscellaneous	Total revenue freight loaded			Received from connections		
										This year	Corresponding year	Corresponding year	This year	Corresponding year	Corresponding year

# General News Department

The Air Brake Association has selected the Hotel Sherman, Chicago, as the meeting place for the 28th annual convention which will be held on May 3-6, 1921.

The spring meeting of the American Society of Mechanical Engineers will be held at the Congress Hotel, Chicago, on May 23 to 26. Sessions are planned by the professional sections on aeronautics, fuel, management, material handling, machine shop, power, forest products and railroads, the details of which will be made public later.

A preliminary compilation of the revenues and expenses of the railroads for the month of December indicates a net operating income for that month of only about \$23,000,000, whereas to earn a 6 per cent return provided for by the transportation act the roads should have earned about \$86,000,000. Returns for 157 of the larger roads showed a net operating income of \$14,000,000.

The directors of the Gulf Coast Lines, acting in behalf of a group of the principal owners of the road, have offered a limited amount of the stock, of the constituent companies, to employees at \$65 a share (par value \$100). According to the announcement, the company will guarantee returns of six dollars a share on this stock for a period of 30 months.

Prof. W. Z. Ripley of Harvard University, who has been engaged by the Interstate Commerce Commission to report on a tentative plan for the consolidation of the railroads into a limited number of systems, has submitted to the commission a report proposing a plan applying to the eastern railroads and is expected to submit his report on the western and southern roads later in the month.

William Mitchell Acworth, the well-known English economist and writer, is now Sir William Acworth, the title of Knight Bachelor, conferred by the Viceroy of India and approved by the King of England, having been announced in London on January 12. Sir William is chairman of a governmental committee which has been appointed to inquire into the administration of the railroads of India, and he is now in that country. Sir William's books on railroad affairs are among the best, and the best known, in the English language. His detailed and thorough knowledge of the philosophy and the history of railroad economics in all the countries of the world is unique, and he is sure to illuminate every feature of railroad management or operation on which he writes. In the important doings of the British Government, and of Parliament, in connection with the railway reorganization plans of the past two years Sir William has had an active share.

## New York Railroad Club Meeting

J. J. Mantell, manager, New York Region, Erie Railroad, will speak on "Transportation Problems of the Metropolitan District" at the meeting of the New York Railroad Club in the Engineering Societies Building, New York, on Friday evening, February 18.

## Safety on the Southern Pacific

The Southern Pacific reports substantial diminution in certain casualty records for 1920. Deaths of employees by accident were fewer by seven, or 13.2 per cent, as compared with 1919, and 17, or 27 per cent, compared with 1918. The number of persons killed in grade crossing accidents per million locomotive miles was 0.95, in 1920, compared with 1.40 in 1919, a decrease of 32 per cent.

There was a total of 760 highway crossing accidents in 1920, of which 393 were caused by attempts to cross tracks in front

of trains; in 163 cases, or more than 21 per cent of the total, automobiles were run against trains; 116 automobiles stalled on the track and were hit by trains; 19 skidded into a train or a car; 53 ran into and broke down crossing gates; three ran down and injured crossing flagmen, and 13 accidents resulted from miscellaneous causes.

During the year 1920, 195 meetings were held of safety committees, at which 4,490 safety suggestions were discussed; 182 papers were read on accident prevention and 70,408 employees were talked to individually by members of safety committees.

## United Engineering Society—Board of Trustees

At the annual meeting of the Board of Trustees of United Engineering Society, on January 27, the following persons were elected officers of the society for the ensuing year: President, J. Vipond Davies; vice-president, Calvert Townley; vice-president, W. L. Saunders; secretary, Alfred D. Flinn; treasurer, Joseph Struthers; assistant treasurer, George H. Pegram.

## Engineering Council and A. S. M. E.

### to Meet in Syracuse

Herbert Hoover will be the principal speaker at a meeting in Syracuse on February 14 at which it is expected the plans of the American Engineering Council for dealing with industrial relations and, particularly, with the waste due to unemployment will be outlined. On the following day, February 15, the National Council of the American Society of Mechanical Engineers will meet.

## Resolution Regarding Dangerous Highway Crossings

Representatives of organizations attending the National Conference on Highway Traffic Regulations, held at Washington, D. C., from January 9 to 12, 1921, adopted resolutions recommending increased protection for grade crossings by giving special attention to the most dangerous ones. The detailed resolutions were:

RESOLVED, That this Conference express its approval of the present efforts to eliminate dangerous grade crossings, and recommend that, so far as practicable, dangerous grade crossings be both avoided in future construction and eliminated in existing construction.

Pending the removal of such crossings, this Conference recommends that the proper authorities be authorized to classify grade crossings as "ordinary" and "dangerous," and require the latter, in addition to standard grade crossing signs, to be marked with uniform and conspicuous signs specifying the speed with which such crossings may be crossed, obedience to such speed restrictions to be required by law.

RESOLVED, That this Conference recommend that red lights be used as signals of extreme danger and for no other purpose except for vehicle tail lights; and that green lights be used as traffic regulation or direction signs and for no other purpose.

RESOLVED, That this Conference, recognizing the need for a uniform system of highway signs, request the U. S. Bureau of Standards to make a study of signs, including colors, size and arrangement of letters, height and location.

Representatives of the American Railway Association and the American Electric Railway Association were present and voted; as well as members of various automobile associations, safety associations, police and highway associations and the National Safety Council.

## Instruction in Kiln Drying

The February course in practical kiln drying of lumber, given by the Forest Products Laboratory at Madison, Wis., will be held from February 14 to 25. The instruction in the course is not confined to any particular kind of lumber or type of kiln, although methods of drying different species of lumber and the operation of various types of kilns are discussed. Emphasis is laid on the underlying principle of suc-

cessful kiln drying and these can be adapted to any conditions. The course will be particularly concerned with ways and means to cut down present losses in seasoning, both outdoors and in the kiln. The following are some of the subjects covered: Testing lumber while drying; methods of preventing checking, case hardening, warping and collapse; regulation of temperature, humidity and circulation in the kiln; advantages and disadvantages of different types of kilns and kiln equipment, and identification of lumber. A co-operative fee of \$150 per person is charged to pay the expenses of conducting the course.

The practical course of instruction at the laboratories in boxing and crating, which was given from January 10 to 15, will be repeated March 7 to 12 and May 2 to 7. Registrations for these courses can be made by mail for either date.

#### A. R. A. Names Executive Committee

The secretary of the American Railway Association, J. E. Fairbanks, has announced the personnel of the executive committee for the calendar year 1921 as follows: Division I, Operating, General W. W. Atterbury; Division II, Transportation, E. J. Pearson; Division III, Traffic, C. H. Markham; Division IV, Engineering, H. G. Kelley; Division V, Mechanical, W. B. Storey; Division VI, Purchasing and Stores, W. G. Besler; Division VII, Freight Claims, N. D. Maher.

#### I. C. C. Appropriation

The Senate on February 8, disagreed to an amendment of its appropriation committee proposing a reduction from \$1,900,000 to \$1,600,000 in the appropriation for the general expenses of the Interstate Commerce Commission. The appropriation for the present fiscal year was \$1,600,000 and the commission had asked for \$2,160,000, but the House cut it to \$1,900,000 and the Senate committee attempted to cut it to the figure for this year. The action of restoring the figure to that set by the House was taken after a considerable discussion of the expenses of this commission and of the Federal Trade Commission, in which one or two senators criticized the salaries paid by the Interstate Commerce Commission. Senator Smoot started to read a list of the salaries, including the chief counsel, director of service, director of finance, director of traffic, at \$10,000 a year each, one assistant counsel at \$6,500 and another at \$5,000. Senator Warren read a letter from Chairman Clark of the commission inviting attention to the fact that the transportation act very largely increased the jurisdiction and duties of the commission and that the intelligent consideration and determination of some of the new questions placed within the commission's jurisdiction required men of capacity, unquestioned integrity, experience and industry. The commission has never expended a dollar, he said, for salaries or in any other direction which it did not feel was fully justified in the interests of the service and it has not in any instance fixed a salary that did not seem to be imperatively necessary in order to induce men to enter the service rather than to accept offers from outside the government service which from the sole point of salary were more attractive.

#### Heavy Electric Traction Program for A. E. R. A.

The committee on heavy electric traction of the Engineering Association of the American Electric Railway Association has made preliminary assignments on the subject of heavy electric traction about as follows:

1. Co-operate with the American Railway Engineering Association regarding progress in heavy electric traction with a view to keeping the members of the American Railway Engineering Association posted on developments in the field. In this connection cover foreign practice as well as that in the United States.

Much of the information pertaining to foreign electrification will be obtained from the files of H. W. Cope and from the General Electric Company. Any additional information which is deemed desirable will be obtained by correspondence.

2. Continue compilation of statistics regarding electric locomotives.

Last year's committee issued a number of questionnaires

regarding equipment to America's electrified railroads, and to industries operating electric locomotives. The results, however, were not entirely satisfactory, comparatively little information being obtained. In order to attack the subject from a different direction, Mr. Cope will undertake to go over the list of companies which are using Westinghouse equipment and will tabulate information from the engineering files of the Westinghouse Company. A. H. Armstrong, chairman of electrification committee, General Electric Company, will be requested to compile similar data from the files of the General Electric Company.

It was the consensus of opinion that locomotives and multiple unit car tabulations should be continued. The subject "Locomotives" will include locomotives with four driving axles, and multiple unit cars will include equipment in which the trailers, as well as motor cars, are equipped with controllers for operating from either end. Equipment which does not conform strictly to these limits may be included at the discretion of the traction committee.

3. Continued study of electric switching engines.

Records of electric switching results are scarce, as few companies operate electric switches extensively and some data will probably be obtained regarding steam switching and further data selected on electric switching as it becomes available.

4. Study the subject of multiple unit cars vs. electric locomotives in passenger service and report on the percentage of service given by means of such cars.

There are virtually but three railroads in this country which operate both multiple unit and locomotives equipment electrically, and information necessarily will come from these railroads. C. H. Quereau, superintendent electrical equipment, New York Central, will take charge of obtaining and compiling data on this subject.

#### Boston Mayor Opposes Consolidation

##### of New England Roads

In his annual message to the City Council, Mayor Andrew J. Peters devotes several paragraphs to the proposals advanced as to the possible consolidation of the New England carriers with carriers west of the Hudson River.

"The Transportation Act," says Mr. Peters, "provides that the Interstate Commerce Commission shall prepare and adopt a plan for the consolidation of the railways of the United States into a limited number of systems and which would provide that 'wherever practicable the existing routes and channels of trade and commerce shall be maintained.' Studies of this problem are now being made and will soon be considered for recommendation for action by the Interstate Commerce Commission.

"One plan under consideration is that the New Haven system shall be consolidated with the Pennsylvania Railroad, and that the Boston & Maine and Northern railroads shall be joined to the New York Central. Another plan is that the New England roads shall be consolidated in one or two systems.

"The proposed consolidations of the New England railroads with the Pennsylvania and New York Central would be a most unfortunate catastrophe for all New England, especially for the people of Boston. This transfer would take the control and direction of our railroads away from Boston and place them in the hands of interests in New York or elsewhere. To such interests the problems of New England would be of minor importance, and the intimate touch with local conditions so essential in this situation would be entirely lacking.

"I am deeply opposed to any consolidation which would give to the railroads west of the Hudson River the power to determine whether New England should develop its present industrial facilities, or become the rich man's summer playground. These railroads would take over the New England roads provided only that such a consolidation was profitable to their stockholders. Such profit could come only at the expense of New England.

"Our manufacturers would have new difficulties in reaching western markets. At the present time New England shippers can ship west over any of six trunk lines, but, were the New Haven consolidated with the Pennsylvania under the ruling of the Interstate Commerce Commission, the latter road could

compel New England freight, originating on its lines, to move over its own rails to Chicago or its other western terminals. So, shippers would have but one line in place of six. In export traffic, it is easy to see that the Pennsylvania road would do its export business at its own terminals in Baltimore, Philadelphia, or New York, rather than haul its ocean-bound freight the additional distance to Boston. With the harbors of Boston and New England, and a proper amendment of our Interstate Commerce Act, it would be possible for a New England road to develop its water connections and, by the aid of water routes, reach any of the distributing points of our country."

**Relations of Employer and Employee**

L. F. Loree, president of the Delaware & Hudson Company, speaking before the Chamber of Commerce of the State of New York at a meeting held in New York City on February 3, objected to resolutions proposed by the committee on industrial problems, and proposed instead thereof a resolution calling for the proper incorporation of both employee-unions and employer-unions. The committee had proposed to seek legislation, both at Washington and Albany, looking to the endorsement of the views on the settlement of industrial disputes which were set forth in the report made by the President's Industrial Conference last March. The Chamber of Commerce committee had in mind particularly street railway conditions and the public service interests of similar character, but the resolution as well as Mr. Loree's proposal is of interest in the whole industrial field.

Mr. Loree said, in part:

"What are the roots of the labor trouble? They are eighty years old and should be familiar to all of us. First, they are founded on the basis of discontent. Properly regulated, discontent is a necessary function of success; but let it run wild, and it leads to anarchy.

"The second thing is the attitude of labor on the closed shop question and the boycott.

"The third is the organization of secret societies, which cannot, I think, be looked upon with unconcern by any civilized government, and particularly by any person who has reflected upon the Jacobin movements which preceded the revolution in France, or who bears in mind the actions of those who are threatening the life of the British government today. So I suggest that this substitute be adopted in place of the report of the committee:

"Be it resolved, That the Chamber of Commerce of the State of New York appeals to the Legislature of the State of New York to enact legislation to give effect to the recommendations of Governor Nathan L. Miller in his annual message to reform the organization and powers of the Industrial Commission so as to provide for a single-headed commission, with a board of three, to be allotted to discharge exclusively quasi-judicial and legislative functions, and to be clothed with authority to investigate labor conditions and to deal with labor disputes; and to that effect legislation be enacted:

"1. To declare all organizations having for their purpose the control of wages or conditions of employment, by joint action on the part of employees or employers, to be charged with a public interest, and hence properly and necessarily subject to public supervision and regulation.

"2. To provide that all such organizations shall have capacity to hold property and sue and be sued, in their corporate names, in all respects as though they were individuals.

"3. To provide for the supervision of the accounts and records of such organizations, including insurance funds and similar activities; in the same way that the accounts and records of street railway and similar corporations are supervised.

"4. To provide for the supervision of every vote upon the question of ordering a strike, including the following: (a) no such vote to be taken until after a summary inquiry by public authority concerning the matters in dispute, (b) every person voting to be furnished with a statement made by public authority of the results of such inquiry, (c) every such vote to be taken by secret ballot, and (d) an honest count and freedom from intimidation and corrupt influence to be safeguarded by public authority."

**Traffic News**

The Transportation Club of Louisville, Ky., will hold its annual banquet on February 24.

The railroads of Ohio have made a general advance in passenger rates, to the basis of 3.6 cents a mile, in accordance with the order of the Interstate Commerce Commission, and corresponding to the rates which the Commission has prescribed for interstate passenger fares. It is understood that officers of the State of Ohio will, if not successful in their present proceedings in the lower court, appeal to the United States Supreme Court against this federal action.

**New England Hearings Concluded**

The hearing before an examiner of the Interstate Commerce Commission on the application of the New England lines for larger rate divisions was brought to a conclusion on February 7 after a day had been devoted to rebuttal testimony. This, it was generally understood, was purely for the record because it was expected an adjustment would be reached as a result of the letter ballot which is being taken on the plan to raise a fund of \$15,000,000 among the trunk lines to be distributed among the New England lines.

Prof. W. J. Cunningham of Harvard University replied to the testimony offered at the previous hearing by W. H. Williams, chairman of the Wabash, which had attributed the difficulties of the New England lines to local conditions and factors involving the efficiency of operation, rather than to insufficiency of rate divisions. Mr. Williams also took the stand again, and several other witnesses testified regarding details of operation and rate-making.

**Post Office to Pay Railroad Administration**

As briefly noted in last week's issue the post office department has asked Congress for a deficiency appropriation of \$65,575,832 for the amount due the Railroad Administration for the retroactive increase in railway mail rates for the period of federal control.

The sum named has been agreed upon by officials of the Post Office Department and the Railroad Administration as the balance due for the service performed during the period named, with the exception of certain sums now a matter of litigation in the Court of Claims for the performance of incidental, side, terminal and transfer service which the department contends is not specifically chargeable prior to March 1, 1920.

The amount of this adjustment was determined as follows:

"The average monthly earnings of the railroads during the 18 months from January 1, 1918, to June 30, 1919, was \$4,345,635.10. This period was used as a basis for the reason that practically all accounts had been adjusted for that period under the former basis of pay. At that rate the pay for the 26 months of federal control (26 times \$4,345,635.10) would have been \$112,986,512.60. Applying to this sum the flat increase of 57 per cent agreed to at conferences with officials of the Railroad Administration, the increased earnings of \$64,402,312.18 was realized. The aggregate earnings for the entire period at the increased rate is therefore \$177,388,824.78.

"To this debit the following credits should be applied:

Fines .....	\$431,926.04
Advance payments during the period from July 1, 1919, to Feb. 29, 1920, on routes where final adjustments were not made .....	19,806,554.49
Final adjustments at the rates authorized in the Interstate Commerce Commission's order No. 9200 ..	2,540,061.70
Final adjustment at the rates authorized by the act of July 28, 1916 .....	10,813,018.69
Aggregate payments for this service performed from Jan. 1, 1918, to June 30, 1919 .....	78,221,431.83
<b>Total .....</b>	<b>111,812,992.75</b>

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission has rendered its decision in the Michigan passenger fare case ordering increases in the intrastate rates corresponding to those allowed for interstate traffic.

The commission has suspended until June 7 the proposed withdrawal of the interchangeable acceptance arrangements applying on 60-trip commutation tickets of the Baltimore & Ohio and the Pennsylvania between Baltimore and Washington.

The commission has further suspended until April 2 the operation of a supplement to a Minneapolis & St. Louis tariff which provides for the cancellation of joint through rates on coal from mines on the Minneapolis & St. Louis in Illinois to destinations in Michigan and Alexis, Ohio.

The Interstate Commerce Commission has suspended from February 5 until June 5, 1921, the operation of certain schedules shown in a supplement to a Minneapolis & St. Louis tariff which propose increased proportional commodity rates on grain and flour, carloads, from Council Bluffs, Ia., Omaha and South Omaha, Neb., (when originating beyond) to Duluth, Minn., Superior, Wis., and certain other points taking same rates.

The Interstate Commerce Commission has issued a correction of its order authorizing increases in intrastate freight rates in Illinois. The order erroneously provided that the increases authorized were to be applied to the rates in force. As the rates had been increased under the order of the Illinois commission by a percentage less than that authorized by the commission in the general rate case, the order was amended to provide that increases shall be applied to the rates in force on August 25, 1920.

The Interstate Commerce Commission has vacated its suspension of numerous tariffs filed by Agents W. J. Kelly and F. A. Leland, which in putting into effect the rate increases authorized by the Interstate Commerce Commission in Ex Parte 74 made increases of 35 per cent in class and commodity rates between eastern and southern groups and the Southwest. The tariffs were suspended under protest of various shippers that the commission's order provided for an increase of 33 $\frac{1}{3}$  per cent in these inter-territorial rates. The commission finds that 35 per cent was properly applied as to certain inter-territorial rates based on combinations, but its suspension stands as to many of the tariffs.

### Court News

#### Exclusive Privilege to Solicit Business

##### On Railroad Premises in Kansas

The Kansas Supreme Court, reviewing the cases in the various jurisdictions on either side of the question, holds that a railroad company may grant an exclusive privilege to one carrier of passengers and merchandise and exclude all others who desire to go upon its premises for the sole purpose of soliciting customers or business.—Mader v. City of Topeka (Kan.), 189 Pac. 969.

#### Contributory Negligence at Flag Station

There is no law or custom requiring a train to stop on any particular spot even at a regular station, let alone at a flag station, and especially at one with no mark for indicating where passengers are to stand for boarding the train; and the Louisiana Supreme Court holds that one who, after assisting a friend to flag an approaching train, started walking down the track, on the theory that the train would stop before it reached him, was guilty of contributory negligence. Wells v. M. L. & T. (La.), 84 So. 492.

### Boiler Inspection Act Does Not

#### Apply to Locomotive Cab

The New York Appellate Division holds that the federal Boiler Inspection Act, requiring locomotive boilers and appurtenances to be kept safe, does not apply to a locomotive cab, so that sections 3 and 4 of the Employers' Liability Act, precluding the defenses of contributory negligence and assumed risk, where a safety act is violated, do not deprive the railroad of these defenses in an action for injuries caused by a depression in the floor of the cab. A cab is not appurtenant to a boiler, and the intention of the act was to guard against accidents peculiar to boilers.—Brown v. L. V., 191 App. Div. 691, 181 N. Y. Supp. 800.

### State Commissions

The Railroad Commission of Louisiana, following a re-hearing in connection with the order issued by the Commission last March, requiring the Louisiana Railway & Navigation Company to improve its roadway, has annulled and cancelled the proceedings against the railway, in which a fine of \$1,000 was imposed, with the threat of \$100 a day for each day in which the Commission's order was not complied with. The testimony shows that the railroad has within two years spent about \$2,000,000 in improving its roadway and its plant generally; that abnormal weather conditions have prevailed throughout the past two years, and that the officers are in good faith prosecuting the work necessary to put the road in good condition. A number of patrons of the road testified that strenuous efforts were being made to give good service.

### Personnel of Commissions

Charles P. Coady, at present a member of congress, has been appointed a member of the Public Service Commission of Maryland, succeeding James C. Legg, deceased.

H. D. Lyon, heretofore inspector, has been appointed senior railway signal engineer, Bureau of Safety, Interstate Commerce Commission, and has been assigned to work in connection with tests and development of automatic train control devices under Section 26 of the Interstate Commerce Act. Investigation of railroad accidents will continue to be a part of his duties. Mr. Lyon had his first signal experience as a helper in the installation of electro-pneumatic block signals on the Central of New Jersey about 1892; his subsequent experience ranged from helper to foreman in construction work for the Union Switch & Signal Company and the Standard Signal

H. D. Lyon

Company; he also held positions as signalman on the Central of New Jersey, maintainer on the New York Central, maintainer and inspector on the Interborough Rapid Transit Company, and assistant chief inspector, general inspector and field engineer on the New York Central. In January, 1910, he resigned from the New York Central to become inspector for the Block Signal and Train Control Board of the Interstate Commerce Commission, and was engaged in engineering work in connection with investigation of block signals and automatic train control devices until the Board was abolished in June, 1912. He was thereafter assigned to the Bureau of Safety and has served as an inspector in that bureau until the present time.

## Equipment and Supplies

### Locomotives

THE MEMPHIS, DALLAS & GULF is inquiring for 1 locomotive.

### Freight Cars

THE FRUIT GROWERS EXPRESS is inquiring for 100 steel underframes.

THE RHODESIAN RAILWAYS are inquiring, through the car builders, for 15 cars.

THE LACKAWANNA STEEL COMPANY, Buffalo, New York, is inquiring for from 100 to 200 flat cars of 70 tons capacity.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 40 caboose cars from the Mt. Vernon Car Manufacturing Company.

CHARLES P. PERIN AND S. M. MARSHALL, 1107 Broadway, New York, are asking for prices on 300 steel ore hopper cars and 500 steel coal hopper cars, to be of 50 tons capacity, for export to India.

THE TENNESSEE COAL, IRON & RAILROAD COMPANY has ordered 150 70-ton gondola cars from the Chickasaw Shipbuilding Company and not 157 70-ton as incorrectly reported in the *Railway Age* of February 4 (page 347).

### Passenger Cars

THE CHICAGO, BURLINGTON & QUINCY is inquiring for 10 dining cars.

THE BESSEMER & LAKE ERIE, reported in the *Railway Age* of December 3, as being in the market for 8 steel coaches, 4 baggage cars and 3 combination mail and baggage cars, has renewed its inquiry for this equipment.

### Iron and Steel

THE MISSOURI, KANSAS & TEXAS has ordered 14,000 tons of rails from the Illinois Steel Company.

THE CHICAGO & EASTERN ILLINOIS has ordered 2,500 tons of steel rails from the Illinois Steel Company.

THE OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY has ordered 10,000 tons of rails from the Illinois Steel Company.

### Miscellaneous

THE CHICAGO & EASTERN ILLINOIS has ordered 100 per cent rail joints from the Rail Joint Company, to be used with the recent order for 2,500 tons of steel rails ordered from the Illinois Steel Company, 750 tons of which are 100-lb. rail.

### Trade Publications

GATE, GLOBE, ANGLE AND CHECK VALVES.—The Walworth Manufacturing Company, Boston, Mass., has issued a six-page folder which illustrates the diversified line of brass valves which this company manufactures. A list is included showing the sizes in which the various types are made and giving a list of prices. The circular calls attention to the fact that the Walworth Manufacturing Company has been making valves since 1842.

CANADIAN TIES FOR INDIA.—The Canadian government steamer "Canadian Inventor" has sailed from Vancouver, B. C., for Calcutta, carrying creosoted ties from the Vancouver Creosoting Plant; 3,800,000 feet. The ties are being sold in competition with Australian woods.

## Supply Trade News

T. T. Bond, formerly traffic manager of Fairbanks, Morse & Co. at Chicago, has been elected vice-president of Harry C. Wood & Co., freight brokers and forwarders, New York.

John L. Bacon has been appointed manager of service and inspection department of the Franklin Railway Supply Company, with headquarters in New York. Mr. Bacon was formerly district manager of the Cleveland office of the same company.

G. Lewis Taylor, for the past 12 years assistant chief engineer of the McClintic-Marshall Company, Pittsburgh, Pa., has been appointed chief engineer, succeeding the late Paul L. Wolfel. Mr. Taylor graduated from the University of Pennsylvania in 1900.

A. D. Graves, who has been appointed general manager of Pratt & Lambert, Inc., Buffalo, N. Y., as was announced in the *Railway Age* of January 28, is a native of Ohio, his boyhood having been spent in Columbus. He was a bookkeeper in a wholesale drygoods house for nearly five years previous to entering the employ of a concern manufacturing varnish. In 1908, he started as a salesman for Pratt & Lambert and spent the next ten years in developing trade in Philadelphia and vicinity, when he became manager trade sales. Mr. Graves is one of the successful 12 Pratt & Lambert men whose high percentage of sales won them a trip to Europe in the summer of 1914.

A. D. Graves

Theodore L. Dodd has been elected vice-president and a member of the board of directors of the Alleghany Steel & Tube Company, with headquarters at Chicago. Mr. Dodd will have jurisdiction over the sales in the Middle West, extending to the Pacific coast.

B. A. Bell, railway specialist for the Western Electric Company, has been appointed railway representative of this company at Atlanta, Ga., effective February 1, succeeding J. W. Smith. Before taking up the duties of railway specialist Mr. Bell was general salesman for the Western Electric Company.

The Forman-Bassett Company, Cleveland, Ohio, have opened new headquarters in the Hotel Cleveland for the sale of the General Fireproofing Company's line of steel office equipment, expanded metal lath, concrete reinforcements and waterproofing compounds. F. W. Wagner is sales manager in charge of the branch.

The Austin Machinery Corporation of Louisiana has been incorporated under the laws of that state as distributors for Louisiana, Arkansas, Mississippi and Tennessee for the products of the Austin Machinery Corporation. The capitalization is represented by \$100,000 of preferred stock and \$200,000 of common stock. The general offices of the corporation will be at 1020 Maison Blanche Building, New Orleans, La.

Alexander England, assistant chief engineer of the Westinghouse Air Brake Company, Wilmerding, Pa., has been appointed chief engineer, to succeed S. W. Dudley, whose retirement on February 1 was noted in the *Railway Age* of

February 4. **R. E. Miller**, engineer of tests and inspection, has been promoted to superintendent of tests and inspection; **W. E. Dean**, assistant engineer of tests, has been promoted to engineer of tests, and **A. A. Mackert**, chief inspector, has been promoted to engineer of inspection.

**Alba B. Johnson**, formerly president of the Baldwin Locomotive Works, has resigned from the board of that company and also as a director of the Standard Steel Works, Philadelphia, Pa. **John M. Hansen**, president of the Standard Steel Car Company, Pittsburgh, has been elected a director and member of the executive committee of the Baldwin Locomotive Works and **W. L. Austin**, vice-chairman of the board of directors of the Baldwin Locomotive Works, has been elected a director of the Standard Steel Works, Philadelphia, to succeed Mr. Johnson.

**E. Emery**, formerly manager of the R. H. Blackall Company, Pittsburgh, Pa., has opened offices in the Oliver building, Pittsburgh, under the firm name of the **Emery Sales Company**, handling railway supplies. Mr. Emery will serve as special representative, reporting to the Pittsburgh office of the Schaefer Equipment Company, handling its full line of foundation brake details in a defined territory. He will also have charge of sales in the Pittsburgh district of the Mason Packing Company, Pittsburgh, which manufactures the Mason semi-metallic packing for locomotive air pumps, and will represent the Standard Horsenail Company, New Brighton, Pa., handling its line of taper pins, shaft keys and channel pins. Mr. Emery was graduated from the Chicago Manual Training School in 1899, after which he was connected for two years with the F. B. Reddington Company, Chicago, in an engineering capacity. He was for eight years with A. Sorge, Jr., & Company, Chicago, handling a steam specialty line. He was engaged in sales and engineering work for a time and later was with the Parker Boiler Company, Philadelphia, Pa., for one year as general sales manager. Mr. Emery was then assistant sales manager of the Rust Boiler Company, Pittsburgh, and when that business was sold to other interests he joined the R. H. Blackall Company.

E. Emery

**E. D. Kellogg** has been appointed New Jersey representative for the Conveyors Corporation of America, Chicago, manufacturers of machinery for handling coal, sand, gravel, ashes and other loose bulky materials. Mr. Kellogg will handle the American trolley carrier and the American steam jet conveyor in the northern half of New Jersey, with his headquarters at the eastern office of the company, 110 West Fortieth street, New York. Mr. Kellogg graduated from Stephens Institute of Technology in 1898, and specialized in the design and construction of steel structures in this country and Canada until 1916, when he entered the material handling field with the Terry Manufacturing Company, New York, manufacturers and builders of heavy derricks and traveling cranes.

The Toledo Crane Company, Bucyrus, Ohio, successors to the Toledo Bridge & Crane Company, Toledo, builders of Toledo cranes, has been chartered under the laws of Ohio, with the following officers: **C. F. Michael**, president; **W. F. Billingsley**, vice-president and general manager; **A. G. Stoltz**, treasurer, and **C. Gallinger**, secretary. The officers with **C. H. Dexheimer** are the stockholders and directors. All stock has been subscribed and paid in and none will be offered for public subscription. The main office is at Bucyrus, with

sales offices in New York City, Boston, Philadelphia, Pittsburgh, Buffalo, Cleveland, Cincinnati, Chicago, St. Louis, Kansas City, Seattle, Salt Lake City, San Francisco, Birmingham and Minneapolis. The company will have completed by March 15 a building 120 ft. by 320 ft., to be used for erecting and assembly, with a machine shop 60 ft. by 300 ft., a structural shop 90 ft. by 300 ft., a pattern shop 60 ft. by 140 ft., and a forge shop 40 ft. by 100 ft., all to be equipped with modern tools.

**J. Allan Smith** has resigned as president of the U. S. Light & Heat Corporation, Niagara Falls, N. Y. Mr. Smith is leaving to engage in business for himself, a step which he has long been contemplating. He has been identified with the affairs of the U. S. Light & Heat Corporation for a number of years, managing its business during the most precarious times of its existence. In the early days the business of this company largely consisted of the manufacture and sale of train lighting devices, and under the management of Mr. Smith, the storage battery manufacturing business has grown until now it is one of the largest battery producers of this country. Mr. Smith has been succeeded by **C. O. Miniger**, of Toledo, Ohio, who is vice-president of the Willys Corporation and general manager of the Auto-Lite division of that corporation at Toledo. Mr. Miniger is well known to the automobile industry; he has been closely identified since the early days of the automobile with the manufacture and sale of electric lighting and starting devices for motor cars. He was one of the original incorporators and organizers of the old Electric Auto-Lite Company which began in a very limited way manufacturing electric starting devices. When John N. Willys acquired control of that company, Mr. Miniger was placed in charge of its affairs and through his efforts its business has been built up to one of the largest producers of electric starting and lighting devices for motor cars. It has also become a large producer of farm lighting outfits. Mr. Miniger will give all of the attention which may be necessary to his new duties but will still continue to be in charge of the Electric Auto-Lite division of the Willys Corporation at Toledo. His title in the U. S. Light & Heat Corporation will be president and general manager. **C. L. Lane** has resigned as vice-president and general manager of the U. S. Light & Heat Corporation and **D. H. Kelly** has been elected to serve as vice-president and assistant general manager. Mr. Kelly was for eight years secretary of the Toledo Scale Company, Toledo, and for the past two years has been assistant sales manager of the Willys Light division of the Electric Auto-Lite Corporation. He has had 10 years' experience in the railroad field.

## Obituary

**Clifford J. Ellis**, district manager of sales for the Midvale Steel & Ordnance Company and the Cambria Steel Company,

C. J. Ellis

with headquarters at Chicago, Ill., died at his home in Evanston, Ill., on January 31. Mr. Ellis had been district manager of sales for more than 30 years and for 37 years had been in the service of the Cambria Steel Company at Chicago. He was born on November 23, 1860, and when 19 years of age entered the employ of Wood Morrell & Co., Johnstown, Pa., who controlled the Cambria Iron Company. Not long thereafter he became assistant to the treasurer and in 1883 he was transferred to Chicago, entering the sales department of the company, where he had served up to the time of his death.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was noted in the *Railway Age* of February 4 (page 349), as intending to build a complete ice plant at Hobart Station, Cal., at a cost of approximately \$500,000, has awarded the contract for this work to C. A. Fellows, Los Angeles, Cal. This company has awarded the contract for the construction of the frame blacksmith shop at Newton, Kan., which was noted in the *Railway Age* of January 28 (page 308), to Jerome Moss, Chicago. The Santa Fe will build new icing facilities at Clovis, N. M., including platforms at a cost of \$21,660. The company's icing facilities at Waynoka, Okla., will be also increased by the construction of additional platforms and ice chutes so as to permit the handling of 44 cars instead of 17, as at present. The work at Waynoka will cost about \$30,000.

**CHICAGO UNION STATION.**—This company, which was noted in the *Railway Age* of January 28 (page 308) as accepting bids for the wrecking of the old Chicago & Alton freight house at Harrison street and the Chicago river, has awarded the contract for this work to the W. J. Newman Wrecking Company, Chicago.

**ILLINOIS CENTRAL.**—The Groom Coal Company will build a frame coaling station at Belleville, Ill., on the line of this company.

**NORTHWESTERN PACIFIC.**—This company is preparing plans for improvements contemplated on its terminal at Sausalito, Cal.

**PATTERSON & WESTERN.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of its line between Patterson and Jones Station, Calif., a distance of 23.6 miles.

**RED RIVER VALLEY.**—This company has completed surveys for a line from Fargo, N. D., north to Alvarado, Minn., a distance of approximately 100 miles. The project was abandoned temporarily during the war, but has been revived and the company plans to begin construction of this line during 1921.

**SOUTHERN PACIFIC.**—The Railroad Commission of California has ordered this company to improve its depot facilities at Oakland, Cal., at a cost of not less than \$50,000, declaring that the existing facilities are unsatisfactory.

THE ATCHISON, TOPEKA & SANTA FE, in ten months of 1920, paid 259 bills for loss or damage on trunks, suitcases and traveling bags, a total expenditure of \$5,449, or an average of \$21 per shipment; and J. R. Hitchcock, assistant general manager of the company's Coast Lines, has sent to station agents a six-page table showing for each of these damaged shipments the date, the starting point, the destination, the amount of the bill and a brief description of the nature of the damage.

Two hundred and fifty-nine items of this kind make an impressive exhibit. One wonders what would be the average loss per shipment, if all shipments, including those not damaged, had been included.

Some of the losses were, no doubt, simple thefts, but the statement says that losses are in the minority; the majority is made up of damage items. A great many entries read "chafed" or "ratched," and the salient feature of the comments printed in the circular is a call to enforce more strictly the rule requiring such goods to be adequately packed and protected. But it appears that about 80 per cent of the shipments originated east of the Santa Fe's eastern terminus, many of them in New York and New England, so the question of getting this economy-lecture into the right hands is not an easy one.

The same pamphlet contains a similar table of losses on drugs and druggists' sundries which totals 707 claims, amounting to \$7,824; an average per shipment of about eleven dollars.

## Railway Financial News

**BALTIMORE & OHIO.**—*Authority to offer bonds as security for notes.*—This company has been authorized by the Interstate Commerce Commission to pledge from time to time as security for short term notes \$9,935,000 of various bonds which are nominally issued or authorized.

**CHESAPEAKE & OHIO.**—*Authorized to guarantee note.*—The Interstate Commerce Commission has authorized this company to guarantee a promissory note of the Louisville & Jeffersonville Bridge for \$54,000, payable to the United States.

**CHICAGO, BURLINGTON & QUINCY.**—*Oral argument on capitalizing surplus.*—The Interstate Commerce Commission has announced an oral argument on February 14 on the application of this company to capitalize its surplus.

**CHICAGO, MILWAUKEE & ST. PAUL.**—*Authorized to guarantee note.*—The Interstate Commerce Commission has authorized this company to guarantee a 10-year 6 per cent promissory note of the Indiana Harbor Belt for \$116,000 as part security for a loan from the United States.

**CHICAGO, ROCK ISLAND & PACIFIC.**—*Application to issue bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$1,000,000 general mortgage 4 per cent gold bonds, dated January 1, 1898, and maturing January 1, 1988, to be deposited with the Central Union Trust Company of New York as a basis for an issue of \$1,000,000 first and refunding mortgage 4 per cent gold bonds, dated April 1, 1904, and maturing in 1934, which are to be held for use from time to time as collateral for short term loans.

**CHICAGO, TERRE HAUTE & SOUTHEASTERN.**—*Stockholders approve lease to C., M. & St. P.*—The lease of this property to the Chicago, Milwaukee & St. Paul for 999 years has been approved by 68 per cent of the stock and 79 per cent of the income bondholders.

**CHICAGO & EASTERN ILLINOIS.**—*Authorized to issue stock and bonds for reorganization.*—The Interstate Commerce Commission has authorized this company to issue \$4,285,000 of prior lien or first mortgage bonds, \$32,156,000 of general or second mortgage bonds, \$24,030,150 of preferred stock, and \$25,500,000 of common stock, in accordance with its recent application for the purpose of reorganizing the Chicago & Eastern Illinois. The company is also authorized to assume liability for the payment of various outstanding bond issues which are not to be disturbed in the reorganization, together with equipment obligations, and in the event that a loan of \$785,000 be made to the company from the revolving fund, and that the director general of railroads shall lend \$3,500,000 to the receiver, the company is authorized to issue and pledge as security for such loans additional prior lien or first mortgage bonds not exceeding \$1,071,000.

**CHICAGO & NORTH WESTERN.**—*Bond issue.*—Kuhn, Loeb & Co. announce the purchase of \$15,000,000 15-year 6½ per cent gold bonds, which are offered to the public by them and the National City Company for subscription at 99¼ per cent and accrued interest, to yield about 6.58 per cent. The purpose of the issue is to provide funds to pay off \$10,000,000 Chicago & North Western debenture 5 per cent bonds, maturing April 15, 1921, and \$5,000,000 Milwaukee, Lake Shore & Western consolidated mortgage 6 per cent bonds, maturing May 1, 1921. The new issue will be secured by the pledge of \$18,000,000 face value Chicago & North Western 5 per cent general mortgage bonds. The issuance of these bonds is subject to the approval of the Interstate Commerce Commission.

**New director.**—Marshall Field, 3rd, has been elected a director to succeed James A. Stillman, president of the National City Bank, resigned because of Section 10 of the Clayton Act.

**CHICAGO & NORTH WESTERN.**—*Authorized to guarantee note.*—The Interstate Commerce Commission has authorized this company to guarantee the 10-year 6 per cent promissory note of the Indiana Harbor Belt for \$116,000 as part security for a loan from the United States.

DELAWARE, LACKAWANNA & WESTERN.—*Oral argument on capitalizing surplus.*—The Interstate Commerce Commission has announced an oral argument on February 14 on the application of this company to capitalize its surplus.

DENVER & RIO GRANDE.—*New stockholders' committee head.*—Benjamin B. Odell, president of the Aetna Explosives Company and former Governor of New York, and S. M. Schatzkin have become members of the stockholders' protective committee. Mr. Odell was elected chairman of the committee, following the resignation of the chairmanship by Jefferson M. Levy. The other members are George F. Secor, G. Tracy Rogers and John T. Steele.

ELECTRIC SHORT LINE.—*Application for bond issue.*—This company has applied to the Interstate Commerce Commission for authority to issue its 15-year gold bonds, at not less than 90, at the rate of \$15,000 per mile, and its non-cumulative preferred stock, at not less than 90, at the rate of \$10,000 a mile, to complete its line from Hutchinson to Clara City, Minn., 52 miles.

FORT SMITH & WESTERN.—*Sale ordered.*—Federal Judge F. A. Youmans has ordered the sale of this road to the highest bidder on March 31, at Fort Smith, Ark. The road has been in the hands of a receiver since October 9, 1915. A new company, the Fort Smith & Western Railway, was incorporated in Delaware, January 10, 1921, with an authorized capital of \$7,000,000. The incorporators are Alton S. Dustin, Homer H. McKeehan, and W. E. Stewart, Cleveland. The Corporation Trust Company is the company's Delaware representative.

GEORGIA & FLORIDA.—*Application to issue certificates.*—This company has applied to the Interstate Commerce Commission for authority to issue \$1,600,000 of certificates of indebtedness of 8 per cent for three years, half to be used as collateral for a loan from the United States and half for the improvement of its property and to retire existing indebtedness.

INDIANA HARBOR BELT.—*Application to issue bonds.*—The Interstate Commerce Commission has authorized this company to issue \$579,000 of 5 per cent general mortgage gold bonds and to pledge them with the Secretary of the Treasury as security for a loan from the United States. As evidence of the loan the company will give its 10-year 6 per cent promissory notes secured by the pledge of the bonds and guaranteed as to payment of principal and interest by the New York Central, Michigan Central, Chicago, Milwaukee & St. Paul, and Chicago & North Western, which own the capital stock of the Indiana Harbor Belt, and the amounts to be guaranteed by each are substantially proportionate to their respective holdings.

*Loan approved.*—The commission has announced its approval of a loan of \$579,000 to enable the company to provide itself with miscellaneous equipment and other additions and betterments.

LONG ISLAND.—*Equipment trusts sold.*—Plympton, Gardiner & Co., Cassatt & Co., Paine, Webber & Co., of New York, and Strother, Brogden & Co., of Baltimore, Md., announce the sale of \$1,656,000 6 per cent equipment trust certificates, series "C," at prices ranging from 99.51 to 92.18, to yield 6¼ per cent.

LOUISVILLE & JEFFERSONVILLE BRIDGE.—*Authorized to issue bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$162,000 of 4 per cent first mortgage gold bonds and to pledge them with the Secretary of the Treasury as security for a loan.

LOUISVILLE & NASHVILLE.—*Authorizations asked.*—Application has been made to the Interstate Commerce Commission for authority to assume obligations imposed by a trust agreement and a lease of equipment, by which it agrees to pay to the United States Trust Company of New York, as rental and on account of the purchase price of equipment, \$14,933,379.22, of which approximately \$3,908,379 is payable in cash and \$11,025,000 in 15 annual instalments of \$735,000 each, from 1922 to 1936, with interest at 6½ per cent. It is proposed to sell the equipment trust certificates to J. P. Morgan & Co. at \$95.70. The equipment proposed to be purchased consists of 12 Pacific, 16 Mikado and 6 switching locomotives, 2,000 steel underframe box cars, 100 stock cars, 300 coke cars, 300 low-side gondola cars, 10 cabooses, 2,000 all-steel hopper cars, 3 postal cars, 8 baggage cars, 25 coaches and 7 dining cars.

This company has applied also for authority to issue \$3,500,000

of first mortgage 6 per cent bonds, dated March 1, 1921, and maturing March 1, 1971, secured by a mortgage on the Southeast & St. Louis Railway, to retire a similar amount of bonds issued by that company under its mortgage of 1881. It is proposed to exchange as many of the new bonds as possible for the old bonds and to sell the balance to J. P. Morgan & Co.

LOUISVILLE & NASHVILLE.—*Equipment trusts sold.*—An issue of \$11,025,000 6½ per cent equipment trust certificates. Series D, has been sold to J. P. Morgan & Co.

MAINE CENTRAL.—*Dividend passed.*—The directors have passed the quarterly dividend on the preferred stock, payable March 1. Similar action was taken in the previous quarter.

MICHIGAN CENTRAL.—*Authorized to guarantee note.*—This company has been authorized by the Interstate Commerce Commission to guarantee the 10-year 6 per cent promissory note of the Indiana Harbor Belt for \$173,000 as part security for a loan from the United States.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—*Equipment notes sold.*—Dillon, Read & Co. have sold \$2,500,000 6½ per cent equipment trust gold notes, Series "J," at par and interest, for 1926 to 1931 maturities, and increasing ¼ per cent for each maturity thereafter to 101, for 1935 maturity.

NEW ORLEANS, TEXAS & MEXICO.—*Loan approved.*—The Interstate Commerce Commission has approved a loan of \$234,000 to aid this company in providing itself with additions and betterments. The applicant itself is required to finance \$234,246 to meet the loan of the government.

*Authorized to issue bonds and notes.*—The Interstate Commerce Commission has authorized this company to issue eight promissory notes to the amount of \$25,000 each, payable to the order of the American Car & Foundry Company at 7 per cent, to execute an agreement for the purchase of five Russian locomotives from the War Department; to issue \$800,000 of first mortgage 6 per cent gold bonds, and \$530,000, or such amount as may be required, of 5 per cent non-cumulative income bonds, and to pledge them with the Secretary of the Treasury as security for a loan. The company is also authorized to issue \$280,000 of 5 per cent non-cumulative income bonds, and approval is given for the delivery of \$175,000 of voting trust certificates, representing an equal amount of capital stock to comply with the plan of reorganization, dated August 25, 1915, under which the company was organized.

NEW YORK CENTRAL.—*Authorized to issue bonds.*—The Interstate Commerce Commission has authorized this company to issue \$7,000,000 of 6 per cent refunding and improvement mortgage bonds and to pledge them with the director general of railroads as security for a demand note.

NEW YORK CENTRAL.—*Authorized to guarantee note.*—The Interstate Commerce Commission has authorized this company to guarantee a 10-year 6 per cent promissory note of the Indiana Harbor Belt for \$174,000 as part security for a loan of \$579,000.

PARIS-ORLEANS RAILROAD, FRANCE.—*Bond issue.* A. Iselin & Co., Hemphill, Noyes & Co., and Halsey Stuart & Co., are offering 5,000,000 francs, 6 per cent bonds, foreign series, of the Paris-Orleans Railroad (Compagnie du Chemin de Fer de Paris à Orleans). The bonds are offered at 92, which at the present rate of exchange is equivalent to \$65.50 per 1,000 franc bond. They are redeemable at par, by drawings, not later than 1956.

PENNSYLVANIA.—*Application for bond issue.*—This company has applied to the Interstate Commerce Commission for authority to issue the \$60,000,000 of 15-year 6½ per cent secured gold bonds, which were recently sold to Kuhn, Loeb & Co., subject to the commission's approval at 95.40, and also \$60,000,000 of 6 per cent gold bonds, series "C," secured by its mortgage, dated June 1, 1915, to be used as security for the 6½ per cent issue.

PICKENS RAILROAD.—*Application for loan.*—This company has applied to the Interstate Commerce Commission for a loan of \$10,000 to enable it to take up a note and pay an overdraft at a bank, and also to pay its employees back wages.

PITTSBURGH & LAKE ERIE.—*New director.*—James B. Yohe has been elected a director, succeeding R. B. Mellon.

**RARITAN RIVER.**—*Authorized to issue stock.*—This company has been authorized by the Interstate Commerce Commission to issue and sell at par 1,600 shares of common stock of the face amount of \$100 a share to reimburse its treasury for expenditures from income.

**ROCK ISLAND SOUTHERN.**—*Application for loan.*—The receiver has applied to the Interstate Commerce Commission for a loan of \$150,000 for two years for the purchase of one locomotive and improvements to roadway and equipment.

**SEABOARD AIR LINE.**—*Authority asked for bond issue.*—Application has been made to the Interstate Commerce Commission for authority to nominally issue \$713,000 of its first and consolidated mortgage bonds to be used, together with \$1,077,000 of the bonds already held in the company's treasury, as collateral security for loans from the United States.

**UNION PACIFIC.**—*May purchase Kansas City Northwestern.*—Unconfirmed reports are to the effect that this company is planning to buy in the Kansas City Northwestern for the purpose of acquiring terminal facilities at Kansas City. The Kansas City Northwestern ceased operating November 1, 1919. J. M. Lee is receiver.

**VIRGINIA SOUTHERN.**—*Authorized to issue notes and bonds.*—The Interstate Commerce Commission has authorized this company to issue 6 months' promissory notes to the amount of \$37,000 at 6 per cent, payable to the First National Bank of Richmond, Va., and also \$150,000 of its first mortgage 6 per cent gold bonds, of which \$76,000 is to be pledged as security for a loan from the United States and \$74,000 as security for a note to the bank.

**WHEELING & LAKE ERIE.**—*Authority asked for bond issue.*—This company has applied to the Interstate Commerce Commission for authority to issue \$884,000 of its 6 per cent mortgage bonds to reimburse the treasury for expenditures and to be used as collateral for a loan from the United States.

**NAVAL NEWS.**—It is stated that there are many skilled engineers and crews of railroad tugs and lighters in New York harbor now out of work who are more than eager for a return to the old ten-hour-a-day basis.—*Journal of Commerce.*

## Railway Officers

### Executive

J. P. Cowley has been appointed assistant to the vice-president of the Gulf, Colorado & Santa Fe with headquarters at Galveston, Tex., effective February 1, succeeding V. C. James, resigned.

### Financial, Legal and Accounting

C. H. Bender has been appointed paymaster and assistant treasurer on the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Minneapolis, Minn., effective January 1.

A. Hermany, auditor of disbursements of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has been promoted to assistant general auditor with the same headquarters. R. H. Carleton, assistant auditor of disbursements, has succeeded Mr. Hermany as auditor of disbursements. A. A. Middleton has succeeded Mr. Carleton. These changes were effective February 1.

E. E. Lloyd, auditor of disbursements of the Canadian Pacific, has been appointed assistant comptroller with headquarters at Montreal, succeeding W. J. Moule, deceased. H. J. Dalton, assistant auditor of agencies, has succeeded Mr. Lloyd as auditor of disbursements. R. W. Urwin has been appointed assistant auditor of agencies to succeed Mr. Dalton. B. Arnum has been appointed assistant auditor of agencies, succeeding W. H. Blackaller, retired.

### Operating

A. S. McNeese has been appointed assistant trainmaster on the Southern Pacific, with headquarters at Yuma, Ariz., and jurisdiction over the Yuma terminal, succeeding B. I. McNeil, who has been assigned to other duties.

### Traffic

J. S. Rampacher has been appointed district freight agent of the Southern, with headquarters at Philadelphia.

J. G. Kitchell has been appointed commercial agent of the Southern with headquarters at Shreveport, La., effective February 1.

H. V. Wilmot has been appointed district passenger agent on the Northern Pacific, with headquarters at Chicago, effective February 1.

J. H. Fox has been appointed district freight agent on the Canadian Pacific, with headquarters at Edmonton, Alta., succeeding F. W. Sterling, who has resigned, effective February 7.

A. Johnson, chief of the tariff bureau of the Michigan Central, has been appointed assistant general freight agent with headquarters at Detroit, Mich. C. A. Hunt succeeds Mr. Johnson as chief of the tariff bureau.

W. C. Connor, Jr., general agent on the Denver & Rio Grand and Western Pacific, with headquarters at New York, has been appointed general eastern agent of the Chicago & Eastern Illinois with the same headquarters, effective February 14.

E. R. Oliver, whose appointment as freight traffic manager of the Southern, Lines West, with headquarters at Cincinnati, Ohio, was announced in the *Railway Age* of November 12, 1920 (page 863), was born in La Fayette County, Miss., February 25, 1883. He was educated in the public schools and was graduated from the Jefferson Law School, Louisville, Ky., with the degree of LL. B. in 1910. Mr. Oliver began his railroad career in 1898 as a clerk in the traffic department.

Photo by Ewing Galloway

Entrance to the Bergen Archways on the Erie at Jersey City

He held various positions in that department until January, 1906, when he was appointed traveling freight agent at Chicago. The following year he was promoted to soliciting freight agent at Louisville, Ky. In 1910 Mr. Oliver was appointed chief clerk to the assistant freight traffic manager and, in 1912, to assistant general freight agent at Louisville, Ky. On January 1, 1916, he was transferred to Washington, D. C., and on October 1 of the same year to Atlanta, Ga. He was promoted to general freight agent with headquarters at Cincinnati, Ohio, in March, 1920, and was occupying that position at the time of his recent promotion.

**A. M. Farrell**, whose promotion to general freight and passenger agent of the Chicago, Ottawa & Peoria, with headquarters at Joliet, Ill., was announced in the *Railway Age* of January 28 (page 310), was born on January 2, 1884, at Charlestown, W. Va. He entered railway service in 1900 as a clerk in the office of the general superintendent of the Ohio River Railroad, at Parkersburg, W. Va., where he served until 1903, when he was employed by the Western Terminal Trunk Line Association as an inspector. After three years of service in this capacity, Mr. Farrell was appointed chief clerk in the freight office of the Baltimore & Ohio at Huntington, W. Va. In 1908, he was made rate clerk in the division freight office at Parkersburg, where he remained until 1910, when he was appointed traveling freight agent, with headquarters at Elkins, W. Va. Mr. Farrell entered the service of the Chicago, Ottawa & Peoria in 1913. At the time of his recent promotion he was serving as chief clerk in the traffic department.

A. M. Farrell

### Mechanical

**C. J. Sevier** has been appointed assistant to the superintendent maintenance of equipment of the Western Maryland, with headquarters at Hagerstown, Md.

**H. W. Salmon, Jr.**, has been appointed acting fuel agent on the Missouri Pacific, with headquarters at St. Louis, Mo., effective February 1, succeeding **W. P. Hawkins**, who has resigned.

**O. J. Greenwell** has been appointed master car repairer on the Tucson division of the Southern Pacific, with headquarters at Tucson, Ariz., succeeding **A. G. Saunders**, who has resigned.

**H. M. Allen**, locomotive foreman on the Canadian Pacific, with headquarters at Alyth, Alta., has been promoted to master mechanic, on the Kenora Division, with headquarters at Kenora, Ont.

**G. S. Goodwin**, corporation mechanical engineer of the Chicago, Rock Island & Pacific, has been appointed mechanical engineer of the Rock Island System, with headquarters at Chicago, effective February 1.

**A. J. Krueger**, shop inspector of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, has been promoted to master car builder with the same headquarters, succeeding **R. W. Miller**, deceased, effective February 4.

**H. A. Amy**, locomotive foreman on the Canadian Pacific, with headquarters at North Bay, Ont., has been promoted to division master mechanic, with headquarters at Ottawa, Ont. **E. G. Freeman**, locomotive foreman, with headquarters at Cartier, Ont., has been transferred, succeeding **Mr. Amy**.

**J. Gibson**, locomotive foreman on the Canadian Pacific, with headquarters at Sutherland, Sask., has been promoted to master mechanic with headquarters at Moose Jaw, Sask., succeeding **A. Peers**, whose appointment as master mechanic was announced in the *Railway Age* of January 7 (page 174).

### Engineering, Maintenance of Way and Signaling

**C. C. Cunningham** has been appointed division engineer of the Kansas division of the Chicago, Rock Island & Pacific, with headquarters at Herington, Kan., succeeding **F. Nugent**, who has been transferred, effective January 31.

**G. W. Boschke**, whose appointment as assistant chief engineer of the Southern Pacific, lines west of Ogden, El Paso and Portland, with headquarters at San Francisco, was announced in the *Railway Age* of January 7 (page 174), was born on October 10, 1864, at Boston, Mass., and was educated at Wilson College. He entered railway service in 1886 in the engineering department of the Southern Pacific, being engaged in construction work on the Portland route of the Coast division, and the Southern Pacific terminals at Galveston, Tex. During his service at Galveston, Mr. Boschke was employed by the city of Galveston to supervise the construction of the Galveston sea wall. In April, 1905, he was appointed chief engineer of the Oregon-Washington Railroad & Navigation Company, and in addition to his other duties he was appointed engineer maintenance of way on the lines of the Southern Pacific in Oregon. When the Union Pacific and the Southern Pacific were placed under independent operation, Mr. Boschke left railroad service to enter private practice as a consulting engineer. He was engaged in this work and as a contractor at the time of his recent appointment.

### Purchasing and Stores

**H. W. Salmon, Jr.**, has been appointed acting fuel agent of the Missouri Pacific, succeeding **W. P. Hawkins**, resigned, effective February 1.

### Obituary

**Lucius E. Johnson**, until recently chairman of the board of the Norfolk & Western, died February 9, at Deland, Fla. Mr. Johnson retired as chairman of the board on January 1, under the pension rules of the company, as was announced in the *Railway Age* of January 21 (page 262).

**Henry Hiden**, general agent on the Chicago, Indianapolis & Louisville, with headquarters at Birmingham, Ala., died of pneumonia on the evening of February 1. Mr. Hiden had been general agent at Birmingham for the past 12 years, with the exception of a part of the period of federal control, when his headquarters were at Lafayette, Ind.

## Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

It would seem a fairly safe guess that if an observer wanted to find the real center of optimism in the United States in these times of business depression, he would save his time by starting his search at El Paso, Houston or at some of the other leading commercial centers along the Mexican border. It has been so long since conditions in Mexico were such, politically and commercially, that trade with that country could be carried on with facility, that we have almost forgotten how large Mexico really is or how great are its possibilities of trade and development. Conditions south of the Rio Grande are now, however, much happier than they were. The Mexican government has shown that it realizes the necessity of putting its transportation system back on a proper basis and there is no doubt that the agreement made with a number of American roads for the loan of cars and locomotives should prove of much benefit to that end. The effect, however, will not be all on the Mexican side of the border, for it is apparent that the American roads north of the border as well as the jobbing centers served by them will be benefited to an equal if not to a greater extent. These roads are in fact in the position of being prepared for the opening of a new country of great traffic possibilities and their earnings will presumably reflect that fact in coming months.

The situation existing in China today, which is being brought to the attention of the American people by the Committee for the Chinese Famine Fund, is one that has many serious aspects outside of the necessity for charity. The facts are that China in her five northern provinces is suffering from the worst famine in her history and perhaps in all recorded history. In an area of some 100,000 square miles, 45,000,000 are threatened with famine; 15,000,000 are literally starving and the reports tell us that deaths from starvation and disease are occurring at a rate of 10,000 a day. The reason for all this misery is that continuous drought for eighteen months has caused the failure of three successive crops. China is not a poor country; it has much wealth, although of a potential character, and its agricultural possibilities are not small. We are told, for example, that food in abundance can be purchased in Manchuria. The chief difficulty in China is that it lacks transportation and has not reached that stage of economic agricultural development that goes with the building of railway lines and highways. Each agricultural community presumably is in a measure an economic entity in itself. Such a community is not developed to the point where it can raise a surplus nor would it be worth while for it to raise such a surplus, because it could not dispose of it. China proper, exclusive of Mongolia and Tibet, has an area of 1,532,420 square miles and a population of over 300,000,000 as compared with an area of 2,973,890 in the United States and a population of 105,000,000. To serve its large area and enormous population China has but 6,000 miles of railway lines. It is plain enough that the need for assistance in the present emergency is most urgent, but it is equally plain that to avoid a recurrence of such disastrous conditions as

exist at present, China needs new railways and lots of them. It is certainly to be hoped that the eyes of the rest of the world will be opened to that fact, to the end that the many projects and proposals for extended railway development to make available China's great potential wealth may become actualities with less delay through international politics, diplomatic discussion and jealousy.

Several American financial institutions, known in financial circles as the "South American group," are offering to the public \$24,000,000 of 8 per cent gold, sinking fund bonds of the government of Chile. It is understood that the proceeds of this loan will be expended for the most part in this country in the purchase of equipment and supplies for the government railways. It is not proposed to expend any of these funds for the building of new lines but rather to use them for the rehabilitation of the present sections of the government system. The largest purchases by the railways will probably be rolling stock and locomotives, since Chile's present supply of this equipment is known to be inadequate. Aside from the fact that this loan will presumably result in orders for equipment and supplies for American manufacturers, it is interesting from another angle, since it is Chile's custom, as a general rule, to place these loans in London. In fact, it has been reported that an attempt was made in the present instance to place this loan in Great Britain, but that our bankers were able to offer more favorable terms than those in London. It is to be hoped that the New York market for such securities will be receptive. If it is, large loans to Argentina and Brazil will probably be placed here. The result will be a tendency to correct the unfavorable exchange situation and make it easier for American exporters to compete with foreign competitors, besides assuring certain definite purchases from the proceeds of the loans themselves.

The Coal Trade Journal says that the railroads have used the assigned car as a club to "beat down" the price of locomotive fuel. If it was possible to "beat down" the price of coal to 20 dollars a ton in New England last year, what would the railroads have paid had it not been for assigned cars?

If it was necessary to confiscate thousands of tons of commercial coal during the previous year in order to keep the railroads running, how enormous would have been these confiscations had not the assigned car assured a certain fixed supply? If hundreds of cars shipped to the railroads during recent years contained coal that was unfit for locomotive use, what would have happened had it not been possible for the railroads to place assigned cars at mines where they were assured a suitable grade of coal? The railroads did accept great quantities of inferior coal but this does not indicate, as claimed by the Coal Trade Journal, that this coal was acceptable. *Inferior coal was never acceptable*, but the railroads took it in order to avoid confiscating commercial coal and to keep running. When the Boston & Maine recently

rejected 400 cars of inferior coal it did not sell this coal to the Commonwealth of Massachusetts on competitive bids as stated by the Coal Trade Journal, but even if it had done so it would not have proved the coal to be fit for locomotive use. Furthermore, contrary to the statement in the Coal Trade Journal, the "one shipper" who voluntarily admitted that this rejection was justifiable was, as a matter of fact, involved in the original transaction for which that publication first attacked the railroad.

It is difficult to find an argument not already advanced for the more careful selection and training of railroad shop foremen. The present situation, however,

### Selection and Training of Foremen

warrants a reconsideration of these arguments. Efficient, capable foremen could overcome to a certain extent the effect of indifferent workmen but far too few efficient, capable foremen are available. Failure to select and train carefully an adequate number of these men in the past is now costing the railroads dearly. Four years are considered necessary for an apprentice to learn the machinist's trade and yet a machinist is promoted to the position of foreman, directing men instead of machines, and is expected to make good in four weeks or less. The selection of men for prospective foremen should not be left to chance, as past experience has amply demonstrated the possibility of keeping personal efficiency records whereby the master mechanic, or shop superintendent, is enabled to tell at a glance which one of his employees will probably best fill a vacancy among the foremen. Incidentally, this system tones up the whole organization since it enables those in authority to know the work for which each employee is best adapted, and to encourage him to overcome individual weaknesses. Conceding the need for the careful selection of prospective foremen, the best and practically the only method of training them is by affording actual experience in directing the work of others. Every possible opportunity should be given ambitious, promising employees to work as acting foremen in the various departments, taking advantage of the absence of regular foremen on account of sickness, vacation or other cause. This will allow the man to break in under the guidance of more experienced foremen. Trying out a man as acting foreman affords a graceful means of returning him to the ranks should he not make good, thus avoiding the undesirable consequences of demoting him. The acting foreman should be coached carefully and be encouraged by his superiors to assign all possible detail work to subordinates, devoting themselves to the broader problems of managing departments, installing improved methods and developing team work and enthusiasm in the men who are under their direction.

As regards railways, Argentina is more intensively developed in proportion to its population than is our own country.

### British Railways in Argentina

There are 28 miles of line for each 10,000 inhabitants in that country—as against 25 miles for each 10,000 of population in the United States. The total railway mileage of Argentina is approximately 20,370—something over 75 per cent of which is owned by British capitalists and operated by railway men from the British Isles. That these Britons have done and are doing their work well is amply testified by an article elsewhere in this issue—the first one of a series of three which will deal with the railways of Argentina. These articles propose to describe in some detail the extent to which these roads are developed by their British managers and to give a general idea of some of the practices and equipment

of the lines. The penchant of British railway managers to buy British equipment and supplies is well known. The fact that Argentina is not one of the most promising markets for American railway supplies, therefore, scarcely needs to be commented upon. The lines not owned by the British, approximately 5,000 miles, of course offer opportunities for orders to the American concerns which can, in spite of the unfavorable exchange situation, meet the prices of foreign competitors. The strength of the British position in Argentina bears eloquent testimony to the truism that "trade follows the invested dollar." Argentina is growing rapidly and such growth will soon necessitate great increases in railway mileage. The answer to America's foreign trade difficulties in the Argentine, then, is the investment of capital in the enterprises of the country. A loan of \$24,000,000 has, according to press reports, just been arranged in this country for the Chilean government to aid in the rehabilitation of the Chilean railways. Such a loan, besides assuring certain definite purchases in this country, facilitates general buying in America because it tends to correct the disadvantageous exchange situation. A similar loan to Argentina is said to be under consideration. If the report is true the opportunity exists for taking a decided step in the right direction.

Discipline without suspension is not discipline at all unless it is managed systematically and one of the points used in arguments against the Brown system is that small offenses cannot be or at the least are not, carefully weighed, recorded and made to take their proper place in the summing up of merits and demerits by which a man is finally judged. From a recent monthly record of one district of the Canadian Pacific we copy some entries giving evidence that this criticism is not in all cases justified:

#### EXTRACTS FROM RECORD OF DEMERITS, JANUARY, 1921

1 Conductor	... 10 Demerit marks.	Not seeing that his trainman was in his proper position, on passenger train, to cut engine off train on arrival at terminal.
1 Conductor	... 20 Demerit marks.	Not reporting an occurrence in tourist car on his train, after same had been called to his attention.
2 Conductors	... 20 Demerit marks.	Carrying an ex-employee on their train without transportation.
1 Conductor	... 20 Demerit marks.	Failing to register train at end of double track, two offenses.
1 Conductor	... 15 Demerit marks.	Overcarrying an elderly lady who was traveling in day coach on his train.
1 Sec. foreman.	10 Demerit marks.	Worked unnecessary overtime.
1 Sec. foreman.	30 Demerit marks.	Not completing patrol of section on morning inspection, having to send one of his men over same territory twice; wasting time unnecessarily.
1 Trainman	... 20 Demerit marks.	Sleeping on duty while approaching terminal on passenger train, and not being on hand to cut engine off train.
1 Trainman	... 10 Demerit marks.	Repeatedly failing to present watch for comparison.
1 Yardman	... 5 Demerit marks.	Not uncoupling air hose on cars before starting switching operations.

These and other items in the record indicate that "Brownies" can be made to fit the offense, without difficulty, if the superintendent is determined to do justice. It is not possible of course to make comparisons with certainty at this distance; but where entries are put into the record for such minor faults as lack of promptness in cutting off an engine, or wasting an hour's time of a few laborers, or failing to report an incident (in a passenger car) which was of questionable moment, one may feel confident that discipline is being administered with discrimination and care. It is for those who would discredit "book discipline" to set forth how such offenses would be dealt with effectively under the old system. Would they not very likely be turned off with an admonition or a reprimand which would never be mentioned in the record? "Be fair and you can be firm." This well-settled maxim works both ways. The officer who does not carefully make record of the smaller offenses is not fair to the

employer. Having made such record he is the better prepared to be generous—intelligently generous—to the employee, whenever generosity may seem to be advisable.

The rapid growth in the aggregate hauling capacity of railroad motive power, amounting to an increase of 150 per cent

### A Check on Locomotive Development

The rapid growth in the aggregate hauling capacity of railroad motive power, amounting to an increase of 150 per cent in the last 17 years, has heavily overloaded the available maintenance facilities. The effect which the shortage of facilities seems to have had on the serviceability of locomotives was suggested in an article appearing in last week's issue in which it was pointed out that since 1903 there has been a decrease in the annual train miles per locomotive now equivalent to two months' service in 12. But there is another aspect of this situation which may prove even more serious in the future than the decrease in locomotive mileage. Appliances designed to increase the efficiency or the capacity of the locomotive as a power producer, or to facilitate its operation, generally add to the volume of maintenance work. In few cases can the operating economies or other advantages of these appliances be fully realized if their care is neglected. But it is not infrequently necessary to keep the locomotive in operation at the expense of neglecting these appliances in order to do the work which must be performed if the locomotive is to move at all. Such conditions result in failure to realize a full return from these important features of the modern locomotive, a loss of economy not only detrimental in itself but inevitably tending to check the development and practical application of all such improvements. One railroad officer has expressed the opinion that it is useless to consider the application of additional devices to the locomotives on his road until it is possible to maintain adequately the equipment as it now exists. The inability to take advantage of every practical development for increasing locomotive efficiency may readily become even more serious than reduced locomotive serviceability unless a reasonable balance between shop and terminal facilities and the amount and character of equipment to be cared for is restored. If \$100,000,000 to \$200,000,000 be accepted as an approximation of the investment in idle locomotives required to offset the reduction in mileage performance which has taken place since 1903, the failure to realize a possible saving averaging only two or three per cent on the railroad fuel bill would cause a loss on this item alone as great as the carrying charges on the unproductive investment. From whatever angle this subject is approached, it is evident that the provision of adequate shop and terminal facilities is as important and inseparable a part of the motive power problem as the locomotive itself.

## The Labor Board's Decision

THE DECISION rendered by the Railroad Labor Board on February 17 on General Atterbury's suggestions to it has been interpreted as a defeat for the railroads. However that may be, the decision establishes certain precedents which, if the board scrupulously follows them in future, will promote orderly procedure and fairness in the handling of matters over which it has jurisdiction.

One suggestion which was made by General Atterbury, speaking as chairman of the Labor Committee of the Association of Railway Executives, was that the board should approve at once the restoration of the rules and working conditions in effect on each railroad on December 31, 1917. He pointed out that the financial situation of many railways, due to an excessive pay roll and the heavy decline of traffic, was becoming very serious. Spokesmen of the labor unions immediately replied that the board could not regulate wages and working conditions according to the financial condition

of the companies—that the needs of the railways was a matter to be determined by the Interstate Commerce Commission, and that the board's authority extended only over wages, rules and working conditions. The Labor Board, in its decision, recognized that while its authority extends only to fixing reasonable wages and working conditions, it cannot ignore the fact that rules and working conditions affect operating expenditures, and that unreasonable rules and working conditions must impose an undue burden upon the railroads and the public. At the same time, however, it said that the general condition and needs of the railways were matters not for its consideration, but that of the Interstate Commerce Commission.

In effect the board refused to accept facts regarding the financial condition of the railways as evidence having any bearing upon the reasonableness of rules and working conditions. But the board cannot consistently refuse to accept evidence regarding the financial condition of the railroads as having a bearing upon the reasonableness of rules and working conditions, and at the same time allow the labor leaders to take up hours and days of its time with charges, or even evidence, to the effect that the railroads are financially controlled by a few banking houses, that they have wasted money by having repairs to locomotives and cars made in outside plants, and that they are engaged in a conspiracy to break up the labor unions. If the financial condition of the railroads has no bearing on the subject of rules and working conditions, then certainly the sort of Plumb plan propaganda with which the brotherhood leaders have been deluging the board has no bearing upon it. If the board will in future, as its decision indicates, strictly confine those appearing before it to evidence and arguments regarding only the matters over which it has jurisdiction—that is, railway rules, working conditions and wages—its hearings will become solely a means to the rational settlement of the questions over which it has jurisdiction, instead of so largely a vehicle for the airing of wild, reckless and scandalous misrepresentations by the labor leaders.

The board refused to accept General Atterbury's suggestion that it immediately authorize the railways to pay the current wages for unskilled labor upon the ground that no controversy between any railway and its employees upon this subject had properly and legally been brought before it. It is undoubtedly in accordance with the spirit of the Transportation Act that no question shall be brought before the board which has not previously been the subject of conference and become a matter of controversy between the railways and their employees. But while this is the spirit and even the letter of the Transportation Act, it has not always been recognized by the board itself, and has in some cases been completely ignored by the labor unions. The railways individually have desired to negotiate with their own employees regarding every difference arising between them. The labor unions have tried to manoeuvre matters so as to force all negotiations to be carried on by the national labor organizations and the railroads as a whole. They forbade their local chairmen to negotiate at all with individual railways regarding the continuance of the present national agreements, rules and working conditions. The result was that jurisdiction of these agreements, rules and working conditions was taken by the Labor Board practically without any such previous conferences being held, and controversies arising regarding them, as are contemplated by the Transportation Act.

It will be best for all concerned in the long run that every reasonable effort shall be made by the individual railways and their own employees to settle all disputes arising between them before they are carried to the Labor Board. If the board should begin at once to make itself a court of original jurisdiction, instead of a court of appeal, all hope of having a large portion of labor disputes settled locally without its intervention would be destroyed. But here again the board

must recognize the principle that what is sauce for the goose is sauce for the gander. Having refused to allow the railways to make it a court of original jurisdiction, consistency will require it in future to refuse to allow the labor leaders to bring before it any matter which has not first been taken up with the managements of the railways.

Railway employees opposed the passage of the labor provisions of the Transportation Act. They sought at the national election the defeat of every member of Congress who voted for it. Now, in a period of declining prices and wages, they are finding and using it as a protection to them. But for the labor provisions of the Transportation Act, practically all the railways of the country would today be paying much less for unskilled labor than they are. It is to be hoped that in future, when the Transportation Act may serve as a protection to the railway companies, the employees will not forget the benefits they are now deriving from it.

Meantime, it is highly desirable that the railway companies shall comply with all the provisions of the Act, in letter and in spirit. While it is now protecting labor, the time will come, if it is not broken down, when it will protect the railways. It would be very unfortunate if the railways in the present period of stress should break it down and thereby deprive themselves of the protection which, under different conditions, it would afford to them. The railway companies should be at least as consistent and law-abiding as they demand that labor shall be.

## The Labor Board's Responsibility

THE RAILWAYS in many parts of the country are now in the somewhat unusual position (for them) of paying considerably more than the prevailing wages for unskilled labor in many localities. Because of this fact and prompted by the urgent necessity for a reduction of expenses, certain roads have taken it upon themselves to announce reductions in these rates. In its reply to the suggestion presented by General Atterbury for immediate reductions of the wages of unskilled labor the Labor Board stated that the question was not properly before it for consideration and indicated the manner in which it must be brought before it. On February 14, it further ordered one of the roads which had announced a reduction in wages to rescind it, and set a date for a hearing on this question. The entire matter will be thrashed out before the board in the very near future.

In passing on this question the Labor Board bears a peculiar responsibility to the public because of the fact that the wages in question are now higher than those paid by competing industries and because of the amount of money now involved and the even larger amount which will be involved when the more intensive season of maintenance of way work opens. While this question has been raised with reference to all unskilled labor it relates principally to that employed in maintenance of way work where probably 300,000 men are now enrolled, this number increasing to over 400,000 in the summer. At the present time the wages for such labor are fixed at rates ranging from 40 cents to 48½ cents per hour with time and one-half after eight hours, a large part of the men receiving the highest rate. In contrast, unskilled labor of the class employed in railway service can now be secured in large quantities in many places at from 10 to 15 cents per hour less than is now being paid by the roads, and is being employed at these lower rates by contractors and other industries without penalty overtime. It is therefore evident that the railways are now paying over \$250,000 more each working day than is necessary to secure the needed labor.

While the law creating the Labor Board outlines those conditions which must be given major consideration in fixing

rates of wages, and rates paid in other industries constitute only one of these conditions, the Labor Board must be prepared to defend its action before the public if it fixes railway wages above market rates. We do not contend nor do we believe it economical that the railways should pay the lowest market rate at which they can secure men. Rather, they should pay those rates which will enable them to compete on an equality with other industries for efficient labor of the class required. This does not, however, necessitate the payment of the present wages, and the board can hardly do otherwise than to authorize large reductions in the present rates.

## Is the Real Issue Labor Unionism Versus Efficiency?

THE SPOKESMEN of the labor unions before the Railroad Labor Board constantly repeat the charge that in seeking to set aside the national agreements, rules and working conditions established under government control the railways are trying to break down the labor organizations. They allege that the policy of the railways is part of a general movement initiated by Wall street financiers to establish the "open shop."

In this the leaders of the labor organizations are overplaying their hand. The railways have presented a large amount of evidence showing that the present agreements, rules and working conditions cause much inefficiency and large waste. They contend this is due to the facts, first, that no uniform rules and working conditions can be applied to the widely varying conditions of the entire country without producing inefficiency and waste, and, second, that the particular agreements, rules and working conditions now in effect are unreasonable in themselves.

The spokesmen of the labor unions have not presented a scintilla of evidence, or a single argument, either to show that these arrangements actually promote efficiency or that they do not promote inefficiency. If the contention of the railroads that they promote inefficiency is correct, and the implied contention of the labor leaders that their abolition would weaken the labor organizations also is correct, what conclusion must be drawn? Just one conclusion, namely, that maintenance of the present power of the labor organizations is incompatible with rules and working conditions which will promote efficiency.

If this is the position the labor leaders mean to take, some evidence which apparently supports it can be produced. As already has been shown in the *Railway Age*, there was no increase between 1917 and 1920 in the number of employees engaged in the actual operation of trains on the road. Meantime, there was an increase of 141,000, or 47 per cent, in the number of nine classes of employees in the shops. These facts are very significant in view of the further fact that no radical changes were made in rules and working conditions in road service, while a national agreement was made with the shop crafts. The huge increase in these classes of shop employees did increase the numerical power of the labor unions to which they belong. Rules and working conditions which increased efficiency in the shops would reduce the number of men it is necessary to employ in them. This undoubtedly would reduce the number of these classes of railway employees belonging to certain labor unions, and thus the numerical power of these unions would be reduced.

Is this what the leaders of the labor unions really have in mind when they say that the attempt of the railways to destroy the national agreements is an attempt to break the power of the labor unions? If so, then the leaders of the labor unions are raising a direct issue between labor unionism, on the one side, and railroad efficiency, on the other.

If this interpretation is correct, they are trying to maintain the numerical strength of their organizations regardless of the fact that this would mean perpetuating the employment of an excessive number of men, the maintenance of an excessive railroad pay roll and excessive operating expenses, and, in consequence, higher freight and passenger rates than would be necessary under reasonably efficient operation.

There are many people who claim that the increase of the labor unions in numbers and in power is absolutely incompatible with increases in the efficiency of production and reductions of the cost of production. They say that one of the fundamental principles of unionism is curtailment of the average output per man, upon the erroneous economic theory that the less each workman does the more men there will be employment for. They resist the growth of labor unionism because they believe the stronger the unions grow the more the cost of production will be increased, the less total production will become and the less of the necessities and comforts of life there will be made available for the use and consumption of all classes of society, including the working class itself.

Are Frank P. Walsh, B. M. Jewell, and other spokesmen of the railroad labor organizations, who are appearing before the Railroad Labor Board, trying more or less unconsciously to prove the correctness of the views of those who oppose the growth of labor unionism upon the ground mentioned? If so, they are playing directly into the hands of the most uncompromising enemies of labor unionism. The public welfare demands steady and large increases in the total volume of things produced. Every student of economics, every man in public life who is entitled to be there, every intelligent man, knows this. Railroad transportation is one of the essential processes of production. Therefore the public welfare demands that railroad transportation shall be conducted as efficiently and economically as is consistent with railway employees being paid reasonable wages and not overworked. Every intelligent man knows this. Labor union leaders will, in the long run, bring disaster upon their own organizations and their members by making an issue between industrial and transportation efficiency, on the one side, and labor unionism on the other.

Labor leaders would, in the long run, promote the interests of their organizations and their followers by defending the rights of their followers and at the same time doing all they can to increase industrial and transportation efficiency. It is a notable fact, however, that while they have been charging that the railways and other employers are trying to break down the labor unions, they have not advanced a single rational and concrete suggestion for increasing transportation and industrial efficiency.

## The Problem of the Sea Water Structure

THE PROGRESS of civilization is being constantly opposed by a multitude of animal and vegetable pests, many of which seem to thrive with increasing vigor under the new conditions set up by man as he changes his primitive surroundings to the highly developed agricultural or industrial community. Noxious weeds and destroying insects become more virulent as a new country is subjected to settlement. Likewise, marine borers have become an increasing menace. Thus, the reports of the many investigations which have been made to learn the truth about these pests are a unit in showing an increase in their inroads as the use of timber in marine harbors provides a greatly increased field for their operation.

The report on marine borers in San Francisco bay abstracted elsewhere in this issue is of interest to railway engi-

neers as it throws further light on this problem. It presents a fund of information on the nature and functioning of these various organisms, the influence of salinity of the water as affected by the tides, floods, droughts, etc. However, the greatest emphasis is placed on the importance of a high degree of perfection in the treatment of timber that is to be submerged in sea water and of sanitation in keeping the harbor waters clear of all untreated timber which will serve to encourage the growth and spread of these troublesome pests.

As regards the efficacy of preservative processes for the protection of timbers placed in sea water, the present state of the art is in much the same position as that of concrete subjected to sea water. Examples can be cited of both eminent successes and hopeless failures in the use of both materials. Yet in most cases of failure of both concrete and treated timber, some defect in workmanship or material can usually be pointed out to which the failure may be ascribed with more or less accuracy. In the case of each it is clear that much more experimentation and study must be carried on before the full facts can be known. But in the meantime it will be necessary to build docks, trestles, piers, etc., with their supporting portions submerged in sea water, and the prospective builder is compelled to select the material of construction with the facts now at hand.

This determination must be made in each individual case on the basis of the local service records, taking into account the relative availability of the materials in the particular locality.

## New Books

*Fuel Oil In Industry.* By Stephen O. Andros. 240 pages, 6 in. by 9 in. Illustrated. Bound in cloth. Published by the Shaw Publishing Company, 910 South Michigan Boulevard, Chicago.

The use of fuel oils by the railroads is by no means new and the problems involved in its application to the locomotive have been carefully studied by railway engineers for many years; in fact, the value of this book to the railway mechanical or civil engineers might be questioned if it were not for the tremendous expansion in the use of fuel oil in all industries within recent years. Thus the increased price of bituminous coal has assisted in promoting the use of fuel oil both in maritime service and in many hundreds of stationary plants along the eastern seaboard. This in turn has introduced new problems relating to its transportation in bulk and storage in large quantities. Moreover, it must be admitted that refinements bearing upon the handling and burning of fuel oil are generally given more consideration in stationary and maritime service than in railroad use. For this reason, there is a field for a book of this character in railroad as well as industrial service which outlines, as it does, not only the principles of fuel oil combustion and the properties of fuel oils, but the methods of testing, storing and burning it together with a full description of its application to industrial and domestic furnaces. For instance, the book not only describes many of the details involved in the construction of steel storage tanks but refers to an interesting development in concrete oil storage tanks and describes at length all of the pipe setting and auxiliary machinery involved. While the book describes many types of burners that would not be applicable to locomotive service, still there are many points in connection with this subject as outlined in this book that will prove of particular interest to railway fuel engineers. The use of fuel oil in the manufacture of iron and steel and the heat treating furnaces is also described and illustrated in an interesting way.

## Letters to the Editor

### 70-Ton Acid Tank Cars Built in 1912

CLEVELAND, Ohio.

TO THE EDITOR:

In the description of a sulphuric acid tank car of 70 tons capacity in your issue of January 14, the following paragraph appears:

"With the exception of two cars built for the General Chemical Company in 1916, the 50 cars on this order are, so far as known, the first 70-ton acid tank cars constructed."

It may be of interest to your readers to know that we owned and operated tank cars for the transportation of sulphuric acid with a marked capacity of 70 tons and with an actual carrying capacity of 75 tons of acid, as early as the year 1912.

The first car was put in operation in August, 1912; the second car in October, 1912. The next 13 cars of like capacity were added in 1915. In January of this year, we added 10 and we have at the present 15 more coming through the shops, all with a marked capacity of 70 tons, but with an actual carrying capacity in excess of this marked capacity.

JOHN HART,

Traffic Manager, The Grasselli Chemical Company.

### The Importance of Supervision

TO THE EDITOR:

I have read with much interest the editorial in the issue of December 3, 1920, entitled "Will Railway Employees Help Reduce Operating Expenses?" I should like to answer this by stating most emphatically that they will not, unless they are properly supervised. The efficiency in railroad operation, or any other industry, depends entirely on the manner in which labor is directed. I make this positive statement basing it on the unalterable fact that the human race, taken as a whole, is inclined to be lazy, selfish and laden with a desire to govern, rather than submit to government. Not only this; the average man or woman is burdened with erroneous beliefs. This fact makes it an absolute necessity to have labor closely supervised and directed by the very highest quality of mind.

It has been the writer's experience that labor is just what is demanded of it; that is, if it is supervised and directed by one who is truthful, honest, upright, unselfish, energetic and, above all, not lacking in moral courage, there will be no lagging or lack in efficiency. Efficiency is needed more today than anything else, because the loss in this respect is costing the railroads of the United States at least a half-billion of dollars each year. For instance, take the loss in labor efficiency; the loss in material and supplies due to the spirit of "I don't care, it all belongs to a railroad corporation." To sum up this waste in dollars and cents would astound anyone except a deep thinker who has been in railroad work for a number of years.

Supposing the great army of railroad officers and employees, composed of about 2,000,000 of men and women, would get down to real work, a saving of at least ten cents per day each could be made, which would amount to \$60,000,000 per year. Think of the vast number of non-producers now in controversy made up of representatives of labor, capital and the government, who are drawing large wages for engaging in battle royal for what each claims is just and right. The loss to the railroad stockholder, the labor organi-

zation and to the public, which is the government, is enormous and is beyond the conception of the average citizen.

The National Agreement, entered into by the government and the railroad employees during government control, has cost the railroads and the public millions of dollars for service that has never been performed. Parts of this agreement are the greatest pieces of error ever concocted. It is like a house built upon the sands; it has no solid base, and anything that is not based on principle cannot stand. The rules laid down in the National Agreement contain provisions that force the railroads to pay for service that is not performed. A rule that will force a government, a railroad, a private corporation or individual to pay for service that is not actually performed is not based on principle; its foundation is faulty and it cannot stand.

The abolition of piece-work was one of the greatest mistakes ever made because it is the only real protection that the railroads and the energetic man have against laziness, indifference, etc. The farmer, who is the base of our existence, the salesman, the engineer, the trainman, the coal miner all work on a piece-work basis; then why not the mechanical workmen on railroads? It is the only method that can be used to put "pep" in some men and keep up human interest.

The United States is today starving for industrial peace. The cry of "Peace, peace," when there is no peace, causes me to think that those who are responsible and who indirectly or directly supervise labor have not the moral courage to enforce the rule which is contained in the agreement between the railroads and organized labor. The National Agreement says that eight hours shall constitute a day's work, which I understand to mean that each man working under this agreement will work faithfully for eight hours, taking as much interest in the work as if the business wholly or partially belonged to him. Are the parties to this agreement doing this? I will let someone else answer this very important question.

During my many years of railroad service, having met and associated with many railroad officers and employees, I have met almost the universal thought, which to my mind is erroneous, "We must get along with the men; a railroad officer who cannot get along with the men will not last very long." This statement is correct. The officer who cannot get along with the employees will not last very long, but the real meaning is many times misconstrued by those who think that to follow the line of least resistance is the ideal way of getting along with the men; or, in other words, to permit some, or the whole to break the rules; to come and go and work when it pleases them. This is buying peace at a great price and it is a peace that is no peace.

In thinking of organization, I have often thought of the human body. What a wonderful organization it is! Governed by mind, the most powerful force known to the human race, the body and members thereof are directed by a mental force called desire. The railroad employees of this country are like one great human body; they will move quickly or slowly, efficiently or inefficiently; they will help reduce operating expenses or not, just in proportion to the quality of mind governing.

J. A. ALEXANDER.

THE CANADIAN PACIFIC has taken a lease for 21 years of the first two floors and basement of a new 21-story building at Madison avenue and Forty-fourth street, New York City, and the building is to be known as the Canadian Pacific building. The passenger departments of both rail and shipping interests, lands, colonization, and development work will be brought together here, but the freight department will continue to have an office at the Woolworth building. Negotiations are under way with other transportation interests for space in the Canadian Pacific building.

Virginian Gondola Car of 120 Tons Capacity

## Operating Economies Effected by Using 120-Ton Cars

Virginian Increases Gross Trainload from 7,950 to 13,200 Tons—  
First Application of New Six-Wheel Truck

THE VIRGINIAN RAILWAY has recently received from the Pressed Steel Car Company at Pittsburgh, 1,000 steel gondola coal cars of 120 tons capacity. This equipment is the heaviest in the history of transportation and is notable for two reasons: first, because it is the first instance where a large number of cars of such extremely high capacity have been placed in service, and, second, because the

water coal, the normal operation of the road depends upon the ability to dump cars promptly on arrival at the pier. In order to secure the maximum capacity of the pier, duplicate unloading facilities have been provided. Two separate car dumpers, one handling a 55-ton car and the other, two 55-ton cars, or one 120-ton car, dump into electrically operated conveyor cars. The conveyor cars from one dumper are drawn

The First Application of the Lamont Truck Was Made on Ten of These Cars

equipment has been developed especially to meet the operating conditions on the Virginian.

Of the total traffic handled by the Virginian, 92 per cent is coal moving to tidewater and inland points from mines west of Princeton, West Virginia, the greater portion of which moves to Sewalls Point pier, 342 miles from Princeton. The profile consists principally of slight descending grades; thus the tonnage that can be handled in a single train is limited over a large part of the line, not by the tractive capacity of the locomotive, but by the difficulty of securing proper operation of the air brakes in the handling of long trains on descending grades to avoid break-in-twos.

Since such a large proportion of the traffic consists of tide-

water coal, the normal operation of the road depends upon the ability to dump cars promptly on arrival at the pier. In order to secure the maximum capacity of the pier, duplicate unloading facilities have been provided. Two separate car dumpers, one handling a 55-ton car and the other, two 55-ton cars, or one 120-ton car, dump into electrically operated conveyor cars. The conveyor cars from one dumper are drawn

Under normal conditions the Virginian moves a large proportion of its traffic in its own equipment, consisting principally of gondola and hopper cars of 55-tons capacity and, latterly, 120-tons capacity. Two of the former cars can be handled on the two-car dumper, or one 120-ton car, from which it will be noted that the adoption of a car carrying a heavier load will have the effect of increasing the capacity of the dumper and the efficiency of the pier. With this in

mind, plans were made for the development of equipment having twice the gross weight of the 55-ton cars. In 1917 four sample 120-ton cars were placed in service to determine whether the use of such equipment would be practical and economical, and as a result of these experiments, the order for 1,000 cars of this capacity was placed in the spring of 1920, immediately after the roads were returned to private control.

The advantages of the 120-ton car under the conditions prevailing on the Virginian Railway can be judged by the comparison of this equipment with the 55-ton cars. The new cars with a capacity of 240,000 lb. weigh 78,900 lb., making the ratio of load to dead weight 75.3 per cent. The gondola and hopper cars with a capacity of 60 tons weigh 41,000 lb. and 44,000 lb. respectively, making the ratio 74.5 and 73.2 per cent.

The 120-ton cars are 49 ft. 6 in. long inside, while the 55-ton hopper cars are 32 ft. 6 in. long and the gondolas 40 ft. long. Thus the gross weight per foot of length for

wide inside and has a depth at the center of 8 ft. 5 $\frac{1}{8}$  in. and at the ends over trucks of 7 ft. 4 $\frac{1}{4}$  in. The cubical capacity is 3,850 cu. ft. level full or 4,450 cu. ft. with a 30 degree heap. This latter figure, with coal at 54 lb. per cu. ft., is equivalent to approximately 240,000 lb. The cars are stencilled 218,000 lb. capacity, but adding a 10 per cent overload brings the capacity to approximately 240,000 lb., the load which the car is designed to carry both from the standpoint of strength and as to dimensions.

The size of the car, coupled with the fact that it is deeper at the center than at the end, gives it the general appearance of one of the modern quadruple hopper cars. However, it is not a hopper car as it has no hoppers, drop doors or means of discharge other than from the top. It is to be operated solely on the lines of the Virginian and dumped only in car dumping machines. These facts suggested the design finally adopted.

The sides, it will be noted, are entirely free from outside side stakes or other projections beyond the plane of the side sheets. The car presents a smooth, straight surface throughout the depth of the body at all points to engage the blocking and clamps in car dumpers, thus avoiding concentrated stresses on side stakes, top angles and other projections while the car is being dumped. This construction also admits of using practically all of the clearance width of the road for the inside or available loading width of the car and provides the required cubic capacity in a minimum length and height.

The sides are formed of  $\frac{1}{4}$  in. plates sloped in near the top at an angle of approximately 15 degrees and then flanged out, overlapping the horizontal leg of the top angle to which they are riveted. The top angles are standard 4 in. by 4 in. by  $\frac{1}{2}$  in. rolled angles with the vertical flange outside in line with the plane of the side sheets. On the inside of the side construction 14 stakes are provided on each side and the connection between these stakes and the side top angle is effected through malleable iron castings, as is shown in the drawing of the car body. The side

Interior of the Car Body, Showing Gusset Side Stakes, Bolsters and Cross Bearers

the 120-ton car is 61.7 per cent greater than for the 55-ton gondola, and 31.0 per cent greater than for the hopper. For a given length of train, the net tonnage that can be handled in the larger cars is even greater.

It has been found entirely practical to handle trains of 120-ton cars, but no extensive tests have been made so far because of adverse weather conditions. It has been demonstrated, however, by actual test that the gross load behind the tender in these trains averages 13,200 tons, compared with 7,950 tons hauled with the smaller equipment. It is the opinion of the operating officials that with favorable weather conditions, a train haul of 14,000 tons gross or 10,540 tons net load will be secured by the use of the 120-ton coal cars.

#### Construction of the Cars

As already mentioned, these cars have been made extremely wide and high in order to keep down the length as much as possible. The car body is 49 ft. 6 in. long by 10 ft. 2 $\frac{3}{4}$  in.

stakes consist of reinforced triangular gussets and 5 in. rolled bulb angles all directly connected to bolsters, cross bearers and floor supports, all of which are located inside of the car body. Along the bottom the sides are reinforced by 3 $\frac{1}{2}$  in. by 3 $\frac{1}{2}$  in. by  $\frac{3}{8}$  in. rolled angle, which also supports the floor. This angle extends to within approximately 2 ft. 4 in. from either end. At these points the plane of the side sheets is dropped back into the car to bring the ladders inside the clearance limits and also to afford these a certain amount of protection in car dumpers and elsewhere. The assembled side construction forms an efficient girder which will carry the weight of the lading as well as the dead weight of the car at a low fiber stress and leave the center sills to take care of the buffing stresses.

The center sills are made up of two 13 in., 37 lb. standard rolled channels applied with the flanges toward each other and reinforced at the top by a cover plate and at the bottom by 4 in. by 3 $\frac{1}{2}$  in. by  $\frac{3}{8}$  in. rolled angles. Five hundred cars are equipped with Westinghouse N-12-A draft gear and

Lewis or Lamont trucks, being known as Class G-4 cars, while the remaining 500 cars have Cardwell duplex draft gear and Buckeye trucks. These are known as Class G-3 cars. On the Class G-4 cars the center sills are spaced 18½ in. apart and on the Class G-3, the standard 12⅞ in. spacing is employed. The center sills develop an effective buffing area of over 30 sq. in. and the ratio of stress to strain figured according to A. R. A. practice is below .05.

The ends are formed of ¼ in. plates reinforced at the top

middle of one of the cross bolsters, the ends of which in turn are carried on the longitudinal equalizers under the side frames. The principal feature of the equalizing system is the location of the springs at the journal boxes instead of over the equalizer. The journal boxes are of special construction in which seats are provided for coil springs on either side of each box, the truck frames resting directly on the springs of the end journal boxes. The springs at each of the middle journal boxes are spanned by a spring cap; on

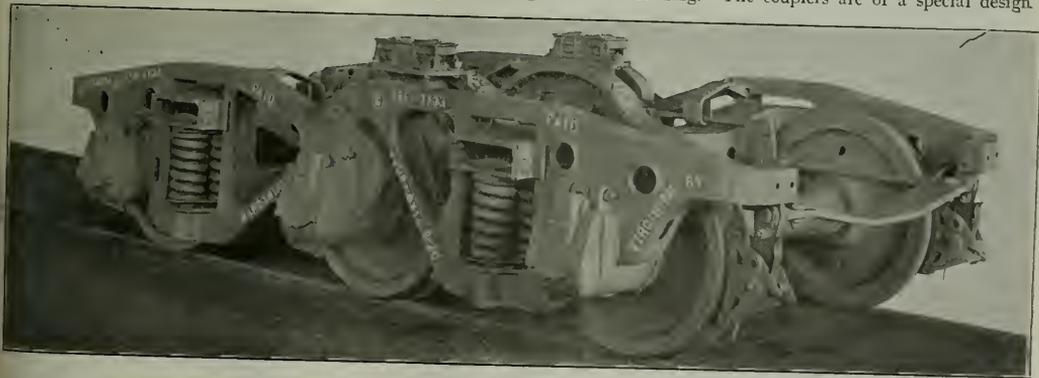

The Buckeye Six-Wheel Truck

by a 5 in. by 3½ in. by ⅜ in. rolled bulb angle, intermediately by two pressed steel braces extending the full width of the car and at the bottom by the floor sheets which are flanged up to engage the ends and riveted thereto. The floor sheets are all ¼ in. plates and all floor supports, including bolsters and cross bearers, are of built up construction.

The trucks are of the six wheel type with cast steel frame, three designs being used as previously mentioned. They are equipped with A.R.A. standard 6 in. by 11 in. axles, 33 in. rolled steel wheels, Stucki side bearings and clasp brakes.

the middle of this cap bears an equalizer, from the ends of which are hung the inner ends of the main equalizers. The other ends of the latter are hung from the truck frames.

Westinghouse empty and load schedule KDE-4-10-16 brake equipment is used for the power brake and for braking the cars by hand a special screw type of hand brake is provided, as the ordinary type would not be suitable for spotting these cars on dumpers and in handling them about the mines where at points it is necessary to drop them down steep grades after loading. The couplers are of a special design.

The Lewis Truck

The first application of the Lamont six-wheel truck, which has just been developed by the American Steel Foundries, has been made under ten of these cars. The outstanding features of this truck are its short wheel base of 8 ft. 3 in., the arrangement of the springs and equalizing system, and the three piece bolster which uniformly distributes the load over the four points of support.

The bolster is made up of a central or equalizing member and two cross bolsters. The central bolster carries the center plate and side bearings and at either end rests on the

having A.R.A. type D heads and slots for connecting to the draft gear with 2 in. by 6 in. forged keys and cast steel yokes.

The completed cars are 10 ft. 11¼ in. high from rail to top of sides. The Class G-3 cars weigh 78,800 lb. of which 41,600 lb. represents the weight of the body and 37,200 lb. the weight of the Buckeye trucks. The Class G-4 cars weigh 78,900 lb., the body weighing 43,200 lb. and the Lewis trucks 35,700 lb. These dead weights make the ratio of revenue earning load to total weight hauled 75.3 per cent.

## British Railways Predominate in Argentina

Most of Argentina's Lines Are Ably Operated by Britons with  
British Methods and Equipment

By John P. Risque

### Part I

ARGENTINA has approximately 20,370 miles of railways, most of which radiate fan-like from Buenos Ayres, and the American tourist who travels on almost any of them will find himself in the care of English railway men, for more than 75 per cent of the railways of Argentina are owned and operated by Britons.

On leaving Chile for the Argentine, Great Britain (in a railway sense) is entered immediately. The Transandine, which the traveler takes at Llai-Llai in Chile, is British throughout. At Mendoza, in the Argentine foothills of the Andes, the tourist leaves the Transandine after an interesting ride over the Andes and changes to the Buenos Ayres & Pacific, a 5 ft. 6 in. gage line, also of British ownership. The tiny Transandine train when it pulls up under the train shed at Mendoza at 7:45 p. m. alongside the waiting 20 car, double-headed Mendoza-Buenos Ayres express on the 5 ft. 6 in. gage track of the Buenos Ayres & Pacific, makes a comparison in which there is something of the ludicrous. It presents to the stranger, however, his first object lesson in gages, for varieties and extremes of which no other country excels the Argentine.

Anxious for a closer look at each car of the long train on which he expects to spend the night, the traveler will find three express cars, two baggage cars, three first-class day coaches, a dining car and 11 "dormitorios"—as the huge sleeping cars are called in that country—all resembling our own in design, with the exception of the "dormitorios," which

contain private compartments of from two to four berths each, arranged crosswise of the car. The car roofs are arched, giving the train an appearance of uniformity in its entire length.

The cars are of wooden construction; four wheel trucks seem to be in general use; wheels are spoked and have steel tires on them—they are spelled "tyres" on the requisitions; vestibules as well as the doors seem unnecessarily narrow; couplers are of the screw and hook type, and the absence of foot plates exposes them to a considerable degree under the feet of the passenger who passes from one car to another. Large buffers, supported by springs, keep the cars apart and on the start of this exceptionally heavy train the passenger will unconsciously make a mental note that the start is easy compared to the start at home, where, under similar conditions, there would be a yank and thump of the drawbar that seems to indicate the withdrawal of one end of the car.

If the traveler had not noticed the drums under the cars as he peered under them in the dark for a look at the brake equipment, he would not be aware that the train was not being controlled by air brakes; the vacuum brake system seems to handle the train perfectly. The heavy train on its way from Mendoza in the Argentine foothills to Buenos Ayres, 24 hours away, has the slope in its favor. There is sufficient difference in elevations of the two terminals of this line to enable the double-header to attain a speed of 54 miles an hour. Stations all have an appearance of neatness; they

are well painted and clean, indicating constant attention. Crossing gates are numerous and quite elaborate. The names on the stations along the line are hard to pronounce, being Spanish, but trying it is good practice. If the traveler would get the full benefit of the ride, let him write down the names of the stations as he passes them. It is likely that following such names as Monte Redondo and Tamangueyu (or easier ones like Uribelarrea) there will occur such refreshing and familiar names as Newton, Monroe or Musters. Like the sprinkling of towns whose names end in "field" all over the United States, Argentina has some 50 "villas"—Villa Adeline, Villa Dolores, Villa Trinidad; the possibilities are enormous.

If the passenger has been careful enough to avoid missing any of the names, sooner or later he will write one down that will open a train of thought and conjecture as to its origin: "Open Door"—its significance is a mystery. From his observations of the English lines so far, he may as well decide that the name has nothing to do with the railway supply market on these roads, but though this door may be ajar, allowing an occasional order to sneak through to an American firm, it is not wide open enough to let through any volume of encouragement.

As he approaches Buenos Ayres if it were not for the distinctiveness of the architecture which proclaims the entrance to a foreign city, through miles of suburbs, the American could easily imagine himself entering the outskirts of a large city at home. The terminal of the Buenos Ayres & Pacific in Buenos Ayres is a wooden affair which it is expected to be replaced some day by a permanent structure. The arrival at this station places the interested railroader in a position to make some observations in regard to the arrangements of railway stations. Stepping out of the station in which he has just arrived, he sees the passenger station of the meter gage Central Cordova fronting on the same street; adjoining the latter is the beautiful \$10,000,000 monument of the

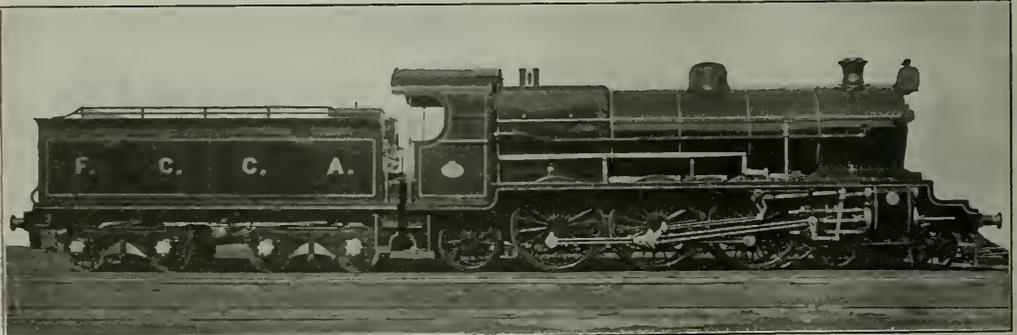

stations he will commence to get an inkling of the size of the railroad layout that confronts him. If he has less than six months in which to make a study of these railways—and nothing has as yet been said of the Argentine government's system radiating from Santa Fe in the northern province of that name—it would be advisable to single out any one of the British broad gage railways and quote his observations from that line. To all intents and purposes, his story of this line will be, to those who are unfamiliar with the details of

A Typical Crossing Gate in Argentina

the railroads and the ways of the railroad men of that country, quite characteristic of all the other railway lines.

The Retiro station is the starting point of a great 3,000 mile line. It has had lavished upon it an apparently unlimited amount of money and the brain work of engineers who seemed to have seen far ahead of the present requirements. Opened for business in August, 1915, the Retiro station's weekly record of trains in and out is 2,225, while the claim for the number of passengers handled yearly amounts to 24,000,000 incoming and outgoing. The principal dimen-

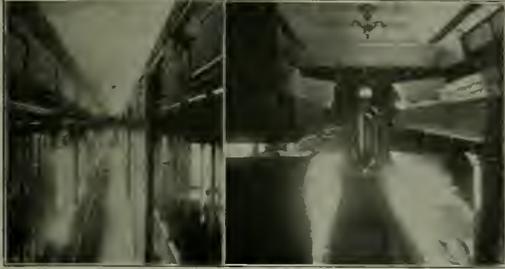

The Prevailing Type of Power in Passenger Service on the Central Argentine

5 ft. 6 in. gage Central Argentine Railway, "Retiro Station," the photograph of which is said to have been admired all over the world. As the spectacle of the three large railway stations, standing close together on the same street, gradually becomes more familiar, the question as to why they did not combine to build a common terminal, as in Washington or St. Louis, comes to the visitor's mind.

Having assimilated the situation sufficiently at these three stations, the tourist will find that further logical preparation for a trip out into the country is suggested by a visit to the other two large passenger terminals in the city—one, the Plaza Once station of the Great Western; the other, the station of the Buenos Ayres Great Southern at Plaza Constitucion. By the time the visitor gets through studying these

sions of this terminal show that the total area occupied by the main building and train sheds is approximately 800,000 sq. ft. The frontage along Avenida Maipu and in line with the other two terminals previously referred to, is 525 ft. with a glass covered carriage entrance to the ticket office which measures 200 ft. in length by 60 ft. in width and the ceiling of which is 65 ft. 6 in. from the floor. Leading from the ticket office, there is a magnificent grand hall 480 ft. long by 82 ft. wide and with 62 ft. between the floor and the ceiling. The floors throughout are laid in mosaic patterns of tile and polished concrete and the lower 7 ft. of the walls in the ticket office and grand hall are tinted in olive green. Above this belt, the walls are finished in imitation stone and the ceilings are decorated with plaster of Paris mouldings.

The dining hall measures 90 ft. by 40 ft. and has stairways leading to private dining rooms overhead, which have balconies looking out over the grand hall and the train gates which line the rear. There is also an additional dining room, called a first-class refreshment room, measuring 98 ft. by 60 ft. which corresponds to an American "lunch counter." Three of the eight train platforms measure 1,150 ft. in length; the remaining five are 820 ft. long, and all track-ends are equipped with hydraulic buffer stops. The station is complete with all facilities such as an information bureau, telegraph offices, parcel checking rooms, telephone booths, hair dressing parlors, retiring rooms and lavatories, barber

A Corridor and a Stateroom in a Central Argentine Sleeping Car or "Dormitorio"

shops, a post office and all of the miscellaneous adjuncts which contribute to the comfort of passengers.

From one end of the grand hall to the other, there is a display which is well worth the time of the railroader who would profit by the lesson of "the other man's ways." Of particular interest to the intending traveler in the country, will be found the entertaining arrangement of photographs, maps and clearly printed and understandable descriptions of points of interest out on the line, with time-tables, all of which are neatly framed and protected by glass on the "sandwich boards" distributed along the passageway. From four to six of these boards stand on either side of the ornamental, four-faced clock in front of the ticket office, with long double benches in between. Two or three of these same boards are located in front of the ticket office at the entrance; on every hand, the most interesting kind of advertising attracts the traveler. The advertisements of places are supplemented by large photographs of interiors and exteriors of the kinds of trains that will carry him. The lesson is so obvious that an American will perhaps wonder why his own lines do not try to a greater extent to capitalize in a similar manner the attractions of their own lines.

The second part of this article will appear in an early issue of the *Railway Age*.

## Reduction in Western Live Stock Rates Asked

WASHINGTON, D. C.

**A** PETITION asking a general reduction in the advances in rates on live stock in the Western district allowed by the Interstate Commerce Commission in Ex Parte 74, and attacking the general policy of the rate-making provisions of the transportation act as applied by the Interstate Commerce Commission in that case, has been filed with the commission by S. H. Cowan, Clifford Thorne, Graddy Cary and S. C. Rowe on behalf of the National Live Stock Shippers' League, the American National Live Stock Association, the National Wool Growers, the Cattle Raisers' Asso-

ciation of Texas, the Corn Belt Meat Producers Association and the Kansas Live Stock Association. The petition particularly attacks the allowance of one-half of 1 per cent in addition to 5½ per cent as authorized by the law in the discretion of the commission. This, it is declared, is not a part of a lawful rate and is not for transportation service, but a tax against the shippers beyond the power of Congress or the commission. The amount allowed to the railroads of the Western district as a whole by reason of the addition of one-half of 1 per cent to the return proposed to be provided by the new rates, the petition says, amounts to \$40,500,000 per annum. A reduction in the rates is asked by the amount of one-half of 1 per cent, which, it is declared, would effect a reduction of 30 per cent in the Western group and 20 per cent in the Mountain group of the advance allowed. It is also asked that a maximum advance in cents per 100 lb. shall be fixed by the commission. A large part of the petition is devoted to a showing as to the unfavorable condition of the live stock industry, which is said to be aggravated by the high rates.

It is alleged that the effect of the advance is to permit some railroads to earn in excess of 6 per cent on their value for the creation of a general railroad contingent fund and to provide for a reserve fund which is declared to be an unlawful, unjust and unreasonable basis of making rates, compelling the shippers to pay in addition to the reasonable rate for the service performed an unjust tax. The petition says the rates were made unreasonable by the percentage of advance and the complaint is directed to the advance rather than to the specific rates. It is stated that the petitioners will ask of the commission a special ruling allowing the case to proceed as against the principal Western systems and their subsidiaries for the purpose of determination of the issues in the case on the ground that the great bulk of the live stock traffic in the Western district is carried by the principal systems of railroads which will earn and do earn in excess of 6 per cent of their fair value.

It is asserted that no value of such systems was found by the commission nor was any basis named upon which the sum could be estimated. For this reason the position is taken that the shipper is deprived entirely of his right to reasonable rates "if this enormous advance is to be made to meet alone the requirement that the aggregate earnings of the Western district shall equal 6 per cent on an aggregate value of all lines at the excessive figures used in Ex Parte 74 as the basis of the calculation, without any basis of value of the system or systems of roads, which the shippers must use or quit business, as many will be compelled to do because of the conditions herein detailed, coupled with these exorbitant rates on live stock, feed and farm products." The petition asserts that in rendering its rate decision the commission was not acting in accordance with the provisions of the law, which required that rates shall be just and reasonable and that the requirements of the law as the commission construes it are impossible to carry out, "as has been proven by operation since August 26 because traffic is insufficient and the expenses of operation are too great."

The commission never having found what should be taken as the valuation of the properties separately, the petition asserts, there exists no basis for the advances of 25 and 35 per cent in the Western district, and it is also asserted that the valuation used by the commission for the district as a whole exceeds the value of the railroads by \$25,000 a mile.

TRANSPORTATION COURSE AT COLUMBIA.—Government regulation and operation of railroads will be dealt with in a course in railway traffic management to be given by the Department of Extension Teaching, Columbia University during the spring semester.

# Freight Car Loading

WASHINGTON, D. C.

THE FREIGHT CAR LOADING, according to reports compiled by the Car Service Division of the American Railway Association, continued to decline during the week ending February 5. The total number of cars of revenue freight loaded was 696,997, as compared with 699,936 during the week before and 762,680 for the corresponding week of 1920, but it was greater than for 1919 or 1918, when the figures were 692,614 and 686,621, respectively. The coal movement loading shows a decrease of over 20,000 cars as compared with the previous week. The summary follows:

have been reported. The lessening demand for open cars is one of the prime factors in stimulating the return of such equipment to the home roads, and an unusually large percentage of this equipment is returning home in bad order. This should be a period of rehabilitation; a definite car repairing program at this time is most necessary if the heavy transportation demands of the near future are to be satisfactorily met.

Flat Cars.—Requirements have practically been protected. Surplus cars should be sent to owning lines in accordance with Car Service Rules.

During the period since the car shortage has given way to a large car surplus there has been more or less friction

January 15	.....	.....	.....	.....	.....	.....	173,500	207,860	709,888	840,524	758,669	509,708	627,293	609,250
January 8	39,690	31,494	190,284	11,479	42,982	10,717	169,093	210,674	706,413	830,673	723,801	492,817	596,859	543,265

In a summary of general conditions as of February 14, the Car Service Division says:

Box Cars.—Requirements for box cars are being satisfactorily protected. Reports indicate improved demand for this equipment, surplus box cars for week ending January 31st showing a decrease for the first time since the surplus developed. Special attention should be given to the return of grain cars to their owners to avoid a shortage of cars in this service.

Auto Cars.—Cars should be disposed of in accordance with Car Service Rules. Where loaded with freight other than automobiles, care should be exercised to avoid commodities which leave a residue which will damage the finish of autos when later used in that service.

Stock Cars.—Practically all requirements being protected. Surplus cars should be disposed of according to Car Service Rules.

Refrigerator Cars.—There is an adequate refrigerator car supply in all sections. There is quite a fair movement of perishables from Florida and California, principally citrus fruits. Our information is that potatoes are still being quite generally held back in potato producing sections on account of unfavorable markets. Railroads are still permitted to load refrigerator cars with suitable non-perishable freight in the direction of the empty movement.

Open Top Cars.—A very decided improvement has been noted during the past few weeks in the movement of open top cars under the Car Service Rules. There exists on the part of most of the railroads a disposition to interpret and apply the rules liberally and this has resulted in minimizing to a large extent such temporary difficulties as

between railroads as to the disposition of empty cars and almost as great a scramble to avoid the necessity for paying per diem on idle cars as there was formerly to obtain possession of cars which could be loaded. To meet this condition, the Car Service Division has announced in a bulletin to all railroads that reciprocal arrangements are being made between certain railroads for the storage of surplus cars where the equipment is not needed by the owner and where facilities permit holding the cars, per diem being waived while cars are held out of service.

## Empty Car Mileage

By this arrangement there is saved the expense of empty mileage for the return of cars to owners, with the prospect that loading may develop for the cars a little later or in the direction of the home road.

"In view of the fact that many roads have now on their rails ample number of home cars for local needs and to fully supply the repair forces," the circular says, "it is our recommendation that consideration be given to making arrangements of this kind wherever the conditions justify. A plan of this kind does not conflict with car service or per diem rules, and where it results in the mutual reduction of transportation expense it would certainly seem highly desirable under present conditions to encourage the practice."

The number of surplus freight cars continues to increase. For the week ending February 8 the average was 358,065 as compared with 324,186 the previous week.

The percentage of home cars on home lines on February 1 had reached 58.9. On March 1, 1920, when the roads were returned by the government, 21.9 per cent were at home.

# Employees Seek to End National Agreements Case

## B. M. Jewell Asks Labor Board to Refer Dispute Over Working Rules to Joint Conference

**B.** M. JEWELL, appearing before the Railroad Labor Board at Chicago on February 17 in the resumption of hearings in the controversy over National Agreements, asked that the Board take the following steps immediately:

"First: That the Board refer the National Agreements which are now before it to a joint conference of the representatives of the railroads and of the labor organization with the recommendation that their disagreements be adjusted by negotiation as soon as possible—the Board agreeing to pass immediately upon any points of difference which may arise from the negotiations.

"Second: That the Board request the representatives of the railroads and representatives of the labor organizations to meet the Board in conference to consider the establishment of boards of adjustment as contemplated by the Transportation Act.

"Third: That in reply to Mr. Atterbury's notice to the board and his subsequent letter to the chairman advising him that he contemplates filing a flood of individual complaints to reduce the wages of unskilled employees, the Board recommend to Mr. Atterbury that he meet in general conference with the representatives of the employees affected so that the existing General Agreements will not be impaired and the matter brought to the board in the form of a single complaint."

Mr. Jewell declared his constructive proposals were brought forward with the following objects in view:

"1. To insist upon the fundamental principle of collective bargaining which is now the real issue before the Board in our pending cases.

"2. To expedite the cases which otherwise will absorb a vast amount of time and effort.

"3. And to restrain Mr. Atterbury and the railroads from preventing the proper functioning and destroying the effectiveness of this Board by flooding it with a large number of individual complaints which it cannot handle."

Mr. Jewell also asked that a conference be called immediately between the railroad labor chiefs in Chicago and the members of the Association of Railway Executives who are meeting in Chicago on February 18.

"We do not wish to perpetuate any unreasonable rules or working conditions," Mr. Jewell asserted. "We do not wish to cause the railroads unreasonable expense. We shall not now advocate—and never have supported—any rules that do this."

"In closing, I wish to emphasize the fact that we are not asking you to render a decision. Neither are we requesting that you secure the consent of the railroads to the procedure we suggest. It is clearly within the province of the Board to make a recommendation even on its own motion. We are asking you to make these recommendations because of the fundamental principles involved in the pending cases to which the question of the propriety or reasonableness of certain rules is secondary, and in order that the work of the Board may be accelerated and the status and functions of the Board conserved."

Mr. Jewell presented as an alternative the necessity for postponing the case until March 14 to allow time for the preparation of a reply to the carriers' presentation.

### Atlanta, Birmingham & Atlantic Case Continues

The efforts of the Atlanta, Birmingham & Atlantic to secure authority to reduce the wages of its employees below

the rates set by the Board's decision of last July have attracted more attention, the case coming before the Board simultaneously with the introduction of General Atterbury's evidence in the National Agreements hearings outlining the precarious financial condition of many of the carriers. The case is also viewed with interest inasmuch as the rulings of the Board in this case will undoubtedly establish precedents which will serve to guide the Board, the carriers and the labor organizations in preparing, submitting and arguing future cases of this character. It is not, however, considered in the light of a test case by railway executives.

The opening of the case was described in the *Railway Age* of February 4, (page 319). The carrier had ordered a cut in the wages of its employees effective on February 1 because of its inability to meet its operating expenses. Despite drastic reductions in working forces and in train service the carrier was losing about \$100,000 a month. The employees objected to the wage cut and, when conferences were held between their representatives and representatives of the carrier, a controversy arose as to whether the wage reduction could be made effective, under the terms of the Transportation Act, pending a decision by the Labor Board. The representatives of the carrier held that the wage cut was unavoidable and would have to be made on the date announced even though the Board had not reached a decision on the employees' appeal. The employees held that the existing rates of pay should be continued until the Board had made its ruling.

When the case came before the Labor Board on January 25, the employees refused to present evidence in the case until the Board had instructed the carrier to rescind its wage cut order. The representatives of the carrier after presenting voluminous evidence showing the financial condition of the road, held that they had not violated the spirit or letter of the Transportation Act in cutting their wages first and then coming before the Board. Subsequently the Board passed a resolution upholding the employees' contention and ordering the carrier to rescind its wage cut order. This resolution was reproduced in full in the *Railway Age* of February 4, (page 319).

Hearings in the Atlanta, Birmingham & Atlantic case were completed on February 15, both sides closing their presentations. The Board then took the case under advisement.

Another case similar in many respects to that of the Atlanta, Birmingham & Atlantic was also brought before the Board on February 15. The Missouri & North Arkansas, through an order issued by the receiver of the road, C. A. Phelan, reduced the wages of its employees on February 1. The employees protested to the Board and as a result the case was docketed. In the meantime the employees of the road walked out and their places have been filled with "imported labor."

Mr. Phelan in making his presentation on behalf of the carrier took the position that the carrier is not legally before the Board because, not being a party to the controversy which ended with the Board's decision number 2, it has never been heard on the subject of wages and has not therefore violated the Board's award in reducing the wages of its employees. The rates of pay fixed by decision number 2 had been applied on the Missouri & North Arkansas only on the condition that the road could earn enough to pay them. M. C. Carry and Charles MacGowan, appearing in the case on behalf of employees, asked the Board to refuse to hear the case because the company had violated the Board's ruling by

putting into effect a wage cut without authority from the Board.

The urgency of the Atlanta, Birmingham & Atlantic and the Missouri & North Arkansas cases has caused the Board to hold extra sessions during the vacation from consideration of the National Agreements case. The evidence of the employees and representatives of these two roads being completed, February 17 was set as the date upon which hearings in the controversy over the National Agreements would be resumed.

### W. S. Carter Presents Employees' Case

The case was reopened on February 10 when E. P. Curtis, vice-president of the Order of Railway Conductors, and W. S. Carter, president of the Brotherhood of Locomotive Firemen, presented the employees' side of the controversy. Mr. Carter attacked as irrelevant the carrier's contention of inability to pay the existing rates as justification for the wage cut. The financial condition of the road was a subject for the consideration of the Interstate Commerce Commission and not the Labor Board, according to Mr. Carter. In discussing this phase of the controversy, Mr. Carter stated that the application of the consolidation provisions of the Transportation Act would eliminate the financial difficulties of the carrier and that in his opinion the Atlanta, Birmingham & Atlantic would be consolidated with the Louisville & Nashville.

B. L. Bugg, president of the Atlanta, Birmingham & Atlantic, replied to Mr. Carter's statements by reiterating that the financial and operating statistics and evidence presented to the Board at the session on January 25 dealt only with the road's inability to pay the wages fixed by the Railroad Labor Board.

The hearings in this case were continued in the evening of the same day, and Chairman Barton, in opening the extra session, pointed out to both the carrier and its employees that the Transportation Act empowers the Board to fix just and reasonable wages upon seven considerations and suggested that the additional evidence presented to the Board in this case deal, as far as possible, with these seven considerations. The representatives of the carrier reiterated their position, i. e., that the road cannot continue to operate unless its payroll is reduced.

The hearings were continued on February 14, when Mr. Bugg, acting in accordance with Chairman Barton's suggestion presented a large amount of data regarding the decline in the cost of living in the territory served by his line and the wages paid for similar work in outside industries. This data showed that, whereas the road is asking for reductions of from 20 to 25 per cent in its wage rates, the cost of living has decreased about 33 per cent. Similarly the wages paid in outside industries have decreased from 25 to 50 per cent while the road's wage scales have remained unchanged. Representatives of the employees protested the introduction of this new evidence without avail, inasmuch as Chairman Barton had specifically requested the presentation of such evidence.

### Board Halts Erie Wage Cut

Following the precedent established in the Atlanta, Birmingham & Atlantic case the Board issued an order on February 14 directing the Erie to rescind its recent order reducing track laborers' wages, re-establishing the seven day week for train dispatchers and deducting the January 31 earnings of telegraphers. The order was to have been effective on February 1. The United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers and the American Train Dispatchers Association filed a complaint with the Board, and the following resolution was passed by the Board as a result:

I

Resolved, in case of disputes which have arisen between the Erie Railroad and its employees by reason of the said railroad having reduced the wages of track men to 30 cents per hour, effective February 1, and having ordered that train dispatchers work 7 days per week without relief and having ordered the deduction of January 31 earnings of telegraphers whether they work or not on that day, that objection having been made by the United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers and by the American Train Dispatchers' Association and a dispute having arisen in regard to the proposed reduction and deduction and the matter having been brought before this Board, the Board decides that no change of any kind in the rates of pay or in the rules and working conditions shall be made, except by agreement between the parties, until the disputes are heard and opportunity given for this Board to decide. The Board will proceed with the further hearing and consideration of these disputes and sets February 23, 1921, as the date of such presentation of evidence and arguments as the parties may desire to offer.

The Board suggests further conference between the parties and an effort on their part to agree upon a settlement.

II

Whereas, this Board having reason to believe that Decision No. 2 of this Board has been violated by the Erie Railroad in that the said carrier on or about January 31, 1921, directed the reduction of wages of the trackmen, employees of the said carrier, to 30 cents per hour, contrary to Article III, Section 6, of Decision No. 2 of this Board, and also having directed the deduction of January 31 earnings from the January earnings of all monthly rated employees and of all daily rated employees classified as monthly rated employees prior to Decision No. 2 of this Board.

Resolved, that pursuant to Section 313, Transportation Act, 1920, notice be given to the chief executives of the Erie Railroad and to the organizations of employees directly interested in such orders of the said carrier of a hearing to determine whether in the opinion of the Board a violation of the decision of this Board has occurred.

The Board sets February 23, 1921, as the day of the hearing.

### Board Decides Norfolk & Western Dispute

The dispute between the Norfolk & Western and its conductors and trainmen, reported in the *Railway Age* of January 7, (page 126) and of January 14, (page 202), was ended by the Board in a decision dated January 29 and announced on February 14. There were 25 points in controversy in this case, 13 of which were decided by the Board in favor of the carrier and 10 of which were dismissed either because of lack of jurisdiction or improper presentation. But one point was decided in favor of the employees and one point was dismissed with recommendations for further negotiation.

The Board held that the railway was within its rights and complied with the provisions of Supplement 25 to General Order No. 27, in changing the home terminal from Columbus, Ohio, to Portsmouth. The employees objected to this on the ground that it was arbitrary and designed to inconvenience them. The railroad was sustained also in the employees' request for reclassification of service, which, if granted, would have the effect of increasing the present rates of pay for "shifter" and "mine run" service. On the subject of yardmen's seniority, in which the union leaders asked for a new rule that "when a foreman forfeits seniority as such as provided in Section (e) he may displace any junior helper," the Board denied the request, with the explanation that the existing rule and practice is just and reasonable. Discrimination between white and black workers was not recognized by the Board, which denied the employees' request for a new rule as follows:

"Any vacancies occurring in the ranks of yardmen will be filled with promotable men. This in no way to interfere with the rights of yardmen in the service of the company. The or-

ganizations represented in this agreement will be insured not less than 85 per cent of the men employed in the yard, and will be given preference in the employment of yardmen available."

Testimony during the hearing of the case showed that "promotable men" meant white men, since no white man could be expected to give place to a negro superior, and that the request for 85 per cent Brotherhood of Railroad Trainmen in the yards' employees was to exclude many negroes from the yards, since they are not eligible for union membership.

Among the other points in the controversy decided in favor of the carrier are the following:

Controversy over rates of pay in branch line service, i. e., the proper application of the provisions of Supplement 16 to General Order 27 of the Railroad Administration.

The request for a new rule in the trainmen's schedule regarding the "duration of agreement."

The request for a new rule stating that yardmen riding cars on hump yards will not be required to control more than one car unless they are coupled.

The request for a new rule giving preference in filling switchtenders' positions to former yardmen and trainmen.

The request that yardmen handling work or wreck trains in yard limits be paid yard rates instead of road rates.

The request that a self-propelled clam shell used on main track by masonry forces be classed as a work train.

The employees' request for a rate to be incorporated in the trainmen's schedule for baggagemen handling express was decided in favor of the employees.

# Some Suggestions on Office Correspondence Filing

## General, Unit and Sub-Files and File Book for Cross Reference Facilitate Locating Letters

By Grant Gibson

**I**S YOUR CORRESPONDENCE file a real file system or a fill system? When you need a particular file, can you put your hands on it immediately or do you "dig," and if so, how much time do you lose in "digging?" When you call for a file, does your file clerk bring you the entire subject file or the individual piece you need?

One railway officer termed his correspondence file "a barrel system" and by way of explanation added that from the difficulty he had in getting the proper file quickly, he assumed all the correspondence was thrown into a barrel and his file clerk had to burrow into it every time a file was called for.

The file is the heart of office organization, and with a weak heart the office cannot function properly.

The system described in the following was put into effect

number as a suffix in addition to the general file number.

As example, refer to sketches given in Figs. 2, 3 and 4. The subject file in Fig. 2 is "Engine Failures." It is given general file number 1 and the first engine failure is given suffix number 1, making this unit File 1-1; the second failure is given suffix number 2, or File 1-2, etc.

"Accidents to Trains" is the subject in Fig. 2 and this is given general file number 2.

Each subject has a general or prefix number and each case coming up under the subject is given an individual number.

### Recording of Files, Incoming Mail

To be a first-class file clerk, a man must have a good memory. On the other hand, a first-class file system is one

The diagram shows a rectangular file book layout with a width of 15 inches. It features a grid with three main columns: 'Received', 'Sent', and 'File No.'. The 'Received' column is the widest, followed by 'Sent', and 'File No.' is the narrowest. There are several rows in the grid, with the first row being a header row. The grid is enclosed in a dashed border.

Fig. 1

in a master mechanic's office; it has since become a standard in all mechanical department offices on the road, including that of the superintendent of motive power, and doubtless the ideas presented would prove of value in other departments.

In addition to absolutely solving filing difficulties, this standardization has many virtues. It permits of transfer of file clerks from one shop to another, makes it much easier in the event of a transfer of chief clerks, and last but not least, makes for economy in stationery and printing. The file book is standard and the file boxes are standard. For permanent storage of old files, a cheap, heavy, telescopic cardboard box is used.

### The Unit System

A unit file system does away entirely with "generalities," as it gives to each batch of correspondence an individual

that does not tax the clerk's memory. Therefore a "fool proof" system necessarily requires written records.

The mail should be opened by the file clerk, stamped with a dating stamp and immediately entered. The clerk quickly becomes familiar with his general numbers and where the correspondence is voluminous, he usually first marks his general file number on all the mail (using a colored pencil) and next sorts numerically, in sequence, by this number. He is now ready for entries.

The index tags, as shown in Fig. 5, show the file number and subject. Having already marked his general file number, the clerk quickly turns to the corresponding number on the tag. The clerk enters the date of the letter and, by abbreviation or initial, from whom received is noted in one of the squares allotted for this under the caption "received" at the left hand side of the file page.

He uses the wider space to the right of the "sent" space

for miscellaneous information such as car number, locomotive number, date, location, division, etc. This gives the advantage of quick location of specific cases. Figs. 2, 3 and 4 give examples of this. The large space on the right of the sheet allows an opportunity to give brief information as to the sense of the letter. On the right is the general file number and the unit number, which unit is marked on the correspondence in the ordinary way.

The numbers applied are the permanent identification mark for this piece of mail and any subsequent letters sent

File 1-1: A letter from the general manager dated November 25 was received, pertaining to the failure of engine 200 at Marion, Ohio, on November 23, on account of a bursted flue. A letter was sent to the master mechanic on November 27, that he replied on December 1 and the case was closed out to the general manager on December 3.

File 1-2: Received letter from general manager November 27, wrote master mechanic November 29, received reply December 1, but case not closed out to general manager as no entry is made under "Sent" for general manager. Thus al-

Fig. 2

out are marked with this same number, in addition to which a small rubber stamp is used which reads "In answering this letter, kindly refer to file number . . . ." Before long the majority of letters on old subjects which come in have a file reference which simplifies the clerk's work.

While the clerk is entering, he sorts the mail in two baskets, one for the new cases just coming in, and the other for "look ups"; that is, referring to a case on which there are some previous papers. When all the letters are entered he takes his "look ups," secures his papers from the files, attaches them to the new letter, places these cases with those of new cases and places the entire lot on the chief clerk's desk for perusal, disposition, etc.

This, at first hand, may appeal to the reader as a slow process, but in the office of the superintendent of motive power on one of the largest mid-west railroads it consumes only from one and one-half hours to two hours each morning, so by 10:00 a. m. the chief clerk has the day's mail before

most at a glance the file clerk can tell just how the case stands.

**Filing**

Two sets of file boxes are used, one for closed files and one for open files, or files on which an answer is expected. The closed file simply consists of one file box for each general file number and the units are filed numerically therein, the lowest number being on the bottom, this to permit of ready access to papers as one usually refers to the latest cases.

The outside of the file box contains a small receptacle in which a card is placed. The card identifies the box thus:

File No. 1  
From No. 1 to

As the box is filled, the number of the last unit is written on the card and the box is ready for storage. The open file can usually be handled in one box. This is handled numeri-

Fig. 3

him, and he rarely finds it necessary to go back at the file clerk for additional papers.

**Outgoing Mail**

The outgoing mail is sent out three times a day: namely, 11:30 a. m., 3:00 and 5:00 p. m. This mail is collected by the office boy, who encloses the originals and turns over to the file clerk all carbons as well as closed cases and statements that have served their purpose. On new cases, the file clerk sets up new file numbers, but on old cases he has the file reference on the letter. In entering the old case, he merely puts the date and to whom sent under the caption "Sent." On new cases, he enters under the same heading and fills in the entire item in the same manner as described in "Incoming Mail." Thus a complete written record is maintained.

A moment's study of Fig. 2 reveals:

cally also, filing, first by general file number, then by unit number. The advantage of the open file is to permit of tracing for answers and for a ready reference when matching up incoming mail. The open files are usually kept on the file clerk's desk.

**Cross Filing**

The greatest bugaboo encountered in a subject file is brought about by one letter referring to more than one subject. As example, refer to Fig. 3, the second item, File 2-2, in which C. B. & Q. car 150123 is concerned. This case naturally is entered under "Accidents to Trains" as the car was derailed. Months hence, an inquiry relative to this car may come in with no reference to its being in an accident. To guard against inability to locate entry of this kind, two entries are made in the file book, the first under accidents and the second in the "Foreign Car" section of the file book

but it would also carry a mark "Circular Letter X-1." Each circular issued demands an acknowledgment.

All papers pertaining to this letter are filed under the circular letter number and cross filed to the subject covered, one copy of the circular letter (without any attachments) being filed in a separate box. By this method, the file clerk has three means of locating his file.

The foregoing describes the system as it has been applied in the mechanical department, but the application of it could be made general in railroad practice. A study of the particular subjects in the various departments for the purpose of applying general file numbers is all that is necessary.

## Gasoline Explosion at Memphis\*

ON JANUARY 24, 1921, vapors from a tank car of gasoline on the Union Railway spur on Front street, Memphis, Tenn., became ignited and resulted in a blast that killed 11 people and badly injured 19 others. Probably 40 or 50 men, women and children received slight injuries from falling debris or from burns. The explosion wrecked an oil plant, levelled a block of frame buildings and broke window panes within a radius of five blocks, the estimated loss being \$200,000.

The gasoline contained in the car was a volatile product known as absorption gasoline with a gravity of 81.5 deg. Baumé, initial boiling point of 80 deg. F. and end point of approximately 360 deg. F. The car was spotted on Saturday, January 22, and the following Monday morning, January 24, a negro workman at the plant opened the tank car without relieving the pressure within. The pressure of vapors that existed in the car is not known although it has been said that the relief valves had been giving off vapors previous to this time. This statement has not been verified but

Fig. 1. View Showing Dangerous Fire Following Explosion of a Tank Car of Gasoline

probably there was a pressure of nearly 25 lb., at which the valves popped. The removal of the dome cover resulted in the sudden relief of pressure and gasoline vapor and liquid gasoline boiled out of the dome head in large quantities. The wind from the west in carrying these vapors across the street, mixed them with air and formed readily ignitable mixtures. The vapor became ignited by open fires in the frame buildings on that side of the street and instantly there was a terrific explosion which demolished every house on the west half of that block, as well as destroying buildings

\*The account of this explosion is taken from a special bulletin issued by the Bureau of Explosives and the report of an investigation conducted by the Department of the Interior, Bureau of Mines.

in the blocks north and east. This explosion was followed by a second and more muffled one which was made by the flame flashing back to the tank car where vapors issuing from the dome caught fire and burned as they came out. The damage on the west side of the track in the oil plant itself was due largely to the fire that followed. This fire caused the destruction of a garage containing four automobiles, the ruin of a warehouse of sheet iron construction and the loss of several hundred barrels of oil and grease stored therein. These drums of oil caused several minor explosions and, upon breaking, burned with intense heat.

To add to the danger of the fire, there were seven 11,000-

Fig. 2. Wreckage of Homes in Immediate Vicinity of Explosion

gal. tanks filled with gasoline and kerosene, which stood opposite the garage in the oil plant, and five more tanks elevated against a concrete wall at the west side. A second car of absorption gasoline, spotted at the same time as the one which exploded, was vented and the escaping vapors burned as shown at A, Fig. 10. The storage tanks also were vented at the top with nipples enclosing wire gauze and as vapors formed and passed out of these vents into the air, they burned quietly. Neither the second tank car nor any of the tanks, shown in the background of Fig. 2, were damaged in any way. It is interesting to note that after the fire had been extinguished, the car from which the explosion originated was still about half full of gasoline. The car was damaged only slightly and the wooden foot boards were only partly burned.

The serious results of this explosion demonstrate once more the need for ceaseless vigilance in handling tank cars of gasoline or other volatile liquids which may explode. In handling gasoline, the Interstate Commerce Commission regulations require that a car, when loaded, must have a certain voidance above the gasoline. This voidance is to take care of any expansion of the liquid which may occur if it becomes heated in transit. Safety valves are provided which will relieve any pressure above 25 lb. within the car. These valves should always be opened before the tank car is unloaded. In case pressure develops, the car can be sprayed with water and the resultant cooling will condense the greater part of these powerful vapors, thus reducing the pressure measurably.

Another way to relieve the pressure is by leaving the valve open and allowing the gas to dissipate slowly. In addition, there are in the dome cover several holes above the threads which will allow the escape of vapors before the cover is entirely removed, thus warning a man when there is pressure within. In no case should the dome cover be removed until this pressure is relieved.

# Hearing on Burlington and Lackawanna Financing

## Interstate Commerce Commission Hears Oral Arguments on Proposals to Capitalize Expenditures from Surplus Earnings

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION enjoyed a brief respite on February 14 and 15 from its usual procedure of listening to the "hard luck" stories of needy railroads by turning its attention to the problems of two of the most successful and prosperous companies, the Chicago, Burlington & Quincy and the Delaware, Lackawanna & Western, that have applied to the commission for authority to capitalize improvements and extensions made during past years out of surplus earnings and to distribute the new securities or their proceeds to the stockholders. The applications have been under consideration for some time by the commission's Bureau of Finance and its Division 4, consisting of Commissioners Daniels, Eastman, Meyer and Potter, and both hearings and arguments had been held before the director of the Bureau of Finance, but it was announced on February 10 that the two cases had been assigned for oral argument before the commission itself and that discussion was desired of the following questions among others:

1. To what extent, if any, should the applicant be permitted to capitalize its surplus (a) into stocks, (b) into interest bearing obligations?
2. In what way will granting the application benefit, or, denying it, injure (a) the applicant, (b) any other common carrier, (c) the public?
3. What special or emergency features are there in the application which would warrant exceptional treatment in granting or denying it?

As these are the first cases since the commission opened its finance docket to go to the full membership of the commission, their assignment for special argument was taken to indicate a difference among the members of Division 4, but the cases also represent the most important that have come before the commission under its new function of regulating the issuance of securities. The questions asked by the commissioners during the argument indicated no particular hostility to the proposals of the two carriers but it was apparent that some of the commissioners desired a full discussion as to one or two points involving the relation of the applications to the specific requirements of the statute. There were no signs that the commissioners were particularly impressed by the arguments advanced by the representatives of the Nebraska state commission that the possession by the Burlington of a large surplus is evidence of excessive rates or that it constitutes a trust fund belonging to the public, but questions were asked intended to bring out clearly what benefit the Burlington would derive from the plan of financing proposed as distinguished from the benefits to be derived by the Great Northern and Northern Pacific companies, its two principal stockholders, that desire the proposed dividend from the Burlington to help retire the joint 4's which mature on July 1.

The argument in support of the Burlington application was made by Hale Holden, president of the Burlington, and by C. W. Bunn, general counsel of the Northern Pacific and E. C. Lindley, general counsel of the Great Northern. The application was opposed by John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners; Hugh LaMaster, assistant attorney general of Nebraska, and B. C. March, executive secretary of the Farmers' National Council.

### Arguments for the Burlington Application

The Burlington's application is for authority to create a new general mortgage and to issue \$109,000,000 of 50 year, 6 per cent bonds, of which \$29,000,000 would be held in

the treasury and \$80,000,000 sold to provide funds for a cash dividend. The company also asks authority to issue \$60,000,000 of additional capital stock as a stock dividend and it has been stated that the rate of dividend would be reduced from 8 per cent to probably 6 per cent.

Mr. Holden made the opening argument outlining the history of the Burlington and the facts in the case. He pointed out that the acquisition of the Burlington by the two northern lines in 1901 had accomplished the same purpose as an extension of the Burlington to the Pacific Coast and an extension of the northern lines to Chicago and the great markets of the Burlington territory, and was, therefore, a logical development, the wisdom of which has been demonstrated by its success. The Burlington then proceeded with a program of intensive development of its own property, which has now reached a mature condition under honest, efficient and economical management. The capitalization has not been increased, but has been actually reduced and a surplus has been accumulated wholly beyond any need of a surplus, as that term is commonly understood, for the purpose of a reserve. He agreed that a prudent reserve should always be maintained if possible and stated that the company proposed to reserve about \$114,000,000. He pointed out that this is a special case based on a special set of facts and entitled to special consideration.

He gave figures showing the enlargement of the plant called for by increasing tonnage and pointed out that substantially none of the \$200,000,000 expended for improvements has been devoted to non-productive improvements. Also, he said, the company has not used its funds for extraneous enterprises. The ton mileage of freight handled per mile of road has increased 197 per cent with a decrease of 20 per cent in train miles per mile of road. He said that the expenditures have produced results in the public interest and the company is still in the stage of increasing returns. Moreover, the company is not likely to stand still; the great Mississippi Valley is capable of much greater development and even with the increased capitalization, Mr. Holden said, there can be no sensible argument that the company should not be able to continue to accumulate a surplus. Under its present financial structure, however, Mr. Holden said, the company is headed into the jaws of a tight situation because its present general mortgage is limited to \$300,000,000 and to 5 per cent interest. Five per cent bonds cannot be marketed except at a discount and under the mortgage they could not be retired before maturity. The company proposed a ratio of bonds to stocks of three to one, but that represents a maximum and the commission has power at any time to restrict it in connection with its decision on any part of the bond issue.

Chairman Clark said he had been hearing for years that too large a proportion of bonds in relation to stock represented dangerous financing and he asked why there is an apparent change of view in this case. Mr. Holden said he agreed with the general proposition that it is better to finance with stock than with bonds, if possible, but that the stock of the Burlington could not be sold at a fair price at this time. The company's fixed charges have been reduced in 20 years by \$422,000 a year and the additional bond issue will in no way impair the credit of the company. The purpose of the bond issue is to provide cash to aid the stockholders in meeting a very heavy maturity, the joint 4's secured by the Burlington stock as collateral, and if it were not for this situation the company probably would not be proposing a

bond issue at this time. In reply to a suggestion by Commissioner Eastman that the Burlington ought to be able to issue stock, Mr. Holden said it would be possible, but it would be more expensive than an issue of bonds. Commissioner Potter remarked that the proper ratio to consider is not the ratio between bonds and stock but the ratio between bonds and stock plus surplus. Mr. Holden also pointed out that the company might have now had the money in the bank available for cash dividends because it might have issued bonds to represent the improvements.

In reply to a question as to the benefit of the proposed issue to the Burlington, Mr. Holden said it is just as important to preserve the present relation of the Burlington to the Great Northern and the Northern Pacific as it has been for the last 20 years. Commissioner Meyer asked if the approval of the proposed financing plan would in any way affect the commission in connection with its consideration of consolidations. Mr. Holden said that the companies would hope that the commission would approve of the relation of the three companies, but that it would not be foreclosed in any way from taking such action with reference to a consolidation as might seem advisable at the time.

C. W. Bunn, general counsel of the Northern Pacific, pointed out the importance to the Burlington of having a new general mortgage because to issue the amount of bonds that have already been approved by the Illinois commission would practically close the mortgage and the Burlington would then have three closed mortgages covering practically all its lines and would have no credit for a new mortgage. Referring to the proposed \$60,000,000 stock dividend, Mr. Bunn said that it was conceded that bonus stock should not be issued, but that this stock has been paid for in advance by the earnings which have been devoted to improvements instead of to dividends. He also declared that the stock dividend would be totally valueless to the stockholders because it would result in a lower dividend rate and simply dilute their stock. Its purpose is merely to provide a proper base for the bond issue and the two northern lines have not the slightest intention of disposing of it. He also pointed out that the capitalization of the Burlington is only about \$31,000 a mile, or not more than half that of other roads in its territory. The \$119,000,000 of bonds that have been authorized by the Illinois commission, he said, had not been issued because of the disturbed conditions created by the war and because of the low rate of interest. The company could have issued bonds during the 120 days after the passage of the Transportation Act before the provisions relating to the issuance of securities became effective, but it was thought more becoming to put the question up to the commission. Mr. Bunn said that the plans for meeting the maturing of the joint bonds on July 1 cannot be fully matured until the commission renders its decision but it is proposed to use the proceeds of the \$80,000,000 Burlington bond issue to pay off that amount of the joint bonds and that it has been planned to refund the balance of \$135,000,000 to \$140,000,000 either by new joint issue or by the issuance of separate bonds by the two companies. He pointed out that the Burlington stock can no longer be used as collateral at \$200 a share as it was for 20 years because under present laws only one-third of the collateral behind a collateral trust bond can be stock. The northern lines would have to use mortgage bonds to the extent of two-thirds. Without the proposed dividend from the Burlington, Mr. Bunn said it would probably cost 8 per cent to refund the joint bonds with a new joint collateral trust obligation and the interest charge would, therefore, be about \$17,000,000. If \$80,000,000 can be retired the balance could be met by issues of mortgage bonds at 6½ per cent, on which the interest charge would be only \$13,500,000 so that the plan would result in a total saving of about \$3,500,000 in interest.

## Opposing Arguments

B. C. Marsh, executive secretary of the Farmers' National Council, opposed both the Burlington and the Lackawanna applications on the ground that they would require the public to pay rates on fictitious capitalization.

J. E. Benton, general solicitor of the National Association of Railway & Utilities Commissioners, used a similar argument, saying that the stockholders of the Burlington have always received reasonable dividends so that the surplus represents excessive earnings. He also discussed the surplus as if it were a reserve fund and said that the accretions of a reserve belong to the fund and not to the stockholders. He also argued that it had not been shown that the proposed issue would be of any benefit to the Burlington itself. Commissioner Eastman said that one of the strongest arguments in favor of the plan was that the issue of \$80,000,000 by the Burlington would enable the two northern lines to retire that amount of bonds and to make a total saving of interest charges. Mr. Benton said that the needs of the northern lines have nothing to do with the cost and that any issue by the Burlington must be for the proper purpose of that company.

Hugh LaMaster, assistant attorney general of Nebraska, said that his brief had raised the point that the Transportation Act seems to contemplate that the Interstate Commerce Commission shall consider the law of the state in which a railroad has been chartered, but he did not press the point in his argument. He opposed the application on the ground that the applicant is only nominally a party at interest and that the exigencies of the Great Northern and the Northern Pacific are not proper ground for granting the application. He took the position that the Burlington surplus represented the contributions of the people in the Burlington territory through excessive rates. Commissioner Daniels insisted that the people have merely paid for service rendered and that they have received what they paid for. He also said it made no difference if dividends had been paid at the rate of 100 per cent on the stock; the question involved is whether the owners of the road have received more than a fair return on the value of the property. Commissioner Potter asked what should have been the company's policy in providing improvements and whether they should have been paid for by bond issues. Mr. LaMaster said that securities should have been issued for extensions and when the surplus got sufficiently large the rates should have been reduced. Commissioner Potter asked why if the company should have issued securities from time to time it should not be allowed to issue securities against the expenditures now. Mr. LaMaster said that in the former case the money would have been furnished by the markets of the world instead of taken from the people who paid the rates. He also asserted that the surplus represents a trust fund belonging to the people and that its disposal after the rates have been collected is a judicial and not a legislative function. He admitted that there is no question that the legal title to the property is with the railroad. He also argued that the Burlington has not shown any need of additional capital and that it has always been able to provide for its requirements out of earnings.

When E. C. Lindley, general counsel of the Great Northern, began his closing argument, Commissioner Ford asked particularly for discussion as to the relation of the proposed issue to the necessities of the Burlington as distinguished from the necessities of the stockholders. Mr. Lindley referred to the Burlington's need for a new mortgage and pointed out that the Illinois commission had already authorized \$119,000,000 of bonds and that when the Transportation Act substituted the judgment of the Interstate Commerce Commission for that of the Illinois commission the company naturally proceeded to try to make the bonds just as liquid as they were before. The law does not require,

he said, that there must be an affirmative benefit to the Burlington provided the issue is consistent with its purposes, compatible with the interests of the public and will not impair the ability of the company to serve the public. It is to the interest of the Burlington, he said, that the \$60,000,000 should be permanently capitalized and it is also to its interest, as well as that of the two northern companies, that the relation between the three companies, which has been beneficial to all three, should be continued. He pointed out that the Gould lines had built to the Pacific coast and had been bankrupted; also that the extension of the Chicago, Milwaukee & St. Paul to the coast had resulted disastrously, whereas the plan adopted by the Burlington and its two northern connections had been a tremendous success. It is to the interest of the Burlington that the two northern lines remain its avenues to the Northwest and enable it to compete with the Union Pacific and other lines. It is also to the interest of the Burlington, as well as to all other railroads, that so large an issue as \$215,000,000 should not be refunded at 8 per cent as this would affect the credit of every railroad in the country. The proposed plan is the best one that the companies have been able to think of because it uses the credit of all three roads to make a saving of \$2,500,000 to \$4,000,000 in interest charges. It is also to the interest of all railroads that the rights of stockholders shall be protected. For the commission to deny this application, he said, would serve notice on all roads that they could no longer retain surplus earnings without running the risk of never being able to get them out and would result in every railroad paying out every dollar of net earnings in dividends currently.

In reply to assertions that the surplus represents excessive rates, Mr. Lindley said that the total return on the investment in the Burlington had been less than the 6 per cent which the law declares to be a fair return and its rates throughout the greater part of the period under discussion have been largely made by the interstate or state companies.

In concluding, Mr. Lindley pointed out that the time for taking care of the joint bonds is rapidly approaching and that it would be practically impossible now to develop any other plan. It would take 75 days, he said, to give the necessary legal notice and prepare for a special shareholders' meeting. The proposed plan has already been approved by 99 1/3 per cent of the stockholders, including holders of three-fourths of the minority stock, and none of the minority stockholders voted against the plan.

**Lackawanna Application**

The application of the Delaware, Lackawanna & Western for authority to issue additional stock to the amount of approximately \$90,000,000 or approximately twice the amount of the present issue, was discussed briefly by W. S. Jenney, general counsel of the company. After reviewing the history of the road and its finances, he said that the Lackawanna is one of the very few roads in the country that should be able to continue to earn over 6 per cent on its value and that the capitalization should be made more consistent with the value. He said that to increase the number of shares of stock would be of benefit to the stockholders, although in fact representing no more property, because the additional pieces of paper bearing a lower rate of dividend would sell for more in the markets than the present issue bearing a high rate of dividend.

Alfred P. Thom, general counsel of the Association of Railway Executives, closed the argument with a discussion of the broad principles involved, asserting that if the public interest is not injured, the method to be adopted is for private management to decide. The question for the commission, he said, is whether the proposed plan will in any way operate against the public interest. If it will not, it is not necessary

for the commission to inquire as to whether the carrier is affirmatively benefited. That question comes within the domain of private management. The statute should not be construed to allow the commission to usurp the functions of private management. The issue of stock dividends to represent actual investment already made, he said, is a lawful purpose within the corporate powers of the company and in the case of the Lackawanna the proposed plan will tie \$40,000,000 of assets to the company that are not tied to it now because the amount may be declared as a cash dividend. Mr. Thom argued at length that the carrier has absolute title to its earnings under lawful rates and said that "no accumulation of earnings have ever been declared by a "respectable" court anywhere to belong to anyone but the lawful stockholders.

**Maturities of Railway Funded Debt**

THE BUREAU OF RAILWAY ECONOMICS has made a compilation from the annual reports of the carriers to the Interstate Commerce Commission showing the total maturities of the funded debt of the Class 1 carriers. The details are given as to maturities on mortgage bonds, collateral trust bonds, income bonds, miscellaneous obligations and total for each year to 1949 and from then on by decades. The compilation follows:

RAILWAY FUNDED DEBT (ACTUALLY OUTSTANDING) MATURING EACH YEAR FROM 1920 TO 1949, AND EACH TEN YEAR PERIOD THEREAFTER. Railways of Class I - United States

Year of maturity	Mortgage Bonds	Collateral Trust Bonds	Income Bonds	Miscellaneous Obligations	Total
1920	\$102,098,600	\$23,083,000	\$1,898,000	\$15,090,160	\$134,174,760
1921	73,904,815	227,013,900	-	22,254,288	323,172,773
1922	57,983,500	44,579,000	-	33,633,260	136,195,760
1923	77,657,000	6,836,000	-	234,597	84,527,597
1924	9,068,000	3,000,000	-	7,612,447	19,680,447
1925	142,423,976	44,991,830	-	49,193,252	236,609,057

\* Does not include equipment obligations amounting to \$771,121,223 and also \$11,790 receipts outstanding for funded debt. Adding these amounts to the total of \$9,795,036,142, the total funded debt actually outstanding of the railways of Class I amounted to \$10,566,827,317 as of December 31, 1919, which is approximately 65% of the total funded debt of all steam roads in the United States. Forgoing returns do not include data for the Pittsburgh, Shamokin and Northern R.R.

T. O. EDWARDS, auditor of the Southern Pacific, discovering that a number of employees of the road have lost liberty Bond savings and other "nest eggs" through misrepresentation of unscrupulous promoters, has issued the following warning: "No matter how attractive the proposition may seem to be on the surface, employees, before investing their savings, should consult with some responsible banker in their community who will gladly give them frank and unbiased advice, whether they are a patron of the bank or not. There are many opportunities for sound and profitable investments at the present time, but attempts are being made every day to defraud the public and impose upon the credulous."

# Marine Borers Invade Piling in San Francisco Bay\*

Serious Losses to Railway and Other Structures Along Waterfront  
Threatened by Teredo

EARLY in 1914, the activity of marine borers was noticed in the dykes of the Mare Island Navy Yard, at the upper extremity of San Pablo Bay, which is the northern arm of San Francisco Bay, as well as at two nearby points on the east shore of that bay. One of the latter was a dock between Crockett and Vallejo Junction and the other a dock at Oleum, a mile or so south of Crockett. Sporadic attacks of marine borers are reported to have been observed in that region at isolated times running as far back as 1870. In any case, these attacks were of short duration and did no serious damage. The waterfront structures erected by the industries were

servers' Association. The committee was organized with Frank D. Mattos, manager treating plant, Southern Pacific, Oakland, Cal., chairman, and included some 20 engineers connected with industries and railways interested in this problem.

The objects of the survey were to determine the extent of the damage from marine borers in San Francisco bay, especially that of excessive severity which has occurred within the last three years in the northern portion of the bay; to determine the present distribution of the several marine borers and as much of their past history in the bay as it was possible to learn; to increase the present knowledge of the dissemination, growth and habits of the borers; to study the factors influencing the rate of attack and amount of damage from them, including the effect of climate and river discharge upon the salinity conditions in the bay; to throw more light upon the effectiveness, both in physical life and economic advantage, of the various methods of protecting wooden piling, and of the substitutes for it, together with the best methods of construction which have been developed; and to correct data on the relative costs of the different methods of protection and construction.

The name "San Francisco Bay" is technically applied only to the larger and more important southern arm of the body of water which has its connection with the Pacific Ocean through the Golden Gate. The name is more often

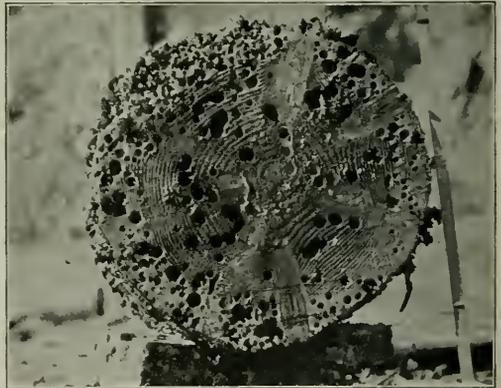

Dock at Oleum, Calif., Which Failed in 1919 and Plunged Several Cars into the Bay

all built on untreated piling, because of the absence of marine borer activity in those waters and the belief that the fresh water discharged into San Pablo bay from the combined flows of the Sacramento and San Joaquin rivers would probably prevent any invasion of San Pablo bay by salt water, which would carry with it the various forms of marine borers.

The attack of 1914 appeared to be sporadic, like the earlier ones. But at Mare Island in 1917 attacks by the same shipworm, which was identified as a teredo, again appeared, and during the following years spread very rapidly. In 1920 these failures assumed such proportions and became of such frequent occurrence that the critical nature of the local situation was brought to the attention of the officials of the American Wood Preservers' Association on June 16, 1920. As a result, a special committee was appointed on July 22, 1920, to study the marine piling problem in San Francisco bay, with instructions to report at the seventeenth annual meeting of the association at San Francisco in January, 1921. The committee began its active work late in July, 1920.

Shortly before June 16, 1920, but practically coincident with the above action, the Forest Products Laboratory of the United States Forest Service at Madison, Wis., had proposed a plan for the study of the marine piling problem covering the entire coastal waters of the continental United States. It was the logical step to unite both proposals, and the San Francisco Bay Marine Piling Survey became, therefore, the first unit of the proposed nation-wide program of the Forest Products Laboratory, under joint co-operation with the American Wood Pre-

Action of *Xylotrya* (Large Holes) and *Teredo* (Smaller Holes) in Pile After 2½ Years' Service

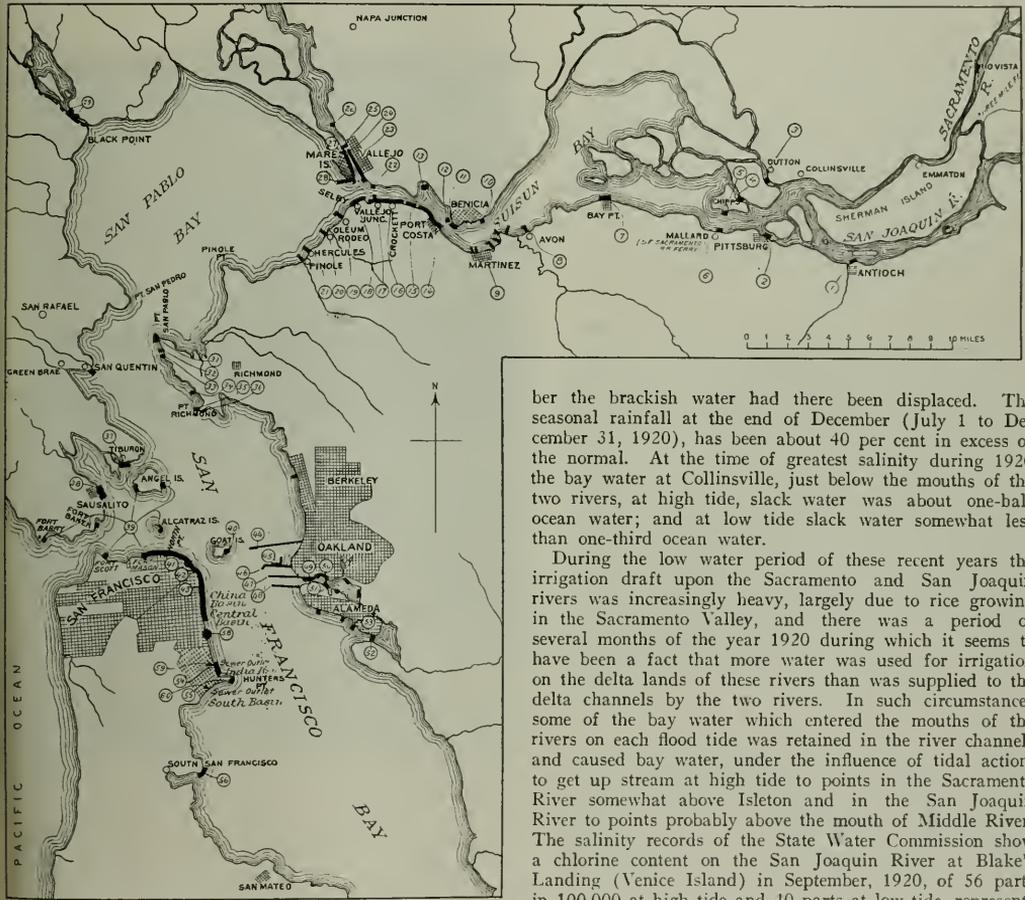

used than any other, however, when it is desired to indicate the entire body of water. This larger bay has its longer dimensions closely parallel to the seacoast. It is 52 statute miles in its greatest length in a single direction, and has a maximum width of slightly under 12 miles. The outlet through the Golden Gate is at a point about three-fifths of the total length of the bay from south to north. At a point about one-half of the remaining distance north from the Golden Gate the width of the bay is reduced to a little over one mile, and that point marks the division between San Francisco Bay proper and the upper area known as San Pablo Bay.

\*Abstracted from an elaborate report of the San Francisco Bay Marine Piling Committee of the American Wood Preservers' Association, and presented at the annual convention of that association in San Francisco on January 2.

At the eastern end of San Pablo Bay there enters a channel known as Carquinez Straits, through which the combined flow of the Sacramento and San Joaquin rivers is discharged into San Pablo Bay. The Carquinez Straits are from seven to eight miles in length and above them is a large area of water composed of many tidal flats and salt marshes known as Suisun Bay. At a point about 18 miles above Carquinez Straits is the junction of the Sacramento and San Joaquin rivers.

Destruction from marine borers in San Francisco Bay

structures, although built wholly of untreated wood, had stood from 30 to 40 years. The destruction there since 1917 by the teredo has been swift and unusually severe. Every waterfront structure as far upstream as Antioch has been attacked by the teredo. This year (1920) the waters of Suisun Bay had reached their maximum salinity about the middle of September and, a few weeks later, particularly after the winter rains commenced, the increasing flow of the rivers accelerated the freshening of the water in the upper end of Suisun Bay, so that by the middle of Novem-

Map of San Francisco Bay

has been most active in the regions nearest the Golden Gate, where unprotected timber is destroyed within a few months. Destruction is nearly as rapid southward around the San Francisco waterfront. On the Oakland side destruction is somewhat less rapid, unprotected piling lasting from 18 months to three years. In the Oakland estuary the activity of limnoria is greater than that of the xylotrya and piling may be destroyed in as short a time as six months.

In the northern area, including the lower course of the Sacramento River, Suisun Bay, Carquinez Straits and the adjacent portions of San Pablo Bay, many of the piling

ber the brackish water had there been displaced. The seasonal rainfall at the end of December (July 1 to December 31, 1920), has been about 40 per cent in excess of the normal. At the time of greatest salinity during 1920 the bay water at Collinsville, just below the mouths of the two rivers, at high tide, slack water was about one-half ocean water; and at low tide slack water somewhat less than one-third ocean water.

During the low water period of these recent years the irrigation draft upon the Sacramento and San Joaquin rivers was increasingly heavy, largely due to rice growing in the Sacramento Valley, and there was a period of several months of the year 1920 during which it seems to have been a fact that more water was used for irrigation on the delta lands of these rivers than was supplied to the delta channels by the two rivers. In such circumstances some of the bay water which entered the mouths of the rivers on each flood tide was retained in the river channels and caused bay water, under the influence of tidal action, to get up stream at high tide to points in the Sacramento River somewhat above Isleton and in the San Joaquin River to points probably above the mouth of Middle River. The salinity records of the State Water Commission show a chlorine content on the San Joaquin River at Blake's Landing (Venice Island) in September, 1920, of 56 parts in 100,000 at high tide and 40 parts at low tide, representing about 92 parts of high and 66 parts of common salt, respectively. The highest salinity was shown by the samples taken on November 22. The chlorine content of the water was then 66 parts in 100,000. This is equivalent to about 99 parts of common salt in 100,000 parts of water. The situation relating to the up-river penetration of bay water is aggravated by the fact that the work of channel enlargement in progress since 1913.

The Xylotrya

The cosmopolitan character of the distribution of the marine borers depends upon the ease with which their larval stages may be carried by currents of the sea, or in the water tanks of steamers, and upon the facility with

which the borers themselves may travel long distances in driftwood, in exposed wood of vessels or in timber rafted by sea. This makes it a biological certainty that all great ports are subject to repeated invasions by borers from other localities.

The xylotrya is the largest of the three borers found in the bay. When full grown in our waters it measures as high as two feet in length and has a diameter at the head or shell-bearing end of three-fourths of an inch. Tubes over three feet in length and seven-eighths of an inch in diameter have been found in old piling on the San Francisco waterfront. Its burrows differ from those of the two species of teredo found in San Francisco Bay in two important particulars. They are larger and they present continuous minor deviations from the straight or curved course which teredo pursues. Their burrows are therefore less symmetrical and regular than those of teredo. The burrow of xylotrya enters the pile at right angles to the surface as a small pin hole and turns obliquely, usually downwards, enlarging rapidly within two inches of the surface to one-quarter inch and within four inches to three-eighths to one-half inch. It does not restrict its course to sap wood, and in cases of sparse seeding of the borers, often bores obliquely deep into the wood before turning to run with the grain of the timber. For this reason, surface samples may not reveal lightly infected piling.

Xylotrya is generally found in association with limnoria in our waters and the two invade the pile together, although it is probable that when once limnoria gets possession of the surface, xylotrya has a small chance to get into wood. However, creosote-treated piling hollowed out by limnoria sometimes has a few xylotrya at work within creosoted shell but not traversing it.

The rate of growth of xylotrya under existing conditions in the bay is seen in the fact that piles in the dolphin off the Alameda Mole, driven in February, 1919, were so weakened at the mud-line, mainly by xylotrya, that they had to be removed in November, 1920, that is in about 20 months. Piling in the neighborhood of the Golden Gate last only six months, owing to the combined action of xylotrya and limnoria. In so far then as our data go, it appears that the principal molluscan borer to be guarded against in the main and lower parts of San Francisco Bay and on the ocean front where salinities are those normal to the sea or approach it is xylotrya.

### The Teredo

The teredo navalis is the ship-worm of the dykes of Holland. This species is the medium-sized species of the three molluscan borers occurring in this region. It is, when full grown in the autumn, from 4 to 10 in. in length, generally 6 to 8, and the diameter of the head end is from  $\frac{1}{4}$  to  $\frac{3}{8}$  in. The body lies in the burrow which enters the pile horizontally, and generally, but not always, turns downward at once and expands within one or two inches to a nearly uniform diameter throughout the rest of its course.

The tubes or burrows of teredo differ from those of xylotrya in our timbers in being smaller and somewhat more thickly set or crowded. They enter the piling less deeply than xylotrya, whose burrows, whether few or many, are wont to enter the pile even to the center, while teredo enters deeply by reason of crowding. Moreover, xylotrya works in shallow water less readily than teredo. When crowded the burrows are often only  $\frac{1}{8}$  in. in diameter. The burrows enter by minute holes 0.008 in. in diameter when first made, but enlarged to as much as 0.03 as the animal grows older. The burrow runs a curved or straight course, often with the grain and downwards

when not crowded, or more or less obliquely across it when crowded.

The burrows twist and turn to avoid crossing each other and the direction of the tube may even be abruptly reversed in a short turn, or the inner end abandoned and a new course established at a point above it. They are generally straighter or more regularly curved, and have smoother course established at a point above it. They are subject walls.

The degree of destruction of the timber by excavation is a function of the density of settlement and penetration. In piling with a fairly heavy infection from Port Costa, we

Penetration of Teredo Four Inches Into Green Douglas Fir Pile in Four Months

find that in four samples the average per cent excavated was 45.5 per cent. In densely attacked timber, the percentage of excavation will run somewhat higher than these figures.

In December, 1919, it was found that teredo had penetrated the piling of the Southern Pacific slips at Port Costa and Benicia two to three inches, and in some instances had almost completely eaten the pile through at the mud-line. A pile pulled at Vallejo Junction in June, 1919, and sawn in two-foot sections, did not contain teredo, nor was it found in surface sampling at low tide on Southern Pacific structures in the upper bay in June, with surface salinities of 3.3 parts per 1,000, but was detected in great numbers on October 15, 1919, in surface and bottom salinities of 22 parts per 1,000, at Vallejo Junction when a steamer broke off some piling, and shortly thereafter at Port Costa and Benicia, in surface salinities of 12.1 and bottom of 17.6 parts per 1,000, in pulled piling. By the autumn of 1920 they spread up stream until they had reached Antioch on the San Joaquin, 25 miles above Carquinez Straits and 50 miles from the Golden Gate, and up the sloughs of the Delta to Dutton.

This progressive invasion was the direct result of the continued shortage in the annual rainfall and run-off during these years, which permitted the settling of the larval stages on unprotected piling during the breeding season of midsummer and the survival of the borers in the wood during the brief season of the spring freshets of these years. In the upper bay from Pinole through Oleum, Mare Island, Vallejo, Crockett, Port Costa, Benicia, Martinez, to Moccoco and Avon, the destruction of piling by this teredo in the summer of 1920 reached a climax which left little or no untreated piling undamaged and not a little of it wholly destroyed by penetration to the center or near it, at the mud-line.

In the meantime the invasion had spread elsewhere to unprotected structures, such as those above Black Point on Petaluma Creek, to the wharves at Richmond, and to the unprotected piling of the dolphins of the Alameda Mole, to some points in the Oakland Estuary, to the Bay Farm Island bridge, and to the Dumbarton cut-off at the southern end of the bay. It was also found during the survey at South San Francisco, in the Bay View sewer outlet, and at the sewer outlet at Hunter's Point, in new piling in the boom at Islais Creek, and sparingly at Pier 7 on the San Francisco waterfront in treated piling which had been opened up by the attack of limnoria. From the distribution thus shown it is to be inferred that all unprotected piling in San Francisco Bay may be expected to show upon examination an attack by this borer.

### The Limnoria

In addition to the molluscan borers attacking marine structures described above, there are three others belonging to the crustacea of general distribution, namely limnoria, sphaeroma, and chelura. Limnoria and sphaeroma only have been found as yet in San Francisco Bay. These borers owe their efficiency as destroyers of wood to their powerful biting jaws by which they cut their way into the hardest of wood. They both belong to types of crustaceans adapted to life in the zone of extreme environmental conditions, between tides where moisture, light, salinity, temperature, food supply, and stability of the substrate are subject to rapid and extreme change. The body of the limnoria is small, the largest individuals attaining a length

Failure of a Corbel on Pile Cut Off Too Close to Water, Barnacles Indicate High Water Line

of  $\frac{1}{4}$  in. and one-third as wide. It is elongate slipper-shaped, flattened dorso-ventrally, and has rounded ends.

Limnoria is found on both the Atlantic and Pacific shores of the United States, north to Bering Island, and has been reported on European coasts from the Adriatic to Norway. It is common along the California coast in piling on the ocean front. In San Francisco Bay it is very destructive in the Golden Gate, on the Oakland and San Francisco water fronts, at Dumbarton cut-off and at Sausalito, Tiburon and Richmond. It was not found north of San Quentin and San Pablo Point and took no part in the invasion of the Upper Bay with teredo. It is thus abundant where salinity is not much reduced by fresh water.

Limnoria destroys piling by gnawing its interlacing branching burrows into the surface of the wood. We have found from 200 to 240 burrows per square inch in heavily

attacked timber. These burrows are from 0.050 to 0.025 in. in diameter and follow the softer zones of spring growth between the more resinous harder zones of the annual rings. Piling infested by limnoria thus has an outer scurf of  $\frac{1}{8}$  to  $\frac{3}{16}$ , rarely  $\frac{1}{4}$  in. of perforated somewhat laminated wood, which is readily broken or falls away as the attack proceeds. In square timbers the attack progresses rapidly through the harder zones of the annual rings on radial sections, leaving these resinous strips as projecting ribs.

The borer is particularly insidious in its attacks upon creosoted piling because of its habit of creeping into small crevices. If cracks open through the saturated zone of a creosoted pile or if bolt or dog holes or peavey holes or other breaks in the continuity of this protection occur, limnoria is sure to find its way into the retreat thus offered and to begin its destructive work. It will reduce such a pile to a mere shell. It is sometimes found in such piles actually at work in the creosoted zone itself. Whether it does this because it slowly becomes acclimatized to the repellent substance or because of defective creosoting, low grade oil, or progressive leaching out of the toxic elements of the oil, is unknown.

The proportion of the wood removed by limnoria in its burrows is somewhat less than that removed by teredo. Teredo-eaten piling has a firmer consistency because of the thicker partitions between the burrows. Limnoria-eaten wood is more friable or spongy because of the numerous small burrows and the more or less elastic resin zones left somewhat intact by these borers.

A test of the average amount of excavation in five pieces of Douglas fir squared timber eaten by limnoria from Tiburon showed an average of 42.8 per cent. The considerable number of borers remaining in the burrows somewhat reduces the apparent volume of the excavation. The probability is that it is often in excess of 40 per cent.

### The Sphaeroma

The sphaeroma is a larger, stouter form than limnoria, but with the same general structure. The body is broadly ellipsoidal in outline seen from above with rounded ends. It is one-half inch long and one-quarter inch wide and rolls up into a ball about a quarter of an inch in diameter when disturbed. Its color is dark olive to slightly reddish brown. It is often mottled or blotched with lighter dull yellowish areas on the middle of the back. The eyes are prominent and lateral in position.

Sphaeroma is very often found in crevices or other sheltering nooks outside of its burrows and is evidently something of a forager. It does not appear to depend upon the wood eroded from its burrow for food, for its stomach contents are made up of the minute vegetable and other growths which cover the surface of the piling.

The excavations made by sphaeroma pentodon in marine structures are very characteristic in size, distribution and location. They have circular openings up to nearly one-half inch in diameter, enter the wood horizontally or turn more or less abruptly and run with the grain in the softer layers of the wood. They do not exhibit the expansion characteristic of the molluscan burrows.

Sphaeroma works mainly between high and low tide, though found at all levels on piling. Its workings are obscured in deeper water by the more intense activities of limnoria and the growth of other marine organisms. Between tide levels it gives to the piling a pitted appearance with its large, open, dark-colored burrows. Its work is erratic in that often only certain piles are subject to its attacks while neighboring ones may be untouched. It sometimes runs channels on the surface of wood, especially in the more deeply submerged piling.

The sphaeroma has a wide range of distribution in our locality. It has been found at Sausalito, Tiburon, Black

Point, the Mare Island dikes, in Napa Creek, along Carquinez Strait and upstream to Antioch in water of low salinity. It also occurs along the western water front and Oakland Estuary and in the southern part of the bay to South San Francisco and the Dumbarton cut-off. It is known to occur northward to Alaska.

#### Exterior Indications of Marine Borers

The crustacean borers work upon the surface of submerged wood and leave an open record of their destructive activities in the erosion caused by their burrows. *Limnoria* and *chelura* erode so rapidly that few other forms of marine life can obtain, or long retain a foothold on the wood in which these borers are working.

In the case of the molluscan borers, the case is different. They enter the wood as minute larvae and leave only a pinhole to mark the places. There is nothing to indicate to the casual observer either their presence or the degree of destruction which they have accomplished.

The survey of the Sacramento River to Sacramento brought out the fact that certain forms of marine life had gone up the river as far even as Walnut Grove, and that these same forms were luxuriantly thriving on piling attacked in Carquinez Straits, as salt water had invaded that territory. They serve, therefore, as indicators to the uninitiated that the sea with its fauna is invading new territory. These marine organisms are the barnacles and the hydroids. The former are well-known crustaceans encased in an armor of shelly plates which cover piling, rocks, ships' bottoms, and any available substrate with hosts of more or less close-set, whitish, angular bodies ranging up to a hazel-nut in size. The hydroids are moss-like plant-animals which form a grayish or brownish mass or, when dead, hair-like growth over piling.

There is fortunately another marine animal of cosmopolitan distribution, the European edible mussel, *mytilus edulis*, whose somewhat angular black shell is attached to rocks, piling and any stable or floating substrate. The occurrence of young mussels on marine piling is a danger sign for the engineer to look out for teredo.

There is one outstanding feature of the present outbreak of marine borers in San Francisco Bay and of this survey which affects State and Federal supervision of navigable waters and of shipping and engineering practice in the construction and maintenance of marine structures, such as wharves, moles and piers. It is this, namely, that within the area infested by marine borers all unprotected wood-work is a potential breeding ground for harboring these pests, increasing their numbers, and sending forth their migrating larvae. In every case an infested bit of wood is a contagious spot. A single infested pile in 25 ft. of water and its 100 sq. ft. of surface affords shelter for upwards of 150,000 teredos, and each of these is capable of producing more than 2,000,000 larvae per year. Each pile, barring the death rate of larvae, thus produces enough young to seed 2,000,000 other piles.

#### The Engineering Problem

To the engineer responsible for the design, construction and maintenance of structures in sea water, accurate information on the relative cost and the permanence of various kinds of piling and pile protections is of the greatest importance. After describing the various methods of protecting piles in some detail, the committee concluded that:

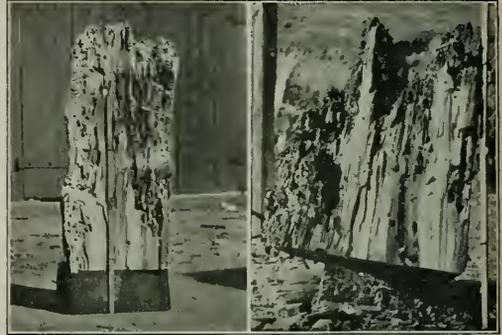

(1) Marine borers are very active in San Francisco Bay, and in places where their attack is severe will destroy untreated piling in as short a time as six to eight months. In other places the untreated piling may last two to four years.

(2) The information secured indicates that it is reasonable to expect a life of five to eight years from paint and

batten protections if the work is well done. If it is not well done or if the covering is damaged by careless handling this range of life cannot be expected.

(3) When carefully handled so that there is no injury extending through the shell of treated wood within the water section, it appears possible for properly creosoted Douglas fir bearing piling to give a life of 25 to 30 years in San Francisco Bay.

(4) Most of the attack on creosoted piling by marine borers, which the committee has observed throughout this survey, appears to have begun in spots where untreated wood has been exposed by damage in handling the piles or placing the superstructure. It is urgently recommended that improvements be made in the methods of handling

Section of Untreated Douglas Fir Pile After 7 Years' Service      Pile Broken from Pier After 2½ Years' Service

creosoted piles and building structures upon them, so that damage to the surface of the piles may be reduced to a minimum.

(5) Precast reinforced concrete piles and pile casings have not been in use in San Francisco Bay a sufficient length of time to determine their ultimate life. A detailed examination of those structures which have been in service for 10 years shows no evidence of deterioration and they seem capable of a long further life.

(6) Cast in place concrete pile jackets and cylinders may be expected to give satisfactory results if properly constructed of suitable materials. The difficulties of this type of construction, however, are of such a nature that the probability of securing a maximum length of life is less than in the case of precast concrete piles or pile coverings.

(7) The selection of a type of piling or pile protection for a given structure must be made upon the basis of cost and permanence of the materials under consideration, the character of the structure and the probable need for future alterations to meet the changing requirements of commerce. When a comparatively short increase over the life of green wooden piling is sufficient, the surface protections will often be found economical in waters not exposed to severe storm action; if a moderately long physical life approximating the average economic life of marine structures in this harbor is desired, a good creosote treatment will provide it at the lowest annual cost so far as present knowledge goes; if conditions warrant building for the greatest permanence, with less regard for first cost, concrete construction may be useful. For the protection from further damage of wooden piles already in place and showing attack by borers, not yet severe enough to require condemnation, the concrete casing, precast or poured in place, is the only means of salvage so far found by the committee.

# Reading Dissolution Plan Filed at Philadelphia

In Conformance with Supreme Court Decision, Court Asked to  
Defer Central of New Jersey Sale

**T**HE PLAN FOR THE SEGREGATION of the Reading Company and affiliated corporations decreed by the United States Supreme Court, and modifications suggested by the government were filed with the Federal District Court at Philadelphia on Monday, and March 1 has been fixed to hear argument on the plan.

The plan provides that the Reading Company, a holding concern, will assume the \$93,524,000 general mortgage 4 per cent bonds, which are the joint obligation of the Reading Company and the Philadelphia & Reading Coal & Iron Company. The coal company will pay the Reading Company \$10,000,000 in cash or current assets at market value and \$25,000,000 in 4 per cent mortgage bonds of the coal company. The \$25,000,000 bonds to be issued by the coal company to the Reading will mature on January 1, 1997, the same date as the general mortgage bonds. These bonds shall be subject to redemption at par and accrued interest on any semi-annual interest date.

The Reading Company will merge the Philadelphia & Reading Railway Company under the authority of the present charter of the Reading Company and will subject the railway property to the direct lien of the general mortgage. The name of the Reading Company after the merger will not be changed and the company will be subject to federal and state regulations as a common carrier. If and whenever the general mortgage bondholders' committee shall determine to declare the plan of exchange effective the Reading Company shall execute a refunding and improvement mortgage which shall constitute a direct lien upon all the railroad's railroad property, railroad equipment and railroad stocks and bonds then owned by the Reading Company, or thereafter acquired by means of bonds issued thereunder. Deposited general mortgage bonds will be kept alive under said refunding and improvement mortgage until the general mortgage is released.

## Plan Asks Court to Defer Jersey Central Sale

The proposed plan asks the court to defer the actual sale of the stock held by the Reading Company in the Central of New Jersey, pending the grouping of railroads by the Interstate Commerce Commission under the Transportation Act, but subject to the further order of the court.

To this last proposal the government has entered an objection and has suggested that the Reading Company shall, "with all due diligence," offer for sale at reasonable price and upon reasonable terms the stock of the Central of New Jersey now owned by it, for a period of years to be named by the court. If at the expiration of such period a sale of the stock has not been made, then, on application of the attorney general, the court may decree a sale at public auction at a price not less than a minimum price to be agreed upon between the Reading Company and the attorney general.

The government's opposition to the proposal to place the Reading Company's interest in the stock of the Jersey Central in the hands of trustees pending the working out of the regrouping of railroads by the Interstate Commerce Commission is because it "means in practical effect a continuance of the status quo indefinitely." The government contends that the consolidation of the railroads of the country would take such a long time that the effect upon the companies involved in the dissolution plan would be to maintain their present status for an indefinite time.

A plan submitted separately provides that the Central of New Jersey shall dispose of all its capital stock of the Lehigh & Wilkes-Barre Coal Company now owned by it to persons

or corporations who are not its own stockholders or stockholders in either the Reading Company, the Philadelphia & Reading Railway Company or the Philadelphia & Reading Coal & Iron Company, and who previous to or at the time of the purchase shall qualify as purchasers by a duly executed affidavit. Should all of the said stock not be disposed of before the expiration of six months after entry of this decree or previous to any date which may be fixed by the court, the remainder shall be transferred to the Central Union Trust Company of New York, as the custodian and depository of the court, subject to the provisions of this decree and to the further orders and decrees of the court.

In accepting this plan, Judges Buffington, Woolley and Davis modified a decree previously entered enjoining the Central of New Jersey receiving dividends from the Lehigh & Wilkes-Barre Coal Company so as to permit the railroad company to receive such dividends pending the sale of the coal stock.

## Separation of Coal Company

The greater part of the plan is taken up with the dissociation of the coal company from the holding company. It provides that the mortgage under which the \$25,000,000 4 per cent bonds are to be issued may contain provisions for the issue of additional bonds to provide for additions and betterments to a limited amount, to be determined by the Reading Company and the coal company prior to the creation of the mortgage. The bonds are to mature January 1, 1997, the same date as the general mortgage bonds.

With certain exceptions general releases of all claims and liabilities as between the Reading Company and the coal company, including the claim of approximately \$70,000,000 carried on the books of the Reading Company as an asset and on the books of the coal company as a liability, will be exchanged.

The Reading Company agrees to obtain the release of the coal property from the lien of the general mortgage and the discharge of the coal company from liability on the general mortgage bonds, provided such release and discharge can be secured by payment by the Reading Company to the bondholders of a premium not exceeding 10 per cent upon the par value of the outstanding general mortgage bonds. The Reading Company will make payment of the premiums on the order of the committee to be formed in the interest of the bondholders.

"It is assumed," the plan says, "that the attorney general will ask the court to direct the release of the stock of the coal company from the lien of the general mortgage on such terms as the court may fix. If practicable the coal company will consolidate with the Delaware Coal Company, of which it owns the entire capital stock and the consolidated company will issue stock without par value to the Reading Company. If that is not practicable, a new corporation will be created to acquire from the Reading Company the stock of the coal company or the interest of the Reading Company therein, and such new corporation will issue no par value stock. The number of shares to be issued by the consolidated coal company or of such new corporation may be 1,400,000.

"Such no par value stock will be sold to the stockholders of the Reading Company, preferred and common, share and share alike, for \$3,600,000, or \$2 for each share of Reading stock. It is proposed to carry out this sale, in accordance with the precedent established by the Union Pacific-Southern Pacific case, by distributing to Reading stockholders, assign-

able certificates of interest in the coal company stock, exchangeable for such stock only when accompanied by an affidavit that the holder is not the owner of any stock of the Reading Company. Any further steps which may be deemed necessary by the court will be taken to the end that an independent board and management to be approved by it will be maintained by the coal company, so that the independence of this company shall not await the necessarily gradual process of distribution of the stock of the coal company among persons not holders of stock in the Reading Company."

The government in a memorandum filed by Assistant Attorneys-General Myers and Nebeker has given its approval to the plan except as to the parts of it relating to the separation of the Reading and Central of New Jersey as above noted and except as to the proposal to convert the stock of the coal company into stock of no par value. Concerning the latter, the government is not altogether satisfied that no other plan is practicable nor is it certain just what the consequences of the proposed plan might be. In general, however, the government is inclined to the view that this is not a matter of consequence as regards the ultimate desire for a complete dissolution between the several corporate defendants, but "at the same time the government cannot refrain from expressing its belief that, if practicable a much better solution would be to secure a fair appraisal of the value of the coal properties and issue capital stock in that amount, and fix the par value per share at an amount which would result in the issuance of a number of shares approximately equal to the number of shares of Reading Company outstanding."

The Reading Company is a proprietary and not a holding company. It owns the entire outstanding capital stock of the Philadelphia & Reading Railway Company, the Philadelphia & Reading Coal & Iron Company, the Philadelphia & Reading Terminal Company, the Reading Iron Company and \$14,504,000 of the outstanding \$27,436,800 stock of the Central of New Jersey, etc. It also owns \$20,000,000 purchase money bonds of the Philadelphia & Reading Railway together with certain real estate, part of which was the property of the old Philadelphia & Reading Railroad Company and rolling stock and floating equipment leased to the Philadelphia & Reading Railway Company. The Central Railroad of New Jersey in turn owns \$8,489,000 of the \$9,212,500 capital stock of the Lehigh & Wilkes-Barre Coal Company.

The Reading Company has stock outstanding amounting to \$70,000,000 common, \$28,000,000 4 per cent first preferred and \$42,000,000 4 per cent second preferred. Of this total of \$140,000,000 stock, over \$60,000,000 is owned by the New York Central and Baltimore & Ohio as follows: Baltimore & Ohio, \$6,065,000 first preferred, \$14,265,000 second preferred and \$10,002,000 common; a total of \$30,332,000; New York Central, \$6,065,000 first preferred, \$10,002,000 second preferred and \$9,852,500 common, a total of \$30,182,500.

The case in connection with which the present dissolution plan was filed, was begun in the form of a bill in equity instituted by the United States government in the district court for the eastern district of Pennsylvania in September, 1913, alleging violations of the anti-trust law, the commodities clause of the Interstate Commerce Act, etc.

In a decision in July, 1915, the court refused to sustain the government's contentions with the exception of that relating to the control of the Lehigh & Wilkes-Barre Coal Company by the Central of New Jersey. The court said, "In the carriage of coal the Reading Railway and Central Railroad are not competitors" yet "they reach the same general field, the same general source of supply and carry a similar article to many of the same markets." The court held "the union of these interests in the holding company

is condemned by the rule laid down in the Northern Securities Case." The court stated, however, that it was not disposed to disturb the ownership of the Reading Company in the Central of New Jersey "unless the friendly and mutually advantageous alliance of the two railroads in this particular (with respect to traffic other than coal), must be destroyed in order to reach the unlawful combination in another particular that would otherwise escape."

The case was appealed to the Supreme Court by the defendant companies and also the government. In its decision on April 26, 1920, adopted by a vote of 4 to 3, the court sustained the government's contention that the Reading Company controls railroads and coal companies in violation of the anti-trust laws, and declared that the Reading Company and its associates constituted a monopoly in anthracite coal and ordered its dissolution. The decree ordered a dissolution of the combination of the Reading Company, the Philadelphia & Reading Railway Company, the Philadelphia & Reading Coal & Iron Company, the Central Railroad of New Jersey, and the Lehigh & Wilkes-Barre Coal Company. The court held that "the great power lodged in the Reading holding company, which is the combination of railroads and coal companies, is a flagrant violation of the anti-trust laws of our country." It further held that the organization of the holding company was an attempt to evade the anti-trust law and the Constitution of Pennsylvania.

The effect of the decision of the Supreme Court was to affirm in part and reverse in part, the decision of the lower court, and to remand the case with a direction to enter a decree in conformity with the opinion. The District Court has affirmed "as to the Lehigh Coal & Navigation Company, the Lehigh & New England Railroad Company, the Lehigh & Hudson River Railway Company as to the restrictive covenant in mining leases with respect to the shipping of coal, as to the dissolution of the combination between the Philadelphia & Reading Coal & Iron Company, and the Lehigh & Wilkes-Barre Coal Company, maintained through the Reading Company and the Central Railroad Company of New Jersey." As to the Wilmington & Northern Railroad Company and as to the individual defendants, the bill was dismissed without prejudice. As to the Reading Company, the Philadelphia & Reading Railway Company, the Philadelphia & Reading Coal & Iron Company and the Central Railroad Company of New Jersey, the decree of the District Court was reversed and the case remanded with direction "to enter a decree in conformity with this opinion, dissolving the combination of the Reading Company, the Philadelphia & Reading Railway Company, the Philadelphia & Reading Coal & Iron Company, the Central Railroad Company of New Jersey and the Lehigh & Wilkes-Barre Coal Company, existing and maintained through the Reading Company, with such provision for the disposition of the shares of stock and bonds and other property of the various companies, held by the Reading Company, as may be necessary to establish the entire independence from that company and from each other of the Philadelphia & Reading Railway Company, the Philadelphia & Reading Coal & Iron Company, the Central Railroad Company of New Jersey and the Lehigh & Wilkes-Barre Coal Company, and also that such disposition shall be made by the decree of the stocks and bonds of the Lehigh & Wilkes-Barre Coal Company, held by the Central Railroad Company of New Jersey as may be necessary to establish entire independence between these two companies to the end that the affairs of all these now combined companies may be conducted in harmony with the law."

Judges Buffington, Woolley and Davis in the U. S. District Court at Philadelphia on October 8, 1920, filed an order fixing 90 days from that date for the filing by the Reading Company of a plan of dissolution in conformity with the decision of the U. S. Supreme Court, but the time was later extended.

# Some Present Day Problems of the Railroads\*

## Magnitude of Railroad Business Difficult to Comprehend— Necessity of Reducing Operating Costs

By Daniel Willard

President, Baltimore & Ohio

THERE ARE MANY PROBLEMS confronting the railroads, and many confronting all of us. The railroad problems are seasonal; they are periodic; and they are economic. I think, however, that the most constant and persistent problem that confronts the railroads at all times, through all seasons and all periods, is the problem that grows out of being misunderstood. The railroads are such a large undertaking and we have to talk in figures that we so little comprehend that this difficulty is ever present.

First of all, we talk about an American railroad system, and there is not any such thing as an American railroad system in the sense that there is an American telephone system, for instance, which has wire communication under the same general control from one part of the United States to another. No one ever visualized the railroads in that sense, because their development has been quite unlike that of the telephone. The railroads helped to develop the country. The telephone came in after the country was developed.

### Billions Are Hard to Comprehend

When we speak of the American railroad system we, of course, have something in mind, and while it is not a concrete system under one control, like the Pennsylvania Railroad, we will say, it is in a general way a system that coordinates with itself, but is made up of more than 1,800 separate and independent companies. Now those 1,800 companies have altogether about 260,000 miles of main line. They own about 2,300,000 freight cars and about 60,000 locomotives, and something like 55,000 cars designed for passenger train service. So far I have been able to discuss the matter and keep within terms of millions. But immediately we begin to discuss the earnings, the costs and performance of the property, we get into terms of billions. But we cannot discuss the railroad problem without talking in billions. For instance, the books of the carriers show that this great property has cost something like twenty billions of dollars to start with. It depresses many people when they think how much money we must have in the property and how much of it probably we did not get properly. It is because the size is so great that that feature is misunderstood in the beginning.

Then we try to talk about the performance of the railroads. Immediately we say they earn six or seven billions of dollars a year and some one says that is as much as the value of all the farm crops in a certain period and consequently there must be something wrong about it. But the railroads not only carry the crops from the farms, but they perform a general service for all the people in the United States that can only be put in concrete terms when we say they carry 448 billions of ton miles a year. No one understands, certainly I do not, what is meant by this figure. I have no definite conception of 448 billions of ton miles. I can put it in another way and comprehend it a little better. For instance, it works out this way: the railroads carry 4,000 tons one mile every year for every man, woman and child in the country. Putting it another way: they carry ten tons 400 miles for each inhabitant of the country. Then in addition to that they carry billions of passenger miles, which no one under-

stands, but again when these passenger miles are resolved into somewhat simpler terms, they are the equivalent of 400 miles of travel annually by every man, woman and child in the country. Now when we consider the amount of traveling for every individual to me it does not seem so unreasonable when it is said the railroads tax each person, if it is a tax, some fifty or sixty dollars a year. My own investigation leads me to think that the people get more for \$50 or \$60 a year which they pay the railroads, than they get from any other concern or undertaking to which they pay money.

The trouble is that we talk in such big figures all the time that no one understands what we are talking about. When we get into billions, millions become minimized. They lose their relative value. To illustrate: I saw not long ago a statement by the statistician of the director general of railroads—he was pointing out the accomplishments of federal control—and he said that one of the outstanding accomplishments was this fact: the director general was able to re-route the business so as to cut out circuitous routes which had saved the movement of 17,000,000 car miles a year. Well, 17,000,000 car miles is a great many car miles to save a year, and if we were in the habit of discussing this problem in terms of millions, no doubt it would have a relative value of some importance, but when you consider that the total car miles which the railways moved in the year was 23,000,000,000, then your 17,000,000 becomes .07 of one per cent.

### The Seasonal Problem

The other problems I have said are seasonal, periodic and economic. Take the seasonal problem. One of them which I call seasonal was the situation that confronted the railroads last summer. We had just come out of a war. There was banked up, so to speak, a great amount of goods to be moved. During the war the government had not been able to keep up increasing the facilities of the railroads. During the war there was a most prodigious increase of all kinds of productive capacity in our country. Farmers cultivated more land, old factories were enlarged, new factories were built, and all that sort of thing; but the railroads stood still. It happened that in spite of the fact that some people said they had broken down, they were, nevertheless, able to move all the things necessary to carry on the war, and consequently nothing was done to increase their facilities—that is to say, nothing of real permanent value.

### Heavy Requirements and a Depreciated Plant

For instance, the director general during the 26 months' period of federal control, bought 100,000 freight cars. Now 100,000 freight cars is a lot of freight cars, but we wear out almost a hundred thousand every year—50,000 anyway—and he bought in the 26 months only what the railroads themselves were in the habit of buying every twelve months. So you can see at the end of the war, after having sustained unusual service, the railroads were not only inadequately equipped, but their equipment was in an impaired condition. I do not speak of that to criticize at all. I am simply telling you the facts so you will understand the situation. When the roads were turned back to their owners on March 1 of last year, the owners of the properties were called upon to perform the largest service of transportation ever performed

\*An address delivered before the annual meeting of the National Civic Federation at New York.

and with this plant which had been allowed to depreciate.

During the war movement of materials for road building, for house building and for other projects not necessary in conducting the war was virtually stopped. When the war was over, everybody wanted to ship all at once. The railroads were confronted with a difficult task and their immediate problem was a very vital one, at least from the standpoint of those who favor the continuation of private ownership and control. So from that point of view, this particular problem developed last spring: Is it possible for 1,800 different railroad companies to so function and work together that they can, under private ownership with government regulation, perform in the aggregate as great an amount of service as they could perform if they were unified under one general manager or director general?

Last summer the roads—the 1,800 separate companies working together in a common interest—appreciated that it was expected of them that they should do as much as had been done with the same plant under government control. The result was that the combined tonnage carried by all the railroads was 448 billion ton miles, as I have stated. The largest sum ever carried before was 440 billions. So the railroads showed that, acting independently under the present law, they could realize the benefits of unified control just as well as they could be realized under government operation, and as a matter of fact within the same period of time and with the same plant, they carried eight billion ton miles more than the plant had ever carried before. Now, that was one of the problems. I think we got away with that problem rather successfully.

#### Today's Problem Concerns Net Earnings

Today the railroads are looking for tonnage to carry. I suppose the business the railroads are carrying today is 30 per cent in volume less than it was last summer. And the problem now is no longer how can we give the maximum service with a given plant, but how can we obtain necessary earnings to maintain the institution of private ownership. That is the problem today. It shifts. The problem is never the same from one time to another, except the difficulty of being understood. That is always there. Today the problem is one of net earnings.

#### Increased Percentage of Gross

##### Earnings Paid for Labor

This matter brings in the cost of operation and leads us immediately to another problem, and a very important one, and that is the labor problem. Now the labor problem is very important with the railroads because so large a part of all the money collected by the railroads is immediately paid out for labor. I suppose at the moment—but I do not know, and neither does any one else know because there are no general figures available at this time—that out of every dollar that the railroads collect at least 60 per cent is being paid out for labor. Before the war that percentage used to vary around 40 to 45. It gradually got up to 60. It is too high. It must come down. Just how it is going to be worked out, I do not know. The railroad rates are as high probably as they ought to be and certainly no one could recommend that they should be raised any more at this time. Still it is a matter of common knowledge that with the rates high as they are, many of the important railroads today are not earning their operating expenses and very few are earning their full interest at the present time.

Now, of course, that cannot go on as a permanent thing and if the rates cannot be increased and the volume of business does not increase, then the cost of doing business must be reduced, or the scheme will fail. I do not think the scheme will fail. I expect business will gradually get some better and finally get back where we would like to see it.

I am not one of those who wants to see conditions back as they were before the war. Take the labor matter. Before

the war, it was generally recognized that railway workmen were relatively not receiving as high wages as workmen in other undertakings. There are reasons for that which I need not go into. But the difference became accentuated as we got into the war. Some of the wages of the workers in effect today—many of them perhaps—will probably have to be readjusted downwards. I do not think that the time has come for that as yet. But there is a matter in connection with the labor of the railroads that is demanding serious thought. During the period of federal control the so-called National Agreements were entered into between the director general and the mechanical crafts.

In the working out of those National Agreements conditions arose which, in my opinion, are not right at the present time—if, indeed, they were ever right. The attitude of the railroads before the Labor Board is that those features in the national contract which have the effect of, we will say, discouraging efficiency—have the effect of paying men for work that is not performed—should be eliminated. It is a general thought, too, that the unskilled laborers upon the railroads are perhaps being paid more now than is justified under all the circumstances, because we must bear this in mind: whatever the wages paid by the railroads are, the public must pay through rates and charges. Not only that: if the public should be willing to maintain a rate of wages that is unreasonably high for a certain class of workmen, then the farmers and other employers of the same kind of labor would be obliged to pay similar wages, and that gets into the cost of living. No one wants to see any workman working for a wage that is not fair and is not reasonable, considering all the circumstances.

We will save a considerable sum of money in the purchase of supplies, the price in that connection having gone down materially in the last two or three months. The railroads are reducing their forces now because it is found with a lesser volume of business that so many men are not necessary, and then the older men who are coming back to their original jobs are more efficient, and fewer men do more and better work. This is enabling the railroads to reduce the labor charge somewhat.

#### Praise for the Transportation Act

Now there is only one other problem I will speak of just now although I might refer to many. That is the problem which must be ever present in the minds of those who favor private ownership and control of the railroads. It is this: does the Esch-Cummins Act make private operation possible? I believe it does. Whether private ownership and operation of the roads continue or not depends upon whether the people want it to continue, and will be satisfied with the service the roads give them. It gets back to the railway managers themselves. If they give the public a service that measurably meets the public requirements, then I believe the public will want private ownership to continue.

I think that perhaps what I have said is sufficient to give an indication of some of the problems that the railroads are trying to overcome at the present time. The most important of all is the difficulty of being understood. The second problem, which is always in reserve, and may be up for discussion at any time, is this: can the railroads, under 1,800 individual companies, co-ordinate their efforts so as to give the maximum service in times of emergency? I say they can because they have. The next is, can they so work out their operations, adjust their costs—labor, material and so forth—so as to live on the rates that the people in this country can afford to pay? At the moment that is our serious problem, but when I reflect that in the past the railroads in this country have paid the highest wages paid by railroads anywhere in the world and at the same time have moved their freight cheaper than it has been moved anywhere else in the world, I cannot help believing that we are going to do it again. I believe we will overcome that problem also.

# General News Department

The Western Railway Club will hold a meeting at the Sherman Hotel, Chicago, on February 21, at which G. M. Basford will address the club on "The Foreman." Motion pictures entitled, "For the Good of the Commonwealth," distributed by the Commonwealth Steel Company, will be shown.

Ten Pullman conductors and three other persons have been arrested at Pittsburgh, Pa., on charges of stealing tickets of the Pennsylvania Railroad. It is said that discovery has been made of large thefts carried out by the conductors in taking up tickets and then, through third parties, having them redeemed as unused.

Governor Miller, of New York, has proposed to the legislature that New York harbor (which is also Jersey City harbor) be controlled, so far as State legislation is concerned, by a governor, or governing board, acting under the joint authority of the two states, New York and New Jersey, and that action be taken at once looking to the necessary agreement or treaty between the states.

W. J. Tollerton, general mechanical superintendent of the Chicago, Rock Island & Pacific and chairman of the Mechanical division of the American Railway Association, has been designated as American reporter to the International Railway Congress to be held at Rome, Italy, in April, 1922, on question No. VII—Passenger Carriages.

A list of other reporters and questions to be reported on appeared in the *Railway Age* of June 18, 1920 (page 1925).

The extinguishment of fires on Pennsylvania Railroad property, in the year 1920, by the fire brigade made up of the company's employees resulted, without doubt, in saving much property which, if dependence had been placed wholly on outside firemen, would have been lost. A record of fires put out with the company's apparatus before the arrival of the city fire department shows a loss of only about one-eighth of 1 per cent of the insurance value of the properties endangered. The number of fires thus extinguished was 223, and the loss amounted to only \$28,725, whereas the property saved had an insurance valuation of \$23,000,000.

Nathan L. Miller, Governor of New York, has proposed to the legislature new statutes radically reorganizing the public service commissions and providing for the relief of the subway and elevated lines in New York City, which are now operating at a loss, the fares being still five cents. The commission for the First District (New York City) would be made one of three members, instead of one member as at present, and would devote itself wholly to matters of "rapid transit." It would have broad powers in the regulation of fares. The commission sitting at Albany (Second District, five members) would regulate all other public service functions throughout the State. It is proposed to make the terms of members fifteen years, so as to minimize political influence.

## Treasury Payments to Railroads

The Treasury Department announced on February 14 that it had paid out \$181,064,637 to railroads for loans from the \$300,000,000 revolving fund; \$262,514,874 for advances on account of the six months guaranty, \$1,311,700 as final payment of the guaranty, and \$841,812 to short lines for reimbursement of deficits during federal control.

## Foreign Trade Convention

The National Foreign Trade Council will hold its eighth national convention at Cleveland, Ohio, on May 4, 5, 6 and 7. The present difficulties of our foreign trade will be discussed at length with a view of surmounting them. Particular attention will be paid to the unfavorable exchange situation and there will be, in addition, group sessions to discuss the various problems of those interested in particular phases of foreign trade.

## Railroad Guaranty Bill in Senate

The Winslow bill, providing for partial payments to the railroads on account of their guaranty for the six months following the termination of federal control, was considered by the Senate committee on interstate commerce in executive session on Wednesday and it was decided to report the bill out at once with the amendment added when it was passed in the House, in lieu of the Townsend bill to accomplish the same purpose. Consideration of the bill in the Senate has been delayed by appropriation bills but it was expected to take it up and pass it on Thursday, probably at a night session, although Senator LaFollette was expected to oppose it. It is not now expected that the other Townsend bill, which is a substitute for Section 10 of the Clayton law, can be put through at this session but it was to be considered by the Senate committee on Friday.

## Hearing on Clayton Law Substitute

A brief hearing was held on February 11 before the House Committee on Interstate and Foreign Commerce on the bill proposed as a substitute for Section 10 of the Clayton law, which was originally introduced by Representative Esch and Senator Frelinghuysen at the request of the Association of Railway Executives, but has been reintroduced by Senator Townsend. It has been favorably reported by the Senate Committee as modified in accordance with suggestions made by the Interstate Commerce Commission. Alfred P. Thom, general counsel for the Association of Railway Executives, and Chairman Clark of the commission advocated the passage of the bill and Chairman Clark urged that, because of the short period remaining of the Congressional session, the form of the Townsend bill be adhered to in the interest of expedition. He pointed out that the provisions of the Clayton law, which have been in effect since January 1, seriously interfere with transactions between railroad companies in a single system and that its application to security issues is inconsistent with the provisions of the transportation act which give the Interstate Commerce Commission complete jurisdiction over security issues.

## Reduction of Rates and Wages Proposed in Congress

Representative Black of Texas on February 14 introduced in Congress a joint resolution directing the Railroad Labor Board to make further investigation of wages and salaries paid to railway employees under its decisions of July, 1920, and to make such changes and modifications in such decisions as it may determine are justified in the public interest and will at the same time award railroad employees just and reasonable wages. Mr. Black also introduced at the same time another joint resolution directing the Interstate Commerce Commission to review its decision of July 29, 1920, which allowed increased rates under section 15-a of the interstate commerce act, and to make such reductions, if any, in such rates as it may find to be just and reasonable. The resolutions were referred to the committee on interstate and foreign commerce. Mr. Black had previously made a speech in the House in which he asserted that railroad rates are now too high, but that they were necessitated by the increases in railroad wages made during the period of federal control and last year. He expressed the opinion that to get back to normal the question of rates and wages should be considered together.

Senator Trammell of Florida has also introduced a resolution in the Senate directing the Interstate Commerce Commission to investigate the present high freight rates on citrus fruits, vegetables and other perishable farm products with a view to bringing about early legislation that will result in a reduction of the existing rates on such products.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF DECEMBER AND TWELVE MONTHS OF CALENDAR YEAR 1920

Table with columns: Name of road, Average mileage during period, Operating revenues (Total, Passenger, Freight, Mail, Express, etc.), Maintenance of way and equipment, Trans-shipment, Traffic, Operating ratio, Net railway income, Net operating income (after rentals, less), and Increase (decrease) comp. with last year.

### Civil Service Openings for Engineers

The United States Civil Service Commission announces an open competitive examination for senior mechanical engineers. Grade 1, salaries \$3,000 to \$5,000. A vacancy in the Bureau of Locomotive Inspection and vacancies in positions requiring similar qualifications at salaries ranging from \$3,000 to \$5,000 will be filled from this examination. Applications should be made on form 1312, which must be filed with the Civil Service Commission, Washington, D. C., not later than March 29.

### December Earnings

The net operating income of 188 roads that have thus far reported to the Interstate Commerce Commission for December amounts to only \$14,807,000. On this basis the net operating income of all the roads could hardly exceed \$20,000,000, whereas to earn 6 per cent on the valuation used by the Interstate Commerce Commission in the rate case the December net operating income should have been approximately \$86,000,000. The returns available cover an average mileage of 215,000. The 188 roads had total operating revenues amounting to \$482,000,000, which was an increase of 21.6 per cent as compared with December, 1919. Their operating expenses were \$437,000,000, an increase of 20.2 per cent, and the net operating income represents an increase of 43.3 per cent as compared with December, 1919. The railroads reporting for the Eastern district had a net operating income of only \$1,660,000, those for the Southern district \$7,547,000 and those for the Western district \$5,599,000. The Western roads had earned over \$8,000,000 in December, 1919, but the roads in the other two districts made a better showing in 1920 than in 1919.

### Hoover Appoints Committee on Waste

At the meeting of the executive board of American Engineering Council at Syracuse, N. Y., on February 14, Herbert Hoover announced the personnel of the Committee on Elimination of Waste. This is a continuation of the movement started by Mr. Hoover when he was elected president of American Engineering Council. The main points of his plan were outlined in his speech before that body at Washington, D. C., and appearing on page 933 of the November 26, 1920, issue of the *Railway Age*. The men composing the committee are representative of managerial, consultant, educational, editorial and other activities. The committee is as follows: J. Parke Channing, New York, chairman; Dr. Ira N. Hollis, Worcester, Mass.; L. W. Wallace, Baltimore, Md.; H. R. V. Scheel, Passaic, N. J.; L. P. Alford, New York; George D. Babcock, Peoria, Ill.; F. G. Coburn, Bethlehem Shipbuilding Company; Morris L. Cooke, Philadelphia, Pa.; Harrington Emerson, New York; E. E. Hunt, New York; C. E. Knoepfel, New York; Robert Linton, Fred J. Miller, J. H. Williams, New York, and Robert B. Wolf, New York. Mr. Hoover is also a member of this committee.

The council gave formal approval to the action of the committee on procedure requesting that President Harding put an engineer on the Interstate Commerce Commission. The procedure committee was authorized to name six qualified engineers when requested to do so. It was recommended that engineering efforts be extended to the whole question of government reorganization planned under a special congressional committee. The plan for the registration of engineers as presented in the council's report was endorsed and the appointment of another committee was authorized. The Russian Affairs committee was made a new committee on International Relations, the personnel of the old committee being retained. The council decided to recommend to President Harding that an engineer be appointed assistant secretary of war.

While other problems came up at this meeting, such as the betterment of patent office conditions by the passage of the Nolan bill and the establishment of a National Department of Public Works, the work of the meeting was confined chiefly to organizing and getting under way its first big task, that of eliminating economic waste. L. W. Wallace, Philadelphia, Pa., was elected permanent executive secretary and will have full charge of the New York and Washington office of the society. The April meeting of the board will be held in Philadelphia.

## Traffic News

A permanent injunction restraining the state of Illinois from interfering with the collection by the railroads of the increased passenger rates was granted by the United States District Court of Appeals at Chicago on February 15.

Postmaster General Burleson has asked Congress for an additional deficiency appropriation of \$1,900,000 for the increased railway mail rates for the four months ending June 30, 1920. He had previously obtained an appropriation of \$8,000,000 for the period based on an estimate.

At the transportation discussion held by the Traffic Club of Chicago on February 15, H. C. Barlow, R. C. Ross, J. J. Pelley and Samuel O. Dnnn addressed the club on the subject of "Railroad Consolidations." Mr. Pelley, a member of the Car Service Commission, discussed the terminal feature of this problem.

The Miami Valley Traffic Club was organized at Dayton, Ohio, on January 25, with a membership of 175. A governing board was elected and on February 7 this board elected officers for the club as follows: W. E. Boyer, district representative, Pennsylvania Lines, Dayton, president; T. T. Webster, traffic manager, G. H. Mead Company, Dayton, vice-president; F. L. Marshall, traffic manager, Pioneer Pole & Shaft Company, Piqua, Ohio, second vice-president; H. T. Ratliff, traffic manager, Champion Coated Paper Company, Hamilton, Ohio, third vice-president; R. B. Mann, fourth vice-president; Maurice T. Otto, traffic manager, Dayton Chamber of Commerce, secretary; and R. H. Hagerman, treasurer.

### American Railway Association—Traffic Division

J. E. Fairbanks, General Secretary, announces that the Traffic Division of the American Railway Association has been reorganized and that the membership of the General Committee is as follows:

Representing Traffic Executive Committee, Eastern Territory.—G. H. Ingalls (N. Y. C.); G. D. Dixon (Penn.); Gerrit Fort (B. & M.); F. Zimmerman (C. I. & L.).

Representing Western Traffic Executive Committee.—L. J. Spence (S.P.); H. M. Adams (U. P.); S. G. Lutz (C. & A.); C. E. Perkins (M. P.).

Representing Executive Committee, Southern Freight Rate Association.—Lincoln Green (Southern); R. A. Brand (A. C. L.); J. L. Edwards (A., B. & A.); F. B. Bowes (Ill. Cent.). G. H. Ingalls is chairman, and J. Gottschalk, secretary, with headquarters at 143 Liberty Street, New York City.

### Iowa Legislature Objects to I. C. C.

#### Jurisdiction Over State Rates

Senator Kenyon of Iowa has presented to the Senate a concurrent resolution adopted by the Iowa legislature calling upon Congress "to so amend the transportation act and in such plain language that the authority of the states over intrastate traffic in their respective territories will be maintained without an opportunity for misrepresentation." The resolution says that the Interstate Commerce Commission in its recent decision in the Illinois case interprets the transportation act as giving it "complete authority over the railroads, the entire field of transportation, the traffic itself and of the instrumentalities and means of carrying it on." This, the resolution declares, means that "the laws of the states and their officers are defied and that the federal commission has assumed exclusive authority over the railroads." It is declared that the freight and passenger rates are already burdensome to the producers and consumers, "with the likelihood that the railroads will ask for further increase in rates, with no consideration apparently having been given in the recent raise in rates to the low cost of construction and operation in the prairie states."

## Equipment and Supplies

### Locomotives

THE KOPPERS COMPANY, Pittsburgh, Pa., is inquiring for 2 locomotives.

THE TEXAS-MEXICO is inquiring for some 0-6-0 and 4-6-0 type locomotives, to be equipped for burning oil.

### Freight Cars

THE WAH CHANG TRADING CORPORATION, Woolworth building, New York, has ordered 20 flat cars of from 12 to 15 tons capacity, from the Magor Car Company, for export to Hong Kong, China.

### Iron and Steel

THE LOS ANGELES & SALT LAKE is inquiring for 10,000 tons of rails.

THE GREAT NORTHERN has ordered 11 plate girder spans with a total of 367 tons of steel, from the Wisconsin Bridge & Iron Company.

### Railway Construction

AHUKINI TERMINAL & RAILWAY COMPANY.—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a narrow gage line on the Island of Kanae, Hawaii.

ATCHISON, TOPEKA & SANTA FE HOSPITAL ASSOCIATION.—This company is asking for plans and specifications for a 100-room modern hospital, with two stories and basement and a separate building for a nurses' home at Albuquerque, New Mexico. Dr. J. P. Kaster, Topeka, Kan., is chief surgeon.

CHICAGO UNION STATION.—This company is accepting bids for the construction of a new railway mail terminal between Harrison and Van Buren streets and the Chicago river, Chicago.

GREAT NORTHERN.—This company, which was noted in the *Railway Age* of January 28 (page 308), as accepting bids for the erection of a 500-ton frame coaling station at Troy, Mont., has awarded the contract for this work to the Howlett Construction Company, Moline, Ill.

LOUISVILLE & NASHVILLE.—This Company has awarded a contract to the Union Bridge & Construction Company, Kansas City, Missouri, for the construction of foundations and masonry for a bridge across the Alabama river near Montgomery, Ala.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—This company contemplates the construction of a brick passenger station and a new freight house at Menasha, Wis., at an estimated cost of approximately \$100,000.

MISSOURI, KANSAS & TEXAS.—This company is making location surveys for the line it contemplates building from Austin, Tex., to San Marcos, a distance of 31 miles.

MISSOURI, KANSAS & TEXAS.—This company, which was announced in the *Railway Age* of February 4 (page 349), as accepting bids for the construction of a reinforced concrete inbound freight house at Dallas, Tex., with dimensions 50 ft. by 600 ft., with a second story office, 50 ft. by 100 ft., to cost about \$350,000, has awarded the contract for this work to Hickey & Montgomery, Dallas.

OREGON SHORT LINE.—This company contemplates the construction of a new timber-treating plant at Pocatello, Idaho.

THE REGAN AUTOMATIC TRAIN STOP has been tried on the State Railroad of France, under the direction of Joseph Beaumont, chief engineer of the Regan Company.

## Supply Trade News

A. E. Brown has been appointed general manager of the railroad department of the **Truscon Steel Company** with headquarters at 22 W. Monroe Street, Chicago.

H. A. Kuehle, who has been engaged in the sale of power apparatus for the **Western Electric Company**, has been placed in charge of railroad sales in the Cleveland office. Mr. Kuehle graduated from the Case School of Applied Science in 1904 and has been with the Western Electric Company since 1914.

Harry L. Oviatt, has been appointed travelling representative of the **Armstrong Manufacturing Company**, Bridgeport, Conn., manufacturers of pipe threading tools and taps. Mr. Oviatt has been with the Bullard Machine Tool Company, Bridgeport, for the past 13 years; for the last 3 years connected with its advertising department.

Alexander England, who has been appointed chief engineer of the **Westinghouse Air Brake Company**, Wilmerding, Pa., as was announced in the *Railway Age* of February 11, has been

A. England

a member of the Air Brake organization for the past 22 years, and since 1914 he has served as assistant chief engineer. Mr. England was born in Dundee, Scotland, and was indentured at an early age with the Scotch firm of Pierce Brothers, engineers and shipbuilders, to serve an apprenticeship in marine engineering. After having completed his apprenticeship and finished a course of study that earned him a diploma in mechanical engineering from the City and Guilds of London Technical Institute, he entered the service of the Mercantile Steamship Company of London as an engineer in the Mediterranean and Black Sea trade. In 1887 he left the marine service and went to Pittsburgh, Pa., where he took a position as assistant superintendent of the firm of Thomas Carlin's Sons, manufacturers of hoisting engines, brick plant machinery, etc. Later he became superintendent of the Specialty Manufacturing Company, Allegheny, engaged in general machine building. He then went to the Jones & Laughlin Steel Company to assist in the reconstruction of the Eliza furnace plant at Pittsburgh, as engineer in charge of designs for special machinery and equipment for the handling of coal and coke. In 1898 he went to the Westinghouse Air Brake Company to take up special work under the chief engineer, and he has been in the service of the company continuously since that time. He was made chief draftsman in 1905, and remained in that capacity until 1914, when he was appointed assistant chief engineer.

P. F. Merritt, formerly assistant to purchasing agent, Central region of the Pennsylvania Railroad, in charge of coal purchases, has been elected vice-president of the Eastern Fuel Company, affiliated with the American Coke Corporation, the Georges Creek Coal Mining Company and the Reilly-Peabody Fuel Company. Mr. Merritt's headquarters are at the general offices of the company, Pittsburgh, Pa.

Max Grant, who has been associated with the Tropical Paint & Oil Company, Cleveland, Ohio, has been appointed manager of technical railway sales, of the **Glidden Company**,

Cleveland, and **M. F. Emrich**, formerly vice-president and general manager of the Campbell Paint & Varnish Company, St. Louis, a subsidiary of the Glidden Company, has been appointed general sales-manager of the industrial division of the Glidden Company, with headquarters at Cleveland.

**N. B. Payne & Co.**, 25 Church street, New York, dealer in electric cranes and hoists, has extended its lines of material handling machinery to include the portable conveyors of the A. C. Warner Company, Philadelphia, Chicago Automatic Conveyor Company's coal elevators and the McKinney-Harrington Company's package pilers and car loaders. **Edmund Otto**, for several years secretary of the Hardware & Supply Company and prior to that associated with Manning, Maxwell & Moore, Inc., New York, is now associated with N. B. Payne & Co., in this branch of its business.

**George J. Blanton**, who for the past 4 years has been connected with the engineering sales department of the **Chain Belt Company**, Milwaukee, Wis., has been appointed New York district manager for this company. Mr. Blanton entered the service of the Chain Belt Company in 1917, previous to which he had been, for 8 years, with the General Electric Company, 3 years of which were spent in Schenectady, N. Y., and 5 in the Milwaukee office. Mr. Blanton is a graduate of the University of Michigan, College of Mechanical and Electrical Engineering, class of 1909.

At the annual election of officers of the Concrete Mixer Association of the United States, held at Chicago on January 28, Clifford S. Messinger, general sales manager of the Chain Belt Company, Milwaukee, Wis., was elected president; W. B. Knickerbocker, of the Knickerbocker Company, Jackson, Mich., was elected vice-president and A. T. Scannell of the Archer Iron Works, Chicago, was elected treasurer. H. E. Smith, president of the T. L. Smith Company, Milwaukee, Wis., was made chairman of the executive committee, while P. A. Koehring, secretary of the Koehring Machine Company, Milwaukee, Wis., and Z. W. Carter, sales director of the Austin Machinery Corporation, Chicago, were elected members of the executive committee.

Successful operation during the past year, under the Webb-Pomerene act, is reported by the Locomotive Export Association, New York City, in its annual report to the Federal Trade Commission. Large foreign orders were secured in Belgium and Roumania, and executed at the American plants which are members of the association. The report states that: "We believe the arrangement under which the Locomotive Export Association has been operating proved of decided advantage to the locomotive building industry, and is likely to be of still greater advantage when the locomotive builders of the United States will have to face the keen competition of European builders, which is already making itself manifest in South America and in the Far East."

"Before the war, Great Britain and Germany controlled the European locomotive market," the Commission says in a press notice in this report. "But in recent years the United States has been the only country prepared to ship locomotives in quantity, and our industry has made rapid strides. Total exports of steam locomotives from the United States in the year 1920 numbered 1,711, valued at \$53,629,847, showing an increase over the exports in 1919, which were 959, valued at \$30,275,728."

### Locomotive Superheater Company Takes Over Locomotive Feed Water Heater

The Locomotive Superheater Company, New York, has acquired the patents and business of the Locomotive Feed Water Heater Company, also of New York. Feed water heating and superheating have many factors in common, and logically the former can best be perfected by a combined organization broadly experienced and trained in this field. During the past few years remarkable progress has been made in successfully adapting feed water heaters to locomotives, and if the thermal efficiency of the locomotive is to be further increased the development of the feed water heater should be conducted with a full knowledge of the engineering features of the superheater.

The Locomotive Superheater Company will conduct the further

application of the apparatus for preheating feed water through its regular engineering, inspection and service organizations, to which has been added the operating organization of the Locomotive Feed Water Heater Company. This consolidation of resources and effort promises more intensified development and better service to the railroads.

### Baldwin Locomotive Works

The annual report of the operations of the Baldwin Locomotive Works for the year ended December 31, 1920, issued on Tuesday of this week shows that the company made a net profit for the year after Federal taxes and charges of \$4,428,518. After the deduction of the preferred dividends of \$1,400,000, there was a balance of \$3,028,518, equal to \$15.14 a share on the \$20,000,000 common stock as compared with \$4,376,243, or \$21.88 a share in 1919.

The gross sales for the year were \$73,542,666 as compared with \$84,307,776 in 1919 and \$123,179,251 in 1918. The profit in 1920 after the deduction of manufacturing costs, the addition of other income and the deductions of taxes, other than Federal taxes, etc., was \$8,407,269 as against \$8,871,243 in 1919. From this profit there was deducted in 1920 an amount of \$1,100,000 for Federal taxes and \$2,878,751 representing the entire manufacturing profit on the company's credit sales for the year. The item of \$1,100,000 for Federal taxes is the smallest for several years—deductions for this purpose in 1919 being \$3,095,000 and in 1918 \$12,509,817. Dividends on the common stock were paid at the rate of 7 per cent amounting to \$1,400,000. The total paid out in dividends in 1919 was \$700,000 and in 1918 and 1917 no common dividends were paid.

The consolidated balance sheet of the Baldwin Locomotive Works and Standard Steel Works Company as of December 31, 1920, follows:

Assets	Liabilities
Bald. Loco., 1920, real estate, etc. .... \$27,439,263	B. L. pf. stock..... \$20,000,000

### Obituary

**Raymond H. Pilson**, third vice-president of The Ajax Metal Company, Philadelphia, Pa., died on February 4.

**C. B. Schoenmehl**, president and treasurer of the Waterbury Battery Company, Waterbury, Conn., died at his home in Waterbury on February 14.

### Trade Publications

LOCOMOTIVE CRANES, CRAWLER CRANES AND CRAWLER SHOVELS.—Victor R. Browning, Cleveland, Ohio, has issued three eight-page bulletins describing the line of cranes and shovels and drag-line excavators manufactured by that company. The superstructure of these cranes may be mounted on double trucks or single trucks for operation on standard gage railway tracks or on caterpillar travelers. The use of grab buckets, shovel buckets and drag-line excavators is also illustrated.

BROWNLEE & GREEN, LTD., Manchester, England, have recently reprinted an article by David Brownlie entitled "Exact Data on the Performance of Steam Boiler Plants, Average Figures for the Performance of Some Different Types of Steam Boilers." The author points out that the figures usually taken in practice are entirely erroneous and presents data obtained as a result of investigations during ten years of nearly 500 boiler plants, giving the average figures for different types of boilers.

## Railway Financial News

**BOYNE CITY, GAYLORD & ALPENA.**—*Authority to issue notes.*—This company has been authorized by the Interstate Commerce Commission to issue from time to time within two years, short term promissory notes to the amount of \$250,000, payable within two years with interest at 7 per cent, to secure loans to pay maturing short term loans, interest on funded debt, obligations for equipment, taxes and payments on interchange roads.

**CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.**—*Authority to issue notes.*—This company has been authorized by the Interstate Commerce Commission to issue its 6 per cent promissory note for \$1,000,000 in renewal of a note of like amount to the Chicago & North Western and to repledge \$1,200,000 of debenture gold bonds as security therefor.

**CENTRAL OF NEW JERSEY.**—*Delayed dividend declared.*—A decree filed by Judges Buffington, Woolley and Davis in the Federal District Court at Philadelphia relative to the Lehigh & Wilkes Barre Coal Company (see article entitled Reading Dissolution Plan Filed at Philadelphia, on another page), reads in part as follows:

"It is hereby ordered adjudged and decreed that the decree heretofore entered in this suit and the injunction issued pursuant thereto be and hereby are modified so as to permit the Central Railroad of New Jersey to collect and receive any dividends upon the stock of the Lehigh & Wilkes Barre Coal Company owned by it which have been or may be declared previous to the disposal thereof, pursuant to the directions of this court."

Acting in pursuance of this order the directors have declared the semi-annual dividend of \$2 per share, payable February 25 to holders of record February 23. The postponement of the dividend was noted in the *Railway Age* of December 31, 1920, page 1182.

**DELAWARE & HUDSON.**—*Authority to issue stock.*—This company has been authorized by the Interstate Commerce Commission to issue not to exceed \$9,634,000 of common stock to be used for the conversion of its 5 per cent, 20-year convertible gold bonds.

**GREAT NORTHERN.**—*New Directors.*—W. P. Kenney, of St. Paul, Minn.; E. E. Loomis, president of the Lehigh Valley; Nicholas Terhune and H. F. Smith, of New York, have been elected directors to succeed A. D. Thompson, deceased, of Duluth, Minn.; J. E. Reynolds, A. B. Hepburn and Seward Prosser, of New York. The three last named were compelled to resign because of Section 10 of the Clayton Act.

**HOCKING VALLEY.**—*Authority to issue bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$2,037,000 of its general mortgage bonds and to pledge \$2,220,000 of its general mortgage bonds with the Secretary of the Treasury as security for a loan from the United States.

**ILLINOIS CENTRAL.**—*Authority to pledge bonds as security for loans.*—This company has been authorized by the Interstate Commerce Commission to pledge from time to time \$20,234,000 refunding mortgage 4 per cent gold bonds as security for the payment of current short term loans. Authority was also granted to issue \$3,708,000 Illinois Central and Chicago, St. Louis & New Orleans joint first refunding mortgage bonds to reimburse the treasury of the Illinois Central for advances made for additions and betterments to the property of the Chicago, St. Louis & New Orleans and the Canton, Aberdeen & Nashville, and to pledge the bonds as security for short term loans of the Illinois Central.

**ILLINOIS SOUTHERN.**—*Sale and reorganization.*—See Missouri-Illinois Railway.

**MISSOURI-ILLINOIS.**—*Application for purchase of another line.*—This company has applied to the Interstate Commerce Commission for an order authorizing the purchase and operation of the railroad and other property of the Illinois Southern Railway to be operated in conjunction with the Mississippi River & Bonne Terre Railroad.

**MISSOURI, KANSAS & TEXAS.**—*Reorganization plan.*—J. & W. Seligman and Hallgarten & Co., will proceed with the reorganization plan for this company without waiting for the approval of the Dutch bondholders. It is expected that the plan will be filed with the Interstate Commerce Commission within the next two weeks.

**MOBILE & OHIO.**—*Authority to pledge bonds as security for notes.*—This company has been authorized by the Interstate Commerce Commission to repledge \$500,000 of St. Louis Division 5 per cent gold bonds as security for a loan or loans to be represented by short term notes of less than two years' maturity.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.**—*Authority to issue bonds.*—This company has been authorized by the Interstate Commerce Commission to sell \$495,000 of first consolidated mortgage 5 per cent gold coupon bonds now in its treasury, for the purpose of reimbursing the latter for moneys expended in retirement of underlying bonds.

**NORFOLK SOUTHERN.**—*Loan approved.*—The Interstate Commerce Commission has approved a loan of \$311,000 to aid this road in providing itself with equipment and in making additions and betterments to ways and structures at a total estimated cost of \$622,000. The carrier itself is required to finance about \$311,000 to meet the loan of the government.

**NORFOLK SOUTHERN.**—*Authority to pledge bonds and notes as security for loan.*—This company has been authorized by the Interstate Commerce Commission to issue and pledge \$222,000 of first lien equipment notes and \$200,000 of first and refunding mortgage 50-year gold bonds with the Secretary of the Treasury as security for a loan of \$311,000.

**PEARL RIVER VALLEY.**—*Authority to issue notes.*—This company has been authorized by the Interstate Commerce Commission to issue promissory notes for \$25,000 to be dated as of November 3, 1920, and \$111,400 to be dated as of the date of issue, to take up outstanding notes, to cover open accounts and to provide funds for construction work in progress.

**PITTSBURGH AND LAKE ERIE.**—*Authority to issue notes.*—This company has been authorized by the Interstate Commerce Commission to issue \$750,000 of six months, 6 per cent promissory notes, dated February 4, 1921, and a similar amount to be dated February 26, 1921, in renewal of notes for like amounts to the Union Trust Company of Pittsburgh.

**READING COMPANY.**—*Protective Committee for Preferred Stockholders.*—A protective committee composed of Adrian Ilesin, R. B. Dodson, trustee of the J. A. Garland estate; E. G. Merrill, president of the New York Life Insurance & Trust Company, and W. A. Law, president of the First National Bank of Philadelphia, all of whom hold or represent substantial amounts of the first and second preferred stocks of the Reading Company, has been formed to protect the rights of the holders of these issues in the forthcoming Reading reorganization. See article on another page of this issue entitled "Reading Dissolution Plan Filed at Philadelphia."

**SOUTHERN.**—*Authority to issue bonds.*—This company has been authorized by the Interstate Commerce Commission to issue and sell at not less than 80 per cent of par and accrued interest \$950,000 of first consolidated mortgage 5 per cent bonds maturing July 1, 1924, for the purpose of retiring a like amount of Virginia Midland serial mortgage 5 per cent bonds, maturing March 1, 1921.

**WISCONSIN & NORTHERN.**—*Authority to issue notes.*—This company has been authorized by the Interstate Commerce Commission to issue and renew short term notes to the amount of \$500,000.

### Dividends Declared

**CANADIAN PACIFIC.**—Common, 2½ per cent, quarterly; preferred 3 per cent, semi-annually; both payable April 1 to holders of record March 1.

**CENTRAL OF NEW JERSEY.**—2½, semi-annually, payable February 25 to holders of record February 23.

**CINCINNATI NORTHERN.**—3 per cent, annually, payable March 1 to holders of record February 21.

**CRIPPLE CREEK CENTRAL.**—Preferred, 1 per cent, quarterly, payable March 1 to holders of record February 15.

**READING COMPANY.**—2nd preferred, 1 per cent, quarterly, payable April 14 to holders of record March 28.

**SOUTHERN PACIFIC.**—\$1.50, quarterly, payable April 1 to holders of record February 2.

**USON PACIFIC.**—Common, 2½ per cent, quarterly; preferred, 2 per cent, semi-annually; both payable April 1 to holders of record March 1.

## Railway Officers

### Executive

**W. H. Ogborn** has been elected president of the Dayton, Toledo & Chicago with headquarters at Dayton, Ohio, succeeding John Ringling.

**S. E. Cleage**, general manager of the Knoxville, Sevierville & Eastern, with headquarters at Knoxville, Tenn., has been appointed receiver, with the same headquarters, effective Feb. 1.

### Financial, Legal and Accounting

**J. H. Lane** has been elected secretary of the Dayton, Toledo & Chicago succeeding Richard Fuchs.

**Parks C. Archer**, assistant general claim agent of the Chicago & Alton, with headquarters at Chicago, has been promoted to general claim agent, succeeding J. H. Howard, who has resigned, effective January 20. He was born in Warren County, Mo., on May 2, 1877, and was on the editorial staff of a newspaper at Hannibal, Mo., before engaging in railroad work. He entered railroad service on July 1, 1905, as chief clerk to the district claim agent on the Illinois Central at Memphis, Tenn. A few months later he was promoted to division claim agent and served in that capacity until March 15, 1909, when he was appointed division claim agent on the Chicago & Alton, with headquarters at Mexico, Mo. In September of the same year, he was transferred to Chicago. On November 1, 1912, he was appointed chief clerk to the land, tax and claim agent. Mr. Archer had been serving as assistant general claim agent since February 1, 1917. During the war he was appointed acting general claim agent of the Chicago & Alton, the Chicago, Peoria & St. Louis, the Peoria & Pekin Union, and the Peoria Railroad Terminal Company.

P. C. Archer

this capacity, he was made auditor of disbursements. He was holding this position at the time of his recent promotion.

### Operating

**C. B. Gorsuch** has been appointed superintendent of the Wheeling division of the Baltimore & Ohio with headquarters at Wheeling, W. Va., effective January 1, succeeding E. V. Smith, deceased.

**C. F. Urbutt**, assistant superintendent of the Iowa and Dakota divisions of the Chicago, Milwaukee & St. Paul with headquarters at Chamberlain, S. D., has been appointed trainmaster of the Iowa division with headquarters at Perry, Ia., succeeding F. A. Maxwell who has been transferred to Madison, Wis., effective February 15.

### Traffic

**H. L. Purdy** has been appointed division passenger agent on the Wabash, with headquarters at Buffalo, N. Y., effective February 10.

**J. M. Horn**, general freight agent of the Canadian National with headquarters at Winnipeg, Man., has been transferred to a similar position at Vancouver, B. C., with supervision over the territory from Lucerne, B. C., west, including the Grand Trunk Pacific Coast Steamship Company, succeeding A. Brostedt, temporarily assigned to other duties.

### Mechanical

**O. C. Cromwell** has been appointed assistant to the chief of motive power and equipment of the Baltimore & Ohio with headquarters at Baltimore, Md., effective February 1.

**E. E. McGann** has been appointed master mechanic of the Pittsburgh division of the Baltimore & Ohio with headquarters at Glenwood, Pa., effective February 1, succeeding W. C. Burel, resigned.

**E. R. Lewis**, editor of the Maintenance of Way Cyclopedia, one of the publications of the Simmons-Boardman Publishing Company, has been appointed office engineer of the Michigan Central with headquarters at Detroit, Mich., effective February 15.

**J. E. Gould**, master mechanic of the Charlotte Harbor & Northern with headquarters at Arcadia, Fla., has been appointed master mechanic of the Cumberland & Manchester with headquarters at Barbourville, Ky. **F. S. Markett** has succeeded Mr. Gould at Arcadia.

**G. W. Ray**, master mechanic on the Western division of the Chicago & Alton, with headquarters at Slater, Mo., has been transferred to the Northern and Southern divisions, with headquarters at Bloomington, Ill., succeeding M. J. McGraw, who has resigned, effective February 1. **F. Stone** succeeds Mr. Ray.

### Obituary

**F. C. Donald**, commissioner of the Central Passenger Association with headquarters at Chicago, died February 14 at his home in Hubbard Woods, Ill.

**E. S. Draper**, principal assistant engineer of the Boston & Albany, died at his home in Boston, Mass., on February 6. Mr. Draper was born at Wayland, Mass., on February 19, 1883. After attending the public schools at Wayland he entered Tufts College and was graduated with the class of 1904. In January of the following year he entered the service of the Boston & Albany as a rodman and subsequently served the company in various capacities in the engineering department until March, 1912, when he resigned to become a draughtsman for the Stone & Webster Corporation at Boston. In April, 1913, he re-entered the employ of the Boston & Albany as assistant engineer and was appointed engineer of structures in January, 1918. In May, 1920, he was promoted to principal assistant engineer in which capacity he was serving at the time of his death.

**Alfred Hermany**, whose promotion to assistant general auditor of the Chicago, Rock Island & Pacific, with headquarters at Chicago, was announced in the *Railway Age* of February 11 (page 393), was born at Philadelphia, Pa., on August 29, 1869, and entered railway service in 1884. His first assignment was in the operating department of the Philadelphia & Reading and he later served in the office of the auditor of receipts. He left the service of the Philadelphia & Reading in 1887 to accept employment in the traffic department of the Star Union Line at Philadelphia. In 1891, Mr. Hermany assumed charge of traffic matters on the Pacific Coast Railroad, but after a year of service with this company he was appointed secretary to the president of the Spokane Falls & Northern. He was promoted to assistant auditor of this road in 1895, and four years later was made auditor and assistant manager of the Pacific & Idaho Northern. Mr. Hermany came to the Chicago, Rock Island & Pacific as a clerk on June 22, 1903, and was shortly promoted to chief clerk to the controller. In 1905, he was appointed auditor of passenger traffic, and after seven years of service in

Only a few months ago operating officers were exerting every effort to move the traffic which was threatening to overwhelm them. Campaigns were being conducted to load more tons per car, to move cars more miles per day and otherwise to increase the amount of freight which could be handled.

### A Problem of Another Character

Within the last three months the traffic has declined so rapidly that operating officers are now hard pressed to re-adjust their organizations and methods to bring their expenditures within the greatly reduced revenues. This problem has developed with startling rapidity and is of at least equal difficulty in solution. It may be academic to say that these conditions require operating officers to scrutinize every detail of their operation from a new viewpoint to ascertain wherein their methods may be revised to meet these new and changed conditions. The situation is so acute that no officer can afford to overlook any detail which may help in bringing his costs into conformity with his revenues.

Serious delays often occur to freight trains after they have been made up because of poor facilities for the delivery of running orders to the train crew preliminary to their departure. Oftentimes delays are occasioned by the necessity for the conductor's walking some distance for orders and then back to his train. Very often such a delay will upset a despatcher's lineup and cause a number of trains to lose considerable time at meeting points. In order to overcome this condition, one road has installed telephones, connected to the despatcher's circuit, at the outgoing ends of certain busy yards so that when a train is made up and ready to leave the conductor can communicate directly with the despatcher who gives him his running orders. The conductor copies these orders and deposits one copy in a locked box provided for that purpose after the order is completed. Serious delay is avoided and the despatcher has a better opportunity to handle train movements more efficiently. These telephones can be installed at slight expense, and in connection with automatic signals will contribute to more expeditious train movements.

### Bettering Train Movements By Telephone

With printed bulletins containing reports of seventeen committees in the hands of the members, the opportunity for a thorough discussion of the committee work at the twenty-second annual convention of the American Railway Engineering Association is assured.

### Getting Ready for the Convention

Those who attended the meeting last year will recall that many who took part in the discussion confessed a lack of thorough preparation owing to the fact that the bulletins did not reach their hands until just before the convention. This criticism will not apply to the meeting to be held next month since the bulletin containing the first three reports was issued early in December and three others have followed at regular intervals so that all but seven committee reports are now in bulletin form. Owing to the fact that responsibility for a considerable portion of the delay

last year can be laid at the door of the printer rather than that of the association, the latter cannot claim full credit for this improvement in the convention preparations although much of it unquestionably has resulted from the efforts of the officers and directors in pressing the work of the various committees. Be that as it may, the prompt appearance of the bulletins should be an important factor in bringing about a successful convention.

The South African Railways are advertising in this country, through the High Commissioner at London, for bids covering the electrification of two sections of their lines, as is announced elsewhere in this issue. One of the projects involves the line from Capetown to Simonstown. It is understood that this

### South African Electrification Bids

improvement will be primarily to relieve congestion in the suburban district around Capetown. The other section to be improved lies between Durban, on the east coast, and Pietermaritzburg, a short distance in the interior. This second project is said to be for the purpose of securing a more economical operation of freight traffic over heavy grades. Both installations may be regarded, however, as largely experimental. The railway management will have the opportunity to study the results of electrification in the two situations where thus far it has been most generally used, i. e., in suburban service and on heavy grades. If the original installations prove their value there is hardly any doubt that the program will be extended, particularly on some of the heavy grades which are so numerous in South Africa. It is well known that there is a considerable factor of inertia in any market. If buyers begin purchasing from a certain group of manufacturers and the goods they buy are satisfactory, other conditions remaining the same, the market will tend to favor the original source of supply. It is to be hoped, therefore, that American concerns will succeed in securing contracts for at least a satisfactory portion of the materials and equipment for the electrification. The fact that the railways are advertising in this country is a sign that other of our products have already found favor in South Africa. It is to be expected, of course, that a certain prejudice for British goods will be encountered and, too, the factor of exchange may interpose some difficulties. Earnest efforts on the part of our supply manufacturers should, however, be able to counteract these obstacles at least to the extent that some substantial portion of these orders be placed in America.

J. J. Mantell, manager of the New York region of the Erie, in his address on the transportation problem of the metropolitan district of New York, before the New York Railroad Club on February 18, was, to say the least, somewhat unkind to the proposals recently advanced by the New York and New Jersey Port and Harbors Commission. Mr. Mantell was in charge of the railroad terminals in the New York terminal district for the Railroad Administration; he can be regarded,

### New York Terminal Development

therefore, as a real authority on conditions at that city. We do not wish in this brief comment to go into the matter of the criticisms made by Mr. Mantell as to the plan of the commission, except to note that he expresses the opinion that the proposals of the commission, or others like them, are impracticable and that the results would not warrant the expense. He suggests what he believes to be a simpler solution in the form of rail-head deliveries on the steamship piers for export freight, and for domestic shipments the use of specially arranged motor truck bodies or detachable containers along somewhat the same lines as used at Cincinnati for interchange l. c. l. freight. The advocacy of the container system by an authority of Mr. Mantell's standing is a thing of no small importance, particularly inasmuch as he proposes it as a solution of a very difficult problem at our most important seaport and commercial center. Further than that, it bears out the conclusion of many other authorities that the idea of using containers of this and similar character has now gone beyond the visionary stage and has proved itself practical and a real element of progress in transportation.

No one can successfully challenge the statement that railroad shop foremen and gang leaders, by their direct contact with the workmen, play an all-important part in securing good shop output. To an employee, his foreman represents the company; the effect of an incompetent, arbitrary, or unfair foreman in

#### Selection of Foremen

lowering the morale of men under his direction is hard to estimate. The business of being a foreman is in reality a profession which cannot be entirely learned in a lifetime. Foremen should be executives and the art of successfully managing men certainly is not less difficult to learn than that of operating machines. For this reason, the common method of selecting foremen from the ranks simply because of ability as master workmen is most unsatisfactory. A capable foreman will not allow himself to become buried in detail work but will assign all possible details to subordinates, spending a large proportion of his time outlining and planning the work of his department. Much thought and study should be given to ways of improving the relations between the workers and the managements. A foreman must be able to control himself and deal both tactfully and firmly with the workers under him, showing absolutely no partiality due to religion, politics or personal preference. It is becoming increasingly evident that to be efficient and handle his job intelligently, a foreman must be a good business man. He must know, or develop means of finding out, the cost of individual operations in his department; otherwise large amounts of money will be wasted in inefficient practices. For example, it often happens that the cost of repairing a certain locomotive part will be greater than the initial cost of a new part. This fact may not be self-evident and unless the foreman is business man enough to find out relative costs, the wasteful practice will continue. In view of the qualities outlined above, it is safe to say that most railroads at the present time do not make the position of foreman attractive enough to interest men of the required caliber.

Several Belgian newspapers have published articles, thought to have been maliciously inspired, which charge that the American locomotives delivered last year to the State Railways are inefficient and that the Ministry of Transportation displayed poor business judgment in purchasing them. An official statement in the Belgian "Chronique des Travaux Publics," a translation of which appears elsewhere in this issue, answers these attacks one by one and gives ample

#### Propaganda Answered by Service

testimony to disprove every criticism offered. Not only are the locomotives from America, says the statement, meeting all requirements, but they are actually giving better service than was expected of them. It is pointed out that the price, \$55,250 each, paid in bonds falling due in five years, was not exorbitant. If exchange approaches par at the time of the maturity of these bonds the engines will cost only 280,000 francs, instead of 795,000 as was alleged in the newspaper attacks. Even if the engines cost as much as 800,000 francs eventually, however, queries the statement, was it not at the time necessary that locomotives be obtained as soon as possible regardless of cost? European industry could not supply them, so the Ministry turned to America. The statement gives further details to prove that the American locomotives were satisfactory: The boiler is said to be perfect; the engines haul 1,409 tons with ease up a 0.5 per cent grade at a speed of 25 miles an hour, instead of at only 22 as called for by the contract. It is admitted freely that the locomotives have shown some minor defects, which, however, are easily remedied. It is disappointing to learn that propaganda so malicious on its face should have been launched against the products of American industry. On the other hand, it is extremely gratifying to learn that, as a matter of fact, the American locomotives are giving service which is eminently satisfactory—and this information comes, not by innuendo from questionable sources, but from the Ministry itself, which has the locomotives under constant observation.

"Think and Act" is the slogan for 1921 on the Minneapolis & St. Louis, as set forth by E. E. Nash, general manager, in a pamphlet issued to employees in

#### Circulars Should Elicit Intelligent Responses

January following a conference of officers at Albert Lea in December. This is a commonplace injunction; but the good advice contained in the pamphlet on how to think and how to act, for the promotion of the efficiency of the railroad, is anything but commonplace. In fact, this is one of the best things of the kind that we have seen and some of its paragraphs are quoted in other parts of this paper. It is brief and informal, but brevity and informality constitute one of its virtues. The boy who was challenged to name, if possible, something better than one of his Aunt Mary's pies replied promptly, "two of Aunt Mary's pies." Something of that kind might be said of this pamphlet; or, at any rate, that Mr. Nash has not put in all of the useful matter that he might profitably lay before his subordinates, while the duplication of the style of the pamphlet might be a valuable exercise for other managers. But, to drop the pie simile, the thing that would be better than this pamphlet would be the same pamphlet with a supplement containing notes on the "reaction" of the subordinate officers, and the employees, as they read it. The important question with all such brochures for trainmen, enginemen and other operating employees is, how much of the contents will they assimilate? The safety first "catechism" proposed in the *Railway Age* of February 11, page 358, contains valuable suggestions on this point. It is no simple matter to carry out the catechism idea, but the principle is an important one, and experiments in that direction would be well worth while. Asking questions and getting them rightly answered involves enormous work; but it is certain that a large percentage of most circulars of this nature fail of their purpose and that responses (of the kind most commonly seen in railroad circles) are often no better than none at all. American railroad officers have for 75 years been "instructing" their men in calm disregard (most of the time) of one of the fundamentals of pedagogy: namely, that the person taught is not surely in possession of an idea presented by his teacher (if it is at all complicated) until he himself has imparted it to some other person.

### Reading and Jersey Central

The plan for the segregation of the coal properties of the Reading Company was filed at Philadelphia on February 14, and since that time the financial experts have been engaging their attention in trying to figure out the value of the stock of no par value which will be issued by the new coal company and a proper quotation for the rights which will be given to the present Reading stockholders. There is, however, another interesting feature of some importance in the segregation plan, and that is the government's attitude as to the divorce of the Reading's control over the Central of New Jersey. As noted in the abstract of the plan given in last week's issue of the *Railway Age*, the proposed plan asks the court to defer the sale of the Jersey Central stock now held by the Reading pending the grouping of the railroads by the Interstate Commerce Commission according to the clause relating to railroad consolidation in the Transportation Act. The government, however, has objected to this because "it means in practical effect a continuance of the status quo indefinitely." The consolidation would take such a long time, it contends, that the effect upon the companies involved in the dissolution plan would be to maintain their present status for an indefinite period. This state of affairs brings out an interesting distinction in the attitude of two branches of the government towards the regulation of railroads. Congress in the Transportation Act has expressed itself as favoring consolidations worked out on a comprehensive and proper basis. The government as represented by the department of justice, however, still seems to adhere to the older idea that consolidations of railroads should be looked upon with distrust and possibly disfavor. Bearing in mind that the Central of New Jersey is to give up its control of the Lehigh & Wilkes-Barre Coal Company, it is difficult to see what harm there can be from the standpoint of the law for the Reading to retain its control in the Jersey Central. In short, it would seem, speaking generally, that the government attorneys, in objecting to the postponement of the sale of the Jersey Central stock by the Reading were showing themselves about a year behind the wishes of the people as represented in the passage by Congress of the Transportation Act.

### Standard Tie Specifications Becoming Established

ONE OF THE CONSTRUCTIVE MEASURES introduced by the Railroad Administration which bids fair to be perpetuated is the standard specification for cross ties. When first put into effect these specifications were opposed by many railway men and producers alike. However, as they have become more generally used this opposition has largely disappeared. It is particularly significant that the National Association of Railroad Tie Producers, which includes in its membership the manufacturers of nearly one-half the tie output of the United States, adopted standard specifications practically identical with the Railroad Administration specification, as it has since been revised by the Committee on Ties of the American Railway Engineering Association, for submission to the annual convention of that association next month. Since it is expected that the engineering association, which also comprises the Engineering Division of the American Railroad Association, will adopt these specifications, practical agreement is thus assured.

This action should do much to stabilize the cross tie industry to the benefit of both the producer and consumer. Prior to federal control when each road developed its own specification there was no uniformity in sizes, grades or classifications. The result was that the producers were at the mercy of the railways in times of limited purchases and

over-production, while the railways were equally at the mercy of the producers in times of active buying and under-production. With a standard specification which fixes definitely the classification for every tie the only point to be determined is the price and this is a matter for negotiation.

Because the benefits of uniform standard specifications are so evident it is essential that the railway purchasing and engineering officers co-operate with the producers to make these specifications a success. This implies accurate, uniform and impartial inspection, for any specification serves simply as the basis on which inspection and acceptance of materials are to be made. Since any inspection brings into play the question of judgment to a greater or lesser extent, it is of vital importance that the railways recruit and train a corps of inspectors who will interpret and enforce the specifications in the spirit in which they were drawn. Such criticism of the uniform specifications which has been heard up to the present time has been directed almost entirely to inspection. Those in charge of the purchase of ties must therefore give attention to this problem sufficiently to insure that the inspection is reasonable. The cross tie producers and the railways have performed a constructive service in agreeing upon a common specification. It is to be hoped that they will unite their efforts in the further and almost equally important step of developing a uniform inspection of ties produced under these specifications.

### Fundamental Issues in Labor Controversy Made Plain

DEVELOPMENTS last week made very clear the fundamental issues between the labor unions and railways in the controversy over national agreements. The unions directly concerned do not include the "Big Four" brotherhoods in train service. They include principally the shop crafts and other unions composing the Railroad Department of the American Federation of Labor. B. M. Jewell, head of the Railroad Department, demanded that the Railroad Labor Board arrange a national conference between the unions he represents and railway executives upon the subject of national agreements. He, Frank P. Walsh and W. Jett Lauck, made detailed arguments for this plan. The Association of Railway Executives met the day after this proposition was made, and adopted resolutions rejecting it and setting forth its reasons for doing so.

#### 1. Collective Bargaining Under the Transportation Act

Messrs. Jewell and Walsh argued for a national conference on the ground that disputes between the railways and their employees regarding wages and working conditions should be settled by "collective bargaining." They claimed that the labor provisions of the Transportation Act contemplate "uniform wages and conditions of employment for railroad workers with the fundamental rights of a living wage and collective bargaining." Explicitly interpreting "collective bargaining" as meaning national collective bargaining "on the basis of organization (i.e., union) recognition," they declared "the Transportation Act of 1920 will be emasculated and rendered abortive" and "this Board will be destroyed insofar as its efficient functioning is concerned" unless the principle of collective bargaining as interpreted by them is accepted by the railways.

The railway executives rejected their plan upon the ground that "under normal conditions the adjustment of rules and working conditions and of basic wages cannot successfully be made the subject of national conferences and negotiations," because "this would result in requiring all railroads to operate under rigid and uniform rules and

working conditions, and under rigid and uniform wages," which would prevent economical and efficient operation.

It is difficult to see how anybody who has read the labor provisions of the Transportation Act, and who is not trying to mislead, can contend that they contemplate merely national collective bargaining on the basis of "organization recognition." Section 302 expressly provides that "railroad boards of labor adjustment may be established by agreement between any carrier, group of carriers or the carriers as a whole, and any employees or subordinate officials of carriers, or organization or group of organizations thereof." Section 307 says that the Labor Board may hear any dispute that is likely substantially to interrupt commerce "upon a written petition signed by one hundred unorganized employees," as well as upon the application of any carrier or group of carriers, or any organization or organizations of employees. It is doubtless true that these conditions contemplate collective bargaining; but it is plain that they contemplate such bargaining either by a single railway and its own employees, whether organized or unorganized, or by a group of railways and their employees, or by all the railways and their employees. If the law contemplated negotiations solely between railways and labor unions it certainly would not have provided that a dispute could be brought before the board by one hundred or more "unorganized" employees.

From a legal standpoint the unions have just as good a legal basis for contending for national negotiations as the railways have for contending for negotiations between each railway and its own employees—and no better.

Furthermore, the law clearly does not contemplate "uniform wages and conditions of employment." It authorizes agreements upon wages and working conditions by railways and their employees either locally, regionally or nationally. If railways and their employees in different parts of the country agreed to different wages and working conditions, the agreements would be perfectly legal, but then wages and working conditions would not be uniform.

The Labor Board itself, in fixing wages, is required to take into consideration, among other relevant circumstances, "the scales of wages paid for similar kinds of work in other industries" and "the relation between wages and the cost of living." Suppose the Board should find that in one part of the country the wages paid in other industries and the cost of living were lower than in another part of the country. It would then be bound by the law to make lower railway wages in the former part of the country than in the latter, in which case the wages fixed by the board itself would not be uniform.

## 2. The Real Objects of the Labor Leaders

Since Mr. Jewell and Mr. Walsh, in arguing for exclusively national conferences and absolutely uniform wages and working conditions, have not, from a legal standpoint, a leg to stand on, it is evident they are seeking ends other than that of scrupulous compliance with the letter and spirit of the law. What are these ends? They show beyond question what one of them is when they attempt to read into the law "uniform wages and conditions of employment." They show what another of them is when they constantly reiterate that by seeking abrogation of the present national agreements, with their uniform rules and working conditions, the railways are trying to break down the labor unions. Naturally the national leaders of these unions want to make the national unions as powerful as possible. This makes the national leaders as powerful as possible. The more power the national labor leaders have concentrated in their own hands the more dangerous they can make it for the railways and the public to refuse to comply with their demands, however unreasonable. The more power they have the more they can do to promote the Plumb plan of employees' operation of the railways, which is their ultimate goal.

The railways are opposed to exclusively national negotiations for precisely the same reasons the leaders of the labor unions want them. They know that in national conferences the union leaders would fight to the last ditch for uniform wages and working conditions throughout the country—that it is for the very purpose of perpetuating these things that the labor leaders insist upon national conferences. The railway executives believe that only by conferences and agreements between the various railways and their own employees can wages and working conditions be adjusted to local conditions and to the views of the individual managements and their own employees as to what is reasonable and just. They believe that uniform wages and working conditions throughout the country unavoidably result in great inefficiency and waste.

As the Association of Railway Executives said in the resolutions adopted by it, "one of the great advantages of private over government ownership and operation of railroads lies in the greater adaptability (under private operation) of individual railroads to the geographical, social, economic and operating conditions which vary greatly with different portions of the country," and "restoration and maintenance of this variation is essential to private operation and to its ability to furnish efficient and economical transportation at the lowest possible rates."

Since the leaders of the labor unions, in their arguments before the Labor Board, explicitly contended for "uniform wages and conditions of employment," it is not necessary to prove that in a national conference they would stand fast for these things. And since these things in this country, with its varying conditions, always have been and are now incompatible with economical and efficient railway operation, the position taken by the labor leaders upon this subject affords one of the best possible arguments against exclusively national conferences. In addition, however, the railway executives feel sure that in national conferences the labor leaders would go the limit to perpetuate rules and working conditions which are unreasonable, not merely because they apply throughout the country, but in themselves.

The labor leaders recently have said that they would not insist upon unreasonable rules and working conditions which prevent efficient and economical operation, thereby implying that they would give up in national conferences any unreasonable rules and working conditions now in effect. The railway executives take no stock in this talk because they know, first, that the very labor leaders who talk thus now are the same men who got these national agreements, with their unreasonable rules and working conditions, established by the Railroad Administration, and, second, that they are the same men who, from the time the railways were returned to private operation, have demanded that these arrangements be perpetuated.

They got piecemeal abolished in all railroad shops under government control, although almost every experienced railway officer consulted by the director-general opposed this step. They got those reclassifications of employees, which have resulted in many cases in four to six men being required to do the same work that formerly was done by one or two. They got established the rule requiring employees who check in and out on their own time to be paid every week for an hour's work they do not do. They got established the rule which requires many thousands of employees to be paid for the time they use in eating their lunch. It has been asserted that there is not an unreasonable rule in these national agreements which was not previously in the schedule of one or more railways. But did the fact that one or more railways, probably under coercion, agree to an unreasonable rule make it reasonable for the labor leaders to secure the application of that same rule throughout the United States?

### 3. Record and Attitude of Labor

#### Leaders Show What They Want

These labor leaders have a past record, and are now taking a position, which makes perfectly clear why they do not want local conferences and agreements, and do want national conferences and agreements. They want national conferences and agreements because they want to perpetuate uniform wages, uniform working conditions, the prohibition of piecework, and other unreasonable and indefensible concessions they got under government control. But these things cannot be perpetuated under private operation without largely defeating the purpose for which Congress and the public returned the railways to private operation—that is, more economical and efficient operation.

Insofar as the principles and methods of government operation are perpetuated, the results of government operation necessarily will be perpetuated. The railway executives are trying to restore efficiency and economy under private operation, and they refuse to agree to settle the question of rules and working conditions by national conferences because they believe that the wrong and harmful principles and methods of government control can be got rid of only by the managements and the employees of each railway dealing directly with each other.

The fundamental issue is plain and unescapable. The labor leaders and the railway executives have joined in making it plain. It is whether rules and working conditions shall be determined by methods primarily intended to consolidate and increase the power of the labor unions, or by methods primarily intended to increase the efficiency and economy of railway operation.

## The Silver Lining of the Railway Cloud

THE CLOUD HANGING OVER the railroad industry at the present time is very dark and angry looking. The tremendous decline of business since October and the high operating costs, if continued, would result in many railways being bankrupted. But the cloud has a silver lining.

In the three months of September, October and November, 1920, the railways moved the largest freight business they ever handled in those months. The business in September and October was especially heavy. In these months, however, the railways as a whole, and those of each of the three large territories, failed to earn the six per cent return it was expected they would earn under the new freight and passenger rates. They earned only about two-thirds of it.

The experience of those three months was enough to convince every student of railway operating and financial matters that if the costs of fuel, materials and labor then prevailing were not reduced the railways would be unable to earn their six per cent return, or anywhere near it. If, however, the business had continued to be heavy, the difficulties in the way of reducing the unit costs of operation and the total operating expenses in the near future would have been almost insuperable. The public would never have agreed to a further advance in rates. It is impossible to see how, in these circumstances, the railways ever could have been put on a prosperous basis.

The great slump in business came, however. Railway operating officers, who for months had been obliged to devote their attention almost exclusively to getting the traffic moved, became able to devote much more time to the study of economies. Prices of fuel, which is one of the largest items of railway expenses, began to yield. Coal is now being charged into operating expenses at the high prices for which it was contracted in the past, but when new coal contracts

are made it undoubtedly will be possible to get substantially lower prices. The depression in business is causing reductions in wages and in prices by manufacturers of railway materials and supplies. These reductions are not great, but in due time they will be reflected in reductions of operating costs.

The most recent statistics show that last August the number of railway employees had increased to the unprecedented figure of more than 2,200,000. This increase in employees was largely due to the fact that with the demand for labor in all industries greatly exceeding the supply, and with the railway managements bound hand and foot by all kinds of restrictive rules and working conditions, it was impossible to get efficient work from many classes of railway employees. The payroll was running at the unprecedented annual rate, according to the latest statistics, of more than \$3,800,000,000 a year. As long as business continued heavy it was practically impossible to reduce labor costs. Since September 1, the railways have laid off fully 300,000 men. The decline in the cost of living and in the wages of labor in other industries, and the tremendous decline of traffic and earnings, have enabled them to bring far more forcibly and effectively to the attention of the Railroad Labor Board and the public the necessity for reducing labor costs. Prospects for a substantial reduction in the near future in the wages of unskilled labor are good. Apparently, also, the prospects of securing relief from the iniquitous and burdensome national agreements, rules and working conditions are much better than they would have been if the present situation had not developed.

In consequence of all these things there seems to be good reason for believing that the operating expenses of the railways, and especially their unit costs of operation, will be reduced far more than they could or would have been if the present crisis had not come. If this should be the case, when traffic revives, as in time it is sure to revive, the railways will be able to handle it with lower expenses than they had last summer and fall when the business was heavy. This would mean larger net earnings obtained, not through advances in rates, but through reductions of expenses, and what the railways need is not merely larger net earnings, but that these larger net earnings shall be gained through reductions in expenses. When the railways begin to make larger net earnings, and only when they begin to do so, will they be able to enter upon a program of enlarging their facilities.

It will be recalled that Dickens' famous character, Mark Tapley, was always happiest when things seemed to be going worst, and was reduced to profound depression when everything apparently was going well. The *Railway Age* has no desire to acquire the reputation of the Mark Tapley of the railway business. It is plain that if the traffic of the railways should continue to be so abnormally small as now, and their unit costs of fuel, materials and labor so abnormally high, the result would be disaster. The reason why present conditions give cause for optimism is that apparently these very conditions are going to bring about the permanent reductions of expenses which it has been plain for months were essential to putting the railroads on a sound basis.

The industry never was on a more precarious basis than that disclosed by the statistics of earnings and expenses in September, October and November, showing that with the largest business ever known and the highest rates known for many years the railways were unable to earn anything approaching a reasonable return. The reason why present conditions probably will prove a blessing in disguise is that they probably will make possible the beginning of reductions in expenses which in the long run will make possible the earning of reasonable net returns under the present rates, or even under lower rates.

## Letters to the Editor

### The Stop and Proceed Rule

HERINGTON, KANSAS.

TO THE EDITOR:

In your issue of January 21 reference is made to a proposed change in the stop and proceed rule so as to permit a train to pass an automatic block signal at stop without stopping, under certain conditions.

It would be a mistake to give a stop indication a multiplicity of meanings. It seems to me extremely difficult to justify a line of thought that would permit a train to pass an automatic block signal at stop without stopping. These signals perform the same function that a burning red fuse or the explosion of one torpedo performs on non-automatic block territory. The responsible manager could well hesitate a long time before authorizing a train on single track to pass any of these signals without stopping.

If a change is necessary in certain places or on certain railroads, it would be preferable to change the indication of the signal so that it would give a caution indication instead of a stop indication.

E. H. HEATH.

[Mr. Heath agrees, evidently, with the majority. The majority do, indeed, hesitate long before relaxing the stop rule on single track. Our former correspondent would in all probability hesitate in like manner; but, while hesitating as regards single track, he might try the experiment on double track. Practically, a reduction to five miles an hour is as good as a stop; the question is whether enginem men could be trained to obey a five-miles-an-hour rule as well as they obey a stop rule. The distant-signal rule which we referred to says, in effect, "If you shut off steam you may pass the signal;" the essence of the requirement being that (1) if the enginem man does something to indicate that he is alert, (2) has evidence that it is safe to keep moving and (3) is moving at a speed moderate enough to give him ample time to consider his action calmly and without hurry, he may save the delay and cost of a stop.—EDITOR.]

### The Importance of Intelligent Inspection

ERIE, PA.

TO THE EDITOR:

On every side one hears a consistent and persistent denunciation of wasteful manufacturing methods as they concern both labor and material. There is one very prolific source of waste, however, that is rarely touched upon. When a manufacturer contracts to make a number of articles for a customer, the customer often insists on having his inspector resident in the manufacturer's shop to watch the progress of the work, and to pass on its acceptability, according to the terms of the contract. This is especially true of government and railway contracts.

Some of these inspectors are men of exceptional ability and intelligence, who try in a broad, common-sense, business-like way to protect their employers' interests without working any hardship or injustice to the manufacturer producing the articles contracted for, and who give and take in their decisions, considering always the impossibility of perfection, and appreciating the relative importance of details. Such men are important factors in industrial progress, and in the distribution of rewards they should not be overlooked.

There is another class of inspectors, however, who are narrow in their vision, arbitrary in their decisions, and arro-

gant in their conduct. Because of the authority invested in them for the time, these men become self-centered, and without any thought or consideration of the general welfare, take advantage of every slightest pretext to reject this or that article at various stages of its completion. This is done regardless of the value of the labor and material involved—which become a dead loss to the manufacturer and to industry in general, without benefiting the purchasers in any degree whatever.

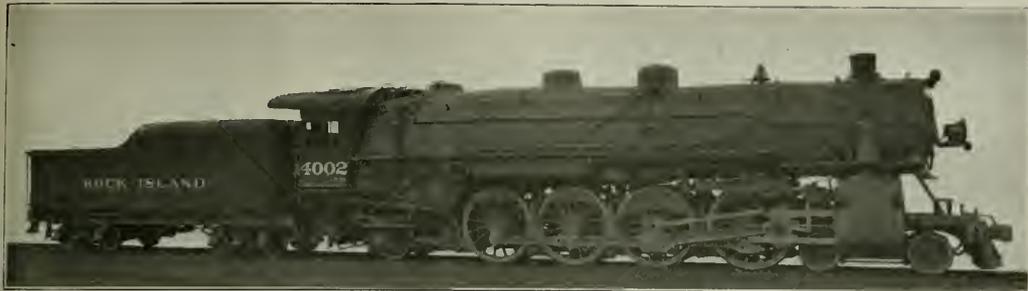

Inspectors of this type are far too numerous, and are a distinct detriment and hindrance to industrial progress. They not only strike terror to the hearts of the members of an organization so unfortunate as to have one thrust upon them, but they are directly responsible for immeasurable wastage which directly affects the cost of manufactured articles. They are a real menace, and every legitimate effort possible should be made for their elimination. Oftentimes the employers of such men are directly and avowedly responsible for their conduct, by placing strict limitations on the exercise of their sense of judgment, and insisting on a rigid observance and enforcement of the letter of contracts, ignoring that spirit of fairness so essential to the equitable fulfillment of any contract.

When an unjust inspector imposes unwarranted hardships on a manufacturing organization, the old law of self preservation gets into action, and inspires reprisals that often result in covering up errors and defects that would otherwise have been called to the inspector's attention and remedied. It also results in straining, perhaps to the breaking point, business relationships that had hitherto been most cordial and mutually profitable.

The gravity of this condition makes its correction imperative. Inspectors should be chosen with great care. Wherever possible they should be good mechanics, of an amiable disposition and natural good judgment, who have had sufficient training in the technique of the particular phase of manufacture in which they are interested. They should be given as wide discretionary powers as the exigencies of the work in hand requires. Their reports to their employers should cover the number of rejections, as well as the accepted articles, and when these rejections are greater than seems reasonable, the matter should be taken up with the manufacturer. He, being on the defensive, will undoubtedly reveal any unfairness or injustice to which he may be subjected by the inspector, and which, for fear of unpleasant and embarrassing contractual conditions which might arise, he would otherwise keep to himself.

G. GRIEG.

ACCORDING TO ESTIMATES prepared under the supervision of Ernest F. Buchard of the United States Geological Survey, 1920 was a record year in the production, shipment and gross value of Portland cement. The production is estimated at 100,302,000 bbl. and the shipments at 96,329,000 bbl., valued at \$193,548,000, compared with 80,769,378 bbl. manufactured and 85,596,616 bbl., valued at \$146,656,076, shipped in 1919, an increase of 24 per cent in production, 13 per cent in shipments, and 31.9 per cent in value of shipments in 1920. The stocks of finished cement increased from 5,852,497 bbl. at the end of 1919 to about 8,290,000 bbl. at the end of 1920, or more than 41 per cent. The average mill price in bulk at the mills for the whole country was \$2.01 a barrel in 1920, compared with \$1.71 in 1919, an increase of 17.5 per cent. The lowest average price reported by any group of plants in 1920 was \$1.77 a barrel in the Illinois-western Indiana district, and the highest average price was \$2.47 in Washington. These prices compare with \$1.62 and \$2.05 in 1919 in the same localities. There were 115 plants manufacturing Portland cement in 1920, compared with 111 active plants in 1919, one additional plant each having been operated in Alabama, Indiana, New York and Oregon.

## Mountain Type Features New Rock Island Power

Greater Steaming Capacity and Larger Driving Wheels Indicate Trend in Development of This Type

UPON RETURN to private management, the Chicago, Rock Island & Pacific was one of the earliest to place large locomotive orders. These orders included 10 Mountain, 10 Mikado and 15 Santa Fe type locomotives all of which were purchased from the American Locomotive Company and constructed at their Dunkirk plant. None of these types is new to the Rock Island since this road has operated both Mikado and Santa Fe type locomotives of the same general design in freight service for several years and was one of the first railroads to adopt Mountain type locomotives for heavy passenger service.

The selection of these locomotives by a railroad that has had experience with each type is in itself significant and would indicate that the Mikado has made a place for itself which the advent of heavier power cannot usurp. It also serves to demonstrate that the Santa Fe type is here to stay and verifies the foresight of those who placed the Mountain type in passenger service on the Rock Island system seven years ago.

When the first Mountain type locomotives were placed in service on the Chicago, Rock Island & Pacific, they enabled the consolidation of the St. Louis and the Chicago sections of the Colorado trains into one train west of Phillipsburg, Kansas, where maximum and ruling grades of 1.0 per cent are encountered. The trains hauled by these locomotives usually consisted of 10 or 11 all-steel cars weighing from 675 to 750 tons although as high as 1,175 tons in 19 cars have been handled successfully over a division of 140 miles. Subsequent tests which demonstrated the high capacity of these first Mountain type locomotives were described in the April 16, 1915, issue of the *Railway Age Gazette*, page 829.

### Pioneer and New Mountain Types Compared

The policy of the Chicago, Rock Island & Pacific with respect to the design and equipment of new locomotives has been consistently directed toward obtaining maximum efficiency in operation and economy in maintenance. Therefore, a comparison between the pioneer and the new Mountain type locomotives affords an interesting commentary upon the development of this type practically since its initiation in passenger service.

It will be observed from the specifications which are submitted in connection with this article that the rated tractive effort of both locomotives is nearly identical, but that the weight of the new locomotives is considerably greater than that of the original Mountain type. The new locomotives

weigh 29,000 lb. more on the drivers and are proportionately heavier throughout.

This increased weight is largely accounted for in the boiler dimensions as the total heating surface of the new locomotives, excluding the superheater, is nearly 600 sq. ft. greater. The greatest proportional increase occurs in the firebox heating surface of the new locomotives which is over 30 per cent greater than the firebox heating surface of the older locomotives. This increase is largely accounted for by the application of three thermic syphons to each locomotive as the other firebox dimensions, including the grate area, are practically the same.

The most striking difference in design, however, appears in the driving wheel dimensions, the new locomotives having 74 in. driving wheels as compared with the 69 in. wheels of the earlier locomotives. As the cylinder dimensions of the two locomotives are the same, it will be seen that the larger driving wheels tend to balance the larger boiler, which carries 200 lb. pressure as compared with 185 lb. on the original locomotives. These are the first Mountain type locomotives built with driving wheels as large as 74 in. and their ability to sustain high speeds with heavy trains will be watched with interest. It is to be hoped that the Rock Island will test these locomotives in the same thorough manner that the original Mountain types were tested so that comparative results will be available, as the development of a new type depends much upon such tests.

### Special Features of the New Locomotives

Among the novel characteristics applying generally to all three classes of the new locomotives is the short slope of the cab front which permits all of the wrapper sheet staybolts to be outside of the cab so as to facilitate inspection and removal. All the piping is arranged so as to interfere as little as possible with inspection and minor repairs to staybolts. The location of cab appurtenances was given special attention in the design of these locomotives from the standpoint of both safety and accessibility. An outside steam turret is provided with extension handles to the valves so that all pipes having boiler pressure are located outside of the cab. The injectors also are located outside of the cab. The detached water column is specified in accordance with the recommendations of the mechanical standards committee of the Railroad Administration. This arrangement was proposed as a result of the exhaustive tests conducted by the Bureau of Locomotive Inspection of the Interstate Commerce Commis-

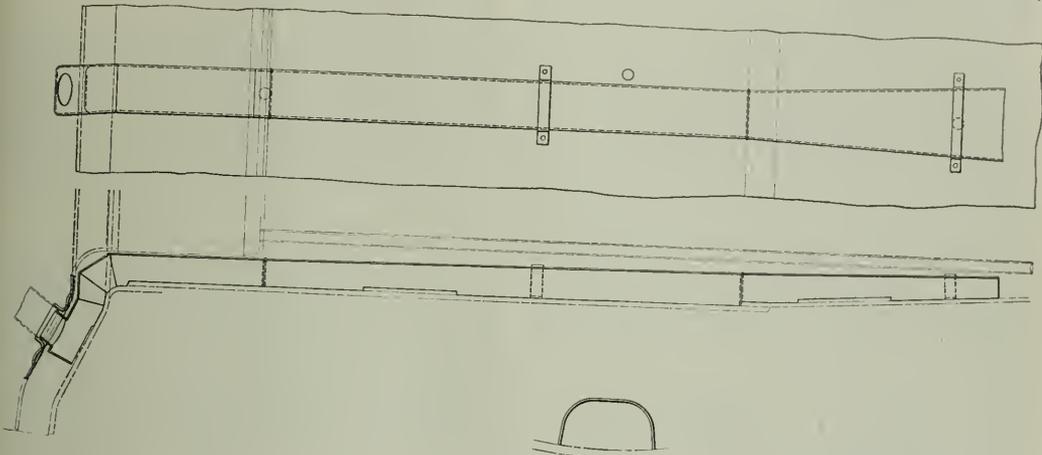

sion which determined the advantage of mounting the gage cocks and gage glass upon a column so mounted as not to be influenced by the flow of water against the back head of the boiler.

The tenders of these locomotives are of the Franklin type with unit draw-bar attachments and Commonwealth cast steel

radius so as to eliminate the customary angle in the corners of the cistern to which the side and bottom sheet are attached and which usually give a great deal of trouble on account of leakage.

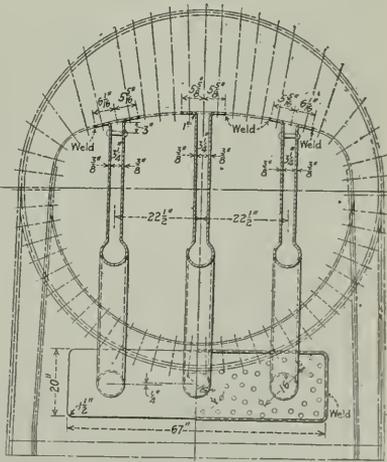

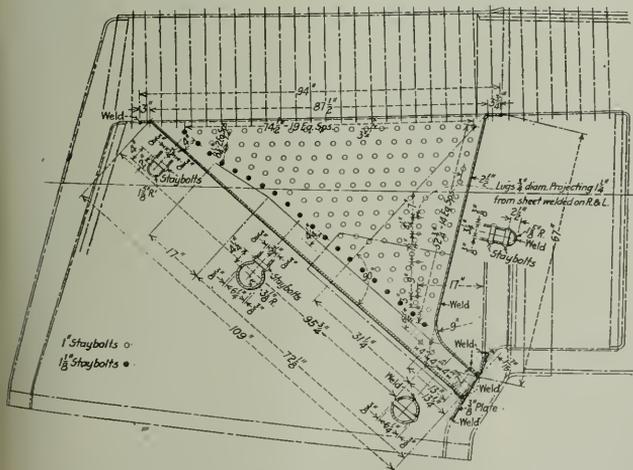

We are indebted to W. J. Tollerton, general mechanical superintendent, for the following statement relating broadly

Intake Channels for the Thermic Syphons Applied to New Rock Island Locomotives

underframes. This is in distinction to the Vanderbilt type of tender which was constructed for the first Mountain type locomotives and has characterized the Rock Island locomotives for many years. It should be noted in this connection that the new tenders for the Mountain type locomotives have

to the principles governing the design of these locomotives: "Many of the features on these locomotives were brought about by closely watching previous engines of similar design, and the idea has been to eliminate any weakness that may have developed; also the design is prepared with a view to

Detailed View of the Nicholson Thermic Syphons as Applied to Rock Island Mountain Type Locomotives

a water capacity of 10,000 gal. and carry 16 tons of coal in comparison to the tenders attached to the original Mountain type locomotives which had a maximum capacity of 8,500 gal. of water and 14 tons of coal. The locomotive tender has a low center of gravity with rounded bottom and corners bringing the side and bottom sheet connection above the

greatest possible reduction of possible future shop labor when the engine is overhauled, by easy accessibility of the different parts, and the idea of making each part, if possible, run from shopping to shopping without renewal. It must be appreciated now, more than ever, that anything that can possibly be done to increase mileage and get a quicker turn

on the engine, both at the terminal and when passing through shop, should be anticipated at the time the design is made."

### Special Equipment Applied to the New Locomotives

The most noteworthy addition to these new locomotives in the form of a specialty designed to increase economy and capacity is the Nicholson thermic syphon, the details of which are illustrated in connection with this article. While this device has been applied to locomotives on the Rock Island for over a year and is now giving satisfactory service on a number of other railroads, this is the first instance in which the syphons have been specified throughout on new orders of Mountain, Mikado and Santa Fe type locomotives. As will be observed from the specifications and drawings, the syphons add 141 sq. ft. of heating surface to the firebox and serve to support a brick arch in place of arch tubes. The purpose of the syphons is to increase the capacity of the locomotive by increasing the firebox heating surface as noted and to improve the circulation within the boiler resulting in a freer steaming and more economical locomotive.

Two other novel and interesting specialties applied to these locomotives are the wrist and knuckle pins. These designs are patented by the U. S. Metallic Packing Company and have the advantage of enabling the pins to be removed

has been found entirely practical to meet the maximum service requirements on Mountain and Mikado type locomotives by means of hand firing and it was thought that the application of syphons would further improve the free steaming qualities of these locomotives. However, the Mountain type locomotives are designed so that stokers may subsequently be applied if found necessary.

In addition to the Alco standard drifting valve these locomotives are equipped with an auxiliary saturated steam line to the cylinder. A manually operated quick opening 1 1/4 in. starting valve is connected to a 1 1/4 in. pipe extending from the turret to the front end of the boiler. From this point, 1 in. branch pipes lead into each steam pipe. A copper pipe, having its own connection from the hydrostatic lubricator in the cab, is led to this steam line. A 1 1/4 in. tee is also inserted near the cab for emergency oiling of the piston valves by the engineman in case the force feed oil pump fails en route.

### Mountain Type Locomotive Dimensions

The Mikado locomotives purchased by the Rock Island last year do not differ materially in design from locomotives of the same type which have been in service on the railroad for some years and the new Santa Fe type locomotives are substantially the same in design as the locomotives of this type built for this railroad in 1918 and described in the December 6, 1918, issue of the *Railway Age*, page 993.

The Mountain type locomotives which were constructed for the Rock Island in 1913 and referred to in the foregoing were described fully in the January 9, 1914, issue of the *Railway Age Gazette*, page 86, but for convenience the principal dimensions of these locomotives are tabulated together with the dimensions of the new locomotives as follows:

#### General Data

	Chicago, Rock Island and Pacific Mountain Type Locomotives	
	Built in 1913	Built in 1920
Tractive effort .....	50,000 lb.	50,400 lb.
Cylinders, diameter and stroke .....	28 in. by 28 in.	28 in. by 28 in.
Weight in working order .....	333,000 lb.	369,000 lb.
Weight on drivers .....	224,100 lb.	253,000 lb.
Weight on leading truck .....	57,500 lb.	57,000 lb.
Weight on trailing truck .....	51,500 lb.	59,000 lb.
Weight of engine and tender in working order .....	490,500 lb.	559,000 lb.
Wheel base, driving .....	18 ft. 0 in.	19 ft. 10 in.
Wheel base, total .....	38 ft. 11 in.	41 ft. 0 in.
Wheel base, engine and tender .....	70 ft. 2 1/2 in.	79 ft. 3/4 in.
<b>Ratios</b>		
Weight on drivers ÷ tractive effort .....	4.48	5.02
Total heating surface ÷ grate area .....	6.66	7.32
Total heating surface ÷ grate area .....	65.4	74.4
Per cent firebox heating surface to evaporative surface .....	7.58	8.66
Per cent superheating surface to evaporative surface .....	22.9	26.6
Total evaporative surface ÷ volume of cylinders .....	206	234
Grate area ÷ volume of cylinders .....	3.14	3.15

#### Wheels

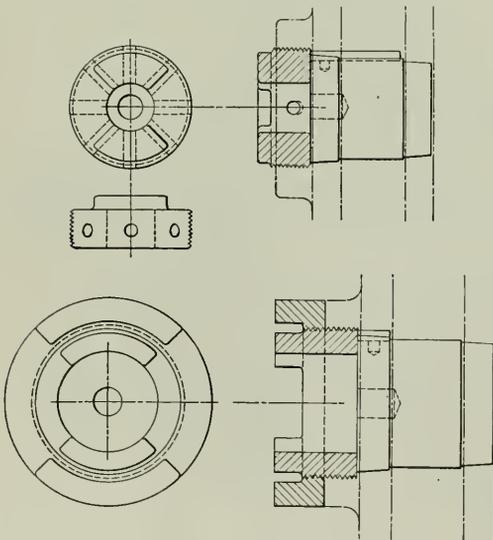

Driving, diameter over tires .....	69 in.	74 in.
Driving, thickness of tires .....	3 1/2 in.	4 in.
Driving journals, main, diameter and length .....	11 in. by 22 in.	12 in. by 22 in.
Driving journals, others, diameter and length .....	11 in. by 13 in.	11 in. by 13 in.
Engine truck wheels, diameter .....	34 in.	33 in.
Engine truck journals, diameter and length .....	7 in. by 12 in.	7 in. by 12 in.
Trailing truck wheels, diameter .....	42 in.	43 in.
Trailing truck journals, diameter and length .....	9 in. by 14 in.	9 in. by 14 in.

#### Boiler

Style.	Conical.	Conical.
Working pressure, pounds per sq. in. . . . .	185 lb.	200 lb.
Outside diameter, first ring .....	78 in.	80 in.
Firebox, length and width .....	107 1/2 in. by 84 in.	108 in. by 84 in.
Tubes, number and outside diameter .....	207—2 3/4 in.	216—2 1/2 in.
Flues, number and outside diameter .....	36—5 1/2 in.	45—5 1/2 in.
Tubes and flues, length .....	22 ft.	22 ft. 5 in.
Heating surface, tubes and flues .....	3,805 sq. in.	4,283 sq. ft.
Heating surface, firebox .....	312 sq. ft.	406 sq. ft.
Heating surface, total .....	4,117 sq. in.	4,689 sq. ft.
Superheating surface .....	944 sq. ft.	1,247 sq. ft.
Grate area .....	62.7 sq. ft.	63 sq. ft.

#### Tender

Tank .....	Cylindrical.	Rectangular.
Water capacity .....	8,500 gal.	10,000 gal.
Coal capacity .....	14 tons	16 tons

Removable Knuckle Pins Applied to New Rock Island Locomotives

from the outside and the rods taken down irrespective of their position.

The new locomotives are all equipped with force feed lubricators, Barco flexible steam heat and air brake connections, Alco power reverse gears, Baker valve gear, the Woodward engine truck, oscillating front driving box, Franklin adjustable driving box shoes and wedges, hollow main crank pins with internal grease lubrication and adjustable hub plates by means of which the lateral can be taken up without dropping the wheels.

The locomotive smoke-box is equipped with the Unit spark arrester which is cylindrical in form and can be readily removed through the front door. Franklin grate shakers are applied to all of the locomotives but stokers of the Duplex type are applied only to the Santa Fe type locomotives as it

# Executives Outline Future Labor Policy

## Employees' Plea for Joint National Conferences on Rules and Working Conditions Rejected

DEVELOPMENTS in the several controversies over wages and working conditions during the past week have been confined largely to the results of a meeting of the Association of Railway Executives at the Drake Hotel, Chicago, on February 18 at which time the attitude of the carriers in regard to proposals previously made before the Railroad Labor Board by representatives of the employees was clearly defined. Similarly the carriers' attitude toward the whole labor problem was definitely outlined.

The progress of the hearings before the Labor Board on the employees' demand for the perpetuation of the national agreements formed during federal control has been outlined in the previous issues of the *Railway Age* up to and including the hearing on February 17 when B. M. Jewell, vice-president of the Railway Employees' Department of the American Federation of Labor and chief spokesman for the employees, requested the Board to either recognize his interpretation of the principle of collective bargaining or grant a recess until March 14 in which he could prepare a reply to the presentation which has been made in this case on behalf of the carriers. Mr. Jewell was followed on the stand by Frank P. Walsh who said in part:

### Statement by Frank P. Walsh

We submit that the Transportation Act contemplated three things:

1. Efficient and economical service to the public;
2. Uniform wages and conditions of employment for railroad workers with the fundamental rights of the living wage and collective bargaining;
3. A guarantee to the owners of the railroads of a fair return on their investment.

It was not an Act primarily and essentially for the relief of the railroads or their owners. None of the three purposes of the act shall take precedence over the others; none of the three parties in interest shall receive greater consideration than the others. Accordingly we believe that the time has come to sound a solemn warning to this Board and to the country. If the purpose of the railway executives as reflected in the utterances and acts of General W. W. Atterbury, are not restrained, the Transportation Act will be emasculated and rendered abortive, this Board will be destroyed insofar as its efficient functioning is concerned, and we shall have endless turmoil and instability in the railroad industry.

In the circumstances we are constrained to ask that this Board before proceeding to a determination of any other causes now before it shall require the carriers to comply with the letter and spirit of the provisions of the law under which we are endeavoring to function as public servants. Failing this it shall be our earnest effort to inform the public and the Congress of the United States as to the real situation in this controversy to the particular end that Congress shall not enact into law the pending measures for the financial relief of the railroads. At this moment the carriers of the country are attempting to dip their hands into the United States Treasury and extract the enormous sum of \$750,000,000, which is only their initial effort. It is our contention that the merits of these colossal drafts on the revenue of the country should not even be considered by the national law makers so long as the carriers refuse to come before this Board with clean hands and demonstrate to the public that they will honestly comply with the law. The Winslow bill has passed the House and the Townsend bill is now on the Senate calendar. However, we do not apprehend that either bill can become a law until the railroads have kept faith with the public and with the railway workers.

This law was passed primarily at the instance of the carriers. It contains features against which we protested; but we are law-abiding, and since its enactment it has been our constant endeavor to comply with its every requirement. Nor have we sought to destroy the efficacy of the law or the efficiency of this Board by seeking special privileges and asking extraordinary decisions or ruling to further our selfish interests.

### Meeting of Executives on February 18

The Association of Railway Executives, in its meeting on February 18, unanimously accepted a report from its Labor committee and unanimously adopted resolutions making clear that the railways will not accept the plan proposed by leaders of the labor unions to the Railroad Labor Board for national conferences between the labor unions and the railways regarding rules and working conditions and wages of unskilled labor.

The Association made clear that its opposition to the present National Agreements with certain classes of employees, and its opposition to national conferences, must not be construed in any way as an attack upon labor organizations themselves.

"What we have been trying to do, and all we have been trying to do," the Labor Committee said in the report adopted by the Association, "is to get the opportunity to deal with our own employees so as to restore the efficiency of labor on these railroads, and if possible avoid non-employment and defer serious wage reductions. The leaders of the labor unions by the position they have taken have directly raised the issue whether the maintenance and increase of the power of the national labor unions shall be placed above the public interest in the efficient and economical operation of our transportation system."

This statement referred especially to the demand made by Mr. Jewell, to the Railroad Labor Board on February 17. The report of the Labor Committee follows in part:

### Report of Labor Committee of Executives' Association

Pursuant to the resolution adopted by the member-roads on January 7, 1921, the labor committee met in Chicago on January 27, 1921. For the information of the committee, each company had been requested by the chairman to give certain information regarding its earnings and labor conditions. The committee found the situation was even worse than it had anticipated; that there was grave danger that the necessities of the carriers and justice to the public would require the initiation of numerous cases for reduction in basic wages before the United States Railroad Labor Board—following its then procedure—could possibly render its decision on the abrogation of the pending national agreements and rules and working conditions; and that a situation would develop through which the Labor Board would be utterly unable to meet and promptly dispose of all the issues presented; and that the possibility of orderly procedure would be destroyed and superseded by confusion and chaos.

When the resolution instructing the labor committee to meet was adopted by your association, the general condition of the railroads, and especially their financial situation, was very unsatisfactory. The present freight and passenger rates were fixed late in August. On the basis of a 6 per cent annual return on the valuation of them, fixed by the Interstate Commerce Commission, in September, October and November, the railroads as a whole actually earned in these months, in which an unusually large business was handled, but two-thirds of the return expected.

Between the time the labor committee was instructed to meet and the date of its meeting, the railroad situation had rapidly become worse. There had been an unprecedented decline in traffic with most serious effects upon the net operating income. The net operating income it was estimated that on a 6 per cent annual basis the railways should earn in December was \$86,800,000. The amount they did earn was approximately \$17,000,000. The rate of return earned in September was 4.1 per cent; in October, 4.6 per cent; in November, 3.3 per cent; in December, only 1.4 per cent; in the four months, 3.35 per cent. Telegraphic reports received from individual railways throughout the country showed that the results of operation in January were even worse than in December. Many railroads were not earning, and with the current costs and traffic had no prospect of earning, their bare operating expenses, leaving them without any net return to meet their fixed charges.

Over 300,000 railroad cars were idle, as well as hundreds of

locomotives, compared with a year ago when there was a shortage of about 60,000 cars. Eliminating idle facilities and tracks it is estimated that at present prices over a billion dollars of equipment was unproductive. Possibly 280,000 men had been discharged by the railroads and the working time of those retained in service in many cases was reduced.

The time for recruiting unskilled labor forces for 1921 was at hand and the industries, the municipalities, and business generally had been employing unskilled labor at rates much below those established by the Labor Board. Meantime, important changes had taken place in other lines of business. The reduction of railway traffic reflected an extensive curtailment of production. In many branches of industry wages were being reduced. This was especially true as to wages of unskilled labor, which, except on the railroads, were being reduced throughout the country.

While regretting the informality, the labor committee decided that the situation required that its chairman should appear before the Railroad Labor Board on January 31, lay before it the acute situation of the railways, and make certain suggestions to it regarding matters over which it has jurisdiction under the Transportation Act.

### National Agreements Limited to Federal Control

The question of continuance of the national agreements, rules and working conditions established under government control had been pending in one form or another ever since the railways were returned to private operation on March 1, 1920. They were limited by their nature and express provisions to the period of federal control. Immediately upon the expiration of federal control, demand was made by the labor organizations that the railroads as a whole accept and continue them in toto. The conference committee representing the railways definitely declined to discuss the question of national agreements, rules and working conditions with the national representatives of the labor unions because only the question of increased wages had been referred by the President of the United States to the bi-partisan committee representing the employees and the railways. The labor organizations then on April 28, 1920, presented to the railroad companies individually demands that these agreements be continued by them individually. Except in a few instances no bona fide conferences or negotiations were had because the local labor union officers presenting the national agreements did so under instructions from their national officers, which precluded these local labor representatives from agreeing with the officers of individual railways to a single alteration or modification.

Despite these facts in conformity with the demand of the labor organizations, and over the protest of the Conference Committee of Managers representing the railways, the United States Railroad Labor Board in its wage decision of July 20, 1920, took jurisdiction of the subject of rules and working conditions in the wage controversy. The labor organizations made their presentations in support of continuance of the agreements at the time they made their presentations for advances in wages. The following is from a letter from the United States Railroad Labor Board, dated December 18, 1920, to the heads of all the labor organizations:

"This Board has set Monday, January 10, 1921, as the date of the hearing on that portion of the dispute between certain carriers and your organizations submitted to this Board on April 15, 1920, which was not decided in Decision No. 2. The said portion of that dispute relates to rules and working conditions. *The Board understands that your organization submitted its presentation as to rules and working conditions as a part of its submission of said dispute.*"

When the hearings were renewed on January 10, the spokesmen of the labor organizations stated that they rested their case except for such rebuttal as they might make to the railroads' presentation. They had never up to that time presented a single argument or theory in support of the proposition that the same rules and working conditions should be applied to the railways throughout the country regardless of the wide variation in local conditions, although they had had ample opportunity to do so.

The conference committee representing the railways then began its presentation against continuance of the national agreements and had practically finished it when your labor committee met in Chicago on January 27. Therefore, when the chairman of your labor committee appeared before the Board on January 31, the main presentations had been practically finished, but the real seriousness of the situation had not yet impressed the public, nor did the labor organizations or the Labor Board feel the urgency for a prompt decision.

### Unreasonableness of Existing Rules

The committee representing the railways had laid before the Board voluminous and conclusive evidence showing the unreasonableness of the existing rules and working conditions, and especially the unreasonableness, injustice and wastefulness of applying the same rules and working conditions to railways throughout

the country. Therefore, not only was there no impropriety whatever in asking that the Board should at once terminate these rules and working conditions, but your labor committee had decided that they would be derelict in their duty to the railroads and to the public to hesitate in presenting the actual condition of the railroads, and requesting the prompt action the situation demanded.

The financial condition of the railways made it imperative that no effort should be spared to increase the net operating income. This, as we pointed out to the Board, could only be done either by an advance in freight and passenger rates or a reduction in operating expenses, and "with declining prices and wages in industry and agriculture the country demanded that the solvency of the railroads must be assured by a reduction in operating expenses, and not by a further advance in rates."

Not only the evidence which had been presented by E. T. Whiter's committee on behalf of the railroads, but also statistics of the Interstate Commerce Commission, showed that the national agreements, rules and working conditions forced on the railroads as war measures were causing gross waste and inefficiency, and were among the main reasons why on the present high rates the railways were unable to earn a reasonable return. We estimated that the elimination of this waste would reduce railway operating expenses at least \$300,000,000 a year. This estimate was conservative, in view of available facts regarding the excessive increases in the number of employees and in the pay roll in every branch of railroad service to which the national agreements, rules and working conditions had been applied.

Between 1914 and 1917, before the wages, rules and working conditions of certain employees had been nationalized, the railways handled an increase in freight traffic of 31 per cent with an increase in the number of their employees of only 93,000, or 3,000 men per one per cent increase in freight traffic. On the other hand, while, between 1917 and 1920 the increase in their freight business was only about 13 per cent, the increase in the number of their employees, as shown by the statistics of the Interstate Commerce Commission, was 261,000, or over 20,000 men per one per cent increase in freight traffic.

It was because we believed the Labor Board had sufficient testimony and facts from the representatives of both the labor unions and the railroad companies to show that these national agreements, rules and working conditions were causing enormous wastes and inefficiency, and because the railway situation had become so acute as to make further continuance of this waste and inefficiency a menace to the solvency of many railroads and to the national welfare, that your labor committee instructed its chairman to appear before the Board on January 31 and suggest immediate abrogation of these agreements, rules and working conditions.

It has been charged before the Railroad Labor Board by spokesmen of the consolidation of labor unions that our suggestion that these national agreements, rules and working conditions be abrogated is a part of a huge plot originating in Wall Street, to break down labor organizations. The record of the proceedings as outlined shows that the railways began opposing a continuance of these arrangements immediately after their properties were returned to private operation, when production in the country was at its height, when the demand for labor in all lines exceeded the supply, and before the so-called "open-shop" movement in other industries was begun.

### Railways Have Acted in Public Interest

The record demonstrates that the railways have acted throughout independently, primarily in their own interest, but also in the interest of the shippers, the farmers and industries.

That record completely disposes of the charge that we began and have continued the effort to prevent continuance of these working rules and arrangements as a part of any attack upon the labor organizations. What we have been trying to do, and all we have been trying to do, is to get the opportunity to deal with our own employees so as to restore the efficiency of labor on these railroads, and if possible avoid non-employment and defer serious wage reductions.

Our effort to do this cannot be construed as an attack upon the labor unions, except upon the assumption that efficiency of labor upon the railroads is incompatible with continuance of the strength and growth of the consolidation of labor unions, represented by Mr. Jewell and his committee.

The Railroad Labor Board rendered a decision upon our suggestions on February 10, holding that it could not approve the re-establishment at once of the agreements, rules and working conditions in effect upon each railroad as of December 31, 1917, because it could not assume without evidence that they were just and reasonable. The Board said that the duty is imposed upon it by the Transportation Act, of determining just and reasonable wages and working conditions for employees of carriers, and "all questions involving the expense of operation or necessities of railroads and the amount of money necessary to secure the suc-

cessful operation thereof are under the jurisdiction, not of this Board, but of the Interstate Commerce Commission."

It added: "This Board is not insensible, however, of the fact that the national agreements, rules and working conditions which are the subject matter of the dispute now being heard by the Board, do affect the expenditures of the railroads. If any of these rules and working conditions are unjust and unreasonable, they constitute an unwarranted burden upon the railroads and upon the public. It is, therefore, the duty of this Board to use the utmost practicable expedition, consistent with the necessary time for hearing and consideration, in determining whether any of the rules and working conditions now in effect are unreasonable."

The Board also denied our request that so much of its Decision No. 2 as fixed wages for unskilled labor be set aside and the prevailing rates for unskilled labor in the various territories served by any carrier substituted. The following is quoted from that part of its decision, relating to this matter:

"The boundaries of the power of this Board to decide controversies between railroads and their employees are set out in Section 307 of the Transportation Act. Section 307 (b) provides:

"The Labor Board upon the application of the chief executive of any carrier . . . shall receive for hearing, and as soon as practicable and with due diligence decide all disputes with respect to the wages or salaries of employees not decided as provided in Section 301."

"Section 301 provides that it shall be the duty of all carriers and their officers, employees and agents to consider disputes in conference between representatives designated and authorized so to confer by the carriers or the employees or subordinate officials thereof directly interested in the dispute. If the dispute is not decided in conference, it shall be referred by the parties to the Railroad Labor Board."

The recognition by the Board of the fact that the national agreements, rules and working conditions affect the expenditures of the railways, and that if any of these rules and working conditions are unjust and unreasonable they constitute an unwarranted burden upon the railroads and upon the public, is clear and helpful. We have proved that these arrangements are unjust, unreasonable, and are imposing an undue burden upon the railways and upon the public.

The present railway situation is so acute that we also hope that the Board will, to quote the assurance given by it in its decision, "use the utmost practicable expedition, consistent with the necessary time for hearing and consideration." The Board in its decision said it is "endeavoring to perform this obligation (of acting expeditiously) and will be better able to succeed in doing so if it is not further interrupted by the introduction of unwarranted demands by either party." We take this to mean that the Board will require both parties in future to deal solely with the matters actually before it, and will not yield to demands of the spokesmen of the labor organizations that it permits them to introduce a large amount of entirely irrelevant matter about alleged "conspiracies" against labor unions—demands obviously made to divert attention from the real issues and to cause protracted delays.

The decision of the Board upon our suggestion regarding the wages of unskilled labor shows that before this question will be given formal consideration it must be brought before the Board in controversies arising from conferences between the railways and their employees.

In one important respect the position taken by the Board regarding this matter is gratifying. It seems to mean that in future the Board will act, as it evidently was intended by the Transportation Act that it should act, as a court of appeal, and will not take original jurisdiction of any matter until it has first actually become the subject of controversy between the railways and their own employees. The contention that the Board should not take jurisdiction of any matter until it had been the subject of conferences and controversy was taken by the conference committee of managers in opposition to the demands of the consolidation of the labor organizations that the Board, without such previous conferences and controversy, should take jurisdiction of the question of national agreements, rules and working conditions. The conference committee of railroads has contended throughout that the steps necessary to bring the question of national agreements, rules and working conditions properly before the Board never were taken. It is the earnest desire of the individual railway companies to confer and negotiate with their own employees regarding all questions affecting wages and working conditions before these questions are taken before the Railroad Labor Board; and this is in accordance with the letter and spirit of the Transportation Act.

The decision of the Board upon our request for immediate approval of reductions in the wages of unskilled labor relegates the initiation of action upon this matter to the individual railways and their own employees.

The following resolution was later adopted by the association:

### Resolution Adopted by Executives

RESOLVED, That it is the sense of the Association of Railway Executives that the following fundamental principles should guide the railroads of the United States in their relations with their employees:

1. That the conduct of modern transportation is a great co-operative enterprise requiring for its highest success the honest and loyal co-operation of both employer and employee.

2. That Section 301 of the Transportation Act requiring every reasonable effort and conference and negotiation between each carrier and its own employees to avoid disputes which might result in interruptions to traffic should be complied with in spirit and in letter.

3. That one of the great advantages of private over government ownership and operation of railroads lies in the greater adaptability of individual railroads to the geographical, social, economic and operating conditions which vary greatly with different portions of the country.

4. That the restoration and maintenance of this variation is essential to private operation and to its ability to furnish efficient and economical transportation at the lowest possible rates.

5. That in view of the foregoing facts it is in opposition to sound public policy to require all railroads to operate under rigid and uniform rules and working conditions or under rigid and uniform wages, not only because it prevents efficient and economical operation but equally for the reason that it inevitably results in injury to and dislocation in other industry and to farmers and stock raisers, who are brought into competition with the railways for labor.

6. That under normal conditions the adjustment of rules and working conditions and of basic wages cannot successfully be made the subjects of national conference and negotiation, as that implies by its very nature a violation of the differing needs of the railroads and of the territories which they respectively serve.

7. That any insistence by leaders of railway labor organizations that their claims to recognition shall be admitted in violation of the foregoing principles can only result in precipitating a clear cut issue between the interests of the public in the conditions essential to efficient and economical railroad operation and the alleged interests of railway employees in standard and uniform wages and working conditions, regardless of the differing needs of the various railroads and of the widely differing character, needs and resources of the various parts of the country which they serve.

### Executives Ask Carriers to Negotiate With Employees

T. DeWitt Cuyler, chairman of the Association of Railway Executives, announced that, following the meeting of the member roads in Chicago on February 18, the following letter, signed by General W. W. Atterbury, chairman of the association's labor committee, had been sent to each individual road:

In previous correspondence numerous companies have indicated that the prevailing rate of wages of common or unskilled labor in their territory has greatly declined below the rates set by Decision No. 2 of the United States Railroad Labor Board of July 20, 1920. They have stated that they were being subjected to criticism because of failure to bring their wages for the same kind of labor into some fair relation to the now prevailing rate.

When I appeared before the United States Railroad Labor Board on January 31, urging the immediate abrogation of the national agreements, rules and working conditions, I also suggested some form of general permission which would enable the carriers to use the prevailing rate of wages for common or unskilled labor in other industries as a minimum rate for railroad employment. The decision of the United States Railroad Labor Board, dated February 10, holds that this matter can be raised only as a result of negotiations between carriers and their employees.

Accordingly, the adjustment of the wages of common or unskilled labor is a problem for each individual carrier to be handled by it in accordance with the conditions prevailing in its locality. Whether or not adjustment should be undertaken at this time, and what classes of common or unskilled labor should be affected, are questions of policy for the determination of each individual carrier. So, likewise, is the determination of the new rate of wages which the company attempts to negotiate. The only matter of common concern is that the procedure must be in strict accordance with Section 301 of the Transportation Act, and with the decisions of the United States Railroad Labor Board. This will in general require a thirty-day notice of a desire to meet and confer with duly accredited representatives of the classes of common labor proposed to be involved; the endeavor at such conference to negotiate a satisfactory reduction in wages; and, in event of failure, the certification of the dispute to the United

States Railroad Labor Board with such evidence as to prevailing rates of wages in other industries and decline in the cost of living as will in the opinion of the company tend to sustain the justness and reasonableness of the proposed reduction.

### The Board Replies to Jewell

The Labor Board on February 19 announced in reply to the requests made by Mr. Jewell for either a continuance of the hearings on national agreements until March 14 or the remanding of the controversy to joint conferences, that representatives of the maintenance of way employees would reply to the carriers' presentation beginning on March 1, followed by similar presentations in support of the demand for the perpetuation of the agreements made with the clerks, firemen and oilers and signalmen. Mr. Jewell will, according to the Board's ruling, appear before the Board on March 10. Mr. Jewell's request to remand this controversy to joint conferences between the carriers and the employees was ignored by the Board in its ruling.

### Decisions in A B & A and Missouri &

#### North Arkansas Cases

The disputes between the employes of the Atlanta, Birmingham & Atlantic and the Missouri & North Arkansas and these carriers—the hearings on which have been described in previous issues of the *Railway Age*—have been remanded to the parties involved, by decisions of the Board handed down on February 21. After reviewing the history of the case, the Board's ruling as to the Atlanta, Birmingham & Atlantic said:

In view of the fact that the record shows clearly that no conference has been held between the parties with reference to the justness or reasonableness of the wages fixed by decision number 2 of this Board, the Board does not deem it necessary to decide to what extent, if at all, a carrier's financial condition is a factor in the determination of just and reasonable wages to be paid by such carrier.

In the judgment of this Board the conferences heretofore held do not constitute a compliance with section 301 of the Transportation Act, for the reason that no conference has been held between the parties with reference to the justness and reasonableness of the present wages.

It is the decision of this Board that it is without jurisdiction to determine the present dispute until section 301 had been complied with by conference of the parties, the subject matter of which conference shall be whether the present wages are just and reasonable.

The Board further decided that further consideration of this dispute be deferred until it shall be made to appear that the parties have conferred and determined on the question of whether present wages are just and reasonable, based on the relevant circumstances as required by the Transportation Act, 1920, or until parties have refused to enter into conference on the said question.

A similar ruling was made in the Missouri & North Arkansas dispute, the following being added to the decision:

It is the opinion of this Board that the action of the carrier in reducing wages February 1, 1921, after an application for a hearing had been filed by the organizations interested was improper. However, extenuating circumstances exist in this case, particularly in that this Board failed to act in the premises prior to February 1. For this reason the Board does not deem it judicious to proceed under section 313 of the Transportation Act.

It is the decision of the Board that all employees, including those who have been laid off, on their being returned to service accept under protest the wages offered.

If the parties do not reach an agreement in the conference required by this decision the Board will set March 5 as the date of a further hearing of the dispute and will determine what wages are just and reasonable with reference to the carrier and will make its decision effective as of February 1, 1921.

If conference is refused by the carrier, this Board will proceed under section 313 of the Transportation Act, 1920.

FOREIGN TRADE amounting to more than 1,000,000 pounds sterling was carried by British commercial airplanes from the inception of the service in August, 1919, to the end of November, 1920.

## A Municipally-Operated Mountain Railroad\*

By A. J. Cleary,

Assistant General Manager, Hetch Hetchy Railroad

THE HETCH HETCHY RAILROAD, owned and operated by the city of San Francisco, Cal., begins at a junction with the Sierra Railroad, 26 miles east of Oakland and continues eastward for a distance of 68 miles to the Hetch Hetchy water supply and power project dam site. Its primary object is to transport construction materials for this dam. The railroad is standard gage, with a maximum grade of four per cent and a maximum curvature of 30 deg. Its cost was approximately \$30,000 a mile, or \$2,000,000 for the entire road.

For motive power we first experimented with engines of the Shay type, since the grade was regarded as steep for rod engines, and the curvature seemed to be rather excessive but the cost of maintaining geared locomotives was found excessive. Accordingly, specifications were prepared for a 90-ton Mikado locomotive which would be built to negotiate our grades and curves. This was furnished by the American Locomotive Company and is provided with a special lateral motion driving box. It has given no trouble whatsoever. It can make the trips much faster; it can haul as big a load, and its upkeep is much less.

Before the railroad was built hauling was done in that part of the country by motor truck and the cost was approximately 60 cents per ton mile for all types of freight. With a distance of 68 miles and 258,000 tons of freight to be moved, the difference between the cost of truck haul, the cost of hauling this freight by railroad at six cents under present conditions means a saving of several million dollars in hauling the city's construction materials alone. There are possibilities for hauling a great deal of freight which will be obtained from the timber interests that are now building mills along the railroad. That will be back-haul and will practically be clear profit, as we would have to build the railroad anyway, for handling our own materials. The tariffs which we put into effect at the start may appear excessive, but the cost of the railroad will have to be written off within a period of 10 years, and consequently the rate which we charge for carload lots is 12½ cents per ton mile.

From a passenger standpoint the Hetch Hetchy also has good possibilities. When the Hetch Hetchy dam is built the valley will be converted into a lake, seven miles in length and about a mile wide, which will have all of the beauties of Lake Tahoe together with the scenery of Yosemite. Overtures have been made to the Southern Pacific and the Santa Fe to take over the operation of the Hetch Hetchy Railroad eventually.

For hauling passengers we have used motor vehicles equipped with flanged wheels. We also do a great deal of our freight hauling, such as express service for meat and perishable provisions for the various camps by flanged wheel motor trucks. We find that we save a great deal of the cost of operation by handling all light freight in this same manner.

PUBLIC OWNERSHIP IN CANADA.—Unless the Dominion Government Cabinet gives the board of directors of the Canadian National Railways substantial support and a free hand in the broad principles of management and operation, public ownership of railways in Canada is doomed to failure. The board cannot be held accountable for the successful operation of the enormous railway property unless it be given sufficient financial help to buy needed equipment and to make necessary replacements and repairs.—*Canadian Engineer*.

The Montana Canyon as Seen from a St. Paul Observation Car

## The Use of Helpers in Electric Train Operation\*

Helper Cut in 100 Tons Ahead of Middle and Operated for Braking Over Summit and Down Grade

By W. F. H. Hamilton

Railway Equipment Department, General Electric Company

OPERATING WITH HELPERS is the common method for handling freight trains. The practice on the Chicago, Milwaukee and St. Paul was to put the helper (where only one was used) at the rear of the train just ahead of the caboose. The helper could thus be easily cut off to take water, and could be readily cut in to the train at the start and cut out the train at the summit of the grade. This method leaves one or two cars in the train, at the location where the drawbar stress changes from pulling to pushing, which are very nearly free and can change the slack either way easily. This causes trouble in handling the train and may be termed "floating slack."

It was also the practice with steam power to run helpers from the bottom of each grade to the summit; there they were cut off, turned, and then returned to their original stations, only occasionally being run clear over the hill.

Electric operation was started on much the same basis. The helpers were put at the rear of the trains while ascending the grades but were cut off at the summit and run around to the head-end of the train. There the two locomotives were connected in multiple unit and were used to control the operation down-grade.

This method of operation was tried for a month or so but the results were not entirely satisfactory. Signaling between locomotives was difficult because the trains were longer and the whistles on the locomotives were not as powerful as those on the steam locomotives. The road (leading) locomotive could not slack the entire train, which was necessary in case the helper was not ready to start and, when stopping, the engineer on the helper did not always realize it promptly. This resulted in drawbars being damaged to such an extent

that they were pulled out when starting again. Much of this trouble came from the "floating slack" near the middle of the train referred to above, and also because electric locomotives do not slow down as much with the application of load as do steam engines.

### How Helpers Are Now Used

The method was then tried of cutting the helper into the train about 100 tons ahead of the middle. This insures the slack being stretched out on all cars and makes starting easier because each locomotive handles practically its own tonnage. Also it was found practicable to keep the helper locomotive in the train while descending and allowing it to regenerate to assist in holding the train. This method of operation proved successful and has been used ever since.

The helpers all operate out of one station and normally run clear over the hill, returning with the next train in the opposite direction. Occasionally it is necessary on account of traffic movement to cut the helper out at the summit and let the road locomotive take the entire train down the grade. At such times both regeneration and air brakes have to be used in combination as previously described. Operating the helpers out of one station reduced the number of crews and locomotives required.

When ready to start on an ascending mountain grade with a helper in the train, the train brakes are released and the train is held by the independent brakes on the two locomotives. The engineer on the road locomotive "whistles off" and the engineer on the helper locomotive answers if he is ready. These whistles are not always heard, however. When the engineer on the road locomotive hears the helper "whistle off" or after waiting a reasonable length of time, he brings the controller onto the first or second notch and releases the independent brakes. This keeps the locomotive from roll-

\* This is the third of a series of three articles on this subject. The first (Railway Age, January 21, 1921), dealt with passenger service requirements and passenger train operation. The second (Railway Age, February 4, 1921), dealt with general requirements of freight train operation.

ing back against the train and as soon as the brakes release the controller is moved out slowly until the train starts, or until the current is as near the wheel slipping point as it is advisable to go. This stretches all the slack in the train as far back as the helper locomotive. The engineer on the helper locomotive watches the drawbar of the car forward of his locomotive and as soon as this stretches out brings his controller onto the first or second notch and releases the independent brakes on the locomotive. As soon as they have released he notches the controller out slowly and carefully until the train starts, or until his locomotive has reached as close to the wheel slipping point as it is desirable to go. After the train has started both engineers watch their ammeters and accelerate as close to the wheel slipping point as desirable until they have reached the full parallel position of the controller.

If, however, the train does not start in what the engineer on the road locomotive considers a reasonable time he notches back his controller slowly and allows the train to drop back gradually against the helper locomotive. This is a signal to the helper locomotive to be ready to start and as soon as the engineer on the road locomotive feels the jolt of the train bunching against the helper locomotive he again attempts to start as before. In cases where several attempts are made to start, this "rolling back" operation is usually repeated with increasing severity each time so that the engineer on the helper locomotive will have no doubt as to what is required. When the latter sees the train dropping back against him as shown by the drawbar of the car ahead, he brings the controller on the first or second notch and releases the independent brakes so as to be ready to start when the leading locomotive pulls the slack out of the train ahead.

In stopping the train, the engineer on the road locomotive notches his controller off slowly. This becomes apparent on the helper locomotive by the ammeters indicating a higher value of current and the helper locomotive engineer noticing this, notches back his controller to hold a slightly lower value of current than was required by the train while running. This process is continued until the train comes to rest when he applies the independent brakes and shuts off the controller. The engineer on the road locomotive does the same and sometimes applies the automatic air brakes to assist in stopping. This process of stopping requires as much or more care than starting and the control must be designed to give the proper steps both when turning off as well as when turning on.

It is really surprising how much information can be obtained from the ammeter on the helper locomotive and from the action of the drawbar of the car ahead. With a little experience and a reasonable knowledge of the profile so as to know where slowdowns may be expected it is possible to tell practically everything that the engineer on the road locomotive is doing.

When descending a grade the helper locomotive also regenerates to assist in holding the train. If the start down the grade is made at the summit and the train has to be pulled in order to start it, the helper locomotive engineer commences regeneration when he notices the drawbar on the car ahead show in. If the start is made from rest on the descending grade he commences regeneration when the first airbrake application is made at the same time as the road locomotive. The helper locomotive is only supposed to regenerate enough so that the road locomotive can readily control the train speed. This means that about 30 to 40 per cent of the load is taken by the helper and 60 to 70 per cent by the road locomotive. In case the helper does not regenerate enough the engineer on the road locomotive makes an application of the airbrakes and releases soon afterwards. The helper locomotive engineer notices this and knows it is a signal to increase the amount of regeneration.

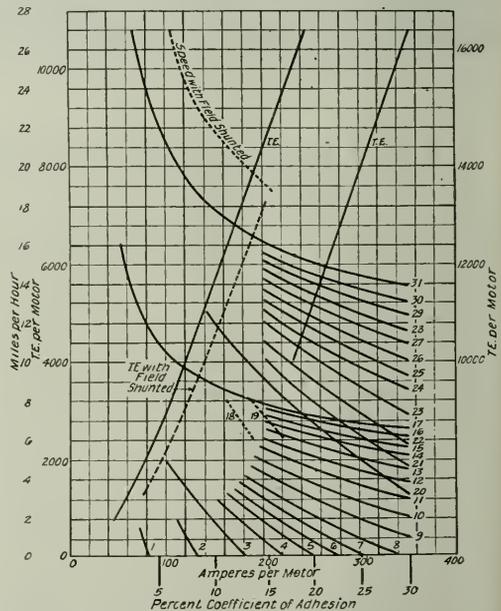

When stopping, the road locomotive engineer makes an

application of the automatic brakes and then shuts off his controller when the line current has dropped to about zero. The engineer on the helper locomotive does likewise and both allow their driver brakes to apply. After the train has stopped, the brakes are released on the helper locomotive and the train is held by the independent brakes on the leading locomotive only.

At the bottom of the grade the helper locomotive is cut out. The brake pipe pressure is also dropped from 90 lb. which is carried on mountain grades to 70 lb. A wise engineer applies and releases the brakes on the train twice, making heavy applications each time before starting as otherwise the brakes will stick due to what is virtually an overcharged brake pipe.

### Cold Weather May Cause Many Difficulties

The operation of starting on a mountain grade is fairly easy in good weather but in cold winter weather after the train has been standing an hour or so and the oil has con-

Speed-Tractive Effort Curves of Resistance for the Electric Freight Locomotives Used on the C. M. & St. P.

gealed in the journal boxes it is no easy matter. Care must be taken not to apply so much power that a drawbar will be pulled out of some car weaker than the others; this danger is always present in merchandise trains. One is often between "the devil and the deep sea," for if enough power is applied to really get the train going in good shape a drawbar or "lung" may come out; if less power is applied the train accelerates slowly and there is the possibility of not being able to accelerate to a running position of the controller before the rheostats overheat.

The friction after the train has been running for an hour or so is about the same as it is in warmer weather but it is very high when starting. Then too there is usually more or less ice and snow on the track which makes the locomotives slip their wheels easily and requires good sanding of the track and careful watching by the engineer. It is possible by notching back a couple of notches to catch wheels that have just started to slip but once they are allowed to

spin it is necessary to shut off and start over again. Wheel slipping, especially if it occurs suddenly on mountain grades, is dangerous in that the sudden shifting of load which takes place between the two locomotives is liable to pull out or push in a drawbar. Wheel slipping can usually be detected before it becomes serious by the "fluttering" of the ammeter needle and when this occurs an application of sand must be made promptly. This "fluttering" is noticeable whether the ammeter is in the circuit of the particular motor which is slipping or not.

The airbrakes give a great deal of trouble in weather colder than 10 deg. F. The hoses freeze stiff, usually when the train is standing more or less bunched; when it is stretched out again they leak badly or open up entirely. This often causes the brakes to stick and their action is uncertain at best. When the brake pipe is leaky the feed valve chatters because of the large volume of air passing through it and this is not only very disagreeable to one who has to listen to it continuously but the valve usually manages to freeze up in time and must be thawed out. Sometimes it freezes shut, in which case the brakes apply at once due to the leaks in the brake pipe; sometimes it freezes open and admits main reservoir pressure to the brake pipe. This means that the brakes will stick after it has been thawed because of the brake pipe being overcharged. In such cases it is best to attempt to keep the train moving, although it is sometimes necessary to shut the controller off in case the additional load due to the brakes dragging causes the current to go too high.

When an application of the automatic airbrakes is made on a long train, there is first a high pitched whistle which is caused by the air exhausting from the equalizing reservoir and this is followed, in maybe a second or less, by the deep roar of the air exhausting from the brake pipe itself. With a very leaky brake pipe the leaks may draw down the pressure faster than the equalizing valve in the brake valve can. In such cases only the first high pitched whistle is heard. This usually means a damaged drawbar before the train is stopped as in such cases the brakes apply hardest at the rear of the train and the train is stretched out. To counteract this an effort is made to draw down the brake pipe pressure faster at the brake valve by making as heavy an application as possible without actually going into emergency.

### Train Slack

Train slack is very peculiar and in a long train seems to give trouble in three sections; the head, middle and rear. The cars in these sections seem to run closely bunched together with considerable slack between the sections and this more or less free slack is always ready to start trouble. This is especially the case on lighter grades or nearly level stretches. There was a certain station on the C. M. & St. P. where there was a sag in the track with about 2,000 ft. of not over .4 per cent grade on each side of the sag. When running through this sag the controller had to be moved back to series in order to prevent too high a speed being attained, but still power was being applied to the train. Twice while the writer was instructing on this particular section of the road trains broke-in-two near the middle while passing through the sag. Apparently the rear end speeded up enough to overtake the head or middle portion and some cars came together enough to either uncouple, or else when the train stretched out again as it started to ascend the grade there was enough of a shock to pull out a drawbar or break a knuckle. These two cases happened within a short time of each other and give some idea of the unforeseen and unavoidable incidents which happen in freight train handling.

There was a certain canyon on the St. Paul where there were many curves on about an .8 to 1 per cent grade—just enough so that the train had to be held back a little at times

when descending and yet not enough to require heavy applications of the airbrakes. Application less than 8 to 10 lb. usually mean that the brakes will stick more or less after releasing so that with steam locomotives more or less trouble was experienced in taking trains through. With the electric locomotives regeneration is used instead and the need of the light applications is eliminated and operation is thus made easier.

### Locomotive Design

To meet the conditions of train handling, as outlined above, successfully the control equipment of the locomotives must be carefully designed so that sufficient rheostat steps and ample rheostat capacity will be provided. The acceleration curves on resistance of the C. M. & St. P. freight locomotives are shown on the chart. It will be noted that the change in tractive effort between notches when accelerating to a maximum of 25 per cent coefficient of adhesion is about 21,000 lb. for the total of 8 motors on a locomotive. The rheostats are designed to allow an acceleration at an average value of 210 amp. corresponding to about 16 per cent coefficient of adhesion for 25 minutes and 300 amp. corresponding to 25 per cent for 15 minutes. These capacities have proven ample in service but are not too large for winter work. It will be noted, too, in examining the curves that the steps are close together from the fourth notch to the eighth, inclusive, and are then spread out more. This provides steps close together at the most critical time in starting a heavy train. The increments in tractive effort between steps have always been satisfactory so that it may be assumed that the proper increment to use with this size locomotive is about 20,000 lb. to 25,000 lb. per step after the train is in motion.

The field shunting position gives about 50 per cent shunting which is about the maximum which can be used on account of the commutation of the motors.

It is necessary that the traction motors be so designed that they can have currents up to 20 to 25 per cent coefficient of adhesion applied for about five minutes with the locomotive stationary without injury to the commutator. This is often required in starting heavy trains. No trouble from this cause was ever experienced on the C. M. & St. P. locomotives.

Direct current locomotives using series motors for freight service have a great advantage as far as this work is concerned in that the tractive effort developed depends only on the current input and does not vary with the voltage. Therefore, variations in voltage do not affect the ability to pull the train or the current input but simply change the speed. There is some increase of heating due to slower speed of the blowers but this can be neglected for short periods. In case of reduction of voltage for any reason the trains can still be kept moving. The auxiliaries were designed to operate at a minimum of one-half normal voltage (1,500 volts) and some will operate as low as 1,000 volts, although at this voltage the air compressors will not pump up a long train. This feature is also made use of by the power limiting system which was described in the April 9, 1920, issue of the *Railway Age*.

They also have an advantage in that the speed during regeneration can be varied over quite a wide range especially if the train weight is below the maximum. This allows the lighter trains to make faster time and helps in getting trains over the road. When operating full tonnage trains on the mountain grades, practically only one speed is available ascending or descending, but there are usually stretches of lighter grades or nearly level track between mountain grade sections where it is desirable to use higher speeds.

Freight service in mountain railroading is far more fascinating than passenger service although, of course, it involves much longer and harder hours. It requires at times

the greatest skill, patience and resourcefulness on the part of the engineer, and this is not always appreciated by those who have not followed the work on the road, particularly in winter.

The writer would like to express his thanks to the engineers and others on the C. M. & St. P. with whom he was associated, particularly in the early days of the electrification, who worked out many of the methods described in this article and who also showed him many practical "kinks" in train handling that in considerable measure made the writing of this article possible.

## Freight Car Loading

WASHINGTON, D. C.

**F**REIGHT CAR LOADING during the week ending February 12 continued to decrease, showing a reduction of over 15,000 cars as compared with the week before, according to the weekly report of the Car Service Division of the American Railway Association. The total number of cars loaded with revenue freight was 681,627, as compared with 786,633 in the corresponding week of 1920, and 687,128 in 1919. The summary follows at the bottom of the page.

The number of surplus freight cars continues to increase and for the week of February 15 averaged 392,550. There were also scattering shortages amounting to 388 cars.

The Car Service Division announces that effective March 1, 1921, the district embargo zones with headquarters at Atlanta, Boston and Philadelphia will be consolidated into one zone with headquarters at Washington, D. C., under the supervision of the Car Service Division as district representative. The following will thereafter constitute the district embargo headquarters:

District embargo headquarters	Representative	Address
1. Washington, D. C.	Car Service Division	718 18th street, N. W.
2. Montreal, Que. ....	C. P. Riddel, District Embargo Chairman	263 St. James street.
3. Chicago, Ill. ....	J. Pelley, Chairman, Car Service Commit- tee	431 So. Dearborn street.
4. Winnipeg, Man. ....	E. J. Stone, District Embargo Chairman	Union Station.
5. Ft. Worth, Texas...	R. L. May, District Em- bargo Chairman	11 Touraine Building.

To minimize the expense incident to the present method of handling embargoes, some of the smaller roads which heretofore received embargo notices from district embargo head-

quarters at the points mentioned have been assigned to a designated trunk line connection for the purpose of receiving embargo information issued by other roads. There will be no change in the present method of placing embargoes by the roads affected. Where a road is shown as being assigned to a trunk line connection that road will receive all notices of placement of embargoes, modifications, extensions or cancellations direct from the designated trunk line connection which will promptly transmit such embargo information in the manner provided for in Circular CSD-37 and Supplement No. 2 thereto, due regard being given to the utilization of railroad wires where facilities are available.

NO SITUATION can possibly arise to excuse lack of good manners on the part of any employee. Courtesy is due every patron with whom we come in contact, rich or poor, well dressed or poorly dressed, no matter who he is. You will find that good treatment on your part to the patron will bring good treatment on the patron's part to you. He will treat you as well as you treat him. Courtesy always brings big dividends. It pays you, and it pays the company. It pays you, because it makes friends for you and saves complaints against you by patrons, thus raising your standing with the company. It pays the company, because the company is always judged by the conduct of its employees. Courtesy is simply the exercise of kindness and helps make life go smoothly. Nothing makes so many friends as kindness. Nothing adds so much to our own equipment and character. We can all be kind if we choose. It is true that kindness never fails of its reward. It is also true that discourtesy toward a patron under any circumstances is a betrayal of the company's interest. Practice courtesy, not some of the time, but all the time. Your record will speak for itself, should you be reported for some seeming grievance by a patron. If you are courteous to all patrons, the company will soon hear of it, because the public, as a rule, will find pleasure in praising your work. If your manner is discourteous, the public takes equal delight in doing all it can against you, and then the company's interests, as well as your own, suffer. Look above the weaknesses of individuals in the crowd and meet discourtesy with courtesy, impatience with patience. We can do much towards educating the public by example.—*E. E. Nash, general manager, Minneapolis & St. Louis.*

PENNSYLVANIA RAILROAD STOCKHOLDERS on February 1, 1921, numbered 134,743, an increase of 1,675, compared with that of January 1, and of 14,434, compared with the totals of February 1, 1920.

## REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

# Getting Better Results from Railroad Organizations\*

Subordinate Officer Occupies a Strategic Position, but Is Not Properly Trained to Fill It

By George M. Basford

**D**ISCUSSIONS ON REDUCING COST of transportation do not really begin before someone mentions the real key to the situation, which is effort of the individual all along the line to improve his production, to save. The next thing mentioned is the foreman and supervision. The foreman today is the most vital influence on the road.

Giving my conclusion first I am going to suggest what seems to me to be an absolutely unquestionable necessity on railroads today. I am going to suggest a foreman for a new job. The job is to take charge of the whole railroad organization, as an organization, as a general foreman of personnel, but the man would have a title and standing that places him next to the chief executive of the road. This officer would supply a missing link in our troubled days. The chief executive was formerly so close to the small organization that he could know every man. Not only did he know every man, but he handed to them, by contact, his ideals, his desires and his inspiration. As organizations grew this link was lost. It must be found again. At this precise point in the development of railroads, and in the present complication of their problems there is nothing to be done that will net as much as securing the co-operation of the rank and file for increased production and the reduction of cost of transportation. The minute the men in the ranks, on the track, in the shops, yards, terminals, trains and engines center their minds to the fact that the best thing they can do for themselves, for the railroads, and for the public, is to get busy to save dollars, the railroads will be saved.

It is not enough that some should be striving or that some departments should be organized for effective effort of the individual. It is necessary that the effort should be general, bringing departments into combined efforts. Now we hear men say, "I should worry, the coal is not charged to my department." To answer this there must be some way for these men to learn the policy of the road with respect to coal, and the policy with respect to everything they use.

## It Takes a Shock to Wake Us Up!

Is it radical, is it revolutionary to suggest a high officer for the exclusive administration of the organization as an organization, who will himself be a part of the policy of the company and whose duties are to see that everybody from himself down to unskilled labor understands that policy? Sometimes it takes a shock to wake us up. Right now we are having one. Until organization questions receive some sort of consistent attention we shall continue in trouble and in trouble that has a remedy.

How can anyone defend such a thing as this? An important department of one of our fine big railroads has not once in 30 years been presided over by an officer who grew up on that road and in that department, but in this time many importations have been made. All have been able officers but they came from "outside." Think this over!

Another big road recently had a narrow escape. A vacancy in a high position was about to be filled by an outsider when the president's attention was called to a man already in the service, who for years had been preparing for exactly that position. He was promoted. He has made good. Some say, "We need new blood." The answer is you already

have it. Circulate it. Every time a stranger is imported to a high position notice is served on the entire organization that it is useless for the individual to exert himself. This is just what has happened on many of our railroads. When foremen and men see this why should the men desire to be foremen and why should foremen wish to go higher?

"Give me a bunch of good foremen and the yard will run itself," says the ship builder.

## A Picture

Two years ago a large industrial organization started such a plan. It involves 15,000 men in a number of plants and includes a very large office and sales force in this country and abroad. A remarkable man was selected to manage personnel, training and promotion. He reports to the board of directors and works with the executive assistant to the president. Policies are established by conferences in which the personnel officer has a part. He carries these policies out through and with the organization, everybody knowing that he represents the highest authority. He has begun with recruiting, training and promotion questions, is developing co-operation such as is seldom seen and has made remarkable headway in better understanding among not only the different plants of the company but among the officers and men of individual plants.

To succeed the policies must be definite and the objects of the organization must be known. This officer is supplying through the organization itself that which was lost when great growth came. He is bridging the distance that was rapidly increasing between the executives and the men. He has established apprentice schools, workmen's schools and foremen's schools, which means that the foremen are studying men and methods of dealing with them and are becoming managers of men. The work he is doing is entirely applicable to the railroad, the small road as well as the large one. The railroad needs the facts he is collecting. Who have we got in our employ? What is he doing? What is he capable of doing when trained to do it? The roads need the job analysis he is making for his company and the system he is working out to find and fit men to the jobs.

## Chief Clerk

Let us think a moment how chief clerks are selected. It is a personal matter with the officer. Chief clerks sign the officer's name, take action for him in his absence. I have seen over one hundred officers of a certain road in conference for several days at headquarters here in Chicago—while the chief clerks ran the road. Because this is personal service these men are selected with personal care and from men who have been through long periods of training. Naturally they make good. We should therefore think of two things in this case.

First, these men are often good material for promotion. Think of this—the chief clerk is close to his superior. He absorbs from his superior the things that made that superior successful. He grows by his contact with a bigger man. This is training, of the sort that we are talking about. Moreover, the chief clerk is in an exposed position where good work shows up quickly and clearly. Let us get the obscure men up into a brighter light and see what happens.

Second, every man on the road must and does act for the

\*From an address before the February meeting of the Western Railway Club.

boss in his absence and should be selected with equal care and should be trained as well. Every man signs the name of the boss on every job he does and the railroad is about 150 ft. to 200 ft. wide and perhaps 2,000 miles long. The boss is away most of the time from most of his subordinates.

### Biggest Job on the Road

Someone has said that "the foreman is the top sergeant of industry." Nothing is more true or more important in any industry than this. The character of an organization is up to the character, ability and progressiveness of the foreman. No matter who or what the captain is, the company is practically useless unless the top sergeant is right. If the foreman is a timeserver, as sometimes he has been taught to be, the men will be timeservers also and the result is well known. Who on a railroad ever gets shop foremen or yard foremen together to tell them how important their jobs are and to show them that to their men they represent the railroad? Are they encouraged to know the manhood, ability and possibilities of their men? Does the foreman look with his own eyes alone or does he look with the eyes of the management? Does he know his men when off the job? Is he their friend and advisor?

How is a new foreman selected when a foreman leaves? He may be most skilled with his hands and may be most proficient with his own work, but he must know how to manage and operate the most complicated, most delicate machine in the world—a human organization with intricate problems always present. Is he usually told about the management of men and is he helped and supported as he should be in that management?

### Foremen's Schools and Meetings

Some big successful industries are getting to a point of appreciating what foremen can do and are already holding foremen's schools and foremen's meetings to bring these important men to see their own possibilities. Remarkable results are being obtained by leading the foremen to realize that they are really administrators of human affairs, that they require wisdom as well as ability, that an army is what its commander makes it, that the gang reflects the leader and that the leader must know and have the confidence of the men he leads.

In the question of shop foremen a new situation developed instantly when piecework was abolished. It is not true that piecework furnished the incentive to the individual worker, whereas incentive in earlier days had been supplied by the foremen? Under piecework the foremen deteriorated, in some cases to the mere checking of work. Foremanship received a knockout when, by piecework, men received more than the foremen did. When piecework disappeared this left many roads with foremen who were not trained at all and did not know how to furnish the incentive to the men. This is not the fault of the foremen, but of the system of things which changed. It confirms the opinion that the loss of inspirational contact has been serious.

### The Traveling Engineer

Is it possible that these vitally important men can get closer to the men on the engines and represent to them the ideals and the humanity of the wonderful organization of a railroad? There is no finer body of men than those who run our engines, but as a body what do they know, what do they see of the management? It is represented to them by rules, the breaking of which means trouble. These men can affect the treasurer's figures more than any other class of men on the road. For instance, they can improve ton-mile figures more than anyone else can. I believe that a 10 per cent saving in fuel lies in the hands of these men whenever the desire to save it is made an ideal with them and when the idea of saving is "sold" to them.

Here is the man who must be the manager of his men. He is often isolated and must rely on himself and frequently faces great difficulties of weather, lack of facilities, even of conveniences, and without sufficient subordinate supervision in his work. His work is a continuous emergency. A big roundhouse job is as big as the head of the department had a generation ago.

The new officer we are talking about would give the roundhouse foreman great encouragement, would help him get the facilities he needs inside and outside of the roundhouse. This officer would be able in a short time to provide him with trained men. Here is a good place for a start to be made in reducing idle time of engines. Here is where industrial intelligence counts heavily. Co-operation counts most of all. Dispatchers should understand the roundhouse. Traveling engineers should spend enough time there to understand how engines come in off the road.

### Track Foremen

Here are men who work alone. Weather, flood and unexpected trouble add to daily routine. Here training and encouragement count, as everybody knows who has had occasion to rely on these remarkable men in emergencies. In the case of track foremen industrial intelligence is of great value because of the nature and conditions of their work. These men have a wonderful opportunity to effect small savings that in the aggregate are huge.

### Recruiting Offices

Without a systematic method for taking recruits into employment, without insisting that employing officers should work to a certain plan or system the character of recruiting will depend largely upon and will be limited by the ability, the personality and methods of those who do the hiring. Various manufacturing plants employ highly trained recruiting officers in employment offices. Some concerns go so far as to employ psychological tests, others use intelligence tests, means for selecting recruits having become a science. We may hold different opinions as to the tests suggested and used, but it seems decidedly necessary that greater care in some form should be exercised, especially in recruiting for permanence. Those who have made exhaustive study of employment offices and recruiting offices in industries say that there is no case on record of this work having been abandoned when once started.

Employment management in industry has become a profession, devoting itself to getting and keeping men through uniform, consistent policies.

### Recruiting Along the Road

Let us select for various jobs young men and boys who are recommended because of character, physical ability and the necessary intellect. One way to select them is to enlist the aid of local officials along the line of road. Station and local officials of all departments may be asked to recommend those they know about or whose parents they know. The headmaster of the grade school or the principal of the high school, the clergy, and even the local judge may and will recommend the best material when they are interested to do so. Having in mind office boys, apprentices and young men it stands to reason that living along the line of the road they will already have an interest and an embryo undeveloped loyalty to the property from which the loyalty so greatly needed under present conditions may have promise of development. Wherever this is done the results have justified the plan and it seems worthy of consideration.

### Labor Turnover

To engage new men, teach them their duties and launch them into service costs a lot of money. To engage, train and then lose them in large numbers is a very serious loss. It is

one of the biggest leaks in industry. To hire and lose a skilled man costs from \$250 to \$300 in one industry which has been studied. It must cost railroads more than that because in many cases great damage is done by such men. I know of one large railroad shop which for three years in fairly busy times had not found it necessary to go beyond its own apprentice graduates to supply all the skilled talent needed and in that period no skilled workman was hired from outside.

### Inspiration

A large majority of men take pleasure in accomplishment of a good piece of work. Making something, repairing something or making a good run over the road brings satisfaction and is in itself an inspiration. Praise is often in order but must be used with discretion, so also censure. Notice taken in either case indicates that the company cares whether work is done well or not and most men will respond.

A road had three shops far apart and a flue job at each. One of the flue gangs had made a record. The leaders of the gangs at the other shops were sent to investigate. They went back and beat the record. This was not all. All three flue jobs were overhauled, new machinery installed and a lot of money saved. Mere expression of interest inspired those men to do good work and they were happier for doing it. It is a part of training of men to show them that the job they are doing is of great importance to the road.

### Friends

Everybody needs a friend. Every young man finds a turning point in his career, a point in his life when he wakes up to a realization of his responsibility and his opportunity. It may be that a word of advice, of caution, of recommendation given at the right time will make, and the absence of it will break a career. It is most fortunate if this friend is his employer or the representative of his employer, the foreman, the general foreman, the master mechanic, the train master, the chief dispatcher. In older days when organizations were small it was the boss himself. In these days of big things it is the representative of the boss. The most important thing a big organization can do is to provide the thing that bigness has outgrown—personal contact with big unselfish minds, minds big enough to give a point of view to an individual. The employer is really the best friend of the employee. If this is not true in any case it must be made true. Then it must be understood by every officer and every workman. How shall this be done? It must be somebody's business to get it done.

### Good Soldiers

Nobody ever wanted "good soldiers" as railroads want them now. Railroad men are good soldiers, but who are their leaders and why? Most men are followers, in fact everyone is a follower of some sort. We worship heroes and ideals. We follow leaders more able, capable or perhaps more dominant than ourselves. Shall we follow our superior? That depends upon their leadership and we are "company men" or "organization men" depending on the influences and their strength.

What is to be done about it when others lead our people away? Is there nothing we can do? Let us remember that the "old man" used to be the leader, and let us consider the possibility of regaining some of his leadership in the days that are to come. It will be needed. Men always have followed and always will follow those whom they think "get" them most. It is important to find a way to discover, recognize and reward individual ability.

### Discussion

Talking things over brings co-operation. When people get together for discussion responsibility is necessarily forced upon those present and the natural tendency is to look at

the question from the other man's point of view. This is the value of meetings, especially when the object is to reveal and develop the importance of the person who has a tendency to consider himself obscure and overlooked. Nothing in any organization helps so much as for this man and that man to stand up and tell in his own way what or who is holding him back. When the accused must answer the chances are that more complete understanding will be reached. The chief who is present is not the only one who will begin a liberal education from discussions with his foremen or his men.

### Apprenticeship

I use the word apprenticeship with hesitation simply because to most people it suggests merely "trades." It really represents training, thorough training of the hands, of the mind and of the morals of the lad. What we need today is a modern up-to-date substitute which will fit the times and the change from an employer with one employee to the multiple employer with thousands of employees. The principles involved remain the same. Let me quote from a report of a Massachusetts Commission on industrial training:

"In many industries the processes of manufacture and construction are made more difficult and more expensive by a lack of skilled workmen. This lack is not chiefly a want of manual dexterity, though such a want is common, but a want of what may be called industrial intelligence. By that is meant mental power to see beyond the tasks which occupy the bunch for the moment, to the operations which have preceded and to those which follow it—power to take in the whole process, knowledge of materials, ideas of cost, ideas of organization, business sense and a conscience which recognizes obligation."

Consider what the sort of training this suggests would mean in saving money for the railroads, applicable as it is to every department, every office, the track, the yard, the terminal, the roundhouse and of course the shop. Apprenticeship of this kind should not, by any means, be limited to the shops. Some roads, notably the Santa Fe, have faithfully developed apprenticeship and have enjoyed wonderful results. This road should be proud of the 1,506 graduates of its apprenticeship courses. What has been done with shop trades should now be extended to every department, every office and every job.

### Selling an Idea

Experience in selling something to people who think they do not want it would help the leaders of big organizations more than they know. An organization must have ideals. To succeed these must be sold to those who are to carry out the principles—to the official staff and by them they must be sold to the rank and file. Is the ideal of reduced cost of transportation sold to the men in the ranks? Do many of the men say, "What do I care? There is more coal, more material, and more time where this came from." When the ideal that the roads are working for is sold to the men the present labor problem will be simplified. Foremen and subordinate officials can and I believe will accomplish this in the future, but selling necessarily involves something to sell—which in this case is not lacking—and ability to bring the purchaser's mind to the need to buy.

### Looking Ahead

How are we to look ahead when we have so many troubles in hand? Troubles we shall always have and if years ago we had looked into the future on the personnel question our difficulties today would be less. If we do so now they will be less ten years from now.

In the development of railroads a lot has happened since the day when a road was so small that the superintendent was the only operating officer—when the master mechanic and everybody else, having to do with operation, reported to

the superintendent. The old "Czar" system has gone. In that system the "Old Man" held everyone's job in the palm of his hand, hired and fired as he liked, rewarded and punished as the old time head of the family rewarded and punished his children and there was no one to question him. In those days the captain of a ship held little more power than the railroad official.

There was something fine about the old method when the highest operating officer knew everybody. In spite of the faults of the system, which really was the best system for the time, it has left us some of the best traditions and has given transportation service some of the best of men. It gave co-operation. Co-operation had to be because there was someone on hand to enforce it. This effect of co-operation has probably done more than any other one thing to tie railroad men together and make so many of the old time railroaders feel that any man in railroad service was, in a large sense, a member of his own family. This feeling is not as strong today, co-operation is not as common, but it is, and will remain, a factor that we cannot do without. It must be provided.

Another feature of old time railroading was the training of men. I refer not only to apprenticeship, but to the careful training of every new man for his job. As a matter of course boys entering the shops were apprentices, so also were firemen, brakemen and switchmen and all the rest. In those days somebody had time to instruct new men. Whatever else we say of those days, certain features of the times indicate a thoroughness which we do not get today. In days of old, promotion was controlled by prejudice, by favoritism, sometimes by family ties, but with all the faults of the early days, men were seldom imported from other roads.

No one wants the old days back, but it is fitting to consider features of the old which should be provided with the new.

Some of these are the careful selection and training of new recruits, the spirit of the railroad men of older days, co-operation and the intimate knowledge of the men in the ranks on the part of someone in authority. Of all the things we need to take out of the past and apply to the future, the things we need the most are the selection, the training and the knowledge of men. Railroads are too big, even departments are too big to permit the operating officers to know who are working for them, but some substitute for these features of old times must be found. A way must be found for foremen at least, or sub-foremen, thoroughly to know the men working for them, their personalities, their capacities, their abilities and their qualifications for promotion. This and the selection and training of men may be supplied under present conditions and may yet make railroad service as happy as it ever was, but to accomplish this requires a lot of thought, a lot of time and a definite plan which will enlist the co-operation of the men. It calls for a high officer whose job it is to see it done.

When specially trained men were wanted in 1918, C. R. Dooley and staff delivered 100,000 trained men to the army in six months and had 40,000 more nearly ready when the armistice was signed. About 70,000 of them went across, men trained in 67 different trades. These men were selected as well as trained. Nothing that lies before the railroads is as difficult as that. The report which outlines the problem, the plan, the organization and the execution will open the eyes of any man who does not know about it.

When railroads start in to tackle their production problem in as thorough a fashion and with as complete a plan, cost of transportation will come down. Nothing will influence the workers as a real plan will do it. When they understand the plan, its objects and the country's need of it the workers will want to do their part and without their earnest efforts in co-operation success is out of the question.

There is no other way. An enlightened mind is the greatest asset on earth.

Our high official in charge of personnel cannot be expected to change the atmosphere of the organization quickly. He will not himself attempt to make the change. He will not himself attempt personally to train everybody. He will see that everybody on the road is trained, that every officer trains his own successor. He will see to it that men are specified and treated as carefully as steel and iron are. He will use the entire organization and will inspire everyone in it by concentrated effort to bring out the best in every individual in the direction of enlightened team work.

## Propaganda Against American Locomotives

**A**N UNUSUAL TRIBUTE to the locomotives supplied to the Belgian Government by the United States builders and some interesting comments on their assistance to Belgian railway transport because of their prompt delivery have recently appeared in the Belgian official publication—"Chronique des Travaux Publics." It appears that there has been current in Belgium some malicious criticism or propaganda against these locomotives to the effect that they have proved unsatisfactory in service and that the government committed an error in securing them at an exorbitant price. The remarks in the "Chronique des Travaux Publics" deny these allegations and show on the contrary that the American locomotives have proved eminently satisfactory and have given even better service than was called for in the contracts. It is further pointed out in the article in question that the contract calls for a deferred payment over a five-year period during which time exchange may return to par in which case the price of the locomotives will be anything but unreasonable—and, most important of all, it is further shown that the prompt delivery in much shorter time than deliveries have been made by Belgian or British firms has enabled the government lines to restore efficient service in a much shorter time.

The locomotives in question numbered 150. They were built by the Baldwin Locomotive Works and the American Locomotive Company. The contract for their construction was signed in Brussels on December 13, 1919. The first engine was completed at the Schenectady works of the American Locomotive Company on March 1, 1920. All of the engines were completed by June 15 and stripped and packed. All of them were in service by the first days of December, 1920. These engines have been described in the *Railway Age* in articles which appeared in the issues of April 9, 1920, (page 1144) and December 17, 1920, (page 1069).

The complete statement which appeared in the Belgian "Chronique des Travaux Publics" and which disproves the charges of inefficiency made against the locomotives built in this country is published herewith in translation:

The press has a great deal to say about the American locomotives recently acquired by the Belgian government. Those who publish the news speak of these engines in such terms that their absolute ignorance of the situation is evident. Several journals echo the ideas of the narrators who are spreading the opinion that the Minister of Railways has been tricked and has bound our railways under a ruinous contract.

The origin of these rumors apparently goes back to a report from Charleroi. It is said there that the government in buying American locomotives made a poor business deal and let itself be trapped by the promise of quick delivery.

In the first place it is said that the government, following the armistice, found in its shops only German engines constructed under different designs from our own. Furthermore, it is said that after having heard the advice of engineers the government decided to make certain changes in the design of these engines, viz., replace the original fireboxes and tubes with others of copper—more resistant to oxidation. This information is not cor-

rect, for it has never been proposed to make such changes. The government, on the contrary, is using steel tubes more and more for all its steam engines. It has recourse to brass tubes only when it finds it advantageous from a point of view of price or maintenance.

These journals have next resorted to a criticism of the American engines. Contrary to what has been said, it is the government itself which took the initiative in ordering these locomotives from America. It ordered 150 of them and they were all delivered on time. It is not true that they cost 795,000 francs each, because it is necessary to take into consideration the factor of exchange. Their purchase price was \$55,250, including tender, c. i. f. Antwerp. They were paid for in Belgian treasury bonds, payable in five years. There is a good chance that the dollar at the end of five years will approach par. If the dollar were at 10 francs, the cost of the locomotive would be 552,000 francs, and if the dollar returns to par this cost will be reduced to 280,000 francs. Moreover, even supposing that the price eventually paid is even 800,000 francs, did the government do wrong in giving the order? Yes or no, following the armistice, did we need locomotives? To ask the question is to answer it. On the other hand, was it possible to get them immediately from Belgian or English concerns? No.

Another untruth. The statement has been made that not only were the American locomotives purchased at a high price but that they do not give the service that was expected of them. If we are well informed, the American locomotives measure up to the most optimistic expectations, inasmuch as we are using them on the Luxembourg line, the hardest division of our railways—and all are giving the best of service. If a fault is brought to light from time to time, it can be excused by the fact that our own class "10" and "36" locomotives are not exempt from fault, either. The good quality of the American engines is proved by the significant fact that they are used in passenger service. The most important part of the locomotive—the boiler—is perfect. There is another important consideration which proves to what flights of fancy these critics have gone; that is, the manner in which they disregard the fact that the American locomotives were built according to the specifications of the mechanical department officers (du Service de la Traction), who have specialized along this line; Messrs. Corteil and Dasse and other engineers of the railways.

The conclusion of these critics is as far from the facts as the foregoing—that we have not sufficient motive power after having spent considerable sums to acquire it. The facts are that the amount of motive power has been increased sufficiently so that the government has proposed to let Rumania have 32 of our Consolidation type engines, 12 of the "35" class and 6 of the "30" class. The administration has, in addition, offered for sale 93 engines of the "28" class.

It is alleged, also, that the government, about to repeat its mistake, has instructed its engineers to draw up new plans. This is not true. It is said, moreover, that in ordering engines from the United States, the government injured the industry of the country. Now, the industry of the country has not been injured at all, because 100 locomotives were ordered in this country—to be delivered within the first six months of the new year—yet without anyone cherishing the hope of actually receiving them at that time. The same can be said of the English railway supply industry from which 200 engines were ordered to be delivered before December 15, 1920, and of which order no one expects even the first ten until April, 1921.

When all motive power is newly placed in service there are always certain modifications suggested by actual operation.

In operation the American locomotive measures up to the conditions of the contract agreed to by the builder. These conditions were: to haul 1,000 metric tons (1,409 short tons) at a speed of 36 kilometers (22 miles) an hour up a continuous grade of 5 millimeters (to the meter, or 0.5 per cent). It has hauled, however, with ease the load called for by the contract, not at a speed of 36 km., but at 42 kilometers (25 miles) an hour. It has shown great durability in road service and it operates on a curve of a radius of 120 meters (370 ft.).

It is only just to admit that in service the engine under consideration betrays some minor imperfections, due notably to the use of a metal of insufficient hardness for the brass work, to the absence of habbit on the bearings of the side and main rods and their insufficient lubrication. These are slight inconveniences which are easily remedied.

In a word, the American locomotives are giving entire satisfaction. They conform to the technical requirements imposed and they have today already given considerable service. Some have been in service since May and June, 1920. The last were put into service in December.

We will close these comments by directing attention to the following: We shall always defend the interests of our national industry, but there are unusual situations which call for immediate solution and which we must face squarely. This is the case of the order given to American concerns. Those who today permit

themselves to criticise blindly the course we have taken would cry still more loudly if, for lack of locomotives, the paralysis of our transportation system had remained of long duration. The exigencies of domestic commerce—the national economic rehabilitation—not being able to wait until our own industry could furnish the indispensable material, the state did well to acquire the locomotives from the United States as soon as possible.

Thanks to their being placed in service at an early date the government has been able to realize earnings from them at a similarly early date. This detail is not the least interesting feature of the question.

## President-Elect Harding Confers With New York Central Head

THE IMPORTANCE of the transportation question of the country, its effect favorably or adversely to the manufacturer, farmer and business generally, prompted Senator Harding to call into conference on February 18, A. H. Smith, president of the New York Central, who during government control was director of the eastern region. Senator Harding has been well acquainted with Mr. Smith for a long time.

They reviewed the conditions of operation and the financial status of the railroads at present, and prospects for the future, as related to the public need. Mr. Smith, after his conference with Senator Harding, said:

"Mr. Harding appreciates deeply the basic importance of transportation to the country's welfare. He intends to go into the situation in such manner as may enable him to determine so nearly as possible what it is that causes the recurring difficulties in the transportation situation.

"The measure of regulation as related to management is to be weighed. Where there is division of authority there must necessarily be joint participation also in responsibility.

"The fact is that large improvements and additions, as well as equipment, were added by the government during the war, at war-time prices, costing approximately one and one-half to three times normal prices, and have been placed upon the railroad carriers and capitalized into freight and passenger rates instead of being paid for by the government, as other war costs were paid for, together with the added costs of labor, and the national working agreements which were applied during the war and are still in effect—these things have forced the rates on freight to such a high figure in some instances that it is slowing down production and distribution.

"At the same time, railroads are meeting great difficulty in paying their obligations and are laying off men and stopping repairs and betterments in order to keep themselves out of bankruptcy, when they should proceed with such work so that the roads and equipment will be in readiness for use when required.

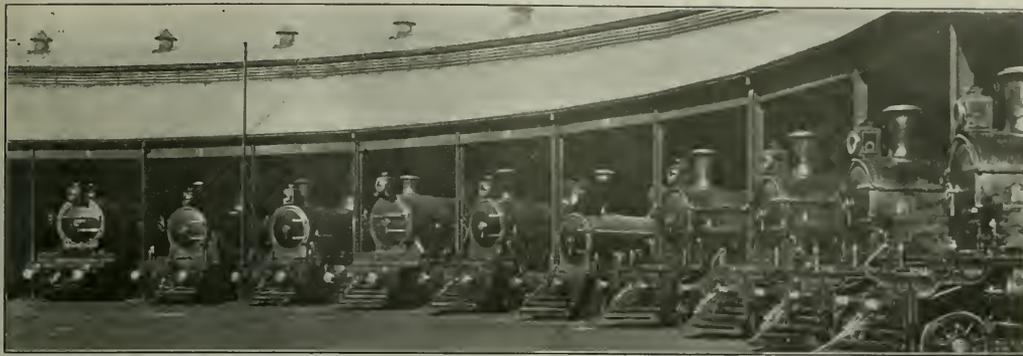

"For these reasons, Mr. Harding wished to be informed as to the causes of the present transportation situation."

ON THE PENNSYLVANIA SYSTEM alone about 95,000 tons of new steel rails and 5,300,000 new cross ties were used last year. Of the 95,000 tons of new rail laid in 1920, 82,500 tons, or 87 per cent, was heavy 130-lb. rail. The use of heavier than 100-lb. rail was commenced by the Pennsylvania in 1915 and at the present time only a small percentage of rail used on the system is less than 130 lb. Steel rails for 1920 use cost approximately \$48 a ton, an increase of \$8, or 20 per cent over the previous year's cost and 63 per cent more than the cost of rails ten years ago. Cross ties cost the Pennsylvania Railroad 32 per cent more in 1920 than in 1919 and 153 per cent more than ten years ago. Since 1910 the Pennsylvania Railroad has laid 1,347,289 tons of new rail and 56,230,904 new cross ties.

## British Railways Predominate in Argentina

The Central Argentine—A Typical Line—Is Well Equipped for Handling All Classes of Traffic

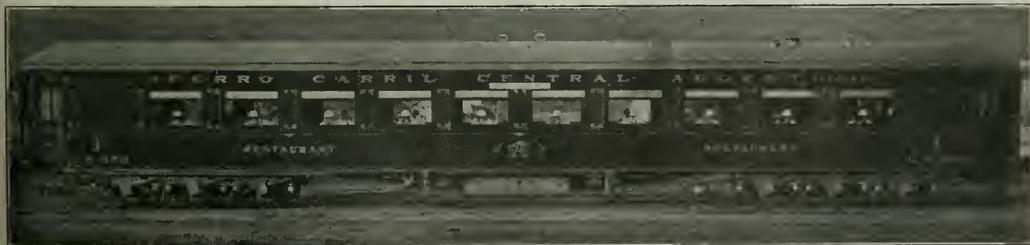

By John P. Risque

### Part II

**T**HE FIRST PART of this article, which appeared in the *Railway Age* last week, was, in the main, a general discussion of the railway situation in Argentina as a whole. In the present installment it is proposed to select a typical road and describe it in some detail, inasmuch as it would be impossible to give similar information about all of them.

The road that is chosen as being typical is the Central

Argentine, the tenderest and most important of all good-byes. The revenue from the sale of these tickets is said to contribute about \$30 a train to the coffers of the company—an item worthy of consideration at any large terminal. The tickets are dispensed by vending machines which work both day and night without any apparent interruption aside from the time required to refill them. One of the most interesting objects in Retiro station is the 1½ in.

Standard Dining Car of the Central Argentine

Argentine. We start our investigation of it at its New Retiro station in Buenos Ayres, which was described briefly in the first installment of this article. Before leaving that description, however, mention should be made of the feature of platform tickets and of the unusually interesting miniature Pacific type locomotive No. 191.

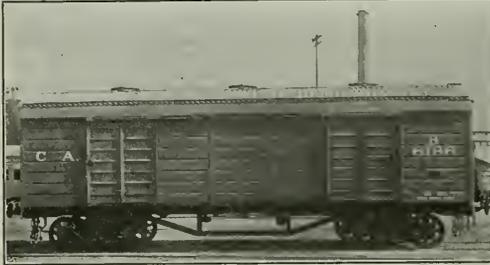

There is probably no country in the world where the institution called "platform tickets" has met with a greater response than in Latin America. Particularly is this true where ample platforms will admit of allowing, in consideration of ten cents a person, almost any number of people to pass the train gates to speed a parting friend on his way. For all Latin America counts that final "despedida," the last

scale model of the Pacific type passenger locomotive No. 191. This diminutive locomotive is mounted upon a mahogany base about three feet from the floor and enclosed in a glass case. Typical rails, ties and ballast support the machine the driving wheels of which are sufficiently raised from the rails to allow them to turn if one inserts a ten cent piece in the slot indicated for the purpose. All money collected is turned over to the orphan asylums of Buenos Ayres and in the little over five years during which this faithful little collector has been working, it has taken in the sum of over \$14,000 and is said to have turned its wheels sufficiently to have carried it all over the system and back. The coin makes an electrical contact which starts the motor, driving

the wheels and turning on a reflected lighting system which shows the engine details well. The reproduction is perfect and the model is well finished. Lagging and jacket on the left side of the boiler and the cylinders have been left off, as well as that of the dome, for the benefit of the critical, and an open front door of the smokebox reveals that the same attention to detail as that which marks the rest of the machine is shown in the layout of the superheater pipes and front end arrangements. The model is the product of the tool room at the Rosario shops of the line, mention of which is made below.

A map of the Central Argentine Railway reveals a tendency to extend in a northwesterly direction from Buenos

The passenger receipts of this line are aided by an extensive movement to the hills of Cordoba and Alta Gracia at certain seasons of the year, where at the latter resort, the company maintains the Sierras Hotel with accommodations for 300 guests. The almost perfect climate of this region is

A Pressed Steel Grain Car on the Central Argentine—  
Equipped with Manholes for Roof Loading

Ayres, the longest stretch being 694 miles from Buenos Ayres to Tucuman, the capital and largest city of the northern province of that name. Here connection is made with the Argentine Government Railways which extend to the potentially important town of La Quiaca, on the Bolivian frontier. A majority of the network of other lines operated by the Central Argentine parallel those which run from Buenos Ayres to Cordoba and Rio Cuarto. There are many branches crossing these lines at various angles, all of which combination well serves the rich agricultural and stock raising provinces of Cordoba and Santa Fe, as well as a certain section of the province of Buenos Ayres. The principal freight traffic of the line is made up of all varieties of agricultural products, live stock, hides, wool, flour, firewood, charcoal, timber and lime, which comes from the center of

Front View of Central Argentine Pacific Type

an attraction in itself, to which asset the railway has contributed a rifle range, tennis courts, golf links and facilities for other sports. Tucuman's mild winter climate permits many who can afford the expense of escaping from the rigors of Buenos Ayres' winter, and Rosario de la Frontera, a point

Old "Goods Wagons" on the Central Argentine Converted to Refrigerator Cars

that industry's activities in Cordoba, as well as sugar from the district of Tucuman, which is said to produce 100,000 tons per year. Large grain elevators are owned and operated by the company at Buenos Ayres, Rosario, Villa Constitucion, San Nicolas, Cerana and Santa Fe.

further north and milder still, attracts invalids to its thermal baths. Fast express service is maintained between Buenos Ayres and the outlying cities; the time to Rosario being 4 hrs. and 30 min.; Santa Fe, 9 hrs. and 25 min.; Cordoba, where the company recently completed a new passenger sta-

tion, 13 hrs; Alta Gracia, 14 hrs.; Santiago del Estero, 21 hrs. and 30 min.; and Tucuman, 23 hrs. and 15 min. The actual mileage under operation is 3,305 and there are 409 stations on the road. The equipment comprises 679 locomotives, 787 passenger cars, 18,592 freight cars and a miscellaneous assortment of service cars amounting to 836.

Apparently, the "crack" train of the Argentine is the famous "Rapido" on the run from Buenos Ayres to Rosario, a distance of 182 miles. This train maintains a speed of about 42 miles an hour for 4½ hours, the running time between the two points. The relatively short ride on this train is typical of the best that the country affords; the trip is recommended for those whose limited time would interfere with a longer absence from Buenos Ayres. The line is double tracked and stone ballasted all the way and the train generally is made up of a baggage car, a kitchen car, a 68-seat dining car, a parlor car and two first-class day coaches with seating capacities of 82 and 72, respectively, each with from two to three private compartments in the centers of the cars. The train is vested throughout and the dining arrangement is worthy of special mention. All food is prepared in the kitchen car and carried back to the diner. Meals are excellent and are served on the table d'hôte plan by a well organized squad which has been trained to see that passengers get the best of service. Good wines and beer are obtainable as "extras."

The Central Argentine has not been excepted from the struggle with the fuel problem; quiebracho, that famous hardwood of the country, is the principal item on the fuel bill. Oil, recently tried out on the Rapido's run, is scheduled for adoption, and preparations are being made to convert engines on a broad scale for oil burning. Conditions got so bad at one time, not so long since, that the locomotives on this line were compelled to burn corn, on the ears or otherwise—any way they could get it was agreeable.

The heavy passenger locomotives on the road are principally Pacific types of British manufacture, equipped with outside rods, pilots and headlights. The Briton's inevitable "streamline" design of the running board, extending from the front end to the windowless cab of reduced proportions, as well as the omission of sand box and bell and all of the other miscellaneous fittings that go on the boiler of the American locomotives, give these engines a trimness that is attractive. The locomotives are kept as immaculately clean as the interiors of the cars themselves and, while it is contended elsewhere that such details do not increase their effectiveness or show up on the balance sheet to an advantage, yet it must be admitted they show a pride of ownership in a manner which is entirely admirable. Of course, the labor cost of such maintenance in Latin America is low enough to make such care and attention possible. The freight locomotives are just as carefully designed from the standpoint of attractiveness as those in passenger service, and the best ones are of the 4-8-0 type, also with outside rods, and some have inclined cylinders. Superheaters are common but, due to the difficulties of securing replacements from England during the war, a number of the engines are said to be running at the present time on saturated steam. Rectangular running sheds (engine houses) are popular as locomotive terminals and are called "galpones."

The third and concluding part of this article will appear in an early issue of the *Railway Age*.

**PENSIONS ON THE LACKAWANNA.**—Since the operation of the pension system was started in June, 1902, the Delaware, Lackawanna & Western has paid a total of \$1,684,450 in pensions to 970 of its employees who were retired either for length of service or because of disabilities received in the service of that company. On December 31, 1920, there were 457 pensioners on the Lackawanna's retired list.

## 88 Railroads Operated in December at a Deficit

WASHINGTON, D. C.

**E**IGHTY-EIGHT RAILROADS, operating 79,151 miles, failed to earn their operating expenses and taxes during December, according to a preliminary compilation made by the Bureau of Railway Economics of the returns of 202 Class I roads and large switching and terminal companies to the Interstate Commerce Commission. These 88 roads had a deficit of \$20,173,000, while 114 roads, operating 153,289 miles, earned a net operating income of \$37,210,000. The 202 roads therefore had a net operating income for the month of only \$17,037,000, which was at the rate of only 1.17 per cent on the valuation fixed by the Interstate Commerce Commission for the purposes of the rate case. For the four months since the increased rates went into effect the net operating income of the roads has been \$233,147,000 or at the rate of 3.4 per cent instead of the 6 per cent which is frequently referred to as having been "guaranteed." In September the net operating income was \$75,000,000, in October it was \$85,000,000 and in November it was \$55,000,000. In September 49 roads failed to earn operating expenses and taxes, having a deficit of \$3,471,450. In October 41 roads operated at a deficit, amounting to \$2,586,733, and in November 64 roads had deficits, amounting to \$7,056,598.

According to the Bureau's compilation, the 202 roads in December earned total operating revenues amounting to \$550,608,000, an increase of 21.5 per cent as compared with December, 1919. Operating expenses amounted to \$498,265,000, an increase of 20.2 per cent. The net operating income of \$17,037,000 represents an increase of 24.1 per cent as compared with December, 1919. These figures do not take into account lap-over items growing out of settlements with the Railroad Administration.

For the calendar year 1920 the Class I railroads had a net operating income of only approximately \$72,000,000, which represents a return of only a fraction of one per cent on their valuation. Moreover this includes about \$50,000,000 which was included in the January accounts by the Railroad Administration as an estimate of the back mail pay owed by the Postoffice Department which has not yet been paid but for which an appropriation bill is pending. For the first eight months of 1920 the roads will ultimately receive a guaranty at the rate of \$70,000,000 to \$75,000,000 a month, or around \$600,000,000 after allowing for the deficits. Since September 1 the roads have earned about \$233,000,000 net which added to the guaranty would give the companies a return for the largest year's business they ever did of something less than the amount of the annual guaranty for the period of federal control.

Out of 194 roads whose returns for December and 12 months were published in last week's issue of the *Railway Age*, 95 had deficits for the year after paying expenses, taxes and rentals.

The preliminary report of revenues and expenses for December as compiled by the Bureau of Railway Economics is as follows:

	1920	1919	Per cent of increase 1920 over 1919
<b>Total operating revenues:</b>			
Eastern District .....	\$254,351,000	\$199,744,000	27.3
Southern District .....	87,790,000	73,657,000	19.2
Western District .....	208,467,000	179,903,000	15.9
United States .....	550,608,000	453,304,000	21.5
<b>Total operating expenses:</b>			
Eastern District .....	237,007,000	191,459,000	23.8
Southern District .....	77,104,000	65,023,000	18.6
Western District .....	184,154,000	157,936,000	16.6
United States .....	498,265,000	414,418,000	20.2
<b>Net railway operating income:</b>

## December Freight Car Performance

WASHINGTON, D. C.

THE NET TON-MILES of freight handled by the railroads in December aggregated 34,722,365,000, according to the monthly bulletin of freight car performance compiled by the Bureau of Railway Economics. This represents a decrease of about 2,700,000,000 ton-miles as compared with November, but an increase of 3.3 per cent as compared with

December, 1919. The corrected cumulative figures for the year have not yet been compiled, but the total ton-mileage for 1920 was approximately 445,000,000,000, which breaks all previous records for a year.

The average carload, 31.2 tons for December, was the largest ever recorded for a month, but the average miles per car per day fell to 24.8 and the percentage of unserviceable cars increased to 7.9. The summary of the report of the Bureau of Railway Economics follows:

Region	Net ton-miles (thousands)	Frt. car-miles (thousands)			Freight cars on line daily		Efficiency ratios		
		Total	Loaded	Per cent loaded to total	Total	Unserviceable	Car-miles per day	Tons per car	Per cent of unserviceable cars
	1	2	3	4 = 3 ÷ 2	5	6	7 = $\frac{2+5}{31}$	8 = 1 ÷ 3	9 = 6 ÷ 5

## Great Increases in Number and Wages of Employees

Statistics Show There Were 2,200,000 in August and Wages Running at Annual Rate of Over \$3,800,000,000

STATISTICS RECENTLY compiled by the Interstate Commerce Commission and the Bureau of Railway Economics throw new light upon the extent to which the number of railway employees and their wages have been increased, especially under government control, and the actual cost of the advances in wages which were made during the period of federal control and later by the United States Railroad Labor Board.

The Commission's statistics showing the number of employees on Class I railroads and their total compensation for the two quarterly periods from January, 1920, to March, and from March to June disclose that the average number of employees during this six months' period was 1,999,142. Their total compensation, exclusive of the compensation received as back pay under the provisions of the Labor Board's award of July 20, was \$1,596,680,238. Using the latter figure as a basis, multiplying by two to obtain the yearly payroll, exclusive of the Board's wage award, and adding \$417,000,000, the estimated wage increase in eight months of 1920, it will be found that the railroad's total payroll in 1920 was about \$3,610,000,000.

In 1917 the average number of employees on Class I railroads was 1,732,876. Their total compensation was \$1,739,482,142. According to estimates based upon the Commission's figures, therefore, there was an increase of 266,266 employees and an increase in the annual payroll of \$2,078,517,858 between 1917 and 1920.

Again, using the yearly payroll figure, indicated by the statistics for the first six months of 1920, and adding \$625,000,000, a full year's wage increase under the Labor Board's award, it will be seen that the railroads' payroll following the wage award was at the rate of \$3,818,000,000.

These estimates are made upon the assumption that the number of employees remained the same throughout the year. This, however, was not true. Beginning in April the number of employees in service increased each month, the highest mark being reached in August when, according to figures prepared by the Bureau of Railway Economics, there were 2,210,000 employees. This represented an increase over the April number of 257,554 employees and over 1917 of at least 500,000 men.

Beginning in September the carriers, pressed with the necessity to reduce operating expenses in the face of a rapidly declining traffic, began to curtail their forces. By the end of the year approximately 300,000 men had been laid off. From this it can be seen that the reductions which were made in the working forces were almost offset by the increases which had been made earlier in the year.

The statistics which have been prepared by the Bureau of Railway Economics and which are given in the accompanying table, show in detail form the increases which have occurred in the number of the various classes of railway employees and in their total and average annual compensation. In general they illustrate the enormous increases in compensation and in number of certain classes of railway employees which work under the national agreements and which are now seeking their continuance. The data which are shown for 1920 is estimated on the basis of returns covering the months of January, February and March, 1920, to which has been added the additional compensation which would accrue to each class under the increased wages.

It will be seen from this table that the largest increases in the number of employees took place among foremen in the mechanical departments, machinists, boilermakers, blacksmiths, electricians, air-brake men, car inspectors, car repairers and mechanics, helpers and apprentices, hostlers and enginehouse men, all employees who work under the national agreement formed during federal control between the shop crafts and the Railroad Administration. These same classes of employees have received in the majority of cases increases ranging from 70 to 126 per cent.

Another interesting fact disclosed by these statistics is that every class of railway employee, with the exception of messengers and attendants and other unclassified workers, now receive at least \$1,200 per year. Six groups, namely, general mechanical foremen, train dispatchers and directors, yardmasters, road freight engineers and motormen, road freight conductors, and road passenger engineers and motormen, receive over \$3,000 per year. Of these the road freight engineers and motormen are the highest paid, receiving an average annual compensation of \$3,579. Again, 39 classes of employees out of 66 now receive \$2,000 per year or more.

## States to Attack Constitutionality of Transportation Act

WASHINGTON, D. C.

THE CONSTITUTIONALITY of the transportation act, not only as to its provisions under which the Interstate Commerce Commission has been increasing state rates to prevent discrimination against interstate commerce, but also as to the rate-making rule which provides for a 6 per cent return on the aggregate value of the railroads, is to be attacked in the Supreme Court by representatives of the state authorities on February 28 in connection with the argument on the Wisconsin rate case. This case is the first of the state rate cases which have arisen from the Interstate Commerce Commission's orders under the provisions of the transportation act to get before the Supreme Court. It comes up on an appeal by the Wisconsin state authorities from the decision of the federal court for the Eastern district of Wisconsin, which granted an injunction asked by the roads restraining interference with the Interstate Commerce Commission order advancing the Wisconsin intrastate rates. The Interstate Commerce Commission now has rendered its decision in the cases arising from the failure or refusal, in whole or in part, of a dozen states to put into effect the percentages of increase authorized by the federal commission in Ex Parte 74 and it has uniformly ordered increases by the amount of the percentages applied to interstate rates, with certain minor exceptions such as commutation or short distance coal rates.

### Conference of Attorneys General

A conference of attorneys general and rate counsel of the several states having cases pending before the Interstate Commerce Commission in which the commission is proceeding to advance state rates, or having litigation pending in the courts growing out of orders lately made by the commission attempting to advance state rates, was held at the office of John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, in Washington, on February 16 and 17, to consider pending rate litigation and whether they should file a brief in the Wisconsin rate case.

Attorneys general or state counsel were present in person or by representative, or sent written approval of the objects of the conference, representing the states of New York, North Carolina, South Carolina, Florida, Ohio, Indiana, Illinois, Michigan, Wisconsin, Iowa, Kansas, Missouri, Louisiana, South Dakota, Nebraska, Texas, Montana, Utah, Nevada, and Arizona.

It was unanimously determined by the conference to file a joint brief in the Wisconsin case together with the state commissions represented by Mr. Benton.

The following statement was issued by the conference:

"The attorneys general and counsel present severally represent states whose sovereign rights to regulate their own internal commerce, and the rates and charges imposed upon the public for transportation of the same, have been already invaded, or are now threatened with invasion, under the Transportation Act of 1920. It is their duty to enforce the laws of their respective states, and to protect their peoples in the enjoyment of those rights and powers which were reserved to each state under the federal constitution.

"They believe that the Transportation Act of 1920 under which the Interstate Commerce Commission claims to exercise power to set aside the state statutes, and orders, rules and regulations in force under state laws ought to be declared unconstitutional for the following among other reasons:

"1. As construed by the commission, it is destructive of our dual form of government and contrary to the spirit of our institutions. From the very formation of the government there has been no question as to the constitutional right of the

people of the several states to control purely intrastate traffic. This principle was upheld by John Marshall and has been uniformly admitted by all the courts of the United States to this time. The construction placed upon the Transportation Act, if sustained by the Supreme Court in the Wisconsin case, will overturn this established principle of constitutional law, and will centralize in a body of 11 men sitting in Washington power over the entire commerce of the United States, both interstate and intrastate.

"2. It prescribes a fixed return on railroad capital regardless of business conditions. Under such a law, if prices fall and traffic grows less, railroad rates increase. The commission is commanded to make rates that will yield a fixed return without regard to the value of the transportation service rendered. This is not only economically unsound, but it is violative of fundamental law.

"3. Under the group plan it commands the commission to fix an aggregate value and make rates that will yield in the aggregate the fixed return thereon. The worthless roads of the country, ill-considered ventures, duplicated lines, speculative enterprises, roads that have served their useful purpose and outlived the industries that once justified their construction—roads that perform no sufficiently useful service in the actual movement of traffic to enable them to earn—are valued with the good, and the roads that can earn, because they are the highways of commerce and traffic must move over them if it moves at all, regardless of the rate imposed, are given by this law the right to earn on their own value and the values attributed to the other roads as well. In the exact words of the act, this will enable such carriers 'to receive a net railway operating income substantially and unreasonably in excess of a fair return upon the value of their railway property.' One-half of the unreasonable excess is to be taken by the government, to be loaned to carriers or expended for equipment to be leased to them. The half that the government thus takes is an unjust tax to be expended for a selected class. The half that carriers are permitted to keep is in excess of the fair return they are entitled to by the common law. Both the half which nominally goes to the government and the half that the carriers keep represent an excess burden laid on shippers, whose right to a fair rate under the constitution is equal to the carrier's right to a fair return on its property. Because the law aims to compel the commission to disregard this right it violates again the fundamental law.

"For these and other reasons the public officials here represented deem it their duty in the first case before the United States Supreme Court involving the Transportation Act to challenge both the construction which the commission has placed upon the Act and its constitutionality as well."

A Head-on Collision on the Cambrian Railway, Wales, Resulting from Failure of Employees to Obey Rules Under Staff System of Operation

# What Determines Adequacy of Railway Maintenance

A. R. E. A. Formula Offers Basis for Arriving at Settlement for  
Federal Control Period

By J. P. Hallinan

THE RETURN OF THE RAILROADS of the United States to their owners under the Transportation Act of February 28, 1920, brought the necessity of an early settlement of accounts with the Government for its occupancy of the proprietors, and in this adjustment some questions are being raised which seem to merit the attention of owners.

It will be recalled that the sequence of events preceding the execution of a contract between the various roads and the Government was as follows:

1. By a proclamation dated December 26, 1917, the President, acting under the powers conferred on him by the Constitution and laws of the United States, by the joint resolutions of the Senate and House of Representatives, bearing date of April 6, and December 7, 1917, respectively, and particularly under the powers conferred by Section 1 of the act of Congress approved August 29, 1916, entitled "An act making appropriations for the support of the Army for the fiscal year ending June 30, 1917, and for other purposes," took possession and assumed control, on December 28, 1917, through a director general of railroads, of all the railroads of the United States.

2. By an act approved March 21, 1918, called the Federal Control Act, Congress authorized the President through such agency as he might determine, to enter into an agreement with the owners for the maintenance and upkeep of the properties previously taken over, as well as for the determination of compensation and respective rights and obligations.

3. By a proclamation dated March 29, 1918, the President authorized director general of railroads to execute agreements in accordance with the Act of March 21.

At the time the Government assumed control of the roads, which, it is evident from the foregoing, was a wartime measure, the necessity for immediate and complete command of transportation facilities was recognized by the owners of the roads as well as by the authorities of the government. Difficulties of transport and of financing had arisen which could be solved only by consolidation of resources under unified direction backed by competent authority.

After the assumption of control had been recognized by Congress, a general form of contract was prepared. Investigation into the conditions attending the operation of individual roads, which under ordinary business procedure would be entered into prior to formulating a contract, was precluded by the urgency of the situation, with the result that the contract, as entered into, dealt only with average conditions and was expressed along very general lines. Condensed in a single statement, the contract provides that the government take over the railroads as of midnight of December 31, 1917, at an annual rental equal to the average annual net earnings for the three-year period ending June 30, 1917, and will return them in substantially as good condition as when taken over, subject to degree of use. The measure of compensation is clearly stated and the amount of compensation was readily ascertainable from the records of the Interstate Commerce Commission.

The intent of the government to return the properties in as good condition as when received is stated with equal clearness but no measure of maintenance is provided and none

was available from the records of the Commission beyond general comparisons of expenditures, affording no means of determining the character or adequacy of maintenance of road and equipment in detail with due regard to use, nor of the appurtenant facilities. Under these conditions and in view of the evident necessity of setting up some standard of maintenance, the upkeep section of the contract provides: "that the annual expenditures and charges—or the payment into funds of an amount equal in the aggregate—to the average annual expenditure and charges during the test period—shall be taken as a full compliance" with the agreement to return the property in substantially as good condition as when taken over. It further provided that: "due allowance shall be made for any difference that may exist between the cost of labor and material—and the average for the test period and—for any difference in use—so that the result shall be, as nearly as practicable, the same relative amount, character and durability of physical reparation."

It is apparent that upon the settlement of accounts, no difficulty need be experienced in adjusting the claims for compensation. A fixed rental per annum for a definite term is a purely accounting matter. The application of accounting values, however, to physical reparation, requires comparison of the physical condition of the property at the beginning and at the end of the period covered. Unfortunately, the exigency of the situation did not permit a joint inspection at the beginning of federal control, and it was not provided for upon the return of the property, so that the roads now find themselves in many instances confronted with a statement of over-maintenance in point of money expended on a property clearly in need of immediate physical repairs. In such circumstances, it seems proper to examine further into the equities involved and to arrive, if possible, at some measure of maintenance that can be fairly applied, and that will take into consideration the degree of use.

If we consider a property that is comparatively new, on which the cycle of wear has not come fully into operation, a property still in the development period, with its traffic rapidly increasing, it is evident that its expenditures for maintenance during any three-year period will have been less than normal—and the question then becomes, not what amount per annum had been expended on maintenance during the test period, but what amount should normally have been expended, with relation to its traffic, had the rate of wear been then determined. Fortunately, this subject has previously been investigated, though from a different angle and for an entirely different reason. It was studied in detail by J. B. Berry in 1902, when considering the effect on maintenance charges of contemplated reductions in grade on the mountain divisions of the Union Pacific, and was carried on by other engineers through the committee on Economics of Railway Location of the American Railway Engineering Association. In 1913 this committee under the direction of A. K. Shurtleff, chairman, made an exhaustive investigation of the maintenance accounts for 1911, of 53 of the leading railroads, and as well of the accounts by divisions of a single system having 8,000 miles of track, for a period of four years. From the average values thus ascertained a formula was deduced which permits the scientific operation of wear due to age or decay from that due to traffic,

and the consequent calculation of the additional amount required for adequate maintenance by reason of increased use, under average conditions, on the average road.

The full report of the committee is published in the Proceeding of the American Railway Engineering Association; but as the formula has been found peculiarly applicable to the situation under discussion, the basis is stated briefly. Mr. Shurtleff departs from the sole factor of freight ton-miles generally used as a traffic comparison, and takes into consideration all other factors of mechanical wear, arriving at a basis termed equivalent ton-miles, composed of the following:

- (1) Net freight ton-miles (including company freight).
- (2) Freight train car miles times average weight of empty cars, excluding caboose.
- (3) Passenger train car miles times two times average weight of cars and contents.
- (4) Freight locomotive-miles times two times average weight of locomotives.
- (5) Passenger locomotive-miles times four times average weight of locomotives.

This assumes, based on evidence accumulated by the Association, that a freight locomotive exercises twice the destructive effect on the tracks of a freight car, a passenger locomotive four times and a passenger car twice the effect of a freight car.

The factor of use was arrived at by taking the average life of materials in each account considered and comparing this with the average life under the definite volume of traffic reported. In the case of the renewals, for example, the proportion of renewals due to decay was found on the roads considered, to be 6.5 per cent of the total in the track, and the additional renewal due to traffic was found to be 0.3 per cent per million equivalent ton-miles or an addition of 0.046 per cent (per million equivalent ton-miles) to the 6.5 per cent annually renewed because of decay. Where the ties decay faster, the additional percentage due to traffic remains approximately correct. The proportion of wear in sidings, as compared with the main line for the average road is, of course, subject to increase on roads having a dense mining or manufacturing traffic where the sidings come into greater use.

It is believed that by the use of the A. R. E. A. formula in combination with the average values and rates of wear from which it was deduced, a fair basis may be established for comparison of expenditures for maintenance on all primary accounts affected by traffic. Necessarily, account must be taken, in applying average values, of important differences in physical characteristics, as of excess curvature when considering rail wear.

A concrete instance that has recently come under the writer's observation is that of a short line put into operation in 1910. The cycle of wear on this property did not come into full operation until 1918 and 1919, the period of Federal Control. Based on expenditures during the test period, properly equated in accordance with the language of the contract, the government rendered a bill for over-maintenance amounting to nearly a million dollars. Legally, the position of the government was perhaps sound, but in equity it was decidedly unsound, as it was very apparent that the property was under-maintained. Upon investigation of primary accounts, it was found that on accounts affected by traffic (which had nearly doubled during the period of federal control), the actual renewals were but slightly greater and in some instances less than during the test period, although during that period the cycle of wear had just commenced to operate. Application of the A. R. E. A. formula to these accounts, and taking as a base the less than normal expenditures during the test period, developed a standard of maintenance which, when applied to the expenditures during the period of Federal Control, showed a

net deficit of more than half a-million dollars, a situation more in keeping with the actual physical condition of the property.

On maintenance of equipment accounts, a similar difficulty was experienced in arriving at a measure of maintenance, the condition as to money spent and actual upkeep being as irreconcilable as in the accounts of maintenance of way. This was finally solved by the application of the factor of car-days of home cars in use for comparative expenditures on rolling stock and that of locomotive-miles per 100 tons weight per 100 man-hours repairs, as the factor most clearly indicating the adequacy of maintenance of locomotives.

In this investigation an interesting sidelight was thrown on the effect on efficiency of an administration highly centralized and detached from individual responsibility. In this case the result was a progressive loss in efficiency and in morale in all departments, although the organization was practically the same as under corporation management, a condition which the writer believes, from experience in other countries, is inherent in all government operations of a civil character.

In applying any measure of maintenance, it is held that quantities, or materials applied, should be considered wherever possible, instead of money or book values, on the principle that the return of a property in equivalent physical condition for equivalent physical use can only be accomplished by the continued physical replacement of materials worn out, and the practical conclusion that a property cannot be said to be maintained if the rate of wear is allowed to become excessive.

For a short time—a very short time on a railroad under heavy traffic—financial equivalent may take the place of physical betterment, but eventually actual materials are required in constantly increasing quantities as maintenance is deferred, up to the point where traffic ceases, and maintenance becomes reconstruction. Accounting values can be a criterion only when taken in connection with application of materials at the time and in the quantity required to keep pace with the rate of wear.

The suggestion to apply the A. R. E. A. formula and average replacement quantities in the adjustment of accounts for the use of the railroads by the government does not proceed from a partisan viewpoint. As a matter of fact, its use will be found in many cases to justify an apparently excessive expenditure during federal control on roads where in the test period. It may be made to serve, also, as a re-transportation plant had not been fully maintained durable guide for appropriations for future maintenance (the purpose for which it was originally designed) and as a rather eloquent measure of administrative efficiency.

Construction of a Railway from Dover, England, to Folkestone, the First Step in the Building of the English Channel Tunnel

# Railway Terminal Problems of Greater New York\*

## Freight Terminals in New Jersey and Rail-Head Piers Proposed to Eliminate Waste of Water Transport

By J. J. Mantell

Manager, New York Region, Erie Railroad

**T**HE TRANSPORTATION PROBLEM in the metropolitan district is one about which considerable has been said and written. We have seen the business which moves through the port of New York increase to such proportions that the imperative need of improvement in the situation has become apparent, even to the layman. Only by the co-operation of transportation, commercial, industrial, civic, state and national bodies for a common purpose will some real practical solution of the problem be forthcoming. The matter cannot be dwelt upon in its entirety, as burdensome detail and statistics would necessarily have to be furnished, and while such data is interesting to show the uneconomical conditions which exist, it is my purpose to treat the subject in a general way on account of the limited time; then, too, there are many who are not intimate with the transportation details of the port, and statistics, at the best, are rather dry.

### Importance of the Port of New York

The port of New York presents the largest, most difficult and expensive freight handling problem in the world today; there is no other port like it. The New York district leads any other port district in the Western Hemisphere in population by nearly 200 per cent. Substantially 45 per cent of the foreign commerce of the United States passes through this port, and within the district are located more manufacturing industries than in the cities of Chicago, Philadelphia, St. Louis and Cleveland combined.

In speaking about transportation we have two branches of service in mind; passenger and freight. The passenger problem is by no means as momentous as that of supplying a congested scene of industrial activity with the articles which must have an inlet and an outlet. With a population of approximately eight millions in the metropolitan district we must consider, first, an uninterrupted movement of food-stuffs in their original or manufactured state; second, the raw, fabricated and finished products required to supply the industries of the district. Then we have traffic of the same character transient to the New York district, but which is dependent upon the port; namely, the large volume of import and export business, the New England business that moves via rail and water and the coastwise steamship traffic.

### Importance of the New Jersey Terminals

To give you an understanding of the volume of freight that is moved through the New Jersey shore terminals of the various railroads, approximately 90 per cent of the export and 85 per cent of the domestic freight passes through these terminals. With these few figures before you, the general plan of the railroads terminating in New Jersey may be explained as embracing large outer classification yards where the road trains are brought in, broken up and the freight grouped for various destinations in the metropolitan district. These outer classification yards are connected by freight running tracks with switching and holding yards maintained along the water front which are used for the purpose of serving lighterage piers, freight stations, float bridges, grain elevators, coal piers, industrial sidings, team tracks, etc., and the freight is moved from the outer classification yard to the waterfront yard by drag service.

### Classes of Service

To effect the delivery of freight in New York, both for domestic use and for export, the railroads maintain two classes of service; namely, car-float and lighter. Car-float service is used principally for the handling of cars from New Jersey terminals to New York pier stations and for transfer service in the harbor. Most of the domestic business is handled in cars on car-floats to the various pier stations and to the few team yards which are maintained. At the various stations the freight is unloaded and cars utilized for outbound loading. You appreciate that New York is a consuming city, with the result that a very large proportion of the cars unloaded are moved back to the New Jersey shore empty.

The export, import and coastwise steamer traffic is conducted by lighter service. A small amount of domestic freight, such as lumber, other building materials and rough or bulky freight is also handled by lighter to private or public docks. The difficulties attending the uneconomical transportation service of the port can be better understood when it is realized that almost all of the freight is divorced from a rail route and must be transported by water to reach its destination. The lighter service in New York Harbor dates back to 1862. The Erie and New York Central Railroads entered into competition for business on both sides of the North River; the Erie met the Manhattan competition by lighterage; the New York Central met the New Jersey competition in the same manner. This was actually the beginning of lighterage.

### Handling Steamship Freight

Handling steamship freight by lighter service involves a highly specialized routine. On arrival of freight for export, it is necessary to secure from the consignee documents permitting delivery of freight to a certain steamer, space for which has been engaged in advance, and the railroad company is obligated to make delivery of particular consignments not later than a specified date, the time of receipt by the steamer being gaged by its ability to handle every consignment comprising its cargo and being further dependent upon the nature, size and weight of shipments.

The railroad companies have provided storage piers for what is known as covered dock freight, or freight that must be protected from the elements. They also provide storage ground for what is known as open dock freight, which does not need such protection. These facilities enable the prompt release of equipment while awaiting disposition orders on lighterage freight. Delivery of freight to steamer's side is made in covered or open lighter as best suits the individual needs, and before final delivery by the railroad company is accomplished under the present scheme, a minimum of two physical handlings of the freight have been performed. Where the freight is located on the pier or on the ground at the time delivery orders are lodged, it means that three or four handlings are required before final delivery to the steamer.

To carry on the lighterage and car-float service in this port, the railroads terminating on the New Jersey shore where their service should rightfully cease, maintain 150 tug boats, about 1,800 barges and lighters and about 300 car-floats, or nearly 2,300 pieces of lighterage equipment which is owned

\*A paper read before the New York Railroad Club on February 18.

by the railroads and, in addition, there is chartered for the transportation of coal, grain and other commodities, considerable more craft. The railroads entering this port are assuming very great obligations in effecting deliveries of freight to New York and when you consider that it costs as much to move a ton of freight from the outer classification yard previously described to a pier station or steamship sling, as it does to pull that ton of freight from Buffalo or Pittsburgh to the classification yard, which is located within a few miles of the New York City Hall, you wonder what is wrong.

### The Real Cause of Congestion

You have heard and read many stories of railroad congestion at the port of New York during the war and most people were led to believe that it was due to inability of the railroads to take care of the business moving through the port on account of insufficient terminal yards and other railroad facilities. I happened to be in charge of railroad terminals in the New York terminal district for the Railroad Administration during the war, and while some yards were crowded and congested, it was not due to lack of proper railroad terminal facilities. The congestion and backing up was the result of the poor steamship facilities which obtain at this port.

A commission was created in 1917 by the concurrent action of the legislatures of the states of New York and New Jersey to study the problem of the port as a whole and recommend a policy to be pursued for the best interests of the entire port. It has just completed and submitted a joint report with comprehensive plans and recommendations.

### The Port Commission's Report

The commission has made sixteen specific recommendations and I want to take enough time this evening to dwell on the three principal recommendations which cover the comprehensive physical plan; that is, the improved railroad system which it is claimed will be the backbone of a rational port development and the formal adoption of which, in conjunction with the compact, the commission urges upon the legislatures.

There is no question that a belt line from a point near Little Ferry on the West Shore railroad to the lower end of Newark bay, as recommended by the commission, will be constructed some day, with the industrial development that is bound to take place on the large expanse of meadow land back of the Palisades, or between the Palisades and the Hackensack river. This line would be used for industrial purposes as well as to serve steamship piers and warehouses which will follow on both sides of the Hackensack river and Newark bay in connection with the plans that Jersey City has for its west side development, and the city of Newark has for its development. This line of railroad is practicable and could be utilized for several different purposes. In addition to serving the industries and docks, it could also be used as a belt line between the outer classification yards of the different railroads.

The outer belt line which the commission plans to begin at Piermont, N. Y., on the Hudson river to pass southwesterly to the west of Paterson, N. J., and the Orange mountains, comes through the Orange range near Summit and continues in a general easterly direction to termini on deep water. A railroad of this kind would be little used; it is impracticable and does not justify present consideration. We may need a railroad of this kind in the distant future, but I doubt it.

### The Automatic-Electric Railway

We now come to the most important recommendation made and that is number 2, or the so-called "automatic-electric system. The commission has evolved a plan which will release the Hudson river waterfront from pier station occupancy, will afford some relief to the New Jersey waterfront,

will dispose of the New York Central's surface tracks, will provide ample capacity for the future and will still effect a large saving in terminal costs.

The plan is based on the general principle of a moving platform or a continuous conveyor placed underground. This system will resemble a railroad in appearance but will function more as a conveyor. The idea of the scheme is to link up the New Jersey railroads by a belt line along the eastern margin of the Hackensack meadows and build a joint yard and transfer station. The automatic-electric tracks will start from this station in New Jersey, pass under the Bergen hill and the Hudson river to a point in Manhattan at about 47th street. The tracks will then pass under certain streets and would serve some nine or ten warehouses and run south to a point near Battery Place where the tracks enter another set of tunnels under the Upper bay to the joint yard.

To carry out a scheme of this kind it is estimated will cost at least \$240,000,000. Who is going to finance the project and how can a facility of this kind be made to pay? It would be confined only to certain kinds of domestic freight, or, in other words, small package freight, and would not be able to take care of the heavy pieces of structural steel, building materials of various kinds, machinery and other heavy articles which are so essential in our city. It would simply be a small package railroad to release waterfront piers; the overhead expense would be so prohibitive that a project of this kind could not be capitalized.

### Use of Containers a Solution

I will separate my recommendations into two classes: first, the handling of domestic freight; second, the handling of export freight.

Under existing conditions the handling of domestic freight, both from a railroad and merchant standpoint, cannot be done economically. There is pier congestion; there is waiting in line; there is loading and unloading. The average truck in New York is only moving from 25 per cent to 30 per cent of the time. There is duplication and cross-haul. The problem can be solved and this would be advantageous both to the merchants and railroads, and my recommendation is that we give serious thought to a plan which would provide for the handling of freight from existing and centralized freight stations in New Jersey to warehouses and store-door delivery in New York on practically all carload business, which amounts to at least 40 per cent and create inland stations in the metropolitan district suitably located in proper zones for receiving and distributing l.c.l. freight. These inland stations would be equipped with specially arranged bodies or containers where the assortment for particular consignees and particular destinations could be made, the stations to be equipped with proper mechanical appliances for prompt handling of these removable bodies to and from tractor trailers. In other words, you can do your business on wheels, keep your motor tractor turning over, increase its efficiency, do away with the waste of rehandling on the railroad and the trucking waste which at present exists in New York and effect a real store-door delivery. A tunnel connection via Staten Island should be made to Bay Ridge and thus link the New Jersey shore with Long Island.

For the handling of export traffic, we have the beginning of a splendid steamship pier development with the rail-head deliveries planned by the Cunard line on the New Jersey shore at Weehawken. There should be a gradual development by railroad and individual enterprises of multiple-story steamship piers, properly equipped with modern machinery for the direct handling of cargo between railroad and vessel. The railroads could get together and fix switching rates for the interchange of cars between their respective terminals via rail routes instead of lighterage, and it would only require a small expenditure to develop the existing switching facilities.

# Tie Producers' Convention Discusses Specifications

Meeting at San Francisco Approved Proposed Requirements of  
the A. R. E. A. Committee

THE PRINCIPAL ACTION taken by the National Association of Railroad Tie Producers at its third annual convention at San Francisco on January 27-28 was the adoption of standard specifications for cross ties. These specifications differ in only a few particulars from those which the Tie committee of the American Railway Engineering Association will recommend to that organization for adoption at the annual convention at Chicago in March.

The Tie Producers' Association suffered a grievous misfortune just two weeks before the convention through the death of its president, E. M. Blake of Charles R. McCormick & Company, San Francisco, Cal. Mr. Blake had fathered the project to hold the convention in San Francisco and had been the prime mover in most of the activities of the association during the past year. Through his efforts the association obtained an appreciable increase in membership and now enrolls 61 individuals and firms, producing approximately 50,000,000 ties annually. The sessions of the convention were presided over by John H. Johnson (B. Johnson & Sons, Richmond, Ind.), who was the treasurer of the association.

## The Tie Specifications

The specifications as adopted by the association were presented by W. Nixon (Western Tie & Timber Company, St. Louis), chairman of the committee on this subject. They are as follows:

### MATERIAL

**Kinds of wood:** Before manufacturing ties, producers shall ascertain which of the following kinds of wood suitable for cross ties will be accepted: Ash, beech, birch, catalpa, cedar, cherry, chestnut, cypress, elm, fir, gum, hackberry, hickory, larch, locust, maple, mulberry, oak, pine, poplar, redwood, sassafras, spruce, sycamore and walnut. Others will not be accepted unless specially ordered.

### PHYSICAL REQUIREMENTS

**General quality:** All ties shall be free from any defects that may impair their strength or durability as cross ties, such as decay, large splits, large shakes, large or numerous holes or knots, or grain with slant greater than one in fifteen.

**Resistance to wear:** Ties from needle-leaved woods shall be of compact wood throughout the top fourth of the tie, where any inch of radius from the pith shall have not less than one-third summerwood in six or more rings of annual growth, or not less than one-half summerwood in fewer rings. Ties of coarse wood having fewer rings or less summerwood will be accepted if specially ordered.

**Resistance to decay:** Ties for use without preservative treatment shall not have sapwood wider than one-fourth the width of the top of the tie between 20 in. and 40 in. from the middle, and will be designated as "heart" ties. Those with more sapwood will be resigned as "sap" ties.

### DESIGN

**Dimensions:** Before manufacturing ties, producers shall ascertain which of the following lengths, shapes or sizes will be accepted, and whether ties are to be hewed or sawed and in either case whether on the sides as well as on the top and the bottom.

All ties shall be 8 ft., 8 ft. 6 in., or 9 ft. long.  
All ties shall measure as follows throughout both sections between 20 in. and 40 in. from the middle of the tie:

Grade	Sawed or hewed top, bottom and sides	Sawed or hewed top and bottom
	1	None accepted
2	6 in. thick by 7 in. wide*	6 in. thick by 7 in. wide
3	6 in. thick by 8 in. wide	6 in. thick by 8 in. wide
4	7 in. thick by 7 in. wide	7 in. thick by 7 in. wide
5	7 in. thick by 8 in. wide	7 in. thick by 8 in. wide
6	7 in. thick by 9 in. wide	7 in. thick by 9 in. wide
7	7 in. thick by 10 in. wide	7 in. thick by 10 in. wide

\*Width of tie in all cases refers to the top width.

Northern white cedar or tamarack (larch) pole ties manufactured from timber, measuring 8 in. in diameter under the bark at the small end, shall be classed as grade No. 1. All other usable ties shall be classed as grade 0 ties.

### MANUFACTURE

All ties shall be straight, well hewed or sawed, cut square at the ends, have bottom and top parallel, and have bark entirely removed.

### INSPECTION

Ties will be inspected after delivery at suitable and convenient places satisfactory to the railroad, which reserves the right to inspect ties at points of shipment or at destination. Ties will be inspected at points other than the railroad's property whenever in the judgment of the railroad there is sufficient number to warrant it; but the shipper shall provide accommodations for the inspector while away from rail or steamer lines and transport him from or to a railroad station or steamer landing.

Inspectors will make a reasonably close examination of the top, bottom, sides and ends of each tie. Each tie will be graded independently without regard for the grading of others in the same lot. Rafted or boomed ties too muddled for ready examination will be rejected. Ties handled over hoists will be turned over as inspected.

Ties will be rejected when decayed in a degree sufficient to materially impair the strength or serviceability, except that the following will be allowed: in cedar, "pipe or stump rot" up to 1½ in. in diameter and 15 in. deep; in cypress, "peck" up to the limitations as to holes; and, in pine, "blue sap stain."

A large hole in woods other than cedar is one more than ½ in. in diameter and 3 in. deep within, or more than 1 in. in diameter and 3 in. deep outside the sections of the tie between 20 in. and 40 in. from its middle. Numerous holes are any number equaling a large hole in damaging effect. Such holes may be caused in manufacture or otherwise.

A large knot is one exceeding in width more than ¼ of the width of the surface on which it appears; but such a knot may be allowed if it occurs outside the sections of the tie between 20 in. and 40 in. from its middle. Numerous knots are any number equaling a large knot in damaging effect.

A shake is a separation of one ring of annual growth from another. One which is not over 4 in. long or ¼ in. wide will be allowed.

A split is a break across annual rings. One which is not over 10 in. long will be allowed provided a satisfactory anti-splitting device has been properly applied.

A tie will be considered straight: (1) When a straight line along the top from the middle of one end to the middle of the other end is entirely within the tie; (2) when a straight line along a side from the middle of one end to the middle of the other is everywhere more than 2 in. from the top and the bottom of the tie.

A tie is not well hewed or sawed when its surfaces are cut into with score-marks more than ½ in. deep or when its surfaces are not even.

The lengths, thicknesses and widths specified are minimum dimensions. Ties over 1 in. more in thickness, over 3 in. more in width, or over 2 in. more in length, will be degraded or rejected.

The top and bottom of a tie will be considered parallel if the difference in the thicknesses at the two sides or ends does not exceed ½ in.; that is, one side may be 7¼ in. while the other is 6¾ in. wide; or one end may be 6¾ in. in length while the other is 7¼ in. thick.

All thicknesses and widths apply to the sections of the tie between 20 in. and 40 in. from the middle of the tie. All determinations of widths will be made on top of the tie, which is the narrower of the horizontal surfaces.

Ties which are oversize will be accepted as follows: 8 in. to 9 in. by 9 in. to 12 in. as Grade 4; 9 in. to 10 in. by 9 in. to 12 in. as Grade 3. Ties over 10 in. thick or over 12 in. wide on top will be rejected. Ties will be graded up by their smaller ends and graded down by their larger ends. The dimensions of the tie will not be averaged.

Split redwood ties are permitted a slight variation in size but

such variation must not be more than 1/2 in. one way or 3/4 in. two ways.

DELIVERY

Ties delivered on the premises of the railroad for inspection shall be stacked not less than 10 ft. from the nearest rail of any track at suitable and convenient places; but not at public crossings, nor where they will interfere with the view of trainmen or of people approaching the railroad. Ties shall be stacked in alternate layers of 2 and 7, the bottom layer to consist of 2 ties kept at least 6 in. above the ground. The second layer shall consist of 7 ties laid crosswise of the first layer. When the ties are rectangular, the two outside ties of the layers of 7 and the layers of 2 shall be laid on their sides. The ties in layers of two shall be laid at the extreme ends of the ties in the layers of 7. No stack may be more than 12 layers high, and there shall be 5 ft. between stacks to facilitate inspection. Ties which have stood on their ends on the ground will be rejected.

Each stack shall have fastened to it a tag on which is written the owner's name and address, the date when stacked, and the number of ties of each kind of wood in the stack.

All ties are at the owner's risk until accepted. All rejected ties shall be removed within one month after inspection.

Ties shall be stacked as grouped below. Only the kinds of wood named in a group may be stacked together.

CLASS U—TIES WHICH MAY BE USED UNTREATED

Group Ua Black Locust White Oak Black Walnut	Group Ub "Heart" Doug- las Fir "Heart" Pines	Group Uc "Heart" Cedars "Heart" Cypress "Heart" Red- wood	Group Ud "Heart" Catalpa "Heart" Chestnut "Heart" Red Mulberry "Heart" Sassa- fras
---	---	---	--

CLASS T—TIES WHICH SHOULD BE TREATED

Group Ta Ashes Hickories "Sap" Black Locust Red Oaks "Sap" Black Walnut Honey Locust	Group Tb "Sap", Cedars "Sap", Cypress "Sap", Douglas Fir Hemlocks Larches "Sap", Pines "Sap", Redwood	Group Tc Beech Birches Cherries Gums Hard Maples	Group Td "Sap", Catalpa "Sap", Chestnut Elms Hackberry Soft Maples "Sap", Mulberries Poplars "Sap", Sassafras Spruces Sycamore White Walnut
--	---	---	--

SHIPMENT

Ties forwarded in cars or vessels shall be separated therein according to the above groups, and also according to the above sizes if inspected before loading.

DISCUSSION

The attitude of the convention was generally favorable to the specifications as many advantages of the promulgation of a general specification were pointed out. Attention was called to the fact that the standard specifications of the United States Railroad Administration enabled the western mills to take the business of the eastern roads safely, whereas in the absence of such a specification, a lack of knowledge concerning eastern trade practice would have made this considerably more difficult.

Statistical Data

One important feature of the convention was the presentation of statistical data on the production of ties throughout the United States. The production of ties in the south and southwest was low at the beginning of the year, increased appreciably during the summer months, and declined again in the fall. In the central western states the production of ties has increased greatly, 2,500,000 ties being cut in Illinois in 1920 as compared with 1,000,000 in the preceding year. In the far west, the 1920 production was about normal, aggregating between 14,000,000 and 15,000,000 ties. The outlook for a large production in this area is less favorable, for the logging for the season is done before March 1 and the present depression in the lumber industry is causing a curtailment of logging operations.

A paper by A. A. Baxter, general manager of the Douglas Fir Exploitation and Export Company, contained some interesting facts on the export of ties from the west coast during 1920 and are summarized as follows:

UNTREATED	
United Kingdom .....	103,100,000 ft. b. m.
China (sold and shipped in 1920) .....	1,100,000 ft. b. m.
China (sold in 1920, to be shipped during the first half of 1921) .....	7,200,000 ft. b. m.
West Coast of South America .....	990,000 ft. b. m.
TREATED	
China—Taku Bar .....	415,000 ft. b. m.
India .....	7,411,000 ft. b. m.
San Domingo .....	1,473,000 ft. b. m.
Total untreated .....	112,390,000 ft. b. m.
Total treated .....	9,299,000 ft. b. m.
Grand total .....	121,689,000 ft. b. m.

Other Business

Other papers covered the various trade and technical problems of the tie producers and included a paper by C. L. Hill, Forest Products, United States Forest Service, on the Timber Resources of the United States, with special reference to the Pacific coast, and one by John Foley on The Tie Supply of the Future.

At the concluding session of the convention on Friday afternoon the following officers were elected:

President, Charles R. McCormick, Charles R. McCormick & Co., San Francisco, Cal.; first vice-president, J. H. Johnson, B. Johnson & Son, Richmond, Ind.; second vice-president, R. J. Witherell, L. D. Leach & Co., Chicago; secretary, Warren Nixon, Western Tie and Timber Company, St. Louis, Mo.; treasurer, J. J. Schlaflay, the Potosi Tie and Lumber Company, St. Louis, Mo.

Chicago was selected as the place of next meeting.

"The Gospel of Appreciation"

On the Santa Fe

J. R. HITCHCOCK, assistant general manager of the Atchison, Topeka & Santa Fe Coast Lines, is the author of a series of interesting educational pamphlets now being issued to employees on the coast lines. The latest circular, entitled "The Gospel of Appreciation," is designed to encourage efficiency and courtesy and to make public numerous examples of exceptionally good work by individual employees.

The circular takes up illustrations and testimonials sent in by patrons of the company, both shippers and passengers, who have been pleased with the service rendered by employees with whom they have come in contact. It then sets forth a number of instances of meritorious services which have come directly to the attention of the officers. The list covers all phases of railroad work. One trainman has discovered a defective brakebeam and by prompt action has prevented a serious accident; others have given assistance in similarly difficult situations, perhaps not in the line of duty. Still other employees have done conspicuously good work in cases of derailment. The pamphlet praises station employees, foremen and clerks who have displayed intelligence and honesty in preventing pilferage or in apprehending thieves. It tells of trainmen who have gone out of their way to move their trains on time, of agents whose warehouses are especially clean and well-kept, and who all will be rewarded for their energy and diligence.

The idea of these various illustrations is to impress the employees with the fact that good work will be recognized, no matter where, or under what circumstances, it may be accomplished. To quote Mr. Hitchcock: "It is appreciated that many trying circumstances must be encountered in the transportation game. They must be dealt with patiently, courteously and efficiently, in order to accomplish the best results. . . ."

# Winslow Partial Payment Bill Passed by Senate

## Will Authorize Immediate Disbursement of Large Sums Due the Railroads Held Up on a Technicality

WASHINGTON, D. C.

THE WINSLOW BILL, authorizing and directing the Secretary of the Treasury to honor certificates of the Interstate Commerce Commission for instalment payments to the railroads on account of their guaranty for the six months following the termination of federal control, was passed by the Senate on February 22 without a record vote, in the form in which it was passed by the House on February 8, and sent to the President. The provisions of the bill will make possible prompt payments of a large part of the sums still due the railroads, estimated at about \$370,000,000 for the six months' period, on certificates of the Interstate Commerce Commission for amounts certainly due pending a final adjustment of the balance. The commission was prepared to issue such certificates after September 1 and did issue some but they were not honored because of a ruling by the Comptroller of the Treasury.

There has been no indication of the attitude of the President toward the bill, although the Treasury Department has been hostile to it, but it would seem that there are enough votes for the bill in both the Senate and the House to pass it over a veto, if necessary, if it can be done within the short time allowed. The President has referred the bill to the Secretary of the Treasury and to the Interstate Commerce Commission for an opinion. The Senate had deliberately taken up the bill, amid the congestion which usually prevails toward the close of a session, with the purpose of having another day available, in case the President should disapprove the bill and keep it for 10 days, in which to pass it over the veto by a two-thirds vote. A fight against the bill was made by Senator La Follette of Wisconsin but merely served to consume time and furnish ammunition for the publicity forces of the labor organizations. The Senate voted 36 to 35 on February 21 to take up the bill in place of the agricultural appropriation bill and an agreement was reached to conclude the debate at 5:00 p. m. on the following day. The bill was passed about 3:00 p. m. after very little debate.

Senator La Follette used six hours with one of his characteristic speeches, which again demonstrated the manifold possibilities which lie in the use of statistics, presenting an amendment that no money shall be paid to the roads until after an investigation by the Interstate Commerce Commission of the expenditures of the railroads during the guaranty period, in spite of the fact that the Transportation Act authorizes the commission in ascertaining the amount of the guaranty, to make readjustments for abnormal or improper charges to operating expenses and to determine the amount to be charged for maintenance. The proposed amendment was rejected 47 to 19. An amendment proposed by Senator Kirby to eliminate the provision in the law for a 5½ or 6 per cent return on the aggregate value by repealing Section 15-a was defeated by a vote of 59 to 14 and one proposed by Senator Trammell of Florida to reduce the "fair return" to 3 per cent was defeated 61 to 7. Senator Trammell recently introduced an amendment to provide for 4 per cent as a fair return, with the idea that it would reduce freight rates sufficiently to induce the consumers to buy more Florida fruits and vegetables, but after he found that the railroads have been making less than 4 per cent on the present rates he reduced the percentage. The two amendments aroused a lively discussion of the freight rate question, Senators Kirby and Trammell insisting that the "guaranty" of 6 per cent to the railroads had put rates so high that the producers of agricultural products cannot market their products. Sena-

tor Kellogg pointed out that under the new rates the railroads have earned at the rate of only 3.3 per cent since September 1. After the 3 per cent amendment had been defeated Senator Trammell offered a 4 per cent amendment which was rejected.

Extracts from Senator La Follette's speech were sent to the press by the publicity man who has recently been handling the numerous statements to the press issued by W. Jett Lauck and the labor unions affiliated with the American Federation of Labor in their mudslinging campaign against the railroads which has been used as a smoke screen for the national agreements. He denounced the bill as providing for the presentation to the railroads of "a gift from the public treasury before the gift promised is due," and asked why the railroads instead are not required to pay back to the government the "enormous debts" which they owe on account of permanent improvements and equipment provided during the period of federal control, which the Transportation Act permits to be funded for 10 years, and for money borrowed from the revolving fund, which under the law is to be paid back in 15 years.

He said the railroads owe the government \$750,000,000 for betterments and \$350,000,000 for equipment provided during federal control, which he attempted to give the impression the railroads are trying to sneak off with, and \$192,000,000 borrowed from the revolving fund, a total of \$1,292,000,000. He took the position that the railroads themselves have delayed the payment of their guaranty by failing to present final "claims" for the amounts due, preferring to leave the accounts open—"leave the door of the treasury ajar so that they may come back year after year, pyramiding new claims upon the old and gradually swelling the total." He said that while it was intended that the guaranty would enable the railroads to give improved service, in practice it has proved an "invitation to fraud and extravagance" and in this connection he rang the changes upon the charges made by the shop craft unions regarding the car and locomotive repair work sent to contract shops. "The courageous policy," he said, "would be to repeal the law by which this gift was made. The government owes the railroads no debt. The railroads are indebted to the government in so many millions of dollars that it is doubtful if they can ever discharge the debt."

Senator Townsend of Michigan, who was in charge of the bill for the committee on interstate commerce, discussed it in part as follows:

There is about \$350,000,000 due now; \$250,000,000 has been paid. This amount is due under contract with the government, under acknowledged liability by the government and the amount has been appropriated by Congress.

The committee on interstate commerce have had long hearings on this subject, and we have determined upon an amendment to the Transportation Act of 1920 which is advocated by the Interstate Commerce Commission and approved by the railroads, and, as I understand, meets with no informed opposition. Under that act we had supposed, at least, that Congress had provided for the payments of the sums due in installments. When it was determined that a certain amount was actually due to the railroads, it was supposed that the Interstate Commerce Commission could make a certificate to that effect and it would be paid by the Secretary of the Treasury. It turned out, however, that the Secretary of the Treasury submitted this question to the Comptroller of the Treasury, and he advised that no payments could be made to the railroads of any amount, except in final settlement. That is the ruling today; and many of these settlements, from the very nature of things, can not be completed entirely for possibly several years.

Now, not only are the railroads embarrassed—indeed, that is

hardly the greatest thing that is to be considered here—but the concerns with which the railroads have been doing business can not carry their accounts any longer. Some of them are behind in payments more than five months, and some of these concerns themselves are threatened with bankruptcy. There is certainly but one alternative for them to take, and that is to cease supplying the railroads with coal and other material. That will still more embarrass the railroads. I say to you, Mr. President, in all candor, I believe that many of these railroads, especially the weaker lines, are threatened with bankruptcy unless they can obtain the money due them from the United States and needed for their operation. Their credit has already been extended to the limit.

Your committee believes that there is no question about the obligation of the United States; but we provide that the amounts must be determined as certainly due, and the Interstate Commerce Commission is seeing to it that the full payment is not made to the railroads, but that a certain amount is reserved to meet, under all circumstances, any possible contingencies as to balances in the future.

Senator Pomerene of Ohio put in the record the following memorandum from the Bureau of Statistics of the Interstate Commerce Commission:

#### Revenues and Expenses Since 1917

The revenues and expenses as shown by the monthly reports of Class I roads, 1917 to 1920, are as follows:

Calendar Year	Operating revenues	Operating expenses	Net operating income	Operating ratio
1917.....	\$4,050,463,579	\$2,858,212,210	\$974,778,937	70.57
1918.....	4,926,593,957	4,017,209,501	693,111,170	81.54
1919.....	5,184,230,244	4,419,988,750	515,793,287	85.26
1920.....	6,213,489,049	5,810,970,021	67,823,711	93.53

It will be seen that in spite of an increase of over \$2,000,000,000 in operating revenues, the net return has been nearly eliminated because of an increase of about \$3,000,000,000 in operating expenses. This is reflected by the increase in the operating ratio.

The volume of traffic in 1917 was slightly below that of 1918 and 1920, but somewhat greater than that of 1919. The principal source of the increased revenues is from the increase in rates. Certain increases granted by the commission in 1917 became operative for the full year 1918, but the general increase effective in June, 1918, of 25 per cent in freight rates, was reflected in the revenues of that year for only the last half of the year. In 1919 no general increases were made. In the calendar year 1917 Class I roads received an average revenue per ton mile of 7.15 mills, while in 1919 the corresponding figure was 9.73 mills, an increase of 2.58 mills per ton mile. Applied to the total freight traffic of 1917, namely, 394,465,400,493 ton miles, the increased freight charges per annum over the basis existing in 1917 amounted to approximately \$1,017,720,000. In 1920 the increase in freight rates was made applicable late in August. While this increase has been estimated at 33 1/4 per cent, the statistics do not indicate that the increase realized has been as great as that. Taking an increase over 1919 of 30 per cent for illustration, the increase would be 2.919 mills per ton mile, which when applied to the traffic of 1917 would produce approximately \$1,151,440,000.

Passenger fares were also increased in June, 1918, and again in August, 1920. In 1917 the average revenue was 2.090 cents per passenger mile, as against 2.541 cents in 1919, an increase of 4.51 mills. Applied to the traffic of 1917, or 39,476,858,549 passenger miles, this amounts to approximately \$178,000,000 annually. The increase allowed in 1920 was 20 per cent. Reports available at this time indicate that an average increase of 4.6 mills per passenger mile was realized. Applied to the 1917 traffic as above, the increased annual revenue amounts to \$181,589,000. There has also been added a surcharge on Pullman travelers for the benefit of the railroads, amounting to perhaps \$25,000,000 annually, and an increase in compensation for carrying the mail yielding about \$45,000,000 annually.

The increases above mentioned total nearly \$2,600,000,000 annually on the basis of the traffic of 1917.

On the side of expenses, wages are the principal source of increase. Increases were granted in 1918 and made retroactive to January 1 of that year. Further increases were granted from time to time by the Director General of Railroads, and there was an increase of about 22 per cent in July, 1920, granted by the United States Railroad Labor Board, the increase being made retroactive to May 1, 1920. According to statistics published by the Interstate Commerce Commission for the first six months of 1920, the pay roll of Class I roads, without any of the increase granted by the Labor Board was \$1,596,680,268, which, for 12 months would have been \$3,193,360,536. The actual pay roll in 1917 was \$1,739,482,142, an increase of \$1,453,878,394. Twenty-two per cent of the \$3,193,360,536, is \$702,539,200. This added to the \$1,453,878,394 gives a total increase in wages over the 1917 basis of \$2,156,417,594.

It may further be assumed that the fuel consumed in 1917 would, at the prices paid by railroads in 1920, have cost \$200,000,000 additional annually. Increased taxes account for about another \$60,000,000. In addition there were increases on materials, the amount of which can not be given at this writing.

It should be said that all of the figures showing the results of increases in rates and costs are subject to revision, and are given at this time merely to illustrate roughly where the increased revenue came from and where it went. No statement can be made at this time as to the extent to which the roads were under- or over-maintained during 1920.

If the rates granted in August had been in effect during the whole year 1920, the roads would have made a better showing. What showing will be made in 1921 depends so much on the extent to which traffic revives and to what extent economies in expenditure can be effected that it is quite impossible to make a prediction. It may be noted, however, that in October, 1920, the best month under the new rates and fares and under the new wage schedules, the net railway operating revenue was \$86,455,487.

## A New and Novel Crossing Sign

THE NOVEL WARNING SIGN shown in the accompanying illustration has been erected by the San Antonio & Aransas Pass at the intersection of its line with Roosevelt avenue, in San Antonio, Texas. Surmounting a sign which bears the words, "Did the Driver of This, Stop, Look, Listen?" is a platform about eight feet above the ground, upon which is placed a wrecked automobile which figured in a fatal accident at a country road crossing on the Waco district of that road some time ago and which re-

The New Crossing Sign Used by the San Antonio & Aransas Pass to Reduce Grade Crossing Accidents

sulted in the death of two occupants of the car and serious injury to a third.

A series of similar accidents at different points on the line suggested to J. H. Newberry, claim adjuster of the San Antonio & Aransas Pass, the necessity for devising some sort of a warning different from anything theretofore used, and of such a nature as would attract the attention of motorists and cause them to "stop, look and listen" before crossing railroad tracks. The new warning sign, devised as a result, seems to be serving the purpose for which intended, for it is causing much comment and the idea is being taken up by safety men of other roads.

THE HUDSON'S BAY COMPANY, which has been reported as intending to build a light railway across the 24-mile portage between Fort Fitzgerald and Fort Smith which would connect the Peace river and the Mackenzie river, has abandoned its plan for this project. It was found upon investigation that there is not a sufficient prospect of freight to justify the construction of a line.

# General News Department

Fire early on the morning of February 16, destroyed a two-story shop building of the Missouri Pacific at St. Louis, Mo.; estimated loss, \$100,000.

The House Committee on interstate and foreign commerce on February 19 reported favorably a bill to provide a substitute for Section 10 of the Clayton anti-trust law in the same form in which the bill has been reported to the Senate by the Senate Committee on interstate commerce.

Seven passengers and a motorman were killed and 20 passengers injured in a butting collision of electric cars between Bridgeport, Conn., and Shelton on February 22. Several persons were burned to death, the wreck having quickly taken fire from a can of gasoline (belonging to a passenger) which was in the vestibule of one of the cars and was ruptured in the collision.

Eight thousand is the number of members of the National Safety Council who own or operate shops or other industrial plants; and the officers of the Council propose to proprietors to conduct intensive campaigns, for some particular feature of safety, in all of these plants during one month throughout the year; a month to each feature. January was devoted to special efforts to prevent ladder accidents and February to infections arising from minor injuries. For March, the program is unsafe clothing; for April, horse play.

The Interstate Commerce Commission and the American Railway Association Committee on Automatic Train Control have decided to place inspectors on the Chicago & Eastern Illinois, Chesapeake & Ohio and Chicago, Rock Island & Pacific to check up and report on the operation of the automatic train control devices in service on those roads with a view to furnishing up to date information as to what, if any, changes would be necessary if it should be decided to order an extension of the present installations or an installation on another road.

The governors of 35 states have expressed favorable opinions on the operation of public service commissions in their states; this, according to the New York Times, being the result of a questionnaire which was sent out by Governor Charles H. Brough, of Arkansas. Governor Campbell, of Arizona, the 36th governor who responded to the questionnaire, said that he could not commend the work of the commission in his state; this, however, not because of any fault in the principle of commission laws, but to the personnel of that particular commission. Twelve states seem to have furnished no replies.

Personal appearance is one of the principal things by which one is judged. It is easy to present a good appearance. It is not upon the clothes that a person wears nor upon their quality, but upon their condition, that a good appearance depends. A man may wear the best clothes, but if he is untidy, he will give a bad impression. On the other hand, old clothes, pressed and clean, will give a good appearance. It is the same with a railroad. If things are left in a slipshod condition, material scattered along the tracks, equipment neglected, station grounds and platforms untidy, employees unbrushed, unshaved and unshined, the public gets the impression that the railroad is run down and badly managed. If employees form the habit of thinking that "anything will do," the railroad gets the same thinking from the public.—*E. E. Nash, General Manager, Minneapolis & St. Louis.*

## Full Crew Law Costs Indiana Roads \$1,000,000 Yearly

The full-crew law of Indiana costs the railroads of that state a million dollars a year; and Frank E. Lewis, general superintendent of the Chicago, Indianapolis & Louisville, at a meeting of merchants and manufacturers in Lafayette on February 15 urged them to co-operate with the railroads in seeking the repeal of

the law. He said that the law was costing \$1,000,000 a year without contributing anything to the safety of train operation. The third man is only in the way. He told the shippers that inasmuch as they were paying the bill they should lend a hand to the movement for the repeal of the law. Fifty shippers present agreed to communicate with representatives in the legislature, urging them to vote for the repeal.

## Loyalty Means Obedience and Justice

E. E. Nash, general manager of the Minneapolis & St. Louis, in a circular to his subordinates, says:

"In the operation of a railroad nothing is more essential than obedience. The first requirement of a good officer is obedience. He has no right to expect a subordinate to do anything which he is not willing to do himself. An officer is obedient when he is just to his subordinates and loyal to his superiors. He will command obedience when he frames his orders carefully and so issues them that his subordinates can obey them. It is demoralizing to issue a mass of instructions when it is known that some of them cannot be carried out. This makes an executing officer or employee careless; and soon he begins to use his own judgment as to which orders he will obey. This looseness soon permeates an entire organization."

## The Snell Forestry Bill

The National Forestry Program Committee, with headquarters at New York, is calling the attention of all users of forest products to the Snell Forestry Bill, now pending in Congress, which provides for a comprehensive national forestry program in order to establish a continuous supply of timber for the people of the United States. The bill is sponsored by the Forest Service and is supported by the National Forestry Program Committee which has been formed by manufacturers, consumers and converters of forest products to work for a policy which will mean an adequate and continuous supply of raw material. The Committee has secured agreement among the industries using the products of forests upon the measures proposed, as being fair to all concerned. Hearings will be arranged at which any points of issue will be clarified and Congress shown how vitally necessary a comprehensive forestry policy is to the industrial and public welfare of the nation.

## Senator LaFollette Wants Information

Senator LaFollette on February 18 submitted to Congress two resolutions calling for a large amount of information from the Railroad Administration and the Interstate Commerce Commission on the subject of railroad expenses during the guaranty period and the efficiency and economy of railroad operation during the period of federal control, for which he asked immediate consideration. The resolutions were placed on the table because of an objection by Senator Townsend, who asked for opportunity to look them over.

The first resolution called for information concerning the charges that railroad companies have paid excessive prices for car and locomotive repair work in outside shops. The second resolution called upon the director general of railroads for information relative to improper conditions in shops, engine houses and repair yards, comparative efficiency of shop and engine house operation, all studies of maintenance of equipment made on the basis of the check of locomotive shop output and round house and shop costs, all information prepared and submitted to federal managers regarding maintenance of equipment during the test period; also during the seven years prior to the test period and during the year 1918, and, in general, all information gathered and tabulated by the administration relative to maintenance of equipment, as well as the equation factors for increased costs of

labor and material, to enable comparisons to be made as between the test period and the period of federal control.

### Deficiency Appropriation for Valuation Work

Congress acted with unusual expedition on February 15 to pass a deficiency appropriation bill for \$1,000,000 to carry on the railroad valuation work by the Interstate Commerce Commission during the balance of the fiscal year ending June 30, 1921, after it had been informed by Chairman Clark of the commission, the day before, that within 48 hours all of the funds available for the purpose would be exhausted and that if the appropriation were not put through at once it would be necessary to call in the men from the field. The commission had asked for the deficiency appropriation some time ago and it was provided for in the general deficiency bill, which has recently been passed by the House. The bill, however, required further consideration in the Senate and after it had been explained that the commission needed the money to meet its payroll on February 15 a special joint resolution for the \$1,000,000 appropriation was introduced in the House and promptly passed, and shortly thereafter it was also passed in the Senate. The appropriation for \$1,000,000 in the deficiency bill will be taken out of that bill in conference.

### A. R. E. A. Program

The program for the twenty-second annual convention of the American Railway Engineering Association, which will be held in the Congress Hotel, Chicago, on March 15-17, is as follows:

TUESDAY, MARCH 15

President's address.  
Reports of secretary and treasurer.  
Reports of committees on:  
Signals and Interlocking.  
Ballast.  
Stresses in Railroad Track.  
Electricity.  
Track.  
Rail.  
Standardization.  
Uniform General Contract Forms.

WEDNESDAY, MARCH 16

Signs, Feuces and Crossings.  
Ties.  
Iron and Steel Structures.  
Water Service.  
Economics of Railway Labor.  
Economics of Railway Operation.  
Economics of Railway Location.  
Shops and Locomotive Terminals.  
Buildings.  
Annual dinner at 6:30 p. m.

THURSDAY, MARCH 17

Masonry.  
Roadway.  
Wood Preservation.  
Wooden Bridges and Trestles.  
Yards and Terminals.  
Rules and Organization.  
Records and Accounts.  
Conservation of Natural Resources.  
New Business.  
Election and installation of officers.  
Adjournment.

Speakers at the annual dinner at the Congress Hotel will include John F. Wallace, consulting engineer, New York, and David Kinley, president, University of Illinois, Urbana.

### Boost!

If you were working in a grocery store, wouldn't you make it a daily habit to let some person know what a good store you were working for? What good groceries were on sale there? What reasonable prices were asked? And generally how well customers were treated?

You can be just as enthusiastic about boosting for "M. & St. L." as you could for the best store. We have a first class railroad, but it can be made a much better road if each employee will do more to make it so. You can boost hard for it and you will be telling the truth when you do so. If you live at a competitive point, ask your merchants on what road they ship their goods or travel, and urge them to use "M. & St. L." Such a question and request, put when you are spending money, is bound to do great good and you will be sowing seed that is sure to bring forth a good harvest. You may be living at a non-competitive point; but "Talking M. & St. L." all the time, day in, day out, by employees.

will do much to boost our gross receipts from which we all get our bread and butter, whether it be from non-competitive points or from competitive points. In reality, there is no such thing as a non-competitive point. Furthermore, the merchants you talk to in this way will have an added respect for "M. & St. L." and also more respect for you, as an employee who likes his job and his employer.—E. E. Nash, general manager, Minneapolis & St. Louis.

### Mail Across Continent in 33 Hours

Postoffice department airplanes carried 300 lb. of mail from San Francisco to New York, about 2,700 miles, on February 22 and 23, in 33 hours 20 minutes, less than half the best time previously made, this being accomplished by keeping up the flying all night. The time actually on the wing was 25 hours 53 minutes. The record as given in press despatches is as follows:

#### SPECIAL AIRPLANE MAIL TRIP, FEBRUARY 22 AND 23

	Pac. time	E. time	Pilot
San Francisco, left Tuesday.....	4:30 a.m.	7:30 a.m.	.....
Reno .....	.....	.....	.....
Salt Lake .....	.....	.....	.....
Cheyenne .....	5:50 a.m.	8:10 p.m.	Knight.
North Platte .....	.....	.....	.....
Omaha .....	.....	.....	.....
Iowa City .....	.....	.....	.....
Chicago, arrived Wednesday.....	6:40 a.m.	9:40 a.m.	Webster.
Chicago, left .....	7:00 a.m.	10:00 a.m.	.....
Cleveland, arrived .....	10:52 a.m.	1:52 p.m.	.....
Cleveland, left .....	11:03 a.m.	2:03 p.m.	Allison.
Bellefonte .....	.....	.....	.....
New York .....	1:50 p.m.	4:50 p.m.	.....

The landings for fuel and refreshment at North Platte, Omaha and Iowa City, were made by the aid of flares marking the boundaries of the landing fields. Knight, the night flyer, steered his course of about 1,000 miles by compass. With the route from Omaha to Chicago, about 500 miles, he was wholly unacquainted.

These successful flyers were not the only ones who made the experiment on that day; westbound as well as eastbound trials were made; and one of the eastbound flyers, Capt. W. E. Lewis, was killed at Elko, Nevada.

### National Railway Appliances Association

#### Assigns Additional Exhibit Space

C. W. Kelley, secretary of the National Railway Appliances Association, has sent out the following list of exhibitors supplementing that published in the *Railway Age* of November 19 (page 897), and bringing the list of exhibitors up to date. There are now but four unassigned spaces and it is expected that these will be taken during the present week. The supplementary list is as follows:

American Radiator Company, Chicago.  
American Malleable Castings Ass'n, Cleveland, Ohio.  
Brown Hoisting Machinery Company, Chicago.  
L. S. Brach Mfg. Company, Newark, N. J.  
The Basic Mfg. Company, Chicago.  
Barrett-Gravens Company, Chicago.  
Challenge Company, Batavia, Ill.  
Detroit Steel Products Company, Detroit, Mich.  
Duke Nut Lock Company, Chicago.  
Elwell Parker Electric Company, Chicago.  
Federal Electric Company, Chicago.  
The Goss Company, Chicago.  
Howlett Construction Company, Moline, Ill.  
Headley Good Roads Company, Philadelphia, Pa.  
Leich Electric Company, Genoa, Ill.  
Lakeswood Engineering Company, Cleveland, Ohio.  
McGraw-Hill Publishing Company, New York.  
National Surface Guard Company, Chicago.  
Oiley Paint Mfg. Company, Chicago.  
Page Steel & Wire Company, Menomson, Pa.  
Reading Specialties Company, Reading, Pa.  
Geo. J. Roberts Company, Dayton, Ohio.  
Stuebing Truck Company, Chicago.  
Standard Asphalt & Refining Company, Chicago.  
Train Control Appliance Company, El Paso, Texas.  
Turner Day & Woolworth Handle Company, Louisville, Ky.

### Medical and Surgical Section—A. R. A.

J. E. Fairbanks, general secretary of the American Railway Association, announces the establishment of a medical and surgical section in the Operating Division; and railroads, members of the association, are requested to send him the names of their chief surgeons or other officers who may properly become members. It is proposed to have in the section the surgeon-general of the United States Public Health Service, and also a representa-

tive of the State and Territorial Health Officers' Association. The temporary officers of the section are Dr. D. Z. Dnott, chief surgeon, Western Maryland, chairman; Dr. G. G. Dowdall, chief surgeon, Illinois Central, first vice-chairman, and Dr. Duncan Eve, chief surgeon, N. C. & St. L., second vice-chairman. These and the following twelve surgeons constitute the temporary committee of direction:

William B. Coley (N. Y. C.); Robert J. Graves (B. & M.); C. W. Hopkins (C. & N. W.); J. A. Hutchison (G. T. R.); A. W. Ide (N. P.); A. F. Jonas (U. P.); R. W. Knox (S. P.); J. P. Kaster (A. T. & S. F.); Southgate Leigh (Virginian); S. C. Plummer (C. R. I. & P.); J. B. Walker (Pennsylvania); H. S. Cumming, surgeon general, Bureau of the Public Health Service, Washington, D. C.

The temporary committee of direction has appointed three standing committees. On sanitary codes, Dr. R. W. Knox (S. P.), chairman; on physical standards, Dr. C. W. Hopkins (C. & N. W.), chairman; and on hospital standards, Dr. A. F. Jonas (U. P.), chairman.

### Scale Men to Meet in Chicago

One added feature of engineering week in Chicago this year is the sixth annual meeting of the National Scale Men's Association which will be held at the Auditorium Hotel, Chicago, on March 15-17, inclusive. The program for this meeting, which is given below, consists largely of papers prepared by railway scale men. The annual dinner will be held Wednesday noon and all of Wednesday afternoon will be devoted to a visit to the National Railway Appliances exhibit.

TUESDAY, MARCH 15

10:00 a. m.

Address of welcome by Joseph P. Griffin, president, Board of Trade of Chicago.

President's address by B. B. Gordon, general scale inspector, Pennsylvania System.

1:30 p. m.

Motor Truck Scales, by Charles B. Barackman, scale inspector, C. R. I. & P.

Address by William F. Cluett, chief deputy inspector, Department of Weights and Measures, City of Chicago.

Standards, by Dr. S. W. Stratton, director, United States Bureau of Standards.

Automatic Indicating Scales, by E. D. Gordon, sales engineer, General Automatic Scale Company.

Repairing Counter and Portable Scales, by A. R. McFarlane, scale inspector, C. B. & Q.

The Testing and Inspection of Industry-Owned Scales, by C. H. Mann, superintendent of scales, Southern Railway.

WEDNESDAY, MARCH 16

9:30 a. m.

The Scale Inspector's Relation to Scale Sales, by L. R. Boyer, sales engineer, Fairbanks, Morse & Co.

Official Supervision of Grain Weighing at Terminal Markets, by James T. Bradshaw, grain warehouse commissioner of Missouri.

Scales and Weighing from the Viewpoint of a Railroad Engineer, by R. Hayes, structural engineer, Southern Ky.

Weights and Weighing from a Freight Agent's Standpoint, by H. C. Howe, freight claim agent, C. & N. W.

Weights on Grain Shipments from the Standpoint of the Country Shipper, by George A. Wells, secretary, Western Grain Dealers' Association.

Scale Specifications and Requirements of Interstate Commerce Commission Docket 9009, by Henry L. Goemann, president, Goemann Grain Company.

Address by H. A. Foss, weighmaster, Chicago Board of Trade.

THURSDAY, MARCH 17

9:30 a. m.

Linear Measurements; the Basis of all Metrological Standards, by Charles C. Neale, the Measuregraph Company.

Address by A. B. Jacobs, president, Strait Scale Company.

The Present Status of the Grain Scale Situation, by C. A. Briggs, United States Bureau of Standards.

The Proper Use of Cement and Concrete, by Professor Duff A. Abrams, Structural Materials Research Laboratory.

Method of Computing Fibre Stresses, by H. O. Hem, consulting engineer, Toledo Scale Company.

Design of Weigh Bridges, by James L. Miller, engineer of bridges, N. Y. C.

Testing Mine Scales, by L. A. Fischer, United States Bureau of Standards.

1:30 p. m.

Testing Hopper Scales Under Normal Working Conditions as Compared with Results of Shut-Down Tests, by G. O. Awe, chief scale inspector, Missouri State Weighing Department.

Waterproof Decks for Railroad Truck Scales, by John E. Armstrong, assistant engineer, Canadian Pacific.

Shop Treatment of Steel for Scale Pivots, by A. Malmstrom, chief scale inspector, A. T. & S. F.

Errors in Scale Weighing Beams, by W. E. Thompson, supervisor of scales, Minnesota Truck and Hopper Scale Department.

Protecting Structural Steel Against Corrosion, by C. Pettis, general scale inspector, N. Y. C.

Waterproof Fits and Scale Drainage, by T. O. Dean, superintendent of scales, T. & G.

Address by R. C. Welsh, scale inspector, Pennsylvania System.

## Traffic News

The St. Louis Southwestern will use the freight terminal facilities of the Illinois Central at Memphis, Tenn., effective February 28.

F. M. Elkinton was elected president of the Milwaukee Traffic Club at the annual meeting on February 4. J. G. Love was elected first vice-president; W. Bowersock, second vice-president; L. R. Conger, third vice-president; and R. S. Dahl, secretary and treasurer.

The eighteenth annual dinner of the Transportation Club of Detroit was held at the Hotel Statler, in that city, on February 24. The speakers included Charles F. Moore, of New York, who spoke on "Dollars and Sense," and George A. Matthews, whose subject was "The Invisible Line."

The Erie Railroad has inaugurated a foreign trade service for the benefit of shippers and will publish regularly foreign trade bulletins dealing with the foreign ports and their facilities. The second number, just published, contains a very complete and detailed account of the port of Cardiff, Wales.

Senator Fletcher of Florida has introduced in the Senate a resolution requesting the Interstate Commerce Commission to furnish to the Senate full information regarding all traffic agreements, arrangements or understandings between the eastern trunk line railroads and the foreign flag steamship lines.

The State of New York, which entered suit in the Federal Court to enjoin the increases in intrastate fares and freight rates recently ordered by the Interstate Commerce Commission, was defeated, the decision, handed down at Utica on February 22, by Judges Manton, Ray and Hazel, being in favor of the federal authorities on all points. The attorney general of the state proposes to appeal without delay to the Supreme Court of the United States.

Senator Kenyon of Iowa has introduced in the Senate a bill to amend the Transportation Act so as to provide that the rate-making provisions in section 15-a authorizing the Interstate Commerce Commission to fix rates calculated to afford a return of 5½ or 6 per cent shall not apply to intrastate traffic. The bill says that "the commission shall have no power to fix or adjust rates, passenger or freight, which are within a state, and such power to fix or regulate intrastate rates is hereby conferred entirely upon the respective states."

A Shippers' Service Association has been organized at St. Louis, Mo., with offices in the Victoria building, by I. L. Burlingame, for many years general manager of the Terminal Railroad Association of St. Louis, as president, and W. E. McGarry, who was associated with Mr. Burlingame, and later connected with the American Railroad Association, Car Service Division, as chairman of the St. Louis district. Mr. McGarry will act as vice-president and general manager of the association, which has been organized to furnish service in traffic and transportation problems.

### The Traffic Club of Denver

A new organization, the Traffic Club of Denver (Colorado), was put in operation at a meeting at the Metropole Hotel in that city on February 16. It is composed of prominent railroad and commercial traffic men and meets a general need which has been felt for some time. The following officers and directors were elected: President, J. F. Vallery (C. B. & Q.); first vice-president, F. B. Choate (U. P.); second vice-president, Harry Dickinson (Civic Association); secretary, C. B. Rader (Denver Grain Exchange). Directors: Fred Wild (D. & R. G.); L. P. Banks (S. P.); Geo. W. Martin (C. R. Q. & P.); F. W. Myers (A. T. & S. F.); M. H. McEwen (C. M. & St. P.); Ashley Faynor (I. & G. N.); T. J. Toner (D. & S. L.); Mr. Flickinger (Morey Merc. Co.); H. G. Naylor (Midwest Oil Co.); F. M. Andrews (Denver Dry Goods Co.); G. W. Work (Colo. M. & E. Co.); and the officers above named.

## Commission and Court News

### Interstate Commerce Commission

The commission has rendered its decision in the North Carolina intrastate rate case ordering increases by percentages corresponding to those authorized for interstate traffic in Ex Parte 74.

The commission is to investigate the action of the Alabama Public Service Commission in denying the carriers' request for permission to establish a surcharge of 50 per cent on intrastate passengers in Alabama.

The commission has suspended until June 20 the operation of certain schedules appearing in a Hocking Valley tariff which propose reductions in the amount of switching charges that will be assumed by the railway company at Toledo, Ohio.

The commission has suspended until June 23 the operation of certain schedules shown in Agent E. B. Boyd's tariff, which propose increased rates on pig iron from points in Alabama, Georgia, Kentucky, Louisiana, Tennessee and Virginia to Ogden and Salt Lake City, Utah, and points taking same rates.

The Interstate Commerce Commission has issued its decision in the Utah intrastate rate case ordering an increase in the intrastate passenger fares by the amount of the increases applied to interstate traffic to correct discrimination against interstate commerce. The present intrastate rates on coal and on ore were not found unreasonable, preferential, prejudicial or discriminatory.

The Interstate Commerce Commission has suspended from February 15 until June 15, 1921, the operation of certain schedules which propose to increase the rates on various commodities from points in the Mountain-Pacific territory in Colorado, New Mexico and Wyoming to El Paso, Texas, and related points located in the Western group from 25 and 33½ per cent to 35 per cent over rates in effect August 25, 1920.

The Interstate Commerce Commission has prescribed the following instructions as the second paragraph of section 2, of the general instructions on page 9 of the Classification of Investment in Road and Equipment of Steam Roads, Issue of 1914: "If the total cost of additions and betterments to any class of equipment, or any class of fixed improvements (except additional, or extension of, tracks), under a general plan, considered as a whole, is less than \$100, the amount expended shall be charged to the appropriate account in operating expenses. This rule is not to be construed as authorizing the parceling of expenditures in order to bring them within this limit.

The Interstate Commerce Commission has issued a notice to shippers calling attention to the fact that Section 206-c of the transportation act provides that complaints praying for reparation on account of damage claimed to have been caused by reason of the collection or enforcement during the period of federal control of unreasonable rates or rates otherwise in violation of the interstate commerce act may be filed with the commission within one year after the termination of federal control. The commission says it is not vested with jurisdiction to consider claims for reparation filed after the expiration of that time and that notification to the commission that a complaint may or will be filed later for the recovery of damages is not a filing of complaint within the meaning of the statute.

### State Commissions

The State Senate of Colorado has passed a bill repealing the law which created the State Railroad Commission and the measure has been sent to the House.

The Public Service Commission of the State of Kansas has continued all railroad rate cases for a period of six months from March 1. This means that there will be no change in existing intrastate rates prior to next September.

## Foreign Railway News

### Electrification in South Africa

The South African Railways are advertising in the United States for bids for materials to be used in the electrification of their lines between Capetown and Simonstown and between Durban and Pietermaritzburg. The following materials will be needed for the Capetown project: Motor coaches and underframes, motor bogies, electrical equipment for coaches, substation equipment and power station transformers, boilers and boiler house equipment, turbo-alternators and condensing plant. For the work at Durban the following materials are desired: Electric passenger and freight locomotives, electric switching locomotives, substation equipment, boilers and boiler house equipment, turbo-alternators, condensing plant and transformers for substations and power stations. It is understood that the Capetown project is a multiple unit proposition and the one at Durban primarily to secure cheaper operation on heavy grades.

Specifications can be obtained from the High Commissioner for the Union of South Africa, 32 Victoria street, S. W. 1, London, England. The charge for these is £5 5s, for the first copy and £2 2s, for additional copies. Sums expended for these specifications up to three will be refunded upon receipt of bona-fide bids. Bids will be received by the High Commissioner at London up to May 3. It is understood that the total cost of the work will exceed \$20,000,000.

### Plans for Spanish Cars Received

Specifications for freight and passenger cars, of which the Spanish government intends to order a large number, have been received by the Bureau of Foreign and Domestic Commerce and are on file at the Custom House, New York. Bids for this equipment opened in Madrid beginning February 14, 1921.

### Car Exports in December

Passenger cars exported in December totaled 32, valued at \$258,451—the highest figure for any month of the year. Freight car exports were 1,611, valued at \$2,267,660, showing a considerable improvement over the figures for each of the two preceding months. Cuba was the destination of 865 of these cars, while 300 were sent to the Philippine Islands. The detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries	Passenger		Freight and other		Parts of cars, Dollars
	No.	Dollars	No.	Dollars	
France .....	..	..	..	..	425,607

December Exports of Car Wheels and Axles

Exports of car wheels and axles in December totaled \$631,999 in value. The largest shipments during the month were to Spain. These exports were valued at \$201,546. The figures, by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Dollars
Belgium	3,203
Spain	201,546
England	2,595
Canada	93,671
Costa Rica	1,026
Guatemala	2,737
Honduras	1,330
Fanama	200
Mexico	76,086
Jamaica	2,278

Japan	50,904
New Zealand	537
Other British Oceania	28
Philippines	12,121
British South Africa	96
Total	631,999

December Exports of Track Material

Spikes weighing 3,158,612 lb. and valued at \$143,177 were exported during December. Cuba was the destination of by far the largest shipments of this material. Rails valued at \$3,324,802 and weighing 52,986 tons were the month's totals. The exports of switches, frogs, splice bars, etc., were valued at \$784,108. The detailed figures, by countries, as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce, follow:

Countries	Spikes		Steel rails	Switches, frogs, splice bars, etc.	
	Pounds	Dollars		Tons	Dollars
Denmark			119	7,497	959
Finland			197	13,748

Equipment and Supplies

Locomotives

THE NEW JERSEY, INDIANA & ILLINOIS is inquiring for some Mogul type locomotives.

THE OLIVER IRON MINING COMPANY, Duluth, Minn., is asking for prices on 12 locomotives.

THE MEXICO & NORTH WESTERN is inquiring for some 2-6-6-2 type and some 2-8-0 type locomotives.

CERRO DE PASCO RAILWAY (Peru) is inquiring through the locomotive builders for one Mikado type locomotive.

THE UNITED FRUIT COMPANY, New York, has ordered 2 Forney type locomotives from the Porter Locomotive Works. The locomotives will have a total weight of about 12 tons and will be used on the Truxillo Railroad, Honduras.

Freight Cars

THE ATCHISON, TOPEKA & SANTA FE is inquiring for 1,000 50-ton gondola cars.

THE BANGOR & AROOSTOOK has ordered 30 ballast cars from the Rodger Ballast Car Company.

THE LOUISIANA & ARKANSAS has ordered 25 Hart convertible dump cars from the American Car & Foundry Company.

THE ERIE is having general repairs made to 300 50-ton all-steel gondola cars, at the shops of the Greenville Steel Car Company, Greenville, Pa.

Passenger Cars

THE ANN ARBOR has revived its inquiry for 2 combination smoking and mail cars and 4 passenger coaches.

THE NORTHERN PACIFIC is inquiring for 22 coaches, 12 dining cars, 12 70-ft. baggage cars, 5 combination mail and express cars and 11 combination baggage and express cars.

Iron and Steel

THE ATLANTIC COAST LINE is inquiring for 3,000 tons of rails.

THE MISSOURI PACIFIC has ordered 150 tons of plate girder spans from the American Bridge Company.

Miscellaneous

THE ATCHISON, TOPEKA & SANTA FE is inquiring for 1,000 rolled steel car wheels, 36 in. in diameter.

Trade Publications

MACHINE TOOLS.—George Swift & Sons, Halifax, England, have issued a general catalogue of machine tools, illustrating and describing the line of radial drills, lathes, slotters, shapers and planers which are included in the regular line manufactured by this company.

LOCOMOTIVE CRANES.—A catalogue of detailed parts of Brown-hoist locomotive cranes has recently been issued by the Brown Hoisting Machinery Company, Cleveland, Ohio. All the parts are shown in photographs in which each detail is clearly numbered to facilitate identification for ordering. The book also contains illustrated directions for erecting and operating these locomotive cranes.

## Supply Trade News

The general offices of **The Watson Engineering Company** have been changed from 1101 Hippodrome building, to 4614 Prospect avenue, Cleveland, Ohio.

**S. D. Inman**, who has been associated with the Conveyors Corporation of America, Chicago, has been placed in charge of the engineering and design of its American trolley carrier monorail conveying equipment.

**Frank P. McCaughey**, a member of the firm of **McCaughey Brothers**, railroad contractors, died suddenly at his home in Chicago on February 4. Mr. McCaughey entered the railroad contracting field with his two brothers John J. and Patrick E., in 1882.

**Max Grant**, whose appointment as manager of technical railway sales of the **Glidden Company**, Cleveland, Ohio, was announced in the *Railway Age* of February 18, was born in Berlin, Germany, in 1876. After serving for three years in the paint business in Germany he came to America in 1896, and went to the Devoe-Raynolds Company, serving first at Chicago and then at New York. About five years later he was appointed superintendent and later became manager of the Canton Paint & Varnish Company, Canton, Ohio. In 1910, he was appointed manager of the railroad paint department of the Wrinkle Paint Manufacturing Company, Columbus, Ohio, and since 1915, was manager of the railway paint department of the Tropical Paint & Oil Company, Cleveland, until his recent appointment as manager of technical railway sales of the Glidden Company with headquarters at Cleveland.

M. Grant

**Robert P. Sanborn** has been appointed manager of the traction department of the **Edison Storage Battery Company**, Orange, N. J. He previously served for several years in the power and mining department of the General Electrical Company, Erie works, Erie, Pa.

The **Federal Engineering Company** has just been organized to specialize in railway plumbing, heating and power plant work. The headquarters of the new firm are at 3240 S. Michigan Boulevard, Chicago, and the company will maintain a branch office at Kansas City, Mo.

The **Commonwealth Steel Company**, St. Louis, Mo., has recently established an employee's benefit association, which provides insurance against sickness, accident or death for the employees. The company has offered to each member of its force a life insurance policy, varying in amounts from \$500 to \$2,000, depending on the length of service.

**Harry A. Pastre** of the **Elliott Company**, Jeannette, Pa., has been appointed manager of a special railroad department. Mr. Pastre for some time has had charge of the company's relations with the railroads and the development of products specially designed for railroad work. The Elliott Company controls the Lagonda Manufacturing Company of Springfield, Ohio, and the Liberty Manufacturing Company of Pittsburgh, both makers of arch tube cleaners.

The **Hazard Manufacturing Company**, Wilkes-Barre, Pa., manufacturers of wire rope and electrical wires and cables, on February 1 opened a new sales office and warehouse at 1701-1703 First avenue, Birmingham, Ala., in charge of **R. J. Bravand**, district manager. Mr. Bravand has been with the Hazard Manufacturing Company for 22 years.

**N. C. Hoyles, C. E.**, has been appointed manager of the Cincinnati, Ohio, branch of the **Pittsburgh Testing Laboratory**, Pittsburgh, Pa. From 1909 to 1914, Mr. Hoyles was manager of the Birmingham, Ala., branch of this company. In 1914, he joined the Canadian military forces, went overseas with the Canadian engineers, and at the close of the war was mustered out with the rank of Lieutenant-Colonel. For the past year, he has been assistant manager of the Pittsburgh Testing Laboratory's New York office.

A bulletin issued by the Bureau of Labor Statistics of the United States Department of Labor on employment in selected industries in January, 1921, summarizes reports from 46 car building and repairing establishments which in January, 1921, had on their payrolls 44,613 employees, or 5½ per cent less than for January, 1920. The amount of the payroll in January, 1921, however, was \$3,125,082, or 9.6 per cent greater than that for January, 1920. A similar comparison for January, 1921, and December, 1920, is given for 45 establishments, which shows a decrease of 12.4 per cent in the number of employees on the payroll and a decrease of 20.2 per cent in the amount of the payroll. The bulletin states that the industry reports that in order to reduce expenses and on account of the general business conditions the number of employees was reduced. The per capita earnings for the period in January were 8.9 per cent lower than for the December payroll period.

## Obituary

### Charles B. Schoenmehl

**Charles B. Schoenmehl**, president and treasurer of the **Waterbury Battery Company**, Waterbury, Conn., who died on February 14, at his home in Waterbury, as was noted in the *Railway Age* of February 18, was born in New York City in November, 1858. At the age of 15 he entered the employ of the Benedict & Burnham Company and afterward went to the Waterbury Brass Company in the tube rolling department. During his employment with the latter company he first took up the study of electro-chemistry.

He commenced experimenting with electric batteries in the early eighties; his first attempt to market a battery was about 1884, while in the employ of the Waterbury Brass Company, when he made and sold to physicians in and about Waterbury batteries for use with medical coils. These batteries were made by him at night after his day's work in the brass company. In 1886, he developed a new type of open circuit cells, and about this time he began taking out patents covering batteries in general. The first type of battery marketed under a trade name was Victor cell.

In 1896, the Excelsior cell was placed on the market, this was of the cylindrical type and was based upon patents which were kept more or less active by additional combination and improvement patents. Up to 1896, he did all the work of manufacturing and selling his battery product himself, still producing at night such batteries as were sold, and

C. B. Schoenmehl

retaining his employment in the Waterbury Brass Company.

The Waterbury Battery Company was organized in 1898 with a few hundred dollars Mr. Schoenmehl had borrowed to start operations. Subsequently he secured additional finances from a friend but this was all repaid later from the profits of the company's business. The company started operation with one employee, and its manufacturing plant consisted of a small building 20 ft. by 30 ft.

The first product of the company was the Excelsior battery. In 1904, a new compressed cylinder type of copper oxide cell was presented to the trade under the trade name of Schoenmehl's primary battery. This type, in modified form, is still being sold in large quantities, and the present Unit cylinder type of cell now being featured by the company is the further development of this original cylinder type. In 1906, the company placed upon the market a plate type of battery. This type, with certain modifications, also a high internal resistance or track circuit type of primary battery produced in 1912, are still being made in large quantities.

During 1912, Mr. Schoenmehl put out his multiple plate type element and the same year he acquired the business and plant of the Gordon Primary Battery Company. In the acquisition of this business, he obtained all the patents covering the Gordon battery to which he subsequently added combination and improvement patents.

Mr. Schoenmehl was a prolific inventor. Since the organization of The Waterbury Battery Company he has invented and patented in the United States and Canada a great many improvements in primary batteries as well as other devices including patents covering the electro-deposition of metals, and he originated and devised the method of electro-deposition of copper now in use in some of the great mining centers of the West. Altogether Mr. Schoenmehl has taken out upward of 60 patents in the United States.

### Arthur H. Johnson

Arthur H. Johnson, for many years signal and telegraph superintendent of the London & South Western, and formerly well known in America, died in England on January 23. He had retired from active service in 1918 because of failing health. He was the eldest son of Henry Johnson, also prominent in former years in the signaling field in this country, and brother of Sidney G. Johnson. His first railroad service was on the Lancashire & Yorkshire. He lived in this country about twelve years and was connected with the Union Switch & Signal Company, the Johnson Railroad Signal Company and later with the Standard Signal Company; and he designed the Johnson interlocking machine. For about two years he was signal engineer of the Erie Railroad.

When he returned to England some 23 years ago he joined W. R. Sykes, the inventor of controlled manual signaling apparatus. He married at that time Mr. Sykes' daughter. A couple of years later he went to New Zealand, for the government railroads, as signal and telegraph superintendent, spending several years there, establishing for the New Zealand Railways a signal and telegraph department. All this was before he entered the service of the London & South Western, which was about 1903.

He was the author of a valuable sketch of the history of railroad signaling which was published in the *Railroad Gazette* in August, September and October, 1894.

Mr. Johnson is survived by his wife, two sons and two daughters. His eldest son, Clive, now 21 years old, served with the army in France, during the latter part of the war, as lieutenant in the British Regulars.

RAILROAD OFFICERS should be thoughtful of everyone, think of others' requirements and consider what other people will think of them. They should give their subordinates as much consideration as they expect their subordinates to give them. No one can afford to talk or write in a domineering or angry way. During the past few years there has been a noticeable lack of thoughtfulness, not only for the railroad, but also for the public. Conditions have been so free and easy that about all any railroad man thought about was how much wages he could get.—E. E. Nash.

## Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company contemplates the construction of a bridge across the Iowa river about 20 miles west of Fort Madison, Ia., to cost approximately \$250,000.

ESQUIMALT & NANAIMO.—This company has awarded a contract to the Foundation Company of British Columbia for the construction of a line from Port Alberni, B. C., to Great Central Lake, a distance of 10½ miles. The work will include the erection of one steel lattice girder span with a 150 ft. deck on concrete piers and four frame trestles and will cost approximately \$480,000.

ILLINOIS CENTRAL.—This company contemplates extensions to its roundhouses at Dubuque, Ia., Waterloo, Ia., and Freeport, Ill., to handle new and heavier equipment which is now being delivered.

ILLINOIS CENTRAL.—This company contemplates the construction of a viaduct 700 ft. long and 36 ft. high, carrying McLemore avenue over South Yards, Memphis, Tenn.

LIVE OAK, PERRY & GULF.—This company has begun the reconstruction of its blacksmith and car shops at Live Oak, Fla. The buildings will be of frame construction, 50 ft. by 60 ft. and 60 ft. by 150 ft., respectively. The following new machinery will be purchased: a plane, a shaper, a drill press and a wheel press.

LOUISVILLE & NASHVILLE.—This company has awarded a contract to H. W. Hancock, Louisville, Ky., for the construction of a roundhouse and shops at Loyall, Ky., at an approximate cost of \$150,000.

MISSOURI, KANSAS & TEXAS.—This company has awarded a contract to T. H. Johnson, Sedalia, Mo., for the construction of a one-story brick passenger station at North Jefferson, Mo. This building will replace a frame structure destroyed by fire and will be 21 ft. by 60 ft. and will cost approximately \$13,000.

MT. STRETER.—This company has awarded a contract to the James V. Stryker Construction Company, Denver, Col., for the construction of a line from Meeker, Col., through Mt. Streter and Craig to Wamsutter, Wyo., a distance of 150 miles. The project will cost approximately \$10,000,000 and will require three years for completion.

SOUTHERN PACIFIC.—This company which was noted in the *Railway Age* of February 11 (page 391) as having been ordered by the California Railroad Commission to build a new station at Oakland, Cal., is asking a rehearing of the case, stating that an Oakland syndicate will build a six-story office building including station facilities on the station site under a 50-year lease.

WESTERN PACIFIC.—On the application of this company for a certificate of public convenience and necessity authorizing the construction of a branch line 175 miles in length in Butte County, Cal., the Interstate Commerce Commission holds that the line in question, which is to be built for the sole purpose of serving a tract of timber, will be a spur track within the meaning of paragraph 22, section 1, of the interstate commerce act and a certificate is not required.

THE GOVERNMENT owes the railroads \$350,000,000, but won't pay. Yet some people like the government's business methods so much that they would have the government own and operate the railroads and almost everything else.—*Forbes Magazine*.

MAKING FRIENDS.—We want to make our relations to the public uniformly courteous and efficient. Doubtless there are times when it would be easier to be curt than courteous. But the easier course is by no means always the better. Difficulties merely make a given task more worthy of accomplishment. Good service depends not only on what you do, but upon the way you do it. That is true of all work. Whatever satisfies or pleases a patron is good service. Whatever dissatisfies or displeases a patron is, in most cases, bad service. Has the thing been done right? This is always the final test.—E. E. Nash, general manager, Minneapolis & St. Louis.

# Railway Financial News

**ANN ARBOR.—Asks Authority to Repledge Bonds.**—This company has applied to the Interstate Commerce Commission for authority to repledge from time to time \$700,000 of its improvement and extension mortgage bonds.

**BALTIMORE & OHIO.—Asks Authority for Bond Issue.**—This company has applied to the Interstate Commerce Commission for authority to nominally issue \$2,782,000 of its refunding and general mortgage bonds and to issue bonds of certain subsidiaries to be pledged as further security under the refunding and general mortgage and to use the bonds as collateral security.

**CANADIAN PACIFIC.—Leases Railway.**—Application will be made to the Board of Railway Commissioners for Canada, on March 8, for the approval of a 99-year lease from July 1, 1920, of the Nakusp & Slocan Railway.

**CHICAGO, MILWAUKEE & ST. PAUL.—New Director.**—Burton Hanson has been elected a director.

**CHICAGO & NORTH WESTERN.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue and pledge \$15,000,000 of general mortgage 5 per cent gold bonds under its mortgage of 1987 for the purpose of exchanging, retiring, refunding or paying certain existing bonds reserved for in the mortgage of 1987, maturing April 1 and May 1, 1921. The company also asks authority to execute a trust indenture and to pledge thereunder the \$15,000,000 and also \$3,000,000 of general mortgage gold bonds now in its treasury and for authority to issue and sell \$15,000,000 of 6½ per cent secured gold bonds dated March 1, 1921, and maturing March 1, 1936, for the purpose of facilitating the retirement and refunding of the existing bonds. The latter bonds have been sold to Kuhn, Loeb & Company, subject to the approval of the commission, on a basis of 95.40.

**CHICAGO & WESTERN INDIANA.—Asks Authority to Issue Bonds.**—Application has been made to the Interstate Commerce Commission for authority to issue \$130,000 of its consolidated mortgage 4 per cent bonds, dated September 1, 1920, to retire and refund a like amount of general mortgage 6 per cent bonds.

**CLEVELAND UNION TERMINALS COMPANY.—New York Central Asks Authority to Purchase Stock.**—The New York Central, the Cleveland, Cincinnati, Chicago & St. Louis, and the New York, Chicago & St. Louis have applied to the Interstate Commerce Commission for authority to purchase the stock of this company for \$10,000 and an order approving the grant by it to the New York Central and other companies of the right to use for 999 years the passenger station and approaches proposed to be constructed by the company in Cleveland, on the southwest corner of the Public Square, in accordance with a city ordinance. It is stated that the company has prepared plans for the station which, with land, approaches, etc., is estimated to cost about \$60,000,000. The railroads propose to enter into an agreement with the terminals company providing for the acquisition of the necessary lands and for the construction of the terminal by the sale of first mortgage gold bonds of the terminals company to be issued in series, each series maturing in 50 years and to be guaranteed by the separate railroads. The bonds are to be convertible into cumulative, preferred stock and the first series proposed is for \$6,000,000 but authority for the bond issue has not yet been requested.

**COLLINS & LUDOWICI.—Sale.**—The sale of this road, about 46 miles in length (formerly part of the Georgia Coast & Piedmont, abandoned in 1919), at public auction at Reidsville, Ga., on February 1, for \$70,000, has been confirmed by Judge Shepherd of the Superior Court of Tattall County, Georgia. Half of the road was bought by L. Metzger & Co., of Mobile, Ala., and half by W. A. Dubberty and John D. Bradley, of Glenville, Ga. Efforts, it is said, are being made to save the road from being junked.

**DAYTON, TOLEDO & CHICAGO.—Sale.**—This road has been sold by John Ringling to W. H. Ogborn, of Chicago, and a group of

associates. Mr. Ogborn will become president of the road, which runs from Dayton, Ohio, to Delphos, 95 miles.

**DELAWARE, LACKAWANNA & WESTERN.—Net Operating Income Declines.**—The statement of the 1920 operations submitted to the stockholders at their annual meeting on February 23 showed a net operating income of \$6,104,886, a decrease of \$5,842,478 from the preceding year's net. The chief items in the company's financial report are given in the following table:

	1920	1919
Revenues:		
Transportation of coal.....	\$20,228,484	\$19,055,523
Transportation of merchandise.....	40,132,599	32,839,878
Transportation of passengers.....	13,868,517	12,380,787
Total revenues.....	83,340,062	71,824,047
Expenses:		
Maintenance of way and structures.....	10,178,887	7,682,365
Maintenance of equipment.....	19,508,625	15,132,815
Transportation expenses.....	40,165,381	30,661,441
Net railway operating income.....	6,104,886	11,947,364

**GULF, TEXAS & WESTERN.—Receivership.**—It is reported that W. F. Knox, secretary and treasurer, has been appointed receiver. The road operates between Jacksboro, Tex., and Salesville, 130 miles.

**INDIANA HARBOR BELT.—Authorized to Issue Note.**—The Interstate Commerce Commission has authorized this company to issue a promissory note for \$23,020 at 6 per cent in renewal of a note for the payment of land at Hammond, Ind.

**INTERNATIONAL & GREAT NORTHERN.—Loan Approved.**—The Interstate Commerce Commission has approved a loan of \$260,750 to aid this company in providing itself with new equipment and additions and betterments to way and structures at a total estimated cost of \$521,500. The company itself is required to finance an equal amount to meet the loan of the government.

**KNOXVILLE, SEVIERVILLE & EASTERN.—Receivership.**—Col. S. E. Cleage has been appointed receiver on the petition of the Mechanics Bank & Trust Company, as trustees of the bondholders.

**LOUISVILLE & NASHVILLE.—Asks Authority to Pledge Stock and Bonds.**—This company has applied to the Interstate Commerce Commission for authority to pledge from time to time \$22,164,000 of bonds and \$4,126,025 of stock in its treasury as collateral for proposed loans on short term notes, including a proposed loan of \$4,500,000 from J. P. Morgan & Co. evidenced by short term notes.

**MINNEAPOLIS & ST. LOUIS.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$2,096,000 of its refunding and extension mortgage 5 per cent bonds, of which \$1,382,000 is to pay at maturity an equal amount of first mortgage 6 per cent bonds maturing April 1 and the balance is to be issued against installment payments on various equipment obligations.

**MISSOURI-ILLINOIS RAILWAY.—Illinois Southern taken over.**—This road has been organized under the laws of Missouri to take over and operate the property formerly owned by the Illinois Southern Railway, has secured a franchise to do business in Illinois, and has consummated the purchase of the Illinois Southern property. The Missouri-Illinois, which is now in possession of the property, plans to resume operation of the road at the earliest possible time. The company has established its general offices at Bonne Terre, Mo.

**MISSOURI PACIFIC.—Authorized to Issue Equipment Trusts.**—This company has been given authority by the Interstate Commerce Commission for the issuance of \$1,836,000 of equipment trust certificates at 6½ per cent for the acquisition of 25 Mikado locomotives, 15 switching locomotives and 10 passenger locomotives at a total estimated cost of \$3,076,000.

**NEW YORK CENTRAL.—Asks Authority to Purchase Stock.**—See Cleveland Union Terminals Company.

**NORTHERN PACIFIC.—New Director.**—Stephen Birch has been elected a director.

**NORFOLK SOUTHERN.—Final Payment of Guaranty.**—The Treasury Department announces that it has paid to this company \$1,311,700.63 on a certificate of the Interstate Commerce Commission for final payment of the guaranty under section 209 of the transportation act, for the six months' period following the termination of federal control.

**READING.—Preferred Protective Committee Approves Plan.**—The committee for the protection of the holders of first and second preferred stock, through its chairman, Adrian Iselin, has issued a notice to stockholders saying the dissolution plan filed with the court meets its approval.

"It provides," says the notice, "for equitable and just treatment of the preferred stockholders, as it deals with the preferred stock on the same basis as the common issue. Nevertheless, it has been considered desirable that the committee should be at the hearing in support of the plan before the court, in order to be prepared to oppose any modifications that may be adverse to the interests of the preferred stockholders."

The hearing on it is set for March 1.

The Reading dissolution plan was abstracted in last week's issue of the *Railway Age*, page 425.

**SOUTHEASTERN EXPRESS COMPANY.—Capital Stock Oversubscribed.**—The capital stock of this company, consisting of 10,000 shares each of \$100 par value, was offered to the public on February 17, and was oversubscribed. The Southeastern Express Company was incorporated in Alabama on October 6, 1920. Fairfax Harrison, president of the Southern Railway, in an announcement dated February 18, said:

"The books for subscription to the million dollars of capital stock offered to the people of the South by the Southeastern Express Company were opened yesterday morning and were closed at night. The stock was allotted proportionately to all the 14 states served by the lines of Southern Railway System and the Mobile & Ohio Railroad. The reports received this morning show over-subscription in every state.

"The stock list will be made up of the names of at least 2,500 widely distributed Southern business men holding on the average about four shares apiece. No single subscription in excess of 100 shares was received and no officer or employee of the railroad was permitted to participate, although many of them, especially the employees, offered to subscribe.

"This result of the test of practical business democracy and individualism in the South at a time of business depression is of course gratifying to us, but has perhaps a larger significance. Certainly it fully justifies our confidence that the people of the South desire competition in express service and are willing to back their desire with their money and their support in other respects.

"The Southeastern Express Company will now proceed under the able management of its president, John B. Hockaday, to purchase its necessary equipment and will begin service at the earliest practicable moment, of which announcement will be made."

**WESTERN MARYLAND.—Equipment Notes Offered.**—The National City Company is offering \$1,500,000 7 per cent equipment gold notes, preferred series. The prices yield from 6.75 per cent to 7 per cent, according to maturity. The certificates are dated March 1, 1921. There is due \$100,000 annually each March 1, 1922 to 1936, inclusive.

### Dividends Declared

Cincinnati, New Orleans & Texas Pacific—Preferred, 1½ per cent, quarterly, payable March 1 to holders of record February 19.

Erie & Pittsburgh.—\$.87½, quarterly, payable March 10 to holders of record February 28.

North Pennsylvania.—\$1.00, quarterly, payable February 25 to holders of record February 10-February 20.

**GEORGE A. GILLINGHAM**, a ticket seller in the Pennsylvania station, New York City, has received a prize of \$50 as the most courteous ticket seller in the city, this sum being given by the *Daily News*, a reporter of which paper has been going about the city to try his skill in exhausting the patience of ticket sellers, conductors, clerks in stores and other persons. Recently he gave the prize—one of which was awarded every day for a considerable time—to a conductor of the Hudson & Manhattan. Mr. Gillingham, whose portrait is printed in a circular issued by the railroad company, appears to have been prepared for all contingencies. The circular says:

The reporter posed as an uninformed and somewhat exacting, but not overly quick-witted traveler, and made a number of minute inquiries regarding rates and time-tables between New York and Kansas City. He also inquired innocently why lower berths cost more than upper ones. This information having been furnished, with the greatest cheerfulness, he requested the ticket seller to put it down in writing, which required some trouble and considerable time. Departing with the memorandum he returned, about an hour later, and shortly explained he had lost it and asked to have the same information again furnished in full and once more in writing. Mr. Gillingham, although busy, made no objection and furnished another written memorandum. The reporter then put Mr. Gillingham's patience to a further test by engaging him in a discussion over the question of accepting a check in payment for transportation from New York to Kansas City. Gillingham, when informed that he was the winner in the competition, made no comment, except to say—"By being polite I can serve twice as many passengers."

## Railway Officers

### Executive

**W. H. Ogborn**, whose election as president and general manager of the Dayton, Toledo & Chicago, with headquarters at Dayton, Ohio, was announced in the *Railway Age* of February 18 (page 440), was born at Lafayette, Ind., on September 27, 1873. He entered railway service in March, 1887, with the Lake Erie & Western, as a messenger boy in the offices of the general superintendent at Lafayette. During the next four years he served successively as messenger, yard clerk, operator and agent. In 1891, he was employed by the Wabash, on which road he served as a clerk, agent and yardmaster at various points in Indiana until 1893, when he entered the service of the Atchison, Topeka & Santa Fe in the freight department at Chicago. A year later he was employed by the Chicago, Rock Island & Pacific in the accounting department at Chicago. In 1898, he returned to the Wabash as a contracting agent with headquarters at Chicago. In 1900, Mr. Ogborn was appointed traffic manager of the Barry Steamship Company, a position which he held until 1903, when he returned to railroad service, as chief clerk and accountant to the manager of the Lehigh & Wabash Dispatch Fast Freight Line, Chicago. From 1905 to 1915, he served as general freight and passenger agent of the Illinois Southern, with headquarters first at Chicago and later at St. Louis, Mo. In the latter year he was made general manager of the St. Joseph Valley Railway, with headquarters at Elkhart, Ind. Mr. Ogborn was appointed general manager of the Dayton, Toledo & Chicago on December 15, 1920, and was serving in this position on February 7, 1921, when, with his associates, he negotiated the purchase of the railroad from the Ringling interests.

**A. B. Calder**, assistant general passenger agent of the Canadian Pacific with headquarters at Montreal, has been promoted to the executive staff of the company. Mr. Calder was born at London, Ontario, in 1868 and was educated at Manitoba College. He started his railway career in construction work but shortly thereafter, in 1887, entered the service of the passenger traffic department of the Canadian Pacific. For a year he was city ticket agent at Winnipeg, Man., after which he served the company at Tacoma, Wash., San Francisco, Calif., Seattle, Wash., and Chicago. At the two latter cities he was general agent. At the outbreak of the war Mr. Calder was assigned by the company to work with the British and Canadian Recruiting Mission. He returned to the company at the close of the war as assistant general passenger agent and in that capacity in 1919 conducted the tour through Canada of the Prince of Wales and his party.

A. B. Calder

### Financial, Legal and Accounting

**Herbert N. Paist**, whose election as treasurer of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Minneapolis, Minn., was announced in the *Railway Age* of January 21 (page 263), was born on October 15, 1859, at St. Paul, Minn., and entered railway service in May, 1882, as a night operator

on the Chicago, St. Paul, Minneapolis & Omaha, at Brewster, Minn. During the succeeding year, Mr. Paist served as day operator and agent at Brewster and on May 1, 1883, he was transferred to Heron Lake, Minn., where he was employed until 1885. In that year he was transferred to Lake Crystal, Minn., and 6 years later was appointed cashier, with headquarters at Sioux City, Ia., a position which he held until 1894. On the latter date he entered the service of the Minneapolis, St. Paul & Sault Ste. Marie, serving as an agent at various points until October, 1896. At this time he was transferred to the office of the auditor, and after two years' service there, he was promoted to traveling auditor. At the time of his election as treasurer, Mr. Paist was serving as paymaster, and assistant treasurer, positions which he had held continuously since 1900.

### Traffic

**H. C. Montgomery** has been appointed general agent on the Chicago, Indianapolis & Louisville, with headquarters at Birmingham, Ala., effective February 20, succeeding Henry Hiden, deceased.

**F. E. Lewis**, whose appointment as assistant general freight agent on the New York Central, with headquarters at Detroit, Mich., was announced in the *Railway Age* of January 21 (page 263), was born on March 5, 1884, at Fayette, Ohio. He entered railway service in June, 1899, as a student and extra station man on the Lake Shore & Michigan Southern at Deerfield, Mich. A year later he was transferred to Morenci, Mich., as station man and extra agent. In May, 1902, he was made agent and operator and served in this capacity at various points until 1910, when he was made soliciting freight agent and traveling freight agent, with headquarters at Toledo, Ohio. In 1911, he was appointed commercial agent with headquarters at Detroit, Mich., and after 6 years' service in this position, he was promoted to division freight agent. At the time of his recent appointment, Mr. Lewis was serving as division freight agent, with headquarters at Hillsdale, Mich., where he had been transferred in 1918.

F. E. Lewis

**L. D. Gruber**, traveling freight and passenger agent on the Denver & Rio Grande, has been promoted to general agent with headquarters at St. Louis, Mo., succeeding **J. L. Hohl**, who has been transferred to Chicago. Mr. Hohl succeeds **J. E. Courtney**, who has been transferred to New York, succeeding **W. C. Connor**, who has resigned. These promotions and changes were effective February 15.

### Operating

**J. B. Hersh**, general yardmaster on the Baltimore & Ohio, with headquarters at Garrett, Ind., has been promoted to trainmaster, with headquarters at Willard, Ohio, and jurisdiction over the Willard terminal.

**J. F. Coleman**, trainmaster on the Northern Pacific, with headquarters at Tacoma, Washington, has been appointed chief dispatcher, with the same headquarters, effective February 15, succeeding **J. F. Thomas**, who has been transferred.

**J. B. MacGregor**, supervisor of telegraph on the Grand Trunk, Western Lines, with headquarters at Battle Creek,

Mich., has been promoted to assistant superintendent of telegraph, with the same headquarters, effective February 15.

**A. O. Veitch**, whose promotion to superintendent of the Olympic division of the Chicago, Milwaukee & St. Paul, with headquarters at Port Angeles, Wash., was announced in the *Railway Age* of January 7 (page 173), was born at Cambridge, Ohio, and spent the early years of his railway service with the Baltimore & Ohio. After serving successively with this road as operator, dispatcher, chief dispatcher and assistant trainmaster, Mr. Veitch entered the service of the Chicago, Milwaukee & St. Paul on March 1, 1912, as a train dispatcher at Miles City, Mont. He was shortly promoted to chief inspector and has served in that capacity at various points on the line. At the time of his recent promotion, Mr. Veitch was serving as trainmaster on the Idaho division, with headquarters at Spokane, Wash.

### Mechanical

**D. G. McCormick** has been appointed mechanical engineer of the Mobile & Ohio with headquarters at St. Louis, Mo.

### Obituary

**M. H. Smith**, president of the Louisville & Nashville, died at his home in Louisville, Ky., on February 22 at the age of 85. Mr. Smith had been ill for several months.

**Francis C. Donald**, formerly commissioner of the Central Passenger Association, with headquarters at Chicago, whose death on February 14, at his home in Hubbard Woods, Ill., was announced in the *Railway Age* of February 18 (page 440), was born at Canfield, Ohio, and entered railway service in March, 1883, as northwestern passenger and freight agent on the Chicago & Atlantic (now a part of the Erie), with headquarters at St. Paul, Minn. In March, 1886, he was transferred to Chicago as city passenger and ticket agent and a year later was promoted to general passenger and ticket agent. When the Chicago & Atlantic was taken over by the Erie, Mr. Donald was appointed general passenger agent of the Chicago & Erie. In October, 1890, he left railroad service to become vice-chairman of the Central Traffic Association, with jurisdiction over the passenger business of the organization. He was made commissioner of the passenger department of the Association in December, 1892, and served in this position until February, 1896, when he was appointed commissioner of the Central Passenger Committee. Mr. Donald had served as commissioner of the Central Passenger Association for over 23 years, having been appointed to the position in February, 1897. In addition to his other duties he had been chairman of the Chicago Eastbound Passenger Committee since October, 1890; Commissioner of the Mileage Exchange Order Bureau of the Central Passenger Association since September, 1897; and chairman-treasurer of the Railway Ticket Protective Bureau since February 1, 1903. During the period of federal control the work of the Central Passenger Association was taken over by the Central District Passenger Committee and Mr. Donald was made secretary of this organization. When the roads were returned to private management, he returned to the reorganized Central Passenger Association and was serving in an advisory capacity at the time of his death.

The number of tank car shipments of sulphuric acid of varying degrees of concentration has increased greatly in the last few years. This is a commodity of

### A Hazardous Commodity

a dangerous character and accidents which would be negligible under ordinary conditions may be serious if acid is involved. The majority of railroad

employees probably do not realize this; in fact serious injuries have resulted from men stepping into acid that has leaked from tank cars. All who have jurisdiction over, or are engaged in the movement of cars containing this product, should at all times exercise particular care and use all possible precautions to protect both the car and the lading. Switching crews are vitally interested in proper handling as a measure of self-protection. Yardmasters and others, having control of hump yards, should appreciate the necessity of strict adherence to the rule requiring car droppers to ride the cars to a standstill. Each car of acid carries the Bureau of Explosives' danger signal in the form of the regulation white label on both sides and ends of the tank, but familiarity breeds contempt for potential hazards and the warning is not infrequently disregarded. The significance of the placard should be recognized by all concerned in the interest of the operating road, as well as the tank car owner.

Progress in engineering design is always most rapid during periods of intensive construction. Conversely, the least

### Little Progress in Concrete Design

development occurs during periods of retrenchment. The truth of this principle with regard to the design of concrete structures during the last

six years is exemplified most eloquently in a bulletin of the International Railway Congress on the subject of concrete work, which was written in 1914 by the late C. H. Carlidge, but not published until December, 1920. The dearth of progress since this paper was written is an effective measure of the marked cessation of railway expansion. Railway concrete structures, barring the typical reinforced concrete, multiple-store building, are in a class by themselves. Even highway bridges, which are now being built in great numbers with the impetus to road construction, have little in common with railway structures. Consequently the progress in concrete work as regards design in lines outside the railroads has had little influence on railway practice. It is for this reason that there have been few recent developments to compare with those that took place during the period which saw the completion of the Tunkhannock viaduct, the building of the high abutments for the St. Paul trestles in the Bitter Roots, the inception of the reinforced concrete trestle design on the Burlington, the later years of track elevation at Chicago, and similar work on the Kansas City Terminal, unit construction roundhouses on the Santa Fe and butterfly train sheds at Denver and elsewhere. Of course, it is not presumed that all progress has ceased, but such developments as the concrete snow sheds of the Union Pacific and the use of flat slabs for grade separation work on the Lackawanna stand out as exceptions that prove the rule. Construction practice embracing such matters as proportioning, mixing, concreting in cold weather and surface

finishes are common to all classes of structures whether built by railroads, highway authorities or private individuals. Consequently, the railroads have shared in the progress along such lines even though the amount of work done by the railroads themselves has been very meagre. As regards design, on the other hand, further progress awaits the restoration of railway development on a scale commensurate with the needs of the country.

Figures, especially when expressed in millions, have little meaning unless they can be visualized by comparison. To

### Who Is Stopping This Leak?

state that loss and damage on American railroads for the year 1920 amounted to \$280,000,000 may sound impressive. However, a better idea of the magnitude of this waste can be gained from the fact that last year it cost the railroads nearly as much as did taxes and almost half as much as locomotive fuel. The waste of fuel has been recognized for years as a serious cause of loss and the mechanical associations have given attention to reducing it to a minimum. Loss and damage has reached its present proportion only since the war. Some roads have effective organizations for dealing with it, but the majority of roads not only are not organized to combat the waste, but from all indications hardly realize that the problem exists. Yet the field for saving in this direction is probably as great as the possible saving in fuel. If fuel consumption were brought down to the irreducible minimum, probably not more than 25 per cent could be saved, in the present state of engineering development. On the other hand, probably 50 per cent of loss and damage is preventable, which would make the possible saving by correct practice approximately the same. At any rate, loss and damage represents one of the big leaks that the railroads should constantly be alert to stop.

A clam shell which is being propelled along a railroad track through the instrumentality of its own spontaneous

### Regulation of Clam Shell Transportation

internally-developed kinetic energy ought to be treated the same as a common gravel train; or, at least, that is the opinion of a grievance committee which recently appealed to the Railroad Labor Board at Chicago to adopt that ruling, as noticed in the *Railway Age* of February 18, page 413. To the weary newspaper reader who is hoping to see some rift in the clouds which now envelop the general railroad situation, the referring of such a petty detail to a company of men burdened with grave matters of nation-wide interest must seem absurd to the point of disgust. One of the characteristics, however, of these modern days of collective bargaining is the multitude of smallest details which the central powers—both of capital and of labor—are called upon to deal with and the incident of the clam shell may perhaps serve a useful purpose in showing us which way we are drifting. How long before our administrative and regulating machinery will come to a dead stop wholly because of internal friction?

The Interstate Commerce Commission—which costs us a thousand dollars a day—has to give the same sober attention to an overcharge on a carload of scrap iron from Texarkana to Poplar Bluff as to a general rate problem affecting the current freight earnings of 100,000 miles of railroad. The New York Public Service Commission has just issued and circulated a formal report rebuking a railroad company for being stingy with coal in a small country waiting room. In Canada, the railway commission recently formulated and published a ten-page report to please a grievance committee which, being short of grist for its mill, had complained about the irregular application of Rule 93 of the Standard Code. The commissioners evidently gave up the attempt to comprehend the merits of this much-discussed rule and decided the case along the line of least resistance—an expenditure of several hundred dollars with no discernible benefit to the public.

As the time approaches when the railways of Great Britain are to be returned to their owners it becomes increasingly

### Difficulties of the British Railways

apparent that the politicians are not disposed to provide the legislation needed to insure either an adequate return on the invested capital or to free the carriers from increased costs and vexatious restrictions which have arisen under government control. Most of the freight traffic of the British railways is hauled a relatively short distance. Competition by motor trucks is, consequently, an ever-present danger which makes rate increases beyond a certain point highly inadvisable. The adoption of the eight-hour day, the granting of greatly increased wage rates and the high prices which must be paid for supplies are a heritage from government control which the railways must accept. The chairman of the board of directors of one of the companies proposes that the government return the properties without restricting decreases in wages and without assuming control over rates. In this manner, he says, the companies can arrange to charge the rates which will bring the greatest returns and each road will be allowed to negotiate with its own employees to arrive at a wage scale which the company can afford to pay. Others propose, as the only means by which adequate returns on the invested capital can be assured and, consequently, the quality of service maintained, that the government continue paying the present guaranteed return until such time as the costs which have increased some 300 per cent under government control can be decreased sufficiently to allow the railways to pay adequate returns to investors out of regular earnings. It is to be hoped that the British government will soon realize the importance of securing for the railways the financial position which they must have if they are to keep pace with the growing needs of the country.

The exports of locomotives and passenger cars in 1920 were greater than those of any previous year. The figures com-

pared by the Bureau of Foreign and Domestic Commerce, shown in detail elsewhere in this issue, give 1,711 locomotives and 123 passenger cars as the totals for the year. The same totals in 1919 were 959 and 104, respectively, and the total value of locomotives exported during that year was considerably less than the \$53,629,847 total for 1920, but the value of passenger car exports in 1919 exceeded the 1920 total. The export totals of other railway materials during the past year, however, afford less encouragement to those who desire to see American railway supplies maintain their position in the world's markets. Only 21,676 freight cars, valued at \$37,-

192,502, were exported in 1920, as against 27,317, valued at \$57,473,824, in 1919. In addition, the exports of car wheels and axles show a decrease of more than 20 per cent from the 1919 totals, track spikes more than 30 per cent, steel rails almost 10 per cent and miscellaneous track material almost 20 per cent. This decrease can be traced in most cases to a decline in buying power in our markets abroad and to renewed foreign competition. The situation is not, it would appear, altogether hopeless. If some arrangement can be made to extend long term credits to purchasers abroad the danger of competition on the part of foreign concerns, due now largely to exchange rates which are unfavorable to this country, will be materially lessened and the buying power of the foreign markets will be to some extent restored. The extension of such long term credits is the purpose of the Foreign Trade Financing Corporation which is now being organized under the Edge law. It is to be hoped that its plans for meeting the serious problems which now confront our export trade may secure from the American people the hearty support which is necessary if they are to succeed.

A close study of car conditions will disclose a large number of difficulties in the way of effecting a permanent improvement, and it is not possible to cover

### A Demoralizing Influence

them all in a brief classification. It is probable, however, that the three most pronounced difficulties are a lack of adequate facilities, considering the railroads of the United States as a whole, the continued perpetuation of weak equipment and a lack of uniformity in the distribution of the burden of car repairs. These conditions are not new, but with the growth of traffic and the increasing severity of operating conditions they have gradually become more aggravated in spite of all efforts to bring about permanent improvements. The continuance of these conditions suggests that there is something fundamentally wrong in the methods of dealing with them. One such fundamental weakness is the policy of fixing prices for labor and material for foreign car repairs only high enough to cover the actual cost plus overhead for the average railroad. Of course, an attempt to attribute all of the evils in the car situation to this policy would be futile, but it is equally futile to attempt to prove that this policy does not exert a strong influence toward their continuance. Prices set to cover the bare cost plus overhead for average conditions, necessarily do not cover these items for roads whose costs are higher than the average. These roads, therefore, have little incentive to provide facilities to take care of their full share of the burden of car maintenance, as their immediate interests may often seem to be best served by continuing to do only what is necessary to keep cars moving on their own lines. The result is that the roads with comparatively low costs or with operating conditions which demand a high standard of car maintenance for safety, are burdened with an abnormally large share of the maintenance. Such roads must often do extensive work on weak equipment at prices considerably lower than the actual cost of the same work if performed by the owning road. It seems evident that such prices exert a demoralizing influence, not only tending to perpetuate, but actually to aggravate, the evils of the car situation. Would not a scale of prices definitely established to include a profit of 10 or 15 per cent under average conditions exert a powerful influence toward the equalization of the burden of freight car maintenance? It is true that the profit of those roads whose costs are low would be considerably higher than the 10 or 15 per cent; but on the other hand, those roads whose costs are high would not be compelled to take a loss should they attempt to do their full share of the work.

## Enactment of the Winslow Bill

PROBABLY IN THE FUTURE we shall look back to the signing of the Winslow Bill by President Wilson as marking the beginning of a substantial and important improvement of conditions in the railroad and railway supply industries. It will be some time before large amounts of the money authorized to be paid to the railways in installments will be received by them. The passage of the bill makes certain, however, that as soon as the Treasury Department can raise sufficient funds the railways will begin to receive part of their money. The new national administration which takes control today will naturally want to promote a revival of business as rapidly as practicable, and there is no way immediately available by which it can do this better than by speeding up payments to the railroads. Because the government owes hundreds of millions of dollars to the railroads, they owe proportionately large amounts to companies from which they have bought materials and supplies. These concerns in turn have borrowed heavily at the banks. This condition has reduced railroad purchases, seriously hampered and almost bankrupted many railway supply companies, and impaired the ability of the banks to furnish credit to concerns desiring to enlarge their operations. There can be no doubt that as the railways are enabled to pay their present current indebtedness they will begin to buy materials in larger amounts. This in turn will help the railway equipment and supply business, and whatever causes activity in any particular line of business is bound to help the general business situation.

The passage of the Winslow Bill through Congress by large majorities, and its prompt signing by President Wilson, were a strong indication not only of the public sentiment which demands fair play for the railroads, but also of the loss of influence of certain labor organizations. The leaders of these labor organizations sought to prevent passage of the bill, and they appealed to the President not to sign it. It has not been many years since the government at Washington heeded pleas from them which were hardly more unreasonable. Their activities in connection with the Winslow Bill had apparently no influence at all. The enactment of this legislation was important in itself, and even more important as an indication of public sentiment.

## Farmers and the Railroad Situation

ONE OF THE MOST fundamental troubles with the business situation in the United States today is that the purchasing power of the farmers, who are the largest class of its people, has been largely destroyed. The purchasing power of the farmers has been largely destroyed by heavy reductions in the prices of practically all the things they have to sell, which have not been offset by corresponding reductions in the prices of most of the things that they buy.

The farmers produced more grain in 1920 than ever before. But their power of buying is determined by the total amount for which they can sell their products.

The aggregate value of their products measured in the prices of farm machinery, automobiles, coal, railroad transportation, building materials, is less than it has been in years. Until their purchasing power is restored they will and must buy much less of almost everything than they have bought heretofore.

With them buying so much less there is an inevitable reduction in the amount of commodities of all kinds that the merchants can sell, that the manufacturers and the mines can produce, that the railways can get to transport. This reduction in mercantile, manufacturing, mining and transportation activity inevitably results in all these industries laying off many thousands of men. The consequence is the wide-

spread unemployment that now prevails, which in itself reduces the demand for farm products and the prices of them.

There is but one remedy for this condition. This is to restore the purchasing power of the farmers. Theoretically this might be done either by increasing the prices of the things they sell or reducing the prices of the things they buy. As a practical matter it cannot be done in the former way. The decline in the prices of farm products is due to world-wide conditions, and there is no prospect of conditions so changing as to cause a substantial increase in these prices.

The purchasing power of the farmer must be restored by reductions in the prices of the things he buys. The main reason why reductions cannot be made in the prices of many of these things is the present high cost of producing them. This high cost, in turn, is mainly due to the reduced productivity and high wages of labor in many industries.

The wages of coal miners are higher than ever before. This keeps up the price of coal. Coal enters largely into the cost of manufacturing and of conducting transportation. Therefore its high cost tends to keep up the cost of manufacturing and of operating railroads. The railways, owing to artificial, rigid and iniquitous rules and working conditions, are being forced to employ an excessive number of men, and, in addition, are paying the highest wages ever known. The high price of fuel, and especially the present rules and working conditions and wages, are making the cost of railroad operation excessive. This, in turn, renders it impracticable to reduce the freight rates the farmers or any other class pay. On the present rates the railways are earning an utterly inadequate return. On a six per cent annual basis they should have earned \$408,000,000 net operating income in the last four months of 1920. They actually earned \$233,146,000. They should have earned \$87,000,000 in December; they earned only \$17,000,000.

The costs of producing the things the farmers buy should be reduced in order that the prices that the farmers must pay for them can be reduced. The cost of railroad operation especially ought to be reduced so that the freight and passenger rates the farmer must pay can be reduced.

While, however, the farmers have suffered heavy losses by reductions in their prices, and owing to these reductions in their prices they have had their purchasing power largely destroyed, organized labor throughout the country, and especially on the railroads, is opposing every effort to reduce the labor costs of the things that the farmer must buy.

The railway companies are seeking the abolition of the wasteful rules and working conditions adopted under government control. They are seeking reductions of the wages of unskilled labor, for which they compete with the farmers in every community in the country. The railroad payroll now constitutes at least 65 per cent of total railroad operating expenses. It must be reduced if there are ever to be any reductions of rates.

Organized labor meets this situation by carrying on Plumb plan propaganda among the farmers and by opposing every effort made by the railways to get changes in working conditions and wages which will enable them to operate more efficiently and economically, and thereby make possible reductions in freight and passenger rates.

There are many farmers who apparently think that the present high rates of the railways are maintained to enable them to earn fancy profits. In the month of December, 1920, the total wages paid to railway employees amounted to about \$300,000,000, while the total net operating income received by the companies was about \$17,000,000. The farmers are being injured by having to pay railway rates that are too high in proportion to the prices of the farmers' products, and the railways are being ruined because with present rates, present traffic and present operating costs they cannot earn anything approaching a reasonable return.

The purchasing power of the farmers must be restored. Not only their welfare, but that of the entire country demands it. Normal general business and normal general prosperity cannot return until the purchasing power of the farmers has been largely restored. Since it can be restored only by reducing the costs of production in other industries, and the cost of transportation, it is high time that the farmers should begin directly to interest themselves in the efforts being made by business men and railroad managers to reduce production and transportation costs.

Since labor costs are now about 65 per cent of the total operating expenses of the railways, the Railroad Labor Board, with its control of rules, working conditions and wages, virtually has control of 65 per cent of the operating expenses of the railways. The railways are before the Board trying to get action which will enable them to reduce these labor costs. Since not only the present extremely small net earnings of the railways, but also the present high freight and passenger rates, are mainly due to these high labor costs, the farmers and others who pay railway rates should recognize the fact that the railway managers, in trying to reduce labor costs, are working in the interest of those who pay the rates.

## Railroad Returns for 1920

TAXES PAID by the railroads in 1920—or those for which they became liable, because some of the roads are behind in their tax bills as well as other bills—amounted to 4½ times as much as the net operating income which the roads earned for their owners. Total operating revenues for the year, according to the Interstate Commerce Commission statistics made public this week, were \$6,225,402,762, the largest in the history of the railroads and \$1,041,000,000 greater than for 1919. Operating expenses, however, consumed \$5,826,197,474 of this, or \$1,406,000,000 more than in 1919, and taxes, \$281,380,620, or \$83,000,000 more than in 1919. Taxes include \$33,349,938 of war taxes for the period from March to December after the roads were returned by the government. After deducting for uncollectible revenues and equipment and joint facility rents this leaves a net operating income, or profit from railway operations, of only \$62,264,421.

This compares with an average of over \$900,000,000 for the three years preceding the war. It represents a return of about one-third of one per cent on the valuation of \$18,900,000,000, which the Interstate Commerce Commission used for the purposes of the rate case. It is less than the roads should earn in one month to receive the 6 per cent which the Transportation Act prescribes as the measure of a fair return on the investment. It is less than one-fourth of the taxes charged by local state and federal governments for the privilege of owning property and doing business and the protection of the laws, and it represents a profit of almost exactly 1 per cent on the gross business done during the year when the railroads handled more freight and passengers than ever before in their history.

These figures strikingly illustrate the importance to the railroads of the relief to be afforded by the Winslow bill, which authorizes partial payments, pending final settlement, of the guaranty provided for by the Transportation Act for the six months following the termination of federal control, which has just been signed by the President. Without the guaranty most of the railroads would have been bankrupt several months ago, particularly as the entire net operating income of \$62,000,000 was earned by only about half of the Class I railroads, the other half having deficits for the year. With the promise of the guaranty and with the assistance of about \$262,000,000 actually advanced on applications filed

prior to September 1, the roads have struggled along for a year but it took a new law, passed a year after the passage of the Transportation Act, to make any of the balance available and the relief could not have been delayed much longer without disastrous results.

The total guaranty for the six-months period is estimated at about \$600,000,000, of which about \$200,000,000 has already been paid out for back wages under the Railroad Labor Board award of July 20. In addition the railroads received about \$150,000,000 for their guaranty for January and February, 1920, when they were still under federal control. While the tax-payers are grumbling about paying the guaranty, they might pause to remember that the railroads themselves have to pay nearly half of it for their taxes.

## New Books

*The Maintenance of Way Cyclopaedia*, edited by E. T. Howson and E. R. Lewis. 860 pages, 2,500 illustrations. 11½ in. by 8½ in. Bound in cloth and leather. Published by the Simmons-Boardman Publishing Company, Woolworth building, New York City. Price, cloth \$10, leather \$15.

This is the latest of the series of cyclopedias and dictionaries to be published by the Simmons-Boardman Publishing Company. It also represents another step in the plans of this company of some 10 years' standing for the fuller treatment of maintenance of way subjects, which was started in the publication of the *Maintenance of Way Section of the Railway Age* and which later developed into an independent form in the *Railway Maintenance Engineer*. The cyclopaedia is a companion book to the *Car Builders' Dictionary* and the *Locomotive Dictionary* which have been issued by the same publisher at intervals for upwards of 30 years. It has been edited in co-operation with the American Railway Engineering Association, with the assistance of a committee of this association appointed for that purpose. It represents an endeavor to place in permanent form between the covers of one volume, the vast fund of information contained in a variety of texts, association proceedings, personal papers, etc. But the work goes much further than this in that a large amount of material is presented which has received little or no treatment heretofore.

Consistent with the adoption of the term "cyclopaedia" the authors have endeavored to make the contents of interest and value alike to the railway employee engaged directly in some particular branch of maintenance of way as well as to the general or operating officer who finds it necessary to enlarge his knowledge of maintenance of way matters because of his general responsibility over the work of that department. The needs of the purchasing and stores officers, who are required to deal with maintenance of way materials, have also been kept in mind. As stated in the preface: "The thought has been to select that which is representative of the best in the maintenance of way field, to incorporate the most modern methods, to include those standards bearing the approval of the prominent technical societies and to show those devices which have been proved to be of undoubted value."

A particular effort has been made to include a large amount of maintenance of way information not previously presented in a permanent form and to clear up confusion of terminology as far as possible in this volume, the editors having co-operated with the American Railway Engineering Association and allied technical associations in the adoption and use of preferred terms. In general the nomenclature of the *Manual of the American Railway Engineering Association* has been accepted. The work of this association

was also drawn on in no small measure by incorporating the latest specifications approved by that organization as well as standard plans, etc. In order to make the book most readily usable it has been arranged in two separate departments, editorial and catalog, while the editorial portion has been further subdivided into sections, each relating to some particular branch of maintenance of way and each with its own alphabetical arrangement. Thus, there are separate sections for track, bridges, buildings, water service, signals, and wood preservation, as well as a general section to cover miscellaneous unclassified subjects.

The catalog section of 218 pages is designed to supplement the general information in the text section with itemized descriptions and illustrations of specific devices referred to more generally in the text section. Here the reader can supplement the general facts gained from the text pages with specific information concerning the particular line of products he desires to investigate. To insure that the reader will find all matter relating to any subject, a general subject index is given in the front of the volume, give page references to all sections of the book where the subject is treated in any way. In addition the catalog section is fully indexed by a directory of products, an alphabetical index of manufacturers and a trade-name index.

*Straight Business in South America.* By James H. Collins. 285 pages, 5 in. by 8 in. Bound in cloth. Published by D. Appleton & Co., 35 West 32nd street, New York City.

An unbiased American, with his eyes and ears wide open solely for information on Latin America for his countrymen, has returned after eight months of intimate contact with the South Americans, and his book, a result of that expedition, apparently omits nothing of value for those who know little of the respective countries on that continent and are interested in trading or building in Latin America. To them, a careful reading of this book, as well as the preparation therefor of a permanent space on the book shelf for reference, is advisable. Its index will be found useful in its references to paragraphs on "American Backwardness in South America," "Misrepresentative Americans," "The Argentine as a Spender," "Picking Up the Spanish Language," "Thrift" "Time" and "Tassajo," as well as hundreds of other intimate items which convey the writer's familiarity with the countries visited, their inhabitants and their views on the methods of the Yankee, as well as their opinions on his competitor, the European. Chapter XI, "Why South America Needs Continental Methods," conveys a bird's-eye view of what South America's railway systems are—and are not. It points out the opportunity for reward to the railway builder, and the South American's attitude on the investments of the foreigner.

AT THE PRESENT TIME there is much talk of the narrow viewpoint of laboring men due to specialization in industry. It is undoubtedly true that the majority of workers have very limited knowledge of the products that they help to produce with the exception of that part on which they are directly employed. Modern workmen are not unresponsive when efforts are made to give them a broader knowledge of their work, however, as is well illustrated by the experience of the Industrial Works, Bay City, Mich. This company has been conducting a "Crane College" for shop and office employees to teach them more of the results of their daily work. The course consists of eighteen lectures, one each week, by various department heads best fitted to handle their subjects. So great was the interest developed in the portion of the course dealing with air brakes that, as an offshoot of the "Crane College" proper, an intensive series of lectures on the Westinghouse air brake was given, in which 69 students were enrolled.

## Letters to the Editor

### Do the Work at the Initial Terminal

ST. PAUL.

To the Editor:

I am a firm advocate of classification at the initial terminal so that trains will leave in station order. Many roads in the west use this system, while others use the zone system. However, some roads, notably the larger and more prominent lines, throw their trains together indiscriminately at the initial point with the idea that the required classification will be obtained in the course of rehandling at the intermediate yards. A number of roads practice this and go farther by wiring the next terminal information concerning the exact position of all cars in a train and their destination. This helps the intermediate yardmaster considerably in preparing for the fray, but in case of reduction on lower commodities and an application of more important freight, the only thing left for him to do is to re-switch the train, with the result that approximately two hours is lost. When this is repeated at, say, every freight terminal between the Mississippi river and the Pacific coast, it is not surprising that a lot of time has been lost. If the train were properly classified at the initial terminal and each subsequent terminal it is advised concerning the consist of the train, the "add" can properly be aligned to cut in and the "cut out" can be quickly handled, one hour will be the maximum time required.

I have noticed that refrigerator cars are often in several different positions in a train, whereas they could easily be assembled and a minimum time used for the service. It is absurd to suppose that a train of high class freight thrown together haphazardly at its initial terminal will right itself by the time the final destination is reached. Has consideration been given to the amount of switching required at the intermediate yards? The relative importance of high class freight traffic on any railroad is the same to the freight traffic manager as the high class passenger traffic is to the passenger traffic manager. It is hardly probable that the large roads out of Chicago and St. Louis would place in the middle of the train a Pullman that was to be cut out at the first junction point. Then why not give the same observance to the freight traffic?

EMMETT H. BURCH.

### Don't Neglect Refrigerator Cars

CHICAGO.

TO THE EDITOR:

The average person has only a slight conception of either the service performed by the refrigerator car, or of the necessity for it under our present mode of living. The time is long past when such delicacies as grapefruit, oranges and sea foods are considered luxuries, to be enjoyed only by the wealthy, for within the last 20 years the refrigerator car has placed these and similar commodities within reach of all.

To illustrate the extent to which this refrigerator car service is now used, we find that during the year 1917 the Class I roads transported approximately 30,000,000 tons of perishable freight, requiring the movement of 2,300,000,000 refrigerator car miles. But while railroad men may justly regard this work of distributing perishable commodities throughout the length and breadth of the land with pride, the service is still far from perfect. In fact these imperfections, represented by claims paid out for loss and damage to perishable freight during 1919 approached \$13,000,000, and this

sum, based on the invoice value of the goods in carload lots, does not begin to represent the economic loss to the country as a whole.

In my opinion this tremendous waste can be overcome in some measure by closer co-operation between shippers and carriers, and by co-ordination of effort between the carriers themselves. The shipper, for example, should see that the cars intended for perishable freight are in condition to give adequate service, and are properly cooled or heated according to the season and the commodity to be transported. He should not fail to instruct the carrier as to the attention which his shipment will require en route, whether it be icing, ventilating or protection against cold. The carriers, on the other hand, are especially interested in the condition of their cars, in maintaining schedule time, and in carrying out the instructions of their shippers to the letter.

It is significant that the roads best equipped to handle the refrigerator car business, are the ones to secure this business to handle. In many instances they have created perishable freight departments manned by specialists who devote their entire time to the work. The officers of these roads find that their expenditures in this direction are repaid many times by their savings in claim payments and by the continued good will of their patrons. During the past few years, however, the maintenance and development of refrigerator equipment in general has not kept pace with the increasing demand for, and production of perishable products. War-time conditions, too, interfering with the construction of new cars, and the adequate repairing of existing equipment, have resulted in a condition so serious that measures must be taken quickly to enable the carriers to handle the increasing volume of perishable freight without a still more enormous bill for loss and damage than they now have.

I hope that our executive officers, in allotting their funds for 1921, will realize the seriousness of this situation, and will look with consideration upon two items—repairs to refrigerator cars, and new refrigerator equipment. With the application of these remedies it does not seem too much to expect that we can reduce the \$13,000,000 paid out in loss and damage claims on perishable freight in 1919, at least to the pre-war figures of \$2,750,000. And surely this would seem worth the effort.

J. D. SHIELDS,

Freight Claim Agent, Chicago, Burlington & Quincy.

## Two Opposing Views on Maximum Car Loading

NEW BRITAIN, Conn.

To the Editor:

In 1919, during the life of the Railroad Administration, the question of maximum car loading now being discussed in your columns was before the shippers of the country and was given every consideration, and the shippers co-operated (at some cost to themselves) so as to get the full benefit of all available equipment. There is a limit to this loading of equipment, based upon commercial usage, classification, and tariff minimums. Shippers, at much inconvenience and financial loss, and receivers, at a much greater outlay financially, handle, and have been handling, larger quantities of merchandise than they would under ordinary commercial conditions. The return of the carriers to corporate control and operation was a relief to the commercial interests of the country, in that it again opened up competition among carriers and the fight for conservation of equipment was not as strenuous as it was under federal control.

The loading of cars to full visible or carrying capacity, of less than carload shipments for various points, does not bring satisfactory results; nor is it conservation of equipment. It ties up more cars at transfer points, for the reason that a check clerk and trucking crew can handle four cars

reasonably loaded where they are handling one loaded to the roof. Further, the amount of damage in cars so loaded offsets any other advantage which might be named.

We are being requested by the carriers to load, as far as possible, all shipments of 10,000 lb. direct to final destination, to save extra labor and handling at transfer points. This we have always done. I am very sure that the shippers will do everything they possibly can to conserve equipment, but the carriers should not overlook the commercial customs and necessities, and the fact that it is the continual movement of water over the dam that operates the mill, rather than a large volume today and nothing tomorrow. It is the same way with business. There must be a continual movement of raw material in to the factory, and finished product out. The receiver or jobber must count upon the source of supply and his ability to spread his capital out and turn it over a number of times, rather than invest in large quantities of some article or commodity which is liable to be left on his hands for a long period.

R. W. POTEET,  
Manager, The Stanley Works.

MANSFIELD, Ohio.

To the Editor:

The grain trade has for several years been compelled, with minor exceptions, to give maximum loading in that the tariffs of the carriers call for loading cars to full capacity. This trade, more than any other interest, has given capacity loading and at a sacrifice to itself. In a great many cases by loading so heavily it has not been possible to obtain proper inspection upon the inbound road and the shipper has had to accept deterioration in grade, due to the condition of the grain and delay in switching at terminals. In a great many cases at the small country points where the shipper has only a minimum quantity of grain to load, he needs a 60,000-lb. or 80,000-lb. capacity car, but was furnished a 100,000-lb. capacity car. In consequence the shipper was compelled to pay for dead space due to the rule of having to load to the capacity of the car.

Under these circumstances I could not advocate, for the grain trade, any more intensive loading than that in effect. On the contrary, as a matter of common justice to the grain trade, the rules in effect should be modified to a more equitable basis. The grain shipper will always load the cars to capacity when cars are scarce and the condition of the grain will warrant such loading, because he is anxious to secure elevator space and take advantage of market values. Therefore the rule which is in effect with the carriers does not increase the loading but creates a hardship at times.

## Passenger Trains in Disastrous Collision

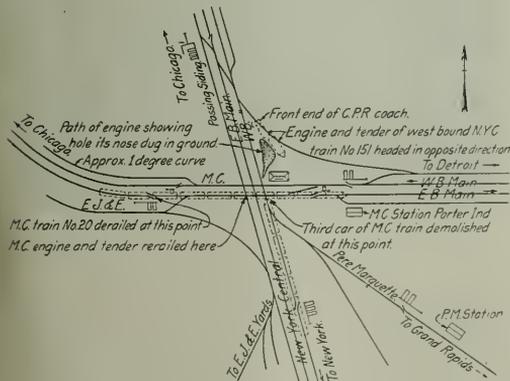

Michigan Central Train Runs Over Derail Onto Crossing and  
New York Central Train Crashes Into It

ON SUNDAY EVENING, February 27, westbound New York Central passenger train No. 151 plowed through the third coach of eastbound Michigan Central train No. 20, at an interlocked crossing of these lines at Porter, Ind. Thirty-seven persons were killed and 4 seriously injured. Preliminary investigation indicates that the

The trains involved in the collision were New York Central westbound passenger train No. 151, known as the "Interstate Express," and Michigan Central eastbound passenger train No. 20, known as the "Canadian." The accident happened on the crossing of the interlocking plant at Porter, Ind., 40 miles southeast of Chicago on the New York Central and 44 miles southeast of Chicago on the Michigan Central. Both trains were approaching the crossing at a high rate of speed. Investigation after the accident disclosed that the levers in the interlocking machine were in the proper position to permit of a westbound movement on the New York Central and that the routes on the Michigan Central were set against the passage of trains. The New York Central train No. 151 leaves Buffalo daily at 8:30 a. m. and is due to arrive in Chicago at 7:30 p. m. This train is scheduled to arrive at Porter, Ind. (Norwood), at 6:21 p. m.

Michigan Central train No. 20 leaves Chicago at 5:05 p. m., arriving at Windsor, Canada, at 1:45 a. m., where it is turned over to the Canadian Pacific for movement to Toronto, Montreal and points east. The train was made up largely of Canadian Pacific cars, the baggage car, smoker, day coach and three sleepers being Canadian Pacific equipment, while the diner and two sleepers were Michigan Central and Pullman equipment, respectively. This train was due to arrive at Porter at 6:16 p. m. and was running a few minutes late at the time of the accident. The schedule time of this train is 50 miles an hour between Hammond, Ind., and Michigan City. The schedule running time of the New York Central train between La Porte, Ind., and Englewood (Chicago), Ill., is 41 miles an hour.

At the point of the accident the Michigan Central tracks run almost due east and west. About 1,000 ft. west of the crossing there is a curve to the north of about 1 degree, after which the track is again tangent, while east of the crossing the track is tangent for some distance. The New York Central tracks at this point are tangent. The interlocking at this place is a mechanical plant equipped with electric route locking and approach indicators on both railroads and is

Sketch Showing Track Layout and Position of Trains at Time of Accident

engineman on the Michigan Central train had run past a home interlocked signal in the stop position at a high rate of speed, his train being derailed on the split point derail which was open. After running on the ties for a distance of approximately 800 ft., the third coach of the train remained upright and standing directly on the crossing of the New York Central. The New York Central train, traveling at high speed, struck this coach, reducing it to a mass of kindling wood.

maintained by the New York Central. After the accident the levers in the machine were found in the proper position to give the New York Central train the route over the plant.

The preliminary investigation indicated that the engineman of the Michigan Central train ran past the eastbound home signal in the stop position and through the open derail. The train then ran on the ties for a distance of 300 ft., when the engine was rerailed on the crossing diamond, continuing across the crossing to a point where the day coach, Canadian Pacific 1560, the third in the train, was on the crossing of the westbound New York Central main when the New York Central train crashed into it. It was in this coach, which was of wooden construction, that the heaviest loss of life occurred. The impact of the New York Central engine was so great that the day coach was reduced to a mass of splinters, part of the wreckage breaking out the windows on the

and did not slow down when we were certain the signal was right. Proof that we were not to blame for the wreck is seen from the fact that the engine and one coach passed the derail. I will not state what I believe caused the wreck. The derail was locked and I could not be to blame."

Joseph Cook, the leverman on duty at the interlocking plant at the time of the accident, declared after the accident that Engineman Long ran by the home signal. The New Central train had been given the route, as its approach was announced first by the indicator in the tower. In his statement he said, "Under normal conditions the block is set against all trains. The train hitting the buzzer first is then given the right of way. \* \* \*

"That is exactly what happened when the buzzer sounded yesterday. It showed that the New York Central train was the first to hit the buzzer by almost a full minute ahead of the Michigan Central flyer.

"I released the block which permitted the New York Central train to go through. Just as the train hit the crossing I saw the Michigan Central train coming around the curve at 60 miles an hour. I saw right away what was going to happen and thought the tower would be demolished. I called to Charlie Whitehead, the telegraph operator in the tower with me, and made for the steps which lead to the ground. The Michigan Central train by this time had hit the derail, which clearly showed that the block had been set against it and plowed over the ties and track, tearing them up as it went across the New York Central track. When the third coach of the Michigan Central train passed over

south side of the interlocking tower as well as the siding in some places. One peculiarity of the accident was that those killed were mostly decapitated, and a number were mutilated so badly that identification was difficult. After the New York Central engine plowed through the day coach it left the track near the northwest corner of the tower and plowed into the ground, which was level at this point, digging a hole about 10 ft. deep. The momentum was so great that the engine and tender were turned completely around and over on their sides upon the wye connection between the New York Central and Michigan Central tracks, breaking and twisting the rails. The engineman and fireman of the New York Central train were killed and many of the passengers in the Michigan Central day coach were buried under the engine and tender. In this coach were between 60 and 80 passengers, many of whom were railroad employees returning to Michigan City, Ind., and Niles, Mich., after spending Sunday in Chicago.

An examination of the stock rail at the eastbound derail on the Michigan Central indicated that the top had rolled slightly and at the point where the wheels dropped to the ties the lower corner of the head was sheared. From this point for a distance of about 800 ft. the ties in this track were reduced to pulp. The crossing frogs were skewed, the lugs on several being broken and it was necessary to replace four of them.

After the accident Engineman Long of the wrecked Michigan Central train was reported as saying: "My fireman, Block, first sighted the signal that meant a clear track and called my attention to it. We were running at full speed

Photo by International

**The Scene of the Collision at Porter, Ind., Showing the New York Central Locomotive**

the New York Central right of way the New York Central train cut through it. As the locomotive of the New York Central train passed over the track it toppled over and the coaches of both trains were scattered in all directions.

"I cannot understand how the engineman of the Michigan Central train could have proceeded against the two blocks which were set against him. I can't help but feel that the engineman must have been asleep, for there are two blocks which are visible for almost a mile and half before he reached the crossing. I heard later that his fireman had admitted that the engineman disregarded the block. Investigation of the scene of the accident will show that the Michigan Central train hit the derail and the plowing up of the ties is conclusive proof that the blocks were correctly set."

In a statement issued by General Manager Henry Shearer of the New York Central at Chicago, it was said that "at

6:23 p. m., February 27, Michigan Central passenger train No. 20, engine No. 8306, ran past the eastbound home signal at Porter (Norwood), Ind., interlocking plant 40 miles east of Chicago, striking the open derail, derailing its engine and entire train. The train kept on going on the ties and the engine jumped back on the track at the crossing. The engine, baggage car and smoker of the Michigan Central train had gotten over the crossing and as the day coach, Canadian Pacific No. 1560, the third car, was on the crossing, New York Central train No. 151 struck the Canadian Pacific coach, demolishing it, derailing and turning over the New York Central engine and derailing four cars behind the New York Central engine."

On Monday morning, February 28, a preliminary investigation of the accident was held at Michigan City, Ind., by officers of the Michigan Central and the New York Central. Representatives of the Indiana State Railway Commission have also started an investigation, as have representatives of the Interstate Commerce Commission.

Henry Shearer, general manager of the Michigan Central, on Tuesday issued the following statement:

"In the matter of the unfortunate collision at the crossing of the New York Central and Michigan Central at Porter, Ind., on February 27, after careful investigation of the facts with all interested employees and conference with officials just completed, it has been determined that engineer W. S. Long and fireman George F. Block, on engine No. 8306, train No. 20, violated rules and regulations in failing to observe and properly obey signal indications, and will be forthwith dismissed from the service."

## Automatic Train Stop Committee

THE BUREAU OF SAFETY of the Interstate Commerce Commission, and the special committee of the American Railway Association, which meet in joint session every month to discuss automatic train stops, have decided that the definitions of the functions of and requisites for installation of automatic train control systems need not be perfected to the last degree before some actual forward step may be taken. At a meeting on February 15 they embodied in a progress report the following paragraph:

"The functions to be accomplished and the specifications and requirements to which a device to be installed in any designated location must conform will of necessity be determined by traffic, operating and other local conditions and can be prescribed in detail only when the specific location for an installation has been designated. In connection with the test installations now in contemplation, it may be necessary to establish specifications and requirements merely tentative at the outset and subject to modification and development as the work progresses. Such specifications and requirements for several test installations, together with records of alterations in the installations which may become necessary in the course of the tests, should furnish data from which the commission may ultimately prepare specifications and requirements to be prescribed in accordance with the terms of the law."

Preliminary to this, the committees, quoting the definition of automatic train control (paragraph 1) adopted the clauses below (paragraphs 2 and 3).

1. *Definition* (Adopted by A. R. A., May, 1914).

An installation so arranged that its operation will automatically result in either one or the other or both of the following conditions:

First—The application of the brakes until the train has been brought to a stop.

Second—The application of the brakes when the speed of the train exceeds a prescribed rate and continued until the speed has been reduced to a predetermined rate.

2. *Functions.*

The primary function of an automatic train control system is to enforce obedience to the indications of fixed signals. The following features may be included, separately or in combination, in automatic train control systems:

1. *Automatic stop.*

(a) Without manual control by engineer; requiring train to be stopped, after which apparatus may be restored to normal condition manually and train permitted to proceed.

(b) Under control of engineer, who may, if alert, forestall automatic brake application and proceed.

2. *Automatic speed control.*

(a) Automatic stop, after which train may proceed under low-speed restriction until the system is automatically restored to normal or clear condition by reason of the removal of the condition which caused the stop operation.

(b) Low-speed restriction, automatic brake application being under control of engineer who may, if alert, forestall application at a stop indication point or when entering a danger zone and proceed under the prescribed speed limit, until the system is automatically restored to normal or clear condition by reason of the removal of the condition which caused the low-speed restriction.

(c) Medium-speed restriction, requiring the speed of a train to be below a prescribed rate when passing a caution signal or when approaching a stop signal or a danger zone in order to forestall an automatic brake application.

(d) Maximum-speed restriction, providing for an automatic brake application if the prescribed maximum speed limit is exceeded at any point.

3. The following general requirements applicable to automatic train control devices may be stated:

1. An automatic stop device shall be effective when the signal controlling it indicates stop, and so far as possible when that signal fails to indicate existing danger conditions.

2. An automatic speed control device shall be effective when the train is not being properly controlled by the engineer.

3. An automatic train control device shall be operative braking distance from the signal location if signals are not overlapped, or at the signal location if an adequate overlap is provided.

## New York Commission on

### Automatic Train Control

THE JOINT COMMITTEE appointed last August, pursuant to a request of the New York Central Railroad Company, following a recommendation by the Public Service Commission, Second District, that the company consider the installation of an automatic train control device, on March 1 submitted its report. The committee consisted of Public Service Commissioner George R. Van Namee, chairman; C. R. Vanneeman, chief of the Division of Railroads, and James J. Gill, inspector of equipment, for the commission; and W. H. Elliott, signal engineer; H. S. Balliet, assistant terminal manager, and T. L. Burton, air brake engineer, for the railroad com-

pany. Numerous plans and devices have been examined and the committee reports to the commission as its conclusions:

1. That only devices employing the induction means of actuating the locomotive apparatus should be installed.
2. That no device now available has been developed to a point warranting installation without a preliminary test on a short section with one locomotive equipped.
3. That of the devices examined, those of the following proprietors may be tried in active service with the minimum of preliminary test; George P. Finnigan, the General Signal Company and the Sprague Safety Control & Signal Corporation provided that a modification of the present practice of snow flanging is made.
4. That a two-block or three-block section of track 4 immediately west of Signal Station 9, between Schenectady and Hoffmans, on the Mohawk division is a desirable place in which to make a test of a train control device.

This report is signed by the members appointed by the Public Service Commission, the members appointed by the railroad having withheld their signatures on account of a request having been received by the railroad company, from the joint committee of the American Railway Association, that the Sprague device be tested on its railroad; and, further, because these members felt that there should be co-operation between the Public Service Commission committee and that of the American Railway Association before a report is rendered. The members appointed by the commission, however, are of the opinion that the committee has completed the work for which it was appointed and that therefore the report should be submitted to the commission.

The commission at once considered the report in executive session and issued an order to the New York Central to show cause on Thursday, March 10, why it should not immediately install one of the devices suggested in the report, and conduct investigations of its feasibility under actual operating conditions.

## New Passenger Terminal for Cleveland Planned

THE NEW YORK CENTRAL has filed with the Interstate Commerce Commission an application for authority and for a certificate of public convenience evidencing the Commission's approval for the construction of a union passenger station in Cleveland, Ohio, for the use of the New York Central, the Cleveland, Cincinnati, Chicago & St. Louis and the New York, Chicago & St. Louis.

Plans have been under consideration for several years, for the construction of a passenger terminal on the lakefront, to accommodate the New York Central, the Big Four and the Pennsylvania which use the present union station at Cleveland. It has become apparent, however, that the future growth of Cleveland industrially, as well as in population, may be better provided for with a passenger terminal of sufficient size to accommodate all of the railroads, located so as to be free from interference by operations connected with necessary service to industrial plants.

On January 6, 1919, the city of Cleveland passed an ordinance containing provisions for the location of a passenger station on the Public Square and for necessary changes in streets for the station and approach tracks. The New York Central, the Big Four and the Nickel Plate have now filed applications with the Interstate Commerce Commission asking for permission to enter into a contract with the Cleveland Union Terminals Company for the construction and operation of such a passenger terminal, in order that there may be ample time for complying with all of the legal provisions necessary for the financing, which should be undertaken as soon as the time is opportune.

A substantial portion of the passenger terminal will be devoted to the operation of suburban and interurban railroads, which will add distinctly to the terminal's usefulness and convenience to the public.

The plan proposes the purchase by the railroads of the entire capital stock of the Cleveland Union Terminals Company, in proportion of 64 per cent by the New York Central, 28 per cent by the Big Four and 8 per cent by the Nickel Plate, this being the relative proportion of passenger business handled by the respective railroads in Cleveland. The Cleveland Union Terminal Company is organized under the Union Depot Act of Ohio and is to construct the station pursuant to the provisions of the ordinance of the city of Cleveland, adopted to permit the project, which ordinance provided that it should become a contract upon its acceptance by the Terminal Company.

While the present plans contemplate the use of the new terminal by the New York Central, the Big Four and the Nickel Plate, the station is so located as to be readily accessible for all the other steam railroads entering Cleveland and the contracts provide that any or all the other roads may enter the station in the future if they desire, upon terms to be agreed upon. Electrification is provided for between the passenger station and the points for changing power exterior to the terminal limits.

The present passenger station on the lakefront was constructed fifty-five years ago and its location below the general level of the city, hemmed in by bluffs and other obstacles, has prevented adequate improvement as well as restricted its accessibility to the public. In 1918 President A. H. Smith of the New York Central, in his capacity as then Eastern Regional Director of the Railroad Administration, appointed a joint committee representing all seven railroads entering Cleveland to consider the union station problem. This committee reported and the city of Cleveland enacted an ordinance to permit the construction with the proviso that its terms should be accepted within a given period, but due to the non-acceptance by certain of the roads, the ordinance was subsequently amended to provide that the project might be accepted by at least two of the three railroads on the lakefront, and this resulted in the present agreement and application for permission to proceed.

The length of the passenger terminal, which includes the passenger station and its approaches, is to be about three and a half miles. The general plans, as filed with the Interstate Commerce Commission with contracts and agreements, provide that the station initially shall cover approximately twenty acres, with property available to add an additional ten acres in the final improvement. Initially, there will be fourteen miles of trackage, with provision for the addition of ten miles more for use of the steam railroads. For use of the suburban and interurban lines, there are to be nine and a half miles initially and space for eight and a half additional miles.

The Union Terminal track and platform layout will be 30 feet below the level of the Public Square, with a service floor for waiting rooms, ticket offices, etc., ten feet below level of the street and connected therewith by ramps. The railroad terminal facilities will be surmounted by an office building twelve stories in height and a tower extending upward twenty stories. In order to distribute pedestrian traffic, the terminal plans provide for entrance and exits to streets on four sides, the main access opening directly upon the Public Square.

A BILL increasing the personnel of the Wisconsin Railroad Commission from three to five, and providing that at least one of the commissioners be a woman, was introduced in the Legislature on February 16.

# Proposed Hill Line Financing Plan Disapproved

## Interstate Commerce Commission Authorizes Capitalization of Surplus by Stock Issue But Objects to Use of Bonds

WASHINGTON, D. C.

THE PLAN of financing proposed by the Chicago, Burlington & Quincy for the purpose of assisting the Great Northern and Northern Pacific to meet the maturity on July 1 of the \$215,000,000 of joint 4 per cent bonds issued against their Burlington stock by capitalizing part of its surplus, was disapproved by a majority of the Interstate Commerce Commission on February 28. The commission granted authority to the Burlington to issue \$60,000,000 of additional capital stock as a stock dividend and made no objection to the capitalization of surplus as such, but it denied authority to issue \$109,000,000 of first and refunding mortgage 6 per cent bonds, of which \$80,000,000, or the proceeds, were to be used as a dividend to enable the two northern companies to reduce their joint bond issue by the amount of their share of the dividend in order that the balance of about \$140,000,000 might be refunded at a lower rate of interest than could be obtained for an issue of the full amount.

Eight of the nine members of the commission offered no objection to the idea of capitalizing extensions and improvements paid for out of surplus earnings, but a majority of five objected to the idea of issuing interest-bearing securities for that purpose.

The commission answered the principal objection advanced against the plan by saying that there is no proof that the Burlington surplus income is the result of excessive rates, and it said that "no one questions the right of owners to compensation for sacrifices made in foregoing dividends," but the denial was extended to the proposed bond issue, which the report refers to as a "bond dividend," which would materially increase the company's fixed charges for 50 years by a railroad which itself "has no need for the bonds and which can advantageously issue all the stock reasonably required for its needs." "Division of that part of the surplus not needed for ordinary surplus purposes by means of stock appears more in accord with applicant's and the public's welfare," the commission said.

According to the statements made by the representatives of the Hill lines at the hearings, the proposed stock issue was intended primarily to afford a broader base for bond issues and would be practically valueless to the stockholders because it was proposed to reduce the dividend rate from 8 per cent to probably 6 per cent. It was stated that the bond

issue was proposed instead of a stock issue as a less expensive means of financing, because the stock could not be sold at par. The commission's report suggests that the refunding of the joint bonds could be accomplished at a reasonable rate by the issuance of bonds of the Great Northern and Northern Pacific secured by mortgage and the pledge of Burlington stock.

The commission was very much divided in opinion on the questions raised by the Burlington application. Concurring opinions were written by Chairman Clark and Commissioner Potter and dissenting opinions by Commissioners Daniels and Ford, protesting against the refusal to authorize the proposed bond issue, while Commissioner Eastman in a dissenting opinion objected because the stock dividend had not also been denied. Commissioner McChord also wrote a separate concurring opinion agreeing fully with the majority report. The majority opinion, therefore, apparently represents the views of Commissioners Meyer, Aitchison, Hall and McChord, with the partial concurrence of Commissioners Clark and Potter, the vote of whom was necessary in order to get a majority vote for even the stock issue. Eight members of the commission, or all except Mr. Eastman, therefore, approved the stock issue but only four approved both the bond and stock issues. Commissioner Daniels describes the permission which is granted as "largely ineffectual" and the denial as "essentially technical or formal."

The hearing on the Burlington's application was held before the director of the commission's Bureau of Finance in December and the early part of January and the case was referred to Division 4, consisting of Commissioners Meyer, Potter, Daniels and Eastman. Commissioner Eastman's dissent put the case before the full commission and an oral argument on the Burlington application and that of the Delaware, Lackawanna & Western to issue a stock dividend covering its surplus was held before the full commission on February 14 and 15. It was announced at the office of the secretary of the commission on Saturday afternoon that the commissioners were in conference and that the decision would be given out about 5 o'clock, but at 5:30 it was stated that the decision would be postponed and another conference was held on Monday.

An abstract of the majority and of the separate concurring and dissenting opinions follows:

### Report of the Commission

The Chicago, Burlington & Quincy Railroad Company seeks approval under section 20a of the interstate commerce act of its first and refunding mortgage and authority to issue \$60,000,000 par amount of capital stock and \$109,000,000 principal amount of first and refunding mortgage bonds. No objection to the granting of the application was made directly by any state authority other than the Nebraska State Railway Commission. The Northern Pacific Railway and Great Northern Railway appeared in support of the application.

Applicant is an Illinois corporation and the railroads incorporated in other states which it now operates have been conveyed to it in fee simple. In 1901 the Great Northern Railway and the Northern Pacific Railway jointly acquired control of applicant's system by the purchase of \$108,000,000 or 96.79 per cent of its capital stock, giving in payment therefor their joint 4 per cent bonds maturing in 1921 and pledging the stock acquired as collateral security.

Applicant has outstanding \$110,839,100 par amount of capital stock and \$174,040,800 prin-

cipal amount of bonds, of which \$168,050,000 is in the hands of the public. The greater part of its funded debt is issued under three mortgages.

Its Nebraska extension mortgage is a lien upon 269 miles of road, and is secured by deposit of \$23,494,000 of first mortgage bonds on 1,202 additional miles of subsidiary companies which have conveyed their roads to applicant. There have been issued thereunder to reimburse the treasury for expenditures for extensions of lines \$29,441,000 of 4 per cent bonds maturing in 1927, sold at prices ranging from 84.5 to 95.12, netting applicant \$26,843,383. Discounts thereon of \$2,597,617 were charged to construction. Of these bonds \$20,024,000 are outstanding, \$18,294,000 in the hands of the public and \$1,730,000 in applicant's treasury.

Applicant's Illinois division mortgage covers 1,646 miles of road. There have been issued thereunder \$85,000,000 in bonds maturing in 1949, \$56,000,000 to be used to retire prior bond issues, the remainder to reimburse the treasury, \$15,000,000 being for expenditures for construction and acquisition of roads before July

1, 1899, and \$14,000,000 being for additions and betterments subsequent to that date. Some \$50,835,000 of these bonds bearing interest at 3.5 per cent were sold at prices ranging from 75 to 103.5, netting applicant \$45,992,235. Discounts thereon of \$1,088,975 were charged to construction and of \$3,753,790 to profit and loss. Some \$34,165,000 of 4 per cent bonds were sold at from 98.5 to 104.5, netting \$35,228,505. Discounts thereon of \$9,880 were charged to construction and \$1,073,385 of premiums were credited to profit and loss. Of the 3.5 per cent bonds \$384,000 and of the 4 per cent \$189,000 are in applicant's treasury. The balance of both issues are in the hands of the public.

A general mortgage maturing in 1958 covers substantially all of applicant's railway property existing in 1908, being a first lien on more than 5,000 miles of road. It is so limited that not over \$300,000,000 can be outstanding thereunder at any one time, and that bonds cannot bear over 5 per cent interest. There have been issued thereunder and are outstanding \$65,247,000 of 4 per cent bonds which were sold at

from 91.5 to 100, netting applicant \$62,444,450. Discounts thereon of \$2,602,550 are being amortized from income during the life of the bonds. Before the passage of the transportation act, 1920, the Public Utilities Commission of Illinois authorized the issuance of \$121,378,000 of general mortgage 4 per cent bonds; of this amount \$2,252,000 have been issued, leaving \$119,126,000, of which \$9,873,000 were in applicant's treasury and \$109,253,000 remain unexecuted.

The investment in road and equipment, as shown in applicant's accounts is \$503,745,838. Its outstanding securities amount to \$284,879,900, leaving a book surplus of \$218,865,937. Applicant contends that it has an actual surplus materially in excess of that figure which does not take into account investments in property other than road and equipment, and does not include any sum in consideration of its guaranty under section 209 of the transportation act, 1920. It asserts that the value of its physical property upon the basis provided in section 19a of the interstate commerce act amounts to \$572,800,000, or about \$70,000,000 more than the total shown as investment in road and equipment. Depreciation of its equipment has been charged to the amount of \$48,514,240. Applicant states that since July 1, 1901, it has invested out of earnings \$189,070,776 in additions and betterments to its property, only a small portion of which was expended for non-revenue producing assets; that it has in addition used earnings to retire bonds, expending a total of \$91,348,478, properly chargeable to capital account, no part of which has been capitalized. During that time applicant has increased its mileage from 7,600 to 8,900 miles. The total mileage owned and operated has increased from 7,700 to 9,300 miles. Second track has been increased from 425 to 1,700 miles and yard track and sidings from 1,000 to 3,200 miles. The tons of traffic handled have increased from 17,000,000 to 49,000,000; the ton miles from 3,800,000,000 to 14,000,000,000; the density ton miles per mile of line from 582,000 to 1,483,000; the trainload from 200.43 to 722.19 tons; the carload from 12.5 to 26.5 tons. Applicant has during this time reduced its funded debt and now has securities in the hands of the public totaling \$31,164 per mile of road.

Objectors do not deny the existence of property value used and useful in rendering the public service materially in excess of applicant's present capitalization, and do not question the nature of the expenditures involved. They question the right of a public service corporation to declare dividends from invested surplus accumulated from earnings during a period when the stockholders were receiving regularly a fair dividend upon the outstanding capital.

Applicant's net income applicable to dividends for the past 10.5 years has been as follows:

1910	\$13,308,746
1911	16,843,763
1912	14,106,754
1913	19,430,746
1914	17,114,007
1915	17,288,913
1916*	43,878,845
1917	28,009,002
1918	15,947,881
1919	16,561,229

Total 10.5 years.....\$202,490,286

Average per year.....\$19,284,789

\*18 months' period due to change in report year.

Notwithstanding this large net income available for distribution among the stockholders the average of all dividends paid from 1901 to 1920 was 8.51 per cent upon the abnormally low capitalization and 3.916 per cent upon the average property investment in excess of all outstanding bonds.

**Income Not the Result of Excessive Rates**

There is no proof that this income is the result of excessive rates. Traffic has been carried by applicant at rates controlled by state or interstate regulatory bodies, substantially the same as those applicable over competing lines. Nor is there any proof that the total return upon the fair value of applicant's property has been excessive. Applicant's rate of capitalization \$19,000,000 of net surplus has in fact been recognized by the public utilities commission of Illinois, the state of its incorporation, under express statutory provision. A five-year statutory limitation prevented that body from considering surplus accumulated during an earlier period.

Applicant points out that its present financial structure is inadequate for present and future

needs. Its Nebraska extension and Illinois division mortgages are closed, and its general mortgage so limited that its use is impractical under present conditions. The execution of a new mortgage subject to these existing liens would be futile. Applicant now proposes to close the general mortgage without issuing further bonds under it, and to execute a 50-year refunding mortgage to secure coupon bonds to be issued in series at interest rates, and redeemable at times, and on terms, to be determined by the directors at the date of issuance, subject to our approval.

Applicant points out that bonds under its general mortgage could not bear more than 5 per cent interest and if they could be marketed at all would have to be sold at heavy discount, and that they would not be redeemable before 1958. It is shown that the amount of bonds issuable under that mortgage would not meet applicant's needs for additions and betterments at the current rate beyond 1933, and if the proposed dividend were paid would not meet requirements beyond 1929. It is contended that the proposed financial program would better applicant's credit and strengthen its position.

Authority is sought to issue \$109,000,000 of first and refunding mortgage bonds at 6 per cent, \$29,000,000 thereof to be used for future additions and betterments subject to our approval, \$80,000,000 thereof to be held free in applicant's treasury for any lawful use including the proposed additions as dividends. It appears that they would be used solely for dividend purposes and if authorized would be distributed among the stockholders.

Applicant calls attention to the necessity of refunding on July 1, 1921, \$215,227,000 of its controlling road's joint 4 per cent bonds given in payment for its stock, and points out that practically all of its material dividend issue, if authorized, would be available to those roads for use in meeting that obligation, thus materially reducing their fixed charges. It points out that as the controlling roads are its principal stockholders it is their foregoing of dividends which has produced its invested surplus. It contends that its own increase in fixed charges would be offset by the material advantage resulting to its established connections. It shows that the proposed financing would slightly reduce its ratio of bonds to stock, placing it substantially upon the basis of 1.5 to 1, and would not so increase fixed charges as to impair applicant's ability to serve the public.

Objectors contend that applicant should not be permitted to increase its fixed charges without a showing of resulting benefit to applicant. The issuance of the proposed bonds at this time would materially increase applicant's interest burden without apparent necessity. The interest rate at the time of the above-mentioned expenditures from surplus was not in excess of 4 per cent. Authorization of bonds at that rate at the present time would seem inexpedient. Division of that part of the surplus not needed for ordinary surplus purposes by means of stock appears more in accord with applicant's and the public's welfare.

Both the wisdom and legality of the joint acquisition and ownership of the Burlington by the Great Northern and the Northern Pacific are questions foreign to this proceeding and therefore require no consideration on this occasion.

While we do not minimize the advantages derived by applicant from its connections with the northern lines we are not convinced that the continuance of these connections is dependent upon the continuance of the proposed bond dividend. The general advantages of minimizing fixed charges in refunding the joint fours are apparent, but we cannot share applicant's apprehensions relative thereto. The northern lines enjoy a position relatively favorable to financing such a refunding. The value base of applicant's stock and its desirable collateral security. No evidence has been introduced which convinces us that the refunding could not be accomplished at a reasonable rate by the issuance of bonds of the Great Northern and Northern Pacific secured by mortgage and the pledge of applicant's stock.

Confusion has been injected into this case by the failure to distinguish between the issuance of bonds to reimburse the treasury from the proceeds thereof for expenditures for additions and betterments, and the issuance of bonds from invested surplus for dividend purposes. We cannot accept applicant's argument which finds in the Illinois commission's approval of the issuance of 4 per cent or 5 per cent bonds to

reimburse applicant's treasury for expenditures for additions and betterments, a sanction of a dividend of 6 per cent bonds. It is true that both the authorizations contained no express prohibitions against such a dividend, but each of its orders provided that the bonds should be sold and a majority of the orders specified sale for cash; all required that the proceeds be applied to specified purposes. One order made optional the pledge of the bonds. The Illinois statute enumerated the purposes for which a public service company might issue securities without including the issuance of dividends, and expressly stated that securities might be issued for no other purposes. Nor is it certain that the question before the Illinois commission was wholly analogous to that here presented, the approval of a bond issue during a normal period differs materially from approval of an issue at an abnormal rate at an abnormal time when the only material advantage anticipated inures to parties other than the applicant.

Applicant's authority to issue \$60,000,000 additional capital stock is not in question for the proposed mortgage, under which the aggregate amount of such bonds cannot exceed three times the outstanding capital stock. It is proposed to issue such stock as a dividend.

If applicant's petition is granted in full it is urged that there will remain a corporate surplus of \$101,781,197; that this amount would be adequate to meet applicant's emergency needs, support its borrowing power, afford insurance against obsolescence, minimize short term financing, and serve as a general financial balance wheel. Allowance should be made, however, pending the valuation of applicant's system, for shrinkage of book values, so that the adjusted capitalization will not leave applicant with an inadequate actual surplus.

**Present Capitalization Below Actual Investment**

The evidence establishes (1) that the Chicago, Burlington & Quincy Railroad has a great uncapitalized surplus; (2) that the present capitalization is far below the actual investment or any fair value for rate-making purposes which we may subsequently fix under the Valuation Act, section 19a of the Interstate Commerce Act; (3) that the increase in capitalization which would follow the grant of this authority would still leave the total capitalization of the Burlington below the actual investment and the probable fair value of the property devoted to the public service; (4) that the remaining uncapitalized surplus would be sufficient to serve the purposes for which a surplus should be accumulated; and (5) that the present financial structure of the Burlington is obsolete and inadequate and that a new form of mortgage and a larger stock base to meet the requirements of statutes governing investments by savings institutions in various states are necessary.

We find that the proposed issue of \$60,000,000 capital stock of the Chicago, Burlington & Quincy Railroad Company as a dividend (a) is for a lawful object within its corporate purpose, and compatible with the public interest, which is necessary, appropriate for, and consistent with the proper performance by it of service to the public as a common carrier, and which will not impair its ability to perform that service, and (b) is not necessary, appropriate or appropriate for such purpose; but that applicant has not justified an authorization of the issuance as dividends of mortgage bonds against its surplus and that authority therefor should be denied. If applicant desires, we shall give consideration on the present record to an application to issue bonds for appropriate purposes other than dividends.

The question of a proper return on the fair value of property devoted to the public use is not pertinent. It is not before us. No one questions the right of owners to compensation for sacrifices made in foregoing dividends. The denial in this case extends only to the issuance of a bond dividend by a railroad which has no need for the bonds, and which can advantageously issue all the stock reasonably required for its needs. The more adaptable form of mortgage which the applicant desires can be provided without the issuance of a bond dividend. An appropriate order will be entered.

Chairman Clark Would

Approve Bond Issue Also

CLARK, Chairman, concurring:

I concur fully in the approval of the issuance of \$60,000,000 of stock of the company and do find myself in accord with the refusal to authorize \$80,000,000 of bonds. I regard the case as

unique, and, therefore, as one that should not be decided upon the idea that it establishes a general precedent or a general policy. The Burlington has an abnormally low capitalization and an abnormal surplus from income that has been spent upon the property. That surplus has been accumulated at under rates fixed by state and federal regulatory bodies. Competing carriers, under the same rates, have not accumulated similar surpluses. The Northern Pacific and the Great Northern own 97 per cent of the stock of the Burlington, and have so owned it for some 20 years. They must refund their obligations, assumed in acquiring that stock.

Looking at the situation in its general aspects, and from the standpoint fixed in the present law of considering and dealing with the railroads in a national sense or in large groups, it would seem that the main question is what will be the effect upon the public interest. The northern lines must pay these joint collateral bonds or make good any deficit from surrender of the collateral. It is not clear that that would, as it seems to me, cause the placing upon these lines an additional burden as a net loss, to be borne by the public. Obviously these owning lines will not choose that course. The debt, which I regard as well secured, must be met. Is it more to the public interest that it shall be done by retaining this \$80,000,000 of Burlington's surplus, which admittedly will be large enough for all reasonable purposes if the \$80,000,000 is disbursed, and adding a like sum to the capitalization of the owning lines, with substantially larger fixed charges, than to consider the three systems as a family and permit the owning lines to have the benefit of that much of the surplus of the Burlington which is not needed by it? The answer, in my opinion, in any of the three systems would not be substantially different in either event. It seems certain that under any plan that is left open for refunding this debt the fixed charges will be much greater for a long term of years than they would be if the \$80,000,000 of bonds were made available for the sole purpose of reducing the principal amount of the debt about to become due.

#### McChord Agrees With Majority Report

McCHORD, Commissioner, concurring:

Agreeing fully with the majority report, I wish to state briefly certain other considerations which lend support to my concurrence in the conclusions reached. When all is said and done, the submitted justification for the course proposed is that, as against an available interest rate of 6 per cent for Burlington bonds, funds obtained by the Great Northern and Northern Pacific upon their own securities probably would cost them 8 per cent. This purely speculative apprehension does not justify itself to my mind. The now outstanding bonds of those lines are in a large measure collaterally secured by capital stock of the Burlington, and the credit of that company would equally well be available on an issue of its own bonds or of refunding issues of the Great Northern and Northern Pacific collaterally secured by an equivalent dividend issue of Burlington capital stock. Indeed, the total pledged security would be ample, in the ratio of the accumulated surplus, than that by which the now maturing bonds were originally supported.

It does not appear that the two lines most concerned, as they might and should have done, have laid before the interests from whom the requisite financial assistance is to be obtained the merits of refunding issues of bonds of those lines and the enhanced value of the securities they would have to offer. If when this were done, the financial interests were nevertheless to take advantage of the necessities of those carriers and demand a prohibitive rate of interest, which is hard to believe, these interests must bear their share of the responsibility for the impairment of the carrier's transportation functions. The present transportation and industrial situation calls for moderation and forbearance, and there can be no condoning an abuse of opportunity which can only tend to block a downward trend of prices so essential to the mutual welfare of carriers and shippers.

The assertion that if this application is denied the outstanding 4 per cent bonds cannot be refunded at less than 8 per cent, is startling. If the financial institutions of the country have determined to increase the interest rate on such bonds 100 per cent, and it is accomplished, our railroads cannot weather the storm. Good business judgment on the part of the Great Northern and Northern Pacific would dictate the sub-

mission to the present bondholders of an offer of 6 per cent refunding bonds, representing an increase of 50 per cent in earning power and resting upon a materially enlarged basis of security.

An approval of the proposed application and the devotion of approximately 98 per cent of the proposed refunding bonds to the retirement of the maturing Great Northern and Northern Pacific bonds would virtually weld into one inseparable system, for the life of the bonds, the three trunk lines, although it is by no means certain at this time that such a merger would suit the purposes of amended section 5 of the act. For other reasons, we should proceed with particular care in the financial matters, especially in these critical times and until the trend of events is definitely determined.

#### Potter Finds Bond Issue in Public Interest

POTTER, Commissioner, concurring:

I concur in that part of the majority report which authorizes the issuance of \$60,000,000 of stock, but do not concur in the view that permission to issue \$80,000,000 of bonds should be denied. The withholding of permission to issue the bonds under the circumstances as they are presented, is, to my mind, hostile to the public interest.

The issuance of bonds to reimburse the treasury of a carrier and replace income used for additions and betterments not only is lawful, but has the sanction of established practice and general public and official approval. When carriers have in their income account surplus funds not needed, they have the right to distribute that surplus among their stockholders, and the control of such distribution is not within our jurisdiction. The question presented by the situation before us is whether the issuance of bonds to reimburse the treasury is proper, coupled as it is with the proposed distribution among the shareholders of the restored income. The importance which existing conditions attach to this question is obvious. It is not a good time to issue securities carrying the present high interest rates. If, however, securities must be issued, they should be issued so as to take advantage of the lowest available rate. A basis that is high is preferable to another basis that is still higher. The real question which is involved in the existing situation is whether permission to put out securities on one basis should be denied when because of that denial we will have to authorize the issue of securities on another and higher interest basis.

The investing public holds the bonds of the Northern companies maturing July 1, 1921, in the aggregate amount of \$215,000,000. The record made upon the public hearing before us when all interests were represented supports the conclusion that the plan proposed will accomplish a reduction of the interest burden upon the three properties considered together, substantially as low as has been available under any other plan. The Northern companies as Burlington stockholders naturally consent to the proposed bond issue and distribution. It does not appear that the minority of Burlington stockholders in any way will be injured thereby. We are to consider the question of public interest. Courts applying the law will attend to any question as to relative rights of shareholder. The comparatively favorable interest basis which the proposed plan affords serves the public interest in an important way. By reducing the aggregate interest burden of the three companies, their net income will be increased, the drains upon their earnings will be reduced, their aggregate strength and credit will be improved, and they will be enabled better to serve the public. A plan which facilitates the lowering of the basis upon which a large financial undertaking is handled should naturally have a tendency to improve the general credit situation in which carriers and shippers have a vital interest. This consideration will apply particularly to the carriers in the Northwest group.

We should deal with the substance of things. The ownership of approximately 97 per cent of the Burlington stock by the Northern companies justifies treating the Burlington company as an instrumentality through which its properties are owned by the Northern companies—if this may be done in justice to the minority of Burlington stockholders, and if that for the purpose of this application be so treated in justice to them. The stockholders of the Northern companies are the persons vitally interested in the situation before us. They own practically all of the assets of the Burlington company in the same way

they own the assets of the Northern companies. They must finance \$215,000,000 on July 1. It is natural and right for them to feel that if they can make a saving by using their Burlington security in part instead of relying entirely upon the property of their Northern companies, they should be permitted to do so, when to do so is, as in this case, consistent with the public interest and in the interest of the Burlington minority shareholders.

#### Daniels Says Permission

Granted Is Largely Ineffectual

DANIELS, Commissioner, dissenting:

The chief objection to the majority report goes not to what the report grants, but to the far more vital permission which it withholds. It concedes the propriety of capitalizing surplus to the amount of \$60,000,000 in stock, the effect of which is remote, while it denies the propriety of capitalizing surplus to the amount of \$80,000,000 in bonds, the beneficial effect of which would be immediate. It allows a stock dividend which will be available as a stock base for bond issues in the future, and denies a bond issue which will effect substantial economies in refunding at present. It provides for the future financing of the Burlington, while it disallows the means proposed for financing the current and pressing exigencies of the Burlington's proprietors. The permission granted therefore seems to me to be largely ineffectual.

The majority report evidently attaches no conclusive weight to the objection most seriously urged before us against the proposed capitalization of the Burlington's surplus—that a public service corporation has no right to declare dividends from invested surplus acquired from earnings during a period when the stockholders were receiving regularly a fair dividend upon the outstanding capital stock. It properly points out that the average rate of dividend paid from 1901 to 1920, was 8.5 per cent upon the abnormally low capitalization, and 3.916 per cent upon the average property investment in excess of bonds." It declares correctly that "there is no proof that this income is the result of excessive rates." It calls attention to the fact that "applicant's right to capitalize \$129,000,000 of the surplus has in fact been recognized by the public utilities commission of Illinois, the state of its incorporation"—all of which, it may be added, was in the form of bonds, not stock.

The majority report therefore affirms the lawfulness of this stock dividend as against uncapitalized surplus derived from earnings under reasonable rates and reinvested in property permanently devoted to the service of the public. The proposed dividend against the surplus, if the dividend took the form of bonds, is not denied by the majority report on the ground that such a dividend would not be for some lawful object within the applicant's corporate purposes, or otherwise in conformity to the requirements of the act of the legislature of 20a of the interstate commerce act. The denial is mainly based on the finding that "the applicant should not be permitted to increase its fixed charges without a showing of resulting benefit to applicant."

Why should applicant be permitted to increase the stock base on which additional dividends are anticipated, without a showing of resulting benefit to applicant? And why should the denial not extend to the issuance of a stock dividend to a railroad which has no need for more stock?

The answer suggested by the majority report is that the applicant has a need for more stock in order that it may have a larger stock base and in order that it may execute a new mortgage under which the permissible bond issues may be greater than those expedient under its present general mortgage. That this is technically true may be at once conceded. But the differentiation made between the additional stock which it may have and the additional bonds is found to have no need, rests on the rather tenuous ground that future financing will be promoted by an increase in stock. The total stock as increased, it may be observed, will carry no greater equity than the existing stock, and will be worth financially less than the mortgage needed. This distinction is only a valid distinction between the two parts of the application, what justification can be found for a proposal to capitalize surplus derived from earnings and invested in the property when there is no intention of executing a new mortgage requiring an enlarged stock base if by executing any more

gage at all? No one may question the right of owners to compensation for sacrifices made in foregoing dividends, as the majority report affirms, but it would appear that the finding of the need of the railroad for more stock which will cast an increased dividend charge on the carrier and the simultaneous finding of no need for more bonds carrying additional fixed charges is rested on an essentially technical or formal basis.

The essential error, as it appears to me, in the reasoning of the majority report is centered in its too exclusive consideration of the Burlington as a separate and distinct legal entity, and in a disregard of the essential factors in the case. Railroad corporations, after all, are legal entities created by which individuals effect their ends. To disregard the individual shippers served and the individual investors involved, to say nothing of the general status of railroad credit, by confining attention to the legal entity known as the Burlington, is to miss the significance of the whole situation. The two northern carriers, the Northern Pacific and the Great Northern, own substantially 98 per cent of the stock of the Burlington. "Both the wisdom and legality of the joint acquisition . . . are questions foreign to this proceeding." Since they acquired their ownership they have permitted a large part of the Burlington's earnings to be reinvested in extensions, additions, and betterments. In consideration thereof they are to obtain a stock dividend of approximately \$60,000,000. But these northern carriers in their acquisition of the Burlington stock executed joint obligations of approximately \$215,000,000 which fall due on July 1, 1921. The refinancing of an amount as great as this is unparalleled in the history of railroads, and is being undertaken at a time when the ordinary run of investments is carrying unusually high rates of interest. The plan which these northern companies propose is to discharge a part of this huge obligation by obtaining \$80,000,000 in bonds of the Burlington, of which they are the proprietors, and by applying the proceeds thereof to that end. The residue of the indebtedness they propose to finance jointly or severally by the issuance of their own obligations. In essence, their plan, matured after months of study, is to redistribute the \$215,000,000 of indebtedness, so that a part thereof will be secured by the bonds of the strongest member of the trio. If the proposition were to saddle a part of the indebtedness on a carrier only distantly related to the two northern companies, and in which they had not for 20 years past reinvested the greater part of its earnings to which they were currently en-

titled in dividends, the plan would merit instant disapproval. But in thus proposing to mortgage the Burlington, they are mortgaging property built up out of earnings to which as proprietors they might during the past 20 years have asserted and enforced their claim. In reality, therefore, the proposal is akin to one which proposes in discharge of indebtedness, to pledge as part security that which, by reason of their equity therein, is their most available asset. It is testified that this plan of refunding will save annually in fixed charges an amount computed to be not less than \$688,000, and which may be as great as \$3,529,000. The exact annual saving depends on the interest rate necessary if the two northern carriers allow issue bonds for refunding. This annual saving in fixed charges is the essence of the matter. In the aggregate, the saving spread over the life of the bonds proposed to be issued, will be of the greatest magnitude.

To deny the proposed issue of Burlington bonds to the effect that the refunding can be accomplished at an undefined but reasonable rate of interest by the issuance of mortgage bonds by the two northern companies alone, secured by the pledge of the Burlington's stock, appears to me to be a radically unwise step. When the transportation act, 1920, prescribed a return to carriers uniform for all rate groups, and expressly stated that the efficient and economical "management" the rejection of a project which would permit savings in fixed charges running into the millions, is directly at variance with the expressed object of the statute.

It is, of course, conceded that the application to capitalize surplus for a bond dividend ought not to be granted, unless it clearly appears that such a dividend, which might properly be restricted to the \$80,000,000 requested for refunding purposes, would leave a substantial surplus uncapitalized, and would involve no reasonable doubt of the Burlington's ability to meet the additional fixed charges. These matters are not discussed in detail in the majority report, and are therefore analyzed in the margin.\* The separate question of the specific benefit to the Burlington of its co-operative operation with the two northern lines is recited in the dissenting memorandum of Commissioner Ford.

There are two further observations which seem pertinent. The first is that the approval sought of the pending application is based on the situation disclosed in this particular case, and would affect not at all the indefinite continuance of the joint ownership of the Burlington by the two northern lines, or the question of future consolidations that may arise under section 5 of the interstate commerce act.

The second relates to the responsibility of certain financial interests and institutions for the rate of interest on whatever securities may issue to effect the refunding of the Burlington Joint 4's. The rates of interest currently prevalent, are fundamentally traceable to world-wide causes which can be affected only in a minor and largely inappreciable degree by the instrumentalities through which securities are currently marketed. Just as the rise in war prices was a universal outcome of the relative scarcity of commodities, so the prevalent high rates of interest are a result of the universal dearth of capital seeking investment as compared with the current demand therefor. The high interest rates, as has so often been said, are rather the symptoms of the evil the industrial world confronts in the relative dearth of capital, rather than the essential evil itself. Holders of maturing obligations are offered a wide range of choice in investments carrying attractive rates of return. The instrumentalities which effect the marketing of securities have therefore to reckon with a situation not of their creation and which they can not materially affect.

**Eastman Objects to Capitalization of Surplus**  
EASTMAN, Commissioner, dissenting in part: The majority of the report recommends that the majority, except that I believe the stock dividend should also be denied.

The chief purpose of the stock and bond dividends sought is to meet the needs, not of applicant, but of its stockholders, the Northern Pacific and the Great Northern. The most persuasive argument in favor is the saving in interest charges which might result. The total amount now total about \$215,000,000 fall due on July 1, 1921. It is testified that if the attempt is made to refund them by the issue of bonds of the same kind, it may not be possible to do so on better than an 8 per cent basis. On the other hand, applicant can issue \$80,000,000 of bonds on a 6 per cent basis, and if it is permitted to do this, and to turn over the proceeds, or the bonds themselves, as dividends to the Northern Pacific and Great Northern, the amount so realized can be used to retire some of the maturing bonds and the remainder can be refunded by the issue of mortgage bonds of the northern lines, with the net result that something like \$3,500,000 in interest charges may be saved. This saving is apparently figured by comparison with the issue at 8 per cent of collateral trust bonds like those maturing and not by comparison with the issue of mortgage bonds of the northern lines for the total amount. But is the reasoning sound? In 1901 the

\*Making reasonable allowance by way of offset against the applicant's asserted investment out of earnings since June 30, 1901, and down to August 31, 1920, it may be reasonably assumed that a surplus in excess of \$140,000,000 has since that period been accumulated by the applicant out of earnings invested in and now existing in railway property permanently and necessarily devoted to serving the interests of the public and no part of which is now represented by issued capital obligations outstanding. It may be added that if applicant's contention is substantiated with reference to amounts legally due by reason of the guaranty for the six months following federal control and for compensation during federal control, the corporate surplus which it now claims will be materially augmented. On August 31, 1920, the applicant's comptroller estimated as due under the guaranty alone \$21,668,851.15.

It is generally conceded that where a carrier has accumulated a surplus a certain part thereof should remain uncapitalized. This part should cover non-revenue earning property, and also serve as a certification of credit. If such a minimum surplus remains uncapitalized, but is invested in revenue-earning property, there is an assurance that even in times when the ordinary level of returns is somewhat depressed, the carrier's earnings from a property base in excess of surplus capital will afford the opportunity to pay returns upon the capital outstanding. It is therefore proper to inquire what residual surplus would remain uncapitalized should a total issue of \$60,000,000 in stock and \$80,000,000 in bonds be approved in this case. Applicant's balance sheet for August 31, 1920, shows as before indicated, and exclusive of \$21,668,851.15 estimated to be due under the guaranty, a surplus of \$233,239,309.28. If the corporate surplus last indicated be reduced by \$10,767,815.75 for estimated additional depreciation in equipment not yet carried in the carrier's accounts, said corporate surplus would be reduced by the issuance of \$27,450,614.19 in total securities to \$221,471,493.53. This, however, represents the total corporate surplus as against which there stand assets of the applicant in equipment not yet carried in the carrier's accounts. However, the remaining uncapitalized surplus may be reduced from this standpoint. The balance sheet aforesaid gives as investment in road and equipment \$503,745,837.57. If we deduct therefrom not only the accrued depreciation on equipment of \$80,647,507.63 now carried among the corporate liabilities, but also the additional estimated depreciation of \$17,875,000.00 on investment in road and equipment would be reduced to \$452,330,514.19. This last named amount would exceed by \$27,450,614.19 the total outstanding securities in which they would exist. The additional \$140,000,000 in securities to be now authorized. When in addition to this \$27,450,614.19 the allowance is made for the estimated amount of \$21,668,851.15 due under the guaranty, there would be in excess of the outstanding capitalization over \$49,000,000, to which, if we were to estimate the total corporate

surplus, a large and substantial addition would have to be made for cash on hand amounting, as of August 31, 1920, to over \$17,500,000 for investments in affiliated properties, especially the Colorado & Southern, all of which, even when allowance is made for offsetting items would indicate a residual uncapitalized surplus of such substantial magnitude that it is clear that the issuance of \$140,000,000 additional securities would not fail to leave an ample margin of uncapitalized surplus.

The net income and income applicable to dividends since July 1, 1901, stated in tabular form, are as follows:

Term	Net income	Income applicable to dividends
Since July 1, 1901	Total . . . . .	\$351,818,777
	Annual average . . . . .	18,355,759
Since July 1, 1909	Total . . . . .	245,198,601
	Annual average . . . . .	21,958,077
Since July 1, 1914	Total . . . . .	161,091,710
	Annual average . . . . .	26,122,966
		24,917,621

If we assume that future income would approximately equal that since July 1, 1914, it is apparent that, after making the requisite deductions therefrom, including the additional interest charges, there would remain an average annual net income of \$21,322,966 and an annual income applicable to dividends of \$20,117,621. This latter amount would suffice to pay a dividend of 6 per cent on \$170,839,100, and for investments in capital stock would have been increased to pay a dividend of 6 per cent thereon, leaving annually \$9,867,275 available for extensions, additions and betterments. It should be stated that in the figures just cited the amounts for 1918 and 1919 based on applicant's just compensation under federal control and the amount for the months ended August 31, 1920, on the guaranty under section 209 of the transportation act, 1920. For the 12 months of 1920 the railway operating income of the applicant, deducting for equipment rents and joint facility rents, appears to be only \$8,012,045.93. These figures, however, covered applicant's operating income and do not include any part of the estimated amount of \$21,668,851.15 due under the guaranty. Applicant's lessened earnings in 1920 appear to be attributable to causes which have affected all carriers. Assuming, as we may, that these causes are but temporary and have been in a measure counteracted by increased rates accorded, it can not be said that the public interest is adversely affected by the proposed security issues impairing the substantial soundness of applicant's financial structure.

The kernel of the application is the request for authority to issue \$80,000,000 of bonds. The \$60,000,000 stock dividend which the majority have approved is a far less important part of the plan and, without the bonds, will be of relatively little consequence to applicant or its stockholders. From the public standpoint the objections differ only in degree. The application should, I feel, be rejected in its entirety.

Foab, Commissioner, dissenting:

Although I concur in so much of the majority report as authorizes the issue of capital stock, I dissent from the finding that applicant has not justified the issuance of bonds against its surplus. I allow that the formal terms in which the application was made did not warrant our approval of the bond issue as proposed. I allow that on the face of it any proposal to issue bonds as a dividend to stockholders is not only vicious in character, but is also reminiscent of practices that have in the past brought shame and disgrace upon American railroad manage-

ment which it was planning to obtain by extension of its lines, and when the Northern Pacific and the Great Northern were in need of terminal facilities at Chicago and other western cities which they were planning to obtain, it was decided that combination of interests would supply them more economically and efficiently than would be possible by independent action, each carrier for itself. After efforts made in various directions, the northern carriers in 1901 obtained control of the Burlington. Since then the mileage owned and operated by the Burlington has been increased over 1,334 miles and the freight tons handled have increased from about seventeen millions in 1901 to over forty-nine millions in 1919. The financial results of this increase are set forth in the following table, in which the Burlington is contrasted with systems of similar character, one of which, the Chicago & Northwestern, had been sought in the way of similar alliance before the northern carriers turned to the Burlington:

ity to serve the public would be at all impaired.

The immediate need for a bond issue is to provide for the maturing obligations of the northern carriers, contracted in acquiring their holdings of Burlington stock. If they can get the use of \$80,000,000 of Burlington bonds they say they can by that much reduce the amount of their maturities and can then refund the remainder at about 6 per cent. If denied that resource, they say they will not be able to effect refunding for less than about 8 per cent. The majority report does not share applicant's apprehensions relative to the difficulties of refunding operations at a reasonable rate of interest without this Burlington bond issue, but it will scarcely be disputed that it will cost more without that issue than with the use of it by the controlling roads.

The evidence presented to us has been such as to convince me that the practical results of the relationships between the Northern Pacific, the Great Northern and the Burlington have

ment. But the application was accompanied by explanations of purpose, which purpose we had power to secure by appropriate stipulations, that seemed to me to entitle it to our favorable consideration to the extent of granting authority to issue \$80,000,000 in 6 per cent bonds as well as \$60,000,000 in stocks. It seemed to me that when the circumstances of the case were duly considered, the essence of the proposition before us was whether we should facilitate arrangements tending to conserve the present relations between this applicant and the controlling roads and to obtain for them needed financial accommodations on favorable terms.

The record shows that nearly 98 per cent of the capital stock of the Burlington road is held in joint ownership by the Northern Pacific and the Great Northern. At a time when the Burlington was in need of Pacific Coast termini

it is admitted that although the fixed charges of the Burlington would be augmented by this bond issue, its capitalization per mile would still be low as compared with that of other large systems in the same general territory. Per mile of road owned it amounts for the applicant, to \$31,836.45, as against \$46,232 for the Chicago, Rock Island & Pacific; \$47,919 for the Chicago & Northwestern; \$52,641 for the Great Northern; \$55,875 for the Atchison, Topeka & Santa Fe; \$56,046 for the Missouri Pacific; \$60,165 for the Chicago, Milwaukee & St. Paul; \$65,483 for the Northern Pacific; and \$87,196 for the Union Pacific. In case there were authorized \$60,000,000 additional stock and \$80,000,000 additional bonds, or a total of \$140,000,000, the applicant's capitalization per mile would amount to \$47,478. I see no grounds whatever for thinking that the applicant's abil-

ity been signally to the advantage of all these carriers, and particularly to that of the Burlington; that it is to the public interest that this relationship shall be allowed to continue; that it is to the interest of the Burlington that the controlling carriers shall not be subjected to interest charges that can be avoided if they are allowed to avail themselves of their equities in the Burlington's assets; and that it is to the public interest that carriers shall not be unnecessarily burdened with capital costs which must inevitably be reflected in their charges to the public for their service, and in the character of that service. Therefore it appears to me that while in form this proposed bond issue was a dividend to stockholders, it was in substance a readjustment of obligations to the common benefit of all three carriers, and decidedly to the public interest.

## Interstate Commerce Commission Orders Increase in Texas Rates

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION has rendered its decision in the Texas intrastate rate case in which, following similar decisions in other states, it orders an increase in the intrastate rates and fares corresponding to the increases allowed on interstate traffic in its decision in Ex Parte 74. The Texas commission had limited the increases in intrastate rates and charges for freight service to 33½ per cent in place of the 35 per cent which was allowed for interstate traffic in that territory, and it denied any advance in passenger fares on the ground that it was without jurisdiction to authorize increases above the rates fixed by the state statute, which provided for a fare of 3 cents per mile.

The commission in its decision refers to its previous decisions and orders in various cases affecting Texas rates, particularly the Shreveport case, in which maximum class rates and many commodity rates were prescribed and says that under the requirements of the Shreveport case and other cases in which the Shreveport scale has been prescribed the rates on interstate commerce to and from Texas and the great majority of rates on intrastate traffic in Texas have been placed upon a fixed and non-prejudiced relationship which was not destroyed by the decision in Ex Parte 74.

It is estimated that less than 30 per cent of the traffic moving intrastate over the 26 principal carriers in Texas was affected by the order of the Texas commission. The rates on

over 70 per cent were increased 35 per cent to accord with the increases in interstate rates. The commission in its decision says in part:

Based on the intrastate revenue of the principal Texas lines during the year 1919, derived from freight traffic not subject to the orders in the *Shreveport Cases*, and assuming that the same volume of traffic will continue in the future, the carriers estimate that their annual loss in revenue, due to the restrictions placed upon them by the Texas commission, will approximate \$265,000. The anticipated loss in passenger revenue is much greater. During 1919 the Texas lines earned from their intrastate passenger traffic slightly less than \$35,000,000. With the same volume of traffic the fares approved by us and made effective on interstate travel would yield an annual return greater by \$7,000,000. It is estimated that an additional loss of over \$1,500,000 will result from their failure to receive the surcharge upon passengers occupying space in sleeping and parlor cars. The record shows that for the seven months ended July 31, 1920, the operations of the Texas lines, including both state and interstate traffic, were conducted at a loss of more than \$10,000,000.

For many years the passenger fares in Texas were the same per mile as those assessed for the interstate carriage of passengers. Since August 26, 1920, the intrastate passenger has been accorded a material advantage, although he may travel in the same train and even in the same seat with an interstate passenger who pays a higher fare. A passenger from Shreveport destined to Houston, for example, will pay a fare of \$8.38, exclusive of war tax, for the distance of 233 miles, while an intrastate passenger from Longview, going to the same point, will be required to pay but \$6.98 for the same distance, a difference in favor of the latter of \$1.40. For most of the distance they may travel on the same train. A passenger traveling from Kansas City to Houston occupying a lower berth will be charged a total fare of \$38.82, including war tax, while an intrastate passenger traveling from

Sierra Blanco to Houston, substantially the same distance, will be charged \$29.87, or \$8.95 less.

Business houses located in Shreveport, Kansas City, and cities in other states compete with local Texas concerns in the development of trade and commerce in Texas. One of the items of expense common to both is the railroad fare of salesmen. The higher basis of fares required is a burden on them.

The lower fares in Texas tend to convert interstate revenue into intrastate revenue. This results from the common practice of rebuying tickets at border points, paying the intrastate fare in Texas and the interstate fare beyond the border. The record indicates that at three such points on the Texas & Pacific Railroad, 120 passengers, on an average, are daily rebuying tickets to defeat the interstate fares. The Missouri, Kansas & Texas Railroad enters the state of Texas near Denison, and the number of passengers rebuying tickets at that point renders it necessary at times to hold the trains for their accommodation. Because of the large territory covered by the state of Texas the practice of rebuying tickets causes a substantial loss to the carriers. The distance from the eastern border of the state to the western border is over 900 miles and the earnings on interstate travel may be adversely affected to the extent of \$5 per ticket on travel across the state, and, with Pullman surcharge added, over \$8.

The carriers introduced voluminous exhibits in which they have undertaken to apportion their revenues and expenses between state and interstate freight traffic and thus determine the rates of return on the values of their properties within the state devoted to the public use. The information was developed by the application of what is known as the Oklahoma formula—a formula devised to provide a means for segregating revenues and expenses as between freight and passenger traffic, line and terminal, and state and interstate. The general purport of these exhibits is to show that the carriers, as a rule, have received during recent years a lesser rate of return from their intrastate than from their interstate operations.

Evidence relating to the earnings of the carriers on state traffic was received over objection of counsel for the state commission, and in order to afford that commission an opportunity to submit similar data in its possession, upon which it had predicated its findings, a further hearing was ordered. The record as supplemented, contains the calculations relied on by the Texas commission as establishing the fact that an increase of 33½ per cent in intrastate freight rates, added to the amount derived from the increased interstate rates and fares, would yield the carriers fully 6 per cent net return on the property investment.

We deem it unnecessary for the purposes of this report to enter upon a discussion of the testimony and exhibits dealing with the valuations of railroad properties in Texas and the earnings of the carriers on state traffic. In a proceeding similar to this, *Increased Rates within Illinois*, 59 I. C. C., 350, it was urged that in prescribing the measure of the increases to be applied to the rates and charges of the carriers throughout the country necessary to yield the return fixed by Congress for the two years beginning March 1, 1920, we had failed to determine the values of the railroad property separately in that and other states. We pointed out therein that Congress had laid upon us the duty of prescribing rates so that in the aggregate they would yield a certain return, as nearly as may be, "upon the aggregate value of the railroad property of such carriers held for and used in the service of transportation," and expressed the view that the interstate commerce act required us to determine upon a valuation for the total property of the carriers and not for the property that might be assigned to interstate traffic. We adhere to that view and repeat that, in our opinion, the manifest intent of Congress was to repose in us full and final authority to provide the revenues found necessary to yield the specified return by considering the entire structure of rates, both state and interstate, and the aggregate value of the railroad property held for and used in the service of transportation without regard to state lines, and to protect interstate commerce against any rate, fare, charge, classification, regulation, or practice that causes discrimination.

## Accident Reports, Third Quarter, 1920

THE INTERSTATE COMMERCE COMMISSION, Bureau of Safety, has issued its "Summary of Accident Investigation Reports No. 5," which is for the quarter ending with September, 1920. The pamphlet fills 56 pages and the index shows 25 accidents, as follows (the first two occurred in 1919, all of the others in 1920):

ACCIDENT INVESTIGATION WITH REFERENCE NUMBERS  
650. Baltimore & Ohio, Glenwood, W. Va., December 11.  
653. St. Louis-San Francisco, Knobview, Mo., December 21.

- 721. Washington & Old Dominion, Clark, Va., September 11.
- 722. New York Central, Canastota, N. Y., September 18.
- 723. Texas & Pacific, High, Texas, September 20.
- 724. Detroit United, Ortonville, Mich., September 24.
- 725. Chicago, M. & St. P., Piedmont, Mont., September 30.

Of the collisions here described, eight, not including those on interurban lines, occurred on lines which are reported as having no block system in force. These eight are the Atchison, Topeka & Santa Fe; the Gulf, Colorado & Santa Fe; the Kansas City, Mexico & Orient; the Minneapolis & St. Louis; the Peoria & Pekin Union; the Southern; the Texas & Pacific, and the Western Maryland.

Trainmasters, dispatchers and others will find many interesting facts in this pamphlet, none the less interesting because several months old. Beginning on page 41 there is an instructive chapter on how not to manage things when running passenger trains on a double-track line against the current of traffic. The dispatcher and the superintendent come in for censure as well as men of lower degree.

The time-honored custom of running circus trains with cars in poor condition and without suitable brakes appears not yet to have been abandoned, as will be seen readily from the report of a collision at High, Texas, on September 20, 1920.

One report which the busy reader may perhaps think himself too busy to read is that of a rear collision at Canastota, N. Y., on September 18, in which two employees were killed and which report, after giving interesting details for more than a page, gives the true explanation in a single line, at the end; it appears that the engineman was at the time sound asleep.

For a case in which the conditions were 100 per cent bad the reader will perhaps turn to the report of a butting collision, page 20, near Piedmont, Ga., on July 8, resulting in the deaths of three employees, where the engineman overlooked an opposing train, and where the conductor and all the rest of the crew were unfamiliar with the road. And the engineman had only recently been promoted from fireman.

## British Railways Predominate in Argentina

The Central Argentine's Modern Equipment and Efficient Methods  
Exemplify the Country's Progress

By John P. Risque  
Part III

**B**ECAUSE OF THE OBVIOUS impossibility of describing in any detail the equipment and operations of all the railways of Argentina, it was decided to select one of the roads which because of its modern equipment and efficient operation could be said to exemplify the extent of railway progress in the country. The Central Argentine, as was

chain couplers, and the newer cars have vacuum brakes. The popular car roof is of corrugated iron, arched as are the roofs of the passenger cars. The grain cars are provided with manholes in the roofs to facilitate quick loading at the elevators. A considerable amount of freight is hauled in open-top cars covered with tarpaulins. Because of this fact "loading gages" are a feature of most of the freight yards. These gages are suspended loosely from a cross-arm attached to an upright mast. They indicate the limit in the height of the load. An offset is provided in the center to allow for the passage of the locomotive "chimneys."

Quick loading and unloading of cattle is facilitated by end doors placed in the cattle cars. A string of empties ready for loading is set on the patron's siding with the first car opposite the cattle runway from the corral and all of the end doors but the last one, at the end of the string of cars, are left open. The cattle are driven in through the first cars, and arranged in order in the last one, after which the door is closed and the loading goes on as before until the job is finished, the doors of each car being closed as the car fills. Compared to the laborious methods of loading cattle cars in this country—one car at a time loaded through a side door, the door closed and the next car pried into place with many pinch bars, and more or less profanity, or—what is more expensive still—a locomotive coupled to the string to move it when necessary—the efficiency of the Central Argentine's method furnishes further food for reflection for those who doubt the ability of foreigners to teach us anything about railroading. The plans showing the designs of those cars are available to us; further information concerning this superior method would probably be gladly furnished by its users. At water stations along the route the stranger's eye will probably not fail to notice the riveted leather waterspouts which hang from the standpipes, in place of the all-metal ball-jointed pipes in use in his own country. The British railroader could learn some things in America as well as teach us.

**A Carload of Quebracho the Principal Fuel of Argentina**

noted in a previous installment of this article, was chosen as meeting these requirements.

In the matter of freight equipment this road is comparatively well advanced. The greater part of its rolling stock in freight service consists of large box, flat and grain cars with four-wheel trucks. Many of these cars are of pressed steel. The old six-wheel "goods wagons" of small capacity are rapidly disappearing. Platforms have been added to a number of these old cars, insulation installed and lattice applied, and they are now giving good service as refrigerator cars. All of the rolling stock is equipped with buffers and hook and

In September, 1915, the first trains were run on the electrified suburban division of the Central Argentine at Buenos Ayres. This third rail double track system is now in operation between Buenos Ayres (Retiro station) and Tigre, a point on the river of that name about 18 miles distant. Multiple unit power is used, the current being generated at 20,000 volts at a special power house built for the purpose at San Fernando. This current is delivered to four substations along the line by underground cables and is transmitted to the third rails at 800 volts, d.c. The patronage of the line is exceedingly heavy and the service is fast and frequent. Steel underframe cars of unusual length, with doors in the center in addition to those at the ends, are run on this division.

Practically all of the road's cars are built at the Rosario shops, while extensive locomotive shops are operated 10 miles further out of the same city at a point called Perez. This plant bears the name of the "Gorton workshops" and was completed in June, 1912. The boundary fences of the layout include some 70 acres. At the main entrance to the yard is located the administration building for the mechanical department. This building is so well planned and maintained that it seems to the American railroader more like the headquarters of an industrial concern than the headquarters of a railway shop, so little used is he to convenience or comfort in the mechanical department plants in this country. Close inspection of this building, which contains the principal offices, the timekeepers' office, the drafting room, the medical consulting rooms and the mess room, will provide other little lessons here and there for the railroad man who is anxious to make his visit profitable.

The administration building itself would seem to teach that such elaborate preparations for the care of the occupants pay after all, in that the work done by employees so well taken care of can rightly be expected to excel that done by those who are provided only with the dingy and poorly equipped shop buildings used for such purposes elsewhere. Other observations confirm this generalization. For instance the mess room is equipped with convertible benches, the backs of the seats of which are secured by a conventional cast or malleable iron frame at each end and are hinged in such a manner that by pulling them forward a table is formed which has the added advantage that the part of the board upon which the workman leans before the change is the

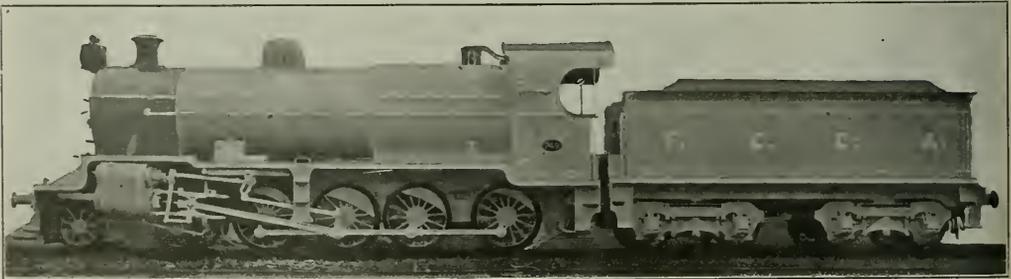

it a width of 125 feet and a floor area of nearly 39,000 sq. ft. The pattern storehouse is protected with automatic sprinklers. The blacksmith shop is 80 ft. by 340 ft. and equipped with 19 double and 14 single forges, 8 steam hammers and a battery of electrically driven power hammers, 6 oil furnaces and a section fitted with complete spring making and repairing machinery. The latter department, due to the scarcity of steel for the leaves of springs, has had a rather hard time of it during and since the war, the engineering

A Grain Elevator on the Parana River at Rosario, Argentina

department having had to resort to all kinds of methods to "get by," even to changing styles and sizes in order to utilize what small stocks of spring steel they could get.

The machine shop, including erecting and tender shops and a section for coppersmiths, is 413 ft. by 1000 ft.—the installation covers more than 9 acres. The two locomotive erecting bays are served by two 50-ton cranes, and the rest of the shop is equipped with a number of traveling cranes of less capacity. The boiler shop is 165 ft. by 415 ft. and is equipped with three 25-ton traveling cranes. The paint shop for locomotives is 66 ft. by 348 ft. and has an underground storage system for the care of all paints and varnishes. The main stores building has a floor area of 32,243 sq. ft. and is equipped with a great quantity of labor saving

A Central Argentine Freight Locomotive Equipped with a Superheater

bottom side of the table upon which he eats his lunch. A stop, arranged at the hinge, limits the travel of the frames to the desired point.

Lying close to the administration building are the electrical transformer substation, the pump houses and the elevated tanks for the shops' water supply. There are four main buildings in the shop system, viz., the pattern shop, the pattern storehouse, the machine shop and foundry. The foundry is 315 feet long and contains three bays which give

machinery. The whole plant shows in its design a due regard to providing for future expansion, based upon the Central Argentine's previous record for continuous growth. Electric power for the entire works is supplied by the company's power house in Rosario and is carried to Perez by  $3\frac{1}{2}$  miles of underground and  $6\frac{1}{2}$  miles of overhead cables at 20,000 volts. At Perez its three phase alternating current is reduced to 500 and 220 volts for power and lighting purposes respectively. The arrangements and equipment throughout

are of the best procurable. No expense seems to have been spared to make the plant complete and it stands forth as a monument to some individual's thorough understanding of the needs of the mechanical department of the road, which needs have for a decade been met in some supposedly more progressive countries by the crumbs which have fallen from the budget table.

In the completeness of the organization of this South American railway, the personnel department has not been overlooked. The company circulates its own "house organ" in Spanish and English every month. The publication is called the Central Argentine Railway Magazine. It is edited by the road's publicity department and contains in

A Modern Pressed Steel Gondola on the Central Argentine

some 50 pages all the latest news relating to additions, betterments and plans of the company, well illustrated with many photographs. There is also a "personal" department which covers the activities of the members of the staff of thousands of employees. The publicity department is responsible also for the time tables which are unique and—if the reader will pardon another admonition—teach another lesson to the American railroad man. These "horarios," as they are called in the language of the country, not only provide time tables, but contain many illustrations and descriptions of places along the lines with a comprehensive and easily read map of the entire system. Interspersed with this material are advertisements by concerns along the railway, which advertisements are not only unobjectionable, but, on the contrary, are highly instructive and serve to help the company pay for the printing cost.

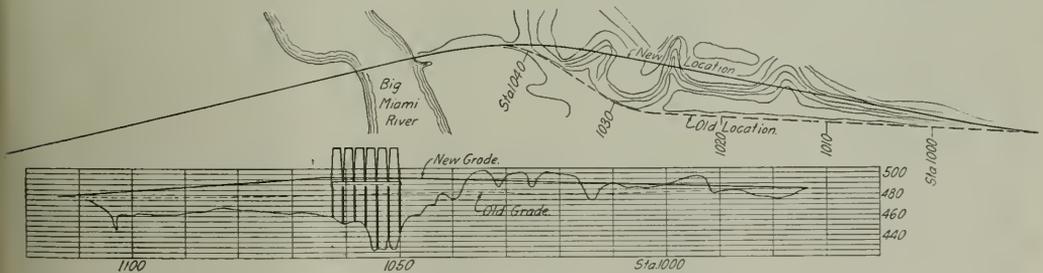

## Baltimore & Ohio to Build Large Bridge

ONE OF THE MOST IMPORTANT railway bridge projects recently undertaken is that being carried out by the Baltimore & Ohio at Lawrenceburg, Ind., on the main line between Cincinnati and St. Louis. It consists in the renewal of the existing bridge over the Big Miami river with six spans of double-track, through riveted Warren trusses, each 206 ft. 2 in. center to center of end piers. In addition there will be two 45 ft. double-track deck plate-girder approach spans at each end. The total estimated weight of the steel work is 8,000,000 lb. One feature of the superstructure is the large operating clearance provided. The trusses of the through spans are spaced 30 ft. in the clear, thus providing for tracks at 14 ft. center to center with side clearances of 8 ft. The vertical clearance is 25 ft. above base of rail.

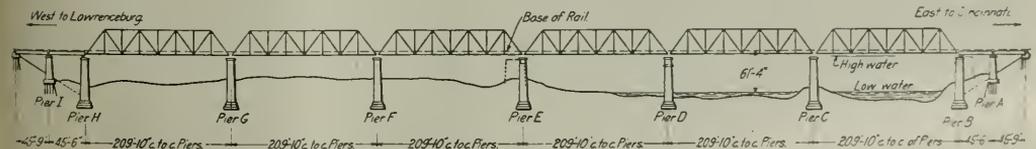

The project entails a raise of grade of about 10 ft. above the old rail level, and this change necessitates a relocation of the east approach so as to afford support for the new grade against the hillside. This is indicated on the map.

The substructure forms the most formidable part of the project and will be entirely new except for the use of one old pier (Pier D) which will be extended for second track and raised to the new grade. All of the piers supporting the truss spans will be carried to natural foundations by the means of the pneumatic process. The two abutments and the piers A and I under the girder spans will be carried on concrete piles. The caissons for all of the piers except the one embracing the old pier will be constructed of reinforced concrete.

The contract for the fabrication and erection of the superstructure has been awarded to the American Bridge Company. The masonry and grading contracts have been placed with the Vang Construction Company, Cumberland, Md. The entire project is under the general charge of H. A. Lane, chief engineer of the Baltimore & Ohio, Baltimore, Md.; the fabrication and erection of the superstructure is being performed under the immediate supervision of P. G. Lang, Jr., assistant engineer of bridges, while the steel work is in the hands of A. H. Griffith, district engineer, Cincinnati, Ohio.

# Operating Statistics for December and 1920

The Interstate Commerce Commission has issued a summary of operating statistics for the month of December, 1920,

of roads having annual operating revenues in excess of \$25,000,000.

Some of the principal items shown in the statement are as follows (including mixed and special train service):

Region and name of road	Net ton-miles (millions)		Net ton-miles per loaded freight car-mile		Car-miles per car-day		Net ton-miles per car-day

# State Rate Question Argued in Supreme Court

## Forty-Two State Commissions Protest Against Centralization and Attack Transportation Act as Unconstitutional

WASHINGTON, D. C.

THE POWER of the Interstate Commerce Commission to prescribe statewide schedules of rates for intrastate traffic for the purpose of removing discrimination against interstate commerce, was contested and defended in briefs filed in the Supreme Court of the United States on February 28 by representatives of 42 state railroad commissions and of the railroads. The test case is an appeal by the railroad commission and state authorities of Wisconsin from a decision of the federal district court for the eastern district of Wisconsin enjoining the state officials from interfering with the establishment by the railroads of the increased passenger fares ordered by the Interstate Commerce Commission. Oral arguments in the case will be heard by the court later in the week or the early part of the coming week. Briefs on behalf of the railroads were filed by Alfred P. Thom, general counsel for the Association of Railway Executives, and by Bruce Scott, general solicitor, and Kenneth F. Burgess, general attorney, of the Chicago, Burlington & Quincy. A brief on behalf of the 42 states as amici curiae was filed by John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, and A. E. Helm, commerce counsel of the Kansas Court of Industrial Relations, in addition to that of the Wisconsin commission.

### The Broad National Purpose of Congress

"In this case," said Mr. Thom in his brief, "there is brought to the bar of this court the broad and reasonable policy adopted by Congress to deal with the entire subject of transportation from a national standpoint and to provide for its adequacy and competency, in the interest of all the people, by a system which will foster and preserve its instrumentalities in full vigor and will create equality of commercial opportunity and privilege as between all its users, irrespective of their location and irrespective of the markets which they seek to reach."

Mr. Thom argued that either the commerce power, the war power or the power to establish postoffices and postroads, standing alone "is adequate to sustain the validity of the power exercised by Congress with reference to the state rates of carriers engaged in interstate commerce."

In respect to the war power, he said in part:

"This court has held, in the case of Northern Pacific Railway Company vs. North Dakota, that the war power of Congress extends to the regulation of intrastate rates. The power in the case just referred to was exercised during a state of actual hostilities. But the war power does not exist only during the war. It likewise, in order to be adequate, must extend to all reasonable measures of preparation. Thus there can be no doubt that the war power includes the power of reasonable preparation and organization for the purposes of national defense. We accordingly submit that the following proposition cannot be successfully questioned:

"That the war power of Congress under the Constitution is not confined, in its exercise, to an actual state of war or to dealing with the consequences of actual war, but also includes all measures of proper, reasonable and adequate preparation for war.

"That the existence of an adequate and competent system of transportation, both rail and water, reaching and making available the national resources for supplying and provisioning armies and navies and transporting troops and munitions

of war is essential to the effective and successful exercise of the war power and the performance of the war duty, and is so closely and directly related to the power itself as to become an integral part of it.

"That coming under the due and reasonable exercise of the war power, Congress may in its discretion, as a means of fostering and promoting in full vigor these essential agencies, control and regulate, within constitutional limitations, their rates and charges, both state and interstate—otherwise it would be in the power of the states to obstruct and defeat the war power which the states themselves conferred upon Congress and the exercise of which, for the protection of themselves and their people, they have the right to exact from Congress."

Mr. Thom said that the rights of the states are of two kinds: the rights they reserved when they entered the union and the rights they acquired by the compact of the Constitution when they entered the union. Among the latter was the right to have the federal government regulate the commerce in which all are interested.

"The commission is given the power, and it is made its duty, to protect the body of interstate and foreign commerce against undue or unreasonable preferences, prejudices and discriminations created by the act of a state or under its authority. It takes no argument to show, if the revenues permitted by a state from state traffic do not bear a proper relationship to the revenues which Congress in this act has required the commission to provide from interstate commerce, that there is an unjust and hurtful discrimination against interstate commerce."

Messrs. Scott and Burgess in a joint brief contended that in enacting the Transportation Act, Congress provided a comprehensive plan of railroad regulation in the national interest to avert a crisis threatening the transportation of the country upon termination of federal control. They also contended that Congress can control both intrastate and interstate rates when they are so intermingled that adequate regulation of the latter necessitates regulation of both.

Some extracts from this argument are as follows:

### Correction of Discrimination a Necessary

#### Part of Interstate Regulation

"The power of the Interstate Commerce Commission to require the removal of unjust discrimination and undue preference caused by intrastate rates lower than reasonable maximum interstate rates, has been upheld by this court in decisions dealing with both the constitutionality of the congressional action and the interpretation of the statute.

"Subsequent to the decisions Congress enlarged the power of the Interstate Commerce Commission in respect to intrastate rates by adding paragraphs 3 and 4 to Section 13, Interstate Commerce Act, as contained in Section 416, Transportation Act, 1920, approved February 28, 1920.

"Counsel for appellant contends that this section grants no new authority to the Interstate Commerce Commission with respect to unjust discrimination and undue preference, and the same argument was presented to the Interstate Commerce Commission.

"In the new section Congress both sets a statutory standard for intrastate rates, and authorizes the commission, on finding the facts of departure from that standard, to prescribe the intrastate rates 'hereafter to be observed.' Yet appellant contends that the section adds nothing.

"Congress enacted the Transportation Act, during the period of federal control of railroads. The act had the declared purpose of providing for the relinquishment and the return to private operation under such public regulation and protection as would insure adequate transportation service to the whole country.

"As to the regulation of rates, the final rule enacted by Congress was that initial jurisdiction over regulation of intrastate rates should be returned to the states and should continue there unless and until the Interstate Commerce Commission in the exercise of newly granted administrative powers, should on appropriate complaint and hearing find any unjust discrimination against interstate commerce or undue prejudice against persons and localities to exist, in which event the Interstate Commerce Commission should prescribe the intrastate rates necessary to remove such discrimination or prejudice, which should thereafter be observed, 'the law of any state or the decision or order of any state authority to the contrary notwithstanding.'

"In order to accomplish the result desired, Congress hit upon the plan of dividing the railroads of the country into convenient groups for rate-making purposes, and providing for a basis of rates in each group which would yield a fair return upon the value of the property of the carriers devoted to transportation purposes, the rates so made to be reasonable from the viewpoint of both the users and proprietors of the railroad plants.

"It was conceived that the success of the plan made it essential that some regulating body should initiate and establish rates within the rate group, which would be just and reasonable to the public, and, at the same time, would yield the revenue necessary to avert a breakdown of transportation throughout the country. It was manifest that these important functions must have final lodgment in a single regulating body, since unity of action and harmony of purpose were essential to success. It was known to the Congress that the great preponderance of the business of the country was interstate commerce, and that there could be no doubt as to the power of Congress under the Constitution, to intrust these important matters to a federal body. It was obvious, therefore, that the Interstate Commerce Commission, which had been long functioning to the satisfaction of the country, which was informed by experience and enlightened by a great body of expert knowledge, which was administering the Valuation Act, and familiar with the rate structure of the country, should be selected as a governmental agency intrusted with the duty of dividing the country into rate groups, of ascertaining the value of property within such groups, and fixing the rate of return. No single state commission could have been selected. Nor could these matters have been intrusted to all the state commissions acting separately, since to do so would have been to create 48 rate groups with 48 different bases of rates, and the possibility of 48 different standards of measuring the value of the property, and the necessary rate of return. The problem was manifestly a national one. In the light of the formation of rate groups state lines could not be considered.

"In the actual limitation of rates within the groups and on the basis so prescribed, Congress for the first time placed the Interstate Commerce Commission under the mandate of prescribing in the first instance the rates applicable to that portion of the commerce which was interstate. As to the rates on intrastate commerce, Congress yielded to the urgent solicitation of some of the states by returning to the states a portion of the duty and responsibility which they had had in respect thereto prior to federal control. This it did by omitting from the new legislation a direct mandate upon the Interstate Commerce Commission to prescribe intrastate rates in the first instance. But in so doing, Congress was careful to prescribe a standard to which the states must adhere—that the rates maintained or initiated by them should not result in disadvantage or prejudice against persons or localities in interstate commerce or in 'any unjust discrimination against interstate commerce' itself.

"Having in mind the distinction of the Minnesota Rate Cases, Congress did not authorize the court to determine when such variance from the standard might exist, but intrusted its determination as a question of fact to the Interstate Commerce Commission—not as a question of law to the judiciary.

"It is impossible to read Section 15a (Sec. 422, Transportation Act) and Section 13 (Sec. 416, Transportation Act) of the Interstate Commerce Act as they stand today, each in the light of the other, and both in the light of the underlying purpose of Congress, and arrive at any other conclusion than that Congress had determined the time had arrived when the interstate and intrastate transactions of interstate carriers had become so intermingled as to require ultimate responsibility for both to be within the realm of national supervision.

"Thus, a failure on the part of the states to follow or decline to follow the lead of the Interstate Commerce Commission might or might not result in preferences and discrimination, dependent upon the particular facts in particular cases, and the justification which might exist therefor."

After an exhaustive discussion of the commission's order itself, the brief says no one has ever demonstrated why the intrastate rates should be lower than interstate rates, when, transportation conditions being similar. If such demonstra-

tion were made in any particular case doubtless the commission would give recognition by appropriate differences in the rates prescribed. No one has ever suggested any proportion why the intrastate rates should fail to produce their proportionate share of such increased revenue as Congress might determine was necessary to keep open and in successful operation the railroads engaged in interstate commerce.

### Nine States Reduced Revenues by \$41,000,000

The brief says that the reports of the commission show that the annual direct loss in revenue of which the carriers in nine states have been deprived by the failure to allow the full amount of increase amounted to \$41,680,256, which would be greatly increased if the intrastate rates were reduced to the maximum of 2 cents a mile prescribed by the unprepared state statutes in some of the states, and the indirect losses resulting from the use of lower intrastate rates to portions of interstate transportation, the commission found could not be measured in terms of dollars.

### Brief of State Commissions

In explaining the interest of state regulatory commissions in this case, the brief filed on behalf of the 42 states says:

"The state regulatory commissions joining in this brief seek to preserve power to serve the people of their respective states in the manner prescribed by their laws. The Transportation Act of 1920, as construed by the Interstate Commerce Commission, destroys the power of such commissions, and of the legislatures of their sales as well, to regulate intrastate commerce.

"Already the commission has made state-wide orders dispossessing the states of New York, North Carolina, South Carolina, Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Nebraska, Arkansas, Montana and Utah of power over substantially all passenger fares. Like orders have been made covering freight rates in the states of Indiana, Illinois and Nebraska. The commission has also instituted proceedings looking towards like orders with respect to freight rates or passenger rates, or both, in the states of Georgia, Alabama, Florida, Missouri, Kansas, Louisiana, North Dakota, Texas, Nevada and Arizona. The orders made by the commission, by the provisions of the act, and by the express terms of such orders, are 'to remain in force until the further order of the commission.' Such orders, therefore, in their operation, are not confined to the removal of discriminations existing at the time of the making of the orders, leaving in existence state power thereafter to regulate rates upon the traffic affected, but result in the permanent destruction of all state power over such rates.

"While these orders of the commission thus far made under the Transportation Act relate to passenger fares and freight rates only, it may be said that all power of regulation is involved. Section 13 (4) of the Interstate Commerce Act, as amended by the Transportation Act, under which the orders of the commission have been made, authorizes action with respect to any 'rate, fare, charge, classification, regulation or practice' which causes 'undue, unreasonable or unjust discrimination against interstate commerce.' If it shall be held in this case that the commission can find a rate prescribed by state law discriminatory, and make an order setting the same aside, because in the opinion of the commission it is too low, and so burdensome to interstate commerce, it will be claimed that the commission may make a like finding and order as to any regulation requiring the provision of terminal or station facilities, or the furnishing of equipment or the making of improvements to safeguard life, or the doing of anything that requires the expenditure of money; and thus, if that claim shall be sustained, the power to regulate carriers in any respect, as to their intrastate operations, will be found to have been transferred from the states to the federal government.

"The state regulatory authorities jointly in this brief, therefore, believe it to be their duty to press upon the attention of the court the revolutionary character of the power which the commission has attempted to exercise in this case, and to urge that no such construction as the commission has placed upon the Transportation Act can have been within the intent of Congress, and, further, that if such construction can be held in accord with such intent, then the act is unconstitutional, as an invasion of the reserved power of the states under the federal compact."

A large part of the brief attacks the general rate-making rule of the act providing for a net return of 5½ or 6 per cent on aggregate value. After quoting the direction to the commission to exercise its power to prescribe just and reason-

able rates so that carriers shall earn a return "as nearly as may be" to the fixed percentage it is contended that Congress by this intended only to command the commission in adjusting rates to do what it could to enable carriers to earn the income prescribed by the exercise of its power to regulate interstate rates. If the rates prescribed by state authority should chance to be too low, and because of that fact the net railway operating income should fall short of producing a fair return on the aggregate value of all carrier property, it is contended that this would still be "as nearly as may be" to that return by reason of anything that the commission may do.

The rule of Section 15-a is declared to be arbitrary in its operation as to traffic on roads which through lack of traffic are unable to earn a fair return at reasonable rates.

The brief says in addition:

"The commission is commanded, under the rule as construed, to establish rates which shall yield a fixed percentage return. The level of rates that will produce this return is thus by legislative mandate declared reasonable, without respect to the worth of the transportation service rendered, or to the effect of the rate on traffic. Under this rule, in times of business depression, when prices fall and the volume of transportation decreases, rates must be advanced without regard to the worth of the service rendered.

"Paragraph 5 recites in substance that the plan will enable 'some of such carriers to receive a net railway operating income substantially and unreasonably in excess of a fair return upon a value of their railway property held for and used in the service of transportation.' Later paragraphs of the section provide that the excess above a fair return so collected by a road shall be divided equally between the road and the government.

"This rule operates to impose upon the internal traffic of a state, moving upon the lines of such carriers as earn excessive returns, the payment of charges which, as to such traffic, is unreasonably in excess of fair payment for the transportation service rendered.

"If it be admitted, for the purpose of this argument on this particular point, that non-compensatory rates upon intrastate traffic may weaken interstate carriers, and so retard or otherwise injure interstate commerce that the federal government may require the same to be increased, this does not reach the situation under discussion. Power to raise rates that are non-compensatory in a very different thing from power to raise rates that already yield a fair return on the value of the property used, to a point where they will yield 'substantially and unreasonably in excess of a fair return on such value.'

"The federal power with respect to intrastate rates is dominant only to the extent that its exercise is necessary to protect interstate commerce from injury. When the returns yielded by rates in effect are adequate there can be no weakening of carriers, nor injury to interstate commerce from failure to increase them, and hence the federal power never becomes dominant as to such rates.

"Laying aside for the moment the question of constitutionality of Section 15-a, it may be pointed out that the construction which the commission has placed upon it goes far beyond the design of Congress. Congress was not seeking to establish uniform rates upon all traffic. It was, so far as interstate rates were concerned, seeking to establish as the basis for determining the sufficiency of such rates, group values instead of values of particular properties.

"Paragraph 5 does not contemplate 'uniform rates' upon all traffic, but 'uniform rates upon competitive traffic.' There may be ground for argument that it is good policy for the federal government upon competitive traffic to allow some roads to earn more than a fair return, so that weak competing roads may be sustained. But the competitive traffic is ordinarily through traffic, which passes state lines, and is so subject to federal regulation. Intrastate traffic, on the other hand, in very large part, is not competitive, being often confined to a single route.

"We maintain, however, firmly that the public policy which shall control in the regulation of carriers, so far as such carriers are engaged in the transportation of intrastate commerce, must be determined by the state and not by the federal government. If it be granted, for the sake of argument at this point, that a failure to permit reasonable returns upon the intrastate business of an interstate carrier may be found to constitute unjust discrimination, such discrimination can be found only when the return upon the value of the property devoted to such transportation is in fact unreasonable.

"If it is claimed to be good policy to go beyond what is reasonable in some cases, it is the constitutional right of a state to determine that question for itself. Its determination may be unwise, but it alone has the right to make it.

"The commission's misconstruction of the true purpose of

section 15-a as to uniformity of rates produced the order complained of in this case. We have before called attention to the entire failure of the commission to make delimit the persons and localities, if any, injured by the intrastate rates sought to be displaced by its order. If the commission found all intrastate passenger fares in Wisconsin in fact discriminatory it would undoubtedly, in view of the decision of this court in *Illinois Central Railroad v. Public Utilities Commission*, 245 U. S., 493, have clearly stated that finding, as it might easily have done. Instead, however, it has expressly left open the question of what rates are discriminatory and what rates are not discriminatory. Doubtless for the purpose of most expeditiously exercising the new power which the commission believes has been committed to it, it has applied Mr. Ford's methods, and has standardized its reports. Having stated its conception of the law, and its methods of procedure, in the New York and Illinois reports, which are part of the record here, it has since contented itself by reference to those reports, making its findings as to discriminations found in all the cases relating to the same class of traffic in the same form, and leaving the earlier reports to be examined for statements of reasons and of procedure."

It is asserted that the railroads desire to centralize regulation as much as possible because, being human, they resent interference and "a bureau in Washington hundreds or thousands of miles away from people who want to complain, and buried in thousands of complaints that would suffice to keep 48 commissions busy, comes as near to ideal regulation from the railroad point of view as can be imagined."

It is also asserted that the commission failed to comply with the law in not making a separation of the aggregate value of the railroads in the Western territory when it divided it into the Western and Mountain-Pacific districts for the purpose of the rate case, and also in failing to hold conferences and joint hearings with the Wisconsin Railroad Commission before ordering an advance in the Wisconsin rates.

## Railroads to Receive Partial Guaranty Payments

WASHINGTON, D. C.

PRESIDENT WILSON on February 26 signed the Winslow bill, providing for partial payments to the railroads on account of their guaranty for the six months following the termination of federal control, on certificates to the Treasury Department by the Interstate Commerce Commission. The President announced his approval of the bill after having received opinions on it from both the commission and the Treasury Department. It is understood the commission fully approved it, as it had recommended such a bill in its annual report, and that the Treasury Department interposed no objection, now that the problem of raising the funds to meet the payments to the railroads is about to be transferred to a new administration.

The way is thus prepared for early payments to the railroads for a large part of the approximately \$350,000,000 still due on their guaranty, and the railroads owe so many bills both to other railroads and to companies that have accounts against them for materials, supplies and equipment that it is expected that the relief afforded by the law will be widely distributed.

How much money will be made available and how soon depends on the Interstate Commerce Commission, which it is understood proposes to issue certificates as rapidly as possible for such amounts as it feels perfectly safe in certifying as certainly due the carriers pending final adjustments. The commission had prepared some certificates for partial payments which were withdrawn when it was advised that the comptroller of the Treasury had ruled that payments could not be made and officers of a large number of roads have been conferring with the Bureau of Finance since the passage of the new law in the effort to arrange for additional certifications to meet pressing needs as soon as possible.

President Wilson was urged to veto the Winslow bill as

"an unjust and unjustifiable concession to the railroad owners, who have shown a wanton disregard for law and lawful processes," in resolutions adopted by the executives of the national and international trade unions affiliated with the American Federation of Labor, at a conference in Washington on February 23. The resolutions also urged the legislative representatives of all organizations affiliated with the federation, in the event the President should veto the bill, to use every effort and all legitimate means to prevent the passage of the bill by the Congress over the Presidential veto. The resolution states that the railroads are seeking through this bill additional financial benefits from the Treasury to an amount and in a manner not contemplated by the original transportation act. The reason for this opposition to the bill is indicated in a preamble to the resolution saying that "the railroads, closely organized through the Association of Railway Executives, so that they stand as a unit in all matters pertaining to the relations between the carriers and the workers, have declined to meet in general conference the corresponding national organization of the workers," and that this is evidence of a purpose to destroy trade unionism that is identical with the so-called open shop movement in the steel industry and in violation of the Transportation Act.

When Congress adjourned on March 4 no action had been taken on the bills which had been favorably reported by the Senate and House committees as a substitute for Section 10 of the Clayton law, which became effective on January 1. The original bills introduced at the request of the railway executives' association have been largely rewritten in accordance with suggestions made by the Commission.

Another bill which was not acted upon was that proposed by the state commissioners' association and approved by the Interstate Commerce Commission to amend the railroad valuation act by eliminating the provisions requiring the Interstate Commerce Commission to ascertain and report the cost of acquisition of railroad land. A hearing on the bill had been held by the House committee on interstate and foreign commerce but no report has been made.

### Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight during the week ended February 19 shows a slight increase over that for the previous week, for the first time since January 15. The total was 695,506 as compared with 681,-

627 during the week ended February 12 and as compared with 772,102 and 700,913 during the corresponding weeks of 1920 and 1919, respectively. The summary as compiled by the Car Service Division of the American Railway Association is shown in the table at the bottom of the page.

Reports received by the Car Service Division show that on February 15, 64.1 per cent of the freight cars were on home roads, as compared with 58.9 per cent on February 1 and 21.9 per cent on March 1, 1920, when the railroads were returned. In a summary of general car conditions for the last half of February, the Car Service Division says that it is generally felt that the peak of the open top car surplus has now been reached and that after the first of March the demand for this class of equipment will progressively increase, not only for the transportation of coal and for manufacturing necessities but also with the renewal of building and road construction activities made possible by improved weather conditions. "Due to the lack of demand for open top cars and the observance of the car service rules," the circular says, "very satisfactory progress is being made in relocating such equipment to the home roads. These cars upon arrival home are being overhauled and repaired as fast as possible in anticipation of heavy transportation demand in the near future when business has resumed its normal proportions." There has, however, been a steady increase during the winter in the percentage of bad order cars reported. On February 1 the percentage was 9.4 per cent as compared with 8.5 per cent on January 1, 7.4 per cent on October 1 and 6.7 per cent on March 1, 1920.

The freight car surplus is steadily increasing and during the week ending February 23 it reached a point never before attained except during the period of depression following the armistice. The number of cars on the railroads of the United States for that week was 423,193 and for the railroads of the United States and Canada the number was 450,250. There were 172,713 idle coal cars and 203,817 idle box cars. During the spring of 1919 the car surplus at one time reached nearly 500,000 cars.

OFFICERS OF THE CANADIAN NATIONAL say that labor conditions, so far as railways are concerned, are improving. They anticipate that by the end of February a large number of men will be shipped out along the line for the commencement of spring work. Owing to the return of a large number of railway workers to Europe during the past few months, a shortage of such labor is looked for.—*Commerce Reports.*

#### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts, Comparison of Totals This Year, Last Year, Two Years Ago, for Week Ended Saturday, February 19, 1921

Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L. C. L.	Miscellaneous	Total revenue freight loaded			Received from connections

## Milton H. Smith

MILTON H. SMITH, president of the Louisville & Nashville Railroad, who died at Louisville, Ky., on February 22, was almost the last of the generation of railway executives to which he belonged. Perhaps the only exception which can be made to this statement is that of Marvin Hughitt, chairman of the Chicago & North Western, who became president of the North Western in 1887. The beginning of Mr. Smith's career as a railroad president antedated that of Mr. Hughitt's, Mr. Smith having become president of the Louisville & Nashville on June 11, 1884. He had, furthermore, been vice-president of the railroad since 1882, and in this position had been the chief executive officer of the property. Therefore, it can be correctly stated that he was the real head of the Louisville & Nashville for more than thirty-eight years.

Most of the development of the Louisville & Nashville into a great railway system occurred under his management. When he became vice-president in 1882 it had 3,233 miles of line, 364 locomotives and 10,762 freight cars. When he died it had 5,041 miles of line, 1,209 locomotives and 53,100 freight cars. Even these figures give a very inadequate idea of the development of the property under his management. It was, when he became the head of it, a small, poorly developed, inadequately equipped property. He left it one of the leading railways of the country in point of physical condition, strategic location, traffic handled and earning capacity. He deserves, therefore, to be ranked among the greatest railroad builders, developers and managers of his time.

Probably the country never produced a greater railroad administrator than E. P. Ripley, for many years president of the Santa Fe. The regard in which Mr. Smith was held by Mr. Ripley was strikingly shown by the following telegram which Mr. Ripley sent to Mr. Smith on September 12, 1916:

"Congratulations on long, useful and well spent life.

This will be one of many, but there will be few from people who have known you so long as I have. We are both nearing the foot of the hill, but if I leave behind me as good a reputation as you will, it will be the best legacy I can leave to my children."

Mr. Smith was 84 years old at the time of his death. The great success of his career was largely due to the length of his active life, and the length of his active life and the enormous amount of work he did were largely due to the fact that nature endowed him with an unusually powerful natural constitution. He worked during most of his life without taking any form of recreation, and it has been said of him that he never learned until he was past 75 years old that the Louisville & Nashville trains would continue to run if he occasionally took an afternoon off to play golf. In the last years of his life he played golf and took more or less rest, but he continued to work hard right down to the last.

Like most of the successful railroad men of his generation,

Mr. Smith was eminently a fighter. He fought everybody who opposed him and he usually won, but he fought fairly. He was distinctly "a diamond in the rough." He was rough in his external appearance and manner, but those who came intimately in contact with him all found that, like most men of his general type, he was really very kind-hearted and considerate.

Like many railway men of his generation, Mr. Smith was extremely averse to newspaper publicity and boasted that he was never interviewed. He had a keen sense of humor and a happy gift of sarcasm which were displayed in a letter which he wrote to one newspaper man who had published a story about him. He began by denying a statement that the newspaper man had made to the effect that he was 79 years old. Having challenged the correctness of almost everything else in the story, he concluded by saying: "You got one thing right, my name is Milton Hannibal Smith."

Mr. Smith was an intense lover of accuracy, and before his death dictated a memorandum giving in detail the correct chronology of his life. He was born on September 12, 1836, in Windham Township, Greene County, New York. He moved with his parents to Cook County, Illinois, in October, 1850. In 1858 he went south and lived in Tennessee and Mississippi until January 1, 1860, when he entered the employ of the Southwestern Telegraph Company as a telegraph operator at Oxford, Miss.

In October, 1860, he went to Jackson, Tenn., as assistant agent of the Mississippi Central Railroad and operator for the Southwestern Telegraph Company. In June, 1861, he was transferred to the superintendent's office of the Mississippi Central at Holly Springs, Miss., as telegraph operator and chief clerk.

He entered the employ of the United States Military Railroads in September, 1863, in charge of transportation at Stevenson, Ala. He performed the same duties at Chattanooga, Tennessee, during the Atlanta campaign of the Union Army, and afterwards also at Huntsville, Alabama, Knoxville, Ten-

nessee, and Atlanta, Georgia.

In September, 1865, he went to Louisville and entered the employ of the Adams Express Company. In June, 1866, he went to Alabama as division superintendent of the Alabama & Tennessee River Railroad, returning to Louisville in August of the same year as local agent of the Louisville and Nashville Railroad. He was made general freight agent of that road in June, 1869.

In October, 1878, he went with the Baltimore & Ohio to Baltimore, and was subsequently made general freight agent, holding that position until October 1, 1881. He then became general agent of the Pennsylvania Railroad in New York, which position he resigned on January 1, 1882, to become third vice-president and traffic manager of the Louisville & Nashville. He was made chief executive officer of the road with the title of vice-president on July 6, 1882. He was elected president on June 11, 1884, and again served with the title of vice-president from October 6, 1886, to March 9, 1891. There was, however, no change in his duties

M. H. Smith

during this period. It was decided that the railroad needed stronger financial representation in New York and the title of president was given to one of its officers in New York. Subsequently this officer was given the title of chairman of the board, and Mr. Smith again took the title of president on March 9, 1891.

One of the principal officers of the Louisville & Nashville wrote to the *Railway Age*: "The biographical sketch heretofore furnished you was prepared by Mr. Smith himself, his idea being that if the newspaper men were absolutely accu-

rate as to the essentials they might say anything else about him that their fancy might dictate." The same officer wrote: "He was such a wonderful man that it is hardly possible to say that he possessed any one outstanding quality or characteristic. His versatility knew no bounds. His genius sprang from an incomparable combination of rugged integrity, love of truth and extraordinary breadth of vision. I valued and admired him so greatly, and his life was such an inspiration to those who came in contact with him, that I am sure you cannot exaggerate his virtues and achievements."

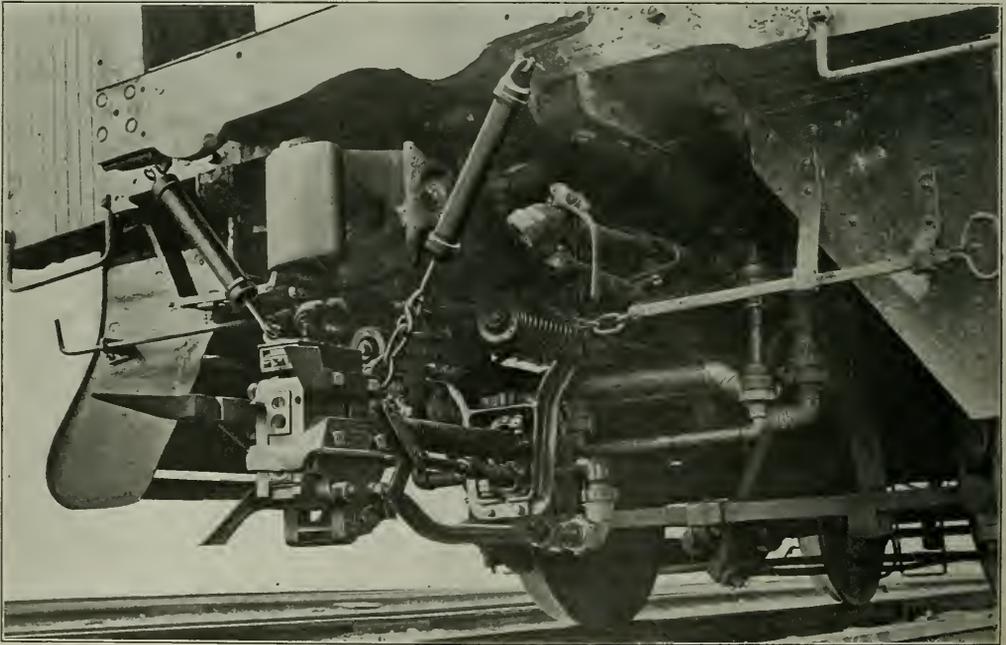

## The Futrell Automatic Train Line Connector

New Type Suspension, Positive Lock for Connector Heads and Removable Gasket Plate Are Features

**D**URING THE PAST 18 MONTHS the Baltimore & Ohio has had in service on a local passenger train a new design of automatic connector. This device, which is the invention of Thomas J. Futrell, is made by the Futrell Coupler Company, Streator, Ill. While the construction follows the general principles of some of the existing types, there are several unique features, the most notable being the arrange-

stem which extends from the rear of the coupler head. Two springs attached to the bracket force the yoke forward and another spring is applied to the stem of the coupler head. These parts are adjusted so that the connector when not coupled extends 534 in. ahead of the pulling face of the coupler knuckle.

Beneath the main stem of the connector is an auxiliary

The Futrell Connector, Showing Suspension, Piping and Electric Contacts

ments for locking the heads and taking care of movement between coupled cars.

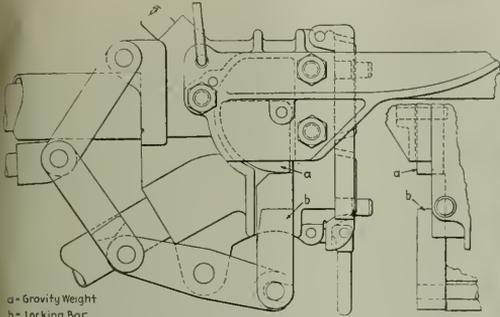

The coupler, as shown in the illustration, is of the butt-face, wing type. The head casting is suspended beneath the coupler by diagonal wire cables which are supported by an enclosed spring mechanism from the car body. A bracket is attached to the center sill behind the coupler carrier iron and a yoke shaped lever, pivoted to the bracket, supports a

stem with a spring adjustment. This stem operates a lock through a toggle arrangement and after the connector faces are in contact the lock is caused to engage a slot in one of the wings as it mates with the coupler head. The details of operation of the locking arrangement are clearly shown by the drawing of side and front views of the head. In a recess in the head beneath the left side wing is a segment, *a*, pivoted near the upper edge. The portion of this segment lying

within the head serves as a stop for the locking bar, *b*. The lower outer edge of the segment extends into the guide in which the wing of the opposing connector engages the head. Thus as the wing moves in it will force the segment upward and release the locking bar, which is then free to enter the

relative movement between the ends of adjacent cars. The yoke shaped lever, being pivoted at the upper end, is free to move forward or backward to take up motion resulting from the compression of the drawbar springs and a trunnion casting between this lever and the stem of the coupler head provides for lateral and vertical movement.

The wing type gathering mechanism has a vertical range of 7 in. and a horizontal range of 7 in. On the earlier designs, four wings were used but the latest type has but two. An additional means of insuring perfect alinement in the head is provided by two pins in the face which register with recesses in the opposing connector head. As is the usual

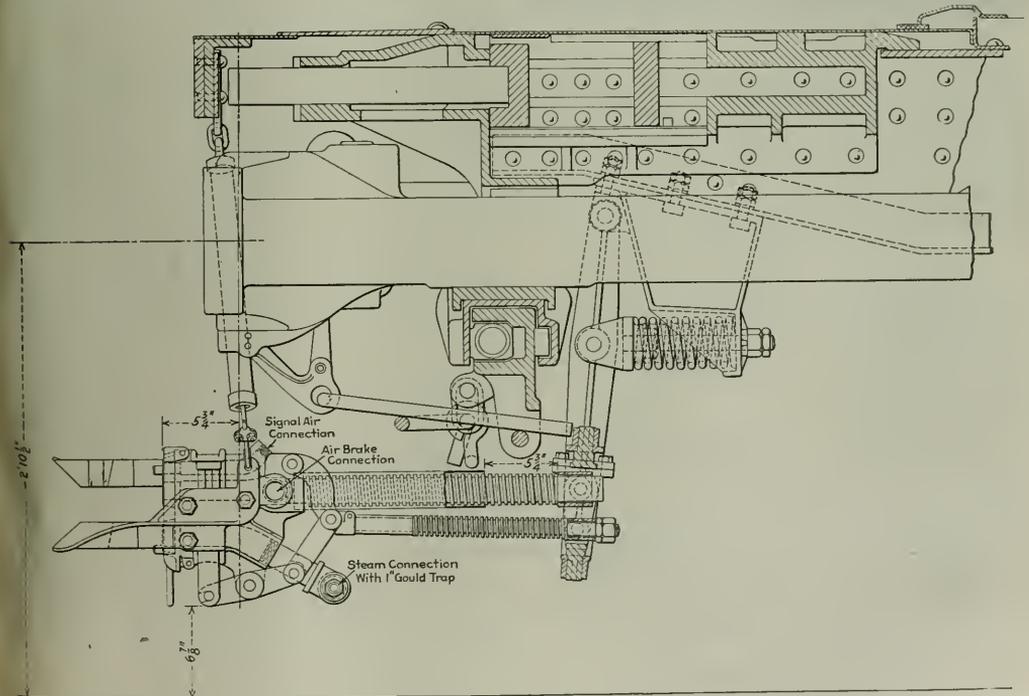

Side View of Head Showing Locking Mechanism

End View of a Car Equipped with the Connector

slot in the wing. When the connectors are separated the locking bar is returned to the lower position and the segment, being released as soon as the wing is removed, returns to its original position by gravity.

practice in this type, the ports are located on the vertical center line, the air signal connection being at the top; the

Side Elevation of the Connector Head and Suspension

The heads, when locked, form practically one solid part and since the connectors are supported from the car body, it is necessary to provide sufficient freedom of movement to insure that no additional stresses are placed on the heads by

air brake in the center and the steam heat at the bottom. The sizes of the openings are as follows: air signal  $\frac{7}{8}$  in.; air brake  $1\frac{3}{8}$  in.; steam heat  $1\frac{1}{2}$  in.

The gaskets are held in place by a detachable gasket plate

fastened to the front of the head. The plate is hinged at the top and is locked at the lower end by a cam which forms part of the gasket plate keeper. In order to remove the gasket plate, the handle must be raised to the position shown by the dotted lines. When the two connectors are coupled, the handle is held in the vertical position and there is no possibility of the plate becoming unfastened. It will be noted from the illustration that the gaskets are tapered to fit

where they can be reached from the side without going between the cars. The piping and cocks to which the rubber hose are connected are not disturbed in the installation of the coupler and for that reason no other provision is made for interchanging with equipment fitted with the standard connections.

## Advantages and Cost of Railroad Electrification

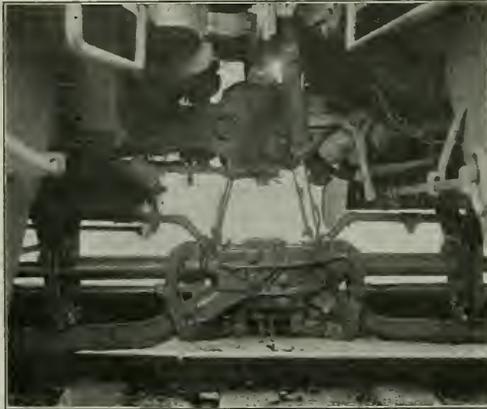

A MEETING of the Electrical Section of the Franklin Institute was held in Philadelphia, Pa., on February 24, which was addressed by A. H. Armstrong, of the General Electric Company. Mr. Armstrong called electrification an economic necessity and spoke of the need for developing railroad facilities. He said that it is a matter of grave national concern properly to diagnose the true character of the ailment affecting our transportation system, and to prescribe the treatment of greatest promise for its future recovery. He enlarged on the subject of how electric operation could best be used to meet future railroad requirements and told of what had already been accomplished.

In summing up his paper, Mr. Armstrong said that electrified terminals in large cities would revolutionize present steam locomotive practice and not only effect economies in operation, but greatly stimulate traffic by introducing radical improvements and facilities. With no immediate prospect in sight for any material reduction in the price of labor, its output must be increased, and electric operation has demonstrated its effectiveness in this direction. In addition, locomotive division points may be indefinitely extended. All of these improvements in the electrified property will cost large sums of money, although in some items of operating expense, such as fuel, crews and maintenance, direct savings are effected of such magnitude as to show a reasonable return upon new capital charges incurred. The argument for electrification, however, is built upon a broader foundation than a direct return upon the investment. It has to do with the vital question of the future growth of our transportation system and its effect upon our national prosperity.

In answer to several questions put to Mr. Armstrong relating to electrification costs and mileages, he said that the original 440-mile electrification on the Chicago, Milwaukee & St. Paul cost about \$13,000,000. This included 42 freight and passenger and two switching locomotives. This, he said, figures out at about \$28,000 per route-mile or \$18,000 to \$19,000 per single-track mile. The freight and passenger locomotive cost about \$130,000 each, and they replaced 112 steam locomotives, worth about the same in total as the electrics; hence the items of locomotive costs about offset each other. The last 220-mile electrification on this road cost more, having been carried out in war time, the increase being, roughly, about 50 per cent.

BOLIVIA, Colombia, Honduras, Nicaragua and Peru are now included in the list of countries to which letters may be mailed at the domestic rate, two cents an ounce. Domestic rates apply also on second class matter. The weight limit on newspapers and other printed matter is 8 lb., 12 oz.; maximum weight for single volumes, 11 lb.; maximum dimensions of rolled papers, 40 in. in length by 6 in. in diameter.

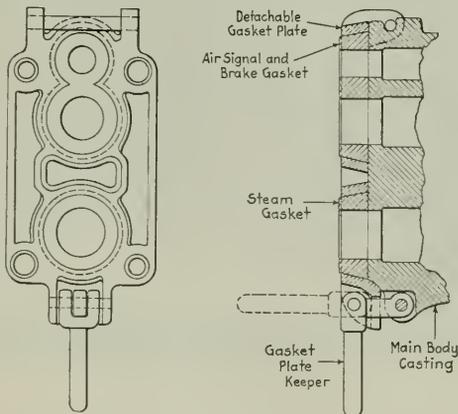

THE CHICAGO, BURLINGTON & QUINCY has appointed a loss and damage committee to take charge of a campaign for reducing freight claims to a minimum. The company has prepared bulletins describing the work of the committee and calling for the co-operation of officers and employees in keeping down the number of claims, which, the bulletin states, represent "additional expenditure that buys criticism, complaints and extra work."

A Side View of the Connectors in the Coupled Position

the plate and the air brake and signal ports have a single gasket in common. With slight changes in the gasket holder, A.R.A. standard air hose gaskets could probably be used. In the design of the head, provision has been made for the attachment of electrical connections at the top of the head casting.

All connections between the connector head and the train line are made by pipe and flexible joints, both the Barco and

Details of Removable Gasket Plate

McLaughlin type being used. In order to make the connections to the head, tees are inserted in the train lines behind the angle cocks. Ordinary air cocks are used in the air connections and a quick opening throttle valve in the steam passage. The levers for the operation of these cocks are placed toward the center of the car just behind the steps

# Labor Board Resumes Hearings on Working Rules

## National Agreement with Clerks Is Defended—Other Proceedings Before Wage Tribunal

HEARINGS in the controversy between the carriers and various classes of their employees over the latter's demand for the perpetuation of the National Agreements formed during the period of federal control were resumed before the Railroad Labor Board at Chicago on March 1, when representatives of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, appeared before the Board to justify the agreement made with the clerks and present their rebuttal statements.

The Board had previously announced that representatives of the maintenance of way workers would be heard on that date, but at the opening of the session Chairman R. M. Barton of the Board stated that the program had been rearranged and the clerks would be heard first.

The session was opened by E. H. Fitzgerald, grand president of the Brotherhood, who, after describing the history of National Agreements, spoke briefly of the necessity, from the employees' standpoint, of the Board's recognizing the principle of collective bargaining as defined by B. M. Jewell in the previous hearings. Mr. Fitzgerald contended that such action would end the present controversy and that it would be settled amicably.

The remainder of the testimony presented on behalf of the clerks dealt wholly with rebuttal statements to various parts of the presentation made by E. T. Whiter on behalf of the carriers. During the morning and afternoon sessions on March 1, R. P. Dee, vice-grand president, W. E. Gollings and J. F. Murray, general chairmen of the clerks' organization, testified in reply to certain groups of the objections to this National Agreement put forward by Mr. Whiter.

The character of the testimony offered at these sessions indicates the manner in which the labor executives propose to reply to the carriers' objections to National Agreements. If similar testimony is presented by each of the organizations involved, it will doubtless take some time to complete the case. Such development would be in line with the attitude which has been taken by the labor executives since the beginning of the case.

### Clerks Complete Presentation

The presentation in support of the clerks' demand for continuation of their national agreement was completed on March 2, Mr. Fitzgerald testifying in part as follows:

Our testimony, though voluminous, is but a brief history of the struggle through which the employees have gone in their efforts to emancipate themselves from industrial servitude. The deplorable conditions that existed prior to the time they organized, to which frequent reference has been made during the progress of this hearing, were not confined to any particular railroad but were general throughout the country. Our testimony has given you some idea of the conditions our people worked under. It has shown you that under the old regime they were denied living wages, as statistics will prove; that they were subjected to most unfair and unjust working conditions; that they worked long hours without extra compensation; that they had absolutely no protection against dismissal without cause; that they had no assurance that their skill and industry would be rewarded; that they were utterly at the mercy of their employers. And to add insult to injury, every attempt they made to collectively improve those conditions was ruthlessly thwarted by summarily dismissing from the service every known leader; by the denial of their constitutional rights of free speech and free assembly; by spying upon and discharging employees found entering a union meeting.

It is amazing that these employers should have thought that this sort of treatment was profitable. It is more amazing that they should come before this board and declare, in the face of

facts that are incontrovertible, that our national agreement is detrimental to the service and makes the economic operation of the railroads impossible. I repeat the assertion that I made earlier in my testimony, that the employees whom I represent are giving better service today than before they had a national agreement. I deny absolutely that the conditions under which these employees formerly worked are conducive to good service. Those conditions are conducive of nothing but poor workmanship and bad citizenship. Those conditions are inimical, not only to the interests of the worker, but to the public.

The management denies that their request for the setting aside of the national agreement is an attempt to restore the old order of things. They declare that they simply want system agreements substituted for national agreements. But these men who are asking for this are the same men who have positively refused to deal collectively with their employees; they are the men who were responsible for the conditions we have been talking about. Have they suddenly had a change of heart? Judging from our past experiences we believe not—we have been beguiled too many times by promises from these men.

We are not living in the same world we lived in five years ago. Old industrial methods will not meet the requirements of new industrial needs. The railroad workers, having finally loosened the bonds of industrial autocracy and having lifted themselves to a position bordering upon, but still far from just, are not going to peaceably surrender the things they have struggled for years to gain.

This is a momentous problem confronting your board. You hold, as it were, in the palm of your hand the welfare of two million men. The industrial peace and tranquillity of the nation may depend upon the decision you render. Labor is looking for no special privileges. It wants only what it is justly entitled to; namely, a fair and square deal, and it is determined to have that. The Congress of the United States passed the Transportation Act declaring that it was necessary to properly safeguard our great public highways. We have heard a great deal about the protection the Transportation Act affords the employees. What protection does it afford if it fails even to guarantee them just and equitable wages and working conditions? No protection whatever will be left them if the national agreements are set aside except their economic strength, which they will surely use to prevent a return to the former intolerable conditions.

It is interesting to note that during the past few weeks, all of the labor organizations' spokesmen have talked of "the request of the managements for the setting aside of the national agreements." It will be recalled that this controversy was brought before the Board by the employees who demanded the perpetuation of their national agreements. The vigor with which the carriers have opposed this demand has evidently caused the representatives of the employees to forsake the aggressive and adopt a defensive policy.

### Walsh Asks for Decision on Labor's Request

The railroad labor organizations, through their general counsel, Frank P. Walsh, on February 24, petitioned the Board for an immediate decision on labor's previous request for the calling of a joint conference between railway executives and labor leaders to settle the controversy over national agreements. A decision without delay was desirable, Mr. Walsh said, "since it may be necessary for us to seek a judicial determination as to certain features of the Transportation Act and as to certain interpretations of the Act by the carriers, by ourselves, and by your honorable body."

The petition said in part:

"On February 17, 1921, a formal request was submitted for a recommendation by the Board that all grievances and complaints of the railway executives as to rules and national agreements be remanded to a general conference between the national organization of the carriers and the national representatives of the railway employees.

"We now ask that the Board at the earliest possible moment hand down its ruling or decision on that request. It is essential that we know at as early a moment as possible the decision of the Board in this important matter, as it necessarily will determine largely the scope and character of our preparation in the case which the Board has set for hearing March 10, 1921.

"It may be necessary for us to seek a judicial determination as to certain features of the Transportation Act and as to interpretations of the Act by the carriers, by ourselves and by your honorable body, and for this additional reason we urge respectfully that the Board hand down its decision as soon as possible."

No action has so far been taken on this petition.

Frank P. Walsh, general counsel for the railroad labor organizations affiliated with the American Federation of Labor, later addressed a petition to the Railroad Labor Board at Chicago, asking that the Board hand down, at the earliest possible moment, its ruling or decision on the request for a recommendation by the Board that all grievances and complaints of the railway executives as to rules and national agreements be remanded to a general conference between the national organization of the carriers and the national representatives of the railway employees.

"It is essential," the petition said, "that we know, at as early a moment as possible, the decision of the Board in this important matter, as it necessarily will determine largely the scope and character of our preparation in the case which the Board has set for hearing March 10. It may be necessary for us to seek a judicial determination as to certain features of the Transportation Act and as to interpretations of the Act by the carriers, by ourselves and by your honorable body, and for this additional reason, we urge respectfully that the Board hand down its decision as soon as possible."

#### Erie Hearings Closed

Hearings in the controversy between the Erie and its train dispatchers and track laborers, the opening phases of which were described in the *Railway Age* of February 18 (page 412), were held on February 23. The Erie, on February 14, issued an order reducing the wages of track laborers where the "going" rate was lower than the rates fixed in the Board's award of last spring, re-establishing the seven-day week for train dispatchers and deducting the January 31 earnings of telegraphers. Representatives of the employees concerned protested to the Board, which as a result issued an order directing the Erie to rescind its order until hearings could be held before the Board. The Board, at the same time, ordered an investigation to determine whether the Erie had violated Decision No. 2 in ordering these wage reductions.

When the case came before the Board on February 23, F. W. McLaughlin and J. G. Luhrsen, representing, respectively, the organizations of the maintenance of way workers and the train dispatchers, contended in their testimony that the question of whether or not the Erie had violated the Board's Decision No. 2 was the only question which was properly before that body, and asked for a ruling first on that phase of the controversy. The question of the justifiableness of the wage cut was not properly before the Board. Mr. McLaughlin contended, because conferences on this dispute had not been held between the carrier and representatives of the men.

Mr. Luhrsen contended, in addition, that the train dispatchers are not required, by the terms of the Transportation Act, to confer with the management until the order making effective the abolition of the weekly rest day and the deduction from the pay of the telegraphers is rescinded.

Samuel Adams, representing the Erie, pointed out that the employees had objected to changes made in their working conditions. This dispute, he contended, could not properly be before the Board, inasmuch as rules and working conditions are now under consideration by the Board. In

reply to questioning, Mr. Adams stated that the Erie had not complied with the Board's order to rescind its wage cut ruling and held that the Board has no jurisdiction to make "stay" orders without hearings and proper representation by all the parties interested.

R. S. Parsons, general manager, presented the carriers' reasons for ordering a wage reduction, stating that in December, 1920, \$1.01 was paid out for materials and wages, exclusive of the expenditures for taxes, which run about \$300,000, for every \$1.00 of income. In January, he testified, because of the continued slump in business, \$1.07 was paid out for every dollar of income. These facts led to the ordering of a reduction in the wages being paid unskilled labor only after every other form of economy had been employed, he added.

"It has been represented here," Mr. Parsons said, "that we are paying track men 30 cents per hour. That is only partially true. The order was to pay the men the 'going rate.' Through the Youngstown (Ohio) district, we are not paying 30 cents, but 38 cents, and it is only in the isolated districts where labor is plentiful that we are paying 30 cents per hour. We are now paying anywhere from 30 to 48 cents per hour."

W. S. Bratton, in closing the case for the employees, said: "I think the Erie has violated Decision No. 2, and if they refuse to put into effect the orders of this Board and pay the wages, it is up to us, and we will endeavor to find a way to collect the money from the Erie Railroad Company."

The case was closed on February 23.

#### Missouri & North Arkansas Employees Walk Out

Four days after the Board had remanded the dispute between the Missouri & North Arkansas and its employees to conferences between the management and representatives of the men, the officers of that road were notified that unless the wage reduction order was rescinded the men would walk out. The management replied that under the ruling of the Board, reported in part in the *Railway Age* of February 25 (page 454), it could not comply with the request. The threat materialized on February 27, when the enginemen, trainmen, telegraphers and station agents left their work.

The strike was ordered after the railroad company, in compliance with authorization from the federal board, had called upon the employees to appoint representatives to confer with the railroad management on the question of reducing wages. Brotherhood officers have let it be known that the strike has the backing of the national organizations, and that strike benefits will be paid the striking employees for the period of the tieup.

The Board has not decided what action it will or can take in this matter. C. W. W. Hanger, a member of the Board, said in regard to these developments:

"The Board has received a telegram from the general manager of the Missouri & North Arkansas stating that the employees had gone on strike. We have not officially considered the action and the telegram was in the nature of advice rather than complaint."

#### A. B. & A. Enters Receivership

As a sequel to the Atlanta, Birmingham & Atlantic case, the progress of which was described in the *Railway Age* of February 4 (page 319), of February 11 (page 367), of February 18 (page 412), and of February 25 (page 454), B. L. Bugg, president of the road, was named receiver by Judge S. H. Sibley in the United States District Court at Atlanta, Ga., on February 25. During the progress of the hearings before the Labor Board, it was asserted by the representatives of the road that the wage reduction placed in effect on February 1, would enable the line to keep out of the hands of the receiver. The dispute was remanded

by the Board to conference between the carrier and its employees. Counsel for the company, in answering the petition for the receivership, stated that with the state and federal railroad commissions fixing rates and the Labor Board fixing wages, it was unable to meet expenses, and in the interests of all parties concerned, a receivership was desirable.

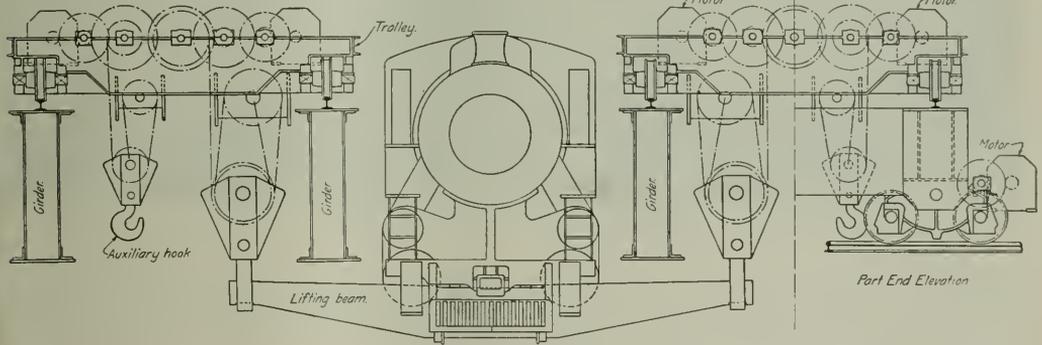

Later Judge Sibley signed an order putting into effect the schedule of reductions which Mr. Bugg, as president of the road, had urged before the Labor Board. These reductions amount to approximately 50 per cent of all increases granted since the government assumed control of the property in 1917. At the same time Judge Sibley indicated his willingness to grant a hearing should the men desire to make a showing in court as to wage scales.

## A New Type of Erecting Aisle Saves Shop Headroom

ONE OF THE MOST formidable problems imposed in the design of modern locomotive repair shops is to provide a traveling crane capable of lifting a complete locomotive high enough so that it may be carried over the tops of

quired. Thus, with adequate allowance made for clearance, the height of a locomotive on the floor, plus that of another one being passed over the top of it, plus the depth of the traveling crane and its trolley, gives a total height of 54 to 56 ft. or more from the floor to the underside of the roof trusses. This height is obviously a source of great expense in construction and is also a disadvantage in the operation of the shop because of the waste of heat, inefficient illumination and disadvantageous height to which the crane operator is removed from the floor.

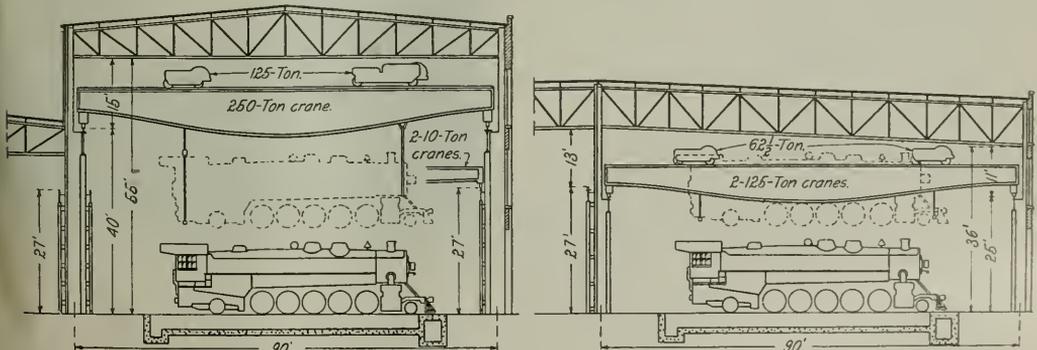

An appreciation of these shortcomings of the prevailing arrangement of shop structures has led to the development of the "gap crane" erecting shop by which from 15 to 18 ft. of the vertical height of the shop building may be saved. This is the invention of Harvey Shoemaker, formerly motive power superintendent of the Bangor & Aroostook. The idea is simple. The girders of the crane are spread apart a sufficient distance to permit the locomotive to be lifted up between them. As a consequence the crane may occupy the same vertical position as the locomotive, consequently the vertical height between the floor and the underside of the roof trusses consists of the height of the locomotive on the floor, plus the height of the locomotive in the air, plus the necessary clearance. The idea will be understood more clearly after an examination of the illustrations.

Cross Sectional Elevation of a Gap Crane

other engines in the shop to be set down at some other point. With the rapid increase in the length and weight of locomotives, so that 90-ft. cranes are now common, this utility has added greatly to the cost of erecting shops. One feature that has been especially troublesome is the great headroom re-

The gap crane is made up of four girders arranged in pairs with the two pairs separated a sufficient distance to allow the entire locomotive to be lifted up between them. Four trolleys of 62½ tons capacity each are used in pairs with the hooks or lifting devices at the ends of the fall lines

How a Gap Crane Reduces the Required Headroom in an Erecting Shop

attached to lifting beams which engage the front and rear ends of the locomotive. The lifting beam at the front end may be placed either under the extended sills or side frames which support the pilot truck or may be provided with adjustable saddle blocks and placed under the front end of the boiler, thus giving the same advantages as the sling rig but with greater resistance against overturning.

The gap crane may be constructed as a single unit or the two pairs of girders may be arranged to serve as independent "twin" cranes with provision for multiple unit control when they are used together for lifting a locomotive. Another feature of this development is the facility it offers for adapta-

is a large carrier, supported at its outer end by rods attached to a boom. This carrier contains the main conveyor by means of which the freight is transferred to and from the barge, the carrier being raised or lowered by means of blocks and tackle and a hoist as shown in the illustration to provide for the changing water level. The main conveyor is supplemented by a second conveyor extending the length of the main frame (on the wheels) and, when necessary to deliver the load at some distance behind the machine, by a third conveyor projecting to the rear. These auxiliary conveyors may be raised or lowered as found desirable for delivering packages to the floor of the dock, to freight cars or to motor trucks. The fact

Raising and Lowering of the Boom Compensates for Variation in the Distance from the Water to the Dock Level

tion to old shops equipped with a crane of limited capacity. Thus, if a shop is equipped with a traveling crane of 120 or 125 tons capacity, a second crane of the same capacity may be provided and the two arranged to serve as twin cranes.

One point not to be overlooked in considering this development is the need in any modern shop of auxiliary or messenger cranes of 10 to 20 tons capacity. In the modern shop where high headroom has had to be provided for the lift-over operations, the auxiliary cranes have been usually operated on a separate runway about 27 ft. above the floor and therefore from 12 to 16 ft. below the runway upon which the large capacity crane is supported and thus the small cranes are enabled to operate without any appreciable interference with the large cranes. With the use of the gap crane in shops of 10 to 12 pits in erecting aisles, it is believed that the use of a single crane runway for both the heavy and light capacity cranes will work out very satisfactorily.

that the entire frame rests on wheels lends considerable flexibility to the equipment in reaching the points of receipt and delivery to the greatest advantage. They will handle package freight up to an individual package weight of 400 lb.

The Lower End of the Main Conveyor Hoisting Package Freight from the Deck of a Barge

## Mechanical Equipment for a Railway Water Terminal

**A** NEW TYPE of material handling equipment has been developed for use at rail-water terminals where large variations in the stage of water occur. Thus, the illustrations show the use of this conveying system by the Illinois Terminal Railroad at Alton, Ill., for the transfer of freight to and from barges on the Mississippi river.

The equipment consists of a frame, mounted on wheels, that runs on a track laid on the dock perpendicular to the water front. Extending from the "water" end of this frame

This form of conveyor, some types of which will handle packages weighing up to 800 lb., is handled by the Brown Portable Conveying Machinery Company, Chicago.

# General News Department

The American Railway Tool Foremen's Association will hold its eleventh annual convention at the Hotel Sherman, Chicago, on August 9, 10 and 11.

The legislature of Indiana has before it a bill to repeal the full train crew law of that state and also one to repeal the full switching law; and the bill has actually been passed by the lower House by considerable majorities.

Senator Cummins, chairman of the Senate committee on interstate commerce, announces that he proposes to introduce at the beginning of the next session of Congress a bill providing for the compulsory consolidation of the railroads into 14 to 18 systems.

Proposals to reduce the pay of unskilled workmen on April 1, noticed in another paragraph, referring to the New York Central, are also being issued by the Central of New Jersey, the Lehigh Valley and other roads; and similar notices will probably be issued within a few days by all of the prominent Eastern roads.

Senator Calder's bill for the regulation of the coal industry was reported to the Senate on February 24 by the committee on manufactures. The committee has been holding hearings on the bill, and has eliminated the provisions for price-fixing and government control and operation during emergencies. The bill provides for greater publicity regarding mine operation and costs of production.

The American Society for Steel Treating will hold its 1921 convention and exhibition at Indianapolis, Ind., on September 19 to 24 inclusive. The exhibition will be in the Manufacturers' Building at the State Fair Grounds which will provide a floor space of 76,800 sq. ft., and the meetings will be held at the Women's Building, which is located a short distance from the exhibition hall, where three or four large rooms will make it possible to hold sectional meetings simultaneously.

The Chicago Safety Council, through its Steam Transportation Committee, has requested all of the railroads to furnish information with respect to accidents to school children while trespassing on railroad premises. It is intended that this information shall be compiled periodically and forwarded to the superintendent of schools who in turn will place the data before all the scholars in bulletin form. In line with its work the committee is urging that school instruction be made a part of the school curriculum.

William G. McAdoo, formerly director general of railroads, declaring the transportation act a failure both in theory and effect, told newspaper men at Washington the other day that the railroads were drifting toward government ownership, which, he added, seemed to be the only apparent solution. The increasing of rates has not solved the railroad problem, Mr. McAdoo said, and the railroads have not been put into the condition desired, "despite the payment of millions of dollars of taxpayers' money to them under the terms of the transportation act." He did not discuss the question of how many of the millions had been paid.

The New York Central has notified its "unskilled" workmen—freightmen, platform, storehouse men, freight handlers, trackmen, track walkers, car laborers, asphaltmen, etc., to send representatives to a conference with officers of the company to be held in New York City on March 8, when revisions of wages will be proposed, to go into effect on April 1. It is understood that about 30,000 employees of the New York Central are affected by this notice. Many of them have no organization, and, apparently, committees will have to be chosen this week. Any properly accredited representative of 100 or more men of any craft, whether connected or not connected with a brotherhood, will have a standing in the

conference. The other roads in the New York Central system have as yet taken no action in this direction. The large majority of unskilled laborers are now receiving about 48.5 cents an hour, which is higher than the prevailing rate in most cities on the lines of the New York Central.

Persons killed in automobile accidents in the United States in 1919, according to statistics gathered by the Census Bureau, numbered about 8,000, and an officer of the Southern Railway calculates that the actual total is considerably larger than the total number of persons killed on the railroads of the country. He says:

"Automobile accidents in the United States claimed 1,474 more victims in 1919 than were killed in accidents on American railways. Deaths from automobile accidents showed a total of 7,969 for the Census Bureau's registration area, comprising about 80 per cent of the country's total population. In 66 of the large cities there were 3,808. In railway accidents the Interstate Commerce Commission reports 6,495 killed (less than for any previous year since 1898). This included 2,553 trespassers and 1,882 other persons, not either passengers or employees, of whom a large percentage were the victims of collisions between automobiles and railway trains." [Adding non-train accidents on railroads the total is 6,978.]

## New Rules for Reporting Operating Statistics

The Interstate Commerce Commission has prescribed revised rules relative to operating statistics intended to continue, with some modifications, the compilation and report by Class 1 carriers, except switching and terminal companies, of the basal operating statistics reportable to the commission in special monthly and annual forms pertaining to the year 1920. The principal changes are, briefly: (1) The requirement of gross ton-miles of locomotives and tenders in connection with certain items; (2) the addition of a statement of the average number of serviceable and of unserviceable locomotives by classes of service; (3) the omission of rating ton-miles and of locomotive-hours; (4) the requirement of direction of movement for freight-train car-miles only; (5) the requirement of monthly and cumulative figures for like items in the same forms without a separate statement of annual figures other than those appearing in the regular annual reports of the carriers.

## Precepts for Minneapolis & St. Louis

### Employees—And the Rest of Us

[From an Official Circular]

Courtesy, consideration and common sense, practiced continuously, will create a "real" personality on "M. & St. L."

Never overlook any opportunity to boost "M. & St. L."

No matter what may be your position on "M. & St. L.," remember this one thing: The patron comes first.

Surround your job; bound it on all sides with Perseverance, Conscientiousness, Faithfulness and Efficiency.

If you feel the job on "M. & St. L." is not big enough for you, make it bigger.

Don't be afraid to ask intelligent questions.

Be willing to assist your fellow-workers.

Whenever a question is asked, take pains to answer it accurately, fully, briefly, promptly and with a pleasant smile.

Do not get angry under any circumstances.

If you are in the wrong, you can't afford to get angry.

If you are in the right, you don't need to get angry.

## Servants of the Public Must Be Respectful

Respect in the railroad business is closely connected with obedience, for disobedience to a superior is disrespect. In the operation of a railroad, there are necessarily officers of various

ranks. Fitness for a position is the first consideration in choosing an officer. When an employee is chosen for an official position he is entitled to the respect that the position demands. When respect is wanting, little, if any, attention is paid to instructions issued. In order to command the respect of subordinates it is essential that officers be competent to fill the positions they occupy. It is not possible for an officer to secure from his employees the respect to which he is entitled, unless he is willing to respect his superior.

Officers are entitled to respect. It is just as easy to say "Yes, sir," as it is to say "Yah." Certainly it is much more respectful. To respect a person or a position, one must have confidence in the person or position. It behoves every officer to conduct himself so that he will command, and be in a position to demand, the respect of his subordinates.—*E. E. Nash, general manager, Minneapolis & St. Louis.*

### On-Time Record of the Illinois Central

The Illinois Central has just issued the seventh article in its series of public statements, featuring the road's record for passenger train punctuality together with additional information on its service and equipment. The circular presents the percentage of trains arriving on time for four months ending with November, 1919, as compared with the percentage figures compiled by the United States Railroad Administration as follows:

All Railways.	Illinois Central System.
August, 1919.....	83 per cent
September, 1919.....	84 per cent
October, 1919.....	84 per cent
November, 1919.....	82 per cent
	95.4 per cent
	96.2 per cent
	95.4 per cent
	96.2 per cent

Reviewing the conditions for 1920 the article says that for the entire system 79,022 passenger trains were operated during that year on its 6,000 miles of line. The low level of on-time arrivals in 1920 was in January and April, when a figure of 93.4 per cent was reached whereas the high level came in October when a percentage of 97.3 per cent was made. The percentage average for all months of 1920 was 95.55.

### Store Door Delivery

Pursuant to a vote of the Federal Highway Council, the desirability of establishing store door delivery of freight in large cities is to be presented to the principal railroads by a committee, of which J. C. Lincoln, traffic manager of the Merchants' Association, New York City, and formerly chief freight traffic officer of the Wabash Railroad, is a member. It is proposed to recommend that the railroads themselves provide the necessary plants and conduct store door delivery and collection, including in the operations all merchandise to or from freight houses, even carload freight; but not including freight loaded or unloaded at team tracks. In New York City large quantities of freight shipped in carloads is handled over the platforms. The committee will recommend that a reasonable charge be made for the service, separate from the regular freight charge, and that rates be published in separate tariffs. Other members of the committee are A. E. Beck, Baltimore Md.; W. J. Pitt, Philadelphia, Pa.; T. T. Harkrader, New York; W. J. L. Banham, New York, and Dr. R. S. MacElwee, director, Bureau of Foreign and Domestic Commerce, Washington, D. C.

### Retrenchment

Further extensive reductions of forces by the Pennsylvania Railroad were reported on February 26, at Altoona, Pittsburgh and other points. The operation of the Pittsburgh Terminal as a separate division is to be discontinued and the old division boundaries will, in general, be restored.

The Delaware, Lackawanna & Western has ordered further reductions in forces at the Scranton shops. The Union Pacific on February 26 ordered further extensive reductions in its shops. On the New York Central, large numbers of men returned to work in the shops at Collinwood, Ohio; Elkhart, Ind., and other points, after forced vacations of one or more weeks.

The Canadian National, following the severe falling off in business throughout large sections of Canada, has taken off some passenger trains in New Brunswick, including trains

No. 31 and No. 32 between Moncton and Levis. In the western part of Ontario considerable numbers of men have been dismissed and two divisions have been consolidated into one.

Two hundred men in the shops of the New York, Ontario & Western at Middletown, N. Y., resumed work on March 1 after a layoff of a month.

### Economy; Trust Men to Practice It

If we are fair with ourselves, we shall admit that we have never done as much as we could do to economize. We have been living in the thought of "getting by." Waste starts in with the little things and gradually grows and grows until it reaches the larger ones. How many officers when sending a telegram, censor it, to be sure that the fewest possible words have been used? It is not uncommon for employees to receive an order to have a certain thing done and then in the same order, instructions how it should be done. Surely, that is not economy. Every man must be credited with possessing the ability to think and use ordinary judgment, and he should not be deprived of his right to exercise it. If the employee is not permitted to think for himself, to think out his problems, to think how the thing should be done most economically, how can we expect him to be broad and independent? A subordinate official should grow and expand so that when his turn comes he may be ready for promotion. Economy means the wise spending of money or time, good stewardship, careful administration. We are just as large as we will permit ourselves to be. Economy comes by using what we have to the best possible advantage. An inventory of "M. & St. L." will show that we have practically as many resources on this railroad as other railroads have. In many instances we have much better.—*E. E. Nash, general manager, Minneapolis & St. Louis.*

### Revenues and Expenses for 1920

The net operating income of the railroads of the United States for the calendar year 1920 was only \$62,264,421, or about one-third of 1 per cent on the valuation used by the Interstate Commerce Commission last summer for the purpose of the rate case, according to the final summary of revenues and expenses for December, and the year 1920, issued by the commission. Total operating revenues for the year were \$6,225,402,762, or \$1,041,000,000 greater than for the year 1919 when the roads earned a net of \$516,290,090. Operating expenses, \$5,826,197,474, were \$1,406,000,000 greater than in 1919 and taxes, which amounted to \$281,380,620, were \$83,000,000 greater. The Eastern roads had a deficit for the year of \$99,384,902, while the other districts showed decreases as compared with 1919. For the month of December the net operating income (for the whole country) was only \$10,225,583, although the total operating revenues were \$97,000,000 greater than for December, 1919. The summary, which covers 188 Class I roads and 15 switching and terminal companies, is given in the table.

#### RAILWAY RECEIPTS AND EXPENSES, DECEMBER AND TWELVE MONTHS ENDING WITH DECEMBER

Item	Calendar Year		December	
	1920	1919	1920	1919
27. Average number of miles operated....	235,580.01	234,428.79	235,881.09	234,571.20
REVENUES:	Dollars	Dollars	Dollars	Dollars
28. Freight .....	4,325,078,866	3,556,918,712	386,057,436	303,704,454
29. Passenger .....	1,288,808,159	1,180,010,766	115,060,511	100,080,515
30. Mail .....	150,404,467	57,456,159	8,876,400	9,716,268
31. Express .....	143,501,613	127,708,607	9,664,053	10,048,057
32. All other transportation .....	163,494,648	126,333,455	18,680,428	11,070,184
33. Incidental .....	148,731,748	130,500,436	11,850,844	11,928,652

(d) Debit item.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

**AIR BRAKE ASSOCIATION.**—F. M. Nellis, Room 3014, 163 Broadway, New York City. Next convention, May 3-6, 1921, Hotel Sherman, Chicago. Exhibit by Air Brake Appliance Association.

**AIR BRAKE APPLIANCE ASSOCIATION.**—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.

**AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Pontius, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

**AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.**—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa.

**AMERICAN ASSOCIATION OF ENGINEERS.**—C. E. Drayer, 29 S. La Salle St., E. I. R. R., 322 South Michigan Ave., Chicago. Next meeting, June, 1921, Quebec, Can.

**AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.**—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

**AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—J. Rohschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 24-26, 1921, Kansas City.

**AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Biffitt, 8 W. 40th St., New York.

**AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.**—C. Borcherdt, 202 North Hamilton Ave., Chicago, Ill. Next convention September 12-14, Hotel Sherman, Chicago.

**AMERICAN RAILWAY ASSOCIATION.**—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.

Division I.—Operating, W. J. Frupp (Chairman), General Manager, New York Central Railroad, Eastern Lines, New York, N. Y.; R. E. McGarty (Vice-Chairman), General Manager, Central Region, Pennsylvania System, Pittsburgh, Pa.

Freight Station Section (including former activities of American Association of Freight Agents), C. E. Fish (Chairman), Freight Agent, Baltimore & Ohio Railroad, Chicago, Ill.; J. G. Gilmore (First Vice-Chairman), Agent, Pennsylvania System, Eastern Region, Philadelphia, Pa.; C. M. Teschemacher (Second Vice-Chairman), General Agent, Chicago & Alton Railroad, Chicago, Ill.; R. O. Wells (Secretary), Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section, D. Z. Duncit (Chairman), Chief Surgeon, Western Maryland Railway, Baltimore, Md.; G. G. Dowdall (First Vice-Chairman), Chief Surgeon, Illinois Central Railroad, Chicago, Ill.; Duncan Eve (Second Vice-Chairman), Chief Surgeon, Nashville, Chattanooga & St. Louis Railway, Nashville, Tenn.

Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association), R. S. Mitchell (Chairman), Chief Special Agent, Missouri Pacific Railroad, St. Louis, Mo.; H. C. Darling (First Vice-Chairman), General Superintendent of Police, Baltimore & Ohio Railroad, Baltimore, Md.; Emmett Gregg (Second Vice-Chairman), Superintendent Special Service, Atchison, Topeka & Santa Fe Railway, Topeka, Kan.; J. C. Madison (Secretary), 5 Church St., New York, N. Y.

Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents), H. Hulatt (Chairman), Manager of Telegraphs, Grand Trunk Railway, Montreal, Ont.; W. H. Hall (First Vice-Chairman), General Superintendent of Telegraph, Missouri, Kansas & Texas Lines, Denison, Texas; R. F. Finley (Second Vice-Chairman), Superintendent Telegraph, New York Central Lines, West of Buffalo, Cleveland, Ohio; W. A. Fairbanks (Secretary), 75 Church St., New York, N. Y.

Division II.—Transportation (including former activities of the Association of Transportation and Car Accounting Officers), E. J. Pearson (Chairman), President, New York, New Haven & Hartford Railroad, New Haven, Conn.; J. J. Bennett (Vice-Chairman), President, New York, New Haven & St. Louis Railroad, Cleveland, Ohio; C. W. Crawford (Chairman, General Committee), 431 South Dearborn St., Chicago, Ill.; G. W. Covert (Secretary), 431 South Dearborn St., Chicago, Ill.

Division III.—Traffic, G. H. Inghalls (Chairman), Vice-President, New York Central Lines, New York, N. Y.; J. Gottschalk (Secretary), 143 Liberty St., New York, N. Y.

Division IV.—Engineering, H. R. Safford (Chairman), Assistant to the President, Chicago & Burlington & Quincy Railroad, Chicago, Ill.; C. J. Kelloway (Vice-Chairman), Superintendent of Signals, Atlantic Coast Line Railroad, Wilmington, N. C.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill. Next annual meeting, March 15-17, 1921, Chicago, Ill.

Construction and Maintenance Section, H. R. Safford (Chairman), Assistant to the President, Chicago, Burlington & Quincy Railroad, Chicago, Ill.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill.

Electrical Section, George Gibbs (Chairman), Chief Engineer of Electric Traction, Lone Island Railroad, New York, N. Y.; E. B. Katte (Vice-Chairman), Chief Engineer, Electric Traction, New York Central Railroad, New York, N. Y.; E. H. Fritch (Secretary), 431 South Dearborn St., Chicago, Ill.

Signal Section (including former activities of the Railway Signal Association), F. W. Pickering (Chairman), Signal Engineer, Union Pacific Railroad, Omaha, Neb.; F. B. Wizeand (First Vice-Chairman), Signal Engineer, New York Central Railroad, Western Lines, Cleveland, Ohio; W. A. Christoffersen (Second Vice-Chairman), Signal Engineer, Northern Pacific Railway, St. Paul, Minn.; H. S. Balliet (Secretary), 75 Church St., New York, N. Y.

Division V.—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association), W. T. Tolbert (Chairman), General Mechanical Superintendent, Chicago, Rock Island & Pacific Railway, Chicago, Ill.; J. Coleman (Vice-Chairman), Assistant to General Superintendent, Motive Power and Car Departments, Grand Trunk Railway, Montreal, Que.; V. R. Hawthorne (Secretary), 431 South Dearborn St., Chicago, Ill. Next convention, June 15-18, 1921, Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.

Equipment Painting Section (including former activities of the Master Car and Locomotive Painters' Association), E. L. Younger (Chairman), Foreman Painter, Missouri Pacific Railroad, Little Rock, Ark.; J. G. Keil (First Vice-Chairman), Foreman Painter, New York Central Railroad, Western Lines, Elkhart, Ind.; J. R. Ayers (Second Vice-Chairman), General Manager, Canadian Pacific Railway, Montreal, Que.; V. R. Hawthorne (Secretary), Foreman Painter, Boston & Maine Railroad, Reading, Mass.

Division VI.—Purchase and Stores (including former activities of the Railway Storekeepers' Association), H. C. Pearce (Chairman), General Purchasing Agent, Seaboard Air Line Railway, Norfolk, Va.; H. E. Ray (Vice-Chairman), General Storekeeper, Atchison, Topeka & Santa Fe Railway, Topeka, Kans.; I. P. Murphy (Secretary), General Storekeeper, New York Central Railroad, Western Lines, Collinwood, Ohio; W. J. Farrell (Assistant Secretary), 75 Church St., New York, N. Y. Second annual meeting June 20-22, 1921, Atlantic City.

Division VII.—Freight Claims (including former activities of the Freight Claim Association), H. C. Fribble (Chairman), General Claim Agent, Atchison, Topeka & Santa Fe Railway System, Topeka, Kans.; H. C. Howe (First Vice-Chairman), Freight Claim Agent, Chicago & North Western Railway, Chicago, Ill.; D. C. MacDonald (Second Vice-Chairman), Assistant General Claim Agent, Canadian Pacific Railway, Winnipeg, Man.; Lewis Pilcher (Secretary), 431 South Dearborn St., Chicago, Ill. Next meeting Coronado Beach, San Diego, Calif., May 17, 1921.

**AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.**—C. A. Lichtig, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 18-20, 1921, New York City. Exhibit by Bridge and Building Supply Men's Association.

**AMERICAN RAILWAY ENGINEERING ASSOCIATION.**—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Next annual meeting, March 15-17, 1921, Congress Hotel, Chicago. Exhibit by National Railway Appliances Association.

**AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.**—(See American Railway Association, Division 5.)

**AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

**AMERICAN SHORT LINE RAILROAD ASSOCIATION.**—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.

**AMERICAN SOCIETY FOR TESTING MATERIALS.**—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

**AMERICAN SOCIETY OF CIVIL ENGINEERS.**—Col. H. S. Crocker (acting secretary), Engineers' Society Building, 33 W. 39th St., New York City. Next convention, April 27, 1921, Houston, Texas. Regular meetings 1st and 3d Wednesday in month, except July and August, 33 W. 39th St., New York.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—Calvin W. Rice, 29 W. 39th St., New York. Next meeting, May 23-26, Congress Hotel, Chicago.

**AMERICAN STEEL TREATERS' SOCIETY.**—W. H. Eiseman, 154 East Erie St., Chicago.

**AMERICAN TRAIN DISPATCHERS' ASSOCIATION.**—C. L. Darling, Northern Pacific Ry., Spokane, Wash. Next convention, June 20, 1921, Kansas City, Mo.

**AMERICAN WOOD PRESERVERS' ASSOCIATION.**—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis.

**ASSOCIATION OF RAILWAY CLAIM AGENTS.**—Willis H. Palling, C. R. R. of N. J., Jersey City, N. J. Next meeting, June 15-17, 1921, St. Louis, Mo.

**ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.**—Jos. A. Andreuccetti, C. & N. W. Ry., Room 411, C. & N. W. Sta., Chicago. Exhibit by Railway & Electrical Supply Manufacturers' Association.

**ASSOCIATION OF RAILWAY EXECUTIVES.**—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

**ASSOCIATION OF RAILWAY SUPPLY MEN.**—C. L. Mellor, 212 W. Illinois St., Chicago. Meeting with International Railway General Foremen's Association.

**ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.**—(See American Railway Association, Division 1.)

**ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.**—(See American Railway Association, Division 2.)

**BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.**—A. J. Filkins, Paul Dickinson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.

**CANADIAN RAILWAY CLUB.**—W. A. Booth, 131 Charron St., Montreal, Que. Next meeting, December 14.

**CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

**CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.**—Thomas B. Koeneke, Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

**CENTRAL RAILWAY CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.**—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill. Next meeting March 3-4, 1921, Hotel Sherman, Chicago.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

**CINCINNATI RAILWAY CLUB.**—H. Boutet, 101 Carew Bldg., Cincinnati, Ohio.

**EASTERN RAILROAD ASSOCIATION.**—E. N. Bessling, 614 F St., N. W., Washington, D. C.

**FREIGHT CLAIM ASSOCIATION.**—(See American Railway Association, Division 7.)

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Next convention, August 16-18, 1921, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May 24-26, 1921, Hotel Sherman, Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1061 W. Wabasha St., St. Paul, Minn. Next convention, September 12-15, Hotel Sherman, Chicago. Exhibit by Association of Railway Supply Men.

**MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.**—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, October 4-6, 1921, Buffalo, N. Y.

**MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York. Next convention, May 23-26, 1921, Planters' Hotel, St. Louis, Mo.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—(See American Railway Association, Division 5, Equipment Painting Section.)

**MASTER CAR BUILDERS' ASSOCIATION.**—(See American Railway Association, Division 5.)

**NATIONAL ASSOCIATION OF RAILROAD TIE PRODUCERS.**—E. E. Pershall, T. J. Moss Tie Company, 720 Security Bldg., St. Louis, Mo.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Harbor Square, New York.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago. Meeting with American Railway Engineering Association.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in month, except June, July and August, 29 W. 39th St., New York.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting, 2d Thursday in month, alternately in San Francisco and Oakland.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Building, Washington, D. C. Next annual meeting, June 8, 1921, Hotel Traymore, Atlantic City, N. J.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Naxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, American Club House, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—D. C. Welty, Missouri Pacific R. R., Little Rock, Ark.

**RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Meeting with Traveling Engineers' Association.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

**RAILWAY REAL ESTATE ASSOCIATION.**—R. H. Morrison, C. & O. Ry., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION.**—(See American Railway Association, Division 4, Signal Section.)

**RAILWAY STOREKEEPERS' ASSOCIATION.**—(See American Railway Association, Division 6.)

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with American Railway Association, Division 5.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. & N. Y. R., Burlington, Ill. Next annual convention, September 20-22, 1921, Chicago. Exhibit by Track Supply Association.

**ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, Schroeder Headlight & Gearing Co., New York City. Meeting with American Railway Association, Signal Section.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' As-

## Traffic News

At Vera Cruz, Mexico, the amount of freight lying on the docks awaiting transportation inland is said to amount to 40,000 tons. Locomotives, as well as cars, are lacking.

The Railway Commissioners of Canada have authorized a general increase in the freight rates on liquor, from first-class to double first-class; in carloads it is to be advanced to third-class.

The Indiana Coal Traffic Bureau, the Knox County Coal Operators' Association and the Southern Indiana Coal Bureau, said to represent 85 per cent of the coal tonnage mined in Indiana, have asked the Interstate Commerce Commission to withdraw its service order No. 18 regulating the assignment of cars for railroad fuel loading.

The house committee on interstate commerce has favorably reported a bill introduced by Representative Coady of Maryland, to extend the guaranty provisions of Section 209 of the transportation act for the six months following the period of federal control of the railroads to the Merchants' & Miners' Transportation Company. A similar bill has been introduced in the Senate by Senator Smith.

At Bridgeburg, Ont., which is just across the river from Buffalo, N. Y., the receipts at one ticket office recently increased rapidly from about \$2,500 a month to \$10,000 a month, this in consequence of large numbers of purchases by persons coming to Bridgeburg from Buffalo to begin their trip to some point in the United States, advantage being taken of the difference in the value of Canadian and American money. A rule has now been adopted under which these passengers, as soon as they come into the United States, are called upon by the conductor of the train for a payment sufficient to cover the difference in exchange and the full United States war tax.

## Coal Production

A sharp decline again marked the production of soft coal during the week ended February 19 and for the first time since the market broke last December the output fell below even the level of 1919, according to the weekly bulletin of the Geological Survey. The total production is estimated from reports of railroad shipments at 7,472,000 net tons, or 5 per cent less than that for the preceding week. In the corresponding week of 1919 the output was 7,722,000 tons. The present rate of production is below the lowest point reached in 1920 during the railway switchmen's strike. With car and labor supply at present ample, the bulletin says, the factor limiting production is absence of demand.

## New England Roads Ask Higher Mail Rates

The New England railroads have petitioned the Interstate Commerce Commission for a further increase in the rates for the transportation of the mails, on the ground that the rates prescribed by the Interstate Commerce Commission in its decision of December, 1919, are inadequate. During the original hearings before the commission on the subject of railway mail pay, the New England roads asked for rates 33 1/3 per cent higher than those accorded to the railroads generally, on the ground of their higher operating expenses and the character of their service. The petition states that the rates of pay now in effect are not in conformity with the provisions of the law of July 28, 1916, under which the commission fixed the rates, in that they do not yield and since September 1, 1920, have not yielded them fair, reasonable or adequate compensation for the service performed. The commission is asked to re-examine the facts and circumstances surrounding the transportation of mail on the New England lines and the service performed by them, with special reference to the period since September 1, 1920.

## Stock of Southeastern Express Company

### Taken by Business Men

Fairfax Harrison, president of the Southern Railway, announced on February 18 that the books for subscription to the million dollars of capital stock offered to the people of the south by the Southeastern Express Company were opened the previous morning and were closed at night. The stock was allotted proportionately to all the 14 states and the District of Columbia served by the lines of the Southern and the Mobile & Ohio. The reports received show oversubscription in every state, at least 2,500 widely distributed southern business men having taken shares. No single subscription in excess of 100 shares was received and no officer or employee of the railroads was permitted to participate.

"This result," said Mr. Harrison, "fully justifies our confidence that the people of the south desire competition in express service."

## Transcontinental Freight by Water

Freight between places south of the Atlantic Coast and ports on the Pacific is now moving by way of the Panama Canal in an estimated volume of 250,000 tons a month. Rates by water are, on many commodities, about 25 per cent lower than by the transcontinental railroads. Since last August, when the Interstate Commerce Commission authorized a horizontal advance in the freight rates, the rail movement, especially of export freight, has been at a standstill. The coastwise steamship companies have increased the number of sailings until there is a departure of a freighter in the coastwise trade every day both eastbound and westbound. Eleven lines are operating from the Atlantic to the Pacific. With the marked depression in ocean freight rates, American ship-owners, unable to make profits on the transoceanic voyages, have placed their steamers in the coastwise trade. The Luckenbach Steamship Lines have made the voyage from the Atlantic to the Pacific in eighteen days, while the slower ships, owned by the Shipping Board and by some of the other companies, average from 24 to 26 days. Merchants say that the steamship companies have taken away from the railroads the east-bound movement of lumber from the Pacific Coast. In order to meet this competition the rail lines have announced reductions of seven cents per hundred pounds.

## New England Roads Appeal to Governors

The presidents of the Boston & Maine, the New York, New Haven & Hartford, the Maine Central and the Bangor & Aroostook have asked the Governors of the six New England States to use their influence to aid the railroads in securing without delay authority to make a general advance of ten per cent in rates, both freight and passenger. At a conference in Boston on February 27, at which all of the Governors were present, the railroad representatives declared that the increase was made necessary because the roads were operating under a deficit of more than \$27,000,000 a year and were failing by about \$50,000,000 to earn 6 per cent annually on the conservative estimate of their values.

"In order that adequate and satisfactory transportation service may be assured to New England," a memorandum presented to the Governors said, "it is essential not only that the immediate solvency of these roads should be assured but also that their credit should be re-established \* \* \*"

The Governors decided to appoint citizens' committees of five in each State to examine into the condition of the roads. Governor Cox, of Massachusetts, announced that the committees which would be named without delay, would convene in Boston probably "within the next ten days."

The railroads proposed to make the increase effective until February 28, 1922. It would not apply to coal and coke, switching charges, or export and import traffic in cases where the latter meets competition from other ports.

The executives told the Governors that although the proposed increases had been figured to provide \$23,000,000 additional revenue this year, a decrease in the volume of traffic would cut that figure to about \$18,000,000. Trunk lines might be generally relied upon to come to the aid of New England roads with payments aggregating \$15,000,000 a year, subject to the approval of the Interstate Commerce Commission.

## Commission and Court News

### Interstate Commerce Commission

The Commission has suspended until June 29 the operation of proposed changes in rates on rough and sawed stone from Bedford and certain other Indiana points to Dexter and Poplar Bluff, Mo.

The Interstate Commerce Commission has suspended from March 3 until July 1 the operation of a uniform increase of 20 cents per net ton in the rates on coal, carloads, from points on the Cumberland Railroad to points in Florida.

The Commission has suspended until June 25 the operation of schedules which provide increased commodity rates on iron or steel bolts, in less than carload quantities, from Kansas City, Mo., to Galveston and Beaumont, Tex., and points taking same rates.

The Commission has suspended until June 28 certain tariffs providing rates to, from and between points south of the Ohio river, including Mississippi Valley, purported to be established in conformity with orders of the commission in the Memphis Southwestern Case.

The Commission has suspended until June 29 the operation of items in W. J. Kelly's tariff which provide increased carload rates on green salted hides from Chicago, Milwaukee and certain other western points to Old Fort and Morgantown, N. C. Johnson City, Tenn., and other points.

The Commission has suspended, until June 25, the operation of proposed increased rates on petroleum and its products from points in Arkansas and Louisiana to Memphis, Tenn., purported to be established in conformity with order of the Commission in the Natchez Case, Docket 8845, 58 I. C. 610.

The Commission has suspended until June 29 proposed increases in the charges (50 and 75 cents a car) for loading and unloading live stock at the stock yards, in Sioux City, Iowa, Omaha, East St. Louis, and at other points, to \$1 and a proposed provision for the absorption of these increased charges by the carriers.

The Commission has suspended until June 29 the operation of certain schedules providing rates to, from and between points south of the Ohio river, including Mississippi Valley, purported to be established in conformity with orders of the Commission in the Memphis Southwestern case and the Murfreesboro case.

The Commission has suspended until June 29 the operation of items in a Kansas City Southern tariff which propose the cancellation by the Texarkana & Ft. Smith of the rule providing for the switching of carload shipments of lumber and timber to and from the tracks of the Texas & New Orleans, at Port Arthur, Tex.

The Commission has suspended until June 29, schedules published in a Union Stock Yard & Transit Company of Chicago tariff which propose to increase the existing charge of 75 cents for loading and 50 cents a car for unloading live stock at the Union Stock Yards, Chicago, to one dollar a car, and to provide for the absorption of such charges by the principal roads bringing live stock to the city.

The Commission has suspended until July 23 the operation of all schedules published in a supplement to a Minneapolis, St. Paul & Sault Ste. Marie tariff which name increased switching charges and proposed restrictions in the absorption on carload freight switched between industries on the line of the Minneapolis & St. Louis and the Railway Transfer Company of the City of Minneapolis and points of interchange with the Minneapolis, St. Paul & Sault Ste. Marie.

The Commission, on the petition of the Tennessee railroads, has ordered an investigation of the situation created by the re-

fusal of the Railroad and Public Utilities Commission of Tennessee to permit the carriers to increase their intrastate rates on common brick, sewer pipe, concrete and stone and gravel when for use in the construction of public highways and consigned to government authorities, to correspond with the increase permitted by the Commission for intrastate traffic.

## State Commissions

The Railroad Commission of the State of Louisiana has taken up with the Interstate Commerce Commission the matter of the charge by the railroads of 50 to 75 cents on each passenger crossing the Mississippi River on railroad transfer boats.

The Northwestern Pacific has applied to the Railroad Commission of California for authority to lease a branch line in Mendocino County, Cal., known as the Albion branch, to the Albion Lumber Company. The lumber company agrees to operate this branch and to render the same service as that now given by the Northwestern Pacific.

The Public Service Commission of Missouri has acted upon the application of the carriers in the state for authority to make increases in freight and passenger rates similar to those prescribed by the Interstate Commerce Commission, by ordering that the temporary increases authorized in August, 1920, shall be effective for a period of 12 months from September 1, 1920. The order provides that at the expiration of this twelve-month period, the basis of the rates shall be restored to that in effect on February 29, 1920, unless extended or changed by the commission.

## State Rates Advanced

The Interstate Commerce Commission has rendered its decision in the Indiana, Nebraska and South Carolina intrastate rate cases ordering advances in the intrastate rates to correspond to those allowed by the interstate commission in the general rate advance case.

## Overcharge Claims

The Interstate Commerce Commission announces that on February 17 the Railroad Administration notified the railroads that claims against the director-general for overcharges in connection with freight, passenger, demurrage, storage, etc., should be no longer accepted. Claimants must file such claims with the Interstate Commerce Commission.

The circular says: "A statement of unsettled overcharge claims on hand shall be prepared and filed with the Interstate Commerce Commission on or before February 28, 1921. Such statements shall be entitled 'Claims against Director General, as Agent, for alleged violation of Section 6.' . . . Such claims shall be handled to conclusion in accordance with established practice. Statements shall be rendered to the Interstate Commerce Commission monthly showing disposition of each claim settled or rejected during the month."

The commission says that these instructions were issued after conference with the commission, and that it will co-operate in the effort to make the plan inexpensive and expeditious.

## Court News

In an action under the federal Employers' Liability Act to recover for the death of a repair man in the signal department who, while engaged in oiling a switch, was run over by an engine running backwards, the Pennsylvania Supreme Court holds that the failure of the engineman to give the customary warning was unusual and unexpected, not to be ordinarily foreseen, and the risk of which was not assumed by the employee.—*Dutrey v. P. & R. (Pa.)*, 108 Atl. 620.

The Pennsylvania Supreme Court holds that an asphalt used as a mere yard convenience for the purpose of cleaning and overhauling engines after completing their day's run and putting them in condition for subsequent use for either state or interstate traffic is not an instrumentality of interstate commerce.—*Reynolds v. P. & R. (Pa.)*, 109 Atl. 660; certiorari denied, 252 U. S. 507.

# Foreign Railway News

## Spanish Northern Will Electrify

The Spanish Northern is asking for bids, through the Spanish government, for materials to electrify a portion of its line, according to cable advices from Commercial Attache Cunningham at Madrid. Bids will be opened also on April 22 covering the construction of a steam railway from Soria to Castejon. It is also said that the government will soon be in the market for more cars and locomotives.

## Chinese Railway Manager Visits America

Dr. Yen Te-Ching, managing director of the Canton-Hankow Railway, arrived in San Francisco February 8. It is understood that he intends to make an investigation of railway and lake transportation in this country and that he will avail himself of all opportunities afforded to visit plants where quantity production is demonstrated.

## France Borrowing Money for Equipment

New York investment houses are offering to the public 6 per cent bonds to the value of 50,000,000 francs of the Paris-Orleans Railway. These bonds are guaranteed by the French government and will net about \$65.50 per 1,000 franc bond, at the prevailing rate of exchange and at the prevailing price of 92. The proceeds of this loan, it is understood, will be expended in this country for locomotives and cars.

## Work Started on New Mexican Line

The Mexican government has begun the construction of a line to extend from Durango, capital of the state of that name, to Mazatlan on the Pacific coast. Work has commenced on the Mazatlan end of the line. The proposed railway has been laid off in sections of 10 kilometers each. The construction offices are located at Mazatlan. Work will soon begin at Durango, also, it is said. It is estimated that from two to three years will be required to complete the work.

## English Firm Secures Contract for

### Repairing Russian Locomotives

LONDON.

Sir W. G. Armstrong, Whitworth & Co., Ltd., has signed a provisional contract for the repair of locomotives in Russia. It is estimated that 50 per cent of the locomotives owned by the Russian railways are in need of repairs and that the contract will amount to many thousands of engines. The work is to be done at the company's Scotswood Works and arrangements are being made to bring 20 locomotives a month to the works for some years.

## Chinese Eastern Asks Bids for Tie Treating Plant

The Chinese Eastern is asking for bids from this country for the construction of a "sleepers impregnation works" (tie treating plant). The proposed plant is to be, insofar as is possible, on wheels so that it may be moved from place to place with little difficulty. Any company bidding on the plant will be expected to offer also bids for its operation during the first year. The bids are open until June 1. Plans and specifications may be obtained from Engineer Alexandroff, Chief of Maintenance of Way and Works, Chinese Eastern Railway, Harbin, Manchuria.

## Committee Reports on English Railway Agreements

LONDON.

The Colwyn Committee, made up of members of Parliament, which was to investigate and report on the various agreements made by the government with the railways dur-

ing the period of government control, has made an extended report in which it is estimated that the total claims of the railways covering arrears of maintenance, abnormal wear and tear and replacement of stores will amount to £150,000,000 (approximately \$600,000,000 at the current rate of exchange). The Committee has indicated that these claims are more than what the railways should receive. The committee feels that the existing agreements should not be given their legal interpretation but should be considered in the light of the circumstances under which they were made and that the spirit of the agreements should govern their interpretation. It is claimed by the committee that some of the railways have already received more than they rightly should for deferred maintenance.

### Railway Supply Exports in 1920

The exports of steam locomotives and passenger cars in 1920 were greater than in any previous year. The totals for the exports of all other railway materials, however, fell considerably below similar totals for 1919. The detailed figures, as reported by the Bureau of Foreign and Domestic Commerce, follow:

	1920	1919	
Railroad spikes.....	37,185,246 lb.	\$1,607,672	55,487,231 lb. \$2,896,073
Steel rails.....	594,634 tons	36,066,505	652,443 tons 38,986,855
Switches, frogs, etc.....	.....	7,569,420	..... 9,280,725
Steam locomotives.....	1,711	53,629,847	..... 30,275,728
Passenger cars.....	123	1,171,674	104 1,606,540
Freight cars.....	21,676	37,192,502	27,317 57,473,824
Car wheels and axles.....	.....	9,061,305	..... 11,843,738

### Locomotives to Be Built in Poland

LONDON.

It is stated by the Warsaw correspondent of the London Times that with the object of encouraging home industries the Polish government has recently signed contracts with a number of manufacturers in Poland for the delivery of large quantities of rolling stock for the Polish railways within the next 10 years. The firms chiefly concerned are the Polish Locomotive Works, Sosnowice, which has received an order for 1,100 locomotives; Lilpop, Rau & Lowenstein, Warsaw, which has received an order for 1,000 locomotives, 20,000 freight cars and 3,000 passenger cars; and the Ostrow Wagon Works, which has received an order for 18,000 freight cars and 2,800 passenger cars. None of these firms are in a position to carry out these orders with their present plants. The Polish Locomotive Works does not at present build complete locomotives, although it manufactures locomotive boilers. Neither has the Lilpop, Rau & Lowenstein plant built locomotives previously. The Ostrow Works is an entirely new enterprise and its factory is still in course of construction. Obviously these firms will need foreign capital and machinery to enable them to complete their orders.

### Locomotive Exports in December

The figures for the exports of steam locomotives in December show a total of 154 valued at \$4,746,907. This is the largest figure in point of number since September and in point of value since August. The largest exports in December to any one country were for Cuba. These shipments totaled 52 and were valued at \$1,593,023. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Canada.....	8	121,046
Honduras.....	1	3,325
Salvador.....	3	61,550
Mexico.....	4	33,000
Jamaica.....	1	14,350
Cuba.....	52	1,642,100
Argentina.....	7	297,500
Brazil.....	46	1,593,023
Chile.....	1	10,000
Colombia.....	1	2,000
China.....	6	383,024
Dutch East Indies.....	4	19,000
Japan.....	5	33,500
New Zealand.....	1	11,000
Philippine Islands.....	2	14,900
Egypt.....	12	507,329
Total.....	154	4,746,907

## Equipment and Supplies

### Locomotives

THE PEKING-SUIYUAN is inquiring through the locomotive builders for 26 locomotives.

THE ATCHISON, TOPEKA & SANTA FE is inquiring for 10 Pacific, 15 Mikado, 15 Mountain and 10 Santa Fe type locomotives.

THE COLOMBIAN NORTHERN (South America) reported in the *Railway Age* of January 28, as inquiring for some 2-8-2 type locomotives, has ordered one locomotive from the American Locomotive Company.

### Freight Cars

THE AMERICAN SMELTING & REFINING COMPANY, New York, is inquiring for 15 ore cars of 60 tons capacity.

THE HONOLULU IRON WORKS COMPANY, Woolworth building, New York, is inquiring for 30 cane cars of 30 metric tons capacity, for export.

THE UNITED FRUIT COMPANY, New York, reported in the *Railway Age* of January 7, as inquiring for 40 box and 40 flat cars, has ordered 50 box and 40 flat cars, of 20 tons capacity, from the Gregg Company, for use on its division at Banos, Cuba.

### Passenger Cars

THE CARNEGIE STEEL COMPANY is inquiring for one all-steel pay-car.

THE UNION PACIFIC, reported in the *Railway Age* of December 24, as inquiring for 14 dining cars, has ordered this equipment from the Pullman Company.

### Iron and Steel

THE INDIANAPOLIS TERMINAL has ordered 500 tons of rails from the Illinois Steel Company.

THE HONOLULU IRON WORKS COMPANY, Woolworth building, New York, is inquiring for 300 tons of light rails and accessories, for export to Honolulu.

THE DELAWARE, LACKAWANNA & WESTERN is advertising for bids to be received until noon March 9, on serial contract No. 13, for fabricated steel plate work for the following: Washington, N. J., bridge, 170 tons; Cortland, N. Y., grade elimination, 64 tons; Coventry, N. Y., bridge, 56 tons; Sherburn, N. Y., bridge, 101 tons; Buffalo, N. Y., bridge at Delavan avenue, 1,155 tons.

### Track Specialties

THE INDIANAPOLIS TERMINAL has ordered 100 per cent rail joints from the Rail Joint Company for 500 tons of rails ordered from the Illinois Steel Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 100 per cent rail joint equipment from the Rail Joint Company for 100,000 tons of rails purchased for installation in 1921.

THE BOSTON & MAINE will receive bids until noon March 14 on Inquiry No. 3,578; 600 gcs 7/8 by 4 3/4 track bolts, for delivery at Salem, Mass., and 550 kegs 1 in. by 5/4 track bolts, delivered, Fitchburg, Mass.

THE BOSTON & MAINE will receive bids until noon March 14 on Inquiry No. 3,579; 15,360 joints for 100 lb. rail, for delivery at Fitchburg, Mass., and 28,000 joints for 85 lb. rail, for delivery at Salem, Mass.

THE BOSTON & MAINE will receive bids until noon March 14 on Inquiry No. 3,551; 320,000 tie plates for 100 lb. rail, for delivery at Fitchburg, Mass., and 325,000 tie plates for 85 lb. rail, 47,000 for 75 lb. rail, and 8,000 for 72 lb. rail, for delivery at Salem, Mass.

## Supply Trade News

**W. J. Rochl**, formerly assistant purchasing agent on the Missouri Pacific, has been appointed sales representative on the St. Louis, Mo., district for **A. M. Castle & Co.**

The **Independent Pneumatic Tool Company**, Chicago, on February 26, removed its Pittsburgh, Pa., office from 1208 Farmers Bank building, to 718 Bessemer building, corner of Fort and Duquesne Way.

**Marcel Garsaud** has been appointed New Orleans sales agent of the Whiting Corporation, Harvey, Ill., succeeding **J. S. Barelli**. Mr. Garsaud's office is in the Whitney Central Bank building, New Orleans, La.

**Dwight P. Robinson & Company, Inc.**, engineers and contractors, New York, recently opened branch offices in the Dominion Express building, Montreal, Que. **Alexander C. Barker**, vice-president, is in charge of the office.

**Robert C. Weller** has been appointed general sales manager of the **Lakewood Engineering Company**, Cleveland, Ohio, and **Carlton R. Dodge** has been appointed western sales manager, with headquarters at 1215 Lumber Exchange building, Chicago.

The **O'Malley-Bear Valve Company** of Chicago has been appointed exclusive agent for the **Chapman Valve Manufacturing Company** of Indian Orchard, Mass., and will have charge of the sale of the Chapman lines of valves in the railway field in the United States.

**William C. Wilson**, formerly connected with the Taylor-Wharton Iron & Steel Company and William Wharton, Jr., Company, in the capacity of manager of sales, northeastern territory, has become associated with the **Pittsburgh Screw & Bolt Company**, Pittsburgh, Pa. He will be located at its New York Office, 50 East Forty-second street.

**Roy G. Owens**, vice-president and general manager of sales of the **Lakewood Engineering Company**, Cleveland, Ohio, is now giving his entire time to the executive department and **Robert C. Weller**, assistant general manager of sales at Cleveland, has been promoted to general manager of sales, succeeding Mr. Owen, effective February 25. **Carlton R. Dodge**, manager of field sales at Cleveland, has been appointed Western sales manager with headquarters in the Lumber Exchange building at Chicago, effective March 1.

The **Liberty Car & Equipment Company** and the **Illinois Car & Manufacturing Company**, both of Hammond, Ind., have been consolidated and will now conduct their joint business under the name of the **Illinois Car & Manufacturing Company**, with general offices at Hammond, Ind., the officers of the consolidated company are: **P. H. Joyce**, president; **J. W. O'Leary**, vice-president; **J. F. Farrell**, vice-president; **J. E. Fitzgerald**, treasurer, and **O. R. Shearman**, secretary. The plant at Chicago Heights will be known as the Liberty plant and the one at Hammond as the Hammond plant.

After March 1, the **Richmond, Va.**, office of the **Vapor Car Heating Company, Inc.**, will be discontinued and all future business from the Southeastern territory will be handled from the offices of the company in Washington, D. C. The Washington office is in charge of **Harry F. Lowman**, who will be assisted by **L. B. Rhodes, Jr.**, previously connected with the sales department of the **U. S. Light & Signal Corp.** Mr. Rhodes, Jr., has been assigned to the Southeastern territory formerly handled by his father, **L. B. Rhodes**, whose death was noted in the *Railway Age* of February 4 (page 348).

The **Millholland Sales & Engineering Company** has been organized at Indianapolis, Ind., by **W. K. Millholland**, formerly president and general manager of **W. K. Millholland Machine Company**, Indianapolis, and **Ernest Millholland**, formerly works manager of that company, to handle machine

tools. **W. K. Millholland** was educated in mechanical engineering at **Lewis Institute**, Chicago, and entered business with the **International Machine Tool Company** at Indianapolis as a draftsman. After two years' service with this company he went with the **Warner and Swasey Company** at Cleveland, Ohio, as a designer, and after serving this company for four years, was appointed sales engineer for several large machine tool companies. Not long thereafter he took over the management of the **W. K. Millholland Machine Company**, which company he had been with for six years. **Ernest Millholland** was educated in mechanical engineering at **Lewis Institute**, Chicago, and then attended the **University of Illinois** for two years. On leaving college he entered the service of the **W. K. Millholland Machine Company**, where he has served as works manager for the past ten years.

**E. E. Hudson**, vice-president and general manager of the **Waterbury Battery Company**, Waterbury, Conn., has been elected president of the company to succeed **Charles B. Schoenmel**, deceased,

and **Francis T. Reeves** has been elected treasurer. Mr. Hudson for the past 22 years, with the exception of a little over a year's time, has been in the sales and managerial departments of concerns manufacturing primary batteries and has been identified with the installation of the primary battery. In July, 1898, he served as chief clerk in the primary battery sales department of the **Edison Manufacturing Company**, remaining in that position until June, 1902. Shortly afterward, he served as an accountant in the controller's department of the **United States Steel Company**. In December, 1903, he became secretary and treasurer of the **Battery Supplies Company**, Newark, N. J., and in 1905 was appointed sales manager of that company. When the **Edison** company absorbed the **Battery Supplies Company**, in 1908, he was appointed assistant manager of sales in the primary battery department. He became sales manager of that department in February, 1909, and in September, 1913, was elected also vice-president. In October, 1914, in addition to these duties, he was given charge of the manufacturing, as well as the sales, and in March, 1915, was made division manager in general charge of the entire primary battery business of **Thomas A. Edison, Inc.** In 1914, he was chairman of the **Railway Telephone & Telegraph Appliance Association** and in 1916, he was chairman of the **Signal Appliance Association**, previously having been a director. He also served for seven years as a director of the **National Appliance Association**, which is to the **American Railway Engineering Association** what the **Signal Appliance Association** is to the **Railway Signal Association**. On January 1, 1917, he was elected vice-president and general manager of the **Waterbury Battery Company** and now becomes president of the same company.

E. E. Hudson

### Railway Steel-Spring Company

The annual report of the **Railway Steel-Spring Company** for the year ended December 31, 1920, contains a consolidated income account which includes the **Canadian Steel-Tire & Wheel Company, Ltd.** This shows the net earnings for the year to be \$4,435,350. After deducting a reserve of \$1,000,000 for taxes and \$2,025,000 for dividends (7 per cent on the preferred stock and 8 per cent on the common), there was left a surplus of \$1,410,350 for the year.

President **F. F. Fitzpatrick** speaking to the stockholders in the report says: "The results of the Canadian subsidiary were

entirely satisfactory and fully justified the establishment of the plant at Montreal.

"The financial condition of your company continues to show improvement and it is expected that the results for the year 1921 will be satisfactory. The fore part of the year will, no doubt, be a period of readjustment and stabilization, while the last half of the year will probably show an improvement in the general business conditions."

### Locomotive Superheater Company

The election of three new vice-presidents is announced by the Locomotive Superheater Company, New York. Gilbert E. Ryder, in charge of the service department, has been elected vice-president in charge of sales, with office at New York; Henry B. Oatley, chief engineer, has been elected vice-president in charge of engineering, with office at New York, and Charles H. True, works manager, has been elected vice-president in charge of production, with office at East Chicago, Ind.

Gilbert E. Ryder, vice-president in charge of sales, was born at Minneapolis, Minn., in 1880, and studied engineering at the University of Wisconsin, and also at the University of Illinois. His railroad experience began with an apprenticeship on the Chicago, Milwaukee & St. Paul, and included service as a journeyman in the mechanical department of that road at Dubuque, Ia.; Ottumwa, Ia., and West Milwaukee, covering five years. His engineering experience followed in the fuel testing bureau of the Technologic Branch of the United States Geological Survey. He later served the city of Chicago as deputy smoke inspector in charge of locomotives, which placed him again in

superheating and has been an active factor in its development. He is, in a large measure, responsible for putting superheater design upon a practical operating and manufacturing basis in locomotive, marine and stationary practice, and, without sacrifice of efficiency, has developed uniformity of sizes and design.

Charles H. True, vice-president in charge of production, was born in Boston, Mass., and was educated at the public schools of Schuyler, Neb., and the University of Nebraska, graduating in 1898 with the degree of electrical engineer. Immediately upon graduation he entered the service of the Union Pacific at Omaha, and served in both the locomotive and car shops. In 1902 he became roundhouse foreman at Grand Island, Neb., and in 1903 resigned from the Union Pacific to take a similar position at Trenton, Mo., with the Chicago, Rock Island & Pacific. In October of the same year he was transferred to the Silvis shops as assistant superintendent of shops. In 1905 he was appointed mechanical engineer with the Railway Materials Company, at Chicago, and was engaged in the design of metallurgical furnaces for blacksmith shops and boiler shops. In 1910 he refitted and took charge of the Phoenixville, Pa., plant of this company. Two years later he resigned his position with the Railway Materials Company to become works manager of the Locomotive Superheater Company at East Chicago, which position he held until his election as vice-president, as above noted.

### Pressed Steel Car Company

The earnings from operations of the Pressed Steel Car Company for the year ended December 31, 1920, were \$3,060,985. Dividends on stocks and money from other sources

G. E. Ryder

H. B. Oatley

C. H. True

contact with the locomotive fuel conservation problem. This was followed by editorship of the Railway Review at Chicago, after which he entered the service of the Locomotive Superheater Company ten years ago. He became a member of the service department and later took charge of that department. He also developed and had charge of the publicity department. Mr. Ryder takes responsibility of the sales of the company (railroad, stationary and marine), with an unusual preparation in wide and very valuable engineering and practical experience.

Henry B. Oatley, vice-president in charge of engineering, was born at Rochester, N. Y., and attended the public schools at that place. He received his engineering education at the University of Rochester and the University of Vermont, graduating from the latter in 1900 with the degree of mechanical engineer. He then entered the service of the Schenectady Locomotive Works, his experience while on this work embracing locomotive design and shop testing. He was associated with F. W. Cole in the early development of the superheater for locomotives by that company. In 1910, upon the formation of the Locomotive Superheater Company, he was appointed mechanical engineer, and in 1916 he was appointed chief engineer for the company, which position he held at the time of his election, as above noted. In April, 1917, he was granted a leave of absence and served as an officer in the U. S. Navy on the battleships Ohio and Indiana. He entered service with the 1st N. Y. Naval Militia, which was the first body of armed troops to move after the declaration of war with Germany. Mr. Oatley is a recognized authority on

brought the gross earnings for the year up to \$3,194,278. From this there was deducted \$662,472 for depreciation, obsolescence, etc., leaving a net of \$2,531,805. Dividends amounting to \$1,875,000 were paid during the year. The working capital—surplus and undivided profits—on December 31, 1920, was \$15,120,993.

The annual report signed by President F. N. Hoffstot says: "The year 1920 was a difficult one for all manufacturers, and especially for our class of business. . . . In the early Fall it looked as if there would be a considerable buying movement, but the action of the government in failing to make partial payments tied the railroads' hands and has made it very difficult for them to carry out their commitments and has prevented them from entering into new ones. About 60,000 cars were ordered during the year and 25 per cent of these were bought by private owners in order to protect the execution of their obligations. This condition of affairs, with inefficiency and lack of co-operation on the part of labor, has helped to bring about a depression which will last until there is a readjustment. . . . The government has granted rates which, with old-time efficiency, would produce earnings ample to take care of improvements and betterments, but when the same government fails to promptly pay its debts, and make good the depletion of properties loaned to it during the war period, it paralyzes all the advantages from the increased rates. The public, as usual, pays the bill."

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company and the California, Arizona & Santa Fe have been authorized by the Interstate Commerce Commission to abandon a part of the Barnwell branch in San Bernardino County, Cal., extending from mile post 30, near Barnwell, to Ivanpah, a distance of 15.18 miles.

**BALTIMORE & OHIO.**—This company is preparing plans, in co-operation with the city of Dayton, Ohio, for the construction of a viaduct 60 ft. long over the railroad tracks at Springfield Pike, Dayton. A definite time for undertaking the project has not yet been decided on.

**CHICAGO UNION STATION.**—The announcement in the *Railway Age* of February 18 (page 437), that this company was accepting bids for the construction of a new railway mail terminal between Harrison and Van Buren streets and the Chicago river at Chicago, was partially incorrect. The company was accepting bids for the excavation work in connection with this project and has awarded a contract for the work to the Chicago Foundation Company, Chicago.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.**—This company has prepared plans, in co-operation with the city of Springfield, Ohio, for a subway to eliminate a grade crossing on Main street, Springfield.

**ILLINOIS CENTRAL.**—This company will extend nine passing tracks on the Paducah district between Central City and Paducah, Ky., at an approximate cost of \$75,000. The company has also authorized the extension of passing tracks on the Dubuque district between Freeport, Ill., and Waterloo, Ia., at an estimated cost of \$65,000. A new 100-ft. turntable will be installed at Waterloo, Ia., at an estimated cost of \$45,000, and another new 100-ft. turntable will be installed at Dubuque, Ia., costing \$35,000. The company will build two bridges at Council Hill, Ill., to cost \$30,000 each.

**INTERSTATE.**—This company has been authorized by the Interstate Commerce Commission to construct an extension from Norton, Wise County, Va., to a point about 9 miles west of St. Paul in Scott County, a distance of about 25 miles, and a branch line therefrom extending from Coeburn up a stream called Tom's Creek, a distance of 15 miles.

**JEFFERSON & NORTHWESTERN.**—This company is constructing a freight and passenger station, with facilities also for the general office, at Jefferson, Tex., to replace the joint facilities now being used with the Missouri, Kansas & Texas.

**KENTUCKY & TENNESSEE.**—This company has applied to the Interstate Commerce Commission for a certificate of convenience and necessity authorizing the construction of an extension in McCree County, Kentucky, 2½ miles.

**PACIFIC FRUIT EXPRESS.**—This company will build an icing plant at Council Bluffs, Iowa, with a capacity of 50 cars a day.

**TEXAS & PACIFIC.**—This company contemplates improvements and additions to its terminal facilities at Ft. Worth, Tex., including new yards, a new freight house and additions to its shops.

**TOLEDO, ST. LOUIS & WESTERN.**—This company has awarded a contract for a 300-ton all-steel coaling station, with sanding facilities, at Delphos, Ohio, to the Ogle Construction Company, Chicago.

THE PACIFIC RAILWAY CLUB will hold its annual election of officers at Oakland, Cal., on March 10. The following members have been nominated: For president, G. H. Harris, general superintendent, San Francisco-Oakland Terminal Railway; for first vice-president, F. S. Foote, professor of railroad engineering, University of California; for second vice-president, J. N. Clark, chief of fuel bureau, Southern Pacific; for treasurer, G. H. Baker, assistant general freight agent, Atchison, Topeka & Santa Fe.

## Railway Financial News

**ATLANTA, BIRMINGHAM & ATLANTIC.—Receivership.**—Col. B. L. Bugg, president of this road, was appointed receiver on February 25 by Judge S. H. Sibley in the United States District Court at Atlanta. The order was issued on petition of the Birmingham Trust & Savings Company of Birmingham, Ala., which alleged that it held a note for \$90,000 due March 7 which the road was unable to pay. In its petition the Birmingham Trust & Savings Company said that while the road's gross receipts were \$9,000 per mile per year, it was losing \$100,000 per month.

The Atlanta, Birmingham & Atlantic operates 640 miles of line in Georgia. Its receivership is the climax of the wage controversy caused by a notice of the company issued December 29 making a cut of 50 per cent on all increases given to the employees since December, 1917. The case was taken before the Railroad Labor Board as noted in the *Railway Age* of February 11, page 367, and February 18, page 411. Latest developments in the dispute may be found on another page of this issue.

**CHICAGO & EASTERN ILLINOIS.—Sale Postponed Again.**—The sale of this road, set for March 1, has been postponed again owing to disagreement between holders of the company's two chief defaulted bond issues on the price to be paid for the company to be formed to take over the road.

**CHICAGO, BURLINGTON & QUINCY.—Stockholder Comments on I. C. C. Decision.**—Robert J. Frank, a minority stockholder of the Chicago, Burlington & Quincy, who opposed the proposed issue by the road of bonds to be distributed as a dividend, commenting on the decision of the Interstate Commerce Commission against such an issue, said:

In event that the Great Northern and Northern Pacific Railways are now unable to perfect plans for refunding so-called C., B. & Q. joint 4s when they become due, without the aid of the Burlington company, holders of these bonds need not necessarily suffer any loss in consequence of the Interstate Commerce Commission decision. On the contrary, if these bondholders act collectively they may avail themselves of the provision in collateral trust agreements whereby C., B. & Q. stock pledged thereunder can be appropriated by holders of joint bonds. Such course would avoid any financial disturbance, and not unnecessarily embarrass either of the northern lines. It is my opinion that a merger or consolidation of Great Northern with the Burlington system should now be undertaken.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—Asks Authority to Purchase Road.**—This company has applied to the Interstate Commerce Commission for authority to acquire the capital stock of the Evansville, Indianapolis & Terre Haute.

**DENVER & RIO GRANDE.—Stockholders Lose on Appeal.**—The United States Circuit Court of Appeals on February 28 affirmed the action of the Federal District Court of Denver in denying stockholders of the Denver & Rio Grande the right to intervene in the case of the Equitable Trust Company of New York, in which the latter obtained an order for the sale of the road.

**ERIE.—Asks Authority to Issue Equipment Trusts.**—This company has applied to the Interstate Commerce Commission for such authority as may be necessary for an equipment trust agreement entered into before the effective date of the provisions of the Transportation Act relating to the issuance of securities, providing for the issuance of \$4,600,000 equipment trust certificates to be delivered to the Standard Steel Car Company for equipment upon the delivery of the cars.

**LEHIGH VALLEY.—Order to File Dissolution Plan in Sixty Days.**—The mandate of the United States Supreme Court ordering the dissolution of the combination effected by the Lehigh Valley Railroad Company, the Lehigh Valley Coal Company, the Lehigh Valley Coal Sales Company, Coxe Bros. & Co., Inc., Delaware, Susquehanna & Schuylkill Railroad Company, has been filed in the United States District Court for the Southern District of New York. The District Court has issued a temporary decree ordering dissolution of the combination within 60 days.

The companies are given by the decree of the court 60 days in which to file a plan with the Federal Court for the dissolution of the combination, "with such provisions for disposition of all shares of stocks, bonds or other evidence of indebtedness and all property of any character of any one of said companies, owned or in any manner controlled by any other of them as

may be necessary to establish their entire independence of one from each other. If defendants shall fail to file a plan within the period stated the court will take such further steps as may be deemed necessary to dispose of the stocks and bonds referred to and dissolve effectually the unlawful combination so as to recreate out of the elements composing the combination a new situation in harmony with the law."

**LOUISVILLE & NASHVILLE.**—*Authorized to Issue Bonds and Equipment Trusts.*—The Interstate Commerce Commission has authorized this company to issue \$3,500,000 of first mortgage 50 year, 6 per cent bonds, to be dated March 1, 1921, and to exchange them so far as possible for 6 per cent first mortgage bonds maturing March 1, 1921, and to sell any remaining bonds to J. P. Morgan & Co. at not less than 99. Authority was also granted to the Southeast & St. Louis to assume obligations in respect of these bonds by executing a first mortgage upon its property and franchise. The Louisville & Nashville has also been given authority by the commission for the issuance of \$11,025,000 of equipment trust certificates to be sold on a basis not exceeding 7 per cent, for the purchase of equipment at an estimated cost of \$14,933,379.

**PENNSYLVANIA RAILROAD.**—*Application to Lease New York, Philadelphia & Norfolk.*—This company and the New York, Philadelphia & Norfolk have filed a joint application with the Interstate Commerce Commission authorizing the lease to the Pennsylvania of the railroad property and franchises of the New York, Philadelphia & Norfolk for 999 years from July 1, 1920. The entire capital stock of the company is owned by the Pennsylvania.

**PENNSYLVANIA.**—*Annual Report.*—The annual report for the year ended December 31, 1920, which was published on Monday, shows a net income of \$32,801,673, a decrease of \$10,066,425, as compared with the year 1919. Other important figures shown in the income statement are as follows:

	1920.	*1919.
Government compensation for January and February, 1920	\$13,156,968	
Income accrued March 1—August 1, 1920.	37,981,814	
Net railway operating income	11,965,085	
Total compensation and net railway operating income	63,103,867	4,022,596
Total non-operating income	24,562,834	671,072
Gross income	87,666,701	4,693,668
Total deductions from gross income	54,865,028	5,372,757 (in.)
Net income	32,801,673	10,066,426
Sinking fund	2,239,790	176,887
Dividends	29,950,404	300
Balance of income for the year.	611,479	9,889,238

\*Decrease shown in every item except total deductions from gross income.

This report will be treated more fully in next week's issue of the *Railway Age*.

**PEORIA & PEKIN UNION.**—*Guarantee of Notes.*—The Interstate Commerce Commission has authorized the Lake Erie & Western, the Peoria & Eastern, the Chicago, Peoria & St. Louis and the Chicago & North Western to assume liability as guarantors for the payment of the principal and interest of 5 separate notes aggregating \$1,529,150, to be issued by the Peoria & Pekin Union, payable to the Secretary of the Treasury, for a loan of \$1,799,000 from the revolving fund.

**READING.**—*Hearing on Dissolution Plan.*—At a hearing in the United States District Court at Philadelphia before Judges Buffington, Wooley and Davis, on March 1, representatives for the common stockholders presented petitions for leave to intervene, and suggestions for modification of the dissolution plan recently filed, as noted in the *Railway Age* of February 18, page 425. J. D. White, appearing for the Prosser committee in behalf of the common stockholders, asked a modification of the plan, providing that the Reading Company reduce its capital stock.

C. C. Leffingwell, of New York, appearing for the railroad, and A. F. Myers, special attorney general, approved of the railroad plan with modifications. Mr. Myers said that the government would be compelled to ask the court for a strict compliance with the mandate of the U. S. Supreme Court that the Jersey Central stock be disposed of within a reasonable time. He said the Transportation Act provided for a consolidation of railroads after leave granted by the Interstate Commerce Commission, and such matters and formalities take so long a time that the government would have to insist that the dissolution plan of the Reading and Central of New Jersey be effected as promptly as possible.

After hearing the discussion the court decided not to pass on the case but gave the stockholders two weeks to intervene in the proceedings.

The following statement was made by Seward Prosser, president of the Bankers' Trust Company, as chairman of the committee representing Reading common stock:

"As the committee views the situation, the plan in effect, though not in form, distributes to the preferred and common stockholders alike the existing earned surplus of over \$30,000,000, in which the preferred stock, except on dissolution, has no interest. The elimination from the statement of such surplus will result from the proposed plan of complying with the decree requiring the segregation of the coal and iron company's property. The equities between the stocks can be maintained, in the opinion of the committee, by a proper reduction of the capital stock of the corporation spread over all classes of stock alike."

**ST. PAUL AND KANSAS CITY SHORT LINE.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$619,000 of first mortgage gold bonds at 4½ per cent interest to reimburse the treasury for expenditures. The bonds are to be delivered to the Chicago, Rock Island & Pacific.

**SEABOARD AIR LINE.**—*Loan Approved.*—The Interstate Commerce Commission has approved a loan of \$1,173,500 to this company to enable the company to meet its maturing indebtedness.

**SOUTHERN.**—*Asks Authority to Pledge Bonds for Security.*—This company has applied to the Interstate Commerce Commission for authority to pledge and repledge from time to time as security for short term notes all or any part of \$7,229,000 of its development and general mortgage 4 per cent gold bonds payable April 1, 1956, which have been nominally issued and are held unnumbered in its treasury.

**TEXAS CITY TERMINAL.**—*Asks Authority to Issue Certificates.*—This company has applied to the Interstate Commerce Commission for authority to issue \$1,984,300 of first mortgage 20 year, 6 per cent bonds and \$500,000 of common stock, to be delivered, with the exception of directors' shares, to A. S. Peabody, in payment for the railway and terminal property formerly owned by the Texas City Transportation Company, which was in part leased to and operated by the Texas City Terminal Railway to March 17, 1920. On that date the mortgage was foreclosed and the property was later sold to Mr. Peabody.

**TEXAS MIDLAND.**—*Asks authority to issue bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue bonds to the amount of \$500,000 or such part thereof as is necessary to cover the construction of an extension of 14 miles.

**THE ST. LOUIS-SAN FRANCISCO.**—*Asks Authority to Sell or Pledge Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue and sell or pledge from time to time \$4,232,000 prior lien mortgage, 6 per cent gold bonds, dated July 1, 1928. It is stated that there are no present plans for the disposition of the bonds, but that it is proposed to sell them at not less than 90 or pledge them at not less than 75.

**WASHINGTON & LINCOLNTON.**—*Asks Authority to Issue Notes.*—This company has applied to the Interstate Commerce Commission for authority to issue three short term notes to the amount of \$13,000, to the Atlantic Coast Line and the Louisville & Nashville.

**WHEELING & LAKE ERIE.**—*Asks Authority to Pledge Securities as Collateral.*—This company has applied to the Interstate Commerce Commission for authority to pledge as collateral for short term notes which may be issued from time to time any bonds, stocks or other securities which now are or may be held in its treasury.

### Dividends Declared

- Boston & Albany—Two per cent, quarterly, payable March 31 to holders of record February 28.
- Buffalo & Susquehanna—Common, 1½ per cent, quarterly, payable March 31 to holders of record March 16.
- Fonda, Johnstown & Gloversville—Preferred, 1½ per cent, quarterly, payable March 15 to holders of record March 10.
- Pittsburgh, Ft. Wayne & Chicago—Common, 1½ per cent, quarterly, payable April 1 to holders of record March 10; preferred, 1½ per cent, payable April 5 to holders of record March 10.

## Railway Officers

### Executive

**J. L. Wilkes**, general manager of the Jacksonville Terminal, Jacksonville, Fla., has been elected president and a director of the company.

### Financial, Legal and Accounting

**C. E. Coomes** has been appointed auditor of the Florida East Coast, with headquarters at St. Augustine, Fla., effective February 21, succeeding **E. Y. Quinn, Jr.**

**Arthur L. Parmelee**, whose appointment as auditor and assistant secretary of the Grand Rapids & Indiana, with headquarters at Grand Rapids, Mich., was noted in the *Railway Age* of January 28 (page 309), was born at Grand Rapids, Mich., on June 7, 1880. Mr. Parmelee was educated at Ferris Institute and entered railway service in the maintenance of way department of the Grand Rapids & Indiana on December 1, 1895. During the next six years he served in this department except for two different periods when he left the service to complete his schooling. In February, 1901, he transferred to the transportation department with headquarters at the local freight office at Grand Rapids but four years later he returned to the maintenance of way department, entering the office of the division engineer as chief clerk. He entered the service of the accounting department on December 5, 1911, as a clerk and has served successively as assistant chief clerk, chief clerk from 1913 to 1920, special agent in closing out federal accounts and general division accountant, the last being the position which he has retained in addition to his new duties and which service he was performing at the time of his recent appointment.

### Operating

**J. P. Darling**, superintendent of the Northern division of the Bangor & Aroostook, has been granted a leave of absence on account of illness. **J. H. Curtis**, trainmaster of the Northern division, will act as superintendent until such time as Mr. Darling is able to resume his duties.

**E. F. McPike**, superintendent of refrigerator service of the Illinois Central, with headquarters at Chicago, who was granted a leave of absence to serve as chairman of the perishable freight division of the American Railway Association, has resumed his duties with the Illinois Central, effective February 15.

**H. S. Taylor**, chief dispatcher of the Southern division of the Gulf, Colorado & Santa Fe, has been appointed acting trainmaster of the same division succeeding **F. H. Christian**, who has been assigned to special duties. **J. J. Paul**, assistant chief dispatcher, has succeeded Mr. Taylor as chief dispatcher.

### Traffic

**S. C. Rhodes** has been appointed general agent, passenger department, of the Union Pacific, with headquarters at Kansas City, Mo., effective March 1.

**J. D. McCartney** has been appointed assistant general passenger agent of the Central of Georgia with headquarters at Savannah, Ga., effective March 1.

**E. A. Shreve** has been appointed district passenger agent of the Union Pacific, with headquarters at Salt Lake City, Utah. The position of general agent, passenger department, at that point has been abolished.

**A. C. Hilton**, general agent passenger department of the Erie, with headquarters at Buffalo, N. Y., has been appointed general eastern passenger agent, with headquarters at New York, effective March 1, succeeding **J. Buckley**, deceased.

**J. H. Webster**, general agent of the Erie, with headquarters at Cincinnati, O., has been appointed general agent passenger department, with headquarters at Buffalo, N. Y. **J. A. Dolan** succeeds Mr. Webster as general agent at Cleveland.

**J. O. Goodsell**, assistant general passenger agent of the Union Pacific, with headquarters at Kansas City, Mo., has been transferred to Omaha, Neb., in the same capacity. Mr. Goodsell will have charge of work in connection with the organization and solicitation of outside agencies.

**E. P. Fisher**, traveling freight agent on the Atchison, Topeka & Santa Fe, with headquarters at Cincinnati, Ohio, has been appointed to general agent, with headquarters at Indianapolis, Ind. **Charles Moore**, city passenger agent at Wichita, Kan., has been promoted to general agent, with headquarters at Des Moines, Ia., succeeding **S. Larimer**, who has been transferred to Atlanta, Ga., succeeding **W. J. Curtis**, who has been transferred to Buffalo, N. Y.

**C. W. Dorfinger** has been appointed district freight and passenger representative on the Baltimore & Ohio, with headquarters at Los Angeles, Cal. **A. G. Mariner** has been appointed district freight representative with headquarters at San Francisco, and **S. M. Tate** has been appointed district passenger representative, with the same headquarters, effective February 1, the date on which these new outlying agencies were opened by the company. Other appointments on this road are **L. G. Reynolds**, recently made district freight and passenger representative at Omaha, Neb., and **J. P. Hanley**, freight representative at Chicago.

### Mechanical

**J. B. Merritt** has been appointed road foreman of engines on the Second district of the New Mexico division of the Atchison, Topeka & Santa Fe, with headquarters at Raton, N. M., succeeding **J. T. Stuvort**, who has been transferred to the Third district.

### Engineering, Taintenance of Way and Signaling

**C. T. Jackson**, district engineer on the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been promoted to principal assistant engineer, with the same headquarters, effective February 21, and the two offices of district engineer on the Southern district have been consolidated.

**E. R. Lewis**, whose appointment as office engineer of the Michigan Central, with headquarters at Detroit, Mich., was announced in the *Railway Age* of February 18 (page 440), was born on November 20, 1869, at Raritan, N. J. He graduated from the State University of Iowa in 1890 and entered railway service with the Missouri Pacific in 1885. During the next two years he served as axeman and rodman on construction work with that company and during the next seven years he served successively as levelman, clerk in the timber department, levelman on bridge location, division engineer, and as a reclamation engineer in Wyoming. In 1896, he was appointed division engineer in charge of work on the government levees in connection with Mississippi river improvements. Mr. Lewis spent seven years in construction work on the Cape of Good Hope government railways in South Africa, and from August, 1906, to June, 1912, he served as division engineer on the Michigan Central, with headquarters at Bay City, Mich. On the latter date he was appointed assistant to the general manager of the Duluth, South Shore & Atlantic, with headquarters at Duluth, Minn. His jurisdiction was later extended over all matters pertaining to the engineering department of this road. He resigned this position in February, 1919, to become editor of the *Maintenance of Way Cyclopeda*, a Simmons-Boardman publication, at the conclusion of which work he resigned to return to the Michigan Central, as announced above.

### Obituary

**F. E. Shrimpton**, general auditor of the Canadian Pacific, died of heart disease in Montreal, on March 2, aged 53.

### An Opportunity To Regain Lost Traffic

When the recession in business activity commenced several months ago the automobile industry was one of the first to feel the effects. In view of this, there is special significance in the fact that the demand for automobile cars was well sustained, even after a large surplus of other types had developed. If the supply of such equipment is hardly adequate during a depression, there is every reason to believe that a serious shortage can be anticipated when business again assumes normal proportions. During the war the railroads lost a large amount of this high grade traffic through inability to handle it. Automobiles were sent under their own power for distances up to 1,000 miles from the factories. The cost of furnishing drivers is much greater than the freight charges and manufacturers will not continue this expensive practice unless they are forced to do so. Automobile traffic not only carries a fairly high freight rate, but on many roads it would also provide a back haul to balance merchandise traffic. The special features of automobile cars do not add materially to the cost of construction nor to the expense of maintenance. Practically all commodities, including grain, can be carried with entire success in cars of this type and they are more adaptable traffic units than box cars. For this reason, the roads when ordering new equipment should provide enough automobile cars to meet the demands of the maximum traffic.

### British Supply Exports Increasing

The exports of railway equipment and supplies from Great Britain in 1920, the totals of which have recently been made public, afford concrete evidence of the strenuous and far from unsuccessful efforts of British supply manufacturers to regain their foothold in the markets which during and immediately following the war depended to a large extent upon American industry. Shipments of locomotives during the year were valued at \$23,949,576 (at the present rate of exchange), a figure more than three times as great as the similar total for 1919. At the same time exports of locomotives from this country in 1920 showed an increase in value of about 75 per cent over 1919. In the matter of steel rails, the exports from the United States in 1920 actually declined from the totals of the previous year, while British manufacturers increased their foreign sales by more than 25 per cent. The value of passenger cars exported from Great Britain in 1919 was \$2,377,408 and, in 1920, \$6,780,028. Similar figures for the United States are \$1,606,540 and \$1,171,674 respectively. These figures speak for themselves. In the value of freight car exports, British manufacturers increased their business from \$9,496,568 to \$22,838,844 in the course of the year. These figures, which are given in detail elsewhere in this issue, do more than indicate a condition as it existed at a particular time; they show a trend and that trend is away from American manufacturers and American goods, and toward foreign competitors and their products. One of the strongest factors militating against American goods in foreign markets is the unfavorable exchange rate. The efforts of those who are planning to solve this problem by arranging to extend long term credits to foreign purchasers,

consequently, deserve the whole hearted support of everyone. The opening up of a brisk export trade at the present time would be of tremendous assistance in restoring normal business conditions in this country.

For many years, with only one exception, we believe, the manufacturers of railway equipment and supplies have made

### Convention of the Mechanical Section

exhibits in connection with conventions of the railway mechanical associations. Because of bad business conditions the Railway Supply Manufacturers' Association, through which these exhibits are made, is seriously considering not making an exhibit this year. Its executive committee met this week and before this editorial is published a decision upon the question of giving the exhibit probably will be reached. Whether the exhibit is given or not, the conventions of the Mechanical Section and of the Purchases and Stores Section of the American Railway Association ought to be and doubtless will be held. There never was a time when the mechanical officers of the railways were confronted with more important and difficult problems than now. Many of these problems demand associated action by the railways, and all of them need thorough discussion. A decision in the interest of economy not to give the exhibit of equipment and supplies would be in keeping with the conditions and spirit of the present period. These very same conditions, however, demand that the various sections of the American Railway Association shall meet and transact the business assigned to them. There is need for the greatest practicable economy in the operation of the railways, but with the conditions confronting the roads at the present time it would be false economy for them to save the comparatively small amount that would be saved by not holding these conventions this year. The savings which will be made if the various sections of the American Railway Association meet and transact the business that they should, will be vastly larger than the amounts that would be saved by not holding the conventions.

The hearing on the Reading segregation plan held at Philadelphia on March 1 brought out many interesting points, not the least interesting of which were

### Central of New Jersey

those relating to that part of the plan dealing with the disposition of the majority stock of the Central of New Jersey now owned by the Reading Company. The Reading in its plan asked the court to postpone action in this matter pending the grouping of the railroads by the Interstate Commerce Commission under the terms of the Transportation Act. Comment has already been made in these columns concerning the government's objection to such postponement and the opinion was expressed that the government's attorney was not acting according to the intent of the people as expressed in the Transportation Act. Nor are we made to feel otherwise by the government's contention that the Supreme Court's decision was handed down after the passage of that act. The attorney for the Reading brought out at the hearing that to require the Reading to dispose of

the Central of New Jersey stock at this time is a much more serious affair than might at first be supposed. The argument was advanced that to require the Reading to sell the Jersey Central stock now or in the immediate future would be an actual hardship and the Reading attorney asked the mercy of the court not to require such sale. The Interstate Commerce Commission is now working out its plan for railroad consolidations. No one knows what disposition the plan may finally make of the Central of New Jersey. In other words, with that in mind, no other carrier would be justified in purchasing the stock because that carrier would not be in a position to know whether such purchase would be approved. The result would be that there would be no market for the stock and it would have to be disposed of at a great sacrifice. The situation is further complicated, the attorney pointed out, by the fact that the Reading has pledged its Jersey Central stock to the par value of \$14,000,000 under bonds amounting to \$23,000,000 which bonds may not be redeemed under 105. It is hard to believe that the Supreme Court wants such action as this taken and we repeat that we do not see how there can be any objection from the point of view of the law in a postponement of the sale of the stock until the consolidation plan is finally determined as provided in the Transportation Act. The tendency today is toward consolidation and the public approves of it. No argument is needed to show that the Jersey Central is a natural adjunct to the Reading in giving it entrance into the big railroad center of New York. It is difficult to agree with the government's contention in this aspect of the case; we feel that its objection to the postponement of the sale of the Jersey Central stock represents retrogression rather than progress.

The *Railway Age* apologizes to its readers for an erroneous statement regarding loss and damage which was made in our last week's issue. This statement indicated loss and damage on American railroads for the year 1920 amounted to \$280,000,000. Detailed figures for the year 1920 are not yet available. In 1919 payments for loss and damage of all kinds, including damage to property, loss to live stock on right of way and in transit, loss and damage to freight and baggage and injuries to persons, amounted to \$156,275,579. Of this amount \$106,804,861 was chargeable to loss and damage of freight. What we meant to do was to give an estimate for 1920, and in making the estimate a miscalculation was made which resulted in the total estimate being about \$100,000,000 too large. Even when correctly stated, however, the figures for loss and damage are quite large enough. No other part of operating expenses affords opportunity for relatively so great a real saving.

We publish elsewhere in this issue a paper entitled "The Spirit of Safety First" which was prepared by Charles E. Norman, a switchman on the Chicago & Alton, and read by him at a recent safety meeting of employees of this railroad in Chicago. The principal reason why we publish and call attention to it is that it is an excellent and very human discussion of the problem of safety on railroads. It emphasizes the means by which safety may be promoted, the direct and indirect advantages to the employee and his family, and the fact that "safety first goes beyond the conservation of life and limb—it brings out efficiency, economy and co-operation." Mr. Norman has stated the philosophy and purpose of safety work in a few sentences. The paper is all the more interesting because it was prepared not by some railway

officer specializing upon safety work, but by a switchman whose everyday life brings before him constantly the hazards of railway employment. It bespeaks not only the right attitude toward his work and toward his fellow employee, but also toward the general operation of the railroad. While controversies always will occur between railways and their employees regarding wages and conditions of work, it is a great mistake to assume that these things indicate any want of an adequate sense of duty and responsibility on the part of a large majority of employees. It is easy to criticize railway employees and their unions, and they give much justification for criticism, but it would be impossible to find among any class of workmen in the world a better spirit or more intelligence than can be found among the railway employees of this country as a whole, and especially among those directly concerned with the operation of trains.

The report on determining the cost of reproduction new of all-steel freight cars, which is abstracted on another page of this issue, is another important contribution to the subject of railway equipment valuation. Like an earlier report of the equipment committee of the Presidents' Conference Committee on Federal Valuation—the report relating to the cost of reproduction new of locomotives, which was abstracted in the *Railway Age* of September 3, 1920—the present report represents the results of detailed study and scientific analysis. The equipment committee has worked out a method characterized by simplicity; it is similar to that which was utilized for determining the cost of locomotives. It permits the determination of the cost of reproduction new of a steel freight car on the basis of its weight, multiplied by the cost per pound, with proper additions in the form of net prices for the specialties. In working out this plan the committee had the advantage of the assistance of two of the larger car builders. Its figures for the period 1910 to 1914, inclusive, are based on the prices of no less than 71,108 cars of the four types considered—hopper, gondola, coke and tank. The report is further of interest in that there is worked out a price relationship of the year 1910 to the first half of 1920 in the form of percentages of the 1910 to 1914 average price as 100. As we have noted in these columns before, this is something concerning which there has been a great deal of surmise but until this investigation little of authoritative value. The *Railway Age* in abstracting the report has given it considerable space, which is fully justified by the importance and value of the investigation upon which the report is based. The report has much use from other than valuation viewpoints. Mechanical officers, in particular, are often called upon to figure the prices of old equipment. They now have as valuable assistants in such work the report on the cost of reproduction new of locomotives and that on all-steel freight cars. The reports on wooden and composite freight cars, as well as those on passenger cars, will probably be available shortly.

The vital importance of adequately trained foremen in any attempt to reduce transportation costs was one of the keynotes of the recent address by George M. Basford before the Western Railway Club, reported in the *Railway Age* of February 25. A forceful simile used in the address, and one which will appeal particularly to those familiar with army organization, was the quotation, "the foreman is the top sergeant of industry." Foremen must not be mere time servers, or men selected solely for their ability as master craftsmen. They should be

### Cost of Freight Cars

### Foremen Hold a Strategic Position

executives who can understand and direct the men in their respective departments, outlining the department work and creating a better feeling between the workers and the managements. The ability to visualize the work of other departments also is desirable in order that the efforts of all may be co-ordinated for the single purpose; namely, maximum transportation at minimum cost. Foremen with the above qualifications are in direct line for promotion and with enough of these men carefully trained, no railroad need call in outsiders to fill executive positions. What is the conclusion when "an important department of one of our fine big railroads has not once in twenty years been presided over by an officer who grew up on that road and in that department?" The conclusion is that a large majority of the foremen are not adequately trained and encouraged to qualify for higher positions. Why should foremen and men strive for advancement when they see the high positions being filled by strangers? As has been emphasized many times in these columns, it is important to make the position of foreman attractive and worth striving for. Under the piece work system, a knockout blow was struck at the efficiency and morale of railroad foremen when they were allowed to make less pay than some of the men working under their direction. Hardly a more important problem confronts the railway managements today than the proper selection, training and support of foremen in all departments. There will always be problems and difficulties in railway operation, but attention to personnel problems in the past would have prevented many of the present difficulties. Experience, therefore, teaches a lesson which should not be forgotten.

## Another Coal Crisis on the Way

IF PRESENT TENDENCIES in the production and transportation of coal are not speedily changed the American people within a few months will be confronted with the most serious danger of a coal famine ever known. The production and transportation of bituminous coal have been rapidly declining, and within recent weeks have reached the lowest levels for years, except during the coal strike in November and December, 1919.

It is but two months since the week ended December 11, when the mines produced and the railroads transported 12,865,000 tons of bituminous coal. They are now producing and transporting only 7,300,000 tons weekly, a decline of 43 per cent. It is but a few months since the railways were being generally denounced because they could not haul all the coal the country needed. Today 175,000 coal cars are standing idle because consumers and dealers are not buying and the mines are not producing coal with which to load them.

The situation demands the immediate attention of coal consumers, dealers and operators, railway officers and the Interstate Commerce Commission. There has been a plethora of propaganda in the past because the railroads could not handle enough coal when people wanted it. There is need to make all concerned understand now that if the railroads are not soon given opportunity to haul more coal, the coal situation developing will be far more acute than any previously experienced.

The only time within recent years, except during the miners' strike, when the production and transportation of coal were anywhere near so small as they are now was early in 1919. The situation now, however, is much more threatening than then. Not only is less coal being produced than then, but the country entered the year 1919 with a storage supply of about 58,000,000 tons, the largest amount ever on hand at the beginning of a year, while it entered the year 1921 with comparatively small storage supplies.

The production of coal continued to be small throughout the first half of 1919. Everybody knows the sequel. The storage supplies were almost exhausted. Business suddenly revived, and with it the demand for coal. The railways were unable to transport it as fast as it was wanted and could be produced, and a howl went up all over the country that there was danger of a coal famine and that the railroads were to blame. In November, 1919, came the strike in the coal mines, which was followed by a coal shortage of several months' duration, due not only to the strike but to the small production in the early part of 1919. The railways throughout 1920 had to make herculean exertions to get enough coal to the northwest to keep it from freezing and enough to New England and other parts of the country to keep their industries going. Priority had to be given to the use of open top cars for the transportation of coal, with the result that many business activities, especially building and highway construction, had to be practically stopped.

We are moving toward a repetition of this experience, but in a more serious form and with more serious consequences. The annual average consumption of coal in this country for four years has been 535,000,000 tons, or more than 10,000,000 tons a week. The reduction of consumption owing to mild weather and industrial depression has been large, but far from sufficient to justify a reduction of production to 7,300,000 tons a week.

The main reason for this reduction, as shown by the reports of the United States Geological Survey, is "no market." Consumers and dealers won't buy. Probably the main reason they won't buy is the present prices. They are lower than those of a few months ago, but still high. The main reason they stay so high is the excessive wages being paid to the miners. In the two years March 31, 1918, to March 31, 1920, the mine workers in the Central Competitive Field were given five advances. This field embraces Pennsylvania, Ohio, Illinois, Indiana and the southwest, and has set the pace for the country. Repeatedly wage scales were made to remain in effect for specified periods and advances granted before these periods had expired because the mine workers refused to abide by their contracts.

The advance in the daily wage rate between 1918 and 1920 was from \$3.00 to \$7.50, or 150 per cent. Many consumers and dealers are not buying because they expect coal prices to be further reduced and believe they should be. Because of this buyers' strike, hundreds of thousands of miners are unemployed, a large part of all the coal cars are idle, and the country is drifting toward a serious crisis.

The present wage scale was adopted to stay in effect until April 1, 1922. Since the miners in the past have repeatedly demanded and secured advances in wages before contract periods have expired, there is no reason why the mine operators should not demand and secure a reduction of wages before the present contract period expires. The entire industry of the country is suffering from the present prices of coal. This is especially true of the railroads. They consume one-third of all the coal produced. Their fuel bills now amount to about \$750,000,000 a year. One of the principal reasons for their present high operating expenses is the excessive cost of coal. The question whether there is to be any reduction of miners' wages and consequent further reduction of the price of coal this year should be settled as soon as possible so as to reduce the length of the buyers' strike.

In every year for four years the transportation and business of the country have been demoralized by demands that the railroads should in certain periods to prevent a coal shortage handle more coal than they are physically capable of handling. The railroads and the Interstate Commerce Commission should definitely announce at an early date in terms leaving no possibility of misunderstanding, that no priority will be given to coal this year, no matter what may

because the alleged necessities of coal producers and consumers, or of those of any section. The railroads can transport all the coal the country needs if given opportunity to handle it in reasonably uniform volume, and if the stupidity and selfishness of the coal producers, dealers and consumers which have caused one coal crisis after another cause another this year, their stupidity and selfishness should be allowed to produce their natural results. The railroads should cease to be made the "goat" for these coal crises.

Meantime, where are the construction concerns which made such a howl last summer when, owing to priority being given to coal, they could not get enough cars to ship materials? Why are not they "shipping early" in some of the 175,000 open top cars now standing idle? A few months ago when the railways were moving the largest volume of freight ever handled, many people were charging they had "broken down" because they did not move more. Now, when over one-third of the railroad capacity of the country is idle, many people are saying private operation has "broken down" because with this enormously reduced traffic the railways are facing a financial crisis. The most varied and bitter experience does not seem to teach the American people anything regarding transportation matters.

## What Kind of a Railroad Are You Trying to Make?

NO GREAT THING ever was done by any man or group of men who did not consciously have an ideal and work steadily and powerfully to attain it. "Where there is no vision, the people perish." The great railroad systems of the United States have been developed by men, or groups of men, who knew what kinds of railroads they were trying to create, and consciously and steadily used the best means available for accomplishing their purposes. They had enormous difficulties to overcome. They encountered obstacles and enemies at every step. They had failures behind them that they could look back to, as well as successes ahead of them that they hoped for. In the long run they won. The present great railroad systems prove that. They are monuments to the courage, vision, energy, resolution and resourcefulness of men such as Commodore Vanderbilt, Thomas A. Scott, A. J. Cassatt, James J. Hill, E. H. Harriman, E. P. Ripley, Milton H. Smith and others.

The great railroad men of the generations to which these men belonged had the advantage of doing most of their work before government regulation and government operation intervened. In making and carrying out their plans they hardly had to think about interference from public authorities, and very little about co-operation with the managers of other railroads. When they thought of other railroads they usually thought of them in terms of competition, not co-operation. They did not trouble themselves much about what their employees were going to think. Most of their employees were not organized, and the unions that did exist were small and weak compared with those that exist at present.

Government regulation, growth of labor organizations and other changes in conditions make it necessary for a man or group of men now engaged in developing and operating a railroad to consider many things their predecessors did not have to consider. But in the most important respect of all there has been no change. It is just as important now as ever that the head of a railroad and his principal officers should have a definite ideal of the kind of a railroad they are trying to make, and definite means for making this kind of a railroad and should work constantly with indomitable resolution and perseverance in carrying out their plans. Only in this way can they make railroad systems which will

be physically sound and well rounded, and which will produce good operating and financial results.

There are those who will contend that present conditions are so unfavorable as to render it impracticable to form definite ideals of what kind of railroads they are going to make and to adopt and successfully carry out plans for making them. But there were people who thought and talked that way when James J. Hill started to build the Great Northern to the Pacific coast. There were others who thought E. H. Harriman had undertaken a task beyond human power when he started to rehabilitate and reconstruct the Union Pacific. There were even those who thought at certain stages of Mr. Hill's and Mr. Harriman's careers that they were not perfectly sound mentally. They were subsequently enlightened by the discovery that if there was anybody insane it wasn't Mr. Hill or Mr. Harriman.

The year 1921 is not the first when conditions were unfavorable in this country to developing railroads and making them pay. It is not the first when many of the railroads were on the verge of bankruptcy. After the panics of 1873 and 1893 many of the predecessors of the present generation of railway officers either changed unfavorable conditions, or adapted their methods to them. They didn't change their ideals, or refuse to have any. All the railway officers of that period did not achieve their ideals. Many were discouraged by conditions and gave up or lost the fight. Their names can be found in large numbers by searching in Poor's Manual; but they do not appear in any histories of the period. On the other hand, there were those who never forgot their ideals and never quit, no matter how discouraged they may have been at times. The great railroad systems of this country are monuments to men who talked less about what had been done to them and their railroads than they did about what they and their railroads were going to do and who didn't quit. Their names can be found in many histories.

Private management of railroads in the United States is on trial. This is not the first time it has been on trial. It may be the last time unless the railway leaders of this generation squarely and fully meet the test. They were put to a severe test last year. It looked for awhile as if they were not going to meet it. They were called on to move the largest freight business in history with deteriorated facilities, with serious strikes on their hands and without any organization to bring about needed co-ordination in their operation. They showed at first a disposition to pull apart instead of pulling together. They waked up in time, however, organized themselves, gave the finest example of railroad team work ever seen, moved more freight than had ever been handled in the same length of time, and almost wiped out the car shortage before the slump in business began.

They are confronted today with a situation more perilous than that. They need courage, energy, breadth of vision, unity of purpose and foresight, to meet it. They are displaying a want of unity of thought and purpose regarding certain most important matters that demand unity of thought and action. We have no doubt, however, that private operation will pull through the present crisis. But the country is getting tired of transportation crises. It is up to the railroad managers not only to pull the railroads through this crisis, but to adopt measures for preventing future crises.

They must develop more unity of thought and purpose in dealing with their labor problem and with public opinion. But the future of the railroads is mainly in the hands of their individual managements. If each railroad could and would solve its own problems, there soon would hardly be any national railroad problem. Solution of the problems of each individual railroad demands that it shall individually establish better relations between it and its own public and its own employees. This will not be done until the chief executives and principal officers of each railroad have a

definite ideal as to what kind of a railroad they intend to make, definite plans for making it and indomitable resolution in carrying them out.

The prime requisite to the solution of the railroad problem under private ownership is the development and operation of each railroad so that under the particular conditions to which it is subject it can render the best practicable service at the lowest practicable cost. Without success in this there will be no success. The railroad manager who has such an ideal and such plans must, under present conditions "sell" them to his public and his employees, as well as to the financiers. But he cannot "sell" them to anybody else if he does not first sell them to himself so that he really believes in them. Once he has sold them to his public and his employees he will get the support of his public and his employees, and they will help change the most unfavorable conditions with which the railroads are now confronted.

The thing has been done in the past. It is being done by some railroad managers now, as bad as conditions are. They have ideals. They know what they are trying to do and how they are trying to do it. By taking their public and their employees into their confidence they are getting their support and making progress.

## The Accident at Porter, Indiana

ON SUNDAY EVENING, February 27, a New York Central passenger train crashed into a Michigan Central passenger train at an interlocked crossing of these lines at Porter, Ind., resulting in the death of 37 people. It would seem at times that human toll is a necessary part of railroad operation. However, even this high penalty may be warranted if the lessons learned from such accidents are applied to remedying conditions so that similar accidents may not occur in the future.

Practically every precaution of modern signaling had been taken to protect trains at this busy grade crossing. Derails were placed ahead of the home signals as a means of enforcing a stop if an engineman should fail to heed the signals. Electric locks were placed on the interlocking machine as an additional check on the mechanical locking, these locks with their control circuits so arranged that when a route was lined up for a train on one road it was locked electrically for that train and could not be released until that train had passed unless the leverman had again placed his signals at the stop position and released himself by means of a time release. The operation of this release required a predetermined time in order to insure that a train which might have accepted the route had either been brought to a stop at the home signal or had passed over the plant. This added precaution was deemed necessary to prevent a leverman, in a moment of confusion, from throwing a derail in front of a train. Yet, in spite of all these precautions two fast passenger trains collided on the crossing through no fault of the mechanical and electrical equipment which had been designed to prevent just such accidents and through no fault of the men operating the plant.

What, then, was the cause of the accident and what lessons may be learned as a result of it?

Analyzing the conditions, three factors are seen to enter into the cause of the accident, (1) a "man failure" on the part of the engineman and fireman on the Michigan Central train; (2) a derail located too near the crossing and (3) a train order signal so located with respect to the home signal that there was a possibility of its light being confused with a clear home signal indication.

Treating each in order: The engine crew failed to see the red light on the home signal and may have mistaken the green light on the train order signal for the home signal indi-

cation, as the smoke of a train standing on a siding near the home signal may have obscured its light momentarily. No one will question the fact that the engine crew believed they had a clear signal as it would be suicidal on their part to run past a stop signal at a high rate of speed knowing that there was an open derail ahead.

The derail, which was of the split point type, was 311 ft. from the nearest crossing frog, with a trailing point switch located about midway between the derail and the crossing. Here, then, the effective distance of the derail might be only about 165 ft. as the trailing switch would have a tendency to derail an engine or cars.

The train order signal was in line with the interlocking signal when viewed on the tangent track, although the indications ought not to have been confused by the engineman of a train approaching around the curve which lies between the distant and the home signal at this particular point.

As a result of this accident it is evident that many derails in high speed routes should be moved back to meet present operating conditions. Thirty years ago a distance of 300 ft. was deemed sufficient but since that date heavier and more powerful motive power has come into use and train speeds have increased while the derail has not been moved back to keep pace with this development.

The train order signal is but little used in automatic signal territory where railroads make proper use of their signal systems. Provisions should be made at interlocking plants to interlock with the home signals or other steps should be taken to remove the possibility of its light being mistaken for the home signal indication. There are many places throughout the country where such an indication may be so mistaken today.

"Man failure" was the primary cause of the accident. The best signaling and interlocking apparatus did not in this case, as in many others, prevent the man failure from resulting in a great catastrophe. There is good reason to believe that an automatic train control or train stop would have prevented this accident as well as a large number of others such as at Ivanhoe, Amherst, Corning, Mount Union and South Byron. When it is considered that automatic block signals on many lines are located only about one mile apart and that an engineman on a fast passenger train may pass a signal on an average of every 50 sec. it is not to be wondered at that "man failures" sometimes occur. This accident, like many others that preceded it, pointedly and seriously raises the question whether it is not time to supplement the signal system with train control on lines where it is necessary to maintain high speed schedules under all weather and operating conditions.

## Pennsylvania Railroad

CONSIDERING THE SIZE of the Pennsylvania Railroad, the amount of traffic carried over its rails and the varied nature of that traffic, it is natural that there should be plainly reflected in the operations of the system those features which characterize the operations of the railways of the country as a whole. The Pennsylvania Railroad, of course, has problems of its own, as has any railroad, but it constitutes so large a proportion of the country's total railway mileage that, speaking generally, it can be said that to analyze its present difficulties is to analyze those of all the railroads.

The Pennsylvania Railroad Company, the parent company of the system and itself operating 7,425 miles of railway, in 1920 had a total compensation and net operating income of \$63,103,867, including compensation of \$13,156,968 for January and February when the road was still under federal control; the guaranteed return of \$37,981,814 for the six months from March 1 to August 31 and net operating income

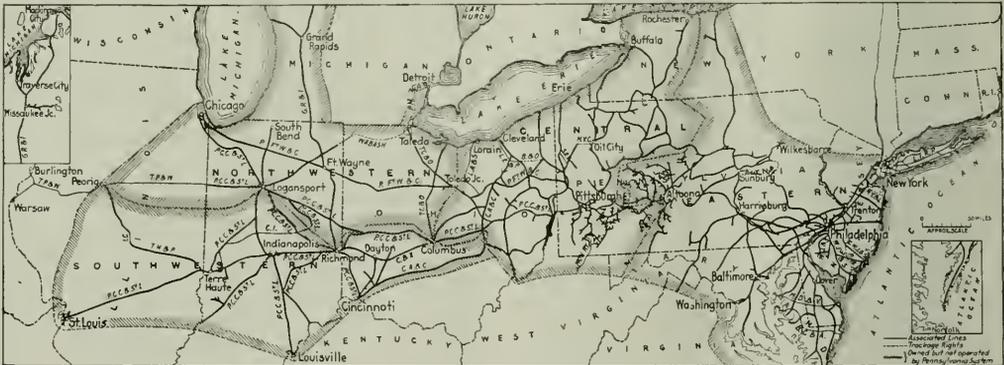

of \$11,965,085 for the four months from September 1 to the end of the year. This total of \$63,103,867 was \$4,022,596 less than the compensation in 1919. The company's non-operating income was \$24,562,834, an increase of \$671,072 over 1919. The gross income totaled \$87,666,701. Deduction from gross income totaled \$54,865,028, an increase of \$5,372,757 over 1919, represented in the main by increased interest payments on funded and unfunded debt. The net income for the year was \$32,801,673, a decrease of no less than \$10,066,425 from 1919. The six per cent dividends amounted to \$29,950,404 and \$2,239,790 was applied to sinking and other reserve funds. The balance transferred to profit and loss—namely \$611,479—was \$9,889,238 less than in 1919.

It is interesting that although the Pennsylvania is our largest railroad system and its operations among the most complex, it is the first of all the railroads to issue its annual report. This is caused by the necessity of having the report ready for the annual meeting of the stockholders on the second Tuesday in March. The result is that the report does not include the figures for operation and maintenance, which will explain the omission of any reference to such figures in the present review. These figures, however, will be issued later

operations of the Pennsylvania Railroad during the year 1920.

The Pennsylvania Railroad on its return to private control on March 1, 1920, introduced a new form of organization whereby the road was divided into four regions, each in charge of a vice-president. In reviewing the results of the year's operations it would be natural to see how this new form of organization has worked out. The many unusual conditions existing in 1920, however, have made this difficult, and President Rea does not attempt it in his report. That it has enabled improvements to be made is, however, well known. It is the consensus of opinion that the morale of the forces on the Pennsylvania is improving from month to month. The officers of the road realize the extreme importance of this morale and regret only that the present uncertain labor situation on the railways as a whole prevents more rapid progress toward restoring the old time efficiency and favorable attitude on the part of the men towards their jobs and towards the railroad by which they are employed.

The stockholders on March 8 voted on a number of things which are of leading importance to the progress of the Pennsylvania System. One of these was a proposal to authorize an increase in the indebtedness of the company by \$100,000,000 to provide for future financing. The other relates to

The Pennsylvania System

as soon as they become available. The stockholders voted on March 8 to change the date of the annual meeting to the second Tuesday in April so as to give more time for the preparation of the voluminous information which the Pennsylvania makes available for those interested in the details of its operation. The omission of these operating statistics from the present report does not, however, rob the report of value. There are so many things considered in its pages that it is of more than ordinary interest.

The Pennsylvania Railroad System prior to the advent of federal control, was noted for its splendid organization and the excellent morale of its forces. It was also noted for its engineering characteristics and its excellent up-keep. No doubt the extremely high standards of the latter had their effect upon morale and made it something more real and tangible. At any rate it would be almost trite to say that the 26 months of federal control added nothing to these things and subtracted much. The Pennsylvania Railroad today does not have that new and finished appearance it once had and the morale of the forces cannot be said to compare with what it was before the disturbing circumstances of the war had come into play. Organization and morale are most important on any railroad, but on a system the size and complexity of the Pennsylvania they have an unusual importance. These facts must be borne in mind in any analysis of the

leases of certain of the subsidiary lines. The Pennsylvania Railroad System was made up of some 600 constituent transportation corporations. This number has gradually been reduced through acquisition or merger so that at the end of 1919, for instance, there were a total of but 177, including railroad, bridge, real estate, water supply companies, etc. The list of operating companies owned or controlled by or affiliated in interest with the Pennsylvania System in 1920 totaled 20, operating a total of 11,749 miles of line. These companies operate some 50 companies whose properties are under leases or operating agreements. Of the operating companies the largest is the Pennsylvania Railroad itself which operates 7,425 miles of line. There are also included the Pittsburgh, Cincinnati, Chicago & St. Louis, 2,434 miles; the Grand Rapids & Indiana, 562 miles; the New York, Philadelphia & Norfolk, 122 miles; the West Jersey & Seashore, 356 miles; the Long Island, 395 miles, etc. It is now proposed to co-ordinate several of these lines more closely into the system by leases, particularly the Pittsburgh, Cincinnati, Chicago & St. Louis, the Grand Rapids & Indiana, the New York, Philadelphia & Norfolk, etc., which lines are now made parts of the system by ownership of stock.

The Pennsylvania Company, which since 1917 has been purely an investment company, until recently owned over three-quarters of the stock of the Pittsburgh, Cincinnati,

Chicago & St. Louis. More recently it offered to purchase the minority shares by exchanging P. C. C. & St. L. 5 per cent bonds, guaranteed by the Pennsylvania Railroad, par for par for the stock. The Pennsylvania Company and the Pennsylvania Railroad Company have thus secured about 98 per cent of the total stock. The proposal now is to lease the railroad for a period of 999 years from January 1, 1921, for a rental amounting to the fixed charges and for a period of five years 4 per cent on the stock and thereafter 5 per cent.

The case as to the Grand Rapids & Indiana is similar. The Pennsylvania Company by an offer to exchange for the minority stock 4 per cent second mortgage bonds of the Grand Rapids & Indiana which it held in its treasury has acquired about 97 per cent of the outstanding Grand Rapids & Indiana stock. The lease of the latter carrier is like that of the Pittsburgh, Cincinnati, Chicago & St. Louis except that the rental agreed upon is the fixed charges and 4 per cent on the stock. These leases are already agreed and were approved by the stockholders at their annual meeting.

The stockholders were on March 8 also asked to approve long term leases of the New York, Philadelphia & Norfolk, the Cincinnati, Lebanon & Northern, the Cumberland Valley & Martinsburg, and certain of the operating companies, as well as leases of various of the companies whose properties are at present under operating agreements. All of these companies are controlled through majority or in some cases practically entire ownership of stock. There will still be left some 12 operating companies, the two most important of which are the Long Island, 395 miles, and the West Jersey & Seashore, 356 miles, which it is not proposed to lease at this time. These leases represent a most important step in the development of the Pennsylvania Railroad System. They are the present stage in a process of development and integration which extends over a long period. The lines in question have been operated as parts of the system for many years, but it is expected that if they are operated as leased lines, increased efficiency and economy in administration will be facilitated. There will also be simplification and reduction of accounting and the change will permit the system to route traffic and use the terminals and facilities of all the companies for the system without regard to the separate ownership and results to each of the leased companies. Another important feature is the financial aspect. The development of the subsidiary lines which it is now proposed to lease has been assisted by the Pennsylvania Railroad, and in fact their credit has been based chiefly upon the guarantee of the latter; nevertheless it is expected that the proposed arrangement will even further assist the credit of the system.

The balance sheet of the Pennsylvania Railroad Company as of December 31, 1920, shows that on that date there was outstanding funded debt of the Pennsylvania Railroad itself amounting to \$362,851,260. This was an increase of \$56,780,000 over 1919. The amount given of course does not include the recent financing in the form of the \$60,000,000 fifteen-year 6½ per cent bonds maturing February 1, 1936, as this sale was not made until the latter part of January, 1921. The organization of the constituent companies of the Pennsylvania system is so complex that it is not generally realized that these increases in funded debt represent to an extent only increased indebtedness of the system and to a greater extent refunding of the indebtedness of the subsidiary companies. Thus there appears for the first time in the balance sheet an item of \$50,000,000 ten-year 7 per cent secured gold bonds, due April 1, 1930. These notes are secured by \$50,000,000 6 per cent bonds, due April 1, 1970, which were issued in 1920 but which do not show as increased indebtedness on the balance sheet for the reason that they are held by trustees and have not been issued to the public. The proceeds of the \$50,000,000 ten-year notes were used in part

to pay off funded debt of the Philadelphia & Erie, an acquired company. The funded debt had been assumed by the parent company. It matured July 1, 1920, and was as follows: \$7,928,000 of 6 per cent bonds; \$5,263,000 of 5 per cent bonds and \$5,880,000 of 4 per cent bonds.

The \$60,000,000 fifteen-year 6½ per cent bonds maturing February 1, 1936, and which were issued in January, 1921, are to be used as follows: \$20,000,000 to purchase from the Pennsylvania Company locomotives, cars and other equipment acquired by the Pennsylvania Company for operation on roads which that company leases, but the leaseholds of which are now held by the Pennsylvania Railroad; \$22,000,000 to purchase also from the Pennsylvania Company stock of the Pittsburgh, Fort Wayne & Chicago (a leased line) and stock of other companies embraced in the system; \$6,138,000 to pay installments on equipment trusts due in 1921 and \$1,151,000 for certain real estate mortgages. Carrying the matter now to the Pennsylvania Company it should be noted that the proceeds paid over to the latter in these transactions are to assist in meeting maturities of long term indebtedness of the company due June 15 and July 1, 1921. Thus of the total of \$60,000,000, the sum of nearly \$50,000,000 is to be used for refunding although at a higher rate of interest than the present indebtedness.

Returning now to the increases in the funded indebtedness of the Pennsylvania Railroad in 1920 reference should be made to the \$6,780,000 of 6 per cent collateral note due November 11, 1930, issued to the United States government to cover a loan from the revolving fund for additions and betterments including a grain elevator, engine house facilities, yard tracks and shops. In the matter of equipment trust obligations, note should be made of the issuance to the United States government of equipment trust certificates amounting to \$52,012,000 for cars and locomotives allocated to the Pennsylvania System by the United States Railroad Administration. The Pennsylvania followed a liberal policy in connection with the standard equipment and took a large amount of it. The equipment has been assigned to various lines of the system and these lines will assume the obligations accordingly.

On December 31, 1920, the Pennsylvania Railroad had 133,068 stockholders, an increase of 13.03 per cent over December 31, 1919. The average holding was 75 shares. It would be difficult to point to any other single factor to show the respect in which the Pennsylvania Railroad's prestige and policies are held in this country or abroad. This wide distribution of stock is the result of the conservative and sane financial policy and the efficient management for which the Pennsylvania is noted. We point to these facts to show how unfortunate it is that the progress that the system has made in the many years of its existence should have been impeded in any way by the results of the war as shown in the effects of federal control. However, the Pennsylvania Railroad may be looked upon merely as a large part of the country's entire railway system. We have enough confidence in the general railway situation to believe that railway conditions as a whole are going to improve in satisfactory fashion as time goes on. Those who have invested in Pennsylvania Railroad securities will bear in mind that the Pennsylvania has no special conditions that should prevent it in any way from realizing its share in the general improvement. It may seem a simple thing to say, but it is important to realize that the measure in which the company will realize the benefit of improvement will naturally depend principally upon operating efficiency. The Pennsylvania, like any road, has before it not only the task of restoring its operations to their pre-war efficiency but its management will also give due regard to the changed conditions embodied in the working out of the provisions of the Transportation Act.

The following table shows the principal figures of the operations of the Pennsylvania Railroad in 1920 and 1919:

	1920	1919
Mileage operated .....	7,425	7,327
Freight revenue .....	\$384,372,254	\$318,996,194
Passenger revenue .....	133,241,548	123,903,032
Total operating revenues .....	566,860,758	489,279,945
Maintenance of way and structures .....	89,190,602	72,448,041
Maintenance of equipment .....	177,897,960	144,113,675
Traffic expenses .....	3,046,930	4,113,754
Transportation expenses .....	293,230,169	215,463,217
General expenses .....	13,617,083	11,428,801
Total operating expenses .....	590,049,937	455,387,461
Taxes .....	19,014,599	15,412,661
Net railway operating income.....Def.	48,447,371	13,908,663

The following gives in brief the corporate income account:

	1920	1919
Compensation, January and February .....	\$13,156,968	
Guaranty, March 1 to August 31.....	37,981,814	
Net railway operating income, September 1 to December 31 .....	11,965,085	
Total .....	\$63,103,867	\$67,126,463
Non-operating income.....	24,562,834	25,233,906
Gross income .....	87,666,701	92,360,369
Deductions from gross income .....	54,865,028	49,492,271
Net income .....	32,801,673	42,868,099
Dividends .....	29,950,404	29,950,704
Balance to profit and loss.....	611,479	10,500,717

## New Books

*Steam Locomotives of the Present Time (Die Dampflokomotiven der Gegenwart).* By Robert Garbe. 7½ in. by 10½ in., illustrated. Volume 1, 859 pages; volume 2, 54 lithographed tables and drawings. Published by Julius Springer, Lindestrasse 23, Berlin W. 9, Germany.

This is a second edition of this well-known work originally published in 1907. The test has been brought up to date and an attempt has been made to present the same well-rounded survey of locomotive development in all countries that was given in the earlier work. Apparently the war interfered with the compilation of data and some parts of the book are unfortunately incomplete.

The book opens with a historical sketch of the use of highly superheated steam in locomotives and a discussion of the essential progress in locomotive building in the past 20 years. The first chapter deals with superheat as a working medium, the question being discussed largely from the theoretical viewpoint. The succeeding chapters are devoted to the calculation of the main dimensions of superheated steam locomotives, two-cylinder and multi-cylinder locomotives with simple and double expansion and the uniflow engine of which a rather extended discussion is given. Various types of superheaters are described and noteworthy structural details of more recent locomotives are discussed. A section is devoted to the latest developments in feed water heating. The superheated steam locomotives of the Prussian State Railways are described and the section following is devoted to superheated locomotives of various railroads in countries other than Germany. The American locomotives are described in this and in a previous chapter but the types shown cannot be classed as typical examples of the latest developments in motive power in this country. The results of numerous tests of superheated steam locomotives principally in Germany are set forth and it is notable that these are nearly all from seven to ten years old.

Apparently the principal shortcoming of the book is the lack of complete and up-to-date information concerning the locomotives built by the allied countries. This, however, is not of primary importance as American readers would be chiefly interested in the book for the information they might obtain regarding the progress that has been made in Germany in the years during which communication was interrupted. Apparently the descriptions of German motive power have been given painstaking attention and the work of German designers during and since the war, is here presented for inspection for the first time.

## Letters to the Editor

### "Economics at Small Expenditures"

HAILEYVILLE, Okla.

TO THE EDITOR:

The *Railway Age* of December 17 contained a letter on the above named subject by H. L. Reed, general superintendent of the Rock Island Lines. While no doubt the managers of the railroads are looking for men with new and effective methods for handling railroad work that can be put into practice without the expenditure of a great deal of money it has occurred to the writer many times that while they were looking for such men they would also look for men who can produce results with the facilities at hand and the methods already in effect.

Two of the important factors in connection with railroad operation are the cars and the locomotives. The capacity of the box car and the locomotive is about the same the year around.

Day after day train crews are called at terminals to leave at a certain time, but for some reason or other the greater per cent are late; some excuse is always offered: engine late, train not made up, bad order cars to set out, cars without bills in train, held up for incoming trains, etc., etc. Some conductors and engineers are always ready to go on time and some others are always late. It has been found that some crews make more overtime than others; yet the fellows who are behind seem to get along just as well as the one who gets over the road and saves the overtime.

When business slacks is the time to reduce all expenses and not wait two or three weeks to see if it will not come back and in the meantime the railroads are paying men for short days and the like.

Freight trains will leave a terminal and after they are out on the road some distance will begin to receive messages about certain work to be done on the trip. Except in the case of emergency, such instructions should be given them at the time the conductor is cleared at the terminal, thus giving him a chance to line up his brakemen and the engine crew in order to be ready to do it on reaching the designated places.

It does not seem right that a train crew should be permitted to live at one end of the run and the engine crew at the other and the company pay deadhead miles when any member of the train crew lays off or becomes sick simply because he lives away from the home terminal.

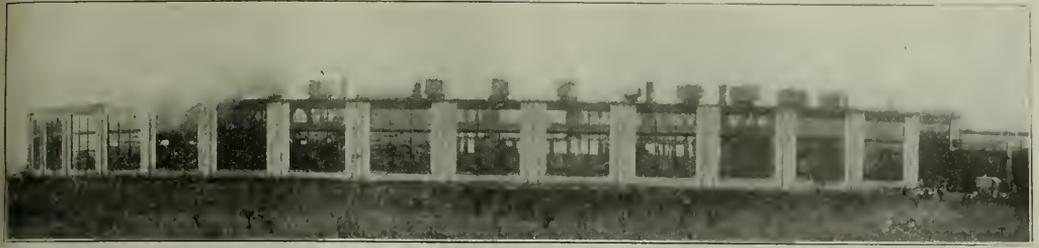

When engines are scarce, it does not look well to have two or three engines standing around idle and the railroad blocked with cars. Every day a foreign car is on the rails means an expense.

A great deal of expensive overtime can be eliminated by reducing train service on Sundays, thereby doing away with the services of many car men, machinists, etc.; dead freight and empties can lay in the yards over Sunday without any great inconvenience.

When trains exceed the speed limit and encroach upon the time of other trains, thereby inviting accident, it is time something is being done to remedy the condition. It does not require college graduates to detect the above lost motion in the operation of the railroads; and it is just the things mentioned above, and many more of a similar nature, which need correcting. The payrolls covering supervisory forces have been increased to an enormous extent during the past five or six years but the same old conditions still rock along. Who is responsible?

J. L. COSS,

Train Dispatcher, Chicago, Rock Island & Pacific.

The Outer Wall of the Engine House Is Largely Glass

## Small Engine Terminal Embodies Novel Details

Pere Marquette Roundhouse at New Buffalo Is Characterized  
by a Number of Unique Developments

THE PERE MARQUETTE has recently completed the construction of a new locomotive and freight terminal at New Buffalo, Mich., as the principal feature of a project to readjust the length of engine districts between Grand Rapids, Mich., and Chicago, and thereby obtain an improved operating arrangement. The engine terminal is of particular interest as an example of modern thought in details and arrangement as applied to a relatively small layout. A somewhat similar layout was completed about the same time for the Pere Marquette at Plymouth, Mich.

The New Buffalo project is an entirely new development designed to supersede the existing terminal at Benton Harbor, 29 miles further east. This change lengthens the Grand Rapids engine district from 86 miles to 115 miles and

Buffalo is a town of only a few hundred inhabitants, provision has also been made for a 50-room hotel for the accommodation of the terminal employees and train crews. The classification yard comprises a simple drill yard of 15 tracks averaging about 4,000 ft. in length in addition to running tracks for the main line and the La Crosse (Indiana) branch. A separate grid of tracks to the east of the classification yard provides a scale track, a caboose track and four tracks for car repairs. The operation of the classification

View from the Top of the Coaling Station

The Coaling Station

shortens the Chicago district to 63 miles, or to 50 miles to South Chicago. The district to the east of New Buffalo is thus made of a normal engine length, while that to the west is of a length that can be operated as a turn-around for certain classes of traffic. The primary advantage of the new arrangement lies in the fact that the New Buffalo terminal is located very near to a point marking a change in ruling grades, so that while engine rating east of New Buffalo is 2,400 tons, west of New Buffalo it is 3,200 tons. Consequently, one of the primary functions of this terminal is to adjust the train lengths to the ruling grades. It will also serve as the primary point for classifying trains for movement over the various branches of the road.

The facilities comprise a complete engine terminal, a classification yard and a car repair yard and, since New

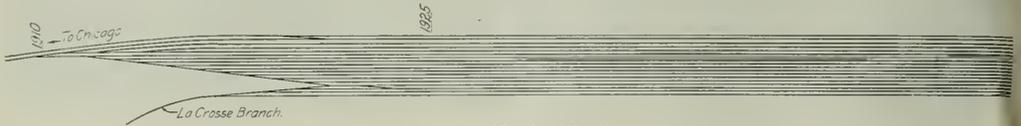

yard is facilitated appreciably by long switch leads extending 7,000 ft. to the east and 4,500 ft. to the west respectively. The track arrangement for the engine terminal is so simple as to require no explanation.

### The Engine House

The roundhouse has been built with 16 stalls with space left for 11 additional stalls without interfering with the existing track arrangement. The design of the roundhouse is marked by the efforts made to secure adequate light and ventilation. To this end the roof is generally higher than in

most roundhouses of the same general type. For instance, the windows in the outer walls have a clear height of nearly 20 ft. Further light is afforded by clerestory windows placed one panel back from the doors and also by 80 sq. ft. of glass area in each of the doors and the transoms over them. As a means of insuring permanent value to the glass area in

flood lights fitted with 100-watt nitrogen lamps. They are mounted in such a way as to be adjustable, both horizontally and vertically, so that in addition to providing general illumination, it is possible to concentrate the light on any portion of the space between the locomotives where work may be in progress. Further illumination is made possible by provision

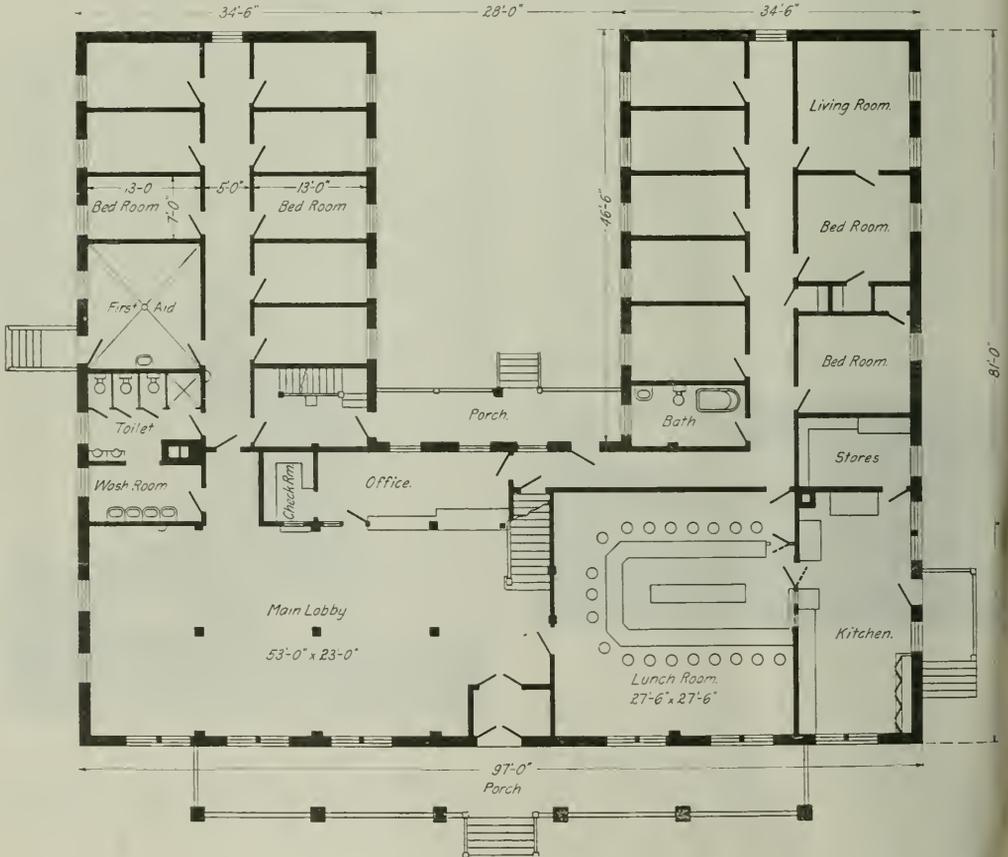

The Classification Yard

the clerestory windows, a gallery or permanent scaffolding has been provided throughout the entire length of these windows, so that the roundhouse forces will have no excuse for not keeping them clean.

Special pains have been taken also to provide adequate

for a plug receptacle in each stall for the use of extension cord lamps. The provision of high ceilings is only one measure taken to assure good atmospheric conditions in the house. A further effort in this direction is provision for smoke jacks of

First Floor Plan of the Employees' Hotel

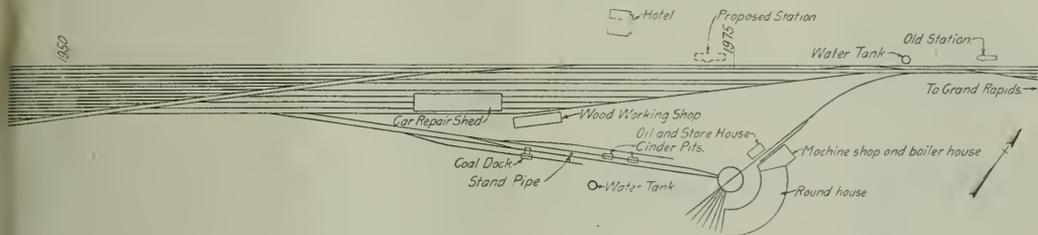

artificial light with rather unusual results. Instead of vertically hung lights, flood lights have been provided as shown in the plan with three in each line of posts, one on the pilaster in the outer wall, one on an intermediate line of posts and one on the door posts. These are the Utility type

wide spread, these being Johns-Manville Transit board jacks with a bottom length of 12 ft. To insure the elimination of smoke and gases which fail to enter the smoke jacks, a large ventilator of wooden construction has been provided over the midpoint of each stall. The results secured in the operation

of the engine house thus far, with these facilities for ventilation, have been fully up to expectations.

The roundhouse is of frame construction with brick walls, and follows the usual practice except for the use of cast iron door posts. Cast iron is also used extensively in the framing

at its inner end with a pit or manhole in which the return pipes for condensation from the heating coils is connected to the main return pipe, these catch basins being connected by a line of eight-inch sewer pipes through which the main return extends to a pit in the boilerhouse. From this the condensa-

The Engine Terminal

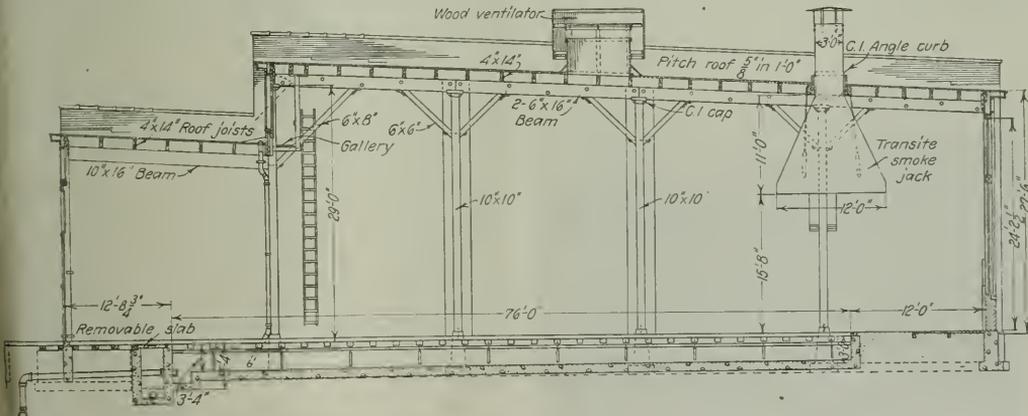

connections, following high-grade mill construction practice. Another unique feature of the locomotive doors is the use of old rails as door stops. These rails extend the full height of the door and are braced from the lintels by angle irons. The advantage of the full height door stop is that it eliminates a tendency to warp the door. The roof consists of 1 1/2 in. D. and M. boards on 4-in. by 14-in. joists, spaced 3 ft. to 3 ft. 9 in. center to center and covered with a five-ply tar and gravel roofing.

The Engine Pits

A refinement in the engine pit construction is seen in the extension of the pit walls in the direction of the turntable for

tion is returned by a steam trap to the boilers. A drop pit embracing Tracks 1 and 2 follows the usual construction except that it is fitted with angle iron bridges for the skidding of the rail girders, these bridges being so placed that they do not interfere in any way with the dropping of the wheels. For the present a heavy spread of cinders serves as a floor for the roundhouse with the exception of an 8-ft. walk extending the length of the outer wall.

Owing to the fact that all engines served by the New Buffalo terminal are pooled in the two adjoining engine districts and would, therefore, frequently run into Grand Rapids where the system repair shops are located, provision has been made at the new terminal for only minor repairs.

Longitudinal Section Through a Typical Stall

about nine feet beyond the inner ends of the pits, thus putting the pit rails on the same character of support to a point three feet outside the house. This insures perfect grade and alignment of the track within the house. The rails are spiked to 6-in. by 7-in. ties imbedded in the concrete walls at intervals of 2 ft. 6 in. These ties also serve as spiking timbers for the jacking planks which flank the track on either side. Owing to the fact that the roundhouse is heated by direct radiation with pipe coils in the pits, the tops of the pit walls are provided with a coping or overhang to serve as a support for the steam coil hangers and also to protect them from falling objects. The engine pits drain to a small catch basin at the inner end which is connected by a drain with a drainage system outside the house. Each engine pit is also provided

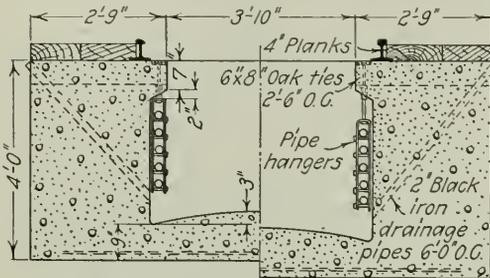

Consequently, the machine shop, the boilerhouse and the necessary offices were readily housed in a small wing located at one end of the roundhouse. The requirements for the boilerhouse are not extensive since all electric current for lighting and power use is being purchased from a local public utility, the only boiler capacity required being for heating purposes. The boiler room is equipped with two 150-hp. horizontal tubular boilers and the pumps required for boiler feed and for a National boiler washing system. The machine shop is floored with Kreolite creosoted wood blocks and the boiler room with paving brick.

The turntable is a 90-ft. deck table built by the American Bridge Company and operated by a Nichols tractor. Special pains have been taken to provide adequate subdrainage with

the use of a bed of cinders and a circle of six-inch drain pipes connecting with the catch basin.

### The Turntable

The auxiliary facilities of the engine terminal include a 250-ton Roberts & Schaefer coaling station of reinforced concrete and structural steel, a sand drying plant, two Robertson cinder handling plants, an oil and storage house and a 100,000-gal. conical bottom water tank built by the Chicago Bridge & Iron Works. The last named serves a standpipe between the inbound and outbound tracks. The water service

Typical Half Section of the Engine Pits

involves no particular problem at this point because of the existence of a pumping station and sand serving trains on the main line. The new work consisted of an extension from the existing pipe lines to the new tank and standpipe. The combined oil and storage house consists of a building 31 ft. by 63 ft. with one story and basement and having a reinforced concrete floor, while an area 18 ft. by 33 ft. on the first floor used for handling oil is provided with a reinforced concrete roof. The oil tanks are housed in the basement and the

The Inner Side of the Round House Is Well Lighted

portion of the first floor used for handling oil is separated from the remaining portion by fire walls with tin-clad fire doors.

### The Car Repair Shed

The car repair yard is served by a building 35 ft. 10 in. by 184 ft., of which a length of 42 ft. will be used as a woodworking shop, 70 ft. as a lumber shed, 21 ft. as a casting shed, 20 ft. as a storeroom and 30 ft. as a lunch room, toilet and office. This building will be entirely of frame construction. The lumber and casting sheds will be furnished with continuous rolling doors for easy access.

The hotel is a two story building in the shape of a "U." In addition to a main lobby, restaurant and some 50 rooms, shower baths, toilets and wash rooms, a small first-aid room has been provided owing to the absence of anything in the nature of a hospital in the community. In the absence of a public sewerage system, the outfalls of the sanitary plumbing of the roundhouse, car repair house, hotel and station, are to be run into two septic tanks.

In addition to the facilities above described which are now nearing completion, the plans for this terminal include a new passenger station with provision for office space on the second floor.

This terminal was designed and constructed under the direction of Job Tuthill, chief engineer of the Pere Marquette, Detroit, Mich., with Frank Manning as assistant engineer in charge. H. V. Snyder & Son, Battle Creek, Mich., was the general contractor. Work on this project was started during the period of government control but the progress was slow on account of two protracted interruptions. With the return to private control the work was prosecuted more vigorously and the engine terminal was turned over to the mechanical department on November 4, but other portions of the plant were not completed until sometime later.

## No Time to Reduce Rates

WASHINGTON, D. C.

THE PRESENT RAILROAD situation affords little prospect of reductions in freight rates, says Chairman Clark of the Interstate Commerce Commission in a letter to Senator Harris of Georgia, in reply to a letter inquiring as to the possibility of a reduction. Earlier correspondence between Chairman Clark and Senator Harris, who expressed the opinion that a reduction in rates would stimulate traffic, had previously been made public. Under date of March 5 Mr. Clark wrote:

"I wish it were possible for me to write you encouragingly in response to your letter of the third instant, but I do not see that I can add to what I said in my letter to you of December 22 on the same subject, to wit, the probability of reductions in freight rates.

"The situation is not so good now as it was in December. There has been quite a substantial falling off in general traffic.

"The average operating ratio of the railroads of the United States is something over 90. That means that for every dollar that the railroads earn they pay out in operating expenses more than 90 cents. Due to the narrow margin between revenue and operating expenses a great many roads are not earning their operating expenses and fixed charges and a good many are not even earning their operating expenses.

"Under these circumstances it is difficult to find an argument in favor of reducing rates unless in instances in which it can be shown that the rates are stifling the traffic and that lower rates which would still be compensatory would effect a movement from which there would be some return.

"I have just been going over some figures of the shipments of fruits and vegetables from Florida for the season 1920-1921 as compared with the season 1919-1920. These figures show that from November 1, 1919, to February 28, 1920, both dates inclusive, the number of carloads of fruits and vegetables shipped from Florida by rail was 26,886 as compared with 28,420 carloads during the same period in the season of 1920-1921."

A similar letter was also sent to a Florida senator who has been urging reductions in rates on the ground that the high rates have prevented the movement of Florida products.

# Employees Win Verdict in Erie Controversy

Labor Board Finds Carrier Guilty of Violating Wage Rulings—  
National Agreements Hearings Continue

THE ACTION of the Erie Railroad in ordering reductions in the wages of its track laborers, the re-establishment of the seven day week for the train dispatchers and the deduction of one day's pay from all employees, without negotiation with the men affected, was condemned by the Railroad Labor Board in a decision dated March 2 and announced on March 7. This decision found the Erie guilty of violating the Board's Decision No. 2 on six counts and denied jurisdiction in the controversy over wages until proper conferences have been held and a disagreement reached.

The progress of this controversy has been reported in the *Railway Age* of February 18 (page 412), and of March 4 (page 520).

After reviewing the history of the controversy the Board handed down an opinion which follows in part:

The intent of Congress in enacting Title III of the Act was to prevent interruption to the operation of any carrier growing out of disputes between the carrier and its employees. To accomplish this intent the Act (Section 301) makes it the duty of all carriers, their officers, agents and employees to exert every reasonable effort and to adopt every available means to avoid any interruption to operation growing out of disputes between the carrier and its employees. The same section requires the carriers and their employees to consider and if possible to decide all such disputes in conference between the representatives designated and authorized so to confer by the carrier or the employees directly interested in the dispute. This section also requires that if the dispute is not decided in conference, it shall be referred by the parties thereto to the Railroad Labor Board, which board by Section 307 is required to hear and decide such disputes so referred.

In April, 1920, an organization of railroad yard employees which was not a party to the conference of March 10, 1920, referred to above, after unsuccessful efforts to decide their disputes with the carrier by conference, abandoned the service in concert and made application to this Board for a determination of what should constitute just and reasonable wages for them. Prior, however, to the application, the Labor Board had adopted Order No. 1, which provided in part as follows:

It is decided and ordered by the Labor Board as one of the rules governing its procedure that, as the law under which this Board was created and organized makes it the duty of both carriers and their employees and subordinate officials having differences and disputes to have and hold conferences between representatives of the different parties and interests, to consider and if possible to decide such disputes in conference, and where such dispute is not decided in such conference to refer it to this Board to hear and decide; and as it is further contemplated and provided by the law that pending such conference, reference to and hearing by this Board it shall be the duty of all carriers, their officers, employees and agents to exert every reasonable effort and adopt every available means to avoid any interruption to the operation of any carrier growing out of any such disputes; therefore, this Board will not receive, entertain or consider any application or complaint from or by any party, parties or their representatives who have not complied with or who are not complying with the provisions of the law or who are not exerting every reasonable effort and adopting every available means to avoid any interruption to the operation of any carrier growing out of any dispute between the carrier and employees.

The intent and plain meaning of Order No. 1 was to serve notice on employees and carriers alike that the law required carriers and their employees to consider their disputes in conference and refer them, if undecided, to this Board and to refrain, pending this Board's decision, from any act which would tend to bring about an interruption to commerce.

The application of the striking yard employees was not entertained, as they were not acting in obedience to the mandate of the Act.

The officers of the Erie Railroad Company have been at all times aware of Order No. 1.

On December 17, 1920, the Labor Board issued an announcement, which said in part:

The Labor Board calls upon the officers of all carriers subject to the Act to obey it in letter and spirit and particularly calls upon them to meet in conference representatives of the employees seeking the decision of disputes to decide such disputes in conference, if possible, and if not possible to join in referring such disputes to this Board, and to refrain from in any manner intimidating employees seeking the redress of grievances or punishing representatives of employees seeking conference.

The Labor Board also calls upon all organizations of employees of carriers subject to this Act to obey it in letter and spirit and particularly calls upon them to join in a reference of the dispute to this Board if it is

not possible to decide it in conference, and to refrain from submitting strike ballots to the membership in advance of such reference.

The interest of the public as well as that of the officers and employees of carriers requires that such officers and employees faithfully observe the provisions of the Act. Departures from its letter and spirit, if persisted in, will be widely imitated, its purposes destroyed, transportation interrupted and the well-being of our people impaired.

The purposes of this announcement have been fulfilled by the compliance of substantially all carriers and organizations of employees of railroads.

The officers of the Erie were furnished with copies of this announcement, and it is believed they were fully aware of its contents long prior to the promulgation by them of the orders complained of herein.

At the hearing on February 23, 1921, the position of the carrier on the charge of violation of Decision No. 2 was stated by its counsel. This statement, it is believed, may be fairly thus summarized:

The decision alleged to have been violated is Decision No. 2. Decision No. 2 found the wages therein determined to be just and reasonable, to be such on July 20, 1920; the decision did not find those wages to be now just and reasonable. The Labor Board is without power to determine wages for an indefinite time. The decision did not specify how long it was to remain in effect. When certain conditions upon which the Labor Board had predicated its findings have substantially changed since the decision, as in this case, the relation between wages and the cost of living and the scale of wages paid for similar work in other industry, departure by the carrier from the decision does not constitute such a violation of Decision No. 2 as to justify a finding of violation by this board.

It was contended that the said condition had in fact changed. Evidence of such change was offered in the shape of statements by the general manager tending to show a reduction in the scale of wages paid common labor and a reduction in living costs.

No evidence was offered of any change in the scale of wages paid for work similar to that of train dispatchers.

As to the carrier's departure from the rules and working conditions assumed as a basis of wages by Decision No. 2, and as to which the Labor Board had directed no changes should be made except by agreement, it was contended that the carrier had never accepted that portion of the decision, although it had, prior to the orders complained of, obeyed such direction, and is now participating by its representative in the proceedings to determine the reasonableness of such rules.

The position of the carrier and the evidence submitted have had careful consideration.

It was not the intention of this Board that Decision No. 2 should constitute a perpetual edict, nor is there any expression therein to justify such an inference. The carriers and the organizations of their employees were left free by that decision to negotiate such agreements as they saw fit, subject to the power of this Board to suspend any such agreement if it should involve such an increase in wage as would be likely to necessitate a substantial readjustment of the rates of any carrier. No restraint was attempted to be placed upon the power and legal duty of the carriers and their employees, if it was not possible to agree upon a readjustment of wages, to refer the dispute to this Board for decision. This Board sits day and night to hear, consider and decide such disputes. It was the intention of the Labor Board, however, that the rates found therein to be just and reasonable should be paid by carriers parties to the decision until other rates should be agreed to by the parties or until this Board on proper reference should determine other wages to be just and reasonable.

A decision voidable in whole or in part by one party to proceedings at its option upon any change in conditions determined by that party to be substantial is a novelty in law and as fantastic as novel. Its bare statement would seem to carry refutation, yet it was gravely advanced by the learned counsel for this carrier. Its consequences are, therefore, stated.

This position, of course, renders nugatory and vain the elaborate and costly processes established by the Act and applied by this Board. It sweeps aside at the will of one party a decision arrived at after the presentation of evidence and argument by the many parties to the dispute, accepted by all and now obeyed by substantially all carriers. It justifies a disregard of the factors specified by Congress for the ascertainment of just and reasonable wages and substitutes for these factors the financial benefit of the carrier. If valid, the intent of Congress that conference,

reasonableness and justice should be substituted for power, violence and disorder in the settlement of railroad labor disputes is utterly destroyed and legislation enacted after the most careful consideration rendered ridiculous and even fraudulent. If a carrier may arbitrarily reduce wages decided to be reasonable and set aside rules while a party to proceedings with regard to such rules, no reason appears why railroad employees may not announce an immediate intention of abandoning the service in concert unless demands for increased wages or more favorable working conditions are at once satisfied, provided a trend toward higher living costs shall have appeared or wage scales in similar industries shall have advanced. Such conduct is highly provocative of interruption to traffic and is not only not consistent with the Act, but is thereby clearly condemned and prohibited.

It is the judgment of this Board that no carrier may, without violating the spirit and letter of Decision No. 2, in case its revenue for any month should be estimated to be insufficient to meet its expenses for labor and material for that month, arbitrarily appropriate to itself wages due its employees in such amount as to make expenses for labor and material equal or exceed revenues for that month.

It was not, in the judgment of this Board, the intention of Congress that, consistently with Title III of the Transportation Act, a carrier may join in the reference of a wage dispute to the Labor Board, accept its decision, apply increases in rates in part authorized by the Interstate Commerce Commission to provide for wage increases decided by this Board to be just and reasonable, and, if revenues of any month are estimated to fall below expenses for that month, arbitrarily reduce wages to such a point as to bring estimated expenses for any month within estimated revenues for such month.

There is a simple, orderly and legal method open to all carriers to secure appropriate relief in case they are of the opinion that the wages fixed by Decision No. 2 are not just and reasonable. If, after the failure of conference between duly authorized representatives of the carriers and of the employees directly interested to decide a dispute and reference to the Board thereof, the carrier is able to show that the wages fixed by Decision No. 2 are not now just and reasonable, this Board will, as its duty is under the law, decide what wages are just and reasonable.

This procedure was at all times well known to the officers of the Erie Railroad.

The Transportation Act makes it the duty of this Board in case of disputes as to wages duly referred to it to determine what wages are just and reasonable. It is, therefore, clear that Congress intended that carriers should pay just and reasonable wages in order that transportation should not be interrupted by strikes over wage disputes. Congress was aware that there might be disagreement between the parties as to what constituted just and reasonable wages and in order to secure uninterrupted transportation during the pendency of the controversy made it the duty of the officers of carriers to confer with the representatives of the employees interested. Section 301 clearly expresses this intent and requires the performance of this duty. The relation between the scale of wages paid for similar kinds of work in other industries and the relation between wages and the cost of living are not the only factors determining reasonable and just wages.

Five other factors are named in the Act and other relevant circumstances are required to be considered by this Board and also inferentially by carriers, in determining just and reasonable wages. Furthermore, it is clear that Congress intended that the scale of wages paid in other industries and the relation between wages and the cost of living should be of sufficient certainty and stability to warrant the increase or reduction of wages by reason of changes in this factor. It will require time to determine whether the scale of wages now paid by other industries for the classes reduced in pay by the Erie is temporary or of sufficient permanence to be considered as a factor affecting justness and reasonableness of railroad wages. This necessity was recognized by the President of the United States on August 25, 1919, when he urged railroad employees to refrain from pressing their demands for increased wages pending a better opportunity to estimate the permanency of high living costs. This request was obeyed by such employees, although obedience required the endurance of heavy economic pressure for eleven months, and living costs continued to rise during this entire period. No evidence except a claim of general information to that effect was offered by the Erie of a substantial reduction in living costs. According to the Department of Labor statistics, these costs have receded 11.4 per cent from July 1, 1920, to February 1, 1921.

No evidence was offered by the carrier of any changes in the scale of wages paid for similar kinds of work in other industries except as to common labor.

No relation was shown or attempted to be shown between the changes claimed in the factors specified and the reduction made. It is the opinion of this Board, accordingly, that the action of

the Erie is not even consistent with the legal theory advanced by its counsel.

It was also suggested by the counsel for the company that Title III imposed no duty on officers of carriers to confer with representatives of organizations of employees. This suggestion is contrary to the plain meaning of the requirement of Section 301 that all available and reasonable means and efforts must be adopted and exerted to avoid interruptions to operation growing out of any dispute between carriers and their employees. All such disputes are to be considered and if possible decided in conference between representatives designated and authorized so to confer by the carriers and employees directly interested in the dispute. The evidence shows that the representatives of the employees directly interested so designated and authorized were the designated officers of the complaining organizations. It was clearly the legal duty of the carrier's designated officers to confer with such designated officials of these organizations. This duty was admitted by the general manager of the carrier, but as to the complaining organizations it was not performed.

It was the position of the general manager that the financial necessities of the property compelled the action taken. The evidence of necessity offered consisted of the statement that the estimated expense for labor and material for December exceeded the estimated income for that month by 1 per cent and for the month of January by 7 per cent.

This is not a proceeding to determine what wages are now just and reasonable as to this carrier for the classes of employees concerned herein. It is to determine whether or not there has been a violation by this carrier of Decision No. 2 of this Board.

When the Erie Railroad Company shall have rescinded the orders set out above and shall have paid the wages determined by Decision No. 2 to be just and reasonable, to such of its employees as have not agreed to receive other rates of wages and when also it shall be made to appear that the officers of this carrier have had or sought a conference with the authorized and designated representatives of the employees directly interested and when, if it has not been reasonably possible to decide the disputes in conference, the dispute shall have been referred to this Board by the parties thereto or by either of them, this Board will hear and determine such dispute and decide what wages are now just and reasonable.

This Board cannot consider in this proceeding what wages are now just and reasonable for the employees concerned herein.

The management of the Erie, in reducing wages and in altering working conditions without seeking conference with the representatives of the employees interested, in the opinion of this Board, has acted in conflict with Section 301 of the Act and in conflict with Order No. 1 quoted above. Therefore, this Board may not, consistently with Title III of the Act and with the said order, determine just and reasonable wages in this dispute.

The actual decision of the Board was rendered as follows:

It is the judgment and decision of this Board that the management of the Erie Railroad Company has violated Decision No. 2 in the following respects:

(1) By deducting the January 31st earnings from the January earnings of all monthly rated employees not consenting to such deductions.

(2) By deducting four-twenty-eighths of the February earnings of all monthly rated employees not consenting to such deduction.

(3) By deducting January 31st earnings from the January earnings of such daily and hourly rated employees classified prior to wage awards as monthly rated employees who have not consented to such deduction.

(4) By deducting four-twenty-eighths of the February earnings of the employees set out in (3) above who have not consented to such deductions.

(5) By arbitrarily reducing the wages of trackmen to 30 cents per hour and to other hourly rates contrary to Section 6, Article III of Decision No. 2.

(6) By arbitrarily requiring train dispatchers to work seven days per week for wages determined by this Board in Decision No. 2 to be just and reasonable for six days' work per week, contrary to Article V of Decision No. 2.

This decision is not to be construed as a finding that the carrier has not violated Decision No. 2 in other respects.

### Atlanta, Birmingham & Atlantic Employees Strike

Employees of the Atlanta, Birmingham & Atlantic, the first carrier to come before the Board to justify a reduction in wages on March 5, went on the first "authorized" strike since the Board was created. About 1,500 men walked out and traffic on the road is at a standstill. B. L. Bugg, president and receiver of the road, has announced that new men will be employed and operation resumed as soon as possible.

This development came after a series of rapid events commencing with the carrier's announcement of a wage reduction effective on February 1. The progress of these developments was recited in the *Railway Age* of February 4 (page 319), of February 11 (page 367), of February 18 (page 412), of February 25 (page 454), and of March 4 (page 520). After appointing Mr. Bugg receiver of the road, Judge S. H. Sibley of the United States District Court of Atlanta, Ga., issued an order putting into effect the wage reductions which Mr. Bugg had previously asked the Labor Board to authorize. It is against this ruling that the men are striking.

Heads of railroad unions in Chicago declare that the strike has been called to enforce compliance on the part of the carrier with the provisions of the Transportation Act. Their position is that the wage cut is in violation of the order of the Labor Board that no reduction be made pending further conferences between the line and its employees.

Members of the Labor Board have unofficially taken the ground that an "extremely delicate" situation has arisen out of the action of the carrier in cutting wages under the order of Judge Sibley. The present issue therefore is whether or not a federal court can override a decision of the tribunal established by the Transportation Act. Some of the union chiefs hold that nothing short of a decision from the United States Supreme Court will make clear the relation of the Board to the federal courts.

March 26 has been set by Judge Sibley as the date upon which hearings on the revised wage scales will be held. The Labor Board has taken no further action.

#### Missouri & North Arkansas Strike Continues

A situation somewhat similar has already arisen on the Missouri & North Arkansas, where the employees have been on strike for over a week. The latest returns from Harrison, Ark., the headquarters of the road, indicate that with the return of some of the strikers, together with the employment of new men, normal service is gradually being resumed. C. P. Phelan, general manager of the road, has announced "that no unions will be recognized hereafter and that Missouri & North Arkansas will be operated from now on as an 'open road.'"

The development of this controversy was described in the *Railway Age* of February 25 (page 454), and of March 4 (page 520). These three cases are viewed by many as means whereby the prerogatives and power of the Labor Board, and the intent of the labor provisions of the Transportation Act may be definitely settled.

#### Individual Carriers Act to Reduce

##### Wages of Unskilled Labor

Acting in accordance with the suggestions made by the Labor Committee of the Association of Railway Executives recently several of the carriers have requested representatives of their unskilled labor to participate in conferences at which the justness and reasonableness of proposed reductions in their basic wages are to be discussed. This course is in conformity with the provisions of the Transportation Act. It is not probable that agreements will be reached at these conferences and they will accordingly be referred to the Labor Board for settlement. Among the roads which have already requested conferences with their unskilled labor are the New York Central, the Pennsylvania, the Delaware, Lackawanna & Western, the New York, New Haven & Hartford, the Boston & Albany, the Boston & Maine, the Michigan Central, the Cleveland, Cincinnati, Chicago & St. Louis, the Northern Pacific, and the Missouri Pacific.

#### Executives Abolish Labor Committee

At a meeting of the Association of Railway Executives held at New York on March 4 the labor committee, of which

General W. W. Atterbury is chairman, was abolished, the Association asserting that the committee had virtually completed its work and that its further maintenance was a constant invitation to seek a uniform settlement of labor matters which ought to be settled between each railroad and its own employees. The Association also decided to stand clear of national boards of adjustment, declaring itself in favor of decentralization of labor relations.

Following the meeting, Thomas DeWitt Cuyler, chairman of the Association, issued a statement which said:

At its meeting today the Association determined to abolish its labor committee. This action was taken on the recommendation of the committee itself. The committee has now substantially performed its work and its further maintenance is a constant invitation to seek additional and uniform settlement of labor matters which ought to be settled between each carrier and its own employees. Many of these settlements should differ on different railroads and in different parts of the country.

The railroads never have desired national and uniform action on labor matters. But on the termination of federal control they were faced with certain arrangements which had been applied on each and every railroad without variation.

In connection with national boards of adjustment, the national agreements now before the United States Railroad Labor Board, and the wages of unskilled labor, the railroads have been moved by one fundamental policy, namely: the endeavor to restore to the individual managements the opportunity of dealing directly with their own employees and of having a reasonable voice in determining the conditions under which they fulfill their individual responsibilities to the public for efficient and economic management.

Since the whole effort of the railroads' labor matters has been directed toward a reasonable decentralization, with its opportunities for variation in close relation to differing conditions in different parts of the country, the decentralization of the handling of labor problems would seem now to be warranted, and is taken as an evidence of good faith behind the fundamental policy which the railroads have been pursuing.

#### Jewel Asks Board to Subpoena Labor Committee

B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, on March 5 asked the Labor Board to subpoena the members of the Association's labor committee, which was abolished, to appear as witnesses when he resumed his reply to the presentation made on behalf of the carriers in the national agreements controversy. The request was filed by Mr. Jewell as an answer to the action of the Association in abolishing the committee.

Several days previous Mr. Jewell filed a letter with the Board charging that the railway executives are in a state of dissension over the question of abrogating national working agreements. He urged that before proceeding further with the cases now pending the Board should rule on the request of the unions for a national conference with the railway managements over the agreements.

The letter charged that a year ago a majority of the railroad executives were in full accord with the union leaders on the question of establishing bipartisan boards of adjustment and declared that Gen. W. W. Atterbury as a "minority of one had ridden roughshod" over the other executives.

"He prepared a minority report," the letter states, "and presumably because of the support which he was able to secure from the financiers who dominate the transportation industry, was able to thwart the will of the other executives, prevent the establishment of the national boards of adjustment, and refuse any conferences on national agreements."

#### Pennsylvania Proposes Blanket Reductions

The Pennsylvania Railroad has announced its intention to reduce wages not only of unskilled labor but of all employees and officers as well. An announcement issued Wednesday by the Board of Directors points to the necessity of reducing expenses and says, "a foundation for the restoration of normal business cannot be laid until there has been a frank recognition of the real situation and a readjustment of wages

to meet the altered conditions." The announcement read as follows:

In view of the changed economic conditions it is a manifest obligation to the public generally, and especially to shippers, passengers, investors and stockholders, that railroad expenses be reduced. The management of the Pennsylvania Railroad has already made a reduction of over 70,000 men in its personnel, seriously curtailing maintenance of roadway and equipment, consolidated divisional organization and has stopped all expenditures on new work.

Even with such economies as have already been enforced, it takes almost the whole of current earnings merely to pay current operating expenses. It is evident that the requirements of the Transportation Act that railroads shall be administered in an efficient and economical manner cannot be satisfied without still further reductions in expenses. In February, 70 per cent of all Pennsylvania System operating earnings were absorbed by charges for labor against a normal charge for labor of less than 50 per cent of earnings.

A foundation for the restoration of normal business cannot be laid until there has been a frank recognition of the real situation and a readjustment of wages to meet the altered conditions. The more promptly an adjustment to the inexorable facts is made, the more promptly can those who are now idle be re-employed and a basis established for renewed prosperity. In making a readjustment of salaries and wages, it is but fair and proper that the burden should be borne by all officers as well as employees.

It is accordingly resolved that the executive officers of the Pennsylvania Railroad Company are directed to give as promptly as possible proper notice that it is the intention of this company to reduce the salaries and wages of officers and employees to accord with economic conditions.

In readjusting salaries and wages, the management shall have due regard among other relevant circumstances, to

1. The scale of wages paid for similar kinds of work in other industries.

2. The relation between wages and the cost of living.

3. The hazards of employment.

4. The degree of responsibility.

5. The training and skill required.

6. The character and regularity of employment, and

7. Inequalities of increases in wages or of treatment, the result of previous wage orders or adjustments, certain of which items are variable, differing materially as between various localities over so large an area as that covered by the Pennsylvania System. This differentiation shall be recognized in all readjustments.

Such reductions as are made in salaries and wages shall bear an equitable relationship to the increases in pay made since January 1, 1918. The equitable differentials which should apply between various classes of employees shall be maintained or restored.

All procedure in effecting such readjustments of salaries and wages shall be taken in an orderly manner and in strict accord with the Transportation Act.

### National Agreements Hearings Continue

The presentation of rebuttal statements on behalf of the clerks, train dispatchers, signalmen and maintenance of way workers continued during the past week. The remarks of the representatives of the United Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees were outlined in the *Railway Age* of March 4, (page 519). E. H. Fitzgerald, grand president of that organization, was followed on the stand by J. G. Luhrsen, president of the American Train Dispatchers Association, who opened his presentation with the charge that the following roads have violated the "existing" agreement with the American Train Dispatchers Association: the Atlanta, Birmingham & Atlantic, the Atchison, Topeka & Santa Fe, the Atlantic Coast Line, the Boston & Maine, the Bessemer & Lake Erie, the Buffalo, Rochester & Pittsburgh, the Baltimore & Ohio, the Chicago & North Western, the Central Vermont, the Chicago, Rock Island & Pacific, the Chicago & Alton, the Central of Georgia, the Chicago Great Western, the Chicago, St. Paul, Minneapolis & Omaha, the Chesapeake & Ohio, the Chicago, Terre Haute & Southeastern, the Chicago, Burlington & Quincy, the Central Railroad of New Jersey, the Denver & Rio Grande, the Detroit, Toledo & Ironton, the Davenport, Rock Island & Northwestern, the Delaware, Lackawanna & Western, the Detroit & Mackinac,

the Erie, the El Paso & Southwestern, the Fort Dodge, Des Moines & Southern, the Grand Trunk, the Georgia & Florida, the Gulf, Colorado & Santa Fe, the Great Northern, the International & Great Northern, the Illinois Central, the Joplin & Pittsburg, the Kansas City Southern, the Long Island, the Lehigh Valley, the Louisville & Nashville, the Los Angeles & Salt Lake, the Missouri, Kansas & Texas, the Missouri, Kansas & Texas of Texas, the Minneapolis, St. Paul & Sault Ste. Marie, the Michigan Central, the Missouri & North Arkansas, the Mississippi Central, the Mobile & Ohio, the Missouri Pacific, the Maine Central, the New York Central, the Northern Pacific, the Nevada Northern, the Oregon Short Line, the Pennsylvania, the Pere Marquette, the Philadelphia & Reading, the Pacific Coast, the Quincy, Omaha & Kansas City, the Southern, the Southern Pacific, the St. Louis Southwestern, the St. Louis-San Francisco, the Spokane International, the Spokane, Portland & Seattle, the Toledo, St. Louis & Western, the Texas & Pacific, the Tidewater Southern, the Utah, the Union Pacific, the Wabash, the Western Pacific and the Western Maryland.

Mr. Luhrsen later supplemented these charges with specific instances in which these individual roads are alleged to have violated various rules of the "existing" agreement.

To a large extent the testimony offered by the organizations so far has been an attempt to refute the statement made by Mr. Whiter to the effect that economical and efficient operation cannot be obtained as long as the national agreements are continued in effect. Mr. Luhrsen voiced the employees' stand in saying, "I charge that the greatest single factor today making for the dissatisfaction of employees is inequality of treatment in the matter of both wages and working conditions by employers. With the elimination of the greatest source of discontent and dissatisfaction you will have gone far toward the securing of employees who will labor in harmonious co-operation for the common good of their employers, and thus have increased the efficiency of the carriers."

That the carriers have taken advantage of the absence of rules and regulations governing the working conditions of train dispatchers to deprive them of the agreed return for their labor, was charged by Mr. Luhrsen in his presentation to the Board.

In support of this charge he cited numerous instances where it is alleged train dispatchers have been deprived of their full pay as interpreted by the employees.

In summarizing his presentation on March 7, Mr. Luhrsen said:

"We have shown that train dispatchers have suffered the disadvantage attaching to both officers and employees without enjoying the advantages of either class. We have demonstrated by actual illustration the injustice that has resulted and is resulting by reason of the lack of rules and regulations at issue before this Board. In clear and unmistakable language we have shown the necessity for, and beneficial effect of, the establishment of these fundamental principles governing the working conditions of train dispatchers. We have pointed out in minute detail the chaos, dissatisfaction, discontent and general inefficiency that will result by failure to establish or maintain these fundamental principles in some concrete form that will permit of their enforcement. We have submitted argument and evidence to refute the theory advanced by the carriers that the establishment of these fundamental principles will in any manner destroy confidential relations between train dispatchers and their superior officers and have uncovered the motives of the carriers in objecting to the establishment of the rules and regulations we have presented here. The distinction of the carriers, despite their repeated statements to the contrary, to negotiate rules and regulations governing the working conditions of dispatchers on the individual properties have been clearly demonstrated.

"We have waited patiently for the carriers to offer any reasonable or sound objection to the establishment of these rules and regulations and have so amended and modified our original presentation as to eliminate those portions to which merited objection was raised by the carriers. The carriers have signally failed to show wherein any single rule is either unfair, impracticable or un-

reasonable and we stand ready and willing either at this late date to so amend or modify our proposed regulations as to eliminate any rule which upon analysis proves unfair or impracticable."

The representatives of the signalmen and maintenance of way workers followed Mr. Luhrs on the stand. Ab-

stracts of the testimony presented by these organizations will be included in next week's *Railway Age*.

On account of the time consumed in these rebuttal statements, the date of the reappearance of Mr. Jewell before the Board has been postponed until March 14.

## What Can Be Done to Reduce Freight Claims

Loss and Damage Payments Becoming Increasingly Larger  
—Steps Must Be Taken to Reduce Them

By W. P. Holabird

Inspector Freight Claim Dept., Erie Railroad, Huntington, Ind.

**T**HE FREIGHT LOSS and damage claim payments made by the carriers have been increasingly large during the past two or three years. In a measure this increase has been due to the higher market value of the freight transported. Consequently when reductions in market values occur, the carriers will possibly be able to show some reduction in loss and damage disbursements. However that may be, freight claims are much higher than they should be and can be attributed to one or another of 11 general causes, namely, losses from stations, pilferage, careless sealing of cars, errors of employees, rough handling of cars, mishandled waybills, careless inspection of equipment, failure to safeguard perishable freight, neglect in reporting stray shipments, carelessness in handling refrigerator cars, and incomplete bills of lading.

Losses from stations frequently occur when a shipment is unloaded at destination and one or more pieces in the shipment are found to be damaged and are sent to the cooperage shop for reconditioning. These articles are often delayed at the shop and the balance of the shipment is delivered with too brief an explanation of the cause of the delay. The tally, as well as the delivery portion of the freight bill, should contain enough information to enable the delivery clerk to know the exact location of the freight that he would otherwise check short.

Should it develop that a shipment is complete when it is checked out of a car but is short when delivered, the clerk should be notified immediately. The police department should also be notified so as to enable its representative to investigate at once.

All freight house labor, especially at the larger stations, should be required to pass through one gateway or door in going to and from work. Police department representatives should always be present at these times to see that employees do not carry away company property. It is impossible to formulate any special measures which the police department should follow in the discharge of its general duties, as circumstances alter cases in this line of work. But from a freight claim standpoint, there are two very important preventive measures which should be employed. One is a complete and accurate seal record made at all stations. The other is a system for sending to the police department promptly a copy of all damage and short reports when the circumstances indicate pilfering.

Side doors of merchandise cars (except peddler cars) should be secured by a small block of wood at the rear of the door about two feet below the roof of the car. End doors should be cleated on the inside. Cars of merchandise should be assembled in terminal yards and if delay can be avoided these cars should be put into one train. The police department should appoint a representative to ride on these trains periodically over the entire division.

It is advisable to make frequent checks of seal records. This check should be made by obtaining billings from yard officers in terminal yards, not only to find the contents of the cars, but also to determine the car numbers and the junction points where the cars reached the carrier's rails. A complete record of seals should be made at this time. Finally a visit ought to be made to the different junction points to verify the seal record taken by the junction agent in order to discover whether he is properly recording the full reading of the seals.

### Waybills Frequently Mishandled

A loading system should be in effect at all merchandise transfers and large stations which will verify the proper loading of each shipment. Such a system falls short, however, unless it is followed by a system of invoicing and mailing of waybills on freight shipped in less than carload lots. It should be made known that waybills are being properly mailed to points where the cars are listed and that there is a waybill for each piece of freight in the car. This refers to all merchandise cars (with the exception of way cars) where the waybills accompany the cars. If freight is shipped to the wrong destination and is buried in the car in such a manner that it cannot be removed at the loading point, the waybill should by all means accompany the shipment to avoid separation of the shipment from the waybill when making its return journey. It is safe to say that 75 per cent of the "over freight" on all railroads is due to the mishandling of waybills.

To prevent freight claims resulting from defective cars, a low grade of equipment should be used for the loading of hides, oil and similar commodities to save cars in good condition for high class merchandise. These low grade cars should be marked, not by a tag or chalk mark, but by a stenciled wood block. Car inspectors should be instructed to assume responsibility for the inspection of all equipment placed for loading, and should keep a record of all cars inspected, showing whether they are fit for loading and if they are, for what class of freight.

Carload perishable freight which is transferred on account of mechanical defects should be placed promptly by yard crews, and the transfer started immediately. In warm weather the car to which the freight is to be transferred should be sufficiently cooled so that the lading will not be injured when the transfer has been completed.

### Stray Shipments Must Be Reported

One of the greatest contributors to shortages under loading seals is the failure of junction agents to issue over reports covering stray shipments which are moving to connecting lines. When claims for shortage of entire packages are filed covering shipments destined to foreign lines, there is no

way to locate the route traveled by the shipment if no over reports have been issued.

This difficulty might be overcome by having the agent issuing the stray waybill make the necessary over report. In any event, these shipments should not be delivered without complete proof of ownership. If this is to be secured from consignees by a personal call or a letter, stray waybills should be carefully checked against each shipment to ascertain order numbers, requisition numbers, the name of the shipper and any other information shown on the shipments. They should then be sent to the consignee or shipper with some information that will be of benefit to him in securing the information desired.

A standard form of ice plug should be adopted on all refrigerator cars. To keep the dispatchers well posted, all train temperature records should be taken at least every four hours. It might be well for dispatchers to send messages to conductors in charge of such trains reminding them when the temperature is at the freezing point, so that they can close all ventilators, except on those cars which are billed to travel otherwise. Standard thermometers should be placed at all water stations and important stations where it is the custom of conductors to look over their trains. This will enable the conductors to keep proper temperature records should it be necessary for them to operate the ventilators while the cars are in their charge.

Periodical checks should be made at junction points and ice houses and also on trains carrying cars under ventilation, to see that the crews are operating the vents properly. This check should be made especially during changeable weather conditions.

#### Thorough Organization Necessary

The question naturally arises as to how the carriers can accomplish all the preventive measures referred to in this article. Much can be done if every railroad employs a freight claim representative on each division, reporting to the freight claim agent. These men should have station and warehouse experience and should co-operate closely with officers and department heads.

Regular monthly claim prevention committee meetings should be held on all divisions, attended by the heads of all the departments, with the superintendent presiding and the freight claim department representative acting as secretary. All business brought up at these meetings should be carried on the minutes until it has been disposed of or corrected. In addition to this, a general committee should be organized consisting of officers having jurisdiction over two or more divisions, to handle all matters that cannot be taken care of by the divisional committees.

To prevent claims, we must prevent the causes which lead to claims.

## "The Spirit of Safety First"\*

By Charles E. Norman

Switchman

**S**AFETY FIRST should be the uppermost thought of employees at all times. It is our duty to use safe methods of doing our work so as to avoid accident and keep our casualty lists down. Mistakes will sometimes be made which cause an accident. Mistakes can be remedied, but the loss of life or limb to a fellow employee and the loss by damage to property cannot be replaced. So let us study the cause, discuss it with fellow employees, get in harmony with one another and try to make the Safety First spirit dominate our every act.

Many accidents are the result of some employees taking a chance. In my judgment this is one of the greatest debits against Safety First. Chance has no place in railroad work. The man who takes a chance will get in bad sooner or later.

If an accident is caused by a defect in track or equipment, report the facts at once to the proper officer, so that it and similar defects may be corrected at the earliest moment. If caused through negligence, free discussion will cause other employees to be on the alert.

Many personal casualties are the result of bad practices which should be avoided. These are the ones we are trying to correct. You are all familiar with them but I want to mention one or two in particular; I refer to employees not familiar with the movement of engines and train trying to hit the footboard of a fast approaching engine or trying to grab the side ladder or steps of fast moving train and giving us a shock that is to say the least unpleasant. I am sure the men who belong on the footboard do not encourage it, but we should go farther and warn inexperienced men not to take these chances. We footboard men already on the engine should also give the fellow employee about to get on the footboard plenty of room to land safely.

Another point I wish to emphasize is a strict compliance with the rules and regulations of the company. If we study the rules and all understand them alike we lessen the danger of a misunderstanding and possible accident.

After a day's work without an accident or casualty we go home in a happy frame of mind and it reflects on the family and all about us—it's contagious. On the other hand, after an accident we go home out of sorts and if we are responsible and it is serious and we get crippled or lose our job, prosperity stops right there and in place of happiness there is gloom and despondency. Therefore, if for no other reason, we owe it to our families to keep the Safety First spirit alive and it ought to have first place on our seniority list.

We have been hearing a great many comments on Safety First—some good and some bad—but I am glad to say the good is in the majority. Let us hope it won't be long until they are all good. The knocker knows right down in his heart that he is wrong. He knows he would not last long on a railroad if he followed unsafe methods. So let us meet the issue square-faced. Don't beat around the bush with it. Get right down to honest, fair-minded safety work. It means so much to all of us and those dependent on us.

I often wonder how many of our terminal employees read a new time table. I try to read all of them and yet I found something in the last one I did not know or had overlooked. It's a good reminder on Safety First, so don't pass it up idly—read it and digest it with the other rules and regulations.

Finally, let me say that Safety First goes beyond the conservation of life and limb—it brings out efficiency, economy and co-operation. What more can officer or employee expect? Let us all make it our signal board and always try to have a clear board.

American Red Cross First Aid Train at Krasnoyarsk, Siberia

\*Paper presented at the Chicago Terminal "Safety First" Meeting of the Chicago & Alton, on February 4, 1921.

# The Cost of Reproduction New of Steel Freight Cars

Method Developed by Presidents' Conference Committee Permits  
Ascertainment on Basis of Weight

THE EQUIPMENT COMMITTEE of the Presidents' Conference Committee on Federal Valuation has recently issued its studies on the Method of Determining the Cost of Reproduction New of All-Steel Freight Cars\*. The report deals with gondola, hopper, coke and tank cars but not with box cars. The interesting feature is that the committee has worked out a method whereby a price is figured based on the weight of a so-called base car and to which price are added certain net figures to cover the cost of the specialties. This is an adaptation of the method used for determining the cost of locomotives, which method was described in the *Railway Age* of September 3, 1920, in an article entitled "The Cost of Locomotives for Valuation Purposes."

The present report was worked up in co-operation with two of the leading car building firms. These two firms were requested to furnish information as to all-steel freight cars of the classes noted as follows: (1) Description of the so-called base car; (2) list of the specialties; (3) light weight

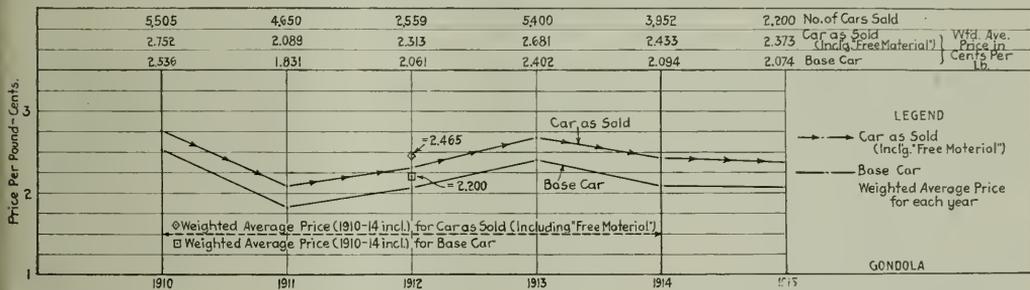

The sub-committee having the work in hand was thus furnished with data covering sales of 84,158 all-steel freight cars of a total light weight of 3,552,118,237 lb.

## The Base Car

The term "base car" as worked out was meant to cover a car of simple design selected so as to reduce the data to a common basis.

The "specialties" are those parts not included in the base car, or parts similar to parts on the base car but of different construction, weight or cost. It is noted in the report that "as further explanation a 'specialty' item might properly be called an 'accessory' similar to the term commonly used in the automobile business."

Several pages of the report are devoted to a list of the "net prices" of the specialties and the list in question will be found below. The net price of a specialty is a figure obtained by deducting from the excess price of the specialty its excess weight multiplied by 2.5 cents, the average price

Weighted Averages for the All-Steel Gondola Car

of each car sold 1910 to 1915, inclusive; (4) date of contract for each sale of 100 cars or more from 1910 to 1915, inclusive; (5) price per pound of the base car for each sale of 100 cars or more from 1910 to 1915, inclusive.

This information was asked for each sale of all-steel cars in the period mentioned 1910 to 1915 with the following exceptions: (a) All cars sold to foreign countries, except to Mexican and Canadian railroads operating lines in the United States; (b) all cars sold to industries, except those used in interstate traffic, and (c) all sales less than 100 cars.

\*This report was prepared by a sub-committee, consisting of: H. E. Hale (chairman), engineer, Eastern group, Presidents' Conference Committee.

K. C. Gardner, manager of sales, Central district, Pressed Steel Car Company.  
 W. R. Maurer, engineer, equipment and machinery, New York, New Haven & Hartford.

T. F. McCormack, general manager's department, Pressed Steel Car Company.

A. W. Neel, assistant engineer, Eastern group, Presidents' Conference Committee.

J. I. Sutherland, chief estimator, Standard Steel Car Company.

A. W. Wille, sales department, Standard Steel Car Company.

W. L. Wilt, special accountant, Pennsylvania Railroad.

and was reviewed and approved for distribution by the equipment committee, consisting of:

J. Howland Gardner (chairman), vice-president, New England Steamship Company.

P. F. Smith, Jr., works manager, Altoona shops, Pennsylvania Railroad.

W. T. Tollerton, general mechanical superintendent, Rock Island lines.

F. O. Walsh, superintendent motive power, Atlanta & West Point Railroad.

W. H. Wilson, assistant vice-president, Northern Pacific Railway.

W. L. Wilt, special accountant, Pennsylvania Railroad.

H. E. Hale (secretary), engineer, Eastern group, Presidents' Conference Committee.

per pound of the base car for 1910 to 1915. (The average "base car price" of 2½ cents applies to the determination of the net price of the specialties only.) The excess weight and price of the specialty as referred to, are the difference in the weight and price of the base car device and the specialty device. This is pointed out possibly more clearly by the following example:

Item	Weight	Price
Specialty—KC 1012 Westinghouse air brake.....	415 lb.	\$35.75
Base Car Part HC 812 Westinghouse air brake.....	305 lb.	23.00
Difference (Increase)	110 lb.	\$12.75
110 lb. multiplied by 2.5 cents.....		2.75
Net price of specialty..... (plus)		\$10.00

In arriving at the allowance for specialties and component parts of cars purchased, the actual average prices were used. The weights were ascertained from manufacturers, railroads and by actual weights determined by car companies.

The term "light weight" of the car refers to the manufacturer's weight as the car left the shop and is the weight upon which the unit prices in the report are based. In estimating the "cost of reproduction new," it is noted that the manufacturer's weight should be used, and where additions and betterments have been added, due allowance should be made for additional weight of the additions and betterments, if any.

On a rebuilt car, or where the character of the car

has been changed, the weight of the rebuilt car as it left the shop where it was rebuilt must be used.

All prices as given in the report are f.o.b. car companies' works. The date of contract of sale was used in the report, in classifying the data by years.

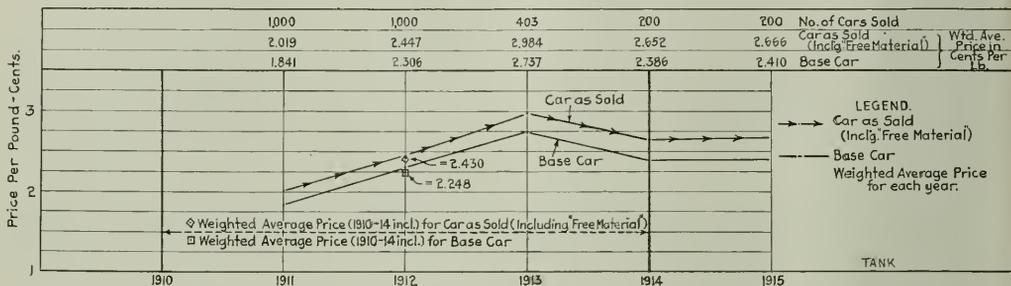

The price per pound of the base car for each sale was obtained by deducting the total net price of all specialties from the total price of the car as sold by the car manufacturer (including "free material") and dividing by the total light weight of the car as it left the shop. Any so-called "free material" that may have been furnished by the carriers was allowed for by setting up an amount equal to that which

The following example illustrates the method:

(1) Price paid the manufacturer, which does not include "free material".....	\$864.00
(2) Price of "free material" furnished by the carrier.....	76.00
Total.....	\$940.00
Total net price of all specialties.....	60.00
Total price of base car for one sale.....	\$880.00
(4) Light weight of car as it left the shop.....	40,000
(5) Price per pound of base car for one sale, \$880.00, divided by 40,000 lb.....	2.2

Price Per Pound Not Influenced by Car Weight

Diagrams and studies were made for the consideration of the sub-committee and the equipment committee, showing

Weighted Averages for the All-Steel Tank Car

would have been charged by the car manufacturer, if the car manufacturer had furnished this material. (Note: In making up these prices for so-called "free material," no account has been taken of any special discounts that may be given to a particular carrier.)

the trend of prices, which indicated that the price per pound was not influenced by the total weight of the car; therefore, it was decided to give a weighted average price per pound for each year and also for the five-year period 1910 to 1914, inclusive. An average price curve on locomotives for the

LIST OF SPECIALTIES FOR ALL-STEEL FREIGHT CARS

Item No.	Description of Specialty	Years 1910 to 1915, incl. Net prices per car	Price

71	Wheels (Base car—33-in. cast iron of any weight)		
72	Rolled steel, 33-in.....	47.00	
73	Cast steel, 33-in.....	124.00	

period 1910 to 1914, inclusive, was requested by Director C. A. Prouty of the Bureau of Valuation and for that reason a similar average for the freight car data was prepared.

In line with the foregoing, diagrams were prepared showing the yearly weighted average price per pound of the base freight car—all steel (also car as sold, including "free material"). The total output of the two car companies was used (excluding certain cars as previously stated) and data was grouped by years according to date of contract of each sale. These diagrams are given in this article and are shown for gondola, hopper, coke and tank cars. Figures for box cars are not shown.

**Method of Determining Prices 1916 to 1920**

Having thus worked out the method of determining the costs of the car for the period 1910-1914, inclusive, the com-

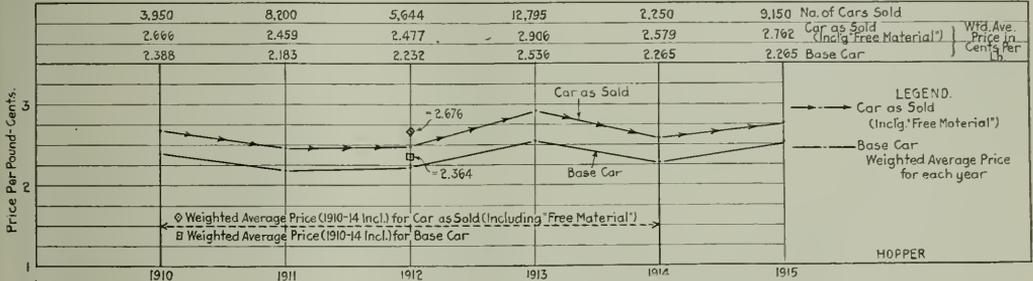

material," for the all-steel freight cars mentioned in above paragraph (a).

From the above information the following data was prepared:

Year	No. of cars sold	Wt. aver. price per pound of car as sold (incl. "free material")	Percent of price, 1910 to 1914, incl.
1910 to 1914, incl.	71,168	2.57 cents	100
1916	21,307	4.01 cents	156
1917	4,750	5.11 cents	199
1918	12,383	6.36 cents	247
1919	Nine	Nine	347
1920 (1st 6 mos.)	2,900	7.70 cents	300

Note: No sales of all-steel freight cars were made by these two companies in 1919.

The period of 1910 to 1914, inclusive, was selected as the base period for determining the range of prices in other years, largely due to the fact that there was available a large amount of information for that period on which to establish

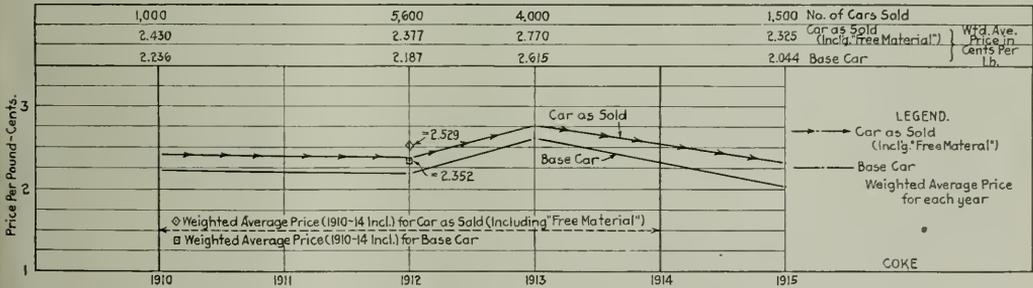

**Weighted Averages for the All-Steel Hopper Car**

mittee was next called upon to establish a guide for determining the cost of reproduction new for the years following.

On account of war conditions, etc., causing very erratic fluctuations in the prices of cars and more especially prices

a base. Other base periods for index numbers have been used by the government, such as 1890 to 1899, inclusive, or the year 1913, etc., and it should be clearly understood, it is noted in the report, that nothing in the report is intended

**Weighted Averages for the All-Steel Coke Car**

of specialties pertaining thereto, the equipment committee felt that it was not advisable to attempt to set up a base car price with an accompanying net price of specialties for the years subsequent to 1915. It was therefore decided to present a trend in prices of cars showing the increase in average price for the years 1916 to 1920, inclusive, over the average price of 1910 to 1914, inclusive, taken as base or 100 per cent. For this period, the following data was secured from the two car manufacturers:

(a) Total light weight of all-steel freight cars sold by them for each calendar year for the period 1910 to 1920 (first six months) inclusive, including certain sales as before mentioned.

(b) The total price received including the so-called "free

to suggest that the 1910 to 1914, inclusive, period should be a pricing period for valuation purposes.

**A Typical Example**

With this information available it becomes a simple matter to determine the cost of reproduction new for any year from 1910 to the first six months of 1920.

(a) All steel gondola car, 100,000 lb. capacity, light weight 42,000 lb. at 2.20 cents (1910 to 1914, inclusive, weighted average price)	924.00
(b) Coupler centering device, patented	6.00
Coupler operating device, patented	3.00
Bolsters, cast steel truck	20.00
Side frames, patented cast steel truck side frames (Andrew's)	34.00
Draft gear, Miner tandem	12.00
Brake beams, M.C.B. of patented design	5.00
Brake equipment, Westinghouse K.C.—1013	10.00
Side bearings, patented design (Wood's body)	8.00
Roller device, Barber (3 rollers)	6.00

(c) Carrier's cost of inspection during construction, and inspection and testing of materials.....	4.00
(d) Cost of engineering.....	6.00
Total.....	\$1,038.00
(e) For 1918 apply 24.7 per cent.....	2,564.00
(f) Add freight charges, using 1918 tariff rates, from manufacturer's shop to carrier's line or point of distribution, determined by the construction program (unless cars to carrier's lines are, under a proper construction program, delivered under load).....	18.00
(g) Total "cost of reproduction new" of all-steel gondola car in 1918.....	\$2,572.00

gestions made while the transportation act was under consideration, for the creation of a department of transportation with a cabinet officer at its head, which would place the whole subject of transportation within the responsibility of a cabinet officer who would be much more closely in touch with the executive than an independent organization such as the Interstate Commerce Commission.

## Reorganization of Department of Commerce to Include Transportation

WASHINGTON, D. C.

HERBERT HOOVER, the new Secretary of the Department of Commerce in President Harding's cabinet, is working out plans for the reorganization and enlargement of the activities of the Department of Commerce, which it is understood will be announced very shortly, which will give his department a considerable degree of jurisdiction over the subject of transportation in all of its phases. Mr. Hoover,

## Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight continues to decline, according to the reports compiled by the Car Service Division of the American Railway Association for the week ending February 26. The total for that week was 658,222, as compared with 695,506 for the previous week, but a large part of the reduction is undoubtedly accounted for by the holiday on Washington's Birthday. For the corresponding week of 1920, the loading was 783,295 and for 1919 it was 666,708. The summary follows:

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO AND FOR WEEK ENDED SATURDAY, FEBRUARY 26, 1921

Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise	Miscellaneous	Total revenue freight loaded			Received from connections

January 29	1921	39,830	32,368	162,652	9,749	53,677	7,693	179,123	214,844	699,936	803,332	718,297	489,184	588,838	577,709

in announcing his acceptance of a cabinet office, stated that he had stipulated that he should be left free to carry out some of his ideas for reorganizing the department, which included the possibility of taking over some of the functions exercised by other departments, and President Harding has stated that he is in sympathy with the general idea.

Mr. Hoover's plans are understood to contemplate the division of the present Bureau of Foreign and Domestic Commerce into two bureaus, one for foreign commerce and one for domestic commerce, the latter of which it would be his purpose to make an important factor in the development of the whole field of domestic commerce. In this department the plan provides for a sub-bureau of transportation which would co-operate with the Interstate Commerce Commission and the Shipping Board for the purpose of effecting a greater degree of co-ordination between rail and water transportation, including inland water transportation now under the jurisdiction of the War Department, as well as in the government regulation of transportation.

Such a plan as is proposed by Secretary Hoover would to some extent carry out the idea which was behind the sug-

The car surplus for the week ending March 2 declined slightly to 413,450. The week before it was 423,193.

## Virginian 120-Ton Cars

AMONG the illustrations accompanying the description of the 120-ton coal cars for the Virginian, published in the issue of February 18, there is a plan and side elevation of the body, which appeared on page 402. Several incorrect dimensions are shown on this drawing. The distance from the center line of the body bolster to the striking plate, should be 7 ft. 3½ in., instead of 6 ft. 11 in. The distance between truck centers should be 36 ft. 1¼ in. and not 36 ft. 10¾ in. Both these dimensions are correctly given in the details of the underframe on page 404. The wheel base of the truck is shown on the drawing of the car body as 8 ft. 8 in., whereas the wheel base of the Buckeye truck used was 8 ft. 6 in., of the Lewis truck 9 ft., and of the Lamont truck, 8 ft. 3 in.

# A Reduction of Rates vs. Improved Service

Interesting Railway Income Catechism Used by R. B. A. in  
Argument Against Decrease

**I**SSUE HAS BEEN TAKEN by the Railway Business Association with those who believe that a reduction in railway rates should be made for the purpose of encouraging traffic over the railroads. It believes that while there is a possibility that such a reduction in rates might expedite the resumption of business in 1921 by a few weeks or months, the step would be at a too great risk. "America's contribution to civilization," it says, "is to give American railroads an opportunity to rebuild the system so that they can face with confidence the approaching strain of traffic burden which is to make or break non-government roads in this country." This objection to any proposal to decrease rates is contained in a circular recently distributed to members of the organization. The bulletin is entitled "Making or Breaking the Railroads." The introduction is signed by Alba B. Johnson, president, and one of the features of the bulletin is a Railway Income Catechism prepared by Frank W. Noxon, secretary of the organization:

An abstract of the bulletin follows:

## Making or Breaking the Railroads

There is a serious proposal to reduce transportation rates. The aim as set forth is to affect favorably the return of normal traffic movement. Most often this is accompanied by the assumption that there will be a reduction in railway wages and is predicated upon other economies hoped for.

## Net Income the Crux

To you it need not be said that any plan of rate reductions will invite headlong national disaster unless considered in the light of its competently estimated effect upon one basic essential—*net railway operating income*. If we ignore *net railway operating income* we may hasten general business resumption by a few weeks or months in 1921, but in doing it we may break transportation down at the next peak of load, bringing an irresistible demand for government seizure.

There is nothing upon which to base an expectation that with operating costs as they now are 100 per cent capacity tonnage would net the railroads 6 per cent income on the present rates, any more than capacity tonnage yielded 6 per cent in September, when the disparity was \$33,000,000, or in October, when the disparity was \$20,000,000—two record months neither of which had been previously exceeded even during the war. Little more could be carried now than was carried in September. The roads have waited for overdue payments on the guaranty from the government. Beginning with September, shortages of income have dictated prudence. Hence the roads have been doing little or no construction. At lower rates, with present carrying capacity, the failure to yield 6 per cent would be still wider. Nor is there certainty or even probability that a reduction of rates would bring 100 per cent capacity tonnage. The depression is due to other and deeper causes. It began, indeed, with a downward curve in merchandise purchases as early as June (some compilers say May 15). Wage reductions are too dubious a possibility to count upon.

## Shall Roads Equip Themselves?

Our railroad problem is primarily to make the experiment prescribed by Congress and which is now being conducted by the Interstate Commerce Commission. What tonnage the roads carry now or a few weeks from now is of secondary

importance. The foremost question is whether they shall equip themselves to carry the cargo—vastly greater than all previous demands—which as history repeatedly shows will again overwhelm them almost before we are conscious that unemployment and commercial failures are waning. In any event to project a reduction in rates now, with hearings and consideration consuming nobody knows how long, would not stimulate any business to which rates are of consequence, but put a brake upon it, as does a pending bill to change the customs tariff or as does an unstable price situation.

## Continuity of Policy

Our besetting sin in America, as with the peoples of every clime and every age, is to clutch at the immediate and forget the permanent. The problem of administering regulation is to require the railroads to treat the citizens fairly and so to treat the railroads that they will be able to serve the citizens adequately. This balance involves underlying principles which will take a long time to work out. They can only be applied with ultimate success if public policy be continuous and measurably indifferent to momentary shifts in business conditions. The public should regard the Interstate Commerce Commission as an engineer, who is employed for a specific function, who is hungry for information, but who is likely to know a great deal more about the actual needs and the sufficiency of given means for attaining stated ends in this field than all the rest of the nation individually or collectively.

It may be that a wiser organization of federal regulatory agencies could have been made. The Railway Business Association was among those who urged Congress to make a different arrangement. But this is the arrangement Congress did make. We must take somebody's technical judgment. The thing now is to get in behind the commission for a full trial of what Congress has authorized it to undertake. The integrity of the commission, a national boast before the Act was signed, was never more signally exemplified than when some of those members who had not favored the aims of the Act promptly announced their determination to execute it with zeal and joined in electing as transition chairman out of his rotary turn the Commissioner who had been the spokesman for the commission before committees of Congress. That these pledges have been scrupulously kept is the impression of an overwhelming majority of shippers' representatives whose occupation involves contact with the commission's work.

## Transfer of Initiative

What is that work in relation to rates? A very different responsibility from what it was under the old act. One of the most difficult conceptions for writers and others to fix in their minds is that Congress has transferred the initiative in revenue rate adjustments. Congress places this initiative not upon the railroads, where it formerly rested, but squarely upon the commission. Those proposing rate reductions have referred to the roads as having carried on a campaign for advances and gotten all that they asked for. This comment discloses a misunderstanding of the new act which calls for earnest efforts toward its correction. The commission ordered a proceeding. It invited all concerned to participate in hearings, including not only the railroads but the shippers. It decided the valuation basis upon which to compute the net income percentage. It chose as between  $5\frac{1}{2}$  per cent

and 6 per cent in favor of 6 per cent as the net income to be aimed at. Finally it directed the carriers to file tariffs accordingly. In other words, the people of the United States, acting through an agency created by their Congress, on their own motion took up the question whether railroad income and railroad rates were adequate in the national interest and required the railroad companies to correct in a prescribed manner such inadequacy as had been found.

The public cannot better provide for its own welfare than by strengthening the hands of its chosen agent and protecting that agent from one of the easiest types of clamor to stimulate and one of the hardest to deal with—clamor for rate reductions without consideration of railroad responsibilities to the public or of railroad income wherewith to discharge those responsibilities.

### Stability of Rates Essential

The Commission aims at 6 per cent. It makes transportation rates which it computes will suffice, supplemented by economies, to approximate that income. Not every month. Not every year. To shippers stability of rates is as essential as avoidance of excessive rate levels. The commission could not if it would and would not if it could constantly slide the rate level up and down responsive to temporary business fluctuations. Bonds run for years. The money with which to pay interest upon them is the aggregate of sums earned in all the years of the period. The proceeds of a stock issue (if our railroads shall ever again be able to sell stock) is determined by the conjecture of investigators and their advisers as to the net income which will on the

average through years to come be available for dividends. One of the obligations of the commission is to observe how the rate level acts in times of various tonnage volume. They are only at the vestibule of their experience with the rates which were made effective last August. Imagine a family crowding around the physician every few hours and entreating him to turn from the remedy he has given and try something else before the first has shown what it can do.

Net railway operating income is the indispensable theme for adequate consideration in discussing any proposal for rate reductions. Net railway operating income must in future attract more capital than has been attracted to our railroads in years past or—

First—we shall lose our transportation primacy;

Second—we shall lose our foreign trade opportunity, which is utterly dependent upon our domestic superiority in every process cognate to manufacture, including inland rail transportation;

Third—we shall lose our private ownership of railroads and with it our individual initiative, followed by rapid loss of private control and of individual initiative in other lines of business if not in all;

Fourth—we shall take the swift final step to loss of our representative political institutions.

Is it worth while to expedite the resumption of business in 1921 by a few weeks or months at such risk?

America's contribution to civilization is to give American railroads an opportunity to rebuild the system so that they can face with confidence the approaching strain of traffic burden which is to make or break non-government railroads.

## Railway Income Catechism

Q. Are not railway rates too high?

A. Some rates, perhaps. Others are perhaps too low. The Interstate Commerce Commission is constantly correcting such inequities.

Q. But are there not particular rates that impede or stop freight movement?

A. Yes. The rate on news print paper from Maine to Chicago impedes the movement; it prevents it. Wisconsin takes the Chicago market. The rate on shoes from Brockton to Denver will be too high for Brockton to compete with St. Louis in the Denver market. If so the rate stops the movement. Brockton would then have its selling area restricted by a development just as truly economic as was the establishment of shoe factories at St. Louis.

### Income the Test

Q. Ought not rates to be made so as to move the business?

A. Yes, if the business ought to move.

Q. What is the test whether a given business ought to move or not?

A. Generally speaking, whether total net railway income can be kept at the required point in case that business is moved at a rate which will move it; in other words (if the rate adds nothing to railway income), whether giving an unduly low rate to one kind of business either will create new and profitable business in related directions sufficient to offset the lost revenue or can be made up by rate increases on existing traffic. More volume of tonnage as such has no value to the railroad or to the general public. The public stake is primarily in having a railroad at all and in keeping it at service pitch. The railroad's stake is in earning enough net income to maintain and improve itself so that service can be satisfactory.

Q. Who is to judge what traffic shall move and what shall not?

A. The Interstate Commerce Commission.

Q. Upon what does the Commission base its judgment?

A. Thirty years' experience and present continuous contact with all kinds and conditions of shippers and railroads.

### Too Soon to Judge New Rates

Q. As a matter of fact is not the whole level of rates too high?

A. Nobody knows yet. The Interstate Commerce Commission fixed the present level so short a time ago as August 26, 1920. Their function was and is to find out whether that level will in fact as they believed and hoped yield to each group of railroads as a

whole 6 per cent on the value of the aggregate property. The demonstration has only begun.

Q. But is it not evident already that earnings from the present rates are disappointing?

A. Those who hoped that there might not be a depression in tonnage just yet are disappointed that one came so soon; but everybody knew there would be depressions, and it can hardly be called a disappointment to have a slump in earnings with a slump in traffic.

### Income Disappointing, Not Earnings

Q. Was not October, 1920, a great traffic month and was not October railway income disappointing?

A. Precisely—railway income; but not railway earnings. The tonnage produced gross—record gross—but expenses ate it up. Income lacked \$20,000,000 of 6 per cent. Whether traffic moving at present rates will or will not yield 6 per cent will depend upon (1) how often the tonnage reaches capacity of the roads to haul it and how long it continues at capacity, (2) how severe and how protracted are the slumps and, (3) how much decrease can be accomplished in operating expenses.

### History Says "Don't Risk It"

Q. Would not a reduction in rates expedite the return of traffic flow in general business and ultimately give the roads the income?

A. That is what the Interstate Commerce Commission thought in the first large-scale rate-advance cases.

In 1910 the Eastern and the Western roads sought advances. These were denied as the Commission believed increase in traffic would afford larger income. The actual result suggests the man who admitted he had a loss on every unit of business he did but said, "Where I make is by doing so much of it." Gross hit a high peak in 1913 at \$3,125,135,798 as compared with the \$2,750,667,435 in 1910, an increase of \$374,468,363. Contrast this with net railway operating income. This in 1910 was \$824,241,201 and in 1913 it was \$829,863,248—a gain of less than \$5,000,000, although the investment in road and equipment had meantime risen by \$1,931,242,689 and the interest on funded debt by \$35,170,704. The great gross tonnage in that heavy year 1913 was a great opportunity to lay something by for a rainy day. It was worse than lost, because the rates had not been raised. The owners of the roads actually had in 1913 many millions fewer dollars available for dividends, improvements out of earnings or surplus against lean years than they had in 1910 with \$374,468,363 more gross

earnings. Traffic later fell off and the roads had neither volume nor rates. The Commission then accepted the verdict of the facts and granted increases.

The average net income in the three years 1915-17 was only 5.2 per cent. Mr. McAdoo raised rates during government control. Volume of traffic was not affected by this one way or the other, because war needs forced on the roads every ton, every passenger they could carry. The people are being taxed now to pay the amount by which peak of load plus, not on reduced rates but on greatly increased rates, fell short of the guaranty—itself an average of three previous years one of which was lean.

September and October, 1920, were record months in gross, exceeding any war month. The facilities were strained to the utmost, shippers co-operating with full loading and prompt car handling. The new rates had gone into effect August 29, yet failed by \$33,000,000 to yield 6 per cent in September and by \$20,000,000 in October.

### Doing 110 Per Cent Capacity

Q. Is it true that in any business the highest profit is made on the last 10 per cent, in railroading perhaps the last 5 per cent of volume transacted and do not the railways make the largest income per unit of work done when running full capacity?

A. In any business when the plant is in poor repair, so that heavy use swells maintenance, or when the plant has to be enlarged to take all the business that is offered so that overhead has to be paid on new capital, expenses rise faster than gross and up goes income. Our railways, or many of them, are constantly but a few jumps ahead of dilapidation on the one hand and of saturation on the other. While they are doing the last 10 per cent of present capacity they are meeting increased labor cost inevitable during congestions and pouring money into repairs, yet driving rescuable facilities to an untimely scrap heap, or they are doing 110 per cent or more of present capacity by enlarging the plant; and if they enlarge on any considerable scale they enlarge for the future and are thus once more in the position of any business which is developing its gross up toward that theoretically most profitable 10 per cent.

### Road's Own Tonnage

Q. Is there no tonnage they could better be handling than to sidetrack cars and store engines?

A. Yes. Their own. A general merchandise depression should be the signal for vigorous use by the roads of their tracks and rolling stock in the conveyance of material for the manufacture and reconstruction of their own facilities. The Railway Business Association has a Committee on Stability of Railway Purchases, which urges precisely this program, emphasizing that at no other kind of period can building and rebuilding of railroads be done so economically, with so little inconvenience to general traffic and yet with so beneficial an effect upon employment of labor in industry and trade.

Q. Why do not the railroads come into the market?

A. Some of them have come in and are getting bargains. Most of them have not the money and cannot get it. The 5.2 per cent which they realized from 1915 to March, 1920, was not enough as now officially certified. The 5.2 per cent promised them for the six months ended September 1 last, they have not received. The income since September 1 has averaged what would represent an annual rate between 3 per cent and 4 per cent.

### Other Factors Brought Depression

Q. Were not freight rates an important factor in bringing on the present depression?

A. Probably they had almost nothing to do with it. The commodities most often mentioned—building materials—were not moving and would not have moved on any conceivable freight rate because capital had been driven from building by causes which are well known. The large factor in the present depression is that consumers stopped buying. The beginning of that strike was weeks before the August rates went into effect. The rate increases applied previously to August, except in a few cases were an insignificant part of the rise in commodity prices. Prices generally, regardless of freight rates, dropped as soon as buying fell off; and the August rate increase came without in the least retarding the price decline.

### Economies Essential

Q. Ought not railway wages to come down?

A. The Railway Business Association does not discuss labor controversies. We can, however, see no wage reduction in such immediate prospect that it can be counted upon to offset rate reductions in 1921.

Q. Will not other economies provide net income?

A. It is to be hoped they will. President Willard, chairman of a committee for the railway executives to lay conditions before the Interstate Commerce Commission when the present rate level

was being adopted, said that the roads did not rely upon these advances for the whole increase in net income, but would do their utmost to supplement the revenue by economies. The object in applying for abolition of the so-called national agreements affecting labor cost was economy.

### Major Economies

Q. Do not the railways obstinately neglect to introduce methods which would save millions a year?

A. That is what Louis D. Brandeis said in 1910. He declared that the railways as a whole could save a million dollars a day from shop economies through installation of "scientific management." Later a railroad bulletin announced that through economies sums much larger than that had been actually realized and Mr. Brandeis issued at Boston a statement claiming that his admonition had been heeded and his prediction fulfilled. Inspection of the bulletin itself disclosed that the economies referred to had preceded the admonition and the prediction. The comparison was for a period of years ending before Mr. Brandeis ever took part in a rate case. The economies were preponderantly not shop economies but economies from major capital investments such as those in straightening of curves, elimination of grades, multiplication of tracks, installation of signalling, enlargement of vehicles, with rebuilding of road and bridges to carry heavier trains, and development of terminals. Of the future it has been said by the Committee on Adequate Facilities of the Railway Business Association:

"Heavy investment in additions and betterments, with corresponding adjustment of income through economies or rates or both is the only means of getting ultimately to a lower rate level or even avoiding in the future a chronic condition of indefinitely rising rates."

There is a great group of industries maintaining special facilities and expert staffs, engaged all the while in the quest for inventions or methods which will promote safety, efficiency and economy. This has been the situation for many decades. Under that system American railways have won esteem abroad as the most progressive in the world. The one obstruction at this date to the most vigorous prosecution of progressive experimentation and installation of demonstrated improvements is weakness of railway credit.

### Public Wise if Kept Informed

Q. Will not the public resist wage reductions if not accompanied by rate reductions?

A. Experience suggests that this will depend upon the vividness with which the public continues to be reminded of its stake in adequate net railway income. The bracketing of rates with wages implies that there was some year in the past when wages and rates were both correct, so that both having been raised both should now come down. But wages had been rising steadily for many years before any increase in rates was granted. A point that looks large to some writers is that the railroads have exaggerated the perfection of their physical condition before the war. This is an issue of fact which will be determined by agreement between the individual road and the government or by the courts in suits to determine over- or under-maintenance during governmental control. For the present discussion it is enough to remark that the worse anybody can show the condition of the roads to have been before they were taken over, the more must fair observers be convinced that railway income, and hence maintenance, credit and improvements, had suffered in the years preceding.

### Ravages Regulatory

Q. Has not the damage to the railroads in the war been exaggerated?

A. It is not the ravages of war which created the need for the present rate level. It is the ravages of the old regulatory act, under which the average net income for the three years 1915-17 was 5.2 per cent on the cost of road and equipment—a rate which Congress in 1920 authorized the Commission to raise to 6 per cent. It is true this increase of income was not made to cover the war period. Congress said the roads needed at least 5.5 per cent and might need 6 per cent. The Commission says 6 per cent. For the 22 months of governmental control the guaranty was only 5.2 per cent. On the other hand the government is under contract to make good any neglect to keep the properties up under government control. If this is done they can ultimately be put in relatively good repair and their problem will be the improvement and enlargement of facilities; the roads will begin, so to speak, where they left off when the President took them, with inadequate facilities but with the Commission endeavoring to give them an increase in their average income from the 5.2 per cent actual just before the war and guaranteed during the war to the 6 per cent of the new act, or to such rate after March 1 next as the Commission then may compute to be essential.

## Investigation of the Railroad Situation Proposed

WASHINGTON, D. C.

SENATOR CUMMINS, chairman of the Senate committee on interstate commerce, has announced his intention of introducing in the Senate at the opening of the extra session of Congress a resolution for a general investigation by his committee, or a sub-committee, of the railroad situation under the Transportation Act, with particular reference to the operating expenses of the railroads since their return to private management a year ago. The proposed investigation is intended not only to bring out clearly the facts and the reasons for the enormous increase in railroad operating expenses during the past year, which were \$1,400,000,000 greater than in 1919, but also to consider how a more economical basis of operation may be made possible so as to carry out the declared purpose of the Transportation Act of assuring the railroads a fair return on their valuation, in view of the fact that there is almost unanimous agreement that any further advance in rates no longer presents a feasible solution of the problem. In other words the senator and others with whom he has conferred are anxious to bring out as speedily as possible what may be done to bring down the cost of transportation to a more normal and reasonable basis and believe that such an investigation should precede any attempt to further amend the Transportation Act.

Senator Cummins has in mind a thorough inquiry into the reasonableness of the expenditures, including a comparison of the costs under private and under government operation and going into the question as to whether there has been any reckless and extravagant management of the railroads since March 1, 1920, as has been charged in some quarters, and if so, as to who is responsible. His talks on the subject, however, do not indicate that he has any particular idea of making a "goat" of the railroad managers or that his proposed investigation is of the accusatory type of many Congressional investigations. They indicate rather that he is inspired by a desire to develop the real facts of the situation and the proper remedy before the new Congress gets into a frame of mind for desultory tinkering with the Transportation Act. One or two senators have already proposed to meet the situation by reducing the percentage which the law declares to be a fair return or by repealing the percentage rule of rate-making entirely, ignoring the fact that the present rates, with a low volume of traffic and a high level of expenses, are not producing anything like the expected return.

Senator Cummins has expressed the opinion that unless something is speedily done to improve the present condition the railroads are headed straight for government ownership, which he is not in favor of, but he is counting on a considerable improvement in general business conditions. He proposes to find out whether there is any truth in the charges that have been given much publicity that the railroads have been extravagant while under a government guaranty and while under a law which many people have been fooled into thinking guaranteed them a specific return under any conditions.

The senator is by no means aligned with the labor faction that has been making most of the charges. He understands full well that the railroad managers are in no way to blame for the \$400,000,000 increase in wages from May 1 to the end of the year, nor for the increased cost of coal, and that a large part of the increased operating cost is a direct inheritance from the Railroad Administration because an increase in wages and time and one-half for overtime awarded by Director General Hines in the latter part of 1919 naturally loomed up heavier in the accounts for the full year 1920 than for the few months they were in effect in 1919, and the National Agreements executed by Mr. Hines with the labor

organizations affiliated with the American Federation of Labor cost considerably more money during 1920 than they did in 1919. He doubtless appreciates also that the fact that the railroads had been promised a guaranty payable in the indefinite future, hardly gave them either the incentive or the means for extravagance in the six months from March 1 to September 1, 1920, any more than the fact that the present rates are supposed to net 6 per cent gives them any money to throw away at a time when traffic is so light and expenses are so heavy that most of them are earning no return at all. However, he is by no means convinced that all of the necessary reductions in operating expenses can be expected to be made in the payroll and he has some ideas of his own that railroad methods can be improved in many ways that will reduce costs. In fact, he used the expression "obsolete" in referring to some methods of operation as well as some managers. It is well known that he believes economies would result from a consolidation of the railroads into a small number of systems and he also believes that large savings could be effected by consolidating railroad purchases.

Senator Cummins has consulted several of the members of his committee regarding the proposed investigation and believes there will be sufficient support for his plan. He has also been conferring on the subject of the railroad situation with members of the Interstate Commerce Commission, railroad officers and others for the purpose of gathering facts and ideas. Senator Cummins has been in close touch with President Harding during his recent sojourn in Florida before the inauguration, and it is known that railroad matters were also brought to Mr. Harding's attention there by several prominent railway executives.

The uselessness of investigation by Congressional committees has become proverbial, and is frequently commented upon by members of Congress themselves, but many of the members of the Senate committee on interstate commerce have been almost so steadily engaged on a study of the railroad problem since the beginning of the Newlands investigation in the fall of 1916 that they are learning the language of the subject and many of them have gained a deep insight into the problem. More is to be expected, therefore, from this committee than, for example, from the three senatorial committees that during the past year or so have been investigating the coal industry and have produced nothing in the way of results except a large additional amount of publicity for the fact that the price of coal has been very high and that somebody must have been profiteering.

The hearings conducted by the Newlands committee in 1916 and 1917 constituted a very general investigation of the railroad problem, but because of the intervention of the war and the taking over of the railroads it failed to produce definite results or even a report. The protracted hearings before the Senate and House committees on the federal control bill amounted to almost another general investigation and the exhaustive study made by both committees leading up to the passage of the Transportation Act naturally covered a very wide range, while both committees have had hearings since on several phases of the subject.

The Interstate Commerce Commission, of course, is closely in touch with most phases of the railroad situation at the present time except possibly the details of the labor situation that comes within the province of the Railroad Labor Board, and, aside from its general familiarity, it has been and is making, under the provisions of the Transportation Act, a close analysis of the operating expenses during the six months following the termination of federal control for the purpose of ascertaining the amounts which may be charged for maintenance and of certifying the amount of the guaranty. What the commission has to say, therefore, will undoubtedly constitute an important part of the evidence to be taken by the committee.

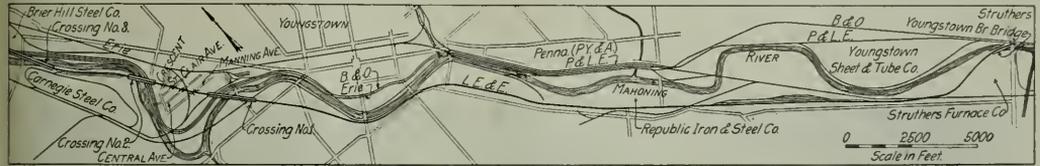

# P. & L. E. Conducts an Extended Paint Test

Coatings Supplied by Eleven Manufacturers Subjected to Severe Service for a Period of Six Years

THE PITTSBURGH & LAKE ERIE recently completed an interesting experiment in the painting of steel bridges which had been undertaken to test the relative merits of several brands of paint for given conditions of exposure and to determine the effect of dispensing with the shop painting of structural steel. Conjecture on this latter point was founded on two premises, namely, the difficulty frequently encountered in securing proper workmanship in shop painting, and also in the fact that steel is covered with a mill scale which has a tendency to loosen after a period of expo-

town Branch bridge which was built about the same time as the other structures.

The paint used was supplied by eleven paint manufacturers, each of whom was permitted to select the paint most suitable for the conditions of exposure described by the railway officers. The manufacturers were also invited to specify methods of application which in their opinion would accomplish the best results, but after being afforded an opportunity to examine the railway company's specifications for paint workmanship, they all expressed their willingness to have

The Bridges Are Located in a District Where They Are Subjected to a Variety of Exposures

sure. It was felt that if this scale was afforded an opportunity to flake off before any painting was done, the paint coatings subsequently applied might prove more permanent, particularly as this practice is followed to a considerable extent in England.

An opportunity to work out these ideas in a comprehensive way was afforded about 1913 on the occasion of the building of the Lake Erie & Eastern, a subsidiary of the Pittsburgh &

their paints applied according to the methods adopted by the railroad.

The bridges were fabricated and erected during 1913 and 1914 under specifications eliminating all shop painting except on surfaces concealed in shop assembly and erection and for necessary marking. Exceptions to this occurred in three cases which were all given shop coats according to usual practice. The exigencies of the construction schedule were

1. Badly Deteriorated Coating. 2. An Example of Paint Coat Subjected to Abuse by Pounding and Scratching. 3. Typical Pitted Surface After Brushing and Scraping

Lake Erie serving as a terminal utility in the Youngstown, Ohio, industrial district. Within a distance of two miles near the north end of this line there is practically a mile of railway bridge structures involving seven independent bridges of various designs and conditions of exposure. These include three crossings of the Mahoning river, several railway undercrossings, two overhead highway bridges, one overhead foot bridge and two street subways or undercrossings. These bridges involved both ballasted floor girders of "through" and "deck" types and open floor truss spans of considerable length. In addition to this group of structures, the painting tests also included an open-floor through-girder bridge of the Pittsburgh & Lake Erie at Struthers, known as the Youngs-

such that the bridges were field painted from four months to fourteen months after erection, the erection having been done in from two weeks to seven months after fabrication of the steel. Thus, the steel surfaces were allowed to stand exposed to the elements for a variable time before the two field coats of paint were applied.

The condition of the spans at the time that the field painting was done varied widely. Some were badly rusted and scaled, while on others considerable areas of the mill scale were still intact.

In general, from 80 per cent to 95 per cent of the mill scale was well rusted and was easily removed by scrapers, wire brushes, etc., in the usual manner for cleaning surfaces. The

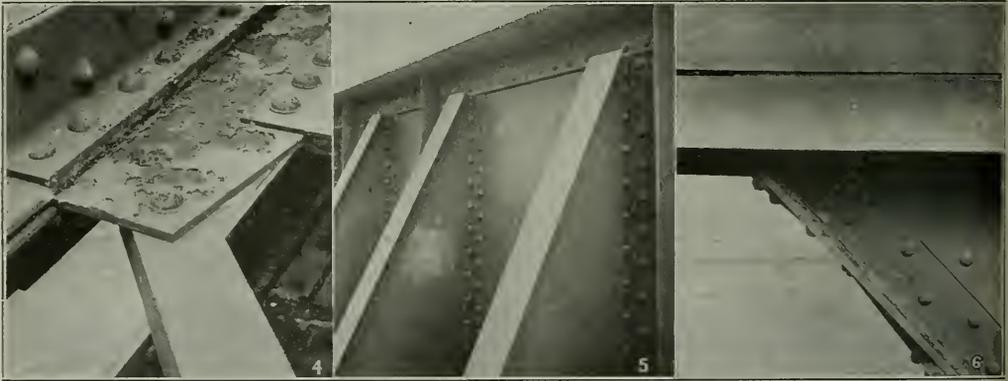

remainder of the mill scale was removed by chipping with hammers; sand blasting was not used.

The painting conformed to the usual methods. It was the intention to give the bridges a third field coat in lieu of the missing shop coat after a sufficient interval to disclose any defects in the earlier coatings which were to be corrected and spot-painted before the third field coat was applied. Unfortunately, the vicissitudes of the war period prevented the execution of this feature of the plan.

Any study of this test must be founded on the thorough understanding of one important fact, namely, that the exposure to which these bridges are subjected is unusually severe. In the first place the atmospheric conditions in Youngstown correspond with those to be encountered in any important center of steel manufacture. Moreover, all or portions of many of the structures are subjected to local exposure of greater severity, foremost of which is the presence underneath, at a number of places, of railway tracks carrying heavy traffic. Another important item is the peculiar condition encountered at the crossings of the Mahoning river. The water in this stream is used repeatedly by the various industries in its passage through the Youngstown

tures which with two exceptions varied from 66 per cent to 89 per cent, the average being 79 per cent. The two exceptions were 37 per cent and 44 per cent, and the cause of this poor showing is not at all apparent. An idea of the wide variation in the conditions may be obtained from an examination of the photographs. In general all horizontal surfaces were in a worse condition than the vertical surfaces. The most common condition where rusting has taken place, is a general roughness of the surface, produced by the breaking of very small blisters, which in general are easily removed with a wire brush.

One or two of the highway overcrossings suffered from what may be termed "malicious mischief," scratching, cutting and hammering, presumably done by children in the neighborhood. In one case the paint was injured by the paste used to stick war posters on the webs of the girders where this paste was smeared on the surface beyond the edge of the paper. The influence of filth accumulation was also noted at the bottom of some of the girders. The painting was all done between July 1, 1914, and Jan. 16, 1915, in which time the thermometer registered as low as 4 degrees below zero. Painting was only done under favorable condi-

4. Severe Scaling of Horizontal Surface. 5. An Example of Well Preserved Paint. 6. Paint in a Generally Fair Condition Subjected to Slight Pitting, with Bad Peeling in Certain Places

district, with the result that it rises to a temperature of as much as 150 deg. F. which, with the manufacturing waste and sewage which it accumulates, gives the water a character entirely different from a normal stream of fresh water. One of the bridges crosses the river almost directly over the wasteway of a dam where the resultant spray is high in impurities.

A study of these structures after six years of service shows such a wide variety of conditions of the painted surfaces that it is difficult to draw more than general conclusions. The officers of the railroad, however, have been enabled to learn something of the relative merits of the paint coatings used. In one place in particular there was a rather marked difference in the results secured with two brands of paint under practically identical conditions.

As regards the other purpose of the test, to determine the advantage, if any, of omitting the shop coat, the conclusion is not so clear because of the wide variation in results. As stated previously, there was a wide variation in the condition of the steel at the time that the field coats were applied and there were also wide variations in exposure. The condition of the paint surfaces determined from a careful inspection and graded according to carefully weighted values for the various attributes of the paint, resulted in the establishment of conditions-per-cent for the coatings of the various struc-

tions, and the general results do not seem to have been influenced in any way by the time of year the paint was applied.

Owing to the widely different exposure conditions, it is very difficult to reach a thoroughly satisfactory conclusion. The cost of cleaning the surfaces in the field before applying the paint, was considerably greater than the cost of applying the shop coat, and the results obtained are apparently in favor of the shop coat, but it must be borne in mind that these structures have three coats as against two coats of the all-field-painted structures, and also that it was not the intention to expect the two coats to last for the six year period.

An important point to be considered in putting this idea into use is the greater burden of responsibility placed on the field painting forces in thorough cleaning before the painting is done. Structures allowed to stand without paint protection for a considerable period are obviously covered with considerable coatings of rust and scale and unless the surfaces are thoroughly cleaned, the result will probably not be as good as if a shop coat had been applied to the metal with its mill surface.

This study has been carried on by the engineering department of the Pittsburgh & Lake Erie. We are indebted to A. R. Raymer, chief engineer, for an opportunity to compile the information presented above.

# Repair and Maintenance of Steel Freight Cars\*

## Necessity for Adequate Shop Facilities and Proper Organization Strongly Emphasized

By Samuel Lynn

Master Car Builder, Pittsburgh & Lake Erie

**H**EAVER MOTIVE POWER, with greatly increased train tonnage, has created a demand for cars of increased capacity. The limit of capacity apparently has not yet been reached, since one of the large car companies has, within the year, constructed cars of 120 tons capacity.

While no accurate figures are available, it is estimated that approximately 70 per cent of the two and one-half million freight cars in service in North America are either of all-steel, steel underframe or steel center construction. As this number of cars represents an investment of over three billions of dollars, the importance of keeping them in good repair and in service is self-evident.

### Maintenance Badly Neglected

A casual inspection in almost any classification yard will reveal the fact that repairs to steel cars have been badly neglected during the past few years. Large numbers of cars may be seen with floor, hopper and side sheets badly corroded and in many cases rusted and worn entirely through. A close inspection will usually develop the fact that center sills are buckled either in front of, or between the body bolsters. This condition is due either to faulty construction, sills of insufficient area, abuse in service, or neglected maintenance. Conditions existing during the recent world war imposed many hardships upon the railroads generally, making it almost impossible for them to keep the maintenance of their freight equipment up to pre-war standards. Shortage of labor and materials, coupled with the pooling of equipment, had a tendency toward deferred maintenance, which resulted in merely patching up worn out cars and keeping them in service long after they would have been shopped for rebuilding under a normal maintenance program. The large percentage of home cars on foreign roads resulted in neglect, since proper material for repairs of foreign cars was not generally carried in stock. This resulted in makeshift repairs, most roads doing only enough work on foreign equipment so that it would haul one more load, in the hope that it would carry that one load off the line and never return. The results of this practice are now most evident when cars are being returned to the home roads in large numbers and in almost universal bad order.

The speaker believes that the exterior of steel cars should be kept well painted, as by this process at least one side of the steel is protected against corrosion; in addition to this, well painted equipment is a good advertisement for any road. It is obviously impracticable to attempt painting the interior of open top steel cars, since the commodities usually carried in such cars consist of coal, coke, iron ore, limestone, furnace slag and mill products, which in the process of loading and unloading so badly damage the paint that it would serve no purpose—as a protective coating. The interior of steel equipment is where corrosion is the most evident and is probably due to moisture laden with acids from the products of the mines and mills, or to electrolysis caused by impurities existing in the steel itself.

I would like to here state a few things that in my opinion are necessary to maintain steel car equipment properly and economically.

*First:* Shops should be provided at points where heavy repair steel car work is to be performed. They should be well lighted and ventilated, and in the colder sections of the country should be properly heated. Overhead crane service is desirable, and by proper arrangement eliminates the necessity for material tracks between the working tracks. Small wall or jib cranes should be installed for handling yoke riveters, etc. The money expended for shops will repay the investment many times over in a few years. While I would not say that a steel car cannot be repaired outside under adverse weather conditions, I believe that the work can be carried on more successfully where shops are provided.

*Second:* Shops should be well equipped with suitable machinery, properly located so that repair parts may be made economically without any lost motion or backward movement. It is a question whether or not it pays to attempt the manufacture of all steel car parts in the average railroad shop. Some of the larger railroads buy most of their car repair parts already punched and pressed into the proper shape ready for application. However, it is necessary to have sufficient machinery to make odd parts or to extend the supply when exhausted, as it is almost impossible to keep sufficient parts on hand to meet all conditions.

Punches, shears, hydraulic presses, heating furnaces, and a good supply of efficient pneumatic tools are indispensable in the modern shop and will soon repay the initial cost of installation. Sufficient compressor capacity with facilities for supplying dry air at all times is necessary for the economical use of pneumatic tools. Proper facilities should also be provided to take care of the scrap parts that will accumulate, and the shop and surroundings should be kept clean at all times. While this may not seem important to some, nevertheless it has a certain moral effect on the workman, which should not be underestimated.

*Third:* Other facilities must be provided, such as storehouses, storage yards, air brake shops, paint shops, oil houses, etc., depending on the size of the shops. The storehouse or material supply house should be located as near the shops as possible and electric tractor service or other means installed for convenient and economical transportation of materials. Fuel supplies and stores should be under direct supervision of the foremen in charge, or if the shop organization does not permit this, the storekeeper and car foreman should be very close together and work in perfect harmony.

### The Importance of Supervision

*Fourth:* Another and probably one of the most important factors in repairs to steel cars is the quality and quantity of supervision. Sufficient intelligent supervision must be furnished or the work will lag and both the quality and quantity of the output will suffer. The gang foreman who comes into daily personal contact with every man under him is the keystone of any organization. He forms the contact point between the management and the men and when the contact is broken, the current ceases to flow. These men should be selected from the ranks, if possible, and should be men who have developed ability and initiative in their work and they should also have ability to handle the workmen. While a thorough knowledge of how to perform the work is necessary, this is not the first requisite, as ability

\*Abstract of a paper read before a meeting of the Canadian Railway Club, March 8, 1921.

to handle men and personality stand above this qualification. Foremen should be intelligent and fairly well educated in order that they may read the rules, blueprints and instructions and apply them intelligently, and also that they may be eligible for promotion to higher positions as vacancies occur. Wages paid foremen should be sufficiently attractive to create an incentive for the men to fit themselves for such positions.

The successful supervisor, in addition to his knowledge of the work, should show loyalty toward his employer, have the courage to enforce discipline, insist on and obtain a fair day's work from every man in the service, and be absolutely impartial in handling his men in order to obtain and hold their co-operation and respect. He should also have the vision and ability necessary to discover trouble makers and weed them out before the remainder of the organization becomes contaminated. No man should be placed in the position of foreman unless the appointing officer feels that the man selected is capable of developing the necessary initiative and ability to accept any position up to the top of the shop organization, as those men selected for the bottom round of the ladder should be capable of advancing step by step until they reach the top. Most higher supervisory officers have not the time to mingle with the workmen and they must depend on their foremen to provide the little touches of personality and co-operation that are the life of any organization.

*Fifth:* Another important feature is the personnel of the shops. Wages paid and working conditions should be such that they will attract capable young men to seek employment in railroad shops. Unless this is done, there is a tendency for skilled mechanics to seek more remunerative employment in industrial work. This is particularly true in the large industrial centers. The tendency prior to federal control in some sections of the country, due to shortage of mechanics and inability to induce young men to enter the service, has been to hire foreigners from central and southern Europe, men who have never had any mechanical training, and to try to make mechanics out of them. These men come to us wholly unacquainted with our language, our customs, and our laws, and must be assimilated into our organizations. While at first a rather costly proposition, with proper and tactful handling they usually learn rapidly, and have become the mainstay of some of our car shop organizations. It is important that those charged with the handling of these men, should by careful and tactful treatment instill in them the principle of loyalty to their employers; with proper encouragement and fair dealing on the part of their foreman the majority of these men readily become acquainted with our methods of work. The nationalization of foreigners has become important and it is very generally conceded that they are more easily reached in the shops than in their homes. However, any tendency toward radicalism should be carefully watched and immediate steps taken to circumvent it.

The only commodity a railroad has to sell is transportation. Anything that tends to increase the quantity or speed of transportation is a distinct addition to the wealth and resources of the country. Good, efficient motive power may be essential, but without freight cars the railroads would have little use for locomotives. Estimating that four per cent of all the cars in the country are shopped, every day of unnecessary delay in returning them to service represents a per diem loss to the railroads of approximately \$100,000. The importance of providing adequate shop facilities is self-evident.

#### Suggestions as to Repairs

In the actual work of repairs it is suggested that draft attachments and center construction be sufficiently strengthened so that the shocks incident to modern service will be absorbed and distributed throughout the car, without causing extensive damage to the superstructure. Center and draft

sills should have sufficient area and should be protected against buckling by the use of cover plates. A common cause of failure is due to bodies of hopper cars not being securely fastened to center sills. A few rivets are driven in inside hopper sheets to hold the body to the sills, and the heads corrode and wear off, allowing the rivets to pull through the sheets. This results in the whole strain being thrown on the body bolsters, which are usually of a wide single plate type, with the result that they are unable to stand up under the strain. The sills start moving back and forth under the car and it soon gets in such condition that permanent repairs become a rather expensive proposition. Sides and ends of steel equipment should be properly reinforced to prevent bulging out under load. Drop door equipment should be kept in proper working order to facilitate unloading. Care should be taken in repairing trucks to provide side bearing clearance and to see that brakes and all running gear are kept in good condition.

A well defined program of reinforcement should be outlined and put into practice on all roads. The cost of such additions and betterments is usually insignificant when the future life and productive service of the car is considered. Money appropriated for such features is a good, sound investment when judiciously used, and should pay large dividends. Many roads make the mistake of repairing their older equipment in kind as they do not have exacting conditions on their lines. Such equipment should either be reinforced or kept on their own lines and not offered in interchange, where there is a possibility of it getting out into the large industrial centers and in heavy tonnage trains, when it is almost an impossibility to keep it off the repair tracks.

This places an unnecessary burden of expense on both the owner and the handling line. As cars come into the shop for general repairs, a careful inspection should be made, and if the car has not deteriorated to the extent that it is felt advisable to scrap it, it should be repaired in accordance with a well defined reinforcement program, as outlined. Otherwise, if this is not done, after considerable money has been spent on the car, due to inherent weakness, it will again be back on the shop track.

In conclusion, if the railroads were provided with the facilities and a maintenance program similar to that suggested in the paper was adopted by all roads, and an honest effort was made to maintain the cars in accordance with that program, the steel cars in the country would give the owners a better return for the money invested in the way of better service and in increased life of the cars.

#### Discussion

There were about 500 in attendance at the meeting; the discussion lasted two hours and had to be cut off because of the lateness of the hour. It was opened by Vice-President Grant Hall of the Canadian Pacific and Vice President W. D. Robb of the Grand Trunk. A large number of visitors were present from the "States."

In general the discussion indicated that there were few roads owning steel cars which had adequate shops or facilities for taking care of them. The problem has been greatly complicated in the United States by the return of badly deteriorated cars to the home roads at the end of federal control. One road converted an old roundhouse and an old storehouse into steel car repair shops by equipping each of them with facilities and tools costing about \$70,000. Five heavy repairs per day are now being turned out of each of these plants.

The metal used in steel cars was seriously criticised because of the rapid rate at which it deteriorates. It was suggested that a better steel be used, similar in composition to the iron used in the Baltimore & Ohio box cars which were built in 1862, the bodies of some of which are still in

existence and have not suffered to any extent from rust and corrosion.

Heavier motive power and careless switching of cars has been responsible in part at least for the failure of some of the earlier designs of steel freight cars.

What is needed more than anything else is a systematic program for making heavy repairs to freight cars so that a certain percentage of the equipment will be given such repairs each year—this percentage to be based upon the number of years which a car can safely run between heavy repairs. Locomotives are shopped on a mileage basis. Why not establish a reasonable and scientific basis upon which to shop freight cars and then see that it is lived up to? This will keep the equipment in prime condition and at a minimum of expense after the program has been well established. It will be necessary to speed it up for some time, however, in order to catch up with the deferred maintenance.

## Partial Payments Being Made on Railroad Guaranty

WASHINGTON, D. C.

THE FIRST certificates issued by the Interstate Commerce Commission for partial payments to the railroads for their guaranty for the six months from March 1 to August 31, 1920, under the provisions of the Winslow law, were paid by the Treasury Department on March 3 and were followed shortly by the issuance and payment of additional certificates. The first of the partial payment certificates were for \$6,000,000 for the Great Northern and for \$637,190 for the Chicago, Milwaukee & St. Paul. On March 5 the Treasury announced the payment of \$7,000,000 to the Northern Pacific and on March 7, \$7,000,000 to the Chicago, Burlington & Quincy. The Chicago, Milwaukee & St. Paul had previously received \$14,297,702 in six advances on applications filed before September 1. The Great Northern had received \$5,000,000 in two payments, and the Northern Pacific had received \$5,000,000. The Burlington had not received any advance.

The commission has also announced the issuance of certificates to the Illinois Central for \$2,376,000, the Chicago & Alton for \$800,000, the Minneapolis & St. Paul for \$400,000 and the Tennessee Central for \$115,000. The Illinois Central had received two advances amounting to \$8,000,000, the Chicago & Alton had received \$700,000, and the Minneapolis & St. Louis had received five advances amounting to \$1,750,000. The certificate for the Alton was paid on March 8 and that for the Illinois Central on March 9.

The commission's certificate form states that it is not at this time able finally to determine the whole amount due under Section 209 but it has definitely ascertained and hereby certifies to the Secretary of the Treasury that the amount for which the certificate is issued, in addition to any sums heretofore certified in favor of the carrier, is due under Section 209.

The Treasury Department has recently announced the payment of loans from the revolving fund on certificates of the Interstate Commerce Commission as follows: Ann Arbor, \$400,000; New York, New Haven & Hartford, \$700,000; Louisville & Jeffersonville Bridge & Railway Company, \$162,000; Virginia Southern, \$38,000, and the Seaboard Air Line, \$1,173,600. The total payments made under the transportation act to date are summarized in a Treasury Department statement as follows:

(a) Under Section 204, for reimbursement of deficits during Federal Control .....	\$841,813
(b) Under Section 209:	
(1) To carriers to which final payment of the guaranty has been made under paragraph (g) including previous advances made under paragraphs (h) and (i) ..	1,311,700
(2) For advances under paragraphs (h) and (i) to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission .....	263,022,874

(c) Under Section 212, for partial payments in respect to the guaranty provided in Section 209 .....	3,813,190
(d) Under Section 210, for loans from the revolving fund of \$300,000,000 therein provided .....	185,016,137
Total .....	\$474,652,714

Additional funds for meeting the payments to the railroads as well as other requirements of the Treasury will be provided by new issues of Treasury certificates of indebtedness amounting to \$400,000,000 announced by the new Secretary of the Treasury, A. W. Mellon, on March 9. In a letter to bankers regarding the new issue, Mr. Mellon said that payments under the recent legislation authorizing partial payments on account of the railroad guaranty may amount to as much as \$200,000,000 during the course of the next month.

The United States Railroad Administration reports the following final settlements with railroads that were under federal control and has paid out to the several roads the following amounts:

Iowa Transfer Railway Company .....	\$7,200.00
Rapid City, Black Hills & Western Railroad Co. ....	4,000.00
Green Bay & Western Railroad Company; Annapee & Western Railway Company, and Kewaunee, Green Bay & Western Railroad Company .....	400,000.00
Southern Steamship Company .....	207,800.00
Wausapea Green Bay Railway Company .....	6,383.07
Escanaba & Leke Superior Railroad Company .....	140,000.00
New Orleans Great Northern Railroad Co. ....	190,000.00
Minneapolis Eastern Railway Co. ....	55,000.00
Louisiana & Arkansas Railway Co. ....	200,000.00
Chicago & Eastern Illinois Railroad .....	3,000,000.00
Lehigh & Hudson River Railway Co. ....	225,000.00
Charleston Terminal Company .....	90,000.00
Cumberland & Pennsylvania Railroad Co. ....	550,000.00
Gulf, Mobile & Northern Railroad Co. ....	100,000.00
Meridian & Memphis R.R. Co. ....	100,000.00

The payments of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control. The settlements were in most cases on the basis of lump sum settlements in which it is impossible to distinguish the separate items of the claims.

## Regan Automatic Train Control Exhibited in France

THE REGAN TRAIN CONTROL system which is in operation on the Chicago, Rock Island & Pacific, and which was described in the *Railway Age* April 30, 1920, page 1293, was exhibited on January 28, 1921, on the State Railway of France before a representative gathering of public and railway officers. A special train consisting of a standard

Regan Control Apparatus on French Locomotive

passenger engine and ten cars—including a dynamometer car—was used. The section of line selected for the test is on the Paris-Dieppe line between Liancourt St. Pierre and Chaumont en Vexin. The grade is descending, one per cent. Special distant and home signals were erected and track circuits

were installed in accordance with R.S.A. standards, the train control circuits on the roadside being connected through the several track relays and signals.

The following tests were made:

1. *Ordinary Working*  
Position of Signals: Distant at caution; home at proceed.  
Result of Test with the apparatus in operation: The speed of the train was automatically reduced to 18.5 m.p.h. at which the controller was set throughout the distant signal section, and on passing the home signal in the proceed position, the train was automatically restored to unrestricted speed.
2. *Non-Observance of Signals*  
Position of Signals: Distant at caution; home at stop.  
Result of Test: The speed was automatically reduced, as before, to 18.5 m.p.h. between the distant and the home signals, and the train was automatically stopped at the home signal location.
3. *Engine on Main Line Between Distant and Home Signals*  
Position of Signals: Distant and home signals at proceed position.  
Result of Test: Notwithstanding that the signals were in proceed position and that the train approached the distant signal at full speed, an automatic application of the brakes at the distant signal brought the train to a stop immediately after passing the distant signal location.
4. *Engine on Main Line Just Beyond Home Signal*  
Position of Signals: Distant at caution; home signal at proceed position.  
Result of Test: Automatic speed reduction to 18.5 m.p.h. at the distant signal; automatic stop application, stopping the train at the home signal.

The apparatus is so designed as to repeat three conditions of the track and signals on the engine: (a) Unlimited speed. (b) Limited speed, and (c) Stop. It provides three indications, though the visual signals in France (as well as in England) are two-position. In the Regan system the train, at each signaling point, has its speed regulated properly for the approach to the signal next ahead, and the speed is reduced automatically, before passing any signal, whenever the signal next ahead indicates stop.

## Single Pedestal Swivel Type Car Seat

A CAR SEAT INVOLVING several important changes from the usual type of construction has been invented and patented recently by Frank Smolar, Dayton, Ohio, and will be placed on the market by the Dayton Car Seat &

Fig. 1. Normal and Inclined Positions of Smolar Car Seat

Manufacturing Company of the same city. One of the principal objects of the new invention is to provide a car seat with a back not normally inclined. The occupant inclines the back at will against springs in the arm rests to whatever

position may be most comfortable and the springs return the back to its normal upright position when the seat is vacated. The inclined position of the back is shown by dotted lines in Fig. 1.

The new car seat is light in weight, easy to install, and is not connected to the wainscoting. The latter feature eliminates drilling and tapping the wainscoting and using the window sill as an arm rest. The seat may be easily and quickly assembled and dismembered for cleaning purposes without the use of tools. A greater height than usual is available for steam pipes and there is ample room for suit cases and traveling bags under the seat bottom. A special effort has been made to secure simplicity of construction

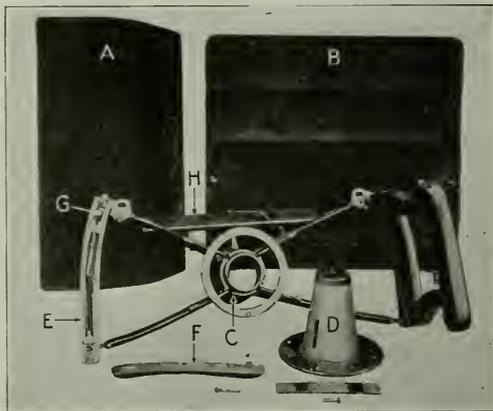

Fig. 2. View of Car Seat Parts Disassembled

without complicated parts to break or get out of order; also a minimum weight consistent with strength and rigidity. The seat may be automatically locked when in either extreme position and is stated to reverse easily, no lubrication being required. The swiveling feature makes it necessary to provide only one foot rest.

A view of the Smolar car seat, disassembled is shown in Fig. 2: *A* and *B* are the seat and back cushions respectively. The main seat support consists of a steel casting or pressed steel framework supported upon and guided by the frusto-conical pedestal *D*. Each arm rest *E* is divided horizontally, the lower section having a deep longitudinal recess, containing the anchor piece, spring, slide piece *G* and guide. Tension of both arm rest springs through the connections shown holds the back cushion in its normal upright position. The top section *F* is provided to cover the recess and parts enclosed in the arm rest.

The foot rest *H* is secured by means of two hinges to the main seat frame. A dog is provided which engages the slot in the pedestal and holds the seat firmly in either of its extreme positions. A small spring holds the dog in engagement with the slot and foot pressure on a small pedal casting fastened to the foot rest releases the dog and allows the seat to be swiveled.

Owing to the fact that the back does not need to be pulled over, cushions for the new car seat can be made to practically any desired height, width or shape to provide the greatest comfort for the passengers.

GOVERNOR CHARLES R. MAREY, of Utah, has vetoed a legislative joint memorial to Congress to amend the Transportation Act so as to give the state control of railroads in the making of intrastate rates.

# General News Department

The New York Railroad Club will hold its regular monthly meeting on Friday, March 18, at the Engineering Societies' Building in West 39th Street. F. M. Brinkerhoff will present a paper entitled "Safety of Passengers in Steel Cars."

The Chicago & Alton has opened a new inbound and outbound local freight house on West Harrison street and the Chicago river, Chicago. This house is a two-level structure of fireproof construction, with a track capacity for 125 cars at the house, and a team track yard accommodating 150 cars.

John F. Wallace, chairman of the Chicago Railway Terminal Commission, has resigned on account of the pressure of personal business, this resignation to take effect as soon as the commission is reorganized by the City Council. Mr. Wallace will continue to co-operate with the commission in its future work.

The employees of the Gainsville Midland, a road operating 74 miles of line, with headquarters at Gainsville, Ga., have had their wages reduced about 33 per cent by an order issued on March 3 by Judge Evans of the United States District Court, to the receivers, who are in charge of the road. The receivers, G. C. Carson, vice-president of the road, and W. B. Veazey, general manager, took charge on February 15. It is proposed to reduce the total of the payrolls from \$180,913 to \$116,950.

The general managers of the New York Central, at a meeting in New York City on March 8, conferred with representatives of the unskilled laborers on the proposal of the company to make important reductions of pay on April 1. The workmen took the proposal under consideration and another conference is to be held on March 22. It is proposed to reduce the pay of workmen on the freight piers in New York City from 57 cents an hour to 45 cents; and trackmen at "principal points" will be paid 40 cents an hour, with lower rates at "intermediate" points. For some classes of men it is proposed to reduce the rates to those in effect prior to the issuance of decision No. 2 of the United States Railroad Labor Board.

The "Hummer," Chicago & Alton, eastbound train No. 10, Kansas City to Chicago, was stopped by two robbers on February 25 near Quincy Junction, Ill., and three registered letters and a package were carried off. The train had just crossed the Mississippi river when the bandits, who had boarded the train at Louisiana, Mo., climbed over the tender and ordered the engineman to stop the train. One of the engine crew was then ordered to cut the train behind the combination baggage and mail car and the engineman was forced to run the engine and car a mile up the track. In the meantime the car had been entered, the loot gathered and the robbers then made their escape. An attempt to hold up this train earlier in the month failed when the engineman drifted past the point where he was ordered to stop by a lone highwayman.

Executives and counsel of the Great Northern and Northern Pacific, accompanied by some New York bankers, conferred informally with the members of the Interstate Commerce Commission on Wednesday regarding a new plan for meeting the maturity on July 1 of the \$215,000,000 joint 4 per cent bonds, secured by the 97 per cent of the stock of the Chicago, Burlington & Quincy owned by the two roads, in view of the fact that the Interstate Commerce Commission has spoiled the plan which had been proposed for paying off about \$80,000,000 of the bonds with the proceeds of the \$80,000,000 Burlington bond dividend which the commission declined to authorize. The majority report of the commission suggested that the joint bonds be refunded by new bonds secured in part by mortgages on the two roads and in part by Burlington stock as collateral.

## Atlantic City Exhibit Abandoned

At a meeting of the executive committee of the Railway Supply Manufacturers' Association at Pittsburgh on March 10, it was decided not to exhibit at the annual convention of Division 5 (Mechanical) of the American Railway Association, scheduled to be held at Atlantic City June 15-22 next.

## The Classification of Bridges

C. F. Loweth, chief engineer of the Chicago, Milwaukee & St. Paul, will present a paper on the "Classification and Maintenance of Old Railroad Bridges" before the Western Society of Engineers, Chicago, on Thursday evening, March 17.

## Change in Time Zone Boundary

A bill to transfer the Panhandle and Plains section of Texas and Oklahoma to the Central Time zone was passed by both houses of Congress in the last hours of the session on March 4 and the Interstate Commerce Commission on Monday last issued an order readjusting the western boundary line of the Central Time zone in accordance with the law.

## Pennsylvania Orders Reduction in Service

The Pennsylvania Railroad, to further reduce expenses, announced on Tuesday the withdrawal of one passenger train between Philadelphia and Washington and one between Baltimore and Washington; also the combining of two through trains into one from Philadelphia westward in the morning and another similar combination in the evening. Since the beginning of the retrenchment policy, in December, the Pennsylvania has reduced its total force from 279,000 persons to 218,000.

## Chief Interchange Inspectors and Foremen Meet

A meeting of the Chief Interchange Car Inspectors' and Car Foremen's Association of America was held at the Hotel Sherman, Chicago, on March 3 and 4, for the purpose of discussing and recommending proposed changes in the M. C. B. Interchange rules. The meeting was attended by about 100 members of the association and recommendations were adopted proposing a number of changes in the rules, which will be placed before the appropriate committees of the mechanical division of the American Railway Association.

## Annual Railroad Conference of the A. A. E.

The third annual railroad conference of the American Association of Engineers will be held at the Congress Hotel, Chicago, on Monday, March 14. The main object of this meeting is to develop co-operation between employers, employees and the public. Among the papers to be presented are: The Effect of the Railway Labor Board's Decision on the Salaries of Railroad Professional Engineers, by T. D. Trueblood, assistant engineer, Chicago & North Western; Educational Co-operation with the Management, by Prof. Lewis Gustafson; An Educational Plan Now in Effect, by W. L. Lewis; and Railroad Occupational Classification.

## Employee Educational Work on the Great Northern

To meet a desire expressed by a number of employees, particularly in the engineering department, for an opportunity to acquire a broader knowledge of railroading than comes to them through the routine work of their own departments, the Great Northern is developing a course of study to be taken up at bi-monthly meetings, in St. Paul, of a class of several hundred

employees. The course is designed to cover a period of about six months and the class is open to employees of all departments who are interested.

The extent of the interest is indicated by the fact that over 400 employees responded to the call for the first meeting. Interest in the plan is also developing among employees at outlying points and consideration is being given to means of extending it. This work had its inception among employees and officers at the headquarters of the road at St. Paul. Consideration is also being given to the development of a course of study that will meet the special requirements of interested employees in the mechanical department.

### Large Coal Cars

The Pennsylvania Railroad System now has in service 37,437 open-top cars of 70 tons capacity; and the average capacity of all its open-top cars is almost 55 tons—109,958 pounds. This, together with other interesting information, is shown in Quarterly Supplement No. 1, to the Railway Equipment Register. The company has also 168 such cars of 75 tons capacity and one each of three larger capacities. The Norfolk & Western has 1,110 of 100 tons capacity and the average of all its open-top cars is 110,289 pounds. Some totals for these roads and for the Virginian, are shown in the following table:

OPEN TOP CARS—AVERAGE CAPACITIES			
1	2	3	4
Road	Cars holding 50 tons or more	Total open top cars	Average capacity all open top cars, lb.
Norfolk & Western.....	34,299	37,856	110,289
Pennsylvania.....	170,260	174,279	109,988
Virginian.....	7,294	7,477	105,679

All of these roads have, of course, some smaller cars, the number of which is indicated by the difference between the number in column 2 and that in column 3. Of the 21 roads shown in the list referred to, the following nine report the average capacity of their open-top cars as 45 tons or more; Central of New Jersey; Chicago & Northwestern; Chicago, Burlington & Quincy; Erie; Illinois Central; Missouri, Kansas & Texas; New York Central; Southern Pacific (in Texas and Louisiana); and Southern.

Information of this kind concerning other roads is in preparation for future issues of the Supplement. The lists include box cars and other revenue cars also, and altogether they include a total equal to about 30 per cent of the total freight car equipment of North America. The roads in the present lists which report the average capacity of their box cars at 45 tons or more are the Pennsylvania (84,873 cars), 94,952 lb., and the Southern Pacific (in Texas and Louisiana), (9,124 cars), 93,860 lb.

This Supplement, containing the various compilations heretofore appearing in the regular monthly issues of the Railway Equipment Register, and also the complete list of names of all the railroads and private car companies in the country, with names of officers in charge of car maintenance, car records, etc., is issued in February, May, August and November at two dollars a year.

### Western Union Wires on L. & N.

The litigation concerning the rights of the Western Union Telegraph Company on the lines of the Louisville & Nashville railroad seems destined to go on forever. A new complication was introduced on February 16, when Judge William Rogers Clay, Court of Appeals, at Louisville, granted an injunction to the telegraph company to prevent the railroad from removing poles from the railway right-of-way.

The injunction was issued on the ground that the telegraph company is entitled to a full opportunity to have the merits of its case decided by the Supreme Court.

This case has been going the rounds of the Federal and State courts for more than eight years. It probably will be more than a year before the Supreme Court renders a final decision.

The case was taken before the Court of Appeals after Judge Samuel B. Kirby had denied the telegraph company an injunction. Previously, Judge Walter Evans, in the Federal District Court, granted an injunction, but the Circuit Court of Appeals dismissed it. Then Judge Evans fixed nine months as the time the telegraph company should have to remove its poles. Attorneys for the telegraph company contended that this time might expire before the Supreme Court gave its decision.

The basic point before the Supreme Court is whether the Western Union lost its condemnation rights in an act passed by the Legislature in 1916. Prior to that time it had sued to condemn portions of the railway right-of-way for its poles. A jury fixed the sum to be paid for this privilege at \$500,000. Judge Evans set this verdict aside as excessive and fixed the sum in a second trial at \$5,000.

Matters were complicated further when the Legislature passed an act repealing the statute on which the Western Union was basing its contentions. The railroad then moved that the case be dismissed on the ground that the telegraph company had lost its condemnation rights.

Judge Evans held that repeal of the law applied only to the future and not to rights acquired previously. This decision was reversed by the Circuit Court of Appeals and the injunction dissolved. The question of condemnation rights then was taken before the Supreme Court.

### Four Vacancies on Interstate Commerce Commission

President Harding is expected to act with reasonable promptness in appointing members of the Interstate Commerce Commission to fill the four vacancies that now exist and it is understood he will also appoint a new director general of railroads to succeed John Barton Payne, who retired as Secretary of the Interior on March 4. There has been one vacancy on the Interstate Commerce Commission ever since the membership was enlarged because James Duncan, who was given a recess appointment, never accepted the position. There has also been a vacancy since December 31 when the term of Robert W. Woolley expired, and Commissioners Potter and Ford were serving under recess appointments which expired on March 4, because their appointments had not been confirmed by the Senate. There have been rumors that Commissioners Potter and Ford will be reappointed and it has been the general understanding that John J. Esch, who has been chairman of the House committee on interstate and foreign commerce, would be appointed.

### Michigan Central Train Crew Held Responsible for Porter Collision

At the conclusion of the inquest following the Porter, Ind., train disaster, held at Valparaiso, Ind., on March 4, the Michigan Central engine crew who were charged with responsibility for the wreck were arrested but were immediately released on bail furnished by the Brotherhood of Locomotive Enginemen and Firemen. Both men attended the inquest but neither testified. After the finding of the coroner's jury the two issued a statement in which they set forth that the interlocking home signal governing the route over the derail 311 feet from the crossing where the New York Central train plunged through the Michigan Central train, gave them a clear right-of-way, although the distant block showed a yellow light. This last signal they claimed to have complied with by bringing their train under control. Witnesses at the inquest claimed that the home signal had been set against the train, these witnesses including the engineman and fireman of a freight train which was standing on a siding to allow the passenger trains to pass. Two brakemen of this same train testified that they had tried to flag the Michigan Central train with the white lanterns at hand, and it was their belief that the strong headlight of the train had made these invisible. The engineman of the freight train, in testifying, said that smoke from his engine might have interfered with the engineman of the Michigan Central train having a clear vision of the home signal. It was brought out at the inquest that the Michigan Central train normally had the right of way at the crossing but on the night of the wreck it was eight minutes behind schedule.

Meanwhile the joint board of inquiry of the State Public Service Commission of the State of Indiana and Interstate Commerce Commission met at Gary, Ind., on March 8, to investigate the causes for the wreck and testimony was taken from the towerman and the crew of the freight train which was on the siding at the time of the disaster. E. J. Lewis presided, while others at the hearing were John W. McCardle, vice-chairman, Glenn Van Auken, H. B. Lyon and J. S. Hawley, representing the Interstate Commerce Commission.

## Traffic News

The consolidated ticket offices at Tacoma and Seattle, Wash., were discontinued March 1, each line establishing an office of its own in these cities.

"The Port of Astoria," Astoria, Oregon, has established a traffic and transportation department and has appointed as its manager, Roger D. Pinneo.

The Arkansas & Louisiana Missouri Railway announces that its road has been rehabilitated and that through trains are now being run from Monroe, La., north to Crossett, Ark., 52 miles. The company operates freight service between Bastrop, La., and Huttig, Ark., 31 miles.

Intrastate passenger fares in Michigan may be kept at three cents a mile, this being the decision of the Federal Court at Detroit on March 4 in the suit of the railroads for an injunction restraining the Public Utilities Commission of the state from enforcing a rate of 2.5 cents.

The six New England special committees appointed by the governors of the New England States on February 27 to consider the traffic crisis in that territory, met in Boston on March 8 and had a further conference with representatives of the railroads. An executive committee was named to formulate a plan of action.

Senator Phipps of Colorado has presented to the Senate a concurrent resolution of the general assembly of Colorado petitioning Congress to so amend the transportation act as to protect and preserve the powers of the several states with relation to intrastate rates, services and facilities and the local fares of the common carriers within the states.

The Texas City Transportation Company which formerly owned the Terminal Railroad and dock facilities at Texas City, Tex., has been reorganized and a new company has been recently incorporated under the name of the Texas City Terminal Railway Company. The new organization has taken over and will operate the facilities of the old company.

The Traffic Club of Oklahoma City, Okla., was organized on February 14 and the following officers were elected: President, H. C. Conley; first vice-president, H. H. Hunt; second vice-president, H. D. Driscoll; secretary, K. C. Baker; treasurer, D. D. Decker; directors, J. L. Carleton and M. C. Burton. A meeting is planned on March 7 at which time the object and purpose of the club will be explained to invited guests eligible for membership.

### Passenger Traffic for November

The number of passengers carried by the railroads in November, 1920, after the increased rates had been in effect for three months, was still greater than for November, 1919, but the average journey was slightly less. The total was 96,632,000 passengers, an increase of 1.6 per cent, but the average journey was 36.38 miles as compared with 37.2. As a result the passenger-miles for the month showed a decrease of .6 per cent. Passenger revenues for November were \$106,829,660, an increase of 15 per cent over November, 1919. The average receipts per passenger mile were 3.62 cents as compared with 2.61 cents.

### Last Year's Grain to Be Moved

Larger stocks of grain of last year's crops were held on the farms on March 1 this year than on that date in almost any other year in history, according to estimates announced by the Department of Agriculture. The wheat on the farms on March 1 amounted to 207,000,000 bushels as compared with 164,000,000 bushels a year ago. This quantity had been exceeded in March, 1916, when 244,000,000 bushels were held, but the stock on hand on March 1, this year, represented 26.4 per cent of the crop, whereas that of March, 1916, represented 23.8 per

cent. On March 1, 1920, the wheat on the farms was 17.6 per cent of the crop. Of the corn crop 1,572,000,000 bushels, or 48 per cent, were held on the farms on March 1, as compared with 1,070,000,000 last year. There were also 689,000,000 bushels of oats as compared with 418,000,000 last year and 69,000,000 bushels of barley as compared with 36,000,000 last year. In 1919 there were 81,000,000 bushels of barley.

### Revised Regulations for Explosives

The bill recommended by the Interstate Commerce Commission to modify and strengthen the existing law regulating the transportation of explosives, including more specific penalties and bringing within the jurisdiction of the commission's regulations a number of recently developed explosives and other dangerous articles, was passed by Congress on March 3.

### Anthracite Shipments—January, 1921

Shipments of anthracite in January, as reported to the Anthracite Bureau of Information, amounted to 5,740,538 gross tons, against 6,436,320 tons in December, 1920, a decrease of 695,782 tons. There were 25 working days, but three of these were observed as religious holidays in some parts of the region, and a strike in the Panther Creek valley helped reduce the total output. The month's total was nevertheless almost equal to that of November, 1920, 5,765,347 tons, and was slightly in excess of the record for the corresponding month of January, 1920, when 5,713,319 tons were shipped.

Shipments by originating carriers were:

	January, 1921	December, 1920
P. & R. Ry.....	1,172,873	1,324,604
L. V. R. R.....	1,058,127	1,161,305

Total.....	5,740,538	6,436,320

### 1920 Traffic and Car Performance Break Records

WASHINGTON, D. C.

The fact that the railroads in 1920 broke all previous records for the volume of freight service performed and that they also established new records for efficiency in freight car performance has been known for some time but the final figures for the year, just compiled by the Interstate Commerce Commission, show some interesting comparisons with the three previous years of the period of war and of federal control. New records were established for ton mileage, car and train load and net ton miles per car day.

The net ton miles of freight handled by the railroads during the year aggregated 445,975,000,000, exceeding the total for 1918, heretofore the record, by eight billions, or about two per cent. In 1919 the railroads handled 393,684,000,000 ton miles; in 1918, 437,000,000,000; in 1917, 430,000,000,000, and in 1916, 396,000,000,000.

The average load per loaded car for 1920 was 29.4 tons, which also breaks all previous records for a year. For 1919 the average car load was 28 tons, for 1918 it was 29.2 and for 1917 it was 27. The average mileage per car per day for 1920 was 24.9. This was greater than the average for 1919, which was 23.0, but was the same as the average for 1918 and less than that for 1917, which was 26.1.

The average train load in 1920 was 728 tons as compared with 718 in 1919, 681 in 1918 and 653 in 1917. The average ton miles per car per day was 497 as compared with 441 in 1919, 487 in 1918 and 495 in 1917. The average number of serviceable freight cars on line daily was 2,293,758 as compared with 2,287,769 in 1919; and the average percentage of unserviceable cars was 7 per cent, as compared with 7.1 per cent in 1919.

The average cost per freight train mile (selected accounts) was \$2.046, as compared with \$1.649 in 1919. The average cost per mile for locomotive repairs was 51.4 cents as compared with 43.2; enginemens, 23.9 as compared with 23.2; fuel, 63.8 as compared with 49.6; other locomotive and train supplies 12.7 as compared with 11.6; enginehouse expenses, 12.2 as compared with 10.5, and trainmen 34.7 as compared with 26.8.

## Court News

### Commission and Court News

#### Interstate Commerce Commission

By a second supplemental order the Interstate Commerce Commission has suspended until July 10, various schedules which propose to increase the existing charges of 50 cents per car for loading and unloading live stock at stock yards at East St. Louis, Ill., Sioux Falls, S. D., and various other points to \$1 per car and provide for the absorption of these increased charges by the carriers reaching such points.

The Interstate Commerce Commission has announced a supplemental hearing on March 24, at Topeka, Kan., before Examiner Disque, in the matter of rates, fares and charges in Kansas on the lines of the Arkansas Valley Interurban, the Union Traction Company, Kansas City, Kaw Valley & Western, Joplin & Pittsburg, and such other common carriers of freight or passengers operating by electric power in the state as shall appear.

The Commission has made public a tentative report of Examiner H. C. Keene, recommending the dismissal of a complaint filed by the Arizona, Nevada and New Mexico state commissions asking for a reduction in passenger fares between points in Arizona, Nevada and New Mexico and between points in those states and other states, on the ground that they have not been found to be unreasonable, unduly discriminatory or unduly prejudicial.

The Interstate Commerce Commission has announced a hearing on March 21, at Chicago, Ill., before Chief Examiner Quirk, in the matter of rates, fares and charges in Illinois, maintained or participated in by the Pullman, Chicago & Calumet River, Chicago Heights Terminal Transfer, Chicago River & Indiana, East St. Louis Connecting, Manufacturers Junction, Aurora, Elgin & Chicago, Chicago, Lake Shore & South Bend, Chicago, Ottawa & Peoria, Danville, Urbana & Champaign, Bloomington, Decatur & Champaign, Illinois Central Traction, St. Louis Electric Terminal, St. Louis, Springfield & Peoria, East St. Louis & Suburban, St. Louis & Belleville, St. Louis & Ohio River, and such other common carriers of freight or passengers operating by steam or electric power in the state as shall appear.

The Interstate Commerce Commission has issued its decision in the Louisiana intrastate rate case, in which it orders an increase in the passenger fares including the surcharge for Pullman passengers, but excepting commutation fares or fares for special occasions, corresponding to the increase allowed for interstate traffic. Similar increases were ordered in the rates for the transportation of milk in passenger trains, but the commission deferred for later consideration the issue with respect to rates on sugar cane for the reason that there is no discrimination as between intrastate shippers of sugar cane and interstate shippers of the same commodity. The question of sand and gravel rates was also reserved for later determination and the issue as to rates on rice and cotton was withdrawn.

#### State Commissions

A temporary injunction enjoining the Ohio Utilities Commission and the attorney general of the state from interfering with action of the railroads in Ohio in charging increased passenger rates was issued in the United States District Court at Columbus, on March 3. The injunction, which supersedes a temporary restraining order granted recently, is to stand until the case is decided on its merits. Appeal to the United States Supreme Court will be taken by the state, it was reported. Although Ohio, together with several other states, already has a case before the United States Supreme Court contesting application of the increased rates to intrastate traffic, appeal of the decision, it was pointed out, would bring the matter up as a separate action wherein the Ohio three-cents-a-mile law and other conditions peculiar to the state could be taken into consideration.

#### Statute Imposing Tax on Gross

##### Receipts of Freight Line Held Void

The Mississippi Supreme Court holds that the provision of section 112 of the State Constitution of 1890 that taxation shall be equal and uniform, and that property shall be assessed for taxes according to its true value, can be complied with only by taxing all property at the same rate on its true value, and the Legislature is without power to provide for the taxation of property by any other method. Consequently chapter 113, Mississippi Laws of 1912, which provides for a fixed charge on the gross receipts of a freight line company in lieu of all taxes on the property of the company used in its business, is void.—*Rock Island v. Robertson* (Mass.), 84 So. 449.

#### United States Supreme Court

##### Limitation of Liability Without Choice of Rates

On March 10, 1915, a consignor delivered to the Pacific Mail Steamship Company at Yokohama, Japan, 56 cases of "Drawn Goods and Renaissance," consigned to his own order at New York, and received a bill of lading for ocean transportation to San Francisco and thence by the Southern Pacific and its connections, by rail, to destination. The property was totally destroyed in a collision on the Union Pacific. A successor in interest claimed, in an action against the Union Pacific, the fair invoice value of the goods, \$17,449, and the railroad conceded his right to recover, but only to the amount of the agreed valuation of \$100 per package, \$5,600, to which it contended he was limited by the bill of lading. The New York Appellate Division rendered judgment for the plaintiff for \$5,600, with interest and costs. This was reversed by the New York Court of Appeals and judgment directed for the plaintiff for \$17,449, with interest and costs. The case was taken to the Supreme Court of the United States on certiorari, and that court has affirmed the judgment, against the carrier.

On the face of the bill of lading received at Yokohama was the notation: "Weight 26,404 lbs.; Ocean weight rate, 50 cents; Freight \$132; Rail, minimum carload weight, 30,000 lbs.; Weight rate, \$1.25; Freight, \$375." "On the back of the bill of lading a printed provision limited the value and the liability of the companies therefor in case of total loss to \$100 per package. In the schedules of the Union Pacific was a rule, Rule 9A, providing that when property is transported subject to the provisions of the Western Classification, the acceptance and use are required, of the Uniform Bill of Lading. For the purposes of the case only, it was admitted, and accepted by the Supreme Court, that this rule 9A permitted and required that the property should be treated as moving east of San Francisco under the Uniform Bill of Lading, although, in fact, no other than the Yokohama bill of lading was issued. The railroad contended that the agreed valuation of \$100 per package in the Yokohama bill of lading was necessarily imported into the Uniform Bill of Lading; it became the valuation "agreed upon" within the terms and conditions quoted from that bill, and limited the plaintiff's recovery to that amount, \$5,600, regardless of the value of the property and of the fact that it was lost by the carrier's negligence.

The Supreme Court holds that "this valuation rule, where choice is given to and accepted by a shipper, is, in effect, an exception to the common law rule of liability of common carriers, and the latter rule remains in full effect as to all cases not falling within the scope of such exception. Having but one applicable published rate east of San Francisco the petitioner [the Union Pacific] did not give, and could not lawfully have given, the shipper a choice of rates, and therefore the stipulation of value in the Yokohama bill of lading, even if treated as imported into the Uniform Bill of Lading, cannot bring the case within the valuation exception; and the carrier's liability must be determined by the rules of the common law. To allow the contention of the petitioner would permit carriers to contract for partial exemption from the results of their own negligence without giving to shippers any compensating privilege." *Union Pacific v. Burke*. Decided, February 28, 1921. Opinion by Justice Clarke.

## Foreign Railway News

### Serious Competition by Germany

LONDON.

The Russian Soviet government recently asked for bids for 1,000 locomotives to be delivered over a period of years. The price quoted by two German firms backed by Krupps was approximately \$52,000 rate of exchange as against the lowest British quotation of \$80,000.

### German Locomotives for Spain

LONDON.

German firms have secured a large contract for locomotives for Spain. They have agreed that 90 per cent of the purchase price shall be paid when the locomotives are under steam on the Spanish railroads, the other 10 per cent to be paid six months after they have been proved satisfactory.

### Westinghouse Brakes in France

According to a Paris cable to the New York Herald, the Westinghouse air brake is being tested by the French minister of public works, and will, according to present indications, be adopted as standard for the French railways. Several other brakes are being tested under the direction of the minister. Among them are the Kunz Knorr, the Lipowsky and several French, German and English models.

### Railway Strike in Mexico

A general railway strike is in effect in Mexico, resulting, according to newspaper reports, from the failure of the administration to recognize what is described as a radical union of all classes of railway workers. It would appear that there is considerable violence in connection with the strike. Reports of bridges blown up, engines disabled and attempted destruction of railway buildings appear with frequency in the daily press. It is also reported that a number of strikers have been executed for deeds of violence.

### Receipts and Expenditures on English Railways

LONDON.

The Ministry of Transport has issued a statement regarding the financial results of the working of the railways during the eight months ended November 30, 1920. The total revenue earned was approximately \$597,406,558 at the present rate of exchange. The total expenditure was \$564,848,273, giving a balance of revenue over expenditure of \$32,558,284. The standard year proportion of net receipts under the given guarantee was \$116,637,500, to which is added for interest on capital works brought into use, or \$2,761,500. Thus the net government liability for the eight months ending November 30, 1920, is \$89,255,659.

### England's Exports of Railway Materials

LONDON

The returns of the Board of Trade of Great Britain for December give the value of railway material exported during the year 1920 to be as follows as against the exports for the year 1919:

	1920	1919
Locomotives .....	\$23,949,576	\$7,124,936
Rails .....	10,792,760	8,036,736
Passenger cars .....	6,780,028	2,377,408
Freight cars .....	22,858,844	9,496,568
Wheels and axles .....	7,700,028	3,286,300
Tires and axles .....	5,668,812	3,603,820
Chairs and metal ties .....	5,263,208	1,270,816
Miscellaneous track materials .....	9,475,140	3,115,620
Total track materials .....	39,388,672	12,572,568

These figures are quoted at the present exchange rate. The weight of rails exported was 131,079 tons for the year 1920, as against 125,256 tons for the year 1919.

## Equipment and Supplies

### Locomotives

THE PEKING-HANKOW has ordered 30 Prairie type locomotives from the Baldwin Locomotive Works.

THE SEISEN-SHOKUSAN (Korea) has ordered 1, 0-6-0 type locomotive from the Baldwin Locomotive Works.

THE TEXAS-MEXICO, reported in the *Railway Age* of February 18, as inquiring for some 0-6-0 and 4-6-0 type locomotives, has ordered one of each of the above types from the Baldwin Locomotive Works.

### Freight Cars

THE PEKIN-MUKDEN, reported in the *Railway Age* of January 21, as inquiring through the car builders for 300 or more 44-ton capacity gondola cars, is now inquiring for 200, 40-ton gondola and 200, 30-ton box cars.

### Iron and Steel

THE MISSOURI PACIFIC has ordered 150 tons of plate girder spans from the American Bridge Company.

THE CHICAGO UNION STATION COMPANY has received bids for 6,000 tons of structural steel to be used in the construction of the new railway mail terminal, Chicago. The company has also received bids for 420 tons of structural steel to be used in building the Madison street viaduct, Chicago, and for 320 tons for use in widening Canal street, Chicago, between Van Buren and Jackson streets.

### Track Specialties

THE MAINE CENTRAL is in the market for 1,000 tons of tie plates.

THE PITTSBURGH & LAKE ERIE is asking for from 1,400 to 1,500 kegs of standard spikes.

THE BANGOR & AROOSTOOK is inquiring for 500 tons of tie plates and for frog and switch material.

### Signaling

THE LOUISVILLE & NASHVILLE has ordered from the General Railway Signal Company an electro-mechanical interlocking-machine for Biloxi, Miss.; four mechanical levers and four electric.

Ph. to by Underwood & Underwood

The New York, New Haven & Hartford Fighting the Snow on Cape Cod

## Supply Trade News

Langley Ingraham has been appointed general sales manager of the railroad department of **The Lowe Brothers Company**, at Dayton, O., effective March 1.

J. F. Duesenberry, heretofore with the commission on car service, American Railway Association, at Washington, has been appointed Auditor of Camps, of the International Lumber Company, International Falls, Minn.

H. M. Pratt, manager of the branch office of the **Southern Iron and Equipment Company** at New Orleans, La., has been appointed general sales manager with headquarters at Atlanta, Ga. A. C. Wood succeeds Mr. Pratt at New Orleans.

The **Southwark Foundry & Machine Company**, Philadelphia, Pa., has opened a district office at 804 Swetland building, Cleveland, Ohio, under the management of its representative, Stewart Bolling, who has served for seven years as engineering salesman for this company.

H. J. DeLaney, formerly railroad representative at Houston, Tex., of the **United States Rubber Company**, New York, has been appointed special railroad representative of its Southern division, in charge of the railroad business at its New Orleans, Birmingham and Houston branches.

The **National Malleable Castings Company**, Cleveland, Ohio, has bought the draft gear business, assets and goodwill, as of January 1, 1921, of the **Butler Drawbar Attachment Company**, Cleveland. The business of the latter company has been transacted for many years through the **National Malleable Castings Company**.

W. J. Roehl, whose appointment as sales representative in the St. Louis, Mo., district for **A. M. Castle & Co.**, Chicago, was announced in the *Railway Age* of March 4, entered the railroad business on May 4, 1906, as a clerk in the office of the supply agent of the **Misouri Pacific**. In May, 1910, he was promoted to chief clerk, remaining in that position until March 1, 1913, when he was promoted to chief clerk to general purchasing agent. On June 1, 1918, he was appointed assistant purchasing agent on the same road, holding that position until January 31, 1921, when he resigned to enter the service of **A. M. Castle & Co.**, as above noted. Mr. Roehl's headquarters are at 1946 Railway Exchange building, St. Louis,

W. J. Roehl

William P. Wescott, district manager at New York of the **Galena Signal Oil Company**, Franklin, Pa., has been elected also treasurer and a director. He succeeds as treasurer, J. French Miller, who was secretary and treasurer, Franklin, Pa., and is now secretary; he succeeds as director E. V. Sedgwick, New York, who has resigned.

At the annual stockholders' meeting of the **H. Channon Company**, the number of directors was increased from 5 to 7, and Geo. E. Scott, vice-president of the **American Steel Foundries**, and F. C. Honnold, president of the **Chicago & Big Muddy Coal Company** were added. The officers and the other five directors were re-elected.

The **Power Equipment Company**, 131 State street, Boston, Mass., has been appointed New England representative of the **Conveyors' Corporation of America**, Chicago, for the sale of its American trolley carrier monorail conveying equipment, and Colwell & McMullin, 79 Milk street, Boston, are the New England representatives for its American steam ash conveyor.

On March 1, the **Locomotive Superheater Company**, New York, changed its name to the **Superheater Company**. For years the **Locomotive Superheater Company** has served the steam railroads of the world, and necessity for greater conservation of fuel in other fields has resulted in the expansion of its organization to serve the marine and all fields where steam is used for power. Through the application of **Eslesco** superheaters, railroad shop plants, industrial plants, public utility operations and excavating equipment are operating more effectively and more economically. The development of feed water heating equipment for locomotive and marine use has further broadened the activities of the company, and it was felt that with this expansion, the name of the organization was inadequate.

### Bucyrus Company

Net earnings of the **Bucyrus Company**, Milwaukee, Wis., for 1920 were \$1,010,984, against \$982,563 in 1919. There was carried to surplus \$530,984, bringing that item to \$3,113,606. The income account for the year and balance sheet as of December 31 with comparisons, follow:

INCOME ACCOUNT		
	1920	1919
Net earnings after interest and taxes.....	\$1,010,984	\$982,563
Dividends .....	480,000	220,000
Surplus .....	580,984	762,563
Previous surplus .....	2,582,621	1,820,058
Total surplus .....	3,113,606	2,582,621
BALANCE SHEET—ASSETS		
Cash .....	567,083	249,483
Accounts and bills receivable.....	1,764,076	1,745,585

### New York Air Brake Company

The annual report of the **New York Air Brake Company** for the year 1920 shows sales of \$6,545,846 compared with \$3,551,667 in 1919. Total income including profits from sales was \$1,779,315 compared with \$1,665,000 in the preceding year. These figures are equal to \$7.51 and \$6.24 respectively earned on the capital stock in each year.

After the payment of dividends on the capital stock the company reported a deficit for the year of \$222,017, but this does not include depreciation in inventory which was deducted from the profit and loss surplus, thereby reducing that account from a total of \$6,054,168 at the close of 1919 to \$4,047,628 at the end of 1920. The writ-off for inventory loss amounted to \$1,534,522 and in addition \$250,000 was written off for contingent services.

President Charles A. Starbuck in his report says:

"Owing to the stringency in the money market during the past year, the railroads were not able to purchase very large amounts of new equipment, and while our sales were nearly double the year before, over one-half of the amount was for repair parts which the railroads were compelled to purchase to keep their trains in operation.

"You will note that provision has been made for federal taxes, reserve for depreciation and an additional substantial reserve for contingencies, and further that a very large amount has been written off various assets to meet the present-day deflated condition.

"Your property has been maintained in the highest state of efficiency, and liberal allowance expended for maintenance and repairs.

"The indebtedness to banks for borrowed money has been decreased substantially \$2,000,000 during the past year, and this has been accomplished largely through the reduction of merchandise inventories.

"Now that the Winslow bill has become a law and the railroads are receiving the money due them from the government we expect that they will soon place orders for large amounts of new equipment."

### American Locomotive Company

The unfilled orders of the American Locomotive Company on December 31, 1920, as shown by its annual report, amounted to \$24,270,702 as compared with a total of \$8,999,921 at the close of 1919. Of the unfilled orders, about 64 per cent was for domestic work and 36 per cent for foreign business, while in the previous year 32 per cent was domestic and 68 per cent foreign.

The gross earnings for the company in 1920 amounted to \$66,884,613 as compared with \$70,073,582 in 1919. After deducting from the gross earnings \$58,137,473 for the cost of manufacturing, maintenance, administrative expenses, interest on bonds of constituent companies and an allowance for depreciation of \$1,326,811 on all classes of property there remained a gross profit for the year of \$8,747,140 from which has been deducted an allowance of \$1,636,014 for estimated United States and Canadian income and profits taxes, the remaining balance of \$7,111,126 being the available profit for the year. Dividends of seven per cent on the preferred stock and 6 per cent on the common, amounting to a total of \$3,250,000, were paid during the year. There remained a surplus of \$3,861,126 from which \$2,000,000 was reserved for additions and betterments to the present plants of the company and \$1,861,126 was credited to surplus.

President Andrew Fletcher in his report to the stockholders said: "The available profit for the calendar year was 10.6 per cent on gross earnings in comparison with 13.5 per cent for the calendar year 1919. An amount equal to \$21.45 per share was earned on the common stock of the company after providing for the regular \$7.00 per share on the preferred stock.

"For the future extension of the company's business it was decided to obtain property for a plant in the midwest section of the country and after careful consideration the St. Louis, Missouri, industrial district was decided upon as being a very advantageous location, not only because of the great number of railroads centering there, but also from the fact that it has been estimated that approximately 80 per cent of the materials entering into the manufacture and construction of locomotives and their tenders can now be obtained within a comparatively small radius of miles of that section. The company therefore negotiated the purchase before the close of the year of approximately 160 acres of land in the St. Louis district for the proposed plant. It is not at present the intention of the company to proceed with the erection of the plant and building operations will be deferred until general business conditions of the country become more stable.

"The excess of current assets over current liabilities December 31, 1920, was \$37,318,565. There has been included in current liabilities a reserve of \$1,911,538 to provide for current shrinkage in value of notes and bills receivable carried as current assets, and for the estimated loss at the prevailing discount on December 31, 1920, which would obtain in converting to United States dollars that part of the net working capital of the Montreal Locomotive Works which is expressed in Canadian dollars on the balance sheet of the Montreal Locomotive Company.

"The reserve of \$5,970,422 in current liabilities set up for accruals for United States and Canadian income and profits taxes, is, we believe, sufficient to provide for any differences in interpretation of the laws by the Internal Revenue Departments of both countries.

"The company has no bills payable outstanding and of the \$8,685,186 cash on hand on December 31, 1920, a considerable part of it since the first of the year has been invested in United States Treasury 5 3/4 per cent certificates.

"The amount of materials and supplies of inventory account together with work in progress December 31, 1920, was \$14,609,096 in comparison with \$7,170,805 as of December 31, 1919. The materials and supplies have been valued at cost or market price whichever was lower.

"The prospect in the immediate future of orders for equipment

of any appreciable volume is not promising. The unsettled general business conditions of the country at this time with the consequent drop in traffic on the railways, the conditions of railway finances, of labor and of materials are not conducive to any great amount of purchasing on the part of the railroads; however, it is a fact, that the effective equipment of cars and locomotives of the railroads of the United States has not kept pace the past few years with the natural growth and development of the country."

### CONDENSED INCOME ACCOUNT OF THE AMERICAN LOCOMOTIVE COMPANY, MONTREAL LOCOMOTIVE WORKS, LIMITED, AND AMERICAN LOCOMOTIVE SALES CORPORATION COMBINED

### Trade Publications

**TAP DRILL SIZES.**—A table of tap drill sizes for S. A. E. or A. S. M. E. machine tool standards has been prepared in pocket form by the Greenfield Tap & Die Corporation, Greenfield, Mass. Larger charts containing similar data and suitable for hanging in the shop for ready reference by the workmen, have also been brought out.

**ACHIEVEMENT.**—This is the caption of a folder being distributed by the J. G. White Engineering Corporation, 45 Exchange place, New York. It gives information about and illustrations of power developments, hydro-electric developments, transmission systems, and other important engineering projects in this and in foreign countries.

**STEEL STRUCTURES FOR RAILROADS.**—In a 12-page booklet issued by the McClintic-Marshall Company, Pittsburgh, Pa., are given views of a large number of structural steel buildings and bridges, fabricated and erected by that company for railroads in various parts of the country. Included among these are freight houses, shops, roundhouses, bridges, viaducts, and miscellaneous structures.

**OIL DRIVEN AIR COMPRESSORS.**—The oil engine driven air compressors manufactured by the Chicago Pneumatic Tool Company, are described and illustrated in bulletin 607, recently issued. The booklet opens with a short general description of the machine and the type of fuel required. This is followed by a condensed illustrated description of the important details of construction. One of the interesting features of the bulletin is a comparison of the cost of operating an oil engine compressor unit and the comparative cost of operating an equivalent sized steam driven compressor. The concluding pages are devoted to illustrations of the various types of machines with tables of sizes, weights, etc.

**THE EASTERN REGION** of the Pennsylvania Railroad in January broke all records for punctuality since the company resumed the management of its property last March. Of the total of 81,713 trains run 91.7 per cent arrived at destination on time and 95.8 per cent made schedule time. In January last year only 77 per cent of the trains were on time and 87.4 per cent of them made schedule time.

**RAILROAD WORKMEN** of various crafts at a number of places in the southern states announce that, throughout that region, a vote will be taken in the unions to see if a strike shall be ordered to support the strike of the employees of the Atlanta, Birmingham & Atlantic. Commissioner Chambers of the United States Board of Mediation, has tendered the services of that board as mediators in the strike on the A. B. & A.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company has authorized the construction of a blacksmith shop at San Bernardino, Cal., with dimensions of 80 ft. by 306 ft., to cost \$107,000. The company will also build a lavatory building at Needles, Cal., to cost \$22,500.

**CHICAGO UNION STATION COMPANY.**—This company will shortly accept bids for the construction of a 260 ft. viaduct at Madison street, Chicago. The company will also widen Canal street 40 ft., between Van Buren and Jackson streets, Chicago.

**ILLINOIS CENTRAL.**—This company contemplates building a passenger station at Gilman, Ill., replacing a structure burned recently. The company also contemplates the construction of passenger stations at Baton Rouge, La., and Grand Junction, Tenn., replacing facilities no longer adequate.

**MISSOURI PACIFIC.**—This company contemplates rebuilding its shops at St. Louis, Mo., which were recently destroyed by fire at a loss of \$150,000.

**MONTANA RAILROAD.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the operation of its recently constructed line of 6 miles.

**SAN ANTONIO & ARANSAS PASS.**—This company is adding a second story to its freight station at Yoakum, Tex.

**ST. LOUIS-SAN FRANCISCO.**—The Employes Hospital Association of the St. Louis-San Francisco contemplates the construction of a new 120-bed hospital at Springfield, Mo., replacing the present structure.

**UVALDE & NORTHERN.**—The Interstate Commerce Commission has denied this company's application for a certificate of public convenience and necessity for the construction of a line of 37 miles in the counties of Uvalde and Real, Tex., on the ground that the Commission cannot find in the record that degree of assurance of a reasonably successful enterprise which would warrant the issuance of a certificate.

**WICHITA FALLS & SOUTHERN.**—The Interstate Commerce Commission has issued a certificate authorizing this company to construct a line from Newcastle to Breckenridge, Tex., a distance of approximately 44 miles. Protests against the granting of the certificate were filed by the Eastland, Wichita Falls & Gulf, the Cisco & Northeastern, the Texas & Pacific, and the Gulf, Texas & Western, on the ground that the construction of the new line would reduce their revenues.

Parts of Big German Guns Being Shipped as Scrap to the Foundries in Accordance with Terms of the Treaty

## Railway Financial News

**ALABAMA & VICKSBURG.**—*Loan Approved.*—The Interstate Commerce Commission has approved a loan of \$1,564,000 to this company to assist it in meeting its maturing indebtedness aggregating \$1,936,900, and in providing itself with additional locomotives at a total estimated cost of \$340,000. The carrier itself is required to finance about \$715,000 to meet the loan of the government.

**BERGEN COUNTY.**—*Asks Authority to Extend Bonds.*—This company has applied to the Interstate Commerce Commission for authority to extend for 10 years the maturity date of \$200,000 of first mortgage bonds maturing on April 1.

**BUFFALO, ROCHESTER & PITTSBURGH.**—*Bonds Paid.*—The \$1,300,000 6 per cent bonds due February 1, 1921, were paid off at maturity at the office of A. Iselin & Co., 36 Wall street, New York. The company obtained a government loan of \$1,000,000 to help it in meeting this maturing debt.

**CENTRAL OF NEW JERSEY.**—*Coal Company Dividend.*—The Lehigh & Wilkes-Barre Coal Company has declared a special cash dividend of 150 per cent on its \$9,210,000 stock outstanding. Of this dividend, amounting to \$13,815,000, the Central of New Jersey gets \$12,734,000 on the stock which it owns. The decision to declare the special dividend resulted from a necessity imposed on the Jersey Central by the Reading segregation of disposing of its Lehigh & Wilkes-Barre stock. By a modification of the Reading decree the coal company was permitted to declare any dividend warranted by its financial condition.

**CHICAGO, MILWAUKEE & ST. PAUL.**—*New Directors.*—Mortimer N. Buckner, of the New York Trust Company, and W. E. S. Griswold, of the Lima Locomotive Works, have been elected directors to succeed Percy A. Rockefeller and John A. Stewart, resigned, in compliance with the provisions of the Clayton Act.

**CHICAGO, ROCK ISLAND & PACIFIC.**—*Asks Loan from Revolving Fund.*—This company has applied to the Interstate Commerce Commission for a loan of \$1,905,000 for five years from the revolving fund, to pay off at maturity on October 1, 1921, a like amount of bonds of the Cedar Rapids, Iowa, Falls & North Western.

**CHICAGO & NORTH WESTERN.**—*Authorized to Issue Equipment Trust Certificates.*—This company has been authorized by the Interstate Commerce Commission to enter into a proposed trust agreement providing for the issuance of \$9,630,000 of equipment trust certificates, with interest at not exceeding 7 per cent, to be sold at not less than 97 per cent of par, for the purchase of equipment authorized by the board of directors to the amount of \$9,684,093.

**DENVER & RIO GRANDE.**—*Confirmation of Sale Deferred.*—Postponement of confirmation of the sale of this road until March 25, during which time the stockholders would be given an opportunity to purchase the road for \$10,000,000, has been ordered by Federal District Judge Lewis, of Colorado, sitting at Kansas City, Mo., with Federal Judge W. H. Sanborn. Judge Lewis announced the decision after an all-day hearing on an action to enjoin confirmation of the sale fixed by the court November 20 at \$5,000,000.

"It is ordered," the court instructed, "unless the stockholders shall make or cause to be made a deposit of \$100,000 with the clerk of the court, and also cause such depositary to consent in writing filed with the clerk, the said \$100,000 may be and shall be paid over to the receiver for the benefit of the property under administration if the depositary fails to bid and purchase the equities in the properties described in the master's sale for the sum of \$10,000,000 or more within twenty days after March 5, 1921. Unless no higher bid is made or accepted by the court the sale already made will be confirmed."

**GAINESVILLE MIDLAND.**—*Receivership.*—Gordon Carson and W. B. Veazey of Gainesville, Ga., have been appointed receivers. The road operates between Gainesville and Athens, 42 miles, with a branch line to Monroe, 32 miles. President George J. Baldwin recently said that the road would have to cease operations as a result of the refusal of employees to vote a reduction in their wages. Mr. Baldwin submitted the following statement to the employees:

The Gainesville Midland has lost in operating expenses over and above all income and revenue during the last twelve months, \$84,484.87, and this loss is continuing with no apparent prospect of improvement. Under these conditions, which have crippled the road, it is clearly apparent to everyone that unless immediate relief can be secured it can no longer continue to operate. We have no credit or means of securing additional funds.

The wages of employees have increased from the sum of \$83,343.20 paid in 1917, to \$180,913.02 in 1920.

The principal owners of the road and mortgage creditors have indicated a willingness to defer any interest or income on the investment of over a million dollars to adjust the situation as far as they can.

The proposition is therefore made to the employees to devote all income from the operation of the road during this period to the payment of necessary operating expenses and to the wages of employees for the above period of the wages of employees payrolls on this basis:

This is the only possible way the road can continue to operate and we therefore urge your serious consideration and immediate acceptance of this plan.

**NORFOLK & PORTSMOUTH BELT.**—*Asks Authority to Issue Notes.*

—This company has applied to the Interstate Commerce Commission for authority to issue \$63,900 of notes to the Baldwin Locomotive Works for new locomotives.

**NORTHERN PACIFIC.**—*Forms Company to Develop Oil Lands.*

—This road has joined with experienced oil interests in creating a new concern known as the Absaroka Oil Development Company. George T. Slade, formerly vice-president of the road, will be president of the new company, which will take up and deal with all applications for leases received by the railway during the last few months. An announcement of these changes says:

It is the intention and desire of the new company so to develop the Northern Pacific lands as to promote the interests not only of the Northern Pacific, but as well of the states in which the lands are situated.

The Northern Pacific owns a substantial acreage of land and of oil and gas rights in parts of North Dakota, Montana and Wyoming, where there are possibilities of oil production. Preliminary investigations have disclosed some 35 so-called "structures" in these states where geological conditions indicate there may be oil and gas. Some of these structures have already been tested and in two locations oil has been produced in commercial quantity, namely, Elk Basin district, mostly in Wyoming, and the Cat Creek district, in the central part of Eastern Montana.

In order to handle its land and rights in the most intelligent and progressive manner and so as to further the development of the oil and gas resources of North Dakota, Montana and Wyoming, the Northern Pacific Railway Company has joined with interests experienced in the oil business in creating a company known as the Absaroka Oil Development Company. This company will be the medium through which the railway company will continue a thorough investigation of all the oil and gas possibilities of its land holdings and make explorations for its own account or lease to others with a right to explore and develop. The company will have its main headquarters in New York City with an office in Billings, Mont., in charge of responsible managers and agents.

**PENNSYLVANIA.**—*Annual Meeting.*—The stockholders at their annual meeting in Philadelphia on March 8 approved, subject to a formal stock vote, the resolution authorizing the corporation to increase its indebtedness \$100,000,000 for such expenditures as the directors deem necessary. All leases of subsidiary lines presented to the meeting were also approved, subject to a stock vote, and the annual meeting was changed from the second Tuesday in March to the second Tuesday in April.

*Annual Report.*—The Pennsylvania Railroad's annual report is reviewed editorially in this issue.

*Authorized to Issue Bonds.*—The Interstate Commerce Commission has issued an order authorizing the issuance of \$60,000,000 of 15-year, 6½ per cent secured gold bonds which were recently sold, subject to the Commission's approval, to Kuhn, Loeb & Co., at 95.40, and also for the issuance of \$60,000,000 of general mortgage bonds at 6 per cent, to be pledged as security in part for the 6½ per cent bonds.

*New Director.*—Edgar C. Felton, of Philadelphia, has been elected a director to succeed Andrew W. Mellon, of Pittsburgh, resigned.

*Reading.*—*Call for Proxies.*—A letter has been issued by the common stockholders' protective committee of the Reading Company, of which Seward Prosser, president of the Bankers Trust Company of New York, is chairman, calling for proxies and stating proxies have been received for about 300,000 shares. The committee has taken the position that the Reading Company's accumulated surplus of \$33,000,000 belongs to the common stockholders, and will support this contention at future hearings.

John L. Clawson, in a letter to William A. Law, president of the First National Bank and a member of the preferred stockholders' committee, objects to that section of the plan which provides for payment of \$10,000,000 to Reading general mortgage bondholders upon signing of discharge of coal company from lien of mortgage. Mr. Clawson says:

"If the \$10,000,000 to be paid should be used for the purchase of Reading bonds in the open market, it would relieve the railroad of at least \$400,000 a year interest which would accrue to the benefit of all the stock. The

mortgage would then be reduced by this amount, and the bonds which are to be received in additional consideration for releasing the coal stock, could be held by the trustees as security for the balance of the general mortgage bonds.

"In reference to the Reading Iron Company it will be found the decree states that the Reading company shall become a railroad company alone; therefore, this stock should be distributed among the holders in same manner as the coal stock. This would be a considerable advantage of great value to the present stockholders which you represent."

*Intervention Sought.*—The Penn Mutual Life Insurance Company as the owner of \$1,000,000 par of the Reading general mortgage 4 per cent bonds has filed a petition in the District Court of Philadelphia for leave to intervene in the Reading segregation plan for the protection of its rights in the distribution of the assets of the company. Because of its holdings the company states it is vitally interested in the distribution of the assets of the Reading Company. This is the first petition for intervention filed since the hearing on the plan on March 1. At that time Judge Buffington stated that all interests would be allowed two weeks to file petitions to intervene in the suit. The Prosser Common Stockholders Committee, the Iselin Preferred Stockholders Committee and the Central Union Trust Company of New York, trustee under general mortgage, are already on record as having intervened in suit.

**SAVANNAH & ATLANTA.**—*Receivership.*—C. E. Gay, Jr., president and general manager of this road, was appointed its receiver on March 4, by Judge Evans, of the United States District Court at Savannah, Ga. The petition for the receivership was filed by Theodore G. Smith and John B. Johnston, receivers for Imbrie & Co., of New York, who own a majority of the common and preferred stock of the Savannah & Atlanta. The financial difficulties of this banking firm forced it into the hands of receivers on March 3, and hence the receivership of the road, which was heavily indebted to it. The Savannah & Atlanta operates between Camak, Ga., and Savannah, 147 miles.

**SEABOARD AIR LINE.**—*Authorized to Issue and Pledge Bonds.*

—This company has been authorized by the Interstate Commerce Commission to issue \$715,000 of first and consolidated mortgage gold bonds at 6 per cent, maturing September 1, 1945, and to pledge various securities with the Secretary of the Treasury as security for loans aggregating \$2,625,000 from the revolving fund.

**ST. LOUIS-SAN FRANCISCO.**—*Not to Take Over A. B. & A.*—E. N. Brown, chairman of the St. Louis-San Francisco, denies the road is negotiating to take over the Atlanta, Birmingham & Atlantic, with which it connects by subsidiary line at Birmingham.

**VALDOSTA, MOULTRIE & WESTERN.**—*No Bids at Sale.*—There were no bids made for this road when it was offered for sale at the upset price of \$165,000 at Valdosta, Ga., on February 22.

**WASHINGTON & CHOCTAW.**—*Sale.*—This 11-mile line has been sold to the Cochran Lumber Company, of Meridian, Miss.

**WESTERN MARYLAND.**—*Authorized to Issue and Pledge Equipment Notes.*—This company has been authorized by the Interstate Commerce Commission to issue \$1,500,000 of equipment gold notes, preferred series, and \$1,500,000 junior series, and to pledge the \$1,500,000 of the junior series with the Secretary of the Treasury as part security for a loan from the revolving fund. The notes are to represent the deferred payments on the purchase price of 40 freight locomotives now under construction by the Baldwin Locomotive Works.

**WILLIAMSPORT & NORTH BRANCH.**—*Foreclosure Sale.*—Holders of \$540,000 bonds of this company bought in the railroad property at the upset price of \$25,000 fixed by the court. There are holders of \$5,000 bonds who did not join in the purchase.

## Dividends Declared

Kansas City, Ft. Scott & Memphis—Four per cent preferred, 1 per cent quarterly, payable April 1 to holders of record March 23.

Lehigh & Wilkes-Barre Coal Company—Special cash 150 per cent, payable March 5 to holders of record February 28.

Lehigh Valley—Common, 1¾ per cent quarterly; preferred, 2½ per cent quarterly; both payable April 2 to holders of record March 12.

Minneapolis, St. Paul & Sault Ste. Marie—\$2, semi-annually, payable April 1 to holders of record March 19.

Northern Pacific—1¾ per cent, quarterly, payable May 2 to holders of record March 18.

St. Joseph, South Bend & Southern—Common, 1 per cent, quarterly; preferred, 2½ per cent, quarterly; both payable March 15 to holders of record March 11.

Western Pacific—Preferred, 1½ per cent, quarterly, payable April 1 to holders of record March 18.

## Railway Officers

### Executive

**Henry Ford** has been elected president of the Detroit Toledo & Ironton, succeeding **J. A. Gordon**, who will remain on the board of directors.

**C. H. Drazy**, assistant to the vice-president of the Illinois Central, has resigned, effective March 1, to engage in the automobile accessory business.

**Charles Hicks**, formerly general manager of the Tennessee, Alabama & Georgia, and who since December 15 has been temporary receiver of that company, was, on February 5, appointed permanent receiver.

### Financial, Legal and Accounting

**H. B. Crane**, chief clerk to the president of the Chicago, Indianapolis & Louisville, has been promoted to cashier, with headquarters at Chicago.

**W. E. Kennedy**, auditor capital expenditures of the Louisville & Nashville, with headquarters at Louisville, Ky., has been promoted to assistant controller, succeeding **G. W. Lamb**, who has resigned, effective March 1. Mr. Kennedy will continue to have jurisdiction over the auditor capital expenditures department.

### Operating

**J. A. Gleason**, special assistant to the general manager of the Chesapeake & Ohio, has been appointed superintendent of telegraph, with headquarters at Richmond, Va., effective February 15.

### Traffic

**D. R. Peck** has been appointed general agent of the Kansas, Oklahoma & Gulf, with headquarters at Chicago, effective March 1.

**M. Broadbudd** has been appointed commercial agent of the Norfolk & Western, with headquarters at Ft. Worth, Tex., effective February 16.

**F. S. Olds** has been appointed general live stock agent of the New York, Chicago & St. Louis, with headquarters at Cleveland, O., effective March 1, succeeding **W. L. Ryan**, deceased.

**D. S. Romney** has been appointed assistant to the general manager of the Utah-Idaho Central, with headquarters at Ogden, Utah, effective March 15, succeeding **E. F. Muller**, who has resigned.

**G. A. Howard** has been appointed chief dispatcher of the Brownville division of the Canadian Pacific, with headquarters at Brownville Junction, Me., succeeding **J. H. Todd**, transferred, effective March 4.

**J. E. Hutchinson**, commercial freight agent of the Western Maryland, with headquarters at Minneapolis, Minn., has been transferred to a similar position with headquarters at Cleveland, O., effective March 1. **C. C. Gray** succeeds Mr. Hutchinson at Minneapolis.

**H. P. Hathaway**, division freight agent on the Chesapeake & Ohio, with headquarters at Chicago, has been promoted to assistant general freight agent, with the same headquarters, succeeding **William Fitzgerald**, who has resigned. **F. J. Vanderblue** succeeds Mr. Hathaway.

### Engineering, Maintenance of Way and Signaling

**J. A. Gorr**, division engineer of the Shreveport division of the Louisiana lines of the Southern Pacific, has been transferred in a similar capacity to the Lafayette division, Lafayette, La., succeeding **J. A. Lambert**, resigned.

**C. T. Jackson**, whose promotion to principal assistant engineer of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, was announced in the *Railway Age* of March

C. T. Jackson

4 (page 534), was born at Miami, Mo., on July 13, 1881, and graduated from the University of Missouri in 1903. He entered railway service in the same year as an instrumentman on the Montana Railroad, being employed in the construction of the road's Harlowtown and Lewistown line. When the Montana Railroad was purchased by the Chicago, Milwaukee & St. Paul, Mr. Jackson remained in the employ of the latter company, and from 1905 to 1909 served as assistant engineer and locating engineer, with headquarters at Helena and Butte, Mont., being engaged in the construction of the Coast extension of the St. Paul. In 1909 and 1910 he was assistant engineer on the LaCrosse division, with headquarters at Sparta, Wis. In 1910 he was appointed locating engineer, and served in both that capacity and as district engineer until 1915, being engaged in building the line from Lewistown to Great Falls, Mont. In 1915 he was appointed pilot engineer in connection with valuation work, and district engineer with headquarters at Butte, Mont., and later at Chicago. He was serving in the latter capacity at the time of his recent promotion.

### Obituary

**J. G. Walker**, chief dispatcher of the Houston division of the Texas lines of the Southern Pacific, died at San Antonio, Tex., on February 28.

**C. G. Hedge**, formerly vice-president of the Missouri, Kansas & Texas, died at Garden City, Long Island, on March 6, at the age of sixty-nine.

**C. W. Hillard**, vice-president of the St. Louis-San Francisco, died at his home in New York on March 8. Mr. Hillard was born in England in 1855. He came to this country in 1876

C. W. Hillard

and entered railway service as private secretary to the president of the Chicago, St. Paul & Minneapolis (later absorbed by the Chicago & North Western). He was later appointed assistant secretary of this road and continued in this capacity until 1882. In 1885 he became secretary and treasurer of the Chicago & Indiana Coal Railway. When this road was absorbed by the Chicago & Eastern Illinois in 1887, Mr. Hillard became vice-president and treasurer of the latter company. When this road came under the control of the Chicago, Rock Island & Pacific in 1906 he became fourth vice-president of the Rock Island. From 1907 until his death Mr. Hillard was vice-president of the St. Louis-San Francisco.

## Railway Age

# EDITORIAL

DAILY EDITION

A layman who attended a meeting of engineers was deeply impressed with the way in which they discussed the various questions. "They arm themselves with facts and lay them on the table face up," he said. It is because of these characteristics that engineers can be a large factor in

### The Engineer and the Public

helping to place the needs of the railways clearly and forcefully before the citizens of the communities in which they live. There is little question as to the roads being given a square deal by the public if the exact conditions under which they are working and their resources are clearly understood by the public. Here is a real opportunity for the engineer if he will but realize his importance and value as an educator.

It is perhaps trite to suggest that a railway man can learn more in a given space of time at an exhibit like the one now in progress at the Coliseum than it would be possible for him to absorb in any other way. However, it would seem rather strange to advocate the supply show as a source of economy for the exhibitor, yet many of the manufacturers are actually finding this to be the case. As one exhibitor expressed it yesterday, "I have been planning to make an extended trip to call on a number of railway men I have not seen for a considerable time, but I have met so many of them here today and expect to find most of the rest of them before the show is over that I can call my trip off." The exhibit is just another evidence of efficiency in modern business.

### The Exhibit as a Money Saver

When business is good most people think it is going to get better. When business is bad most people think it is going to get worse. The wise minority knows that when it is very good it is going to get worse, and that when it is very bad it is going to get better, and profits by its superior wisdom at the expense of the majority which always thinks that present tendencies are going to continue to prevail. Business is now very bad and, therefore, the man who says that it is soon going to get better takes the chance of having most people think he is either whistling to keep up his courage or is a little crazy. The fact is, however, that business already is getting better. There is no surer measure of business activity than the amount of freight handled by the railways. There was a tremendous decline in freight business which began in October. About six weeks ago the decline stopped and the business remained small but steady until the week ended March 5. In that week car loadings increased to 712,822, or about 50,000 over the preceding week. This is the first week in which there has been a substantial increase since the big decline began. The increase may not be maintained, but all indications

### Will Business Get Better?

are that the decline in business has stopped and that its tendency hereafter will be more or less slowly upward. It will be recalled that a lady once asked a sea captain whether it was going to quit raining. He replied that he thought it was. "It always has, you know, ma'am," he said. Likewise, the decline in business activity was bound to stop sooner or later. It always has. Furthermore, business never stands still very long. When it is not getting worse, it is almost always getting better. It is risky to make predictions, but we venture to predict that future developments will show the railroads and the country are now seeing the very worst that they are going to see for a long time to come.

Engineers of all kinds—civil, mechanical and electrical—can be important factors in helping the railroads through the present difficult situation. It is vital that waste and lost motion be eliminated from all departments and operations. This will require the most searching and scientific analysis of operating and other conditions, a task for which men with an engineering training are specially fitted. The Federation of American Engineering Societies, under the leadership of Herbert Hoover, has a strong commission at work looking into conditions in industry with a view of suggesting ways and means by which waste of all kinds may be eliminated. The engineer has restricted his energies in this direction in the railway field almost entirely to studies made in relation to improvements and betterments in facilities and equipment. It would appear that he must be called upon to accept larger and broader responsibilities.

### Engineers and Improved Operation

The March stated meeting of the present Signal section of the Engineering division, American Railway Association, which has been held each year in connection with the annual meeting of the American Railway Engineering Association and National Railway Appliances Association at Chicago, has been called off for the first time. Because of the benefits derived from the meeting itself and from the opportunity to view the exhibit of railway appliances, which are used in the railway maintenance of way and signal fields, the March stated meeting has been considered by many of us as great or greater importance than the annual meeting. The members present at these meetings in the past have had the opportunity to talk over their problems with the experts in the railway field who are in attendance at the Coliseum for this purpose, and as a result they have returned to their respective railroads broader and better men. The cancellation of the Signal section meeting, as well as other section meetings of the A. R. A., cannot help but react unfavorably on the members of these sections, as it raises a question in their minds as to whether their particular associations have

Cancellation of  
March  
Signal Meeting

been strengthened by an amalgamation with the A. R. A. or whether it would not have been better to co-operate with the A. R. A. along the lines adopted by the A. R. E. A.

Twenty-six years ago the eleventh of March, the Railway Signaling Club was organized to advance the science of signaling and 18 years ago its name was changed to the Railway Signal Association, which name it retained for 16 years, when in 1919 it became the Signal division, Engineering section, American Railroad Association, the name being again changed to the Signal section, Engineering division, American Railway Association, under the last reorganization of the A. R. A. At the time of its amalgamation some members were bitterly opposed to its change in status. Others were neutral, preferring to pass judgment at a later date, and still others were favorably disposed to the change. Good arguments were advanced both for and against the change. A difference of opinion still exists which will be strengthened by the cancellation of the meeting, and the best work cannot be accomplished without the whole-hearted support of the entire membership.

It is a fact that much good work has been accomplished by the association since it became a part of the A. R. A. and for the benefit of the railroads it is desirable that this good work be continued. This, however, cannot be done if the feeling is allowed to prevail that the meetings may be arbitrarily cancelled. As it is now, it will be necessary for the section to overcome increased opposition to the amalgamation made two years ago.

## The Value of Exhibits of Railway Appliances

TWO LARGE EXHIBITS of appliances and supplies have been given almost every year by the railway equipment and supply companies for many years in connection with railway conventions. One of these has been the exhibit of the National Railway Appliances Association on the occasion of the annual convention of the American Railway Engineering Association. The other has been that of the Railway Supply Manufacturers' Association on the occasion of the conventions of the railway mechanical associations. The Railway Supply Manufacturers' Association decided last week not to give its annual exhibit in connection with the mechanical conventions in June. This decision was made in order to save money at a time when owing to bad general business conditions the earnings of both the supply companies and the railways are seriously depleted. The action of the Railway Supply Manufacturers' Association raises the question whether and how often such exhibits should be given. The cost to supply companies that exhibit is a substantial amount of money. The expense incurred directly or indirectly enters ultimately into the price that the railways must pay for equipment and supplies. The consensus of opinion of railway officers and railway supply men always has been, however, that the opportunity given railway officers to examine in a short time a large amount of appliances and machinery used by the railways, including the new ones and the improvements made from year to year in the old ones, had a very direct and important tendency to enable the railway officers to select and buy those things which would contribute most towards increasing the efficiency and economy of operation.

The savings indirectly resulting it has been believed far exceed the direct cost of exhibits. The *Railway Age* always has shared this view and we still have no doubt

whatever that it is correct, but there are times and circumstances which may justify the abandonment of the exhibits and even of the railway conventions. It would, however, be a great mistake to abandon the exhibit under such conditions. There never was a time when there was such pressing need for reducing railway operating expenses as now. Temporary reductions may be obtained by drastic retrenchments. These, however, usually involve the deferring of large amounts of maintenance and in the long run deferred maintenance never is economical. The large permanent reductions in operating expenses needed cannot be obtained except by constant, thorough study of all the reasons why expenses are high and the utmost effort in devising and carrying out measures that will change the conditions which make them high.

The development of means of permanently reducing expenses must include thorough investigation of all new and improved railway appliances. If railway officers can and do learn more about these things within a few days by inspecting large exhibits than they could learn in weeks or months if such exhibits were not held, then the value of the exhibits as a means of increasing railway efficiency and economy is justified. In periods of stress and depression such as the present time every measure anybody may suggest which will cause immediate savings is likely to be adopted regardless of its ultimate and larger consequences. The question of giving large exhibits of railway appliances in connection with conventions is one which may properly be considered at any time, but acute conditions such as exist at present should not be allowed to cause snap judgment to be taken which ignores the larger and broader effects of the important policies of the railways and of the railway supply companies. Temporary emergencies make necessary the adoption of temporary expedients to meet them, but temporary emergencies should not be allowed to dictate or even suggest the abandonment of the exhibits or of any other means which have been successfully used for a long period of years to promote the development and increase the efficiency of the railroads.

## Annual Meeting of the National Railway Appliances Association

The annual meeting of the National Railway Appliances Association will be held in the dining room at the Coliseum at 11 o'clock this morning. Reports will be received from retiring officers and new officers will be elected. It is also expected that the question of holding an exhibit next year will be discussed at length.

The Nominating Committee appointed by President J. B. Strong to select officers of the Association for the ensuing year submitted its report last evening. The selections were as follows:

President—George C. Isbester, American Chain Company, Chicago.

Vice-President—T. W. Aishton, National Malleable Castings Company, Chicago.

Directors for three years—A. A. Taylor, Fairbanks, Morse & Company, Chicago, and G. E. Geer, Wyoming Shovel Company, Chicago.

The secretary-treasurer will be elected later by the new board.

According to the by-laws Mr. Strong will become honorary director. Mr. Taylor, who was elected to a full three-year term, was filling an unexpired term of one year. P. C. Jacobs, who has served as honorary direc-

tor during the past year, now retires. Messrs. Johnson, Shugg, Gillingham and Filkins remain on the board.

The nominating committee consisted of P. C. Jacobs, Johns-Manville, Incorporated; L. B. Sherman, *Railway Age*; E. E. Hudson, Waterbury Battery Company; A. S. Anderson, Adams & Westlake Company, and G. R. Lyman, William Wharton, Jr., & Company.

### A. R. E. A. Convention Program

The following is the program for the American Railway Engineering Association convention which will open this morning. The morning sessions will extend from 9:15 a. m. to 12:30 p. m. and the afternoon sessions from 2 p. m. to 5:30 p. m.

#### Tuesday, March 15

	President's address.	
	Reports of secretary and treasurer.	
	Reports of standing and special committees.

	Adjournment.	

### Mark W. Potter Confirmed

The Senate on Saturday confirmed the appointment of Mark W. Potter as a member of the Interstate Commerce Commission. It will be recalled that Commissioners Potter and Ford were serving under recess appointments made by President Wilson; these expired on March 4, since they were never confirmed by the Senate. President Harding nominated Mr. Potter and John J. Esch, but Senator La Follette objected to Mr. Esch and has insisted on the right to file a minority report to the action of the Committee Interstate Commerce in recommending confirmation. This will delay Mr. Esch's confirmation until the extra session of Congress called for April 11. There are still two more commissioners to be appointed; one to fill the vacancy which has existed since the expiration of Robert W. Woolley's term on December 31, and the other to fill the vacancy which has existed since the Commission was enlarged and caused by the fact that James Duncan did not accept the recess appointment made by President Wilson.

### The Railroad Labor Board

#### Subpoenas Railroad Officers

The Railroad Labor Board at the instance of representatives of the labor unions yesterday issued subpoenas for the following railway officers to appear before it on Friday: W. W. Atterbury, vice-president of the Pennsylvania Railroad; C. R. Gray, president of the Union Pacific; W. T. Tyler, vice-president of the Northern Pacific, and Robert S. Binkerd, assistant to the chairman of the Association of Railway Executives.

Frank P. Walsh, attorney for the labor organizations, some time ago presented a request that all members of the Labor committee of the Association of Railway Executives should be subpoenaed for the purpose of explaining to the board the attitude of the railways regarding national boards of adjustment and national agreements. The Association's Labor committee was abolished at its last meeting. Robert S. Binkerd was secretary of this committee and the labor organization asked that he be subpoenaed to bring before the board papers showing the deliberations of the railway executives and national agreements. General Atterbury was chairman of the Labor committee.

Mr. Gray was a member of the Labor committee and also formerly was director of operation of the Railroad Administration. W. T. Tyler succeeded Mr. Gray as director of operation of the Railroad Administration, but was not a member of the Association's Labor committee. He evidently was subpoenaed because of his former position in the Railroad Administration. Mr. Tyler has been very sick and it is regarded as doubtful if he will be able to appear before the board.

While the labor spokesmen asked that these men be subpoenaed for the evident purpose of getting them to tell about the deliberations of the railway executives before they determined upon their policy regarding boards of adjustment and national agreements, it is a notable fact that the subpoenas issued by the Labor Board require them merely to appear and give testimony upon the subject of national agreements.

The attorney for the labor unions, in demanding that the subpoenas be issued, gave notice to the board that unless they were issued the labor unions would refuse to go on with the hearings on national agreements and would withdraw.

### The Annual Dinner

The annual dinner of the American Railway Engineering Association will be held in the Gold Room of the Congress hotel at 6:30 Wednesday evening. The speakers will include John F. Wallace, consulting engineer, New York City, and formerly chief engineer and general manager of the Illinois Central and chief engineer of the Panama Canal; Dr. David Kinley, president of the University of Illinois, and the Honorable William Renwick Riddell, justice of the Supreme Court of Ontario, Canada.

### New Superintendent of Telegraph

#### on Canadian National

William Gerard, assistant superintendent of telegraph of the Canadian National Railways, at Winnipeg, Man., has been made plant superintendent of the Canadian National telegraphs with jurisdiction over the railroad and commercial lines over the territory from Port Arthur to Edmonton, with the same headquarters.

A. H. McKeen, system signal engineer of the Union Pacific, was on the train which was wrecked at Agnew, Ill., yesterday. Mr. McKeen came to attend the committee and the A. R. E. A. meetings.

\* \* \*

With this convention E. H. Fritch has completed 22 years' continuous service as secretary of the American Railway Engineering Association. This is a most unusual record which reflects credit on both the association and Mr. Fritch. His many friends in the association hope that he may be able to serve for 22 years more at least.

\* \* \*

The uncertainty prevailing in the railway industry at present is reflected in the fact that a considerable number of signal engineers and other signal department officers, who at first contemplated attending the stated meeting of the Signal division of the A. R. E. A., had decided to remain at home after the meeting was called off, but later received word at the last minute to be in attendance and are present at the A. R. E. A. meeting and the exhibit of the National Railway Appliances Association at the Coliseum.

\* \* \*

Dean F. E. Turneure, of the University of Wisconsin, will be unable to attend the convention this year. He was here yesterday to attend the meeting of the Board of Directors of the American Railway Engineering Association, but had to return to Madison last night. Dean Turneure's anxiety to get away was prompted by the holding of a legislative budget hearing at the Wisconsin state capital and the dean feels that his presence is necessary in the interests of the College of Engineering which must be represented.

\* \* \*

V. C. Armstrong, president of the Rail Joint Company, presided yesterday at a luncheon and business meeting of representatives of that company from various parts of the country. It was stated that the company has enough orders on hand at present to keep it busy for the next four months and the outlook is good for increased business. J. G. Greer, district sales agent from San Francisco, was on the Overland Limited of the North Western which was wrecked at Agnew, Ill., yesterday morning.

\* \* \*

Louis Yager, engineer maintenance of way of the Northern Pacific, at St. Paul, was among the early arrivals at the convention yesterday. Mr. Yager is now recovering from a long illness, having been taken sick during the summer while in Washington on work incident to the liquidation of claims against the Railroad Administration. After being confined to a hospital in Washington for four months, he recovered sufficiently to return

to his home in St. Paul only about the first of January. Mr. Yager has been active in the work of the Committee on Economics of Railway Operation during the past year, serving as chairman of one of its sub-committees.

\* \* \*

Among the interesting visitors at the Coliseum yesterday was Mr. Yoshiyuki Hashimoto, who plans to spend the week at the exhibit with Mr. K. Asakura, a member of the German Reparation Commission. Mr. Hashimoto is a civil engineer by profession and is a member of the committee of three delegated by the Imperial Government of Japan to investigate the relative merits of narrow gage and broad gage railways in foreign countries, with a view to recommending the extension of the present narrow gage system of the Imperial Government Railways or of remodeling the narrow gage system to a broad gage system. Mr. Hashimoto called attention to the fact that the Imperial Government Railways comprise about 8,500 miles of road within the confines of Japan and a total of about 10,000 miles, including Formosa and Manchuria. 6,000 miles of this railway system being owned by the Imperial Government and the remainder owned by private interests but subject to the regulations of the Imperial Government. He also stated that the Japanese parliament in its last session had authorized the expenditure of a billion dollars to improve the present system. Mr. Hashimoto has been making a study of this problem for a period of two years and is now returning to Japan. He expressed the opinion that the American railways were the finest that he had encountered in his extensive study, while the African system was the finest of the narrow gage railways. Mr. Hashimoto stated that the Japanese railways are also experiencing the general depression in business following the war, at the present time, but are still handling a fairly large amount of business and that the wages and prices of materials have not yet begun to decrease materially.

\* \* \*

A. G. Shaver, consulting signal and electrical engineer, has returned within the past month from a trip through Great Britain and France where he was investigating the railroad situation. In discussing the railroad situation in England Mr. Shaver felt that the facilities were quite inadequate, particularly around the vicinity of London, the lack of room seriously handicapping expansion. The signaling also appears to be inadequate to handle the traffic properly. However, the signal engineers are alive to this question and are taking such steps as they can to relieve the situation. In this connection the use of automatic block signals is being seriously considered and is a very live question at present. Unlike the practices in the United States some of the larger railroad shops manufacture a number of small articles such as screws, bolts, nuts, etc., instead of buying them. The railroads are still under government supervision and it is hard to tell what the future holds for them as they are handicapped materially by the lack of finances.

Speaking of conditions in France, Mr. Shaver said the railroads were handicapped by government regulations and that the situation was almost identical to that which exists in Great Britain. The railroads mostly are in a fair condition and the French have applied certain American practices to railroad operations to a more or less extent, particularly with reference to train despatching and the application of air brakes. The signaling consists almost entirely of the manual type, much of it being uncleanly and cumbersome. Nearly every railroad yard of the Nord, Etat and Est show evidence of American operating practices. Electrification is a live subject because of high price of coal and it is receiving particular attention in the south of France.

A. R. E. A. Board of Direction in Session Yesterday.

## Seeing the A. R. E. A. as Its Own Officers See It

### How the Association May Be of Greatest Help in Solving the Serious Problems of the Day

**T**HE AMERICAN RAILWAY ENGINEERING ASSOCIATION is a factor of ever increasing importance in the affairs of the railways. Conceived for the purpose of uniting the efforts of individual railway engineers in the advancement of railway practices, it has ever fostered individual initiative while winning the utmost confidence and respect of the railway managements. Three years ago, when the movement for centralized control of all railway activities was in its ascendancy, a strong effort was made to effect an affiliation with (or shall we say—subordinate to) the American Railway Association, but those in command of the engineering association's affairs were successful in consummating an arrangement which insures the perpetuation of the association in its established form, yet affording that means of contact with the superior body which will assure the necessary degree of conformity and full measure of co-operation. This has left the A. R. E. A. with that degree of independent action so necessary for the free play of individual initiative. The thoughtful member is conscious of the debt he owes to those leaders of the association who were instrumental in effecting this happy arrangement.

Under the pressure of the kaleidoscopic changes which are confronting the railroads from day to day, every officer, every employee and, with them, every association of railway men: is being constantly put to a new test which will determine what each and all of them may accomplish to help the railroads in the serious problems imposed upon them. Surely every loyal member of the association is anxious that the A. R. E. A. shall adjust its activities so as to be of greatest benefit to that end, and by the same token he is interested in knowing what the officers of the association have in mind as to the proper relations which the society shall bear to the problems of the day. To this end we present below statements by the president, vice-presidents and seven of the directors, expressing their views on various phases of

the association's activities and policies which are directed in the main toward the particular problems now in hand.

#### More Scientific Direction and Control Is Needed

By H. R. SAFFORD, President

Assistant to the President, Chicago, Burlington & Quincy, Chicago

The events and conditions incidental to the maintenance of railroads which have occurred and developed during the past three years are worthy of serious consideration by the maintenance engineer when viewed in the light of their effect upon future maintenance problems and policies. In this consideration the American Railway Engineering Association has a very direct and substantial interest.

If one thing is apparent above all others it is that maintenance policies and the execution of them in the future must be along more scientific lines than has been necessary in the past in order to obtain the highest degree of "economical and efficient management," to quote the language of the Transportation act. This comment is not made in a critical sense, with an implication that scientific effort has not been characteristic of the past practices. It is made because economic pressure increases and the history of the world has been, that the survival of the industry or the nation is wholly dependent upon the development and application of economic reforms and measures to combat that pressure.

The maintenance of way policy must have thoughtful and scientific treatment for two reasons: It is a very definite and basic element in operating expense and, therefore, in net earning power. It is now feeling the severe effect of the inflated costs of labor and material, particularly the former, and the reduced efficiency which has naturally gone along with them and the readjustment of these high costs will be accompanied with difficulties because this period of readjustment is more difficult in many ways than the period of the upward trend.

We have heretofore thought that we had developed very complete and satisfactory methods of handling the maintenance policy and program and the American Railway Engineering Association and corresponding agencies for the study of the problems of design and maintaining of equipment have done a tremendous work in perfecting practice, but these results were achieved under conditions not exactly like those we now see—they tended to create the picture of the ideal condition with perhaps less of the element of economic necessity that now has to be considered. The analyses which have characterized the application of the contract between the Government and the carriers to the adjustment of matters growing out of federal control have precipitated or at least stimulated a desire to apply measures of performance which heretofore appeared less necessary.

The maintenance policy on a railroad, both of fixed property as well as rolling stock, has been an evolution from years of growth and development of the property, wherein the intimate knowledge of officers of the property and its needs seemed sufficient to insure a high degree of efficient control. Then suddenly came a situation which called for an accurate measurement or analysis of the component parts to determine not only the elements thereof, but their weighted values, and we found difficulties in establishing them—first, because the measurement had to be based upon a relatively short period for a complete determination and, second, because the relative values were inconsistent and irregular. Of course, we hope we will not have to go through a similar experience again, but there are other reasons for applying ourselves more energetically than ever to the perfection of such measures for future requirements.

The determination of a proper net earning power depends upon a normal and consistent maintenance program almost as much as a normal transportation expense. But what is a normal maintenance program? Basically it would appear to be a restoration of service units as rapidly as the exhaustion of them—otherwise the program is not normal. There are very definite influences to which values must be given to enable the maintenance to be normal. In fixed property they are: Traffic, weather or natural exhaustion, and increasing investment. In equipment these same three influences exist plus the service and capacity unit in the case of locomotives in order to give consideration to their size and degree of earning power. These are the primary considerations and are capable of being valued with sufficient accuracy to help the manager to control his earning power.

Much good work has been done during the past two years in this study. Much remains to be done. The starting point is the accounting data and herein lies an important phase of the question in which the engineer has an interest and I believe that interest is being more appreciated by the accountants. As a matter of fact, the interdependence of the two departments is increasing; the accountant must recognize that the value of the accounts to the management must depend upon his cooperation with all departments spending money.

It is highly important that the engineer feel a greater degree of responsibility in perfecting his knowledge of accounting principles and practice. He must understand them to use them, and a failure to do so will react to his disadvantage. Without such knowledge he cannot properly analyze the economic features of his problems and cannot perfect his reports to his superiors to the degree necessary to enable the executive to pass properly upon them, and they need to be considered now in the light of strict economic benefit because the margin of earning is growing less.

It is the duty of the maintenance officer to devote

more time to training the young man along these lines of study in the earlier years of his experience. As a rule college courses do not develop a great deal of this and there is increasing need for it. The association can profitably direct its energies along these lines; somewhat remote perhaps from technical features and yet equally important. As construction standards reach perfection more time can be devoted to the economic and business features—this is still engineering.

## Can the A. R. E. A. Aid in the Solution of Transportation Problems?

By L. A. Downes, First Vice-President

Vice-President of the Central of Georgia, Savannah, Ga.

As will be noted in Article 1 of its constitution, the American Railway Engineering Association has for its purpose the advancement of knowledge pertaining to the scientific and economical location, operation and maintenance of railroads. Since its inception over twenty years ago, the attention of the association has only been directed to engineering problems involving location and maintenance. It was not until recently that committees were formed to consider economics of railroad operation and the economics of railroad labor.

The European conflict, in which our country became involved, resulted in the exigency of federal operation of our railway lines as a unit, in order to facilitate the transportation of troops, supplies and munitions of war. The war itself created new conditions, and with the return of the railways to their owners by the Government, many new and complex problems resulted, and these must be solved. These problems are of such nature and magnitude that to solve them and meet the new conditions confronting us will require the skillful effort of railway managers to attain the utmost economy and efficiency as expressed in the Transportation act.

But little progress can be made in the work of some of the committees, whose scientific investigations and reports are based upon certain principles which the changed conditions do not govern. There are two committees, however, viz., the Committee on Economics of Railroad Operation and the Committee on Economics of Railroad Labor, which have a broad field in which to work and analyze the changed conditions, with a view to effecting necessary economies and improve transportation service.

As outlined in its constitution, it is within the province of the Association to take up the question of economic operation, and the report that is to be given to the convention this year by the Committee on Economics of Railroad Operation is worthy of careful study. The Board of Direction in its work next year should assign to this committee such subjects in the minds of railroad officers, which have considerable bearing upon the economical operation of railway property at this time.

It is quite improbable that conditions which prevailed on the railroads prior to 1917 will return soon, if ever, and the full value of the experience and scientific research of the American Railway Engineering Association should be dedicated to the solution of present and future transportation problems, and I cannot but feel assured that good work to that end will be done by this Association during the coming year.

## Our Problems Are Still Essentially the Same

By J. L. CAMPBELL, Second Vice-President

Chief Engineer, El Paso & Southwestern, El Paso, Texas

In my opinion the problems of engineering and maintenance are still substantially what they have been heretofore, and that the outline of work of the American

Railway Engineering Association for 1920 is a fair representation of the general character and scope within which the work of the Association should continue to lie.

The problems of railway engineering and maintenance are modified by existing psychological, social, economic and political conditions which are adversely affecting the operating ratios of the railroads to such extent that the big emergency problem is one of avoiding receiverships and bankruptcy by performing transportation service at a cost less than the revenue received therefor, requiring an unusual degree of economy and efficiency in the engineering and maintenance departments.

The psychology of the situation originated in or began to crystalize with the enactment of the Adamson law. That phase of the general problem has been accentuated by subsequent federal legislation and control, perhaps not necessarily so, but certainly as to the particular things done and the results thereof.

One of the outstanding things in the present situation is the question of compensation of railway employees and the relation which it should maintain to other costs of transportation. Through its committee on the Economics of Railway Labor, the Association could establish working relations with this question, but it conceived that that matter does not fall within the field of its work. In the 1920 report issued in Bulletin 231, the committee indicates the broad contact which the association may make with the human element involved in the problems of engineering and maintenance.

The human heart with its frailties, virtues and aspirations is one of the big problems in the business of transportation. As the hearts of railway owners and employees are co-ordinated in the Spirit of Christ and the Golden Rule one of the big problems of transportation will approach a more satisfactory solution.

### Better Accounting of Maintenance Expenditures Needed

By C. A. MORSE, Past-President

Chief Engineer, Chicago, Rock Island & Pacific, Chicago

Under the Transportation act the railroads are divided into certain groups which are permitted to charge a rate that will return for the group as a whole six per cent interest on the value of the railroads in that group. Consequently, it would seem as though it was going to be necessary for the railroads in each group to follow, as far as possible, the same practice in regard to maintenance, and that it is going to be necessary to follow some classification as to the importance of different portions of each railroad so that all the railroads in a group will maintain the portions of the road under each classification in practically the same way.

Following this line of thought, it would seem as though wages and working conditions should be the same on all the railroads in a group. It also appears desirable, if not absolutely necessary, to have some plan worked out by which the expenditures for different items included in maintenance could be classified, so that the expenditures of all roads in a group would be accounted for in the same manner. This would enable comparisons to be made not only between the different railroads but between different portions of the same railroad, in order to awaken interest in the most economical methods for handling the various classes of work.

Maintenance of way and structures comprises about 20 per cent of the total operating expenses, and it is the only portion of the operating expenses that is not analyzed in such a way as to give comparative costs as between operating divisions and between different railroads. The only basis of comparison today is the cost

of maintenance of way per track mile and the cost per 1,000 gross ton miles, which is of little value, owing to the fact that the operating expenses due to improvements and retirements are included in the general item of maintenance of way and structures, and the division or railroad that has a big improvement program under way shows large maintenance of way expenses as compared with the division or railroad that happens to have little improvement work in progress at the time.

If what may be termed ordinary maintenance was kept separate from maintenance in connection with the "A. & B." program, and from the items covering rail relaying, ballasting and the tie renewal programs, and if retirements could be set up separately, we would be able to make proper comparisons of: A—Ordinary Maintenance, B—Tie Renewals, C—Ballasting, D—Relaying of Rail, E—Retirements. These could be made per mile of operated line or per 1,000 gross ton miles, but the real comparison would be for ordinary maintenance, which should include all of the work of the regular maintenance of way organization, both labor and material.

One of the weak points in the present accounting rules is that which calls for contract work to be charged to material. There is no reason why it should not be divided into labor and material the same as company work. Altogether too much money is spent under the name of material, which is not properly supervised, owing to the fact that on many railroads the allowances only cover labor, the material being figured as a certain percentage of the labor charge. By doing certain work by contract local officers get a lot of work done which they could not otherwise get done and keep inside of their allowance.

While it does not seem as though this close supervision should be necessary, much expense is needlessly incurred in the maintenance of way department of railroads, due to personal equation in the local organization and an ambition to get the individual divisions or territory in as good condition as possible, regardless of the requirements of some other part of the railroad.

The American Railway Engineering Association with its splendid organization should be able to go into this matter and recommend a classification of tracks and also a set of accounting forms that would give the results outlined above. It looks as though the Interstate Commerce Commission would have to put something of this kind into effect and it would be a big help to the commission, and would insure the working out of a practical set of forms, if the American Railway Engineering Association would take hold of the matter and be able to make definite recommendations at its next convention.

### A Readjustment Is Necessary

By J. G. SULLIVAN, Past-President

Consulting Engineer, Winnipeg, Man.

In my opinion the engineering problems of the railroads are so closely associated with financial questions, high wages and restrictive schedules, that before we can hope to see any material development these matters will necessarily have to go through some form of readjustment. The value of the dollar is about 50 per cent of what it was before the war and rates of interest nearly twice as high, making fixed charges on public utilities about four times what such charges are on those constructed before the war. This places such a handicap on any new development in the way of railway construction that we cannot hope to expect very much new construction in the near future.

With such unstable conditions, about the only thing the railway engineer can do is to practice strict economy, which should hasten the day of readjustment, even if this

plan does not offer very much encouragement for the immediate future.

### Each Engineer Must Solve His Own Problems

By ROBERT TRIMBLE, Past-President

Assistant Chief Engineer, Pennsylvania System, Pittsburgh, Pa.

In my judgment the fundamental problems confronting the railroads at the present time are not those of engineering or maintenance, but very largely problems of finance and operation. The most serious maintenance problem that we have to contend with is that of getting rail, ties and track material delivered so as to be placed in the track with the minimum of labor. If the material was furnished so that ties could be put in and spaced, rail laid and surfacing done all in proper sequence, radical economies should be obtained. About all the engineers can do is to make suggestions. The deliveries of material will follow with the law of demand and supply. I believe that so far as the American Railway Engineering Association is concerned, it can hardly help us solve our individual or special problems.

### Committee Service Offers an Opportunity

By E. H. LEE, Director

Vice-President, Chicago & Western Indiana, Chicago

Our Association is a lusty youngster. It has already passed its 21st birthday, but its growth in membership during the past year has been greater than ever before. Among the general objects for which the Association is working may be enumerated: The study, analysis and classification of the constantly growing body of knowledge, upon which the science of the construction and maintenance of railroads rests; the careful study of new ideas brought to its consideration, the endorsement for use of those which are approved, and the rejection of those which are believed to be unsound or unsuitable; the promotion of acquaintance and friendship among its members and their education along lines not otherwise available.

The Association can best fulfill its primary object of serving its members as individuals by rendering efficient service to their employers, the railroads. It is hard to overestimate the value of the services of those men, many of them leaders among the railroad men of the country, who as organizers and officers of the Association have directed its affairs; but after all it has been the work of its various committees that has given the Association its acknowledged standing among similar railroad organizations.

The rapid increase in the membership of the Association has provided new and valuable material for committee service. This has caused the officers to give renewed attention to the efficient use of this material in order that the past fine record of achievement may not only be maintained, but surpassed. An informal questionnaire has recently brought out the general opinion among committeemen that while some committees are now sufficiently large, others could be increased in size; that in the larger committees a distribution of the work among sub-committees might prove advisable; and that a reasonable rotation in committee membership would best promote the work, offering at the same time to the newer members that reasonable hope of a share in the committee work to which they are equitably entitled. The discovery and employment on committees of the brains and ability of the younger and less well known members would be of immense value, not only to the Association, but to the men themselves; in widening their horizon, in focusing their attention upon the larger underlying principles, and in avoiding the danger of giving undue weight to the

mass of detail inherent in their work. It is hoped that committeemen may consider it an important duty and privilege to bring to the notice of their chairmen good material for their committee personnel.

By the same token, "The Lord helps those who help themselves." Even under the favoring conditions of larger committees and more rapid rotation in membership, eligible men, ready and willing to serve, may fail of committee appointment. The wisdom of giving some thought and making some personal effort to secure his own share in work of this kind will therefore doubtless occur to the newer member of the Association, who is a man of energy and initiative.

### The Vital Spark of Our

### Association Is Brain Energy

By HADLEY BALDWIN, Director

Assistant Chief Engineer, Cleveland, Cincinnati, Chicago & St. Louis, Cincinnati, Ohio

The ineptitude of political control in its ponderous attempts to regulate certain segregable evils susceptible to separate remedy, has widened its grasp and tightened its hold upon the transportation industry. The genius of the industry which aforesaid, applying to its affairs its own home-made control that was generally quick, wholesome and happy, functioned freely in its gigantic achievements that redounded to the national welfare, now finds itself, in the cloudy dawn of a new era so-called, clamped, as it were, in a strait-jacket, its potentialities discounted, its natural prerogatives largely withdrawn, its internal discipline demoralized, its treasury empty and its engineering for public service depreciated.

In this state of affairs is wrapped the fundamental problem confronting the railroads, whose proper solution involves the welfare of the nation and its civilization.

When a soldier returns crippled from the war the fundamental problem is to restore him to normal health and functioning. The incidental or intermediate problem is to help him achieve what he can in spite of his unfortunate handicap for the time being and in the case of the crippled railroads presumably it is these secondary problems, real and immediate as they are, that have been suggested as a field for employing the energies of the American Railway Engineering Association.

There has never been a time, of course, when in the providing of facilities to meet traffic demands and in the upkeep of the properties of the railroads, the serious and thoroughgoing exercise of engineering education, experience and judgment was not vital, whether in the exhaustive determination of design or in a searching analysis of the elements of initial and current costs, to the end of determining the limits and methods of procedure in any contingency. More and more is this being recognized, and just to that extent is the physical development of railroads and their operation becoming really scientific.

The prosperity and development of the industry depends, in a simple analysis, upon three things: capital, labor and brains. The availability of capital for development is now greatly curtailed by virtue of conditions which we all know and partly understand. The availability of labor also is greatly curtailed by virtue of conditions we all know and partly understand. One of the causes, in the view of men who try to keep cool heads in the contemplation of events, is that a period of unfortunate schooling has tended to bring the workers to a point of view that in its logic looks somewhat away from patriotism if, indeed, it has not insinuated a betrayal of their own better natures. In the situation it is obvious that there should now be no embargo on the concentration of cool, honest brain power in its patriotic

application to the immediate, pressing problems of the time. The moment is one to which, for every reason, the American Railway Engineering Association should rise with an enlivened purpose. As between matters of academic discussion for remote application and current processes of maintenance and construction, the time compels the Association to work close to the ground and as simply, directly and intensively as possible. Every process now in motion must be stripped down to the strictest economy and efficiency—all waste eliminated, and all opportunities recognized.

What are the requirements for adequate and competent supervision? This is a pressing problem. How to obtain records that are reliable and how to use them is equally important. How to simplify control of effort and make it forceful and complete is a problem whose solution must defeat fairly and firmly and happily, let it be hoped, the slackening of honest effort and indifference to duty wherever it is manifest. Will this be through distant centralized control or by a local supervision clothed with big prerogatives and assuming immediate responsibilities?

After all, what about the great fundamental question, "What should be the nature and limit of government control of the railroad industry?" This is a question that the Association might ponder with profit. There is no danger of too much light from those who know. This question is not to be settled always politically instead of practically and scientifically. At the very least this Association should undertake the problem piecemeal and work to the end of having finally and reasonably clarified and determined governmental prescriptions of consequence that are vague or illogical, as, for instance, the definition between capital and operating charges and credits. The problem of rate making at bottom is one for the railway engineer.

The general range of the Association's committee work need not be disturbed or called in question except to have its prosecution leavened with an earnestness to provide quick help in those directions where the railroads are most particularly in distress. Committees should be bold in recommendations outside of the influence of precedents for we are in an unprecedented situation in which nothing must be taken for granted, except, perhaps, that human nature is essentially good and sound at bottom.

To repeat, about the only thing unleashed in the railroad industry today is brains. The vital spark of our Association is brain energy and nothing else. May it not be dimmed during the present relative prostration of the industry.

### Should There Be Standardization?

By C. F. LOWETH, Director

Chief Engineer, Chicago, Milwaukee & St. Paul, Chicago

The railway problems are many and various. Railroad-ing is so complex and its evolution so rapid that it will always present many problems, perhaps in increasing number, and new problems come trooping up before the old ones are disposed of. Those pertaining to engineering and maintenance are no exception in these respects. The American Railway Engineering Association was brought into being to help relieve some of these problems. It has accomplished a large measure of excellent work in this direction and can confidently be expected to do even more. Its increasing usefulness will be brought about through many agencies. Among these will be increasing open-mindedness and progressiveness.

A successful contractor told me recently that he considered his success, from a financial standpoint, was dependent upon finding new methods for carrying on his

work; that if it was executed along the lines that such work had been previously done, or as most of his competitors would do it, his financial returns would be only those of the average contractor. He insisted on a larger return, and thought it only possible to get it by new and better methods than those commonly prevailing. So with the railroads; they must have new and better methods, materials and practices if they are to prosper and progress. Note the qualification of "new and better." The new is not on that account the better. Occasionally we are forced to return to the old because the new is not as good.

Can the railroad problems be lessened by more standardization in engineering and maintenance matters? Yes, but only as such standardization is wise and well thought out and not too ironclad. There are evidences today of some precipitate and unwise standardizations during the recent federal control of railroads. Standardization should be the tool and servant; not the mind and master. It tends to dull individual initiative and to limit progress; but, at the same time it is in many ways essential to efficiency and economy. Standardization will be of lasting benefit only as it is the result of careful investigation by open and progressive minds, thorough knowledge and ripe experience, and the emphasis must be upon these qualities. In many lines of business of late inventories have been radically scaled down and drastic readjustments brought about. The A. R. E. A. may well take account of stock and determine if its activities are along the best lines, and whether it is placing emphasis on the most important part of its activities.

When the A. R. E. A. was born, there was great and urgent need of standardization. Most engineers wrote their own specifications for cement, structural steel and rails, rail sections were innumerable and in these and other similar things there was no semblance of standardization, but rather confusion, lack of efficiency and wastefulness. This condition has been immeasurably improved, and to the A. R. E. A. is due a large portion of the credit for these changed conditions. But right here the question arises whether the practices of the Association have changed with the changed conditions in the field of its activities; is there not, to some degree at least, a tendency to set up a manual of standards or of recommended practices and make of it a closed book at the expense of progressiveness and up-to-date knowledge?

I have for a long time questioned the wisdom of going so far in formulating definite conclusions on the part of the Association and its committees. There is a natural antipathy in progressive minds to the setting up of rules for one's practices; to be told that this or that is proper and should be followed and by inference that other things are improper; this attitude tends toward controversy rather than investigation and deliberation. Contrariwise the tendency for the thoughtful and progressive mind is to take stock of the experience of those about him, select the best and improve it if possible. I have felt that there was at times an indication on the part of A. R. E. A. committees and conventions that the work of a committee was not fully appreciated, in some cases was perhaps even discredited, unless at least portions of its report were included in the Manual. The desire for definite conclusions on the part of a committee will not infrequently overshadow and compromise the more important work of investigation. Some of the most interesting and valuable committee reports have been those which have covered the subject and have brought it up to date but have not attempted to formulate final conclusions or perhaps have gone only so far as to submit tentative conclusions. There is an ever increasing field of usefulness for committee work in presenting periodically the results

of further study and investigation of the subject in hand, and in such way as to promote discussion and contribution from others. Tentative conclusions will be frequently of value and in time definite conclusions will be justified.

Of the conclusions and recommendations of the committees not all should receive the formal approval of the association. It seems to me both unnecessary and unwise that there should be a compelling desire to bring the conclusions of a committee's work and the deliberations of the convention into complete harmony. In our individual practice we do not feel bound to strict compliance with the recommendations of committees; why then should it be thought desirable that these recommendations should have the formal approval of the Association? It would seem that there are many matters in which it would be the part of wisdom to disseminate the conclusions of the committees without commitment of approval on the part of the Association as a whole. The recommendation of a committee carries considerable weight. Formal approval by the Association should carry a very much larger measure of authority. I cannot but feel that in the past the Association would have been wiser in many cases to have let its committees' recommendations go out for what they would be worth without giving them its formal approval. I think this would enhance the prestige of such recommendations as the Association would make, and at the same time would not detract from the interest, value and prestige of committee reports. Wherever there is a formal approval of recommended practices by the association it should, I think, be the result of something more than the mere majority of a viva voce vote of the convention. This seems desirable so that the action may be more representative, deliberate and authoritative and so that there may be a record of the degree of unanimity.

If the railroad engineer has the means of knowing what his compeers are planning and doing, what their problems are and how solved, what are the qualities of this material and the limitations of that method, all as developed by the study and experience of others, he will readily adapt the knowledge to his own particular needs, and in most cases will add something of permanent value to the general fund of knowledge and experience.

In conclusion: Should there be standardization? Certainly; some is essential. Should there be a Manual of recommended practices? Yes. To my mind, however, neither of these is at this time the most important work of the A. R. E. A.; the emphasis should rather be upon more investigation and dissemination of information along the particular lines coming within the field of the Association's work.

### Prudent Economy Is Required

By F. L. THOMPSON, Director  
Chief Engineer, Illinois Central, Chicago

Much of the work being done by the Association is by no means remote as to the problems now before the railroads of the country. In checking over the work of the committees I find that quite a number of them cover subjects that are live at this time. These include that carried on by the Committee on Economics of Railway Operation and the Committee on Economics of Railway Labor.

These two committees are very important at this time, due to the high cost of all items entering into the operation of a railroad. The expenses of operation and the methods of reducing them, in order to come within the income, probably comprise the most important subject before the railroads of the country today. This is a large problem and one which technically does not come

within the province of the American Railway Engineering Association, except in so far as the cost and expense of doing work apply to the maintenance of way department of a railroad.

Some of the present engineering and maintenance of way problems before the railroads are the following:

1. *Expenses*.—It is now more than ever the duty of an engineer to get the most units of work and material for each dollar expended.

2. *Labor*.—This is very important, as the price of labor has increased due to government control, in some cases, to two and one-half times what it was prior to government control, and in a great many cases this price is twice as much as others are paying for wages in a particular territory. This brings out the necessity of seeing that the best possible efficiency is secured from labor.

3. *Material*.—This is important to the extent that while material can be secured now more readily than in the past, the inspection service which was lax to a considerable extent during the war, needs more supervision so that the material now being received is exactly as called for.

## Exhibits and the Railway Supply Industry

By J. B. Strong\*

THE NATIONAL RAILWAY APPLIANCES ASSOCIATION, in opening its thirteenth annual exhibition of railway appliances yesterday morning, presents one of the largest and best exhibits in its history. It is on a much larger scale than last year, over 5,500 square feet of additional floor area having been provided by using the large ballroom in the Coliseum in addition to the main floor and annex. Even with this additional space more could have been utilized to advantage if it had been available, as that offered was oversubscribed.

Unusual interest and a large attendance at the exhibit are assured this year, especially as this will be the largest exhibition of railway materials to be presented during 1921, owing to the recent cancellation of the June exhibit of mechanical appliances at Atlantic City which had been planned in connection with the annual convention of the Mechanical section of the American Railroad Association (formerly the Master Mechanics' Association and the Master Car Builders' Association).

As in past years, the National Railway Appliances Association has endeavored to make this exhibit of railway appliances used in the construction, maintenance and operation of the railway fixed properties of the greatest technical interest and instructive value to railway officers and other practical railroad men. The practical nature of the exhibit has resulted in an unusually large attendance of roadmasters, supervisors and other officers in direct charge of field forces, as well as members of the American Railway Engineering Association. Railway managements have this year, as formerly, very generally encouraged all of their men who can be spared from their work to attend the convention and to inspect the individual exhibits, recognizing, as the managements do, that these men, many of whom are stationed at outlying points, can only in this way keep up-to-date and informed regarding the equipment and materials which are being offered them for the promotion of safety and economy in the operation and maintenance of their roads. While it is true that the larger manufacturers, with their agencies widely distributed, are in more or less close contact with railway men throughout the country, a condition that is

\*Vice-President, Ramapo Iron Works, Hillburn, N. Y., and president, National Railway Appliances Association.

not possible for the smaller companies with their limited sales force, it is not possible for even the large companies to carry samples of heavy railroad materials to railway men. The exhibit gives both large and small manufacturers an opportunity to present their materials for the inspection of railway men in a manner that is not otherwise possible and railway men have not been slow to avail themselves of its benefits.

The manufacturers appreciate the opportunity of having their products inspected by an intelligent body of railroad men and benefit from the diversified opinions expressed by these men when designing or redesigning their products. Progressive users of railroad materials can best specify the most efficient equipment for their roads when they not only know but see what is available for

The conditions in the railway supply industry have been abnormally bad during the past year, although a spirit of true American optimism is now pervading it. The effects of the Winslow bill, which was passed by Congress during the past month, are already beginning to be felt, for the roads are now able to pay certain accounts of long standing and this in turn is enabling the supply manufacturers to improve their credit and to finance new orders placed by the roads. The railroads are now ordering those materials which are most vitally needed; true, they are ordering in small quantities, but these quantities are increasing. The important factor is that buying has started again. When did it start? The pessimist has not seen it yet; the optimist has scrapped the crepe and is on the job getting busy.

### The President's Annual Dinner

H. R. Safford, president of the American Railway Engineering Association, gave a dinner to the members of the Board of Direction and past presidents in the president's suite on the convention floor of the Congress hotel last evening. Approximately 25 were present.

### Signals and Interlocking

#### Committee Holds Meeting

Committee No. 10, Signals and Interlocking, held a meeting in the rooms of the American Railway Association yesterday to consider signal locations, take siding signals, train order indicators and light signals. In connection with the discussion on light signals the feeling

was expressed that these should be visible for a distance of 3,500 ft. on the brightest day, but it was finally decided that a range of 2,500 ft. would be ample, thus reducing the amount of energy required for lighting purposes. This committee is a joint committee of the Signal section and of the A. R. E. A.

### Signal Supervisors Meet

The annual meeting of the American Railroad Signal Supervisory Association, composed of supervising officers in the signal departments, was held in the Green Room at the Congress hotel at 7:30 o'clock last night.

### E. N. Johnson Promoted

E. N. Johnson, formerly frog and switch engineer of the Canadian National Railways, Lines West, has been appointed track engineer, reporting to the chief engineer, with headquarters at Winnipeg.

### C. & N. W. Train Derailed by Broken Rail

Chicago & North Western Overland Limited train No. 2 eastbound was derailed at Agnew, Ill., 114 miles west of Chicago at 6:15 yesterday morning while traveling at a speed of about 50 miles per hour. Two men of the train crew suffered minor injuries. It is supposed that the rail was broken by the engine or first of the eight cars of the train as this part of the equipment was not derailed. The train followed the Los Angeles Limited by about 10 min., which train was reported to have had dragging equipment.

### Signal Section Will Meet in Colorado

Colorado Springs, Colo., has been selected tentatively as the location for the next annual meeting of the Signal section of the American Railway Association, which will be held on June 6, 7 and 8.

### C. M. Steinmetz Promoted

C. M. Steinmetz has been appointed signal supervisor of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Springfield, Ohio, succeeding J. H. Ross, who has gone to California on an extended vacation.

An All-Concrete Trestle on the Illinois Central

# Solution of Labor Problem of Paramount Interest

## Hearings on Rules and Working Conditions of Maintenance of Way Employees Now Completed

OF ALL THE PROBLEMS confronting the railroads today the most important and the one which will be discussed most freely about the corridors at the convention is the labor problem. Upon its solution depends to a large extent not only industrial peace and reconstruction, but the whole future of private ownership and operation. This problem has centered in Chicago where the Railroad Labor Board has been and is now holding public hearings on the demand of the railway labor organizations for the continuation of their national agreements formed during the closing days of federal control. The developments of the past few months have been so kaleidoscopic that at times the fundamental issues in the controversy have been lost sight of. Now, however, the decks have been cleared, irrelevant testimony has been ruled out of the hearings on national agreements, the procedure necessary to bring wages down has been clearly outlined and the powers and prerogatives of the Labor Board defined. The real issues in the controversy have been reduced to two: (1) Shall the national agreements be continued or discontinued, and (2) shall or shall not wages be reduced?

This labor problem is one which particularly concerns the maintenance of way department and its employees. There, among the unskilled track labor, individual efficiency and output have decreased, and particularly, the cost of living and the wages offered by other industries have fallen materially. During the eleven months ending November, 1920, the railroads spent \$961,642,407 for maintenance of way and structures as compared with \$421,925,611 during the corresponding period of 1917. This is an increase of \$539,698,796, or 128 per cent. This jump in the cost of maintaining rights-of-way and structures is attributable largely to: (1) the increase in the number of employees necessary to perform this work under the existing working rules; and (2) the increases which have taken place in the annual payroll. These factors may be illustrated as follows: During 1917 the railroads employed an average of 350,000 section men and unskilled laborers. During the first three months of 1920—before maintenance of way work was fairly under way for the year—they employed an average of 376,000 section men and unskilled laborers, an increase of 26,000 men and undoubtedly, the average number of men employed in this work increased greatly later in the year when more favorable weather conditions permitted heavy maintenance work to be done. Again, during 1917 the railroads paid these workers \$220,000,000, whereas in 1920 they were paid \$476,000,000, an increase of \$256,000,000 or 112 per cent.

As a result of this and similar situations in other departments, together with a serious decline in traffic, the railroads in the last four months of 1920 failed by \$175,000,000 to earn the return (6 per cent) fixed as just and reasonable by the Transportation Act. During the month of December they earned at the rate of but 1.17 per cent upon their total valuation as fixed by the Interstate Commerce Commission.

The carriers are therefore endeavoring to apply remedial measures by attempting: (1) to have all national agreements, including that with the maintenance of way workers, abrogated and the individual carriers given the right to negotiate new agreements with their own employees; and (2) to be given the right to pay

unskilled labor wages which are just and reasonable and which place these workers on a par with their brethren in outside industries.

The abrogation of the national agreements will not only aid materially in the restoration of individual efficiency, but actually reduce operating expenses by many millions of dollars. This, coupled with reductions in the basic wages of unskilled labor, may enable the carriers to so reduce their operating expenses as to obviate further increases in rates or reductions in all wages.

### History of the Controversy Over National Agreements

The controversy between the carriers and employees over the maintenance of way agreement began on May 4, 1920, when representatives of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers requested the Labor Board to sanction a new national agreement which was even more restrictive than the agreement placed in effect a month and a half before the end of federal control. This request was part of the demands made of the Labor Board in its first case which ended in the wage award of July 20, 1920. The carriers refused to discuss either the old agreement or the proposed agreement on the grounds that working conditions were not involved in the dispute and had not been the subject of conferences between the carriers and representatives of the employees as required by the Transportation Act. The Board in its decision of July 20 stated that the rules and working conditions in effect at that time should be continued until a decision was reached as to their justness and reasonableness.

When the hearings on working conditions were opened on January 10, the employees, including representatives of the maintenance of way employees, stated that they desired only to make rebuttal statements to the carriers' testimony.

### Carriers Oppose Maintenance of Way Agreement

The carriers' opposition to the new national agreement requested by the maintenance of way workers was voiced as follows:

"Our objection to the proposed rules are summarized as follows:

1—The proposed rules extend their scope to classes of employees not heretofore represented by this organization, to many who are not employed in the maintenance of way department by all railroads.

2—The proposed rules are intended to be applied to officers, or to men who may be represented by other organizations.

3—There are vague and conflicting rules.

4—Some of the proposed rules are impracticable of application or contain requirements that involve unnecessary work.

5—The proposed rules will result in a reduction of efficiency and productivity of employees.

6—The proposed rules would prevent the giving to incapacitated employees employment suited to their capacity.

7—The proposed rules effect a further increase in earnings for work performed; also pay for time in which no work is performed."

Following this summary, the carriers' representatives presented testimony to show by specific examples occur-

ing under each rule, the wasteful, inefficient and unjust conditions which would be brought about by the universal application of rules which do not take into consideration varying local conditions. It will not be possible in this short article to take up these objections in detail. However, some of the more flagrant abuses which it was charged would be brought about by the application of the proposed national agreement can be pointed out.

The scope of the proposed agreement was objected to particularly in that its provisions refer not only to the maintenance of way department, but claim to cover all such classes of occupation in any department on any railroads and all such classes of employment not represented by other organizations prior to September 1, 1918.

Concerning this rule, it was said: "We submit that it is unjust and unreasonable to attempt to classify railroad employees according to the particular organizations that may lay claim to represent them. We believe that any rules that are established for the government of employees should be made in keeping with the class of service and in the departments in which the employees are engaged."

Again, the application of this rule would take in subordinate officers. In objecting, the carriers' representative said: "It would be a farce that subordinate officials, required by their duties to direct and supervise the work of employees, and to be responsible for its performance as well as to impose necessary discipline, should themselves be subject to the disciplinary rules of an organization in which they are overwhelmingly outnumbered by the same employees whose daily work they supervise and direct."

Another of the proposed rules deals with the basis for promotions, and bulletining vacancies and new positions, etc. In discussing this rule it was cited that: "A foreman may be taken sick. He may be expected to return for service in a few days, but he may not be able to return until the expiration of a little more than 30 days. Under this rule a number of positions would be changed and men moved to different locations for a few days only, and then all moved back again. The same conditions exist in all classes of this service, and the proposed rule would only result in decreased efficiency and endless confusion."

Another of these rules also makes it mandatory to bulletin within 30 days positions that are temporarily vacant. Regarding this, the following example was given by the carriers' representative: "To bulletin a temporary vacancy of two weeks in a position of pumper at station 'A' 29 days after it occurs, and then take 10 days more to announce the appointment, would make the process futile; or assuming that it was bulletined 30 days in advance that there would be a few weeks' temporary vacancy in the position of pumper at station 'A,' it is not in the interest of efficient and economical management that the pumper at station 'B,' 'C' or 'D,' many miles away, shall be permitted to bid in such a temporary position and thereby set up a train of other changes in personnel. To apply this illustration to the position of common labor seems to us to make the provision more objectionable; in fact, such a provision would be impracticable."

#### General Atterbury Asks for Immediate Action

The carriers' presentation against the perpetuation of the national agreements has just been completed, and the financial condition of the carriers was daily growing more critical when General W. W. Atterbury, vice-president of the Pennsylvania and chairman of the Labor Committee of the Association of Railway Executives, appeared before the Board and suggested:

(1) That the Board declare the national agreements terminated at once; that the question of rules and working conditions be remanded to negotiations between each carrier and its own employees; and that as the basis for such negotiations, the agreements, rules and working conditions in effect on each railroad as of December 31, 1917, be re-established.

(2) That the Board give immediate permission to the railroads to pay for unskilled labor not less than the prevailing rates of wages in the various territories served by each carrier.

The controversy was finally carried to President Wilson when the labor men petitioned him to present the issues involved to Congress, and representatives of the carriers followed with specific answers to the charges made by the labor leaders. The President, however, on February 6 declined to interfere in any way in the controversy.

Mr. Jewell then petitioned the Board for additional time and this petition was granted and Frank P. Walsh, the labor counsel, and W. Jett Lauck, economist, were retained to assist in bringing a "huge conspiracy" charge before the Board. Mr. Jewell planned to ask for postponement of hearings on national agreements and for an immediate hearing upon the evidence they wished to present in support of their charge that railway executives and financiers have conspired to re-establish autocratic control of the transportation industry. However, when the public hearings were resumed on February 10 this plan was killed by a resolution of the Board. The same ruling also denied both of General Atterbury's requests. These developments, in general, remanded the question of rates of pay for unskilled labor to the individual carriers to act in accordance with the terms of the Transportation Act, ruled out irrelevant charges and evidence and cleared the decks for completing the hearings in the controversy over national agreements.

#### Employees Ask for Joint Conferences

When Mr. Jewell again came before the Board on February 17, he requested it: (1) to refer the national agreements to a joint conference; (2) to request representatives of the railroads and of the labor organizations to meet the Board in conference on the establishment of national boards of adjustments, and (3) in lieu of raising the question of the wages of unskilled labor in accordance with the Board's decision of February 10, that the Board request a general conference between the representatives of the railroads and of unskilled labor.

The significance of these requests is that Mr. Jewell was asking the Board to recognize the principle of collective bargaining, which he interpreted as meaning only bargaining between employees and employers on a national scale. As an alternative to this proposal, Mr. Jewell asked for a postponement until March 14. This postponement was later allowed by the Board, which, in so doing, ignored Mr. Jewell's request for joint conferences. At the same time the Association of Railway Executives at a meeting held at Chicago flatly refused to consider the proposed joint conferences. Since that time Mr. Jewell has petitioned the Labor Board several times for an answer upon his proposal, but to date this has not been given.

At the present time Mr. Jewell is scheduled to begin his reply and reports of his plan of attack indicate that the Board will be requested to subpoena certain railway executives, particularly those who are members of the Association's Labor Committee which was abolished on March 4. By this means Mr. Jewell hopes to prove that the carriers are not unanimous in their labor policy.

The rebuttal statement of the maintenance of way em-

ployees began on March 9, J. C. Smock, grand vice-president of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers, opening the testimony with an attack on capital. He charged, as evidence of a concerted movement, that thousands of Mexicans, in direct violation of law, have been brought into the United States within the past year and placed in competition with former employees of the railroads. This has been done, he said, for the purpose of lowering the level of the railway employees to the standard that exists in the country from which they came. In support of a national agreement, he stated, "an agreement applicable to all railroads establishing a uniform working condition will have a tendency to encourage the employees to become steady workers, thus being an agency in preventing the fluctuation of labor, which is authoritatively considered to be a waste of energy and a genuine loss to the country as a whole."

The charges made under the seven specific objections to the maintenance of way agreement were categorically denied by the employees who contended, as have the other organizations, that the proposed agreement serves as a protection to the workers, thus creating contentment and efficiency and that without the agreement the carriers would again begin indulging in alleged sharp practices.

The extension of the scope of the maintenance of way agreement was justified on the grounds that employees in various sub-departments had expressed their desire for protection and to be represented by this organization. Regarding the representation of subordinate officials, the employees contended that foremen in the maintenance of way department are really a part of their gang and their inclusion in an organization of the employees is more fitting than their inclusion in an organization of supervisory officials. Regarding the bulletining of temporary vacancies the employees contended that under no circumstances would regularly assigned men bid in on these positions, but, on the other hand, apprentice foremen and men who are preparing for higher positions would bid in on them to obtain the necessary experience to qualify them for promotion.

Today, then, the major part of the testimony for and against the maintenance of way agreement has been given. The question of national agreements is in the hands of the Board. In so far as the wages of unskilled labor are concerned, the carriers have had the proper procedure pointed out and they have consequently taken steps throughout the country to bring this subject into conferences from which it will probably be referred to the Labor Board.

## Automatic Train Control Activities

**A** MEETING OF THE ENTIRE Joint Committee on Automatic Train Control of the American Railway Association will be held in the offices of the Association in the Manhattan Building, Chicago, on March 16. At the conclusion of the meeting a committee consisting of one member each from the Operating, Engineering, Signal and Mechanical sections, the executive secretary of the committee and two representatives of the Interstate Commerce Commission will start on an inspection trip on the Pacific coast to make an inspection of the National Safety Appliance Company's intermittent induction type of train control as installed on the Western Pacific. This committee consists of T. H. Beacom, vice-president and general manager of the Chicago, Rock Island & Pacific; F. Ringer, chief engineer of the Missouri, Kansas & Texas; T. S. Stevens, signal engineer of the Atchison, Topeka & Santa Fe system, and G. McCormick, general superintendent of motive power of the

Southern Pacific. W. P. Borland, chief of the Bureau of Safety, and H. D. Lyon, senior railway signal engineer of the Bureau of Safety, Interstate Commerce Commission, will be the government representatives. G. E. Ellis, executive secretary of the Joint Committee, will also accompany the sub-committee.

H. R. Safford, assistant to the president of the Chicago, Burlington & Quincy, has resigned as a member of the joint committee. Mr. Safford was one of the members chosen from the Engineering section of the American Railway Association and his successor has not as yet been appointed. M. S. Connors, general manager of the Hocking Valley, a member of this committee representing the Operating section, has also resigned and his place on the committee will be taken by W. M. Jeffers, general manager of the Union Pacific.

## Payments Under Winslow Bill

WASHINGTON, D. C., March 14, 1921.

The effects of the Winslow bill are already being felt by the railways, as is shown by the fact that, since the passage of this bill, the Treasury department has already paid \$30,000,000 to the roads on certificates issued by the Interstate Commerce Commission to apply on their guarantee for six months following the termination of federal control. This amount is in addition to \$263,000,000 paid previously on advances applied for prior to September 1. The certificates paid by the Treasury department under the Winslow bill to date include the following: Great Northern, \$6,000,000; Northern Pacific, \$7,000,000; Chicago, Burlington & Quincy, \$7,000,000; Chicago, Milwaukee & St. Paul, \$3,137,190; Minneapolis & St. Louis, \$400,000; Chicago Great Western, \$835,000; Texas & Pacific, \$1,000,000; Ulster & Delaware, \$219,600; Tennessee Central, \$115,000; Gulf, Mobile & Northern, \$150,000; Philadelphia & Reading, \$2,000,000; Raritan River, \$60,000.

## Forty-five Years from a Cross Tie

A cross tie was on exhibit in the corridor outside the convention room yesterday afternoon which had been removed from track after a service of 45 years. The following letter regarding this unusual tie explains the conditions under which this record was secured:

New Orleans, La., January 17, 1921.

E. H. Fritch, Esq.,  
Sec'y American Ry. Engr. Ass'n,  
431 South Dearborn St.,  
Chicago, Ill.

Dear Sir:—

A cross tie has recently been taken out of the track of the Alabama & Vicksburg Railway about 76 miles east of Vicksburg, Miss., which was put in the track in September, 1875. We have this tie at Vicksburg and the stubs of the spikes in the tie can be seen where the gage was changed in November, 1885. This cross tie has been in the track over 45 years.

The history of the tie is that the railroad company owned a large tract of land about 90 miles east of Vicksburg and settled thereon a colony of Hollanders who cut the timber into cross ties and cord wood to pay for the land.

Mr. J. A. Speer, who was at that time in the employ of the company on an extra gang helped to put this tie into the track and is still in the service of the company.

The tie was cut from what is known as long straw yellow pine.

Yours truly,

(Signed) E. FORD,  
Assistant to President,  
Alabama & Vicksburg.

## Track Committee Meets

The Track Committee met in all-day session at the offices of the association yesterday to discuss the report which will be presented today and to plan for the work of the next year.

# American Association of Engineers Holds Meeting

The Third Annual Railroad Conference Convened Yesterday in the  
Florentine Room of the Congress Hotel

THE THIRD ANNUAL RAILROAD CONFERENCE of the American Association of Engineers was held yesterday in the Florentine room of the Congress hotel, Chicago. The attendance, while representative of 66 different roads, fell below that of previous years, only approximately 100 members registering, in comparison with about 250 for 1920. The day's program was arranged to include a morning, an afternoon and an evening session in order to cover the subjects to come before the conference. The morning session was devoted to the reports of the different railroad sections, general business and one paper on the effect of the Labor Board's decision on the salaries of professional engineers, by J. D. Trueblood.

In this paper an analysis was made of the sources from which the engineers were recruited and some facts were brought out regarding the decrease in the number of graduate civil engineers. The curves illustrated the trend of the total enrollments of all students taking other than civil engineering courses and those taking that course in seven western technical schools. During the period from 1910 to 1920 the increase in enrollment for all engineering courses except civil was about 65 per cent, as compared to approximately 17 per cent for the civils. The more marked contrast was shown in the number graduating, for while there was an increase of about 20 per cent in other than civil there was a decrease of about 33 per cent in the number of students graduating in civil engineering, as compared with the number in 1910-11.

Two other curves were shown, giving a comparison of salaries of engineers as compared with those of the so-called craftsmen. These curves intended to show that the junior engineers had lost ground in the matter of comparative salaries. The curve on cumulative salaries covered three classes of employees, namely, (a) craftsmen, (b) engineers, not technical graduates, and (c) technical graduates.

The discussion of this paper brought out a variety of opinion bearing chiefly on the value of the engineer as an engineer and as a prospective operating man. The comparison of the engineer to craftsmen was not considered comparable, since the craftsman soon reaches a point when his rate of increase practically ceases, while the engineer's does not. In regard to the wage question it was felt that in general engineering service was a marketable commodity and that with exceptions a man was usually paid about what he was worth. Thus, if the engineers were to receive more they would have to make themselves worth more by a greatly increased knowledge of railway problems.

The afternoon session was opened by J. R. Leighty, assistant chief engineer, Missouri Pacific, St. Louis, Mo., as chairman. A paper on "Educational Co-operation with the Management," by Professor Lewis Gustafson, superintendent of the David Ranken, Jr., School of Mechanical Trades of St. Louis, was read. The history of apprenticeship practices was described, as well as the present growth of the student system as it is now being built up in industrial trade and vocational schools and in railway organizations. In effect the paper stated that trade schools were in a measure a revival of the old apprenticeship system and that excellent work was being carried out by means of long term courses varying from one to three years. Courses are given in all of the prin-

cipal trades, the work being so laid out that the student obtains both practical and technical knowledge of the subject specialized in, the intention of the method being to fit the men for ultimate positions of foremen, managers or superintendents.

W. L. Lewis presented a paper on an educational plan now in effect on the Great Northern. Through the action of the railroad section on that road a plan calling for educational courses was presented to the management and adopted. Meetings are held every two weeks at the present time, at which different higher officers describe the problems with which their departments are confronted. Lessons are presented to the students for their solution two weeks in advance of the classes. Special courses will be inaugurated to cover practically all branches of railroading. Chief of interest among the special courses will be one designed to train the engineer as an executive. The educational bureau handling the plan consists of the executive heads of the various departments of the railroad and three members of the railroad section of the A. A. E. There are three standing committees, one each on program, service and progress, which committees lay out the plans and schedules for the lessons and prospective work, check up the progress in classes and in the work and note the resulting effect on the operation of the road.

J. T. W. Jennings, in presenting the report on the revision of salaries schedules, stated that no changes had been made in amounts of compensation as given in the 1920 schedule. Several changes had been made, however, in the duties of certain classes of engineers, the intention being to bring the salary question more on the basis of service rendered rather than on the question of title.

The evening meeting was presided over by C. E. Drayer, general secretary of the Association, in the absence of W. H. Finley, president of the Chicago & Northwestern, who was unable to attend on account of serious illness.

W. W. K. Sparrow, assistant to the president of the Chicago, Milwaukee & St. Paul, spoke on the "Public Versus the Railroads," reviewing the history of railway development, the land grants, abuses in early days, the enormous risk taken by those who pushed the roads into undeveloped territory, etc. Regulation without regard to the effect on the regulated led to restricted development which was not realized by the public until America's entrance into the war, and resulted eventually in federal management. Following a review of the circumstances that resulted in the drafting and passage of the Transportation Act, he explained the principal provisions and related the difficulties which have followed as a consequence of reduced earnings and inability to lower expenses in proportion.

He said the Transportation Act is now on trial and if it is not a success he saw nothing left save government ownership and operation which would stifle all initiative, and kill ambition. On this point, he felt that he was particularly qualified to speak because of his own experience on the state-owned railways of South Africa. After working 10 years he gave up the position which he had attained because he could see nothing ahead of him and he had heard that in the United States there was no limit to promotion based on merit and hard work.

# Annual Exhibit of the N. R. A. A. at the Coliseum

This Year's Show Featured by Large Attendance and  
Record Number of New Exhibitors

THE ANNUAL EXHIBITION of the National Railway Appliances Association which opened at 8 o'clock yesterday morning at the Coliseum was confidently expected to be a "record breaker" by C. W. Kelly, secretary of the organization. From the start of the preparations, interest in the show has been running so high that officers of the Association found it necessary to provide more space for the exhibitors than for several years. To meet this need the Coliseum Ballroom was secured, which has floor space sufficient to accommodate 82 booths, all of which were occupied. In spite of these additional facilities the space has proved no more than adequate to take care of the 60 new exhibiting members of the Association, coupled with the demand of many of the regular exhibitors for more space than was available for them last year. When the show opened it was found that every booth in the Coliseum, Annex and Ballroom was occupied. Although there is no convention of the Signal section of the American Railroad Association, the signal companies are exhibiting as usual, for many signalmen are expected to attend the show.

The unusual interest in the exhibition not only has made additional space necessary but has occasioned a number of special features. The practice adopted several years ago of having the main entrance to the show through the Annex has been discontinued, the Ballroom entrance being substituted instead. The decorating scheme of oatmeal and brown, new this year, is featured by the arrangement of a false ceiling, false sides walling off the balcony, and elaborate festoons covering the balcony railing. The ceiling acts as a canopy for the entire exhibiting space and sets off effectively the old-bronze and white signs and partitions of the booths. The same general decorating effect is carried out in the Annex and Ballroom. A special scheme of lattice work, hung with colored lights, has been worked out for all leads to the stairs and an additional space has been arranged between the main Coliseum and Ballroom by extending the balcony, which has been fitted up in the form of a pagoda, built of lattice frames and also hung with colored lights and smilax.

Public stenographers are in attendance on the balcony, and separate registration booths have been provided for members of the American Railway Bridge and Building Association, the Roadmasters' and Maintenance of Way Association, the Scalemen's Association and the Signalmen's Association. The balcony has been found to supply a third need through its adequate reception room facilities which visitors to the exhibition are finding desirable as meeting places.

Following the precedent established last year, all furniture, electric fixtures and decorative effects have been handled direct by the Association, instead of permitting this work to be done by outside agencies as was customary formerly. The uniformity in the style, color and type of the furniture and individual features provided for the booths of the exhibitors adds an exceptionally pleasing touch to the decorative scheme. An 8-piece orchestra giving concerts morning, afternoon and evening on the balcony lends refinement to the exhibition.

A preliminary survey made with the idea of determining the approximate attendance to be expected at this year's show disclosed the fact that the demand for tickets

by railroad men would be unequalled. Approximately 10,000 invitations were sent out to members of engineering societies, to colleges, to railroad men, and to members of the N. R. A. A. In addition, officers of the Association have provided 125,000 passes, exceeding the average number issued in former years by 50,000. The plan of distribution is practically the same as that which was followed last year. It is intended to confine the attendance at the show to those who are really interested in the exhibit, or who are in any way connected with the railway or railway supply business.

In the same way the experience at the last convention made it seem desirable to open the Coliseum each day during the present exhibition at 8 a. m., closing at 6:30 p. m., with the exception of the second day of the Convention, Tuesday, March 15, when the exhibition will close at 11 p. m. According to Secretary Kelly, the arrangement was found to be very successful last year, in giving both the men connected with the exhibit and visitors to the show an ample opportunity to get together and renew old friendships.

New records were made for opening day attendance. Up to 4 o'clock yesterday afternoon Secretary Kelly reported that 1,291 members of the National Railway Appliances Association had enrolled, while the figures for total attendance stood at 3,184.

The officers and members of the board of directors of the National Railway Appliances Association for the past year were: President, J. B. Strong, Ramapo Iron Works, Hillburn, N. Y.; vice-president, G. C. Isbester, American Chain Company, Chicago; secretary-treasurer, C. W. Kelly, Kelly-Derby Company, Chicago; honorary director, P. C. Jacobs, H. W. Johns-Manville Company, Chicago. Directors, A. A. Taylor, Fairbanks, Morse & Co., Chicago; T. W. Aishton, National Malleable Castings Company, Chicago; E. A. Johnson, Duff Manufacturing Company, Pittsburgh, Pa.; L. W. Shugg, General Electric Company, Schenectady, N. Y.; W. J. Gillingham, Hall Switch & Signal Company, Garwood, N. J. and A. J. Filkins, Paul Dickinson, Inc., Chicago.

## LIST OF EXHIBITORS

The following is a list of firms presenting exhibits, with the devices on display and the names of the representatives present at their booths:

Ackerman-Johnson Company, Chicago.—Expansion bolts; expansive screw anchors; etc. Represented by C. N. Ackerman, W. A. Stein and J. L. Johnson. Space 246.

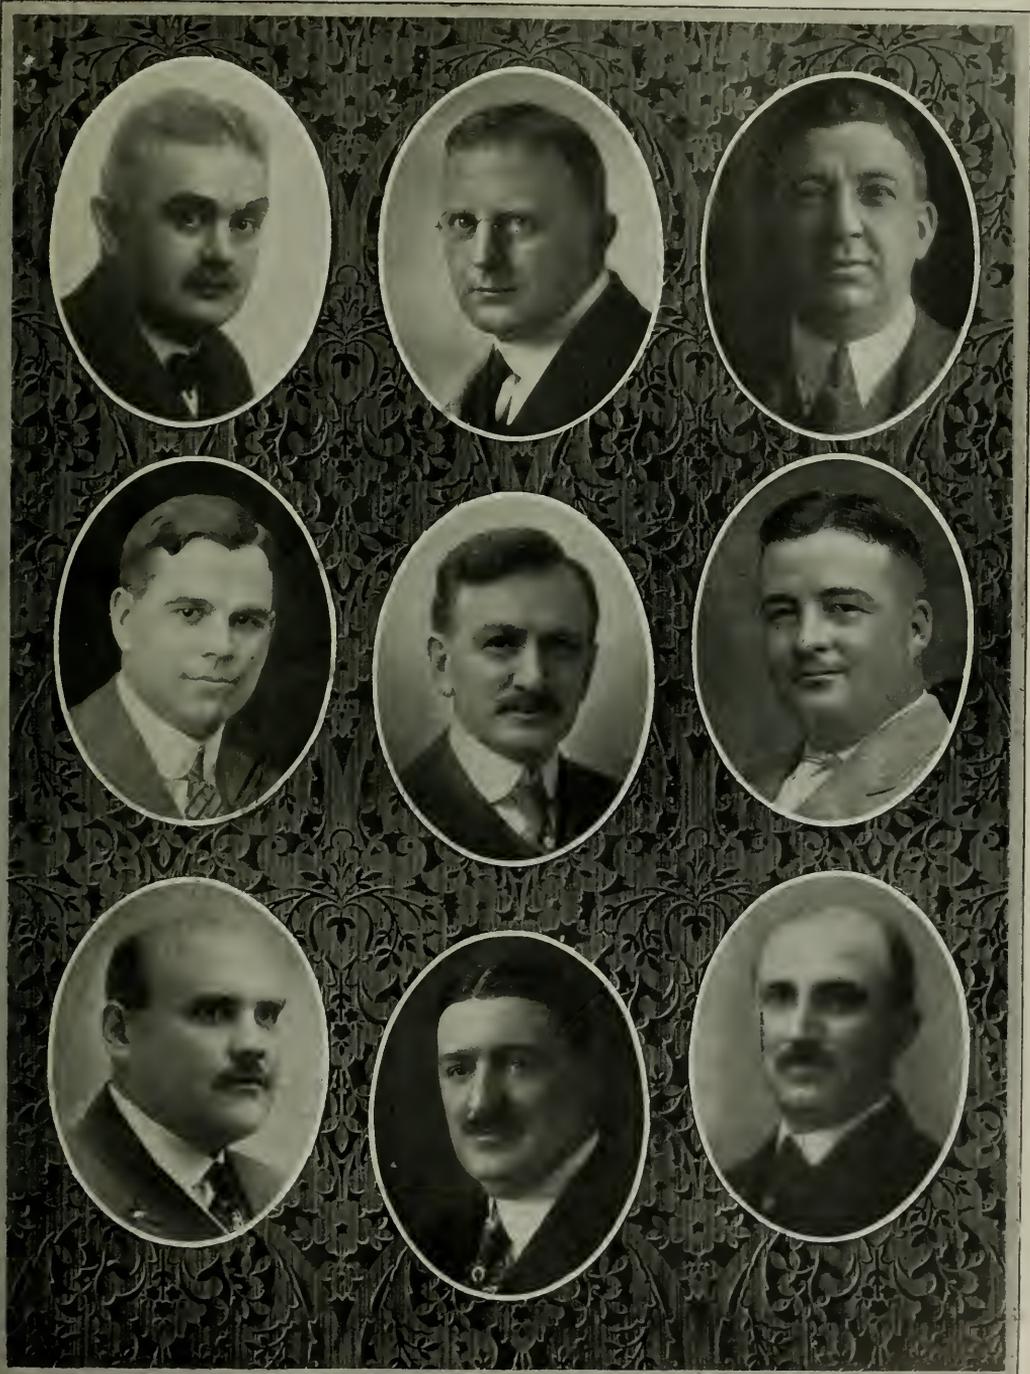

Adams & Westlake Company, Chicago.—Signal lamps; lanterns; long time burners; burner wicks; switch locks; car window sash locks; etc. Represented by A. S. Anderson, C. B. Carson, W. J. Pierson, J. F. Stender, H. G. Turney and G. L. Walters. Spaces 87, 88, 106 and 107.

Adams Motor & Manufacturing Company, Chicago.—Gasoline operated railway motor speeders. Represented by W. E. Adams, B. A. Harris and L. Gerhardt. Spaces 218-218½.

A. G. A. Railway Light & Signal Company, Elizabeth, N. J.—Railway grade crossing signals; flashing signal lights; oxy-acetylene welding and cutting equipment; traffic signals. Represented by J. K. Howard, H. A. Berggren and L. M. Merrill. Spaces 39-40.

Air Reduction Sales Company, New York City.—Oxygen and acetylene cylinders; welding and cutting apparatus. Represented by A. W. Brown, R. T. Peabody, L. A. Tucker and H. H. Melville. Space 167.

American Abrasive Metals Company, Chicago.—Car steps; thresholds and door plates for street and steam passenger coaches; floor plates in engine and boiler rooms; freight corridors; cover

C. W. Kelly, Secretary-Treasurer  
L. W. Shugg, Director  
A. J. Filkins, Director

J. B. Strong, President  
P. C. Jacobs, Honorary Director  
E. A. Johnson, Director

G. C. Isbester, Vice-President  
T. W. Aishton, Director  
A. A. Taylor, Director

plates for trenches; expansion joint; coal-hole and man-hole covers and frames; hot air or heater gratings; pull box covers; door saddles for elevator, fire and other doors; vent and drainage gratings; elevator floors and floor landings. Represented by Charles A. Barker. Space 166.

American Association of Engineers, Chicago.—Represented by E. L. Brandt, C. E. Drayer, F. C. Armstrong, R. C. Bailey, W. S. Cleverger, C. B. Smith, E. Willoughby, C. R. Thomas, E. B. Miller and M. C. Small. Space 165.

American Car and Foundry Company, New York City.—Electric rivet heaters. Represented by A. G. Wood and C. P. Dickerman.

American Hoist & Derrick Company, St. Paul, Minn.—Ditcher. Represented by W. L. Manson, W. B. Maurer, J. L. Hickey and Miss Helen M. Hoeller. Space 88½.

American Chain Company, Reading Specialties Division, New York City.—Replacers; rail binders; derail; guard rail clamps. Represented by J. J. O'Connell, G. C. Isbester and A. P. Van Schaick. Spaces 81 and 84.

American Kron Scale Company, New York City.—Automatic springless dial scales. Represented by C. F. Larson and W. W. Camp. Space 125.

American Malleable Castings Association, Cleveland, Ohio.—Malleable cast iron parts for track equipment and rolling stock. Represented by F. J. Lanahan. Spaces 181, 182 and 183.

American Manganese Steel Company, Chicago Heights, Ill.—Manganese steel castings; crane wheels; conveyor chains; sprockets; car replacers; track work; centrifugal manganese pumps; etc. Represented by W. G. Nichols, W. S. McKee, M. B. Myers, E. C. Bauer, H. A. Hunt and Earl A. Lerner. Spaces 280 and 295.

American Radiator Company, Chicago.—Heating outfits for waystations and interlocking towers. Represented by Grover J. Meyer. Spaces 256 and 269.

American Steel & Wire Company, Chicago.—Railroad fences; steel fence posts; steel fence gates; rail bonds; arc welding machine; wire rope; electrical wires; signal wire; telephone and telegraph wire; locomotive switching ropes. Represented by L. P. Shanahan, B. H. Ryder, J. W. Collins, M. E. Evans, A. W. Froude, W. Mackley, C. S. Knight, J. W. Meaker, O. T. Allen, B. S. Pease and V. R. Sladek. Spaces 51½, 52, 70½ and 71.

American Valve & Meter Company, Cincinnati, Ohio.—Automatic water columns; float valve; switch stands; interlocking switch locks; track appliances. Represented by J. T. McGarry, D. J. Higgins, D. DePinal and F. C. Anderson. Spaces 130, 131 and 132.

American Vulcanized Fibre Company, Wilmington, Delaware.—Fibre; insulation for rail joints; switch rods; steel tie and bridges. Represented by H. C. Hackett, E. W. Patterson and John Barron. Space 126.

Anchor Company, Chicago.—Rail anchors. Represented by O. Metcalf and Geo. H. Chadwell. Space 192½.

Armco Culvert & Flume Manufacturers' Association, Chicago.—Ingot iron corrugated culverts; ingot iron sheets. Represented by T. W. Jenkins, A. J. Bohle and J. E. Buckingham. Spaces 99 and 100.

Austin Company, Cleveland, Ohio.—Model of railroad round house. Represented by O. D. Conover and G. A. Bryant. Spaces 158 and 158½.

Austin Machinery Corporation, Chicago.—Earth moving, concrete mixing and material handling machinery. Represented by H. A. Hooker. Space 300.

Balkwill Manganese Crossing Company, Cleveland, Ohio.—Cast manganese crossings. Represented by S. Balkwill. Spaces 259, 260, 272 and 273.

Barrett Company, Chicago.—Models showing systems of roofing; flashing and waterproofing; protective coatings for roof maintenance; protective iron coatings; wood preservative; prepared roofings; tarvia for paving. Represented by G. R. McVay, W. S. Babcock, F. W. Freeman and G. L. Wilson. Spaces 107½ and 108.

Barrett Cravens Company, Chicago.—Power ox; industrial tractor; lift truck; portable crane; barrel trucks. Represented by T. W. Noble and E. J. Heimer. Spaces 190 and 191.

Bassick Manufacturing Company, Chicago.—High pressure lubricating system; oil. Represented by Carl I. Overton, J. Henly Frier, Jr., Paul D. Wilson, Marion H. Heustis, Wm. H. Roesch and Frank A. Hiter. Space 314.

Benjamin Electric Manufacturing Company, Chicago.—Lighting appliances and fixtures; water tight electrical equipment. Represented by L. E. Snell and C. G. Carlson. Spaces 152 and 153.

Bethlehem Steel Company, Bethlehem, Pa.—Switch stands; one piece guard rail; etc. Represented by R. W. Gillispie, Neil E. Salsich, R. E. Belknap, E. E. Goodwillie, J. F. Hennessy, E. H. Gumbart, J. S. Clark, G. H. Riddle and J. H. Budd. Spaces 199 and 216.

Blaw-Knox Company, Pittsburgh, Pa.—Buckets; sectional steel buildings; forms for concrete construction. Represented by L. R. Grannis and R. B. Randall. Spaces 137-138.

Boss Nut Company, Chicago.—Lock nuts; bolts; rivets. Represented by J. W. Fogg, A. W. MacLean, J. P. Crowley, C. Beaumont, E. T. McAuliffe and J. A. MacLean. Spaces 1 and 2.

L. S. Brach Manufacturing Company, Newark, N. J.—Lighting arresters and signal specialties. Represented by Godfrey Gort. Space 169.

Brown Hoisting Machinery Company, Cleveland, Ohio.—Locomotive cranes; car dumpers; buckets; boat unloaders. Represented by Geo. F. Climo, E. C. Pierce, F. D. Johnson and Bob White. Spaces 231-4.

Bucyrus Company, South Milwaukee, Wis.—Spreader plows; steam shovels; dragline excavators; railway wrecking cranes; unloading plows; etc. Represented by E. G. Lewis and M. L. Woodhull. Spaces 307, 308 and 309.

Bryant Zinc Company, Chicago.—Crossing signals; signal accessories; testing instruments. Represented by D. C. Bryant, A. Muller, S. Miskelly, J. Hensell and T. H. Cole. Spaces 154 and 155.

Buda Company, Harvey, Ill.—Ball bearing jack; journal jack; ratchet jack; barding drill; track drill; switch rods; crossing gate; switch stand; water cooled motor car with generator; replacers; steam tube lighting plant; headlight. Represented by R. B. Fisher, Wm. P. Hunt, Jr., M. A. Evans, J. R. Artrmaier, G. F. Gells, Geo. E. Bryan, A. L. Bliss, S. F. Franks, Geo. Hoover, L. R. Griffin, J. E. Murray, V. Y. Bell and H. C. Beebe. Spaces 61, 62, 63, 64, 65 and 66.

A. M. Byers Company, Pittsburgh, Pa.—Wrought iron pipe; wrought iron signal pipe. Represented by E. A. Small, Jr. and S. K. Turner. Space 253.

Carbic Manufacturing Company, Duluth, Minn.—Portable acetylene lights; motor car lights; oxy-acetylene welding and cutting equipment. Represented by D. C. Duncan, A. D. Guthrie and C. H. Bolinder. Space 15.

Carter Bloxonten Flooring Company, Chicago.—Flooring. Represented by C. J. Carter, M. G. Truman, R. G. Stowell and F. L. Bronez. Space 225.

Challenge Company, Batavia, Ill.—Model railroad tank, tower and fixtures. Represented by Frank Snow, E. W. Johnson, J. A. Anderson and R. L. Lewis. Space 109.

Chicago Bridge & Iron Works, Chicago.—Tank models; pictures and diagrams. Represented by M. J. Trees, H. C. Brown, H. T. Horton, K. I. Small, Ralph Green, C. H. Scheman, C. M. Ladd, Lewis McDonald, C. S. Smith, H. B. Murphy and J. L. Zeller. Spaces 109½ and 110.

Chicago Flag & Decorating Company.—Signal flags; United States and foreign nation flags; signal flag bunting. Represented by George L. Glendon. Space 189.

Chicago Malleable Castings Company, West Pullman, Ill.—Rail anchor tie plate; tie plate key. Represented by J. S. Llewellyn, Warren Osborn, W. L. Beudway, G. B. Greene, Geo. W. Stevens and Alan Rogers. Space 142.

Chicago Pneumatic Tool Company, Chicago.—Riveting and chipping hammers; air drills; pneumatic grinders; portable electric drills and grinders; fuel oil engines. Represented by A. E. Goodhue, C. W. Cross, H. G. Barbee, J. L. Canby, T. J. Hudson, Jr., A. C. Andresen. Spaces 134 and 135.

Chicago Railway Signal & Supply Company, Chicago.—Block signals; relays; switch boxes; crossing bells; signal forgings; etc. Represented by E. W. Vogel, A. C. Dunne, R. F. Frehse, Wm. McClintock, C. R. Ahrens, Carl Suhr, W. E. Ferguson and D. J. McClintock. Spaces 77 and 78.

Central Electric Company, Chicago.—Lighting fixtures; receptacles and plugs for power and lighting equipment. Represented by A. L. McNeil, R. M. Baker, E. H. McNeil, J. M. Lorenze and L. R. Mann. Space 17.

Clark Car Company, Pittsburgh, Pa.—Extension side dump cars. Represented by R. L. Mason and H. G. Doran. Space 135.

Cleveland Railway Supply Company, Cleveland, Ohio.—Guard rail; switch stand; flangeway guard; foot guards; malleable tie plates; malleable iron rail braces and universal cranes. Represented by Frank A. Peck, George W. Pope and Q. J. Winsor. Space 205.

Copper Clad Steel Company, Rankin, Pa.—Weatherproof wire; barb wire; strand; nails; ground rods. Represented by Geo. F. Bain, W. S. Krenz and J. P. Mumford. Space 213.

Creepeck Company, Inc., Hoboken, N. J.—Anticreepers. Represented by P. E. Browne and John T. Reagan. Space 285.

Crerar Adams & Co., Chicago.—50 ton self-lowering jack; 75 ton self-lowering jack; journal jack; bonding drills; track drills. Represented by J. A. Martin, G. D. Bassett, W. I. Clock and Russell Wallace. Space 28.

Chipman Chemical Engineering Company, Inc., New York City.—Chemical weed killer and equipment for application of chemical. Represented by R. N. Chipman, E. D. Jackson, R. B. Davis and I. P. Brookfield. Space 90½.

L. & R. Culvert Company, Chicago.—Sectional cast iron culverts. Represented by T. F. Lundergan, Wm. Robertson, R. F. Repasz. Spaces 242 and 243.

Detroit Graphite Company, Chicago.—Railway paints for bridges, buildings, tanks, equipment, signals, etc. Represented

by R. C. Ashenden, O. N. Edgar, A. B. Edge, J. R. Hintz, H. I. Miller, L. D. Mitchell, J. F. Neimann, F. L. Warner, W. D. Waugh, Walter West and T. R. Wyles. Space 108½.

Detroit Steel Products Company, Detroit, Mich.—Continuous sash; sidewall sash for railroad buildings of all types. Represented by R. S. Bishop. Space 262.

Diamond State Fibre Company, Bridgeport, Pa.—Railway insulation; hard vulcanized fibre; waterproof insulation for track crickets. Represented by G. Swallow, Theo. Herkert and J. B. Rittenhouse. Space 254 and 267.

Paul Dickinson, Inc., Chicago.—Smoke jacks; chimneys for small buildings and roof ventilators; models of engine house with smoke jacks and ventilators. Represented by A. J. Filkins, D. B. Wright and H. Knutson. Space 98.

Dilworth, Porter & Co., Inc., Pittsburgh, Pa.—Represented by W. F. Schleiter, Joseph Dilworth and A. Morrison. Space 27.

Joseph Dixon Crucible Company, Jersey City, N. J.—Silica-graphite paint and other graphite products adapted for railroad equipment. Represented by N. C. Cameron and J. E. Simpson. Space 51.

Duff Manufacturing Company, Pittsburgh, Pa.—Car jacks; locomotive jacks; track jacks. Represented by E. A. Johnson, C. N. Thulin and Earle Thulin. Space 89½.

George E. Gibson, Chicago.—Nut locks. Represented by George E. Gibson. Space 274.

Edison Storage Battery Company, Orange, N. J.—Storage batteries for railway car lighting and signaling. Represented by D.

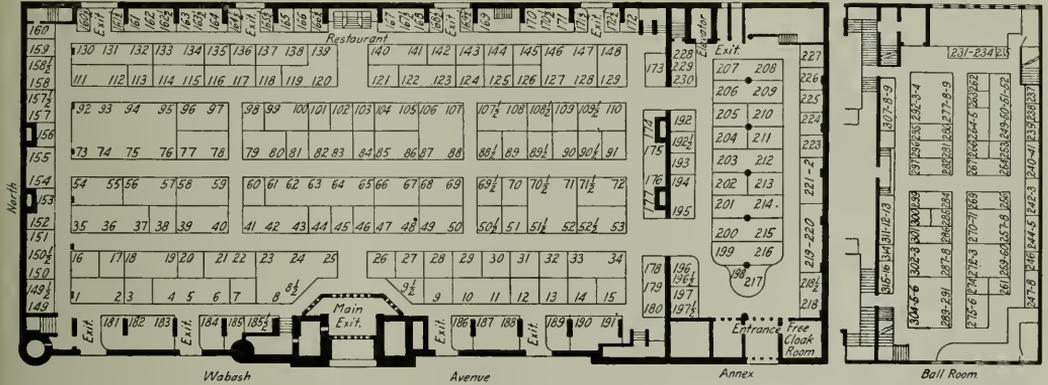

equipped); motor car for heavy service; inspection car; locomotive water crane; water crane valve; oil engine; track scale; electric motors; centrifugal pumps; etc. Represented by G. J. Akers, W. F. Anderson, J. M. Barron, F. M. Condit, E. J. Coverdale, F. P. Drinker, J. C. Flanagan, J. T. Frame, P. H. Gilleland, E. C. Golladay, H. L. Hilleary, G. Howard, J. L. Jones, K. Jurgensen, S. G. Eaton, Roger F. Lane, E. Lang, D. K. Lee, F. J. Lee, G. W. Lewis, L. H. Matthews, C. W. Pank, E. E. Pendency, Stephen Smith, F. C. Snyder, B. S. Spaulding, A. A. Taylor, H. E. Vogel, C. H. Wilson and M. O. Southworth. Spaces 92, 93, 94, 95, 73, 74, 75 and 76.

Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.—Handcar equipment; power deck for converting handcars and pushcars into motor cars; section car; inspection car; handcar equipment; roller bearings; ball bearings; pressed steel car wheels. Represented by H. E. Wade, W. F. Kasper, H. M. Starrett, J. P. Dunning, W. D. Brooks. Spaces 41, 42 and 43.

Federal Electric Company, Chicago.—Sirens; lanterns; fuses. Represented by O. S. Burke, F. T. Baird, P. L. Reymond, H. W. Neal, F. E. Deal, H. L. Duncombe and C. H. Murrin. Space 171½.

Federal Signal Company, Albany, N. Y.—Signals; relays; switch boxes; automatic and interlocking signaling devices. Represented by Paul Renshaw, M. R. Briney, Carl Henze and W. H. Reichard. Spaces 47 and 48.

H. K. Ferguson Company, Cleveland, Ohio.—Erecting aisle; construction section of round house. Represented by H. K. Fer-

Floor Plan of the Coliseum, Annex and Ballroom

C. Wilson, W. F. Bauer, A. S. Knox and A. M. Anderson. Space 20.

Thomas A. Edison, Inc., Bloomfield, N. J.—Primary cells; devices for electrically lighting signals with primary cells; adapters for fitting oil signal and switch lamps to take incandescent bulbs; color and position light signals lighted by primary cells; signal lamp aligning and bulb focusing devices. Represented by L. W. McChesney, R. E. Trout, A. J. Loughren, F. S. Stallknecht, L. S. Dunham, F. W. Brown, P. A. Garrity, B. F. Hines, E. W. Newcomb and R. J. Frost. Spaces 18-19.

Electric Storage Battery Company, Philadelphia, Pa.—Storage batteries for railway signal and car lighting service; three position light signal in operation controlled by mechanical rectifier and storage battery from A. C. current. Represented by J. Lester Woodbridge, F. M. Ethers, H. E. Hunt, J. A. Fitts, W. Dunne, H. M. Beck, T. Milton, G. H. Atkin and H. B. Cranford. Space 60.

Elliot Frog and Switch Company, East St. Louis, Ill.—Manganese insert frog; split switch; switch stand; rails for the above. Represented by H. Elliot, W. H. Elliot, Dickson Fairback, Wm. J. Fairback, H. J. Elliot, A. F. Hess and A. F. Huber. Spaces 281 and 296.

Ellwell-Parker Electric Company, Cleveland, Ohio.—Storage battery electric trucks with 18-inch lifting magnet; truck; paper handling truck; tractor. Represented by Joseph M. Brown. Spaces 257, 258, 270 and 271.

Equipment Corporation of America, Chicago.—Hoisting engines. Represented by Messrs. Capron, Sullivan and Rennolds. Space 227.

Eymon Crossing Company, Marion, Ohio.—Continuous rail crossing. Represented by Byron E. Wilson, James H. Eymon and A. C. Queen. Space 169½.

Fairbanks, Morse & Co., Chicago.—Motor car (magneto

guson, E. M. Haas, O. C. F. Randolph and L. H. Butler. Spaces 163, 163½ and 164.

Friction Car Stop Company, Cleveland, Ohio.—Car stops or bumpers. Represented by J. U. Duffy and B. W. Siftlet. Space 165½.

Frog, Switch & Manufacturing Company, Carlisle, Pa.—Manganese frogs. Represented by L. E. Weidman and A. Gordon Jones. Spaces 207, 208, 302 and 303.

General Automatic Scale Company, St. Louis, Mo.—Automatic weight indicator. Represented by Geo. H. Tontrup, W. F. Siegmund, H. C. Schaper, H. L. Price, E. D. Gordon, H. W. Nolker, Nic LeGrande and C. W. Rhodes. Space 204.

General Electric Company, Schenectady, N. Y.—Turbine generator locomotive headlight; automatic arc welding head; complete line enameled resistor units; diagrammatic layout of automatic substitution for signal service. Represented by J. Roberts, H. W. Stewart, C. C. Bailey, H. M. Jacobs, L. W. Shugg, F. P. Jones, C. B. Keyes, C. Derticos, W. M. B. Bradley and G. F. Bunn. Spaces 35, 36 and 37.

General Railway Signal Company, Rochester, N. Y.—Relays; switch circuit controllers; indicating relays; clockwork time contractor. Represented by F. W. Moffett, F. L. Dodgson, L. Thomas, C. M. Deardorff, J. R. Willis, H. W. Lucia, W. H. Workman and J. A. Geneser. Spaces 49 and 50.

Gilbert & Barker Manufacturing Company, Springfield, Mass.—Portable outfalls; first floor outfalls; bench outfalls; first and second floor pumps and tanks. Represented by O. W. Howard and J. E. Ham. Space 70.

Gosso Company, Chicago.—Beds. Represented by A. E. Gosso, L. Jensen, T. B. Harned, Jr., and A. R. Brunker. Space 168½.

Graver Corporation, Chicago.—Water softeners; pressure filters. Represented by W. R. Toppin and J. J. Felsecker. Spaces 96 and 97.

- Gould Storage Battery Company, Chicago.—Storage batteries; generators for locomotive headlights. Represented by G. R. Berger, Mr. Pipkin, R. N. Chamberlain and R. Shead. Spaces 157-157½.
- W. & L. E. Gurley, Troy, N. Y.—Transits; levels; plane table outfits; current meters; water stage registers; leveling rods. Represented by C. H. Smart and C. F. Kingsley. Space 69½.
- Hatfield Rail Joint Manufacturing Company, Macon, Ga.—Rail joints; rail joint fastenings. Represented by Walter T. Johnson and Roswell A. Merritt. Space 166½.
- Hayes Track Appliance Company, Richmond, Ind.—Derails. Represented by R. H. Gausepohl, S. P. Hayes, S. W. Hayes, P. I. Harris, H. H. Jenkins, O. M. Kendall, H. J. Mayer and F. C. Stowell. Spaces 140 and 141.
- Henion & Hubbell, Inc., Chicago.—Pumps and hydraulic machinery. Represented by Henry M. Henion, Frank P. Perkins and Frank S. Salchenberger. Spaces 244-245.
- Hazard Manufacturing Company, Chicago.—Rubber insulated wire; wire rope. Represented by C. P. Brodthun, T. A. Keefe, L. W. Allen, William S. Hart, H. B. Pfisterer and Geo. P. Cady. Spaces 21-22.
- Headley Good Roads Company, Philadelphia, Pa.—Crossings and platform materials. Represented by W. T. Headley, E. J. Hunt, Jas. P. Hennessy and Francis X. Kern. Spaces 315 and 316.
- Howlett Construction Company, Moline, Ill.—Electric automatic hoist for coaling stations. Represented by W. E. Howlett, S. M. Howlett and J. F. Greene. Spaces 284 and 299.
- Hubbard & Co., Pittsburgh, Pa.—Track tools and shovels. Represented by O. W. Youngquist, W. H. Remmel, J. V. Smith, S. F. Remmel and J. S. White. Space 143.
- Hall Switch & Signal Company, Garwood, N. J.—Signal appliances. Represented by W. T. Gillingham, O. S. Field and D. R. Day. Spaces 85-86.
- Imperial Belting Company, Chicago.—Conveyor and elevator belting; transmission belting. Represented by A. G. Pickett, B. C. Hooper, D. L. Jennings, W. D. Otter, E. H. Willard and E. A. Woodworth. Spaces 282 and 297.
- Ingersoll-Rand Company, New York City.—Tie tamping outfits; concrete picks; asphalt cutting tools; rail drills; bonding drills; nut tightening machines; grinders; wood borers; riveting hammers; drills, etc. Represented by W. H. Armstrong, J. N. Thorp, C. W. Melcher and J. P. Gillies. Spaces 206-209.
- Johns-Manville, Inc., New York City.—Asbestos built-up and prepared roofings; asbestos shingles; corrugated asbestos roofing; waterproofing; industrial flooring; pipe coverings; packings; high temperature cements; smoke jacks; steam traps; insulating cements; transit asbestos wood; hair felt; fibre conduit and electrical materials. Represented by J. E. Meek, J. C. Younglove, G. A. Nicol, F. J. Horne, H. Flannagan, R. A. Hamaker, H. L. Leach, C. E. Murphy, H. G. Newman, H. B. Sewell, J. H. Trent and W. J. Stewart. Spaces 174-177.
- O. F. Jordan Company, East Chicago, Ind.—Spreader; bank sloper and ditcher. Represented by A. L. Greenbaum, S. B. Morian, Jos. A. Adley, Ray Cosgrove, Alfred Jones and A. W. Banton. Spaces 56 and 57.
- Kalamazoo Railway Supply Company, Kalamazoo, Mich.—Railway motor car; motor section car; inspection car; four-cylinder railway motor car chassis; power car with trailer; two-cylinder opposed air cooled section motor car; inspection car enclosed; drills; pressed steel wheels. Represented by John McKinnon, Frank E. McAllister, D. A. Stewart, W. N. Sidman, Jos. Brown, John Ross Bates, H. R. Miller, W. E. Winterle and F. L. Mason. Spaces 23, 24, 25, 8 and 8½.
- Paul J. Kalman Company, Inc., Chicago.—Reinforcing steel and concrete accessories. Space 7.
- Kaustine Company, Buffalo, N. Y.—Waterless toilets. Represented by D. A. Evans, Chas. F. Smale, Frank Fridlund, Harry C. Clark and Robert C. Higgins. Space 29.
- Kelly-Derby Company, Inc., Chicago.—Kaustine waterless toilets; pulsometer steam pumps; two, four and six-wheel steel warehouse trucks; waterproofing compound; steam specialties. Represented by Chas. F. Smale, Frank Fridlund, Harry C. Clark and Robert C. Higgins. Space 30.
- Kerite Insulated Wire & Cable Company, Inc., Chicago.—Insulated wire and cable. Represented by Azel Ames, P. W. Miller, J. W. Young, J. A. Renton, B. L. Winchell, Jr., E. L. Adams, C. A. Reeb, W. H. Fenley and J. A. Hamilton. Spaces 68 and 69.
- Kueffel & Esser Company, Chicago.—Drawing instruments; surveying instruments; measuring tapes; slide rules. Represented by E. W. Kraft, J. J. Carlisle and A. Mossner. Space 90.
- Keystone Grinder & Manufacturing Company, Pittsburgh, Pa.—Railroad tool grinders and attachments. Represented by S. S. Newman and L. J. Cooney. Space 193.
- Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio.—Automatic air dump cars. Represented by J. S. Mossgrove and J. N. Markel. Space 45.
- Lackawanna Steel Company, Lackawanna, N. Y.—Deseamed rails; joint plates; angle bars; steel sheet piling. Represented by H. H. Barbour, Wm. Breeden, F. E. Abbott, M. E. Gregg, Jay L. Hench and E. B. Thomas. Spaces 33 and 34.
- Lakewood Engineering Company, Cleveland, Ohio.—Tractor; trailer; clam shell bucket. Represented by O. W. Stiles, M. L. Weiner, C. R. Dodge, J. A. Doran, C. G. Salisbury, A. M. Kirchner and R. M. Jones. Space 14.
- Layne & Bowler Company, Memphis, Tenn.—Turbine pumps; well screen and strainer. Represented by T. R. Smyth. Space 211.
- Lehon Company, Chicago.—Roofing and shingles; waterproof papers; insulating papers. Represented by Tom Lehon, G. C. Estes, H. M. Voss, H. H. Granade, John E. Eipper and Edw. Leonard. Space 91.
- Leich Electric Company, Genoa, Ill.—Rectifiers for trickle charging storage batteries; telephones; spark plugs; telephone ringing converters. Represented by A. J. Kohn and A. C. Reid. Space 266.
- Robert M. Lucas, Chicago.—Flexible corrosion-proof cements. Represented by Edwin Parr, E. M. Stringer and O. Victor McGrew. Space 238.
- Lufkin Rule Company, Saginaw, Mich.—Measuring tapes; wood and steel rules; tools for shop equipment. Represented by Robert M. Benjamin, Lewis Barnard and Theodore P. Young. Space 121.
- Lundie Engineering Corporation, New York City.—Tie plate. Represented by L. B. Armstrong, S. W. Boyce, E. Brandeis, John Lundie and W. Brooke Moore. Space 145.
- M. W. Supply Company, Philadelphia, Pa.—Switch heater; guard rail clamps; tie plate; guard rail fastener; rail bender. Represented by David L. Vaughan. Space 101.
- Macleod Company, Cincinnati, Ohio.—Rivet forges; oil burners and thawing outfits; carbide lights; sand blast equipment. Represented by Walter Macleod, James Shields and Aug. Schmidt. Spaces 207 and 208.
- MacRae's Blue Book Company, Chicago.—MacRae's Blue Book. Represented by Albert MacRae, Thos. H. MacRae, L. R. Rollins, Lloyd Simonson, C. Hill, J. A. Walsh, F. R. Rice and R. S. Jaquith. Space 9½.
- Maintenance Equipment Company, Chicago.—Rail laying machine; switchpoint straightener; derail; tie spacer; derrick truck car; steel fence posts; power puller; air tools; power ballast screen; rail brace. Represented by H. C. Holloway, W. W. Glosser, J. A. Roche and R. V. Dawney. Spaces 194-195.
- Massey Concrete Products Corporation, Chicago.—Signal cellar; bridge warning pole; crossing slabs; railroad culvert pipe; battery boxes; signal foundation; lighting standard; telephone booth. Represented by J. S. Hobson, F. V. Shannon, Chas. Gilman, B. F. Landers, P. Kircher, G. H. Redding, D. B. Hanna, W. L. McDaniel, E. C. Alexander and E. M. Hatheway. Spaces 54 and 55.
- McGraw-Hill Company, Inc., New York City.—Engineering News Record; Electric Railway Journal, etc. Represented by Wm. Buxman, Fred G. Hudson, A. A. E. Tratman, W. W. DeBerard, J. H. Rudd and H. H. French. Space 185½.
- Mercury Manufacturing Company, Chicago.—Electric tractors; freight house trailers; shop trailers. Represented by L. R. Millar, A. D. Shanks, L. F. Meissner Jr., and Wm. I. Lott. Spaces 116 and 117.
- Metal & Thermit Corporation, New York City.—Rail frogs. Represented by H. S. Mann, C. D. Young, T. B. Skelton and W. H. Moore. Spaces 201 and 214.
- Metal Safety Railway Tie Company, Salt Lake City, Utah.—Metal safety tie. Represented by J. E. Langford, Jr., N. P. Hansen and J. B. Finks. Spaces 240 and 241.
- Midvale Steel & Ordnance Company, and Cambria Steel Company, Philadelphia, Pa.—Car forgings; concrete reinforcing bars; drill steels; wire fence; rails; boiler tubes; rail braces, etc. Represented by J. C. C. Holding, R. V. Sage, G. A. Richardson, G. E. Thackray and F. W. Sager. Spaces 71½-72.
- Miller Train Control Corporation, Danville, Ill.—Standard brake valve. Represented by W. B. Murray, Eugene Murray, Earle Murray, P. E. Herren and H. B. Miller. Space 197.
- Monroe Calculating Machine Company, New York City.—Calculating machine. Represented by W. F. Barklage, R. N. Peck, B. W. Burns, W. E. Hill, H. F. Doty, W. G. Ryan and M. F. Lorton. Space 9.
- Mudge & Co., Chicago.—Railway motor cars. Represented by Burton Mudge, Robert D. Sinclair, Karl J. Eklund, Arthur L. Pearson, George W. Bender, Clyde P. Benning, Jean K. Vanatta and John M. Mulholland. Space 127.
- National Boiler Washing Company, Chicago.—Locomotive terminal facilities. Represented by Spencer Otis, Frederick A. Gale, J. S. Maurer, Thos. G. Dalton, C. C. Lance, F. W. Gale and F. S. Wickman. Space 12.
- National Carbon Company, Cleveland, Ohio.—Signal batteries; dry cells; carbon brushes; carbon products. Represented by J. M. Spangler, C. S. Pfisterer, W. R. Pfisterer, A. E. Pratt, W. A. Sisler, D. H. Green and P. G. Pendorf. Spaces 150, 150½ and 151.
- National Highway Crossing Company, Burlington, Iowa.—Steel

highway railroad crossing. Represented by M. A. Woolldridge. Spaces 247-248.

National Lead Company, New York City.—White lead; red lead; babbitt metal; solder. Represented by A. H. Sabin, F. M. Hartley, Jr., L. T. Wilson and Charles Haas. Space 115.

National Lock Washer Company, Newark, N. J.—Nut locks. Represented by F. B. Archibald, A. T. Thompson, R. L. Cairncross, R. B. Cardozo and Howard Horn. Space 192.

The National Malleable Castings Company, Cleveland, Ohio.—Wrecking hook; rail braces; tie plates; bridge washers; spools. Represented by J. A. Slater, J. A. Faltz, T. W. Aishton, R. T. Hatch, C. H. Krakau, Geo. Rasmussen and L. S. Wright. Space 102.

National Surface Company, Chicago.—Cattle guards; rail saws; tie tongs. Represented by C. C. Zimmerman, H. L. Van Auken and C. F. Hately. Space 210.

National Water Main Cleaning Company, New York City.—Cleaning machine. Represented by Burt B. Hodgman. Space 172.

Geo. P. Nichols & Brother, Chicago.—Electric turntable tractor; transfer table. Represented by Geo. P. Nichols, S. F. Nichols and N. Fries. Space 173.

Northwestern Motor Company, Eau Claire, Wis.—Motor cars; engines. Represented by F. W. Anderson. Space 196.

Ogle Construction Company, Chicago.—Balanced bucket coating stations. Represented by R. A. Ogle, C. F. Bledsoe, M. W. Powell and J. G. Forster. Space 31.

Ohio Brass Company, Mansfield, Ohio.—Signal bonds; propulsion bonds; third rail insulators; high tension porcelain insulators; trolley guard; carrying frame. Represented by W. H. Bloss, W. P. Bovard, E. W. Rowland, Frank V. Cook, F. E. Johnson, R. J. Deneen and M. W. Manz. Space 136.

Okonite Company, Passaic, N. J.—Signal wires and cables. Represented by J. D. Underhill and J. W. Hackett. Space 16.

O'Malley-Bear Valve Company, Chicago.—Gate valves. Represented by Edward O'Malley, Thomas O'Malley, J. E. Brown, J. N. Gallagher, J. M. Pigott, W. H. Morris, F. H. Hitesman, W. J. Murphy and G. Bishop. Spaces 114-115.

Otley Paint Manufacturing Company, Chicago.—Paint. Represented by James J. Otley, W. A. Otley, W. H. Kesler and M. G. Lindsay. Space 161½.

Oxwell Railroad Service Company, Chicago.—Equipment for reclaiming track materials and tools. Represented by G. M. Crownover, F. C. Hasse, L. C. Ryan, W. H. Kofmehl, Wm. Leighton, H. W. Schulze, A. N. Lucas, R. Rivett and W. A. Hogan. Spaces 10 and 11.

P. & M. Company, Chicago.—Rail anti-creeper; bond wire protectors. Represented by Fred N. Baylies, S. M. Clancey, John J. Gallagher, D. T. Hallberg, P. H. Hamilton, Geo. E. Johnson, J. E. Mahoney, Philip W. Moore, Geo. E. Olson, Fred A. Poor, Fred A. Preston, W. H. Reaves, J. N. Reisz, John Ritchie and L. S. Walker. Spaces 122-123.

Page Steel and Wire Company, New York City.—Ingot iron welding rods and electrodes; iron bars and welded tubing; fencing. Represented by W. T. Kyle, C. A. McCune, W. H. Bleecker and E. J. Flood. Spaces 81, 82, 83 and 84.

Pittsburgh-Des Moines Steel Company, Chicago.—Represented by Max Whitacre, W. H. Jackson, W. W. Hendrix, M. P. Cogswell, I. A. Bickelhaupt, E. J. Mershon, J. E. O'Leary, H. W. Ford, W. A. DaLee, C. L. Todd, A. C. Pearsall, G. A. Smith, Herbert Miller, O. D. DeHart, Geo. H. Grase, W. R. Workman and S. E. Andrews. Spaces 52½ and 53.

Pocket List of Railroad Officials, New York City.—Pocket List of Railroad Officials. Represented by J. Alexander Brown, Harold A. Brown and Charles L. Dinsmore. Space 26.

Positive Rail Anchor Company, Marion, Ind.—Guard rail plates and braces; rail anchors; tie plates; rail braces. Represented by L. C. Ferguson, E. A. LeBeau and A. H. Told. Spaces 178, 179 and 180.

Protective Signal Manufacturing Company, Denver, Colo.—Space 3.

Pyrene Manufacturing Company, New York City.—Fire extinguishers; fire alarms; chemical engines; fire appliances and safety devices. Represented by G. P. Rogers, J. P. Maloney and J. D. Cole. Space 186.

Q. & C. Company, New York City.—Derails; clamps; snow melters; braces; steps; insulated joints. Represented by R. J. McComb and E. R. Packer. Spaces 119, 120 and 139.

Rail Joint Company, Chicago.—Rail joints. Represented by V. C. Armstrong, J. C. Barr, B. C. Braine, E. A. Condit, Jr., Alex. Chapman, C. A. Disbrow, Milton Markley, J. A. Greer, C. B. Griffin, H. C. Hickey, Charles Jenkinson, G. H. Larson, J. N. Meade, R. W. Payne, J. G. Runyon, Thomas Ryan, R. R. Seward, E. F. Schermerhorn, McLeod Thomson, W. P. Thomson, F. C. Webb, G. T. Willard, Ben. Wolhaupter and D. P. Wolhaupter. Spaces 79-80.

Railroad Herald, Atlanta, Ga.—Railroad Herald. Represented by E. C. Laird. Space 310.

Railroad Supply Company, Chicago.—Tie plates; derailleurs; crossing signals; highway crossing bells; signal accessories. Rep-

resented by E. H. Bell, H. M. Buck, Paul W. Kohnen, A. H. Smith, H. G. Van Nostrand, E. P. Gowing, Geo. W. Nibbe, T. W. Nicholson, M. J. Fox, F. M. Hill, Geo. J. Schmitt, Jr., R. E. Bell, Geo. T. Cook, Geo. M. Kenyon, F. C. Webb and Royal D. Hawley. Spaces 104 and 105.

Railway Review, Chicago.—The Railway Review. Represented by W. M. Camp, Willard A. Smith and A. E. Hooven. Space 44.

Ramapo Iron Works, Hillburn, New York.—Manganese reinforced switch; switch stands; flange frog; guard rail clamps; tie plate clamp; switch riser plates; adjustable rail brace. Represented by Thomas E. Akers, J. Edgar Davidson, R. J. Davidson, Jr., W. C. Kidd, William Wait Snow and James B. Strong. Spaces 277, 278, 279, 292, 293 and 294.

Rawls Machine and Manufacturing Company, Chicago.—Track-mower. Represented by S. E. Rawls, Elwyn B. Orr and Russell King. Space 210.

Reade Manufacturing Company, Jersey City, N. J.—Weed exterminator. Represented by R. H. Bogle, A. W. Barnard and C. H. Reade. Space 156.

Refinite Company, Omaha, Neb.—Soda water tinsley; water softener; pressure filter. Represented by W. W. Fintner, T. G. Windes and P. L. Markel. Space 184.

Richards-Wilcox Manufacturing Company, Aurora, Ill.—Hardware for engine house doors, freight house doors and sliding doors; trolleys; hoists, etc. Represented by A. J. Eggleston, J. H. Wise and T. G. Perry. Spaces 170, 170½ and 171.

Roadmasters' and Maintenance of Way Association, Sterling, Ill.—Literature. Space, ball room balcony.

Roberts and Schaefer Company, Chicago.—Electric coating station hoist; traction hoist; "RandS" gravity sand drying plants; cinder handling plants. Represented by Clyde P. Ross, G. E. Tebbetts, H. S. Shimizu and E. E. Barrett. Space 89.

Geo. J. Roberts Company, Dayton, Ohio.—Water driven engine; water pumps. Represented by John C. Jamieson. Space 160½.

Roos Foundries, Inc., Chicago.—Guard rail clamps; rail bend-ers; engine and car replacers; bumping posts; replacer clamps; portable derail. Represented by R. D. Gallagher. Space 239.

Safe Lock Switch Machine Company, Lexington, Ky.—Switch machine. Represented by J. F. Leonard and C. F. Jones. Space 159.

Sellers Manufacturing Company, Chicago.—Anchor bottoms; wrought iron tie plates. Represented by J. M. Sellers, R. A. Van Houten, G. M. Hogan, R. J. Platt and T. D. Crowley. Space 124.

Signal Accessories Corporation, Utica, N. Y.—Track contractor; switch adjusters; rail braces; signal and dwarf blades; number plates; pipe carrier supports and hook bolts; foundation extensions; bootleg terminals and anchors; screw locks; signal tape; terminals; lightning arresters; lamp blocks; sacolene blade cleaner. Represented by Wm. F. Bossert and A. J. Crowley. Space 118.

Sherwin-Williams Company, Cleveland, Ohio.—Metal protective paints; target and semaphore finishes; mill white. Represented by P. L. Maury, H. E. Billou, W. F. Gallinger and R. V. Goodremont. Space 13.

Simmons-Boardman Publishing Company, Chicago.—Railway publications, Railway Age; Railway Maintenance Engineer; Railway Signal Engineer; Railway Mechanical Engineer; Railway Electrical Engineer; Maintenance of Way Cyclopedias; Boiler Maker; Marine Engineering. Represented by L. B. Sherman, Henry Lee, C. R. Mills, F. H. Thompson, R. H. Smith, F. C. Koch, R. F. Duysters, C. A. Beardsley, R. E. Jarvis, J. M. Rutherford, B. J. Wilson, E. A. Lundy, Samuel O. Dunn, Roy V. Wright, E. T. Howson, W. S. Lacher, K. E. Kellenberger, Milburn Moore, C. B. Peck, Luther M. Sandwick and D. A. Steel. Space 46.

Simonds Manufacturing Company, Chicago.—Metal cutting machine; cold cutoff machine; metal cutting saws; hack saws; files; tool bits. Represented by Geo. R. Bird, R. H. Myers and H. D. Weed. Spaces 200 and 215.

T. W. Snow Construction Company, Chicago.—Water and coal handling devices. Represented by T. W. Snow, Barton S. Snow, O. T. Snow and W. A. Lathrop. Space 50½.

Southern Hardware and Supply Company, St. Louis, Mo.—Car stopper. Represented by W. D. Achuff and Lorraine Boswell. Spaces 161, 162 and 162½.

St. Louis Frog and Switch Company, St. Louis, Mo.—Flange frogs; manganese steel types of construction. Represented by R. E. Einstein and E. C. Argust. Spaces 286 and 301.

Standard Asphalt and Refining Company, Chicago.—Water-proofing; pipe dip; pipe coating; refrigerator car seal; battery seal; roofing asphalt; the dip; tie plate coating; concrete primer; saturated burlap, fabric and felt. Represented by E. W. Krueger, G. A. Thornton, L. E. Mass, O. H. Beyer, G. Houston, A. L. Sterner and W. F. Bliss. Space 185.

Steel Sales Corporation, Chicago.—Steel rods, bars, wire and sheets; copper and brass; monel metal; copperweld copper clad wire. Represented by W. S. Krenz, J. P. Mumford, Walter

Horn, Geo. Sullivan, H. B. Dickinson and Frank Elliott. Space 202.

Stuebing Truck Company, Cincinnati, Ohio.—Lift truck systems; steel bound platforms; dollies for terminals; conveying systems. Represented by A. O. Kraemer. Space 223.

Templeton, Kenly & Co., Ltd., Chicago.—Track and ballast jacks; bridge and car jacks; wrecking jacks. Represented by J. E. Allen, H. B. Burlow, Bob Evans, J. H. Hummel, Arthur C. Lewis, S. A. Nelson, J. J. O'Fallon, A. W. Preikschat, T. L. Simpson, W. B. Templeton and G. W. Whiteside. Space 32.

Toledo Scale Company, Toledo, Ohio.—Automatic scales. Represented by H. O. Hem, C. H. Hoggood and T. M. Bates. Spaces 4, 5 and 6.

Track Specialties Company, Inc., New York City.—Guard rail clamp; guard rail brace; rail joint; derailleurs; rail bender; "U" spike; rail braces and brace plates; anchor plate. Represented by W. B. Lee. Spaces 275-276.

Train Control Appliance Company, El Paso, Texas.—Automatic stop. Represented by M. B. Bulla. Space 164½.

Torchweld Equipment Company, Chicago.—Welding apparatus; cutting apparatus; preheating apparatus; lead burning apparatus; apparatus for signal departments; welding materials. Represented by W. A. Slack, H. R. Fenstermaker and A. F. Dillon. Spaces 149 and 149½.

Truscon Steel Company, Youngstown, Ohio.—Reinforcing steel; steel sash; metal lath; standard steel buildings; highway reinforcing products; pressed steel; inserts. Represented by A. E. Brown, W. E. Lambert, S. C. Stout and G. F. Sparks. Spaces 221 and 222.

Turner, Day & Woolworth Handle Company, Louisville, Ky.—Hickory handles; track jacks, etc. Represented by T. R. Clendinen. Space 237.

Union Switch & Signal Company, Swissvale, Pa.—Relays; switch boxes; rail joint; phase meter. Represented by Messrs. J. S. Hobson, W. W. Talbert, George Marloff, S. E. Gillespie, J. L. Loucks, Roy Clayburn, W. H. Cadwallider and H. R. Sheene. Spaces 66 and 67.

U. S. Wind Engine & Pump Company, Batavia, Ill.—Stand pipes; water station; wood tank; steel substructure; tank fixtures; railroad pump; tank hoops; switch stands; semaphores. Represented by L. E. Wolcott, J. P. Prindle, Clifford E. Ward, Fred Pearson and Theodore Daniels. Spaces 111 and 112.

Verona Tool Works, Chicago.—Track tools; nut locks. Represented by Wm. F. Hart, E. Woodings, John B. Seymour, P. L. Laughlin, F. B. Nimmo and John S. Wincrantz. Spaces 129 and 145.

Volkhardt Company, Stapleton, S. I., New York City.—Water service supplies. Represented by W. Volkhardt. Space 160.

Wailles Dove-Hermiston Corporation, Cleveland, Ohio.—Protective coatings for bridges, tanks, cars, power plants, bunkers, buildings and signal towers. Represented by Irving Noonan, J. A. Graves, L. A. Demnstaedt and John A. Tilden. Spaces 311, 312 and 313.

Waterbury Battery Company, New York City.—Primary batteries. Represented by E. E. Hudson, G. A. Nelson, S. J. Hough and G. S. Gaunt. Space 38.

Wayne Oil Tank & Pump Company, Fort Wayne, Ind.—Oil storage equipment; oil filtration equipment; oil burning equipment. Represented by Fred H. McCulloch, S. D. Rickard and Carver Wood. Space 144.

Werner Machine Company, West Allis, Wis.—Spike shaper for reclaiming bent spikes. Represented by A. M. Fons, A. W. Tabert, J. M. McDermott and J. A. Goetz. Space 260.

West Disinfecting Company, Chicago.—Insector machines and tablets; insecticides; sprays; disinfectants. Represented by H. E. Daniels, W. L. Larry and E. C. Daniels. Space 263.

Western Electric Company, Chicago.—Electrical supplies. Represented by G. H. Porter. Spaces 58 and 59.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.—Portable arc welding equipment; welding samples; electric motors; control equipment; locomotive headlight sets. Represented by G. H. Jaspert. Spaces 249, 250, 251 and 252.

Wm. Wharton Jr. & Co., Inc., Easton, Pa.—Switches and frogs; guard rail clamps; castings. Represented by Geo. R. Lyman, H. F. McDermott, S. G. Llewellyn and Walter Allen. Spaces 289, 290, 291, 304, 305 and 306.

Woods Brothers Construction Company, Lincoln, Neb.—Retards; concrete piles. Represented by C. W. Sturtevant. Space 235.

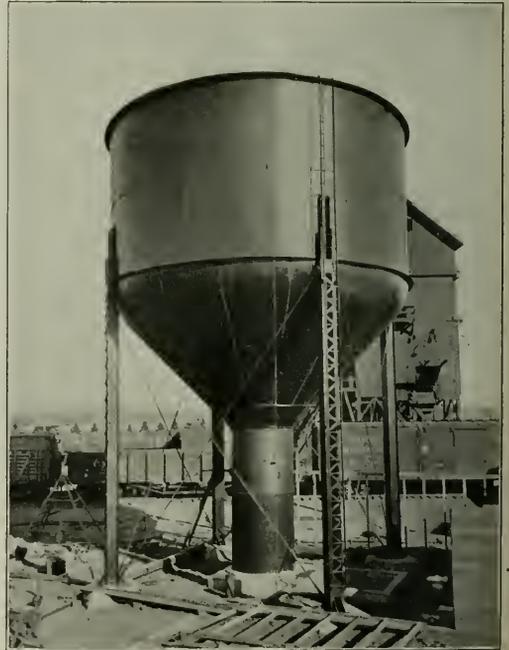

Woolery Machine Company, Minneapolis, Minn.—Railway motor car engines. Represented by H. E. Woolery and D. A. Woolery. Space 226.

Wyoming Shovel Works, Wyoming, Pa.—Shovels and picks. Represented by H. T. Potter, G. E. Geer, Lou Braden, E. L. Ruby and Stanley H. Smith. Space 103.

Yale & Towne Manufacturing Company, Stamford, Conn.—Chain blocks; electric hoists; I-beam trolleys; electric industrial trucks; padlocks; night latches; cabinet locks; door closers. Represented by W. C. Bigelow, H. R. Butler, C. B. Veit, Geo. C. Fishleigh and W. A. Boyce. Spaces 264 and 265.

## A Conical Bottom Water Softener

A WATER SOFTENING PLANT has been completed recently by the Refinite Company, Omaha, Neb., for the Chicago, Milwaukee & St. Paul at Yankton, S. D., which contains a number of interesting features, one of which, the construction of the bottom, is a new departure in water softening design. As will be seen in the illustration, the bottom is similar to that of the conical-spherical water tanks, sloping sharply to the center and terminating in a cylindrical leg of small diameter. The idea in this construction is to facilitate the removal of the precipitates resulting from the softening process. Aside from this feature and that of passing all piping through the body of the tank, the plant conforms to the standard Booth design for railroad service, in

C. M. & St. P. Water Softening Plant, Yankton, S. D.

which the raw water is first discharged over a water wheel located above the tank, after which it passes through a measuring weir into a cylindrical reaction tank, in which the chemical is discharged and the resulting mixture agitated by revolving paddles, emerging from the open bottom as softened water. The water then rises in the settling tank to the storage space in the top of the tank preparatory to passing directly to the locomotives, the precipitates settling out in the bottom, from the leg of which they are removed at will through a sludge valve.

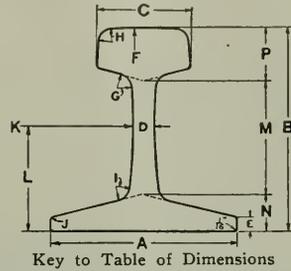

It will be seen that the plant is a combination softener and storage tank, the tank at Yankton being 28 ft. 8 in. in diameter and 41 ft. high, from ground to top, which, at the rated capacity of 10,000 gal. per hour, provides for a total capacity of 100,000 gal. and a storage capacity of 50,000 gal. The system is automatic, all chemicals being prepared in a ground tank of several hours' capacity and being fed automatically into the softener in

proportion to the flow of the raw water. The plant as completed has a housing built around the posts supporting the tank which provides storage space for chemicals, and it is estimated that with the water running about 42 grains hard the plant will remove about 22 tons of scale-forming salts from the water each month.

in the files of that company. These records show that 24 of the sections shown in this chart are what may be termed "live" sections at the present time, i. e., those

### A New Rail Section Chart

THE CHART APPEARING BELOW gives the complete dimensions for 39 rail sections and include the principal steam rail sections that are being rolled for steam railroad use in this country at the present time. This chart was prepared under the direction of C. W. Gennet, Jr., manager of the Rail Inspection department of Robert W. Hunt & Company, Chicago, from records

Table of Rail Section Dimensions

that are being rolled in considerable quantities. These 24 sections are as follows: RE, 130 and 100-lb.; ARA-A, 90 and 100-lb.; ARA-B, 90-lb.; ASCE (all weights); PS, 130-lb.; PS, 85-lb.; LV, 136-lb.; Dudley, 105-lb.; D. L. & W., 105-lb.; C. R. R. of N. J., 135-lb.; C. & N. W., 100 and 90-lb.; G. N., 1920, 90-lb.; A. T. & S. F., 90 and 85-lb.; C. P. R., 85-lb.; D. & R. G., 90-lb., and Harriman.

One section of particular interest at the present time is the RE 130-lb. section, of which 12,000 tons has been ordered by the Baltimore & Ohio, the first road to adopt this section. Another is the PS 130-lb. section of the Pennsylvania System, of which 82,500 tons were laid in 1920, this being 87 per cent of the entire tonnage of new rails laid last year on the lines of that system. Other important sections include the RE 100-lb. used by the Union Pacific, the Dudley 105-lb. rail used on the New York Central Lines and the Lehigh Valley 135-lb. section. The newest rail shown on this chart is the G. N. (Great Northern) 90-lb. section. A study of this chart will impress the reader with the fact that the railroads of this country are still a long way from actual standardization of rail sections.

## A Softening Plant for Small Water Stations

ON MOST RAILROADS there are a number of small water stations where the condition of the water is such as to make its improvement for boiler use highly desirable and in consequence, where railroads, aware of the potential possibilities in softening processes, would likely provide for their establishment if suitable systems could be obtained at a price low enough to warrant the expenditure. In view of this the Graver Com-

Graver Softening Plant for Small Stations

pany, Chicago, has recently developed and standardized in its shop a small softener, which is designed to meet these requirements.

Except for the arrangement of chemical mixing and regulating tanks, which in this case are usually carried on the top of the settling tank, this plant is similar in de-

sign to the manufacturer's type "K" plant, consisting of a sheet steel softener with or without a pressure filter, in which raw water is discharged into the top of a down-take pipe, receives its supply of chemical, proceeds to the bottom of the downtake and thereafter rise in the settling tank and passes to the filter.

Like the large type "K" plant, the softener is equipped with devices for starting and stopping its operation automatically and also regulating the supply of chemicals automatically, and is designed for mixing the chemicals by electric power, although where electricity is not accessible the design can be modified to accommodate a water wheel, as it can also be designed to permit placing the chemical tanks on the ground floor.

The settling tank of the softener is 10 ft. 6 in. in diameter and 38 ft. high, thus permitting all tanks to be shipped in the assembled condition and necessitating only the work of placing the equipment on suitable foundations and of making the pipe and sewer connections preparatory to its operation.

## A New Development in Rail Anchors

TWO DEVICES HAVE BEEN PLACED on the market recently which present a new treatment of the rail creeping problem. They are the "Trak-Ankor" and the Trasco "U" spike, products of the Track Specialties Company, New York City. The first is a narrow

An Installation of "Trak-Ankors"

flat steel bar punched with spike holes, while the second is a  $\frac{3}{8}$ -in. square rod pointed at each end and bent in U shape. Both devices are designed for the same purpose, that of holding together the ties located in the vicinity of the rail joints of the track, the theory being that by so doing rail-creeping and its evils can be prevented at a very low cost.

The theory is based upon the observation that in track not already equipped between joints with anti-creeping devices, the rails are prevented from shifting over the cross ties only at the joints, the slotted spike holes in the rail joints effectively holding the rail to the ties at these points, but only with the result that the joint ties, not sufficiently resistant by themselves, are carried along

with the rail, and in addition, owing to the fact that no two rail-joints of the track come on the same cross-ties, they are subjected to a slewing movement which gives rise to tightening of the gage. This being the case, it is claimed that the creeping can be prevented by dis-

A Trasco "U" Spike

tributing the thrust of the rail at the joints to several ties instead of the two joint ties.

With the "Trak-Ankers" this is accomplished by spiking the plates to the ties as shown in the illustration, a four or six-hole plate being used, depending upon the intensity of the creeping, and the plates being arranged to connect those ties with the joint ties which lie back of the joint. The "U" spikes are arranged according to the same plan but, being long enough only to connect two adjacent ties, are applied in series.

### A Practical Method of Handling Spray Painting Equipment

RAILWAY OFFICERS HAVING CHARGE of work involving the painting of bridges and other structures along the right of way may find a very helpful suggestion for the handling of spray painting equipment in the description of the method employed by the maintenance department of one railroad, the nature of the equipment

Portably Arranged Spray Painting Equipment

used and the method of handling it being evident from the illustration showing a bridge in the process of being repainted. The entire outfit consists simply of a two-man spraying outfit, a gasoline engine air compressing set, and a push car, the air compressor set, in this case, being attached to the car and the paint tank arranged so that it be lifted from it and placed where most convenient for the two painters. In the picture it will be noticed that the paint tank has been placed on the ties near the center of the bridge, permitting a man to work on each side of the bridge. This arrangement of handling painting work adjacent to the track is both one which affords convenience in painting and in meeting calls at different points along the line. Aside from the air compressing set there is plenty of room on the car for a 7 or 13 gal. paint tank,

the hose, and such extra equipment as ladders and safety brackets. The equipment illustrated is made by the DeVilbiss Company, Toledo, Ohio.

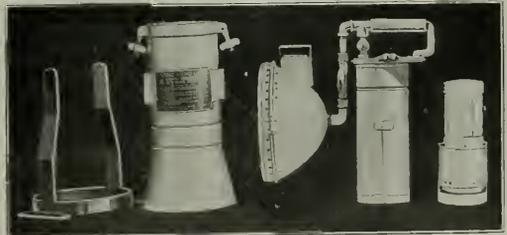

### A New Combination Headlight and Handlight for Motor Cars

KNOWING THAT IT IS FREQUENTLY necessary to operate motor cars at times when an effective and convenient form of lighting is greatly desired from the standpoints of safety and general usefulness, the Carbic Manufacturing Company, Duluth, Minn., has recently developed a lamp under the name of Carbic Model M, which is designed specially for this use. As the name would imply, the lamp is of the acetylene type, the gas in this case being generated within the lamp from calcium carbide prepared in briquet form. As will be seen in the illustration, it consists essentially of a water tank, a gas bell with reflector, and a cake-holding assembly. The process of setting up the lamp consists of inserting one or two Carbic cakes, as the briquets are called, into the cake holder, inserting this assembly, which includes a splash ar-

The Carbic Model M Assembled

rester, into the gas holder, fastening, and thereafter inserting the gas holder into the tank and clamping it, the tank having previously been partly filled with water. When thus set up the lamp is 15 1/4 in. high over all, 6 1/2 in. wide and weighs, empty, 6 1/2 lbs. When charged with 12 Carbic cakes and filled with water it weighs about 12 lb. and has a continuous burning capacity of 8 hr. at a cost of approximately 1 2/3 cents. Clamps on the side of the water tank provide a convenient means of securing the lamp in the stand, the latter being bolted to the car, and a handle which forms a part of the gas holder provides the means of carrying the outfit about as a hand lamp. Located above and attached to the gas holder is also an operating valve for regulating or shutting off the light. The water

Parts of Carbic Model M Lamp

tank of the lamp is made of heavy galvanized metal. The reflector, also of sheet metal, has an aluminum interior of such shape and polish as to project the light, it is said, over a hundred feet ahead and to provide sufficient illumination sidewise to permit a clear observation of a large portion of the right of way. A swing joint placed near the reflector permits its adjustment to any vertical angle. The Carbic cakes for the lamp are furnished in 40 and 75 lb. drums, containing 54 and 110 cakes, respectively,

and the outfit is so designed that the unconsumed portions of a charge need not be discarded, but instead may be used again without wastage.

### A New Inspection Car for Officers

RAILWAY OFFICERS ACCUSTOMED to making extended inspection trips over their lines by motor car realize the importance of reliability in engine performance, high speed consistent with safety, cleanliness and comfort in the accommodations and such shelter as will make the continuation of important trips independent of minor changes in weather. The Kalamazoo Railway Supply Company, Kalamazoo, Mich., has recently developed a car designed to fulfill these requirements. This car provides comfortable seating quarters for 11 men. It is carried on springs, runs equally well in either direction, and is completely enclosed by a steel cab equipped with continuous side steps, three doors on each side, speedometer

Kalamazoo Motor Inspection Car

and electric headlights, markers, interior lights and siren. The upper section of the cab is open on all sides to afford an unobstructed vision in all directions and may be fitted with glass or weather curtains. The engine is a four-cylinder, water-cooled type, equipped with electric starter and is capable of running 40 miles per hour. By reason of the steel underframe of the car, its weight and the long wheel base, it is said that this speed can be maintained safely.

### Culvert Pipe With Reinforced Ends

THE CANTON CULVERT & SILO COMPANY, Canton, Ohio, has recently devised a reinforced end for its "Imperial" riveted corrugated iron culverts, which is said to have greatly increased the serviceability of such pipe in service where the ends are frequently subjected to rough treatment without adding to its cost. A condition of this kind is commonly encountered at the approaches to highway crossings, particularly in the case of the smaller culverts where the fill does not exceed a depth of one or two feet. At such points it is the tendency of drivers of wagons or trucks often to make a short turn in approaching or leaving the grade with the result that some part of the vehicle drops over the edge of the embankment and strikes the culvert, tending to bend it. Obviously the culvert ends can be reinforced to good purpose at such places.

The nature of the Canton reinforcement is shown in the

illustration. It consists simply of bending back the metal of the pipe  $2\frac{1}{2}$ -in. on each end, after which it is rolled back into a  $\frac{3}{4}$ -in. head. Aside from affording great strength to the ends, this type of reinforcement is pleasing in appearance, presents nothing to make handling of the culvert less convenient, and embodies the further advan-

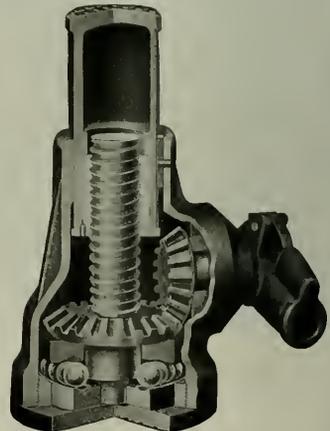

The Imperial Culvert Showing Reinforced End

tage of being made of the same corrosion-resisting material as that in the culvert. This reinforcement, when requested, is placed on all culvert pipe 24 in. in diameter and under.

### An Improved Jack for Bridges

THERE IS NOW ON THE MARKET an improved lifting jack which is designed for use in bridge shimming and similar work. A cross section of this jack is shown in the illustration. As will be seen, the jack is a ball bearing, ratchet jack of the screw-head type. It is built compactly and embodies several new features in con-

Sectional View Duff Jack

struction. Aside from its unusual lifting capacity (35 tons) special features are the small head, positive stop and keyed standard.

The small head facilitates the use of the jack in confined spaces and gives an added insurance that the jack will be placed squarely under the load, thus avoiding the danger present, when, through carelessness, the jack is so placed that the load becomes eccentric. The positive stop, formed by the collar on the nut in the standard

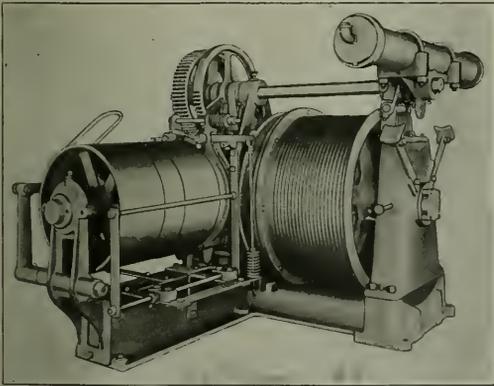

extending beyond the outside of the standard, does away with the danger of raising the jack so far that the standard is pushed out of the base and the load allowed to drop. The key in the standard (in the illustration appearing at the top of the jack on the right hand side between the standard and the base of the jack) prevents any tendency of the jack to twist when heavily loaded.

In this jack the steel screw is of high carbon crucible steel and the nut in which it revolves of hard bronze. It is said that this combination affords, aside from great strength, an unusually low coefficient of friction. The ball bearings used are large diameter alloy steel and they roll in a large diameter race. All gears are of steel with machine-cut teeth case-hardened and heat-treated, and are protected from springing or dislocation by the method of attaching the bonnet and bottom plate.

These jacks are made in two sizes, having heights, when closed, of 9 and 11 in., respectively, raises of  $3\frac{1}{4}$  and  $5\frac{1}{4}$  in., and they weigh 50 and 55 lb. The head and diameter of the base are the same for both jacks, being  $3\frac{3}{8}$  and  $6\frac{1}{4}$  in. The jacks are manufactured by The Duff Manufacturing Company, Pittsburgh, Pa.

### An Automatic Hoist for Coaling Stations Improved

THE ACCOMPANYING ILLUSTRATION shows an automatic hoist manufactured and recently improved by the Howlett Construction Company, Moline, Ill., for use in locomotive coaling stations. This machine is a belt drive type, self contained on the one base, and is designed to execute automatically the hoisting, reversing and lowering movements involved in operating a skip bucket be-

Howlett Automatic Coaling Station Hoist

tween the coal pit below the receiving track of the coaling station and the top of the tower.

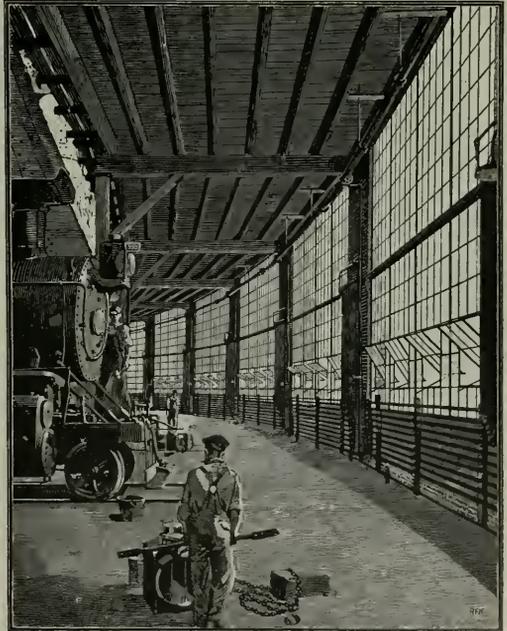

The new features in the hoist as improved are several, chief among which is the combining of the hoist and automatic reversing mechanism in the one machine. The iron cylinder, or barrel, together with the connecting shaft and gears, as shown mounted on the top of the hoist, constitute the major part of this reversing mechanism. In the barrel is a dense liquid and a cast iron ball free to move from one end to the other as the barrel is tilted up or down, this feature of the machine being called into play when the bucket has reached the end of its travel up or down and been halted by an automatic

stop. The stop, aside from shifting the belt to the free pulley and applying the brake to the hoist, raises the end of the barrel then containing the ball, whereupon the ball sinks to the lower end until its added weight becomes sufficient to throw the machine into the reverse gear, the period required for the ball to pass through the liquid allowing time for dumping or loading of the bucket as the case may be, and this time, it is said, being adjustable from 1 to 30 seconds by varying the amount of liquid in the barrels. Another new feature of the machine lies in a safety stop, designed to stop the machine immediately upon the breaking of the belt. The device consists in a ball carried across the back of the pulley and operates in such a case by actuating an emergency brake. The fact that all the gears which carry the load are protected from dust is said to be further improvement of the hoist.

### Fenestra Window Sash

THE DRAWING APPEARING BELOW shows the application of Fenestra window sash, a product of the De-the Howlett Construction Company, Moline, Ill., for round house just completed for the Pere Marquette at Plymouth, Mich. This illustration conveys an idea of what can be accomplished in the way of providing better lighting and ventilation in railway building, such as round houses and shops.

In this particular case each back wall of the house is

An Artist's Conception of the Pere Marquette Round House at Plymouth, Mich.

fitted with windows 15 ft. high and 25 ft. wide, each window comprising 240 panes of 15-in. square wired glass framed in steel and arranged into an upper and lower bay, separated, as shown in the illustration, by a horizontal steel mullion. Ventilation as well as lighting have been

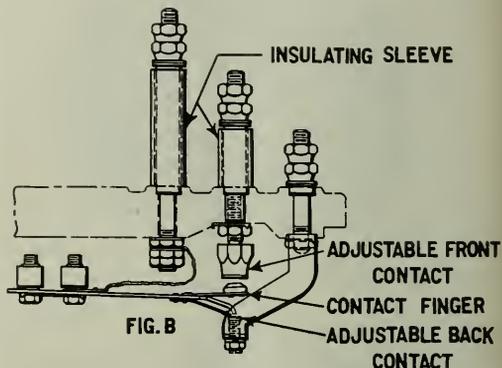

provided in the windows by pivoting four six-pane sections of glass in each lower bay on a horizontal axis. Further lighting and ventilation in the building are provided by monitor windows on each side of a lantern roof extending around the center of the house. These windows are also of Fenestra sash, 6 ft. 6 in. high on the back side of the lantern roof and 8 ft. on the front side, and similarly to the wall windows, occupy almost the entire space between posts.

The predominance of windows over blank walls is obviously a radical departure from the former practice in round house and shop construction. The windows themselves are well reinforced against wind and vibration and, consisting of wired glass in steel sash, are entirely applicable to fireproof construction. The recently constructed New York Central freight house at Weehawken, N. J., the Pennsylvania engine house at Columbus, Ohio, and the Los Angeles and Salt Lake shops at Salt Lake City, Utah, are other buildings thus equipped.

## Two New Railway Signal Relays

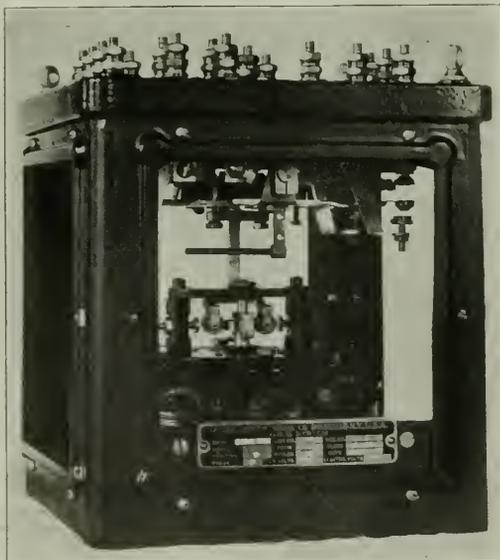

THE GENERAL RAILWAY SIGNAL COMPANY, Rochester, N. Y., has placed on the market two new types of relay, i. e., a universal d. c. relay and a universal a. c. relay. The d. c. relay is so mounted as to be used as a wall or shelf type without change. A spring mount-

The a. c. relay is constructed with all four sides of glass to facilitate inspection. The top is of heavy porcelain, carrying the complete contact equipment and is detachable after disconnecting the lead wires to the stator. The contact movement is operated by contacting rollers instead of links. The rotor and stator are assembled as a unit which may be easily removed. The rotor shaft is

Arrangement of Contact Equipment

mounted vertically on jewel bearings, which construction is claimed to prevent sidewise movement, so that the rotor clearance cannot be changed by adjustment. The rotor chamber is effectively sealed to exclude foreign matter which might obstruct proper movement of the rotor. The relay is furnished as direct-connected or pinion-sector connected; the first is recommended for the average track

The New A. C. Signal Relay

ing can be provided which may be easily attached to reduce the effects of severe vibration when used on elevated structures or trestles. The contact posts are mounted in rows on a porcelain base, step fashion as shown in the illustration, each row being higher than the one in front of it, thus allowing all terminals to be readily accessible. Insulating sleeves around the higher posts prevent the shorting of circuits attached to adjacent posts when nuts are dropped accidentally between them. The principal parts of the relay are the same for all classes, both neutral and polar.

The New D. C. Signal Relay

circuits and the pinion-sector type for long track circuits having unfavorable ballast conditions.

Lightning protection is considered in the construction of the relay, as all metal parts except those carrying cur-

rent are grounded to the relay frame on which is provided a terminal post to be connected to the ground. Two eye bolts are located at diagonally opposite corners of the top; to which a strap may be attached, providing a convenient handle for carrying the relay.

By employing the proper winding the relay may be used for line or track circuits; the relay may be furnished so as to be adapted for either single rail or double rail track circuits by changing connections between five-track phase terminal posts. The two-position relay may be converted into a three-position relay by merely adding counterweights and readjusting the contacts.

### A Recent Development in Oil Engine Design

ONE OF THE VERY PROMINENT features of railroad operation in recent years—quite as prominent, in fact, as the transition from the small steam boiler to the gasoline engine as a pumping unit—is the trend toward the substitution of kerosene (and in some cases the heavier oils) for gasoline as a fuel for the internal combustion engines employed for power purposes by the roads. This transition, necessitating, of course, the remodeling of old engines or their replacement by types better adapted for the heavier fuels, has naturally brought about many changes in machinery and methods, and has led the roads to give close attention to the new developments along these lines calculated to secure greater economy in the use of fuel or to improve conditions generally.

One development which has recently occurred and which is of interest in this respect is the change which the Chicago Pneumatic Tool Company, New York, has made in the design of its Giant Semi-Diesel fuel oil engine. This engine, as the name implies, is a type in which ignition of the explosive mixture is effected by the natural

consists of restricting the combustion to the cylinder head instead of permitting it to occur in the cylinder proper, as was done heretofore. This change is said to be an improvement over the former design in that it reduces the deposition of carbon on the cylinder walls and insures more perfect combustion.

### A Five-Gallon Fire Extinguisher

IT IS RECOGNIZED BY FIRE PREVENTION authorities that one of the most effective features of any fire extinguisher is an ability to direct a stream of water or other extinguishing material on the origin of the fire, and that with a minimum of delay. To this end a portable pump tank has been devised which depends for its effectiveness on the force of an accurately applied stream of water rather than on the use of chemicals. This device consists of a five-gallon cylindrical tank equipped with a double action force pump and a hose, and is designed for use either in unheated buildings or around outside property.

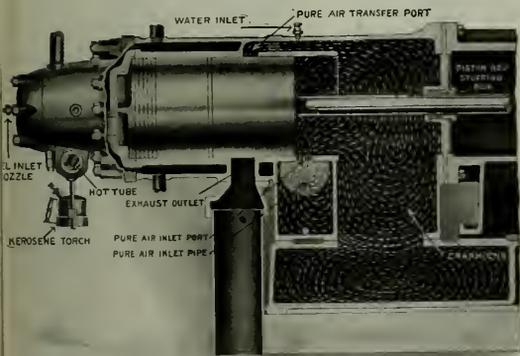

The Accurate Five-Gallon Pump Tank

The outfit uses plain water unless the likelihood of freezing exists, the water in such cases being mixed with a quantity of Accurate Freeze Proof; a proper proportion of this material, it is said, will protect water from freezing at temperatures as low as 40 deg. below zero. The tank is easy to carry, simple to operate, and is capable of discharging a steady stream a distance of 40 ft., the force of such a stream usually being sufficient to beat back the flames and permit the soaking of the burning material. When empty the tank can be refilled from a well or faucet the same as an ordinary pail.

On railroads this outfit is particularly adapted for use in freight rooms, warehouses, cabooses, around docks, etc., in such service affording an obvious advantage over water pails in its greater capacity and in that it permits a more effective use of the water. The tank, having a closed top, also prevents the accumulation of dirt and reduces the evaporation of the contents.

These outfits carry the label of the Underwriters' Laboratories and are recognized by the fire insurance rating bureaus throughout the country. They are products of the Pyrene Manufacturing Company, Chicago.

Giant Oil Engine With Improved Head

heat in the cylinder resulting from the high degree to which the mixture is compressed by the piston; the operation of the engine prior to the ignition consisting of compressing air in the cylinder head, and just at the instant of complete compression, of injecting fuel oil into the cylinder head by an atomizer and converting it into vapor by discharging it against a hot plate, this plate prior to the starting of the engine being heated by torch, after which the heat is maintained by the successive combustions in the cylinder. The change made in this design

### Recent Test of Minwax Waterproofing

ENGINEERS COGNIZANT OF THE importance of elasticity and imperviousness in waterproofing coatings used in connection with bridge decks and subways, the construction of foundation walls, depressed pits, tunnels, and similar work where water under pressure is commonly encountered and contraction and expansion in the masonry as well as the liability of cracking by settlement must be considered, will be interested in the results of a recent test of Minwax waterproofing made by the engineer of tests of the Pittsburgh Testing Laboratory.

The specimens for the test were obtained from a waterproofing blanket consisting of two piles of Minwax saturated cotton fabric and three swabbings of Minwax waterproofing asphalt, the blanket weighing 1,495 lb. per sq. ft. The tabular results of the tensile strength and elasticity tests are as follows, the specimens for the test being 1 in.

wide, the distance between the jaws of the machine, 1 in., and all tensile strength valves being measured at failure.

Specimen Number	Thickness in Inches	Tensile Strength in Pounds per Inch Wide	Strength (Elasticity) in Inches per Inch Wide
Series H, Average of 5 tests.....	0.275	102.4	0.24
Series B, Average of 5 tests.....	0.284	90.4	0.30

In the above test, the specimens of Series A were cut with the fibers parallel to one edge of the blanket and those of Series B perpendicular to the same edge, thus providing a means of determining the difference between the strength of specimens stressed along the woof and those stressed along the warp. The report states that no difference was distinguishable.

Tests to determine the resistance of the blanket to hydrostatic pressure were made on a hydraulic gage testing machine having an area of opening of 1.25 sq. in. No rubber diaphragm was used, as the material remained proof against water up to the bursting pressure, the average value of this bursting pressures of five specimens being 374 lb. per sq. in. with two of the specimens failing at the edge and the others through the center.

### Built Up Sections for Block Paved Crossings

THE HISTORY OF PAVING, like a great many other industrial operations, has been one of constant effort, as manifested in changes in product or method, to improve the service or to enlarge the field of use. One of the recent developments of particular interest to railroads is that which has occurred in the paving of railroad crossings. The conditions encountered in many cases have invited much improvement, particularly where crossings are carried only on ballast, the paving problems at such points frequently combining both those of maintaining pavement, which is subject to the impact and vibration set up by passing trains and street traffic, and of re-

Paving a Railroad Crossing With Kreolite Crossings

moving and replacing the paving frequently to repair the track or tamp the roadbed.

To meet this problem the Jennison-Wright Company, Toledo, Ohio, is offering a form of construction for paving at crossings which employs a built-up section called the Kreolite Crossing. This crossing consists of a solid panel of wood block built according to dimensions or

while in place to fit the spaces between the intersecting tracks and permit of its being removed and replaced bodily. The process of construction consists in building a timber box in each diamond or square of the crossing, the box consisting of plank resting on the ties, ballast, and the bases of the rails, and of timber sides. This box is then paved with wood blocks, each block being nailed to the floor. All the timber as well as the blocks are creosoted and a wing is belted to the floor at the center to provide the means of removing the section. The accompanying illustration of a Michigan Central crossing at Dorr street, Toledo, shows the nature and method of the construction. Such crossings have been in service over a year and are said to have given very commendable service, providing both a crossing capable of withstanding severe wear and affording ready access to the track and roadbed.

### A Power Ballast Screen

THE MAINTENANCE EQUIPMENT Co. of Chicago has recently added to its railroad supplies a power screen adapted to the screening of ballast. This machine is an interesting development in railroad appliances for the reason that it presents the possibility of supplanting the cumbersome and expensive method of screening ballast by forking and, correspondingly, of performing more readily the extensive ballasting operations of this kind which many of the roads endeavor to carry on. The machine consists essentially of a cylindrical revolv-

Power Ballast Screen in Operation

ing screen, feed trough, dirt conveyor and engine all compactly arranged on a structural steel frame mounted on wheels for traveling on a railroad track. In operation, the machine is moved ahead of the ballasting, the ballast to be cleaned meanwhile being thrown into the feed trough, wherein a conveying belt carries it up the incline and discharges it into the upper end of the revolving screen, the coarse material, which remains in the screen, thence falling naturally to the lower end and discharging directly in the center of the track, while the dirt, which passes through the screen, drops upon the wide canvas belt conveyor, on which it is carried and discharged to the side of the track, where it is available for bank widening or it can be hauled away.

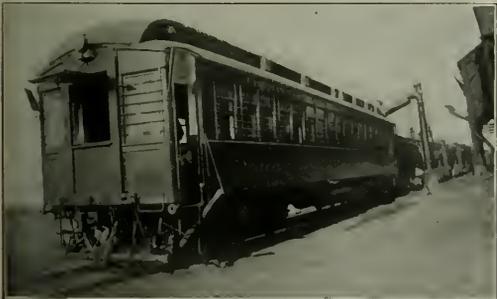

The power is furnished by a 15 h.p., 4-cylinder water-cooled gasoline engine, this engine being adapted to run-

ning at various speeds and arranged not only to furnish the power necessary to accomplish the screening process, but also that for propelling the machine backward or forward along the track. It accommodates an operator's platform on one side and embodies the novel feature of carrying a set of cross wheels by means of which the machine can be lifted off its track wheels and wheeled to the side of the track, the operation requiring about a minute. With respect to the performance of this equipment, it is said that the machine will handle any quality of ballast, has easily screened average material for a depth of 10 in. at the rate of 60 running feet of track per hour, and is capable of accomplishing such work at one-third the cost of hand processes.

## Recent Development in the Killing of Weeds With Chemicals

COINCIDENT WITH THE INCREASED use of chemicals by the railroads for weed killing purposes and the quite general adoption by them of the practice of contracting for the equipment and supervision maintained by the manufacturers of the chemicals as against that of using equipment of their own, the Chipman Chemical Engineering Company, New York, has brought out an interesting development in weed-killing equipment by introducing a Pullman car type of sprinkling unit as a substitute for the original flat car arrangement. The selection of this arrangement along with a few changes made in the sprinkling apparatus were induced by efforts directed by the company to improve its service generally, and particularly with respect to operating speed, total daily performance and comfort for the operating crew. As shown in the illustration, an old Pullman car has simply been remodeled to accommodate the sprinkling system, to provide living quarters for the operating crew, the car when in use being attached to the head of the train of tank cars which carry the supply of chemicals.

It is said that with this equipment the weed killer can be applied effectively while the train is traveling at speeds

Sprinkling Unit for Weed Killing Purposes

as high as 20 to 30 miles per hour, and that, owing to the smooth riding of the coach, as compared to the flat car, and the comfortable living quarters provided the operating crew, the means is afforded of covering a mileage limited only by the speed of the train, traffic conditions, and the requirements of the 16 hour law. With the design of the sprinkling head enabling the operator to distribute the chemical over the width and length of the track according to the need for it, and with the presence in the car of mechanical devices permitting accurate

determinations to be made of the consumption of chemical over each mile, provision is supplied for the economical as well as the effective use of the chemical, supervision being furnished when desired. The design of the equipment is also said to be of value in affording the

Interior View of Car Showing Operating End

means of practically eliminating trouble in sections visited by stock, the system enabling the operator to avoid spraying cattle passes or unfenced portions of track, or of applying a stock repellent in addition to the weed killer. The cost of weed killing by the use of this equipment is said to range from \$50 to \$75 at present prices.

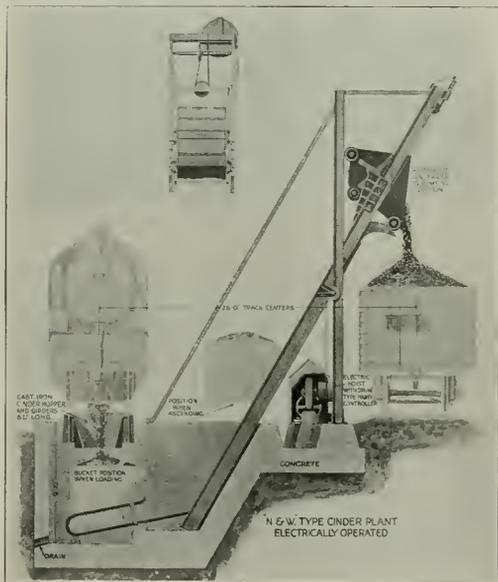

## "RandS" Coaling Station and Cinder Plant

THE ROBERTS & SCHAEFER COMPANY, Chicago, is now introducing two new appliances in coal handling equipment in the railway field. One of these is a portable combination locomotive coaling and cinder loading plant, which is designed also to accommodate a program of ground coal storage. The plant, as the illustration shows, consists essentially of an elevated coal pocket surmounted by an electric trolley hoist system and supported over a standard gage track on a track of its own. The latter track is 21 ft. between rails and can be extended to any length desired. No coal hopper is provided below the coal receiving track. Instead, the coal is lifted directly out of cars by a clam shell bucket, hoisted, and then dumped into the coal pocket or carried beyond it and deposited alongside on the ground, from which it can be readily be picked up and dumped into the coal pocket or reloaded into cars for shipment to other points. By a like process and with the same equipment, cinders which have been dumped into depressed pits along the coaling track can be elevated, transferred by trolley to a point above the coal receiving track, and there deposited in the emptied coal cars or into cars spotted specially for their removal.

It is evident that under suitable conditions this system will permit the operations of coaling, handling cinders, locomotives, and even the handling of a storage project for several points to be carried on by the same equipment. Furthermore, the facility with which coal can be handled from the ground may also be utilized to advantage in avoiding the expense of large coal pockets. In this plant the coal pocket has a capacity of 50 tons, a capacity which in some places would make unnecessary the operation of the machinery during the night. It is equipped on one side with the standard coaling gate and

chute and is said to provide for the coaling of locomotives in as short a period as 45 seconds.

The entire plant is of structural steel, is electrically operated and propelled from a weather-proof cab by one man, and is large enough to provide for an engine consumption of 250 to 300 tons per 10 hours. With respect to the ground storage it is estimated that 1,100 tons of coal may be stored in each 10 ft. interval of the plants travel. The machinery comprises the Shepard electric double drum hoist and the double line Blaw-Knox "Speedster" or the Lakewood one cu. yd. bucket, which

New Type RandS Cinder Plant

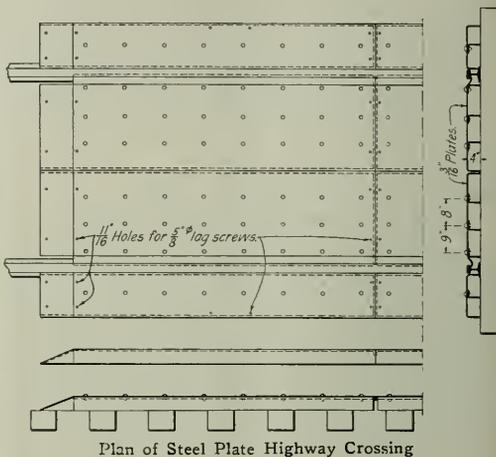

permits the hoisting of approximately 30 tons per hour. Although it is intended that the machinery should be operated by power obtained from electric transmission lines, the plant is so designed that a gas engine generator set can be installed below the coal pocket. Aside from features already brought out in connection with this plant, the plant requires but one receiving and one coaling track, and it can be moved at will to a different location to accommodate a change in terminal arrangements.

### A Steel Plate Highway Crossing

**B**ECAUSE OF THE UNUSUAL ACTIVITY in the development of crossings constructed of other materials than planks, considerable interest is attached to the use of a crossing made of structural steel, of which two are now in use, one on the Chicago & North Western at Milwaukee avenue and Union street, Chicago, and the other at a crossing of the Chicago, Burlington & Quincy in the city of Burlington, Iowa. This is shown in the photograph, where it is seen that the steel construction forms one-half of the street crossing, the other half being of concrete.

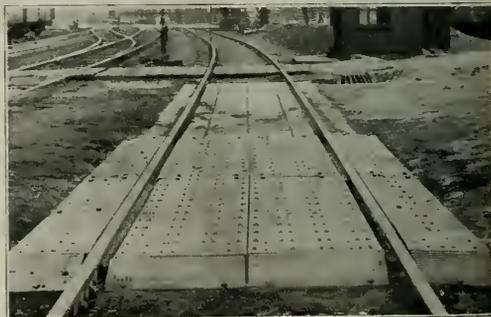

The construction of this crossing, which is being manufactured by the National Highway Crossing Company of Burlington, Iowa, is readily understood from the drawing. The roadway surface is formed by a deck plate of

3/16 in. material, with a diamond pattern non-slip upper face. The plate is supported at the level of the top of rail by steel ribs placed parallel to the rails and resting on the ties or on shims placed on the ties. These are spaced eight inches center to center and are formed of 3/16-in. bent steel plates riveted to the deck plate except at the center line of the tracks, where the deck is divided

into halves. Here the edges of the deck plate for the two halves are turned down to form flanges and a strip of fiber insulation placed between them.

Adjacent to the rails the deck plates are bent down to form flangeways and thus secure an anchorage under the ball of the rail. Further anchorage is provided by lag screws driven into the ties through holes near each end of the deck plates. These deck plates are built in units 7 ft. 11 in. long with ramps at the outer ends to deflect dragging parts of rolling stock. The crossing units out-

Steel Plate Crossing on C. B. & Q. Ry.

side of the rail are made 13 1/2 in. wide of similar construction.

The advantages claimed for this type of construction by the manufacturers are as follows: Low maintenance because of resistance to wearing; neat construction with a well-formed flangeway adjacent to the rail; better protection for the ties which are covered against accumulations of mud, gravel, snow and sleet, yet afforded thorough ventilation and freedom from any influence from freezing and thawing.
