Willard, Daniel, 16, 427, 854  
Winburn, F. E., 703  
Wollner, William S., 1218
- Young, Hugh E., 1169

## GENERAL INDEX

[Illustrated articles are indicated thus\*; Editorials thus†; Letters to Editor thus‡.]

## A

- Abandoned Lines During 1920, 151\*  
 Abernule Collision, 1427†, 1450  
 Accidents (See also Safety First):  
 Abermule, Wales, Collision, 1427†, 1450  
 Baltimore & Ohio at Glenwood, 832  
 Chicago, Milwaukee & St. Paul at Piedmont, 726  
 Collision Problem and Automatic Train Control, 969†, 977  
 Columbus & Greenville near Columbus, 1131  
 Detroit United Railway near Ann Arbor, 1465  
 Explosions, 416\*, 847\*, 919†, 1367  
 Explosives, Report on, 1174  
 Grade Crossing, 1253†  
 I. C. C. Bulletin No. 76, 253; No. 77, 946  
 I. C. C. Investigation Reports, 505  
 New York Central-Michigan Central Collision at Porter, Ind., 495\*, 539†, 568, 775†, 808\*, 823†, 8765  
 Norfolk & Western near Welch, 1418  
 Pennsylvania at Edinburg, Ind., 1289  
 Perth Amboy, N. J., Crossing, 1465  
 Prevention Campaign: C. G. W., 302, 1418  
 Pullman Car Fire: D. & R. G., 812  
 Signal Lights, 1380  
 St. Paul Railway Cars, Safety in, 781\*  
 Acid Tank Cars, 70-Ton, 203\*, 400†  
 Accounting (See also Railway Accounting Officers' Association):  
 A. R. E., A. Definitions, 765  
 Dictating Machines: N. Y. C., 775†, 797\*  
 Disbursement, 1354, 1405  
 Earnings of Individual Trains, 965†, 981\*  
 Equalization Accounts, Rules Governing, 1438  
 Fuel, 1276  
 Maintenance Expenditures, 583, 1403  
 Material, 1357  
 Mechanical Devices in Offices, 775†, 797\*, 965†, 981\*, 1198†, 1215\*  
 Monthly Track Material Report, 766  
 Short Lines' Methods, 1214  
 Shortcomings, 1346  
 Treated Ties, 1303†  
 Additions and Betterments:  
 Needs, 39\*, 703†  
 Programs for 1921, 29\*  
 Adequacy of Roadway Maintenance, What Determines, 471  
 Advertising, Community, 1171  
 Agreement (See also Railroad Labor Board; also National; also Employee)  
 Agreements, English Railway, 1189  
 Agriculture (See American Railway Development Association)  
 Air Brake:  
 Tests with Automatic Straight; N. & W., 907  
 Tests with Westinghouse; Virginian, 1199†, 1206\*, 1407\*  
 Westinghouse Brakes in France, 571  
 Air Brake Association: Executive Committee Meeting, 1082  
 Air Consumption of Double-Capacity Brake; Virginian, 1407\*  
 Air Drill, Little Giant, 696\*  
 Aishon, R. H., President A. R. A., 58\*  
 Alabama & Vicksburg: Cross Tie, 45 Years from, 590  
 Alabama, Tennessee & Northern: Passenger Fares Reduced, 909\*  
 All-Steel (See Car, Freight)  
 Alternating Current Power for Traction, 1427†, 1441\*  
 Almaguam Tribunal, English, 1199†, 1209  
 Amendment of Valuation Act Proposed, 282, 1418  
 American Association of Engineers:  
 Meeting in Chicago, 591  
 Officers Elected, 1183  
 Salaries of Highway Engineers, 266†  
 American Association of Traffic Officers: Officers Elected, 1243  
 American Brake Shoe & Foundry Company: Annual Report, 863  
 American Car & Foundry Company: General Chemical Tank Car, 203\*, 400†  
 American Committee on Land Transportation: International Equipment Association Proposed, 1458  
 American Electric Railway Association: Heavy Electric Traction Program, 386  
 American Engineering Council:  
 Committee on Elimination of Waste, 436, 1367, 1380†  
 Hoover, Herbert, Resigns, 1045  
 American Institute of Banking: Sisson, F. H., on Reducing Rates, 1464  
 American Iron & Steel Institute: Rail Production in 1920, 997  
 American Locomotive Company:  
 Annual Report, 573  
 Mountain Type: C. R. I. & P., 447\*  
 American Locomotive in Belgium, 442†, 462  
 American Newspaper Publishers' Association: F. H. Sisson on Reducing Rates, 1086  
 American Railway Association (See also Car Service Division)  
 Automatic Train Control Committee's Work, 590, 1330, 1467  
 Automatic Train Control Inspectors, 1045  
 Automatic Train Stop Committee's Report, 497  
 Committee on Relations of Railway Operation to Legislation, 859  
 Executive Committee, 386  
 Freight Claim Division Convention, 1198†, 1231  
 Freight Claim Division's Figures, 824†, 833  
 Freight Station Section, 859  
 Fuel Conservation Committee, 194  
 Mechanical Division:  
 Car Betterments in Interchange, 1102†  
 Convention—Abandoned, 535†, 567, 859, 873†  
 Meeting in Chicago Postponed, 859, 1362  
 Officers Elected, 207, 386  
 Medical and Surgical Section:  
 Annual Meeting, 1341  
 Establishment of, 480  
 Purchases and Stores Section:  
 Meeting, Business, 1304†, 1355, 1397  
 Report on Buildings and Structures, 1397  
 Scrap Classification, 1398  
 Signal Section:  
 Meeting, Annual, 1303†, 1329  
 Meetings, March, Cancelled, 577†  
 Traffic Division, 436  
 American Railway Development Association:  
 Annual Meeting, 1129, 1151†, 1171  
 American Railway Engineering Association:  
 Address of President Safford, 609†, 613\*, 826†  
 Committee Chairmen, New, 609†  
 Committee Personnel, Problem of, 609†, 614  
 Convention in Chicago, 265†, 303, 441† (See also proceedings under this head)  
 "Corresponding Members" of Committees, 667  
 Dinner, Annual, 688\*  
 Discussion of Reports, 743†  
 Maintenance Settlement During Federal Control, Formula for Arriving at, 471  
 Membership, Increase in, 610†, 614  
 Officers Nominated, 208  
 Officers, New, 693\*  
 Officers' Views on Railroad Problems, 581\*  
 Proceedings, 609†, 610†, 613\*, 653\*, 743†, 746\*  
 Purdue Alumni Luncheon, 695\*  
 Registration, 610†, 640, 694, 772  
 Reminiscences of J. E. Wallace, 691  
 Report on Ballast, 617\*  
 Report on Buildings, 750\*  
 Report on Conservation of Natural Resources, 767\*  
 Report on Economics of Railway Labor, 650†, 675\*  
 Report on Economics of Railway Location, 680\*  
 Report on Economics of Railway Operation, 649†, 679  
 Report on Electricity, 623\*  
 Report on Iron and Steel Structures, 650†, 653\*  
 Report on Masonry, 743†, 744†, 746\*  
 Report on Rail, 629\*  
 Report on Records and Accounts, 765\*  
 Report on Roadway, 752\*  
 Report on Rules and Organization, 763\*  
 Report on Shops and Locomotive Terminals, 684\*  
 Report on Signals and Interlocking, 627\*  
 Report on Signs, Fences and Crossings, 662\*  
 Report on Standardization, 686\*  
 Report on Stresses in Track, 639\*  
 Report on Ties, 650†, 658\*  
 Report on Track, 633\*  
 Report on Uniform General Contract Forms, 662\*  
 Report on Water Service, 670\*  
 Report on Wood Preservation, 744†, 759\*  
 Report on Wooden Bridges and Trestles, 744†, 756\*  
 Report on Yards and Terminals, 769\*  
 University and the Association, 651†, 688\*  
 Water Asphits, 1101†  
 American Railway Express Company:  
 Service Improved, 1292  
 Wage Reduction Asked For, 1437  
 American Short Line Railroad Association:  
 Activities Increased, 125  
 Annual Meeting, 1164, 1213  
 Court to Determine Status, 1213  
 Organization, 126  
 Purchasing Agency, Consolidated, 1213, 1401  
 Wage Dispute, 846, 903, 1116  
 American Society of Civil Engineers:  
 Annual Meeting, 299  
 New York Section, Officers of, 1243  
 Vertical Lift Bridge, 1391\*  
 American Society of Mechanical Engineers:  
 Advantages of Large Locomotives, 1161  
 Forest Products Section, 302  
 Locomotive Boiler Code, 947  
 Locomotive Design, 1023, 1073, 1153†  
 Terminal Problem, 1169  
 American Society of Safety Engineers: Electrical Hazards and Their Safeguards, 1289  
 American Society of Testing Materials: Annual Meeting, 1439  
 American Steel Foundries:  
 Annual Report, 738  
 Lamont Truck, 401\*, 729\*  
 American Wood Preservers' Association:  
 Annual Convention, 321  
 Marine Borers Invade Piling in San Francisco Bay, 399†, 420\*  
 Anchors (See Rail)  
 Ann Arbor, Mich., Collision, 1465  
 Annual Report (See names of companies; also Bureau)  
 Anti-Friction Bearings on Swedish Rys., 971†  
 Apprentice Training: A. T. & S. Fe., 699†, 714  
 Appropriation:  
 Interstate Commerce Commission, 386  
 Post Office, 274, 387  
 Valuation—Steel Industry Bill, 480  
 Argentina:  
 British Railways in, 396†, 407\*, 465\*, 507\*  
 Freight Rates in, 1197†, 1245  
 Locomotives, Standard Mikado, 722\*  
 Arkansas, Assesses for Highway Construction, 1420, 1428†, 1468  
 Arkansas River—Colorado Floods, 1341\*, 1399\*

 Automatic Control of Locomotive Cut-Off—Tests on C. C. & St. L., 1451\*  
 Automatic-Electric System in New York-New Jersey Port Development, 266†, 269\*, 474  
 Automatic Signal (See Signaling)  
 Automatic Signal & Sign Company: Crossing Sign: C. M. & St. P., 1168\*  
 Automatic Stop (See Automatic Train Control)  
 Automatic Straight Air Brake Tests; N. & W., 907  
 Automatic Train Control:  
 A. R. A., Joint Committee's Activities, 590, 1330, 1467  
 Inspectors to Report on, 1045  
 Latimer, J. D., on, 967†, 977\*  
 New York Commission on, 497, 715

## GENERAL INDEX—Continued

[Illustrated articles are indicated thus\*; Editorials thus†; Letters to Editor thus‡.]

## Automatic Train Control (Continued):

- Railway Business Association on, 851
- Regan System Exhibited in France, 565\*
- Automatic Train Stop Committee's Report, 497
- Automobile:
  - Crossing Accidents, 1253†
  - Crossing Signs, 478\*, 1168\*
  - Drivers, Careful; B. & O., 1183
  - Traffic, 533†
- Average Revenue. (See Revenues and Expenses)
- Aerial Mail Service, 480

## B

- Bad Order Car (See Car Service)
- Baker Truck with Duplex Suspension, 850\*
- Baldwin Locomotive Works:
  - Annual Report, 438
  - Consolidations; Western Maryland, 1117†
  - Havana, Three Types for, 897\*
  - Mikados for Argentine State Rys., 722\*
  - Pacific Type; Reid Newfoundland, 994\*
  - Railroad from Baltic to Black Sea, 304
- Ballast, A. R. E. A. Report on, 617\*
- Ballast Screen, Power, 606\*
- Ballist, H. S.: Electrical Hazards and Their Safeguards, 1289
- Baltimore & Ohio:
  - Accident at Glenwood, W. Va., 832
  - Annual Report, 224†\*
  - Automobile Drivers, Careful, 1183
  - Grade at Lawrenceburg, Ind., 509\*
  - Busess-Getting, 94†
  - Coupler, Fretell Automatic, 516\*
  - Mechanical Trimmers for Handling Coal at Curtis Bay Pier, 1433\*
  - Piece Work Pay, Abolition of, 297
  - Safety Rallies, 253
  - Willard, Daniel, Before Senate Committee, 1175, 1197†
- Bangkok: Book: Freight Must Be Prepaid, 1465
- Baptism of Courage Wanted, 704†
- Barge Flooding, Texaco, Asphalt Mastic for; Pennsylvania, 1181

## On "Buying Now" and "Shipping Now"

LARGE PARTS OF THE CONTENTS of this issue of the *Railway Age* will run counter to the views and inclinations of many of those for whose reading they are especially intended. The parts referred to are those containing articles designed to present the reasons why shippers who can do so should "ship now," and railways that can do so should "buy now." Many shippers believe that they should at present ship no more freight than they have to, and many railways believe that they should not at present buy any more equipment and materials than they have to.

It is always easier to go with the tide than against it. It is always easier to win the approval of people by telling them what they already believe than by telling them what they don't believe. It is always easier to influence people to do what they are already inclined to do than to influence them to do what they are inclined not to do. Of no class of affairs are the foregoing statements more true than of economic and business affairs. "Mob psychology" plays a very large part in such affairs, and when the tide has set in the general direction of shipping or not shipping, of buying or not buying, most people not only go with the tide, but are inclined to suspect the sincerity or intelligence of those who advise going against the tide. And yet this "mob psychology" which prompts most people to do what it is the general tendency to do is one of the principal causes of the violent changes that occur and the heavy losses that are incurred in industry and business.

The longer rises and falls which occur in general business activity are due to economic laws the operation of which no legislation, no public sentiment and no action by private combinations or persons can prevent. But even the effects produced by the operation of laws of nature can be aggravated or mitigated by human action. No human action can prevent the weather from getting hot in summer or cold in winter, but human beings can protect themselves from sun stroke in hot weather and can wear clothing and provide heating systems for their homes that will keep them from freezing in winter. Similarly, human action can prevent the operation of economic laws from causing a large part of the harm that they now do cause.

### 1. Fatalism Regarding Business Affairs

In ancient times men were very fatalistic in their attitude toward economic, as well as toward natural, laws. They considered it inevitable that there should be bountiful crops in some parts of the world and millions starving in other parts of the world. They could conceive of no means by

which food could be transported in sufficient quantities from places where it was abundant to the places where there was famine. A Chinaman even at present considers it as inevitable that many persons should starve annually in his country as that there should be seasonable changes of temperature.

Nobody in the United States believes that numerous people must starve in this country every year, but there are still many who are so fatalistic in their views of economics and business as to believe that violent fluctuations, resulting in periods of great prosperity, followed by periods of profound depression and great loss and suffering, are inevitable; and that to attempt to arrest a general tendency in either direction is as futile as was the attempt of Mrs. Partington to sweep back the sea with her broom.

The *Railway Age* is publishing this "Buy Now—Ship Now" number partly because it does not accept this economic philosophy, and partly because it believes that there exist at present certain special business and transportation conditions which make it peculiarly urgent that the policies of "Buying Now" and "Shipping Now" should be adopted.

Since the economic activities of the United States are the activities of human beings working together in an organized society, we believe it is possible for these human beings to be so informed and influenced that large numbers of them will do things which will tend to shorten industrial depressions and make them less disastrous. The principal reason why the country has periods of such feverish and unhealthy business activity and inflation, followed by periods of great depression, unemployment, loss and suffering is, that it has times when most people go forward with production and buying on the largest possible scale almost regardless of how high production costs and prices mount, and other times when production and buying occur on only a very small scale regardless of how low costs of production and prices descend. It would promote the welfare of all classes if business activity could be restrained in periods of the former kind, and stimulated in periods of the latter kind.

### 2. Prices Increasing—Everybody Buys; Prices Declining—Nobody Buys

We have just passed through a period of the former kind. It has been superseded, with unexpected suddenness and violence, by a period of the latter kind. Almost everybody contributed to the excesses of the former period, and now almost everybody is contributing to the excesses of the latter. Almost everybody bought madly while prices were going up.

In consequence, acute shortages of materials, of labor and of transportation developed. Now, when prices are going down, almost everybody is refusing to buy or ship anything that he does not need to buy or ship at once, and, in consequence, there are great surpluses of productive and transportation capacity, and of labor.

It is axiomatic that action and reaction follow each other, and that the violence of each is in proportion to the violence of the other. Of nothing is this more true than of business activity and prices. The longer production is curtailed, prices decline and a surplus of transportation capacity exists, the more certain it will become that when business activity does revive the demands for products and for transportation will be unprecedented and that prices will advance again. The present business situation is largely due to a "buyers' strike" of unprecedented extent and violence. Because prices, after having gone so high, have declined so much in many lines in such a short time, many persons seem to believe that they will continue to descend without a pause until they reach their pre-war level. Not only is any such continuous fall of prices entirely improbable, but if it should occur it would be ruinous to every class of the people of the United States. It would be impossible to readjust costs of production fast enough to cope with such a decline of prices. Most industrial and commercial concerns would be bankrupted and most of their employees would be thrown out of work. What is needed is a reduction of prices by stages, each stage of the decline being followed by a period during which they are temporarily stabilized.

The time must come, if the country is ever to cease to fluctuate between periods of feverish and unhealthy prosperity and periods of even more unhealthy depression, when leaders in public affairs and in business will resist the tendency to an excessive expansion of industry and overtrading when that tendency prevails, and toward excessive reductions of production and under-trading when that tendency prevails. There never was or will be a better time to begin offering resistance to excessive reductions of production and buying than the present.

### 3. Bearing of Transportation Situation Conditions

The existing transportation situation greatly emphasizes the need for such resistance being made. Five years of costly experience have demonstrated that the railways, with their existing facilities, cannot transport all the commodities that the country can produce unless they are given opportunity to transport them in more uniform volume than in former years. A severe and protracted decline of the amount of freight shipped now would inevitably result in seasonal traffic being offered to the railroads all at one time which would be followed by acute traffic congestions and car shortages, and great delays in the handling of a large part of the freight. These things would restrict production after it began to revive and thereby tend to hold up or increase prices and the cost of living, whereas it is desirable that for some years the general tendency of prices and the cost of living should be steadily, but not violently, downward.

The same general effects that will be produced by the

failure of shippers to ship now all the freight that they can ship will be produced by failure of the railways to buy now all the equipment and supplies that they are reasonably able to buy. The railways themselves, as purchasers of equipment and supplies, are among the largest shippers in the country. Therefore, every unnecessary delay by them in buying will tend to reduce the amount of freight that can be shipped now and to increase the amount of it that must be shipped later. A point of even greater importance is that every unnecessary delay of the railways in buying will restrict the amount they increase their capacity and thereby reduce their ability to handle freight later on. When the next period of heavy traffic comes the railways will be in a very precarious position if they cannot show the public that they have done all they can to prepare for it.

It need hardly be said that the determination of whether those who have freight to ship can and will ship it now, and of whether the railways can and will buy now, is not entirely in the hands of those who have things to ship and of the railways that need to buy. No shipper can ship a thing unless somebody is willing to accept and pay for it, and he must be convinced that the price he can get is reasonable under all the conditions before he will ship it. Likewise, no railway management can be justified in making purchases unless those who have equipment and supplies to sell are willing to sell them at prices which, under all the conditions, the management of the railway is convinced are fairly reasonable. There are great opportunities under present conditions for differences of opinion between buyers and sellers as to whether the prices the former are able to take, and the latter are able to pay, are reasonable; and when these differences of opinion cannot be composed no shipping or buying will be done. But when differences of opinion regarding reasonable prices are very great there is a strong chance that both parties are unreasonable, and that the prices which under the conditions can and ought to be offered and accepted lie between the two extremes.

### 4. Not Urging What Is Impossible

In agitating the subjects of "Buying Now" and "Shipping Now" the *Railway Age* is not engaged in a quixotic effort to get people to do what it is impossible for them to do. A manufacturer who cannot get merchants to buy his goods cannot ship them. A railway which is trembling on the brink of bankruptcy, or whose ability to buy has been restricted or destroyed because the government is withholding from it money which it would require in order to purchase equipment and supplies in normal amounts, cannot be expected to buy in normal amounts. The slogans of "Ship Now" and "Buy Now" are addressed only to those who really can ship now or buy now, and whose failure to do what they can do now will sooner or later make conditions for everybody concerned worse than they otherwise would be.

There are many business interests that can ship now, and many railways that can buy now; and they should consider very carefully whether, by following a policy of delaying shipping and delaying buying, they will not in the long run lose more than they will gain.

## 1920 and 1921

THE YEAR 1920 was in many respects the most extraordinary in the history of the railroads of the United States. The total traffic handled, the total earnings made, the operating expenses incurred and the taxes paid were the largest ever known. The total net operating income earned was the smallest ever recorded since records for all the railways were kept. In 1888, the first year for which we have statistics of the Interstate Commerce Commission, the total net operating income was reported as \$316,000,000. In 1920 it was only about \$150,000,000.

The year in which such an astounding record of earnings and expenses was made could hardly have failed to be remarkable in other respects, and it was. It witnessed the largest single advance in wages ever given to railway employees or to any class of workmen in the history of the world. It witnessed the largest advances in freight and passenger rates ever made. It saw railway construction decline to 314 miles and the amount of railroad abandoned increase to 713 miles. This was the fifth consecutive year in which the investigations of the *Railway Age* have shown more mileage abandoned than built. Railway affairs have reached such a pass that we now make compilations to find, not how much the mileage has increased, but how much it has diminished. The diminution in 1920 was the greatest that ever occurred.

When conditions get so bad that they can hardly get any worse, hope, "springing eternal in the human breast," leads us to anticipate that they will soon begin to get better. The statistics published elsewhere in this issue indicate that conditions in the railroad industry really have begun to improve. The number of locomotives built for domestic service in 1920 was smaller than in 1919, but the number ordered was nine times larger. The number of freight cars built was not as large as in 1919, but the number ordered was three and one-half times larger. The number of passenger train cars built was almost twice as large as in 1919, and the number ordered four times as large.

There was a marked increase in efficiency of operation, to which was due the fact that a record-breaking traffic was handled. As small as the net operating income was, Dr. Parmelee, Director of the Bureau of Railway Economics, estimates in an article published elsewhere, that if throughout the year 1920 the same wages and rates had been in effect as are now a net operating income of \$990,000,000 would have been earned. This would not have been six per cent upon the valuation fixed by the Interstate Commerce Commission, but it would have been five and one-half per cent. Having reached the bottom of the hill the railways before the year closed began to climb upward.

The railways fought and won in 1920 the hardest and most important battle of their lives. They succeeded in getting themselves returned to private operation under unprecedentedly favorable legislation. They secured almost all the advances in rates for which they asked. They began breaking all records for volume of business moved just when

their critics commenced to proclaim they were "breaking down."

Hard as was the battle they had to fight and win in 1920, it seems not improbable they will have to fight an even harder one in 1921. They must earn more net operating income under the new rates than they have been earning and they may have to do so in spite of a reduced business for some months. Apparently there is only one way for them adequately to increase net operating income and that is substantially to reduce operating expenses.

It is not difficult temporarily to reduce expenses by slashing right and left regardless of later consequences. But the railways are confronting the probability that within a few months they will have to handle a larger business than ever. If they recklessly reduce expenditures of all kinds now they will later be criticised upon the ground that by doing so they failed to fulfill their obligation to do their best to prepare for handling the country's commerce. On the other hand, if they do not reduce operating expenses as much as is practicable they will not earn sufficient net income to enable them to raise new capital, and if they cannot raise new capital they cannot adequately increase their facilities.

The Greeks talked about people having to avoid Scylla and Charybdis in order to make a successful voyage. A more modern phrase refers to people who are in the predicament of being "between the devil and the deep sea." A still more modern and perhaps more expressive term describes people as being "between hell and high water." Either of these phrases might be aptly used to describe the situation in which the railways find themselves.

The way out seems clear enough, but to follow it will be by no means easy. The railways should effect every economy that is consistent with proceeding as rapidly and as energetically as practicable to putting and keeping their organizations and property in condition to handle a large business. They will be criticised by those who like to criticise them no matter what they do. They always have been, which is a pretty good reason for believing they always will be. For this reason, the railways should use every means available for presenting to regulating bodies, business men and the public the facts regarding what they are doing, how they are doing it, and why they are doing it. Regulating bodies, business men and most of the public wish success for the efforts being made to show that the railways can be operated more economically and can give more and better service under private than government operation, and they will all help if the railways will show they are doing their best. But their help will be needed and they must be "shown."

As 1920 was in many respects the darkest year in railroad history so it is not difficult to conceive that 1921 may be made the most glorious. The railways achieved a great thing when in spite of all difficulties they in 1920 surpassed all previous records in handling freight. The problem of reducing operating expenses needs the same intelligent, concerted, strenuous treatment in 1921 that was given the problem of

breaking the congestion and eliminating the car shortage in 1920. If as much progress is made in reducing expenses, rehabilitating the properties and increasing their capacity

in 1921 as was made in other respects in 1920 the fears which still so widely prevail regarding the future of the railways will soon be dispelled.

## The Railways and Labor in 1921

FOR THE GOOD OF BOTH the railways and the employees the thing most needed in the railroad field is an increase in the economy and efficiency of operation. The thing most needed to bring this about is an increase in the efficiency of labor. Probably nothing will contribute so much toward increasing the efficiency of labor as a better understanding by the managements and the men of one another's problems and points of view. The best way to bring about a better understanding will be for the officers and representatives of the employees of the various individual railways to get together and frankly talk over their mutual problems. Whether or not national agreements or national boards of adjustment exist under private operation, the efficiency and loyalty of the employees of the individual lines will depend largely upon the fairness and frankness with which the managements deal with them, and frequent conferences between the officers and representatives of the men can hardly fail to beget fairness and frankness on both sides.

"Get together" programs of various kinds are being adopted on different railways, and they seem to promise more satisfactory and beneficent relations in 1921 than have prevailed for some years. The officers and employees of the Missouri, Kansas & Texas recently held their first "staff meeting" under private operation at Dallas, Texas. The meeting was attended by the principal operating officers and officers in some other departments, and by the general chairmen of the committees of the principal labor organizations. Committees composed of both officers and representatives of the employees have been organized to study important problems such as "Shop Efficiency and Welfare Work," "Station Efficiency and Welfare Work," "Roadway Department Efficiency and Welfare Work," etc. The representatives of the employees have expressed their gratification at being invited to attend these meetings and serve on the efficiency committees, and it is believed that the results of the conferences and the work of the committees will be highly beneficial.

In New England the Boston & Maine and its employees have adopted a somewhat similar policy. Officers of the railroad and representatives of the men have been holding meetings, the fundamental purpose of which has been, (a) to discuss grievances not disposed of through conferences between local officers and local committees; and (b) to inform one another of developments arising on either side of mutual interest, and to discuss general questions of operation and policy. By arranging a system of schedules which required that the local officers and representatives of the local organizations should meet regularly, at which all of the matters in dispute would be heard and decision rendered within a specified time, practically all disputes of consequence were soon settled, and the general officers of the railroad and the representatives of the labor organizations were left almost free to discuss general questions of operation and policy.

The men have been encouraged to speak frankly on all matters of interest to them, and the officers have shown no

hesitation in expressing their points of view, and out of it all is gradually developing a better understanding of the difficulties encountered by both the management and the men. The men have been fully informed as to the financial condition of the road, and especially of the causes for the present unsatisfactory situation of the New England railroads generally. Both the management and the men recognize the fact that they cannot introduce a millennium in their relations, but they also believe that each side has been and will be benefited by frank conferences, and the results thus far gained support this view.

On the last day of the old year the management of the Pennsylvania Railroad System issued a statement that it had just concluded with the representatives of its engine and train service employees, "a mutual agreement regarding the settlement of future labor differences, which, if lived up to in spirit by both sides, should, in the belief of the management, eliminate any question of strikes on this railroad so far as train operation is concerned." The arrangement is the outcome of a series of meetings. There has been established the "Joint Reviewing Committee of the Pennsylvania Railroad System" for the settlement of all controversial questions affecting the train and engine service men. The committee will be composed on behalf of the management of two representatives of each of the four regions of the system, and on behalf of the employees of the general chairmen of the men in engine and train service. The votes of the representatives of the employees on the committee will be of the same power as those of the officers, and a two-thirds vote will be necessary to decide any question presented. On all matters except individual discipline cases the full committee will vote. The Pennsylvania system, for operating purposes, is divided into four regions. When a discipline case comes before the joint reviewing committee the representatives of the management and of the employees in the region in which the case arises will not sit as members of the committee, but will act as counsel in the presentation of their respective claims, while the remaining members of the committee will hear the case and determine the issue. The work of the joint reviewing committee will be supplemented by monthly conferences between superintendents of the various divisions and representatives of the men, and between the general superintendents of the grand divisions and representatives of the men.

These are but a few examples which might be cited of policies which are being initiated on the railroads for bringing about better understandings and settling controversies while they are in their incipency and before they reach the stage where they might cause serious trouble. Undoubtedly the year 1921 will see increasing efforts made by the managements and employees of the various railways to come to a better understanding, and more harmonious and efficient working relations established. Nothing could be done which would tend more strongly in the long run to pro . . . the

real interests of both; and the public should regard developments of this kind with great interest and satisfaction because, in the long run, the public will be the chief bene-

ficiary of all policies which tend to make interruptions of transportation less likely, and to promote increases in the efficiency of operation.

## The Government Should Pay the Railways

ONE OF THE MAIN REASONS why many railways are not buying the normal amounts of equipment and materials is that the United States government is withholding from them money that they need. Congress did not intend that this should be done, with the resultant injury it causes to business of all kinds.

Congress is in session and can very quickly, by a simple piece of legislation, remedy the situation. Congress ought to do so.

Congress provided, in the Esch-Cummins Act, for loans up to \$300,000,000 to be made to the railways on the certification of the Interstate Commerce Commission. The plain purpose was to help the railways get through the period of transition immediately following their return to private operation. The commission acted promptly and in good faith to give effect to the intent of Congress, but the bureaucrats in the United States Treasury Department put so many obstacles in the way that the railways have not succeeded yet in getting all the loans Congress provided for.

To further help the railways get through the period of transition following their return to private operation, Congress provided for the guarantee of their net return from March 1 to September 1. Congress knew a deficit was bound to be incurred. Expenses and taxes were exceeding total earnings when the railways were returned. A large advance in wages was impending. The very fact that Congress guaranteed the net returns of the railways for six months is conclusive evidence that it expected a deficit to be incurred until the Interstate Commerce Commission should grant

advances in rates to fulfill the provisions of the act.

Congress provided that payments to the railways on account of the guarantees should be made on the certification of the Interstate Commerce Commission. On September 1 about \$400,000,000 of the amount guaranteed remained unpaid. The commission and the railways assumed that this could and would be paid in installments as the guarantees had been previously, but the Treasury Department has held it up on the ground that after September 1 no further installments could lawfully be paid except in complete settlement of claims.

The withholding from the railways of more than \$400,000,000 due them has left many of them almost without immediate available financial resources. It is disabling them from going ahead with purchases and improvement and maintenance work that are much needed. It is defeating the plain intent of Congress that the railways should be provided with means of getting through the transition period in a way that would help them and the business of the country. Developments within recent months have made it more necessary than it appeared it would be when the Esch-Cummins Act was passed for the railways to make purchases that would serve as a stabilizing and supporting influence to general business. The withholding of the funds due them is crippling them and helping to slow down business of all kinds when it needs to be stimulated.

Congress can and should speedily pass legislation which will cause the railways promptly to be paid the money which is due them and which they greatly need.

## Constructive Work by the Interstate Commerce Commission

ONE OF THE MOST significant and outstanding features of the railway history of 1920 is the constructive work done by the Interstate Commerce Commission. The federal regulatory laws preceding the Transportation Act gave the Commission large powers but did not give it corresponding responsibility for the results of their exercise. The Transportation Act not only gives the Commission greatly increased powers but also new responsibilities. The Commission in 1920 exercised its powers and assumed its responsibilities in a way that deserves high praise and promises well for the future federal regulation of railways.

The Transportation Act gives the Commission new authority for the regulation of operation in times of emergency. A real emergency was created by the conditions resulting from the switchmen's strikes. The Commission, if it had been anxious to do so, could have issued orders regarding the distribution of cars and locomotives and the operation of terminals which would have made it practically the manager of the railroads. It very wisely refrained from doing

so and practically told the chief executives of the railroads that it was their job, not that of the Commission, to manage the roads, and that while so far as was necessary it would help them by the exercise of its authority, it would not assume, unless forced to, the responsibility for actually operating the roads. The result was that the Commission issued such orders as were necessary to help the managements, but left to them both the opportunity and duty of actually conducting operation and the outcome fully vindicated the intelligence and self-restraint that it showed.

The Commission might have timidly refused to grant advances in rates anywhere near as large as those that the railways asked for. If it had done this many railway companies speedily would have been bankrupted, private operation would have failed and the Commission would have been mainly to blame. It might, on the other hand, have boldly granted all the advances in rates for which the railways asked. If it had done that the railways would have been able from the start to earn the full return of six per cent

and the Commission might and probably would have been criticised for being too generous with them. The advances in rates actually granted apparently in the long run will be sufficient to enable the railways to earn a return of six per cent and afford a powerful incentive to efficiency and economy, since it has become plain that only under the most efficient and economical operation possible can the required return be earned. It has saved itself from any just criticism for being too generous. It has given the railway managements an incentive to the utmost efforts to operate efficiently, and it is reasonable to assume that if it finds that the rates granted by it are either too low or too high to yield the specified return of six per cent it will in due time adopt corrective measures.

While the committee of state commissioners delegated to sit with the Interstate Commerce Commission in the rate case recommended that the same advances in state rates should be granted as in interstate rates this has not been done in many states. The state commissions are supposed to have great political power. The Interstate Commerce Commission might have timidly refused to exercise the authority granted in the Transportation Act to cause the state rates to be advanced. On the contrary it has courageously rendered

decisions which if they are upheld by the courts will force the states to put their rates on the same general basis as the interstate rates.

One of the things most needed to enable private operation to succeed has been closer co-operation between the railways and the shippers. One of the principal reasons why there has not been enough of such co-operation in the past has been that the railways often tried to make important changes in rates, in the privileges granted to shippers, and in service without adequate previous conference with them. The commission repeatedly and in numerous ways has used its great influence to get the railways and shippers to confer and agree about important matters instead of carrying them before it for highly controversial hearings.

The commission has acted in accordance with the spirit of the Transportation Act. The public and Congress having made plain that they prefer private ownership and operation and want them given reasonable opportunity to succeed, the commission has been contributing all it can toward their success. Having in the Transportation Act been given its first opportunity to be really helpful and constructive the commission has been doing all it could to be helpful and constructive.

THOMAS DE WITT CUYLER  
Chairman of the Association of Railway Executives

Fluctuations in Freight by Months

## Why Buyers and Producers Should “Ship Now”

Both General and Special Conditions Indicate a Volume of Business which Must Be Given to the Railways in Uniform Amounts to Prevent Serious Trouble

FROM A PURELY transportation standpoint there are several important reasons why it behooves the shippers of the United States who can do so to “ship now.” The word “shippers” is used here to designate those who, whether the originators or receivers of freight, can determine whether it will be shipped now or later.

The railways at the present time have surplus transportation capacity. The net surplus of freight cars on the date of the last report, December 15, was 101,472. The actual surplus capacity which the railways had was larger than this figure indicates.

It is practically certain, however, that this surplus capacity will not exist long. It was created by two things, first, an increase in the efficiency of operation, and secondly, a decrease in the amount of traffic offered. It seems certain not to last long because it seems certain that within a few months there will be a large increase in the traffic offered, and that, meantime, the railways will not be

able substantially to increase their maximum capacity.

The reasons why it appears certain that within a few months the railways will again have all, and more than all, the traffic they can handle are partly reasons of a general character and partly reasons due to unusual special conditions now existing.

There are certain general causes which always have operated in the past, are operating at present, and will continue to operate in future, constantly to increase freight business. These causes are the normal growth of the country's population, and the normal increase of its production and consumption per capita. Study of the history of the freight traffic of American railways shows that even the most violent panics and the severest industrial depressions result in only very brief and comparatively small

declines in the amount of freight offered for movement. The accompanying chart, entitled “Revenue Ton Miles in Billions,” shows the fluctuations of traffic from 1901 to 1920.

**A**LL SHIPPERS who can do so should “Ship Now!” The railways will probably have to handle at least 550,000,000 tons of bituminous coal in 1921.

The total available appropriations for highway construction amount to \$1,394,000,000, vastly exceeding all past records.

The amounts of grain still on the farms surpass anything ever known before.

An abnormal amount of lumber is already cut and ready for shipment.

From 1901 to 1907 the traffic handled increased every year. In fact, the increase was continuous from 1894 to 1907. The latter was a "peak" year, and there was a decline in 1908 following the panic of 1907. It is significant, however, that the amount of freight handled in 1908 was larger than in any previous year except 1907. Freight business then began to grow again, and 1910 was another "peak" year. There was a decline in 1911, but the business handled in that year was greater than in any previous year except 1910, and in 1912 it was larger than in 1910. The year 1913 was another "peak" year, but in spite of the depression in 1914 and 1915 in each of these years the freight traffic was greater than in any previous year except 1913.

In 1916, 1917 and 1918 there were further great increases of freight. The slump in 1919 made the total freight handled in that year less than in either 1918 or 1917, but even in 1919 it was greater than in 1916, which, in net earnings, was the banner year of railroad history. In 1920 traffic again exceeded that of any previous year. There was a slump late in 1920, but in spite of it the railways almost down to the end of the year handled more freight than in the same weeks of any previous year.

The indications are that the traffic in the early part of 1921 will be lighter than it was in the early part of 1920, but the almost unbroken experience of the last 30 years indicates that the total amount of freight offered to the railways during the entire year will be greater than in any previous year, with the possible exception of 1920.

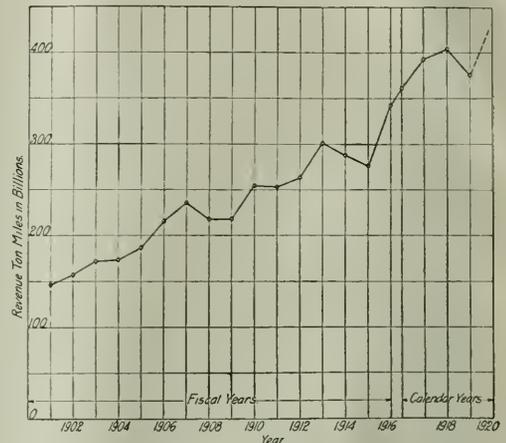

It would be a safe prediction that this would be the case even though there was nothing to base the prediction on except past experience, but there exist at the present time several special conditions which seem to foreshadow a large freight business.

The sharp decline in general business activity in the latter part of 1920 was largely responsible for the decline in railroad traffic. The general decline in business activity, in turn, was largely due to a "buyers' strike," which was as sudden in its coming as it was violent in its effects. The suddenness with which it came and the extent of its effects are indicated by replies received in response to a questionnaire sent out by The Blackman Company, an advertising agency of New York. This questionnaire was addressed to trade and technical papers devoted to 36 different lines of industrial and mercantile business, including most of the important lines of business in the country. The replies to it showed that there had been a diminution of buying in 30 out of the 36 lines of business surveyed. In 22 of these 30 lines of business the reduction in buying had come suddenly. In some businesses it came several months ago, but in a large majority it began within the last six months, and in most of them in September or later. In none of the industries surveyed in which there had been a reduction of buying had the reduction been less than 10 per cent, in most of them it had been over 50 per cent, and in many of them it had exceeded 75 per cent.

So sudden and drastic a reduction of buying in so many lines of business could hardly fail to be followed in a short time by an increase of buying, and, as a matter of fact, in a large part of all the lines of business surveyed the reductions

of prices which had been made had begun to secure responses in increased buying. It seems entirely reasonable to assume that increased purchases in almost all lines of business will be a feature of the spring months of 1921.

Other special conditions of great importance are that there is an abnormal amount of grain upon the farms, that the coal supplies on hand at present are certainly no more than normal, that there is in prospect an unprecedented activity in highway construction, that there is an unusual amount of lumber piled up at the mills ready for shipment, and that there is need for general construction activities to provide buildings for business purposes and homes for people to live in. The country's grain, coal, coke and building materials (including lumber, sand, stone, cement, brick, etc.) normally furnish the railways with over 60 per cent of their total ton-

Annual Fluctuations and Growth of Freight Traffic

nage. It is easy, therefore, to see how a heavy movement of these commodities, which it seems reasonable to expect, will contribute toward making the total traffic large.

Assuming that the railways within the year 1921 will be offered a larger traffic to handle than ever before, except possibly in 1920, what are the prospects that they will be able to handle it? The railways were returned to private operation on March 1, 1920, but what interstate rates they were going to be allowed to charge was not settled until five months later. It was not possible during this time for the companies to make any substantial increase in their facilities. When the earnings produced by the new rates began to be ascertained they were disappointing. There had been increases in operating expenses which had not been contemplated, and many states had failed to make advances in state rates proportionate to those made by the Interstate Commerce Commission in interstate rates. Furthermore, about the end of October there began a decline in traffic and earnings which alarmed railway officials. Besides, the government owed the railways several hundred million dollars and the inability of the companies to get this money reduced their ability to carry on the rehabilitation and expansion of their properties.

Consequently, the railways entered the year 1921 with

practically no more facilities than they had at the beginning of 1920. They have increased their capacity by more efficient operation, and there is no doubt that the amount of traffic that they can handle in any given week or month is larger than it was before. But the experience of the last five years, when the capacity of the railways has been almost constantly unequal to the demands, has shown that if they are to handle in an entire year as large an amount of business as they did in 1920, or even in 1918, the business must be given to them in more uniform amounts from week to week, and month to month, than it was before the war.

The fluctuations in the amount of traffic handled by the railways in different parts of the same year have been much less recently in years when they have handled a large traffic than they have been in years when they have handled a comparatively small traffic. In the year 1915, when the total traffic handled was small, the freight handled in October was 35 per cent greater than in March. Again, in 1919, when the total freight handled was the smallest in any year of the last four, the freight handled in October was 38 per cent greater than in March. These differences represent very wide fluctuations. In 1916, 1917, 1918 and 1920 the railways handled almost every ton of freight they could. In

1916, however, the amount of freight handled in October was only 15 per cent greater than in March, in 1917 only 22 per cent greater, in 1918 only 16½ per cent greater, and in 1920 only 12 per cent greater. The reason why the railways were able to handle, and did handle, so much more business in these years than in 1915 and 1919 was not that they were able to, and did, handle much more in the "peak" months, but that they handled more in the months preceding and following the peaks.

The lesson taught by these facts should not be lost. Experience has indicated that with their existing facilities the railways can move a little more than 1,000,000 carloads of freight a week, or approximately 43,000,000,000 tons one mile a month, and that when they have done this they have about reached the limit. Therefore, if concerns engaged in industry and commerce want them to move in 1921 a traffic as great as that they moved in 1920, or even in 1918, commercial and industrial concerns must endeavor to give the traffic to them in approximately uniform amounts from week to week and month to month. If large amounts of traffic which might be moved in the early part of the year are held back and then thrown upon the railways in unprecedented volume, the railways will simply be unable to handle a large part of it for months afterward.

### Prospective Coal Traffic in 1921

THE RAILWAYS during 1920 transported the largest amount of bituminous coal ever handled by them in any calendar year except in 1918. The statistics of the United States Geological Survey regarding the amount of bituminous coal produced and transported up to December 18 of each of the last four years are as follows:

1917.....	536,288,000 tons	1919.....	441,592,000 tons
1918.....	566,349,000 tons	1920.....	537,555,000 tons

In view of the fact that the amount of coal produced and transported in 1920 was so large, and in view of the further fact that in the latter part of the year there was a decline in general business activity and the weather was mild, the question naturally arises as to how large the railways can reasonably expect the coal traffic in 1921 to be. The correct answer to this question depends, first, upon the supplies of coal now on hand, and, secondly, upon the probable consumption of coal.

Railway officers will have no difficulty in recalling that it required the utmost exertion by the railways to handle the coal actually moved in 1917, which amounted to 551,000,000 tons. In fact, the alleged failure of the railways to handle the coal traffic efficiently and in large enough volume was one of the main reasons for the adoption of government control in 1918. Under government control various extraordinary measures were used to increase the amount of coal transported. The zone system was adopted, cars were pooled and the coal producers were given priority in the use of open top cars.

The result was that the amount of bituminous coal moved was increased about 30,000,000 tons in 1918 as compared with 1917. Toward the end of 1918 there began a decline in general industrial activity owing to the signing of the armistice, and it was estimated that the amount of coal produced in that year exceeded the requirements by 30,000,000 tons—in other words, that the actual requirements of the country were about the same as the amount actually transported in 1917.

Largely owing to the extraordinary reserves accumulated in 1918 and also to the decline in industrial activity, there

was a sharp decline in the demand for and production of coal in the early part of 1919. In the first five months of 1919 the production fell 100,000,000 tons below that of the first six months of 1918. Late in the year came the miners' strike, which further reduced production, and the total production of the year was 121,000,000 tons less than in 1918 and 93,000,000 tons less than in 1917.

In the latter part of 1919 there began a great revival of business activity and a corresponding increase in the demand for coal. The country, therefore, entered the year 1920 with a coal shortage. This was increased by the "outlaw" switchmen's strikes. The railways, in spite of the switchmen's strikes and other difficulties, succeeded, as we have seen, in moving as much coal as they did in 1917, but about 30,000,000 tons less than in 1918. It is the opinion of experts that the production and transportation of coal in 1920 made up the deficiency which existed at the beginning of the year, and also provided the average storage stocks of coal. In other words, the country apparently has entered the year 1921 with normal supplies on hand.

There are, however, no abnormally large stocks on hand, as there were at the beginning of 1919. Furthermore, the consuming capacity of the country increases year by year. The country's consuming capacity increases with its productive capacity, and the unprecedentedly large general freight traffic given to the railways in 1920 shows that the country's general industrial capacity is much larger now than it ever was before.

It was only by herculean exertion that the railways were able to handle the coal traffic moved in 1920. Furthermore, there had to be diverted to the coal traffic the use of many thousands of open top cars which, except for the necessary priority orders issued by the Interstate Commerce Commission, would have been used for the handling of highway construction materials and other traffic.

On the whole it seems to be a safe assumption that unless the depression in business throughout 1921 is unprecedentedly acute the amount of coal the country will need and the railways will have to haul will be practically as great as it

was in 1917 and 1920, or approximately 550,000,000 tons. The actual annual production during the past four years exceeded 535,000,000 tons. The year opens with the railways having no larger supply of open top cars than in 1920. There is more construction work in prospect, especially highway construction, than ever before, and this year those engaged in construction activities should not be obliged, as so many of them were last year, to curtail, or actually stop, their work because the cars they need for shipping sand, gravel, cement, etc., must be used to haul coal.

If the railways are to handle even normal quantities of building materials and at the same time transport approximately 550,000,000 tons of coal, it will be necessary for them to move coal in much more nearly uniform volume throughout the year than they have been given opportunity to do within recent years. They cannot, however, transport coal in approximately uniform volume throughout the year unless consumers and dealers will buy it and producers will ship it in practically uniform volume.

The wide fluctuations which have occurred in the past in the production and shipment of coal are strikingly illustrated by the fact that in the first 98 working days of 1919 the average production was only 1,263,000 tons a day, while toward the end of 1920 the railways were moving 2,200,000 tons a day. The latter figure is more than 60 per cent larger than the former. When the railways are moving an average of only 1,260,000 tons of coal daily they have idle many thousands of coal cars and a very large part of their entire physical plant, while when they are moving 2,200,000 tons of coal a day they are being obliged to put forth the utmost efforts to handle coal.

The railways cannot afford to use so large a part of their facilities to handle coal as they were obliged to use during most of 1920, and the country cannot afford to have them do so. The facilities of the railways are at present inadequate to handling all the country's commerce when general business is active, and if they are obliged during part of the year to devote so large a share of their energies and facilities to moving coal as in 1920 they must neglect other traffic.

The only way to prevent the vast fluctuations in coal traffic which within recent years have been such a disturbing and demoralizing influence both to transportation and to

general business is, as has been indicated, to get consumers and dealers to buy and producers to ship more uniform amounts throughout the year. The average weekly requirements are between 10,000,000 and 11,000,000 tons, and when shipments fall as low as 8,000,000 or even 7,000,000 tons, the result sooner or later will be transportation troubles and scares about "coal famines."

The work of educating the consumers, dealers and producers of coal to ship in more uniform volume throughout the year probably will be long and difficult, but there should be no delay in beginning it. In the spring of 1919 there seemed to be no occasion for warning coal producers and dealers that they ought to "ship now." Their failure to ship the normal amounts of coal in the early part of that year resulted later, however, in a flood of denunciation of the railways by the coal operators because of the alleged failure of the carriers to perform their duty, and was one of the main contributing causes of the national industrial and financial disaster which was only narrowly averted when the switchmen's strike in 1920 interfered for a few weeks with the normal operation of the railways.

The coal consumers, dealers and producers of the country must be made to understand that with the railways as short of facilities as they are now they cannot handle the country's normal requirements of coal without having the coal given to them for transportation in reasonable volume throughout the year, and that if they do not use cars when they can get them they will not be allowed to monopolize the supply of them at other times when they are as much needed for other kinds of industry as for the coal industry.

The Interstate Commerce Commission said in its annual report:

"To the extent that the emergency in the fuel situation can be traced to the failure of dealers or consumers in regions remote from their sources of supply to purchase or make firm contracts for that supply in season, it is to be hoped that timely and effective action will be taken to prevent recurrence. They can hardly expect that our regulatory powers, which have to do with transportation rather than with distribution of commodities, should be relied upon to relieve them from the consequences of their own inertia, to the inconvenience or detriment of other regions and derangement of the orderly movement of general traffic."

## Large Amounts of Lumber at the Mills

IF THE RAILWAYS do not in 1921 have a heavy lumber traffic it will be because dealers do not buy the normal amounts of lumber and not because the lumber mills cannot ship it. The amounts of lumber which have been cut by the mills and piled up by them because they have not received normal orders within recent months are very large. The Bureau of Lumber Economics of the National Lumber Manufacturers' Association gives the information that on October 31, 1918 mills in the South had 1,355,236,000 feet of lumber on hand. This was substantially greater than the amount normally on hand and was 200,000,000 to 300,000,000 feet more than the amount on hand at the same time in 1919. Thirty-four mills in the Northwest reported that on October 31 they had on hand 296,586,000 feet of Douglas fir, which was 10 per cent greater than the amount normally on hand.

This accumulation of lumber at the mills was largely due to relatively small orders and shipments in 1920. Statistics are available regarding the amount of lumber cut and shipped in the 50 weeks ending December 11 from the Southern Pine Association, the West Coast Lumbermen's Association, Western Pine Manufacturers' Association, the California Redwood Association, the North Carolina Pine Association and

the Northern Hemlock and Hardwood Manufacturers' Association. The total cut by the members of these associations was 10,397,670,836 feet, and the total shipments 9,007,892,616 feet. The orders received amounted to 8,236,107,078 feet. The shipments for all the associations amounted to only 87 per cent of the cut and the orders to only 79 per cent of the cut. It was, of course, owing to this disparity between the cut, the shipments and the orders that so much lumber was accumulated at the mills.

The statistics for the different associations are as follows:

	Cut	Per cent	Shipments	Per cent	Orders	Per cent
Southern Pine Association . . . . .	4,289,769,417	100	3,903,804,519	91	3,585,547,271	84
West Coast Lumbermen's Association . . . . .	3,746,602,479	100	3,283,991,469	88	2,876,368,235	77
Western Pine Manufacturers' Assn. . . . .	1,152,687,000	100	911,142,000	79	760,350,000	66
California White and Sugar Pine Manufacturers' Assn. . . . .	514,802,000	100	304,328,000	59	533,665,000	104
California Redwood Association . . . . .	296,605,000	100	263,637,000	89	222,345,000	75
North Carolina Pine Association . . . . .	308,851,940	100	276,249,628	89	203,237,572	66

It will be seen that in only one territory, that of the California White and Sugar Pine Manufacturers' Association,

did the amount of lumber ordered exceed the amount cut, and that in no territory did the amount of lumber actually shipped exceed 91 per cent of the amount cut, and that it ranged as low as 60 per cent of the amount cut.

The total amount cut in the country as a whole was not as large as the average for the last six years, but the orders and shipments were relatively much smaller still. In fact, both orders and shipments were the smallest in 1920 that they were in any of the last five years.

The need for a great increase of housing construction for both business and residential purposes throughout the country is generally recognized. The comparatively small amount of lumber used recently has been due not merely to the high prices of lumber, but to the very high cost of other materials used in housing construction and also to the very high wages of labor in the building trades. Another reason has been the very small amount of building of freight cars and of other work in which lumber is used on railroads.

The prices of lumber have declined considerably from the

high levels reached within recent months, and there seems reason to believe that we are approaching the time when there will be a substantial increase in the amount of lumber used both in general construction work and by the railways themselves. In other words, the prospects apparently are for an increase in the amount of lumber shipped. Any increase in the demand will speedily be followed by a proportionate increase in the amount shipped simply because the manufacturers have so much on hand at the present time which is ready for shipment.

There were, however, no significant indications of increasing orders towards the end of the year. On the contrary, in the four weeks ending December 11 shipments were only 88 per cent and orders only 71 per cent of the amount cut. It seems probable from the figures, however, that the stocks in the retail lumber yards of the country must have become relatively quite small and that they will soon have to begin replenishing their supplies, which, of course, would cause an increase in lumber movement.

## Great Amounts of Grain Still Upon the Farms

THE STATISTICS regarding the size of the grain crops grown in the United States in the year 1920, and the amount of grain which has been shipped since these crops were produced, have an important bearing upon the question of the amount of traffic which the railways will have to handle in 1921. Many farmers are holding their grain because of the recent sharp declines in prices, but both the limits of the farmers' financial resources and the limits of the facilities for storing grain make it seem certain that they cannot continue long to hold back so large a part of their grain as they have been holding back.

The grain crops grown in 1920 were, in the aggregate, the largest ever produced in this country. They were larger even than those produced in the war years when the farmers were being urged, as a matter of patriotic duty, to produce all the grain they could. The crops of 1918, 1919 and 1920 in bushels were, according to the government's crop reports, as follows:

Kind of grain	1920	1919	1918
Wheat	789,078,000	934,365,000	917,100,000
Corn	3,232,367,000	2,358,509,000	2,582,814,000
Oats	1,524,055,000	1,231,754,000	1,538,359,000
Rye	69,318,000	88,909,000	89,103,000
Barley	202,024,000	161,345,000	256,375,000
Total	5,817,642,000	4,774,782,000	5,383,751,000

Under ordinary conditions the raising of such vast crops would have been followed in the immediately succeeding months by the shipment over the railroads of unprecedented amounts of grain. This, however, was not the case in 1920. It is a remarkable fact that, on the contrary, the amount of grain and grain products shipped by rail in every single week from that ended July 17 to that ended December 11 was smaller than in the corresponding week of 1919, in spite of the fact that the total grain crops raised amounted to over 1,000,000,000 bushels more than in 1919. The total amount of grain shipped in the last two weeks of July, 1919, was 108,660 carloads. The amount shipped in the same two weeks of 1920 was only 72,694 carloads, a decline of almost 36,000 carloads. The number of carloads shipped in the months of August, September, October and November, and the first two weeks in December, in the years 1919 and 1920 were as follows:

	1920	1919
August	158,652	195,937
September	174,828	190,131
October	198,321	213,409
November	139,909	160,461
December (two weeks)	73,929	76,863

The total number of carloads of grain shipped in 1919 in the 21 weeks ending with December 11 was 945,461, while

in the same weeks of 1920 it was only 818,333, a decline of 127,128 carloads.

The fact that 1,000,000,000 more bushels of grain were produced in 1920 than in 1919, and that in the 21 weeks when the grain traffic is usually heaviest the amount of grain shipped in 1920 was 127,128 carloads less than in 1919, shows conclusively that there is still on the farms of the country a vastly greater amount of grain than there was a year ago.

It is believed by those who are well informed that the amount of wheat upon the farms is substantially less than a year ago. This is indicated by the fact that in the year ended July 1, 1920, the total exports of wheat were only 122,000,000 bushels, while from July 1 to December 18, 1920, the exports of wheat were about 147,000,000 bushels. On the other hand, the exports of oats have been far smaller than they were last year, while the exports of rye and barley, the other two principal grains exported, have been relatively about the same.

Practically no corn is exported, and most of that which is produced is never shipped at all but consumed upon the farms. But while most of the corn produced is consumed upon the farms, the total amount of it produced is so much larger than the amount of any other kind of grain that the actual amounts of it shipped are very large.

Factors of the situation which have some bearing upon the question of the amount of grain that will be shipped in 1921, are the amounts believed to have been left over from 1919 and the crop prospects for 1921. There is believed to have been an unusual amount of the 1919 crops still on the farms being held for higher prices when the 1920 crops were harvested. As to the prospective crop of 1921, it is stated that the "new winter wheat get-a-way" is the best ever known at this time of year except in December, 1918. With such a vast amount of grain still on the farms, and the winter wheat prospects good, it is difficult to conceive how the total amount of grain that the railways will be asked to transport in 1921 can fail to be very large.

However, whether the roads will be able to furnish sufficient box cars to transport all the grain offered to them undoubtedly will depend upon the way in which the grain traffic comes to them. One of the main reasons why the amount of grain moved in the summer of 1920, when the prices were still high, was so small was that the railways were unable, because of labor and other conditions, to furnish the farmers all the cars for which they asked. It is easy to believe that if the movement of the grain still in

the hands of the farmers is unnecessarily delayed, and there should be an active revival of general business in the spring, the railroads would find it extremely difficult, if not impossible, to furnish the farmers with all the cars for which they would ask.

The farmers are holding back such large amounts of grain because they hope by doing so to get better prices. The recent declines in the prices of grain have been very heavy, and if the farmers could get better average prices by holding the grain than by shipping it in normal, or even more than

normal, volume in the early part of 1921, it would be impossible justly to criticize them for holding it. But the farmers, like other business men, should recognize the fact that transportation conditions as well as prices are an important factor in American business at the present time. They might find that in the long run it was more advantageous to ship a large part of their grain when they could get plenty of cars in which to ship it, than to hold it for higher prices and then find, if and when the higher prices came, they could not get enough cars.

## Vast Program of Highway Construction

IF THE APPROPRIATIONS which have been made for highway construction are a criterion, the amount of road building in the United States in 1921 will far exceed that ever done in any previous year.

It was estimated that the total appropriations for the construction of highways available in 1920 were about \$650,000,000. This was regarded as a very large amount; and it was much larger than was ever available before. It was found impossible to do anywhere near all the road building planned, largely because the threatened coal shortage made it necessary to give priority in the use of open top cars to the transportation of coal. Probably the amount actually spent in 1919 was about \$390,000,000. Expenditures for the same purpose in 1918 were \$286,000,000, and in 1917, \$280,000,000.

The total funds available for highway construction work in 1921 amount to \$1,394,000,000, or twice as much as in 1920. This is the estimate given in a recent bulletin of the Associated General Contractors of America, which published the following table entitled "Funds Available for Highway Construction, 1921":

Total federal aid appropriation.....	\$275,000,000
Forest road appropriations.....	14,000,000
State bond issues.....	543,000,000
County bond issues.....	362,000,000
Direct levies and revenue (estimated).....	200,000,000
<b>Total.....</b>	<b>\$1,394,000,000</b>
Less total of projects completed or under construction.....	264,000,000
<b>Available for new construction, 1921.....</b>	<b>\$1,130,000,000</b>
<b>STATE BOND ISSUES</b>	
1918 (Partly expended)	Colorado..... \$5,000,000
Illinois..... \$60,000,000	Maryland..... 3,000,000
Pennsylvania..... 50,000,000	Minnesota..... 75,000,000
1919 (Partly expended)	W. Virginia..... 50,000,000
California..... 40,000,000	Missouri..... 60,000,000
Oregon..... 12,500,000	Virginia (Legislature to fix)..... 50,000,000
Nevada..... 1,000,000	New Jersey vehicular tunnel..... 29,000,000
S. Dakota..... 4,500,000	
Wyoming..... 2,800,000	
Maine..... 10,000,000	
Michigan..... 50,000,000	
Utah..... 4,000,000	
1920 (New appropriations)	
Alabama..... 25,000,000	
Idaho..... 2,000,000	
Oregon..... 10,000,000	
	<b>Total State Bond issues available for 1921..... \$543,800,000</b>
<b>COUNTY BOND ISSUES, 1920</b>	
Alabama..... \$5,000,000	Nevada..... 1,200,000
Arizona..... 4,400,000	New Jersey..... 200,000
Arkansas..... 2,400,000	New Mexico..... 13,609,000

large portion of the bond issues were approved only recently, and the time necessary to prepare plans and secure approval of the projects will doubtless limit the expenditures.

More significant considerations from the standpoint of the contractors, according to the bulletin of the Associated General Contractors, are certain factors which it mentions, including ability to get labor, materials and transportation service.

It has been estimated that for every mile of highway constructed there must be transported 100 carloads of equipment and materials. Inability to get sufficient transportation has been one of the chief limiting factors affecting road building within recent years. One of the main reasons why the contractors have not been able to get sufficient transportation has been that they have made no special effort to move equipment and materials when adequate means of transportation were available.

### 100 CARLOADS PER MILE OF HIGHWAY

Recognizing this fact, a movement was started some weeks ago by the Lakewood Engineering Company, of Cleveland, one of the largest construction companies in the country, to get those concerned in construction activities to "ship now." It sent letters to contractors, highway engineers, banks, chambers of commerce, railway officials and others concerned, pointing out that "if road materials are transported and stored during the winter and early spring months, when open top cars are more available than they are during the construction season, the contractors could proceed with considerably less interruption and their working season would be increased accordingly." The Lakewood Engineering Company states that many replies have been received to its letter, and that most of those replying are in accord with the plan suggested and offer help in making it a success.

Several letters tell what already has been done along this line. At Ogden, Utah, materials for 20 miles of road were shipped in the winter of 1919-1920, and the road was completed during the season of 1920 in record time. The State of Delaware has followed this practice for three years. The Board of Freeholders of Passaic County, New Jersey, has acquired a central storage yard for stockpiling road materials this winter. Belleville, Ill., reports that it has already stored cement for next season's work.

Nevertheless, the idea of "shipping early" is apparently new to many, although it was strongly urged last year by several state highway departments, as well as by the United States Bureau of Public Roads.

One question frequently asked about the early transportation and storage of road building materials is how the contractor is to pay for the materials and their transportation. The Lakewood Engineering Company points out that in 27 states, and in the District of Columbia, legislation has made it possible to pay the contractor in full or in part for material when it is delivered. It adds, "In those states where it is not possible for the highway departments to make such

It has been estimated by the Bureau of Public Roads that of the total amount available probably not more than one-half actually will be expended during the coming year. A

payments it will, of course, be necessary for the contractor to finance the transportation and storage of materials ahead of time. In such instances he will have to arrange with his banker for the needed funds. But even if he does have to borrow the money, there is every reason why he should do so. The interest on the amount required is absolutely insignificant when compared to the sum the contractor will lose if he should have to shut down his job even only a few days because he cannot get regular delivery of materials during the construction season."

#### RAILWAY TRANSPORTATION AND HIGHWAY CONSTRUCTION

In the circular letter from which the foregoing quotations are made the Lakewood Engineering Company commented at length upon the relation of railway transportation to highway construction, and as its comments are those of a concern which is highly experienced in this field, they are given at some length below:

"Road building materials are usually shipped in open top or gondola cars. In the northern states the greatest demand for these cars comes in the summer months, when they are required for handling coal, ore, sand and stone for construction work and road building, etc.

"In a few instances it has been pointed out by railway executives that on their own particular lines this condition does not exist and these cars are more in demand in the fall, winter, and early spring months than during the summer. However, taking the country as a whole, it is a fact that there is generally a shortage of open top equipment in the summer, and a surplus in the winter. One reason for this is because the navigation season on the Great Lakes closes in November for the transportation of coal and ore. Many cars are needed for this service during the summer and early fall.

"At the close of the navigation season these cars are released, and for a short time are busy carrying coal to the local territory, which can be served after the lake trade is taken care of. But this local service is practically at an end by the last of December, when there begins to accumulate a surplus of open top equipment. The transportation of coal slumps off rapidly after this time, as coal contracts are made on April 1, and from January until that time there is only a very small amount of this business for the railroads.

"It has been the general practice to request shipments of road materials during the actual construction season. The result has been that the railroads are always contending with a peak load just at the time the contractor could do his most effective work if he were able to get his materials. The inability of the railroad to furnish the necessary cars very often makes it impossible for the contractor to get well started on his work, with the result that the close of the season finds him with a job which must be carried over until next year.

"On the other hand, if the surplus cars which are available during the winter and spring months could be put at work hauling materials to be stored by the contractor until his season opens, he would be assured of steady work when he did get under way.

"There now seems no possible reason to look forward to lower prices for materials next year. Freight rates have increased, and a larger demand for materials is expected. The demand is increasing in many localities faster than the supply. Freight rates and the law of supply and demand are the two principal factors governing price. Therefore, it does not seem that material prices will go down. Yet even if there were hope for a decline by next season, the extra cost to the contractor buying his materials for winter and spring storage will really be only a small insurance premium guaranteeing that he will not have to close down his work every few days to wait for materials. Such slight extra cost is mighty cheap insurance.

"The banks of the country are more than willing to help. A contractor needing financial assistance to aid him in shipping and storing materials early should not hesitate to go to his banker. Money loaned for this purpose is really backed by the security of the state for which the road is to be built. And what better security could be wanted?

"The difficulty of unloading sand or stone which has frozen in transit is an objection which is frequently raised to the shipment of road materials during the winter months. It is true

that these materials may freeze in the cars, but material for road construction is shipped generally only a comparatively short distance, and such freezing will be confined to a thin crust unless the cars are delayed in transit or unloading. The proper unloading equipment will make it possible to get the materials out of the cars in a minimum amount of time, which will prevent it from freezing solid.

"Where material is delayed, and becomes frozen in severe weather, it, of course, will be necessary to employ steam pipes, or to apply heat in some other way to thaw it before it can be handled from the cars. But such procedure is far from impossible.

"In the fall it is not possible to continue actual paving where the subgrade freezes slightly at night. Although the temperature during the day may not be below freezing, the contractor will not be permitted to place concrete. But such weather is ideal for continuing unloading and storing materials for next season's work.

"In some of the northern states, where very severe weather prevails, it would, of course, be necessary to withhold shipments during extremely cold weather, because even though they are transported for only a short distance, they may become frozen solid in a very short time under such conditions.

"However, in such states where these conditions do prevail, it is possible to ship materials at all times except during the dead of winter.

"Many quarries close down during the winter months—therefore, an argument has been made that materials will not be available for winter shipment. So far as we are able to learn, the quarries close down largely because of habit. There has been no active market for them during the winter months. They have preferred to stop their work instead of assuming the burden of stocking their materials until next season. If a market could be assured for the quarries which would absorb their output, there is no reason why they should not operate twelve months out of the year, with the exception of time required to make repairs."

Highway construction on a large scale is new in the United States. It is so new that, owing to the war and general financial conditions within recent years, the railroads have not been able to provide sufficient cars to transport all the equipment and materials required to enable contractors to work continuously throughout the construction season if they attempt to ship practically all their equipment and materials in the construction season. The Lakewood Engineering Company, after a long and broad experience in this field, has made clear that it is feasible for contractors to distribute their shipments of equipment and materials more uniformly throughout the year, and that they should "ship now" not merely in the interest of the railroads, but in their own interest and that of the public.

# Railway Executives Comment on "Ship Now"

## Why It Is Important to "Ship Now"

By Daniel Willard

President, Baltimore & Ohio Railroad;

Chairman of the Advisory Committee of the Association of Railway Executives

WHILE IT IS TRUE that there is a surplus of transportation facilities, particularly box cars and freight locomotives, in the United States today, it does not by any means follow that such will be the case two or three months from now. As a matter of fact, having in mind that a large portion of the wheat crop is still in the interior of the country; that we have raised this year one of the largest corn crops ever raised; and further, that funds have actually been provided for a very substantial program of road-building next year, I repeat, for these reasons and others I cannot help feeling that the transportation facilities of the railroads will be fully used by next spring, say March or April.

In order to avoid possible delays which might be experienced at that time because of the active demand for cars, I think it is highly desirable not only from the standpoint of

the railroads but in the public interest, that wherever possible and as much as possible, advantage be taken of the surplus facilities now, to ship in anticipation of the wants later on.

I am inclined to believe that the railroads with their existing facilities could perhaps handle all the business offered during a twelve months' period, providing it were offered uniformly through the entire period, but that of course is exactly what does not happen, and it is certain that the railroads with their present facilities are not able to take care of the possible peak loads, and this is why I think it is wise to urge upon all who can do so to *ship now*.

I think the *Railway Age* is absolutely right in carrying on such a campaign, and I hope it will be successful. As a matter of fact, it has come to me directly that certain large shippers are already acting in accordance with that policy.

## "Ship Early" and Ease the Peak Load

By R. H. Aishton

President of the American Railway Association

FOR THE FIRST TIME in five years, on this January 1, 1921, there is a surplus of transportation in the United States, and the transportation machine is not being worked to its capacity. Two things have brought about this condition:

First: The combined co-operative efforts of the railway staffs, shippers and public bodies whereby the average car loading has increased from 28.3 tons in February, 1920, to 30.0 tons in November, 1920, and average miles per car per day have increased from 22.0 in February, 1920, to 28.0 in November, 1920, the net practical results attained automatically approximately adding 500,000 cars to the equipment without any additional capital investment.

Second: Shipments have decreased through the shut-down or curtailment of industry; uncertainty of commodity

prices has restricted buying; credit conditions have restricted building operations; the situation regarding foreign exchange and the inability of foreign nations to finance purchases have reduced exports, all bringing about a lessened demand for transportation.

As a result, on the one hand of the improved efficiency of the railroads in handling the freight offered, and on the other of the decrease in the volume of business demanding transportation, there is for the first time in years, except for a short time in 1919, a surplus of cars and locomotives above requirements and not actively working to their capacity. This condition is not without precedent, although seldom, if ever, has the transition from insufficient transportation to a surplus of that commodity come as suddenly and violently as in the past few months and as the decline was sudden,

violent and deep, so may we, if past history is any indication, predict a rebound of the same character.

Never before has the interest of the shipper, the public as represented by the Interstate Commerce Commission and the railroads and their owners and officers been so mutual as now. What can be done to meet this future revival of business in addition to what is now being done in a large degree by the railroads in providing additional locomotives, cars and facilities under a most burdensome financial situation, which program will no doubt be augmented with an easier money situation?

With the knowledge born of past experience that the volume of transportation business is a series of peak loads and valleys of depression, and that every peak is higher than the preceding one and every valley of a higher elevation than the one before it, and that the constant trend is upward, it would seem that all interests, those serving the public and those serving the railroads, might with mutual advantage study practical methods of meeting the increased volume of business so sure to come, possibly in a few weeks, certainly before many months.

Regardless of the present car surplus, a decision to:

(1) "Keeping up the habit" of capacity carloading and capacity car mileage during this period of transportation surplus, would be of inestimable advantage when the days of car shortage come again. A habit once formed is not easily gotten away from.

(2) A decision to "Ship Early" would tremendously help the situation and ease off the peak load. There is a great housing shortage, both for business and homes. Is it not

fair to assume that one of the first upward moves will be in building construction? Clearly, if every activity in this direction were to start May 1, there would be a tremendous load on the railroads and inability to meet this sudden load would be unfortunate and affect the public interest in many directions. Can we not anticipate that this may occur and would it not be wise to commence transporting, and if necessary storing even at the cost of re-handling, some of the many materials entering into projects already determined on, in order that there may be no delay due to transportation?

We may definitely assume a large program of highway building and improvement will be started. "Ship Early" would insure an absence of transportation difficulties, such as occurred last winter. In a large part of the United States material can be handled during winter months when there is a surplus of cars as easily as in midsummer, and even where there is severe winter weather a portion of the materials can be transported and handled without great additional expense.

Why not "Ship Early" the thousands of carloads of fertilizer in the winter instead of in the spring when they are required on the farms, and avoid the uncertainties of delays due to an overburdened transportation machine?

Why not "Ship Early" such materials as are required for the maintenance programs of railroads, instead of adding this burden to the heavy load later on?

Might we not profitably have confidence in the future, and having that confidence in this time of depression put the transportation facilities to the utmost possible use in providing against the day of Opportunity?

## Future of Railways Depends on Constructive Regulation

By J. Kruttschnitt

Chairman of the Southern Pacific Company

**W**HAT ENLARGEMENT of facilities *should* the railroads make?

The average annual capital expenditure for the construction of new and the betterment of existing lines for the ten years preceding 1917 was about \$660,000,000, but as the purchasing power of the dollar has declined, at least twice this amount, or \$1,320,000,000 per annum, will be needed to provide what the smaller sum did formerly. In the years 1918-1919 under government control \$806,000,000 only was spent (Annual Report of the Director General of Railroads for 1919). As the normal expenditures for the two years should have been \$2,640,000,000, capital expenditures were short \$1,834,000,000 on January 1, 1920, and this amount, in addition to the normal annual sum of \$1,320,000,000, should be spent in 1920 to catch up, and \$1,320,000,000 should be spent annually thereafter, subject, of course, to reduction ratably with any rise in the purchasing power of the dollar and in the efficient use of existing facilities.

2. What enlargement of facilities the railroads will be able to make in coming years will depend on the extent to which the Transportation Act—passed by Congress after five and one-half years of close study, the greatest (and the only) piece of constructive legislation of the kind ever enacted in this country—will be allowed to work without radical change. It has been in more or less complete operation just ten months—much too short a time to test its merits, when we consider that during this period the railroads have been handicapped by abnormal economic conditions, by shortage of equipment and other facilities and by the disorganization and depletion of their forces following 26 months of government operation. Demands of substantially all classes of employees for increased wages, which long before should have been answered, remained unsettled by the outgoing Railroad

Administration, which by procrastination evaded and shifted responsibility to the incoming owners of railroads. This long strain on the patience of the employees caused the so-called "outlaw strikes" of April, 1920, and the worst congestion of railroad traffic ever known.

With motive power and equipment returned by the government in deplorable condition and large numbers of employees disloyal and deserting, traffic conditions were hardly restored to normal before the end of August, when the wage award, quickly followed by the grant of increased rates, was made. The higher rates have been in force but 17 weeks, during six of which the volume of freight traffic has rapidly fallen; and the refusal of a number of state commissions to harmonize state rates with those prescribed by the Interstate Commerce Commission has deprived the carriers of much necessary revenue. We advert to these facts in order to appreciate that conditions prevailing since the Transportation Act took effect have been such as to make it impossible to form a clear opinion of the changes it will produce in the destinies of the railroads.

The Act unmistakably recognizes the duty of the government in its regulation of interstate commerce to *foster and protect* its instrumentalities and to substitute a *constructive* for a *repressive* policy, under which rates had been kept down to low levels and severe punitive measures had been enforced against the carriers.

The two cardinal and controlling features of the Act are: The continuance of private ownership and operation as a national policy, and, the recognition of public interest and public duty in respect to the adequacy and efficiency of transportation facilities.

To make this policy a success requires the sympathy and co-operation of the Interstate Commerce Commission in in-

terpreting and administering the law, and of the carriers and the public in loyally obeying it. The reduction of the outlaw strike congestion, which was accomplished by the efforts of these three agencies, affords convincing proof of the compelling force of united effort. At least several years of uninterrupted operation of the Transportation Act without interference and under normal conditions of traffic, interest rates, and commodity and labor costs will be necessary to develop its effect on the future of our transportation systems, and it is of vital importance that such free opportunity be afforded.

It is not reassuring, however, to know that amendments that go far towards nullifying it have already been suggested. The most important is the proposal to make consolidations compulsory, presumably following the plan that Senator Cummins proposed in January, 1920, whose main features are grouping of the railroads into systems, each one to be operated by a corporation with a federal charter; the grouping into systems to be brought about by forced sale in condemnation proceedings after a period of seven years, within which voluntary consolidation in harmony with a pre-approved plan is permitted. Hence practically all existing railroads for seven or more years will have to live in apprehension, uncertainty and confusion that will be fatal alike to railroad development and to successful operation and maintenance of the properties.

The effect of such legislation—tantamount to government ownership—upon existing systems would be revolutionary, and the mere threat of it makes the future of the railroads so dark and uncertain as to perpetuate the injury to their credit and destroy the stabilizing effect of the Act of 1920.

Another measure before Congress is to change the federal valuation act unfavorably to the railroads. A fair valuation of the railroads is necessary to accomplish the purposes of the Transportation Act, for its principal provisions are based on such a valuation. If the federal valuation act is to be tinkered with and amended to the prejudice of the rail-

roads, confidence in their future will be to the same extent destroyed.

Another proposed amendment is to change the present provisions of the long-and-short haul clause so as to absolutely forbid any greater charge for a longer than for a shorter haul. The passage of such legislation will very seriously affect the earnings of many large systems of railroads, and the threat of such legislation will also create a lack of confidence in the earning power of the railroads likely to be affected thereby.

Again, there is the anti-strike amendment. One of the objects of the Transportation Act was to provide a method of settling labor controversies and avoiding the serious consequences of an enduring test between the railroads and their employees. Before legislation having this end in view has had time to function, an amendment is proposed the practical effect of which will be, in all likelihood, the bringing about immediately a life and death fight between the carriers and organized labor.

It cannot be too earnestly asserted that a feeling of confidence in the permanence of a constructive fostering policy is absolutely necessary for railroad development and prosperity. Such improvements as the Pennsylvania and New York Central stations in New York were planned years before they were made public, otherwise the provident acquisition of real estate would have been impossible. Without such confidence initiative will be destroyed; no corporation will dare to assume the risk of making plans the completion of which may at any time be halted with irremediable loss.

From the above will be seen how impossible is an answer to the second question as to the ability of the railroads to enlarge their facilities. They will no doubt muddle along until Congress by its treatment of proposed destructive amendments inspires investors with confidence that the Transportation Act that it has created is not to be rendered impotent before it has had the opportunity to prove its value.

## Conditions a Challenge to Resourcefulness of Private Management

By C. E. Schaff

Receiver, Missouri, Kansas & Texas

**T**HE DECLINE in traffic which marked the closing weeks of 1920 complicates the task confronting the railroads in 1921. While it may slow up railroad recovery, it should not be suspended.

Unfortunately, the decline in traffic followed so closely on the heels of the rate advances, that the railroads cannot immediately get the benefit of the increased net revenue which was anticipated. Revenue calculations of the Interstate Commerce Commission, as reflected in the rates established under the Transportation Act, were predicated upon expectation of traffic in undiminished volume. We are again in a situation not unfamiliar to railroads. Our rates have been adjusted to meet one set of conditions, and an entirely different set of conditions has developed before we were well settled under the new rates.

In the face of these circumstances, it should not be discouraging if the railroads fail to maintain the rate of progress toward complete readjustment that was established, following the passage of the Transportation Act and the return to private operation under a sound federal policy.

Despite the difficult conditions which interfered with efficient operation in the months immediately following the return to private operation, the railroads handled a record-breaking tonnage in 1920. Service was everywhere improved. Accumulations of traffic were cleared up. Equipment conditions were made better and the close of the year

found the railroads prepared to carry an increased traffic load. Developments generally had indicated the soundness of prophecies that resumption of private operation was the first step toward restoration of railroad efficiency. Indeed, progress had been so rapid as to discount the predictions made freely a year ago that it would require from three to five years to restore the railroads to pre-war efficiency.

The immediate task of the railroads is to counter-balance, so far as possible, through increased efficiency and decreased operating costs, the adverse effect of the decline in traffic on net revenues. The success we shall have in showing encouraging net revenues in the face of decreased business will, of course, regulate our rate of progress in carrying forward the improvement programs which experience has demonstrated are essential to equip the railroads to handle traffic satisfactorily, when business is again moving in what we should consider normal volume.

These conditions are a challenge to the initiative and resourcefulness of private management. They are difficult, but encouragement is found in the fact that the traffic decline itself is influencing our movement toward a readjustment under which operating costs should be relatively lower.

The response of the railroads to the federal policy adopted early last year, has been distinctly encouraging. With the 1921 task satisfactorily discharged, private ownership and operation will have met an acid test.

## More Freight Should Be Moved in Months of Light Business

By L. F. Loree,  
President, Delaware & Hudson Company

I THINK THE RAILROADS have shown very conclusively that they have the equipment and facilities necessary to handle a business about 15 per cent larger than the movement of October and November, 1920. The results realized from the effort to increase car loading and car movement are very gratifying, but there is still considerable margin for further accomplishment, especially in the car movement. To accomplish this some very bad practices of the railroads and some equally bad practices of the shippers should receive serious attention; and a systematic and determined effort should be made to improve the terminal facilities and the road facilities affecting the movement, especially the former.

A review of the car surpluses and unfilled car requisitions running back to 1907 shows the seasonal character of the railroad business and the very heavy burden thrown on the

roads by the movement in October, November and December, and, equally, the very light movement offering in April, May and June. To the extent that the shipper can move his freight in these months of light business, he can reckon on prompt handling and avoid the delays which may embarrass him in the months of heavy business.

However, the indications all are that the business offering in the Fall months of 1921 can be easily handled. Is it then wise to encourage an abnormal movement in months when weather conditions and short days make the work expensive rather than let it take its normal course and move it when conditions are more favorable and the work is relatively economical?

I am afraid the *Railway Age's* campaign is too like the "sunshine campaign" of 1908 and can serve no useful purpose.

## Shippers Should Anticipate Their Requirements

By C. H. Markham  
President of the Illinois Central Railroad

THERE IS EVERY REASON to believe that the spring will bring a heavy revival of business, following the winter's slump. Railway men are concerning themselves over what effect this commercial revival, if it materializes, will have upon the transportation machinery of the country.

The railways performed a miraculous feat in their endeavors to meet the 1920 demands for transportation, handling an increasing volume of business very largely through the adoption of more efficient and co-operative methods. This performance was made in the face of heavy obstacles which are not likely to face the railways next spring—labor difficulties, disorganized forces, highly deteriorated equipment, inadequate rates and a coal shortage. Therefore, it may be safely predicted that the railways will be able to handle even more business in 1921 than they did during 1920.

It is yet too early to predict with any degree of certainty how great the burden of traffic of 1921 will be, and it is therefore well that those having traffic to offer should realize that the railways are now in a position to handle more traffic than is being offered, and that this position may be changed. By realizing that, and anticipating their transportation requirements as far ahead as possible, shippers may be able, not only to assist in relieving general conditions, but to move shipments which might be tied up, should a paralysis of traffic occur.

In this connection, it should be noted that large road-building programs are being considered in a number of states. In the majority of cases the state money for the purchasing of road-building materials is now available. There are certain classes of material which can be transported at this time, in preparation for the spring business revival, for instance, sand, gravel, cement, etc.

Retail lumber yards are being rapidly emptied of supplies, without adequate replenishment. The spring business revival should bring a demand for the resumption of building programs, which, in turn, will demand a heavy lumber traffic. Such traffic in that line as can be moved now, should be moved.

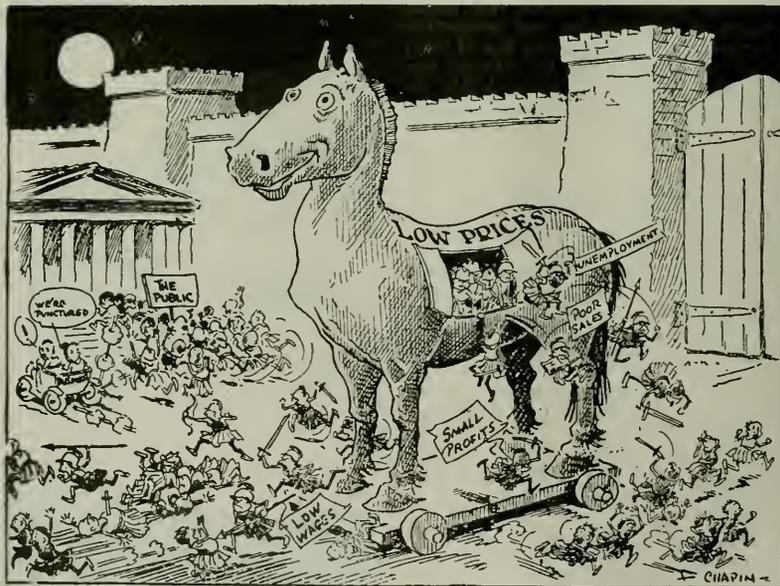

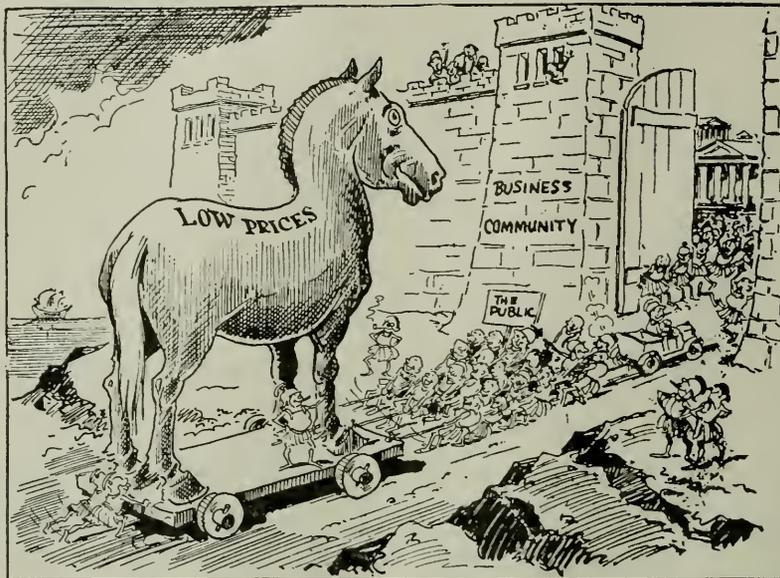

There are other instances of this kind. Every shipper would do well to make a study of his needs for the coming year, and arrange his transportation demands in such a way

that the movement will be facilitated. He will profit by knowing that his demands have been handled, and are out of the way. Business in general will profit by the relief which it will mean in the spring movement. The railways will profit by having transportation demands more evenly distributed.

## Why "Buy Now" Program by Railways Is Needed

Many Factors in Problem Which Those Controlling Purchases Must Consider—"Buying Now" Would in Long Run Help Railways and General Business

THE RAILWAY EXECUTIVE who is considering the problem of the extent of the purchases his railway can make now, and of the extent to which it ought to make purchases now, has to take into consideration many factors.

Many railway companies are so short of funds and have such poor prospects of satisfactory earnings that they really cannot do otherwise under present conditions than carry on a hand to mouth existence. Many others cannot under present conditions raise money for capital expenditures but have sufficient funds available from earnings with which to buy the equipment and materials they require to make immediately needed improvements and to do adequate maintenance work. Some railways, even under present conditions, not only have sufficient earnings to make immediately needed improvements and adequately maintain their properties, but have good enough credit to raise capital in relatively as large amounts and on as easy terms as it can be raised by any industrial, commercial or financial concerns.

Even railways with the best credit hesitate at present, however, to issue securities in large amounts to raise new capital because hardly any railroad can sell stock, and the high rates

of interest which must be paid on bonds will impose a heavy burden of fixed charges for years to come.

Practically all railroads are handicapped in making purchases by the fact that the government owes the companies in the aggregate about \$400,000,000 of the deficit incurred during the guarantee period from March 1 to September 1. The inability of many companies to get their share of this money from the government is one of the principal reasons why they are restricting their purchases as much as possible. Many of them are so short of funds that if they made large purchases now the equipment and supply companies filling their orders would have to give them credit for practically the entire amounts purchased. There is a case on the way to the Supreme Court and also legislation pending in Congress, the outcome of either of which may soon release to the railways a large part of the funds the government is now withholding.

Another reason why many railways which are in an entirely sound condition financially are restricting their purchases is that their earnings under the new freight and passenger rates are disappointing, and that their business recently has been declining. Before deciding on their future

**"RAILWAYS MUST consider the effect which a drastic curtailment of their purchases at present will have upon their immediate ability to maintain and increase the capacity of their plants, and ultimately to handle the traffic offered to them. If later on there are acute congestions and serious car shortages and it can be shown that they have not done all they reasonably could to prepare for handling a large business, they will be subjected to severe criticisms."**

programs they want to see the earnings for a few more months and to get a better idea of how great and how long the decline in traffic is going to be.

Undoubtedly, however, one of the principal reasons why many railways are not buying on a much larger scale than they are buying is that they believe the prices of equipment and supplies should be and will be reduced more than they have been, and are waiting for them to decline further.

There is published elsewhere in this issue in different articles a large amount of data regarding the tendencies of prices of railway equipment and materials from pre-war days down to the present time. The figures regarding the prices of locomotives, freight cars and passenger cars show that they reached their maximum in the first six months of 1920. Comparing with the average for the years 1910-1914, the cost of locomotives in the first six months of 1920 had advanced 151 per cent, of freight cars over 200 per cent and of passenger train cars over 100 per cent. There have been some reductions since these maximum figures were reached, but there is an unmistakable sentiment among many railway officers who control purchases that further reductions must be made before they will be justified in placing orders on even as large a scale as their present financial resources will permit.

The reductions in the prices of some other things the railways buy in large volume have been greater. The prices of open hearth steel rails, which in 1918 was from \$57 to \$65, is now fixed by the United States Steel Corporation at \$47. Track spikes, which sold as high as 5.25 cents and even 7 cents in 1917, are now 3.65 cents. Steel plates for bridges and cars which were 8 cents in September, 1917, and 4 cents in April, 1920, are now 2.65 cents. Pig iron, which was \$50 in July, 1917, and \$51 in September, 1920, is \$33. These are not the prices quoted by all manufacturers, but are the ruling prices. None of them is anywhere near as low as prices in pre-war days, but the declines have been relatively greater than those in the prices of equipment and specialties.

The railways have to consider purchases from the standpoint, not only of their financial resources, but also from that of economy, because the Transportation Act provides not merely that they shall be allowed to earn a net return sufficient to enable them to develop their facilities, but that they shall be allowed to earn this return if they are efficiently and economically operated. Therefore, altogether aside from the matter of their immediate financial resources, they cannot from the standpoint of public regulation and public opinion disregard the necessity of reasonable economy.

On the other hand, the railways cannot afford, in considering the question of purchases, to disregard the effect which the policy adopted by them may have upon their own traffic or their ability to render service. Directly and indirectly they are among the largest shippers in the country. Their purchases not only cause the movement of the finished products they buy, but of the fuel and raw materials that enter into their manufacture. Therefore, other things being equal, the more the railways curtail their purchases now the more they will reduce their own traffic and earnings at a time when they have surplus transportation capacity. Furthermore, the less they buy now the more they will have to buy later on, and the more they buy later on the more they will

increase the traffic that they will have to handle when the movement of freight traffic in general has revived. Therefore, for the railways the arguments for "shipping now" are as pertinent as for any other class of shippers.

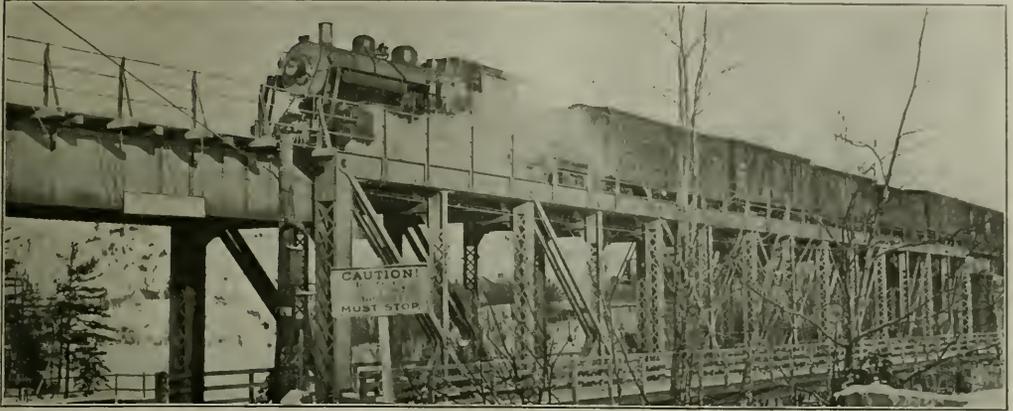

The railways must also consider the effect which a drastic curtailment of their purchases at present will have upon their immediate ability to maintain and increase the capacity of their plants, and ultimately to handle the traffic offered to them. If later on there are acute congestions and serious car shortages and it can be shown that they have not done all they reasonably could to prepare for handling a large business, they will be subjected to severe criticisms which will be difficult to answer.

Reverting to the question of prices, this is one for adjustment between the railways and the equipment and supply companies. All arguments in support of the view that the railways should "buy now" in order to stabilize conditions and prepare for the handling of a large business in future are equally potent in support of the view that the equipment and material companies should do all they reasonably can to make it feasible and desirable for railways to "buy now."

When the buyer and seller cannot agree on prices there is no buying or selling. More uniform purchasing by the railways from month to month and year to year is as desirable from the standpoint of the equipment and material manufacturers as from the standpoint of the railways, but it is evident they must get closer together in their views regarding prices before the process of stabilization of railway purchases can actually be begun.

There can be no doubt that the past policy of the railways has been too largely that of buying in large amounts when general business has been active and prices have been high and of buying in too small amounts when general business has been inactive and prices have been relatively low. It is estimated that at the present time the mills of the independent steel companies on the average are not working to much more than one-fourth of their capacity. The plants of most of the railway equipment and material manufacturers are in somewhat the same general plight. The lumber mills, of whose product the railways are large purchasers, have unusually large quantities of lumber on hand and are operating much below their capacity. Certainly, it does seem that these general conditions afford a good opportunity for the railways and the manufacturers soon to get together on a basis of prices that will justify the railways in beginning to make purchases in as large amounts as the financial resources and prospects of the various railway companies will permit.

There is a good deal of reason for believing that many of the prices now being quoted by equipment and material companies are not the lowest at which they are really willing to make contracts, but are offered as a basis for negotiation, and that lower prices would in many cases be made if it were established with reasonable certainty that large sales actually could be made at these lower prices. Any business concern has a natural reluctance to making reductions in prices when it fears that the effect will be that it will fill only the small orders it is receiving currently at these reduced prices and not get large orders at the reduced prices. There is a great difference, as every fisherman knows, between a mere "nibble" and a real "bite."

## “Buy Now” as Viewed by Railway Supply Interests

### The Public Demands Better Service

By W. W. Salmon

President, General Railway Signal Company

**S**HIPPERS, travelers, merchants, and, in general, the people of the United States who are paying an unprecedentedly high price for transport by rail, expect a good deal better service from the railways than many of them think they are getting.

Any prolonged continuance of failure to get an improved service and equipment of the kind and in the quantity required for the economical conduct of their business will lead to general, grave dissatisfaction and may create an item of bad will on the part of the public that will prove costly to the railway owners.

While it may be possible that by waiting, the railways may make certain purchases at a somewhat lower cost than if they purchase now, and that money may be cheaper then

than now, delay on these accounts in the making of purchases essential to meeting the reasonable requirements of the public will prove, in the long run, to be a “penny wise, pound foolish” policy.

Having for some years devoted a large part of my time to trying to aid in bringing about more liberal and fairer treatment of the railways and having had opportunity to observe how difficult it has been to get the various trade associations of the United States to advocate and approve legislation designed to enable the railways to put themselves in position profitably and adequately to serve the public, I would greatly regret any action or inaction on the part of the railways that would result in the creation of new hostile sentiment toward them.

### Why the Railroads Should Buy Now

By A. L. Humphrey

President, Westinghouse Air Brake Company

**O**NE EVIL from which the railway supply business suffers more than any other is the unfortunate fluctuations in output of most of the principal railway supply plants, which is generally referred to as the feast and famine condition of their order books. This is largely brought about by the fact that the railroads generally regulate their purchases in some direct relation to traffic conditions existing and set aside only such percentage of their gross income as can be spared over and above a certain amount of their daily average income.

When earnings fall off, orders are usually issued to curtail expenditures of all kinds, and especially the purchase of outside material. When earnings begin to increase, the lid is lifted slightly and requisitions are again placed for

needed material, some of which should have been on hand for actual requirements during the dull period.

Anyone familiar with manufacturing conditions must appreciate the fact that this same feast and famine condition is, above all others, the one that militates most against the securing of the thing the railroads are so strenuously contending for at the present time, namely, lower prices. A full order book one month and an empty shop the next month are incompatible with low prices.

If the output of a plant falls below a certain minimum, then the overhead expense is immediately such that, to recoup the loss, prices must be increased rather than lowered, as would be expected on a declining market, and if it is not possible at the moment to secure increased prices

in the long run, the purchaser must pay the actual average cost through a period of years and must in turn take into consideration this very feast and famine condition with which we are all only too familiar in the railway supply business.

If the railroads, like industries, could continue their normal purchases through such times as these, they would immediately have the benefit of the traffic in the movement of raw material for such manufacture, and in turn the handling of the traffic incident to the finished product on the way to remote customers, and an immediate benefit would be secured in the matter of the railroads being able to make needed repairs and maintenance at times when both labor and material were available, as compared with the difficulty in recent years in getting material when it was wanted, which prevented many needed matters of repairs and maintenance being attended to at the proper time.

We have heard from all sides in recent times the complaint that this or that could not be done because material

and labor were not available and, yet, when both become plentiful, the purchases are curtailed.

Another very important item for consideration in this matter is the one of confidence which should be injected into the general situation immediately upon a general purchasing policy being established by important railway systems for the reason that the railroads themselves are the largest purchasers of all kinds of material and the moment one railroad begins purchasing it encourages others to do so with the immediate effect of brighter times for all concerned.

The fear that is now being felt that prices have not reached bottom is based on an unimportant consideration, as it must be realized that, in the main, prices do not vary to a sufficient extent to involve any considerable amount of loss, and, suppose loss does ensue, how long would it be before the industries of the country would be in the same position the railways were in at the time of the last rate increase? Is this desired? If not, buy now!

## Railways Should Buy Only to Meet Pressing Needs

By Samuel M. Vauclair

President, Baldwin Locomotive Works

**I**N MY JUDGMENT this is the time for everybody to be careful and to act with the utmost prudence. I can only recommend railroads, manufacturers, merchants and housekeepers to buy sparingly and only in sufficient quantities to meet their most pressing needs. I feel that there must be a revision downward in the cost of everything, and it can only be accomplished safely by practicing the utmost

economy, not only in business, but in all walks of life from the housekeeper upward.

Therefore, I cannot consistently and sincerely advise the railways that this is the time for them to buy regardless of their necessities. They must be left free to exercise their own judgment, and we as manufacturers must govern ourselves accordingly.

## More Uniform Buying Would Cause Lower Prices

By Charles J. Symington

President, The T. H. Symington Company

**I**T IS NOT WITHIN the province of the manufacturer of railway materials to instruct the responsible officials of the railways as to when they should purchase equipment, but he can perhaps be excused for contributing to the discussion if he believes he can demonstrate that the immediate release of requisitions for new equipment and supplies will operate to the direct financial benefit of the railways themselves.

The fortunes of the railways and of industries are indissolubly linked together and no possible advantage can accrue to the former by the stagnation of the latter. The railways have it in their power by the purchase now of necessary equipment to shorten materially the period of industrial and economic readjustment through which we all are passing, to stimulate at once freight traffic through the resulting movement of raw materials, and, what should be of prime importance to themselves, to get new equipment into service and begin earning money months earlier than if such purchases should be delayed until spring.

The mistake should not be made of assuming that cars, if ordered three months from now, could be placed in service only three months later than if ordered at once. Many plants depending on railway work have recently made drastic reductions in their rates of operation and in their working

forces, amounting in some cases to virtual shutdown. This condition will become practically universal among such plants if a moderate program of railway buying is not inaugurated before February 1. This condition will result in weeks and perhaps months of delay after the railways do decide to buy, before these plants can get their organizations rebuilt on an efficient basis.

Shutdowns and reorganizations cost money, and the ultimate consumer, in this case the railways, pays the bill. This must of necessity be so, as no manufacturer could keep out of bankruptcy if his costs were figured only on his good months. In our own plant we have not had, within my recollection, more than five good months in any one year, with the average around three. I believe our case to be typical and it should be obvious that a more uniform rate of operation would result in decreased costs and correspondingly lower average prices.

Under the particular circumstances which surround us at this time, most manufacturers are stocked up to a certain extent with high priced materials, solely because what looked like a buying movement last year came to a standstill before it had acquired any considerable momentum. This, however, is not such a factor in the present discussion as some of our purchasing agent friends might think. The price of

equipment is of necessity based on the cost of raw materials, but it is affected also by spasmodic buying and at this time particularly by the state of uncertainty which now exists as to when and to what extent railway buying will be resumed.

The present situation demands confidence, and I for one am ready to play with the cards face up. If the manufacturers can start running on railway work before their organi-

zations shall have become scattered, the delay and expense involved in getting production up to its normal speed will have been avoided and satisfactory deliveries can be promised and made. I am convinced that immediate action by the railways would provide the needed impetus for a sane readjustment of business with, as a result, material prosperity for themselves and the prevention of much individual suffering and financial distress.

## Uncertainties of Situation Militate Against Buying

By R. P. Lamont

President, American Steel Foundries

**W**E SHOULD ALL LIKE to see the railroads buy equipment and supplies at this time, and if they did come into the market in a large way it would be very effective in bringing an upturn in the business of the country in certain lines at least, but if I were at the head of a railroad property I am not sure whether I should buy at this time.

At the moment the prices of the various materials such as pig iron, coal, coke, oil, refractories, etc., are relatively high; labor is also at the highest point for many years; and it is difficult to sell securities even at a very expensive rate from a railroad standpoint. On top of this the railroads are confronted with a shrinking business and reduced earnings.

In short, there is nothing in the general industrial or business situation today to justify the buying of additional equipment; however, there is one important offsetting consideration in that there are still people in influential places who would like to see the railroads back under the control of the government, and the railroads are in the position of having to justify the present situation of private ownership by showing that they can give better service than under government operation.

If the roads do buy heavily at the present time and prices and business continue to decline, it will be unfortunate; on the other hand, if they do not buy and business should suddenly improve to an extent that would make it impossible for them to handle the business next fall, it would be a very serious matter. Because of this consideration, it would seem to be desirable for the roads generally to take advantage of the present slack business to get roadbeds and equipment in

the best possible shape, and in addition to buy what other materials and equipment they can without any new financing.

It is difficult to say whether the present process of liquidation and readjustment has just begun or whether it is about completed. There are those who believe that many commodities, including wages, rents, real estate, together with the raw materials above mentioned, are still badly out of line with other commodities such as rubber, sugar, coffee, copper, cotton, wool, breadstuffs, etc., which have had a very severe shrinkage, and that there cannot be a general and sound resumption of business until this liquidation has become more complete. If this is true, the depression may drag through practically all of next year.

On the other hand, if the farmer should begin within the next few weeks to "cash in" his crops and resume buying of ordinary necessities, including agricultural implements, etc., thereby enabling the retailers to get rid of their stocks, so that they can in turn send in orders to the jobbers, who will then be able to replenish their stocks from the manufacturers, there may be a sharp revival of business in the spring. I believe we can have a pretty definite notion by the end of February as to whether or not this will come about, and I should be inclined to defer action on any large program until then.

Our business depends entirely upon railroad purchases, but the situation, as I view it, is so uncertain that I hardly feel like unqualifiedly urging any extensive buying program at this time.

## An Opportunity to Prepare for Greater Economy and Efficiency

By Stanley H. Bullard

Vice-President, Bullard Machine Tool Company

**T**HE SPIRIT of optimism which is the predominant note of every informed statement on business conditions of today, and the future, is founded on the basic soundness of our position, and the fact that true values are resulting from the period of readjustment through which we are now passing and from which we will soon emerge.

It is evident that the "new era" will be one of strict economy—one in which economy will be practically and wisely exercised—one in which judgment and not expediency alone will prevail in every transaction.

There are certain indications that a realization of the necessity for this new brand of economy is sinking deep into the consciousness of practically every unit of our industrial and business structure. And this is good; for it will eventually result in a constantly increasing efficiency

in the use of equipment, a higher sense of responsibility for the good condition of such equipment, and, even though wages are maintained at high levels, an actual lowering of costs in practically every line of production.

We are mentally prepared for this outcome. Are we taking the proper and timely steps to place our shops in a state of proper physical preparedness?

Equipment which has been stressed to its limit in the last few years, and during that time has been at the tender mercy of "the best we could get," is today in doubtful condition to permit truly economical operation. This applies to almost every item and now is the time, in fact the big opportunity, to make a careful survey, put it in shape or replace it with something which will meet the coming demands, and do it with economy.

Equipment manufacturers are in an exceptional position to serve, either in the matter of maintenance repairs (both material and experienced labor) or in the matter of replacement by prompt shipment of equipment of the latest and most efficient design. They are also now able to aid the officials in charge of shop operation in the planning

of better and cheaper methods of performing shop work, bringing to these problems a new viewpoint.

Certainly we are all of us wiser than the Irishman who wouldn't mend his roof when the sun shone, because it didn't leak, and when it *did* leak, couldn't mend it because of the rain.

## Railway Buying and General Business

By E. B. Leigh

President, Chicago Railway Equipment Company

WITH REFERENCE to the advantages of a "Buy Now—Ship Now" policy, not only to the railways themselves but to the country at large: Let me first call attention to a fact, familiar to you, namely, that it has been amply demonstrated that for a period of over fifteen years prior to the Great War, railway purchases not only initiated general activity, but also that once thus started, sustained a general buying movement, and with its logical reflection in general business—in a word, general business prosperity. While this relation was largely suspended during the abnormal conditions of war, the principle is as sound today as ever.

As we are now passing through a period of drastic liquidation, it may be urged that commodity prices have not yet reached their lowest level; while the labor question is far from being adjusted as eventually it must be—hence that it is not yet an opportune time to initiate extensive buying.

Under normal conditions this situation might properly influence and delay all purchases, where postponement is possible, until these important factors have become stabilized.

But are we, or are the railways, operating under "normal" conditions?

It is well known that railway facilities are entirely inadequate, both in requirement and condition; that purchases on an enormous scale must be made before our railways, as a whole, will be able to take care of the country's requirements, once the temporary depression is passed and the several years of unprecedented business, confidently predicted by nearly all authorities, are upon us.

At this particular time, and in view of the unusual con-

ditions surrounding them, it would seem the part of wisdom for the railways to consider the possibilities of ultimate, rather than immediate cost of facilities, when measured in terms of the consequences of delay; for it is worth while to remember that ultimate cost may involve factors other than present price. A margin of price obtained by delay might prove an expensive economy if the delay itself entailed disaster.

Most serious is the prospect that in the next large freight movement (not far off from the most pessimistic standpoint, if measured by the time absolutely necessary for construction), inadequate facilities, poorly maintained, will mean *unsatisfactory service*.

If that occurs it will take every resource of skill and organization to keep the railways in private control. What could prevent this issue from dominating the next presidential campaign? If ever anybody needed the caution against the temptation to be penny wise and pound foolish it is the railways of the United States in the year 1921.

The present period of depression affords an ideal opportunity for the manufacturer to produce and the railways to transport the needed facilities. By so doing both are active; each would gain; the railways by utilizing their present equipment in acquiring their materials and devices; the manufacturer in making prompt deliveries; while each would gain valuable time and headway in that inevitably vast rehabilitation of the railway's carrying facilities.

In view of the situation outlined, and the probable helpful effect upon business generally, surely it would seem wise to "buy now" and "ship now."

# Railroad Power of Rehabilitation Returning

Budgets Indicate Gradual  
Re-establishment of Rail-  
road Credit, With Which  
Expenditure Will Keep Pace

THE RAILROADS of the United States have been considering 1921 programs for additions and betterments which, in terms of new bridges, new rail, ballast, shop extensions, and new equipment approximate a normal pre-war year's work. This statement is based on information furnished us at our request by the presidents of nearly all of the large railroads of the country, approximately one-fourth of whom gave us detailed information concerning the projects now under consideration, these roads being so widely scattered and operating under such diverse conditions as to be representative of the railroads of the entire country. While this program may seem conservative, when compared with the cumulative effect of several years during which not much expansion work has been done, it marks a distinct advance toward better conditions, and the fact must not be overlooked that to raise nearly \$1,500,000,000 now required to carry out such a program would place a strain on the credit of the roads more than twice as great as was required to raise between \$600,000,000 and \$700,000,000 a year before the war.

Executives are keenly appreciative of the need for extensive improvements, and increases in railroad facilities, and there is probably no group in the country more anxious that this need be supplied within the shortest possible time. This statement of the receiver of a large line is typical of similar expressions by others.

"In common with most southwestern lines \* \* \* terminal facilities are inadequate, and if funds were available we would like to spend about \$6,000,000 per year in providing freight train yards and facilities for caring for equipment, passing tracks and ballasting. If we were able to spend \$5,000,000 or \$6,000,000 for the next six years we would include in improvements stretches of double track and about 400 miles of automatic block signals."

The president of an eastern railroad says:

"Should business develop, as I believe it must, this company would need, say, 50 locomotives and 3,000 freight and coal cars, as well as 75 passenger cars. We ought to spend on additional running tracks, yards, stations, and other facilities from seven to ten million dollars."

A western railroad is planning to spend about \$12,000,000 in improvements, including the acquisition of new shops and equipment, probably over a period of three years or more.

While it is impossible to discuss in detail what may be considered the railroads' maximum expectation for the year's capital expenditures, it is evident that the largest item would be for new locomotives and freight cars and that, amounting to about one-half of the total, it would be proportionately a little larger than the average. Of the remainder, the greater proportion would be spent in renewing bridges, relaying rail, providing additional passing tracks and second tracks, and in public improvements, such as grade separation projects and new stations. Yards and terminals, shop extensions and shop facilities together, apparently come in for considerably less than one quarter of the total.

In general, comparatively little new passenger equipment is under consideration. That this is not because of any failure to appreciate the need for additional passenger cars is evident from the following statement by an eastern railroad president:

"It was our expectation to expend approximately \$1,225,000 in the purchase of additional passenger train cars during 1921, but in view of the decision of the Interstate Commerce Commission that no moneys would be loaned from the \$300,000,000 revolving fund for the purchase of such equipment until practically all other needs have been met, it has been found necessary to postpone such purchase until a later date."

## Year's Work Now Uncertain

What the railroads have had under consideration and what actually is likely to be done may be quite different matters. The extent to which all the projects being contemplated will be definitely developed and the extent to which they will be carried out is very uncertain at the present time.

There are five principal reasons for this uncertainty, not all of which affect every case, but some one or more of which is at present exerting a powerful influence to defer the definite formulation of betterment programs on a scale satisfactory to railway executives. These are: First, the sharp business recession since October; second, inability to forecast the full effect on net earnings of the new freight and passenger rates; third, failure to effect settlements with the United States government for the period of government control and the subsequent guaranty period; fourth, the slowness with which loans have been released from the \$300,000,000 fund created by the Transportation Act, and fifth, the convic-

**R**AILROADS possessing cash or credit are pushing ahead with their betterment programs. Other large programs are awaiting the gradual restoration of railroad credit.

The general attitude of railroad executives reflects confidence in the ultimate working out of the present uncertainties to a satisfactorily stable basis, but this faith is tempered by a disinclination to take chances with the solvency of the properties on a guess as to just when the desired stability will be attained.

tion that the prices prevailing during the closing months of 1920 are excessive.

The marked reduction in traffic which has been evident since the latter part of October has had a most marked effect in holding up or causing a complete revamping of programs for the coming year. Thus, the chairman of the board of directors of a southern road says:

"We had outlined a comprehensive plan of development which we now feel, owing to the very considerable recession in business, will be materially modified. Under these conditions I feel that we should go slow in making forecasts and determining just what should be the program for 1921, until we see the signs of revival of business, which I personally feel will take place after the first of the year."

The president of another road says: "At the present time I feel like postponing all expenditures except such as are absolutely necessary until we can see a little farther on."

The president of a western railroad system says that, until business improves, "we have felt that it would not be practicable to make any budget of improvements for next year, because expenditures in that direction necessarily will depend upon the revival of business."

There is an inkling of the problems of management created by the decrease in the volume of freight movement in the statement of the president of another road, who says "I spent some little time in getting the \* \* \* organization into the frame of mind necessary to enable it to deal with a slump in traffic and until there is a radical change in the business outlook I don't want to begin talking to our people about spending money for improvements unless it is something necessary for safety of operation or service to the public."

There are a number of railroads whose credit standing is such that the only means of financing additions and betterments is from surplus earnings. The showing made by such railroads, particularly in the west and southwest, under the new rates during the month of September and October were sufficiently encouraging to lead to the development of tentative improvement programs. The effect of the decrease in traffic on these roads is clearly brought out in the following quotation from the president of one of them:

"The great slump in business which has occurred in the last six weeks and the outlook for its continuance for some months has made it necessary for me to revise the plan which I had in mind and will probably make it necessary for us to hold our expenditures down to those matters which are more or less inseparably connected with the maintenance work, or which are required by state or federal authorities."

Several conditions have arisen in the short time since the increase in freight and passenger rates went into effect which make it very difficult to foresee just how closely they will produce an average net operating income equal to six per cent on the valuation. In the first place the rates have only been in effect for a period of four months, and during that period the heaviest average daily traffic movement ever recorded has been followed by a slump that has reduced traffic to a point considerably below the average for the first six months of 1920, the basis on which the rate increase was established. Furthermore, during September and October, two months of unusually heavy traffic, the net operating income of the railroads as a whole was respectively \$34,000,000 and \$26,000,000 less than the six per cent average designed to be produced by the rates, although the first returns for November are more favorable.

Other factors adding to the uncertainty as to the adequacy of the present rates are stated thus by the president of an eastern railroad: "First of all the rates authorized are not yet all in effect and few, if any, of the roads have been able to adjust their operations, and particularly their forces, upon anything like a stable basis."

Considerable time will probably elapse before operating

practices become stabilized on an efficient basis, and until it is generally believed that such a basis has been reached, no one can say with certainty how far it may be possible to offset conditions unfavorable to the present rates, by decreases in operating expenses.

At the present time, therefore, the ultimate effect of the rates in restoring railroad credit is largely a matter of conjecture.

The first and second causes for uncertainty as to what capital expenditures may be made during the coming year are of very general application; there are probably few instances in which they have not exerted a material influence towards limiting expenditures in the immediate future. The failure to secure settlements with the government, particularly for the six months' guaranty period, and the slowness with which negotiations have been completed for loans from the revolving fund are not of general application, but in the aggregate the amounts involved are great enough to produce a marked effect in delaying the effective rehabilitation of the nation's transportation system. Approximately \$400,000,000 due the carriers under the guaranty provisions of the Transportation Act is locked up in the United States treasury awaiting a decision in mandamus proceedings before the Supreme Court of the District of Columbia to determine whether the treasury department's strict interpretation of the act shall prevent the roads from having access to any portion of this sum until all claims have finally been adjusted.

Following considerable delay at the outset in interpreting the provisions of the Transportation Act pertaining to the distribution of the \$300,000,000 revolving fund, loans are now being approved with much greater celerity and at the present time probably about two-thirds of the total amount has been authorized. This leaves approximately \$100,000,000 still available. When this is added to the \$400,000,000 guaranty fund, the total amount thus withheld very closely approximates the average annual expenditure for additions and betterments made by all the railroads during the years immediately preceding the war period.

Just how this situation has affected some individual railroads is indicated by the following statement of the president of an eastern system:

"What we shall be able to do in that year (1921) is problematical and largely depends on what settlement we may make with the government under the contract and during the guaranty period; when we secure the money, and how much; and also upon financial conditions generally in the immediate future."

The president of a small railroad in the central district which has plans developed for the expenditure of approximately \$1,800,000 in 1921 says, "Whether we will be able to do much of it or not will depend on whether we can work out some settlement with the government which now owes us nearly \$3,000,000. Up to this time we have been unable to get anything and are naturally pretty short of cash."

The belief that present price levels are excessive and cannot long be maintained, in some cases is also a powerful factor in reducing capital expenditures to bare necessities.

"Who has the nerve to buy a thousand freight cars at \$3,200 to \$3,500 a car, or locomotives at \$55,000 to \$70,000, or undertake large construction jobs with an eight-hour day program and existing rates of wages? Who will build extensions to railroads with steel at \$55 to \$57 a ton? \* \* \*

"Manifestly there is some work which must go on willy nilly; but \* \* \* a suit of clothes with patches on the seat are still clothes and a man may still present himself in public and bide his time till the price of another suit comes within reach."

This is the statement of the president of an eastern railroad having \$20,000,000 in bridge and grade separation projects, shop extensions amounting to \$1,000,000 and a new

equipment program amounting to about \$3,000,000 "which ought to be put in hand."

The president of a southern railroad who has authorized expenditures for double track, reduction of grades and other roadway expenditures since the return of the railroads to private control aggregating more than \$12,000,000, and who hopes to appropriate considerably larger amounts during 1921, says: "The present prices for equipment of all classes are in my opinion quite excessive and unless material reductions are brought about we may not be able to increase our ownership on the scale now in contemplation. \* \* \* We have some very pretentious ideas as to additional equipment but I am afraid that we shall be obliged to go rather slowly."

#### Programs Definitely Undertaken

But in spite of all these unsatisfactory conditions tending to withhold expenditures on a large scale, a number of extensive projects have been definitely laid out for execution this year. Others undoubtedly will be decided upon in ample time for completion before the end of the year, as many railroads do not take up final consideration of their budgets until after January 1. Many improvements started during 1920 also will be carried on or completed during the current year. These projects will add materially to the volume of work under way during the year as well as to the facilities which will become available before the end of the year.

The few definite programs, knowledge of which is available, call for total expenditures, including equipment, ranging from approximately \$2,500 to \$26,000 per mile of line.

The Delaware & Hudson Company is planning line reconstruction and new yard projects involving a total expenditure of \$2,250,000.

The Southern Pacific, Texas and Louisiana Lines, has recently authorized expenditures of over \$16,000,000, of which \$8,750,000 is for the purchase of equipment or the construction of equipment in its own shops, \$3,800,000 is for ballasting, \$2,800,000 for rail relaying and \$700,000 each, for the purchase of new shop tools and for bridge work, respectively.

The Chicago & Alton will spend \$2,404,000 for equipment which will become available during 1921, and will complete a new freight house and general office building in Chicago, costing \$1,960,000. In addition to this the freight yard and engine terminal at Springfield, Ill., will be enlarged at a cost of \$425,000, and \$195,000 will be expended on second main track. Other additions and betterments amounting to \$200,000 make a total of \$5,184,000 in additions and betterments which are all expected to be in service before the end of 1921.

The Richmond, Fredericksburg & Potomac, with only 119 miles of line, is spending a little more than \$1,000,000 on improvements, \$500,000 of which is for the purchase of new equipment or rebuilding of existing equipment, while a slightly larger amount will be expended in additional engine house facilities, shop tools, freight station and classification yard enlargements and the construction of a new electro-pneumatic interlocking plant.

The Delaware, Lackawanna & Western will undertake a grade separation project through the city of East Orange, N. J., that will involve a total expenditure of about \$4,000,000.

The Chicago, St. Paul, Minneapolis & Omaha now has under contract 10,500 tons of rail, 10 locomotives, 125 stock cars, five new station projects and extensive yard and station improvements at five terminal points. This work will aggregate \$2,100,000 and will all be completed in 1921. The full program for the year, of which this forms a part, has not yet been completed.

The Missouri, Kansas & Texas has tentatively outlined a program for improvements for this year aggregating approximately \$22,500,000. Of this amount over \$12,000,000

is for 60 passenger cars, 2,800 freight cars and 40 locomotives; \$6,000,000 is about equally divided between shops and engine houses and terminals and yards; \$900,000 is for new rail, \$886,000 for stations, \$701,000 for signals and interlocking plants, and the remainder for ballast, bridges and shop machinery.

The budget of one eastern road, averaging \$7,000 a mile of line, will be spent as follows: \$3,000,000 for new freight locomotives, \$900,000 for seaboard terminal improvements and about \$1,000,000 for new passing tracks, terminal facilities, double track and miscellaneous improvements, to be completed during 1921.

The Norfolk Southern has made definite plans to spend about \$400,000 on grade revisions and strengthening bridges, which will practically double the train haul between Raleigh and Charlotte, N. C., a distance of 156 miles. This road is also planning to spend about \$250,000 on the rehabilitation of 400 freight cars.

The Boston & Maine is planning to purchase 27 new switch engines and 10 freight locomotives.

The Chicago, Indianapolis & Louisville will build a \$200,000 steel freight car repair shop and expects to spend \$350,000 for new locomotives.

The president of a large eastern railroad says: "We are going along and authorizing upwards of \$1,000,000 of new work every month, and have been doing so right along during the past because the \* \* \* company is obliged to do about that each month whether it wants to or not in order to measurably keep up with the procession." This money is spent on such additions as new industrial tracks, enlargement of certain facilities, grade separation and new equipment.

These budgets are reasonably certain of execution during the coming year and they are typical of the plans of other railroads that will be carried out in spite of present uncertain business conditions.

Among the projects under way but incompletely which will be continued during 1921, the Nashville, Chattanooga & St. Louis has appropriations for new capital amounting to \$273,000 for additional terminal facilities, \$314,000 for other roadway improvements, \$264,000 for additional freight cars and \$93,000 for other equipment.

The Wheeling & Lake Erie is spending about \$1,500,000 on additions and betterments, approximately \$1,000,000 of which will be used during 1921. The improvements contemplated are additional yard and terminal facilities at Jewett and Canton, Ohio, and car repair facilities at Brewster, Ohio.

The Long Island now has under way yard addition and improvement projects amounting to \$500,000 and is spending \$540,000 on additional high tension transmission lines to reinforce its electrical installation.

Some of the other projects already under way are the construction of equipment and the building of a double track on portions of the Virginian which, including additional side tracks and improvements in terminal facilities, involve a total expenditure of approximately \$10,000,000; the building of a cut-off on the Kanawha & Michigan and the enlargement of yard and engine terminal facilities on the Texas & Pacific.

Contracts have been let by the Atchison, Topeka & Santa Fe for the construction of new shops at Albuquerque, New Mexico, involving an expenditure of nearly \$2,000,000.

#### The Outlook

The general attitude of railroad executives is not one of pessimism; rather, it reflects confidence in the ultimate working out of the present uncertainties to a satisfactorily stable basis. This underlying faith, however, is tempered by a disinclination to take chances with the solvency of the properties on a guess as to just when the desired stability

will be attained, and it is also restricted in its effect by a lack of credit not within the power of the executives to overcome immediately. One railroad president aptly summarizes the situation as follows:

"While the outlook under the new rate basis \* \* \* is very encouraging, the actual status of the company is that of being convalescent at the moment, and this, I take it, is true of the great majority of American railroads.

"Because of the very poor showing which all of the companies made as a result of operation during the period of federal control, more or less—generally more—doubt has been cast upon the earning possibilities of the companies and consequently upon their credit, and those who determine the standing of railroad credit will want to see the results from a number of months of operation on the new rate basis before reaching a definite conclusion."

The impossibility of any overnight rehabilitation of the railroads' properties and the need for patience on the part of the public is also touched on by the president of a western system. He says:

"I do not think the public should expect too much of the railroads at too early a date. The Transportation Act of 1920 and the increased rates are calculated to restore railroad credit but this will take time and until it is so restored that financing can be done on a reasonable basis railroads cannot go ahead with any comprehensive program of expansion and improvements. When the way is clear for financing, the next step will be to make arrangements therefor. After such arrangements are made, it will then be in order to look for such an improvement in the railroad plant as the needs of the country require and the public expect."

The whole matter sums up to just this: Those roads fortunate enough to possess cash or credit are pushing ahead with their betterment programs, but in general, extensive programs must await the restoration of railroad credit. Credit restoration, at best must be a gradual progress, and the sharp recession in business has temporarily stopped the process. In the meantime the provisions of the Transportation Act to tide the roads over this transition period are functioning only partially and may or may not function completely before the period is past.

With one exception the factors affecting credit restoration must take their course through the "mills of the gods." The volume of traffic alone is subject to some control and this is in the hands of the shipping public.

## New York Central Proposes Lease of Chicago Junction

THE NEW YORK CENTRAL has filed formal application with the Interstate Commerce Commission for authority to lease, operate and ultimately purchase the Chicago Junction Railway Company terminal properties at Chicago. The project proposes the unification of related lines for greater economy and efficiency, and concerns properties valued at about \$33,000,000.

The New York Central has long needed larger freight terminal facilities at Chicago, and the lines embraced in the proposed merger are the only such properties remaining unconnected with a large trunk line system, spreading over the important industrial districts of southwestern Chicago, including the Union Stockyards district. Included in the plan are the lesser terminal properties of the Chicago River & Indiana.

The Chicago Junction terminal facilities connect directly with the New York Central's "outer belt line"—the Indiana Harbor Belt Railroad—forming a natural extension of this company's rails into the heart of the city's southwestern industrial section, and thereby assuring to both railroads an increase in efficiency and capacity which has been impracticable under independent operation. The terminal properties have superior connections also with three other railroads of the New York Central system—the New York Central, the Michigan Central and the Big Four—each of which will be provided with better terminal service for all of its heavy Chicago traffic.

The application states that extensive immediate improvement and development of the existing terminal facilities, which could not possibly be duplicated, is planned. It enumerates in detail the various operating conditions which make acquisition of the additional terminals by the trunk line distinctly a matter in the public interest and cites the ways in which the efficiency and capacity of both the terminal properties and the existing facilities of the trunk line would be enhanced by the consolidation. It is stated that at present the natural flow of a large amount of freight traffic over the main lines actually is impeded and delayed by circuitous routing because of the inadequacy of terminal facilities at Chicago.

The territory served by the Chicago Junction terminal lines, in its extremities extends from Western Boulevard on the west to Lake Michigan and from Forty-ninth street on the south to Ogden avenue.

The Chicago Junction, in general, includes a double-track inner belt line 23.94 miles long, with side tracks and industrial tracks aggregating 168.66 miles. It owns 68 locomotives and 291 cars. The Chicago River & Indiana owns 15.71 miles of terminal road, all within the city of Chicago, and has trackage rights of 28.87 miles over other roads. It owns 9 locomotives and 264 cars. The foregoing are the figures given by Moody's Manual.

The proposed method by which the terminal properties are to be acquired by the New York Central provides for the purchase of all of the capital stock of the Chicago River & Indiana, and the lease thereto, with right of ultimate purchase, of all the properties of the Chicago Junction Railway Company. The properties have been exhaustively examined by experts as the basis for appraisal of valuations.

American Cars Unloaded at Danzig, Poland, Ready to Be Assembled

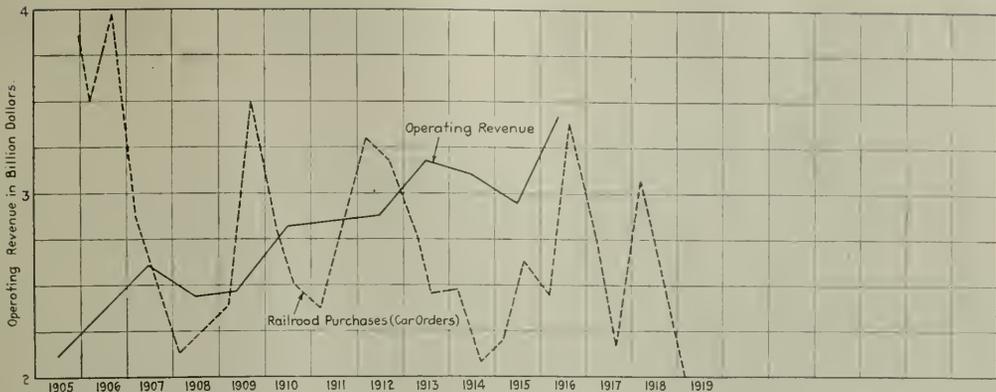

Fig. 1—Railroad Operating Revenue as Compared with Railway Purchases

Railway revenue, which furnishes the financial basis for car purchases, is represented by a relatively straight line, with slight vertical fluctuations and with an upward movement that shows little interruption. The curve representing car purchases, however, is highly irregular and is subject to extreme fluctuation.

## The Next Step Toward Preventing Depressions

Stability of Railway Purchases Offered as Remedy by  
Railway Business Association Committee

“As CAUSES of industrial and commercial depression, crop failures and money panics have been made unlikely. The next step toward continuity of general business and employment is to stabilize railway purchases.” This is the conclusion stated in a report made by the Com-

mittee on Stability of Railway Purchases of the Railway Business Association’s general executive committee.

The committee points out that if the several governmental units and the public utility companies were to pursue a policy of doing their heaviest improvement work in times when

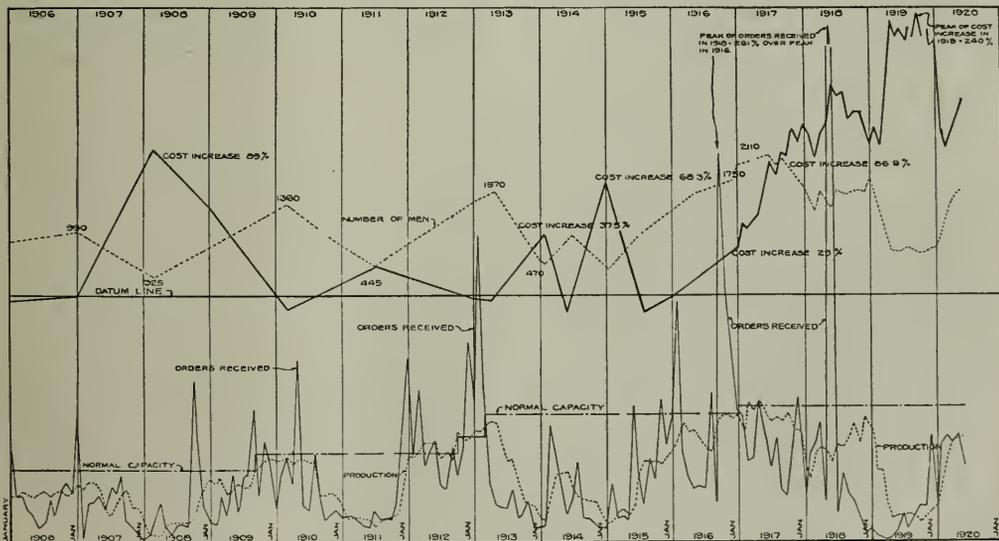

Fig. 2—The Experience of an Industrial Company Supplying Railway Materials

This shows strikingly the relation between volume of railway orders and the production cost level. With the decline in orders and production in 1907, the production cost increase was 89 per cent; in the same time the number of employees fell from 990 to 325. With the revival of railway purchases in 1909 and 1910 the number of employees rose to 1,360, and shop costs dropped to a lower level than had prevailed in the prosperous days of the end of 1906. Similar correspondence between the curves of railway orders, production, number of employees and production cost prevails throughout the chart. It is maintained after the outbreak of the war, though beginning with 1915 costs show a pronounced independent upward tendency.

general business is slack and unemployment serious, and the steam railways followed the same course, the ups and downs in forestry, mining, manufacture and trade would be

of the Committee on Stability of Railway Purchases, in cooperation with the president and secretary, to prepare the first of a series of documents setting forth the substance of

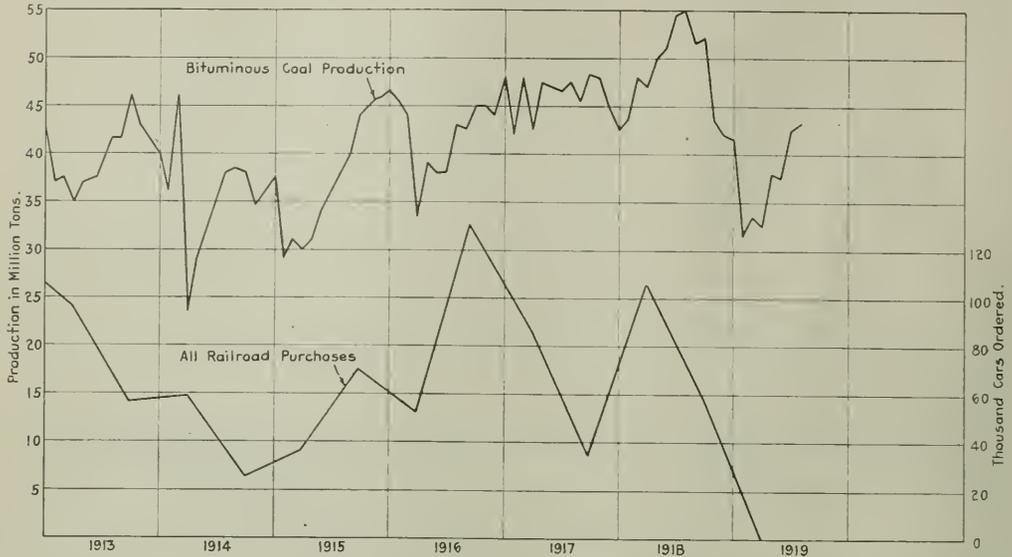

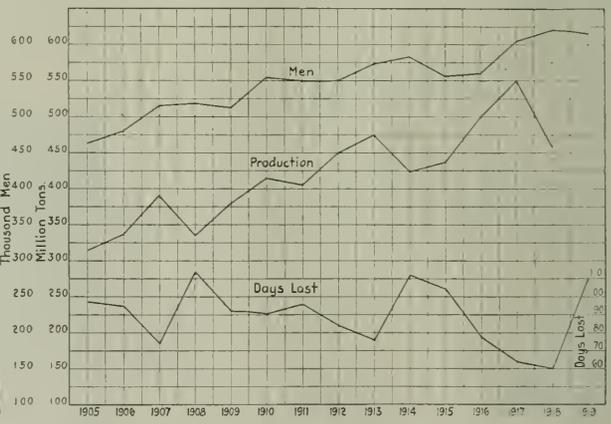

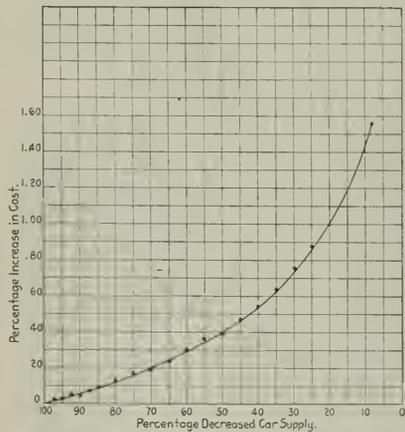

Fig. 3—The Relation Between Railway Car Purchases and Employment in Bituminous Coal Production

This chart, while it does not display the minute correspondence that is characteristic of the two preceding ones, indicates a general relation that is striking. Car orders dropped heavily in 1913; coal production first dropped and then recovered, but rushed downward rapidly early in 1914 by way of compensation. The subsequent upward swing appears first in the railway order curve late in 1914 and extends to the coal production curve with the beginning of 1915. The downward movement appears in the car order curve late in 1915 and in coal production in January, 1916. The car order slump in 1917 is not reflected in coal production; this is of course explained by war conditions, which accelerated business in some directions, while retarding it in others, including railway equipment manufacture. The long downward curve in 1918 appears first in railway purchases and afterwards in coal production.

greatly mitigated, if indeed acute unemployment were not thereby reduced almost to the negligible.

the report for circulation among the railway supply manufacturers and among the railway managers. The chairman of the committee is S. P. Bush, president and general man-

The general executive committee requested the chairman

Figs. 4 and 5—The Production of Bituminous Coal in Relation to Car Supply

The chart on the left refers to cost of production. "The particular cause of lost operating time here selected for analysis was car shortage," says the American Institute of Mining and Metallurgical Engineers, which prepared the chart. "Other causes such as mine disability or dull market, would doubtless have increased costs in the same manner. It is the interruption to operation, not the cause of the interruption, which raises prices." The upward sweep of the production cost curve is rapid and would apparently, if car supply reached zero, attain to that paradise of mathematicians, infinity. The chart is based on monthly records of car operators in the New River district of West Virginia which produced 7,231,343 net tons in 1917. The chart on the right shows the relation between intermittency of employment in bituminous coal production, the number of men required to get out the year's supply under that condition, and the consequent labor cost.

ager of the Buckeye Steel Castings Company, Columbus, Ohio.

Responsive to the authorization mentioned above the following has been drawn:

**Digest of Report of Committee on**

**Stability of Railway Purchases**

Certain strong railway systems have in the past or present boldly made large improvements in dull periods. Their theory was that the accumulation of idle locomotives in roundhouses and idle cars on sidings was the signal to buy more locomotives and cars; because never could they be bought so cheaply as then and never would there be so much available track and motive power wherewith to transport the materials of engine and car construction without crowding general merchandise traffic off the ways. The same applies to construction of track and all appurtenances of the railway, as well as terminal improvements and enlargements.

Not only are these facilities obtained within such periods at least cost for material and labor and at least inconvenience

the basis of carrying on addition and betterment work energetically during times of depressed traffic and earnings, thus avoiding the extreme ups and downs which affect the railway supply industry and which are so costly for all concerned. We have said that the government should give and the railways seize this opportunity to effect economy and to stabilize employment of labor and plant."

The committee has constructed 11 charts illustrating the bearing of railway purchases upon the welfare of labor and of general business. The charts are now printed for the members of the association and others interested.

**BENEFITS GENERAL.**

While stability for the railway supply industry would be a direct result of stabilizing railway purchases, the benefits would be widespread and would extend far beyond the limits of any one industry. "The stabilization of national industry through a soundly constructive railway transportation policy and economical railway purchasing" is the true aim of the committee, according to its report. "A soundly economic

**Fig. 6—Locomotive Construction as Affected by Railway Purchases**

The chart which shows graphically the effect that orders and deliveries of locomotives at the American, Baldwin and Lima plants have had upon the employment of labor there since 1900. The curves rise and fall in unison throughout the chart. Such variations as orders of 4,839 locomotives in 1906 and of 929 in 1908 are shown to be attended by such decreases in employment as from 19,500 in 1907 to 7,000 in 1908.

to general business, but the roads so promptly and economically equipping themselves are ready to carry the next peak of load when it comes. It has always been recognized by those close to the situation that such large railway buying has mitigated unemployment and eased the financial strain upon many industrial and commercial institutions. As adequate railway revenue is essential to a stabilization of purchases, the committee will observe the financial results of railway operation under the rate schedules recently initiated by the Interstate Commerce Commission with a view to offering such recommendations as experience may make desirable.

**ORIGIN OF THIS COMMITTEE**

The Committee on Stability of Railway Purchases was named in response to a clause in the annual report of the general executive committee for 1920:

"Promotion of such stability has long been a part of our work. We have continually declared that sufficient railway income should be permitted for accumulation of a surplus as

purchasing policy can hardly be inaugurated and carried forward unless the general policy governing the railway transportation industry is sound and constructive," the report adds.

E. B. Leigh, appearing on behalf of the Railway Business Association before the House Committee on Interstate and Foreign Commerce on September 15, 1919, testified to the magnitude of the railway supply industry:

"In general I make the statement that no occupation except agriculture employs so many people as do railroading and providing the needs of railroads. From raw material to finished product those employed in railway supply industries are believed to be pretty close to 2,000,000. Apparently another 2,000,000 are now employed by the railroads themselves, a large number of these engaged in the maintenance, improvement and extension of the properties.

"If new railroads were in the course of construction the number of employees would be increased by many thousand more whose existence makes no entry upon the statistics of

employment compiled by the Interstate Commerce Commission until the new road is completed and actually doing business as a common carrier."

indicates, be highly advantageous to the country even if it carried no other beneficial results in its train. The steel industry in the days before the formation of the United

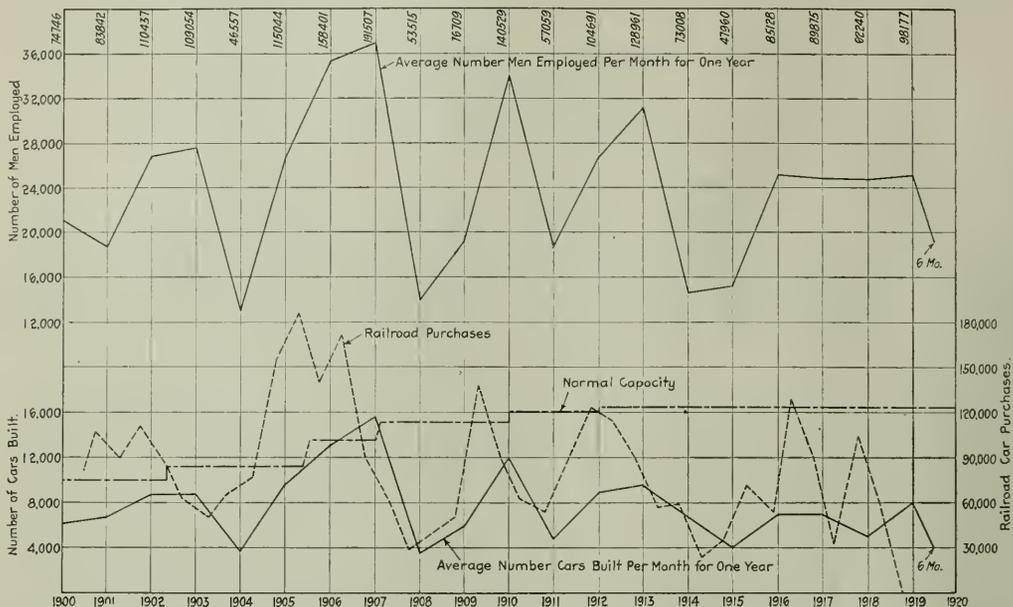

Fig. 7—The Car Building Industry as Affected by Railway Purchases

The curve showing the number of cars built follows the curve of railway purchases at an interval of some months, which represents the time elapsed between the receipt of the order for cars and the completion of the cars. The curve representing the number of employees varies directly and immediately with the production curve, dropping from 128,961 in 1913 to 73,008 in 1914, and rising to 85,128 in 1916. The production curve rarely reaches the line representing the normal capacity of the plants and remains far below that line for the years since 1907.

PRINCE AND PAUPER

The stabilizing of an industry so huge and so far-flung as the railway supply industry would, the committee report

States Steel Corporation, Andrew Carnegie once said, was either prince or pauper. The railway supply industry, while it never resorts to passing the hat, has its long-drawn-out

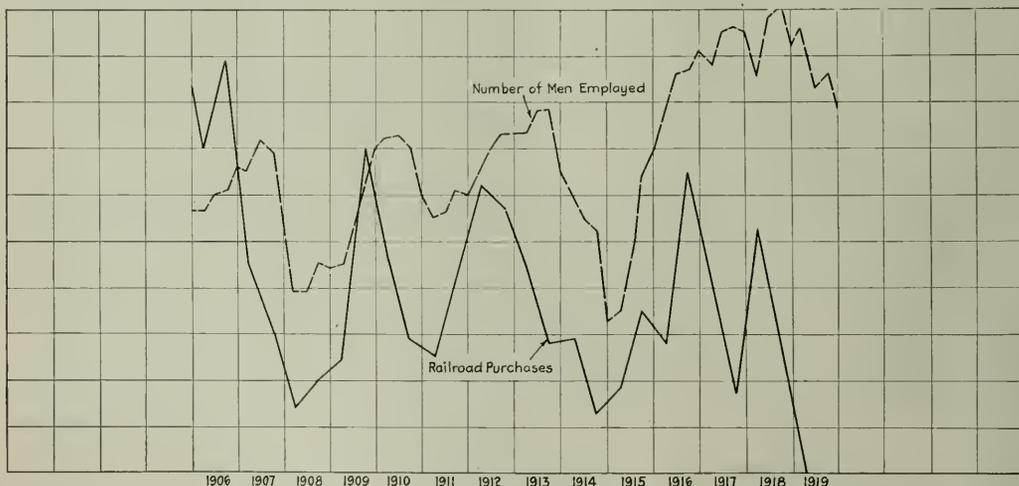

Fig. 8—Employment in the Steel Industry as Affected by Railway Purchases

Employment in the steel industry, as shown by the experience of the United States Steel Corporation since 1906. The curve showing railway purchases describes wide sweeps up and down the chart. The curve showing the number of men employed follows the railway purchase curve at a discreet distance, from which observers deduce that in relationship of the two the railway purchase curve is cause rather than effect.

pauper periods, which subsist on the comparatively princely intervals and which necessitate relatively high wages for capital and labor during the prosperous interludes if the industry is to be prepared to discharge the demands made upon it.

Idle time on the average has been estimated by some authorities as high as 50 per cent in the coal mining industry, 70 per cent in the entire steel industry, 62 per cent in the steel castings industry, 55 per cent to 60 per cent in the car building industry and 65 per cent in the locomotive building industry. If buying continues to be conducted in the present sporadic manner, further additions to these plants will be necessary to care for the next business advance, and these additions will themselves, over a period of years, re-

public utilities, as well as the federal, state, county and city governments, would conduct their buying moderately when trade is brisk and come boldly into the market for labor and materials when business is slack depressions would be greatly mitigated if not done away with altogether."

The reason, Mr. Johnson explained, why a railway could pursue such a policy successfully, though it would in many businesses not be feasible, lay in the fact that a railway, even though its business had fallen off, could predict with certainty that in a short time its facilities would be overtaxed and that certain additional facilities, both of way and of equipment, would be required. It could proceed to place its orders with certainty, just as Ole Hanson while he was Mayor of Seattle found he could do in the case of street

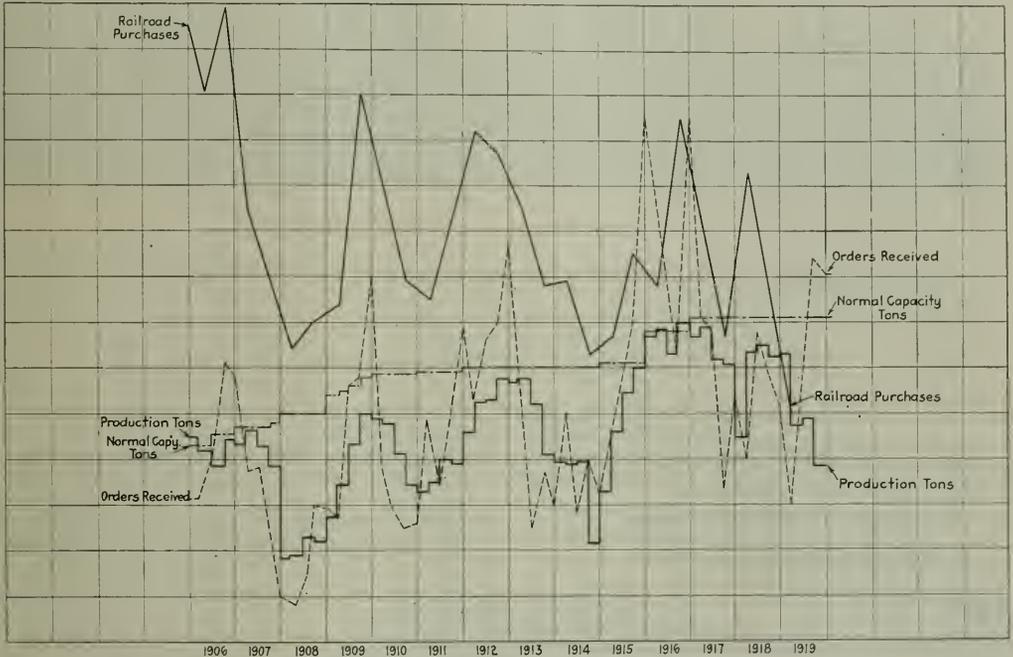

Fig. 9—Steel Production as Affected by Railway Purchases

The relation between railway purchases, orders received, total production and normal capacity in tons, in the experience of the United States Steel Corporation from 1906 to 1919. The railway purchases curve keeps close company with the orders received curve and in some instances displays the phenomenon of preceding it in upward or downward movements. This is true of the drops in 1909 and 1912. The production curve follows the ups and downs of the railway purchases curve throughout the chart.

main idle for much of the time. The total loss from the strikes of the year 1919 has been placed as high as \$2,000,000,000. It is possible that the losses due to shutdowns caused otherwise than by strikes would reach a figure equally high.

**Can Anticipate Needs**

Speaking of the need for stabilized railway purchases, President Alba B. Johnson in an appendix to a statement made in August, 1919, before the House Interstate Commerce Committee, said:

"Some citizens bite this idea to see whether it is bogus. They inquire with a quizzical smile why it is only the railroads that should buy in dull years. What, they ask, is to prevent every kind of business from stocking up when the store is empty of customers? Why need there ever be any depression? The truth probably is that if railways and other

improvements. Mr. Hanson on June 30, 1919, in answer to a letter from the Railway Business Association, wrote:

"We have held back street improvements, which are paid for by special assessments, for four years, making it possible for us to embark at once upon a career of money-spending in necessary public work. There are, as far as I know, very few people idle in Seattle today, not nearly as many as were idle before the war and during normal times."

**EMPLOYMENT OF LABOR**

Steady employment, the committee report says, "is the most essential element to the welfare and contentment of the worker."

"Undoubtedly periods of depression in the past have furnished labor with a very sound basis for some of its demands," the report continues, "and your committee is of the opinion that some reasonable stabilization of employment and

## What Additions to Physical Property Are Necessary?

### Little Increase in Traffic Possible Without Betterments in Terminals and Other Facilities

**C**AR SHORTAGE, like anæmia, is a symptom common to a number of basic ills. In the absence of other related facts, it is therefore difficult to tell which one of them is responsible. Anæmia may be the result of inadequate nutriment, a defective circulatory system, or improper heart action. By the same token, a car shortage may result from an insufficiency of cars, inadequate trackage, a lack of motive power, or all possible combinations of these defects. No matter how plentiful the cars, they cannot be delivered if the tracks over which they must be operated are congested, or if the locomotives which move them are insufficient or are in poor shape for want of proper care.

In view of these fundamental facts, it is patent that any case of inadequate service must be subjected to most exacting diagnosis if the conditions responsible are to be determined accurately. There are cases where a car shortage may be relieved as much if not more by providing more or better locomotives or more trackage and other auxiliary facilities as would be made possible by the purchase of additional cars.

Following the return of the roads to private control in the spring of the past year, the managements were confronted with an unprecedentedly large freight traffic and realizing that private control was on trial, they exerted every possible effort to handle the traffic offered with the facilities at their

disposal. As a consequence they succeeded in handling a greater freight traffic than was ever moved before in an equivalent period. In August, 1920, this reached a maximum of 42,706,830,000 net ton-miles.

**C**ONSIDERABLE ADDITION to track mileage and increase in facilities for the care and repair of locomotives is necessary before the roads can be expected to effect appreciable improvement in car movement.

Large expenditures must be made for more adequate engine terminals, coaling stations and more satisfactory water supply.

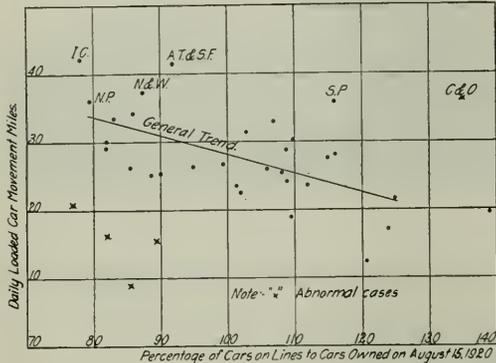

Improved yard facilities, side track extensions, grade separations, deferred bridge renewals, and new passenger stations will also require large sums.

The above figure is virtually the product of the number of cars loaded, the distance that the cars are moved each day and the number of tons of freight loaded in each car. Through the agency of the Association of Railway Executives and the American Railroad Association extreme pressure was imposed on the roads to exert every possible effort to secure a maximum loaded car movement, and there is reason to believe that the managements all entered fully into the spirit of the campaign to this end. However, the results secured differed widely. Some roads moved cars over 40 miles per day; others were unable to move them over 12 miles.

There is no doubt, a considerable variation in the efficiency of the supervision or in the *esprit de corps* on the various roads, but unquestionably a greater difference arises from local business conditions and the physical characteristics of the lines. Short terminal roads obviously will not make as good showings as long lines with simple terminal requirements. Another reason for this disparity of results may be illustrated by the chart showing the average daily car movements of 38 railways in various parts of the

country. In this chart the car movement for the month of August, 1920, is shown in relation to the percentage which the number of cars on each road on August 15 bore to the total number of cars owned by that road. In other words, the chart shows how the relative number of cars on the lines affects the loaded car movement. While this relationship is obviously influenced by a great many other conditions, the chart shows that generally better results in car movement were obtained on roads having a smaller number of cars on their lines than they own.

Considered in other ways, the chart indicates that some railroads have reached a limit in car handling capacity, and must of necessity make appreciable additions and improvements to facilities before they can hope to handle a larger

Approximate Relation of Car Supply to Car Movement

volume of traffic expeditiously. Conversely, the roads which have made the best showings in moving cars, taking due account of peculiar local conditions, are those which have been forehanded in their expenditures for additional trackage and terminal facilities.

While the roads have been successful in increasing the volume of traffic handled through the more intensive use of the facilities at their disposal, the above analysis demonstrates that further progress, insofar as it concerns the daily loaded car movement, is contingent upon additions to the fixed property. As one railroad president has recently expressed it in referring to the requirements of his own road, "We are obliged to spend about \$1,000,000 each month whether we want to or not to measurably keep up with the procession."

Another factor which has played no small part in enabling the roads to handle a large traffic with the existing facilities has been the heavy car loadings. The increase in car loading during the past 12 years is illustrated in the chart which shows the increase in the average car loading each year in relation to the increase in the average car capacity during the same period. A separate portion of this chart shows the percentage relation which the average car loading bears to the average car capacity. From this it is seen that whereas the average car loading was about 60 per cent of the average car capacity for the 8 years, 1909 to 1916, inclusive, it has been possible to obtain loadings of nearly 70 per cent of capacity during two of the last three years.

Car loading will fall off during every period of light traffic, but the pressure for heavy loading can be renewed whenever the demand for cars exceeds the supply. There is, however, little hope for much further increase in the load per car other than that to be obtained as a consequence of increase in car capacity. It is noted on the chart that there has been only a small increase in average car loading during

the past three years. However, it must be remembered that the results for 1918 were obtained very largely by the drastic regulations imposed on the use of cars at that time and the fact that the average was influenced largely by an unusually heavy traffic in bulk commodities in car load lots. Therefore the record obtained during the present year in the absence of war restrictions represents what could be done by the most strenuous efforts of the roads.

It appears, in consequence, that capacity for additional railway traffic must be obtained through an addition to the fixed properties that will permit of the movement of a larger number of cars. This immediately raises a question as to the distribution of funds appropriated to the various items making up the physical properties. In other words, it is of interest to know how the expenditures are to be divided among such items as additional main tracks, yards, engine terminals, sidings, station buildings, etc. One measure of this distribution is afforded by the manner in which the United States Railroad Administration expended the sum of \$541,000,000 appropriated for roadway and track improvement. A study of these allotments shows the following proportionate expenditures: additional main tracks, 10 per cent; yard tracks and sidings, 20 per cent; station structures, 6 per cent; shops and engine terminals, 15 per cent; branches and extensions, 6 per cent; with 40 per cent for miscellaneous items. Estimated expenditures by the railroads during 1920 indicate an almost identical distribution except that yard tracks and sidings were allotted only about 15 per cent and extensions only 2 per cent.

Another measure is afforded by the analysis made in the six billion dollar issue of the *Railway Age* of January 1, 1920, of the requirements of the railroads for additions and betterments during the three years beginning on that date. This analysis allotted 19 per cent to additional main tracks, 23 per cent to yards and sidings, 10 per cent to station structures, 8 per cent to shops and engine terminals, 15 per cent to branch lines and extensions and the remaining portion for miscellaneous purposes.

The difference between the results of these two analyses is readily explained. In general the additions and betterments undertaken subsequent to 1915 have been such as were designed to expedite traffic rather than to reduce the cost of operation. Moreover, they have generally comprised items of limited scope that could be carried out quickly so as to obtain the benefit of their completion as soon as possible. Instead of building large new yards, the roads have been adding tracks to existing ones. New passing tracks have been built or old ones extended. Second tracks have been added where the work was light rather than in locations requiring heavy work. The estimates in the six billion dollar issue, on the other hand, presume a broad construction program designed with a view to permanent results both in the handling of additional traffic and the reduction of operating expenses.

### Motive Power Facilities

The forcible arguments for the need of additional engine terminal and shop facilities which were imposed on the roads during the winter of 1917-18 resulted in an intensive campaign to provide more adequately for the care and repair of locomotives. Engine terminal and shop construction was particularly intensive on the roads east of Chicago, but the Union Pacific may be cited as an example of a western road which has recently carried out a large renewal and enlargement program to this end. A study of construction news items during the past few months shows a preponderance of engine terminal items, indicating that these facilities still maintain the important place which they have held in the budgets for the last three years. One of the largest improvement items, that for the large new locomotive repair shop

for the Santa Fe at Albuquerque, N. M., indicates that the need for additional repair facilities is by no means fulfilled and that shop improvements in general require plans of broad scope involving considerable outlay.

Engine terminals often permit of the addition of stalls to existing houses so that the new facilities are made available at a minimum outlay and after but a short construction period. In considering the character of improvements to be made in the immediate future, it must be remembered that while many large new terminals were built during the last three years the pressure for emergency construction was particularly severe, so there is reason to believe that these minor additions to the older existing plants have already been carried out in the majority of cases where such extensions were feasible. Consequently, projects to be taken up in the future must consist more largely of new layouts or extensions to relatively new plants.

This conclusion is also borne out by the fact that obsolescence plays an important part in the renewal of engine terminals. There is a limit to the extent to which round-house stalls may be lengthened and turntables replaced to provide for the larger locomotives now to be accommodated. Also many terminal layouts are in such cramped quarters

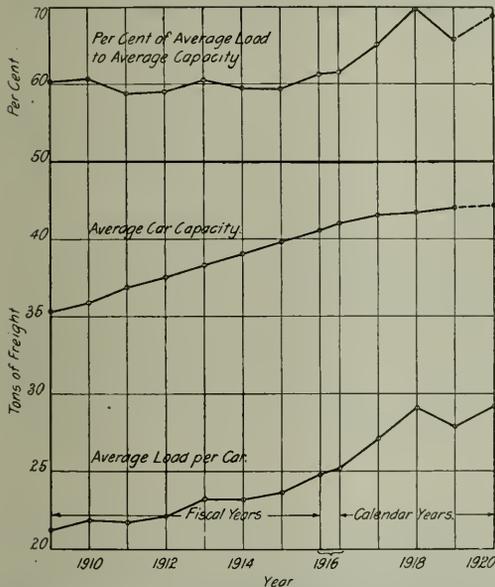

Fig. 2. Chart Showing Relation of Car Capacity to Car Loading

that the addition of new or longer stalls becomes impossible. But even more important are the practical limitations imposed on any attempt to modernize an old layout. An antiquated terminal does not lend itself to alterations that will permit of the application of modern tools, lighting, ventilation, heating, inspection, and other items that go to make up the character of plant necessary for the expeditious handling of locomotives. Consequently, the need for improved terminal facilities is far greater than that to be estimated merely by comparing the number of engine stalls with the number of locomotives to be handled.

Two other elements of the fixed property are closely related to the motive power service, namely, coaling stations and

water supply. Reports of contracts recently awarded include many new coaling stations with storage capacities ranging from 300 tons to more than 1,000 tons. Here again the question of obsolescence as well as inadequacy plays an important part. The high cost of labor places a premium on the use of equipment that is as nearly automatic as it is possible to make it.

Water supply is closely related to the growth of railway traffic. A plant that was adequate for a daily traffic of 80,000 gross tons cannot supply sufficient water for a train movement aggregating 160,000 tons. The Illinois Central, which has been a leader among railroads in keeping abreast with traffic requirements, has given water supply particular attention. Another element to be considered in this connection is the treatment of water in roadside plants which has undergone a revival during the last four years. Enough time has now elapsed for the development of data demonstrating the results gained from these installations and should lead to considerable expansion in the use of the water softening plants.

### Yards and Terminals

There is no question but that the terminal, speaking in the sense of yard trackage, has been and continues to be the neck in the bottle of railway transportation. Even congestion of main tracks can frequently be ascribed to the inability to receive trains promptly at terminals. Generally speaking, yard tracks are being used more intensively than any other portion of the railway plant and as a consequence, there is practically no reserve capacity for periods of extraordinary traffic or reductions in the effectiveness of the operating forces such as took place in the course of the outlay switchmen's strike last spring. The amount of money expended for additional yard tracks and sidings has been the largest item in roadway expenditures, and will no doubt continue to absorb a large portion of appropriations. The indications are that, as in the past three years, this money will be devoted largely to minor additions here and there for the purpose of correcting the defects or deficiencies in existing yards, or for the construction of relatively small new terminals. It is interesting to note in this connection that work on only two freight terminals of first magnitude was undertaken during the three past years. In the New Haven's Cedar Hill yard the work is only partially complete, while that on the Illinois Central's Markham yard was suspended soon after starting.

Belt line construction of the nature carried out by the Chicago & North Western at Milwaukee and Chicago in the period just previous to the war has been conspicuous by its absence, and a number of such projects postponed as a consequence of the war must soon come up again for consideration. As a single instance may be mentioned the proposed belt line of the Great Northern around St. Paul. One item of considerable promise is that of flood lighting of new and existing yards as a means of expediting operation, cutting down damage and discouraging pilfering. Yard improvements form an important part of the current budgets.

### Multiple Main Tracks

A discussion of the terminal situation is not complete without reference to tidewater and lake terminals for the trans-shipment of freight from cars to ships or vice versa. The Lehigh Valley recently commenced work on an enormous terminal of this character on New York Bay, while the Central Railroad of New Jersey has under consideration a \$15,000,000 bridge project across Newark Bay which is designed primarily for the development of waterfront facilities.

Only a few railroads have undertaken second track work on a comprehensive scale during the last five years. The extensive improvement programs carried out by the Southern

and the Union Pacific during this time have been so unique that they stand out in sharp contrast to the policies pursued by the other roads. In each case the need of the improvement was great and the corresponding benefits derived from the completion of the work have been in proportion. The Illinois Central and the Erie have done work of a similar nature although on a smaller scale, but on most other roads the only projects carried out were those entailing relatively light construction. Current budgets contain a few items for immediate consideration, but not in proportion to the amount that must be done eventually, since it is not within reason to presume that the few roads which have undertaken double track work on a large scale in recent years are the only ones which are in need of additional facilities of this character.

### Bridge Construction

Bridge renewals are closely related to the problem of increased traffic carrying capacity of a railroad because of the limitations which old bridges place on the use of heavier locomotives. Any project for the use of heavier power on a railroad must usually carry with it plans for strengthening or renewing bridges on the lines on which the new locomotives as well as those on which the ones they replace are to be used. Bridge work on the railways, especially in structural steel, has been largely restricted in recent years. This tendency, in recent months, has not been limited to the railroads as indicated by the fact that orders taken by the steel fabricators during the last six months represent a tonnage ranging from 25 per cent to 60 per cent of the shop capacities. This means that a large number of renewals have been deferred which must be carried out eventually. At the present time a considerable number of railway bridge projects are under consideration which will take definite form just as soon as reasonable financing appears feasible.

A considerable volume of railway bridge work is concerned with the elimination of existing timber bridges or trestles, either by the use of steel or concrete structures or embankments with small culvert openings. Such projects always form an important item in railway budgets and the current budgets are no exception in this regard. Some idea of the eventual requirements of bridge work may be gained from the fact that three of the more prosperous roads in the middle west have permanent structures in only 35 per cent of their bridge openings, while there are roads in the south and southwest with as little as six per cent in permanent structures.

### Other Classes of Improvement

Thus far the discussion has been limited almost entirely to additions and betterments to the fixed property which are designed to secure more expeditious movement of traffic. Owing to the fact that expenditures for improvements on the railways have been restricted very largely to this end, there has been an enormous accrual of deferred expenditures for improvements which the railroads are called upon to make for other reasons. Chief among these are those which will result in increased economy of operation. Under this head are included grade and line revision projects. Possibilities for obtaining equivalent results through the use of heavier power or through electrification have served to place a somewhat different aspect on the problem from that which it had in the past. Nevertheless, it is clear that much work of this character must be done.

Of the same nature are projects for the readjustment of engine district mileages for the purpose of reducing the overtime in train service. Studies for such changes have been carried on ever since the passage of the Adamson law, but thus far progress in this direction has been made only in cases where terminals could be abandoned because of obsolescence or inadequacy. As a case in point may be mentioned the New Buffalo (Mich.) engine terminal of the Pere Marquette which replaces an outgrown utility at Benton Harbor.

Still another class of improvements are those which the railroads must make because of the pressure of public opinion. These include passenger stations, grade separations and other public improvements. The president of one large system recently estimated that the aggregate deferred expenditures to this end on his line amounted to \$10,000,000. Items of this character were specifically excluded by the special committee of the Association of Railway Executives last summer, when presenting its recommendations to the Interstate Commerce Commission for loans to the roads from the revolving fund, but the perusal of construction columns and current budgets indicated that the demand for expenditures of this kind is being felt.

One especially large field for expenditures is that of grade separation. While this has been carried on extensively in the past within the corporate limits of cities, the nation-wide highway construction which is now in its inception, coupled with the increasing menace of the automobile accident, is sure to exert a powerful pressure for work of this character in rural communities.

Putting on the Finishing Touches at Eddystone

## How the Need for More Motive Power Will Be Met

New Locomotives, Remodeled Old Locomotives and Improved Operation of All Locomotives Imperative

ONE YEAR AGO the railroads of this country were still operating under federal control although living in the anticipation of an early return to private management. Throughout the period of government control, the impression undoubtedly prevailed that the condition of motive power had been allowed to deteriorate and that with the return to private management the railroads would be faced with the necessity for doing much toward the rehabilitation of the motive power. This impression was further substantiated by the fact that the government did not buy nearly as many locomotives as had been purchased in previous years and it was confidently expected that, again in possession of their properties, the corporations would immediately place some very large orders for locomotives.

The *Railway Age*, in reviewing this subject a year ago, estimated upon the basis of statistics relating to the growth of traffic and the increasing demands for motive power since 1905 that no less than 11,566 new locomotives would be required within the next three years. It is surprising to learn, therefore, that less than 1,700 locomotives were ordered during the past year.

The most obvious explanation for a curtailment in locomotive orders at this time is the difficulty experienced in

securing funds for the immediate purchase of new locomotives or for remodeling old ones. We are, therefore, confronted with the fact that the orders during 1920 that were most conspicuous for their size in proportion to the equipment

owned were not confined to those railroads that have the most ample resources. Orders placed by the Chicago, Milwaukee & St. Paul will add more than five per cent to the total number of locomotives owned by that railroad at the time the orders were placed. The Missouri, Kansas & Texas and St. Louis-Southwestern are both adding approximately eight per cent to the number of locomotives owned and, as the tractive effort of these new locomotives considerably exceeds the average of the locomotives already owned, the effective motive power on these railroads will actually be increased by a considerably greater percentage. In this connection, however, the most notable order of the year was placed by the Western Maryland for 40 heavy Consolidation locomotives representing an increase in the number

of locomotives on that railroad of over 16 per cent. During the year the New York Central Lines not only bought more locomotives than any other system, but placed these orders immediately after the termination of federal control. The following is quoted from a statement which this

**T**HE PRICES paid for locomotives in 1920 are the highest on record, but the increased freight and passenger rates and the volume of traffic established new standards for the earning power of individual locomotives.

It is the earning or the saving power rather than the first cost that determines the dividend. Hence some locomotives purchased in 1920 may prove cheaper than the same locomotive purchased later at a lower price.

railroad recently issued to the public in regard to its policy. "When the government turned the railroads back to their owners, experts computed that approximately \$500,000,000 worth of new equipment was the imperative need of the hour. The New York Central Lines immediately placed their \$53,000,000 equipment order covering 196 locomotives, 265 passenger cars and 11,244 freight cars. Last March, assurances were given the shippers and the public generally that no time would be lost in meeting the needs of the service, in rehabilitating existing equipment and purchasing new rolling stock. The New York Central Lines are keeping faith."

#### Additional Motive Power Will Be Needed

It is true that the current depression in business has reduced the demand for motive power and that if this depression were to be prolonged indefinitely the railroads would have little need for additional power at this time. But it is very much safer to gamble on a speedy return to business activity than upon continued depression. It has been an invariable rule among successful financiers to place absolute dependence in the future of this country and there is no safer assumption in the world than that that growth and the traffic demands

on that railroad at the commencement of the year and, because of the high tractive power of these new locomotives, a considerably greater relative contribution to the effective motive power on that railroad. The acquisition of this power is all the more remarkable because at the beginning of the year 87.5 per cent of the locomotives on the Illinois Central railroad were reported in serviceable condition. The significance of this will be more fully appreciated when it is understood that at the same time only 75.1 per cent of all the locomotives on Class I railroads were reported as being in serviceable condition.

Is it not safe to assume that the very liberal policy pursued by the Illinois Central toward motive power expenditures has been in no small measure responsible for the acknowledged efficiency of this railroad and its popularity among shippers, particularly in competitive territory? It is also pertinent to point out further in connection with this order that no matter to what point business may decline within a year following the purchase of these locomotives, the railroad will have had the use of the locomotives in the meantime. Moreover, if these locomotives are used to replace less modern and less powerful locomotives, the railroad will doubtless save enough

Busy Days at Lima

of this country will continue to expand. Every cloud in our financial past has been found to have a silver lining and in planning for the future of the railroads it would be a grave mistake to be swayed from a constructive program of improvements by the immediate business outlook no matter how dismal.

Within the last ten years the annual revenue freight tonnage and passenger traffic has increased to the extent of 43 per cent. Business men usually figure upon an average annual increase of 4 per cent to meet the requirements resulting from a normal increase in the growth of this country and any railroad that is in a position to benefit in proportion to the average increase in business throughout the country must either look forward to increasing its capacity each year by at least that extent or to relinquishing some of the business which should normally come to it.

During the year the Illinois Central ordered 100 Santa Fe type freight locomotives, 25 Pacific type passenger locomotives and 25 Eight-wheel switchers. This represents an addition of 10 per cent to the number of locomotives in service

money in operating expenses thereby to more than discount any price drop in the cost of locomotives that might reasonably be anticipated within the coming year. The same line of reasoning might be applied to the purchase of locomotives this year rather than a year hence. In fact, the "Buy Now and Ship Now" movement to which this issue is dedicated, has a particular significance when applied to locomotives.

#### Analysis of the Situation

The following statement is contributed to the *Railway Age* by one of the best informed motive power executives in the country and may be accepted as an authoritative analysis of the current motive power situation.

"Until recently, when business rapidly declined, there has been a serious shortage of locomotives, due first to the large reduction in buying during government control, and second to the rapidly increasing cost of new locomotives in the past three years which has made it exceedingly difficult to finance new purchases.

"New power should by all means be added when possible

to finance the purchase but the increasing difficulty of financing such purchases demands as never before increasing the efficiency of the present equipment and getting maximum efficiency out of the present locomotives.

"During government control and up to the late Fall it was difficult to secure competent help to maintain the locomotives on the average railroad in proper physical condition. When labor became more plentiful the rapid decrease in gross earnings of the railroads made it necessary to reduce operating expenses, which was immediately reflected on most railroads in upkeep of the power.

"The tremendous overhead expense now carried by the railroads due to the concessions granted employees during federal control makes it practically impossible to reduce operating expenses in conformity with the rapid decrease in gross earnings."

**Better Locomotive Terminals a Factor**

The *Railway Age* has said too much in regard to locomotive terminals throughout the past year not to recognize at this time the important fact that an improvement in terminal

clearly demonstrate the need for the more intensive operation of locomotives:

	1918	1919	1920
Total number of locomotives reported in freight service, month of October	29,224	30,184	41,57
Gross ton-miles, month of October (thousands)	39,641,923	40,160,63	42,562,685
1,000 Gross ton-miles handled per locomotive	1,355	1,331	1,143

This statement, showing an actual decrease in the average gross ton-mileage handled by each locomotive reported in freight service, is eloquent proof of the necessity for those facilities which are designed to keep locomotives in service a greater percentage of the time. In this connection the statements required by the Interstate Commerce Commission showing the percentage of service hours for all locomotives will prove interesting reading when published and it is to be sincerely regretted that as a whole, individual railroads have not shown a disposition to compile these figures voluntarily nor use them locally to the best advantage.

Another interesting statement in this connection, which tends to further emphasize the necessity for better locomotive terminal and shop facilities, relates to the percentage of loco-

**Virginian Mallet Nearing Completion at Schenectady**

facilities tending to reduce the percentage of time a locomotive is held out of service is directly equivalent to adding a corresponding percentage of power to its equipment. If a railroad operating 1,000 locomotives an average of 10 hours daily could, by means of better terminal or shop facilities, increase this average to 11 service hours per day, it would serve the same purpose as the addition of 100 locomotives of similar type to its equipment. The motive power problem is by no means confined to the purchase of new locomotives nor to remodeling old locomotives, it is equally concerned with the intensive operation of existing power.

Any locomotive device that serves to extend the mileage between shoppings or any terminal facility such as a bigger ash pit or a better roundhouse that makes it possible to turn locomotives more rapidly adds something to the available tractive power which the railroad needs. Under many circumstances an investment in such facilities will effect a greater return in available tractive power than an investment of equal magnitude in new locomotives.

Despite the acquisitions of new locomotives and an increase in the average tractive power of all locomotives, the results for the month of October in comparison with previous years as shown in the following table are disappointing and

motives reported in serviceable condition as shown in the following:

	Nov. 30, 1918	Nov. 30, 1919	Nov. 30, 1920
Freight locomotives on lines reporting	28,997	29,801	35,447
Passenger locomotives on lines reporting	13,219	13,676	14,253
Switch locomotives on lines reporting	14,799	15,214	13,380
Total locomotives on lines reporting	60,172	61,613	63,580
Number in serviceable condition	47,462	46,417	48,747
Per cent serviceable	78.9	75.3	76.7

**Most Obvious Way to Increase Capacity**

In many cases the most obvious way to meet the demand for increased locomotive capacity has been found in remodeling old locomotives and the application of approved economy and capacity increasing devices to these locomotives. This is particularly applicable where the restrictions on locomotive weights are such as to limit new locomotives to weights not exceeding that of old locomotives susceptible to modernization and where the traffic is of a character that does not permit of further increase in train loads. Where these conditions obtain it has been found possible to remodel many old locomotives so that they are in every way equivalent to the most modern power applicable to the line, at less than half the cost of new locomotives.

The most notable accomplishment in this direction during

the past year has resulted in the reconstruction of cross compound Consolidation locomotives into strictly modern superheater locomotives of the same class on the Boston & Maine. This railroad is also planning the reconstruction of old Twelve-wheel locomotives into Eight-wheel switchers of modern design and has even extended its modernization program to include Eight-wheel passenger locomotives with 18 in. by 24 in. cylinders to which superheaters are being applied.

There is still a disposition in some quarters to strip the locomotive of economy and capacity increasing devices in order to cut down its first cost to the railroad. When it is clear that an addition of 10 per cent to the first cost of a "plain engine" may suffice to equip this locomotive so that its capacity or efficiency is increased 20 per cent the folly of buying locomotives on the basis of low first cost should be obvious. As a whole, locomotives purchased in 1920 represented the best in design and were equipped with as full a complement of auxiliary apparatus as can be properly maintained with the present shop and terminal facilities. A larger proportion of Santa Fe type locomotives and a smaller proportion of Mallet type locomotives were built than in recent years.

### New Locomotive Characteristics

No new locomotive types made their appearance during the year but several interesting and promising developments were initiated. The new Decapod locomotive now in service on the Pennsylvania is a conspicuous addition to the art and the Consolidation locomotives ordered by the Western Maryland will doubtless embody certain features that will recommend this type to further consideration. The most notable contribution to the development of the locomotive during the year was made in the direction of capacity increasing devices. For the first time new Mountain, Mikado and Santa Fe type locomotives were constructed with thermic syphons designed to add 10 per cent to the capacity of the boiler.

The locomotive booster made its appearance during the year and promises a remarkable increase in capacity when applied to certain types of motive power dependent upon the class of service in which it is operated.

This device is in operation on only a few locomotives at the present time but quite a number of locomotives constructed recently have had trailer axles and other details designed to facilitate the application of the booster at a later date. During the year feed water heaters were applied to Mountain type locomotives for the New York, New Haven and Hartford but locomotive feed water heating has not made as much progress during the year as might have been expected in view of the savings which would surely result from the more general application of this principle.

Year	Number of locomotives	Aggregate tractive power (1,000 hp.)	Per cent increase over 1910	Average tractive effort per locomotive	Revenue freight traffic, (1,000 ton-miles)	Per cent increase over 1910	Passenger traffic, (car-miles)	Per cent increase over 1910
1910	58,947	1,588,894		27,282	255,016,910		32,338,496	
1911	61,327	1,681,496	6	27,949	253,793,702	..	33,201,695	6
1912	62,262	1,746,964	10	28,634	264,080,745	..	33,182,385	6
1913	63,378	1,847,798	16	29,702	301,398,752	18	34,575,873	9
1914	64,760	1,931,954	22	30,420	288,319,890	13	35,258,498	9
1915	63,850	2,014,202	27	31,546	276,830,000	9	32,384,248	6
*1916	65,021	2,075,520	31	31,921	243,699,938	34	34,213,596	6
*1917	63,828	2,145,698	35	33,617	365,771,825	43	39,476,859	22
*1918	64,410	2,196,648	38	34,104	401,946,000	57	42,566,343	32
*1919	64,869	2,303,950	45	35,517	365,000,000	43	46,202,827	43

\*Classes I and II only.  
†Class I only (estimated).

The greatest strides in American railroading have been accomplished by increasing the capacity and efficiency of the locomotive. How much remains to be accomplished in this

direction is apparent from a comparison between the average tractive effort of all locomotives as shown in the above tabulation and the average tractive effort of locomotives now under construction.

In some instances, owing to the traffic conditions or restrictions placed upon wheel loads, the limit has already been reached, and in these instances the full modernization of existing power affords the only remaining field for improvement. But on a vast majority of railroads there is still the opportunity for replacing small power units with new locomotives that in some instances will add 50 or more per cent to the tonnage of freight trains or will eliminate double-heading on passenger trains.

### Outlook for the Future

Instances are not uncommon in manufacturing plants where the entire machine equipment has been scrapped to make place for new machines that would reduce the cost of manufacturing by 15 per cent. Opportunities for effecting greater economies than this through the replacement of old and obsolete locomotives with large modern locomotives everywhere abound; hence, it is reasonable to predict that locomotive orders must again assume large proportions, not only because of the normal 4 per cent increase that will be occasioned by the growth of the country but as a step toward improving the efficiency of the railroads and the character of the service which they can place at the disposal of the public. The inevitable replacement of wornout power is another item on which the builders can depend so that altogether there would seem to be a large amount of business which must sooner or later go to the locomotive builders.

A study of the underlying conditions that affect the cost of manufacturing locomotives clearly indicates the futility of hoping for any immediate and substantial reduction in locomotive prices applying to a volume of orders that is at all in proportion to the needs of the railroads. Labor costs figure prominently in the price of a locomotive and no one appreciates better than the railroad man the extent to which these costs have increased; first, because wages have doubled and second, because the efficiency of the individual worker is lower. While improvement may eventually be anticipated in this direction, it will hardly be rapid enough to manifest itself in any quick reduction in prices.

### The Problem of Prices

Steel prices, comprising the principal material item entering into the cost of a locomotive, have fallen rapidly within the last few months and are still slightly above the levels established by the leading steel producer. There can be no question but that the Steel Corporation has made a sincere effort to stabilize steel prices and having adhered to these prices in a rising market will hold to the same prices in a falling market. Hence, while some shading of prices below these levels may be anticipated, it does not seem likely that with a large unfilled tonnage still booked at these stabilized price levels there can be any substantial reduction below these prices for some time to come. If locomotive costs are figured upon higher steel prices, they must be reduced; but, with the assurance that costs are based upon the prices established by the leading steel producer, no further reduction can soon be anticipated.

Transportation charges affecting both the raw materials entering into the cost of a locomotive and the finished product must also be taken into account in any discussion of locomotive prices and the railroads would certainly be the last to admit that there can be any reduction in these charges. The problem of prices is secondary to having the new equipment that is needed, when it is needed. Hence, it may be repeated, the "Buy Now" slogan applies with particular force to locomotives.

Railroad Yards at Toledo. Photo from Ewing Galloway

## Little Progress in Reducing Equipment Shortage

Meagre Purchases During 1920. Constructive Policy Must Be Adopted to Retain Public Goodwill

**T**HERE WERE ONLY SIX WEEKS in 1920 during which there was not a serious shortage of freight cars. In the past four and one-half years there have been only three short periods when the railroads have had more cars than were required to handle the traffic. During the last few months of the war there was a slight surplus and in the slump directly after the Armistice there was a very large number of idle cars for six months. During the coal strike of 1919 the idle cars exceeded the deferred requisitions by a few thousand for one month, and in the last six weeks, since the recession in business has reduced the volume of traffic, the surplus has increased to over 100,000 cars.

There is only one other instance of a serious and prolonged car shortage in recent years; namely, in 1905 and 1906. The demand by shippers for more equipment at that time resulted in orders for 650,000 cars being placed in those two years. On the other hand, during the four years of equipment shortage, from 1917 to date, the orders aggregated only 309,406; the total for four years is less than one-half the number ordered in the two years cited above.

The small volume of orders placed in 1916 was due to a variety of causes. When the car shortage first developed, the net earnings of the roads were higher than they had been for several years, equipment prices were not excessive and interest rates were low. Consequently, the number of cars ordered in 1916 was fairly large. In 1917 the price of steel increased greatly and this together with the preference given to the needs of the government reduced the volume of orders. When the roads were taken over by the government, plans were promptly made for the purchase of 100,000 cars. The delivery of these cars was delayed and no more orders were placed by the Railroad Administration during the 26 months of federal control.

Since the roads have been returned to the owners there have been various circumstances militating against a resumption of the normal volume of car purchases. Early in the year some of the stronger roads placed orders sufficiently large to increase their total freight equipment in proportion to the growth of traffic. The high interest rate, coupled with high prices, deterred many roads from buying cars. The

revolving fund of \$300,000,000 provided by the Transportation Act was intended to overcome this difficulty, and the Interstate Commerce Commission on May 21 authorized the use of at least \$125,000,000 for the purchase of equipment. The act was amended on June 5 to extend the period of repayment from 5 to 15 years, thus making the condition much more favorable for the roads. However, the Treasury Department took advantage of a technicality to withhold the funds. The commission has authorized loans amounting to \$118,621,385 as reported on November 24, but the loans actually made up to October 20 aggregated only \$56,190,325.

Aside from the problem of financing the equipment, some roads originating little traffic have probably been led to postpone buying due to the fact that the per diem rate was unremunerative on the basis of present prices and the percentage of equipment off the home roads very high. During recent weeks the downward tendency of the prices of basic commodities has probably been principally responsible for the scarcity, not only of orders, but also of inquiries.

Temporarily the problem of furnishing equipment for shippers has been solved. The recession in business has caused a decrease in the freight traffic and at the beginning of the year there was a surplus of over 100,000 cars. But a car surplus in a time of depression has little significance. The roads cannot evade indefinitely the responsibility for furnishing adequate equipment for moving not only a nor-

**T**HE statement has been made that private management will fail because it cannot provide the capital required for new equipment. The advocates of government ownership will find some support for this contention in the record of car purchases during the past year. Despite the car shortage only 1,780 freight cars and 84,207 passenger cars were ordered in 1920.

Unless prompt action is taken, another serious shortage of equipment will occur when business again returns to normal.

mal traffic, but a reasonable overload. They cannot expect to retain the goodwill of the shippers unless they provide facilities for handling the traffic, not by emergency measures and constant delays due to car shortage, but with normal use of the equipment by the shippers and prompt attention to requisitions for cars.

During the major portion of the last four years the roads have not given adequate service. During federal control, shippers were induced to load more nearly to the maximum capacity and to release cars promptly. Since the roads were returned a similar campaign has been carried on, but as a regular policy shippers are not likely to take kindly to such measures as the use of a large amount of dunnage to insure maximum loading without any compensation or loading and unloading on Sundays and holidays, as has been advocated and practised in recent months.

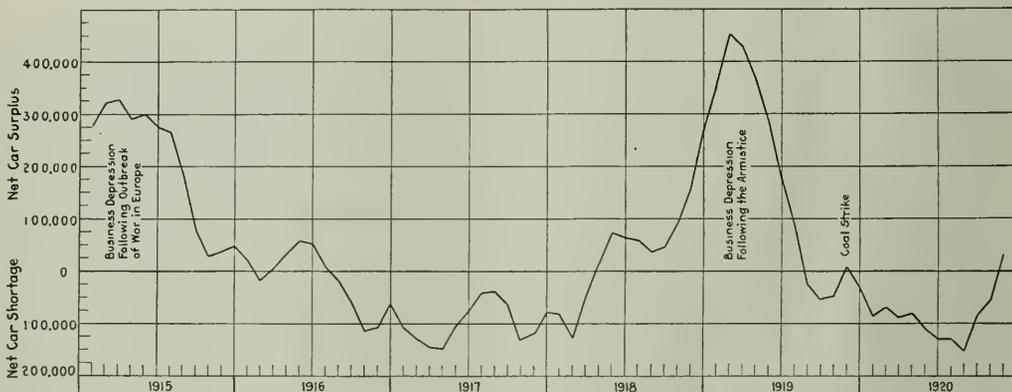

The viewpoint of the shipper has been well expressed in the following words by John M. Glenn, secretary of the Illinois Manufacturers' Association: "The railroads want adequate compensation for carrying freight; the shippers feel that in return for the increased compensation the railroads have been accorded, they are entitled to cheerful, expeditious service. \* \* \* The additional tonnage carried by the

can be met by improved utilization of facilities and how many new cars will be needed. Each individual road has some local conditions to meet that will necessarily affect its policy in making equipment purchases. This article is confined to a discussion of the problem of car supply from the standpoint of all the railroads of the country considered as a system.

An analysis of the estimated requirement for freight cars was published in the *Railway Age* for January 2, 1920. It may be enlightening to review the conclusions stated in that article in the light of the results obtained during the past year. The principal points stressed in that article were as follows:

1—The freight traffic of 1918 although abnormally heavy was not in excess of what may be expected in the next two or three years. The average annual increase of revenue ton-miles is about 4.14 per cent.

2—The efficiency of utilization of cars as measured by the ton-miles per ton of capacity per year increases in times of car shortage and decreases when there is a surplus. As a yearly average, the ideal condition of no pronounced shortage or surplus is obtained when one ton of car capacity is provided for each 3,500 revenue ton-miles moved annually.

Net Freight Car Surplus and Shortage for the Past Six Years

(Normally a surplus of about 100,000 cars should be maintained to enable the railroads to fill requisitions promptly.)

freight cars of this country this year has been largely at the expense of the shippers, who, in order to load their cars heavier, have been obliged to supply a greater amount of dunnage. \* \* \* The consignee does not want a heavily loaded car unless he has a ready market for the commodities and he does not want to pay freight charges on a shipment that may exceed his immediate needs unless there is some inducement."

Viewed from the broad economic standpoint, the proposal to continue rationing cars is indefensible. Studies made in the bituminous coal mining industry show that when the car supply is 75 per cent of the requirements, the cost of production is 16 per cent greater than when all demands for cars are met. If the car supply is one-half normal, the cost of coal is increased 40 per cent. Car supply undoubtedly influences the cost of many other industries in a similar manner and the sum total of the bill which American producers pay when a shortage of cars exists would make up the cost of the additional equipment required many times over.

Bearing in mind that private operation cannot be a success unless it pleases the railroads' customers—the shippers—the question arises to what extent the need for equipment

3—On the basis outlined, the equipment required for three years was calculated. Allowing for deferred retirements and a surplus to take care of the peaks of traffic, the number of cars that should be purchased annually for three years was estimated to be 237,000.

Reviewing these conclusions with the operating results for 1920 in mind, brings out some interesting points. The traffic for the year on the basis of the statistics for the first ten months appears to be only slightly greater than was estimated. If business conditions return to normal, the record should be exceeded in 1921. The most important factor is, of course, the relation of car capacity to traffic, but the results contribute little that will either substantiate or modify the earlier figure.

During the summer and fall, new records for the net ton-miles per car day were established, but this was the result of extreme efforts of both the railroads and the shippers to overcome the car shortage. Heavy loading and quick release of cars both depend on the co-operation of the industries and the highest efficiency in the use of cars seems incompatible with accommodation to the shipper. It may be that in the future slightly better use of the equipment can be secured under all conditions. If this is the case, the demand

for cars will be reduced somewhat. This can only be determined when statistics of car capacity and freight traffic covering a period during which shippers were given normal service become available.

In any attempt to estimate the equipment needs of the roads during 1921, the general business situation must be considered. The present decline in the volume of business cannot continue for a long period. Expert economists have stated that the upward turn will occur in April and this agrees with the views expressed by many leaders of industry. As has already been noted, the traffic of 1920 was not abnormally heavy, and it may be exceeded in 1921. There was a serious shortage of cars last year, and there is only one way to avoid another shortage whenever there is a revival of business; that is, to BUY NOW.

There are several cogent reasons why the railroads should not defer purchases. Most important of these is a stabilization of business. Irregularity of employment is one of the great economic wastes of the present day. If the railroads go into the market now for a fairly large number of cars, the effect would be felt through many allied industries with a favorable reaction on the railroads themselves. The recent reductions in the price of steel furnish another argument for going into the market at this time. The prices of the Steel Corporation and the independent plants are now on the same basis which will probably be maintained for some time. Although the prices of the car builders have been based on the corporation's scale, the quotations for various types of equipment are approximately 10 per cent below the high point of 1920. If the car builders were assured a larger volume of business, the cost might be lowered still further. It may not be out of place to mention that the car building plants have been operating at only a fraction of their normal capacity and the railroads will be obliged to anticipate their requirements by several months, particularly in case there is a sudden demand for large amounts of equipment.

Those who contend that the railroads should stay out of the market at this time base their argument on the assumption that this would insure a more drastic price reduction. Recent developments indicate that prices will eventually drop still further, but from all indications temporary stability has been reached on the present level. It would be out of the question for the railroads to defer purchases until prices touch bottom. The increases to recent high levels were reached step by step for a period of five years. The return to the future normal will also occur step by step and will no doubt require a much longer time.

The rise in prices during the Civil War occurred in approximately three years, but the pre-war level was not reached again for fifteen years. Railroads must buy more cars before the bottom of the market is reached. The important question today is not how to buy at the lowest price. The gain or loss in revenue in a few months due to insufficient car supply may outweigh that many times. The important matter is to make sure that when the revival of business occurs, as it inevitably will in a short time, the railroads will be able to handle the traffic.

In the past, the railroad managers have pointed to the low rate of return as the reason for not furnishing the necessary equipment. The provision of the Transportation Act providing a fair rate of return on railroad securities, was intended to permit the roads to add to their inadequate facilities. There is only one way for the railroads to retain public goodwill. They must start now to buy cars in order that the industries of this country shall receive at the hands of the railroads the service which they need for efficient operation.

### The Passenger Car Situation

One year ago a careful estimate was made of the number of new passenger cars which would be required to restore passenger service to a condition reasonably approaching that to

which the American traveling public has been accustomed.\*

The conditions assumed as reasonable were those existing during 1917, when each passenger carrying car carried an average load of 17.6 passengers. This was considered conservative, since during a period of nine years preceding the war the average passenger car load had never reached 16 passengers. On a hypothesis that the restoration was to take place over a period of three years, and after making allowance for deferred and future normal retirements as well as for prospective increases in traffic it seemed evident that some 8,000 cars would have to be purchased annually.

A review of the past year's developments indicates that, on the same basis, the requirements for new passenger equipment are even greater now than last year. Passenger-mile statistics for a group of representative lines published elsewhere in this issue reflect the tendency toward a continually increasing volume of traffic, apparently somewhat disturbed by the increased rates which went into effect September 1, but not sufficiently to overcome for long the effect of the normal upward trend. On the other hand the total production of passenger cars for domestic roads during the first ten months of 1920 was only 129 cars.

During the past year the demands for additions and betterments to all facilities were urgent. The railroad corporations, with limited cash and credit resources, have found it necessary to choose only the most urgently needed improvements for immediate prosecution. Roadway improvements, locomotive and freight cars have therefore been given attention practically to the exclusion of passenger equipment. The same conditions have applied also where improvements have been financed from the \$300,000,000 loan fund created by the Transportation Act. At the present time a number of roads are considering the purchase of new passenger equipment, and assuming an early improvement in business activity, will place their orders during 1921.

It is unlikely, however, that the passenger car programs, though increasing from year to year, will effect a marked improvement in the service for several years to come.

### Pullman Cars

Following the release from Railroad Administration control, the Pullman Company resumed the construction of sleeping cars, which had been discontinued during operation of the Pullman Car Lines by the Railroad Administration. From March 1, 1920, to the end of the year about 500 new sleepers have been built. Some of these have replaced retirements from the 7,622 cars reported by the Pullman Company for the fiscal year ending July 31, 1919, but they represent the beginning of a program that will gradually restore the facilities to pre-war standards.

# Repair Shop and Enginehouse Equipment Needs

Large Numbers of Unserviceable Locomotives and Cars Furnish  
a Strong Argument for Better Facilities

A MODERN STEAM LOCOMOTIVE intended for either heavy passenger or freight service is worth approximately \$70,000 and with 63,580 serviceable and *unserviceable* locomotives on American railroads, the total capital represented amounts to several billions of dollars. In fact, it is stated to be 50 per cent of the value of all the machinery, implements and tools used in all other industries of the country. Even a larger amount of capital is invested in over two million cars and yet a considerable proportion of both motive power and rolling stock is held out of service and earns no revenue because of antiquated, inefficient repair shop and enginehouse equipment. A manufacturer watches his big investments in machinery most carefully, knows how much the machines are worth, how much they earn and keeps them in operation; otherwise he fails. The railroads should be equally considerate of overhead charges and make both cars and locomotives revenue earners as much of the time as possible by providing facilities for their prompt and thorough repair.

## Locomotives and Cars Out of Service

How long would a manufacturer do business if 25 per cent of his machinery was unserviceable? In 1918 and 1919, 20 per cent and 24.9 per cent, respectively, of the motive power of the country was held out of service awaiting repairs. Figures for the first ten months of 1920, compiled by the Car Service Division of the American Railway Association, show (Table I) that this proportion has been reduced to 23.3 per cent, of which 6.2 per cent of the loco-

motives are held for work requiring less than 24 hours and 17.1 per cent for work requiring more than 24 hours. No goal was set by the Association of Railway Executives for the reduction of locomotives held out of service, but it would be difficult to find justification for so large a proportion as 23.3 per cent. The railroads are now able to handle the business offered to them, but this business is far below normal. Now is the time to get motive power into good operating condition and reduce the locomotives out of service waiting repairs to the lowest possible number.

It is not maintained that the lack of shop machinery and equipment is solely responsible for the large proportion of motive power out of service. Limitation of output due to labor conditions, scarcity of trained foremen and inexperienced workmen are all factors to be considered. That there is a serious lack of modern machinery in many shops and roundhouses, however, is generally admitted and the longer its installation is delayed, the greater the loss to the railroads.

Records of the Interstate Commerce Commission show that in 1917, 1918, and 1919, 5.6, 5.7 and 7.1 per cent, respectively, of the freight cars in the country were in bad order. Based on the first ten months of 1920, the bad order cars have been reduced to 6.9 per cent, but even this figure is far from the 4 per cent goal set by the Association of Railway Executives. Due to present business conditions, it is true that the railroads are not faced with a car shortage, but even the pessimists do not believe that the business depression will last indefinitely and it would seem the part of common sense to get as many cars as pos-

**E**VERYONE FAMILIAR with conditions admits the need for better machine tools and equipment for railroad shops and engine houses. Motive power and rolling stock will be in no condition to handle the increased traffic predicted for next Spring unless adequate arrangements are made for repair and maintenance.

A large proportion of the shop equipment needed should be bought now. Otherwise what may be gained by price reductions will be more than offset by losses due to delayed traffic.

sible repaired before the revival of business activity which is sure to come.

Strenuous efforts have been made in the past few months to reduce the number of bad order cars and one of the reasons it has been impossible to attain the goal of 4 per cent is the present lack of repair shop facilities. More shops should be erected and those already in existence should be better equipped. Particularly for steel car repair work, crane facilities are needed for handling cars and the more or less heavy material going into their construction. In addition to cranes, other machinery is needed for this work such as air compressors, air tools of all kinds, power punches and shears, presses, flanging machines and furnaces.

TABLE I—PROPORTION OF LOCOMOTIVES OUT OF SERVICE FOR REPAIRS

	Repairs requiring less than 24 hours	Repairs requiring more than 24 hours	Total
Week ending July 31, 1920	15.4 per cent	22.7 per cent	
Two weeks ending September 1, 1920	16.3 per cent	22.7 per cent	
Two weeks ending September 15, 1920	6.3 per cent	16.2 per cent	23.5 per cent
Two weeks ending November 1, 1920	6.3 per cent	16.2 per cent	22.7 per cent
Two weeks ending November 30, 1920	6.2 per cent	17.1 per cent	23.3 per cent

The slight reduction in bad order cars already obtained is largely due to the number of cars repaired by builders. During October, 1920, 3,920 cars were repaired by the 23 builders reporting to the Railway Car Manufacturers' Association, the total for the first ten months of the year being 25,180 cars. It is probable that an extensive car construction program will be outlined for the coming year and if so car builders will manifestly be unable to handle as much repair work as formerly. The importance of equipping railway shops to make quick, effective repairs to all kinds of freight and passenger cars can hardly be overestimated.

**Facilities Needed for Modernizing**

Of the 55,000 locomotives in service on American railroads, it is stated that only approximately 35,000 are equipped with superheaters, 43,000 with brick arches, 37,000 with automatic fire doors, 15,000 with power reverse gears, 2,000 with automatic driving box wedges, and 30 with feedwater heaters. In a paper read before the American Railway Association last June, George M. Basford said, that "by spending a few thousand dollars in modernizing, millions of dollars already invested in locomotives ten or more years old will earn greater dividends. These old engines stand as a big non-paying investment and a comparatively small amount spent for modern improvements will change them into a big paying investment."

Admitting the need of an intelligent and extensive modernization program, the question is, Are the railroads physically in a position to carry out this program? The answer must be, No.

"The difficulty in carrying forward an extensive reconstruction program," said C. B. Smith, mechanical engineer of the Boston & Maine before the American Society of Mechanical Engineers, "is in finding the shop facilities either on the railroad or among the locomotive builders in order to advance the work at a satisfactory rate of progress. On roads where the number of old locomotives which warrant rebuilding is sufficient to require a period of more than three years to complete the work, it would seem necessary to arrange for enlargement of shop facilities in order to hasten the reconstruction. If, however, adequate shop facilities are not forthcoming, the improvement program for locomotives must be confined chiefly to the application of superheaters and the substitution of piston for slide valves; together with the minor but relatively important betterments that may usually be applied at the shopping period. On some roads this work alone will require six years at the present rate."

The work of modernizing must go on and Mr. Smith's statement that some railroads are not equipped to apply

modern improvements to locomotives in less than six years indicates a condition that is far too common on American railroads. Present operation expenses must be reduced to a minimum by the installation of efficient locomotive devices, and it has been demonstrated that this will be impossible without more and better shop facilities.

**Roundhouse Equipment Needed**

Another factor which needs attention is the proper equipment of terminals for handling locomotives promptly and economically. A locomotive is earning revenue usually only a few out of each 24 hours and the part of this time lost at terminals offers a fertile field for improvement. It is essential that inspection pits be provided, together with ample ash handling facilities and coaling stations, all on a direct line to the roundhouse. In addition, each roundhouse, especially if at some distance from the back shop, should have a fairly complete machine tool equipment. This will avoid the extra cost of shipping each locomotive part requiring a small machine operation to the back shop and holding up the locomotive while waiting for the part to be returned.

The old excuse is that railroads cannot afford to install machinery in roundhouses, especially the smaller ones. The truth of the matter is that they cannot afford not to. An investigation conducted five years ago showed that locomotives were in the hands of the mechanical department 58.5 per cent of the time and there is no evidence that conditions as a whole have improved greatly since that time. The interest at 6 per cent on \$70,000, the price of a modern locomotive, is \$4,200 a year and the delay of this locomotive at terminals due to inadequate, wornout equipment costs far more than it would to install required new machinery and tools.

**Effect of High Labor Costs**

During federal control working hours for railroad employees were reduced from nine hours in most cases to eight hours per day and the result of this decrease in hours made necessary an increase in the number of employees, variously estimated at about 190,000. The larger number of employees, together with the pay increase granted to all, makes the labor cost over one hundred per cent greater than it was even as late as 1917. Table II shows the rates of pay for certain employees in locomotive and car repair shops and roundhouses.

TABLE II—HOURLY WAGES OF RAILROAD REPAIR SHOP EMPLOYEES

	1917	1918	1919	January, 1920	July, 1920
Machinists	462	746	747	747	857
Boiler makers	463	736	767	767	897
Blacksmiths	446	744	749	749	879
Carpenters	322	536	633	633	763
Car repair men	338	574	696	696	696
Helpers	276	457	507	507	630
Unskilled help	224	361	433	433	533

The increase up to January, 1920, is shown in the fourth column of the table and in July the Railroad Labor Board increased approximately all of these rates by thirteen cents an hour retroactive to May 1. As indicated, practically all of the rates have increased 100 per cent since 1917 and it is self-evident that if the cost of locomotive repairs is to be maintained at a reasonable point every possible labor saving machine and device must be installed.

It is not believed that every small shop in the country should be equipped with heavy, specialized machinery capable of large production. For example, in a certain shop, the method of machining the keyway in a new cross-head is to lay out the keyway, drill four 7/8 in. holes to remove most of the metal and chip and file out the balance. This is a difficult and tedious job requiring the effort of a mechanic at 85 cents an hour for several hours. At first thought, it would be supposed that such a shop could not

afford to be without a keyway milling machine which would perform the operation more accurately, in one-third the time, and at a much less labor cost. The element which must not be forgotten, however, is that such a specialized machine is usually high priced and must be kept busy a large proportion of the time in order to pay carrying charges and show a profit in operation. The problem in this case can be settled in but one way. All new crossheads for the system should be made at one central production shop where there will be enough work to pay for the installation of modern, specialized machines.

In the shop referred to, which is typical of many others, there is a little old radial drill which has certainly seen its best days and, in fact, is so old that no records can be found as to the date of its purchase. This machine is used to drill 2 9/16 in. holes, 4 in. deep, in forged wrought iron stock using a high speed drill; but it goes without saying that no production records are broken. The old drill press does not have the necessary power and the head wobbles so badly on the radial arm that it is difficult to understand how a hole can be drilled at all. What possible reasoning can justify wasting even a helper's time at 46 cents an hour and a high speed tool on such a machine!

It may be that the smaller shops cannot afford to install special machinery, but in any case they certainly cannot afford to maintain in service drills and machinery of the type indicated. The time involved in performing machine operations with this type of tool and the labor cost of operating obsolete machines by high priced mechanics are prohibitive. All parts possible must be made in central production shops where specialized, high production machinery can be installed. The saving in cost of parts so manufactured much more than offsets carrying charges on the investment and the cost of shipping the manufactured parts to outlying points.

#### Similar Problems in English Shops

That more or less similar conditions and problems confront English railway shop managers as do our own is evident from a paper presented before the Institution of Locomotive Engineers by Colonel H. E. O'Brien, deputy chief mechanical engineer of the Lancashire and Yorkshire, Horwich, England. Col. O'Brien states that "while patient attention to methods of manufacture on existing machines will result in increased output, the best results will not be obtained unless the most modern and most highly productive and specialized machinery is installed on a commercial basis. The introduction of high speed steel between 1903 and 1910 put many machines simultaneously on the scrap heap or ought to." (The italics are ours).

Mr. O'Brien does not advocate the wholesale purchase of new and more powerful machines purely on an arbitrary basis. The decision to buy or not to buy must be based on a knowledge of the existing annual output of old machines and proposed new machines. "After all necessary allowances have been made," according to Mr. O'Brien, "it is hardly justifiable to purchase a new machine unless a return of approximately eight per cent on the capital expenditure is obtainable." Certainly no fault can be found with this line of reasoning and when shop foremen and executives clearly show their superiors by reliable figures that a certain machine will earn eight per cent on the investment, it will not be long before the necessary capital is forthcoming.

#### Capital Expenditures for Shop Equipment

It is impossible to ascertain exactly how much has been spent for new shop machinery and equipment in the past year, either to replace wornout machinery or for additions and betterments. The approximate amount is probably around \$7,000,000, which is by no means adequate to cover the needs and only goes to show how large a field there is

for the use of all kinds of machinery and equipment in railway shops and roundhouses. Reports from Chicago indicate that in that section approximately \$1,400,000 worth of machine tools have been purchased during the year. There has been considerable activity in the southwestern district and in the east it is understood that a \$2,000,000 project for increased shop and power house facilities is being considered.

#### Conclusions

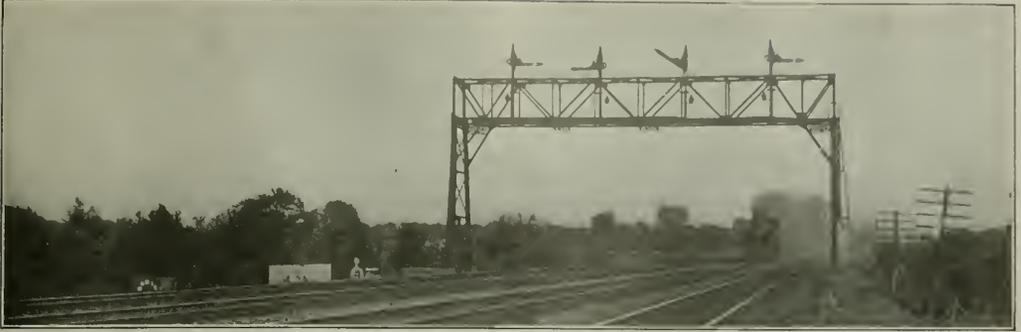

In January, 1920, the *Railway Age* estimated that over one hundred and forty-six million dollars should be spent for improved shop machinery and equipment in the next three years. Of this amount 38 per cent or approximately fifty-four million dollars was considered necessary for the purchase of machine tools. As previously stated, figures are not available to show how large a proportion of this capital was so invested, but it is practically certain that less than one-third of the amount was forthcoming. The estimates stand the test of common sense, however, and nothing has developed in the past 12 months to show that they were extravagant. Certainly the importance of the question and the absolute dependence of industry upon adequately maintained motive power and rolling stock make evident the folly of limiting repair facilities.

The necessity and wisdom of *buying now* depend largely upon the need for a given product. If the lack of a \$5,000 tool in a roundhouse is holding up \$70,000 locomotives even a few minutes a day, it is obviously poor business management to delay buying the tool in the hope it may come down to \$4,000 in price. There is a certain strength to the argument that permanent investments should not be made at present high rates of interest, but if everyone refused to buy, business would stop entirely and all would be losers. Business men as well as students of economics say that the present business depression will end in April or the early summer months when the railroads will again be required to move traffic exceeding their capacity. The shop and roundhouse equipment needed to keep cars and locomotives running at that time should be bought now. There can be no excuse for delay. What is lost in delays to traffic in May or June will far more than offset what is gained by possible reductions in the cost of machine tools and shop equipment.

# Attitude of Investors Toward Railroad Securities

New Speculative Interest in Stocks and Strong Confidence in Bonds Apparent in 1920

JOHN J. ESCH, chairman of the House of Representatives Committee on Interstate and Foreign Commerce, in an address at a dinner given recently in honor of S. Davies Warfield, president of the National Association of Owners of Railroad Securities, made the following statement relative to the rule of rate making provided by the Transportation Act:

"This provision is contained in Section 422 of the Transportation Act and was believed to be necessary to enable the roads to secure the money and the credit required to purchase additional equipment and betterments at lowest possible rates and take care of the present and immediately prospective wants of transportation. With the roads again under private operation and the guaranty of the standard return withdrawn, there must be proper encouragement given to the investing public if the carriers are to obtain the necessary funds to provide the additions, betterments and extensions required by an expanding commerce. The public cannot be compelled, but must be induced to invest. Stabilizing the credit of the carriers is a strong and necessary inducement. A public utility which has its income controlled through the regulation of its rates and its expenses, especially wages, also fixed by government authority, is entitled, upon moral if not legal grounds, to fair and just treatment."

The remarks of Chairman Esch are quoted here because they aptly point out the factors which influence the investing public and indicate the underlying question that must be answered in an article dealing with the Attitude of Investors Toward Railway Securities.

The question is—Has the investor been induced to put his money into railway securities as a result of the various de-

velopments that have taken place in 1920? The answer is that he has.

This answer is developed with due regard to the present state of the security market. It is evident, of course, that there has been but little market for securities of any kind during the past few months. Nevertheless, it does not require much investigation to determine that railway securities

are regarded in a new light as a result of the treatment guaranteed the railways under the terms of the Transportation Act.

It is not desired here to discuss the conditions that have caused the present low level of stock and bond prices. It is desired to discuss the attitude of the investor rather than his ability to invest: the latter point is, however, discussed in the latter part of the article.

The attitude of the investor has two important aspects. One of these is contained in the confidence that has been inculcated through the passage of the Transportation Act. The other is the effect on the investor of the present trend of earnings and the probabilities as to these earnings in the near future. At this particular moment the latter factor is not favorable. It is compensated

for, however, by a strong feeling of confidence in the railway situation. It is apparent on all sides that the public has caught the idea that the railways are to be given a square deal and that investments in railway securities will be reasonably safeguarded. There is in evidence, in fact, a certain feeling of popularity for railway securities at this particular time, encouraged to no small extent by a somewhat lessening confidence in industrial issues.

The favor that has been shown for railway securities has been especially evident in the interest in railway stocks. There is not as yet a market for new issues; reference is

**T**HE BETTER TREATMENT guaranteed the railways by the terms of the Transportation Act has helped create a new feeling of confidence on the part of the buyer of securities.

Railway stocks and bonds are more popular than they were and equipment trust issues have been in special demand.

way stocks did not rise during 1919 as did the industrials so that the space between the lines showing the respective average prices of the 20 railroads and 30 industrials was much greater during the latter part of the year than during the early months. The railway stocks rose to an extent in sympathy with the general upward movement but in the early summer this sympathetic rise ceased. There was in-

volume to indicate a beginning of return of confidence in the railway situation.

The outlaw strikes, the decreased net earnings and the serious freight congestion followed, with the result that the major part of the small rise that had taken place was more than lost. When the Interstate Commerce Commission announced its favorable decision in the question of increased

The Trend of Stock Prices, 1912 to 1920

stead a decline of railway stocks going on contemporaneously with the rise in industrials.

In 1920 the relative relationship has been quite different. A decline in industrial stocks began in November, 1919, which has continued with various interruptions to the present time. One of these interruptions was in March and April.

freight rates and passenger fares, confidence was again restored, so that in August, September and October there was another marked rise in railway stock prices. The falling off in business, the general liquidation of securities, etc., have since come into play so that railway stock prices at present are at a very low level.

The fact that the railways with their increased rates have failed to secure the net railway operating income of 6 per cent in any of the four rate groups has not assisted by any means in recent months in inculcating confidence. It is the general consensus of opinion among observers who are real students of the problem, however, that this is but temporary. They express the opinion, to be sure, that it is not likely that net earnings will increase for several months. They have confidence for the future. They point to the fact that when business picks up gross earnings will, of course, increase while in the meantime the railways should be able to make

rumors that have been started and the activity in the stocks involved exemplify clearly the popularity of the railway shares from the speculative point of view.

**Railway Bonds**

The attitude of the buyer of railway securities towards bonds is shown in quite a different manner from that towards stocks. Bond issues appeal to the investor, whereas stocks, on the whole, have a greater appeal to the speculator. The bonds have stated earnings, the failure to pay which means receivership. The result is, of course, that the bond market

important decreases in their operating expenses, with the result that when conditions are more normal the net earnings should be on a much improved basis. In this regard, particular attention is given to the decrease in coal prices. It is interesting to note that some of those who are selling securities express the hope that further increases in freight rates will not be necessary; they fear that such increases might have an unfavorable effect on confidence in the situation.

The foregoing is written with the thought in mind that the buyer of railroad securities, as a rule, regards railway stocks as speculative rather than investment securities. There are

more in a state of equilibrium and the movement of bond prices reflects different factors from those indicated in the movement of stocks. In discussing the attitude of the buyer of securities towards railway bonds, a further distinction arises in that whereas there have been few new issues of stocks in an extended period of time, new issues of bonds have been made this year in large amounts.

Under present conditions the importance of the attitude of the investor in railway bonds is out of all proportion to that of the attitude of the purchaser of railway stocks. The purchasers of bonds include principally the large fiduciary

The Trend of Bond Prices, 1912 to 1920

many railway stocks that rank as investments. These are pointed out in many cases as being priced on the stock exchange at present far below their real value. Those who deal in stocks have sufficient confidence in the railway situation to recommend such stocks highly. Another factor in connection with railway stocks has already been pointed out in the pages of the *Railway Age*. Reference is made to the live interest that has been shown in the stocks of companies that are spoken of as about to make segregations of their non-railway properties or as suggested for consolidation. The

institutions, such as the trust companies, the savings banks, insurance companies, etc. These institutions have something of a duty towards the public that is not necessarily expected of individual investors. As holders and guardians of the public's funds, they are properly expected to develop their investment policy, so that other things being equal, what they do is in the general public interest. Efficient transportation is one of the most important factors in the country's well-being and prosperity. Naturally, therefore, the investment of funds in railway bond issues is a matter of great

importance and in no small measure a public duty. It is an encouraging thing, then, to find that the railway situation is regarded in such a light by these institutions that they have a most favorable attitude towards investments in railway bonds.

### The New Outlook for Railroad Securities

The following statement by a vice-president of one of the important life insurance companies will indicate how that company regards the situation:

"The new year brings a more hopeful outlook for the return of railroad securities to that sound position which they should occupy in American business. This is true in spite of the present falling off in railroad traffic.

"While recent reports have not shown as large earnings in some instances as was hoped for, it is believed that a return to better conditions in the business world will bring these earnings more nearly in line. It is to be hoped that there will be an early decision by the United States Supreme Court settling the dispute over the power of the Interstate Commerce Commission with respect to the regulation of intrastate rates. The inability of the carriers in some of the states to bring their intrastate rates up to a level with the rates authorized by the Interstate Commerce Commission, has of course had a considerable influence on passenger earnings, as well as freight earnings.

"Naturally the securities of the stronger railroads have emerged ahead of the weaker lines and some of the railroad securities have been good investments even during the unsettled period due to the war.

"The insurance companies have for years realized the basic necessity for railroad securities being of the very highest order for the reason that the success of the railroads is to so great a degree the foundation for business success generally in this country. It is evident that the business world generally is now recognizing this fact and the recent action of the Interstate Commerce Commission shows that there is a more hopeful outlook from the standpoint of government regulation. We look for a much better market for railroad securities, a market which will be of interest not only to the general investor but to the insurance companies, savings banks and other organizations which occupy fiduciary relationship."

The statement made by this insurance officer is borne out by the observations and experience of the bond houses. They have found during this year an entirely new attitude as to railway bonds. There has been a decided change in the attitude of investors, which change was evidenced during the year, first following the passage of the Transportation Act and more emphatically after the increase in rates in August. One of the interesting features has been the change in the middle west where in some quarters for a period in recent years railway investments have not been as well regarded as they might have been. This has now been changed and a ready market has been found for such securities during 1920. It has also been found in the large financial centers that railway bonds are becoming more popular at the expense of industrial issues.

The feeling on the part of investors seems to be that the industrials have been through a boom period which is now over and which will not exist again in the same degree for many years, whereas the railways have just begun to come into their own. Much stress is placed on the protection given the investor by the Interstate Commerce Commission, not only through the rule of rate making provided by the Transportation Act but by the provisions relating to the issuance of new securities, those relating to loans from the revolving fund for maturities, etc.

In speaking of the large financial institutions sight must not be lost of the fact that many of these organizations are

already large holders of railway bonds. These institutions through the National Association of Owners of Railway Securities, of which S. Davies Warfield is president, took a leading part in the working out of the Transportation Act. The fact that the law as finally passed has met with their approval is a matter of no small importance, for, of course, if the law had not supplied sufficient encouragement to investors the companies in question could hardly have felt justified in adding to their already large holdings.

The co-operation of the insurance companies is assured for the future through the new organization known as the National Railway Service Corporation organized by the National Association of Owners of Railway Securities. It is not necessary to enlarge upon the plan of financial assistance to the railways which the new company provides. It is sufficient to note here that its object is to assist in financing the purchase of cars and locomotives. The organization will supply through the investment institutions connected with it 60 per cent of the cost, while the remaining 40 per cent is to be supplied from the revolving fund administered by the Interstate Commerce Commission. Among the companies represented on the board of trustees are the New York Life Insurance Company, the Metropolitan Life Insurance Company, the Society for Savings of Cleveland, the Emigrant Industrial Savings Bank of New York, the Massachusetts Mutual Life Insurance Company, the Travelers Insurance Company, etc. The fact that companies of such standing as these stand ready to assist the railways financially should be clear enough indication of the new attitude of investors toward railway securities.

The trend of railway bond prices for the past two years has been generally downwards to about July of this year, when railway bond prices reached the lowest point which they had touched in many years. In August an upward movement began which ceased in October. Since that time, because of various market conditions, prices of bonds have again dropped so that now they are at a fairly low point, although not as low as earlier in the year.

During the year a number of large railroad bond issues were placed, at yields, on the whole, less than contemporaneous issues for strong leading industrials. About 80 per cent of the new issues were put on the market in April, May and June. The action of the Interstate Commerce Commission in discouraging borrowing at more than 7 per cent served as a retarding factor after that time and later it was not considered feasible to float loans because of the liquidation of business and the generally stagnant condition of the bond market. It is noteworthy that the equipment trust issues floated were especially popular and in great demand.

### The Prospects for 1921

In looking ahead into 1921, the first thing that confronts the observer is the probable net earnings of the carriers for the coming months. It is likely that the net earnings for a few months in the immediate future will be somewhat disappointing. The recession in business will naturally have a drastic effect on gross earnings, which for a time will be clearly reflected in net railway operating income.

It seems to be the consensus of opinion that the present business depression will have worked itself out by about the latter part of spring or early summer. No one expects a boom to follow after that but observers do look for greater stability of business. They expect a cessation of the present rapidly declining prices and possibly a leveling up here and there of prices which may have fallen below the general level. Some do expect increasing prices at that time, but those who believe that there will be pronounced increases in the general level are in a small minority.

While business remains slack and gross earnings remain

## General Railroad Developments During the Year

### Period Since Return of Railroads to Private Management One of Transition and Readjustment

THE OUTSTANDING DEVELOPMENT affecting the railroads during the year was, of course, the return of the properties to corporate management on March 1. A review of the year's activities, therefore, consists largely of an account of the various measures that have been necessary to enable the roads to recover from the effects of the war and 26 months of "unified" operation by the government, and of the process of readjustment to the new conditions created by the Transportation Act.

When the year opened the return to private management had been definitely decided upon and the President had issued his formal proclamation relinquishing the roads as of midnight on February 29, but many of the conditions under which they were to be returned and the policy of regulation to be applied to them in the future were left in a state of great uncertainty until they were determined by the passage of the Transportation Act only a week before the date set for the relinquishment. In fact the conditions were so uncertain that the interests opposed to the relinquishment of federal control, including government ownership advocates in general and the labor leaders of the Plumb Plan League, kept up a bitter fight to the last minute for their retention by the government in spite of the

proclamation which had been issued on December 24, and even tried to persuade the President to veto the bill after it had been passed.

The railroads were returned to their owners on March 1 under a new law which afforded much brighter prospects for the future than they had enjoyed for many years, but with an immediate outlook far from encouraging and with what the Interstate Commerce Commission has since described as "an impaired transportation machine." The railroad companies resumed the reins of management with very little cash on hand as working capital, under a scale of expenses which the rate structure could not hope to provide for until after a readjustment, and in debt to the government for most of the additions and betterments made during the period of federal control. They were faced, at a time of high interest rates, with a need for vast sums for further development to enable them to catch up with the industrial growth of the country during the war period, with their

organizations more or less disrupted, and with the labor organizations bitterly hostile and demanding large increases in wages.

For about a month, with the encouragement afforded by the new law, a new spirit pervaded the railroad world and

PRIVATE management was restored on March 1, with the rate and wage questions still to be settled, with an impaired physical plant, and under a law providing new conditions of government regulation.

Seriously hampered by the outlaw strikes, the railroads recovered sufficiently to break all previous records for business handled.

While rates and wages have been advanced conditions have not yet become stabilized and the full effects of the new law have not yet been demonstrated.

the principal developments seemed to consist of the discontinuance of practices instituted by the government and those incident to a renewal of competition. Traffic soliciting offices were opened, advertising was resumed and occasional reports of an improvement in train service were made much of.

### Switchmen's Strike

Then came the "outlaw" switchmen's strike, and by the middle of April transportation conditions were the worst ever known. Railroad officers who had in previous years spent a large part of their time in opposing the demands of organized labor for higher wages, began to express impatience at the delay of the Railroad Labor Board in passing upon the new demands. Shippers, who had rejoiced with the railroads at the termination of federal control, became critical again because the railroads could not handle their business, and the habitual critics of the railroads began to cry that private management had broken down. Private management had little to do with the wage problem, which, together with dissension in the ranks of unionism and the general spirit of unrest born of the war period, had brought on the strikes that tied up the railroad terminals, but private management had about the biggest job it had ever tackled in dealing with the physical aspect of the situation and in attempting to vindicate the claims that had been made for its superiority over the management that had been in charge for 26 months.

The railroad managers and the employees that remained loyal performed an almost superhuman task in keeping the railroads from a complete breakdown for a few weeks, and after the Railroad Labor Board had begun its hearings and most of the strikers had returned to work or had been replaced by new men, conditions began to improve. The cessation of work in most of the important terminals in the eastern part of the country had left such a congestion, however, and at a time when an enormous volume of traffic of all kinds awaited transportation, that a large number of railroad executives felt it necessary to call upon the Interstate Commerce Commission to exercise the emergency powers conferred upon it by the Transportation Act to assist them in dealing with the extraordinary conditions. The developments more particularly connected with transportation conditions and the combined efforts of the railroads, the commission and the shippers to restore order out of the chaos produced by the strike, are dealt with in another article in this issue.

### Some Strange Contrasts

The railroad history of 1920 presents some strange contrasts. The railroads have handled a larger volume of traffic than in any previous year and their total earnings have consequently broken all records, but expenses have consumed a larger proportion than ever before and as a result the net operating income has been less than for any year in recent history. The year includes one month in which, on account of the switchmen's strikes, the railroads "ceased to function" to a far greater extent than during the period toward the end of 1917 when a similar statement was made of them as a reason for their taking over by the government, but it also includes several later months in which all previous records for the amount of traffic handled were broken.

### The Labor Problem

It had been made clear some months before the railroads were returned that the Railroad Administration did not intend to readjust the rates in keeping with the increases in expenses that had occurred while it was in charge, and it was well recognized that one of the first problems to be solved in connection with the return of the roads was to

readjust their rates to a basis that would be self-sustaining. Developments in January and February, however, resulted in the wage question also being postponed until after the return of the roads and in such a way that it became the immediately pressing problem.

After the President had issued his proclamation relinquishing the railroads the railroad labor organizations renewed their insistence on a settlement of their demands for increased wages which had been pending before the Railroad Administration Board of Wages and Working Conditions for several months. The subsequent developments are outlined in another article entitled "Labor Faces Economic Readjustments in 1921," published elsewhere in this issue.

The settlement of the wage question and the gradual return to something like normal conditions both on the railroads and in the country generally has led to a marked increase in the efficiency and loyalty of railroad labor, but the labor situation has by no means been entirely cleared up. The Plumb Plan League, claiming to represent the railroad employees but including as individual members only about 200,000 of them, has kept up a steady campaign of vilification of railroad managements, largely in connection with its unsuccessful efforts to defeat for re-election the members of Congress who voted for the bill under which the railroads were returned to private management.

A controversy between the labor organizations and the railroads has also arisen from the demand of the former for the establishment of national boards of labor adjustment. The Transportation Act provides for the creation of boards of adjustment by agreement between the companies and the employees, composed of an equal number of representatives of each side and the labor organizations have insisted on the formation of national boards such as those maintained by the Railroad Administration, while the railroads have insisted on local boards to settle local grievances at home and to enable each road to retain some control over matters of discipline.

### Rates Advanced

One of the first questions to which the railroads turned their attention after the return of the roads was naturally an advance in rates to enable them to pay expenses and earn the return prescribed by the new law. Committees had been appointed by the Association of Railway Executives before the return of the roads to study the question of how an advance could best be made, whether in accordance with a plan worked out by the traffic department of the Railroad Administration during 1919 when it had given some consideration to a rate advance, for increasing revenues by raising the low spots in the rate structure, or by a uniform percentage. It was finally decided that the required amount of revenue could be raised in the short time available for the readjustment only by a uniform percentage advance in each territory. Whereas former general rate advance cases had been instituted by the filing of tariffs which were later suspended pending hearings and an investigation, the new law placed a responsibility for the adequacy of rates upon the Interstate Commerce Commission and also authorized the commission to initiate rates.

Informal conferences were held by the representatives of the railroads with the commissioners and in response to inquiries the commission said that it would be appropriate for the roads themselves to formulate specific requests for the establishment of rates which in their judgment would produce the income authorized by law. In the early part of May separate petitions were filed by the carriers in the eastern, southern and western territories seeking general increases in freight rates by percentages which they estimated, if applied to the traffic of the year ending October 31, 1919, would produce a net return of 6 per cent upon the property

investment, assuming that expenses continued at the unit figures prevailing during the first part of 1920.

Hearings were held by the commission extending over more than five weeks during which comparatively little opposition was manifested by the representatives of the shippers who appeared, except by those who were so situated that they would be placed at a comparative disadvantage by a percentage instead of a specific advance; on the other hand, large numbers of representative shippers strongly urged the advance and declared they were far more interested in doing something to enable the railroads to improve their service than in the amount of the freight rate. There was some objection to the use of the property investment accounts of the carriers as even a temporary basis of valuation for the purpose of calculating a fair return and the National Association of Railway and Utilities Commissioners, through its solicitor, urged the commission to take time to build up a figure for the temporary value by a detailed consideration of such information as was available for each road.

After the close of the hearings before the commission, the Railroad Labor Board issued its report awarding an increase in wages amounting to about \$618,000,000 a year, which, it had been understood at the hearings, was to be added to the amount of the rate advance. The railroads filed supplemental proposals to provide for the additional amount by further advances in freight rates and also by advances in rates for passenger and other service not covered by the original applications.

On July 31, only 25 days after the close of the hearings, the commission announced its decision, dated July 29, allowing a 20 per cent increase in rates for passenger traffic and services accessory thereto, a surcharge of 50 per cent, to accrue to the railroads, upon the amount paid for Pullman accommodations, and increases in freight rates of 40 per cent in the eastern district, 35 per cent in the western district, 25 per cent in the Mountain-Pacific district, 25 per cent in the Southern district and 33 1/3 per cent on inter-territorial traffic.

These increases, the commission found, would be necessary under the conditions shown to exist, to meet the increased costs of labor and materials, and to produce as nearly as may be a net return of 6 per cent upon a valuation of \$18,900,000,000. The carriers had used to represent a minimum figure for the value upon which to calculate the return, their cost of road and equipment, aggregating \$20,040,572,611, plus a sum for working capital and materials and supplies, making a total of about \$20,600,000,000. A 6 per cent return on this amount would have been \$1,236,000,000 a year. Six per cent on the figure adopted by the commission is about \$1,134,000,000 or about \$100,000,000 more than the railroads had ever earned in a year and about \$200,000,000 more than the standard return, based on the average for the three years ending June 30, 1917, which was the basis of their guaranty during the period of federal control.

It was roughly estimated that the percentages of increases authorized by the commission would result in an increase in revenues of about \$1,500,000,000 a year if applied to both state and interstate traffic, allowing \$600,000,000 for the new increase in wages and \$900,000,000 to make up the deficiency in net operating income shown by the exhibits based on the constructive year ended October 31, 1919.

#### Attitude of State Commissions

At the request of the Interstate Commerce Commission, three representatives of the state railroad commissions took part in the proceedings in the rate case, concurred in the conclusions reached and issued a statement to the state commissions throughout the country to that effect; some of the state commissions, however, have failed to take action corre-

sponding to that of the Interstate Commerce Commission, while in some states they were prevented from so doing by state laws. The railroads had filed applications with the various state commissions similar to those filed with the Interstate Commerce Commission and after its decision the states were asked to put into effect increases corresponding to those allowed upon interstate traffic, on the ground that anything less would prevent them, to that extent, from realizing the percentage of return contemplated by the law. Increases upon intrastate traffic were approved by the various state commissions as follows:

	Freight	Passenger
Increases approved in full.....	24	23
No increase approved with exceptions.....	17	7
No increase allowed because statutory provisions prevent action by state commissions.....	5	13
Smaller percentage increase approved.....	5	..
Increases denied.....	2	3
Increases denied in part.....	..	2
	48	48

In response to petitions filed by the railroads alleging discrimination against interstate commerce as a result of the action of the states that refused to allow the full increases, the Interstate Commerce Commission instituted a series of proceedings of investigation and in the New York, Illinois and Wisconsin passenger fare cases it has rendered decisions ordering the state rates to be increased by the amount of the interstate advances. The cases involving rates in other states are in various stages of progress, many of them having been submitted to the commission after final arguments.

These state rate cases have brought sharply to the front the conflict between state and federal regulation and the state commissioners, generally, through their association, regardless of whether they had themselves allowed the full advances, have organized to contest the power of the Interstate Commerce Commission to interfere with state rates. They have been represented at the various hearings by counsel and by a committee and have announced their intention of contesting the commission's interpretation of its powers under the new law through the courts. Meanwhile the rate situation in the various states continues to be complicated by the jurisdictional question, as in some cases the railroads have secured federal injunctions against the state authorities and in others the state authorities got an injunction first.

The advances in rates were generally accepted as being adequate on the whole, although for many individual roads and for certain groups of roads they are still inadequate and the New England roads have begun formal proceedings before the Interstate Commerce Commission to improve their condition by obtaining larger divisions of the through rates. The September and October earnings were not sufficient to provide the 6 per cent return contemplated by the law but the gross earnings showed a less percentage of increase than the advance in rates and it is apparent that the full effect cannot be ascertained until later returns become available, as the situation was complicated by the failure to receive the advances in many states and also by the amount of traffic still moving under the old rates.

#### Payment of Guaranty Delayed

Because during federal control the rates were not raised sufficiently to provide for the scale of expenditures and the deficits were met from the Treasury, Congress provided in the Transportation Act for a continuation for six months after the roads were returned of the guaranty which was provided while the roads were under federal control. That is, they were to receive one-half of the average income for the three-year period ended June 30, 1917. The six-months' period was decided upon on advice from the Interstate Commerce Commission that it would take about that long for the proceedings necessary for a general increase in rates. The

guaranty, however, was extended only to such carriers as filed an acceptance agreeing to pay over to the government any excess in railway operating income above the guaranteed amount, and as a safeguard against extravagant expenditures by the railroads, it was provided that for the purpose of computing the guaranty no more should be charged to expenses for maintenance than an amount to be determined by the commission based on the expenditures for the pre-war test period as equated for differences in the cost of labor, materials, etc.

Acceptances of the guaranty were filed by 666 carriers and 35 elected to take their own chances. These included the Southern, the St. Louis Southwestern and the Pere Marquette, but most of them were small roads which were so situated that they expected to earn more than they did before the war. The 35 roads earned about as much as their guaranty but the roads as a whole had a deficit for the six-months' guaranty period of over \$200,000,000, which represents approximately the amount of the retroactive wage increase from May 1 to September 1.

The guaranty for the roads that accepted it was about \$420,000,000 so the amount payable by the government to make good the guaranty is something over \$600,000,000. Advances amounting to approximately \$250,000,000 were paid on account of the guaranty as provided for by the law on applications filed by the roads up to September 1 on certificates by the Interstate Commerce Commission, but when the commission attempted to assist the roads by issuing certificates for additional partial payments on account of the guaranty the certificates were held up in the Treasury Department by a decision by the comptroller of the Treasury that partial payments were not authorized by the law and that payments after the close of the guaranty period could only be made on certificates by the commission for the full amount due to make good the guaranty as finally ascertained.

After several efforts by the commission and the railroads to obtain a reconsideration of this ruling an effort was made to test it in the courts by the filing of a petition by the Grand Trunk Western in the supreme court of the District of Columbia for a writ of mandamus requiring the Secretary of the Treasury to honor the commission's certificate. This delay in collecting the guaranty, the need for which was accentuated by the back wage payments made in July, August and September, has seriously affected the cash position of the railroads and made it necessary for some of them to borrow money from the banks to meet current expenses. The final settlement of the guaranty is likely to be protracted by the many complications entering into the adjustment of the maintenance accounts, and claims affecting the income for the guaranty period may be filed at any time within two years. The Interstate Commerce Commission in its annual report recommended that Congress amend the law to clearly provide for partial payments of the guaranty.

### Loan Fund

The Transportation Act also provided a revolving fund of \$300,000,000 to assist the carriers during the transition period immediately following the period of federal control by loans to meet maturing indebtedness or to acquire equipment or make other additions and betterments. The Interstate Commerce Commission immediately received applications for loans in such numbers and for such amounts that the fund would have been exhausted at once unless some definite plan of apportionment were adopted. The fund is to be loaned at 6 per cent, while the going rate for money has been considerably higher and most roads naturally attempted first to meet as much of their requirements as possible from the fund. The Senate had attempted to provide a larger fund, of \$500,000,000, but because of the opposition of the House the amount had been reduced and it became necessary

for the commission to give careful consideration to its apportionment, particularly as many of the roads most in need of the money were unable to furnish the security required by the law.

As the law was originally passed, the provisions for the loan fund were almost unworkable but an amendment was secured extending the maturity of the loans from 5 to 15 years and giving the Interstate Commerce Commission discretion as to the character of the security to be required. On May 29 the Interstate Commerce Commission held a hearing in respect of the general principles which should guide it in administering the fund and on June 7 it announced a tentative apportionment of the fund for various purposes but this still left open the question of the apportionment between various carriers. After some discussion and conferences the commission asked the Association of Railway Executives and the American Short Line Railroad Association to make recommendations on this point and the commission has been guided to a very considerable extent by their reports.

All of these preliminaries naturally tended to delay putting the fund at work and it was not until the latter part of the summer that any considerable part of the fund had been loaned. Another delay was caused by the position taken by the Treasury Department that it could not issue loans except upon an unqualified certificate from the commission that the railroad could not borrow money from other sources, whereas the commission had qualified several of its certificates with the words "except at excessive rates of interest." The commission finally got around this objection by deciding that the inability to borrow elsewhere referred to in the law meant a practical inability and that it could issue an unqualified certificate if it believed the interest rates that would have to be paid elsewhere to be excessive. The commission, however, adopted a policy of requiring carriers to borrow money for part of their needs from other sources as a condition of their receiving a loan from the revolving fund.

Loans have recently been certified by the commission as rapidly as the carriers have been able to make the necessary showing as to the facts which the commission is required to certify to the Treasury and as its organization has been able to pass upon the various details, but up to October 20 only about \$56,000,000 had been actually loaned from the fund by the Treasury Department. By the first part of November the commission had certified loans amounting to \$115,000,000 from the fund, of which approximately \$81,000,000 had been actually loaned by the Treasury but additional certifications have since increased the total to some \$150,000,000.

## Transportation Conditions During the Year 1920

### Co-operation Between the Railroads, the Commission and the Shippers Overcomes Handicaps

**T**HE RAILROADS during 1920 handled a greater volume of traffic and under probably greater difficulties and more handicaps than in any previous year in their history. They also during the latter half of the year established new records in some respects for the efficiency with which the traffic has been handled with the available facilities, although in the first part of the year, as the result of causes entirely outside of their control, they probably came nearer to a complete breakdown than ever before.

The railroads then organized to beat all previous records of either government or private operation and, with the co-operation of the Interstate Commerce Commission and the shipping public, were making remarkable progress in the accomplishment of the program they had set for themselves when the slump in traffic began. In spite of the business slump during the past two months, it is now clear that all records for freight handled by the railroads in a year have been broken. While the complete statistics will not be available for some time, the figures now at hand indicate practically as great a ton-mileage of freight in 11 months of this year as was handled in the entire 12 months of 1917 and but for the slump in November the 11 months' record might have exceeded that for any previous 12 months with the exception of the year 1918.

For the 10 months ending with October the number of ton-miles of revenue and non-revenue freight was 373,526,000,000, as compared with 328,792,000,000 in the corresponding period of 1919, and 365,855,000,000 in 1918. The ton-mile statistics for November and December are not yet available, but the number of cars of revenue freight

loaded in those months was greater than in either 1919 or 1918. In November, 1919, the total ton-miles were 32,000,000,000 and in November, 1918, the total was 35,000,000,000, while in December in both years the total was 33,000,000,000.

From October 31 to December 25 the total car loading was 6,651,694 in 1920, as compared with 6,271,570 in 1919 and 6,281,389 in 1918.

The weekly car loading has fallen off from 1,010,000 cars in the week of October 23 to 796,858 in the week of December 18. In the latter part of 1918 traffic also fell off sharply after the armistice and in the latter part of 1919 it was reduced considerably by the coal strike. The increase in November and December this year as compared with last year is more than accounted for by the increased coal loading this year, but it is rather difficult to say to what extent the reduction since October is more than reasonable because the traffic of the corresponding period of 1917, which was greater than that for 1918 or 1919, was probably abnormally high and the car loading figures for 1917 are not available for comparison with those of this year. For the week of December 18 this year the loading was less than for the corresponding week of 1919.

Statistics of freight car performance just compiled by the Bureau of Railway Economics for October show that the railroads in that month handled 42,562,685,000 ton-miles of freight, as compared with 40,166,000,000 in October, 1919. This represents, with one exception, the largest volume of freight ever handled by the railroads in a month. In August, in which month a large volume of freight was offered to the railroads to beat the new freight rates which went into

**A**LL RECORDS broken for volume of freight traffic moved, in spite of a shortage of equipment and other facilities and the set-back received from the switchmen's strike.

The railroads have also established new records for efficiency in car performance. Average miles per car per day increased from 22.3 in February to 28.5 in October. Average carload increased in the same period from 28.3 tons to 29.9 tons. New records set for net ton-miles per car day and tons per train.

effect on August 26, the ton-mileage was 42,656,000,000. For each of the months of July, August, September and October the ton-mileage has been over 40,000,000,000, a figure attained in only two months before—August, 1918 and October, 1919. In fact each of the four months broke the freight traffic record for the respective months and the four months have established a record that may not be equalled for some time to come.

The average mileage per freight car per day in October, 28.5 miles, not only established a new record for the year but was greater than has been recorded for any month since May, 1917, when the railroads had started their drive to increase the efficiency of freight car performance just after the United States entered the war. The average load per car, 29.9 tons, was slightly less than for September, when it was 30.1 tons. In average train loading, net ton-miles per car day and net ton-miles per mile of road per day the railroads have broken all previous records for any single month.

The record of ton-miles handled in each month of the year, with comparative figures for 1919, 1918 and 1917, is as follows:

	NET TON-MILES REVENUE AND NON-REVENUE FREIGHT			
	1920	1919	1918	1917
January .....	34,607,000,000	30,178,000,000	27,619,867,000	32,652,615,000
February .....	32,562,000,000	25,474,000,000	29,678,260,000	28,386,350,000
March .....	37,638,000,000	28,813,000,000	37,706,100,000	31,674,619,000
April .....	28,208,000,000	28,593,000,000	37,992,810,000	34,279,892,000
May .....	37,569,000,000	32,276,000,000	37,506,935,000	38,552,222,000
June .....	37,742,000,000	31,881,000,000	37,667,517,000	38,477,862,000
July .....	40,232,000,000	34,916,000,000	39,347,137,000	37,137,162,000
August .....	42,656,000,000	36,416,000,000	40,776,125,000	36,044,332,000
September .....	40,651,000,000	38,678,000,000	39,579,023,000	35,469,005,000
October .....	42,562,685,000	40,166,632,000	39,621,923,000	38,224,083,000
November .....	32,539,248,000	32,539,248,000	35,564,236,000	36,404,612,000
December .....	33,462,298,000	33,462,298,000	33,639,389,000	31,960,171,000

With the lessened demand for transportation service and with greater efficiency in freight car performance, transportation conditions have become decidedly easier during the past two months.

The car shortage, which on September 1 amounted to 147,000 cars, has given way to a large surplus of equipment. For the week ending December 23 the Car Service Division of the American Railway Association reported a surplus of 127,723 cars, largely box cars, while there were still shortages amounting to 9,056, representing largely a demand for coal cars in the eastern districts.

The Interstate Commerce Commission has cancelled all of its priority orders, giving preference in car supply to coal shipments, and the programs for the shipment of coal to New England and to the Northwest via the lakes have been fulfilled. Up to December 25, 1920, the Geological Survey reports a total production of bituminous coal amounting to 547,264,000 net tons, which exceeds that for the corresponding period of 1917—546,025,000—when there was a heavy demand for coal and the production about equalled the demand. In 1918, in the corresponding period the production was 572,692,000 tons but this represented an excess which resulted in a much smaller output in 1919.

For the year 1920, the Geological Survey estimates a probable production of 555,000,000 tons.

Transportation conditions throughout the year have been dominated by two important factors, aside from the general effects of the war and those resulting from the fact that for 26 months the railroad properties had been out of the control of their own organizations and had been operated by a government organization.

These factors were the coal miners' strike which began in November, 1919, and the outlaw switchmen's strike which began in April. The coal strike caused such a depletion of coal stocks as to create an enormous transportation problem in relieving the shortage and building up new

reserves and the switchmen's strike for several weeks caused a paralysis of the efforts to cope with the problem and to handle the enormous volume of general freight demanding transportation. As a result, a situation was created which affected the entire industrial activity of the country. On the other hand the condition caused by the two strikes was so serious and demanded such a degree of forbearance and co-operation on the part of all concerned to deal with it at all, that without doubt, it may be said that the strikes were largely responsible for the great degree of success that was later attained.

### Railroads Returned in Impaired Condition

The condition in which the railroads were returned by the government on February 29 is now fairly well understood by all who are at all conversant with transportation conditions, although at the time a great many people who had become dissatisfied with the results of government operation and conditions resulting from the war seemed to have a confident belief that all that was necessary was for the government to let go and for the former corporate managements to resume control to restore pre-war conditions. It is now well recognized that the roads were returned in an impaired physical condition, particularly as to equipment, as the result of the intensive use to which it had been subjected for three years, that the railroad facilities had not been expanded while the industrial capacity of the country had been enormously developed, that most companies were without working capital, their organizations had been considerably disrupted, and the morale of their employees was at a low ebb, while business was expecting more of the railroads than ever before.

The country had embarked upon a program of reconstruction and production in an effort to replace the shortage and waste of war times and to bring about a condition of prosperity following the period of uncertainty and depression which succeeded the armistice and the railroads were faced with an enormous demand for transportation. In fact they had already in January and February, the last two months under federal control, carried a larger volume of freight than ever before in those months.

The private managements on March 1 inherited a considerable amount of accumulated dissatisfaction among their employees as the result of the unsettled state of their negotiations with the Railroad Administration over matters of wages and working conditions. There was also undoubtedly a feeling of discontent among the men because of the adverse decision of Congress with regard to their proposals for a radical reorganization of the railway industry along the lines of the Plumb plan and because the demands of their leaders that the return of the railroads be postponed had been disregarded.

### The Switchmen's Strike

Private operation had hardly got under way during March when the dissatisfaction among the classes of railroad employees which had received somewhat less consideration than others during the war period made itself manifest in a series of strikes of yardmen and switchmen, which began about the first of April and served seriously to retard railway operations not only during April but during two or three succeeding months. Although unauthorized by the recognized union leaders and branded as "outlaw" movements, the strikes could hardly have been organized in a way to have affected transportation more seriously. Many of the unorganized strikes occurred without warning, in many instances the men went on so-called "vacations" without presenting any demands and many men simply quit their employment to take more remunerative jobs elsewhere. The strikes were most complete in the great eastern cities which

are railroad terminals and gateways and also the centers for great industrial activity, and the effect of the withdrawal of labor from railroad service was wholly disproportionate to the number of men that left the service.

The congestion which had existed at important gateways and terminals was enormously magnified and necessitated the placement and maintenance of numerous embargoes. Hundreds of thousands of cars were left standing in terminals for days and weeks because of the shortage of switching forces, and not only was the ability of the railroads to accept new freight enormously reduced but the congestion backed up and the movement of such freight as was handled was slowed up. In some cases men who left the railroad service to take higher paid jobs with industries that were bidding for labor with which to produce goods that could be sold for almost any prices asked, soon found themselves out of jobs again because the railroads could not supply the industries with cars.

"In effect, it was as if about 750,000 cars for the time being had ceased to exist as facilities of commerce," said the Interstate Commerce commission in its annual report. "The April congestion caused by the strikes had the effect of reducing by fully one-third the equipment available as compared with that available on the resumption of private control."

"The general public will never know how close the rail and water transportation systems of the United States came to a complete cessation of functioning in the industrial heart of the country as the result of strikes beginning in April and which continued in diminishing force until midsummer," said Commissioner Aitchison in a recent address. "Indeed, because the stimulus of war was absent, the condition in the spring of 1920 was more menacing to the domestic welfare of the country than it was in the early winter of 1917 when federal control was assumed."

How the strike affected the volume of traffic handled may be observed in the table showing the ton-mileage month by month. Whereas in March the ton-miles aggregated over 37,000,000,000, in April they were reduced to 28,000,000,000.

### Freight Car Accumulations

The only statistical measure of the congestion produced by the strike is the weekly report compiled by the Car Service Division of the American Railway Association showing the principal accumulations of loaded cars in excess of current movement. There had been congestion during the winter months and the accumulations had ranged from 74,000 in the week ending January 2 to 122,000 in the week ending February 20. On April 2 this had been reduced to 93,000, but on April 16 after two weeks of the strikes, accentuated by bad weather in some parts of the country, the total accumulations amounted to the unprecedented total of 288,000 cars. It was not until the middle of July that the accumulations were again reduced to below 100,000 cars and not until October 8 that the number was brought as low as 41,000, which is about normal for a year of heavy traffic. For the week of December 17 the accumulations were only 28,830 cars. During April the average daily accumulations were 208,698, of which 25,692 cars were held on account of embargoes. By the latter part of October the average had been reduced to 39,807, of which only 1,071 were held on account of embargoes and over half were held awaiting export or coastwise movement.

The worst period of the strikes lasted only about two weeks, during which time the railroads at many points were largely dependent upon office men, officials, inexperienced laborers and even college student strike-breakers for such switching service as was performed. After a week or so the newspapers practically ignored the strike, although to those

particularly interested it was apparent that it was the dominating feature of the situation for the next 10 weeks or more.

Almost every important rail gateway and junction point from Kansas City and St. Louis east to Philadelphia and New York was affected, and even after the railroads had regained something like a normal switching force in point of numbers a large proportion of the men were inexperienced; they had chaotic conditions to deal with and the accumulations of delayed loads were so great that all movement was slowed up for several weeks. The car shortage, which had prevailed since August 1, 1919, was magnified by the slow movement. Shippers could not get their products handled and receipts of raw material were slow and irregular. Goods were in transit much longer than usual, which placed a strain on credit facilities and many plants had to shut down temporarily.

The result was an enormous flood of protests to Washington, to the railroads and to state and even municipal authorities. Shippers and even some railroad men who had previously complained of the wage increases made by the Railroad Administration began to criticize the Railroad Labor Board for inaction. Particularly vociferous were the complaints of the coal operators and the large consumers of coal, who had been striving to overcome the shortage resulting from the miners' strike, and whose demands for cars had greatly exceeded the supply even before the switchmen's strike. The general congestion caused delays in the placing of empty cars at the mines and coal already in cars was delayed in reaching the consumers. In March the Car Service Commission had inaugurated a campaign to furnish cars enough for a weekly production of 11,000,000 tons of bituminous coal and this was attained during the last week of March, but in April production fell to 8 or 9 million tons a week. For several weeks during the latter part of the year production has exceeded 12,000,000 tons a week.

### Unscrambling the Freight Cars

The railroads on March 1 had taken over the Car Service Section of the Railroad Administration, which the latter had taken over from the American Railway Association at the beginning of federal control. It was reorganized as the Commission on Car Service of the American Railway Association, but with a considerably reduced force and very uncertain powers. One of its first tasks was to try to bring about a relocation of the freight cars which had been pooled by the Railroad Administration and which, by reason of the transportation conditions of the latter part of 1919, had become badly scattered from the standpoint both of the needs of traffic and of ownership.

When the railroads were taken over on January 1, 1918, 44 per cent of the cars were on their home lines. When they were returned on March 1 only 21.9 per cent of the cars were at home. Too many coal cars were in the west, where they had been sent at the time of the coal strike and where they had been retained by the increasing demands for local traffic. Too many of the box cars that had moved eastward with grain in the fall of 1919 had similarly been held in the east, although a large part of the grain was still to be moved and the western district was clamoring for cars with which to get rid of the accumulation. Relocation orders were issued by the Commission on Car Service for the movement of large numbers of cars but observance of the orders was slow and on some roads they were honored only if it was entirely convenient to do so.

### Interstate Commerce Commission

#### Asked to Use Emergency Powers

After a few weeks of the uphill struggle, a large number of railroad executives decided that the odds against them were too great and called upon the Interstate Commerce

Commission to exercise its emergency powers. The railroad men were not unanimous in this decision. Some felt that they were making progress and that to ask for help would be a confession of weakness and might lead to the exercise of a greater control over them than they desired. Some felt that the railroads should be able to organize themselves in such a way as to render it unnecessary to ask the Interstate Commerce Commission for assistance. The opinion which prevailed, however, was that while progress was being made the set-back they had received was so great that valuable time would be lost if they failed to take advantage of any possible assistance. The Interstate Commerce Commission possessed powers which the railroads themselves could not exercise; they were restricted by laws against discrimination, and many of them felt that while they were willing to set aside selfish interests in order to co-operate for the common good and the public interest, the extent to which they should do so should be determined by some outside authority and not be dependent upon varying degrees of willingness to sacrifice the interest of a single road to the interest of the entire situation.

On May 15 the executives filed with the Interstate Commerce Commission an informal petition in which they stated their urgent need for additional freight cars and locomotives which there was no immediate opportunity to procure, and that relief in the movement of the commodities most essential at that time—foodstuffs, perishables, livestock, coal and newspaper—could only be afforded by the use and movement of the existing equipment in the most effective manner. In the public interest the roads called upon the commission to exercise the emergency powers granted it by the Transportation Act, with respect to the giving of priority and preference in the movement of necessary food, fuel and other vital commodities; the relocation of empty equipment; the necessary postponement or delay of loading or movement of other less important commodities; and the reduction of passenger service as far as might be necessary in order that to the extent necessary the carriers might be relieved from the operation of federal and state laws and orders recognized under ordinary transportation conditions.

The commission had already formed a Bureau of Service to assist it in carrying out its functions with respect to car service, with F. S. Robbins as director and with a small organization. Acting upon the carriers' petition and upon information already in its possession, the commission determined that an emergency existed of so exigent a nature that its powers ought to be exercised immediately and without the holding of any hearing at the time.

### I. C. C. Service Orders

The railroads' petition had suggested the setting up of a list of essential commodities entitled to priority in transportation and requests for priority to nearly every important commodity were received by the commission, but the commission was not impressed with the need for or desirability of a general priority plan. Later it was impressed with the necessity of special consideration for the movement of coal but its first service orders issued on May 20 were directed toward relieving the congestion and bringing about the relocation of cars. Service Order No. 1 required and authorized the railroads to forward traffic by the routes most available to expedite its movement and relieve congestion, without regard to the routing by shippers or other carriers or to the ownership of cars. The second order required various western carriers to deliver, within a period of 20 days, about 30,000 open-top cars to their eastern connections and the third order required eastern carriers to deliver about 20,000 serviceable box cars, preferably cars owned by western carriers, to their western connections within a period of 30 days.

### Car Relocation

After the expiration of the orders they were continued with some modifications by the Car Service Division until approximately 130,000 box cars had been sent westward and an approximately equal number of coal cars had been returned to eastern roads. The Car Service Division also issued many orders for smaller movements of cars from road to road or from district to district, in accordance with the needs of traffic, and compliance with the directions of the Car Service Division has been so general that it was not necessary for the commission to issue formal orders of this character.

The plan adopted has sometimes been referred to as "pooling," but while the demands of traffic were considered paramount to the ownership of the cars most of the orders issued had the effect of returning cars at least in the direction of the home roads and the percentage of home car on home lines has steadily increased throughout the year.

### Terminal Committees

In addition to issuing the orders, the commission co-operated with the railroads in many other ways. It appointed terminal committees at 30 railroad and traffic centers, assigning to each a representative, usually a safety inspector, who acted as chairman and made reports to the commission. The other members of the typical terminal committee included a representative designated by the railroads; a shipper, preferably one who had served as a member of a somewhat similar committee during federal control; and a representative of the state railroad or public service commission. The railroad representative was usually the chairman of a local car service committee appointed by the Commission on Car Service following the practice adopted in 1917 but abolished after March 1.

Each of the committees was expected to do what could be done informally, by conference, advice and negotiation, to keep its gateway open and to advise the commission as to needs. The commission committees acted in close contact with the committees of railroad operating officers organized by the Car Service Commission, and both played an important part in relieving the unprecedented congestion. One of the principal methods used at first was to take advantage of the rerouting privileges under Service Order No. 1. The use of the embargo was also considerably developed and action was taken in various directions calculated to meet local conditions.

The commission issued its first priority order on June 19, the effect of which was to require coal-loading carriers to use coal cars primarily for the transportation of that commodity and to require roads not loading coal to deliver such cars to their coal-loading connections, to the extent of the ability of such connecting lines to receive and absorb that class of equipment. The railroads were also required to place an embargo upon consignees who detained coal cars unreasonably. This order was followed from time to time by others, designed to promote the movement of an adequate supply of coal to New England via tidewater and to the Northwest via the lakes as early in the season as possible so that it would not have to move later through unusual rail routes with loss of efficiency of equipment and further congestion of gateways. Various other orders were issued, representing modification of earlier orders, curtailing the supply of cars to wagon mines and giving preference to public utilities and public institutions.

The coal transportation situation was greatly complicated, not only by the real shortage of coal following the strike of last year, but by the price situation which resulted from the unusual scramble for this basic commodity. Many large consumers who had made the usual form of contracts for coal early in the year failed to receive their supplies because of

the greater attraction of the "spot" market on which the demands were concentrated. Many others had failed to make contracts because of a hope that prices would go down. The result was that even after coal production had been greatly stimulated the coal was being unevenly distributed and the railroads and the commission were criticized for many situations resulting from the competition among coal operators and sellers for the cars and among consumers for the coal. The coal industry is largely over-developed and even when the railroads are able to furnish enough cars to supply all the coal needs of the country they are not able to supply all the mines with cars enough to handle their full output.

This year the coal demands were met only at the expense of shippers and consumers of other commodities that require open-top cars, such as construction and road-building materials. Loud protests were made by these shippers, both at hearings and in other ways, against the preference accorded the coal traffic, but while every effort was made by the commission to mitigate the inevitable hardship, and from time to time, by amendments to the definition of coal cars in its orders, cars were released for other traffic, and permits were issued authorizing the use of specified numbers of cars for commodities other than coal when the public interest seemed to require such action, the commission took the position that fuel was a first essential. The commission's orders were usually issued after conferences with and recommendations from the railroads, the coal operators and the other interests most concerned.

The first priority orders issued by the Interstate Commerce Commission stated that an emergency existed requiring immediate action "because of a shortage of equipment and a congestion of traffic, aggravated by unfavorable labor conditions." Later, after a large proportion of the switchmen had returned to work and the dissatisfaction among the employees had been largely dispelled by the award of the Railroad Labor Board, the commission left out the reference to labor conditions in its orders, and in its latest orders "congestion of traffic" was omitted as a reason.

### Campaign for Increased Efficiency

It had early become apparent that the railroads were not going to be able to add materially during the year to their supply of equipment or of other facilities. Their properties had been returned on rather short notice, interest rates were high, their credit had been improved somewhat by the passage of the Transportation Act but bankers and investors were waiting to observe its actual effect as indicated in the commission's decision as to increased rates, and the revolving fund of \$300,000,000 provided to assist the carriers in financing new equipment and improvements required many preliminaries before it was actually put at work, while payment of a large part of the six-months' guaranty was also delayed.

It therefore became necessary to minimize the effects of a shortage of equipment by increasing transportation efficiency and by car conservation. Whereas railroad men had been inclined to place a large part of the responsibility for the unsatisfactory conditions upon the shortage of cars and other facilities, the effects of the switchmen's strike were so serious as to make it necessary to concentrate on efforts to bring about an improvement in operating efficiency by increasing the average car load and increasing the average daily mileage of each car. In this respect there has been close co-operation between the Bureau of Car Service of the Interstate Commerce Commission and the Car Service Division of the American Railway Association, the individual carriers and numerous organizations of shippers.

The terminal committees did an important work in urging upon shippers and consignees the necessity for loading and unloading cars promptly and for loading cars as nearly to

capacity as possible and the commission in numerous public statements also called attention to the need for reviving some of the methods of patriotic co-operation practiced during the war. Statistics bearing on efficiency of operation have been analyzed day by day and the attention of the operating executives was called with good results to many situations warranting attention.

### The Railroads' Advisory Committee

Shortly after the commission had been asked to exercise its emergency powers the railroads, through the Association of Railway Executives, appointed an Advisory Committee of nine railway executives, representing the various sections of the country, to direct the co-operative efforts of the railroads in a drive for "more transportation" and to serve as a point of contact with the Interstate Commerce Commission. The committee itself did not attempt to become as active as the Railroads' War Board, which was located in Washington during 1917. It worked largely through the Commission on Car Service, which was reorganized on July 1 as the Car Service Division of the American Railway Association, but Daniel Willard, chairman of the committee, was exceedingly active in an informal way, representing the railroads in conferences with the Interstate Commerce Commission and shippers' association and in making public addresses, and generally directing the campaign.

At a meeting of the Association of Railway Executives in New York on July 16 the campaign was given a definite aim by the adoption of resolutions under which all members of the association and other carriers were urged to devote their utmost energies to the more intensive use of existing equipment and the railways undertook, with the co-operation of the public, to attain the following definite objects:

- (1) An average daily minimum movement of freight cars of not less than 30 miles per day;
- (2) An average loading of 30 tons per car;
- (3) Reduction of bad order cars to a maximum of 4 per cent of total owned;
- (4) An early and substantial reduction in the number of locomotives now unfit for service; and
- (5) More effective efforts to bring about the return of cars to the owner roads.

### Average Car Mileage

The average of 30 miles per car per day, for all roads, had never been attained, so far as available records show. The annual average attained in 1917, under the direction of the Railroads' War Board, was 26.1 miles per car per day. In 1918 the Railroad Administration averaged 24.9 miles, in 1919, 23.1 miles, and in January and February, 1920, 22.8 and 22.3 miles, respectively. The average for March was slightly better, 23.8 miles, but in April, as the result of the strike, it fell to 19.4. Since then there has been an increase in each successive month, until in October an average of 28.5 miles was attained. The average for the seven months, March to September, was equal to that made by the Railroad Administration in the year 1918, while the average for October was higher than was ever attained by the Railroad Administration and was the best ever recorded except in May, 1917, when an average of 29 miles was attained.

### Car Loading

The average car load set by the railway executives as their goal, 30 tons, had been surpassed only in August and September, 1918, when the Railroad Administration had the power to force heavy loading as a part of the war program. In those months an average load per car of 30.4 and 30.2 tons had been attained. The annual average attained by the railroads in 1917 was 27 tons, in 1918 the Railroad Administration had an average of 29.1 tons, which was reduced in 1919 to 27.8, and in January and February, 1920,

the average was 28.3. In March the average was the same as for the preceding two months, in April it was increased to 28.6, in May it fell to 28.3, but from that time on it steadily increased to 30.1 in August and September. In October the average fell again to 29.9.

The combined effect of heavier loading and more rapid movement of cars is reflected in the statistics of net ton-miles per car day. The average for 1917 was 495, for 1918, 491, and for 1919, 441. In March of this year the average was 495, in April it fell to 379, but since then it has shown an increase in each month: June, 505; July, 526; August, 561, and September, 568. The best performance during the war was 542 miles per car per day in June, 1917, while the best performance of the Railroad Administration was 535 in August, 1918. The averages for August and September this year are the highest ever recorded.

The heavier car loading was also reflected in the average trainload, which was increased from 725 tons in March to 788 tons in August. This was a new record, but the average in September fell to 767. The best previous record was 778 tons in September, 1919.

In the return of cars to their home roads substantial progress has been made in spite of the heavy demand for cars throughout most of the year. The percentage of home cars on home lines had been increased from 21.9 on March 1 to 38.7 on December 15 and by that time all orders for the relocation of cars had been fulfilled or withdrawn. With

ceeded by surpluses amounting to 32,368. The railroads were materially assisted in the handling of the grain crops by the fact that so many of the farmers refused to ship their grain to market because of the fall in prices, which will spread the movement over a longer period, and as a result most of the complaints which were made regarding car shortage in the west were those which were made early in the season and those made in anticipation. Surpluses of cars began to be reported from the Southwest by the first part of November.

The heaviest traffic month this year was August. Conditions had been rapidly improving for two or three months and a considerable volume of freight was offered to the railroads just before August 26 for the purpose of getting it into the hands of the railroads before the new increased freight rates went into effect. During the first part of September there was a slight falling off, which was soon recovered, and the car loading increased until the week of October 23, when it was 1,010,961 cars, or within 500 cars of the record set by the Railroad Administration for a week in September, 1919. Since October 23 there has been a gradual decline, although the loading figures were larger than during the corresponding weeks of 1919 or 1918, until the week of December 18, and the total ton-mileage for October was slightly less than it was in August, although greater than for any previous month.

"The situation was met," said Commissioner Aitchison

Item	Sept.	August	July	June	May	April	March	Feb.	Jan.
Traffic density (net ton-miles per mile of road per day).....	5,917	5,998	5,657	5,531	5,292	4,120	5,432	4,901	4,866

the lessened demand for equipment it was believed that the cars would find their way home under the general application of car service rules and an equalization plan put into effect on October 1.

Very little progress has been made in reducing the number of bad order cars and locomotives. Under the intensive use to which they have been subjected for the past four years it was difficult enough to keep the percentages of un-serviceable cars and engines from going higher. The percentage of bad order cars has been less than in 1919, but it increased from 7 in March to 7.3 in October. The statistics of un-serviceable locomotives have not been kept continuously on a comparable basis. On December 1, 17.2 per cent were held out of service for repairs requiring over 24 hours and 6.2 per cent for repairs requiring less than 24 hours. On June 12, 26.9 per cent of the locomotives were un-serviceable.

### Car Shortage

During January and February there was a shortage of freight cars ranging from 70,000 to 80,000. For the week ending March 31 the average daily shortage was 87,600. By June 1 this had been increased to 105,000, by July 1 it was 123,000, by August 1, 125,000, and by September 1, 147,000. This large shortage during the summer months led to many fears that it would be greatly increased by fall when the height of the crop moving season was reached, and much attention was paid to building up the car supply of the western roads, but the increase in the efficiency of car movement actually brought about a decrease in the shortage during September and October, while the number of cars loaded continued to increase.

By October 1 the shortage had been reduced to 80,000, and there has been a steady reduction since until during the week ending November 22 the shortage of 30,724 was ex-

in an address made the early part of November, "squarely and courageously, in a business-like way, without political interferences or pressure of any character whatsoever, under the orderly process of law, by privately operated railroads, directed along consistent lines to secure that unity of object and policy that was the end sought in placing the carriers under federal control during the war. The sum total of cars and rolling stock at the termination of federal control was inadequate to meet the strain which was soon placed upon the transportation system. The effect of the strikes and stoppage of traffic which occurred within six weeks after the roads were returned to their owners, was equivalent to the obliteration of one-third of all the rail equipment of the country suitable for freight carrying service. As the result of the unceasing efforts of railroad operators and employees, with the assistance of the shippers, and under the policy laid down by the commission and enforced and carried out in detail by the carriers individually and through their Car Service Division, the back of the car shortage has been broken, and we are now facing the possibility of a surplus of equipment."

The accompanying table, prepared by the Bureau of Statistics of the Interstate Commerce Commission, gives a comparison of significant averages for September, 1920, with the seven months immediately preceding.

ON NEW YEAR'S DAY let us resolve to make 1921 our banner year for efficiency, loyalty and co-operation. We are entering the new year in a period of readjustment which doubtless will continue to affect us for some time. This should not cause discouragement, but rather inspire to greater ambition. Let it be our watchword this year to perform the common duties of each day uncommonly well.—C. S. Krick, general manager, P. R. R., to the employees.

## Higher Freight Rates Fail to Curtail Shipping

Increased Passenger and Pullman Charges, However, Have a Restraining Influence on Travel

WHEN THE Interstate Commerce Commission, acting in accordance with the provisions of the Transportation Act, granted the carriers increases in freight and passenger rates amounting to about \$1,500,000,000 annually, those unfriendly to the new law predicted that the increased rates would curtail freight and passenger traffic. These increased rates have now been in effect for about four months, and it is possible to "prove up" the results to a limited extent.

The first full month in which the new rates were operative was September. More freight was moved during that month than was ever moved in a single month during the pre-war period, or during federal control. A total of 40,999,843,000 net ton-miles was produced, the third consecutive month in which all monthly records previous to July, 1920, were broken. In July, 40,232,000,000 net ton-miles and in August, 42,706,835,000 net ton-miles were produced. The decrease between August and September was due to an interruption in industrial activity because of the observance of Labor Day and to the fact that there was one less day in September than in August. Again, in October, the second full month in which the new rates were operative, the net ton-miles produced exceeded all monthly records prior to August, 1920. A total of 42,562,000,000 net ton-miles were produced, the second highest total ever achieved and only 144,835,000 net ton-miles below the record-breaking August total. These statistics indicate that instead of an immediate decrease in freight traffic because of increased charges, the amount of business handled by the railroads remained at a record-breaking level for these two months.

Similar figures for later months are unfortunately not available but there are other statistics by means of which the amount of freight handled after the application of increased tariffs can be shown. The number of cars of revenue freight

loaded weekly from the time the increased freight rates went into effect to the latest available weekly record are shown in the accompanying Table I.

This table shows that the number of cars of freight loaded each week increased steadily from 947,743 cars during the week ending September 4, the first week after the increased rates went into effect, to 1,010,951 cars during the week ending October 23. This does not indicate that higher transportation charges exerted a restraining influence on the volume of freight offered for movement but rather that it moved independently of these increases.

Early in the fall business experienced a gradually increasing recession. The railroads in common with other industries began to feel the results of this recession early in November when the amount of freight offered for movement decreased materially. This is clearly shown in the car loading records in Table I by a drop from 1,010,951 cars loaded in the week ending October 23, to 910,592 cars loaded in the week ending November 6. As the depression became more general the car loading further decreased, reaching the lowest stage in the week ending November 27, when

the number of cars of freight loaded totaled 797,673.

That this decline is not due to increased rates is shown by the fact that (1) if the shipping public had been unwilling to pay higher freight rates, the car loading records would not have increased steadily for almost two months; and, (2), in spite of business depression the amount of freight handled by the railroads after the increased rates were made effective continued to be heavier than in the same period of either 1918 or 1919, as shown in Table I. It may be concluded, then, that such statistics as are now available indicate that increased freight rates have not exerted a restraining influence on the volume of traffic offered to the railroads for movement.

**T**HE SIMULTANEOUS advent of a general business recession and the increased freight and passenger rates resulted in declines in both freight and passenger traffic.

Analysis of the available statistics indicate that, despite the higher charges the volume of freight offered for movement continued heavy until the railroads, in common with other industries, felt the results of the depression.

Higher passenger rates have had a restraining influence on travel.

There is one other factor in support of this conclusion, i. e., there has been no general opposition to higher freight charges, either during the Interstate Commerce Commission's hearings or since their application, except on the part of certain individuals who advocate government ownership. It is logical to assume, then, that if the public is as alive to the necessity

are reflected in the volume of passenger traffic before they are seen in the records of freight traffic. The periods in which the business recession and the declines in freight and passenger traffic occurred indicate that this was the case and it is therefore impossible to attribute the declines in passenger travel entirely to an unwillingness on the part of the public to pay higher passenger fares.

In other words, there are two factors, namely, business recession and increased rates, which combined have tended to curtail passenger travel. Which has been most instrumental in effecting this decline is not determinable. Yet it can safely be said that the increased passenger tariffs have exerted some influence. This is especially true of sleeping car passengers who pay the 50 per cent surcharge. L. S. Taylor, vice-president of the Pullman Company, recently stated before the Interstate Commerce Commission that the collection of the surcharge, which accrues wholly to the railroads, had considerably reduced the number of passengers riding in sleeping cars. It may be possible that the reductions which have taken place in sleeping car passengers are no larger than the reductions which have taken place simultaneously in the number of coach passengers, but it is probable that the reduction in the number of sleeping car passengers has been greater.

for higher transportation charges as it appears to be, commodities and merchandise will be shipped, regardless of which freight rates, if markets can be found.

### Effect of Increased Rates on Passenger Traffic

In regard to passenger traffic, complete statistics with which to appraise the results are, unfortunately, not yet available. Observation of general conditions, however, leads to the conclusion that increased passenger rates have tended to curtail travel to some extent. This is indicated in Table II, which contains the records of several of the larger passenger carrying roads radiating north, south, east and west from Chicago, and which shows the number of passengers carried

Another factor which supports the conclusion that the higher passenger rates have tended to curtail travel, is that the public has not accepted the passenger rate increases with as good grace as it has accepted the freight rate increases. This is reflected partially in the attitude of the various state commissions, 16 of which have denied comparable increases in intrastate passenger rates, seven of which have allowed in-

TABLE I—CARS OF REVENUE FREIGHT LOADED, BY WEEKS

\*Figures do not include suburban traffic.

one mile in August, September and October, 1920, as compared with the records for the same months of 1919. While it is true that there has always been more or less of a decline in passenger traffic beginning in August and continuing until spring, the records for these representative lines show that this year this decline has been more noticeable than before.

What portion of this larger decline in passenger travel is attributable to the business recession which was taking place during this period is impossible to determine. However, it is known from past experience that general business recessions

increases with exceptions, and two of which have denied comparable increases in part, making a total of 25 commissions which have not agreed with the Interstate Commerce Commission in its findings.

In conclusion, it might safely be said that developments subsequent to the Commission's rate award indicate, (1) that increased freight rates have had little influence on the amount of freight offered for movement, and (2) that increased passenger rates have had an unfavorable effect on passenger travel to an extent still undetermined.

## Effect of the Rate Increases Disappointing

So Many Uncertain Factors Are Involved That It Is Impossible to Predict Final Result

THE UNPRECEDENTEDLY LARGE increases in freight and passenger rates which became effective on August 26 as the result of the Interstate Commerce Commission's decision in Ex Parte No. 74, have failed thus far to produce the desired and expected effect on either the operating revenues or the net operating income of the railroads as a whole.

In September the full effect of the increases in rates was not shown because a large volume of traffic was handled by the railroads during that month that was billed during the previous month at the old rates and also because the full amount of the increases was not allowed in many states as to intrastate traffic. In October and November the same condition continued as to state rates and by November the amount of traffic had fallen considerably below what had been anticipated at the time the increases in rates which would be necessary to produce a 6 per cent return were calculated. The Interstate Commerce Commission has now rendered several decisions ordering increases in state passenger fares corresponding to the advances made in interstate rates, but it has not yet passed on any of the state rate cases involving the refusal of the state authorities to allow increases in freight rates for intrastate traffic.

Complete statements of the earnings and expenses of the railroads for September and October have now been available for some time and the individual statements of many

roads for November are now at hand. While it would be futile to base any predictions as to the results to be expected for a full year on the experience for two or three months during which conditions were changing so rapidly and at a time when the outlook is so uncertain as to the future course of either traffic or expenses, some tentative conclusions of interest may be drawn from the results of two months during which the freight traffic was greater than had ever before been handled in corresponding months and when passenger traffic, although showing a slight reduction, was at least not below normal.

The increase in freight rates was 40 per cent in the Eastern district, 25 per cent in the Southern district, 35 per cent in the Western district, 25 per cent in the Mountain-Pacific district, and 33 1-3 per cent for interterritorial traffic. It was estimated that the average increase for the railroads as a whole should have been about 34 or 35 per cent. The increase in passenger rates was 20 per cent and there was also a surcharge of 50 per cent of the rates for Pullman traffic to accrue to the railroads.

### September Results

In September, 5 per cent more ton-miles of freight were handled than in September, 1919. An increase of 35 per cent in rates, therefore, should have produced something

**C**OMplete STATEMENTS of the earnings and expenses are available only for the months of September and October.

A large amount of business handled during September was billed at the old rates.

The full amount of the rate increases has not been granted on intrastate traffic by some states.

Business fell off in November considerably below what had been anticipated when the rates to produce 6 per cent return were calculated.

like a 40 per cent increase in freight revenues. The increase was, however, only 26.2 per cent. A change in the character of the traffic handled might have made some difference, but most of the failure to realize the full percentage of increase in September must undoubtedly be attributed to the very large volume of freight offered to the railroads in the week before the new rates went into effect.

The volume of passenger traffic in September, 1920, was slightly less than in September, 1919. The passenger earnings increased 17.4 per cent, the failure to reflect the full percentage of increase being doubtless attributable principally to the effect of the old rates in many states. The total operating revenues in September were 23.6 per cent greater than those for September, 1919. Mail revenue increased 82.6 per cent, but express revenue decreased 13.5 per cent, and all other revenue increased 23.1 per cent.

The increase in total operating revenues was about \$117,000,000, but operating expenses showed an increase of \$111,000,000, or 27.9 per cent, while taxes increased 41.4 per cent, and the net operating income for the month, \$75,310,311, was 3 per cent less than the net operating income in September, 1919, under the old rates. This represented about the amount which the railroads had been guaranteed per month by the government for the preceding 26 months, but it fell considerably short of enough to produce a 6 per cent return. On the basis of the experience of the

per cent. However, their operating expenses were only 24 per cent greater than in September, 1919, and their net operating income was \$9,615,340, an increase of 78.3 per cent. Their net operating income for September, however, to produce a 6 per cent return, should have been about \$15,000,000.

The roads of the Western district had an increase of only 19.3 per cent in freight revenues, 13.4 per cent in passenger revenues and 18.3 per cent in total revenues, while their expenses increased 25.4 per cent, and their net operating income, \$39,584,374, was 13 per cent less than that for September, 1919. The Western roads should have earned about \$46,000,000.

### October Results

For October the net operating income was larger than September, \$86,455,487, an increase over October, 1919, of 13.3 per cent, but the roads should have earned in October \$112,708,000, or 10.4 per cent of a year's net income. Total operating revenues increased by \$132,000,000, or 26 per cent, but the operating expenses increased \$120,000,000, or 29.7 per cent. Taxes had also increased by 35 per cent. Freight revenues increased only 30.5 per cent, although the freight ton-miles had increased nearly 6 per cent, and passenger revenues increased 15.2 per cent. There had been, however, a slight decrease in passenger traffic.

The Eastern roads in October had a net operating in-

d—Decrease.

three-year test period prior to federal control the net operating income for September should be approximately 10.11 per cent of that for a full year, and that percentage of a 6 per cent return for the Class I roads would be \$112,708,800. The shortage for the month, therefore, was \$34,000,000, which can not be made up except by abnormally large earnings in some other month. However, about \$2,700,000 of back wages was charged to the September account which belongs to earlier months.

The Eastern roads in September fared slightly better than did the roads as a whole as compared with September, 1919. Their net operating income was \$26,110,597, a decrease of 2.5 per cent, but to earn 6 per cent a year on the valuation ascribed to them by the commission they should have earned \$47,000,000. Their freight revenues increased 31.3 per cent and their passenger revenues 21.1 per cent, while total operating revenues increased 27.8 per cent and operating expenses 31.2 per cent.

The Southern roads had an increase in freight revenues of 29.3 per cent, or more than the percentage of rate increase applied to their district, but passenger revenues increased only 17.9 per cent and total operating revenues 25.7

come of \$30,128,416, as against \$48,840,000 which they should have earned to produce October's proportion of a 6 per cent return on their valuation. This was an increase of 27.2 per cent, however. Their freight earnings showed an increase of 38.1 per cent over October, 1919, and passenger earnings 21.8 per cent. The roads of the Southern district had a net operating income of \$10,998,230, an increase of 20.2 per cent, but nearly \$5,000,000 less than the October proportion of a 6 per cent return. Their freight revenues increased 26.9 per cent, but passenger revenues increased only 9.8 per cent. The Western roads had a net operating income of \$45,328,841, as against \$48,000,000 which they should have earned. The increase was 4.3 per cent over 1919. The freight revenues increased 23.8 per cent and passenger revenues only 10.7 per cent.

The general slump in traffic which has been so noticeable throughout November and December had begun as far back as October or September, although it was not sufficient to show in the total figures until the first part of November. As there has been a falling off for some time in miscellaneous and manufactured freight which pays comparatively high rates, the failure to realize the expected percentages

of increase in freight revenue may be due to an increasing proportion of low-rated traffic.

The November earnings have not yet been reported by a sufficient number of roads to make a representative showing. While they are showing large increases in net as compared with November, 1919, this is attributed largely to the fact that the November, 1919, reports were considerably affected by the coal strike.

The principal items in the September and October reports for the roads as a whole and by districts are given in the accompanying tables.

### Effect on Individual Roads

An analysis of the effect of the new rates on the earnings of individual roads would require a complicated study to show the proportion of a year's net income that they should earn in September and October and of the comparative volume of traffic, while the valuation figures on which the 6 per cent return is to be figured have not yet been determined. For some roads the results seem to have been very satisfactory, but for others the results are very disappointing. A good many roads had suffered a decrease in traffic.

For September, 21 of the roads having annual operating revenues in excess of \$25,000,000 had less net operating income than they did in September, 1919, under the old

rates. These were the Boston & Maine; Cleveland, Cincinnati, Chicago & St. Louis; Erie; Lehigh Valley; Michigan Central; New York Central; New York, New Haven & Hartford; Pere Marquette; Pittsburgh, Cincinnati, Chicago & St. Louis; Atlantic Coast Line; Southern; Atchison, Topeka & Santa Fe; the Chicago & North Western; Chicago, Milwaukee & St. Paul; Chicago, Rock Island & Pacific; Minneapolis, St. Paul & Sault Ste. Marie; Missouri Pacific; Oregon Short Line; Oregon-Washington Railroad & Navigation Company; Texas & Pacific, and Union Pacific. The Boston & Maine, Pittsburgh, Cincinnati, Chicago & St. Louis, Atlantic Coast Line, and the Oregon-Washington Railroad & Navigation Company had deficits.

In October there were 18 roads that earned less for net than they did the year before. The Lehigh Valley; Pittsburgh, Cincinnati, Chicago & St. Louis; Atlantic Coast Line; Southern; Chicago & North Western; Missouri Pacific; Texas & Pacific, and Union Pacific, that in September earned less than a year before, in October had increases as compared with October, 1919, but the Wabash; Louisville & Nashville; Chicago, Burlington & Quincy; Great Northern, and Southern Pacific, that had had increases in September, had decreases in October. None of the larger Class I roads having annual revenues exceeding \$25,000,000, however, had deficits in October.

## Settlements With the Railroad Administration

Slow Progress Being Made—More Than 11,000 Claims Presented  
—Settlements with 20 Companies

**E**IGHTY-SEVEN RAILROADS and transportation companies have now filed their complete claims with the Railroad Administration for a final settlement of their accounts with the government arising from the period of federal control. Settlements have been made with 20 companies and negotiations have been well advanced with a large number of others. A large number of additional roads are expected to submit their claims in the early part of the year but some of the larger systems, whose accounts are especially complicated, are making extensive studies of the condition of their properties and do not expect to be able to present their claims for nearly a year.

Among the larger roads that have filed claims but have not yet begun their negotiations for a settlement with the Railroad Administration are the Great Northern, Northern Pacific, Missouri Pacific, Southern, Chicago, Rock Island & Pacific, St. Louis-San Francisco, Pere Marquette and Atlantic Coast Line.

The Railroad Administration has recently announced that it has reached final settlements and paid out to the several companies the following amounts:

Ablene & Southern	\$150,000.00
Buffalo, Rochester & Pittsburgh	1,000,000.00
Cincinnati, Indianapolis & Western	400,000.00
Spokane, Portland & Seattle	1,600,000.00
Fort Dodge, Des Moines & Southern	300,000.00
El Paso Union Passenger Depot	5,665.86
Sioux City Bridge Company	98,546.92
Northwestern Pacific	525,000.00
Mississippi Central	220,000.00
Louisiana & Mississippi Railroad & Transfer	33,231.81
Chicago, Milwaukee & St. Paul	13,750,000.00
St. Louis National Stock Yards	100,000.00
Eastern Steamship Lines	250,000.00
Rio Grande Southern	105,000.00
Midland Valley	550,000.00
Bennettsville & Cheraw	29,500.00
Clyde Steamship Company	162,224.00
Chesapeake Steamship Company	62,303.00
Des Moines Terminal Company	15,500.00
Fort Worth Belt	75,000.00

The Gulf, Mobile & Northern also effected a settlement by which it agreed that it owes the government \$100,000.

The payment of claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroads and the administration during the 26 months of federal control.

The Railroad Administration has not made public the amounts of the claims against it nor of its counter-claims against the railroads but it is understood that some of the larger claims are as follows: Chicago & North Western, \$45,586,030; Great Northern, \$29,827,000; Southern, \$84,700,000; Pullman Company, \$24,422,264.

The administration has also made a claim against the Southern for \$71,650,000.

All claims include items for money due on a regular statement of account, including that due for rental, and in the case of roads that have not signed contracts with the Railroad Administration, they usually include a claim for special compensation in addition to the standard return. The largest items in the claims of the railroads are for undermaintenance of way and structures and equipment and for materials and supplies, and there are counter-claims by the government on the same accounts. Most roads owe the government for additions and betterments made during federal control and there are claims by most roads against the government for losses in connection with additions and betterments made for war purposes or for other purposes for which the railroads claim they should not pay. To December 1 a total of 11,239 of such claims had been presented, of which a large proportion have been adjusted or are in process of settlement.

The Chicago & Eastern Illinois has taken its claim for compensation for the period of federal control to the court of claims but has since received an offer of settlement from the Railroad Administration.

## Two Important Valuation Developments in 1920

Kansas City Southern Decision and Transportation Act Create  
New Conditions—Field Work Nearly Ended

**T**HE TWO OUTSTANDING developments in valuation work during 1920 were the decision of the United States supreme court in the Kansas City Southern case and the recognition of valuations as a basis for the returns to the carriers in the Transportation Act. In the Kansas City Southern decision, handed down on March 8, the supreme court of the United States sustained the contention of the railways that the Valuation Act requires the Interstate Commerce Commission to ascertain and report "the present cost of condemnation and damages or of purchase in excess of present value" of common carrier lands. The Transportation Act of 1920 expressly stipulates that the return to the carriers shall be fixed at a specific rate of return on the value of their properties as determined by the Commission from time to time. While efforts have been made during 1920 to complete the inventories of carriers' properties, the effect of the Kansas City Southern decision has been to prevent the fixing of a final value upon any property as yet and to hold up the service of other tentative valuations until the data called for with respect to land can be collected.

### Progress in Inventory Work

Prior to January 1, 1920, the field work had been completed in the Southern district and had practically been completed in the Central, Western and Pacific districts, while a considerable amount of work still remained to be done in the Eastern district. During the year this field work

was completed in all districts except the Eastern where, by reason of the more complicated conditions, it is still under way in all branches and it is not expected that it will be completed until late in 1921. The Division of Valuation is now concentrating attention on the completion of engineering reports on those roads 500 miles or more in length and it is expected that these reports will be completed on most of these roads during this year.

**U**NITED STATES supreme court decision in Kansas City Southern case made it necessary for the Commission to revise its methods of valuing land. Field work completed in all districts except the Eastern. Accounting department has suffered severely from shortage of experienced employees but this is now being relieved. Many engineering, land and accounting reports should be completed this year.

Recognition of valuation in Transportation Act gives new incentive for completion of work.

Up to the present time the work of the land department has not kept pace with that of the engineering section, but that work is now being expedited. With certain changes in methods which are now being developed, it is expected that most of the field work will have been completed in all districts other than the Eastern by July 1, while the latter district with its larger number of cities with their more extensive terminal properties will require several months additional.

The greatest difficulty has been encountered in promoting the work of the accounting department. Owing to the impossibility of retaining adequate efficient forces with the salaries in effect early in the year, it frequently happened that 25 per cent of the entire force in an office changed in a single month. From January 1, 1918, to June 30, 1920, there was a turnover in employees in the accounting department of more than 70 per cent, while on the latter date the accounting section had only about 70 per cent of its quota of authorized employees. However, salaries were advanced somewhat about July 1, since which time the forces have been on a somewhat more stable basis and are now recruited to

practically their quota. It is therefore expected that the work of the accounting department will be brought up rapidly so that many engineering, land and accounting reports will be served on the carriers during the early months of this year.

Present Status of Valuations

Prior to November 6, 1919, the Interstate Commerce Commission had served 55 tentative valuations on the carriers, of which 9 were on Class I and 14 on Class II roads. Since that date, following the filing of the Kansas City Southern

case, further serving of tentative valuations was held up awaiting the decision; since the over-ruling of the contention of the Division of Valuation by this decision on March 8, 1920, no further tentative valuations have been served, although engineering reports have since been submitted to 41 other Class I roads and land reports also to 29 of these roads. The Interstate Commerce Commission itself has not yet handed down any final valuations, and the so-called valuations which were reported for the Texas Midland, the Kansas City Southern and the Winston-Salem Southbound (without, however, including a single sum value) must now

be withdrawn and revised by the Commission in order to bring them into compliance with the decision in the Kansas City Southern case.

### Comparisons Between Cost of Reproduction New and Investment in Road and Equipment Accounts

As the work of the Division of Valuation approaches a point where comparisons can be made between its figures and the carriers' records of investment in road and equipment, intense interest is naturally being manifested in these returns. In testifying before the Interstate Commerce Commission in the rate hearing on May 26 and 27, 1920, Thomas W. Hulme, vice-chairman of the President's Conference Committee on Valuation, presented comparisons between the cost of reproduction new, including the present value of carrier land as reported by the Division of Valuation, and the investment in road and equipment as shown on the carriers' books of Class I roads (shown in the accompanying table). Of the 9 Class I roads with an aggregate of 4,688 miles of road on which tentative valuations have been served, the cost of reproduction new plus the present value of land totaled \$242,594,895 as compared with the carriers records of investment in road and equipment of \$344,579,273, or a decrease of \$101,984,448. On the other hand, in the 41 preliminary engineering and land reports covering 47,165 miles of lines, the aggregate cost of reproduction new plus the present value of land was \$2,961,187,718 while the investment in road and equipment was \$2,813,695,883 or an excess of \$147,491,835.

In view of these figures, which were based on 1914 prices, Mr. Hulme concluded that: "When one takes into consideration the fact that the first roads for which the government undertook its valuation work were either small roads, selected for the purpose of testing out proper methods, or were roads that were then in the hands of receivers or had recently been in the hands of receivers, or been subject to reorganization, and compares the results obtained from the earlier investigations with the results obtained from the preliminary reports of roads that have gotten along very well, but in which there are included but a few of the larger railroad systems of the country, one will naturally conclude that as the stronger and bigger systems are reached, the total of the reports as to cost of reproduction on the 1914 prices and the land values ascertained under the methods used by the Commission, will produce results considerably in excess of the road and equipment accounts."

If valued on more recent prices this comparison would be even more favorable, Director Prouty of the Division of Valuation stating before the Commission in January, 1920, that he had reported to the director general of railroads that the costs in 1918 were approximately 175 per cent greater than those of 1914. Later studies indicate that similar costs in the latter part of 1919 and the early part of 1920 are about 212 per cent of the 1914 costs.

In respect of the financial status of the Bureau of Valuation, Director Prouty stated recently before the appropriations committee of the House of Representatives in connection with the request of the Commission for an appropriation of \$2,000,000 for the valuation work for the fiscal year 1922, that the current appropriation for the bureau is \$1,750,000 but that it is now spending at the rate of \$2,750,000 a year, or \$225,000 a month. This rate of expenditure, he said, would probably continue for the balance of the fiscal year. For the first six months of the next fiscal year, that is, the last half of the calendar year 1921, an expenditure of \$200,000 a month would be sufficient and for the second half of the fiscal year it would be necessary to expend approximately \$200,000 to keep the valuation up to date and about \$100,000 a month for original valuation work.

### The Kansas City Southern Decision

As the state commissioners have supported the Division of Valuation in its position that it was impossible to report intelligently the present cost of condemnation and damages or of purchase in excess of present value of common carrier lands required in the Valuation Act and that, if reported, this information would be of no practical significance, it is not surprising that the National Association of Railway and Utilities Commissioners began to agitate the amendment of the Valuation Act to eliminate this requirement as soon as the full effect of the Kansas City Southern case was realized. As a result of their efforts, Senator Cummins and Congressman Esch introduced bills in their respective houses of Congress last year to effect the desired change. Owing to the adjournment of Congress shortly after their introduction no hearings have yet been held on these bills. The passage of this amendment was strongly urged at the recent convention of the National Association of Railway and Utilities Commissioners.

### Conclusion

The work of valuation has now been transferred almost entirely from the field to the office. The Division of Valuation has undertaken certain basic studies and collected general information preliminary to reporting the cost of land as required by the Valuation Act. With this information at hand the Division of Valuation will be in a position to complete a large number of reports during the year for transmission to the Commission.

It now remains for the Interstate Commerce Commission to complete these reports in form for service on the carriers prior to the determination of their final value. As stated above, the provision in the Transportation Act stipulating that the present rate of return shall be effective only until March, 1922, makes it of great importance that the Commission shall be more fully informed at that time regarding the valuation of the properties of the carriers in order that it may then fix their rate of return more intelligently and accurately.

Further importance is attached to the completion of this valuation work by the provision in the Transportation Act requiring carriers to return to the government one-half of all that they earn over six per cent, for without a valuation of its property it is doubtful whether any railroad will be willing to accept an arbitrary figure as a basis on which this six per cent should be computed. It is therefore to the mutual interest of the roads and the government that this work be completed at the earliest possible date. In an effort to bring this about it has been suggested that in the Eastern district, where the work is most seriously delayed; the roads assist the Commission to complete inventories on the Commission's own basis and without prejudice to their decision.

LET US FACE 1921 with hope, confidence, courage and work. We have had innumerable drawbacks, but by expediting train movement, as well as speeding up the repairs to bad-order cars, and with the cordial co-operation of our patrons increasing the loading and decreasing the time consumed in loading and unloading cars, we have been able to handle with reasonable efficiency the business offered, and are prepared to go into the new year confident that the difficulties of the past will solve the problems of the future. To the public, I wish to express my appreciation of its understanding of our trials, and I pledge myself to continue to do the best that can be done with all we have. To those retiring officers and employees whose lives of service entitle them under our rules to well-merited pensions, I give the thanks of the company for their faithful efforts, and express the hope that the rest which they have earned may be filled only with happiness.—New Year's Greeting from N. D. Maher, president, Norfolk & Western.

## Labor Faces Economic Readjustments in 1921

Post-War Reconstruction Indicates a Change This Year in the Problem of the Railway Employee

**O**RGANIZED RAILROAD LABOR was very busy during 1920. Much was demanded by the carriers and some classes of labor responded well. But labor's "busyness" was not confined to the rendering of service. It was due largely to efforts to: (1), get the highest wages possible before the inevitable economic readjustments came; (2), unite the various railway brotherhoods in order to present a solid front in all controversies and to strengthen their weapon—the strike; (3), combat unrest and dissension in their own ranks; (4), throttle the growth of the new "outlaw" organizations; (5), dictate the actions and complexion of Congress; and (6), perpetuate the rules and working conditions favorable to labor obtained during the period of federal control.

Labor was successful, either wholly or in part, in its efforts toward the first four goals. It failed to reach the fifth. Whether it will reach the sixth is still undecided. From the employees' viewpoint, therefore, labor had a good year, but labor, like all economic factors, is subject to the law of action and reaction. The reaction has without doubt started.

The conditions prevailing at the time of the return of the railways to private operation were such that the carriers could only "carry on" until the application of the labor provisions of the Transportation Act proved them either successful or unsuccessful. Insofar as opposition to certain

of the organization movements is concerned, the carriers have for some time seen that the economic readjustment taking place throughout the country could not but affect the railroad labor problem, and their attitude consequently has been partly due to faith in the eventual return to "an honest day's work for an honest day's pay." As the year closed this faith began to be justified.

When the railroads were taken over by the government in December, 1917, there were pending wage demands of the various classes of employees amounting to about a billion dollars annually. The necessity for solving the labor problem was given by the President as one of the reasons for the institution of federal control, and it was "solved" by granting wage increases totaling over a billion dollars, by adding about 250,000 employees to the payroll, by extending the principles of the eight-hour day and time and one-half for overtime to almost all classes of employees, by abolishing piece work and bonus systems, by strengthening organized railroad labor through negotiating wages and rules only

**O**RGANIZED railroad labor, after a year of success in obtaining higher wages and promoting unity, faces the inevitable economic readjustments connected with post-war business reconstruction in 1921.

The railroads face easier labor conditions, increased individual efficiency and a return to "an honest day's work for an honest day's pay" basis.

Attitude and action of Railroad Labor Board will have a large influence upon a mutually satisfactory adjustment of the differences.

with brotherhood representatives, by consummating national agreements as to working conditions with several of the larger organizations, and by largely destroying the morale and efficiency of the individual worker through centralized control, standardization of wages and working conditions, and disruption of wage differentials built up by years of negotiation.

## Labor Developments in 1920

The salient labor developments during 1920 were the wage awards made by the Railroad Labor Board, appointed and functioning under the terms of the Transportation Act, the trend of the larger brotherhoods toward unity and the dissatisfaction and unrest prevailing among the employees, expressed in part by the unsuccessful yardmen's strikes.

During the first two months of 1920—the last two months of federal control—the labor organizations were primarily engaged in attempting to defeat the passage by Congress of the Esch-Cummins Bill, and in urging the passage of the Sims Bill (Plumb Plan). During the period in which new railroad legislation was under consideration by Congress many threats of political action against representatives and senators voting for the Esch-Cummins Bill were made. In addition, threats of strikes were made; a general strike of members of the United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers was called for February 17, and members of the Brotherhood of Railroad Trainmen were asked to vote on a proposed walkout. Unlike its attitude at the time of the passage of the Adamson law in 1916, Congress refused to be coerced and the labor campaign against the Transportation Act failed.

### Labor Demands Action on Its

#### Requests for Wage Increases

Meanwhile, brotherhood leaders had been carrying on a vigorous fight for action on the billion dollar wage demands which had first been presented during the preceding summer and fall. Beginning early in February a series of conferences between Director-General Hines and leaders of the brotherhoods were held, resulting in the director-general's decision on February 11 that the advances in question should not be granted in view of the approaching termination of federal control.

The director-general's report and decision were referred to President Wilson, who informed the labor leaders of the "unalterable position of the government." The President contended that a temporary basis of living costs ought not to be made the occasion for a permanent wage increase. However, in order that the consideration of wage matters should not be postponed indefinitely he proposed to bring about the earliest practicable organization of any machinery which should be provided by the new railroad legislation, or, in the event that such provisions were not included, to use his influence to get the companies and employees to agree on a special tribunal to settle the matter. He also promised to constitute a committee of experts to begin an immediate investigation of the entire problem for the purpose of expediting its solution.

Following the President's decision and in accordance with his expressed desires, the threatened strikes of maintenance of way workers and trainmen were indefinitely postponed. The labor leaders in their reply to the President's decision objected to waiting for the creation of a tribunal by legislation, but tentatively accepted his proposal for the creation of a joint tribunal composed of representatives of the railroads and employees, on the condition that a final decision be handed down within 60 days after the agreement to establish this tribunal.

When the labor leaders definitely learned of the new labor provisions included in the bill by the congressional conferees at the suggestion of Director-General Hines, they redoubled their efforts to defeat its passage. Open threats were made against those voting in favor of its passage. This campaign of coercion caused resentment among senators and representatives, and the final votes, 249 to 150 in the House, and 47 to 17 in the Senate, were indicative of their reaction.

The signing of the bill by President Wilson on February

28 was followed immediately by a letter from the President to the heads of the 15 organizations which had been fighting for action on their wage demands, announcing that their requests would be handled through the machinery created by the new law. In so acting the President automatically disposed of the organizations' counter proposal that a joint special commission be appointed to render a decision in 60 days.

Accepting the inevitable, the labor leaders adopted resolutions expressing their objections to the Transportation Act but stating that "as American citizens we feel that in the interest of railroad labor there is nothing left for us to do at present except to co-operate with each other in the prompt creation of the machinery provided for in this law."

Labor's next political move was likewise a failure. The so-called Anderson amendment to the Esch-Cummins Bill, introduced and backed by the brotherhoods as part of their fight to continue centralized enforcement of discipline as it was during government control, was defeated in Congress.

### Development of Organization Unity

During the progress of the congressional hearings and the negotiations between Director-General Hines, President Wilson and representatives of the brotherhoods, the unions further merged their interests. This tendency toward unit action was abetted by the fact that both Director-General Hines and President Wilson negotiated with the 16 brotherhoods as one group and considered their demands as a whole. The result was the development of the "Associated Standard Recognized Railroad Labor Organizations," a term used thereafter in all labor negotiations. An officer of the American Federation of Labor is the authorized spokesman for this alliance which was given teeth by an agreement, made in February by the executives of 15 of the principal organizations of railroad employees, that in case of a controversy which might result in a strike, a vote of all the organizations parties to the agreement would be taken so that, if the vote carried and "extreme action" was decided on, all would strike at once.

The railroads were returned to private operation, then, with higher wage levels, changed working conditions, greater unity between the railway unions, wage demands totaling a billion dollars, strike votes, "postponed" strikes and general unrest.

Preliminary conferences between representatives of the carriers and of the labor organizations aimed at settlement of the wage controversy were begun on March 10. The director-general opened the first meeting and urged settlement of the wage question by this means rather than by reference to the new Railroad Labor Board. After almost a month of negotiation the carriers' representatives declined the employees' requests on the ground that they could not assume the responsibility of adding such a burden to the cost of transportation. This transferred the entire controversy to the Labor Board, only the nominations for which had been made.

### The "Outlaw" Yardmen's Strike

The dissatisfaction of the employees because of the long delays reached a crisis at this time and resulted in a series of strikes of yardmen, largely members of the "outlaw" yardmen's associations, which seriously interfered with terminal operation throughout the country. Directed, as this strike was, at the alleged inaction of the brotherhood leaders and at the carriers, it soon found railway officers and executives of the labor brotherhoods fighting side by side to defeat the movement. There was no other course open to either carriers or labor executives. The latter were fighting to uphold contracts they had signed with the railroads and for the life of their organizations. The railroads were fighting to uphold their part of the contracts with the brotherhoods

and because granting the demands of the "outlaws" would have meant not only raising the wage level of all classes of employees, but destruction of the usefulness of the Labor Board before it had begun to function. The only beneficial effect of the strike was to expedite the appointment of the Labor Board. President Wilson submitted his nominations for members of the board on April 14 and they were promptly approved.

### Hearings Before the Railroad Labor Board

The hearings which resulted in the Board's award on July 20 were started at Washington on April 20. The first official act of the Board was to deny representatives of the "outlaw" strikers a hearing of their grievances on the ground that they had not complied with the terms of the Transportation Act and that cases brought before the Board in accordance with the procedure outlined in the Act should have precedence.

The presentation of the employees' demands occupied the board's sessions from April 20 until May 8, when the board moved to its permanent home at Chicago and began hearing the carriers' side of the controversy. The hearings continued until June 2, when the board went into executive session to formulate its award.

Meanwhile, the sporadic strikes of yardmen continued with gradually decreasing effectiveness. The strike situation was brought to the attention of the President and again he entered the controversy by suggesting to the board that it make some announcement as to its probable award which would allay the unrest. The board accordingly set a "deadline," July 20, for its decision, and on that date granted railway employees advances in wages totaling approximately \$620,000,000 annually and retroactive to May 1.

The board's final decision dealt wholly with wages and specifically deferred for later consideration the questions raised as to rules and working conditions. The executives of the brotherhoods met in Chicago, and only one, the Order of Railway Telegraphers, voted to reject the award. Later the chiefs of the organizations ordered a nation-wide referendum with a strong plea against strike votes. And the brotherhoods gladly accepted the board's decision. With the gradual collapse of the "outlaw" strikes, railway labor troubles seemed to be settled for a time at least.

### Other Labor Board Rulings

Several subsequent decisions, whose importance was overshadowed by the magnitude of the July 20 award, were rendered by the Labor Board. The employees of the American Railway Express Company were awarded advances of approximately \$30,000,000 per year, retroactive to May 1. Employees of the Bangor & Aroostook were awarded the same rates as were awarded to other railroad employees in the board's decision of July 30. Lighter captains employed on railroad-operated barges in New York harbor were awarded an increase of \$25 per month effective on March 1. Hearings were begun on October 18 on the demands of employees of short line railroads for the same rates of pay as Class I railroads. These hearings continued until November 24. A partial decision was rendered on December 11, but it is expected that the final decision of the board will be given early in 1921.

### Political Activities of Labor

As stated before, the railway brotherhoods threatened political action against those senators and representatives who voted for the Esch-Cummins Bill. With the aid of the Plumb Plan League and the American Federation of Labor an extensive propaganda was carried on in the national political campaign against them, but without success. The returns from the election show that most of the senators and

representatives who voted for the bill and who were candidates for re-election were re-elected, and, while many of those who voted for the bill were defeated, this was more due to the Republican "landslide" than to the work of the labor organizations.

### National Boards of Adjustment

#### and National Agreements

The year closed with two vital controversies still "hanging fire," the establishment of boards of adjustment and the perpetuation of the national agreements placed in effect during the period of federal control being still in an unsettled condition.

The Transportation Act provides that national boards of adjustment may be established by "agreement between any carrier, group of carriers, or the carriers as a whole, and any employees or subordinate officials of carriers, or organization or group of organizations thereof." The representatives of the employees have stood firmly for the creation of national boards, whereas the carriers have stood as firmly for the creation of boards either for the individual roads or for systems of roads. The brotherhoods' stand is in line with their fight for the passage of the Anderson amendment, *i. e.*, for centralized control over rules and working conditions as far as possible in order to allow unit action.

Many railway executives feel that if national boards of adjustment should be established the principle of the "open shop" in railroad work would be ended and the "closed shop" substituted, with a resulting standardization of working rules, regardless of the varying conditions on the carriers. Others do not entertain the same fear of national boards of adjustment.

During the hearings in the short line railroad case, labor's representatives asked for an executive session of the board at which they could present information regarding existing labor conditions. This request was granted and on November 29 they plied the board with veiled threats based on alleged inability to keep their men in hand unless their demands for the immediate establishment of machinery to handle disputes regarding rules and working conditions were granted. The establishment of such boards is not mandatory under the terms of the Transportation Act nor are there specific provisions authorizing their establishment by the Labor Board. These facts have been recognized by the board; and although it cannot take definite action in the matter, it has offered aid in consummating an agreement between the carriers and employees.

At the present time three bureaus, each composed of three members of the Labor Board, are handling minor wage controversies. It is possible that in the event that the carriers and the brotherhoods are unable to agree upon the establishment of boards of adjustment, these bureaus, or the board as a whole, depending upon the magnitude of the cases, will handle controversies regarding rules and working conditions as it is authorized to do by the Transportation Act. This would throw a large amount of detail work on the members of the board and tend to interfere with their thorough consideration of more important wage matters. Whatever solution of the question is adopted, present conditions clearly indicate that some machinery must be created as soon as possible if the spirit of the Transportation Act is to be carried out.

The question of the perpetuation of the national agreements with several of the larger brotherhoods, consummated during the period of federal control, is another legacy of 1921. It is intimately connected with the question of the establishment of national boards of adjustment, inasmuch as it apparently represents another phase of labor's desire to centralize and nationalize control over rules and working

conditions. The whole controversy is scheduled to come before the board on January 10, 1921.

Representatives of both the carriers and the brotherhoods have been working for some time on their respective presentations in this case. Without doubt the labor leaders will fight vigorously for the continuation of the national agreements, and the carriers' representatives will as vigorously oppose their continuance. Of the controversies likely to arise in 1921, that over the national agreements appears to be the most important.

#### The Outlook for 1921

In looking into 1921, the railway executives seem to have reason to be optimistic, the labor executives pessimistic. The present period of readjustment, with its decreasing living costs and demand for labor, predicts easier labor conditions, increased efficiency and conservatism.

Since September immigrants have been swarming into the United States at the rate of 900,000 a year, while the consulates abroad report that unless legislation interferes the exodus from Europe to America will be measured only by ship capacity. It has been estimated that 10,000,000 Europeans are planning to migrate to America as soon as possible. The estimate for Italy alone is 8,000,000. It is freely predicted, therefore, that unless some restrictive legislation is passed both in the United States and abroad immigration in 1921 will greatly exceed the previous high record of 1907 when 1,285,349 immigrants entered the United States. These conditions led the House of Representatives recently to pass a bill restricting immigration for 14 months and the measure is now before the Senate.

While there is still an admitted shortage of some classes of railroad labor in certain sections, to a large extent transfers from one department to another and from unskilled classes to skilled classes and the employment of new men to complete forces will take care of this difficulty. It may be said, of course, that the largest number of immigrants will be attracted to the cities and into the industries. This would probably be true if the wages paid in industries were as stable as those paid for railway work. Even now, however, a discrepancy between the wages paid in the industries and by the railroads for similar work can be seen. Such

conditions would result in bringing into railway work all of the new labor needed and a shortage of railroad labor would cease to exist, at least temporarily.

What, then, can be expected in 1921? Insofar as the individual worker is concerned, there will be an increase in efficiency through the restoration of morale and discipline. This, in turn, will be attributable to, first, the economic readjustment which inevitably creates unemployment, lower living costs and lower wages, and, second, the surplus of labor due to increased immigration. Furthermore, the railway worker, receiving wages above the going rate, will not readily subscribe to radical, thoughtless action imperiling his position and income.

On the other hand, the indications are that dealings between the railroad labor organizations and the carriers will have to be carried on diplomatically in order to avoid open breaks. Vigorous political and nationalization offensives will probably be continued by the executives of the larger brotherhoods. The outcome of the resulting conflict will depend largely upon the attitude and action of the Railroad Labor Board. At the present time it is not apparent that the board realizes the magnitude of the effect its decisions have had and will have on the whole economic fabric of the nation. It is certain that the public will be awakened to the far-reaching effect of the developments in the railroad labor situation and that, once awakened, will demand firmness in determining the future reward and working conditions of labor.

THE STATE LAW REPORTING COMPANY, Woolworth Building, New York city, announces that it has taken the contract for reporting the hearings before commissioners and examiners of the Interstate Commerce Commission throughout the United States. The work requires the taking of testimony at about 3,000 meetings a year, and the writing out of approximately 1,000 pages a day, and the contractor is required to maintain a number of branch offices throughout the country, from which reporters are sent out to attend hearings held within a certain radius. Sometimes ten or fifteen hearings are held on the same day. The Interstate Commerce Commission employs 40 to 50 examiners who conduct hearings.

## Fate of Railroad Administration Innovations

A Survey of the Present Status of the Important Changes Inaugurated During Federal Control

**A**LTHOUGH MANY of the innovations introduced by the United States Railroad Administration in its unified operation of the railroads and in the handling of their traffic no longer remain in their original form, they have left their influence upon railroad practices in a manner that will be felt for a long time in the future. Some of these changes had long been advocated by railroad men themselves, while others were made possible only by the unusual conditions ushered in by unified control. But whatever may have been the immediate causes of these innovations, the results have been threefold. Certain of them have been discontinued almost in their entirety because centralized control could not, or did not, take cognizance of local conditions which private operation could not disregard. Others have been abandoned because the restoration of competitive conditions made their continuance impossible. A third class comprise those which have been retained in modified form to meet new conditions, and because they present distinct advantages in improved service.

It is the purpose of this article to review the more important of these innovations and to indicate their present status. The changes which will be discussed include the establishment of consolidated city ticket offices, the unification of terminals, the drastic curtailment of advertising, the establishment of joint railroad and shippers' committees on rate matters, the pooling of equipment, the elimination of duplicate train service, the joint use of freight and passenger stations, the discontinuance of off-line agencies, and the

practice of collecting freight for solid train movements, together with the allied "sailing day" plan.

### Consolidated Ticket Offices Remain

One of the innovations which was brought most prominently before the public was the consolidated ticket office. Although the system has been abandoned at many points and has been modified in part where retained, many of the original offices are still in existence with but few roads withdrawing. It was recognized by the railroads at most places when they returned to competitive conditions that the consolidated ticket offices were economical and performed a service to the general public which the separate offices could not render. While many of the roads have considered that the system was detrimental to them individually, they have believed that the handicaps and disadvantages of the loss of identity, and the creation of certain routes of travel at the expense of the smaller roads could be offset by a unit system of identification within

the office and by thorough and active solicitation of traffic outside. The system of allotting a designated space within the consolidated office to a road which provided its own employees at the counter, is the plan in effect where joint, if not consolidated, offices are maintained.

At Chicago three roads have withdrawn from the consolidated ticket office to open separate offices, while 19 roads remain at the original location. The consolidated offices at New York, San Francisco and a number of other points

**C**OMPETITIVE CONDITIONS have necessitated the discontinuance of many of the changes or innovations which were introduced during the period of control by the Railroad Administration.

Some of these, however, have proved of distinct advantage under private management and are being retained in such form as will best suit the new conditions.

Consolidated ticket offices and joint railroad and shippers' committees on rates have been quite generally continued.

nave also been continued. At St. Louis, Mo.; Dallas, Tex., and Kansas City, Mo., the roads have returned to the unit plan of segregation, while at Minneapolis, Minn., since the consolidated office has been broken up, the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific and the Great Northern operate a joint office.

#### Unification of Terminals Retained in Part

Among the innovations of the Railroad Administration which have been retained in part is the plan for the unified operation of terminals. It has been generally agreed that the roads derived numerous benefits from the joint operation of terminals. Many handicaps were also present so that the return to private operation has led to modification, and in many instances abandonment of the plan. Even excluding the unusual conditions resulting from the war, it has become evident that the terminal facilities of the roads have not kept pace with the growing needs of the traffic. For this reason considerable increases in economy of operation and in efficiency of service have been effected through continued consolidation of certain terminal facilities. For example, the Stock Yards District Agency at Chicago, which was formed in August, 1918, through the consolidation of 21 individual railroad agencies, is still in successful operation and is likely to remain permanently. Another co-operative movement, the joint agency established at the Chicago Board of Trade Building in September, 1917, for the convenience of shippers in the collection of freight charges on in-bound grain, and participated in by all roads having Chicago terminals, also bids fair to become permanent.

At the same time, a number of factors incident to the return to the competitive conditions of private management tend to make impracticable the joint operation of terminals. Generally, roads which have built terminal facilities at great expense do not find it expedient to share them with competing roads which have acquired no such facilities. Another consideration has been the difficulty of finding any one road in a terminal center with facilities adequate to take care of the combined business of the other carriers. A third difficulty has been the objections on the part of shippers and consignees to the inconvenience of having to go considerable distances to collect and send freight when their business houses have been located in close proximity to the terminal of the road which they patronized. As a fourth reason, the carriers find it necessary under competitive conditions to adopt measures which will permit them to handle the maximum amount of individual business.

The plan has thus been continued up to the present only in a modified and limited form, but it will exist permanently as a possibility in the provision of the Transportation Act that empowers the Interstate Commerce Commission in transportation crises to "require such joint or common use of terminals, including main-line track or tracks for a reasonable distance outside of such terminals as in its opinion will best meet the emergency and serve the public interest and upon such terms between the carriers as they agree upon, or, in the event of their disagreement, as the Commission may after subsequent hearings find to be just and reasonable."

#### Advertising Resumed in Different Form

When the government took over the railroads as a war-time measure all activities tending to the development of traffic, with the exception of the agricultural development work were stopped. Later, the signing of the armistice and the attendant recession of business forced the Railroad Administration to revive advertising to stimulate travel. With the return of the roads to private control, competitive conditions have necessitated more elaborate campaigns, but the roads are now concentrating more on campaigns of crea-

tive and constructive advertising designed to promote tourist travel, to populate and cultivate new areas, to present service changes and to educate the public regarding railroad conditions. This last—advertising to secure and hold the good will of the public—to work hand and hand with patrons and inform them—may be said to be the underlying principle of present practices.

In this endeavor to bring to their patrons the facts surrounding the operation of the railroads the plan developed by the Illinois Central serves as a striking example. This road is sending a personal representative to interview farmers resident along its lines to ascertain their views and needs. The information thus secured is compiled and then circulated among all the employees throughout the territory served by the road, thus bringing the employees as well as the patrons of the road to understand the problems that both encounter.

Before federal control most of the roads passing through undeveloped parts of the country maintained special departments to promote the settling of these areas as well as to co-operate with the industries they served. These are now being re-established. Thus the Northern Pacific recently created a department of immigration and industry to take over this work. Most of the railroads serving developed areas maintain supervisors of agriculture or departments to co-operate with the growers, shippers and dealers throughout their territory. The supervisor of agriculture of the Union Pacific and the Oregon Short Line recently compiled a list of shippers of agricultural products in their territory, together with a list of the dealers in these products located in the large distributing centers. These lists were mailed to shippers and dealers in an effort to facilitate the sale and marketing of agricultural products. These methods and plans are not new. The interesting and important fact is that they are now receiving more attention.

#### Joint Railroad and Shippers' Committees on Rates Continued

One of the innovations introduced by the Railroad Administration was the creation of joint committees of shippers and railroads to pass on rate matters, which procedure was inaugurated early in July, 1918. This step was the outgrowth of a desire to arrive at decisions on rates by conference and agreement more promptly than was possible by separate action before the Interstate Commerce Commission with its resulting controversies. From this beginning the advantages of joint action have become increasingly evident to both carriers and shippers. Unlike numerous other innovations which have gone by the board wholly or in part with the restoration of competitive conditions, the joint conference plan is in successful operation at present and seems likely to have a permanent place in transportation practice.

That the plan was appreciated by the shippers is evidenced by the fact that on March 10, 1920, a committee representing the Southern Traffic League proposed a plan of continued co-operation with the railroads in the adjustment of rates to produce the 5½ per cent return fixed by the Transportation Act. The League made the proposal that the carriers and shippers work jointly on a new system of tariffs designed to produce the required revenue and opposed the former practice where the carriers customarily presented tariffs to the Interstate Commerce Commission for approval which the shippers had not seen, and which they would consequently oppose in their entirety because of objections to certain features.

The shippers, however, have not been alone in advocating the plan for co-operation. The roads have appreciated their aid in securing needed rate increases, as is evidenced by the fact that representatives of the executive departments of 17 trunk line railroads met with the executive committee

of the National Industrial Traffic League on November 19, 1920, at the annual meeting of the organization in New York to discuss and analyze complaints of the shippers, and to arrange for close co-operation between shippers and carriers.

At this conference the carriers assured the shippers that (1) there is no preconceived or concerted plan of the carriers to change rates, rules, regulations or practices for the sole purpose of obtaining increased revenue in addition to that which has been found necessary by the Interstate Commerce Commission; (2) rate committees and tariff bureaus will be instructed to devote their first attention to readjustments contemplated by the carriers' recent application to the Interstate Commerce Commission, to the prompt publication in regular tariff and supplement form of the authorized rates, and to prompt decisions on the applications of the shippers for readjustment of old rates and establishment of new rates; (3) the responsible traffic officers of the railroads will undertake to review and consider carefully other changes of rates, rules, regulations and practices, initiated or recommended by the rate committees with a view to forestalling any such changes as may be inopportune, and (4) the roads agree to give the same attention to classification matters.

On its side the League (1) insists upon transacting its business with the traffic executives of the railroads who are responsible for the maintenance of proper relations between the carriers and the public; (2) desires the traffic executives to act as the point of contact with the American Railway Association in matters of demurrage and other traffic affairs which are national in scope; and (3) desires the traffic executives to act as the point of contact with the Railway Accounting Officers' Association in all accounting matters in which the shippers are interested.

The result of the meeting was the establishment of joint committees to co-operate in handling matters of mutual interest to shippers and carriers which may arise in the future. With such movement as this gaining headway, it would seem that the plan for joint conferences between shippers and the railroads is to have a lasting effect.

#### Pooling of Cars Abandoned

The pooling of equipment, a feature of railroad operation introduced during federal control, was partially abandoned three months before the roads were returned to their owners. Realizing that the pooling of equipment made it impossible to secure its adequate maintenance the director general issued orders to the roads to return the cars to their home lines as far as possible before the termination of federal control. This order was successful in effecting an increase in the proportion of cars on home roads from 25.3 per cent on December 1, 1919, to 28.3 per cent on February 1, 1920, although this figure fell to 21.9 per cent before the roads were returned to private management on March 1, in spite of the efforts of the director general and the regional directors. Since that date, however, there has been a steady increase in the number of cars returned to their home lines, until an average of 32.5 per cent of the cars were on home lines on November 15, 1920, as compared with a pre-war normal proportion of about 50 per cent.

Thus it is evident that the pooling of cars as a general practice and in the form in which it existed during the period of federal control, has been abandoned, although the Transportation Act authorizes the Interstate Commerce Commission to order the pooling of equipment whenever "shortage of equipment, congestion of traffic or other emergency requiring immediate action exists in any section of the country."

#### Duplicate Passenger Service Restored

Prior to federal control competitive passenger train service had been intensively developed between many points. These

efforts to gain competitive business found no place under government operation where the roads became units in a vast monopoly. Not only that, but the exigencies of war made conservation and economy of operation of primary importance, while service to the public assumed a secondary position for the time. As a result of these conditions the 15 trains which had been running each way between Chicago and St. Louis daily were reduced to 9, and similar reductions were made elsewhere.

The return of the roads to their owners reversed this situation. The movement toward the return to a competitive basis began when the Pennsylvania, before government control was terminated, restored its Broadway Limited between New York and Chicago. Since that time other roads have gradually resumed operation of competitive trains until at the present time service between such highly competitive points as Chicago and St. Louis, Omaha, Minneapolis and St. Paul, between New York and Philadelphia and between other points is practically on the pre-war basis. A number of roads in all sections of the country are also shortening the running time on many of their competing trains, a movement which gives further indication of the return to the old conditions.

#### Joint Freight and Passenger

##### Stations Abandoned Largely

Joint freight and passenger stations have been in existence almost as long as the railroads. Federal control, however, brought about a marked increase in their number because of the elimination of competition between carriers. At many of the smaller terminals where competing roads had maintained separate freight and passenger stations consolidations were effected for the purpose of reducing expenses. In some cases this was successful; in others it resulted in added expense because of terminal congestion. With the return of the roads to private control and competitive operation most of the carriers have found it advisable to restore and operate their separate terminals, although some have found it best to continue as a party to the joint arrangements. Among the latter the continued use of the Pennsylvania terminal at New York City by the Baltimore & Ohio serves as a striking example.

#### Off-Line Agencies Reopened

Competition has also necessitated the restoration of the off-line agencies which were closed early in federal control. Even during government control the re-establishment of these offices had been forcibly brought to the attention of the Railroad Administration, for their withdrawal had caused a storm of protest from the shipping public, which was unable to secure the former service from employees uninformed regarding all of the railroads. The administration sought to remedy this complaint by the establishment of public service freight bureaus, but these were never well developed.

This necessity of service to the shippers, though important in obtaining their good will, was, however, but a means in the all-important solicitation of business when the roads were returned to a competitive basis. The off-line agency is a business-getter, established and maintained to that end. Therefore, with the return of the roads to private control they have practically all been re-established.

In re-opening these agencies the railroads have, nevertheless, modified their pre-war practices to the extent that many of them have replaced expensive street level offices with less showy quarters upstairs where new business can be secured as readily by active solicitation and competent service.

#### Solid Train Movements and the "Sailing Day" Plan

The plan for solid train movements and designated shipping days represents that class of innovations the economy of which had long been recognized by railroad men. In fact,

solid train movements were already employed as far as possible on a number of roads prior to federal control. The possibilities of the plan were found to be greatly extended with the non-competitive conditions obtained under government control where traffic formerly divided between several roads could be concentrated on one line, as was done with flour from Minneapolis, lumber from the northwest and meat from the packing centers. But the plan for solid freight train movements and for setting certain shipping days for specific places was abandoned to a large extent upon the return of the roads to the competitive conditions of private control, for no carrier is willing to turn its share of any business over to a competing road in order that a rival carrier can run a solid train. It is only in cases where the carrier secures enough business itself to make up a solid train that the plan is continued. The demands of the shippers for more individual attention were important factors in bringing this about. "Sailing days" for merchandise cars, for example, have been wholly done away with, although in the case of live stock shipped to Chicago the shipping day plan has been retained.

Among other innovations was the development of the embargo and permit system. Facing a traffic congestion which threatened to paralyze the transportation system of the country and acting under its broad powers, the Railroad Administration early developed a plan for permits and embargoes. These measures have been perpetuated as means for dealing with similar emergencies by provisions in the Transportation Act which specify that the Interstate Commerce Commission is "to give directions for preference or priority in transportation, embargoes or movements of traffic under permits, at such time and for such periods as it may determine and to modify, change, suspend, or annul them."

One of the measures of the Railroad Administration which aroused the most active hostility was the plan for consolidated purchases. Although it did not extend beyond cars, locomotives, rails and ties, it was the cause of bitter controversy throughout the period of government control. Following the return of the roads to private management the centralized control of purchases disappeared. Interest in the plan has been revived recently, however, by a statement from Senator Cummings advocating consolidated purchases by the railroads.

It is evident from the above survey that a number of the innovations inaugurated by the Railroad Administration have been found equally sound under the conditions of private operation. It is equally evident that many of the changes heralded as notable advances in railroad operation are not applicable under competitive conditions, and that railroad practices as a whole will not differ widely in the future from pre-war methods.

## Manufacturers Call Meeting to Fight National Adjustment Boards

THE DEMAND of organized railroad labor that National Boards of Adjustment be formed to handle all controversies over rules and working conditions, instead of settling such controversies by conference between representatives of the company and its employees as formerly, will be protested at a convention of manufacturers, merchants, railway executives and shippers to be held at the Congress Hotel, Chicago, on January 12, two days after this question is scheduled to come before the Railroad Labor Board. Approximately 500 delegates, representing all sections of the country, are expected to attend the meeting. Acquiescence in the railway brotherhood's plan would mean the opening wedge for collective bargaining and the "closed shop" in all branches of American industry, according to the convention call issued by the National Conference of State Manufacturers' Associations, through its president, William Butterworth, who is also a director of the Illinois Manufacturers' Association and vice-president of the Chamber of Commerce of the United States of America.

In explaining the primary purpose of the convention, the call says in part:

"The Transportation Act of 1920 created the Railroad Labor Board which has jurisdiction over railway employees' wages when controversies are appealed to it. The act also provides that Boards of Adjustment be established by agreement between any carrier, group of carriers, or the carriers, as a whole, and any employees or organization, or group of organizations, which, if established, will have jurisdiction over all working conditions and grievances other than wages. These Boards of Adjustment, however, can only be created by consent of employers and employees.

"The railway brotherhoods are insisting upon the creation of National Adjustment Boards. The railway executives are opposing it because, if created, it means the nationalization of railways under the domination of the labor unions and the destruction of discipline, efficiency and loyalty, which are necessary to the efficient and economical operation of the common carriers for the benefit of the people. If the railroads are thus shackled, the resulting conditions must necessarily be reflected in the organization of every manufacturer. It means the 'closed shop' and union domination over all industries alike. This, today, is perhaps the most vital issue facing the manufacturing and producing interests in the United States, and should have immediate attention.

"Therefore, all industrial associations, the purpose of which is the general good of the manufacturing interests, and all corporations, firms and individuals having to do with the production of manufactured articles, and all employers' associations and employers are requested to send delegates to this convention to formulate a clear and fearless expression of opinion, appoint proper committees to carry out the conclusions, to take such steps as will bring to the attention of the country the serious situation that will follow should the railroad brotherhoods succeed in carrying out their purpose, and to transact such other business as may come before the convention.

"Various organizations already have taken cognizance of this matter and have passed resolutions against it. Among these were the Chamber of Commerce of the United States of America, the National Association of Manufacturers, the National Industrial Council, the National Industrial Traffic League, and various individual chambers of commerce, trade and other organizations. The convention of the National Conference of State Manufacturers' Associations, however, will be the first country-wide attempt to express the opinions of the manufacturers of America whose interests will be vitally affected if the railway brotherhoods are successful."

Discussions of the open shop, its effect on employees, companies, production, cost of production and union labor and the immigration problem are also scheduled.

THE DOMESTIC PRODUCTION OF COPPER IN 1920 is estimated by H. A. C. Jensen, of the United States Geological Survey, Department of the Interior, to be about 1,235,000,000 lb., compared with 1,286,000,000 lb. for 1919.

## A Year of Progress in Maintenance of Way

Much Still Remains to Be Done Before the Properties Will Have  
Been Restored to Normal Condition

**T**HE FIRST MAINTENANCE of way season following the return of the railroads to private management was characterized by a general effort to restore the deficiencies which had accrued during the period of government control. Owing to the fact that a large part of the maintenance of way season fell within the limits of the guarantee period established by the Transportation Act, the managements were restricted in a measure by the absence of specific information on the exact interpretation which would be placed by the Railroad Administration on the provision for maintenance of way expenditures during this period. In general they pursued the course of liberal expenditures on much the same scale as would have been the case had the properties been established on a thoroughly independent basis. Whether or not they are to be penalized in their efforts to take up the deferred maintenance during the six-months' guarantee period is still an open question.

Following the return of the roads to a more independent status after September 1, most of them continued the policy of liberal expenditures, although inability to collect compensation due them from the government and reduced earnings caused some of the lines to undertake retrenchment considerably in advance of the normal reduction to the winter basis.

A large part of the maintenance of way season was coincident with a period of remarkable business expansion, coal shortage and labor disturbances in the operating departments of the railroads. These conditions imposed three obstacles to efficient maintenance: an inadequate supply of material, a labor shortage and a congestion of traffic. These influences served to interfere with a realization of the full results in the

programs for taking up the deferred maintenance but the degree to which these factors affected the results varied widely with the location and physical characteristics of the roads.

One of the foremost deficiencies was an inadequate supply of rails. At the beginning of 1920, the United States Railroad Administration had in stock only 375,000 tons of rail, while 200,000 tons in addition were on order undelivered by

the mills. To this available supply must be added 73,500 tons obtained on an emergency order last February, making a total of about 650,000 tons, which represents the entire tonnage of rails made available by the United States Railroad Administration for 1920 renewals. This, however, does not include all of the tonnage provided because, thanks to the corporate organizations of the roads, orders were placed with the mills for delivery following the return to private management. No accurate information is available in regard to the amount of rails delivered during the past year, but it was unquestionably too small to effect any reduction in the accrual of deferred rail renewals.

Taking the country as a whole, the situation as to ties presented a more favorable aspect. Owing

to the failure to establish a satisfactory means of anticipating the needs of the railroads under private management, tie purchases were largely deferred until after March 1. Nevertheless, many of the roads were able to obtain practically their full requirements. Other roads were not so fortunate and have entered the new year with accrued tie requirements considerably in excess of normal. One tendency of the past year in tie purchases which is unquestionably a direct result of the two years of centralized tie purchases was that many roads which had formerly procured their ties locally or within

**D**URING THE ACTIVE maintenance of way season of 1920 the railroads made a concerted effort to restore their properties to a normal condition. Inadequate supplies of materials, local shortages of labor and congestion of traffic, imposed serious obstacles in the way of this undertaking.

Efforts of the management to raise the personnel standard in the maintenance of way forces were aided in the closing months of the year by the sharp change in condition of the labor market.

limited distances from their own lines entered markets in remote territories. Another tendency observed was the impetus given to timber preservation during the past year. A number of new treating plant projects were undertaken largely because certain railroads formerly given to the use of untreated ties have become committed definitely to the use of preservatives.

### The Labor Situation

Labor conditions during the past year were unusually spotty. In spite of the hue and cry that went up early in the year regarding an insufficiency of farm labor to gather the crops, the railroads in strictly rural territory had far less difficulty in securing an adequate supply of men. In some of the industrial centers, on the other hand, labor was exceedingly scarce and inefficient. In fact, it was the opinion of some maintenance officers that conditions were worse than at any time previous. One interesting phenomenon largely influenced by the scarcity of labor was the introduction of contract maintenance work on a few roads, particularly in the form of cost plus agreements. Another phase of the situation is illustrated by the apparent restoration in full of all former practices with respect to the employment of labor through fee labor agencies.

No review of the labor problems of 1920 is complete without reference to the organizations of maintenance of way employees and the relations between the organizations and the managements. In the maintenance of way field, the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers came into the limelight at the beginning of the year through the publicity given to its venture into the co-operative manufacture and distribution of wearing apparel, several glove and underwear factories being purchased outright by the union. Of far greater significance to the country as a whole was the issuance of a national strike order by the grand president, A. E. Barker, which was to have become effective on February 17. This led to a widely quoted exchange of letters and telegrams between President Barker and Director General Hines and President Wilson, with the result that the strike was called off. In April the organization suffered some internal troubles as a result of which President Barker and George Seal, grand secretary, resigned and a group of the members seceded to form a separate organization known as the American Brotherhood of Maintenance of Way Employees.

In general the policy pursued by the maintenance of way officers toward the men during the past year has been one for the restoration of the old-time loyalty to the company.

There has also been an increased recognition of the fact that a corps of foremen of a caliber necessary for the efficient prosecution of the work can only be maintained if good timber for the development of such gang leaders is to be found among the rank and file. The higher wages paid following the award of the Labor Board on July 20 did much to improve the situation in this regard, especially in rural districts where many of the roads are now able to secure a notably higher grade of men than was possible for some time in the past. The eight-hour day, which has been a stumbling block in certain phases of maintenance work, has been maintained rigidly in most quarters, although during periods of the severest labor shortage some roads were forced to employ men on the 10-hour basis, partially to obtain the required output and partially as a means of holding a force which was not satisfied with the compensation obtainable for eight hours' work. With the decline of business operations during the late fall months, the aspect of the labor situation was entirely changed and many roads are now endeavoring to improve the character of the maintenance forces.

### Heavy Traffic and Congestion Interferes

Traffic conditions interfered with the conduct of maintenance in three ways, through the shortage of cars, restrictions on the use of tracks, and reduced work train service. With traffic heavier than at any time in the history of the roads, the pressure to place in revenue service all equipment that was in any way suitable to that end, and to eliminate all possible interference with the use of tracks was unusually severe. This not only reduced the progress of the work but served to increase the cost. In those centers where the out-law switchmen's strike took on the broadest scope and was of greatest duration, work train service was restricted for the simple reason that there were not enough train crews to man these trains.

In conclusion, the maintenance of way forces accomplished all that could be expected of them in view of the obstacles in their way and there has been a noticeable improvement in the condition of railway tracks. In the case of railway bridge and building work, there has been more of a tendency to carry the work over into the future. As a consequence, it may be said that insofar as renewal of rails, extensive ballasting, and renewals of structure are concerned, the railroads still have the great bulk of the work before them and with both materials and labor available on a basis that has not obtained in five years, the opportunity for real progress is at hand.

## Car and Locomotive Prices Reach Peak in 1920

Equipment Ordered During Year Cost Two and One-Half to Three Times 1910-1914 Average

THOSE RAILROADS that purchased locomotives in 1920 paid prices for them averaging about two and one-half times the pre-war prices. The prices of freight cars were even higher in proportion than this, all-steel cars being priced at three times the pre-war figures and cars of composite construction at more than three times the pre-war prices. The increase in passenger car prices was not as pronounced, the 1920 values having been slightly over twice the 1910 to 1914 average.

Detailed figures are given in this article showing this price relationship as between 1920 and the pre-war period. There is also given a table showing the prices paid for the U. S. R. A. standard equipment allocated to the railroads and, what is more important, data showing the prices which have been paid by a number of railroads for equipment which they have ordered in 1920. For purposes of showing more particularly the price trend during the year, there are also shown details of the prices of the basic iron and steel commodities which enter into the manufacture of all types of railway motive power and rolling stock.

Table I is a chart compiled for valuation purposes by the President's Conference Committee on Federal Valuation. The chart represents careful studies made by the engineers of that organization in co-operation with the equipment builders. The studies cover 10½ years, and to derive the figures shown, data were assembled covering the prices of 10,500 locomotives, nearly 275,000 freight cars and some 1,600 passenger coaches. The prices in all instances were "as sold" and cover the date of

sale, not the date of delivery. The base price of 100 in the chart is taken for the period 1910 to 1914, both inclusive. The comparative percentages are worked out for the years 1910 to 1919 and for the first six months of 1920; the last figures are the ones of chief interest in this connection. The

prices for the first six months of 1920 are given in the following percentages of the 1910-1914 base price:

Locomotives	251
Freight cars:	
All-steel	300
Composite	313
Passenger coaches	218

**P**RICES PAID for locomotives in 1920 were two and one-half times the average of prices for the years 1910-1914; for all-steel freight cars, three times; for freight cars of composite construction more than three times and for passenger coaches more than twice.

Present downward tendency of basic iron and steel prices is reflected in reductions in equipment prices of about ten per cent from year's peak.

This information is made available through new conditions.

In using the figures for the first six months it must be borne in mind that approximately two-thirds of all the orders placed during the year were placed before July 1. The price trend for the year was slightly upward from January to May or June. It then ran on a level to about the latter part of October, and since that time it has fallen to slightly below the January figure. In view of these facts, and that but few orders have been placed in the last three months, it is apparent that the percentages given for the first six months are quite representative of the greater part of the orders placed for the entire year.

Table II giving the prices paid, or to be paid when finally ascertained, for the allocated U. S. R. A. standard equipment, needs but little comment. These prices are those set in connection with the equipment trust agreement made last spring to finance these cars and locomotives. They are, of course, for the year 1918, that being the year in which the orders were placed. It is interesting to note in this connection that Table I shows no freight car per-

centage for 1919, no orders having been reported for that year in the valuation studies.

Table III vies with Table I as being one of the most

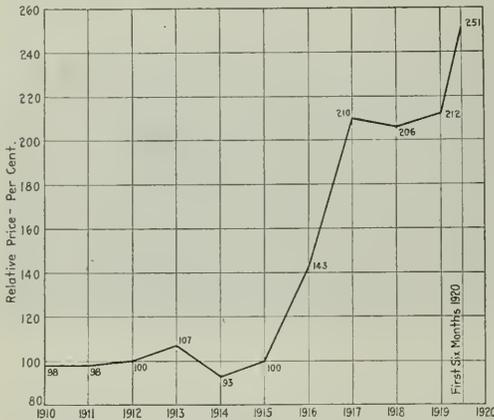

Fig. 1. Relative Prices of Locomotives 1910 to First Six Months of 1920 Shown in Terms of Average Prices 1910-14 as 100

interesting compilations of its kind which has ever appeared in the columns of the *Railway Age*. It gives in detail the prices paid per unit for a large proportion of the

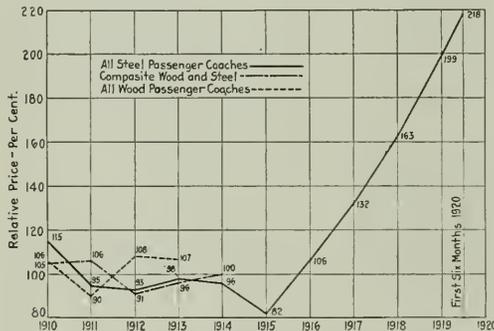

Fig. 3. Relative Prices of Passenger Coaches, 1910 to First Six Months of 1920 Shown in Terms of Average Prices 1910-1914 as 100

cars and locomotives, orders for which were placed during 1920. The information is made available this year for the first time through the publicity, if such it may be called, given applications of the carriers for loans from the revolving fund or in the case of the approval by the Interstate Commerce Commission of issues of equipment trust certificates. The carriers show in their applications the details of the expenditures which the loan or equipment trust issue covers. The commission has adopted a policy of making this information public when its action, favor-

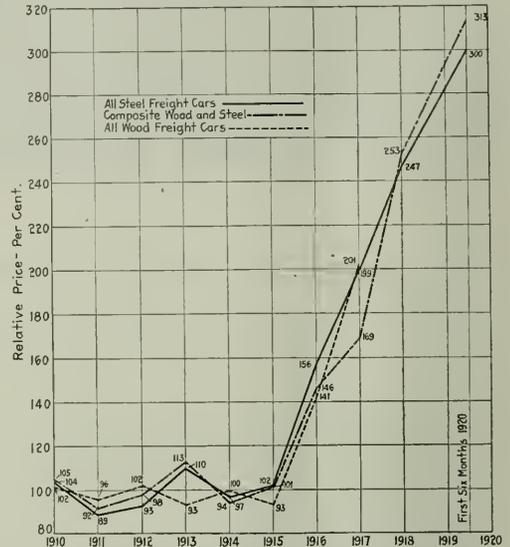

Fig. 2. Relative Prices of Freight Train Cars, 1910 to First Six Months of 1920 Shown in Terms of Average Prices 1910-1914 as 100

able or otherwise, is announced; the information, however, is not available before that action is announced.

The details given vary in nearly every case, depending upon conditions. In compiling the data given herewith, the information made available by the commission has been supplemented by details obtained from other sources. Thus in the usual instance the road shows the number of locomotives (or cars) involved, the type and the total cost of the equipment of that particular type. For instance, a road may indicate that it desires to finance the purchase of

September	46.00	58.74	3.25	3.25
October	44.50	55.00	3.13	3.09
November	39.40	49.75	2.87	2.81
December	34.50	43.50	2.35	2.65

has already been placed, we have supplemented this information from our own records with the name of the builder and the total weight in working order. We have also indicated the issues of the *Railway Age* in which the order was reported and the action by the commission noted. The notation "L.F." indicates that this action referred to an application from the loan fund, while "E.T." indicates that

portant at the present moment is the trend of prices. It has been difficult to secure definite details as to the prices which have been paid for equipment ordered in the last

The Prices of Four Basic Iron and Steel Commodities Which Enter Into the Manufacture of Cars and Locomotives

month or two, one of the reasons being that details are not yet available for the public, the other and equally important reason being that so few orders have been placed. It is for this reason primarily that there are introduced in Table IV the relative prices of several basic iron and steel commodities which enter into car and locomotive manufacture. These prices have also been platted on a diagram, but, however they are shown, the rise to the peak in the early months of the year and the rapid decline in the latter

months is plainly indicated. The prices of cars and locomotives presumably do not vary exactly with these commodity prices, but the lag behind them is not great. Investigation shows that car and locomotive prices have shown a decline in the last month or two. They are now approximately 10 per cent below the peak prices of the year. This, however, is discussed in greater detail in other articles in this issue, so that extended comment on this factor is not necessary.

## Dividend Changes on Railroad Stocks in 1920

### Chicago & North Western Reduced Rate. Nickle Plate Declared Dividends on Three Classes

INASMUCH as the larger proportion of the railroads accepted the government's guaranty of net railway operating income for the six months following the termination of federal control, the dividend changes for the year were not many. The Chicago & North Western reduced its regular dividends on the common stock from 7 to 5 per cent and on its preferred from 8 to 7. The precarious situation of the New England roads resulted in the passing of dividends on the Boston & Maine and Maine Central. The New York, Chicago & St. Louis, however, which declared 2½ per cent on its second preferred stock only last year, this year declared 7½ per cent on that class of stock, 10 per cent on its first preferred, and 5 per cent on its common stock. Increases in dividends were also made by the Chicago, Indianapolis & Louisville, the New Orleans, Texas & Mexico and the Western Pacific.

In the case of the Boston & Maine, the reorganization provided that dividends should be paid on the preferred stock if earned at the rate of 4 per cent from January 1, 1919, to January 1, 1924, and at the rate of 6 per cent thereafter. A dividend of \$2.67 per share was declared in January as an adjustment covering eight months to September 1, 1919. It was the first dividend on the preferred stock since March 1, 1913. On July 1 dividends were paid on this stock as follows: Class A, \$2.00 per share; Class B, \$3.20; Class C, \$2.80; Class D, \$4.00; Class E, \$1.80. The uncertainty as to the matter of divisions of through rates made it necessary in December, however, to omit the dividend which would have been paid January 1, 1921.

The reductions of the regular dividends on the Chicago & North Western common and preferred stocks were made in June. The rate on the common was reduced from 1¾ per cent quarterly (7 per cent annually) to 2½ per cent semi-annually (5 per cent annually) and on the preferred from 2 per cent quarterly (8 per cent annually) to 3½ per cent semi-annually (7 per cent annually). An officer of the company explained the reason for this action thus: "The rate of dividends on the preferred and common stocks had been reduced because, in the judgment of the board, the uncertainties of the present railroad situation made such a course advisable."

Dividends on the common stock of the Chicago, Indianapolis & Louisville were resumed in January after an intermission of two years with the declaration of a semi-annual dividend of 1¾ per cent. This was followed by a 1½ per cent dividend in June.

The Maine Central's usual dividend on the preferred stock has been at the rate of 1¼ per cent quarterly. At a meeting in November no action was taken on the matter of the usual quarterly dividend, this being the first time in the company's history that one has not been declared.

The New York, Chicago & St. Louis this year declared dividends of 10 per cent on its first preferred stock, 7½ per cent on its second preferred, and 5 per cent on its common stock. As to the preferred stock, 5 per cent was declared in January, representing presumably the payments due in January and July, 1919; the remaining 5 per cent on this stock was declared in June. Dividends on this first preferred stock have been paid at the rate of 5 per cent for many years. On the second preferred stock, dividends were paid at the rate of 2½ per cent in January and July, 1917, and in January, 1918. The next dividend was 2½ per cent in July, 1919. The dividends declared on this stock in 1920 were 2½ per cent in April and 5 per cent in July. The common stock dividend of 5 per cent declared in December was the first dividend on this stock since March, 1913, when 4 per cent was paid.

## Prices for Engineering and Maintenance Material

Well-Defined Reduction in Prices of Most Basic Materials—Indications That Others Will Follow

**T**HERE HAS BEEN a well-defined reduction in the prices of most of those basic materials which make up the bulk of the purchases of the railroads for tracks and structures and also determine, in large measure, the contract prices for bridge and building work. This decline has been quite general throughout the entire fields of iron and steel and of lumber, while as to those particular materials for which no reductions have been announced, every indication points to an adjustment in the near future which will bring the remaining items to the general level.

### Rails on Lower Basis

The case of rail is of particular interest because of the primary importance of this item and also on account of the close relation which the history of this commodity bears to the welfare of the railroads. Following the formation of the United States Steel Corporation, early in the present century, the prices of Bessemer and open-hearth rails were fixed at \$28 and \$30 per gross ton, respectively, and these prices were maintained until May, 1916, when they were advanced to \$33 and \$35. They were raised again in December, 1916, to \$38 and \$40 and this higher level was maintained all through 1917.

In 1918, following the formation of the United States Railroad Administration, rail prices ceased to have a real meaning. However, the nominal figures of \$55 and \$57 were set up as the established prices and a few orders for small

tonnages from roads outside of the Railroad Administration brought prices ranging from these figures to as much as \$65 per ton. In 1919, in the course of the efforts of the Industrial Board organized to fix a scale of prices agreeable to both the steel manufacturers and the government, the

tentative figures of \$45 and \$47 were named for Bessemer and open-hearth rail, respectively, but owing to the fact that Director General Hines considered these figures too high and refused to be bound by them, a deadlock ensued which may be said to have continued as long as the Railroad Administration remained in existence. The United States Steel Corporation, however, established these figures as the standard prices for rails and continued them in effect during 1919 and 1920. The independent manufacturers contended that they were too low and set up quotations \$10 or more in excess of them.

When the railroads came into the market last fall for 1921 rail, a further uncertainty arose.

There was talk of higher prices and the manufacturers would not agree to close contracts on the existing basis. Consequently, the railroads arranged for rolling reservations with prices left undecided. However, the influences which have caused the general reductions in prices became effective and various announcements made by officers of the United States Steel Corporation have served to continue the established prices tentatively into 1921. No specific action has been taken by

**P**RICES OF MOST of the basic materials used in tracks and structures have declined.

Steel Corporation quotations of \$45 and \$47 appear to be the prevailing prices for rail.

Lumber and tie prices in the course of readjustment.

Cement prices have not been reduced.

Thus far it is difficult to predict the trend of prices for finished products in the form of equipment or fixed structures.

the independent manufacturers as regards rails, but in view of the fact that they have generally adjusted their quotations for other iron and steel commodities used in the maintenance of way department to the established bases, it is believed that the \$45 and \$47 quotations have been pretty well established as the prevailing prices.

In the meantime another factor has been introduced in the revision of the United States Steel Corporation's extra charges for the use of various specifications or test requirements. Thus, the charge for the nick and break test has been raised from \$0.80 to \$1.60. The Pennsylvania's specifications as applied to 130-lb. rail call for extras totaling \$8.90 instead of \$5.80, while the A. R. E. A. 1920 specifications call for a premium of \$11.80 per ton.

The history of prices for track fastenings for the last 20 months has followed the same general trend as that of rail. The prices adopted by the Industrial Board were established as standard by the leading steel interest, but disregarded by the others, who gradually advanced their prices until they were 75 per cent or more in excess of the fixed standards. These established base prices, however, applied only to orders for very remote delivery, so that the actual prices for reasonable deliveries were really those asked by the independents.

In the last few months with the falling off of business and the announcement that the established prices would be continued into 1921, the other manufacturers have gradually lowered their prices to the "corporation" figures. At the same time there has been some readjustment of the established prices. For instance, the price of track spikes, which was as high as 7 cents per pound in 1917, was fixed at 3.35 cents by the Industrial Board in March, 1919. During the past year the actual sale prices for spikes advanced to about 4.25 cents. This was carried down with the decline but instead of going to 3.35 cents, the hitherto established standard, a new figure of 3.65 cents seems to have become the base. A somewhat similar situation maintains with respect to track bolts. Iron tie plates which were fixed at 2.90 cents in March, 1919, were sold at 4 cents or more, but have recently been offered at 3 cents.

In the case of fabricated structural steel there has not been enough business in recent weeks to establish prices for the railroads, but owing to the fact that there is a well-defined relation between the prices of plain and fabricated materials, the prevailing price of the former offers a reasonably good index of the pound price required by the fabricator. Therefore, it suffices to say that the prices of 2.65 and 2.45 cents established in 1919 for plates and shapes, respectively, have now been definitely restored and there have even been some suggestions of reductions below these established figures. The prices paid for finished structural steel in 1920 were somewhat higher than in 1919, and practically the same as in 1918, but in view of the definite reduction in the plain material prices, there should be a considerable reduction in the present fabricated prices. In this connection, it is well to note that the spread between the price of the plain and fabricated materials is always smallest when the shops have a minimum of work in hand, as is the case at present.

#### Lumber and Ties

The lumber trade has gone through an interesting transition during the past year. Following the abandonment of price fixing by the War Industries board, the price of lumber advanced steadily. With the increased impetus to business at the beginning of 1920, there was a runaway market. The demand exceeded the supply and prices previously unheard of resulted. This led to an abrupt cessation of building activities, with the result that the mills were unable to curtail production as rapidly as the demand for lumber fell off. As a consequence of this the stocks of the mills were speedily

restored to normal, but the prices did not decline materially until about September, 1920. By the middle of December there had been reductions from 10 to 35 per cent below the prices prevailing in July. Thus, we find that some items of southern pine are only slightly above the general range of prices in January, 1918, while as to other items the cost is still appreciably higher. In the case of Douglas fir the reduction in mill prices has been more pronounced because the change in railway rates has effected some modification of the differential between Douglas fir and southern pine prices in various markets. As a consequence, Douglas fir mill prices have fallen from 20 to 40 per cent and are at present not far in excess of the January, 1918, figures.

The history of the tie market during the months which followed the return of the railroads to private management is one of vital interest to railway men concerned with the purchase and use of ties, because of the radical reorganization of purchasing methods instituted during the period of government control. Purchases were centralized, uniform prices were set up and standard specifications were established. Because the changes had been so marked and owing to the fact that the return from government to private management was timed so as to come almost exactly between the seasons of tie purchase and tie delivery, no little anxiety was felt in many quarters concerning the disruption of commercial relations in the tie industry with the change of control.

In a measure these fears were justified by the subsequent occurrences. Many of the roads made no arrangements for the purchase of ties until after the return to private control, with the result that in some quarters there was a general scramble to obtain the available supplies. This was notably the case in the saved tie markets of the south, the condition being aggravated by the fact that this urgent demand for ties came at a time when the commercial lumber mills were flooded with orders in the regular lumber trade. A further complication resulted from the fact that certain Eastern roads which had normally obtained appreciable portions of their supplies locally entered tie markets far outside of their normal fields of operation.

But one result could follow this train of circumstances—the established government prices for ties were superseded by higher quotations following closely the general tendency of the lumber market. This condition was not universal. The railroads that had been so fortunate as to obtain the bulk of their supplies from small producers along their own lines fared much better. Some roads so situated were able to procure ties in the required amounts at the United States Railroad Administration tie prices throughout most of the year, although there were some adjustments upward in the early fall. These roads generally adhered closely to the standard specifications promulgated by the Railroad Administration, but in the markets subjected to more severe competition on the part of the purchasers the standard specifications were frequently modified. Certain railroads also restored the specifications which they had observed before the period of government control.

With the advent of the readjustment period, during the late months of 1920, and following the break in the lumber market there was a general falling off in the prices of sawed ties, corresponding in a general way to the reduction in lumber prices. With this a complete change of front has taken place in the tie market; contractors have endeavored to deliver more ties than contracts called for, and several roads have found it desirable to reduce their supplies by throwing quantities of ties on the market. In the meantime railway tie agents are being approached daily by dealers with large supplies of ties ready to deliver. The adjustment of prices possible under such a condition in the market has not been completed, particularly in the case of hewn ties, but it is expected that some roads will soon be able to reduce

their prices to the small producer appreciably below the Administration standards.

### Cement Prices Not Reduced

The Portland cement prices are distinctive in having shown little or no indication of deviation from the prices prevailing for the last year or more. The trend of prices since October, 1917, is indicated by the following figures taken by averaging quotations prevailing in from 6 to 10 middle-western cities between Pittsburgh and the Twin Cities, inclusive, these prices being per barrel, not including package: March, 1917, \$1.61; October, 1917, \$1.94; March, 1919, \$2.24; November, 1919, \$2.15; October, 1920, \$2.55. The last figure represents an advance of 50 per cent over the price of March, 1917.

### Finished Products

In the case of finished products in the form of equipment or fixed structures the reduction in prices thus far has not been so noticeable. As a case in point, inquiry of the leading signal manufacturers soliciting information as to the tentative prices during the coming year brought no response that predicted a reduction in price. Some of the replies intimated advances up to 25 per cent, but the majority expressed an inability to estimate price tendencies at this time.

## Boards of Referees May Consider Maintenance Claims

WASHINGTON, D. C.

THE BOARD OF REFEREES appointed by the Interstate Commerce Commission to report to the President what would be just compensation for the use of the property of the Western Pacific during federal control has made a formal ruling that it has jurisdiction over all claims arising out of federal control, and is not confined to the question of the annual rental, thereby overruling an objection by the Railroad Administration to the introduction of testimony to prove under-maintenance. The ruling is as follows:

"Counsel for the respondent has objected to certain evidence offered by plaintiff upon the ground that the jurisdiction of this board 'is limited to the making of a report to the President as to the amount of annual rental which shall form the basis of an agreement with the carrier as provided in section one of the federal control act' and that the evidence is offered in support of items of compensation that cannot be stated in our report in the form of annual rent. In support of the objections counsel relies upon the following language of section 3 of the federal control act:

Said boards \* \* \* shall report \* \* \* the just compensation, calculated on an annual basis and otherwise in such form as to be convenient and available for the making of such agreement as is authorized in section one.

"In our opinion the objections should be overruled for the following reasons:

"Section 3 of the federal control act provides that all unadjusted claims for just compensation shall be submitted to boards of referees for consideration and report. That section also provides that such boards shall make a report of the just compensation in each case so submitted. In our opinion the provisions of section 3, upon which counsel for the respondent relies, merely prescribe the form in which our conclusions as to the just compensation shall be reproduced in the report which the statute requires us to make, therefore, those provisions do not limit our jurisdiction and have no reference to jurisdiction. So far as we are now informed we can, in literal compliance with the statute, report every item of just compensation claimed in this case, which may be proved, either calculated on an annual basis or otherwise

in such form as to be convenient and available for the making of such agreement as is authorized in section one of the federal control act.

"Section one of the federal control act, after reciting that the President having in time of war taken over the possession, use, control and operation of certain systems of transportation, gave the President power, within certain maximum limits, to agree with the owners of the systems of transportation as to their just compensation. In the event of failure to reach an agreement the following provisions of that statute become operative:

That all claims for just compensation not adjusted (as provided in section one) shall, on the application of the President or of any carrier, be submitted to boards, each consisting of three referees to be appointed by the Interstate Commerce Commission.

"The statute contemplated that the report of the board of referees would enlarge the power of the President to agree with claimant carriers, the provisions to that effect being as follows:

The President is authorized to enter into an agreement with such carrier for just compensation upon a basis not in excess of that reported by such board, and may include therein provisions similar to those authorized under section one. Failing such agreement, either the United States or such carrier may file a petition in the court of claims for the purpose of determining the amount of such just compensation, and in the proceedings in said court the report of said referees shall be prima facie evidence of the amount of just compensation and of the facts therein stated.

"During the period of federal control railroad corporations of course could not compute the amount of their claims that might arise for under-maintenance of their property and for many acts of omission or commission ascribable to the United States during that period, but it was then obvious that at the end of federal control losses from under-maintenance and all forms of losses to the railroad corporations could be measured and claimed. Having in mind the ending of federal control and the relinquishment of the railroad properties to the owners thereof, Congress passed an act, the transportation act, 1920, which provides in part as follows:

Sec. 200 (a). Federal control shall terminate at 12:01 a. m., March 1, 1920; and the president shall then relinquish possession and control of all railroads and systems of transportation then under federal control and cease the use and operation thereof.

Sec. 202. The President shall, as soon as practicable after the termination of federal control, adjust, settle, liquidate and wind up all matters, including compensation, and all questions and disputes of whatsoever nature, arising out of or incident to federal control.

Sec. 203 (a). Upon the request of any carrier entitled to just compensation under the federal control act, but with which no contract fixing or waiving compensation has been made and which has made no waiver of compensation, the President, (1) shall pay to it so much of the amount he may determine to be just compensation as may be necessary to enable such carrier to have the sums required for interest, taxes and other corporate charges \* \* \* and (2) may, in his discretion, pay to such carrier the whole or any part of the remainder of such estimated amount of just compensation.

(b) The acceptance of any benefits by a carrier under this section—

(1) Shall not deprive it of the right to claim additional compensation, which, unless agreed upon, shall be ascertained in the manner provided in Sec. 3 of the Federal Control Act.

"A full consideration of the issues presented to us in this case at this time leads us to the conclusion that as during the period of federal control the jurisdiction of boards of referees, in cases submitted to such boards, appears to have been substantially the same as to the subjects to be considered as was the President's, to make settlements by agreement, so in the present case the board of referees has jurisdiction to determine the compensation as to all claims arising out of or incident to federal control which the President under the transportation act is authorized to adjust and settle. Therefore, the objections are overruled."

## The Use of the \$300,000,000 Revolving Fund

Loans Certified by I. C. C. Now Over \$170,000,000—Payments by Treasury \$130,000,000

THE \$300,000,000 LOAN FUND provided by Section 210 of the Transportation Act is one of the most interesting of the many interesting features of the Transportation Act. It represented something entirely new in railroad finance. The uses to which it has thus far been put indicate that its inclusion in the railroad law marked real progress. The fund has served as an important factor in the rehabilitation of the railroad systems of the country.

### Terms of the Law

The full text of Section 210 of the Transportation Act, as amended by Section 5 of the Sundry Civil Appropriations Act of June 5, 1920, is given elsewhere in this article. It will be noted that the section provides that applications for loans may be made, "For the purpose of enabling carriers by railroad subject to the Interstate Commerce Commission properly to serve the public during the transition period immediately following the termination of federal control." A loan may be made to a carrier to enable it "to meet its maturing indebtedness, or to provide itself with equipment or other additions and betterments." It is further provided that application for a loan may be made "at any time after the passage of this Act and before the expiration of two years after the termination of federal control." The commission may certify its approval of a loan if it finds that the loan "is necessary to enable the applicant properly to meet the transportation needs of the public, and that the

prospective earning power of the applicant and the character and value of the security offered are such as to furnish reasonable assurance of the applicant's ability to repay the loan within the time fixed therefor, and to meet its other obligations in connection with such loan." The loan must be repaid within a period not exceeding 15 years from the making thereof. All loans bear interest at the rate of 6 per cent, payable semi-annually, and payments of principal and interest are to be placed to the credit of the revolving fund.

It is also provided that the commission must find that "the applicant, in the opinion of the commission, is unable to provide itself with the funds necessary for the aforesaid purposes from other sources." The amount appropriated, as above noted, was \$300,000,000.

### Principles Established

Among the first steps taken by the commission in its handling of the \$300,000,000 loan fund thus provided for, was to establish certain principles. These were announced on June 7. They

were to the general effect that there should be used for equipment \$125,000,000 (of which \$75,000,000 was to be for freight cars and \$50,000,000 for locomotives), for additions and betterments to promote the movement of cars \$73,000,000, and for maturities \$50,000,000. An amount of \$12,000,000 was set aside for the short line carriers.

The matter of the loans was taken up with the Association of Railway Executives as to the applications of the larger

THE LOAN FUND provided by Section 210 of the Transportation Act has proved of material assistance to rail carriers in securing new equipment, making other additions and betterments and meeting maturities.

Delays have been experienced in administering the fund because of questions as to interest rates of accompanying finance and as to payments by Treasury; but these difficulties are now overcome.

Loans now approved total over \$170,000,000.

roads and with the American Short Line Railroad Association as to the short lines. A special committee of the former met on June 25, July 15 and July 22, with W. A. Colston, director of the commission's division of finance, participating. A report was made on June 26 and a final report on July 28. In this report the committee announced its approval of loans as follows:

#### Association of Railway Executives' Recommendations

*Additions and betterments to existing equipment:* To 15 carriers, \$10,724,785. This expenditure, it was noted, would restore to efficient service 15,162 cars.

*Freight and switching locomotives:* To 31 carriers, \$27,173,186. In this case of recommending loans to aid in the purchase of new locomotives the committee followed a suggestion of the commission that the locomotives purchased should be financed 50 per cent from the loan fund and 50 per cent by the carriers. Thus, it was expected that the loans, totaling \$27,173,186, would assist in the expenditure of \$53,346,372, covering 636 freight locomotives and 277 switching locomotives. No recommendations for loans to aid in the purchase of passenger locomotives were made.

*Freight train cars:* To 21 carriers, including the Fruit Growers' Express, \$51,754,455. Inasmuch as it was the desire of the commission to have this money used for as many cars as possible, the recommendations in general provided for the financing of only 25 per cent of the cost of the cars from the fund, the remaining 75 per cent to be financed by the carrier. There were, however, certain exceptions. The amount of \$51,754,455 was expected to aid in the purchase of 46,027 freight train cars of a total approximate value of \$146,646,510. The commission had suggested that if possible 20,000 refrigerator cars be provided for. The committee's recommendations covered only 7,950, but explicit reasons were given showing that such cars in sufficient quantity were being obtained through the assistance of the loan and in other ways.

*Reserve for smaller carriers other than short lines:* The committee recommended the setting aside of \$3,000,000 for these carriers for equipment and \$2,000,000 for additions and betterments to way and structures.

*Maturities:* To nine carriers \$28,800,875.

The provisions of the Transportation Act relating to the loan fund are as follows:

By section 5 of the Sundry Civil Appropriations Act, June 5, 1920, paragraphs (a), (b) and (c) of section 210 of the Transportation Act, 1920, were amended so as to read as follows:

"Sec. 210. (a) For the purpose of enabling carriers by railroad subject to the Interstate Commerce Act properly to serve the public during the transition period immediately following the termination of Federal control, any such carrier may, at any time after the passage of this Act, and before the expiration of two years after the termination of Federal control make application to the commission for a loan from the United States to meet its maturing indebtedness, or to provide itself with equipment and other additions and betterments, setting forth the amount of the loan; the term for which it is desired; the purpose of the loan and the use to which it will be applied; the present and prospective ability of the applicant to repay the loan and meet the requirements of its obligations in that regard; the character and value of the security offered; and the extent to which the public convenience and necessity will be served. The application shall be accompanied by statements showing such facts in detail as the commission may require with respect to the physical situation, ownership, capitalization, indebtedness, contract obligations, operation, and earning power of the applicant, together with such other facts relating to the propriety and expediency of granting the loan applied for, and the ability of the applicant to make good the obligation as the commission may deem pertinent to the inquiry.

"(b) If the commission, after such hearing and investigation, with or without notice, as it may direct, finds that the making, in whole or in part, of the proposed loan by the United States, for one or more of the aforesaid purposes, is necessary to enable the applicant properly to meet the transportation needs of the public, and that the prospective earning power of the applicant and the character and value of the security offered are such as to furnish reasonable assurance of the applicant's ability to repay the loan within the time fixed therefor, and to meet its other obligations in connection with such loan the commission shall certify to the Secretary of the Treasury its findings of such facts; also the amount of the loan which is to be made; the time, not exceeding fifteen years from the making thereof, within which it is to be repaid; the terms and conditions of the loan, including the security to be given for repayment; that

*Short Lines:* \$12,000,000. This was covered by the American Short Line Railroad Association.

It is not necessary to show a recapitulation comparing these recommendations with the suggestions of the commission. The recommendations are shown in full in the detailed list by roads which is given below.

#### The Going Rate for Money

The handling of the loan fund, thus so auspiciously started, has met with two rather disconcerting snags since these recommendations were made. One was in connection with the interest rate which the roads should secure in the financing to meet the government loan. The attempt was made to keep the interest rate down to 7 per cent. Some carriers were able, through special conditions, to meet this condition, despite the fact that the going rate for money at the time was  $7\frac{1}{2}$  or 8 per cent. This difficulty was finally overcome, but not, however, until it had caused much delay. The commission relented in a measure from its strictness. The fact that the loans made from the fund were at 6 per cent no doubt had considerable to do nevertheless with holding down interest rates.

#### Treasury Holds Up Payments

The other snag arose in connection with the certifications to the Treasury. The law requires the commission to certify to the Secretary of the Treasury "that the applicant, in the opinion of the commission, is unable to provide itself with the funds necessary for the aforesaid purposes from other sources." In some of the certificates issued, including the Illinois Central, Burlington, Santa Fe, Great Northern, etc., the commission added the words "except at excessive rates of interest." Because of this technicality, the Treasury held up the payments of the money and created considerable unpleasantness on all sides. A hearing was held by the commission and it decided on the basis of the arguments brought out at that time, that the inability referred to by the law meant a practical business inability. That is, it held that a railroad is in effect unable to borrow money elsewhere when in the commission's opinion the rate of interest elsewhere is excessive. It has since issued "clean" or unqualified certificates. Its decision in this matter, announced in November, said:

the prospective earning power of the applicant, together with the character and value of the security offered, furnish in the opinion of the Commission reasonable assurance of the applicant's ability to repay the loan within the time fixed therefor and reasonable protection to the United States; and that the applicant, in the opinion of the Commission, is unable to provide itself with the funds necessary for the aforesaid purposes from other sources.

"(c) Upon receipt of such certificates from the commission the Secretary of the Treasury shall immediately, or as soon as practicable, make a loan of the amount recommended in such certificate out of any funds in the revolving fund provided for in this section and accept the security prescribed thereby by the commission. All such loans shall bear interest at the rate of 6 per centum per annum, payable semi-annually, to the Secretary of the Treasury, and to be placed to the credit of said revolving fund. The form of obligation to be entered into shall be prescribed by the Secretary of the Treasury, but the time, not exceeding fifteen years from the making thereof, within which such loan is to be repaid, the security which is to be taken therefor, and the terms and the conditions of the loan shall be in accordance with the findings and the certificate of the commission."

The loans for equipment authorized by section 210, Transportation Act, 1920, may be made to or through such organization, car trust or other agency as may be determined upon or approved or organized for the purpose by the commission as most appropriate in the public interest for the construction, and sale or lease of equipment to carriers, upon such general terms as to security and payment or lease as provided in this section or in subsections 11 and 13 of section 422 of the Transportation Act, 1920.

"(d) The Commission or the Secretary of the Treasury may call upon the Federal Reserve Board for advice and assistance with respect to any such application or loan.

"(e) There may be appropriated out of any moneys in the Treasury not otherwise appropriated the sum of \$300,000,000, which shall be used as a revolving fund for the purpose of making the loans provided for in this section, and for paying the judgments, decrees, and awards referred to in subdivision (e) of section 206.

"(f) A carrier may issue evidences of indebtedness to the United States pursuant to this section without the authorization or approval of any authority, State or Federal, and without compliance with any requirement, State or Federal, as to notification."

Under a literal interpretation of the concluding clause of paragraph (b) of Section 210 of the Transportation Act, 1920, as amended, the majority of railroads would be unable to qualify for loans. The remainder of the railroads, while able to make the showing that they are unable to obtain funds from such sources, generally cannot make the further showing required by the statute that "the prospective earning power and character of the security offered are such as to furnish reasonable assurance of the applicant's ability to repay the loan within the time fixed therefor and to meet its other obligations in connection with such loan." Under these conditions it would be practically impossible to make any loans, and Sections 210 of the Transportation Act, 1920, as amended, would be reduced to a nullity.

In order to give force and effect to the statute, the inability to obtain funds from other sources must be construed as an inability to secure funds upon such terms which the carrier with due regard for the public interest would be justified in accepting, and it must be held that an excessive rate of interest or other unduly burdensome or injurious conditions which the exercise of sound business discretion will not permit constitute inability, within the meaning of the statute, to obtain funds from other sources.

**National Railway Service Corporation**

Another of the interesting features in connection with the revolving fund is the provision reading: "The loans for equipment authorized by Section 210, Transportation Act, 1920, may be made to or through such organization, car trust or other agency as may be determined upon or approved or organized for the purpose by the commission as most appropriate in the public interest for the construction and sale or lease of equipment to carriers, upon such general terms as to security and payment of lease as provided in this section."

This provision was not in Section 210 as originally drawn but was added afterwards when the difficulty was made apparent of financing the carriers' needs under the depressed financial conditions at that time. It was suggested by the National Association of Owners of Railway Securities which has since formed the National Railway Service Corporation for the purposes named. The American Short Line Railroad Association has formed a similar organization known as the Consolidated Railway Equipment Corporation.

The National Railway Service Corporation proposes to finance the purchase of equipment on the basis of 40 per cent from the loan fund and 60 per cent from the large insurance and banking institutions associated with the parent association. It will issue two series of equipment obligations, aggregating \$60,000,000 and maturing in 15 years. Equipment is furnished under one of two plans—one the conditional sale basis, the other the lease basis. Ten roads are in negotiation with it and in the case of the Baltimore & Ohio the commission approved a loan of \$5,200,000 to the corporation for the account of the carrier.

**Results to Date**

The Interstate Commerce Commission in the annual report issued in the early part of December said that it had received 140 formal applications for loans, of which 36 had been approved in whole or in part. Thirty-one had been withdrawn and two denied.

Up to that time the total amount of loans approved was \$115,767,710, divided as follows:

To meet maturing indebtedness.....	\$57,790,750
To aid in the acquisition of locomotives and cars.....	28,698,743
To aid in the making of other additions and betterments.....	29,278,215
	<hr/>
	\$115,767,710

In the following are shown the loans thus far reported as approved:

Ann Arbor.....	\$35,000
Ann Arbor.....	250,000
Aransas Harbor Terminal.....	135,000
Atchison, Topeka & Santa Fe.....	5,493,600
Atlanta, Birmingham & Atlantic.....	200,000
Baltimore & Ohio.....	3,000,000
Baltimore & Ohio.....	5,200,000
Baltimore & Ohio.....	200,000
Bangor & Aronstook.....	5,000,000
Boston & Maine.....	6,696,479

Carolina, Chulcheld & Ohio.....	2,000,000
Central New England.....	1,000,000
Central of Georgia.....	300,000
Chesapeake & Ohio.....	7,855,000
Chicago & Western Indiana.....	8,000,000
Chicago, Burlington & Quincy.....	4,446,525
Chicago Great Western.....	997,830
Chicago Great Western.....	240,000
Chicago, Indianapolis & Louisville.....	200,000
Chicago, Rock Island & Pacific.....	2,000,000
Chicago, Rock Island & Pacific.....	7,862,000
Delaware & Hudson.....	1,125,000
Eric.....	8,000,000
Eric.....	1,840,700
Fort Smith & Western.....	156,000
Fredericksburg & Northern.....	20,000
Great Northern.....	17,910,000
Gulf, Mobile & Northern.....	515,000
Hocking Valley.....	1,925,000
Hocking Valley.....	4,511,750
Illinois Central.....	2,500,000
Kansas City, Mexico & Orient.....	2,500,000
Long Island.....	718,000

Missouri Pacific.....	8,621,760
New York Central.....	26,775,000
New York, New Haven & Hartford.....	9,630,000
Northern Pacific.....	6,000,000
Pennsylvania.....	6,780,125
Rutland.....	61,000
Salt Lake & Utah.....	64,000
Shearwood.....	29,000
Seaboard Air Line.....	6,073,400
Term. R. R. Assn. of St. Louis.....	898,925
Texas & Pacific.....	3,000,000
Virginian.....	2,000,000
Western Maryland.....	1,372,800
Wheeling & Lake Erie.....	2,460,000
Wisconsin, Brunswick & Southern.....	50,000
	<hr/>
	\$172,586,294

The loans certified are being delayed somewhat by the Treasury Department. On October 20, the loans actually made totaled \$56,190,325. There is a good deal of red tape to go through in fixing up the security the road is to offer, etc. The treasury has only a small force working on the matter, so that it is considerably behind the commission's certifications. The loans actually made to date are approximately \$130,000,000.

**Details by Roads**

In the remainder of this article there are given the details concerning each road which has been granted a loan from the \$300,000,000 loan fund, as well as the status of the larger part of those applications which are now before the commission. The list is given by roads and is explained as follows:

The word *Recommended* refers to the recommendations given in the report of the special committee on the loan fund of the Association of Railway Executives. The sums recommended are divided into their respective classes and are given at the end in totals. In case action on the application is not noted, as many details concerning the use to which the money is to be put are given as are available. These details are available in all cases for way and structures from the committee's report and are shown in parentheses.

The word *Loaned* refers to the commission's action. In each case details are given as to the commission's findings. The use to which the money is to be put, the additional financing that is to be done by the carrier and other information, insofar as this information is readily available or as space will permit.

The sum given under the *Recommended* head is not necessarily comparable with the sum finally granted by the commission. In many cases the applications were amended and in some cases additional applications were filed which were not reported.

The details follow:

**Ann Arbor**

*Recommended:* \$275,000 for way and structures.  
*Loaned:* \$35,000 to aid in purchase of 3 switching locomotives; estimated cost \$116,000, of which 30 per cent is from loan, 50 per cent in equipment notes, 30 per cent cash.  
*Loaned*, also: \$250,000 for way and structures. Estimated cost \$500,000, 50 per cent from loan. Includes improvements of and additions to facilities at Toledo, costing \$400,000 to enable Pennsylvania Railroad to operate through Ann Arbor terminals to connection with Pere Marquette at Alexis, Ohio, making a through Detroit line.

**Aransas Harbor Terminal**

Loaned: \$135,000 to aid carrier to reconstruct and improve line from Aransas Pass, Tex., to Gulf of Mexico at Port Aransas, Tex., damaged by hurricane. Required that \$275,000 be supplied by security holders or communities interested, and that government loan be used for capital expenditures only.

**Atchison, Topeka & Santa Fe**

Recommended: \$2,149,450 for locomotives, \$7,850,550 for freight cars; total \$10,000,000.

Loaned: \$5,493,600 to aid in purchase of 2,500 refrigerator cars; estimated cost \$11,875,000; 500 gondola cars, \$1,501,500, and 50 locomotives, \$4,298,900; total \$17,675,400, of which carrier to supply \$12,181,800.

**Atlanta, Birmingham & Atlantic**

Recommended: \$200,000 for maturities.

Loaned: \$200,000 to aid in meeting maturity of \$475,000 due July 19, 1920. Required that carrier finance remaining \$275,000 at 7 per cent, which carrier complied with.

**Baltimore & Ohio**

Recommended: \$2,087,000 for existing equipment and \$5,000,000 for way and structures (additional main tracks, yard tracks, sidings, interlockers, telephone train dispatching, shop machinery, bridges, trestles, culverts, heavier rail); total \$7,087,000.

Loaned: \$3,000,000 for way and structures.

Loaned, also: \$5,200,000 to National Railway Service Corporation for account of Baltimore & Ohio for freight-train equipment at a total estimated cost of \$14,233,000, of which railway to supply about \$9,000,000. The National Railway Service Corporation has been approved by the commission as an agency through which loans to carriers for equipment will be made, under special authority conferred upon the commission by the Transportation Act.

**Bangor & Aroostook**

Recommended: \$20,000 for way and structures and \$180,000 for locomotives; total \$200,000.

Loaned: \$200,000. Of this \$180,000, of which carrier is to supply 50 per cent. Remaining \$20,000 for shop machinery and tools, a coal storage plant and passing tracks. Carrier also to supply \$58,000 for other necessary additions and betterments.

**Boston & Maine**

Recommended: \$1,036,490 for existing equipment; \$2,188,564 for way and structures (retaining walls and rip rapping, renewal of bridges, automatic signals, extension to sidings, interlockers, improved water supply, engine house and yard facilities); also \$1,814,047 for way and structures (extension of yard tracks, roundhouse and engine terminal facilities); \$1,245,000 for locomotives; total \$6,284,101.

Loaned: \$5,000,000 to cover maturities of \$8,843,000 in 1920 on condition that road finance the refunding of the remainder of this indebtedness. Loaned, also: \$6,696,479 to aid in purchase of locomotives and to assist in additions and betterments to existing equipment and way and structures at estimated total cost of \$7,869,000. Carrier required to finance about \$1,212,000.

**Buffalo, Rochester & Pittsburgh**

Recommended: \$496,750 for maturities.

**Carolina, Clinchfield & Ohio**

Recommended: \$2,000,000 for maturities.

Loaned: \$2,000,000 for maturities. Required that carrier before receiving loan should effectively finance the other obligations by sale of not less than \$5,000,000 income debentures or at more than 6 per cent and to be sold or exchanged at not less than par without other cost to carrier. Requirement complied with.

Loaned, also: \$1,000,000 for maturities.

**Central New England**

Recommended: \$300,000 for way and structures.

Loaned: \$300,000 for additions and betterments to way and structures at cost of \$500,000, of which company required to finance \$200,000.

**Central of Georgia**

Recommended: \$237,500 for locomotives and \$577,500 for freight cars; total, \$815,000.

Loaned: \$815,000 to assist in purchase of 100 stock, 500 box and 200 gondola cars and 7 Mountain type locomotives; estimated cost \$2,785,000, of which carrier required to finance \$1,970,000.

**Chesapeake & Ohio**

Recommended: \$4,750,000 for way and structures, \$1,058,750 for locomotives and \$1,658,750 for freight cars; total, \$7,467,500. Recommendation of \$4,750,000 for way and structures contingent upon carrier supplying \$2,500,000 additional; for double-tracking, grade reduction and other work necessary to extend operation of Mallet locomotives and large capacity coal cars.

Loaned: \$3,759,000 to aid in purchase of 25 locomotives and 1,000 100-ton freight cars, total cost about \$8,119,000, of which carrier to finance \$4,360,000.

**Chicago & Alton**

Recommended: \$359,400 for existing equipment and \$134,000 for locomotives; total, \$493,400.

**Chicago & Eastern Illinois**

Recommended: \$385,940 for existing equipment and \$502,060 for way and structures (shop machinery and improvements to trestles); total, \$888,000.

**Chicago & Western Indiana**

Recommended: \$1,805,000 for way and structures.

Loaned: \$8,000,000. Of which \$6,000,000 to aid carrier in meeting collateral trust notes due by extension, September 1, 1920; carrier required to finance on basis satisfactory to I. C. C. remaining \$8,000,000 of its maturing obligations. Remaining \$2,000,000 of loan for additions and betterments. These included improvements at power house at 48th street, Chicago, \$165,000; installation of block signals between 15th and 81st streets, \$191,000; completion of elevated yard along Canal street between 23rd and 29th streets, \$933,000; and construction of new yard in vicinity of Chicago Drainage Canal for Belt Railway of Chicago, \$300,000.

**Chicago, Burlington and Quincy**

Recommended: \$1,472,775 for locomotives and \$2,973,750 for freight cars; total, \$4,446,525.

Loaned: \$4,446,525 to assist in purchase of 45 locomotives, 500 stock cars, 1,000 refrigerator cars, 1,000 box cars and 1,000 gondola cars; estimated total cost of \$14,840,550, of which carrier finances \$10,394,025.

**Chicago Great Western**

Recommended: \$872,660 and \$270,000 for existing equipment: \$150,500 for way and structures and \$276,000 for locomotives; total, \$1,169,160.

Loaned: \$997,830 to aid in purchase of 10 heavy locomotives costing \$52,000; to assist carrier in reconstructing 697 box, 200 hopper and 75 refrigerator cars at estimated total cost of \$1,142,660 and for additions and betterments to way and structures, \$301,000. Carrier contributes \$97,830. Item of \$301,000 includes installation of additional yard tracks at Olewein, to cost \$120,000, installation of additional roundhouse equipment at Olewein and larger turntables at Chicago and Des Moines, \$181,000.

Loaned, also, in December: \$240,000 to enable carrier to meet interest on bonds of Mason City & Fort Dodge, a subsidiary line.

**Chicago, Indianapolis & Louisville**

Recommended: \$200,000 for way and structures and \$300,000 for cars; total, \$500,000.

Loaned: \$200,000 to enable carrier to construct modern steel car repair shop at LaFayette, Ind.

**Chicago Junction**

Recommended: \$1,100,000 for way and structures (yards and car shop).

**Chicago, Milwaukee & St. Paul**

Recommended: \$4,940,000 for way and structures (ballast, rail, bridges, yard tracks and sidings, fuel stations, water stations, shop buildings, shop machinery and tools, track elevation) and \$3,150,000 for freight cars; total, \$8,090,000.

**Chicago, Rock Island & Pacific**

Recommended: \$1,257,000 for existing equipment; \$5,000,000 for way and structures (additional yard tracks and sidings, shop machinery and tools, ballast, bank widening, rails, bridges); \$879,583 for locomotives and \$509,667 for freight cars; total, \$7,646,250.

Loaned: \$2,000,000 to assist in meeting maturities, carrier required to finance in same connection, \$6,000,000.

Loaned, also: \$7,862,000, including \$1,425,000 for additions and betterments to existing equipment and \$6,437,000 for additions and betterments other than to equipment.

**Cincinnati, Indianapolis & Western**

Recommended: \$33,500 for way and structures (shop machine tools).

**Delaware & Hudson**

Recommended: \$2,250,000 for way and structures.

Loaned: \$1,125,000. Carrier to supply \$1,125,000, making a total of \$2,250,000 to be used for elimination of Whitehall tunnel at cost of \$500,000, for a new yard at Glenville, \$1,250,000 and one at Port Henry, \$500,000.

**Electric Short Line**

Application for loan for \$42,250 for equipment and additions and betterments denied, on ground that its prospective earning power being doubtful the security offered is inadequate.

**Erie**

Recommended: \$168,532 for existing equipment; \$1,496,897 for way and structures, \$1,242,500 for locomotives, \$250,000 for freight cars and \$5,879,125 for maturities.

Loaned: \$8,000,000 to assist carrier to finance 1920 maturities, aggregating \$23,516,500; also to enter into contracts with holders of these bonds issued by its predecessor companies, extending maturity dates 10 years. Company expected to finance on terms and conditions prescribed by I. C. C. remainder of its 1920 maturities, aggregating \$15,516,500.

Loaned, also: \$1,840,700 to aid in reconstructing freight equipment and in making improvements to existing equipment and for additions and betterments to way and structures. Total estimated cost \$6,680,000, of which carrier to finance \$4,840,000.

**Evansville, Indianapolis & Terre Haute**

Recommended: \$400,000 for way and structures (bridges, rails, ties and ballast).

**Fort Smith & Western**

Recommended: \$215,000 for way and structures (side tracks, yard tracks and ballast) and \$75,000 for locomotives; total, \$290,000.

Loaned: \$156,000 for purchase of equipment; for additions and betterments to existing equipment and way and structures; total cost estimated \$425,356, of which carrier to finance about \$270,000.

**Fredericksburg & Northern**

Loaned: \$20,000 for 3 years to aid in purchase of one second hand locomotive.

**Fruit Growers' Express**

*Recommended:* \$6,750,000 for freight cars.

**Great Northern**

*Recommended:* \$1,550,000 for way and structures; \$1,375,000 for locomotives; \$637,500 for freight cars and \$15,000,000 for maturities; total, \$18,562,500.

*Loaned:* \$17,910,000, including \$15,000,000 to assist carrier in meeting maturities; \$2,010,000 to aid purchase of freight cars and locomotives and \$900,000 for way and structures.

**Gulf Coast Lines**

*Recommended:* \$30,500 for existing equipment; \$200,000 for way and structures (yards and sidings, shops, shop machinery, heavier rail); \$150,000 for locomotives and \$667,063 for freight cars; total, \$1,047,563.

**Gulf Mobile & Northern**

*Recommended:* \$256,050 for existing equipment, \$145,000 for way and structures (interlockers, heavy rail ballasting) and \$113,700 for locomotives; total, \$514,750.

*Loaned:* \$515,000 to aid in purchase of 6 locomotives at cost of \$227,400 and for additions and betterments to existing equipment and to way and structures at cost of \$401,500. Carrier required to finance \$114,000. Locomotives and freight cars to be purchased include 45 heavy Mikado locomotives and 1,000 75-ton ore cars. Total cost \$5,300,000, of which carrier to finance \$3,290,000.

Expenditures for additions and betterments to total \$1,800,000, of which carrier to finance \$900,000. For strengthening existing equipment, \$200,000; for fencing right of way, \$100,000; for cottages for housing employees at White Fish, Mont., \$100,000; for car repair sheds in North Dakota, \$400,000; for additional yard tracks at Allouez, Wis.; Hillyard, Wash., and other miscellaneous passing and station tracks, \$600,000; for additional or improved water supply at Devon, Mont., and miscellaneous use, \$100,000; for shop buildings and tools at Whitefish, Mont., engine terminal and elsewhere, \$300,000.

The item of \$15,000,000 for maturities is to enable carrier to meet in part maturing collateral trust notes due September 1, 1920, aggregating \$20,000,000. This part of loan to be repaid not later than September 1, 1921, when amount of repayment will be available to the government to meet demands of other carriers for loans before the expiration of period provided by law for disbursement of revolving fund. Carrier also required to pledge itself to apply to I. C. C. for loan to construct or build 500 refrigerator cars, 25 per cent of cost of which will be financed by loan and 75 per cent by carrier.

**Gulf Ports Terminal**

*Applied for loan of \$500,000 to enable resumption of construction of 26 miles of unfinished line between Pensacola and Mobile on which roadbed finished for 18 miles and also for the betterment of 46 miles of road now in operation and the purchase of some additional equipment.*

*Loan denied and new application for \$300,000 also denied on ground that applicant not a common carrier, that it did not show loan necessary to enable applicant properly to meet the transportation needs of the public and that security offered not sufficient.*

**Hocking Valley**

*Recommended:* \$159,471 for existing equipment and \$1,352,958 for way and structures (additional main tracks, yard tracks, sidings, shops); total, \$1,512,429.

*Loaned:* \$1,665,000.

**Illinois Central**

*Recommended:* \$2,987,500 for locomotives and \$1,524,250 for freight cars; total, \$4,511,750.

*Loaned:* \$4,511,750 to aid in purchase of 75 locomotives, 1,000 refrigerator cars, 200 flat cars, 200 stock cars and 52 caboose cars; total cost \$12,072,000, of which carrier to finance \$7,560,300.

**International & Great Northern**

*Recommended:* \$40,000 for way and structures (for 90-lb. rail), \$312,500 for locomotives and \$750,000 for freight cars; total, \$1,102,500.

**Kansas City, Mexico & Orient**

*Loaned to receiver \$2,500,000 to aid in meeting maturing indebtedness, consisting of receiver's certificates due December 1, 1920. Loan covers full amount of apparent maturities and was approved after conclusive showing that operation of carrier would have had to be suspended unless the aid of a loan were given.*

**Long Island**

*Recommended:* \$500,000 for way and structures (additional yards, yard tracks, storage yards and interchange tracks) and \$218,500 for locomotives; total \$718,500.

*Loaned:* \$718,000 to aid in purchase of 4 switching and 6 ten-wheel locomotives at cost of \$437,000 and in making additions and betterments to way and structures costing \$500,000. Carrier required to finance \$218,000 of cost of equipment.

**Louisiana & Arkansas**

*Recommended:* \$162,574 for way and structure (additional yard tracks, ties, plates, yard and passing tracks, heavier rail).

**Louisville & Jeffersonville Bridge**

*Recommended:* \$162,574 for way and structures (additional yard tracks, coal station, water station, ash pit, heavier rail and bin).

**Maine Central**

*Recommended:* \$65,900 for existing equipment and \$533,132 for way and structures (heavier rails, ballast, shops, shop machinery and renewal of bridges); total, \$599,032.

*Loaned:* \$653,000 to aid in purchase of 10 locomotives, 6 caboose

cars and work equipment; estimated cost \$534,780, and in making additions and betterments at total cost \$783,132. Carrier required to finance \$665,706.

*Loaned also:* \$1,000,000.

**Minneapolis & St. Louis**

*Recommended:* \$546,500 for way and structures (additional main tracks, yard tracks, sidings, engine terminal facilities, shops, shop machinery, ballast); \$487,500 for locomotives and \$1,240,000 for freight cars; total, \$2,274,000.

**Missouri, Kansas & Texas**

*Recommended:* \$1,050,000 for locomotives and \$300,923 for freight cars; total, \$1,350,923.

**Missouri Pacific**

*Recommended:* \$2,843,179 for structures (rails, bridges, trestles, additional yard tracks, signals and interlockers, telegraph and telephone lines, fuel and water stations, shop buildings, engine houses, shop machinery, tools, wharves and docks) \$97,250 for locomotives and \$1,454,000 for materials; total, \$4,394,429.

*Loaned:* \$8,671,760 for purposes noted.

**New York Central Lines**

*Recommended:* \$2,406,842 for existing equipment; \$12,101,928 for structures; \$2,925,875 for locomotives; \$10,107,950 for freight cars; total, \$27,542,595.

*Loaned:* \$26,775,000 to aid New York Central and subsidiary lines to provide themselves with new equipment and additions and betterments to existing equipment and to way and structures at total estimated cost of \$56,625,000. Carriers required to finance about \$20,000,000. Total proposed expenditure of \$56,625,000 includes \$39,800,000 for new equipment, of which \$29,850,000 to be financed by company and \$9,950,000 from loan; also, \$5,287,000 of additions and betterments to existing equipment to be financed from loan, and \$11,538,000 of additions and betterments to way and structures to be financed by loan. New York Central and subsidiaries have themselves financed by sale of securities since termination of federal control \$63,625,000 for refunding and other necessary corporate purposes.

Expenditures of \$39,800,000 for equipment mentioned include 250 refrigerators, 1,500 50-ton all-steel box, 2,500 50-ton all-steel automobile, 4,000 55-ton hopper, 694 single deck stock and 300 double deck stock cars; total cost \$29,084,315, of which \$21,812,736 to be financed by carriers and \$7,271,579 from loan. Also 66 eight-wheel switching, 40 Pacific, 10 light Mallet, 3 heavy Mallet and 60 heavy Mikado locomotives at total cost of \$10,715,685, of which \$8,037,264 to be financed by carriers and \$2,678,421 from loan.

The details by the lines of the New York Central system follow.

**NEW YORK CENTRAL (INC. BOSTON & ALBANY)**

\$4,490,000 to aid in purchase of equipment; estimated cost \$17,960,000, of which carrier is to finance \$13,470,000. Includes 1,000 50-ton all-steel box; 1,000 50-ton all-steel automobile; 1,500 52-ton hopper; 494 single deck stock and 200 double deck stock cars; 50 eight wheel switching; 20 Pacific, 10 light Mallet and 3 heavy Mallet locomotives.

\$2,486,000 for additions and betterments to existing equipment, all financed from loan.

\$5,500,000 for additions to way and structures, all financed from loan, including engine terminals and facilities, freight yards and freight facilities siding and extensions, interlockers, shop machinery and miscellaneous betterments.

**MICHIGAN CENTRAL**

\$2,045,000 to aid in purchase of equipment; estimated cost \$8,180,000, of which carrier to finance \$6,135,000. Includes 1,000 50-ton all-steel box; 500 50-ton all-steel automobile; 100 single deck stock; 100 double deck stock and 250 refrigerator cars, and 6 eight-wheel switching and 10 Pacific locomotives.

\$1,885,000 for additions and betterments to existing equipment, all financed from loan.

\$613,000 for additions and betterments to way and structures all financed from loan. Includes passing tracks, repair tracks, storage tracks, yard tracks and engine terminals.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS**

\$3,415,000 to aid in purchase of equipment, estimated total cost \$13,660,000, of which carrier to finance \$10,245,000. Includes 500 50-ton all-steel box; 500 50-ton all-steel automobile; 2,000 55-ton hopper and 100 single deck stock cars and 10 eight-wheel switching, 10 Pacific and 50 heavy Mikado locomotives.

\$529,000 for additions and betterments to existing equipment, all financed from loan.

\$4,560,000 for additions and betterments to way and structures, all financed from loan. Included double tracking, passing and storage track, shop tools, machinery and signals.

**CINCINNATI NORTHERN**

\$21,000 for additions and betterments to existing equipment, all financed from loan.

\$92,000 for additions and betterments to way and structures, all financed from loan. Includes passing tracks, interlockers, and tools.

**TOLEDO & OHIO CENTRAL**

\$214,000 for additions and betterments to way and structures, all financed from loan. Includes yard tracks, passing tracks, yard facilities, shop tools and machinery.

**ZANESVILLE & WESTERN**

\$60,000 for additions and betterments to way and structures, all financed from loan. Includes engine terminals and yard tracks.

**LAKE ERIE & WESTERN**

\$366,000 for additions and betterments to existing equipment, all financed from loan.

\$243,000 for additions and betterments to way and structures, all financed from loan. Includes passing track, interlockers, shop machinery and tools, engine house stalls.

**KANAWHA & MICHIGAN**

\$256,000 for additions and betterments to way and structures, all financed from loan. Includes passing tracks and sidings.

**New York, New Haven & Hartford**

Recommended: \$8,130,000 for way and structures (development of freight yards, engine terminals, shops, tools, automatic signals) \$1,750,000 for locomotives; total \$9,880,000.

Loaned: \$9,630,000 to aid in purchase of new equipment and in additions and betterments to way and structure at total estimated cost of \$13,525,000.

**Norfolk Southern**

Recommended: \$78,000 for existing equipment; \$200,000 for way and structures (flattening curves, reducing grades and strengthening bridges, so as to materially increase train haul of engines).

**Northern Pacific**

Recommended: \$2,400,000 for way and structures, \$1,853,978 for locomotives and \$1,746,022 for freight cars.

Loaned: \$6,000,000 including \$3,600,000 to aid in purchase of equipment and \$2,400,000 for additions and betterments to way and structures, total estimated cost \$16,000,000, of which carrier is to finance \$10,000,000.

Equipment to be purchased includes 6 Mallet, 20 Pacific, 25 Mikado and 24 switching locomotives; 306 Hart convertible, 60 air dump and 1,000 steel underframe box; betterments to equipment, \$300,000, making total of \$9,690,208.

Proposed expenditures for additions and betterments to way and structures include: \$362,000 for widening cuts and fills; \$407,454 for ballast; \$1,103,400 for rail and other track material; \$556,557 for bridges, trestles and culverts; \$473,787 for grade crossings and crossing signals; \$538,600 for additional main track; \$334,750 for additional yard tracks, sidings and industrial tracks; \$104,679 for signals and interlocking; \$109,122 for telephone and telegraph lines; \$56,685 for tunnel and subway improvements, \$222,168 for freight and freight and passenger stations, office buildings, etc.; \$105,456 for water stations and appliances; \$104,038 for fuel stations and appliances; \$644,121 for shop buildings, engine houses and appliances; \$475,542 for shop machinery and tools; \$37,327 for electric power plants, etc.; \$506,000 for pile drivers, cranes, etc.; \$201,000 for car sleds; total \$6,368,905.

**Pennsylvania Railroad**

Recommended: \$6,780,125 for way and structures (grain elevator, engine house facilities, yard tracks, shops).

Loaned: \$6,780,125 for purposes mentioned.

**Philadelphia & Reading**

Recommended: \$1,088,125 for locomotives.

**Rutland**

Recommended: \$61,198 for way and structures (bridges, rebuilding swinging bridge at Fort Ticonderoga).

Loaned: \$61,000 to aid in making additions and betterments to way and structures; total estimated cost \$89,000; of which carrier is to finance \$28,000.

**Salt Lake & Utah**

Loaned: \$64,000 to aid in purchase of new equipment; loaned also \$235,400 to assist in making other additions and betterments and in financing pressing maturities carrier has undertaken to finance for new equipment \$213,563 for other additions and betterments, \$78,600 and for maturities, \$43,336.

**Shearwood Railway**

Loaned: \$29,000 to enable carrier to meet maturing indebtedness and to provide additions and betterments.

**Seaboard Air Line**

Recommended: \$750,000 for way and structures and \$2,291,000 for maturities.

Loaned: \$6,073,400 to aid in inquiring refrigerator cars at cost of \$1,058,000 in making additions and betterments at total cost of \$750,000 and in meeting 1920 maturities, aggregating \$8,248,000. Carrier required to finance \$3,982,600. Additions and betterments include ballasting, rail renewals, bridging, shop machinery and facilities, cinder pit and fuel facilities and additional industry tracks.

**Southern Pacific**

Recommended: \$1,397,500 for locomotives and \$6,102,500 for freight cars; total \$7,500,000.

Application denied on ground that the showing made in respect to inability of company to secure necessary funds from other sources, unconvincing. I. C. C. said that only money borrowed by applicant since termination of federal control was \$15,000,000 by the sale of equipment trust certificates, which was characterized as "relatively unimportant, considering the value of the applicant's property, its available assets and its prospective earning power." Carrier had proposed to use loan to assist in purchase of cars and locomotives costing \$17,233,600, of which \$12,204,600 was to be financed by company.

**Tampa Northern**

Recommended: \$57,000 for way and structures (heavier rails and additional tracks) and \$100,000 for maturities; total \$157,000.

**Terminal Association of St. Louis**

Loaned: \$898,925 to aid in meeting demand notes and in making additions and betterments. Amount for maturing obligations \$377,750, total amount of such obligations \$1,511,000; carrier required to finance for period not less than one year at not more than 7 per cent, the remainder of maturities, \$1,133,250. Amount for additions and betterments, \$519,175; carrier itself to finance usual amount; includes improvements to Eads bridge costing \$129,000; a new yard at cost of \$44,900; completion of upper Wiggins yard, \$170,000; a viaduct, \$35,000; equipment for car repair, shop \$2,300; additional trackage, \$109,250 and extension to Brooklyn shops, \$494,700.

**Texas & Pacific**

Recommended: \$1,091,000 for existing equipment; \$1,688,000 for way and structures (new yard and engine facilities additional passing tracks, shop machinery, train, despatching circuits, water supply); total \$2,779,000.

Loaned: \$3,000,000.

**Toledo, St. Louis & Western**

Recommended: \$510,000 for way and structures (yard tracks, storage tracks, new roundhouse, heavier rail and ballast), \$375,000 for locomotives; total \$885,000.

**Trans-Mississippi Terminal**

Recommended: \$750,000 for maturities.

**Virginian**

Recommended: \$2,000,000 for way and structures (completion of double track on ruling grade)

Loaned: \$2,000,000 to aid company in extending its facilities to handle adequately its rapidly expanding traffic; carrier has itself financed large expenditures for equipment and other additions and betterments.

**Wabash**

Recommended: \$200,000 for existing equipment; \$977,200 for way and structures (enlargement of shops, shop tools, heavier rail); also \$191,225 for way and structures (strengthening of bridges for heavier power), \$162,500 for locomotives; total \$1,530,925.

**Western Maryland**

Recommended: \$622,800 for way and structures and \$750,000 for locomotives; total \$1,372,800.

Loaned: \$1,372,800 to aid in purchasing 20 freight locomotives at cost of \$1,500,000 in making additions and betterments to way and structures at total cost of \$622,800; carrier required to finance \$750,000 one-half of cost of locomotives. Has already financed purchase ten modern car floats at cost of \$500,000. Additions and betterments to way and structures at total cost of \$622,800 include passing sidings, \$27,800; engine terminal and yards at Bowest, Pa., \$100,000; dredging at Fort Covington, Baltimore, \$95,000 and enlargement and extension of coal pier at Baltimore \$400,000.

Loaned, also: \$1,050,000.

**Wheeling & Lake Erie**

Recommended: \$1,461,540 for way and structures (additional freight yards, engine terminals and repair shops), \$3,600,000 for freight cars.

Loaned: \$2,460,000 to aid in meeting 1920 short term maturities and in making additions and betterments to way and structures. Carrier required to finance on account of 1920 short term maturities, \$1,200,000.

**Wisconsin, Brunswick & Southern**

Loaned: \$90,000 to aid in meeting maturing indebtedness and proving additions and betterments to way and structures at total estimated cost of \$125,000. Carrier required to finance about \$35,500.

*About a Mile East of the Elkhorn Tunnel on the Norfolk & Western*

## The Electrification of Steam Railroads

### A Brief Survey of Operating Results on the Norfolk & Western and the C. M. & St. P.

**T**HE PART that electrification will play in solving the traffic problem of the future is problematical. A large increase of traffic is inevitable and means must be provided for handling it. The extent to which electric operation will be adopted in the near future will be influenced materially by the success of the operation on those roads which are already electrified.

Comparatively little can be gained by a study of operating results of electrified roads in foreign countries because conditions are very different from those in the United States. In this country interest has been centered on the Norfolk & Western and the Chicago, Milwaukee & St. Paul. Tunnels on these two roads did restrict steam operation, but operation on neither road was circumscribed by tunnel and terminal requirements. Each new application of electric operation presents an individual problem, but many difficulties common to all roads have been and are being worked out on the two roads mentioned. The purpose of this article will be briefly to survey the operating results so far as data concerning them are available in a usable form.

When electric operation on the Norfolk & Western is studied, the proper consideration should be given to a certain few fundamental facts. For example, locomotive main-

tenance costs have been high but it is logical that they should have been under the circumstances. The locomotives were put into a service heavier than anything which had been done before or has been done since; moreover, there was no

precedent to follow in designing equipment for such service. Furthermore, the maintenance of any machine is to a large extent dependent upon the amount of work done by the machine, and the work done per mile and per day is greater for the Norfolk & Western locomotives than for any other locomotives, steam or electric. For example, about 60 per cent as much power is used by 12 locomotives operating over 28 miles of line on the Norfolk & Western as is used by 42 locomotives operating over 440 miles of line on the St. Paul. The power consumption on the Norfolk & Western during 1919 was 67,395,000 kw. hr., while that on the St. Paul was about 120,500,000 kw. hr. During 1918 the Norfolk & Western electric locomotives used 74,325,992 kw. hr., while the St. Paul used about

130,177,000.

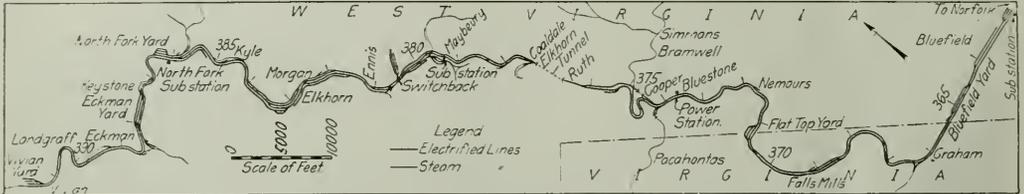

In spite of many difficulties the electric system has been made to give excellent results and operating men agree that it has been the only practical solution for the division's problem.

The function of the electrified section is that of collecting

**O**PERATING PROBLEMS common to a large number of railroads with heavy grades and tunnels have been worked out on the Norfolk & Western and the Chicago, Milwaukee & St. Paul with the aid of electric operation. The operating conditions on the two roads are very different, in that one may be likened to a big yard with very heavy switching operations, while the other is a long section of single track road on which the length of locomotive divisions has been doubled.

from mine sidings and yards in the coal fields the entire eastbound coal tonnage and transporting it up the grades and over the summit to the classification yard at Bluefield, which is a division point. The coal is partly classified at Bluefield and is then moved east by steam power to the various destination points, chiefly to the Norfolk & Western marine shipping pier at Lamberts Point near Norfolk, Va. All coal traffic originates west of the Flat Top yard, about 6 miles east of the summit of the heavy grade, and although a large amount

the 2 per cent grade at 14 m. p. h. where originally three Mallet locomotives were used at a speed of about 7½ m. p. h. The effect of increased speed is especially marked at the single track Elkhorn tunnel, which is over 3,000 ft. long on a 1.5 per cent grade. Because of ventilation requirements, under steam operation, it was necessary to reduce the speed up the grade to about 6 m. p. h., requiring about seven minutes to clear the block. With electric operation this movement is made in about three minutes. Since electric operation

Map of Electrified Section, Norfolk & Western. Fully 60 Per Cent. of the Line Is on Curves

of the coal which originates on the electrified division goes west, the shipments to the east constitute the bulk of the traffic handled electrically. Some coal originating east of the summit is shipped to the west, and this is also handled by electric service to yards near the western end of the electrified section. There is probably more Norfolk & Western coal shipped to the west than to the east, but over the electrified section the total eastbound tonnage is now about six times as great as the westbound. About 80 per cent of the eastbound traffic originates between Eckman and Coaldale.

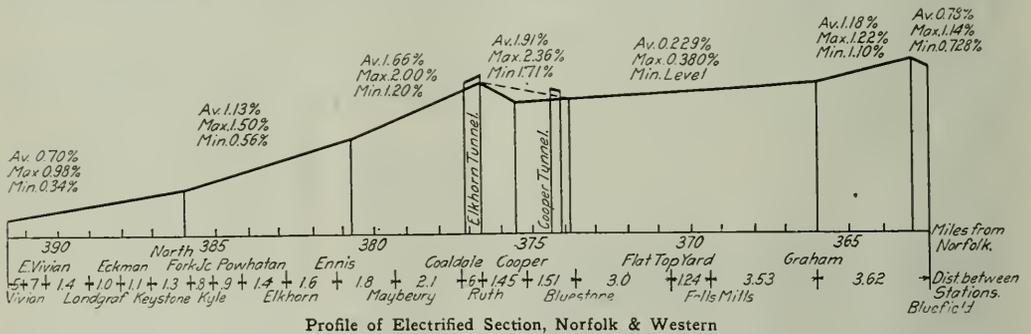

Steam road locomotives are still used over the electrified section for through merchandise freight and for passenger trains, but electric locomotives are used regularly as helpers on three eastbound passenger trains and for most of the through freight trains. An electric helper is also occasionally

was installed the Elkhorn grade has not caused restriction of main line traffic.

**Train Operation**

Several different methods of operation have been tried during the past five years. All trains do not do the same work, but following a locomotive and train crew through a typical day's work will give an idea of how the coal trains are handled.

A train of westbound empties, consisting of from 90 to 110 cars, is made up by a steam switcher in the Bluefield yards. The electric crew take the locomotive to the caboose track where they pick out their caboose and couple it on the rear of the train. The locomotive then goes to the head end of the train and proceeds out. The train is run at both the 14

Profile of Electrified Section, Norfolk & Western

used to help other delayed passenger trains to make up time. The principal duty of the electric locomotives, however, is to make-up and haul extra, eastbound coal trains over the electrified division into Bluefield.

**Reason for Electrifying**

Decision to electrify the Elkhorn grade was made because this section of the road restricted the amount of main line traffic that could be handled. The increasing traffic, together with the heavy grades and added tunnel complications, had made it practically impossible to handle the traffic over this section with steam power. Because of the mountainous country through which the division runs it was not economically practicable to build more tracks and the only solution lay in handling heavier trains at higher speeds.

Two electric locomotives now haul a 3,250-ton train up

and 28 m. p. h. speeds from Bluefield through the Elkhorn tunnel.

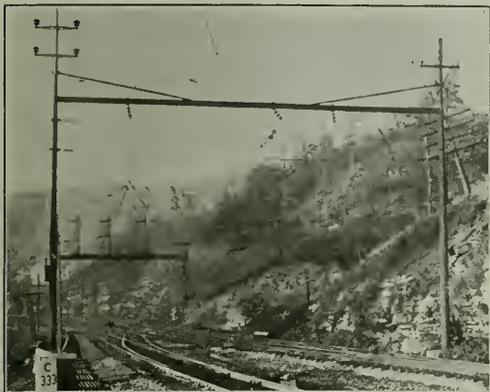

The train then drops down the heavier grade, regenerating power to the line. The empties are set off at various sidings on the way down the hill. When the last of the empties are to be set off, the caboose is uncoupled on the main line and is allowed to roll down the hill until it meets the locomotive as it comes out of the lower end of the siding. They then proceed to the Eckman yards. Had they taken westbound tonnage from Bluefield they would probably have proceeded to Vivian.

At Eckman all or a part of a 3,250-ton train is made up and taken up the grade to the Elkhorn tunnel with the aid of a pusher. If only a part of a full tonnage train is taken east from the Eckman yards the balance will be picked up at other points on the way to the summit.

The method of starting such a train is particularly interesting. When the engineer on the front end is ready to start he backs the train against the pusher. At this signal the engineer on the pusher applies power forward and holds with full load current on the motors until the front end locomotive has taken its share of the load. The pusher then starts forward automatically.

A special hook is used for uncoupling the pusher at the top of the grade, allowing it to go back for another train. The head-end locomotive then regenerates power down the steep grade east of Elkhorn tunnel. With a full tonnage train the one locomotive returns practically full load current to the line.

The train then proceeds to Flat Top yard where the pro-

Typical Overhead Construction on the Norfolk & Western

cedure depends on whether the crew is making its first or second trip for the day. In the former case, it is usual for the train to be left at Flat Top, the locomotive returning west, either light, with empties, or occasionally with westbound loads. In the latter case the train fills out to 4,700 tons at Flat Top yard and proceeds to Bluefield, a pusher being provided on Bluefield Hill. At Bluefield the time allowed for preparing the locomotive for its next trip is forty minutes.

Since the system was put in operation in 1915 more than 50,000 trains have been taken over the electrified section without a regeneration failure. Retaining valves are not used.

### Power Dispatching

All of the power for the electrified section is developed in one steam power house located at Bluestone. From the power house it is transmitted at 44,000 volts, 25-cycle single-phase to five substations, where it is stepped down to 11,000 volts and delivered to the trolley. The load sometimes changes from nothing to 25,000 kw. in a few minutes. One 3,250-ton train requires from 12,000 to 14,000 kw. for starting on a 2 per cent grade and about 8,000 kw. are required to move such a train up the grade at 14 m. p. h. Half of this power is used by each of the two locomotives and about one and one-half minutes are required to reach the speed of 14 miles. Naturally it is difficult under these circumstances to operate with a high load factor. A system of operation has been adopted, however, that has resulted in a 50 per cent load factor and a coal consumption of something less than 3 lb. of coal per kw. hr.

A record of all electric train movements is kept by the power dispatcher at the power house. Telephones are placed along the right-of-way at all important signal towers or bridges. When a conductor has received his train he calls

the power house and reports that he is about to start east or west from a certain place with a train of a certain tonnage and number of cars. This is recorded by the power dispatcher on a log sheet and he also has the stokers and blowers speeded up to meet the coming increase of load. If it is not practicable to carry the increase of load with the number of boilers in service the power dispatcher asks the conductor to delay starting for a few minutes.

If for any reason a train is stopped at a signal for more than three or four minutes the power dispatcher is again informed that it is about to proceed. This method permits the power house operator to anticipate the load, to forestall excessive peak loads and as a result operate with a minimum number of boilers and generators and obtain a high load factor and relatively high efficiency.

### Overhead Maintenance

The 000 Phono-electric contact wire is supported by a 00 solid copper secondary messenger which in turn is supported by a 1/2 in. stranded steel primary messenger. The greater part of the main line overhead is supported by steel channels supported by tubular steel poles. In yards a built-up steel pole is used in connection with a cross catenary. The 44,000-volt transmission lines are carried on one of the steel poles.

A small car equipped with an elevating platform and also an insulated ladder, known as the "hot ladder," were provided for trolley maintenance. Now the platform car is seldom used and practically all overhead maintenance work is done with the ladder. As the name suggests the "hot ladder" is used for working on the catenary when the circuit is live.

As first installed a certain percentage of the auxiliary mes-

The Bluefield Yard. Sleet Like This Did Not Interrupt Traffic

senger was steel and the balance was copper. The action of the gases from the steam locomotives caused the steel wire to rust badly and it is gradually being replaced with 00 solid copper wire. This change will practically double the current carrying capacity of the overhead wires where iron was used as the secondary messenger.

A megger is used for testing insulators. If the test shows a resistance of less than 2,000 megohms the insulator is replaced. It is then taken back to the shop where cleaning may or may not bring the resistance, as measured by the megger, back to infinity. Wood pull-off insulators when taken down are dried out in the shop and revarnished.

In bonding the track originally, two 00 pin type, copper wire bonds were installed per joint, but in replacement only

one bond is put in. This maintains satisfactory continuity and the slight loss in conductivity is unimportant with 11,000-volt current distribution. The bond maintenance has been kept down by this practice.

Sleet is not common in the southern part of West Virginia but has to be contended with occasionally. When there is sleet on the contact wire four pantographs are put up on the locomotives instead of the usual two. During sleet conditions, as shown in one of the illustrations, there was an insulator flash-over caused by a tree limb being blown over a trolley insulator. This slightly interfered with traffic, but aside from this, and occasional arcing at the pantograph shoe, the sleet caused no trouble.

The wear on the contact wire has been measured and found to be between three and four thousandths of an inch per year on the main line. On branches and stub end yard tracks it has been somewhat higher.

### Locomotive Maintenance

Maintaining the locomotives has at times taxed the ingenuity of all concerned. Frames have broken, been repaired and finally a new design of frame has supplanted the old. About half of the locomotives have been equipped with the new frames. The first new frame was installed early in 1920 and as yet none have failed. Crank pins and side rods suffered a similar fate, but the result of the repair and replacement has been highly satisfactory. Chattering wheel slip at first added much to the wear and tear on the locomotives, but it is now the exception rather than the rule.

Several other changes made in the locomotives are of general interest. For example, split babbitted bearings were used as main motor bearings, but were found unsatisfactory because of alignment difficulties and because of throwing oil, some of which would get into the motor windings. It was

The Repair Shop at Bluestone

also necessary to provide drip pans under the gears to keep oil off the track. The split bearings are being replaced by the solid bearings with bronze inserts. These throw very little oil, do not show the tendency to run hot that the split bearings did and the bronze inserts are designed to prevent the motors from dropping down on the pole pieces in case the babbit should flow.

There is a pinion on each end of each motor shaft. At first one of these pinions was shrunk on and keyed to the shaft, the other being shrunk on only. Now they are both shrunk on to the tapered ends of the shaft. The faces of the original pinions were flat and flush with the ends of the pinion teeth. The new pinions have an extended hub on the outer end, threaded so that a puller can be used and have an extended cup at the inner end grooved so that the oil which creeps along the shafts will be thrown back into the

bearing well. A special transformer is used for heating the pinions before they are shrunk on.

Iron collector rings were at first provided for the main motors, but, seemingly due to vibration, they pitted and wore the brushes badly. Copper rings were substituted which have given satisfaction, many of them having the glossy chocolate brown finish considered ideal for commutators.

Several changes have been made on the water rheostats. Small particles of metal from the electrodes caused the outlet cylinders to stick in the gland. This was corrected by making a new gland with a collar which extended upward from the bottom of the rheostat tank for several inches into the liquid. The longest electrodes were also reinforced and the

A St. Paul Passenger Train as Seen from the Observation Car

level of the liquid is not allowed to get below the bottom of the plates. Originally the center electrodes could be lifted out of the rheostat tank while grounded electrode remained in the tank. This permitted a variation of distance between electrodes when assembled. The ground plates are now made integral with, and lift out with the others. Current limit relays have been applied to prevent the outlet cylinders rising too rapidly and thereby overloading the motors and slipping the wheels.

Headlights were removed from the top of the cab where they were close to the pantograph and were placed on the forward and rear trucks.

A number of minor changes have been made to provide for better accessibility, better lubrication and for wear of certain parts.

The firemen or helpers, as they are called, say they consider the electric simpler than steam locomotives. Inquiry into this statement brings out the explanation for this statement. Except in very few cases trouble or faulty operation of any part of the locomotive can be located and remedied by the helper. Even if a motor should burn out it can be cut out and the locomotive operated with three of the four trucks. Under these circumstances, of course, it may be necessary to reduce the tonnage.

The outstanding and pertinent facts are that a new type of locomotive was made to perform a service never before performed and was put into this service practically without experiment. Difficulties have been surmounted as they appeared and at no time have the electric locomotives been unable to handle the business that came over the division.

Electric operation has made it possible to handle the ever-increasing traffic that originates on this division. The far-sighted policy of adopting it has been profitable to the Norfolk & Western and the working out of the problems involved has been a service to all other roads confronted with similar problems.

### Chicago, Milwaukee & St. Paul

Many factors were involved in reaching a decision to carry out the large electrification program of the C., M. & St.

P. and probably the most important of these was the desire to create a market for power. No complete figures have been published to show that the enterprise has been a success financially, but the data available indicate that such is the case. Some conception of the status of affairs may be obtained by a consideration of the following:

**Operating and Capital Costs**

The Pacific division has been operated electrically less than a year, so costs can now be considered only on the Missoula and Rocky Mountain divisions. A comparison of freight traffic operating costs from figures made available in 1918 shows that all costs affected by motive power on the Idaho division, which is steam-operated, were 90 per cent

The St. Paul Right of Way on the Western Slope of the Bitter Root Mountains

greater than those on the Missoula electrified division. On the Musselshell steam division they were 33 per cent greater and on the Rocky Mountain electric division these costs were 11 per cent greater than on the Missoula electric division.

The cost of maintaining and operating the transmission lines, substations, and trolley system, for the year 1919 is given in the table and a final figure showing the approximate total operating costs involved in the delivery of the electric energy to the locomotives.

**OPERATING COSTS FOR 1919**

Account	Total all services	Per unit
255. Power substation buildings.....	\$5,457	\$606.00 per building
257. Power transmission system.....	1,773	4.87 per mile
259. Power distribution system.....	78,461	179.00 per route mile
261. Power line poles and fixtures.....	24,299	55.50 per mile
306. Power substation apparatus.....	40,224	2,870.00 per station
383. } Train and yard power produced.....	102,152	7,300.00 per station
395. }		

Total ..... \$255,396

1. Cost per thousand gross-ton miles trailing freight as actually distributed in accounts..... 28.8c
  2. Cost per thousand's gross ton-miles train freight as actually distributed in accounts..... 24.9c
  3. Cost per thousands gross ton-miles trailing freight on basis distribution in proportion to freight k.w.h.r..... 30.2c
  4. Cost per thousands gross ton-miles train freight on basis distribution in proportion to freight k.w.h.r..... 26.2c
  5. Cost per actual k.w.h.r. delivered to loc. motives..... 1.1c
- The above unit figures include the cost of power.

Power is purchased from power companies and the cost of power at the high tension bus or point of delivery was 22.3 cents per thousand gross ton-miles trailing for freight service and 38.1 cents per thousand gross ton-miles trailing for passenger service. The freight traffic for the year was 2,476,085,000 ton-miles trailing and the passenger traffic 378,080,000 ton-miles trailing. The figures for the passenger service are approximate, as the ton-mile data are based on the assumption of an average weight per car, no record of particular cars handled in all the separate trains being available.

The above figures were taken from reports that have been issued from time to time and from them it appears that the savings in operating costs may vary from 20 to 90 per cent.

This must be balanced against an additional capital charge, due to electrification, of about \$23,000 per route mile. The construction cost, exclusive of locomotives, was \$17,579 per route mile. In the first figure given, the value of the steam equipment displaced has been subtracted.

**Power Supply**

All power for the electric operation is purchased and is delivered to the railroad as 100,000-volt, 3-phase, 60-cycle current. Power for the section between Avery, Idaho, and Harlowton, Montana, is obtained from the Montana Power Company. To prevent the total power demand from exceeding a certain value, apparatus called a power indicating and limiting system is installed. When the power demand reaches a predetermined value, the trolley voltage is reduced automatically. The train speeds are, of course, also reduced accordingly and the reduction of voltage and train speeds continue until the total power demand falls off to something less than the predetermined value. Such a system was installed between Harlowton and Deer Lodge, Montana, in 1918 and on the sections between Deer Lodge and Avery, Idaho, early last year. Train speeds are reduced by this system from 2 to 13 per cent of the time, depending upon the amount of the traffic and the arbitrary value of the limit setting.

Power for the Pacific electric division which extends from Tacoma to Othello, Wash., is purchased from Inter-Mountain Power Company. This section was formally put under electric operation on March 5 last.

**Motive Power**

The first consignment of locomotives was purchased from the General Electric Company and consisted of 12 passenger, 30 freight and 2 switching locomotives. The freight and passenger locomotives were identical except for the gear ratio between the motor pinions and the gears on the main driving axles, as it was considered desirable at that time to have only one type of locomotive for both kinds of service. These locomotives are of the 4-4-4-4-4-4 type and the 12 passenger locomotives have now been regearred for freight service.

Two more switchers have been added and 15 new passenger locomotives were purchased and delivered during the latter part of 1919 and the early part of 1920. Ten of these were supplied by the Westinghouse Electric and Manufacturing Company and are of the 4-6-2-2-6-4 quill geared type and the other five were supplied by the General Electric Company and are bi-polar gearless locomotives with a 2-4-8-8-4-2 wheel arrangement. These locomotives were described in the following issues of the *Railway Age*: December 3, 1919, page 819; January 16, 1920, page 238 and March 26, 1920, page 1051.

**Operating Results**

The manner in which trains are handled with electric locomotives will be described in a series of three articles which will appear in early issues of the *Railway Age*.

The following are some particularly pertinent statements pertaining to the results of electric operation which have been made during the past year by different men familiar with conditions on the road:

"Nearly 30 per cent more tonnage can be handled by electric operation in about 80 per cent of the time it formerly took to handle the lesser tonnage by steam operation.

"The consensus of opinion of the roadmasters and superintendents of the electrified zone is that there is no more slipping of the locomotive wheels on the rail and consequently no more damage to the top of the rail under electric operation than there is with steam locomotives. It has not been found that there is any greater tendency for the rails to creep on account of regenerative braking on de-

scending grades than there was under the braking action of steam locomotives. No case has been found where electric locomotives moving at a high rate of speed have tended to displace the rail on the ties or the ties on the ballast. Roadmasters agree that the electric locomotive is easier on the track than steam locomotives because of less rigid construction. It is stated that the flange wear on curves under electric operation is actually less than under steam operation for the reason that the electric locomotives are less rigid in their wheel arrangement than the steam locomotives.

"One of the marked economies effected by electrification is the reduction of train and enginemen's expense, on account of the increased ton-miles per train mile and per engine-mile and the reduction of equipment repair and roundhouse expense.

"The spacing of trains to hold down the power demand has in combination with the action of the power indicating and limiting system worked out very well. When the load factor was running 60 per cent or higher, the automatic slowing up of trains involved an increased expenditure for freight train and enginemen's time of about 10 per cent. With a load factor of from 50 to 55 per cent, however, the limiting action takes place through only a small part of the day, and while there is a considerable reduction in the maximum demand, there is little effect on the operation.

"As to ease of starting trains, this feature of electric operation is noticeable, conducing to increased comfort of passengers.

"The technical result of the electrification has been quite a success. The financial result, due particularly to fuel and labor conditions, and the indirect value due to publicity of this operation, are equally satisfactory.

"Even allowing for the increased investment charges, the items of operating expense, depending directly upon motive power, are so reduced and additional benefits indirectly obtained are so great as to justify consideration of extending the electrification even on sections with easier grades."

## The Pennsylvania's New Agreement With Trainmen

**T**HE MANAGEMENT of the Pennsylvania Railroad System on December 29 concluded with the representatives of its engine and train service employees a mutual working agreement, regarding the settlement of future labor differences, which, it is expected, will eliminate any question of strikes on that road, as far as train operation is concerned; and a statement has been issued by the company, explaining what has been done, substantially as follows:

This agreement is the outcome of a series of meetings between representatives of the company and of the engine and train service employees, which began in Philadelphia on December 21 and terminated at Pittsburgh on the 29th. Both sides are ready to apply the new principles with the beginning of the new year.

The classes of employees who, through their accredited representatives, have joined with the management in this matter are the enginemen, conductors, firemen, hostlers, trainmen and switch-tenders. As a medium to carry out the purposes of peaceful settlement there has been established the "Joint Reviewing Committee of the Pennsylvania Railroad System" for the settlement of all controversial questions affecting the engine and train service men. Through this committee, the employees involved will, for the first time in the history of this railroad, have equal voice and vote with the management, as the committee will constitute a court of review involving grievances, rules and working conditions, including discipline.

The joint reviewing committee will be composed, on behalf of the management, of two representatives from each of the four "regions" of the system, and, on behalf of the employees, of the general chairmen of the men in the engine and train services. The vote of all members, whether representatives of the management or of the employees, will be of equal power and not less than a two-thirds vote will be necessary to reach a decision upon any question presented.

In all matters, except individual discipline cases, the full committee will vote, and its decisions will constitute precedents, which will be binding equally with respect to similar existing or future cases, upon the management and the employees in all four regions of the system uniformly.

Discipline cases will be handled somewhat differently, as they involve a personal element which must be accorded recognition. It has, therefore, been decided that when such a case comes before the joint reviewing committee, the two representatives of the management in the region in which the case arises, together with the representatives of the employee involved, shall not sit as members of the committee, during consideration of that particular case, but shall act as counsel for the presentation of their respective claims. The remaining members will hear the case and determine the matter at issue. This will insure expeditious handling and fair judgment upon all discipline cases.

The work of the joint reviewing committee will be supplemented by an extension of and improvement upon the methods of handling differences and grievances which were in effect prior to the war. Each division superintendent will have a meeting once a month with the local chairmen of the engine and train service employees under his jurisdiction, at which either side may present matters for consideration. Each general superintendent will have a monthly meeting with the general chairmen, and the general manager of each region will also hold monthly meetings with the general chairmen.

Appeals may be taken in the order named, and appeals from the decision of a general manager will be taken to the joint reviewing committee of the system. Thus, in the final determination of any matter, the employees, through their representation upon the joint reviewing committee, will have equal power with the officers in determining the issue. In this manner, the employees will participate in each step in decisions affecting their personal welfare and the conditions under which they work.

The joint reviewing committee will meet monthly in order that all pending matters may be promptly determined.

For the purpose of definitely establishing decisions and interpretations of committees upon the whole of the company's lines a provision has been adopted to the effect that whenever an agreement is reached regarding any particular controversy, between the representatives of the management and men—whether at a superintendent's meeting, a general superintendent's meeting, or a general manager's meeting—the settlement agreed upon will at once be placed in effect; but its terms will be immediately reported to the joint reviewing committee. The joint reviewing committee, in its turn, will at its earliest convenience, either ratify the ruling as adopted, or modify it as may be thought best; and the principles so established will then become binding upon the management and employees in all regions, and will govern all existing and future cases of a similar nature.

"The management feels justified in expressing the conclusion that the understanding reached should not only make future strikes wholly unnecessary, but should obviate even the necessity for ever taking a strike vote among the engine and train service employees of this railroad, if both sides live up to the friendly spirit in which the understanding has been established."

## Developments In Material Handling Methods

The Railroads Are Making Increasing Use of Mechanical Equipment in the Movement of Freight

**T**HE MOST INTERESTING of recent developments in the use of material handling machinery on the railroads has been in its application to the handling problems presented in the movement of freight. It would probably not be far from the truth to say that all important facilities planned or built recently for handling less-than-carload freight have been so designed as to permit of the use of material handling devices. Also during the past year or so various existing layouts for handling loose bulk material in carload lots, which are predicated entirely on the utilization of machines, have been completed recently or planned during the past year. In pointing out the advantages to be derived from the use of the various material handling devices it is necessary also to describe, in some detail, the layouts in which the machines function.

Among the larger recently constructed freight terminals, in which improved methods of handling freight have been tried out with gratifying results, may be mentioned the New York Central terminal at Cleveland. Briefly, this layout consists of an inbound house 38 ft. wide and an outbound house 75 ft. wide. Both houses are 1,262 ft. in length and are separated by four sets of two railroad tracks which are in turn separated by island platforms 16 ft. 6 in. wide. A

platform 50 ft. in width located at the far end of the layout connects the two houses and the island platforms. Double leaf hand-operated trucking bridges, placed at approximately the one-third points, provide additional connections between the two houses and the platforms.

The mechanical equipment includes fleets of storage battery tractors and trailers and dollies in standard forms and in special forms for special service; lift type storage battery trucks and skid platforms; portable sections of gravity roller conveyor, and a hoist for handling the heavier shipments.

Outbound freight is received from street vehicles and usually is loaded directly onto the trailers. The sections of portable gravity roller conveyor which are mounted in frames designed to suit the conditions are useful in effecting the transfer of the ordinary run of packages from the street vehicle to the trailers. The hoist, which consists of a suspended I-beam runway extending 8 ft. out into the drive and 16 ft. into the house, and which is equipped with two three-ton geared trolley hoists, which operate independently, serves in transferring the heavier packages from the street vehicles to the trailers.

Each trailer is loaded, always, with freight destined for one car. After loading, the trailers are classified by hand into groups destined for a certain section of the house and assembled into trains of six or more trailers. Generally it is possible to so make up the train that the trailers may be cut off progressively, beginning at the rear. When all loaded

**T**HE railroads probably offer as great an opportunity for the application of material handling machines as any other single industry. Such devices are used by the roads in construction, in maintenance, in the shops, at locomotive terminals and for various other purposes. In view of the fact, however, that for years the roads have been handicapped by insufficient terminal facilities it is the application of machines to handling problems at terminals that is of outstanding interest at this time.

trailers have been delivered the tractor makes the return trip, picking up the empties on the way.

Each section of the inbound house is equipped with a large number of skid platforms and one lift type truck. The inbound shipments are handled from the cars by tractors and trailers and where possible the trailers are loaded with freight for one consignee and always with freight destined for one section of the house. When the size of a consignment justifies it, the trailers are unloaded onto the skid platforms where the shipment is held for delivery to street vehicles, the last shift being made with the lift trucks. This arrangement permits of deliveries being made without the re-handling of the shipment, thus saving much labor and reducing the likelihood of damage to a minimum.

#### Modernizing Existing Layouts

Mantua (Pa.) transfer freight station of the Pennsylvania Railroad, which consists of a building 1,200 ft. long and 16 ft. to 30 ft. wide, flanked on both sides by 13 tracks, having a combined capacity for 360 cars, may be cited as typical of the remarkable results obtainable from modernized layouts.

Approximately 135,000 tons of package freight is handled annually at this station. Until recently the transfer movement was made with hand trucks, each trucker handling about 10 tons of freight daily. With the hand trucks replaced with a fleet of 11 storage battery tractors and approximately 600 trailers three men are able to handle an average of 70 tons of freight daily. As a result of this installation night work has been dispensed with, the working day has been shortened and an important saving has been made in the cost per ton of freight handled.

#### Motor Trucks Replace Trap Cars

Probably the most interesting recent development in freight handling on the railroads is the use of motor trucks for interchange and trap car shipments at Cincinnati, which was described in detail in the *Railway Age* for August 6, 1920. Briefly, this is a system for transferring less-than-carload freight between local freight stations by the loading of package freight at the stations into demountable containers or truck bodies which are transferred from motor chassis by mechanical means and are then moved from one station to another on motor trucks.

The mechanical equipment required in this service includes the motor trucks, the demountable bodies, and facilities at each station for transferring the bodies from the

trucks to the floor of the station, and vice versa. The transfer machines consist of a light steel superstructure erected over the driveway and floor locations of the demountable bodies. This supports the electric hoists which are provided with a weaving device to insure accurate aligning of the demountable body with the truck chassis, and are equipped with Sprague standard hoist units of 7½ to 10 hp. for lifting, and 2½ hp. traveling motors.

As a result of this installation the cost of handling freight between the 35 stations has been reduced 35 cents per ton, 15 per cent of the existing platform area has been released for other use, nearly 200 cars have been released from continuous trap car service for the handling of other commodities and switching service has been done away with involving approximately 300,000 switching cuts annually.

#### A New Application for Car Unloaders

The grain elevator recently completed by the Pennsylvania Railroad at Baltimore and described in detail in the *Railway Age* for July 2, 1920, presents some interesting developments in the application of machines for handling loose bulk material. This plant is equipped with four grain car unloaders, each machine consisting of a sidewise-tipping cradle mounted on an endwise tipping table, an appliance for opening the car doors automatically and a grain receiving hopper placed on the side of the tipping table. In operation the machine tips the car on its longitudinal axis 30 deg. towards the side on which the receiving hopper is located, thus forcing the car door open. This causes the grain near the car door to run out, then with the car still in this position, it is tipped endwise 45 deg. by the table, first with one end up and then the other, so that grain in the ends of the car will run out.

The entire operation of unloading a car with this unloader requires less than 10 minutes. Only three employees are required to operate the unloader and attend the car during the process. In other words, the machine will accomplish as much in 10 min. with three men as four men can accomplish in 45 min. with the use of a power shovel.

As the grain is dumped from the cars it falls into a steel hopper discharging to a 42 in. belt conveyor which delivers to cross belts running to four receiving legs or elevators for delivery to the garner. From here it falls by gravity to scales from which it can be delivered to the cleaner and dryer.

Nine shipping legs are provided for elevating grain for shipment.

# Railway Developments in Canada in the Year 1920

High Gross and Low Net Earnings; Increase of Government Ownership and Management; Future Prospects

By J. L. Payne,

Comptroller of Statistics, Department of Railways and Canals

COMPLETE OPERATING RESULTS for the calendar year 1920 are not yet available; but sufficient information is at hand to warrant the statement that the railways of Canada established a record in the matter of high gross earnings. They also established a record for high operating expenses. The result was the lowest net earnings per mile of line for many years. Materials and labor cost so much more than in preceding years that, notwithstanding the fillip given to receipts by higher rates, the railways fell behind. It is to be feared that on this side of the line, as on the other, there is a prevalent opinion that railways have some occult way of escaping the high cost of living which is denied to individuals. This would appear to be the case, since the application of the railways for better tolls to enable them to hold their heads above water was sternly and vigorously opposed.

It may be well to make clear the basic reason for this attitude on the part of boards of trade and other Canadian bodies. The Canadian Pacific is unquestionably prosperous. It has resources which other lines lack, and those resources have an important bearing on its net earnings. Nevertheless, the Canadian Pacific has been suffering a steady diminution of net earnings in common with the few other roads in the

Dominion which are able to do a little better than make one hand wash the other. For example, for the ten months ended October 31 last it showed a gain of \$29,701,408 in gross receipts over the same period in 1919. In spite of this it had a decrease of \$1,543,090 in net earnings; for while gross earnings had increased by 20.8 per cent, operating expenses had increased by 27.4 per cent. Yet the Canadian Pacific has been able to maintain its substantial dividend payments on common stock, and when the case of all the railways is presented there are many people who see only this single road which has done well.

Just how seriously the railways of Canada were pinched during 1920 may be easily figured out by studying the still unpublished official figures for 1919. In that year 36 units out of 72 failed to earn operating expenses. Of the remaining 36, only 14 were able to pay fixed charges, and of these 14 just 5 had net corporate earnings available for dividends. It is only fair to say that this result was not unique for 1919.

That has been the situation, except in lesser degree, for at least the past six years. It was probably intensified in 1920.

It is quite true that gross earnings have shown most encouraging advances during the past decade in particular. In 1910 they were \$173,956,217; for 1920 they probably

**I**N THE 10 YEARS ended 1919, gross earnings per train mile increased 209 per cent, while operating expenses increased 323 per cent. Yet such relief as has been offered in increased rates has been bitterly opposed.

The government now operates 52 per cent of the railway mileage, although the question of government ownership has never received serious public consideration

All conditions at the moment are more or less adverse; it may be characterized as a period of "anxious waiting."

exceeded \$430,000,000. It is, however, quite misleading to base assumptions of prosperity on a single fact of that nature, as students of transportation statistics know full well. Gross receipts must always be measured by certain established standards before their real importance can be determined. Thus, while in Canada an increase of 147 per cent may be assumed to have taken place during the past decade in the volume of total receipts, the increase per mile of line has been only 110 per cent. Put in another way, and answering to a test which goes to the very pith of the whole matter, while in the ten years ended 1919 gross earnings per train mile grew by 209 per cent, operating expenses per train mile grew by 323 per cent. That is really a startling change.

#### Earnings Up 25 Per Cent; Expenses Up 51 Per Cent

There is still another way of setting forth the results of this crucial test. While in 1914 the credit balance created by the difference between gross earnings and operating expenses per train mile was equal to 35.8 per cent, in 1919 that percentage had shrunk to 11.8. During that same period, 1914-19, while gross earnings went ahead by 24.7 per cent per mile of line, operating expenses expanded by 51.2 per cent. It is important to keep the facts for the years since 1914 clearly in mind; for it was coincident with the outbreak of war that severe pressure came upon the railroads. It may help to a better appreciation of the position into which that pressure forced the railways of the United States and Canada if at this point the significant difference between the opportunities of a railway corporation since the commencement of the war period and nearly all other classes of corporations is emphasized.

While the latter were able to adjust their selling prices almost at will, raising them to whatever levels they deemed expedient to meet the rising cost of production, the purveyors of transportation were held rigidly to the earning rates which had been fixed before 1914. It was not until 1918 that any relief at all was granted. Then that relief was bitterly opposed. It was not sufficient, however, except for immediate purposes. The cost of materials and labor continued to rise. After enduring these conditions for two years, a further advance in rates was permitted in 1920. This, at all events, was what happened in Canada. Everybody is familiar with what the unchecked carriers by water did during that same long period of steadily ascending prices. They raised their rates 100, 200, 400 and up to 800 per cent. What would have been the financial position of the railways of North America today if they had been as free to regulate their tolls as were these carriers by water or as were other producers? This is neither an inept nor an unreasonable question.

#### Government Acquires Grand Trunk

By every test which may be fairly applied the railways of Canada have been having a hard time since 1914. Their experience has made many hundreds of millions of dollars of investment unproductive. This has been peculiarly true of the year 1920, because it brought many roads to a very serious state. Yet they have all borne these adverse conditions heroically, and no one may charge them with not having tried to help themselves as far as was humanly possible. They enforced economies both directly and indirectly. That is to say, they cut operating expenses with a ruthless hand, and brought every available device of administrative skill to bear on the reduction of train mileage and car mileage, while on the other hand they increased the carload and trainload. They achieved wonders in all these respects. And still they had to sit down at the end of the year and face a further shrinkage of net earnings. If this were the story of an individual or an ordinary commercial corporation it would provoke sympathy. The railways have learned to grin and bear it.

Aside from financial consideration, the outstanding fact

in the history of Canadian railways in 1920 was the absorption of the Grand Trunk into the Canadian National Railways system. This followed the setting up of that system in 1918, when the Intercolonial and Prince Edward Island railways, which had been the standing examples of government ownership as growing out of the pact of Confederation in 1867—the Canadian Northern, the National Transcontinental, the Grand Trunk Pacific and the Grand Trunk Pacific Branch Lines were thrown into a single operating group. Thus in May, 1920, with the bringing in of the Grand Trunk, the principle of public ownership and operation was directly applied to a little over 52 per cent of the entire railway mileage of the Dominion. It will not be out of place, even though it may represent in some degree the reiteration of what has already appeared in these columns, to present in succinct form the causes which operated to bring about this exceedingly important change in the Canadian railway situation.

It began with the collapse of the Canadian Northern and Grand Trunk Pacific, which really took place in 1914, but was not carried to the point of positive assumption of full operating responsibility by government until near the end of 1917. In fact, some of the steps were not formally taken until 1918. It must be definitely understood that what took place in this regard was dictated by the imperative demands of necessity arising out of the fact that the bonds of these roads had been guaranteed to a high proportion by both the federal and provincial governments. It will not be necessary at this time to take up space in setting forth the full measure of these obligations. It must suffice to say that the Dominion Government deemed it a public duty to keep these properties in operation. As the chief guarantor, the Dominion Government felt impelled to do this for the further reason that it was the only avenue of possible escape from further serious losses. The interests of the growing west also demanded it, since nearly all the mileage was in that section of the Dominion. Under any circumstances the responsibility would remain unaltered.

The Grand Trunk, while hard hit by reason of its primary guarantees on account of its subsidiary, the Grand Trunk Pacific, was not without resources. But the time for financing on a comprehensive scale was inopportune. Moreover, the government needed the old established system in the east to complete the scheme of the Canadian National Railways. The time was favorable for such a change, and after protracted negotiations the matter was brought to an issue early in 1920. The shareholders of the Grand Trunk approved a bargain under which, without going into a mass of details, the government should be given control by becoming the purchaser of the common and preferred stock rights. With that control there passed at the same time to the government practically full responsibility for the liabilities of the Grand Trunk. The operating rights were taken over in May last, and the terms of purchase, subject to certain statutory limitations, will be adjusted by the usual process of arbitration. That process is now under way.

#### Not Due to Definite Policy

Before passing to the consideration of what this tremendous change means, and may mean, so far as the Canadian people are concerned, the fact cannot be too strongly accentuated that these happenings did not follow the adoption of a definite policy in favor of substituting public for corporate ownership. They came about as the direct result of irresistible circumstances. The matter was not made an issue before the electors. There was scarcely time to do that. Anyway, the liability arising out of the guarantees could not be pushed aside no matter what might be the wishes of either government or people; and that liability dominated all considerations. To put it in homely phrase—and there is no other way of doing it so lucidly—the people of Canada

had endorsed the bonds of certain railways which subsequently fell into bankruptcy, and have been obliged to take over the properties secured by those bonds in order to try and reduce the ultimate volume of loss to themselves. They were the trusting endorser. They have never expressed any judgment on the broad question of state control as against private control, since necessity dictated what they should do rather than considerations of policy.

There will be a natural interest across the line in this vast enterprise bearing the stamp of nationalization, and the first question would probably be with respect to results. For the fiscal year 1920 the responsible minister announced a deficit of \$47,000,000. For the preceding year it was several millions under that total on the basis adopted by the Department of Railways and Canals. In an impressive and well-organized speech the minister frankly told Parliament that the deficit for the year did not include any fixed charges attaching to the Intercolonial, the Prince Edward Island or the National Transcontinental. He could not have presented more than an estimate; for the capital accounts of these roads have not been kept on the basis applied to corporate lines. The Minister of Finance has recently intimated that an effort will be made to set up a correct account.

This aspect of the matter is so important that a word or two of explanation would appear to be necessary before the situation as to fixed charges can be understood. In official statistics the sum charged on account of capital outlay is placed at \$330,062,719; but that is the bare cost of construction, and neither includes any interest charges during the building period nor subsequently. Therefore, to compare the Intercolonial with the Canadian Northern, for example, is impracticable. If accumulated fixed charges were now added, the total would, of course, be very materially increased. This was made plain to Parliament by the Minister of Railways some months ago. As the capital account of these three government roads has not been made comparable with the accounts of other units in the Canadian National group, it would scarcely be proper for the writer to indulge in a purely speculative calculation. Others, however, have made the attempt and their figures run into large totals. It must suffice to say that whatever may be the correct capital account, it would, to the extent of the fixed charges attaching hereto, swell the deficit announced by the minister. When the account is brought down to the present time, it would, quite unavoidably be swollen by the accretive power which is exhibited in the proverbial rolling snowball—in other words, by the compounding of interest charges over a long period of years. Moreover, into the final account must be thrown the advances made to the Canadian Northern and Grand Trunk Pacific, and which now aggregate more than \$150,000,000.

### What of the Future?

What of the future? No one could pretend to do more than guess. The Canadian National system, with its lines running from coast to coast, and branching northward and southward in many directions, will be as dependent as other lines on the development of traffic. As settlement proceeds—and the immigration authorities tell of the brightest prospects in that respect—the government roads are bound to receive the stimulation which such a movement carries with it. They are in a position to meet large demands for public service, although they are still short of urgently required equipment. That is in process of being remedied. They are in capable hands from the administrative point of view, and there is a reasonable prospect that by cutting out a considerable parallel mileage in the west economies in operating cost may be brought about. On the other hand, there is great pressure upon the government to build new branches and to extend existing lines into parts of the country where

land has been taken up by settlers. That pressure can only be relieved by favorable action. Some considerable work in standardization has also to be done.

The people of Canada are aware of the burden which rests upon their shoulders to the extent of announced deficits, and they have been candidly told that this burden will be swollen by very considerable charges which have not yet been calculated. There are no signs, in the press or on public platforms, that they are either alarmed or fretful. On the contrary, the attitude of the public mind expresses resignation. They understand that a great task has been assigned to the men who are operating the government system; but D. B. Hanna, the president and chief executive head, appears to command general confidence. There is a feeling that the best is being made of a situation which will not lose any of its grave aspects by the raising of an uproar. They are willing to give the management a free hand and to await results. But they would be surprised if, while they are waiting, a visitor from the United States should ask them why they had swung so pronouncedly over to the side of state ownership. They would tell him at once that the matter had never been considered on its merits; that what had been done had grown out of their position as endorsers of railways bonds. And that would be the whole truth.

### Practically No Additions to Mileage

Coming back to the railway field as a whole, it may be said that wholly trivial additions have been made to mileage during the past two years. F. P. Gutelius, of the Delaware & Hudson, said the other day before a Canadian tribunal that any railway which was built under present conditions would not be able to earn fixed charges. That is probably true. We have just seen that many roads which were constructed in the years when prices were low are unable to earn any return on investment. Worse than that, a high percentage of them cannot pay their way at all. This situation as to earning power no doubt has had something to do with the practical stoppage of railway building in Canada; but the controlling reason is to be found in the fact that our transportation needs, apart from new districts in the west, have probably been met. While our railway mileage expanded by 130 per cent within two decades our population grew by but 70 per cent. Out of that grew our railway problem and the scheme of nationalization to which somewhat extended reference has been made.

Canadian railways are slowly picking up on lost time in the matter of equipment. During the war period they could do very little in that respect. They actually stood still for four years. Now they have to pay terrifying prices, both at home and abroad. But every road in North America knows all about that.

The labor situation is satisfactory in the sense that there are no strikes on nor are any threatened. We have never had serious trouble with the unions on this side of the line. The unions themselves are represented by rather superior men, conservative and considerate in their attitude, and nothing has ever happened to arouse bitterness. At the same time, the railways of Canada feel acutely the pinch of labor conditions. Whatever advances are made in the United States are invariably demanded and conceded on this side.

The whole situation might be summed up within the words "anxious waiting." All the conditions are at the moment more or less adverse. Traffic has not increased since 1918; in fact, it has rather decreased in volume. On the other hand, rates have been advanced to a point which is supposed to take care of the increased cost of operation; but the story of shrunken net earnings is plainly told in the railway accounts. Meanwhile, it is doubtful if the people of North America clearly realize that they are getting transportation service at a lower ton-mile cost than that borne by the people of any other country under the sun.

# The Problem of Rates on the Canadian Railways\*

## Delicate Question to So Adjust Them As to Be Fair to Government and Privately Owned Railways

By E. W. Beatty  
President, Canadian Pacific

THE YEAR 1921 is apt to be of great significance in the railway progress of Canada. It will be a year of test and it will be incumbent upon all the companies to reduce costs by economy and efficiency in order that rates may be reduced as speedily as possible. Canadian transportation companies cannot expect the Canadian people to continue paying high rates if by any act of the railway companies expenses can be reduced sufficiently to permit of these rates being lowered.

Under the present conditions of operation the rates are none too high—in fact, would prove inadequate if the volume of traffic even slightly diminished. The period, however, is one of readjustment and the tendency towards lower costs will undoubtedly become more marked during the coming year. These conditions must be taken full advantage of in order that rates may be adjusted to a more normal basis. That this will be done goes without saying as there is not a transportation officer living who would not prefer the prosperity of his enterprise to be accomplished on a moderate scale of rates and a heavy and free movement of traffic rather than in any other way.

### A Unique Situation

Canada is blessed or handicapped, according to your point of view, with a very expensive railway mileage, a mileage somewhat out of proportion to its population and the transportation necessities of the country at the time a great deal of it was constructed. That improvident construction has brought about an evolution in administration which has been considered inevitable. It has brought a condition which is unique and has no parallel in any other country in the world so far as I know. It means the ownership of the principal systems by the government and the Canadian Pacific respectively and the extens of their respective systems are almost equal.

The situation, which is unique, is that of a private enterprise competing with a government owned enterprise, both, however, subject to regulations by an independent tribunal, the Railway Commission. The existence of this condition naturally creates a situation which imposes upon the government an obligation to exercise an almost judicial attitude towards its chief transportation competitor, while at the same time pressing by all legitimate means the interests of the National Railways against that competitor. It is not necessary for me to elaborate the fact that such an attitude is as difficult as the position is delicate, and to exercise even-handed justice in such circumstances requires an intimate appreciation of national necessities and of the national consequences of a policy which involves unfair discrimination.

The appreciation of service rendered, when it is properly rendered, is the greatest possible protection to a corporation, and if the government's position is difficult by reason of its large direct interest in one enterprise, still the government reflects in its policies the sentiment of the people as a whole, and the sentiment of the people is in a vast majority of cases towards fair competition. But I have another reason for suggesting that the situation gives not the slightest ground for alarm, and that is the acceptance by the government of an existing condition not altogether of their making and a deter-

mination, as expressed through their responsible Ministers, that fair and equal competition will be indulged in.

### Real Problem Is That of Rates

Two theories have been advanced as to the national attitude or the attitude of Parliament towards the question of railway rates. One is that the rates should be such as would enable the National Railways to become self-supporting both as to operating expenses and fixed charges almost immediately. The other is that the rates should not have been increased but that the resultant deficits should have been borne out of the national treasury and the treasury of the Canadian Pacific Railway respectively. Both are equally unsound and as usual the correct course is to be found somewhere between the two extremes. It would be quite improper that you and I and all individuals and companies should be taxed more than they otherwise would be taxed so as to enable shippers of freight to have their produce transported at rates which are less than reasonable. It would be equally improper that the whole burden of maintaining National Railways should immediately be placed upon those who utilize the properties because in the position of that company with its numerous added properties, built not for co-ordination but for competition, it should not be expected to become paying until the development of the country caught up with the extensive over-construction.

While it is, in my opinion, not desirable that governments should intervene in railway administration unless forced to do so, it has one immediate result in enabling them, and through them the people they represent, to appreciate in a fuller measure and in a greater degree the difficulties involved in railway administration, and the burden imposed by unsuccessful operation.

### A Recent Misapprehension

The recent temporary advances in freight rates and passenger rates have been, I think, somewhat seriously misapprehended in many places in Canada—a misapprehension which would be removed by a closer scrutiny of the conditions under which the operations are now being carried on and would result in a more generous attitude towards the railway companies.

One of the small beginnings which have added to the difficulty of the railway situation in the United States was this very lack of appreciation of the railway companies' needs by public tribunals up to the year 1917. The railways were not altogether free from blame in bringing this about, because initially their attitude of inelasticity in dealing with the public developed a sentiment which found reflection in the Acts of Congress relating to transportation and to the administration under those Acts of the Interstate Commerce Commission. That commission seemed, in former years, to regard it as its paramount duty to permit the railways to suffer if by so doing the interest of the public was temporarily advantaged. Obviously this was an incorrect view, the duty of any commission so established being to protect the interest both of the companies and the proprietors of them and the public, rather than that their influence should be directed in favor of either one or the other of the parties in any controversy affecting the railway and the public.

## The Present Railway Condition in Mexico

### Capital Needed for Rehabilitation of Motive Power and Cars and Expansion of Facilities

By W. M. Whitenton

Assistant Chief Operating Officer, Missouri, Kansas & Texas

THE WRITER recently returned from a two weeks' trip covering approximately 3,000 miles of railroad in the Republic of Mexico, entering through the Laredo gateway and returning through the Eagle Pass gateway, visiting the cities of Monterey, San Luis Potosi, Mexico, Guadalajara, Aguascalientes, Durango, Torreon and Monclova.

The last time previously that I was in the Republic of Mexico was in the Spring of 1908. Naturally, I was interested in the changes which have taken place since that time. My greatest surprise was in finding the roadbed of the lines over which I traveled in such a good physical condition. Most of the line from Laredo to Mexico City is laid with 85 lb. rail, in good condition, with good joints, ample ballast and ties. Considerable work has evidently been done on this track during the past five or six months, as the line, surface and drainage, is excellent. Our train jogged along at a speed of 40 to 55 miles per hour with comfort.

Between Mexico City and Guadalajara, Aguascalientes and Durango, and Durango and Torreon, there is a mixture of 75 and 85 lb. rail, all in very good condition, but the track does not show the excellent condition which prevailed so noticeably between Laredo and Mexico City, although there is no "real bad track." Some of it has good ballast, while there are stretches where there is no ballast.

The line between Torreon and Monclova is in good ordinary condition—75 lb. rail and fairly good line and surface—but it shows evidence of insufficient tie renewals. Between

Monclova and Eagle Pass the line is light 56 lb. rail which is in need of ties, and the banks are narrow. This is the poorest piece of track I saw on the entire trip.

Bridges in the Durango-Torreon district suffered a great deal from the revolution. All the wooden structures were destroyed; some of them several times. They have been rebuilt, however, but in many instances only temporarily. A good many of the steel structures were dynamited and damaged by various other means. Most of these have been replaced and repaired.

Summing up the track conditions, I would say that it will, on an average, compare favorably with much of the track in the United States, and is capable of sustaining a considerable traffic, provided it is given a reasonable maintenance allowance.

Station and shop buildings, roundhouses, and various other similar facilities, in the territories where the revolution dominated, show considerable damage; in many instances they were entirely destroyed. It will require a considerable expenditure to replace these facilities. There has been

no real progress made the past ten years in the way of additional tracks, yards, station buildings, etc.

The Aguascalientes shop, ten years ago, would have been considered a modern shop, capable of turning out 25 locomotives per month in classified repairs; the car shops capable of taking care of several hundred cars in heavy repairs. At the present time they are working approximately 2,200 men in both the locomotive and car departments, averaging about 20 locomotives per month and repairing several

THE TRACK conditions compare favorably with much of the track in the United States.

The greatest need is for equipment and rolling stock, the roads having suffered a loss of about 10,000 freight cars and 400 locomotives during the revolutionary period. A considerable amount of passenger traffic is being handled in box cars.

The present railroad administration is up-to-date.

Friendly feeling expressed toward our country.

hundred cars, which is a fairly good output for the plant.

The greatest need of the railways of Mexico is equipment and rolling stock. The lines suffered a loss of about 10,000 freight cars and about 400 locomotives during the revolutionary period. They now have about 350 locomotives awaiting shop, and have a shop capacity of about 75 locomotives per month provided they could get material with which to carry on the work. Labor is plentiful.

There are many hundred remnants of destroyed freight cars. These have all been gathered and assembled at certain convenient points and will be repaired as funds can be provided for this class of work. The passenger equipment is in rather deplorable condition, due to lack of repairs during the past ten years, and a large amount of the passenger traffic is being handled in box cars.

One rather unusual thing is the fact that passenger fares in Mexico have not been changed for more than 25 years; however, it is the opinion that the rates will be increased about the first of January. Freight rates, like ours, have increased the past ten years, and they are on a fairly remunerative basis.

Labor organizations in Mexico are well founded. All of the different crafts and classes are organized and have their general chairmen and committees the same as we have them in the United States. Train service employees receive good remuneration. Station and yard employees are also on a good basis. The shop crafts and track laborers, however, have not been so well taken care of, but are on a fair living wage considering conditions and surroundings.

The present railroad administration is up-to-date and composed of practical men. The director general is a man of about 22 years' experience, having been trained in the early days under the leadership of American railroad men, and for the past few years he has been superintendent and general superintendent of part of the National Lines. He appears to be a man well versed in railroad operation. His

National Lines system. One of these is a yardmaster by the name of Clark, at Durango, and another is R. E. Comfort, terminal superintendent at Vera Cruz.

As I view the situation the crying need of the Mexican railways is capital for the rehabilitation of the rolling stock and motive power and the expansion of facilities in order to take care of what must necessarily follow a stable government—an increased volume of traffic.

I found a most friendly feeling expressed everywhere for the United States and for the Americans. Peace and quiet prevailed everywhere during the entire trip and the only evidence of revolution to be seen were the scars which have been left behind. I am of the opinion that the present government is the strongest that has been in power since the abdication of the old Diaz regime and with proper support I am confident it will be friendly to the United States and that the railroads of this country can well afford to assist the railroads of Mexico in getting on their feet and in opening their transportation and traffic gateways.

## Car Loading Decreases

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight during the week of December 23 was less than for any week in 1920 except one week during the switchmen's strike last April, according to the weekly report of the Car Service Division of the American Railway Association. The total was 639,275, as compared with 684,784 in 1919 and 549,975 in 1918. The heavy reduction as compared with the week before was due to the Christmas holiday but this is also the second week in which the loading has fallen below the total for the corresponding week of 1919. For the week of December 18 the loading was 796,858 cars. The summary of the report follows:

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

official staff, in most instances, are apparently capable men, all of them having come up through the ranks. The employees are made up entirely of Mexicans, there being only two or three Americans in railroad service on the entire

The number of surplus cars continues to increase. For the week of December 23 the total was 127,723, while there were scattering shortages, particularly in the coal fields, of 9,056 cars.

Great Eastern Continental Express

## English Railway Developments During 1920

Freight and Passenger Rates Increased—The Minister of Transport Outlines the Future Policy

By Robert E. Thayer  
European Editor of the *Railway Age*

LONDON, England, December 10, 1920.

THE YEAR 1920 will stand as the second year of a period of the greatest moment in English railway history. It may logically be compared to the year 1919 for American railways. It has been a period of study and investigation looking forward to a future railway policy which bids fair to upset and wholly revolutionize all English railway traditions. It has been a "Ministry of Transport" year rather than a "railway" year. By that is meant that practically all of the developments that have occurred during the year have emanated from the Ministry of Transport rather than from the railways. This demarcation between the Ministry of Transport and the railways is made advisedly, for, unlike the United States Railroad Administration, the Ministry of Transport has held itself aloof from the direct control of railway operation. It has confined its activities more particularly to a study of the broader phases of the subject and the initiation of general policies while the railway managements have operated the roads.

The development during 1920 may be summed up briefly as follows: The Ministry of Transport has been busy formulating a plan for the future of the railways; it has increased

both passenger and freight rates; it has inaugurated a system of statistical reports which are published regularly in four-weekly periods; and it has appointed committees to investigate

electrification problems, standardization, automatic train control, complete revision of the rate structure, railway agreements made during the period of government control, etc. According to opinions of a large number of people, it has been making a strong endeavor to establish the Ministry of Transport as a permanent institution in the English government. On the other hand the railways have been carrying on, improving and reconstructing their plant as best they might to bring it back to pre-war conditions. There has been no real development along the lines of capital expenditures because of the uncertainty of the future, the railways naturally holding all new developments in abeyance until a definite railway policy is evolved by the government.

The year has shown an improvement in general railway conditions in the matter of permanent way, rolling stock and improved freight and passenger carrying capacity, for which the railways themselves are primarily responsible. Sir Eric Geddes, minister of

THE ENGLISH railways have handled more freight and passengers during 1920 than ever before.

The Ministry of Transport has outlined proposals for the future control of the railways which must shortly receive consideration in Parliament. It includes a grouping of the roads, employee representation on the boards, rate fixing machinery, and other provisions which tend toward nationalization, although during the past year the nation rejected railway nationalization.

transport, recently said in Parliament that in spite of the depleted resources and various dislocations due to the war, vastly greater freight and passenger traffic has been carried than ever before in the history of the English railways. There was considerable congestion in freight traffic at the beginning of the year, but this has greatly improved, until now the congestion is not bad enough to warrant wholesale criticism in the press, as at the beginning of the year.

### Discussion of Future Problems

By far the most interesting development during the year has been the discussion of the future railway policy to be adopted by the government. The Ministry of Transport published not long ago a brief report outlining proposals as to the future organization of transport undertakings in Great Britain. This has been taken as defining the policy the government is to follow in its presentation of a final transport bill to the English Parliament within the next few weeks. The proposal is: to group the roads; to provide for each group a board of management, in which the representatives of labor shall participate; to prescribe rates with a provision for government participation of profits above a certain net return on those rates; to provide a method of handling all rate questions; to provide a method of handling wages and working conditions, and to increase further the powers of the state in relation to the railways.

*Grouping*—It is proposed to group the railways into seven distinct groups. The method suggested in this instance is geographic rather than economic, there being a Southern, Western, Northwestern, Eastern, Northeastern, London, and Scottish group. It is proposed that all the railways included in each of these sections of the country shall be amalgamated under one group management. Since this report has been issued there has been a severe criticism of the geographic arrangement. It would entirely eliminate all competition except possibly along the boundaries of the groups. By placing all the Scottish railways in one group it is claimed they would be bankrupt under the rates and labor conditions prevailing at this time. With wages standardized, the wage bill of the Scottish railways has been increased in much greater proportion to the increase in revenue to be derived from the increase in freight and passenger rates than the English roads. The Scottish railways claim that they could not live under such conditions. Furthermore, the public, particularly the shippers, is not ready to eliminate competition entirely.

Substitute proposals have, therefore, been brought forward from various sources based upon economic considerations, and which serve to retain a competition which it is quite agreed must exist if railway transportation is to progress. In these counter proposals a north and south grouping has been suggested, amalgamating certain of the Scottish lines with certain of the English lines so that there would at least be two competitive groups running from the south of England to the north of Scotland.

*Management*—The Ministry's proposals outline a board of management for each of the above-mentioned groups, to consist of 21 members, of which the shareholders should be in the majority and the rest divided, one-third being administrative officers of the group, and two-thirds representatives of the workmen. The railway stockholders have evinced much opposition to this proposal, claiming that employee representation on management councils is one thing, but on a directors' board entirely different. This point will be strongly contested when the final bill is presented to Parliament.

*Finance*—The Ministry's proposal in regard to finances is that rates and fares shall be fixed at such a level as, with sufficient and economical management, will, in the opinion of a prescribed authority, enable railway companies to earn a net revenue substantially equivalent, on some pre-war basis, to the combined net revenue of all the companies absorbed

in the group. Further, it is stated that in case the pre-war return of the railways in the new groups is exceeded the state should participate in such surplus revenues, which should be used for the purpose of assisting the backward districts in developing their transportation system, to developing small railways, and for other appropriate purposes in connection with transportation.

*Rate Fixing Machinery*—It is generally admitted that the basis on which the existing railway rates and charges are fixed is quite unsatisfactory and that it does not meet present conditions. The Ministry is now reviewing the situation and plans are in progress for bringing the whole rate question up-to-date. In the contemplated legislation the Ministry proposes to establish a body similar to the present Rates Advisory Committee, to consider all rate questions. The Ministry does not propose to include any guaranteed financial assistance to the railways in the future but proposes to regulate the railways' income through this rate-making body. In case the railways should not accept any decision of the rate-making body, it is proposed to grant them the right of appeal to a judicial tribunal.

*Wages and Working Conditions*.—In this preliminary report the Ministry states that it is the intention to continue the arrangement now in effect for dealing with railway wages and conditions, namely, that two boards shall be established, the Central Wages Board, consisting of equal numbers of managers and men, and the National Wages Board, consisting of four managers, four representatives of the men and four representatives from the users of the railways, with an impartial chairman. The latter board is to act as a board of last resort. In the case of a request for an advance in wages of the railwaymen during May of the past year, the National Wages Board was called into action and served its purpose admirably.

*Powers of the State*.—The Ministry outlined certain state powers which should be included in the final railway bill which may be classified as follows:

- (a) The protection of the public.
- (b) The economical working of the railway systems of the country.
- (c) Safeguarding national interests.

Under the first heading the state would be given power to require adequate service and facilities and minor extensions wherever it was deemed necessary. However, the group affected by such demands would be given the right of appeal to a prescribed tribunal in case such demands would seriously interfere with its finances. Likewise it is planned to give the state, under the same right of appeal, power to require alterations, improvements, and additions necessary for public safety.

Under the second heading it is planned to give the state the power to impose standards, granting the right of appeal to the companies. The state also would have the right to require co-operative operation, common use of rolling stock and facilities, pooling of traffic and receipts where competition caused waste, and the common use of repair and manufacturing facilities. Furthermore, it is claimed under this heading that the government should have the full power to prescribe the form of accounts and to require compilation of such statistics and returns as are deemed necessary.

### Criticism of the Ministry's Plans

Under the third item, the railways would be required to submit for approval to the government their proposals involving capital expenditures and their plans for raising the capital required, with further power to require adequate reserves for depreciation and renewals before dividends are declared. This also would be subject to a right of appeal by the railway companies.

The above outline of what the Ministry proposes the gov-

ernment should do was published during the summer. Needless to say it has been given the closest and most careful consideration, not only by the railways, but by the industrial interests. The railways, through the Railway Companies' Association, have but just published their criticism of the proposed plans. An abstract giving the general trend of this criticism, which is addressed to the Minister of Transport, is given below:

The railways feel that if the government is to insist upon grouping the railways the principal considerations should be the securing of financial equilibrium within each group. The plan outlined by the Ministry they believe will not achieve this object and they submit an alternative scheme of five groups in contrast to the Ministry's seven groups. The railway companies approve of the Western, Southern and the London groups, as defined by the Ministry, but suggest dividing the Scottish group so that the Caledonian, Glasgow & South Western and the Highland would be included in the government's proposed North-Western group, and that the North British (Scotland) and the Great North of Scotland should be included in a single group with the Ministry's Eastern and North Eastern groups. This gives two competitive groups from London to the North of Scotland. The companies believe that economy will result from a suitable scheme of grouping but not to the extent contemplated by the Ministry. They believe the amalgamation of capital in these groups should be optional and not compulsory; that the "worked lines" should be acquired by the working companies or the groups of companies either on a perpetual lease or by purchase, and that there necessarily would have to be a rearrangement as to joint lines now operated by railroads which would come in the different groups.

The railways will strenuously oppose any suggestion that "workers elected by the workers" shall be appointed to the boards, believing that it is wrong in principle, that it would greatly disrupt discipline and furthermore that it is entirely wrong for the government to insist on any such plan which would interfere with the right of the shareholders to choose their own directors while it, the government, refuses to accept any financial responsibility. The railways quite agree, however, that advantage is to be obtained by some association of the workers with consideration of operating problems, but these should be in the nature of committees to meet under the chairmanship of a director to consider and make recommendations to the board.

In commenting on the Ministry's proposals under the head of finance and rate fixing machinery, the railways call attention to the ambiguity of the government's proposal of fixing rates and fares so that the net revenue substantially equivalent to some prewar basis is to be earned, stating that if the rate of return on capital is not to exceed the prewar rate it would be impossible, on any reasonable terms, to procure additional capital, but if it is proposed to consider net revenue on railway investments in the same relation to other industrial investments as in prewar days it would be a different matter. The railways dispute the ground upon which the state could claim participation in any surplus revenue earned by the railways and protest further that the state is not justified in claiming participation in surplus profits when it will accept no responsibility in respect to loss of revenue due to circumstances over which the railways have no control.

Furthermore, as the railways believe that any bill the Ministry may choose to place before the Parliament cannot become a law at the earliest until June or July, 1921, and that so many serious problems will arise as a result of it, they advocate that grouping should not be compulsory before the beginning of the year 1924. In the meantime the railways propose that the government should continue the present financial agreement and guarantee to the railways the 1913 net receipts. As regards rates the railways strongly object to the Minister of Transport having the right to refuse an advance in rates, and claim that the object in view can be secured if the Minister is to have the right to appear before the "rate-fixing tribunal" proposed by the government, for the purpose of challenging the careful and economical management of the railways seeking the increase in rates.

As regards wages and working conditions, the railways

oppose the Minister's proposal to continue the Central Wages Board and the National Wages Board with the powers they now hold, as it takes from the railways the power of dealing with their own men and for setting up their own machinery for settling disputes. It would also tend to establish as a permanent arrangement the standardization of wages and conditions of service without taking into consideration the different conditions that apply to different parts of the country, which in the opinion of the railways is wrong in principle and uneconomic in practice. In lieu of the Ministry's proposal, the railways suggest the system of Conciliation Scheme Boards which were first established in 1907.

In criticizing the Ministry's proposals regarding the powers of the state, the railways say they will oppose to the utmost any such conditions as enumerated by the Ministry. For the state to have power to require adequate service and facilities and minor extensions, the railways say, would be entirely inconsistent with the principle of private management and the responsibility for capital expenditure. For the state to impose standards is likewise incompatible with lack of responsibility for expenditure on the part of the state. Furthermore, by grouping the railways, standardization will tend automatically to take care of itself. As regards the form of accounts, the railways believe that if the government desires anything different from that already compiled for the shareholders of the railways, the cost of preparing such information should be charged to the state. Regarding state approval of capital expenditures, the railroads feel that this would take away from the boards the control of finance and they strongly object to this proposal. They agree, however, that the state should have the right to demand information regarding depreciation and renewal funds in order to assist the rate-fixing tribunal in establishing adequate rates.

### The Shippers' Viewpoint

The industrial interests also have had something to say regarding the Ministry's plans. The Association of British Chambers of Commerce and the Federation of British Industries have been the leaders in this criticism. The Association of British Chambers of Commerce has adopted and forwarded to the Minister of Transport a report drawn up by a special committee appointed by the association to consider the proposals. As an indication of how the British industries feel a brief abstract of this report is given below:

While the committee welcomed the statement that the Minister of Transport and the government are opposed to nationalization of the railways, it regards the proposals outlined by the Minister as possessing many of the defects of nationalization without the responsibilities of the state which would attach to actual nationalization. It believes that the future powers in relation to railways should be vested in a body not liable to be influenced by political considerations. It advocates replacing the functions of the Ministry of Transport by a joint railway authority on which all interests might be represented.

As regards the grouping scheme, the committee believes that it will result in increased charges for both passenger and freight owing to the entire elimination of competition in any particular district, and while it agrees to the beneficial effect of grouping, such grouping should not be allowed to result in the elimination of competition.

The committee is opposed to the joint management committee as outlined, believing that these boards should be elected by the owners of the railways in the ordinary way. The committee does not question, however, but what representatives of the workers could work to good advantage on advisory committees in regard to the efficient and economical working of the railways, such committees being subordinate to the joint management committees.

It is believed that difficulty would be encountered in raising capital if the spending of such capital came under the jurisdiction of a board not made up entirely of men directly responsible to the providers of that capital. The committee states that the railways should be left to work out their own salvation in raising capital, sufficient opportunity being given to them to earn profits which will produce a satisfactory return to the investing public, and it deprecates any scheme of government loans for the capital requirements of the companies.

By placing the development of railways under the control

of the government, as outlined above, the committee believes that it would probably lead to the use of political pressure, which purely on economic grounds would not be justified.

In commenting on the manner in which the Ministry proposes to handle wages and working conditions, the committee calls attention to the fact that economic conditions of the country must determine the wages and conditions of employment of all workmen, and any permanent machinery which may be provided must not be for the purpose of attempting to circumvent the operation of economic law. It believes that the National Wages Board as now constituted should be regarded as only a temporary expedient to meet an emergency.

As regards the future powers of the state, the committee believes that the prewar control exercised by Parliament through the Board of Trade amply protected the public and that economical working of the railway systems might well be left to the companies of the groups themselves. Likewise standardization should be considered and provided for by the groups.

### Labor Promises "Big Fight"

Labor has not been standing passively by while industry expressed its views on the Ministry's proposed joint management scheme. Within the past few weeks J. H. Thomas, the real leader of the railwaymen, made a strong statement in which a "big fight" is promised should the government not grant labor representation in railway management. Labor has, in the plans issued by the Ministry, a strong ground to stand on.

It will thus be seen that while the past year has had its interesting features, the new year will possibly far surpass it in interest and excitement. To prepare the public for the final introduction of a plan for the future organization of the railways, the Ministry of Transport has been doing a rather extended amount of propaganda work. The daily newspapers have been used to a great extent and as this article is being written a series of unsigned articles entitled "The Future of British Railways" is being published in one of the principal morning papers, the context of which leaves no question of a doubt as to its coming directly from the Ministry of Transport. Throughout the year the Ministry has not neglected many opportunities for free advertising.

The railway owners, on the other hand, have held aloof from following in its steps. The atmosphere at present is far from being pleasant and the railway owners, and also the railway managements, are not nearly so enthusiastic about the Ministry of Transport as they were when the ministry was formed 18 months ago.

### Financial Standing of the Railways

From the time the government took over the railways, five days after the beginning of the war, and up to the end of 1918, there was a profit shown to the government in receipts over expenditures after all dividend guarantees had been paid, but during that time there had been gradually accumulating a bill for deferred maintenance under the various agreements made between the government and the railways. During the past two years some attempts have been made to write this off the books. In 1919 a total of £60,000,000 was provided to meet the demands of these agreements, and for the year 1920-21 the budget called for £22,000,000 for arrears on maintenance and renewal of works and for interest on capital expenditures. This, however, does not represent the full amount that must be paid by the government to the railways, for, under the agreements, the government must turn the roads back to their owners with the same amount of material, or its equivalent in cash under present-day prices, in accordance with the inventory that was taken at the time the government first took over the roads. A committee is now working on this complicated problem, and, while no definite statement has been made, it is estimated that a large amount of money is involved.

The report recently issued by the Ministry of Transport shows how the railway budget has changed, considering a

full normal year under present conditions, in comparison with the pre-war year of 1913. This comparison is shown in Table I, and it will be noted that the expenditure has increased 236 per cent. According to these figures, the sources of revenue bear practically the same proportion to each other for both periods, but it will be noted that there is a vast difference in the proportions on the expenditure side. Labor, in 1913, represented 34.8 per cent of the total railway expenditure. For a full normal year, under present conditions, labor's proportion is 51.5 per cent, an increase

TABLE I—A COMPARISON OF THE RECEIPTS AND EXPENDITURES ON BRITISH RAILWAYS FOR A FULL NORMAL YEAR UNDER PRESENT CONDITIONS AND THE YEAR 1913

	Receipts		Under existing conditions	
	1913			
	Amount in Pounds Sterling	Percentage of total	Amount in Pounds Sterling	Percentage of total
Passengers	44,000,000	32.6	105,000,000	33.0
Parcels and freight	78,000,000	57.7	188,000,000	59.2
Other sources	13,000,000	9.7	25,000,000	7.8
Total	135,000,000	100.0	318,000,000	100.0
	Expenditure		Under existing conditions	
	1913			
	Amount in Pounds Sterling	Percentage of total	Amount in Pounds Sterling	Percentage of total
Labor	47,000,000	34.8	164,000,000	51.5
Coal stores and materials	33,000,000	24.5	92,000,000	29.0
Sundries	8,000,000	5.9	14,000,000	4.4
Total working expense	88,000,000	65.2	270,000,000	84.9
Interest on capital	47,000,000	34.8	48,000,000	15.1
Total	135,000,000	100.0	318,000,000	100.0

Note—The figures for the year 1913 are actual (approximately), but those shown as "Under Existing Conditions" are necessarily estimated. The sum total, £318,000,000, is that sum which must be obtained to avoid a loss which would fall upon the taxpayer.

of 48 per cent over its proportion in 1913. Likewise, attention should be called to the large decrease in interest on capital.

In anticipation of returning the roads to their private owners next August, when the term of the Ministry of Transport expires under the Transport Act, the Ministry has resorted to a unique arrangement in an endeavor to turn back the roads with all deficits wiped out. It so increased passenger and freight rates during the past year, as not only to cover operating expenses up to August 15, 1921, but also to absorb all previous deficits, the intention being that by that time the Rates Advisory Committee would have had sufficient time to formulate a new system of rates which would provide sufficient revenue to meet the current expenses and provide an adequate return on capital invested. The Ministry's estimates have been quite upset, due to the recent coal strike, which resulted, according to the Minister of Transport, in an estimated loss of £8,000,000, and which will have to be absorbed by the government, inasmuch as the rates are not sufficient to cover this added loss.

What the real financial condition of the roads will be when the government turns them back (if it does) it is impossible to predict at the present moment, as much will depend upon the legislation that is passed by Parliament. But what the British public thinks of the railways as an investment, and the confidence it has in the government to return them to the owners on a sound financial basis, is reflected to some extent in the present prices of railway stocks. Table II is shown comparing the high and low values of certain railway securities in 1913, with the average value of the same securities on December 6, 1920. A casual glance at this table will show that the 1920 value is more than 50 per cent under the high quotation in 1913, and, furthermore, the investing public has less confidence in the Scotch companies than in the English companies.

**Passenger and Freight Rates Increased**

During the past year there have been two increases in freight rates and one in passenger fares. The freight rates were increased, for the first time since the beginning of the war, on January 15, 1920, an average of 50 per cent being applied to existing rates on all classes of minerals and merchandise with the exception of manures, basic slag and lime for agricultural uses. This was applied to cover an estimated annual deficit of £50,000,000. This increase included also an increase in rates on parcels and freight carried by passenger train.

On further investigation it was found that the additional revenue derived from this increase of rates was not sufficient to offset the heavy deficits which were constantly increasing. On August 16, 1920, a general increase of 16 2/3 per cent on the then existing passenger fares was made which, to-

crease of passenger fares, believed that it was feasible to grant some excursion rates, regardless of the fact that passenger traveling throughout Great Britain had increased materially over 1913 at the ordinary fares. In response to the suggestion of the committee third class excursions were inaugurated over the week-ends on certain lines during the summer months, in which the round trip was made for the price of a single fare. These reduced fares were restricted to special excursion trains. More recently third-class excursion fares were granted over the Christmas holidays. These excursion fares were permitted on regular trains but were granted only on trips of 100 miles or more at round-trip fares, equivalent to one and one-third times the one-way fare. The Ministry of Transport gave as the reason for restricting these excursion fares to trips of 100 miles or more, that the shorter trips would be made anyway, and a concession was given on the longer trips in an endeavor to induce travel.

Reference was made in the preceding paragraph to the increase in passenger traffic over 1913. Figures presented by Sir Herbert Walker, general manager of the London & South Western, to the Rates Advisory Committee, showed that 1,066,000,000 passengers traveled on the controlled railways at ordinary fares in 1919, as against 818,000,000 traveling at ordinary and excursion fares in 1913; passengers traveling at workmen's fares increased from 255,000,000 in 1913, to 411,900,000 in 1919, and the number of season tickets increased during the same period from 569,310 to 901,082.

At the beginning of the year when freight congestion was very bad, an attempt was made to relieve the situation by increasing the demurrage rates. Before this increase was put into effect, the demurrage rates were the same for each day the cars were held out of service. The new rates doubled the old rates for the first two days and trebled the old rates for each subsequent day. It was expected that this would relieve the situation, but the records of the following months showed that it did not have as great an effect as desired. The following table gives an indication of the results obtained, the percentage shown being the percentage decrease in the number of cars held in demurrage as compared with December, 1919, the month before the increase in demurrage rates went into effect:

January .....	27 per cent decrease	June .....	21 per cent decrease
February .....	39 per cent decrease	July .....	26 per cent decrease
March .....	37 per cent decrease	August .....	17 per cent decrease
April .....	34 per cent decrease	September .....	24 per cent decrease
May .....	29 per cent decrease		

One reason why the railways did not benefit to a greater extent on the increased demurrage rates is because of the fact that about one-half of all the freight cars in Great Britain are not railway owned cars. Before the Transportation Act of 1919 went into effect the Minister of Transport strongly advocated the railways taking over these privately owned freight cars, but because of the great opposition raised by the industries owning them, nothing has been done as yet in this respect.

**Labor Conditions**

The labor conditions were mild in 1920 as compared to 1918. There were a few isolated strikes, barely worth mentioning, which were promptly settled. The reason for the lack of any large amount of disturbance is that railway labor was receiving the benefits of the settlement of the 1919 strike, and the machinery in the form of wage committees set up as a result of the 1919 strike.

In two particular cases there were grave threatenings of disorder. One was in the early summer when the men presented their demand for a blanket increase of £1 a week, and again in October, when a sympathetic strike was threatened to assist the miners in obtaining their demands. In the first case the trouble was overcome by a thorough investi-

TABLE II—COMPARISON OF HIGH AND LOW VALUE OF RAILWAY STOCKS IN 1913 WITH THE AVERAGE VALUE ON DECEMBER 6, 1920, OF SOME OF THE PRINCIPAL BRITISH RAILWAYS

	1913	1920	Percentage decrease*
Caledonian—

Preferred .....	60¾ — 56¾	33	45
North British .....	32¾ — 26¾	12	63.5
North Eastern .....	124 — 116½	78½	37

\* The 1920 value is compared with the high value in 1913. Note: The average decline in all of the above is 5¼ per cent, and for the three Scottish companies alone is 56.9 per cent.

gether with a 50 per cent increase in passenger fares applied on January 1, 1917, brought the total increase up to 75 per cent of the pre-war rates. On September 1, last, another increase in freight rates was made, bringing the total increase in freight rates up to approximately 100 per cent of pre-war rates. As has been stated, these increases were made, not only to cover current expenses, but to wipe out any deficit that might apply on August 15, 1921, when the term of the present Ministry of Transport will terminate.

These increases in both freight rates and passenger fares are intended only as a makeshift, and the Rates Advisory Committee, which was appointed by the Ministry of Transport, has since been making a thorough investigation of the entire rate problem for the purpose of establishing an absolutely new rate structure. The existing rates in effect on the British railways represent a gradual development from a rate basis established years ago, and it has been thought advisable to go over the whole matter with the idea of removing all anomalies and establishing an absolutely new set of rates to meet the present changed conditions in the commercial life of the country. The Rates Advisory Committee has been holding hearings, calling as witnesses representatives from both the railway and commercial interests. Its report will probably be made during 1921, at a time before the roads are returned to their owners.

The present passenger fares vary anywhere from 5.4 cents to 6.45 cents per mile for first-class passengers, and from 3.11 cents to 3.58 cents for third-class passengers, the transition from pence to cents being based on 1d equals 2 cents. Statistics are not available to show the average revenue received per ton-mile for the latest increase in freight rates.

The Rates Advisory Committee, in its report on the in-

gation of the railwaymen's claims by the National Wages Board, which is made up of 13 members, four of which represent the railways, four the railwaymen, four the users of the railways, and an independent chairman. In the second case the sympathetic strike was headed off by the good judgment of the union leaders, although for a time it appeared that the extremists had control. Had not a settlement been reached with the miners at the time it was, there undoubtedly would have been a railway strike.

The railwaymen at the beginning of the year succeeded in getting the wages in the different grades standardized throughout the country. As an indication of how the standard rates are applied, the following figures, showing the standard rates in shillings per week of freight handlers, or "goods porters," as they are called, are given:

Location	Pre-War Rates	Jan. 1920 Rates	Minimum Rates
London .....	20s. to 24s.	61s.	47s.
Other large towns.....	20s. to 26s.	60s.	46s.
Small towns .....	20s.	57s.	40s.

Note.—The January, 1920, rates give the weekly wages of these men at that time with the stipulated increased cost of living adjustment. The minimum rates show the limit to which the weekly wage of these men can fall regardless of the cost of living.

It may be said in passing that this standardization in wages has presented a serious problem for the Scottish railways, where traffic is very much smaller than on the strictly English roads.

The hearings before the National Wages Board on the demand of the railwaymen for the blanket increase of £1 per week applied to all members of the union with the exception of the shopmen, whose claims were handled in the Industrial Court. This new demand was not based on the cost of living, and was considered by the railwaymen wholly apart from settlement of their wages as a result of the September, 1919, strike. Their claim for the £1 a week increase was based on a comparison with wages paid in other industries. The hearing lasted for a little less than a month, in May and June. The award granted varied from four to seven shillings on the part of the enginemmen in contrast to the twenty shillings, or £1, demanded, and from 2½ shillings to 7½ shillings for the railway workers of other grades. The smallness of the award as compared to the demand, speaks well for the work of the National Wages Board.

During the past year there has been an interesting development of the "eight-hour day." It seems that the railwaymen have been seeking to fill in their spare time outside of their prescribed eight hours' work on the railway by seeking outside jobs. The matter came to such a pass that C. T.

some of them were filling in their spare time as musicians, painters, etc.

Mr. Cramp says: "It will be apparent that this union (National Union of Railwaymen) did not fight for and obtain the eight-hour day for railwaymen in order that they should find spare time employment and so prevent other men from obtaining a living."

J. H. Thomas, member of Parliament and secretary of the National Union of Railwaymen, in a talk before the International Transport Federation, recently convened in London, predicts a "big fight" in the next few months over a new stand that the railwaymen are going to make. He said: "We have fought for hours and wages, and we have succeeded in reducing our hours and increasing our wages, but we still believe that the workers' part in life ought not to be that of hewers of wood and drawers of water. We believe that we can contribute something to efficient railway management." Mr. Thomas referred to the bill which will shortly be put forward in Parliament on the future railway policy. He gives warning that the railwaymen will fight hard for participation in any board formed for the control of the railways in the final scheme adopted. In this he has received encouragement from the Minister of Transport through a published outline of what the government believes is a solution of the railway problem, in which it is stated that:

The Board of Management should, in the opinion of the government, be composed of representatives—

- of the shareholders, who should form a majority on the board, and of whom a proportion should hold large trading interests;
- of employees, of whom one-third might be leading administrative officials of the group, to be co-opted by the rest of the board, and two-thirds members elected from and by the workers on the railway.

With encouragement of this sort coming from the Minister of Transport, there is not much likelihood of the railwaymen allowing such an opportunity to pass without a fight, irrespective of how unpalatable such an arrangement might be to the real owners of the railways.

### Statistics

One of the first things the Minister of Transport did after assuming office was to set to work towards establishing a uniform method for the compilation of statistics for the various roads throughout the country. The first of these was published in February, containing statistical information for the four weeks ending February 1. These all applied to

TABLE III—FREIGHT STATISTICS PUBLISHED BY THE MINISTRY IN FOUR-WEEKLY PERIODS

	Ending Feb. 1, 1920	Ending Feb. 29, 1920	Ending March 28, 1920	Ending April 25, 1920	Ending May 23, 1920	Ending June 20, 1920	Ending July 18, 1920	Ending Aug. 15, 1920	Ending Sept. 12, 1920
Net ton miles—revenue freight (millions).....	1,487	1,511	1,546	1,391	1,523	1,430	1,507	1,348	1,439
Average length of haul (miles).....	56.60	56.99	58.04	57.98	58.03	58.30	58.60	58.56	58.31
Gross freight train receipts per ton-mile (pence).....	1,286	1,618	1,653	1,715	1.57	1,657	1,581	1,706	1,848
Gross freight train receipts (less cost of collection and delivery) (pence).....	1,164	1,485	1,529	1,576	1,441	1,517	1,441	1,553	1,709
Average train load (tons).....	134	134,800	135,94	132,69	135,66	132,84	134,56	130,33	134,32
Net ton-miles per engine hour.....	410.02	412.37	423.54	423.78	437.09	438.69	445.47	429.89	436.82
Percentage loaded car miles.....	71.38	71.09	70.89	70.85	70.52	70.38	69.77	69.11	70.47
Average freight car load (tons).....	5.51	5.46	5.48	5.44	5.50	5.40	5.47	5.41	5.38
Cars per train.....	34.03	34.58	35	34.48	35.01	34.95	35.23	34.91	35.48
Average time per day cars in transit (hours).....	1.45	1.51	1.49	1.28	1.39	1.28	1.34	1.22	1.36

Note—A "ton" is equal to 2,240 lb. A "pence" is equal to approximately 2 cents.

Cramp, president of the National Union of Railwaymen, found it necessary to address a letter to the members of the union calling attention to the fact that the Agricultural Laborers' Union and the British Gardeners' Association had filed complaints with the N. U. R. to the effect that the railwaymen, after finishing their railway duties, were encroaching upon their fields of activities with detrimental effect to the men in those lines of occupation. Nor were the railwaymen restricting their field to agricultural employment;

freight. Beginning with the first of July a modified table of passenger statistics was included in the report.

These statistics do not include any information regarding the expenses of the railways. They deal primarily with the amount of freight handled under various classified items used in the rate schedule; classified information on engine hours and engine miles; average length of haul; receipts classified under the principal commodities and per ton-mile; average train load, train hours, train miles, and train miles per train

and engine hour; average car load; car miles loaded and empty; car miles per engine hour; car miles per car; average time cars are in transit, switching, etc., and the number of cars per train.

The publication of these statistics has been an absolutely new departure in British railway history and their presentation has not been attended with any great amount of enthusiasm on the part of the railways themselves, which claim that the clerical effort involved to produce them has added about £1,000,000 to railway expenditure. Some of the more important statistics included in these reports are shown in Table III by the four-weekly periods. It will be noted that for the four weeks ending September 12, during which period the last freight rate increase was put into effect, the receipts

TABLE IV—PASSENGER STATISTICS FOR JULY AND AUGUST

	Number Passenger journeys		Receipts			
			Gross (pounds)		Per pass. journey (pence)	
	August	July	August	July	August	July
1st Class..	2,899,747	3,604,047	803,406	936,229	66.49	62.35
2d Class..	585,409	613,395	95,791	96,318	39.27	37.69
3d Class..	143,959,629	148,222,034	9,225,814	9,181,901	15.38	14.87
Total ..	147,444,785	152,439,476	10,125,011	10,214,448	16.48	16.08

per ton-mile showed some increase. There has been a gradual increase in the net tons per engine hour, but as regards the other important items, but little improvement has been shown.

Table IV contains passenger statistics for the months of July and August, which are those that have thus far been made public.

### Conclusions

Within the next few months it is anticipated that English railway problems will be at least defined by law if not completely settled. The past year has been a year of probation; the nation has rejected nationalization as such but the government seems to have chosen a policy with nationalistic tendencies. If the proposals submitted by the Minister of Transport are approved by Parliament, Great Britain will have added to its official family another department which will materially add to the overhead of government administration. The disposition of the English public at the present time is very much opposed to any additional government expenditure, and with this disposition so readily expressed as it has been recently, both in Parliament and out, it is extremely difficult to predict just what the nature of the final outcome will be.

## Section 10 of Clayton Law Effective

WASHINGTON, D. C.

SECTION 10 of the Clayton act, which became a law on October 15, 1914, but which has been rendered inoperative because of various extensions of the effective date, went into effect on January 1 because President Wilson vetoed a bill passed by Congress to amend Section 501 of the transportation act by extending the effective date of Section 10 of the Clayton act for another year.

A substitute for Section 10 of the Clayton act designed to accomplish the same purpose but in a workable way, drafted by Alfred P. Thorn, general counsel of the Association of Railway Executives, has been introduced in Congress by Senator Frelinghuysen and Representative Esch, and it has been planned to hold hearings on the bill. The action of the President in vetoing the extension will probably hasten action on the substitute. Section 10 provides that carriers shall not have dealings in securities, supplies or other articles of commerce or make contracts for construction and maintenance to the amount of more than \$50,000 in the

aggregate in any one year, with another corporation, firm, partnership or association when the common carrier shall have upon its board of directors or as its president, manager or as its purchasing or selling officer or agent in the particular transaction, any person who is at the same time a director, manager or selling officer of, or who has any substantial interest in, such other corporation, firm, partnership or association, unless such dealings shall be with the bidder whose bid is the most favorable, to be ascertained by competitive bidding under regulations to be prescribed by rule or otherwise by the Interstate Commerce Commission. The Interstate Commerce Commission has prescribed regulations in accordance with the law, which have been suspended from time to time, but which went into effect when the law was made effective by the President's veto of the amendment to Section 501 of Transportation Act.

The Interstate Commerce Commission had submitted a report to the President by which the majority of the members of the Commission approved the extension but four members did not.

The President in his veto message pointed out that the Clayton anti-trust act was responsive to recommendations which he had made to Congress and that one of his recommendations in particular was reflected in Section 10. Continuing, the President said in part:

"The act became law on October 15, 1914, and it was provided that Section 10 should not become effective until two years after that date, in order that the carriers and others affected might be able to adjust their affairs so that no inconvenience or confusion might result from the enforcement of its provisions. Further extensions of time, amounting in all to more than four years and two months have since been made. These were in part due to the intervention of federal control, but 10 months have now elapsed since the resumption of private operation. In all, over six years have elapsed since this enactment was put upon the statute book, so that all interests concerned have had long and ample notice of the obligations it imposes.

"The Interstate Commerce Commission has adopted rules responsive to the requirements of Section 10. In deferring the effective date of Section 10, the Congress has excepted corporations organized after January 12, 1918, and as to such corporations the commission's rules are now in effect. Therefore, it appears that the necessary preliminary steps have long since been taken to put Section 10 into effect, and the practical question now to be decided is whether the partial application of those rules shall be continued until January 1, 1922, or whether their application shall now become general, thus bringing under them all common carriers engaged in commerce, and at last giving full effect to this important feature of the act of October 15, 1914.

"The grounds upon which further extension of time is asked, in addition to the six years and more that have already elapsed, have been stated as follows:

That the carrying into effect of the existing provisions of Section 10 will result in needless expenditures on the part of carriers in many instances; that some of its provisions are unworkable, and that the changed status of the carriers and the enactment of the transportation act require a revision of Section 10 in order to make it consistent with provisions of the transportation act.

"When it is considered that the Congress is now in session and can readily adopt suitable amendments if they shall be found to be necessary, such reasons for further delay appear to me to be inadequate. The soundness of the principle embodied in Section 10 appears to be generally admitted. The wholesome effects which its application was intended to produce should no longer be withheld from the public and from the common carriers immediately concerned, for whose protection it was particularly designed."

Repairing a Railroad in Northern France

## Present Condition of the French Railways

Huge Deficits Have Accrued and Labor Troubles, Including the 8-Hour Day, Have Greatly Retarded Reconstruction

By M. Peschaud

Secretary, Paris-Orleans, Paris, France

**T**HE PRESENT MILEAGE of the French railways is in round numbers about 26,500 miles. This is divided into seven systems, five of which, the Paris-Orleans, the Paris, Lyons & Mediterranean, the Nord, the Est and the Midi, are operated by private companies under state concessions which expire between 1950 and 1960, at which time these railways, under the terms of the concessions, will revert back to the state. The other two systems are known as the State system, founded in 1878 and extended in 1908 by the purchase of the Ouest railway which has a mileage of about 6,000 miles, and, since the end of the war, the Alsace-Lorraine system which is also worked by the State.

The war put a severe strain on the French railways which I have tried to define in my work "Les Chemins de Fer Pendant et Depuis la Guerre" (Railways During and Since the War).<sup>\*</sup> At the outbreak of the war the financial position of the railways was not bad. The privately operated companies had on an average a surplus while the state operated roads had a large deficit. From both a physical and moral standpoint

the railways were in a satisfactory condition, but the war has accentuated more than ever before the principal defects in the French railway system. The roads all converge on

Paris, they are not properly equipped to handle cross country traffic and are too independent, physically of one another. However, it is to be said that the war found the railways in a good state of repair and with a well trained working force in which the "esprit de corps," was excellent and, as history has proved, they were a powerful aid to the country in winning the war.

### Effect of the War on Finances

The war necessarily has had a very bad effect on the financial position of the French railroads. The operating expenses increased in a much larger proportion than the receipts. The operating expenses in 1919 were 461,902,000 fr. (\$92,500,000),<sup>†</sup> or 225 per cent greater than in 1913.

This increase was due partly to the increased expenditures for wages but chiefly to the increased cost of coal. This

**T**HE TOTAL DEFICIT for all the French railways for 1920 will be about \$900,000,000, the operating ratio during the year being in the neighborhood of 125 per cent.

The total number of employees has increased from 355,900 in January, 1914, to about 500,000; the amount of money paid out in wages meanwhile has increased 327 per cent.

The greater part of the railways destroyed in northern France have been reconstructed and are now in operation.

<sup>\*</sup>Published by H. Dunod, Edit. Paris

<sup>†</sup>Throughout this article francs are converted into dollars at five francs to the dollar, the normal rate of exchange.

item alone increased ten times because of the high price of foreign coal, which is used in much greater quantities than French coal. During this same period the receipts, in spite of the 25 per cent increase in rates made at the beginning of 1918 and extended in 1920 to 70 and 80 per cent for passenger and to 140 per cent for freight, increased only 89 per cent, or 302,000,000 fr. (\$60,400,000). The operating ratio increased from an average of 57 per cent in 1913 to 103 per cent in 1919. At the same time the burdens of company capital and loans increased. Taken together it is not to be wondered that the financial situation is deplorable.

The three principal privately operated lines—the Paris, Lyons & Mediterranean, the Est and the Nord—had surpluses in 1913 amounting to 8,000,000 fr. (\$1,600,000), 7,308,000 fr. (\$1,460,000) and 7,000,000 fr. (\$1,400,000) respectively, but since 1914 each of these roads has had a deficit and the deficits of the other railroads have increased. The total deficit for all of the railroads was 2,500,000,000 fr. (\$500,000,000) at the end of the last financial year and it is anticipated that the deficit for the present year will almost approach that sum, making a total deficit of 4,500,000,000 fr. (\$900,000,000). For the year 1920 it is anticipated that the operating ratio will be about 125 per cent.

In order to pay the shareholders of the railways the minimum guaranteed dividends, the Est, the Paris-Orleans, and the Midi have had recourse to advances from the state. The Nord and the Paris, Lyons & Mediterranean, which lost since 1915 the benefit of the state guarantee, have been authorized to borrow money in order to meet these dividends. This privilege, however, expires with the present financial year.

#### Effect of the Eight-Hour Day on Finances

To these serious effects of the war has been added the effect of the eight-hour day. This has had a disastrous influence on the financial situation of the railroads as is indicated by the tremendous increase in the deficit for 1920 and has so affected the output of the employees that it is no exaggeration to say that it has been crushing.

The law establishing the eight-hour day was made effective April 23, 1919, and the railroads were forced to put it into application immediately. This reform came at a time when the railroads had hardly recovered from the shortage in men caused by the war and when they were trying to develop their resources to cope with the continually increasing traffic. It was necessary to increase the number of employees out of all proportion to the actual work to be done. Compared with 1914, there was an increase in the number of employees varying from 25 to 32 per cent for station employees, from 30 to 37 per cent for trainmen, and the increase exceeded 40 per cent for engineers and firemen. The total number of employees was increased from 355,900 on January 1, 1914, to 391,400 in 1919, and, at present time there are about 500,000 employees. Naturally a large number of inexperienced men had to be employed. The wages paid to about 355,000 employees in 1913 was 766,800,000 fr. (\$153,360,000) as compared to 3,276,000,000 fr. (\$655,200,000) paid to about 500,000 employees in 1920, or an increase in wages of 327 per cent for an increase in working force of about 41 per cent.

The output of the workmen has considerably diminished in spite of the increase in the number of men employed. On one of the railroads where the number of locomotive engineers had been increased by 40 per cent because of the eight-hour day, the daily average run has fallen from about 67 miles in 1913, to about 40 miles at the beginning of 1920. Likewise in the shops the hourly output, on account of the application of the eight-hour day and the suppression of piece work, fell to 50 per cent below what it was before in spite of the increase in the number of men employed.

This loss has been partly compensated for by the suppres-

sion of certain privileges and by the introduction of new methods of working which are beginning to have their effect. In brief, the eight-hour day has been responsible for a reduction in the number of available freight cars and has considerably retarded the return of the transportation system to its normal state. It has resulted in the increase in the number of losses, delays and damages, and has upset all the plans taken to put the equipment back into good condition.

#### Condition of Equipment

Since the war the French railways have suffered more from the lack of experienced help than from the lack of the physical plant. The real transportation crisis has been caused by an insufficient number of available locomotives and the delay in repairing them, together with a lack of experienced engineers and firemen. Before the war the number of locomotives out of service for repairs was about 9.8 per cent of the total number. This increased to 20.5 per cent on August 1, 1919, and reached 22.4 per cent on January 1, 1920.

The increase in the number of freight cars out of service for repairs was even greater. Before the war the percentage of bad orders was 3.7 per cent and this item increased to 15.7 per cent on August 1, 1919, and to 18.6 per cent on January 1, 1920. At the present time it requires about double the number of men to keep the same number of locomotives in working order as it did in 1914, and as the number of large engines has materially increased since that time a greater amount of labor per engine is now required. For a given number of workmen the number of repaired units has considerably decreased.

In an endeavor to overcome these conditions the railways are seeking to re-establish the premium or piece work system and are anxious to improve the equipment of the shops by means of labor saving machines. Plans have also been started towards a certain amount of standardization. Four companies, the State, the Midi, the Paris-Orleans, and the Paris, Lyons & Mediterranean, to which was added later the Alsace Lorraine Railroad, formed at the beginning of 1919, an organization called "L'Office Central d'Etudes du Materiel de Chemins de Fer" for this purpose. This organization is divided into four departments, one in charge of tests, one for locomotive design, a third for car design, and the fourth to handle railway electrification.

This committee has already drawn up plans for certain types of standard locomotives. It has made a study of standard designs for freight cars of special types, such as tank cars, steel cars, etc., and has made tests of refrigerator cars for the transportation of fish. After a very thorough investigation of railway electrification this committee has recommended the adoption of 1,500 volts d. c. as a standard.

To improve the car supply the railways offer premiums to the shippers for the prompt release of the cars; they have initiated a sort of priority scheme, and have restricted the passenger service, all of which has notably improved the situation. Freight car repairs have been contracted out to private companies, which has had the effect of bringing the freight car supply almost back to normal. The locomotive situation, however, will not be brought back to its normal basis for another year.

The companies have also established a car service bureau to better control the distribution of cars.

#### Present and Future Developments

Since the war the railways in the north of France have done a large amount of reconstruction work in the devastated territory. It was necessary to rebuild a large part of the lines on the Nord and Est railways which had been destroyed. At present, in less than 20 months, 1,353 miles out of the

1,467 miles destroyed have been placed in operation and the transportation system in the devastated area is practically back to normal. This in itself is quite remarkable when the difficulties above enumerated are considered.

The problem of railway electrification has also become a question of great importance. A law was passed in 1919 regulating the use of hydraulic power and in this act various sites for the development of hydro-electric plants were conceded to the Paris-Orleans. Since that time a law has been passed for the development of hydro-electric plants on the Rhone river. Plans have been laid for the electrification of nearly 6,000 miles of line, distributed as follows: Paris-Orleans 3,250 miles, the Midi 2,125 miles, and the Paris, Lyons & Mediterranean, 1,525 miles. It is anticipated that this electrification program will entail an expenditure of several billion francs and will effect a saving of 1,500,000 tons of coal a year in addition to improving the traffic density along the lines affected.

During the year there have been developments in the use of fuel oil called "Mazout" for firing locomotives. The Nord, the Paris, Lyons & Mediterranean, the Est, and the Paris-Orleans, have formed, together with the principal shipping companies and several large manufacturers, a company called "Les Consommateurs de Petrole," in order to ensure a sufficient supply of this oil.

### Labor Problems

Since the war the railways have endeavored to improve labor conditions by entering into new agreements with the workmen, the provisions of which have a double object:

1. Utilizing the brains and experience of the working staff by giving them every opportunity for putting before their superiors any proposals they may have for improving the service.

2. Safeguarding their interests by guarantees for promotion, increases in salary, strict observance of discipline, with the opportunity for the men to see that the regulations regarding these matters are properly carried out.

For this purpose the workmen elect delegates to three committees. One committee represents the men at local points, the second committee confers with the general manager and a third committee confers with the presidents of the roads. The presidential committee consists of 24 members, 7 from the transportation department, 7 representing the mechanical department, 7 representatives from the engineering department, and 3 representatives from other departments.

The general manager's committee confers with the general manager every three months and the presidential committee confers with the president every six months. These committees will also sit on any inquiry board which is called to give its opinion on questions of discipline. Labor also has representation on committees formed to consider employees' pensions and for the inspection of the co-operative stores. The workmen are thus able to participate in a very practical way in the management of the railways.

Wages have also been standardized so that all employees of the larger railways belonging to the same class of service will be paid alike. Likewise length of service and yearly bonuses have been established.

During the past year there have been two strikes which have put to test the agreements outlined above. The first strike occurred in February but only lasted four days. The second occurred during the month of May and was of a serious character. This lasted 28 days.

The May strike was a revolutionary movement for which elaborate provisions had been made and which was supported by foreign agencies. It was the outcome of a campaign that had been carried on for many years in the Railwaymen's Federation, which at that time included more than half of the railway workmen. This strike was met by a resolute government, a large number of faithful workmen and

by the strong arm of public opinion. In combating the strike the railways reduced the services, put into effect the 10-hour day and employed 9,470 volunteers which were drawn from large schools, colleges, former employees and "Unions Civiques" which were spontaneously formed by the citizens of France.

Despite the strong fight put up against the strike it had a serious effect on the railways and the life of the community for which the agitators are entirely responsible. It has been estimated that the loss suffered by the railways on account of the strike amounted to 140,000,000 fr. (\$28,000,000), and it required from two to five months to recover from the effects of it. However, this strike, so serious in results, showed what public opinion can do when it is supported by a good organization. The strike failed—at its height it involved 40 per cent of the working forces of four railways and 60 per cent of the engineers and firemen—because it met with the hostility of all classes of society.

There is now a much better feeling among the workmen. They are taking a new interest in their work for they are now paid in proportion to the present cost of living, they are guaranteed by the arrangements outlined above a certain amount of participation in the management of their lines, they are sure of finding new privileges on account of this representation, and they will participate by yearly bonuses in the financial results of the railways. The Railwaymen's Federation which started the strike has retired disorganized and it now includes scarcely one-fifth of the entire railway working force.

The French railroads have almost completely regained their physical and moral equilibrium, the transport crisis has been almost overcome, and peace reigns amongst the working forces. The new statute which the companies have drawn up with the government and which Parliament is now discussing will soon open the way to a new future and will put the railways in a position to take an important part in the work of economic reconstruction. After helping to win the war the French railway companies are getting ready to help the country to win the peace.

# Short Line Association Increases Activities

## Experiences Under Federal Control Forced These Roads to Develop a Strong Organization

THE SHORT LINE railroads of the country have been well represented in connection with the principal developments of the year which affected the railroads generally by the American Short Line Railroad Association, which has greatly expanded its activities. Since its last annual meeting 83 railroads have been added to the list of members, so that the total number at the date of a recent report was 440 and new applications are coming in every week.

The short line railroads were given an increased solidarity and the scope of the work of the association was greatly enlarged by the experiences of these roads during federal control. The results of those experiences led the association to take an active part in the work of framing the Transportation Act so as to safeguard their interests upon the return of the railroads to private management and it was found that the short lines, representing local interests, possessed a remarkably strong influence upon members of Congress. The officers of the association have also been remarkably successful in impressing all concerned with the equity and justice of their claims and as a result of their assiduous efforts many provisions of the act were written with a view to their interests.

The trunk line railroads have also been led to accord a greater recognition to the interests of the short lines than ever before. President Bird M. Robinson of the short line association has been made an active member of the standing committee of the Association of Railway Executives and representatives of the short line association are accorded membership on special committees with whose activities they are concerned.

Getting a law passed is sometimes less important than getting it interpreted and applied in the way to accomplish the results intended and the officers of the short line association have found it necessary to keep very busy in this direction throughout the year.

The expansion of the association's organization to handle the increase in its work was authorized at the annual meeting in April and has proceeded as rapidly as circumstances would permit. A law department, a traffic department and a labor department have now been organized and plans for a purchasing department and an equipment trust corporation are under way. The association is also doing a very large amount of ordinary detail work from day to day before the Interstate Commerce Commission, the Railroad Administration and other government departments.

The particular sections of the Transportation Act of interest to the short lines were those authorizing the Interstate Commerce Commission to fix divisions of through rates, because the short lines generally have never been able to effect satisfactory agreements on this subject with their trunk line connections and those providing for a reimbursement of their losses during the period of federal control. Many of the short lines also expected to be able to take advantage of the opportunity to procure loans from the \$300,000,000 revolving fund, but as the law has been interpreted the fund has been of little practical use to them because of the requirements as to security. The question of readjustment of divisions is naturally one that will take time to work out to insure justice to all concerned.

The short lines have been particularly disappointed by the interpretation placed on Section 204 of the act, which was supposed to have been drawn in such a way as to provide for the reimbursement of short lines that were relinquished

from federal control for losses as compared with their income during the test period, but which the Interstate Commerce Commission has interpreted to apply only to roads which sustained an actual deficit for the period during which they operated their own property after the relinquishment. The short lines have also had the same experience as the trunk lines in having payments certified by the Interstate Commerce Commission under this section and under the guaranty section, 209, held up by the Treasury.

Another of the problems of the short lines arose from the increase in the per diem rate after March 1 from 60 cents to 90 cents, and the discontinuance by some roads of the two day free-time allowance, which seriously affected some of the short lines that did not accept the government guaranty. With the co-operation of the Association of Railway Executives the short line association secured a decision from the Interstate Commerce Commission authorizing the continuance of the former rate and free-time allowance for the guaranty period.

The executive board of the American Short Line Railroad Association recently reported the following as a list of the subjects which have been settled or are receiving the assiduous attention of the organization.

1. Settlement of the per diem question.
2. Establishing of the right of short-line railroads to participate in the rate increase in case Ex Parte 74.
3. Defense of short-line railroads before the United States Labor Board.
4. Participation in cases now pending which involve the application of the rule of divisions.
5. Preparation and prosecution of individual applications for the establishment of through routes in accordance with provisions of the Transportation Act of 1920.
6. The preparation and prosecution of individual applications for increased divisions in accordance with the Transportation Act of 1920.
7. Assistance to individual short-line railroads in the matter of valuation now being conducted by the Bureau of Valuation of the Interstate Commerce Commission.
8. Creation of a plan through which short-line railroads may procure loans from the government with which to purchase equipment.
9. Advice and assistance to individual roads in effecting settlements with the director general.
10. Plan for effecting agreements with trunk line railroads for increased divisions through the creation of regional committees in the three classification territories.

Under the head of work to be done the board listed the following:

1. Amend the Transportation Act of 1920 at the coming session of Congress in the following particulars:
  - (a) Broaden terms of Section 210 so the short-line railroads may borrow from revolving fund, which, in most cases, is now impossible.
  - (b) Amend Section 204 so that short-line roads whose earning power was reduced in the guarantee period as compared with the test period may be reimbursed.
  - (c) Amend Section 209 so all roads may procure funds due them under government guarantee without having to wait for the final check of federal auditors, as now required.
2. Maintain close and watchful contact with the Interstate Commerce Commission in the formation of plans for the consolidation of all railroads; and represent short-line rail-

roads before the commission in the adoption of any such plans and the putting of same into execution.

3. Prepare and present to Congress legislation which will assure speedy and fair settlement of claims of short-line railroads against the director general.

4. Oppose legislation which proposes to make changes in the Transportation Act of 1920 which are inimical to the interests of short-line railroads.

5. Protect and further the interests of short-line railroads by pressing for a readjustment of all divisions of freight rates so that each road shall receive a fair return; that is to say, its fair proportion of the revenue produced by the general rate structure.

6. Protect the interests of short-line railroads in the final valuation the commission is required to make as the basis for a fair return to each railroad.

7. Defend the interests of short-line railroads in the further adjustment of railway mail pay.

8. Defend the interests of short-line railroads in the matter of taxation both as to the interpretation of laws now in effect and proposed changes in such laws.

The labor department of the association is under the direction of James Berlingett, assistant to the president, at Chicago, but Mr. Berlingett has recently been given a leave of absence on account of ill health and F. C. Reilly, traffic manager for the western district, is temporarily in charge. This office has given particular attention to the representation of the short lines before the Railroad Labor Board.

The traffic department is under the direction of L. S. Cass, vice-president, and includes three traffic managers, Mr. Reilly for the western district and R. A. Belding for the Official Classification Territory and J. A. Streyer for Southern Classification Territory, with office at Washington; also a tariff bureau at Washington under the direction of I. T. Hanson, assistant to the vice-president. The traffic department will render assistance in negotiations for increased divisions. The legal department is represented by Ben B. Cain, general counsel, and S. S. Ashbaugh, special counsel, at Washington.

The association has organized the Consolidated Railway Equipment Corporation under the laws of Delaware to finance the purchase of new equipment, with the assistance of a government loan, under a plan which is to be announced shortly.

## Norfolk & Western Labor Dispute

HEARINGS in the controversy between the Norfolk & Western and its conductors and trainmen were opened before the Railroad Labor Board at Chicago on January 3. The case was assigned to Bureau No. 3 of the Board, consisting of W. L. Park, chairman, H. T. Hunt, A. O. Wharton, Horace Baker and J. J. Forrester.

It will be recalled that differences between the Norfolk & Western and its trainmen and conductors first arose early in 1919, when they failed to agree on requests for certain changes in the organization's contracts with the road. Because of the unsettled conditions prevailing at that time, the demands were not considered immediately. However, later in the year negotiations were started between the employees and the carrier, ending in November when it was seen that agreement was impossible. It was decided then to submit the matter to the Board, but meanwhile both the trainmen and conductors had taken strike votes. This led the Board to request the executive officers of the conductors' and trainmen's organizations to appear before the Board to show whether or not they had violated the law in ordering this vote. An executive session of the Board was held on December 16 at which this testimony was taken; however, no formal action was subsequently taken by the Board other

than to issue a warning to carriers and brotherhoods, and the case properly came before it on January 3.

When the requests and contentions of the two organizations were assembled it was found that in several instances these requests could be conveniently considered together; accordingly the first point of difference taken up by the Board was that of changing the home terminal from Columbus, Ohio, to Portsmouth. This move was opposed by the employees, represented by Val Fitzpatrick, vice-president of the Brotherhood of Railroad Trainmen, and W. C. Turner, vice-president of the Order of Railway Conductors, on the ground that it would result in loss to the employees who had purchased homes in Columbus and little material benefit to the company. The carriers represented by W. J. Jenks, general manager, and Charles P. Neill, both of whom contended that the change was merely a "paper change" made to reduce the payment of terminal overtime.

The next point of difference considered by the Board was the request of the organizations for a local freight rate for mine run service. The employee's representatives contended that this service should be paid local freight rates for the reason that the men engaged in it cannot make mileage and are required to do switching service between terminals and are not accorded the same treatment in this respect as are the employees of other railroads in the same territory. The representatives of the carrier contended that the employees' request was simply a request for a rate higher than that established by the Board's Decision No. 2.

The next point taken up by the Board was that of the rates of pay for branch line service on the Norfolk & Western. The controversy between the carrier and its employees was based entirely on the manner in which certain wage rulings of the Railroad Administration had been applied and the testimony presented to the Board dealt entirely with the technical aspects of this application.

The preceding three points of difference were common to both of the organizations involved and were therefore considered together. The remaining points of difference taken up at the first day's session were between the Brotherhood of Railroad Trainmen and the carrier and included the employees' request that the rate for "baggage handling express" be incorporated in the trainmen's schedule, a disagreement over the revision of the "called and not used" rule to conform to Supplement 25 to General Order No. 27, and the employees, request for a new discipline rule. The carriers' contention in the first case was that inasmuch as there are no employees handling baggage on their line, the incorporation of the rule in their schedule with the trainmen is needless. In the discussion of the second case, it became evident that the differences between the railroad and its employees revolved about a minor technicality and this led Chairman Park to state that "it seems to illustrate to me, as one member of the Board, the advisability of carriers and employees getting together before they have these formal hearings and perhaps throw out of the window a lot of this, or agree to many things, and certainly agree to a joint statement of facts and to get down to things that you just absolutely cannot agree to." In the discussion following it developed that the representatives of the carrier and its employees agreed on the principles of the controversy, leaving only minor technical points to be adjusted. Practically the same conditions prevailed in discussing the establishment of a new discipline rule, it being found that the differences between the men and the carrier were of a minor character and could easily be adjusted by conference.

A real point of difference between the carrier and its yard employees, however, was indicated early in the Board's opening session when L. C. Going, attorney for the Association of Colored Railway Trainmen, requested permission of the Board to be heard.

## Statistical Section

Railway Revenues and Expenses for the Year 1920

# Railway Revenues and Expenses in the Year 1920

Smallest Net Operating Income in Any Year Since the I. C. C.  
Made Its First Report in 1888

By Julius H. Parmelee

FOR THE THIRD TIME in succession the man who attempts an annual review of railway statistics finds his task difficult. The year 1918 saw federal control inaugurated, with many fundamental though temporary changes in accounting and statistics; saw in May the first general increase in railway wages ever granted; saw in June a marked increase in freight and passenger rates; was face to face throughout with a kaleidoscopic series of changes in rates, wages, prices, and operating conditions that made a statistical review of the year most difficult. Toward the close of the year there was a decided slump in traffic, which continued well into 1919.

The year 1919 not only inherited this disturbing condition from 1918, but added a number of changes on its own account. Wages and prices pursued an almost steadily rising trend, while two things had a marked effect on operations toward the close of the year, namely, the coal strike of November-December, and the near approach of the termination of federal control. The exact date of the return of the railways to their owners was not known until the last of December, yet for months before the end of the year it was regarded as certain that the date of return would not be much later than the first of January, as announced in the President's message to Congress.

The year 1920 opened, therefore, with but one certainty in the railway situation, which was the definite knowledge inherited from 1919 that on March first federal control would terminate. Virtually every other factor in the situation spelled uncertainty a year ago—what the future of the railways would be, what legislation would be enacted, how the wage and labor situation would evolve, what traffic would be offered and at what rates the railways would handle it. Finally, there was the vital question whether railway managements would find it possible to set their houses speedily in order and prove to the American public that its verdict against a continuation of government control of transportation was wise. The year 1920, as the railways looked out upon it twelve months ago, was fraught with potent possibilities and dangers.

Today, one year later, the period has clearly stamped itself as the most important single year of any in American railway history, not only because the railways have returned to their owners under a new public policy of regulation, but also because that policy, with its endless ramifications, will profoundly affect future railway history to the end of time. The Transportation Act became effective with the return of the railways on March first; then came the six-month period

**T**HE STATISTICAL record of the railways of this country for the past year is one of superlatives. It includes among other things:

The greatest traffic in the history of railways.

The greatest operating revenues.

The greatest operating expenses.

The greatest wage aggregate.

The greatest taxes.

The smallest net operating income recorded in more than 30 years.

of readjustment of wages and rates, during which the government wisely continued its financial support; finally, the railway companies on September first launched out under their own power, to meet whatever calm or storm might be ahead. Add to this the operating crisis through which the railways passed as a result of the April strikes, and their successful campaign through the summer and fall to put the crisis behind them, and the story of the year is complete in a few sentences.

This is not the place to recount the railway history of the year 1920, interesting though it is at every point. The reason for reviewing the past three years in a few brief paragraphs is merely to set up the background against which the statistical record of the year may be seen in bolder relief.

Summarized, the statistical record of 1920 is one of superlatives. It includes:

- The greatest traffic in railway history,
- The greatest operating revenues,
- The greatest operating expenses,
- The greatest wage aggregate,
- The greatest taxes, and
- The smallest net operating income in more than 50 years.

#### Traffic

Railways of the United States in the calendar year 1916 broke all records of freight traffic. The total traffic of railways of Class I in that year was 396 billion net ton-miles (including revenue and non-revenue freight). This record was shattered in 1917, with 430 billion, and again in 1918, with 440 billion. There was a recession in 1919 to 395 billion ton-miles, but the year 1920 again broke the record, with approximately 448 billion, which was 8 billions above the greatest previous record, and 13 billions greater than the average of the two war years 1917 and 1918. The fact that in four of the past five years the American railways have surpassed all their previous efforts in the handling of freight evidences their service to the American people during recent war-time and post-war periods.

The monthly freight statistics for 1920 present an interesting story. Stated in billions of ton-miles, it is as follows, November and December being partially estimated:

Months of 1920	Net ton-miles (billions)	Months of 1920	Net ton-miles (billions)
January .....	34.8	August .....	42.7
February .....	32.8	September .....	41.0
March .....	38.0	October .....	42.6
April .....	28.5	November .....	36.5
May .....	37.9	December .....	35.0
June .....	38.2		
July .....	40.4		448.4

This short table speaks eloquently of the successful effort made by the railways during the summer and fall months of 1920 to clear up traffic congestion and meet the unprecedented demands upon their facilities. Prior to 1920, the largest freight traffic recorded for any one month was 40.8 billions of ton-miles, which was in the war-time month of August, 1918. This record was surpassed, it will be noted, in the three months of August, September and October, 1920, with July only a short distance behind. Even the months of November and December, which in normal years show seasonal declines, and in 1920 might well have been affected by the decline in general business conditions, held up their average remarkably well.

As to passenger traffic, railway travel has been growing at a rapid pace, the years from 1915 to 1920 showing steadily maintained increases. In 1917, 1918 and 1919, the normal passenger traffic was augmented by heavy movements of troops. The year 1919 showed the heaviest passenger traffic on record, railways of Class I handling 46.4 billion passengers one mile in that year. This was 4 billion passenger miles greater than in 1918, 7 billions greater than in 1917, and 8 billions greater than in 1916. In spite of the record-breaking figures for 1919, the results for 1920 seem at the

present writing to have equalled the 1919 record. Returns for passenger miles are not reported or compiled so promptly as net ton-miles, but for the first nine months there was an increase of 1.4 per cent over 1919, and while the passenger traffic fell off somewhat after the increase in rates on August 26, indications are that the total for the year was as high as the total for 1919. Whatever the final results may show, it is certain that the freight and passenger traffic combined was greater in 1920 than in any previous year.

The traffic results for 1920 have been emphasized, not only because they represent a record-breaking performance, but more particularly because they prove that the efficiency developed by the railways in 1920, in the way of increased car mileage per day, increased loading per car, and the like, was attained while carrying the heaviest traffic ever handled, and with no greater plant or facilities than before the United States entered the war.

#### Revenues

Total operating revenues of Class I railways in 1920 approximated \$6,230,000,000, the greatest revenue aggregate on record. This was \$1,046,000,000 greater than the revenues of 1919, which represented the largest aggregate up to that time. The increase for 1920 was the result, of course, of the increased rates in effect part of the year and the increased traffic. At the time the new rates went into effect, on August 26, it was estimated that they would produce \$1,500,000,000 a year in revenues, but actual results for the months of September to November do not indicate that as yet such an amount is being realized. Whether it will be fully realized in 1921 will depend upon a number of factors undeterminable at the present time, such as the effect of recent orders of the Commission raising intrastate rates to the interstate level, the trend of traffic and adjustments that probably will be made in local and other specific rates.

In 1913 the revenues of all the railways for the first time surpassed five billions of dollars; in 1920 they were greater than six billions.

Of the \$6,230,000,000 of revenues for 1920, \$4,291,000,000 represented freight revenue, \$1,317,000,000 was passenger revenue, and the balance of \$622,000,000 was revenue from mail, express and miscellaneous operations. As compared with 1919, there was an increase of \$734,000,000, or 20.6 per cent, in freight revenue; an increase of \$139,000,000, or 11.8 per cent, in passenger revenue, and an increase in other revenue of \$173,000,000, or 38.5 per cent. Total revenues increased 20.2 per cent.

The picture of operating revenues by months portrays the cumulative effect of the increased rates and traffic after July.

1920. Month	Total Operating revenues Class I railways (millions)	1920. Month	Total Operating revenues Class I railways (millions)
January .....	\$501	August .....	\$555
February .....	425	September .....	616
March .....	461	October .....	642
April .....	402	November .....	575
May .....	456	December .....	575
June .....	494		
July .....	528	Total .....	\$6,230

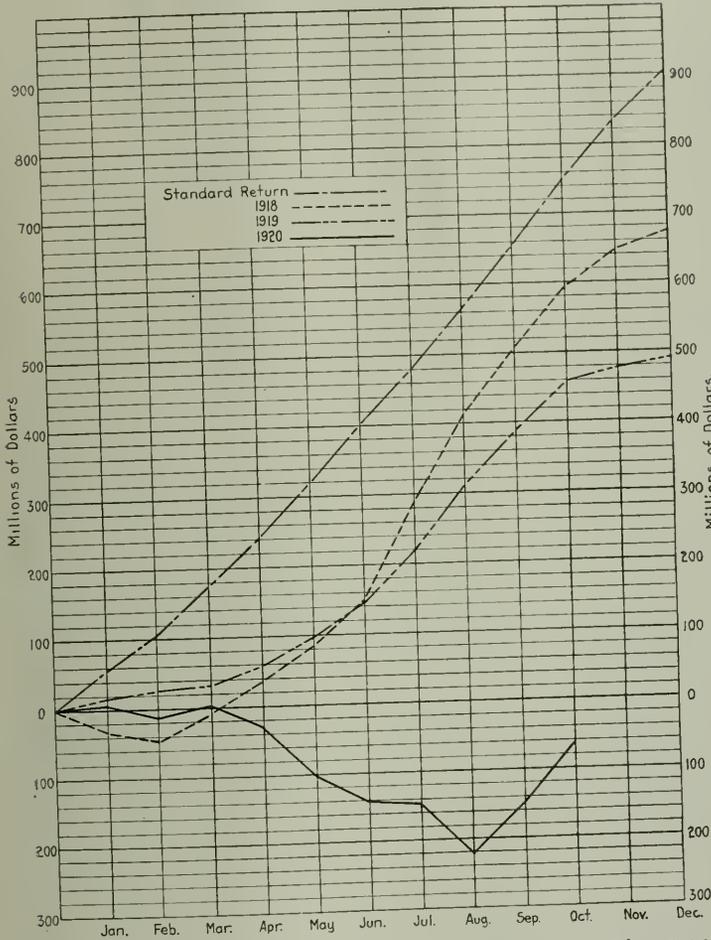

In the table November and December figures are partially estimated. The total for January was out of proportion with the months next succeeding, because it included some \$50,000,000 of back mail pay.

#### Expenses

Total operating expenses in 1920 approximated \$5,750,000,000 for Class I railways. Like the revenues, this was a record amount, being greater than in 1919 by \$1,330,000,000. Part of the increased expense of operation grew out of the increase in wages granted by the Railroad Labor Board as of May 1, which (for the eight months from May 1 to December 31) added some \$400,000,000 to the railway

payroll; part was due to the increased cost of fuel, which the Interstate Commerce Commission has reported, during the first nine months of the year, at seventy-four cents a ton more than during the same period of 1919, which would account for about \$80,000,000 of additional annual expense; part was due to the higher cost of other materials and supplies, and to the greater amounts of material and fuel utilized.

1920 Month	Total Operating expenses Class I railways (millions)	1920 Month	Total Operating expenses Class I railways (millions)
January	\$415	August	\$679
February	422	September	511
March	404	October	527
April	441	November	473
May	478	December	473
June	512	Total	\$5,750

It is important to refer to the text in studying this diagram and to note that the reported revenues and expenses for several months have been adjusted to include or exclude certain items that did or did not belong to these months.

Chart 1—Net Operating Income Calculated by Months. 1918, 1919 and 1920 Compared with Standard Return. Class I Railways

Maintenance of way expenses amounted to \$1,034,000,000, maintenance of equipment expenses \$1,573,000,000, and transportation expenses \$2,851,000,000. The increase in maintenance of way was \$256,000,000, or 32.9 per cent; maintenance of equipment increased \$340,000,000, or 27.6 per cent; transportation expense increased \$658,000,000, or 30.0 per cent. The total operating expenses increased 30.1 per cent.

The operating expenses by months were as follows, November and December being estimated:

The aggregates for May and June are smaller, while those for July and August are greater, than would have been the case had not the wage increase been made retroactive to May 1. Certain amounts of back pay chargeable to May and June were actually charged to July and August, thus throwing the totals for all four months out of line with other months of the same year and with corresponding months of preceding years.

### Wages

Statistics showing the total railway payroll in 1920 are not at hand as this is written, but it seems likely that the wages of the employees of Class I railways aggregated some \$3,260,000,000. This estimate is computed by adding to the 1919 payroll of \$2,830,000,000, two-thirds of the annual increase in wages granted by the Railroad Labor Board, the increase having been in effect during eight of the twelve months. The payroll for 1920 may have been greater than the figure indicated, because there were some minor increases in January and February for which no allowance is made, and because the eight months of the increased wage scale included the months of the year when maintenance work was heaviest. But assuming \$3,260,000,000 as approximately correct, wages in 1920 represented 56.7 per cent of total operating expenses. That is, 56.7 cents out of every dollar of expenditure went to labor. Compared with total revenues, labor in 1920 received 52.4 cents out of every dollar of revenue, compared with 45.1 cents in 1914.

The general increase in railway wages which the Labor Board put into effect on May 1, 1920, was the greatest single increase ever granted by any tribunal to any group of workers in the history of the United States, or, for that matter, in the history of the world. The amount of the increase, reduced to an annual basis, was \$617,000,000, and with collateral increases to certain small groups of employees to whom the award did not apply, made imperative as a result of raising the general level of railway wages, will prove to be no less than \$625,000,000, or about 22 per cent on the scale of wages in effect before the award was made. It is a commentary on the quick way in which the American people have accustomed themselves to think in billions that the announcement of this increase aroused hardly a ripple of pub-

fic comment. By reason of this increase, railway wages are now at the highest point ever reached, the average annual earnings per employee being greater than \$1,800.

### Taxes

Railway taxes in 1920, as reported by roads of Class I, amounted to about \$275,000,000. This does not include \$6,000,000 of war taxes not reported in the federal accounts of January and February. The taxes of \$199,000,000 reported for 1919 did not include about \$36,000,000 of war taxes. Placing the two years on a comparative basis by adding the excluded war taxes, the total for 1920 becomes \$281,000,000, compared with \$235,000,000 in 1919, an increase of \$46,000,000, or nearly 20 per cent. These taxes for 1920 represent the largest amount paid in any one year.

### Net Operating Income

We come now to the most astonishing feature of the railway income account in 1920, which is that the net operating income was the smallest for any year since the Interstate Commerce Commission made its first summary of railway revenues and expenses in 1888. For the first ten months of 1920, to November first, railways of Class I earned practically nothing over expenses, taxes, equipment and joint-facility rentals, and this in the face of the fact that the revenues in January included some \$50,000,000 of back mail pay that was earned in prior years, and that \$6,000,000 of war taxes for January and February were not deducted. This result is so astonishing that it may be well to compare the same ten-month period over the past four years:

Year	Net operating income (ten months ended October 31)	Year	Net operating income (ten months ended October 31)
1920	\$1,078,000	1918	\$605,179,000
1919	481,083,000	1917	833,543,000

The steady decline from \$833,000,000 in the first ten months of 1917 to slightly over \$1,000,000 in 1920 in great measure explains the necessity for the increased rates made effective last August.

For the year 1920 as a whole, I estimate the net operating income of railways of Class I at approximately \$150,000,000, virtually all of which was earned in November and December. Add to this the \$100,000,000 of deficit to be made up by the Railroad Administration for the operations of January and February, and the \$650,000,000 of deficit incurred during the six-month guaranty period and payable from the U. S. Treasury, and the total net receipts of the railways for the year become approximately \$900,000,000, or about the amount of their standard return. This is a return of five per cent on the valuation that may be assigned to the property of railways of Class I, on the basis of the tentative valuation made by the Commission in its rate decision, and falls \$180,000,000 short of a return of six per cent for the year.

The cumulative monthly trend of net operating income is set out in Chart I, which covers the test period, the years 1918 and 1919, and the first ten months of 1920. In this chart the reported revenues and expenses of the several months have been adjusted to include or exclude items that did or did not belong to those months. For example, the back pay charged to certain months of 1918 and 1920 has been transferred to the months to which really chargeable; the back mail pay credited to January, 1920, has been distributed over the months of 1918 and 1919; the war taxes and corporate expenses of the federal control period have been brought into the accounts, wherever they were not already charged. While the results cannot in the nature of things be exact to the last dollar, the chart does compare the monthly results of 1918 to 1920 with what may be considered the normal experience of the test period, thereby eliminating the distorted relationships that exist in some of the accounts as actually reported. The chart does not cor-

respond to the figures already given for 1920 and earlier periods, but is presented with the thought of furnishing a picture of the trend of net income since the government took charge, on a basis fairly comparable with normal conditions.

### Estimated Income Account—1920

Summarizing the revenues, expenses and taxes of Class I railways, as set out in preceding paragraphs, their estimated income account for 1920 was as follows:

	Railways of Class I, 1920
Total operating revenues	\$6,230,000,000
Total operating expenses	5,750,000,000
Net operating revenue	\$480,000,000
Taxes	275,000,000
Uncollectible revenue	1,000,000
Equipment and joint facility, rentals—Dr.	54,000,000
Net operating income	\$150,000,000

	1920	1919
Total revenues (the dollar)	100.0	100.0
Labor	52.4	54.4
Fuel for locomotives	9.0	9.0
Loss and damage	4.0	3.5
Other expenses, materials, etc.	26.9	18.6
Taxes	4.4	4.5
Equipment, etc., rentals	0.9	1.1
Net operating income	2.4	8.9
Add government guarantee	12.0	7.4
Total net receipts	14.4	16.3

Following the income account in the same way through fixed charges, rentals for leased road, other additions and deductions, we find that 5.9 cents out of every dollar of railway revenue in 1920 remained for dividends, betterments and surplus. This compares with 6.9 cents in 1919, 9.3 cents in 1918, 14.8 cents in 1917, and 18.0 cents in 1916.

The chart at the head of this article emphasizes this narrowing margin in a different way. It shows the total revenues, total expenses, and net operating income of the first ten months of 1920, compared with the same months of 1919, 1918, and the test period. The outstanding feature of the chart, of course, is the steadily rising revenues on the left and the steadily lessening net income on the right, falling so low in 1920 as to be scarcely discernible.

### Looking Forward

Turning to the future, where the chief interest lies, the picture is less depressing. The railways have set their minds on no further increases in rates, if it is humanly possible to avoid them, and are making every effort to so reduce expenses and increase operating efficiency as to raise net operating income to a six per cent basis in 1921. While it is impossible to predict the trend of earnings this coming year, yet a glance at the results the year 1920 would have shown, had the increased rates and wages been in effect the whole year, may give a line on the possibilities of the future.

Had the year 1920 been on the same wage and rate level throughout, the results would have been something like these:

	Adjusted results for 1920
Total operating revenues	\$7,300,000,000
Total operating expenses	5,950,000,000
Taxes, etc.	360,000,000
Net operating income	990,000,000
Rate of return on valuation	5.3

In summary, we are closing the book on a remarkable year, both because the whole railway industry moved forward into a new era, and because records were shattered in almost every respect. The period of experimentation with the new conditions is by no means over, and there are still many uncertainties in the year that lies ahead, chief among which is the uncertainty as to earnings adequate to sustain and improve railway credit. In spite of this uncertainty, railway managements are facing the future with hope, a spirit of co-operation, and full recognition of their duty to serve the public.

# Receiverships and Foreclosure Sales During 1920

## Denver & Rio Grande Situation Most Interesting Feature at Present Time

THE DEVELOPMENTS of the year 1920, insofar as railway receiverships and foreclosures are concerned, have not been great. The number of roads in the hands of receivers and the mileage concerned at the close of this year will be found to approximate closely the totals given in the *Railway Age's* annual review number of last year. The list of roads in the hands of receivers shows but few changes in roads as between the two years and no important ones.

There has been one road, however, which has attracted no

of the stockholders to intervene in the foreclosure proceedings. A new company has been formed to take over the operation of the road; it was incorporated in November under the name of the Denver & Rio Grande Western. The Denver & Rio Grande receivership and reorganization are of special interest from two points of view. One is in the fact that the new owners of the road are the owners of the Western Pacific, a road built by the Denver & Rio Grande as an extension to the Pacific coast, wherein we have a case of a sub-

RAILROADS IN THE HANDS OF RECEIVERS

Name of road	Mileage	Date of receivership	Bonds of old company	Stock of old company	Total old company securities

\*Sold at foreclosure October 14, 1919, and reorganized in November, 1919, under name of Gtlf, Pensacola & Northern. Sale not yet confirmed by court so property has not been turned over to new company. †Crenatio's suspended. ‡Authorized.

small amount of interest among students of railway finance during 1920. Reference is made to the Denver & Rio Grande. This road has been in the hands of receivers since January, 1918. It was sold at foreclosure on November 20, 1920, but court confirmation of the sale has been withheld pending a decision from the Court of Appeals on the right

of the stockholders to acquire possession of its parent road. The other point of interest is the proposal on the part of the owners of the Western Pacific in reorganizing the Denver & Rio Grande to eliminate the common stockholders of the property.

Construction of the Western Pacific was started in 1904

and operation was begun in July, 1911. The Denver & Rio Grande guaranteed the interest on \$50,000,000 first mortgage 5 per cent bonds of the Western Pacific and it assisted in its construction also by taking \$25,000,000 second mortgage bonds and \$26,800,000 in promissory notes and other claims. It owned \$62,500,000 of the stock of the Western Pacific.

Denver & Rio Grande is its eastern connection. This naturally is a most important factor, because the Western Pacific has not the branch lines and facilities generally to enable it to make the most of its main line from San Francisco to Salt Lake City without this connection to the east from the latter point over the Denver & Rio Grande. It is competing with carriers stronger than itself, such as the Southern Pacific, Union Pacific and Atchison, Topeka & Santa Fe, which have developed their territory by means of feeders and all of which have through lines of their own to the east. The

The Western Pacific failed to earn the interest on its first mortgage bonds. The Denver & Rio Grande was unable to make good its guarantee, with the result that in March, 1915, the Western Pacific went into the hands of receivers. It was reorganized in December of that year and one of the terms of the reorganization was that the holders of the defaulted bonds should transfer to the new company their claims against the Denver & Rio Grande. The Equitable Trust Company of New York, trustee for the bonds, with the co-operation of the new company (owning about 95 per

cent of the defaulted bonds), then pressed suit against the Denver & Rio Grande and in May, 1917, a decision was handed down by the district court in favor of the Equitable Trust Company and awarding it the sum of \$32,272,274. This verdict was later affirmed by the Court of Appeals, and with accrued interest the total was brought up to approximately \$38,000,000. The final result was the receivership of the Denver & Rio Grande on January 26, 1918.

The Western Pacific's interest in the Denver & Rio Grande is contained not only in its judgment against that property on the defaulted bonds but also in the fact that the

The story of the receivership of the Denver & Rio Grande would be in the main a recital of the developments which have taken place in this Western Pacific matter. It is now proposed to reorganize the road under Western Pacific control as the Denver & Rio Grande Western, but the last step in the reorganization cannot be told until a decision is rendered as to the plea of the Denver & Rio Grande stockholders to have a part in the reorganization. The stockholders claim that the decision in the judgment in favor of the Western Pacific was incorrect and the confirmation of the sale of the Denver & Rio Grande on November 20 is withheld pending a decision on this question.

One of Twenty Santa Fe Type Locomotives Built by the American Locomotive Company for the Boston & Maine

## Locomotive Orders Show Increase in 1920

Domestic Orders for Year Nine Times Total for Previous Year—  
Still Far Below Average Annual Purchases

THE LOCOMOTIVES ORDERED by the Class 1 railroads in 1920 reached a total of 1,668—almost eight times the number ordered for all domestic service in 1919. The orders placed by other railroads in the United States amounted to 103 and by industrial concerns to 227, making a total of 1,998 for all domestic purchases—more than nine times the similar total for 1919.

The orders by Canadian roads and industries from builders either in Canada or the United States were 189 and the orders received by American builders from foreign coun-

tries amounted to 718, making a grand total for all orders of 2,905. In 1919 the total Canadian orders were 58 and the foreign orders 898. Thus it will be seen that there was a considerable increase in orders from every source except in the export trade. Here the 1920 total is 180 less than the 1919 figure. It will be noticed that the orders for the Class I roads have been compiled separately this year. Included with them are the figures for some of the more important terminal railways.

selfes, with some help from the government to be sure, during the period of readjustment attendant upon the return of the carriers to their owners when railway costs were nearing their peak and before adequate returns had been provided by a new rate structure. In view of these facts the showing for 1920 is not entirely unsatisfactory, although it is quite evident that nothing has been done during the past year to make up for deficiencies in the annual purchases of locomotives which have been accumulating since 1912.

It was pointed out in the last statistical number of the *Railway Age* that the foreign orders for 1919 made up more than 75 per cent of all orders placed. In 1920 conditions were quite different, because foreign orders have been small. This decrease in orders from abroad is disappointing; it can be traced to the premium on the dollar which has increased generally throughout the year in most countries and which makes it possible in some cases for foreign manufacturers to underbid our own; to the fact that foreign competitors have been able to increase their production and to direct their efforts once more to their old markets; and to the generally impoverished condition of the countries which most need to replenish the inadequate stock of locomotives on their rail-

tries amounted to 718, making a grand total for all orders of 2,905. In 1919 the total Canadian orders were 58 and the foreign orders 898. Thus it will be seen that there was a considerable increase in orders from every source except in the export trade. Here the 1920 total is 180 less than the 1919 figure. It will be noticed that the orders for the Class I roads have been compiled separately this year. Included with them are the figures for some of the more important terminal railways.

In last year's review of locomotive statistics (*Railway Age*, January 2, 1920, page 125) it was pointed out that the year 1919 set the low mark for locomotive orders as far back as records have been kept. In view of this fact, the 1920 orders can not be considered excessive, as may easily be seen by reference to Table II. The totals for 1916, 1917 and 1918 all exceed the figures for 1920. The totals for 1917 are as large again as the figures shown in the present compilation. During these years greatly increasing demands on the railways together with a steady upward movement of prices which looked as if it would continue indefinitely brought about an economic condition which generally increases buying in almost every field. Then, too, during the war period it was felt that something approaching an adequate number of locomotives had to be provided regardless of cost, and under the regime of the Railroad Administration government credit was available for such purposes.

The orders this year were financed by the railroads them-

ways. One of the most noteworthy orders from foreign countries which was placed in the United States during the year was from Roumania for 50 locomotives. This order was divided equally between the Baldwin Locomotive Works and the American Locomotive Company and payment for it was made in petroleum.

The number of locomotives built in the United States for domestic service during 1920 was 1,857 and for export 1,582, making a total of 3,439. In Canada the production was 165 for domestic use and 68 for export, making a total of 233

and a grand total of all production in the United States and Canada of 3,672. This figure represents an increase of 400 over the similar total, 3,272, for 1919. The total built in the United States for domestic service in 1920 is some 200

for locomotives exported that, due to the failure of two large locomotive builders to furnish figures showing the number built for export, the editors have had to content themselves with estimating the production of these builders from other sources, which, however, are believed to be sufficiently accurate for purposes of comparison.

If the locomotive orders for the preceding year give any data by which production for the following year may be estimated, we can safely assume that the output of locomotives in 1921 should exceed measurably the production for 1920. The fact confronts us always that American roads have for several years fallen far behind in their acquisition of new motive power and that sooner or later the deficiency must be made good. If there is to be an increase in locomotive production in 1921, then, it is a matter which should meet with the approval of all—the public and the railways themselves as well as the locomotive builders.

The locomotive orders which are listed in the accompanying tables are compiled from official sources. Some few omissions of small and unimportant orders doubtless occur. The data presented herewith were supplied by the railways, the industrial concerns and the manufacturers in reply to letters which we sent asking for the information. The lists were checked with the weekly reports in the Equipment and Supplies column of the *Railway Age* and amplified where necessary.

# Increase in Passenger Car Orders Continues

Orders Given Late in 1920 Promise Upward Movement of Production During This Year

THE TOTALS FOR ORDERS of passenger cars during the past year give proof of the upward trend which was noted in the statistical report on passenger car orders last year (*Railway Age*, January 2, 1920, page 133). A total of 1,115 cars was ordered by Class I roads during the year and 666 by other railroads and private car companies in the United States, including the Pullman Company. These

1919 figure. Export orders have dropped even more sharply. Export orders for 1920 were only 38, which is a rather poor showing in comparison with the total of 143 in 1919. Passenger car building has, however, been at a minimum the world over for some years, although eventually it

TABLE I. THE PASSENGER CAR ORDERS OF 1920

For Class I Railroads.....	1,115
Other Domestic (including Pullman Co.).....	666
Total Domestic.....	1,781
For Service in Canada.....	275
For Export to other Countries.....	38
Grand Total.....	2,094

figures added together give 1,781 as a total for the year's domestic orders, a figure which compares quite favorably with the orders in 1917 and 1918—as well as 1919. It will be noted that the statistics given this year separate the orders by Class I roads from the other domestic orders. By following this plan of separation hereafter a more accurate

1916.....	1,732	70	1,802	37	37
1917.....	1,924	31	1,955	45	45
1918.....	1,480	92	1,572	1	1
1919.....	306	85	391	160	160

must increase greatly. The grand total of passenger car orders for domestic service and export in this country and in Canada was 2,094—1,312 more than the 1919 figure, an increase brought about entirely by greater orders from the roads and other buyers in the United States.

The production of passenger cars during 1920 in the

United States for domestic use was 1,272 (including cars for Pullman Company service) and for export 168. These figures show decided improvement over the similar figures, 306 and 85 respectively, for 1919. The cars built are described as: all steel, 1,240; steel underframe only, 171; wood, 21, and not specified, 8. This upward trend of production was predicted in the statistical review of the passenger car situation last year, in view of the increase in orders the latter part of 1919. Much the same situation

obtains at the beginning of 1921. Most of the larger orders for passenger equipment were placed relatively early in 1920.

The car building companies started the year with orders for domestic service on hand and undelivered amounting to 407. The traffic congestion, the difficulty of securing raw material and related conditions prevented them from getting production under way with any great degree of speed. The orders on hand at the end of November had reached a total of 925.

## Passenger Orders in 1920

## Purchases of Freight Cars Increase in 1920

Orders Placed After Return to Private Operation Make Totals Almost Four Times Those for 1919

IN THE NUMBER of freight cars ordered during 1920 there has been, as was the case with the locomotives, a remarkable improvement over the 1919 showing. The orders by Class I roads were 51,250 cars, by other domestic roads 1,044 and by private car lines and industrials 31,913—making a total of 84,207 cars ordered in the United States for domestic

TABLE I—THE FREIGHT CAR ORDERS OF 1920

For Class I railroads.....	51,250
For other American railroads.....	1,044
For private car lines and industrials.....	31,913
<b>Total domestic.....</b>	<b>84,207</b>
For service in Canada.....	12,406
For export to other countries.....	9,056
<b>Grand total.....</b>	<b>105,669</b>

service. To this figure are added the total orders of 12,406 placed by Canadian roads and industries and 9,056 ordered by foreign buyers, which brings the total orders received in this country and Canada during the year up to 105,669. In 1919 the total domestic orders were 22,062—scarcely one-

TABLE II—ORDERS FOR FREIGHT CARS SINCE 1901

Domestic orders		Freight cars	
Year	Domestic cars	Year	Freight cars
1901.....	193,439	1908.....	62,669
1902.....	195,248	1909.....	189,360
1903.....	108,936	1910.....	141,024
1904.....	136,561	1911.....	133,117
1905.....	341,315	1912.....	234,758

1907.....	151,711	1914.....	80,264
Domestic and foreign		Total	
Year	Domestic	Foreign	Total
1915.....	109,792	18,222	128,014
1916.....	170,054	35,314	205,368
1917.....	79,367	53,191	132,558
1918.....	123,770	53,547	177,317
1919.....	25,899	3,994	29,893

fourth the 1920 total. Canadian orders of 3,837 for 1919 are scarcely a third of the purchases for 1920 and the export orders of 3,994 are less than one-half the total purchases for export during 1920.

As was pointed out in the review of the locomotive orders

for this year, the showing for freight car orders is not entirely unsatisfactory in view of the uncertain conditions which prevailed throughout the greater part of the period, even the close of which brought no conclusive proof that the rate structure provided by the Interstate Commerce Commission was going to provide adequate returns to the carriers. The fact remains, however, that the acquisitions of freight cars in 1920 were far from sufficient to make up the defi-

An Abandoned Southern Line

## Railway Lines Abandoned During the Year 1920

Operation Was Discontinued on a Mileage Greatly Exceeding the Amount Built in the Same Period

FOR THE YEAR 1920, 535 miles of main line railways were abandoned for operation in the United States and about 35 miles in Canada. To this amount should be added a total of 178 miles of main line track upon which operation was discontinued or suspended during the latter part of 1919, notice of which, however, was received too late to be included in the tabulated data for that year. This mileage in addition to that abandoned for the year 1920 brings up the total miles abandoned since the last annual compilation to 713 miles, some 24 miles greater than that for 1919, but what is more to the point, some 400 miles more than was constructed during the same period. In other words, the lines abandoned exceed the new construction in the ratio of over two to one.

Of the total mileage abandoned for operation, slightly over 239 miles were given up completely, the equipment sold and the lines taken up or junked. Of the remaining approximately 474 miles, operation was discontinued either permanently or temporarily and in many instances petitions have been made to dismantle the roads. The mileage abandoned in Canada was greater than that reported for 1919; all of it was abandoned permanently and the lines were taken up during 1920. An interesting sidelight on this is that about 90 per cent of the abandoned mileage was on the Great Northern lines through British Columbia.

In contrast to previous years none of the so-called short lines of from 75 to 100 miles or more in length were abandoned completely and junked, the largest one being the Ocean Shore. This road operated two lines, one 38 miles long between San Francisco, Calif., and Tunitas, and the other 15.5 miles long between Swanton, Calif., and Santa

Cruz, all of which was dismantled. Following that in size is the Denver, Boulder & Western operating lines from Boulder, Colo., to Eldora and from Sunset, Colo., to Ward, totaling 46 miles. Actual operation ceased on this road on August 6, 1919.

Among the lines upon which operation was discontinued but which have not been dismantled and are not very likely to be are the Illinois Southern with 136 miles of line and the Kansas City Northern with 170 miles. The first-named road has been recently resold to parties as yet unknown who expect to operate it in the near future—probably in 1921. The Kansas City Northwestern discontinued operation on November 1, 1919, because of the "shortage of coal and other financial difficulties" and it is not unlikely that under better business conditions and under the new rates operation may be resumed in the future. With the exception of these two roads, which are more temporary than permanent abandonments, a comparison of the lines discontinued or dismantled between the years 1919 and 1920 brings out an important difference.

Outside of a few roads the abandonments during the year 1919 covered practically the entire mileage of the lines listed while in 1920 the tabulation shows that in general the tendency of the year has been towards the abandonment of small sections or short extensions of existing lines, in many instances parts of Class 1 roads. In other words, during 1919, and for that matter previous years, the tendency of the country has been towards the wiping out of the smaller lines which proved to have been built in unprofitable locations or under uneconomic conditions. In contrast to this, 1920 indicates a movement towards the tightening up and the weeding out of

**T**HE MILEAGE of the lines upon which operation was abandoned during 1920 greatly exceeds the number of miles of new track built.

The greater part of the mileage abandoned was in the middle and far west.

During the last four years operation has been discontinued on over 1,300 more miles of line than have been built.

Generally speaking, the mileage abandoned in 1920 covered unprofitable lines which never should have been built.

the unnecessary short sections or branches, etc., in order that operating expenses may be kept a minimum.

Another significant point may be noted if the tabulation is studied from a geographical standpoint, i. e., that the greater part of the mileage abandoned lies chiefly in the central west and west, that is, in the states bordering on or lying close to the Mississippi river, from the Gulf to the Lakes and from there west to the Pacific coast. The mileage abandoned in New England and the South Atlantic states was practically negligible—a distinct contrast to the results of 1919 when 255 miles were abandoned in the South Atlantic states and about 28 miles in New England out of a total of 689 miles, the balance of which was scattered generally throughout the country. This factor, in connection with the tendency shown by the marked decrease in the abandonments of entire roads, would seem to indicate that the railway mileage of the United States has about reached the point where future "deflation" will not be so marked or so extreme. This is borne out somewhat by the decrease in the mileage annually abandoned from 1917 to 1919 inclusive; while the figure for 1920 is slightly higher than that for 1919 the fact must not be overlooked that it includes such items as the Illinois Southern, upon which operation will undoubtedly be resumed in the future.

The year 1920 is the fourth one in which our records have shown the mileage abandoned to exceed the mileage of new lines built. Since 1917 there have been 4,032 miles abandoned as against about 2,700 miles of new construction placed in service. Thus there has been a decrease of approximately 1,332 miles in which are included about 225 miles of line abandoned temporarily in 1918 through consolidation under government control as a part of the policy of the Railroad Administration in co-ordinating parallel lines. Some of this mileage no doubt has since been placed in service. Even with that taken into account the figure is distinctive for it shows how markedly the mileage of the railways of the country has decreased, yet it cannot be taken in any sense as an indication of a surplus of mileage for the United States as a whole. It is rather, or at least it would seem to be, a realization of the uneconomic position of various short lines, branches and extensions, and if anything points toward a paving of the way for a more sound and substantial policy for future lines and extensions.

## New Construction Conspicuous by Its Absence

Low Record Established for New Mileage Built in 1920—Old Improvements Still Under Way

**T**HE MILEAGE not only of new railway lines, but of additional second and other multiple main tracks built in the United States during the year 1920, took a tremendous though not altogether unexpected slump, reaching a low mark that will in all probability stand as the low record for a long time. During 1920 only 313.71 miles of first track were completed as compared to 685.98 miles in 1919, while the total completed mileages (first, second and other multiple main tracks) for the two years were 414.35 and 1,135.68, respectively; in 1920 it was therefore less than one-half of what in 1919 was considered a very low record for either new lines or completed mileages. The most important decrease, however, or at least the one having the most bearing upon the operating efficiency of the roads was that concerned with the construction of second, third and other main track. For second track this fell from 681.55 miles in 1918 and 405.32 in 1919 to but 90.87 for 1920. Only 1.89 miles of third track were built as compared with 76.95 in 1918 and 27.54 in 1919. The decrease in the construction of other main track was equally as marked.

In Canada there was some decrease in total mileage constructed as compared to the year 1919, but a considerable increase over that for the years 1917 and 1918. During 1920, 305.39 miles of new lines and 31.60 miles of second track were built, or a total of 336.99—but very little less than the mileage of new construction in the United States. While lower than the 442.46 miles of 1919, it indicates a resumption of the policy of expansion which the Canadian roads have been following in tapping and building up new sections of the country. Canada in many ways is yet an undeveloped country and as a result

railroad construction has since 1904 followed somewhat along the lines of the development in this country from 1895 to 1907—though, of course, on a smaller scale. Since 1913 construction of new lines both in the United States and Canada has fallen off rapidly, reaching its probable bottom for Canada in 1918. While the 1920 work is below the pre-war average, it does, in connection with that of 1919, mark the resumption of construction activities in Canada.

Of the mileage of new lines built in the United States during the year no one project has been of any great size. The largest single item is that of the Government Railway of Alaska, which completed 37 additional miles—practically the only item at all corresponding to the more or less pioneer work of the old days. Next in size was the mileage completed by the Cisco & North-eastern and the Ringling, Eastern & Gulf, with 28 and 26.6 miles, respectively, the total of the two—54.60 miles—comprising practically the entire mileage of new lines for the state of Texas.

Texas, with 54.90, and California, with 54.74 miles, were the only states with any outstanding new track, comparatively speaking, which is unlike the development of the year previous; in that year sections that showed increases were found to be coal, ore and oil territories. It is therefore not unlikely that the construction of new lines in these two states was a result of the development in the southwestern oil fields, the need for which outweighed other financial considerations, such as high building costs, etc.

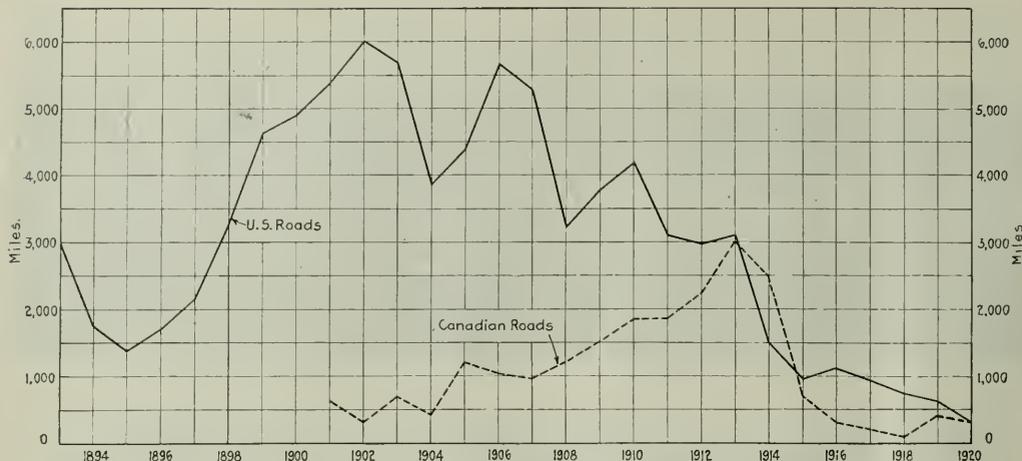

It is interesting to note, in comparing the construction of new lines in both the United States and Canada, the various items listed under "Other Important Work Under Construc-

**M**ILEAGE of new lines in the United States is less than half of that for the previous year, creating a new and exceptionally low mark.

Multiple main track construction practically ceased entirely.

Canadian roads continue to build numerous branches though mileage is still below normal.

Renewal and continuation of unfinished development programs tendency of the year. Work is concerned chiefly with small projects to increase operating capacity.

Curves of Mileage Built in the United States and Canada Since 1893

tion." Few new lines of any size are being started or are now under way, these projects being confined chiefly to short extensions or branch lines in the United States, while in Canada there are numerous branch lines underway ranging from 25 up to 135 miles in length and located chiefly in the middle and far west.

While the construction of new lines in this country has been on a gradual decline since 1901, the most marked fall has been since 1913; undoubtedly this was largely due to

control, and with an administration unwilling to authorize any new work, yet practically sure of being returned to private ownership. This in connection with the hesitation and delay in ordering material or authorizing new work during the guarantee period after the return to private ownership and financial conditions caused almost a cessation of new work. Second and other multiple track fell to a total of but 100.64 miles, of which over 60 per cent was contained in the two states of Illinois and Ohio; this was

the world war, at least up to and including 1918. From the time when the Railroad Administration policies began to be put in action, the development tended more toward intensive development rather than extensive. As a result of this, second and other multiple track were built, even though new lines were not being constructed.

With the advent of the year 1920, the roads found themselves in an uncertain condition—still under government

built chiefly in short sections by the Illinois Central and the Cleveland, Cincinnati, Chicago & St. Louis. The maximum length of any one section of double track work was 13 miles.

In general, construction work has been limited to such facilities as were absolutely needed to conduct operation. Practically no new work of any magnitude was inaugurated with perhaps a few exceptions of which the Clarendon rail

and deep water terminal of the Lehigh Valley at the Port of New York is probably the largest. Considerable work involving heavy expenditures was underway or completed during 1920, but it consisted of large projects started before government control on which progress had been curtailed and on which the work was authorized to be continued or work which was started under federal control. Typical examples of this class include such projects as the New Haven terminal program covering Boston; Cedar Hill

As to bridges, little was done outside of making needed repairs and strengthening existing structures for the use of heavier power. Under new construction such structures as the Allegheny river bridge of the Baltimore & Ohio and the Harrisburg bridge of the Philadelphia & Reading. Grade separation has likewise suffered and outside of some carried over projects practically nothing has been done. Grade reductions, passenger terminal work, etc., have also suffered in much the same manner and with the exception of the St. Paul (Minn.) station, new passenger terminal work of any magnitude has been at a standstill, though such projects as the Indianapolis (Ind.) work still under way and the Union station improvements at Chicago, now in progress must be considered in passing.

As a whole, the work underway or completed during 1920, when considered from the viewpoint of the decreased value of the dollar during that period, has been the smallest for a great number of years and its effect so far as bringing about any immediate or future operating economies has been even less. With the passing of the war and its accompanying government control, the roads have been left in a sadly depleted condition. What the year 1921 will bring in the way of actual new construction is still an open question; the outcome and the corresponding volume of work will depend upon future financial considerations all hinging largely on the results of the new rates. There is no question but that there is a great need for a widespread and extensive program of construction, and since in all probability the rates will prove ample there should, and no doubt will be, a far larger construction program inaugurated during 1921 than the country has seen for the past three or four years.

and Providence, and the Chicago freight terminal of the Chicago & Alton.

The larger part of the work has, however, been restricted to the most needed improvements which would effect temporary increases in the facilities for handling the greatly increased traffic of the year rather than any extensive work designed to bring about future operating economies. This is indicated by the number of small improvements varying from \$100,000 to \$200,000 in cost and covering such work as additions to engine houses, yards, freight house extensions, etc.

Railroad Construction in the United States in 1920

**Alton & Southern**

First Track: Madison, Ill., to Illinois Traction Crossing, 2 miles.

**Americus & Atlantic**

First Track: Flint River, Ga., to Methvins, 3 miles.

Other Important Work Under Construction: Building from Methvins, Ga., to Americus, 11 miles, railway forces doing the work.

**Arizona Eastern**

First Track: Avondale, Ariz., to Litchfield, 5 miles.

**Atchison, Topeka & Santa Fe**

First Track: Oil Junction, Cal., to Landco, 2.82 miles.

Second Track: On Western lines.—At La Junta, Colo., 1.10 miles.

Other Important Work Under Construction: On Eastern lines.—Subway extension at Emporia, Kans., cost \$200,947, completed; bridge renewal between Akron, O., and Winfield, cost \$134,454, 25 per cent completed; viaduct at Argentine, Kans., cost \$188,241, 50 per cent completed; reinforced concrete dock, at Chicago, Ill., cost \$161,189, completed. On Western lines.—Machine shop at Albuquerque, N. M., cost \$1,409,557, 30 per cent completed. On Coast Lines.—Improvements to bridge 194-A on Albuquerque division, cost \$197,954, completed. On Panhandle, Santa Fe.—Addition to roundhouse, Amarillo, Tex., cost \$138,827, 10 per cent completed.

**Atlantic Coast Line**

Other Important Work Under Construction: Building from Goodno, Fla., to Imokalee, 26 miles, company's forces doing the work; yard improvements at South Rocky Mountain, N. C., cost \$114,000, 80 per cent completed.

**Baltimore & Ohio**

Other Important Work Under Construction: Renewal of roof at west end of Fairmount Park tunnel, Philadelphia, Pa., cost \$275,000, 50 per cent completed; purchase and remodeling office building Baltimore, Md., cost \$777,000, completed; revision of Locust Point branch and reconstruction of yard in connection with construction of an industrial plant, cost \$795,000, 40 per cent completed; installation of trimmers on coal pier, Curtis Bay, Md., cost \$138,000, completed; elimination of grade crossing at Claysville, Pa., cost \$153,000, completed; reconstruction of bridge over Allegheny river, Pittsburgh, Pa., cost \$2,110,000, 80 per cent completed; installation of 80 foot turntable, Allegheny, Pa., cost \$100,000, completed; relocation of main line and reconstruction of yard in connection with enlargement of an industrial plant at Girard, Ohio, cost \$336,000, 95 per cent completed; construction of concrete arch and filling of old bridge, Painesville, Ohio, cost \$102,000, completed; enlargement of engine house, South Chicago, Ill., cost \$176,300, completed.

**Baltimore & Ohio Chicago Terminal**

Other Important Work Under Construction: Track elevation 68th street and 39th street, Chicago, cost \$2,000,000, 25 per cent completed.

**Baltimore & Ohio South Western**

Other Important Work Under Construction: Reconstruction of bridge over Big Miami river, Lawrenceburg, Ind., cost \$1,980,000, 15 per cent completed.

**Big Sandy & Kentucky River**

First Track: From near Riceville, Ky., to Sublett, 8 miles.

Other Important Work Under Construction: Building from near Sublett, Ky., to the mouth of Laurel Fork of Oakley Creek in Magoffin county, 4 miles. Contractors: Howard Brothers, Sublett, Ky.

**Boston & Albany**

Other Important Work Under Construction: Renewal of bridge at Westfield, Mass., cost \$250,000, completed; reconstruction of drawbridge at Chelsea, Mass., cost \$800,000, completed.

**California Southern**

First Track: Blvthe, Cal., to Ripley, 8 miles.

**Central New England**

Other Important Work Under Construction: Coal and water station at Hopewell Junction, N. Y., cost \$112,650, 98 per cent completed.

**Central of Georgia**

Other Important Work Under Construction: Reinforcing concrete roundhouse at Columbus, Ga., cost \$506,000, 3 per cent completed; freight station at Macon, Ga., cost \$163,000, completed.

**Central of New Jersey**

Other Important Work Under Construction: Renewal of bridge 214, East Rahway, N. J., cost \$222,000, 25 per cent completed; bridge 217, Maurer, N. J., cost \$375,000, 7 per cent completed.

**Chartiers Southern Railway**

First Track: Crucible, Pa., to Nemaacolin, 5.35 miles.

**Chesapeake & Ohio**

First Track: Man to Gillert (W. Va.) line, 7.20 miles.

Second Track: Logan to Stollings, W. Va., 1.75 miles.

Third Track: Big Sandy Junction, Ky., to Russell, 1.80 miles.

**Chicago & Alton**

Second Track: Nilwood, Ill., to Bierd, 4.37 miles.

Other Important Work Under Construction: Freight terminal, Chicago, Ill., cost \$2,600,000, 50 per cent completed.

**Chicago & North Western**

Other Important Work Under Construction: Bridge construction at Maywood, Ill., cost \$140,000, completed; steel and concrete viaduct at Orleans St., Chicago, cost \$800,000, completed; additional storage bins at

Calumet Terminal elevator, South Chicago, cost \$800,000, completed; bridge construction at Lick, Ill., cost \$130,000, 75 per cent completed; passenger station facilities at Clinton, Iowa, cost \$260,000, completed; bridge construction at Mankato, Minn., cost \$125,000, completed.

#### Chicago, Burlington & Quincy

*Second Track:* Ayres, Ill., to Durley, 5.17 miles.  
*Other Important Work Under Construction:* Elevation and realignment of main tracks, Aurora, Ill., cost \$5,000,000, 75 per cent completed; freight transfer facilities at Morton Park, Ill., cost \$238,000, completed; new engine terminal facilities, Galesburg, Ill., cost \$300,000, completed; new engine terminal at Pacific Junction, Iowa, cost \$100,000, completed; grain elevator at Murray, Mo., cost \$450,000, completed.

#### Chicago, Indianapolis & Louisville

*Other Important Work Under Construction:* Brick car repair shop, LaFayette, Ind., cost \$175,000, to be completed by March, 1921.

#### Chicago, Milwaukee & St. Paul

*Other Important Work Under Construction:* Extension to yard at Aberdeen, S. Dak., cost \$325,000, completed; new yard at Mitchell, S. Dak., cost \$175,000, completed; water supply and treating plants in South Dakota, cost \$300,000, 75 per cent completed.

#### Chicago, Rock Island & Pacific

*Other Important Work Under Construction:* Office building, Chicago, cost \$100,000, 75 per cent completed.

#### Chicago, St. Paul, Minneapolis & Omaha

*Other Important Work Under Construction:* Freight house facilities at Sioux Falls, S. Dak., cost \$111,396, 50 per cent completed.

#### Chicago Union Station

*Other Important Work Under Construction:* Station facilities, Chicago, Ill., from Roosevelt Road on the south to Canal and Kinzie street on the north, Canal street on the west to Chicago river on the east; work expected to be completed in 1923.

#### Cisco & Northeastern

*First Track:* Cisco, Tex., to Breckenridge, 28 miles.

#### Cleveland, Cincinnati, Chicago & St. Louis

*Second Track:* Lamb, Ohio, to Ansonia, 17 miles.  
*Other Important Work Under Construction:* Yard extension at Mattoon, Ill., cost \$115,000, 55 per cent completed; new freight house at Muncie, Ind., cost \$135,000, 90 per cent completed; second track and relocation work, Augusta, Ind., to Whitestown, grading and bridges, completed, cost \$1,160,000, 60 per cent completed.

#### Cornwall Railroad

*Other Important Work Under Construction:* Locomotive erecting and machine shop at Lehanon, Pa., also boiler house, cost \$140,000; 40 per cent completed.

#### Delaware & Hudson

*Other Important Work Under Construction:* New third track, Schenectady, N. Y., to Richmondville Summit, 12.50 miles, including reduction of grade on north throughville, cost \$1,000,000, 70 per cent completed.

#### Delaware, Lackawanna & Western

*Other Important Work Under Construction:* Grade crossing elimination, Sanford's Crossing, Kearney, N. J., cost \$305,000, 85 per cent completed; engine terminal improvements, Port Morris, N. J., cost \$182,000, 70 per cent completed; engine terminal improvements at Seacaucus, N. J., cost \$179,000, 60 per cent completed; new powerhouse, Hoboken, N. J., cost \$139,000, 40 per cent completed; additions to passenger station, Scranton, Pa., cost \$195,367, 30 per cent completed; elimination of grade crossing, Elmhurst, Pa., cost \$112,178, completed; renewal of bridge at mile post 293.56, Avoca, N. Y., cost \$111,817, completed.

#### Donora Southern

*Other Important Work Under Construction:* New yard and additional trackage at Donora, Pa., joint operation with the Pennsylvania Railroad, cost \$130,000, 16 per cent completed. Work held up pending action of Pennsylvania Railroad.

#### East Erie Commercial Railroad

*Other Important Work Under Construction:* Grade separation at Water street in Wesleyville, Pa., cost \$235,000, 25 per cent completed.

#### Erie Railroad

*Other Important Work Under Construction:* Renewal of draw-bridge over Passaic river, Newark, N. J., cost \$600,000, 40 per cent completed; construction of fruit market and track facilities, Newark, N. J., cost \$122,000, completed.

#### Fernwood, Columbia & Gulf

*First Track:* Kokomo, Miss., to Foxworth, 9.52 miles.

#### Florida East Coast

*Other Important Work Under Construction:* Freight house at Miami, Fla., cost \$125,000, 50 per cent completed.

#### Fort Worth & Denver City

*Second Track:* At Wichita Falls, Tex., 1 mile.

*Other Important Work Under Construction:* Freight yard at Fort Worth, Tex., cost \$140,000, 20 per cent completed.

#### Fort Worth & Rio Grande

*Other Important Work Under Construction:* New terminal, including

new yard and mechanical facilities, at Dublin, Tex., cost \$250,000, track, 75 per cent completed, mechanical facilities, 25 per cent completed.

#### Government Railroad in Alaska

*First Track:* Mile post 238 to mile post 275, 37 miles.

*Other Important Work Under Construction:* Building from mile post 275 to mile post 358, 81 miles; reconstruction of bridges and trestles between Seward, and Anchorage, cost \$252,400, completed; 1,559 lineal ft. of snow sheds between Seward, and Anchorage, cost \$195,700, completed; raising track, etc., between Seward, and mile post 238, cost \$223,500, completed.

#### Grand Prairie Branch Railroad

*First Track:* In Arkansas, not specified, 1 mile.

#### Great Northern

*Other Important Work Under Construction:* Twelve mechanical coal chutes, 10 of which are at Spokane, Wash., cost \$306,410, 90 per cent completed; additional yard tracks at Hillyard, Wash., cost \$315,185, and at Allouez, Wis., cost \$115,000, both completed; open dock at Smith's Cove, Seattle, Wash., cost \$161,000, completed; rebuilding part of ore dock No. 3 and approach to ore dock No. 1 at Allouez, Wis., cost \$1,558,000, to be completed by May, 1921; machine shop extension at Whitefish, Mont., cost \$117,720, completed; car repair sheds at Williston, N. Dak., cost \$112,300, completed, and at Grand Forks, N. Dak., cost \$103,500, completed; bridge at Como and 10th avenue, Minneapolis, Minn., cost \$160,400, 2 per cent completed; filling in two bridges in North Dakota, one to cost \$131,940, and the other \$110,200, completed; lining tunnel 'on Billings line, cost \$109,650, completed.

#### Gulf, Colorado & Santa Fe

*Other Important Work Under Construction:* Reconstruction of causeway at Galveston, Tex., work started in 1917, cost \$307,839, 83 per cent completed.

#### Hocking Valley

*Second Track:* Meredith, Ohio, to Owens, 9 miles.

*Other Important Work Under Construction:* Scioto River Channel improvement includes two additional spans to each of two bridges at Columbus, Ohio, cost \$200,000, completed.

#### Illinois Central

*Second Track:* Clinton, Ill., to Heyworth, 8.40 miles; Amboy, Ill., to Sublett, 5.60 miles; Peotone, Ill., to Tucker, 13 miles.

*Other Important Work Under Construction:* Yard extension, Freeport, Ill., cost \$137,000, completed; new passenger and freight station at Centralia, Ill., cost \$298,870, completed; new bridge at Dixon, Ill., cost \$268,210, completed.

#### Indianapolis Union Railway

*Other Important Work Under Construction:* Elevation of train shed and tracks in Indianapolis, Ind., cost \$8,000,000, 80 per cent completed.

#### Kanawah, Glen Jean & Eastern

*First Track:* Mt. Hope, W. Va., to Lee, 1.25 miles.

#### Kansas & Oklahoma

*First Track:* At Liberal, Kan., 0.50 miles.  
*Other Important Work Under Construction:* Building from Forgan, Okla., to Liberal, Kan., 25 miles, contractors: Strickland & Smedley, Forgan, Okla.

#### Kansas City Terminal

*Other Important Work Under Construction:* Holmes street viaduct, Kansas City, Mo., cost \$245,000, 56 per cent completed; Fifteenth street subway, Kansas City, Mo., cost \$447,000, 78 per cent completed; passenger station, Seventh street, Kansas City, Kan., cost \$145,000, 10 per cent completed.

#### Kentucky & Tennessee

*First Track:* In Kentucky, not specified, 1 mile.  
*Other Important Work Under Construction:* Building in Kentucky from mile post 17.5 to mile post 27, 9.50 miles.

#### Lake Erie & Eastern

*First Track:* Brier Hill (Youngstown, O.) to M. Y. Tower, 1.35 miles.  
*Second Track:* Brier Hill (Youngstown, O.) to M. Y. Tower, 1.24 miles.  
*Other Important Work Under Construction:* Raising South avenue bridge, changing streets, etc., Youngstown, O., cost \$400,000, completed.

#### Leesville, Slagle & Eastern

*First Track:* Slagle, La., to Leesville, 10.35 miles.

#### Lehigh Valley

*First Track:* In New Jersey at end of Rampton branch, 0.31 miles; from connection with main line at Bayonne, N. J., to end of branch 1.11 miles; at North Wilkes-Barre, Pa., 0.07 miles.

*Other Important Work Under Construction:* Construction of first unit of a new rail and deep water terminal, Jersey City, N. J., 25 per cent completed; new engine terminal at Ashmore, Pa., completed.

#### Live Oak Perry & Gulf

*First Track:* In Florida from mile post 65 to mile post 68½, 3.50 miles.  
*Other Important Work Under Construction:* Building in Florida from mile post 68½ to mile post 72½, 4 miles. J. C. Donohov, Jacksonville, Fla., has contract for grading, and company's force will construct bridges and lay tracks.

#### Long Fork

*First Track:* From Clear Creek, Ky., to coal mine, 4 miles.  
*Other Important Work Under Construction:* Building from Jack's Creek, Ky., to Coal Mine, 1.65 miles; contractors Blue River Elkhorn Fuel Company.

**Louisville & Nashville**

*First Track:* Hamdin, Ky., to Yellow Creek, 6.87 miles.

*Other Important Work Under Construction:* Mechanical coaling plant, Corbin, Ky., cost \$125,000, 50 per cent completed; yard and mechanical facilities, Loyal, Ky., cost \$600,000, 10 per cent completed; mechanical facilities, Hazard, Ky., cost \$480,000, 5 per cent completed.

**Manufacturers Railway**

*First Track:* At St. Louis, Mo., 0.36 miles.

*Second Track:* At St. Louis, Mo., 0.65 miles.

**Michigan Central**

*Second Track:* In Michigan from Detroit Belt Line, 0.50 miles.

*Other Important Work Under Construction:* Reconstructing bridge over River Rouge at Detroit, Mich., joint expense of Michigan Central and New York Central, cost \$500,000, 95 per cent completed; grade separation, Detroit, Mich., to River Rouge, joint expense Michigan Central, New York Central, Wabash, and Pere Marquette, cost \$1,500,000, 20 per cent completed.

**Minckler Southern**

*First Track:* Porterville Cal., to Ducor, 12.07 miles.

**Minneapolis, St. Paul & Sault Ste. Marie**

*Second Track:* At Neenah, Wis., 2.60 miles; at Waukesha, 3.10 miles; at Stevens Point, 0.40 miles.

**Minnesota Transfer**

*Other Important Work Under Construction:* Grade separation work at Minneapolis, Minn., cost \$100,000, 75 per cent completed.

**Missouri Pacific**

*Other Important Work Under Construction:* New terminal facilities at Gale, Ill., cost \$135,900, completed; raising main tracks over levees and drainage ditches, between Poplar Bluff, Mo., and Fisk, cost \$224,500, 60 per cent, completed; reconstruction and enlargement of passenger station at Little Rock, Ark., cost \$690,000, 80 per cent completed.

**Mobile & Ohio**

*Other Important Work Under Construction:* Freight house facilities at East St. Louis, Ill., cost \$150,000, 30 per cent completed.

**Neame, Carson & Southern**

*First Track:* Staples Junction, La., northwest 8.80 miles.

**Newburgh & South Shore**

*Other Important Work Under Construction:* At Cleveland, Ohio, car shop, cost \$265,000, 60 per cent completed.

**New York Central**

*Other Important Work Under Construction:* Freight office at Weehawken, N. J., cost \$200,000, 75 per cent completed; coaling pit, ash pit and sand house at Rensselaer, N. Y., cost \$365,000, 75 per cent completed; eliminating grade crossing, Brown street, Rochester, N. Y., cost \$60,000, 5 per cent completed; subway under tracks at Harbor Creek, Pa., cost \$110,000, 25 per cent completed; subway at Wesleyville, Pa., cost \$229,285, 35 per cent completed; subway at Erie, Pa., cost \$188,985, completed; viaduct and relocation of freight house at Youngstown, O., cost \$310,285, 85 per cent completed; cinder pit and yard tracks at Collinwood, O., cost \$100,000, 25 per cent completed; raising tracks and separation of grades, Elvira, O., cost \$354,595, 30 per cent completed; stock facilities and new track at Rockport, O., cost \$455,000, 70 per cent completed; raising tracks and constructing subway, Detroit, Mich., cost \$104,445, 5 per cent completed; renewal of River Rouge drawbridge, Detroit, Mich., cost \$270,500, 95 per cent completed.

**New York, New Haven & Hartford**

*Other Important Work Under Construction:* Extension to Cedar Hill (Conn.) shop, cost \$377,080, 34 per cent completed; transfer platform at Cedar Hill, cost \$470,300, completed; improvements at South Bay Coach yard, near South Boston (Mass.) passenger terminal, cost \$225,700, 30 per cent completed; additional tracks, bridge and culvert work, Kingston-Wickford, cost \$165,000, 16 per cent completed; westbound tracks from Bradford to Westerley, R. I., cost \$120,000, 75 per cent completed; pipe flume at power house, Cos Cob, Conn., cost \$100,000, 65 per cent completed; engine facilities and tracks at State Line, Mass., cost \$137,000, completed; extension of branch switch yard, Hartford, Conn., cost \$294,000, 21 per cent completed, work has been deferred.

**New York, Westchester & Boston**

*First Track:* New Rochelle, N. Y., to Chatsworth avenue, Larchmont, 1.46 miles.

*Second Track:* New Rochelle, N. Y., to Chatsworth avenue, Larchmont, 1.46 miles.

**Norfolk & Western**

*First Track:* In Virginia, from Lewis Creek, branch extension, 0.20 miles.

*Other Important Work Under Construction:* New 120-ton capacity dumper and electrification of piers 2 and 3 at Norfolk, Va., cost \$650,000, 30 per cent completed; trimming machine on pier 4, Norfolk, cost \$150,000, to be installed; additional yard tracks and rearrangement of tracks at Norfolk, cost \$210,000, 30 per cent completed; new water supply facilities at Roanoke, Va., cost \$223,000, 75 per cent completed; additional engine terminal facilities at Roanoke, Va., cost \$1,000,000, 75 per cent completed; tie-treating plant at Radford, Va., cost \$500,000, 50 per cent completed; additional yard tracks and engine facilities at Bristol, Va., cost \$1,300,000, 80 per cent completed; passing track extensions between Bluefield, W. Va., and Norton, east \$150,000, 75 per cent completed; cal branch, Pigeon Creek, Rockhouse Fork, from Lenore, W. Va., under construction 18 miles, cost \$2,000,000, 60 per cent completed; bridge to carry freight house spur from Pennsylvania tracks at Cleveland avenue, Columbus, Ohio, cost \$140,000, 90 per cent completed.

**Northern Pacific**

*Other Important Work Under Construction:* Grade separation at Minneapolis, Minn., cost \$350,000, 75 per cent completed; grade separation at Fargo, N. Dak., cost \$196,000, 90 per cent completed.

**Oregon, California & Eastern**

*First Track:* Between Klamath Falls, Ore., and Dairy, 1.50 miles.

*Other Important Work Under Construction:* Building from Dairy, Ore., to Sprague river, 20 miles, company's forces doing the work.

**Oklahoma-Southwestern**

*First Track:* Between Bristow, Okla., and Slick, 13 miles.

*Other Important Work Under Construction:* Building between Slick and Bristow, 37 miles; contractors, Ailhands & Davis Construction Company, Bristow, Okla., 20 per cent completed.

**Oneida & Western**

*First Track:* From Stockton, Tenn., northwest 2.50 miles.

**Patapasco & Back River**

*First Track:* At Sparrow's Point, Md., 2.72 miles.

**Pennsylvania System**

*First Track:* Eastern region.—Hegerman street branch, Philadelphia, Pa., 0.18 miles. On the P. B. & W.—At Chester, Pa., 0.39 miles.

*Second Track:* On the P. B. & W.—At Chester, Pa., 0.19 miles.

*Third Track:* Central region.—West of Alliance, Ohio, 0.09 miles.

*Fourth Track:* Central region.—West of Alliance, Ohio, 0.09 miles; Mazoni, Ohio, to Fairhope, 5.90 miles.

*Other Important Work Under Construction:* Central region.—Relocation of bridge over Clarion river at Parkers Landing, Pa., cost \$600,000, completed; classification yard at Dennison, Ohio, cost \$2,600,000, 42 per cent completed; engine house facilities, Mingo Junction, Ohio, cost \$1,503,000, 90 per cent completed; engine yard facilities, Mingo Junction, cost \$596,000, 98 per cent completed; classification and industrial yard at Mingo Junction, Ohio, cost \$6,000, 33 per cent completed; engine house and shop, Canton, Ohio, cost \$3,270,000, 95 per cent completed; new engine terminal and shop facilities, Scully yard, Pittsburgh, Pa., cost \$3,400,000, 65 per cent completed; additional tracks and yard facilities; Kinsman street yard, Cleveland, Ohio, cost \$244,500, completed; track elevation and grade crossing elimination, from Cedar avenue to Holton street, Cleveland, Ohio, cost \$2,780,000, to be completed in 1922; engine house improvements, Wellsville (Ohio) shop, cost \$1,250,000, completed; reconstructing bridge No. 122, Rochester, Pa., cost \$650,400, completed; West street engine terminal improvements, Ashabula, Ohio, cost \$181,455, completed; low grade freight line, Kenwood, Pa., to Rochester, cost \$4,325,000, 60 per cent completed; new main tracks, yard and engine terminal, Briar Hill to Girard, Ohio, cost \$6,200,000, 25 per cent completed; engine terminal facilities at Wheatland, Pa.; cost \$600,000, completed; relocation of double track line, Summitville, Ohio, to "K" tower, finished, cost \$2,500,000, 78 per cent completed; at Yellow Creek, Ohio, "Y" tracks and second track to Hammondsville, cost \$1,381,000, to be completed in 1921; new engine terminal facilities at Mahoningtown, Pa., cost \$2,268,000, 30 per cent completed. Southwestern region.—New erecting shop at Columbus, Ohio, cost \$450,000, 40 per cent completed; passenger engine terminal, Spruce street, Columbus, cost \$2,500,000, 56 per cent completed; extension of westward classification yard, Columbus, cost \$1,500,000, 90 per cent completed; extension of bridge No. 3 over Secoy river, Columbus, cost \$250,000, 90 per cent completed; engine terminal improvements, Richmond, Ind., cost \$1,500,000, completed; track elevation at Indianapolis, Ind., cost \$200,000, 90 per cent completed.

**Pere Marquette**

*Other Important Work Under Construction:* New engine terminal, yard, etc.; New Buffalo, Mich., cost \$750,000, 80 per cent completed; building new engine terminals, Saginaw, Mich., cost \$980,000, 50 per cent completed; new engine terminal, Plymouth, Mich., cost \$450,000, 60 per cent completed; Thornapple river bridge, McCor's, Mich., cost \$150,000, 30 per cent completed.

**Philadelphia & Reading**

*First Track:* Between Belle Mead, N. J., and Manville, 0.55 miles; in Pennsylvania, not specified, 0.13 miles.

*Second Track:* Between Belle Mead, N. J., and Manville, 0.60 miles; in Pennsylvania, not specified, 0.20 miles.

*Fourth Track:* Between Glenmore, N. J., and Hopewell, 1.74 miles; in Pennsylvania, not specified, 0.15 miles.

*Other Important Work Under Construction:* New county bridge over tracks on line of Fayette street, Conshohocken, Pa., part of cost to be paid by the Philadelphia & Reading, work 40 per cent completed; replacing bridge No. 8 over Susquehanna river, west of Harrisburg, Pa., 22.5 per cent completed; replacing bridge No. 7 north of McAuley, Pa., 53 per cent completed; rebuilding bridge over Oley street, Reading, Pa., 80 per cent completed; elimination of bridges No. 2 and No. 3 north of Molino, Pa., and bridge No. 4 south of Millers, contract let but no physical work done to date; opening Tulip street, Philadelphia, Pa., under tracks of Richmond branch, between Somerset street and Lehigh avenue, 45.7 per cent completed; between Somerset street and Lehigh avenue, 38.5 per cent completed; coaling station and sand house Tulip street engine yard, Philadelphia, 56.5 per cent completed; rebuilding Columbia bridge over Schuylkill river, Schuylkill canal and Fairmont Park, Philadelphia, 80 per cent completed; ash pit, inspection pit, water supply and fire protection, Tulip street engine yard, Philadelphia, 24.5 per cent completed.

**Pittsburgh & Lake Erie**

*Other Important Work Under Construction:* Enlargement of yard at Hazelton, Ohio, cost \$175,000, completed.

**Pittsburgh, Chartiers & Youghiogeny**

*Other Important Work Under Construction:* Building from Van Emman, Pa., to Eighty-four, Pa., 8.36 miles.

**Portland, Astoria & Pacific**

*First Track:* Wilkesboro to Manning, Ore., 4 miles.

*Other Important Work Under Construction:* Building from Manning, Ore., to Krasay, 28 miles; contractors, Utah Construction Company, Portland, Ore.

**Raritan River**

*Second Track:* At South Amboy, N. J., 0.52 miles; Gillespie, N. J., to South River, 1.12 miles.

**Ringling, Eastland & Gulf**

*First Track:* Mangum, Tex., to Breckwalker, 26.60 miles.

**Rio Grande & Southwestern**

*First Track:* In New Mexico, not specified, 9 miles.

**St. Louis, Kennett & South Eastern**

*First Track:* In Missouri, between Kennett, Mo., and Deering, 0.50 miles.

*Other Important Work Under Construction:* Building extension from Kennett, Mo., 9 miles, cost \$175,000, 5 per cent completed.

**St. Louis-San Francisco**

*Second Track:* Eureka, Mo., to Pacific, 6.90 miles; Globe, Mo., to Monett, 4.30 miles.

*Other Important Work Under Construction:* Engine terminal facilities at Alton, Okla., cost \$102,626, 80 per cent completed; at Lawton, Okla., cost \$127,913, 10 per cent completed and at Monett, Mo., cost \$152,319, completed. On the St. Louis-San Francisco & Texas—Engine terminal facilities at Sherman, Tex., cost \$130,875, 80 per cent completed.

**St. Louis Southwestern of Texas**

*Other Important Work Under Construction:* Terminal facilities at Hodge, Tex., cost \$105,500, completed.

**St. Paul Bridge & Terminal**

*Other Important Work Under Construction:* New storage yard at South St. Paul, Minn., cost \$132,642, 30 per cent completed.

**St. Paul Union Depot**

*Other Important Work Under Construction:* New passenger station, St. Paul, Minn., cost \$11,000,000, 30 per cent completed.

**Sewell Valley**

*Other Important Work Under Construction:* Building from Rainelle Junction, W. Va., to Glencoe, 12 miles; contractors, Meadow River Lumber Co., Rainelle, W. Va.

**Southern Pacific**

*First Tracks:* From near Knights Landing, Cal., to Sheffield, 16.49 miles; Marchant, Cal., to Karnak, 2.75 miles. In Texas: Mile Post 2.8 to Mile Post 3.1, Dallas Belt (H. & T. C.), 0.30 miles.

*Second Track:* On the Galveston, Harrisburg & San Antonio. At El Paso, Tex., 0.70 miles.

*Other Important Work Under Construction:* New construction work to eliminate two tunnels between Marcell, Cal., and Cable, cost \$149,090, 25 per cent completed; engine house facilities, Mojave, Cal., cost \$140,304, completed; engine house facilities at Indio, Cal., cost \$101,305, completed. On Central Pacific: New steel foundry at Sacramento, Cal., cost \$126,328, completed. On the Southern Pacific lines in Texas and Louisiana—Additional tracks, Honston-Englewood yards, cost \$245,000, 50 per cent completed; renewing bridge span over Neches river, cost \$118,060, 10 per cent completed; renewing bridge span over Trinity river, cost \$101,241, 10 per cent completed.

**Southern Railway & Navigation Company**

*First Track:* In Louisiana, not specified, 12 miles.

**Staten Island Rapid Transit**

*Other Important Work Under Construction:* Reconstruction of thawing shed, Arlington, S. I., N. Y., cost \$342,000, completed.

**Tampa Southern**

*First Track:* In Florida, not specified, 8.70 miles.

*Other Important Work Under Construction:* Building from Seth, Fla., to Palmetto, 8.80 miles; contractors, E. G. Stoney, Sarasota, Fla.; H. E. Springstead, Palmetto, Fla.; John F. Lamh, Thomasville, Ga.

**Terminal Railroad Association of St. Louis**

*Other Important Work Under Construction:* Enlargement of shop, at Brooklyn, Ill., cost \$510,000, completed; reconstruction of highway deck of west approach of Eads Bridge, St. Louis, Mo., cost \$160,000, 55 per cent completed.

**Texas City Terminal Company**

*Other Important Work Under Construction:* Oil dock at Texas City, Tex., cost \$90,000, and dredging turning basin at Texas City, cost \$75,000, completed.

**Texas, Oklahoma & Eastern**

*First Track:* In Oklahoma, Mile Post 36 to Mile Post 41, 5 miles; from Oklahoma-Arkansas state line to DeQueen, Ark., 8 miles.

**Toledo & Cincinnati**

*Other Important Work Under Construction:* Construction of roadbed for second track in connection with relocation of main line by Miami Conservancy District Commission, North Dayton to Tippecanoe, Ohio, cost \$475,000, completed.

**Union Pacific**

*Other Important Work Under Construction:* Installing concrete lining and extending concrete portals at end of Hermosa tunnel (Old Sherman tunnel), Hermosa, Wyo., cost \$372,500, 34 per cent completed, work sus-

pending for winter; will be resumed in spring; additional yard tracks at Green River, Wyo., cost \$139,000, 84 per cent completed; lining 1,830 feet long of Sherman tunnel with concrete, Hermosa, Wyo., cost \$323,000, 35 per cent completed; concrete viaduct at Central avenue, Kansas city, Kan., cost \$203,380, completed. Union Pacific Coal Company spur, building from Lionok, Wyo., to about 1 mile west, 1.20 miles; contractor, Utah Construction Company, Ogden, Utah. Oregon Short Line building from Strachan to Phosphate Mine, Idaho, 7.54 miles; contractors, Utah Construction Company, Ogden, Utah. Oregon-Washington Railroad & Navigation Company. Engine division improvements; at Huntington, Ore., cost \$168,670, 95 per cent completed, and at Rieth, Ore., cost \$175,250, 75 per cent completed; terminal improvements at Alhina (Ore.) yards, cost \$168,022, 50 per cent completed.

**Utah Railway**

*Other Important Work Under Construction:* Machine shop at Provo, Utah, cost \$200,000, 30 per cent completed.

**Utah Terminal**

*First Track:* Utah Railway Junction, Utah, to coal mines in Spring Canyon, 3.60 miles.

**Uvalde & Northern**

*Other Important Work Under Construction:* Building from Uvalde, Tex., to Camp Wood, 40 miles; contractors: L. J. Smith Construction Company, Kansas City, Mo.; S. M. Bush, Uvalde, Tex.

**Valley & Siletz**

*First Track:* From Camp 1 to Valsetz, Ore., 2.10 miles.

**Virginian**

*Other Important Work Under Construction:* Virginian-Wyoming building from Mahen, W. Va., to Raleigh-Wyoming Coal Company's mine, 14.45 miles. Contractors, W. W. Boxley & Co., Roanoke, Va., and Porter Brothers, Norfolk.

**Wabash Railroad**

*Other Important Work Under Construction:* Reconstructing draw-bridge over Rouge river, Detroit, Mich., cost \$750,000, 12 per cent completed.

**Western Maryland**

*Other Important Work Under Construction:* Coal pier at Port Covington, Baltimore, Md., cost \$700,000, 78 per cent completed.

**Western Pacific**

*First Track:* In California from southwest of Hawley to a point west, 12.61 miles.

**Wheeling & Lake Erie**

*Other Important Work Under Construction:* Engine terminal, Canton, Ohio, and additions to Gambler's yards, cost \$573,380, 12 per cent completed; engine terminal at Jewett, Ohio, including additions to present yards, cost \$486,305, 15 per cent completed.

**Willacochee & Du Pont**

*First Track:* In Georgia, not specified, 2 miles.

*Other Important Work Under Construction:* Building from Shaws Still, Ga., to Du Pont, 19 miles. Contractors, C. M. Green, Willacochee, Ga.

**Willamina & Grande Ronde**

*First Track:* In Oregon, not specified, 1 mile.

*Other Important Work Under Construction:* Building from Willamina, Ore., to Bentley, 7.76 miles, company forces doing the work.

**Winchester & Western**

*First Track:* In West Virginia, not specified, 8 miles.

**Railroad Construction in Canada in 1920****Canadian National Railways**

*First Track:* In Nova Scotia from Halifax Ocean Terminals Railway to Halifax & South Western Railway near Fairview, 0.68 miles. In New Brunswick, from St. John's to Newcastle (Moncton Cut off) 3.86 miles. In Quebec, from Charlotte to Ste. Rosalie, 4.70 miles. In Saskatchewan, from Alaska southeasterly, 2.60 miles; between Melfort and Humbolt, 32.40 miles; from Swift Current extension, 6.70 miles; on Jackfish branch, 10 miles. In Alberta, between Hanna and Medicine Hat, 10 miles; from Munson, 3 miles; from Oliver branch, 23.10 miles; from Onaway branch, 18.10 miles; from Red Deer spur, 6.40 miles. In Manitoba, from Thundershill extension, 8.30 miles. In British Columbia from Koksitah river to Siwash Rips Cowichan river, Vancouver Island, 19.30 miles. *Second Track:* In Nova Scotia, from Springhill to Maccan, 9.13 miles; from Truro to Belmont, 7.69 miles. In Quebec, from Bagot to Ste. Rosalie, 10.94 miles. In Alberta, between Manson and Wayne, 0.84 miles; from Munson, 3 miles.

*Other Important Work Under Construction:* Engine terminal facilities at Fairview, N. S., cost \$824,000, 10 per cent completed; new bridge and track realignment, at Tantramar river, Amherst, N. S., cost \$550,000, 50 per cent completed; yard and terminal facilities at Moncton, N. B., cost \$1,175,000, 9 per cent completed; yard improvements at St. John's, N. B., cost \$255,500, 73 per cent completed; revision of grade and alignment, McGivney Junction to Fredericton, N. B., cost \$264,000, 50 per cent completed; new terminal facilities at Chaudiere Junction, Que., cost \$340,000, 20 per cent completed; new station at Lewis, Que., cost \$130,000, completed; yard and facilities at Dartmouth, N. S., cost \$200,000, completed; Rosebud river bridge, Drumheller (Alberta) subdivision, cost \$117,000, 93 per cent completed; Red Deer (Alberta) river bridge, mile post 59.3, contract let to the Dominion Bridge Company, cost \$250,000, work just started; South Saskatchewan river bridge improvements at mile post 159.8, Duck Lake sub-division, contract let to

the Dominion Bridge Company, cost \$340,000, work just started; building from Siwash Rips Cowichan river to Alberni, V. I., 74.40 miles, work being done by Canadian Northern Pacific forces; building from Kamloops, B. C., to Kelowna and from Vernon to Lumby, 133 miles, contractors, John W. Stewart & Company, Vancouver, B. C.; survey under way from Cowichan river to East Coast, Vancouver Island, 14 miles; engine terminal facilities at Victoria, B. C., cost \$170,000, 80 per cent completed.

**Canadian Pacific**

*First Track:* Russell, Manitoba, northerly, 6.50 miles; Lanigan, Saskatchewan, northeasterly, 50 miles; Moose Jaw, Saskatchewan, southwest (Consul East) 1.5 miles; from Leader, Saskatchewan, 26 miles; Langdon, Alberta, north (Acme-Express), 18.50 miles.

*Other Important Work Under Construction:* Work is now under way, building from Russell, Manitoba, northerly, 5.8 miles; from Moose Jaw, Saskatchewan (Consul East), 58.50 miles; Wymark-Archive line, 25 miles; Bassano, easterly (Milden-Express) 59 miles; Rosetown, Saskatchewan, southeast, 43.20 miles; Leader, 9.20 miles, in Saskatchewan, 14.80 miles, in Alberta; Langdon, Alberta, north 18.80 miles; Weyburn-Stirling, Alberta (Altawan West), 18.90 miles.

**Canada & Gulf Terminal**

*First Track:* In the Province of Quebec, not specified, 2.50 miles.

**Esquimalt & Nanaimo Railway**

*Other Important Work Under Construction:* Building from Alberni, Vancouver Island, to Great Central Lake, 10 miles. Contractors: Foundation Company of British Columbia, Ltd., Vancouver, B. C.

**Grand Trunk**

*Other Important Work Under Construction:* Western Lines—Additional team-tracks and freight house extension and land for site for new yard at Pontiac, Mich., cost \$250,000; new passenger and freight station at St. John, Mich., cost \$106,000, completed.

**Kettle Valley**

*First Track:* From Princeton, B. C., to Loffer mountain mine, 7.25 miles.

*Other Important Work Under Construction:* Building from South Penticton, B. C., to Dog Lake, 2.40 miles, contractors, P. J. Salons, Penticton, B. C.

**Pacific Great Eastern**

*First Track:* In British Columbia, not specified, 37 miles.

*Other Important Work Under Construction:* In British Columbia building from present end of track at mile post 331 to mile post 427 on the Grand Trunk Pacific; contractors, Northeastern Construction Company, Vancouver, B. C.

**Quebec Central**

*Other Important Work Under Construction:* Building from Scotts, County Beauce, Quebec, to Diamond Junction, St. Jean Chrysostome, County Levis, 19.33 miles; contractors, J. T. & J. F. Davis, Quebec, Canada.

**Reid Newfoundland Company**

*First Track:* Branch line to Argentinia, N. F., 3.50 miles.

*Other Important Work Under Construction:* Wharf and terminal buildings at Port-aux-Basques, N. F., 70 per cent completed.

**Roberval-Saguenay Railroad**

*First Track:* At Port Alfred, Que., 2 miles and at Portage des Roches, 0.50 mile.

*Other Important Work Under Construction:* Harbor wharves cost \$750,000.

**Railroad Construction in Mexico in 1920**

**National Railways of Mexico**

*First Track:* Between Durango, Mex., to the port of Mazatlan, 21.13 miles; between Cuatro Ciénegas and Sierra Mojada, state of Coahuila, 39.77 miles.

*Other Important Work Under Construction:* Building from Durango, state of Durango, to the port of Mazatlan, on the Pacific coast, 250 miles, about 87 miles from Durango has been completed, contractors, E. E. Shaw, Durango; Building from Cuatro Ciénegas to Sierra Mojada, state of Coahuila, 99.42 miles, track has been completed on about 76 miles, work is being done by company's forces; building between Allende and Las Vacas, state of Coahuila, 75.80 miles, work is being done by company's forces; building from Empalme Purisima on the Durango-Mazatlan line to Las Animas, 31 miles, of which 19 miles have been completed, contractor, E. C. Rosas, Durango; building new station in Durango to cost \$250,000, masonry and concrete work completed; grade reduction under way from Saltillo to Carneros, 34 miles; building new passenger station at Saltillo, nearing completion.

**FEEDING THE COMMUTER ON KEY SYSTEM BOATS.—**The San Francisco-Oakland Terminal (Key System), served meals to 62,273 passengers on its ferry boats during May, 1920, according to C. D. Bennetts, superintendent of the service department, who recently discussed the growth of the company's restaurant business before the Pacific Railway Club. Mr. Bennetts said that lunch counter facilities were provided on the boats first put into service by the Key System in 1903, and that after a short trial at leasing them to outsiders, which proved unsatisfactory, the company organized its own commissary department. As additional steamers were built, they were also equipped with restaurants, which have been enlarged and re-equipped at frequent intervals to take care of the growing number of patrons who must be served in the twenty minutes that the boats are en route. This need for quick service has led to specialization in a few popular dishes, such as coffee, soup, hash and pie. The food is prepared by Chinese cooks in the company's kitchen in the Ferry Building, San Francisco, and is kept hot on the boat by steam tables. Revenue from the restaurant totaled \$19,197.50 in May, and Mr. Bennetts estimated that during that month 5 per cent of the Key System's passengers were served.

Michigan Central Yards at Detroit

# Signal and Interlocking Work Reaches Low Mark

Reports Indicate That Construction Activities  
Were Lighter Than During Any Period  
Since 1905

A TOTAL of 523.5 miles of road in the United States and Canada was equipped with block signals during the past year. Some of this mileage represents new construction, a portion represents reconstruction, and a part consists of manual block changed to automatic block. Twenty-five roads built new interlocking plants or made changes in existing ones, affecting a total of 86 plants. It is hard to arrive at any definite conclusion as to the number of new interlocking plants installed during this period because a large number of the railroads failed to include in their reports sufficient information to show whether or not the work completed represented new facilities. Where automatic signaling was in use previously, the changes were due largely to replacing one type of signals with another, or on account of additional main tracks.

Comparing the figures for 1920 with those for 1919, published in the January 2, 1920, issue of the *Railway Age*, it is readily seen that a decided drop has occurred in construction work of this character, as the total block signal mileage completed in the United States and Canada during year 1919 was 2,071, as compared to 523.5 miles of road in 1920, or only about 25 per cent of that of the preceding year. Of this 523.5 miles, 515.2 represents the amount completed during the year on roads in the United States. Deducting 1.7 miles manual blocking from the total, leaves 513.5 miles of road upon which automatic block signals were installed during the year. Comparing this mileage with that reported by the Interstate Commerce Commission as of January 1, 1920, and which is recorded in the table showing block signals installed in the United States since January 1, 1907, there appears to have been 466 miles less automatic block signaling completed during 1920 than in 1919. In each and every year shown in that table the

mileage of automatic block signals installed was more than double that reported for the year now closed.

*Under Construction.*—In comparing the total mileage of block signals under construction in the United States and Canada on December 31, 1920, and that under construction on the same date in 1919, it is seen that there is now a decrease of 64.2 miles. The total mileage under construction

on December 31, 1920, consists of automatic block signals in the United States, no Canadian roads having reported any work in progress. While no statements have been made indicating that the automatic block is to replace manual block, all, or a large part of this work in progress is of this character. No road reports any manual block signals under construction.

*Proposed Work.*—The outlook for proposed new work for 1921 is very indefinite at present, as a large number of roads have not yet decided on their budgets. In making a comparison of the block signal mileage proposed for next year with that proposed one year ago, it is seen that there is an increase over that of a year ago of 78.7 miles of road. The proposed new work reported includes a total of 398.7 miles of auto-

matic block signals in the United States, and 43 miles in Canada.

*Interlocking.*—A decided slump has occurred in the number of interlocking plants built or rebuilt during the year. In 1919 a total of 153 were built or rebuilt in the United States, and four in Canada, as compared to 45 this year, two of which are in Canada. Likewise the number of plants under construction in the United States on December 31, 1919, was 46, and 3 in Canada, as compared to 19 this year, one of which is in Canada. A total of 39 plants was proposed a year ago, 3 being in Canada, in comparison with a total of 22 for the coming year, all of which are in the United States.

ONLY 515 MILES of road in the United States were equipped with block signals during the past year; there are 206 miles under construction and 442 miles are known to be proposed for 1921.

Forty-five interlocking plants were completed; 19 are under construction and 22 are proposed for the coming year. These are the smallest construction figures reported for many years.

Statistics of telegraph line construction are given this year for the first time.

**An Outline of the Work**

The figures so far available, together with the data covering work now under construction and in respect to plans for 1921, are shown in the accompanying tables. The data will be found in the tables under nine heads, as follows:

- A—Automatic Block Signaling Completed in 1920.
- B—Automatic Block Signaling Under Construction.
- C—Automatic Block Signaling Proposed for 1921.
- D—Manual Block Signaling Completed in 1920.
- E—Manual Block Signaling Under Construction (None).
- F—Manual Block Signaling Proposed for 1921 (None).
- G—Interlocking Completed in 1920.
- H—Interlocking Under Construction.
- I—Interlocking Proposed for 1921.

From the reports received, the largest mileage of automatic signals installed on a single road was on the Chicago, Burlington & Quincy, which put in service 144.3 miles of single track and 9.3 miles of double track, using 359 signals.

**TOTAL CONSTRUCTION—TWELVE YEARS Miles of road**

Year	Automatic Block	Manual Block	Total
1908	1,387.6	517.6	870.0
1909	2,047.1	4,162.2	6,209.3
1910	3,473.8	2,037.3	5,511.1
1911	2,623.4	2,517.2	5,140.6
1912	1,883.9	5,656.2	7,540.1
1913	4,350.5	1,563.4	5,913.9
1914	3,030.7	6,511.5	9,542.2
1915	1,113.1	1,112.0	2,225.1
1916	1,843.5	196.9	2,040.4
1917	2,242.2	1,214.9	3,457.1
1918	1,794.9	1,398.4	3,193.3
1919	979.4	1,007.1	1,986.5

The next largest installations were made on the Missouri, Kansas & Texas and on the Northern Pacific, each installing 83 miles of single track signals, the first road using 151 signals, two of which were the color light type, and the latter using 150. Signals installed on other roads consisted mostly in the protection of short stretches of track; on additional new multiple tracks or for station protection purposes. In Canada, three short stretches of single track automatic block signals, totaling 6.3 miles, were put in service on the Canadian Pacific, Western lines, mostly for station protection,

while the Grand Trunk installed 2.0 miles for the same purpose.

But ten roads report automatic block signals under construction, the greatest mileage reported being by the Chicago, Burlington & Quincy, which has 71 miles of single track signaling under construction. The Chesapeake & Ohio has under construction, 40 miles of single track, A. P. B. color light automatic signals, while the Baltimore & Ohio has 21.6 miles of double track signaling, and the Illinois Central has 19.7 miles of single track signaling under construction.

Of the work proposed for 1921, out of eight roads reporting such work, the Chicago, Milwaukee & St. Paul contemplates the construction of 122 miles of single track signaling, using 220 motor semaphore signals removed from the electrified zone, while the Missouri, Kansas & Texas is also planning on 168.5 miles of single track automatics, using a total of 282 signals.

The reports from the various roads on proposed block signaling are rather incomplete, inasmuch as most of the roads have not yet prepared their programs or had their budgets approved for the 1921 work.

The only manual block signaling reported as installed during 1920, consisted of 1.7 miles of single track, of which 0.98 mile replaced automatic block. No signaling of this character was under construction on December 31, 1920, nor did any roads report any such work contemplated.

**Automatic Train Control**

The use of automatic train control as an adjunct to automatic block signals has been reported as completed during 1920 on the Chicago, Rock Island & Pacific, between Blue Island, Ill., and Joliet, a distance of 25 miles. It is installed on double track in connection with automatic block signals already in service, and is of the intermittent electrical contact type. An installation of automatic train control is under construction on the Chesapeake & Ohio, between Charlottesville, Va., and Staunton, a distance of 40 miles. Low voltage color light signals with approach lighting is also being installed in connection with the train control. The automatic train control under construction is an extension of the system already in use between Gordonsville, Va., and Charlottesville.

**Interlocking**

Twenty-five roads report interlocking plants as completed during the past year, and Table G gives this list in detail. This table, however, should be taken more as an exhibit of the work done than as showing the precise amount of the increase of interlocking apparatus in use in the country, some of the figures representing only reconstruction or enlargements. Some duplications necessarily occur, as a joint plant may be reported by two or more roads. The same remarks apply also to Tables H and I.

One striking feature indicating the small amount of work done during the past year, under construction or contemplated, aside from the small number of entries in the tables, is the small size of the plants installed, those predominating being of the mechanical type. An analysis of the plants shows that the largest electric plant completed during the year is one of 64 working levers at Barbourville, W. Va., on the Chesapeake & Ohio, while the next largest is one with 40 working levers at Pittsburgh, Pa., on the Pennsylvania. The third largest plant of this type had 33 working levers, and was installed at Weston, N. J., on the Philadelphia & Reading, while the fourth largest consisted of 29 working levers at Newark, N. J., on the Lehigh Valley.

One 20-push-button electro-pneumatic machine was reported as completed during the year at the Russell, Ky., yards of the Chesapeake & Ohio.

Five electro-mechanical plants were reported as completed, one plant on the Philadelphia & Reading having 32 me-

chanical and 35 electric working levers being revised. The largest electro-mechanical plant installed was on the Jacksonville, Fla., terminal, and this consisted of 27 mechanical and 13 electric working levers. A small electro-mechanical plant of 7 working levers, and provided with position light signals, was installed by the Pennsylvania on a drawbridge.

The largest mechanical plant installed was on the Missouri Pacific at Sedalia, Mo., and had 36 working levers, while the largest one revised was on the P. & R. at Belle Meade, N. J., with 46 working levers. Other plants ranged in size from the smallest up to the size given above. Some were of the cabin door lock type, others had time locks; still others had electric locks, while still others had power-operated distant signals as adjuncts.

The largest electric interlocking plant under construction on December 31, 1920, was at Richmond, Ind., on the Pennsylvania System, and consists of 44 working levers; the next

in size being one of 29 working levers at Myerstown, Pa. on the P. & R.

The New York, New Haven & Hartford has under construction two electro-pneumatic push button plants for hump yards at Providence, R. I., and New Haven, Conn., each having 60 push buttons.

The largest electro-mechanical plant under construction as of the above date is one of 43 working levers at Mountain Lake Park on the Baltimore & Ohio, while the Chesapeake & Ohio is building one having 20 mechanical and 18 electric working levers at Kenova, W. Va.

The largest mechanical plant under construction is one of 29 working levers at Madison, Ill., on the Toledo, St. Louis & Western.

Of those proposed for 1921, the largest electric plant is one of 49 working levers to be located at Carlton, Minn., on the Great Northern; the next largest being one of 33 working

<sup>9</sup> Pushbutton mechanism electro-pneumatic, 60 buttons.  
<sup>10</sup> Pushbutton, 60 buttons, also certain switches electrically and mechanically locked for control of movements to repair tracks.  
<sup>11</sup> A. C. track circuits; time locks on steam road.

the next largest proposed is on the Texas & Pacific at Ranger, Tex., and it is to consist of 24 working levers.

The General Outlook

The general outlook a year ago indicated that signal construction work would show some signs of picking up before now, but instead less work was completed than in any year

since 1908. This results from the conditions which have affected the railroads during the past four years and it is because of the readjustment taking place now in the railroad field that the outlook as to next year's budgets is so uncertain. The principal reason for this uncertainty is the inability of the railroads to get money at reasonable rates. This has been further complicated by the action of the govern-

ment that it is difficult to judge what the coming year may have in store in the way of prices for the raw materials, and this will affect the quotations which can be made on signal materials. Labor conditions are by no means stable as a readjustment is taking place in this field as well as in other fields. As a consequence the tendency is to follow a hand to mouth policy until conditions approach a more nearly normal stage.

ment in holding up the amounts due the railroads for the time they were under government control.

The high cost of material and all kinds of labor are also directly affecting the future programs. The material market is further complicated by the fact that the basic materials have fluctuated so radically in cost during the past year

## Railroad Telegraph and Telephone Construction

IN INAUGURATING A SURVEY of the activities in the railroad telegraph and telephone field covering the past year, the *Railway Age* sent out a questionnaire to 198 roads asking for certain data. It is impossible to draw conclusions as to the relative amount of work as compared with that done in other years as this is the first time that an attempt has been made to collect such data. However, basing conclusions on conditions known to have existed in other departments, it would appear safe to assume that the construction work in this department was below normal, although it will require the collection of data for several years before an accurate analysis of this field can be made.

### Work Completed

Thirty-seven out of the 198 roads reported telegraph and telephone construction work completed during 1920. Out of a total of 2,645 miles of long distance telephone conversation circuits, the two largest installations were made by the Pennsylvania System on which 1,014.9 miles was completed in the central region, and the New York, New Haven & Hartford, which completed 600 miles. The Virginian installed 340 miles. The Missouri, Kansas & Texas completed 266 miles of long distance phantom telephone circuits. A total of 820 miles of No. 8 gage iron wire was installed by all roads as compared with 69 miles of No. 9 and 409 miles of No.

6, while 10 miles of No. 8 gage and 430 miles of No. 10 gage copper were installed as compared with 5,421 miles of other gage copper wire.

A total of 15 metallic train despatching circuits were installed while 31 long distance physical telephone and 11 phantom circuits were completed. One road, the Union Pacific, reports the completion of three telegraph circuits for printing telegraph. Sixty-seven way station offices were opened, 50 of which were on the Atchison, Topeka & Santa Fe.

But little overhead or underground cable work was done during the year, a total of 29.3 miles of overhead and 14.8 miles of underground cable being installed. Out of a total of 53 miles of railroad pole line constructed, the Pennsylvania System, central region, installed 34 miles and the Louisville & Nashville 12 miles.

### Work Under Construction

Eighteen roads of the 198 reported work as under construction on December 31, 1920. There were 674 miles of long distance telephone conversation circuits reported under construction, of which 341 miles were on the Northern Pacific and 295 on the Pennsylvania System, central region. A total of 577 miles of No. 8 iron is under construction as compared with a mileage of 84 No. 9 gage and 417 No. 6 gage, while

### Developments of the Past Year

A review of the conditions during the past year indicates that greater attention has been given to automatic train control than ever before, with the prospects that more installations of this character will be made during the coming year. Railway men in general also have shown a keener appreciation of the value of automatic signaling with reference to its use in effecting economies in train operation. In this connection attention has been directed to the elimination of train orders by making the greatest use of the signal system. Electric lighting of signals has advanced quite rapidly, this advance being helped by the possibility of eliminating lampmen, whose wages have been materially increased. Further replacement of gravity battery with caustic soda cells has also taken place as this helps reduce maintenance costs. The track circuit has received marked attention, with the result that low resistance bonds have been developed on a commercial basis so that they may be welded to the rails. This not only effects economy but also increases the safety of the track circuits.

Future developments of signaling will continue along the lines of saving freight train hours and stoppages to trains, in that means will be provided for the handling of the trains by signal indication and remote switches will be placed under the control of the leverman and operated from the nearest interlocking or nearest station. Light signals will be used more than they have been in the past, as each year shows an increasing use of this type of signal. Automatic train control will receive a large share of attention and the tendencies in this connection will be along lines of improvements and standardization as to its use and interchangeability on different roads.

179 miles No. 8 gage copper is being erected on the Union Pacific and 254 miles No. 10 gage on the central region of the Pennsylvania System as compared with 760 miles of other gage copper on all roads reporting.

A total of 13 metallic train despatching circuits are under construction, 12 being in the central region of the Pennsylvania, while a total of 11 physical and 6 phantom circuits is being put in by the various roads. Of the total of 18.3 miles of overhead cable going in, the Great Northern is installing 12.3 miles and the New York, New Haven & Hartford 5 miles. Out of a total of 6.2 miles of underground cable being put in, the N. Y., N. H. & H. is installing 4 miles. Of the 36 miles of railroad pole line under construction, 24.5 miles are being built on the Pennsylvania System, central region. This system is also installing 14 simplex circuits, one composite, seven physical and five phantom circuits. The Union Pacific has three printer circuits under construction.

### Work Contemplated

Twenty-six roads report work contemplated in 1921. A mileage of 7,139 long distance telephone conversation circuits is under consideration on these roads, the quoted mileage being 4,935 on the Pennsylvania System. Of a total of all iron wire to be installed, 760 miles of No. 8 gage, 230 miles of No. 9 gage and 235 miles of No. 6 is contemplated, while 2,324 miles of No. 8 gage copper, 479 miles of No. 10 gage and 9,665 of other gages are to be put in.

A total of 17 metallic train despatching circuits having a mileage of 2,098 is expected to be built during the coming year. Forty-six physical and 19 phantom circuits are in contemplation for this year, while the Gulf & Ship Island expects to install 306 miles of grounded telephone circuits and other roads 122 miles of metallic yard circuits. The construction of 53 miles of railroad pole line is at present under consideration and considerable cable work is contemplated, there being a total of 62 miles of overhead cable and 58 miles of underground cable to be installed. The N. Y., N. H. & H. contemplates the installation of 10 printer circuits and the Union Pacific one; and the Pennsylvania contemplates putting in eight duplex circuits. The Denver & Rio Grande has 210 road miles (2 wires) metallic telephone despatching circuits awaiting authority for installation on the Third division narrow gage line between Salida, Colo., and Grand Junction. The reconstruction of the pole line on this section by the Western Union Telegraph Company is also under contemplation.

## The Attitude of Investors Toward Railroad Securities

(Continued from page 56)

considerably lower than has been the case for many months net earnings will not touch favorable levels. In the meantime, however, it is expected that the carriers will make material decreases in their expenses. They have already decreased their working forces. The decreased costs of supplies will have their effect and this is especially true of fuel which has dropped considerably and is expected to drop much further. The general result will be that when business does pick up again, as it is hoped it will in the late spring or early summer, the carriers should be able to show net earnings on a better scale than the September or October results indicated.

In the first 10 months of 1920 the carriers financed, exclusive of the proceeds granted them from the revolving fund, about \$338,304,000, including refunding issues. Their needs for refunding for 1921 are estimated at \$446,000,000.

For additions and betterments the amounts needed in 1921 are variously estimated, although the authorities seem to agree that something like \$1,000,000,000 will be required. The question that arises, of course, is as to the possibilities of the carriers being able to finance these large amounts. It is the general opinion that the recession in the stock and bond market has ended and that from now on conditions should be much easier. It seems unlikely, however, that conditions will improve sufficiently in 1921 to permit of very much financing through stock issues.

Conditions as to bonds seem much better. It is thought that there will be a gradual reduction in interest rates in the course of the year. We can apparently expect also a more receptive bond market, in which case railway issues should be in what amounts practically to a preferred position as compared with industrial issues, and possibly even with government bonds. We have mentioned the increasing popularity of railroad bonds and there can be no doubt that this popularity and increased confidence in railway shares will show its effect in railway financing. The popularity of short term equipment trust issues has already been commented upon; it might be added that the plan of equipment financing worked out by the National Railway Service Corporation should prove of material assistance.

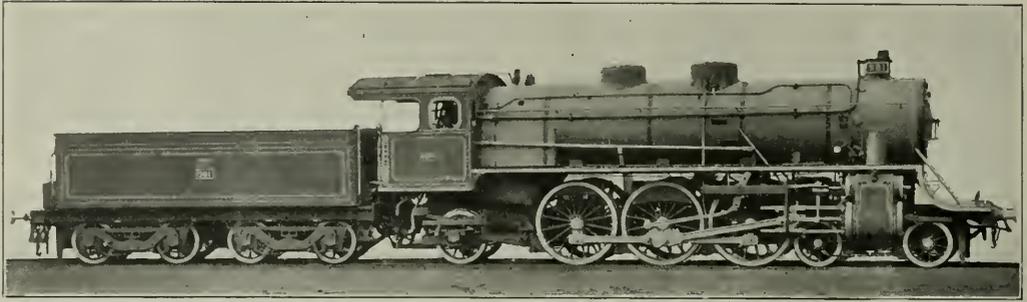

There is a certain drawback in the fact that so much financing will have to be in the form of funded debt and comparatively little in stock. This, in the minds of some, is encouraged by the strong guarantees given railway funded debt in the Transportation Act and in the manner in which the Interstate Commerce Commission has used the \$300,000,000 revolving fund for assisting the carriers in meeting their maturing indebtedness. No one could say that the commission has it in mind to protect bondholders as against stockholders. It happens to be the situation nevertheless and the remedy, it is feared, will not be in sight in satisfactory degree during 1921.

This brings us to the question of the progress that will probably be made as to consolidations during the coming few months. The commission is now engaged in working out the suggestions it is required to make under the terms of the Transportation Act.

The law says:

The commission shall as soon as practicable prepare and adopt a plan for the consolidation of the railway properties of the continental United States into a limited number of systems. In the division of such railways into such systems under such plan, competition shall be preserved as fully as possible and wherever practicable the existing routes and channels of trade and commerce shall be maintained. Subject to the foregoing requirements, the several systems shall be so arranged that the cost of transportation as between competitive systems and as related to the values of the properties through which the service is rendered shall be the same so far as practicable, so that these systems can employ uniform rates in the movement of competitive traffic and under efficient management earn substantially the same rate of return upon the value of their respective railway properties.

Bearing in mind that these consolidations are voluntary and that the act also withdraws handicaps to consolidations that carriers may have desired to work out in the past, it is very evident that from this point of view 1921 should prove a most interesting year. It is likely that if the commission makes sufficient progress the roads suggested for consolidation will see a speculative movement in their stocks that will be something of an exception from the past few years. The excitement that has already been evidenced in the cases of the large crop of rumors of consolidation proves that conclusively. While speculative movements in stocks are never desirable, it is nevertheless true that they do serve to increase popularity in the stocks concerned and related issues. Observers have sufficient confidence in the Interstate Commerce Commission to believe that the situation will be kept from getting out of hand.

One of the Locomotives Shipped to Spain by the American Locomotive Company in 1920

## Railway Supply Exports Show Marked Decline

Adverse Conditions of Exchange and Credit Bring About a Temporary Lull in the Export Showings

THE EXPORTS of railway materials during the first ten months of 1920 fell short enough of the totals for the year 1919 to make it safe to predict that the exports for the whole year, the figures for which are not as yet available, will show a considerable decline from the 1919 totals, except in the case of steam and electric locomotives, where an increase will probably be shown. Taking freight cars as a case in point, it will be noted that the exports for 1919 were 27,317, valued at \$57,473,824, while the figures for the first ten months in 1920 give these totals as 18,932 and \$32,831,303. The year 1919 was a banner year for exports of railway materials, however, and the figures for that year are the only annual totals which exceed the exports of freight cars for the first ten months only in 1920. Much the same situation obtains as regards the other articles of export, i.e., the 1920 shipments, generally speaking, were less than those of 1919, but greater than those of any previous year.

It had been hoped in this country that the heavy export trade which American equipment manufacturers enjoyed in 1919 could be made permanent. Several conditions have arisen during the past year, however, which make the immediate fulfillment of this hope at least somewhat doubtful. The larger part of the shipments in 1919 were the results of orders placed in 1918 or in the early part of 1919. At that time the equipment manufacturers in other countries were either devoting a large part of their production to war materials or had not yet placed their plants on a peace time basis to an extent where they could handle the orders of their own countries, and it was practically impossible for them to make immediate foreign deliveries. Under such circumstances American manufacturers were practically without competition and sold their wares in almost every country where a market existed.

Conditions have changed somewhat during the past year. Manufacturers in foreign countries were able during 1919 and 1920 to resume production in increasing quantities. At first their factories were so disorganized that their costs of production were very high and American concerns could in most cases underbid their quotations. The situation for them in this regard has, however, steadily improved with the gradual return of pre-war efficiency. On the side of the foreign manufacturers and working in their behalf is the heavy premium on the American dollar which is practically world-wide and in many countries so high that purchases in

America are all but prohibitive. Under such circumstances our equipment builders have found it increasingly difficult to compete in prices with foreign manufacturers. The result is that fewer orders have been placed in this country and more are going to foreign concerns.

Another factor which has gone a long way in retarding purchases of railway materials in most countries is the impoverished condition of the greater part of the world as a result of heavy expenditures during the war. Most foreign roads have been in the position in which some of our own have found themselves—in actual need of great quantities of equipment but unable to finance the purchase of it.

The prospects for an early return to heavy exports of railway materials like those of 1919 do not appear as bright as might be wished. In the first place, the credit of the purchasers of this material must be restored so that they can make more purchases. Secondly, the rate of exchange must change so that foreign firms will not find it easy to underbid American manufacturers on account of it. Finally, the labor and raw material which go into the finished product must cost the American manufacturer no more than they do his foreign competitor. Labor costs per unit manufactured can be equalized in two ways: (1) by the same wage scale in America as in Europe or (2) by increased efficiency of American labor to the point where the labor cost per unit is the same as in Europe.

It does not seem at present that the buying power of foreign railways will greatly increase in the near future, nor is there any indication of an early return of the exchange rate to par. The securing of a reasonable cost of manufacture lies largely with the American manufacturers and their employees.

The *Railway Age* publishes each month the exports of railway materials as compiled by the Division of Foreign and Domestic Commerce. These interesting figures give an accurate account of materials shipped month by month with the value and destination. For purposes of comparison these reports have been summarized here.

### Steam Locomotive Exports

The totals of exports of steam locomotives for each of the ten months to October have been compiled in Table I. It will be observed that from January 1 to October 31, 1920, 1,426 steam locomotives valued at \$45,227,046 were shipped.

By comparing these figures with those for other years, it will be noted that the exports of steam locomotives for 10 months in 1920 have exceeded in value, and approach in number, the totals for any previous year. From this it may be deduced that 1920, with two more months yet to be reported, bids fair to exceed the previous years in the number of locomotives

and December will be large enough to off-set them. The freight car situation affords even less hope of equaling even the 1919 figures. During the first ten months of the year 18,932 cars valued at \$32,831,303 were shipped. These figures fall far below the 1919 totals. Cuba was the destination of a large share of this equipment.

Table III gives the exports of car wheels and axles. The only figures which give a proper basis for comparison with these figures are those for 1918 and 1919, because the totals shown for other years are for car wheels only. It will be seen that the total for the first ten months has already exceeded the exports for 1918, but that there is little likelihood that the great value of these exports in 1919 will be reached.

Track Materials

The exports of railway track materials are shown in Table IV. Here the decline in shipments from 1919 has been great enough to be little short of remarkable. In point of quantity

TABLE I—EXPORTS OF STEAM LOCOMOTIVES

Month	Number	Value
January	146	\$4,189,214
February	132	4,380,074
March	125	3,672,579
April	157	4,449,736
May	152	5,906,046
June	163	4,248,348
July	134	4,742,306
August	125	5,424,588
September	154	4,105,405
October	138	3,494,750
Total for ten months of 1920	1,426	\$45,227,046

Comparison with Previous Years (Entire 12 Months)

Fiscal Year	Number	Value
1914	383	\$3,692,225
1915	238	2,115,866
1916	799	12,665,877
1917	1,442	18,243,248
1918	1,457	35,889,632
Calendar Year—		
1918	1,062	27,064,042
1919	959	30,275,728

exported. It may be well to note here that the increase in value is due not alone to increased prices, but also to the increasing size and power of the locomotives which are being ordered each year from abroad.

Exports of Cars

In the case of cars the showing for 1920 is not so promising. The figures for the first ten months as shown in Table

TABLE II—EXPORTS OF CARS FOR STEAM RAILWAYS

Month	Passenger		Freight and other	
	No.	Value	No.	Value
January	16	\$205,811	1,724	\$3,032,309

October	3,534,645	142,611	53,266	3,426,671	689,785
Total for 10 months, 1920	30,046,451	1,289,195	474,599	28,922,669	5,430,490

Comparison with Previous Years (Entire 12 Months)

Fiscal Year	Spikes		Steel rails		Switches, frogs, splice bars, etc.
	Pounds	Dollars	Tons	Dollars	
1914	19,564,618	346,034	338,613	10,259,109	2,534,148
1915	12,289,203	203,663	159,587	4,537,978	2,407,490
1916	59,145,818	1,398,514	537,918	17,631,756	5,261,944
1917	42,809,961	1,502,430	594,389	25,405,469	9,108,617
1918	34,832,142	1,722,922	430,347	22,817,400	6,286,369
Calendar Year—					
1918	22,330,104	1,229,083	453,537	26,402,864	5,882,860
1919	55,487,231	2,896,073	652,443	38,986,855	9,280,725

the figures in all cases give the shipments for the first ten months of 1920 at little more than half those for 1919. Spikes weighing 30,046,451 pounds and valued at \$1,289,195; steel rails weighing 474,599 tons valued at \$28,922,669; and miscellaneous material valued at \$5,430,490 complete the totals for the ten months. While the showing is very unfavorable when compared with the peak year, 1919, the indications are that the full year 1920 will give totals as great, and in most cases greater, than any other year for exports of this material. The weight and value of shipments of spikes and rails have in the ten months exceeded the figures for any other year excepting 1919. Cuba and Japan were the destinations of large consignments of track material.

Table V shows the exports of electric locomotives which during 1920 will probably equal the 1919 figure in point of

TABLE V—EXPORTS OF ELECTRIC LOCOMOTIVES

Fiscal year	No.	Dollars
1914	48	\$437,452
1915	43	324,478
1916	62	452,324
1917	73	563,550
1918	39	161,453
Calendar year		
1918	47	183,200
1919	68	835,978
1920 (first 10 mos.)	60	861,580

number and possibly that of the banner year for export of electric locomotives, 1917, when 73 were shipped. In point of value the shipments for the first ten months of 1920 have already exceeded those of any previous year.

# General News Department

The New York Section of the Signal Division of the American Railroad Association will hold its next meeting on Thursday evening, January 20, at the Hotel McAlpin, Sixth avenue and 34th street, New York City. Louis F. Vieillard, electrical inspector, Long Island Railroad, will present a paper on A. C. track circuits. Men on steam roads using A. C. track circuits are particularly invited to attend and to relate their experience with A. C. compared with D. C. track circuits.

A station, properly equipped, and attended by an agent, must be maintained, in Canada, at every place where the average railroad earnings have been not less than \$15,000 a year. This is in accordance with general order No. 54 of the Railway Commission. The commission has received an application, on behalf of the railroads, for an order amending No. 54 so as to make the limit \$25,000, of which \$4,000 must be on inward traffic. The application is made on the ground that the cost of maintenance of agency stations has more than doubled; and that the rule, if not changed, will require the maintenance of stations at points where there is but a small volume of business.

## Wood Preservers' and Tie Producers' Associations Meet in San Francisco

The American Wood Preservers' Association will hold its seventeenth annual convention at the St. Francis Hotel, San Francisco, Cal., on January 25, 26 and 27. The National Association of Railroad Tie Producers will hold its third annual convention at the same hotel on January 27 and 28. The programs for these two conventions have been completed and are published in abstract below.

In view of the increasing use of western timber throughout the central and eastern states, members of these associations are taking advantage of the opportunity to make first-hand study of lumber conditions in those areas. Special cars will leave Chicago on January 15, with connecting cars from St. Louis and Kansas City, arriving at Seattle, January 19, where four days will be spent in studying the timber resources and methods of producing lumber in the northwest. The party will arrive at San Francisco Tuesday morning, January 25, prior to the opening of the Wood Preservers' convention.

### WOOD PRESERVERS' PROGRAM

#### Tuesday Morning.

Opening business.

#### Tuesday Afternoon.

Report of Committee on Preservatives.

Paper on Creosol, by R. G. Smith.

Report of Committee on Utilization and Service.

Report of Committee on Track.

Paper on Selection and Treatment of Douglas Fir Ties, by A. C. Pestel.

Report of Committee on Flooring and Paving.

#### Wednesday Morning.

Report of Committee on Treatment.

Report of Committees on Fir Ties and Blocks.

Paper on Treated Lumber in Insulating Roofs of Moist Factories, by F. J. Hoxie.

Paper on History of Wood Pipe and Some Data on Its Use, by E. F. Bartells.

#### Wednesday Afternoon.

Paper on Experiments with Butt Treated Poles in California, by P. R. Hicks.

Paper on Perforated Butt Treated Poles, by W. M. Leavitt.

Paper on Wood Preservation as a Conservative Policy, by Walter Buebler.

Paper on Description of Process Used to Treat Pole Butts in Place, by E. F. Hartman.

#### Thursday Morning.

Report of Committees on Pressure and Non-Pressure Treatment of Poles.

### TIE PRODUCERS' PROGRAM

#### Thursday Afternoon.

Convention opens at 1:30 p. m.

Address by Edmund W. Blake, president.

Report of Committee on Specifications, dealing principally with the specifications and inspection rules proposed by the Tie Committee of the American Railway Engineering Association for adoption by that association. These specifications will be discussed with reference to yellow pine ties by R. E. McKee, The Long-Bell Lumber Company; white and red oak ties by Walter Poleman, The Western Tie & Timber Company; redwood ties by H. M. Cochran, The Union Lumber Company; Douglas fir ties by R. L. France, The Southern Pacific; ties manufactured from Rocky Mountain timber by B. Coldren, The Hallack & Howard Lumber Company, and ties manufactured from cedar and northern hardwoods, by Benjamin Finch, of Finch Brothers.

#### Friday Morning.

Reports on tie production from the 11 tie producing districts of the association.

The Relation Between the Tie Producers, Treating Plants and the Railroads, by R. A. Calvin, The Kettle River Company.

The Various Factors Entering into the Cost of Delivered Cross Ties, Both to Producing and Non-Producing Roads, by Howard Andrews.

The Nashville Tie Company.

The Function and Necessity of the Small Mill in Tie Production, by J. S. McCladry, The Bohemia Lumber Company.

#### Friday Afternoon.

The Use of Mechanical Power in the Production of Cross Ties, by R. J. Withrell, of L. D. Leach & Co.

The Timber Resources of the United States with Special Reference to the Pacific Coast, by C. L. Hill, in charge of office of Forest Products, California district, U. S. Forest Service.

The Tie Supply of the Future, by John Foley, forester, Pennsylvania Railroad.

The Effect of Increased Costs of Cross Tie Renewals upon Permissible First Cost of Ties in the Track, by R. H. Howard, chief engineer maintenance of way, Wabash Railway.

The Economics of Railroad Tie Purchasing, by E. E. Pershall, T. J. Moss Tie Company.

Open discussion standardized specifications and inspection and action upon them by the association.

On Saturday a special train will carry the members of the two associations and their guests into the redwood forest near Santa Cruz, Cal.

## Central Railway Club

The next meeting of the club will be held on Thursday evening, January 13, at Hotel Iroquois, Buffalo, N. Y. There will be an exhibition of moving pictures showing the manufacturing methods of the Eddystone plant of the Baldwin Locomotive Works, with an explanatory address by A. H. Ehle, general sales manager. Officers for the new year will be installed.

## Program of the Annual Meeting of the A. S. C. E.

The following is a summary of the meetings and excursions planned for the 68th Annual Meeting of the American Society of Civil Engineers to be held at the headquarters of the society at 33 West Thirty-ninth street, New York, on January 19 and 20, 1921:

Wednesday, January 19.

10 a. m.—Business meeting.

1.15 p. m.—Luncheon.

2:30 p. m.—For the benefit of the society's guests, as well as

for its members in case the business meeting does not continue through the afternoon, arrangements have been made whereby those who desire may have the choice of visiting any or all of the following places of interest:

- (1) Experimental laboratories, Western Electric Company.
  - (2) Surveying and Engineering Instrument Factories of Keuffel & Esser Company, Hoboken.
  - (3) Fox Film Corporation Motion Picture Studios and Laboratories.
  - (4) New buildings under construction for Fletcher's Castoria Company and Western Electric Company.
  - (5) Long Distance Telephone Exchange, American Telephone and Telegraph Company.
- 9 p. m.—President's reception, followed by dancing.

Thursday, January 20.

- 9:45 a. m.—Excursion to Long Island City.
- 1 p. m.—Luncheon, Metropolitan Life Insurance Company Building (Manhattan).
- 2:30 p. m.—Address by President, Metropolitan Life Insurance Company.
- 3-4:30 p. m.—Inspection of "Human Engineering" Work and the buildings of the Metropolitan Life Insurance Company.
- 8:30 p. m.—Address and informal smoker.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, Room 3014, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION.—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—E. A. Pontius, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DRIVING CAR SUPERINTENDENTS.—S. W. Derr, Philadelphia and Reading, Philadelphia, Pa.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago. Next meeting June 20, 1921.
- AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. L. Duncan, C. & E. R. Ry., Chicago, Chicago, Chicago.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 24-26, 1921, Kansas City, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Berchardt, 202 North Hamlin Ave., Chicago, Ill.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, 75 Church St., New York. Next meeting, January 19, 1921.
- Division 1, Operating (including former activities of Association of Railway Telegraph Superintendents).—W. J. Frupp (chairman), General Manager, N. Y. C. R. R., New York. Exhibit by Hulatt (chairman), Manager of Telegraphs, Grand Trunk. Exhibit by Railway Telegraph and Telephone Appliance Association.
- Division 2, Transportation (including former activities of Association of Transportation and Car Accounting Officers).—E. J. Pearson (chairman), President, N. Y. N. H. & H. R. R., New Haven, Conn.
- Division 3, Traffic.—Robert C. Wright (chairman), General Traffic Manager, P. R. R., Philadelphia, Pa.
- Division 4, Engineering.—E. H. Fritch, 431 South Dearborn St., Chicago. Next annual meeting, March 15-17, 1921, Chicago.
- Construction and Maintenance Section.—E. H. Fritch, secretary.
- Electrical Section.—George Gibbs (chairman), Chief Engineer of Electric Traction, Long Island Railroad, New York.
- Signal Section.—H. S. Balliet, 75 Church St., New York. Exhibit by Signal Appliance Association.
- Division 5, Mechanical (including former activities of Master Car Builders' and Master Mechanics' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago. Next convention June 15-22. Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.
- Equipment Painting Section.—V. R. Hawthorne, secretary.
- Division 6, Purchases and Stores (including former activities of Railway Storekeepers' Association).—J. P. Murphy, General Storekeeper, N. Y. C. R. R., New York, Ohio. Second annual meeting, June 20-22, 1921, Atlantic City, N. J.
- Division 7, Freight Claims (including former activities of the Freight Claim Association).—Lewys Pilcher, 431 South Dearborn St., Chicago.
- Division 8, Perishable Freight.—E. F. McPike (chairman), 431 South Dearborn St., Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Litchy, C. & N. W. Ry., 319 W. Wabash Ave., Austin Station, Chicago. Next convention in New York City. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railroad Association, Section II.)—E. H. Fritch, 431 South Dearborn St., Chicago. Next annual meeting, March 15-17, 1921, Chicago. Exhibit by National Railway Appliance Association.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of American Railway Tool Foremen's Association.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.
- AMERICAN SOCIETY FOR TEST MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Col. H. S. Crocker (acting secretary), Engineering Societies Building, 33 W. 39th St., New York. Annual meeting, January 19-20, 1921, 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 49th St., New York.
- AMERICAN STEEL TREATERS' SOCIETY.—W. H. Eisenman, 154 East Erie St., Chicago.
- AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, Northern Pacific Ry., Spokane, Wash. Next convention, June 20, 1921, Kansas City, Mo.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next annual meeting, January 23-27, 1921, San Francisco.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J. Next meeting at St. Louis, Mo.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & W. V. Ry., Chicago, C. & N. W. Sta., Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 492 Broadway, New York, N. Y.
- ASSOCIATION OF RAILWAY SUPPLY MEN.—C. L. Mellor, 212 W. Illinois St., Chicago. Meeting with International Railway General Foremen's Association.

- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division 1.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division 2.)
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—A. J. Filkins, Paul Dickinson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—A. Booth, 131 Charbon St., Montreal, Que. Next meeting, December 14.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
- CAR FOREMEN'S ASSOCIATION OF ST. LOUIS.—Thomas B. Konecne, Federal Reserve Bank Bldg., St. Louis, Mo. Meetings first Tuesday in month at the American Hotel Annex, St. Louis, Mo.
- CENTRAL RAILWAY CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—J. C. Keene, General Car Inspector, Wabash R. R., Decatur, Ill.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—W. P. Elliott, Terminal R. R. Ass'n of St. L., East St. Louis, Mo.
- CINCINNATI RAILWAY CLUB.—H. Boutet, 101 Carew Bldg., Cincinnati, Ohio.
- EASTERN RAILROAD ASSOCIATION.—D. G. Stuart, Washington, D. C.
- FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division 7.)
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich.
- INTERNATIONAL RAILROAD MASTER CARBONERS' ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1921, Hotel Sherman, Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn. Exhibit by Association of Railway Supply Men.
- MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City.
- Next convention, October 4-6, 1921, Buffalo, N. Y.
- MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Next convention, May 23-26, 1921, Planters' Hotel, St. Louis, Mo.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—(See American Railway Association, Division 5, Equipment Painting Section.)
- MASTER CAR BUILDERS' ASSOCIATION.—(See American Railway Association, Division 5.)
- NATIONAL ASSOCIATION OF RAILROAD TIE PRODUCERS.—E. E. Pershall, T. J. Moss Tie Company, 720 Security Bldg., St. Louis, Mo. Next annual convention, January 27-28, 1921, San Francisco.
- NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York.
- NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York.
- NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago. Meeting with American Railway Engineering Association.
- NEW ENGLAND RAILWAY ASSOCIATION.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 30th St., New York.
- PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.
- RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson. Next annual meeting, June 8, 1921, Hotel Traymore, Atlantic City, N. J.
- RAILWAY BOILERMAKERS ASSOCIATION.—Frank W. Dixon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.
- RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Athletic Club, Harrisburg, Pa.
- RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welly, Missouri Pacific R. R., Little Rock, Ark.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, Central Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.
- RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Meeting with Traveling Engineers' Association.
- RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.
- RAILWAY REAL ESTATE ASSOCIATION.—R. II. Morrison, C. & O. Ry., Richmond, Va.
- RAILWAY SIGNAL ASSOCIATION.—(See American Railway Association, Division 4, Signal Section.)
- RAILWAY TOOL FOREMEN'S ASSOCIATION.—(See American Railway Association, Division 6.)
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with American Railway Association, Division 5.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.
- ROADMASTERS AND MAINTENANCE OF WAY ASSOCIATION.—F. I. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Chicago. Exhibit by Track Supply Association.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Tetlow, Schrodter Headlight & Generator Co., New York City. Meeting with American Railway Association, Signal Section.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.
- SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.
- SUPPLY ASSOCIATION OF RAILWAY TOOL FOREMEN'S ASSOCIATION.—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.
- TRACK SUPPLY ASSOCIATION.—W. C. K'dd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters and Maintenance of Way Association.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' Association.

## Traffic News

The Gulf Coast Lines announce that, beginning February 1, a sleeping car will be run regularly between Houston, Texas, and Tampico, Mexico, via Brownsville and Matamoros.

The Supreme Court of New York, at Kingston, has authorized the reopening of the case in which the Court of Appeals recently decided that the New York Central must carry way passengers between Albany and Buffalo at the rate of 2 cents a mile, notwithstanding the order of the Interstate Commerce Commission prescribing a higher rate.

The Interstate Commerce Commission has vacated and set aside as of December 31 its Service Order No. 1 issued on May 20, which authorized and directed railroads to route freight regardless of the routing instructions of shippers or of connecting lines, to relieve congestion, and also its Service Order No. 13 issued on August 24, authorizing carriers to unload cars of grain at Galveston. The emergency which caused the issuance of these orders has been measurably relieved.

The Southern Pacific announces that the Sunset Route via New Orleans has been reopened for through passenger travel on the basis of fares applying over other routes, to and from the eastern and northern territory served by the Sunset Route for 37 years prior to the closing of the New Orleans gateway in October, 1919, by the Railroad Administration. This means that from Chicago, Louisville, Cincinnati and points east thereof, to all points in California, the fares are now as low through New Orleans as those over the other lines.

The Traffic and Transportation Association, of Pittsburgh, Pa., held its election of officers on December 10. S. R. Hosmer, of the Jones & Laughlin Steel Company, was elected president; H. A. Dietz, of the Delaware & Hudson, vice-president; George E. Gree, of the Union Pacific, treasurer; R. F. Heil, of the Guth Refining Company, recording secretary; F. E. Wolfe, of the Atchison, Topeka & Santa Fe, financial secretary; and H. L. Geyer, of the Carnegie Steel Company, custodian. H. A. Cochran, of the A. M. Byers Company, was elected chairman of the executive committee; E. A. Hynes, of the Chicago & Alton; W. H. Spilker, of the Pittsburgh Terminal Warehouse & Transfer Company; A. C. Schweitzer, of the Tonnage Steel Company, and H. A. Dietz are the other members.

### Coal Production

Production of soft coal decreased during the week ended December 25, not only because of the Christmas holiday but also because of a smaller rate of output per working day. The total production is estimated at 9,725,000 net tons. Cumulative production for the calendar year to December 25, amounted to 547,264,000 net tons. If the rate of production be continued during the five remaining days of the year, the total output will be 556,000,000 tons. Production during the first 303 working days of the year was over 1,000,000 tons greater than that for 1917, but 25,000,000 tons less than that for 1918, although 97,000,000 tons greater than that for 1919.

## Equipment and Supplies

### Locomotives

THE FLORIDA EAST COAST is asking for prices on 5 switching and 10 Pacific type locomotives.

THE INTERNATIONAL & GREAT NORTHERN is inquiring for 4 Mikado and 4 switching locomotives.

### Freight Cars

THE JERRY MUGIVAN CIRCUS interests, Peru, Ind., are inquiring for 20 flat cars of 30-ton capacity.

THE SOUTH AFRICAN RAILWAYS are inquiring through their London, Eng., office for 200 gondola cars.

THE UNITED FRUIT COMPANY, Pier 9, North river, New York, is inquiring for 40 box cars and 40 flat cars of 16 tons capacity.

MITSUI & Co., 65 Broadway, New York, has ordered from the Kilbourne & Jacobs Manufacturing Co., 50 air dump cars for the Japanese Government, to be used in Formosa.

### Passenger Cars

THE FLORIDA EAST COAST is asking for prices on 6 passenger cars.

THE DEPARTMENT OF CITY TRANSIT, Philadelphia, Pa., William S. Twining, director, is asking for bids until January 25, for from 50 to 100 steel passenger car bodies for steel passenger cars, for elevated and subway service and for from 54 to 104 motor trucks.

### Iron and Steel

THE SOUTHERN RAILWAY has ordered 5,000 tons of rails from the United States Steel Corporation.

THE BALTIMORE & OHIO has ordered 15,000 tons of rails from the United States Steel Corporation.

THE ATCHISON, TOPEKA & SANTA FE has ordered 40,000 tons of rails from the United States Steel Corporation.

THE CHICAGO UNION STATION COMPANY has ordered 700 tons of structural steel from the Bethlehem Steel Company for use in the construction of the Van Buren street viaduct, Chicago.

THE NEW YORK, CHICAGO & ST. LOUIS has placed an order for 3,000 tons of open-hearth rails, for 1921 delivery, with the Carnegie Steel Company, increasing its order from this producer to 9,000 tons.

### Miscellaneous

MITSUI & Co., 65 Broadway, New York, has ordered 3,200 couplers from the National Malleable Castings Company, to be used on the Japanese Government railways.

## Supply Trade News

**Emanuel Woodings** has been elected vice-president of the Verona Tool Works, Pittsburgh, Pa. Mr. Woodings has been connected with the company 33 years.

**A. G. Shaver**, chief engineer of the **Regan Safety Devices Company, Inc.**, Chicago, has been in England and has made a tour of the Continent, making a study of train control conditions there.

**The Du Pont Fabrikoid Company, Inc.**, Wilmington, Del., announces that its entire business has been sold to E. I. Du Pont De Nemours & Co., Inc., also of Wilmington, and is now operated as the Fabrikoid division of that company.

**Howard H. Marsh**, for nearly eight years district manager of the *Railway Age* and the other publications of the **Simmons-Boardman Publishing Company** at Cleveland, Ohio, has

resigned to become president of the **Victory Equipment Company**, with office at 444 Maison Blanche Annex, New Orleans, La. As head of the Victory Equipment Company, he will handle the following accounts: McMyler-Interstate Company, Cleveland, locomotive cranes, pile drivers and material handling equipment; Ball Engine Company, Erie, Pa., steam shovels and railroad ditchers; Schaefer Equipment Company, Pittsburgh, Pa., truck lever connections, brake levers, brake rod jaws and stake

pockets; and Equipment Manufacturing Company, Cleveland, trucks and trailers. His education, business experience and wide acquaintance fit Mr. Marsh for his new undertaking. He is still a young man, having graduated at the University of Vermont in 1903, with the degree of B. S. in civil engineering. That same year he entered the employ of *Engineering News* (now *Engineering News-Record*) as assistant to the western manager, and stayed there until 1907, when he was appointed western representative of Engineering & Contracting, with headquarters in Chicago. He left the latter place to go to Cleveland as district manager of the **Simmons-Boardman Publishing Company**. Mr. Marsh's removal to New Orleans is due to his desire to be near his family, as it was necessary for Mrs. Marsh to take up her residence in the southwest in order that her health might be restored. In addition to his other work, Mr. Marsh will represent the **Simmons-Boardman Publishing Company** in the southwestern territory.

**W. H. Darrah**, sales representative for the **Upson Nut Company**, and the **Bourne-Fuller Company**, of Cleveland, Ohio, and Chicago, is now connected with the **Michigan Bolt & Nut Works of Detroit, Mich.**, as sales representative in the Chicago territory.

**George S. Bigelow**, formerly manager of the railway department of the **Railway Varnish Company**, is now in charge of the railway department of the **Mountain Varnish & Color Works, Inc.**, of Toledo, Ohio, with offices in the Railway Exchange Building, Chicago.

**John B. Zymour**, formerly with the **National Lock Washer Company**, Newark, N. J., has been appointed manager of the sales department of the **Verona Tool Works**, Pittsburgh, Pa.,

with headquarters at Chicago, succeeding **Howard C. Mull**, who has resigned to go to another company, as noted in the *Railway Age* of December 31.

**William S. Boyce**, for a number of years connected with **The Rail Joint Company**, New York, has been appointed western manager of sales for the **Lundie Engineering Corporation** with headquarters at 30 North La Salle street, Chicago, Ill.

**Harry B. Stafford**, who has opened an office as consulting industrial labor administrator in the Hudson Terminal, 30 Church street, New York, as noted in these columns last week, was formerly for some three years major in the Construction Division of the United States Army, instead of manager, as incorrectly stated.

**F. Lavis** will resume his independent practice as consulting engineer at 120 Broadway, New York City, specializing in transportation developments and especially in those relating to foreign countries. He has been retained by the **American International Corporation**, New York, with which he has been associated since its inception.

**John S. Lemley**, for five years general sales agent of the **G. F. Cottor Supply Company**, Houston, Tex., and later associated with **William D. Jenkins**, dealer in railway supplies, St. Louis, Mo., has been appointed sales representative for southeastern territory for **Harry Vissering & Co.**, the **Okadee Company**, Chicago, and the **Charles R. Long, Jr., Company**, Chicago, effective January 1.

### Lima Locomotive Works Changes

**Lewis A. Larsen**, assistant to the president of the **Lima Locomotive Works, Inc.**, has been elected vice-president and **Waldo H. Marshall** has been elected a director.

Mr. Marshall was formerly president of the **American Locomotive Company** and later resigned to go with **J. P. Morgan & Co.**

Mr. Larsen was born at Ridgeway, Ia., in 1875. He received his early education in the public schools of Ridgeway and Decorah, Ia., and Upper Iowa University, Northwestern University and St. Paul College of Law. In November, 1897, he entered the service of the **Chicago Great Western** as clerk to the master mechanic. He held successively the position of chief clerk to the

superintendent of motive power and chief clerk to the assistant general manager. In 1904 he resigned to accept the position of chief clerk to the superintendent of motive power of the **Northern Pacific** at St. Paul. In November, 1906, he became associated with **W. H. S. Wright**, railway supplies, representing the **Railway Steel Spring Company**, the **Pittsburgh Forge & Iron Company** and other companies, and in 1907 entered the service of the **American Locomotive Company**. In 1909 he was appointed assistant to the vice-president in charge of manufacturing, and July, 1917, was appointed assistant controller. For several years previous to 1917 Mr. Larsen was a special lecturer in the **Alexander Hamilton Institute**, New York. He has also contributed a number of papers to the railroad magazines. In December, 1917, he was appointed assistant to the president of the **Lima Locomotive Works**.

**R. F. Eissler**, has been appointed assistant to the vice-president of the **Chicago Pneumatic Tool Company**, New

H. H. Marsh

L. A. Larsen

York, with headquarters in the company's new office building at 6 East Forty-fourth street, New York. **W. C. Straub**, formerly district manager of the New Orleans branch, has been appointed district manager of the Pittsburgh branch to succeed Mr. Eissler, and **Ross Wyeth**, formerly attached to the Pittsburgh branch, has been appointed district manager of the New Orleans branch to succeed Mr. Straub.

On January 1, the general offices of the **Stone Franklin Company** were removed from 18 East Forty-first street, New York, to 6400 Plymouth avenue, St. Louis, Mo. This change brings the office in close connection with its manufacturing plant. In addition to its general offices in St. Louis, the Stone Franklin Company will also maintain a New York office at 30 Church street, in charge of president **Ralph G. Coburn** and vice-president **C. E. Walker**. **H. D. Rohman**, at present chief engineer of the company, has been appointed vice-president, with office at St. Louis, in addition to his present duties. He will have jurisdiction over sales in the west.

The **B. F. Goodrich Rubber Company**, Akron, Ohio, on December 31, 1920, celebrated its golden anniversary. The company was incorporated December 31, 1870, by Dr. Benjamin Franklin Goodrich. In a golden anniversary greeting to employees and customers, President B. G. Work said in part: "We feel a thrill of pride as we look back over the years and realize the part we have played in the development of the rubber industry." The Goodrich company commemorated the golden anniversary by publishing an attractive 48-page book called the Golden Year of Goodrich, telling of the romance of the rubber industry, its history, and of what great importance it has been in the progress and development of the world. The book was written by Wilbur D. Nesbit and illustrated by W. T. Benda, the Polish-American painter.

## Obituary

WILLIAM ROBINSON

Dr. William Robinson, inventor of the closed track circuit, the distinctive essential element in the automatic block signal system used on all the important railroads of the United States, died at the Muncie Sanitarium, in Brooklyn, N. Y., on Sunday, January 2, at the age of 80. He was born at Cole Island, County Tyrone, Ireland. He was unmarried and had lived in Brooklyn 76 years. He was an inventor in many fields and is credited with an electric welding process and the coaster brake for bicycles. He was a fellow of the American Institute of Electrical Engineers and an honorary member of the Signal Division of the American Railroad Association.

Dr. Robinson's experiments with track circuits began more than fifty years ago. He installed a section, open circuit, on the Philadelphia & Erie, now a part of the Pennsylvania, at Kinzua, Pa., in 1870, one of the co-operating railroad officers being the late Theodore N. Ely, afterward chief of motive power of the Pennsylvania Railroad. The closed circuit, which is the chief element in Robinson's fame, was tried on the same road in 1871, and a patent applied for. He took out patents on other features of automatic signaling, but in a list of electric signal patents published by the Union Switch and Signal Company in 1894, Robinson's name appears only once, namely, November 7, 1882, patent number 267,259. Like all other patentees of important inventions, he had to fight long years in the courts for his rights.

In 1876 Robinson went to Boston and his first extensive experiments were made on the Boston & Lowell, the Boston & Providence, and the Old Colony. In 1878 he formed the Union Electric Signal Company, which about two years later was bought by George Westinghouse and became the Union Switch & Signal Company.

To Robinson, inventor of the closed track circuit, and Professor Joseph Henry (1799-1878), inventor of the electromagnet, the world is indebted for one of the most wonderful elements in modern high-speed railroading, the automatic block signal. All of the automatic signals of American railroads depend on these two features.

## Railway Financial News

**ATCHISON, TOPEKA & SANTA FE.**—This company has declared the regular quarterly dividend of 1½ per cent on its common stock, payable March 1 to stock of record January 28.

**BALTIMORE & OHIO.**—The Interstate Commerce Commission has authorized this company to nominally issue \$7,586,000 of refunding and general mortgage bonds to be held in its treasury and to issue and pledge \$362,000 of its Pittsburgh & Lake Erie and West Virginia System refunding 4 per cent gold bonds as additional collateral security for the refunding and general mortgage bonds; also to issue and pledge \$1,000 of its Pittsburgh Junction and Middle Division first mortgage bonds as additional collateral security for its Pittsburgh, Lake Erie & West Virginia bonds. Authority was also granted to various subsidiary companies to issue and deliver their bonds to the Baltimore & Ohio Company's nominees in payment for additions, improvements and betterments. Authority was also granted to issue conditional sale purchase notes for the conditional purchase of equipment under the terms of the contract entered into with the National Railway Service Corporation, to assume liability as guarantor in respect of an application of the service corporation to the United States for a loan on account of the equipment, and to pledge \$3,250,000 of its refunding and general mortgage bonds as security in part for the performance of obligations under the equipment trust.

**BOSTON & MAINE.**—This company has been authorized by the Interstate Commerce Commission to issue \$609,000 of mortgage bonds dated January 1, 1921, at 7 per cent, to be sold or exchanged for the retirement of bonds of subsidiary companies.

**BUFFALO, ROCHESTER & PITTSBURGH.**—The Interstate Commerce Commission has approved a loan of \$1,000,000 to this company to aid the company in meeting its maturing indebtedness in a total principal amount of \$1,987,000. The company itself is required to finance \$987,000 to meet the loan of the government.

**CAROLINA, CLINCHFIELD & OHIO.**—The Interstate Commerce Commission has authorized this company to issue \$5,000,000 of 15-year 6 per cent cumulative income debentures dated July 1, 1920, and payable July 1, 1935, the proceeds of which are to be applied to the payment or discharge of outstanding short term notes and expenses and other current indebtedness.

**CENTRAL OF GEORGIA.**—This company has applied to the Interstate Commerce Commission for authority to issue \$650,000 of equipment trust certificates at 7 per cent, representing 55 to 60 per cent of the cost of equipment proposed to be acquired at the cost of \$1,066,123. The certificates are to be sold to bankers on a 7½ per cent basis and the balance of the purchase price the company expects to obtain in part from a loan of \$237,912 from the United States Government.

**CHICAGO & ALTON.**—This company has decided not to accept the government's compensation offer of \$3,178,314, which represents the road's standard return. The directors asked for \$4,592,500 and hold that compensation based simply on standard returns is not sufficient. An appeal will be made to the Court of Claims.

**CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.**—This company has applied to the Interstate Commerce Commission for authority to issue a promissory note for \$1,000,000 to the Chicago & North Western in renewal of an existing note and to repledge as collateral \$1,200,000 of its debenture gold bonds maturing 1930.

**CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.**—This company has been authorized by the Interstate Commerce Commission to assume as lessee of the Cincinnati Southern the obligation of paying as additional rental the interest on \$3,500,000 of 5 per cent gold bonds of the City of Cincinnati and of paying annually 1 per cent to provide a sinking fund.

**FREDERICKSBURG & NORTHERN.**—This company has applied to the Interstate Commerce Commission for a loan of \$20,000 from the

government for three years to be used in the purchase of a second-hand locomotive. The company says in its application that the lone engine now possessed is 39 years old and will not last any longer.

**ILLINOIS SOUTHERN.**—This road, which ceased operations under a court order in December, 1919, has been purchased by W. F. Carter, an attorney of St. Louis Mo. The road extends from Salem, Ill., to Bismarck, Mo., about 140 miles.

**MICHIGAN CENTRAL.**—The Interstate Commerce Commission has authorized this company to issue 15 six per cent promissory notes, each for \$262,000, to the New York Central for a loan aggregating \$3,930,000, the proceeds to be used by applicant in procurement of new equipment, and for additions and betterments to existing equipment; to issue one 10-year six per cent promissory note for \$613,000, to the New York Central, the proceeds to be used for additions and betterments to applicant's ways and structures; and to issue \$507,000 of six per cent refunding and improvement mortgage bonds, series B, maturing July 1, 1935, and to pledge same with the New York Central as security for the note for \$613,000.

In connection with the approval of this application, the commission said:

"While no request for a hearing has been made by any state authority answers containing representations on behalf of the states of Ohio, and Michigan, have been filed by the public utilities commissions thereof, in which dismissal of the application is asked, on the grounds: (1) that as the applicant is a railroad corporation organized and existing under the laws of the state of Michigan, we have no jurisdiction; (2) that the issue of securities by the applicant does not involve a federal question; and (3) that the applicant, not being a federal corporation or creature of the federal government, is not answerable to the federal government in any degree so far as its security issues are concerned. The answer on behalf of Michigan also asserts that said state is financially interested in the issue of securities by the applicant, for the reason that upon such issue being authorized by it, a statutory fee becomes payable to the state of Michigan before the issue or sale of the securities takes place.

"No objection to the granting of the application has been offered by the railroad, public service or utilities commissions, or other authorities of the states of Indiana, Illinois, or New York.

"It is well settled that common carriers by railroad engaged in interstate commerce, although organized and existing as state corporations, are nevertheless subject to our jurisdiction. Paragraph 7 of section 20a provides that a carrier may, under our authority, issue securities and assume obligations or liabilities in accordance with the provisions of said section 20a without securing other approval.

"Paragraph 2 of said section 20a provides that it shall be unlawful for a carrier by railroad to issue securities, even though permitted by the authority creating it, unless and until, and then only to the extent that, we authorize such issue. Any security for the issue of which our authority is required, is void if issued without such authority having been first obtained. Upon consideration of the answers of the public utilities commissions of Ohio and Michigan, we are of opinion that we have jurisdiction."

**NEW YORK CENTRAL.**—The Interstate Commerce Commission has authorized this company to issue \$6,494,000 of refunding and improvement mortgage bonds and to pledge them with the Secretary of the Treasury as security for a loan; also to assume obligations and liabilities in respect to \$6,420,000 of 6 per cent equipment trust certificates and to pledge them with the Secretary of the Treasury; also to assume obligations and liabilities as endorser and guarantor for promissory notes to be issued by its subsidiaries to the amount of \$18,299,000, also to be pledged with the Secretary of the Treasury as security for a loan. The commission had previously approved the making of two loans to the New York Central and its subsidiaries aggregating \$26,775,000.

**NEW YORK CENTRAL.**—The Interstate Commerce Commission has granted authority to various subsidiaries of the New York Central to issue their promissory notes to New York Central, the proceeds to be used for additions and betterments to roadway and structures, and to equipment.

**PEORIA & PEKIN UNION.**—This company has applied to the Interstate Commerce Commission for a loan of \$1,861,000 to retire bonds maturing on February 1, which the holders have declined to extend.

**TENNESSEE CENTRAL.**—This company has applied to the Interstate Commerce Commission for a loan of \$3,000,000 for the purchase of locomotives, cars, rail and other track material and to pay outstanding obligations. The company proposes to purchase six Mikado locomotives at a cost of \$270,000 and 300 coal cars at \$3,000 each.

## Railway Officers

### Executive

**Charles Hicks**, general manager of the Tennessee, Alabama & Georgia, with headquarters at Chattanooga, Tenn., has been appointed receiver on application made by counsel of the company.

**S. Ennes**, general manager of the Eastern lines of the Baltimore & Ohio, with headquarters at Baltimore, Md., has been appointed vice-president and general manager of the Wheeling & Lake Erie, with headquarters at Cleveland, Ohio, effective January 1. He succeeds **H. W. McMaster**, who has been granted a temporary leave of absence on account of illness and has been relieved of his duties as general manager but will continue as vice-president.

### Financial, Legal and Accounting

**A. J. Maxwell**, assistant auditor on the Atchison, Topeka & Santa Fe, Coast Lines, with headquarters at Los Angeles, Cal., has been appointed auditor of the subsidiary oil companies of the Santa Fe in California, effective December 15. **C. W. Sowle**, assistant auditor of disbursements, succeeds Mr. Maxwell.

**Edward G. Smith**, assistant treasurer of the Union Pacific, has been appointed treasurer, succeeding **F. V. S. Crosby**, deceased. Mr. Smith was born at Buffalo, N. Y., May 11, 1886. He was graduated from the Buffalo Central High School in 1902 and entered the service of the New York Central in 1903 in the office of the division engineer. In 1905 he was transferred to New York City as a clerk in the office of the engineer maintenance of way. In 1907 he left the New York Central to become a clerk in the treasurer's office of the Union Pacific. While working in this capacity Mr. Smith studied law in the New York Law School and received the degree of LL. B. in 1909 from that institution. The following year he received the degree of LL. M. from New York University and was admitted to the New York bar. Mr. Smith remained with the Union Pacific as cashier until December, 1917, when he resigned to enter the building business. In 1919 he again entered the service of the Union Pacific, this time as assistant treasurer, and served in that capacity until the time of his recent promotion.

### Operating

**J. D. Haydon**, superintendent of the Atlanta division of the Louisville & Nashville, with headquarters at Etowah, Tenn., has been transferred to the Eastern division at Ravenna, Ky., succeeding **M. Seargeant**. Mr. Seargeant succeeds Mr. Haydon as superintendent of the Atlanta division.

**Andrew Dutton**, trainmaster on the Chicago, Milwaukee & St. Paul, with headquarters at Des Moines, Ia., has been transferred to Dubuque, Ia., effective January 1, succeeding **R. L. Blakesley**, who has been assigned to other duties. The position of trainmaster at Des Moines has been abolished.

**A. O. Veitch**, trainmaster on the Idaho division of the Chicago, Milwaukee & St. Paul, with headquarters at Spokane, Wash., has been promoted to superintendent of the Olympic division, with headquarters at Port Angeles, Wash., effective December 22, succeeding **W. H. Molchior**, deceased.

**Allan Pollok** has been appointed manager of dining cars, hotels and restaurants of the Southern Pacific, with headquarters at San Francisco, Cal., effective January 1, succeeding **S. M. Estabrook**, who has been appointed assistant manager of dining cars, hotels and restaurants, with the same headquarters.

**W. F. Thiehoff**, who has been promoted to general manager of the Chicago, Burlington & Quincy, Lines West of

the Missouri River, with headquarters at Omaha, Neb., succeeding G. W. Holdrege, who has retired, effective January 1, was born on June 25, 1866, at Hunnewell, Mo. He entered railway service in 1883 as a section hand on the Chicago, Burlington & Quincy, and became a telegraph operator in 1885. From 1887, to May, 1889, he served as a freight brakeman, becoming a freight and passenger conductor on the latter date. After 16 years' service in this capacity, Mr. Thiehoff was promoted to trainmaster on the St. Joseph division, a position which he held until March 1, 1906, when he was transferred to the Brookfield division. He was promoted to assistant superintendent in 1907, and in July, 1908, he became superintendent of the Ottumwa division. He was transferred to the Beardstown division in February, 1911, and after service for 4 years in that position and as superintendent of the La Crosse division, he was promoted to general superintendent of the Nebraska district, with headquarters at Lincoln, Neb. At the time of his recent promotion, Mr. Thiehoff was serving as assistant general manager of the Lines West of the Missouri River, a position to which he had been promoted in July, 1916.

**R. C. White**, assistant chief engineer of maintenance of the Missouri Pacific, has been appointed general superintendent of the Eastern District with headquarters at St. Louis, succeeding **C. B. Wildman**. Mr. Wildman has been transferred to a similar position on the Western District with headquarters at Kansas City, succeeding **A. H. Webb**, who has been appointed superintendent of the Wichita division with headquarters at Wichita, Kan. Mr. Webb succeeds **J. E. Snedeker**, who has been appointed assistant superintendent of the same division. **W. C. Bevington**, superintendent of the Joplin division with headquarters at Nevada, Mo., who has been on a leave of absence because of illness, has again assumed his duties and acting superintendent **M. J. Crotty** has been appointed superintendent of the Central division with headquarters at Van Buren, Ark. **D. H. Robinson** has been appointed assistant superintendent of the Eastern division with headquarters at Sedalia, Mo., succeeding **G. B. Howden**, who has been appointed trainmaster of the Northern Kansas division with headquarters at Concordia, Kan. **J. C. Gerety**, trainmaster of the Colorado division with headquarters at Hoisington, Kan., has been transferred to a similar position on the Northern Kansas division with headquarters at Concordia, Kan. **J. C. Gerety** has been succeeded at Hoisington by **D. P. Gerety**, who was formerly trainmaster at Wichita, Kan. **S. E. Ridlon**, who was trainmaster on the Northern Kansas division at Concordia, Kan., has been transferred to a similar position on the Missouri division with headquarters at Poplar Bluff, Mo. **D. W. Hickey**, assistant superintendent of the Colorado division, will hereafter have direct charge of the Horace district (including Horace yard) and general jurisdiction over the entire division. These appointments were effective January 1.

### Traffic

**R. H. Morris** has been appointed general western freight agent on the Southern with headquarters at Chicago.

**E. L. Mountfort** has been appointed assistant traffic manager on the Gulf, Mobile & Northern, with headquarters at Chicago.

**G. E. Littlefair** has been appointed general agent of the Fort Worth & Rio Grande, with headquarters at Dallas, Tex., succeeding **C. A. Forrest**, who has been transferred.

**Charles D. Semple** has been appointed commercial agent on the St. Louis-San Francisco, with headquarters at San Francisco, Cal., and **W. L. Evans** has been appointed district passenger agent with the same headquarters.

**W. F. Van Bergen**, auditor of passenger accounts of the Chicago & North Western, with headquarters at Chicago, has retired after 55 years of continuous service with the North Western. **J. O. Clifford**, auditor of freight accounts, with headquarters at Chicago, has been transferred, succeeding Mr. Van Bergen. **E. J. Bloodgood**, auditor of freight overcharge claims, succeeds Mr. Clifford. **J. S. Fox**, assistant

auditor of freight accounts, succeeds Mr. Bloodgood. **G. W. Nelson** has been appointed assistant auditor of freight accounts, succeeding Mr. Fox. The appointments and changes are effective January 1.

**C. M. Davis**, a member of the Southern Freight Rate Committee, Atlanta, Ga., at one time general freight agent of the Atlantic Coast Line, has been appointed assistant freight traffic manager of that company with headquarters at Wilmington, N. C., effective January 1.

### Mechanical

**A. Peers**, division master mechanic on the Canadian Pacific, with headquarters at Moose Jaw, Sask., has been appointed master mechanic with the same headquarters, succeeding **W. J. Renix**, effective January 1.

**E. A. Murray**, master mechanic of the Chesapeake & Ohio with headquarters at Clifton Forge, Va., has been promoted to shop superintendent at Huntington, W. Va., effective January 1, succeeding **H. M. Brown**, resigned. **C. B. Hitch** succeeds Mr. Murray as master mechanic at Clifton Forge.

**R. A. Pyne**, superintendent of the motive power and car department of the Canadian Pacific, Eastern Lines, with headquarters at Montreal, Que., has been transferred to Winnipeg, Man., succeeding **C. H. Temple**, whose appointment as chief of motive power and rolling stock, with headquarters at Montreal, was announced in the *Railway Age* of December 31 (page 1184). **A. Sturrock**, master mechanic of the British Columbia district, with headquarters at Vancouver, B. C., has been promoted to assistant superintendent of motive power, with headquarters at Winnipeg, Man. The appointments and changes are effective January 1.

### Engineering, Maintenance of Way and Signaling

**G. W. Boschke** has been appointed assistant chief engineer of the Southern Pacific, Lines West of Ogden, El Paso and Portland, with headquarters at San Francisco, effective January 1.

**Paul Lebenbaum** has been appointed assistant electrical engineer on the Southern Pacific, with headquarters at San Francisco, Cal., succeeding **F. E. Geibel**, who has resigned, effective January 1.

**S. Morrison**, acting district engineer on the Canadian National, Western Lines, with headquarters at Vancouver, B. C., has been appointed assistant engineer maintenance of way, with the same headquarters, effective January 1, with jurisdiction over all lines west of Edmonton, Alta., and including Vancouver Island lines. The position of district engineer, Pacific district, has been abolished.

### Obituary

**W. H. Molchior**, superintendent of the Olympic division of the Chicago, Milwaukee & St. Paul, with headquarters at Port Angeles, Wash., died of cancer at Seattle, Wash., on December 18, after a long illness.

**Eugene H. Coapman**, who was recently given a leave of absence as vice-president of the Southern, on account of illness, died on January 5 at his home in Washington, D. C. Mr. Coapman was born August 11, 1865, and had been in railway service since 1880. He began as messenger boy on the Chicago, Milwaukee & St. Paul and was later operator, train dispatcher, chief train dispatcher and superintendent of telegraph on various roads. On March 1, 1901, he became trainmaster on the Atchison, Topeka & Santa Fe. He went to the Southern in 1902 as superintendent of the Danville division. In 1905 he was promoted to assistant general superintendent of the Eastern district, in 1906 to general superintendent of the same district, in 1907 to manager of the same district, and in January, 1908, to manager of the entire system. In 1910 he was appointed general manager and in October, 1910, also vice-president. During federal control Mr. Coapman was federal manager of the Southern.

The Coal Trade Journal says that the operators are incensed at the action of the railroads in rejecting coal, and claims the roads "are seeking to avoid living up to their obligations." For several years the railroads have paid prices that are all out of reason but when, on top of these exorbitant prices, they have been forced to accept some of the worst coal that ever came out of a mine, the railroads have felt that this was adding insult to injury. When the Boston & Maine was recently compelled to reject 400 cars of this near-coal the shippers in Cleveland thought that the railroad was taking advantage of a technicality to save some money on a falling market. But when they employed a consulting engineer to report the facts, they discovered that some of the rejected coal was unfit for any use whatever. Now that the tide has turned and the railroads are no longer obliged to accept the poor coal that has been forced down their throats at outrageous prices, the coal trade is talking about a "square deal." This sounds like "kamerad."

### Adding Insult to Injury

The officers and employees of each railroad ought to consider themselves members of a "Conservation Commission," to conserve, not particularly water power, or national forests, or even locomotive fuel or other railroad property; but railroad men. This is the suggestion of J. T. Loree, general manager of the

### A "Committee of the Whole" on Conservation

Delaware & Hudson, in a recent circular to his subordinates. This is his interpretation of the duty to seek "safety first," an idea which usually is formulated in somewhat different language. The desideratum is to inculcate the importance of co-operation. To warn a careless man not to step on rusty nails, or to refrain from adjusting drawbars with his foot, sometimes proves an embarrassing duty; there is a temptation to shirk it. But if a thousand fellow-employees are known to be in the same movement, and the co-operation is manifest, such duties are not so embarrassing. Mr. Loree does not make the mistake of expecting too much from co-operation per se; he reminds his men that "the results will depend on the personal energy, punch, or pep . . . which causes a man to exceed the letter of the law."

A dollar saved is a dollar earned and it is pretty generally believed that this is the only kind of a dollar the railroads are going to earn during the ensuing interval of business stagnation. Fortunately it is not difficult to discover ways in which the railroads can save money and the fuel bill appears to be

### A Dollar Saved Is a Dollar Earned

one of the most vulnerable items to attack. There is no question but what the railroads are going to save fuel; a reduction in traffic will enable them to lay aside the small, uneconomical locomotives and to use the best power they have to the best advantage. The lessened demand for coal will certainly result in the delivery of a better grade to the railroads and the scarcity of good jobs will surely tend to make each employee more inclined to conserve the company's

resources. These factors have so important a bearing on the situation that a reduction in fuel consumption per ton mile or car mile is bound to result whether or not the railroads increase their efforts toward fuel conservation. It is important, therefore, that the railroads should not be misled in the belief that they are making any real progress in this direction just because the figures indicate a fine showing in comparison with the previous year, or even the year before. The railroads must not simply be sure that they are making a fuel saving; they must be sure that they are saving all the fuel that can be saved under existing conditions.

Efficiency and economy, the watchwords for 1921, are subscribed to by every loyal railroad worker. Railroad shop managements at the present time are laboring under the necessity of increasing production to the highest point consistent with quality and decreasing costs. High production, good

### A Call for Efficient Shop Operation

workmanship and low unit costs mean efficient shop operation which will help tide the railroads over a business depression and minimize its serious effects. There are three prominent factors in efficient shop operation; namely, machinery, men and methods. It would be difficult, if not impossible, to say which factor is most important since the elimination or impairment of any one of them will seriously reduce shop output. It is proposed in subsequent issues of the *Railway Age* to develop in a series of editorials ways and means of increasing the productive capacity of shops and lowering unit costs consistent with good quality of work. The railroads have been confronted with a labor shortage almost continuously for the past five years. Conditions have changed so rapidly that the managements of overworked shops have found it difficult to "get by." One emergency has followed another in rapid succession and expedients have been adopted to meet them. Under such chaotic conditions there has been little opportunity for formulating or carrying out a constructive program of building up the shop organization. The fact that little improvement has been made in the condition of locomotives or cars since the roads were returned to their owners is evidence that the shops have little reserve capacity if they are not actually inadequate for present needs. This is an opportune time for each road to take stock of the situation in its repair plants, to analyze the tendencies of the past few years and to set out on the right track if the present policies are not giving results.

Some of the railways are giving out statements showing the percentage of their passenger trains which make their runs "on time." The Pennsylvania states that in the first ten days of December it operated 42,568 passenger trains on its entire system of 12,000 miles. Of this number 85 per cent arrived at

### Reduce the Number of Late Passenger Trains

destination on time, while, including those that started late, 93 per cent made their schedule time over the railroad. On the eastern region 90 per cent of all passenger trains arrived on time, and 95.7 per cent made their runs on schedule time.

The Chicago Great Western shows that in the four weeks ending November 26 of a total of 1,246 trains operated, 1,180, or 94.7 per cent, were on time. A larger number of railroads ought to give out statistics of this kind regarding the performance of their passenger trains. They would show the public that the number of trains late is smaller than many believe, and at the same time serve as a stimulus to the officers and employees to get trains over the road "as advertised." Among the principal causes of delays to passenger trains are locomotive failures. The eastern region of the Pennsylvania has given out information regarding delays due to this cause. There were 521 passenger train detentions on the eastern region in October which were caused by locomotive failures. This was 83 less than in the previous month, and 364 less than the number occurring in October, 1919. The total time lost by passenger trains owing to locomotive failures was reduced from 19,664 minutes in October, 1919, to 11,083 minutes in October, 1920. We think that most persons who have traveled much recently have the impression that there have been occurring on the railways an extraordinary number of delays to passenger trains due to locomotive failures, and it is gratifying to note that some special attention is being given to this matter. There is no feature of passenger service that annoys a larger number of people, or annoys them more, than late trains. Delays to passenger trains have been among the principal shortcomings of railway service in this country, and no reasonable effort should be spared to reduce the number of them.

One of the most promising developments in transportation facilities during 1920 was the consideration given to locomotive terminals. This is not so remarkable for what has actually been consummated in the form of completed locomotive terminals as in the terminal development that is under way and that

#### Locomotive Terminal Development

which is contemplated. Of even greater importance perhaps is the change in sentiment toward terminal development due to a growing appreciation of the importance of the locomotive terminal as an operating factor. Locomotive terminals have until recently been woefully neglected on a majority of railroads. Year after year these railroads have added to the weight of locomotives and to the complexity of this equipment without making any corresponding improvements in the terminal equipment until the limit of terminal endurance has literally been reached and the new power must go begging for want of adequate maintenance between shoppings. It is the lack of suitable terminal facilities that has in many instances retarded the application of efficiency and capacity increasing devices which necessitate any additional maintenance. Moreover, the railroads are waking up to the fact that any reduction in terminal delays is actually equivalent to increasing the power available for service. Also that if locomotives can be kept in service for longer periods between shoppings by means of frequent adequate terminal repairs, this is likewise equivalent to increasing the available power. Obviously, the railroads should get the utmost service out of the locomotives they have before adding to their equipment and when it is observed that locomotives still average more than 50 per cent of their time at terminals and that only 75 per cent of all locomotives are now in a serviceable condition it must be apparent that there is tremendous need for better locomotive terminal and shop facilities. The most notable locomotive terminal development work ever undertaken by any railroad is still under way on the Pennsylvania Railroad. Several units were placed in service during the year and other units are nearing completion. The Michigan Central established a new locomotive terminal at

Niles, and this is only one of many new and interesting projects of a similar character usually involving an entirely new lay-out and a change in engine districts. It is safe to predict that no single feature of the transportation machine will undergo greater relative development within the next ten years than the locomotive terminal.

### Misrepresentation, with a Purpose

THE MACHINISTS' UNION, through a paid propagandist, has recently filled the daily papers with charges that the railroads are manipulating public funds in a campaign to drive the railroad unions out of business. At the same time, a petition has been filed with the Interstate Commerce Commission in which the statement is made that the railroads have wasted half a billion dollars in contracts for locomotive repairs and a quarter of a billion on freight car repairs. The motives which the petition ascribes to the railroad managers in causing this enormous waste are, first, to make profitable the operation of equipment companies controlled by the same financial interests which control the railroads, and, second, to disrupt railroad labor organizations. No statistics are given to substantiate the charges made in the petition, but it is probable that the construction contracts to which it refers are the same as those recently mentioned in the House by Representative Huddleston of Alabama. Mr. Huddleston, who has consistently advocated the adoption of the Plumb plan, filled several pages of the Congressional Record with comparative figures to prove that the cost of repair work in the builder's works was four times as much as it would cost the road to do similar work in its own shops. The figures serve only to prove the truth of the old saying that figures don't lie but liars will figure. The data presented is not convincing to anyone familiar with conditions in railroad and contract shops because railroad cost figures are not representative.

Manufacturers find it absolutely necessary to compute the costs of doing work, including every factor of expense. The railroads compile their figures of operating expenses according to the Interstate Commerce Commission's classification, and many items which are properly chargeable to locomotive or car repairs are allocated to maintenance of way expense as, for instance, the maintenance of shop buildings. Furthermore, there is no adequate provision for depreciation of buildings or machinery nor for overhead expenses. The cost of repairs in railroad shops as ordinarily given includes only direct labor and material costs with a small handling charge added and are not comparable with cost data obtained from manufacturers. If the expense of making repairs in the builder's plants and in railroad shops were computed on the same basis, it is doubtful whether the railroad shops could show a saving on similar operations.

The petition filed by the Machinists' Union states that the general public interest is involved in the proposed investigation, but the underlying reason that has led the organization to make these absurd charges is found in the concluding section of the petition, which suggests that no railroad company be permitted to enter into contracts for repair work by outside companies unless given a permit by the Interstate Commerce Commission. It is further proposed that, as a condition to securing such a permit, the railroad companies must show that they are unable to do the work or that they cannot do it at as low cost as it can be done by outside companies, and if the permit is granted, that the same rates of compensation and the same conditions of employment will be observed by the contractors as are established by the Railroad Wage Board.

The officers of the Machinists' Union are or should be familiar with the conditions existing in railroad shops. They

know that the charges made in their petition are groundless and the circulation of such statements in the daily press is intended merely to influence the action of the Railroad Wage Board which, this week, begins hearings on the question of continuing or abrogating the national agreement. No other single factor has been more largely responsible for the decrease in efficiency in railroad shops than the restrictions imposed by this agreement. Having secured great increases in compensation of railroad shop employees and having imposed conditions that break down discipline and make efficient management difficult, if not impossible, the Federation of Labor is trying to prevent the railroad managers from reducing costs through the only avenue of escape that is now open, by letting work to contract shops. There is little danger that this attempt to muddy the water will deceive the Interstate Commerce Commission or the Railroad Labor Board. Its only effect will be to inflame still further the minds of the uninformed readers of the daily press who believe the mis-statements regarding the Plumb plan and similar propagandism given out by the same organization.

### Supervision of the Lesser Crafts

ONE OF THE PERPLEXING PROBLEMS of supervision in the maintenance of way department concerns those crafts requiring the employment of a relatively small number of men. This applies particularly to the painting and water service forces, but on lines doing only a small amount of permanent work it may apply also to the concrete forces. As a general rule, these gangs are supervised by foremen who report to the master carpenter or bridge and building supervisor, but owing to the fact that the duties of the supervisor are concerned much more with bridge and building carpenter work, his position is usually filled from the ranks of the carpenter foremen.

This practice places a definite barrier in the way of promotion for the foremen of the other crafts, while the supervisor, because of his close contact through long experience with carpenter work, has a general tendency to deprecate the importance of the other crafts. Where these conditions prevail, both the immediate and the general supervision of such work as painting and water service repairs and construction will suffer unless they receive special attention from division officers. Some roads have found it of advantage to provide general supervision for these special crafts by the employment of a general foreman or division supervisor with special training in the particular line for which he is made responsible. This opens up a line of promotion for the foremen under him and also places the work under the direction of a supervisory officer who is equipped to recognize the needs of his particular line and present them to his superiors in the proper light. The current retrenchment of operating expenditures presents another angle of this problem. With reduced activities and reduced forces, especially in the minor crafts, the roads are confronted with a surplus of foremen receiving a rate of compensation in excess of that paid in any time in the past, so there is a natural tendency to reduce the number of them on the payroll.

Because of the importance of adequate supervision it has been suggested that the present offers a good opportunity for revising the form of organization, extending the authority of the more promising of the special foremen over a larger territory with the title of general foremen and salaries commensurate with any increase in responsibility. The lessened activities at present will enable these general foremen to become thoroughly adjusted to their new positions by the time that work is again on a normal basis so that they will be enabled to exercise general supervision of the special

crafts in a manner that will be of unquestioned benefit. Undoubtedly, the form of organization in vogue on some railroads will not permit of the adoption of this modification in supervisory arrangement, but the need of improvement in supervision in all departments of the railroads is such that a plan such as the one suggested should be given serious consideration.

### The Labor Readjustment in the Maintenance of Way Department

DURING THE LAST FEW YEARS labor has prospered as never before on the railways and elsewhere. It has taken full advantage of the widespread industrial activity to secure greatly increased wages, a shorter working day and important concessions in working conditions, all of which have added greatly to operating expenses. Within the last few weeks these conditions have undergone a marked change. The widespread industrial depression which has set in has created a large surplus of labor, and this in turn is bringing about reductions in wages and the withdrawal of many of the war time concessions in working conditions.

The railways have not escaped the decline in business; the slump has been acute. Coming as this does on top of the financial stringency created by the withholding of more than \$400,000,000 due them from the government and the holding up of the increased rates by several states, it creates a serious problem for the roads which threatens to force many of them to adopt drastic measures to weather the storm. Under these conditions it is not surprising that they too are considering the possibility of reducing expenses and curtailing their expenditures for labor by both reducing the number of men employed and the rates of wages paid. Under the new Transportation Act the managements are under an increased obligation to the public to operate their properties as economically as possible and this requires that they take advantage of the falling market for labor as well as materials.

One of the first departments on the railways in which a readjustment in labor conditions will be brought about is the maintenance of way department because it is here that outside labor conditions are first and most directly felt. It is therefore not inopportune to consider certain underlying conditions affecting employment here and their influence on the cost of the work done—the final measure of efficiency. In the past most maintenance of way work and particularly track work has been considered unskilled. No recognition has been given to experience and little or no attempt has been made to retain men in the service. They have been "hired" when business was good and "fired" as readily when traffic declined. This lack of permanency of employment, combined with the lowest market wage rate, has in general brought to the roads only the poorest class of labor which did not desire permanent work or which took the work only until other employment could be secured. While we do not believe that the present demands a continuance of the present high wages, the roads can ill afford to reduce their rates to the lowest in the market as they have done in the past. Rather they should stop at some midway point which will enable them to compete on an equal basis with other industries for efficient labor. That such labor can still be attracted to railway work was demonstrated by the influx of native labor on many roads, particularly in the middle west, following the raising of wages in 1918. This is not the time for minimum wages for maintenance of way work but rather for a wage which produces a minimum cost.

Coincident with the readjustment of wage rates, the present offers an opportunity to replace the drones in the gangs with

workers and to adopt such other measures as will add to the efficiency of the forces, for there are other things besides wages which attract good men into the service. Among these are the readjustment of the working season to increase the permanency of employment and the improvement of living conditions of those employees dependent on the railways for housing and feeding.

## Section 10 of the Clayton Law

AFTER HAVING REMAINED inoperative for six years since its passage on October 15, 1914, Section 10 of the Clayton law, which has for its object the regulation of dealings in railroad securities and supplies between companies which have a so-called "interlocking" relationship, became effective on January 1 because President Wilson unexpectedly vetoed a bill passed by Congress to further postpone its effective date. By its terms the law was not to become effective for two years after its passage and because of its unworkable character, and because it was of no particular importance while the government was operating the roads, its effective date has been repeatedly postponed for a year at a time to give Congress an opportunity to amend it. Because of the pressure of other business, and because the law has come within the province of other committees of Congress than those which have been dealing with railroad questions, Congress has failed to give the matter its attention. A substitute, proposed by the Association of Railway Executives, and intended to carry out its purpose in a more practical way has been introduced by Senator Frelinghuysen and Representative Esch, and because it is proposed to make it a part of the interstate commerce law instead of the anti-trust law, it has been referred to the committees on interstate commerce. The Senate committee has already begun hearings on it.

The essential provision of Section 10 is that no common carrier shall have any dealings in securities, supplies or other articles of commerce, or make contracts for construction or maintenance to the amount of more than \$50,000 a year, with another corporation, firm, partnership or association, when the carrier shall have on its board of directors or as its president, manager or as its purchasing or selling officer in the particular transaction, any person who is at the same time a director, manager, or purchasing or selling officer of, or who has any substantial interest in, such other corporation, etc., except on competitive bids, from the bidder whose bid is the most favorable. The law also requires that the carrier having such transactions shall within 30 days file with the Interstate Commerce Commission a complete statement of the transaction and the commission is directed to report violations to the Attorney General.

The commission in October, 1919, issued its regulations prescribing the method of advertising for and securing bids and of reporting the transaction, but they had been held in abeyance because of the repeated postponements of the effective date of the law.

The law as it stands is admittedly unworkable, and it is full of ambiguous and uncertain language, but as it has been interpreted it would interfere with many transactions which it was never intended to reach and a majority of the Interstate Commerce Commissioners have indicated their belief that it should be amended. The purpose of the law is simple and represents a moral principle to which no one can honestly object and to which the railroads are offering no opposition. The purpose is to prevent transactions between a railroad and another company in which any of its directors or officers may be financially interested, to their private advantage instead of that of the railroad. This it seeks to accomplish, however, not by direct prohibition, but by re-

quiring that transactions between companies in which there is such common interest shall be on the basis of competitive bidding.

The great defects in the law are that it tends to restrict dealings in securities which are already completely under the control of the Interstate Commerce Commission under the provisions of the Transportation Act, that it would seriously interfere with transactions between railroads and their subsidiary companies, and that its terms are in many instances vague and uncertain. Probably the most important defect in the law is that it would probably be held to apply, although undoubtedly it was not so designed, to perfectly proper transactions between the component parts of a railroad system, including carrier companies and also separate companies organized by railroads themselves for the purpose of insuring adequate supplies of fuel, ties, ice, etc. The operation of the law for any considerable length of time would make impossible the practice by which large systems buy in quantities for their subsidiary lines and receive in return their securities for capital expenditures. Manifestly the great multitude of such inter-company transactions cannot be advantageously handled under a system of competitive bids which must be advertised in advance, while a requirement that securities of subsidiaries shall be sold only on competitive bids would tend to break up the control of large systems.

The proposed substitute bill omits reference to sales of securities because another law on that subject is now unnecessary and it also excepts transactions between a railroad and common carrier subsidiaries or non-carrier subsidiaries in which the railroad, either alone or together with other common carriers, has an interest equal to one-half ownership.

The Clayton law is very indefinite as to the kind of dealings between railroads and sellers of supplies which it is intended to reach. It does not define, nor does it make any provision for a definition by the Interstate Commerce Commission as to what constitutes a "substantial" interest in the selling company. A railroad cannot always know when one of its officers or directors may own stock in a company that sells to railroads and whose securities are dealt in on the open market, and it may therefore lay itself liable at any time without knowing it unless it safeguards itself by obtaining competitive bids under the regulations prescribed. Even if it knows that one of its directors has a small interest it cannot ascertain in advance whether that will be considered sufficient to bring the transaction within the law. Neither does it make any provision for exempting purchases of patented articles or articles of such a character that they can be obtained from only one source, or materials and supplies that must be procured quickly in an emergency.

The railroads also object seriously to any requirement that purchases must be made from the bidder whose bid is the most favorable unless this is defined in such a way as to relieve them from the necessity of buying from the lowest bidder, and have inserted in the substitute bill a provision which would give them a considerable degree of business discretion in determining which bid, under all the circumstances, is the most favorable, and also the right to secure more favorable terms by negotiation.

If the best way to repeal a bad law is to enforce it until its disadvantages appear clearly President Wilson may have taken the course calculated to hasten action on the part of Congress to amend the law so that it can accomplish its purpose in a practical way and without needless expenditures on the part of the carriers. The Interstate Commerce Commission is lending its co-operation in the effort to have the law made more workable and the congressional committees which now have the matter in charge have a much better appreciation of railroad conditions than those with which it has been necessary to deal heretofore.

The regulations prescribed by the Interstate Commerce Commission to govern transactions which come within the terms of the law are published elsewhere in this issue.

## A Very Significant Contrast

THE AMERICAN PUBLIC may not know it, but it is deeply concerned in the hearings regarding national agreements between railways and their employees which began before the Railroad Labor Board on January 10. They involve many millions of dollars annually that the railways are directly, and the public is indirectly, paying to railway employees who do not earn it. Therefore, the public should not fail to take note of the difference between the ways in which the representatives of the labor unions and the representatives of the railways are presenting their cases. The difference is most significant.

The question under consideration is whether certain national agreements made under government control by the Railroad Administration with certain labor organizations shall be perpetuated. The representatives of the unions contend that these agreements should be continued for the protection of their members. The representatives of the railways contend that they should not be continued because they foster inefficiency and cause the waste of many millions of dollars annually. They contend that efficient and economical operation of the railways requires the making of agreements between individual railway companies and their employees which can and will be adapted to local conditions.

The following are the respective ways in which the representatives of the two sides opened their cases:

The spokesmen of the labor organizations charged that the railroads are controlled by a group of New York banks, trust companies and insurance companies which are dominated by J. P. Morgan & Co.—a charge already threadbare from frequent repetition. They allege that the railroads have sent to outside companies for repair a large number of their locomotives and cars and have paid excessive prices for these repairs. They alleged that the railroads have laid off thousands of men, not to reduce expenses, but to break down the unions. In short, they charged against the railroad companies, their directors and officers almost every crime in the calendar except murder. They then stated that they would make no attempt to substantiate these charges at this time, and wound up by intimating that unless the Labor Board adopts a course satisfactory to the employees "the service rendered to the public would inevitably suffer"!

The public will seek in vain in their statement for any discussion of the principle or effect of national agreements versus local agreements of railways and their employees. It will seek almost in vain for anything which relates to any matters over which the labor board has jurisdiction. The only body which, under the Transportation Act, can officially take cognizance of the charges of railroad mismanagement made is the Interstate Commerce Commission. If the spokesmen of the railroad brotherhoods had thought that they had a case for national agreements they doubtless would have presented it. Since they did not present a case for national agreements they must have thought they had none.

On the other hand, the spokesmen of the railroads proceeded at once in their presentation with a discussion of the question of national agreements and of the facts and arguments which they believe show that the national agreements should not be continued. They said nothing which was not directly pertinent to the matters under consideration by the Railroad Labor Board. They might have attacked the railroad labor organizations for many things. They might have recalled how they "held up" the government of the United States to get the Adamson law passed. They might have

recalled how the railroad brotherhoods threatened to strike just before this country was entering the war with Germany because the Supreme Court did not decide the Adamson law case quickly enough to suit the unions. They might have referred to the efforts the railroad labor brotherhoods have been making to form a federation of labor unions which would be so strong that neither the railroad companies nor the people of the United States could resist it. But they did none of these things. They simply discussed national agreements, which was the subject under consideration by the Railroad Labor Board.

It is not an uncommon thing for a man who has just picked another man's pocket to begin crying "stop thief!" in order to divert attention from himself. When a man gets paid for doing work that he doesn't do, or gets two or three or four days' pay for doing one day's work, he is simply "grafting" upon somebody. If he is a railroad employee he is "grafting" directly upon the railways and indirectly upon the public. The national agreements and the interpretations of them which have been made are causing many millions of dollars a year of this kind of "grafting," of which the railways are the immediate and the American public the ultimate victims. The spokesmen of the brotherhoods know that the representatives of the railways are going to lay bare the facts about these matters before the Railroad Labor Board and the public. They want to neutralize the effect of the facts which they know are to be presented. Because the facts about the huge graft of which they are the beneficiaries are to be laid bare, they make wholesale charges of grafting against the railways.

Naturally the railroad brotherhoods want the public to think and talk about the alleged sins of the railroads rather than about their own sins. They have been engaged for years in building up rules and conditions of employment as a result of which their thousands of members have been and still are the recipients of many millions of dollars of "honest graft." Why talk about this, however, when it is so much more interesting and thrilling, and also so much safer for the labor brotherhoods and their members, to shout loudly and recklessly about J. P. Morgan & Company, Wall street and the 25 men, more or less, who are the alleged instruments of Morgan & Company and Wall street in controlling not only all the railroads and railroad equipment companies, but, maybe, all the other industries of this country and the world?

The spokesmen of the employees expressly say they will not try to substantiate their charges "at his time." They were not made to be substantiated. They were made to divert attention from the actual graft obtained by the members of the unions through the national agreements and which the representatives of the railways are prepared to prove, to mere alleged grafting by the railways which the brotherhoods are not prepared to prove.

There was another motive also; the propaganda for the Plumb plan is still being actively carried on. Its advocates consider any and every libel they can spread regarding private management as an effective means of furthering the Plumb plan. There never was a more selfish, unscrupulous, mendacious propaganda carried on than that for the Plumb plan and the attacks now being made by the labor brotherhoods are a part of it.

**SAFETY FIRST.**—If every man would give a glance, and warn the man who takes a chance; if every man were pennywise, goggles he'd wear to guard his eyes. If every man in chances wild would stop and think of wife and child; if every man could but observe the good that follows steady nerve; if every man, to dodge the ward, would pull that nail from out the board—then we'd all together make safety first—Charles E. Bradley, S. P. Co.

## Letters to the Editor

### Recognition of Organizations of Subordinate Officers

COLUMBUS, OHIO.

TO THE EDITOR:

It is coming to be realized more and more by all right thinking men that we are living in a world of strange and unfamiliar conditions. Old land marks and guide posts have been swept away, or obliterated and new and strange signs of the times are to a large degree taking their places, and our future success and security as a nation or as individuals depends upon our ability properly to interpret these new phenomena, or perhaps more properly speaking this new aspect of old phenomena.

In the world of economics we are face to face with conditions for which we have no precedent to guide us. The impoverishment of Europe, the debacle in Russia, the Bank of England reserve below 7 per cent, the great extension of bank credits in this country, and the fact that the value of our farm products has shrunk in the past few months by millions of dollars, and that many of our industries are closing for lack of orders, present a problem or series of problems which will not only require the ablest efforts of the wisest minds, but also the hearty and whole-souled co-operation of all classes of our citizens.

In other words, this is no time to "rock the boat."

Nevertheless, there are many men of great influence in the industrial life of our country who believe that this is the time to smash the labor organizations; acting, in fact, somewhat in the same spirit as the farmer whose barn was burning who should seize on that occasion to discharge the hand with whom he had a difficulty the day before, rather than call him in to help extinguish the flames.

The men above referred to are influential and are finding but little difficulty in building up a considerable following among employers who have suffered from the past excesses of labor unions, and by the mistaken zeal of many chambers of commerce throughout the country.

In the transportation field their activities take the form of opposition to the establishment of railway boards of adjustment, and their propaganda is to the effect that they are fighting the closed shop, when the real truth of the matter appears to be that they are opposed to organized labor as such.

This is plainly indicated by their attitude towards organizations which are not strong enough numerically to make them fear the exercise of their strength in the form of strikes.

For example, the Transportation Act of 1920 set up a class of men known as subordinate officials, who should have under this act the same rights of representation and appeal as those accorded to employees who were members of one of the so-called "standard organizations."

Our organization was named by the Interstate Commerce Commission as one of these subordinate official groups. Notwithstanding this fact, however, we have not as yet been able to get them to accord us the same consideration as an organization which they extend to the so-called "standard organizations," and as one result of this condition the majority of the yardmasters of the United States are still working a twelve or thirteen-hour day for less wage per hour than the yard foremen whose work they supervise.

It is true that our membership is possibly less than 5,000 and that we have no strike vote in our constitution, but if the railway executives were really honest in their contention

that they were working for an open shop rather than engaging in an effort to crush all labor organizations, they would extend to smaller and independent orders the same consideration and treatment which they accord the members of the so-called "standard group."

This is not the time to allow old rancors or old quarrels to darken the judgment. It is a time in which methods of conciliation should be employed to bring the various opposing factors in the industrial world together. A time to make an honest effort to get at each other's viewpoint, and to bring about a condition of hearty and whole-hearted co-operation.

The individual who is hoping to use the present industrial depression to smash labor is a "bear on America." He is virtually betting that present conditions will continue and that there will be depression and surplus of labor for years to come.

He is neither a good business man nor a good patriot. He is merely rocking the boat.

J. L. ELDRIDGE,

Senior Grand Vice-President, Railroad Yard Masters of America.

### The Business Basis

NORFOLK, Va.

TO THE EDITOR:

Referring to your editorial note on the Psychology of the Purchasing Agent appearing in a recent issue. The purchasing officer on a railroad is one who should be as intimately acquainted with the financial condition of the property as the owner of a mercantile establishment and should guard his interests in the same way. He has been looked upon so long as an order or requisition clerk that it is hard for most purchasing agents to realize that they are anything else.

The time has come when the supply officer must be looked upon as a financial officer instead of an operating one. The railroads are going through a transitional period which involves a transfer from technical to business operation. The future owners, directors and other officers of our railroads will be primarily business men. When this change is brought about, the financial problem will be for the first time established on a sound basis. Until this is the situation, no economical program of development can be carried out. Equipment and maintenance should be done when business is light and it follows that purchasing should be carried on in periods of depression and only nominal purchases should be made during times of great activity. At such times all equipment should be in use instead of undergoing repairs.

No change can be expected under the present conditions, which are necessarily based on the immediate earnings, until the fundamental facts are recognized, and it is not likely that they will be appreciated until the railroads are owned and controlled by business men and operated as business enterprises.

H. C. PEARCE,

Gen. Pur. Agent, Seaboard Air Line.

THE TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS, MO., has received from the Post Office Department, Division of Railway Mail Service, at St. Louis, a letter of commendation appreciative of the splendid handling of the mails, through the Union Station, during the Christmas rush. The letter stated further that officials and employees, from the general manager down, are entitled to commendation of the highest character. And that "the operating officials of all tenant lines, by their hearty co-operation with the company and its service, should share equally in the credit that properly belongs to all, and in the satisfaction that comes from a proper knowledge that an important public duty has been so creditably performed"

# The Chilean State Railways Are an Open Market

Government Lines Are Adopting American Methods and Standards and Are Well Represented in the U. S.

By John P. Risque

READERS who have followed the accounts of South American railways appearing in these pages from the note book of the editorial representative of the *Railway Age* sent there to record his impressions, have doubtless concluded, if they were previously unaware of the fact, that the railways on that continent offer, as far as Americans are concerned, a somewhat qualified market for the sale of railway materials. In a general sense, this is the impression which the observer has desired to convey. It is hoped that the account of conditions there has so far been sufficiently truthful and clear

and by rivers flowing from them to the Pacific. The range between the central valley and the coast is known as the Cordillera de la Costa—or the Coast Range. That to the east is the Andes and is crossed by the Arica-La Paz Railway in the north and the Antofagasta & Bolivia system as well as the Transandine lines to Argentina, the two former railways having been referred to in previous articles

To the railway constructor or the intending cultivator of Chile's important railway supply market, doubtful just as to "where to head for," in his intentions to introduce himself and his proposition personally, a trip direct to headquarters, the seat of government and the center of railway directing activities, Santiago, is advised.

This charming city with almost a half million population lies in a veritable garden spot 125 miles by rail inland from Valparaiso, the country's second city and chief Pacific port, and has an elevation of nearly 2,000 ft. Here he can inform himself fully as to the relative situation on the lines from almost every angle: what to go to see, what he can afford to miss. If he speaks the language of the country, it will facilitate his mission considerably. Not that the Chileans are unable to speak English, for many of them do,—especially the government officials with whom the stranger will

Train on the Arica-La Paz About to Enter Long Rack Rail Section

to cause careful reflection and study on the part of those who plan a railway supply sales campaign in those parts.

The situation in Chile is "no man's land," however, as far as railway supplies are concerned, when compared to the conditions bearing on American prospects of success in the markets of her eastern neighbor, the intensely British developed Argentina.

For convenience, reference is again directed to the map of South America which reveals the Republic of Chile as one of the most singular geographical countries in the world. Long and narrow, it constitutes the Pacific front yard of several of its neighbors, with a coast line nearly 3,000 miles in length, a width of from 65 to 250 miles and an average width of 90 miles. Its total area is about 292,000 square miles; its population, reported to be about 3,800,000, is made up of a hardy race of progressive people. They are, in the vernacular of our own hustling populace, "full of pep" and they exhibit this admirable trait in nearly everything that they do, a characteristic example of which is the extreme pride they take in calling attention to the fact that nearly all of the railways of their country are Chilean owned, in contrast to the European dominated transportation systems of their neighbors. This showing of pardonable pride is manifest on every hand, for Chile is Chile's own, and if the "extranjero" does not sense it as soon as he sets foot in the country, that stranger has missed the first item on the bill.

Two ranges of mountains traverse the country from north to south, leaving between them a great central valley, interrupted at intervals by low branches of these mountain ranges

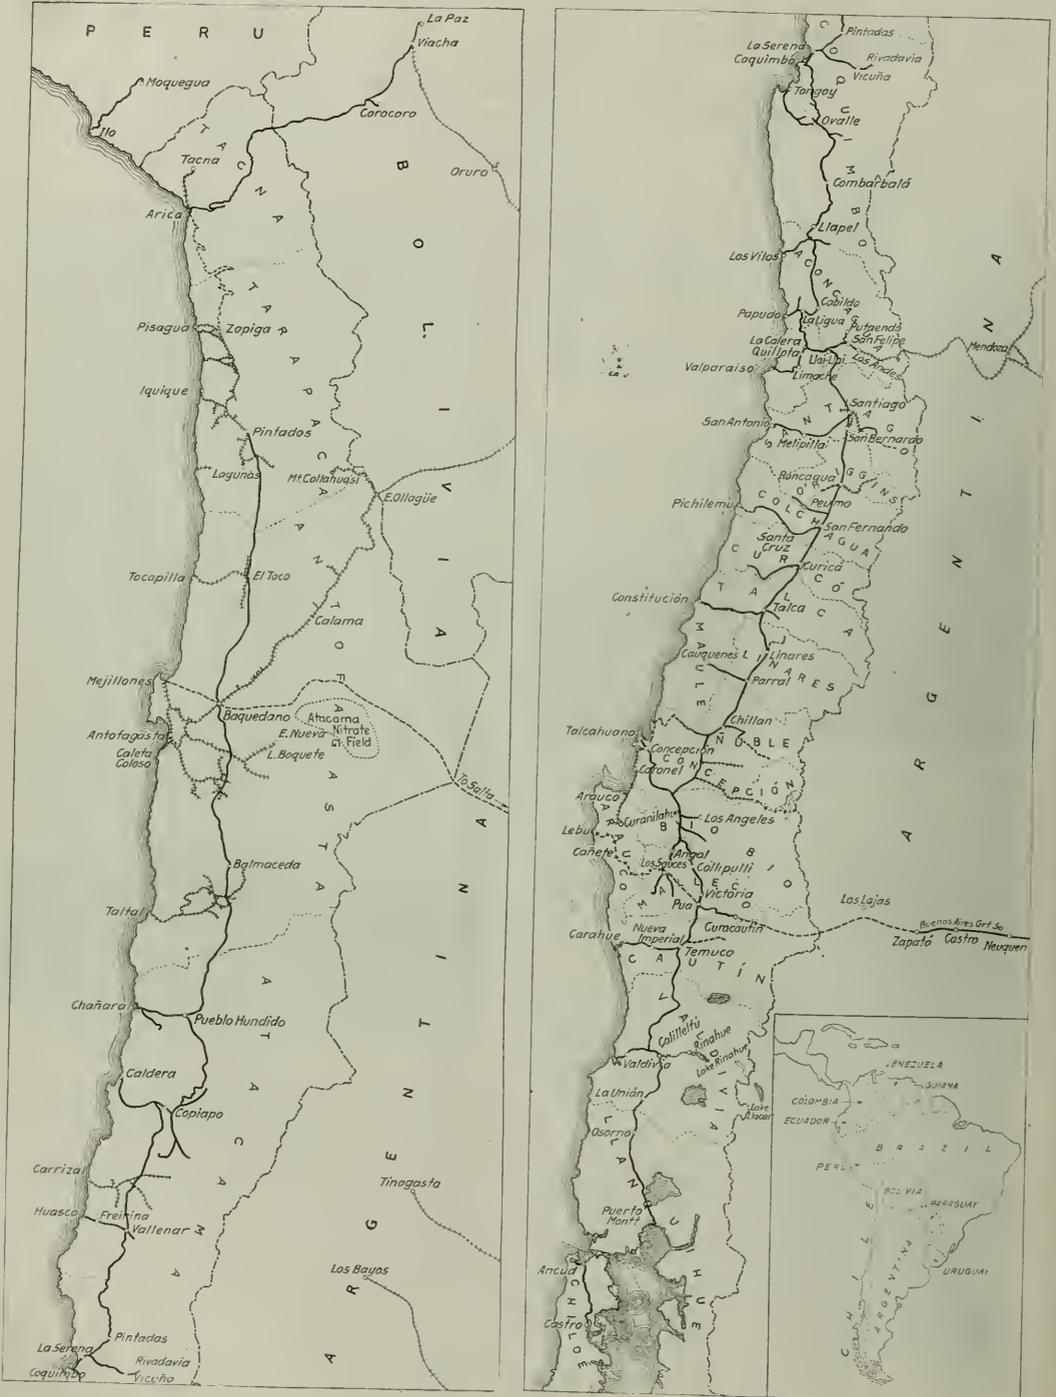

Right of Way Near Frutillar, Chilean State Railways

come in contact. But the familiarity with Spanish is that pronounced asset which promotes an intimacy and a friendship which is an undeniable promoter of a mutually beneficial business relationship.

On account of its enormous length, Chile possesses a variety of climates and can be described as comprising four distinct zones as follows:

The northern or desert zone extends 500 miles south from the Peruvian border. Despite its total lack of rain, rivers and vegetation, it is the greatest source of natural wealth of the country, for it is the great nitrate region and it contains also extensive deposits of copper and iron ore. It is very hot and dry and at places in the province of Atacama no rain has been known for over 50 years. The lack of water is so great that some of the mines have to get their supplies in tank cars while others have managed to secure it by extensive aqueduct piping systems. There are several railway lines

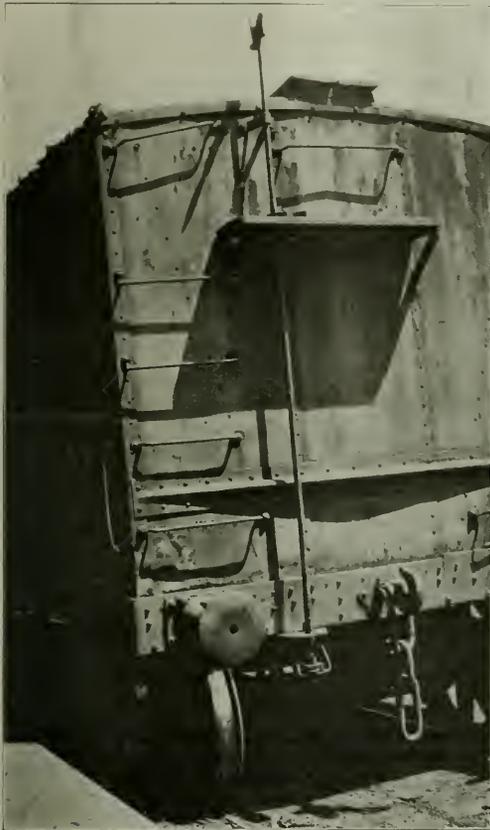

The Railway Map of Chile

connecting the nitrate deposits with the seaports from which there are excellent steamship services. Iquique and Antofagasta are the most important nitrate ports and have a population of some 45,000 and 60,000 respectively. They are surrounded by a bare desert, and each receives its water supply through an aqueduct from sources 80 or 90 miles distant. Despite its importance as a port, Iquique has no harbor, and vessels have to anchor a half mile out. Antofagasta is the port of the Antofagasta & Bolivia Railway and the outlet for a considerable amount of nitrate traffic. Taltal, which lies

of the republic. It contains large sheep raising and forest areas and is thinly populated.

In a similar manner, the 2,195 miles of north and south trunk line, or Longitudinal as it is officially known, can be referred to in geographical sections. Starting in the northern province of Tarapaca, at Pintadas, the lines as far south as Baquedano, a junction on the Antofagasta & Bolivia Railway between Antofagasta and Calama, are operated by private British interests under the name of the Nitrate Railways Company with an approximate mileage of 390. British owned lines connect Pintados with Pisagua and Iquique. Of 4 ft. 8½-in. gage, these railways had, in 1915, 73 locomotives, 53 passenger cars and 1,794 freight cars. From Baquedano south to Pueblo Hundido, a point on the trunk line quite close to the northern border of the province of Atacama, and about half way between Taltal and Caldera, both on the coast, the Chilean government's northern end of the long system is being operated, through recent arrangements, by the British owned Antofagasta & Bolivia Railway. It can be stated, therefore, that the British zone of transportation influence is paramount in the nitrate fields, all the way from the Pueblo Hundido as far north as Pintados, Tarapaca, a zone which contributes more revenues to the state than any other, controlling as it does practically all of the output of the country's bread-winner, as nitrate is known. Official Chilean designation of administration divisions characterizes the operation of the government railways as of three sections. As it is an advantage to be familiar with their local terms, they are referred to in that manner. The Longitudinal Norte (Northern Longitudinal) is the division between Pueblo Hundido and Pintados, the latter point being situated near the northern boundary of Coquimbo. Between Pintados and Calera, the division is known as the Red Central Norte, or the Central Northern System, and Calera will be seen on the map as lying within a few miles of Llai-Llai, a station on the east and west part of the main line from Valparaiso to Santiago. The Red Central Sur, or Southern Central System, includes all of the lines south of Calera to the end of the track at Puerto Montt on the Gulf of Ancud, as well as the relatively short lines on the Island of Chiloe. The following figures, as of 1918, list the rolling stock in use on all Chilean government lines and are official.

End of a Box Car on the Chilean State Railways, Showing Details of Construction

Division	Gage	Locomotives	Pass. Cars	Freight Cars
Arica-La Paz .....	1 meter	30	44	190
Long. Norte.....	1 meter	26	71	314
Central Norte.....	1 meter	139	120	1,267
Central Sur.....	{ 2 ft., 1 meter, } { and 5 ft., 6 in. }	641	506	6,478
Branch, Puente Alto-Volcan	2 ft.	6	11	26
Total equipment .....		842	752	8,275

All divisions but the Central Sur have baggage cars included in the passenger car totals. To the Central Sur's equipment list should be added 106 baggage cars and 806 miscellaneous cars for special service and not definitely described on the list. The government's statement also shows the amount of rolling stock on all private lines in the country, but this list has been omitted here because, in the sense of this article, attempts to transact business with the owners, mostly British, would likely lead the investigator to remote fields—most likely to London.

about 110 miles south of Antofagasta, is the terminus of the Taltal Railway, which also carries a considerable nitrate traffic.

It is understood that at present the Chilean government is negotiating in this country for a loan variously estimated at from \$5,000,000 to \$20,000,000, the proceeds of which are to be used for the purchase of equipment for the government railways. Should this financing be arranged, American concerns would probably be enabled to secure the bulk of the orders. The outcome of the parleys between American bankers and the representatives of the Chilean government is, therefore, awaited with considerable interest.

The second, or mineral zone, extends an additional 500 miles south of the northern zone and is principally a mining center, but there is a considerable agricultural development in the central valley.

The south central agricultural zone is the most populous section of Chile. It includes the most fertile part of the central valley which, in addition to its agricultural products, also produces some coal, certain amounts of minerals and contains large timber areas.

The second installment of this article will appear in an early issue of the *Railway Age*.

The southern, or island, zone is the southernmost part

# Repairs in Outside Shops to Be Investigated

I. C. C. Issues Formal Order; Charges Made by Unions to Commission and Labor Board Denied by Mr. Cuyler

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION on January 6 announced a formal investigation of charges made by representatives of the railroad labor organizations that certain railroads are paying excessive prices for car and locomotive repairs at outside shops. As reported in last week's issue, Chairman Clark had stated at a hearing before the Senate committee in connection with the hearings on the Clayton law that the commission had been making an informal investigation. The order for the formal investigation was as follows:

"It having been reported to the Interstate Commerce Commission that common carriers by railroad subject to the interstate commerce act have caused and are causing certain of their locomotives and other equipment to be constructed and repaired at construction or repair shops other than their own, and have purchased and are purchasing from or through such shops material and supplies used in such construction and repair, at costs in excess of those for similar construction and repairs in their own shops, including material and supplies therefor, in disregard of efficient and economical management, resulting in unreasonable expenditures, and otherwise contrary to law:

"It is ordered, That the commission, upon its own motion and without formal pleading, enter upon a proceeding of inquiry and investigation into and concerning the matters and things above set forth;

"It is further ordered, That this proceeding be set for hearing at such times and places, and that such persons be required to appear and testify, or to produce such books, documents and papers, as the commission may hereafter direct; and that the investigation be carried on in the meantime by such other means or methods as may be deemed appropriate;

"And it is further ordered, That a copy of this order be served upon each common carrier by railroad subject to the interstate commerce act."

## A Statement by the Machinists

Following this announcement by the commission, the National Association of Machinists gave to the press a statement stating that W. Jett Lauck, on behalf of President W. H. Johnston of the machinists' organization, had filed with the Interstate Commerce Commission on January 8, or two days after the commission's announcement, a petition asking for an investigation and charging that the big railroads, "especially those affiliated in a financial way with J. P. Morgan & Co., are closing their repair shops, throwing thousands of union men out of work and giving repair work at extortionate rates to large private equipment companies in which railroad capitalists or banking groups are heavily interested." It was also stated that more than 30,000 union men already have lost their jobs under this plan and a combination of figures was built up as the basis for a statement that the railroads are "milking the national treasury of three-quarters of a billion dollars and manipulating the funds in a campaign to drive the railroad unions out of business," and that in this fashion the railroad managements hoped "to send the unions on the rocks and charge the bill to the public through taxation to pay the subsidies guaranteed by the federal government or by maintaining present high rates to shippers and the traveling public."

Neither the press statement nor the petition explained that the car and locomotive repair work was sent to outside

shops during the guaranty period during which, under the law, the railroads will be allowed to charge to maintenance expenses for the purpose of figuring the guaranty only an amount to be determined by the Interstate Commerce Commission, nor that most of the lay-offs of shop employees referred to occurred at a later period, after the volume of railroad traffic had been greatly reduced. The petition stated that locomotive repair work when done in the outside shops costs the railroads on an average four times as much as it costs in their own shops. The arithmetic was not explained, but it was stated that since locomotive repair work of the entire transportation system of the country amounts annually to between \$500,000,000 and \$600,000,000 the effect would be to burden the general public with an excessive and unwarranted charge of at least half a billion dollars a year. Similarly, it was stated that the cost paid by the railroads for the repair of cars by private companies amounts to at least \$600 a car and if "the Class I carriers alone" would have their repairs done by outside companies on this basis the bill for repair of freight cars would be increased one-quarter of a billion dollars a year. No attempt was made, however, to state that the railroads are having all their cars and locomotives repaired outside. It was stated that data have been secured which show that representative railroad systems have contracted with outside concerns for the repair of at least 50,000 freight cars. The petition says in part:

"We realize fully that your honorable body has no jurisdiction over industrial relations in general or over the relations between railway employees and railway managers. We do claim most emphatically, however, that you cannot permit railroad companies under your jurisdiction to take funds paid by the public for effective transportation machinery, and to use these funds illegitimately and indefensibly for the purpose of disrupting the organizations of railway employees which received government sanction and commendation during the war.

"It is for this reason that we petition you for a complete investigation and hearing. We are prepared to submit to you the facts which we have already collected and which we feel assured that your own records and inquiries will verify. When there has been a complete ascertainment of the facts, and we are afforded an opportunity, we hope to urge in detail for your consideration the following policy in order to correct the evils of which we complain:

"1. That no railroad company be permitted to enter into contracts for repair work on locomotives or cars by outside companies unless given a permit to do so by your honorable body, and

"2. That as a condition to securing such a permit, the railroad companies must show: (a) They cannot do the work which they wish to contract for, or (b) They cannot do it at as low a cost as they can have it done by outside companies, and, (c) If a permit is granted, that the same rates of compensation and the same conditions of employment will be observed by the contractors as are recognized and guaranteed to railway workers by the Transportation Act of 1920, and the Awards of the Railway Wage Board established by this Act."

Later another statement was given to the press quoting Mr. Lauck as to the alleged actual records of contracts for repairing 617 locomotives and about 32,000 cars during the past several months. The total cost for repairing 350 en-

gines in the outside shops was stated to average \$18,026 per locomotive and this was compared with statistics of the Railroad Administration as to the average cost of repairing 1,080 locomotives in company shops during August and September, 1920, which were said to show an average of \$5,096 each. It was also stated that the cost of work done by the large companies averaged much higher than that done by the small concerns. The following table was given as showing a comparison between railroad and private shop costs on the basis of the data secured by the railroad shop organizations and those ascertained by the Railroad Administration:

COST OF LOCOMOTIVE REPAIR WORK BY PRIVATE COMPANIES AND COST OF SIMILAR WORK IN RAILROAD COMPANY SHOPS IN AUGUST AND SEPTEMBER, 1920.

Number of Locomotives	Name of Company Doing Work	Total Cost	Average Cost Per Locomotive
234	Baldwin Locomotive Works.....	\$4,691,176	\$20,048
27	Rome Locomotive Company.....	459,000	17,000
41	American Locomotive Company.....	670,760	16,360
9	Lima Locomotive Works.....	149,535	16,615
11	Charleston Dry Dock Company.....	66,000	6,000
9	Southeast Steamship Company.....	54,000	6,000
10	Merrill & Stevens.....	120,000	12,000
6	Broad Foot Iron Works.....	72,000	12,000
1	Pittsburgh Boiler & Mch. Co.....	1,670	1,670
2	Manufacturers Railway Shop.....	25,080	12,540
350	Total and weighted average.....	\$6,309,221	\$18,026
1,080	Railroad Company Shops.....	\$5,504,144	\$5,096

In this statement it was stated that the locomotive repair bill under the private contract system would be raised from \$500,000,000 a year to \$1,500,000,000 annually and the car repair bill from \$400,000,000 to \$800,000,000, a total increase of \$1,400,000,000. A portion of this statement follows:

"Of the 617 repair jobs, 418 were awarded to the Baldwin Locomotive Works, which is closely affiliated with the banking group controlling the railroads. The exact cost is given for repairing 234 of these, the aggregate being \$4,691,176, averaging \$20,048 per locomotive. In other words, to have this work done by the Baldwin company costs nearly as much for 234 engines as for 1,080 similar jobs done in the railroad shops. Seventy-seven engines repaired by the American, Lima and Rome locomotive companies, all large concerns, averaged well over \$16,500 each, while one job done by the Pittsburgh Boiler & Machine Works, a small company, cost only \$1,670, and repairs to 20 locomotives by two other medium sized companies averaged \$6,000.

"More specific, however, is the comparison of the actual cost of a certain type of repair job in the railroad shop and in the private shop. The Railroad Administration very accurately classified the various types of repair jobs and ascertained the average cost of each class in the shops of the different railroad companies. For example, it found that the cost of doing certain work in the shops of the Pennsylvania Railroad in September, 1920, averaged \$4,466 per locomotive. For doing exactly the identical work on 220 of its engines, however, the Pennsylvania Company paid the Baldwin Locomotive Works \$19,057 each, more than four times the cost.

"Similarly, the New York Central farmed out 27 jobs with the Rome Locomotive Co., 41 with the American and 9 with the Lima, the costs ranging between \$16,360 and \$17,000 for each locomotive, whereas the average cost of the same work in the New York Central shops in 1920 had been \$5,773, or about one-third the amount.

"While the exact charge for the work done at 'cost plus' has not yet been ascertained, it is plain from the terms of the contracts that the cost will be very much more than if done in the railroad shops, and quite likely will exceed the extremely high costs cited above. Cost-plus contracts between the Baldwin company and the New York Central, the Seaboard Air Line, the Burlington, the Milwaukee, and other roads, stipulate that in addition to cost of materials

and labor, 110 per cent shall be added to the labor cost (which is usually from one-half to two-thirds of the entire cost) for overhead, and to the total cost thus computed an additional 15 per cent will be added for profit. The Davenport Locomotive Company, in contracts with the Burlington and other roads, provides for the addition of 5 per cent to material cost, 125 per cent to labor cost, and then takes 20 per cent of the total cost as profit. The contracts of the Rome Locomotive Company provide for similar percentages.

"Similar practice with regard to repair work on freight cars has been far more extensive than for locomotives, although it has not been possible to secure as accurate information as to comparative costs in individual instances. Nevertheless, definite figures have been obtained showing that important trunk lines have contracted with private concerns for the repair of at least 32,000 cars of various types. Information as to other contracts has been received, which, however, do not show the number of cars covered. A conservative estimate of the total number would be 50,000. The Baltimore & Ohio alone has had 12,800 cars repaired by the American Car & Foundry Company, the Ralston Steel Car Company and similar concerns, and the latter company contracted with the Norfolk & Western for the repair of 9,000 of its cars. In fact, the Ralston company's contracts cover 11,500 of the 32,000 cars of which we have record.

"A careful estimate made by experts shows that the repair work for which the Ralston company is being paid at the rate of about \$1,800 per car could be done in the company shops for approximately one-half of this amount, or \$900. It is safe to say, therefore, that the excess cost of having these 32,000 cars repaired by private concerns will total \$28,800,000. If the estimate of 50,000 cars is correct, the aggregate excess will be \$45,000,000.

"This is only one phase of the situation, the other (in which we are even more vitally and directly interested) being the starving out of the machinists' organization in railroad shops, which is a preliminary to a drive which will be made upon all railroad labor organizations, and is one part evidently of the nation wide anti-union campaign admittedly being waged by the group of capitalists centering about the Morgan banking system and its affiliated industrial and transportation concerns, of which the U. S. Steel Corporation is one of the most active."

### Railroad Repair Contracts Criticized in the House of Representatives

Practically all the data regarding the cost of repairs, as included in the statements of the machinists' union, were brought out in a speech by Congressman Huddleston of Alabama in a recent speech in the House of Representatives. In the report of the speech contained in the Congressional Record, a tabulation of contracts for repairs to locomotives and cars is shown with a further statement of the cost of classified repairs in certain railroad shops. The data regarding repair contracts show that the cost per locomotive ranges from \$1,670 to \$30,275.70. Practically no information is given as to the extent of the repairs. The work done in railroad shops is subdivided under the various classes of repairs, the cost being as follows:

Class 1.....	\$26,069.23 (one road only)
Class 2.....	8,195.64 to \$14,498.14
Class 3.....	4,471.66 to 10,658.39
Class 4.....	2,093.71 to 4,576.11
Class 5.....	1,002.09 to 4,025.45

Mr. Huddleston also presented a table listing the members of several prominent financial institutions that were represented on the boards of directors of about twenty railroad equipment builders and supply manufacturers.

Practically the same charges made in the petition to the Interstate Commerce Commission were presented by B. M.

Jewell, representing the American Federation of Labor, at the Railroad Labor Board hearings in Chicago on Monday last.

### Association of Railway Executives

#### Replies to Labor Leaders

On Tuesday, Thomas DeWitt Cuyler, chairman of the Association of Railway Executives, issued an official statement in which he denied the charges of labor leaders that railroads were paying excessive costs for equipment repairs as an attempt to deceive the public. Mr. Cuyler's statement reads as follows:

"At the very moment when real progress is being made in securing harmony and co-operation between the railroads and their employees, statements are being made to the public, which, whether intended or not, will impede these steps of progress, and if such statements are accepted without question, utterly deceive the public as to the facts.

"The Interstate Commerce Commission has ordered an inquiry into the subject of railroad repairs. The Railroad Labor Board has just started a hearing in Chicago on the subject of railroad working conditions. The railroads are co-operating with the Interstate Commerce Commission and with the Railroad Labor Board in an effort to arrive at the facts, and the proper conclusions to be drawn from the facts.

"In spite of this, W. Jett Lauck, on behalf of the machinists' union, issued to the newspapers from Washington, on Sunday, an inflammatory statement; yesterday, in opening the hearings before the Railroad Labor Board in Chicago, B. M. Jewell made another speech of the same character, utterly extraneous to the subjects under consideration; and today, Mr. Lauck from Washington, issues another statement full of insinuation and false conclusions.

"These it would seem are evidences of a concerted movement to appeal to the public over the heads of the Interstate Commerce Commission and the Railroad Labor Board, and to confuse the effort to deal with the subjects in controversy in an orderly manner. The public should be on its guard against such obvious propaganda.

"The railroad companies are preparing to present under oath the facts concerning equipment repairs to the Interstate Commerce Commission. From the facts available to me, I am confident that the investigation of the commission will confirm the following statements:

"1. Under the Transportation Act, the railroads are bound by rigid restrictions as to what they may pay out for repairs and maintenance.

"During the period covered by most of the so-called excessive charges, the railroads were guaranteed net earnings equal to those of the federal control period. For this guar-

anty period the law specifically excludes all unusual or disproportionate charges. For the period since September 1, the law limits railroad expenses to such items as may be justified 'under an honest, efficient and economical management, and reasonable expenditures for maintenance of way, structures and equipments.'

"It is manifest that for a railroad to incur improper charges for repairing its equipment would invite loss of earnings the company has every motive to conserve.

"2. The work given to outside shops was given last spring and summer when the capacity of the railroad shops was absolutely exhausted; the railroads are not now giving repair work to outside shops and depriving railroad employees of the work unless for reasons of economy or speed; such reductions in forces as are being made in railroad shops are the result of falling off in business.

"3. The figures quoted as to the relative costs of repairs in railroad shops and in outside shops are misleading for the following reasons:

"(a) The costs charged against repairs in railroad shops include no charges for interest on investment, depreciation, overhead expenses. Private companies must include such items in their costs.

"(b) Average costs in railroad and outside shops are not comparable for the reason that in order to conserve capacity and to secure the greatest possible results in the quickest possible time the railroads placed with the locomotive building companies a large amount of their heavy repairs, reserving for their own shops the lighter grade of work.

"(c) The vitally important factor is that it was necessary to get the work done at the earliest possible moment; and the railroads secured from the outside firms the best terms obtainable to get the job done.

"4. When the railroads were returned to private operation there was an abnormal percentage of cars and locomotives in bad order requiring repairs. The excess of bad order equipment was beyond the capacity of the railway shops, and the railway labor engaged in the repair of cars had declined in efficiency and output. These abnormal conditions required abnormal remedies to meet them. It was a matter of time and economy to utilize all the facilities of the equipment concerns of the country for these repairs.

"5. That there is absolutely no truth in the charge that banks and railroad companies are in a 'conspiracy' against labor, the 'open shop,' or upon any other controverted point

"A half truth is as bad as a whole lie. The statements referred to have been given a deceptive plausibility by the clever use of half truths. The whole truth will be ascertained by the Interstate Commerce Commission, and the public advised by that body as to the facts."

## Operating a Modern Freight House Efficiently\*

Practices Adopted at New Orange Avenue Freight House of  
New York Central at Cleveland

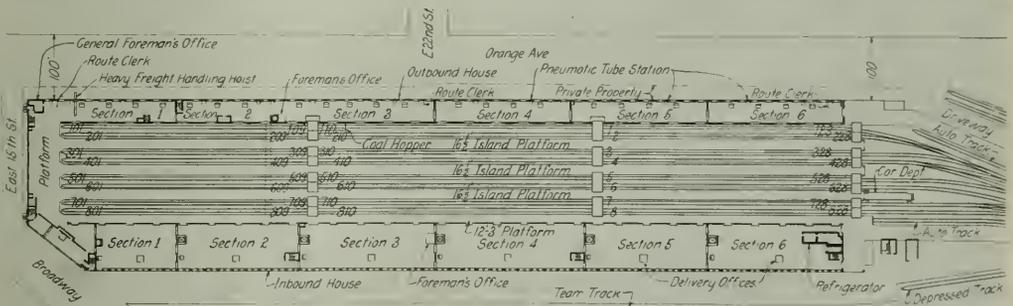

By W. E. Phelps

Assistant Engineer, New York Central, Cleveland, Ohio

IN MARCH, 1918, the New York Central completed at Cleveland, Ohio, its large Orange Avenue freight terminal, which had been several years in building and on which several millions had been expended to produce a plant combining the greatest convenience to the public, exceptionally efficient operating conditions, and an unusual regard for the comfort of its employees. When the new terminal was

served, while the new plant is less than a mile from the center of the business district and on a level with it.

The terminal as a whole, comprises a 3½-mile branch from the New York Central's Cleveland belt line and includes, besides the double-track connecting line, a 1,000-car storage and classification yard and the 35-acre terminal yard proper containing the team yards, which will have about 550

Floor Plan of the Freight House in Relation to the Track Layout

opened, three outbound and three inbound l.c.l. stations, and one team yard, were closed, and all the business was consolidated at the new location. The stations abandoned were largely outgrown and poorly located, 50 or 60 ft. below the level of the business and manufacturing district which they

served, while the new plant is less than a mile from the center of the business district and on a level with it.

### House and Track Arrangement

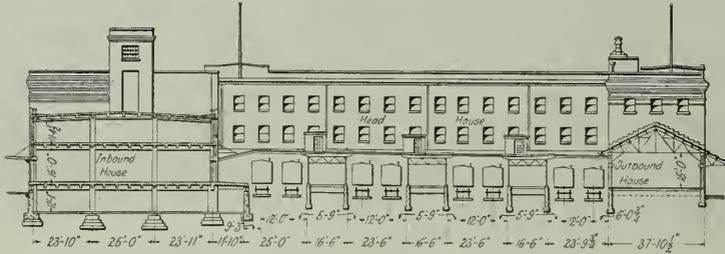

The team tracks range in length from 10 to 30 cars, with driveways 40 ft. or 37 ft. wide, the narrower dimension having been finally determined on as standard. They are largely

\*The engineering features involved in the design and construction of this large local freight terminal were described in the *Railway Age* of July 19, 1918, page 117.

paved with good second-hand paving stone (on a 6-in. concrete base) removed from the many streets which were vacated or changed to permit construction of the plant.

The 38-ft. outbound house, and the 75-ft. inbound house are each 1,262 ft. long and stand opposite each other, 156 ft. apart, with the space between them occupied by a 12-ft. 3-in. platform along the inbound house, and four pairs of tracks separated by three 16-ft. 6-in. roofed-over island plat-

into three sections of 9, 10 and 9 cars each by the bridges, so that the eight tracks have a total capacity of 224 cars. With the tracks cut into these short sections, the bridges provide easy access to each platform at intervals, and with a platform (or house door) adjoining each car, door-to-door spotting of cars is entirely unnecessary. The designated number of cars for each track is simply set in and cut for the bridges. As a result of this and the modified "permanent

Cross-Section Through the Freight House Layout, Looking Toward the Head House

forms. There is no platform along the outbound house, the track-side doors of which are 19 ft. wide and 42 ft. apart, center to center. The two houses and the platforms are connected across the west end by a basement-and-three-story headhouse. The main floor of this comprises a platform 50 ft. wide, while the upper two stories, which extend also around over 296 ft. of the outbound house, contain the house offices, record room, employees' cafeteria, recreation rooms, etc.

For operating purposes, the houses and platforms are also set up" of outbound cars, described later, the house is pulled and set up with unusual rapidity.

"Spot" Numbering System

Freight is handled between cars and trucks all on one floor, the tracks and the streets surrounding the houses being on the same level. The inbound house has full length basement and second floors, reached by seven large elevators; dirty and rough freight, like oil and barrels, baled rags, etc., is placed in the basement, and furniture on the second floor, but most

Interior of the Inbound House Showing the Use of the Lift Truck Trays

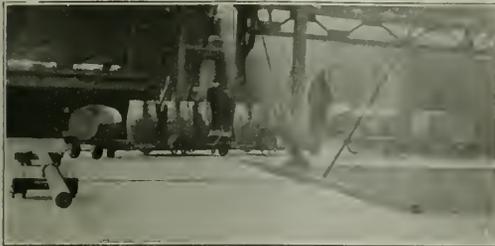

connected laterally at the east end and at two intermediate points by three sets of wooden bascule-lift bridges 16 ft. wide, which are raised and lowered by hand. Signal lights, suspended from the roof above the bridges, automatically indicate to trainmen whether they are up or down; continuous-burning red light signals are also shown over the bumping posts at the ends of the eight house tracks.

The house tracks are of 28 cars capacity, and are divided of the freight is handled on the first floor; fundamentally this is a "one-level" station, as distinguished from some stations recently built in which tracks and driveways are on different floor levels. In the outbound house there are 55 driveway doors, with an automatic five-ton dial scale located between each pair of doors, while the inbound house has 110 driveway doors, with six scales.

The "spot" numbering system for cars at the house gives

the westerly car on each track the number 01, and running from that up to 28 for the easterly car, while each position number is prefixed by the track number, as 101 to 128 for the cars on Track No. 1, 201 to 228 on Track 2, etc. Thus the same position numbers are directly opposite on all tracks, and the system is easily assimilated by the men. Prominent signboards permanently posted on the platforms opposite each car space indicate the numbers.

The equipment used for hauling the freight between houses and cars comprises about 600 four-wheel trailers with 18-in. main wheels, about 40 low-down all-steel trailers for handling barrels, etc., and a number of new-type dollies. The standard type trailers have 3-ft. by 6-ft. platforms, rigid

Outbound Train Handling Special Equipment Used for Hauling Awkward Pieces of Freight

hook couplers, and are equipped with removable pipe or T-iron gates. The earlier types of these trailers were of the usual wooden construction, but 175 recently purchased and put into use are of all-metal construction (except floor), with Hyatt roller bearings, and possess the unusual feature of spring suspension for all four wheels, primarily a floor-saving measure, as well as a spring drawbar device.

Among the dollies are two special types of Stuebing trucks: one a six-ton capacity dolly 9-in. high, with large wheel faces, spring suspension and roller bearings, with a bed of rollers set into the frame, for handling heavy machin-

Typical Trailer Train—Outbound House, Showing Covered Trucking Bridges

ery by rolling on or off; the other a cradle caster type for handling the many shipments of long shafting or forgings with special reference to easy handling into the car.

Eight Mercury tractors, seven small three-wheelers with 30-cell Edison batteries and developing a 600-lb. drawbar pull, and one larger one for handling heavy machines, etc., are the motive power for hauling this freight and equipment. Their batteries are charged at night and given a heavy boost at noon. Trains vary as to the number of trailers, and range as high as 18, the average being about 10. In both houses the crews consist of the motorman and a trainman, the lat-

ter's duties being to couple and uncouple trailers, watch his train to prevent freight from falling, etc.

### A Separate Organization for Each House

The house organization, under a general foreman reporting to the agent, consists of two entirely separate units, one for each house and each under a foreman. There are many differences in the handling of the two kinds of freight and some unusual methods are used in each house, so they will be described separately.

A driver with freight for outbound shipment goes first to any one of three route clerks with his bills; these clerks, in conveniently located special booths in the house, have all the requisites, including experience, for properly routing freight. They mark one copy of the bills with the spot number of the car into which the freight is to go, and return it to the driver, together with a ticket showing the number of bills, time of arrival at the house, etc.; the driver then goes to the indicated door and the checker, after transferring the freight onto trailers, chalks it with the spot number shown on the bills, and his symbol letter, and "OK's" the ticket which

Receiving Heavy Machinery with the Help of an I-Beam Runway at the Door

enables the driver to secure his receipted freight bills from the route clerk. This ticket is also marked to show the time of surrender, thus giving a record of the elapsed time at the station. The checker also marks on the ticket the time he started and finished handling the load.

The average loading per trailer at this house is about 1,330 lb., an exceptionally high figure which is accounted for by many metal products, including auto springs, hardware, bolts, nails, wire, rods, bars and plate, and quantities of paints and oils, manufactured in Cleveland. Outbound heavy steel products, machine tools, etc., are transferred from trucks by a freight hoist consisting of an I-beam runway extending 9 ft. out over the driveway, and 26 ft. back into the house, on which are two four-ton, geared trolley hoists, which can be worked separately or together, and easily handle the heaviest loads acceptable at the house, onto whatever equipment is needed for moving them to the cars.

The loaded trailers in each section are lined up in train order and pulled by tractors onto the proper platform, the rear trailers being cut off one by one as they pass the proper

cars. After all the loads have been cut off, the tractor gathers a train of empties which have been partially assembled by the stowers to take back into the house. No trailers have freight for more than one car—there is no "peddling." As soon as the freight has been pulled off the floor, the checker "shoots" his bills to the office by means of a pneumatic tube system, for rating, billing, etc.

On the platforms, a head stower in charge of an entire platform, shifts his men from point to point as necessary to prevent congestion at any one place, and supervises the loading generally.

To minimize the back-hauling of freight which is taken out on a platform, marked for a car which is found to be full when the freight reaches it, about a dozen telephones connected with the house exchange have been placed on the platforms, enabling a stower to notify the foreman promptly when a car is filled, and a special system of "despatchers" phones to each route clerk's and checker's booth allows the foreman to notify these men quickly of this condition. A bulletin board on which each route clerk's, checker's and stower's loading errors are charged up to the individual develops considerable rivalry among them.

A flexible "permanent set-up" is used for outbound cars,

Typical Trailer Movement in the Outbound House

which are arranged in "groups," a group being a number of cars going to one principal station for unloading or further distribution. Each group is permanently assigned to one position on the house tracks, but the assignment of cars within the group is elastic, within the foreman's discretion. This elasticity obviates the necessity of switching set-backs onto precise spot locations and also permits making extra cars without disarrangement of the set-up, at the same time giving nearly all the advantages of a strictly permanent "set-up." Cars are all set at night. The first train of outbound house freight leaves the yard about 45 min. after the house closes, and the second train soon after.

#### Handling Inbound Freight

In the handling of inbound freight the methods are somewhat analogous, but differ materially in detail. Each firm regularly receiving sizable quantities of freight is assigned a certain space in the house for its freight, the space being marked by suspended signboards, but two of the six sections are assigned to smaller and less regular consignees whose freight is sorted and piled alphabetically according to initial. Thus each consignee's freight is always all together and is always found at the same place in the house, which is a great advantage in reducing confusion.

Tallymen at the cars load all freight on trailers to the different sections, loading them to capacity with any number of lots of freight. They are then hauled by tractor to the

indicated section, and the piler in the section distributes it as necessary. When the lots are large enough to justify it, and the size and shape permit, the freight is piled directly from the trailers onto 3½-ft. by 5-ft. lift truck platforms awaiting delivery. About 400 of these platforms are in use, equipped with stake pockets for use when necessary. One Stuebing 5,000-lb. (hand) lift truck in each section is used to move these loaded platforms to the door for delivery, one man doing it quickly in one easy operation. These platforms and trucks not only speed up delivery and save labor, but are conducive to cleaner and closer piling, and thus save room, this being a valuable feature; it is rather startling to consider that in ordinary freight house operation, according

Some of the New Equipment

to figures from many houses, the floor space occupied by a ton of freight awaiting delivery, figured at fair rental rates, costs close to 20 cents.

A large refrigerator room is maintained for the storage of perishables awaiting delivery or shipment, and facilities are provided for icing a small number of dairy cars. Two tracks are regularly assigned for inbound freight and are set at night and as often during the day as necessary. A comparatively small amount of transfer work is done in connection with the inbound freight work.

The yards are piped for air, and light repairs are made

Loading a Four-Ton Casting on An All-Steel Roller Top Dolly Truck

and air brakes are tested and cleaned as the cars stand at the house for loading or unloading. A car repair shop is also maintained at the classification yard.

Fire drills, with adequate apparatus, are had frequently, and considerable attention is given to fire prevention work. All employees are provided with individual steel lockers and a high class cafeteria and a recreation room are maintained in the office portion of the building, while the house men have a comfortable basement dining room and lounging room, the only place in the house where smoking is permitted. Employees in the house are required to wear badges.

GROUP LIFE INSURANCE for its employees is to be continued by the General Electric Company for another year. During the first year of the insurance plan about \$257,500 in death benefits were paid.

# Hearings on Substitute for Section 10 of Clayton Act

## Majority of Commission Approves Underlying Principle of Section 10 But Favors Some Modifications

WASHINGTON, D. C.

HEARINGS ON THE FRELINGHUYSEN bill, S. 4576, which was drafted by Alfred P. Thom, general counsel for the Association of Railway Executives, as a substitute for Section 10 of the Clayton act, were begun before a sub-committee of the Senate committee on interstate commerce on Wednesday, January 5. Chairman Clark and Commissioner Meyer of the Interstate Commerce Commission testified briefly, saying that a majority of the commission approved the underlying principle of Section 10, but think that some modifications should be made in it, while some of the commissioners think it should go into effect subject to such changes as necessity for may develop later. They said the commission had had nothing to do with the form of Section 10 and had had no opportunity to discuss the matter after they had been notified that hearings would be held. Commissioner Meyer said that he and Chairman Clark had gone over the substitute bill tentatively and it had seemed to them that the entire effect of the law would be nullified by the insertion of the language to provide that it shall not deprive a carrier of the right to exercise an honest business discretion in determining which bid, under all the circumstances, is the most favorable, nor to prevent it, after having taken competitive bids from doing business on some other basis. Under this provision, he said, a railroad might take bids and then make a separate bargain, as is done commonly in other lines of business and to a certain extent in the railroad business. Commissioner Meyer also said he saw no reason why companies should be allowed to charge supplies against subsidiaries for more than the market price under any condition. The bill provides for the approval of a different price by the Interstate Commerce Commission. The bill provides that a common carrier having such dealings as are required by the law to be made by competitive bidding shall preserve in its office, for such time as the commission shall require, a complete record of the transaction, subject to the inspection of the Interstate Commerce Commission. This, Mr. Meyer said, would throw upon the commission initial responsibility for examining the various bids and records, which would place upon it a great responsibility in connection with the hundreds of thousands of such documents and might result in an "inferior" kind of inspection.

The bill provides that whenever the commission shall, after investigation or hearing, have reason to believe that the law has been violated, it is authorized to refer the matter and its own views or findings thereon to the attorney general. Mr. Meyer thought the commission should be authorized to make recommendations to the attorney general as to certain transactions clearly not against the public interest, although technically in violation of the law.

Chairman Clark said he thought he spoke the consensus of the views of the commissioners when he said that such transactions as the law was really aimed at should be prevented and that even if the law did not reach actual transactions the moral effect would be good, but he pointed out several objections to the Clayton act as it stands and said that it is not in harmony with some of the provisions of the Transportation Act. He pointed out that Section 10 does not prohibit common directors, but merely requires competitive bidding on transactions in which common directors or officers are involved. He also said that the Transportation Act contemplates consolidations, whereas the Clayton act would prevent many transactions in securities between companies in a

single system by the requirement that the dealings in securities must be on competitive bids. He also pointed out that the Transportation Act gives the commission control over the issuance of securities and a degree of control over expenditures by the provision that it shall make rates designed to produce a certain return only under conditions of honest and economical management. He said there ought to be a reasonable limitation on the possibility of improper dealings, but that it should not be so extreme as to stand in the way of carrying out the purpose of the Transportation Act. He agreed with Commissioner Meyer that the language intended to give the railroads discretion would nullify the rest of the bill. Mr. Clark said he believed in the principle of the Transportation Act as it applies to consolidations because the grouping of railroads into fewer larger companies would make possible more economical and efficient operation, give better public service and make possible better regulation. He thought it was in the public interest for a parent company to purchase supplies for its subsidiaries in large quantities, but said that they should be sold to the subsidiaries at the price at which they were purchased. He did not think that a parent company should be required to bid in the open market for the securities of its subsidiaries. Mr. Clark also pointed out that if there is extravagance or even graft in connection with the purchase of supplies or of securities Section 10 would not reach it unless common directors or officers were involved.

Senator Townsend called Mr. Clark's attention to a speech made in the House last week by Representative Huddleston, in which Mr. Huddleston presented a memorandum, evidently prepared for him, charging that railroads are paying excessive prices for locomotive repairs in outside shops as compared with the cost in railroad shops. Chairman Clark said he imagined the memorandum was the same or came from the same source as information which had been furnished to the commission some weeks ago. The commission had started an informal investigation and it had had the accounts of two roads checked up. It seems to be established, he said, that the cost of the repairs of these locomotives has exceeded that of work done in the railroads' own shops. The commission had asked the presidents of some of the roads for an explanation. In one case the reply was that the figures as to the cost in outside shops were not accurate, because they represented only preliminary estimates. In some cases the contracts were made on a cost-plus basis. Some of the railroads had replied that the figures did not represent a fair comparison because the cost figures for the railroad shops did not include overhead, interest or depreciation. Others said that they had paid more for repairs in outside shops, but they had felt justified in incurring the additional expense because they needed to have the repairs made and were not able to perform the work promptly themselves. Except for two roads, Mr. Clark said, the commission's investigation is not yet complete, and while the figures received are "significant and illustrative," they require further investigation. It still remains to be established, he said, whether any interlocking relation was involved between the railroads and the companies doing the work outside, but the commission is going into the matter thoroughly with the purpose to get the exact facts.

Alfred P. Thom, general counsel for the Association of Railway Executives, and S. T. Bledsoe, general counsel for the Atchison, Topeka & Santa Fe, testified before a sub-

committee of the Senate committee on interstate commerce on January 6 and 8 that the effect of Section 10 of the Clayton law would absolutely break up the system by which railroad companies purchase materials and supplies for their system lines and receive in return securities of the subsidiary companies. The requirement that competitive bids must be received on dealings between companies having common officers or directors, they said, would make it impossible for the parent company to buy supplies in large quantities for all its subsidiaries and would also subject it to the danger of losing control of the subsidiaries. They declared that they were in sympathy with the underlying principle of the Clayton act, but that amendments such as are proposed by the Frelinghuysen bill are necessary to make it workable. This bill does not apply to transactions in railroad securities because the Interstate Commerce Commission has been given complete power to regulate security issues by the transportation act.

Mr. Thom pointed out that the railroads have persistently sought to have Congress amend the law before its effective date, without interfering with its prohibition of improper transactions, but that Congress has been so pressed with other matters that the subject had not been considered on its merits before the effective date arrived. One reason was that the matter was not of importance while the government was operating the railroads. He also said that the President had vetoed the bill to again postpone the effective date without having before him the carriers' reasons for asking further postponement. After the law was passed, Mr. Thom said, the carriers had asked the Interstate Commerce Commission to give it a construction, by conference rulings, which would except dealings between railroads and their subsidiaries, but the commission had not felt justified in doing so. He illustrated his remarks as to the effect of the law by examples of the separate corporations required by the Texas laws and by the structure of several of the larger railroad systems. The interpretation put on the law by the commission, he said, would require that all dealings between the separate companies of a system be on the basis of competitive bids.

"We are not opposing," he said, "the underlying moral principle that the purchasing agent of a railroad should not have conflicting outside interests, but we are seeking to amend the law to make it workable, and prevent consequences which were not foreseen when it was passed. We are willing that every proposal we make shall be measured by the standard of public interest. In dealings with subsidiary companies there is no conflict of interest."

Mr. Bledsoe said he did not believe Congress had intended to apply the law to transactions with subsidiaries. He thought it was intended to apply to purchases of supplies and sales of securities, but that all doubt should be removed. He showed the committee that the Atchison system consists of five separately-operated lines, several of which are held by Texas corporations, all of the securities of which are owned by the Atchison. The parent company buys most of the materials and supplies for all of them and bills them at cost plus a small handling charge. It also owns most of the system equipment and through trains operate over the system lines. Repair shops are distributed over the lines at convenient points and the repair bills are apportioned on a basis of use. "The details of these transactions are so minute that it would not be possible to handle them on a basis of competitive bids," Mr. Bledsoe said, "and if these great systems are to be maintained in an efficient state of operation you cannot dismember them. If the law is to be applied to these dealings all that is sought to be accomplished by the transportation act would be nullified."

He also pointed out that the Sante Fe lines are joint users of 18 separate depot and terminal companies. He did not know how these terminal company operations can be made a

success if the owning companies cannot have their representatives serve as directors, or if competitive bids are to be required.

Mr. Bledsoe also declared that purchasing by competitive bids is an expensive method and that a good purchasing agent should be able to buy at a lower price by negotiation. The proposed bill would give a railroad the right to buy at less than the lowest bid if possible to do so by negotiation.

Mr. Thom continued his statement on January 8. He said that railroads frequently find it necessary to organize separate companies to furnish fuel and other supplies which are merely an alter ego of the railroad company and in reality a part of its departmental organization. The method of purchasing by competitive bids, he said, has been adopted by governments merely as a safeguard against dishonesty. The Clayton law would practically commit the roads to doing nearly all their buying on competitive bids.

For many kinds of purchases it is practically impossible for the railroad to prepare complete specifications which will cover its requirements and the personal equation with the manufacturer is important. A good purchasing agent can obtain better prices by negotiation with manufacturers than by merely accepting the lowest bid; and frequently it is better economy to buy from responsible manufacturers at a higher price than the lowest bid. Under the law it would be impossible to reject all bids and then negotiate for a still lower one. It would be necessary to ask new bids.

Mr. Thom said that the method of negotiating with bidders results in an economy of millions of dollars. For example, if a railroad asks bids for a thousand cars and the price is satisfactory it might want to increase its order to 1,500 or 2,000 cars at the same price, but under the law it would be necessary to ask new bids.

Senator Kellogg remarked that it would not do much good to require western railroads which as a practical matter must buy rails from the Colorado Fuel & Iron Company because it has the only rail mill in the west, to ask for competitive bids.

The Clayton act, Mr. Thom said, will bring out a horde of impossible adventurers that will try to make the lowest bid with the idea of selling the contract to someone else and will sue the railroads if they reject their lowest bids as not the most favorable. The law does not define what constitutes the most favorable bid.

Mr. Thom then explained the Frelinghuysen bill, proposed as a substitute for Section 10, which does not apply to dealings between railroads and their common carrier subsidiaries but does require competitive bidding for the purchase of supplies from companies having common directors or officers. The bill, however, allows the railroads an honest business discretion in determining which bid, under all the circumstances, is the most favorable. It does not apply to dealings with non-carrier subsidiaries if the railroad owns a majority of its stock except that the railroad would not be allowed to purchase from such subsidiaries at more than the market price except on approval of the Interstate Commerce Commission. Referring to charges made by the International Association of Machinists that railroads are having cars and locomotives repaired at outside shops at excessive prices, Mr. Thom said that the Interstate Commerce Commission had ordered a full investigation. He said that when the railroads were returned by the government an amazingly large majority of their cars and locomotives were in bad order. As much repair work as possible was done in railroad shops and what could not be done by the roads themselves had to be sent to outside shops or left undone. He also said that there was often a difference in the character of the work done in the outside shops, because the equipment requiring the heaviest repairs was sent to them.

Mr. Thom also pointed out that the public is protected by

the provision in the transportation act that the Interstate Commerce Commission shall adjust rates to give a fair return only under honest, efficient and economical management.

Chairman Clark of the Interstate Commerce Commission appeared before the committee again on Wednesday morning and stated that the commissioners are fully agreed that the existing law should be modified and are unanimous in recommending a number of modifications in the Frelinghuysen bill, which he outlined. The commissioners were agreed that the law should not be applied to dealings in securities because the commission already has complete jurisdiction over that subject under the provisions of the transportation law. They were also agreed that it should not be made to apply to transactions between railroads and their carrier subsidiaries or non-carrier subsidiaries controlled by at least one half ownership or by a lease, but the commissioners were opposed to allowing very much discretion in dealings for the purchase of supplies between companies in which there is an interlocking interest.

The first change proposed was one in the title to make the bill an amendment to Section 10 of the Clayton law instead of repealing it, but to insert a provision referring to it in the interstate commerce law so as to make it a part of that law. The commissioners also thought that the law should become effective within 60 or 90 days from its passage instead of at the end of the year. It was also proposed that the law should not apply to transactions amounting to less than \$100,000 a year. The present law applies to transactions amounting to more than \$50,000 a year, and the Frelinghuysen bill applies only to dealings or contracts to the amount of more than \$50,000 in any one transaction. Chairman Clark pointed out that the latter proposal placed too little limitation because transactions could be split up into several amounts each less than \$50,000. Another amendment to the proposed bill suggested was that it should apply to all officers, directors or agents. The commission proposed to eliminate the provision allowing the carrier to apply to the Interstate Commerce Commission for a decision as to what constitutes a substantial interest, for the reason, Mr. Clark said, that it is impossible to define in advance what constitutes a substantial interest, as this may depend on various circumstances. The commission also proposed to strike out the language allowing the carrier to exercise an honest business discretion in determining which bid is most favorable and authorizing it to negotiate with the bidders for more favorable terms. To allow so much discretion, Mr. Clark said, would practically nullify the purpose of the act, and to allow the carrier to increase the quantity to be purchased after having received bids without inviting new bids would make it possible to have a private understanding with one of the bidders that he could secure a larger order than that specified in the bids. He pointed out that the law would not prevent a carrier from negotiating with bidders for more favorable terms except where the interlocking interest exists.

When Mr. Thom asked if the commission would not be willing to provide for emergency purchases without competitive bidding, Mr. Clark said he thought that emergencies could be taken care of in the regulations. He thought there would not be many emergencies in which either the law or the regulations would cause embarrassment because there is no restraint except where the interlocking interest exists. The commission also objected to the provisions in the substitute bill by which carriers might secure the approval of the Interstate Commerce Commission for a different price than the existing market price on transactions between carriers and their non-carrier subsidiaries. The commission also proposed substantially the language of the present law requiring carriers to file with the commission within 30 days a full and detailed record of the transactions which are subject to the law. The Frelinghuysen bill merely proposes that such

records shall be preserved by the carrier in its office subject to the inspection of the commission. Chairman Clark said that if carriers were not required to report the commission would have very little information as to possible violations and if carriers are going to have such transactions as those aimed at in the law they should report the facts to the commission.

Chairman Clark said the commission thinks that Section 10 is out of harmony with the provisions, purpose and principle of the transportation act and that it would be impracticable, if not impossible, for the carriers to conduct their financial business or for the commission to administer its functions of regulating them if limited by the unyielding provisions of Section 10.

Senator Townsend asked if the chairman had anything further to say relating to the charges of excessive prices being paid for car and locomotive repairs in outside shops. Mr. Clark said the commission is proceeding with its investigation and intends to ascertain the exact facts, but no facts had yet been demonstrated from which it could give the committee any reliable conclusions. He said the commission had checked up the figures used by Representative Huddleston of Alabama in a speech in the House, but had not been able to verify them. He pointed out that locomotives had been put to a very severe strain during the war period and said there may have been a very good reason for a railroad to send them to outside shops. It also may be found, he said, that in some instances this was done with a disregard for cost. It may also be found that there was some interlocking interest, but the commission is not yet able to state a conclusion. As to whether there had been under-maintenance of the equipment during the period of federal control, he said there are different views, but he would say that ever since the European war broke out there has been a continuous and tremendous pressure for transportation and equipment has been used to the maximum in an attempt to accomplish the largest possible amount of public service.

## Bill to Provide for Partial Payment of Guaranty

WASHINGTON, D. C.

**A** BILL to MAKE the Transportation Act provide clearly and specifically what the railroads and the Interstate Commerce Commission have contended it already contemplated, but which the Comptroller of the Treasury and the Supreme Court of the District of Columbia have said it does not provide, that is, partial payments to the railroads on account of their guaranty for the six months after the termination of federal control, was introduced in Congress on January 6 by Representative Winslow of Massachusetts. If the bill is passed it would enable the railroads to collect a large part of the \$300,000,000 or \$400,000,000 of their guaranty that is due without waiting for the long and tedious process of final adjustment of the exact amounts. The bill also applies to the amounts due to many of the short lines that were relinquished from federal control as reimbursement for their deficits incurred by reason of federal control.

The Winslow bill proposes to amend and reenact subdivision (g) of Section 209, relating to the six months' guaranty, so as to read as follows:

"(g) The commission shall, as soon as practicable after the expiration of the guaranty period, ascertain and certify to the Secretary of the Treasury the several amounts necessary to make good the foregoing guaranty to each carrier. The Secretary of the Treasury is hereby authorized and directed thereupon to draw warrants in favor of each such carrier upon the Treasury of the United States for the amount

shown in such certificate as necessary to make good such guaranty, it being the true intent and meaning hereof that whenever, and as often as, the commission shall certify to the Secretary of the Treasury an amount as certainly due and necessary to make good the foregoing guaranty to any such carrier, the Secretary of the Treasury is hereby authorized and directed, upon receipt of such certificate, to draw a warrant in favor of such carrier upon the Treasury of the United States for the amount shown in such certificate as an amount necessary to make good the foregoing guaranty, whether such amount is in final settlement or in partial payment, and the Comptroller of the Treasury is hereby directed to countersign the same forthwith. The Secretary of the Treasury shall thereupon deliver the said warrant to such carrier, and the Treasurer of the United States is hereby directed to pay the same, upon presentation, out of the appropriation made therefor in this subdivision. An amount sufficient to pay such warrants is hereby appropriated out of any money in the Treasury not otherwise appropriated.

"In ascertaining the several amounts necessary to make good the foregoing guaranty to each carrier the commission is further authorized, in the case of debits and credits to railway operating income which cannot at the time be definitely determined, to make, whenever in its judgment practicable, a reasonable estimate of the net effect of any such items, and, when agreed to by the carrier interested, to use such estimate as a definitely ascertained amount in certifying the amounts due under the said guaranty, and such estimates so agreed to shall be binding in final settlement."

It also proposes to amend and reenact subdivision (g) of Section 204, pertaining to the short lines that were relinquished during the period of federal control, to make it read similarly.

The House committee on interstate and foreign commerce has referred the bill to the Interstate Commerce Commission for an opinion and has announced a hearing on the bill at Washington on January 14. The railroads have also announced their intention of taking an appeal from the recent decision of the Supreme Court of the District of Columbia denying the petition of the Grand Trunk Western for a mandamus to compel the Secretary of the Treasury to honor a certificate of the Interstate Commerce Commission for a partial payment on account of its guaranty.

## A. R. A. Tackles Fuel Conservation

THE FIRST ACTIVE STEP toward improving fuel efficiency to be undertaken by the American Railway Association has been the organization of joint committee which held its first meeting in New York on January 6. The motive leading toward a more active participation in fuel conservation is the necessity for more rigid economy in the operation of the railroads. It is anticipated that traffic will not be as heavy and hence that the gross revenues will be less during 1921 than in the preceding year and it is realized that the only way in which the railroads can look forward with certainty to an improvement in their net revenues during the coming year lies in the enforcement of greater economies in operation. Officials directing this movement believe that it is incumbent upon the railroads to demonstrate the utmost efficiency in every direction in conformity with the spirit of the Transportation Act.

The fuel bill, on account of its size and its susceptibility to greater efficiency both in purchase and consumption, appears to afford the greatest opportunity for substantial savings. With this in view, the American Railway Association directed the appointment of a representative committee on fuel conservation which will undertake to outline the policies of this association toward fuel conservation.

This committee is comprised of 21 members. Seven members represent the operating department; seven, the mechanical department, and seven represent the service of supply. The members of the committee representing the operating department are: J. B. Parrish, general manager, Chesapeake & Ohio; E. M. Costin, general manager, Big Four; W. M. Jeffers, general manager, Union Pacific; J. E. Hutchinson, general manager, St. Louis-San Francisco; W. D. Robb, vice-president, Grand Trunk; H. M. Eicholtz, assistant to vice-president, Chicago & North Western, and H. McVeagh, assistant to general manager, Big Four.

Those representing the mechanical department are: C. H. Wiggins, superintendent motive power, Boston & Maine; Wm. Schlafke, mechanical manager, Erie; G. H. Emerson, chief of motive power and equipment, Baltimore & Ohio; Jos. Hainen, assistant to vice-president, Southern; W. J. Tollerton, general mechanical superintendent, Chicago, Rock Island & Pacific; John Purcell, assistant to vice-president, Atchison, Topeka & Santa Fe; H. M. Curry, general mechanical superintendent, Northern Pacific, and W. L. Robinson, superintendent of fuel and locomotive performance, Baltimore & Ohio.

The service of supply is represented on the committee by the following members: S. B. Wight, manager purchases and stores, New York Central; Samuel Porcher, general purchasing agent, Pennsylvania; H. B. Grimshaw, assistant to general manager, Seaboard Air Line; L. N. Hopkins, purchasing agent, Chicago, Burlington & Quincy; F. A. Bushnell, purchasing agent, Great Northern; G. E. Scott, purchasing agent, Missouri, Kansas & Texas, and T. Britt, general fuel agent, Canadian Pacific.

William Schlafke, mechanical manager of the Erie, was selected as chairman and William Jeffers, general manager of the Union Pacific, and Samuel Porcher, general purchasing agent of the Pennsylvania, were selected as vice-chairmen. V. R. Hawthorne, secretary of the Mechanical Division of the American Railway Association, was made secretary. The chairman and vice-chairmen constitute a committee of direction of the Fuel Conservation Committee. The official headquarters of the committee will be at the American Railway Association offices in Chicago.

As a beginning of its work, the committee decided to undertake at once the study of four subjects:

- 1—Organization of fuel conservation.
- 2—Inspection of fuel and preparation of specifications for fuel.
- 3—Statistics.
- 4—Existing methods of conservation—mechanical and others.

Four sub-committees were appointed to make special studies of these subjects for report to a general meeting of the Fuel Conservation Committee to be held within 30 days. The personnel of the Committee on Organization of Fuel Conservation is as follows: W. J. Tollerton, chairman; W. D. Robb and S. B. Wight. The committee on inspection of fuel and preparation of specifications consists of E. M. Costin, chairman; G. H. Emerson and L. N. Hopkins. The committee on statistics is comprised of F. H. Hammel, chairman; T. Britt and H. M. Curry, and the committee on existing methods of conservation includes John Purcell, chairman; J. B. Parrish and G. E. Scott.

THE SUIT OF THE STATE OF NEW YORK against the Interstate Commerce Commission, asking for an injunction to restrain the commission from enforcing its proposed increases in intrastate passenger rates in New York is to be heard by the United States District Court at Norwich, N. Y., on January 22. The ten members of the Interstate Commerce Commission, as a body, and as individuals, are named as defendants.

Some Grading Work on the Delaware & Hudson

# Analysis of Railroad Grading Develops Trend Curves

## Valuation Departments of Representative New England Roads Present Interesting Study of Reproduction Costs

IN ARRIVING AT the cost of reproduction of the properties of the roads as of the year 1914, many interesting and difficult questions have arisen. Various railroads of the country, through their valuation departments, have endeavored to make such studies of their properties as would help or enable the engineers of the Bureau of Valuation of the Interstate Commerce Commission, and others, to determine what is a fair and equitable figure. One of the most complete studies of this nature is a grading report made by a committee representing the New England carriers which has gone into the question of unit costs of grading in a very thorough and comprehensive manner.

The report, which covers about one hundred pages of type-

sufficient to show the methods which were used by the committee in developing the diagrams or "trend" curves and may be used as a guide for developing similar studies in other localities wherein the surrounding conditions are more or less uniform. It must be conceded here that this form of study will not apply where an attempt is made to cover a section of country which has widely different industrial and topographical characteristics.

### Type of Country and Roads Represented

The roads represented in the report are the Bangor & Aroostook, covering eastern and northern Maine; the Boston & Albany, covering Massachusetts and eastern New York:

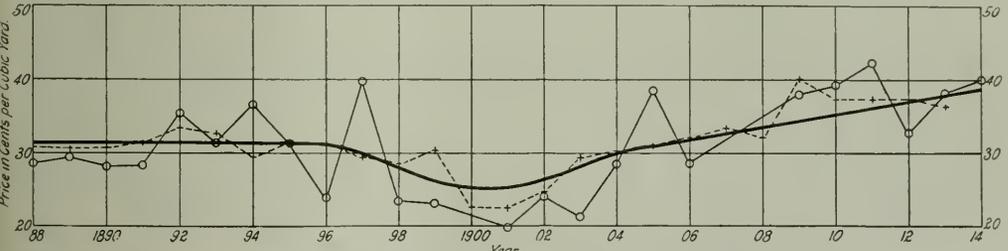

Fig. 1. A Typical Trend Curve of an Individual Road

written matter, tables and diagrams, presents all of the contract data dealing with common excavation, loose rock and solid rock, that this committee could secure and covered the moving of over 34,000,000 cu. yd. of excavation from bank to fill, exclusive of the work on the Southern New England. This represents all of the work of any magnitude which has been done between 1880 to 1915 in the territory covered by the New England railroads. The results obtained from the data and the diagrams confirm what is a matter of common knowledge, that is, that the costs between 1896 and 1900 were low and that from 1900 to 1915 they have increased. The data given herein, while not complete, is

the Boston & Maine, covering northern Massachusetts, eastern New York, Vermont, New Hampshire and southeastern Maine; the Central New England, covering western Connecticut and eastern New York; the Central Vermont, covering Vermont, Massachusetts and Connecticut; the Delaware & Hudson, covering eastern New York; the Maine Central, covering southern Maine and New Hampshire, and the New York, New Haven & Hartford, covering Massachusetts, Rhode Island, Connecticut and southeastern New York.

The section of country thus represented consists topographically of a comparatively narrow coastal plain backed by foothills which become mountainous over a considerable

portion of New Hampshire, Vermont, northwestern Connecticut and western Massachusetts. The coast line is very irregular, being broken by rocky headlands and indented by tidal estuaries with deep deposits of silt, causing heavy subsidence and difficulty in depositing fills.

The rock is largely volcanic, generally granite and con-

hills are full of springs and the rainfall and snowfall are heavy. These springs usually make trouble where the rock lies in pinnacles and saddles or where an impervious clay underlies the sand or gravel, and frequently require pumping, especially where the cut runs with the grade. In many cuts the common excavation approaches hard pan.

**Methods Used in Analyzing**

The prices shown in the accompanying tables were all figured on the "one way" basis, that is on a single price from cut to fill. At first it was attempted to work out the grading on the basis of the contract price without the overhaul and to determine separately a price for overhaul. It was found, however, that not only was there no consistency between the methods adopted by the Bureau of Valuation and the practices of the various carriers, but that no continuous plan had been followed in the case of the individual carriers for any considerable number of years. Some of the contracts named

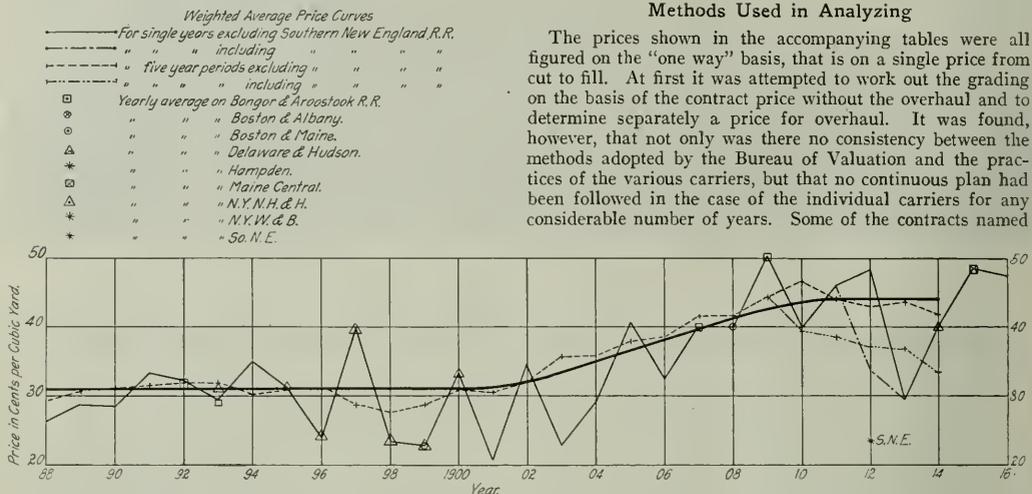

Fig. 2. The Trend Curves Between 1888 and 1916, Showing Yearly Weighted Average of Individual Roads

glomerates. Slate predominates locally in some sections of Maine, Vermont and eastern New York, marble in parts of Connecticut, Massachusetts and lower Vermont and sandstone with fissures filled with trap rock in the Connecticut valley south of the Massachusetts-Vermont line. The rock as a rule is hard to drill and difficult to handle. It generally occurs in small quantities, in saddles and pinnacles cov-

er a price in place, including all haul, some named a free-haul limit of 500 ft., some 600 ft., others 1,000 ft. and others still another distance beyond which overhaul would be set up as a pay quantity.

As a result of this condition, the only common basis to which all the data could be brought was "cost in place" including haul. The diagrams were plotted on that basis and

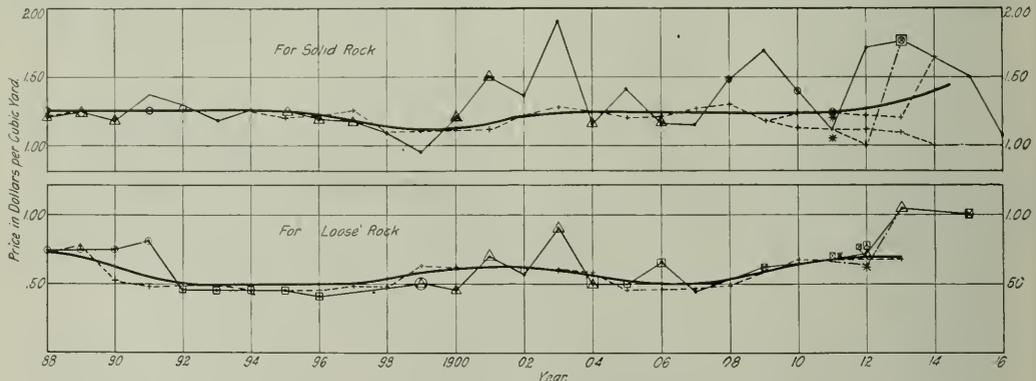

Fig. 3. Trend Curves of Loose Rock and Solid Rock for the New England Group

ered by an overburden of earth of irregular depth. For this reason the grade line of the New England railways has usually been kept high and the deficiency made up from borrow.

The earth is generally gravel or clay or a combination of the two, while the cuts are frequently of sand which, when wet, as is often the case, becomes of a quicksand nature. The

tables were reduced to the same basis, although where the data were available the tables show the two factors separately. Where no figures appear in the overhaul column the cost of haul is included in the total price.

Table I illustrates a part of a typical analysis of one of the roads in question. The data are grouped by years, the date of the contract being the one governing its place in the

tabulation. Taking the year 1911 for an example it will be seen that there were but two contracts, one involving the moving of 13,790 cu. yd. at a cost of 35 cents a yard, or a total cost of \$4,826.50, and the other involving 106,715 cu. yd. at 42 cents a yard or \$44,820.30. Following the first contract through it will be seen that there was a total overhaul cost of \$716.83 which when reduced by the percentage

is also shown in Table II, and graphically by the dotted line in Fig. 1. This method is simply the taking of the weighted average costs of the work let in the individual years, as for instance 1880, 1881, 1882, 1883 and 1884, averaging them mathematically and tabulating the results as a five year weighted average to be represented at the middle of the period, that is, at the year 1882. The next figure was ob-

69 (per cent common to total) gave an overhaul charge of \$494.61. Adding this to the contract cost gave a total cost, including overhaul of \$5,321.11 for moving 13,790 cu. yd., or a cost of 38.6 cents per cu. yd. In the second contract the total cost, including overhaul, came to \$45,353.10 for moving 106,715 cu. yd., or a unit cost of 42.5 cents per cu. yd. The total yardage for the year was then 13,790 plus 106,715 or 120,505 cu. yd., handled at a total contract price of \$5,321.11 plus \$45,353.10 or a total of \$50,674.21, thus giving a unit cost of 42.1 cents per cu. yd. for the year.

The last figures which are shown in the three right-hand columns of the table represent the weighted average for the year 1911. This procedure was followed out for each year and for each individual road. In this particular illustration the tables and diagrams are devoted to common excavation, the same procedure, however, was followed out in the classification of loose rock and of hard rock, of which however only the composite diagram or trend curves are shown.

Securing General Averages for Plotting

The total yearly averages or weighted averages for each road were then tabulated as shown in Table II, which is representative of a part of one of the tables presented in the report.

The results so obtained were plotted on a diagram which is shown in Fig. 1, the light solid line representing the yearly averages. In order to smooth out the irregularities due to any preponderating influence of some local work, a running average was developed by five year periods, which

tained by taking the years 1881, 1882, 1883, 1884 and 1885 and repeating the process and showing the result as for the year 1883. In the fourth column, after the year 1894, will be seen the figure 940,736 which represents the total yardage

TABLE II—WEIGHTED AVERAGE PRICES FOR FIVE-YEAR PERIODS WITH OVERHAUL, EXCAVATION—COMMON—ROADWAY, YARDS AND TERMINALS

Year	Contract price		Quantity	W. A. P.	Amounts	Year to which	
	Price	Amount					Sum—5-yr.
1890..	172,546	\$0.281	48,476.78	806,894	\$0.308	\$248,826.26	1888

dealt with in the years 1890 to 1894, inclusive, at a total cost of \$311,915.01 or at an average unit cost of 33.2 cents per yard. According to the method already described this would then be plotted or shown as of the year 1892. This method was carried out for each road and the results tabu-

lated and plotted as shown. After the diagram had been completed the general trend of the prices was developed by drawing an unbroken line making a graphical average of the high and low spots already plotted.

The next step after securing the averages of the individual roads was the combining of the results so obtained into a general tabulation of all the roads represented in the New England group. The total annual yardages moved, the total cost, and the unit cost were tabulated as in Table II and a five year running average taken for the group. A representative period is shown in Table III and covers the years 1890 to 1910, inclusive. The results were then plotted as shown in Fig. 2.

TABLE III—WEIGHTED AVERAGE PRICES FOR 5-YEAR PERIOD ON ALL NEW ENGLAND ROADS—EXCAVATION—COMMON—ROADWAY, YARDS AND TERMINALS—INCLUDING OVERHAUL

Year	Totals by years			Totals by 5-year periods			Year to apply W.A.F.
	Quantity	Amount	W.A. price	Quantity	Amount	W.A. price

Effect of the Southern New England

In connection with the plotting of the composite diagrams an interesting feature developed through the use of the data obtained on the Southern New England. The committee felt that, in preparing the report, the work on the Southern New England should not be included as it was done under a losing contract manifestly unbalanced, there being a suit pending between the contractor and the road for about one and one-half million dollars, due to a disagreement over classification of material. The work, however, was included separately in order to show what effect its inclusion would have on the results obtained from the other roads of the group.

Referring to Fig. 2 it will be seen that there is a second dotted line beginning at the year 1909 and running downwards to the year 1914. This lower line represents the effect of combining the work of the Southern New England during the year 1912 with the remainder. The yardage in question was exceptionally large in comparison to that of the other roads, being approximately 60 per cent of the total yardage moved in that year and consequently dominates the weighted average. Excluding these figures the general trend of prices for common excavation is shown by the heavy smooth line. The general trend of prices for loose rock and solid rock are shown in Fig. 3.

The Hampden railroad quantities were reclassified to correspond with the government specifications and the sub-contract figures included in the general average and used in the report although the Public Service Commission of Massachusetts found after investigation that the amounts paid the sub-contractors were low and that the higher figures paid to the principal contractors were substantially correct for grading in Massachusetts at that time.

No attempt was made to fix a definite unit price for grading for the individual carriers. The point where the trend line crosses 1914 on the composite diagram is an average for New England and may be or may not be, according to the committee, the proper price to apply to the grading of any one carrier's property.

We are indebted for the above information to H. J. Sargent, assistant chief engineer of the Boston & Maine, Boston, Mass., who has been chiefly instrumental in originating and preparing this study.

Loan Fund Nearly Exhausted

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION ON January 11 issued a statement giving the status of the revolving fund created by section 210 of the Transportation Act, 1920, for the purpose of enabling the rail-carriers of the country "properly to serve the public during the transition period immediately following the termination of federal control." The total amount of the revolving fund is \$300,000,000, and it has been commonly referred to as the \$300,000,000 loan fund, but of which \$40,000,000 has been reserved temporarily to meet claims and judgments arising out of operations during the period of federal control as provided in section 206 of the Transportation Act, 1920—leaving \$260,000,000 available for loans to the carriers.

The total of loans approved by the commission, as of December 31, 1920, is \$205,721,357, as follows:

To aid in meeting maturing indebtedness.....	\$86,173,750
To aid in the acquisition of equipment.....	41,385,870
To aid in making additions and betterments to existing equipment.....	17,291,294
To aid in making additions and betterments to way and structures to promote the movement of freight-train cars.....	60,870,443

Additional loans aggregating \$51,653,594 may be made on pending applications, the commission said. This will leave \$2,625,049 of the revolving fund available for additional loans. There will be credits to the revolving fund, during the transition period, of interest and repayments of principal with respect to loans heretofore made, which credits will be available for still further loans.

The Treasury Department on January 10 also issued a statement of the various payments it had made under the transportation act, as follows:

Total Payments at Close of Business January 8, 1921—	
(a) Under Section 204, for reimbursement of deficits during federal control.....	\$622,877.49
(b) Under Section 209, paragraphs (h) and (i), for advances on account of the sum estimated to be necessary to make good the guaranty therein provided.....	260,266,874.00
(c) Under Section 210, for loans from the revolving fund of \$300,000,000 therein provided.....	166,445,937.00
Total.....	\$427,335,688.49

The railroads to whom payments have been made by the Treasury for loans under section 210, and the aggregate amounts severally paid to them in this respect are as follows:

Atlanta, Birmingham & Atlantic.....	\$200,000
Baltimore & Ohio.....	3,000,000
Bangor & Aroostook.....	20,000
Boston & Maine.....	11,656,479
Buffalo, Rochester & Pittsburgh.....	1,000,000
Carolina, Clinchfield & Ohio.....	3,000,000
Central New England.....	300,000
Chicago Great Western.....	2,445,373
Chicago, Indianapolis & Louisville.....	200,000
Chicago, Milwaukee & St. Paul.....	25,340,000
Chicago, Rock Island & Pacific.....	9,862,000
Chicago & Western Indiana.....	8,000,000
Erie.....	8,000,000
Fort Smith & Western, Receiver.....	156,000
Gulf, Mobile & Northern.....	17,910,000
Illinois Central.....	515,000
Kansas City, Mexico & Orient, Receiver.....	4,440,000
Maine Central.....	2,500,000
Missouri Pacific.....	1,653,000
New York Central.....	8,871,760
New York, New Haven & Hartford.....	26,775,000
Northern Pacific.....	6,730,000
Pennsylvania.....	6,000,000
Rutland.....	61,000
Salt Lake & Utah.....	800,000
Seaboard Air Line.....	300,000
Texas Mississippi Terminal.....	6,073,400
Terminal Railroad Co. of St. Louis.....	1,000,000
Virginian.....	896,925
Waterloo, Cedar Falls & Northern.....	1,000,000
Western Maryland.....	60,000
Wheeling & Lake Erie.....	300,000
Western Maryland.....	1,400,000
Total.....	\$166,445,937

# Labor Board Opens Hearings on Working Conditions

## Carriers Oppose Perpetuation of National Agreements Employees File Charges Against Roads

THAT THE NATIONAL AGREEMENTS between the railroads and various classes of their employees, instituted within six months before the end of federal control, should not, in the interests of "honest, efficient and economical management" be continued longer under private operation, was contended by representatives of the railroads before the Railroad Labor Board on January 10 during the opening hearings on the demand of railway employees for the perpetuation of these agreements.

"The only parties who are fully qualified to consider such regulations are the individual managements and their employees," testified E. T. Whiter, chairman of the Conference Committee of Managers of the Association of Railway Executives, which is presenting the carriers' side of the controversy.

The reasons for the carriers' opposition to national agreements were outlined during the course of Monday's hearings in the opening statement on behalf of the railroads. This opposition, according to Mr. Whiter's testimony, is based on the facts that:

(1) They are ultra-restrictive and therefore prevent the honest, efficient and economical management demanded by the transportation act;

(2) The variable conditions in different sections of the country make the universal application of their provisions impracticable;

(3) The existing rules, the continuation of which is proposed by the men, are capable of various constructions;

(4) The existing agreements provide that the rules contained therein shall apply to all employees of any particular craft regardless of the department of the railroad in which the man is employed; thus leading to a division of jurisdiction and a conflict in the working rules applicable to employees engaged in the same work;

(5) The existing agreements have destroyed acknowledged efficient and economical practices such as the piece-work system for regulating rates of pay;

(6) The railroads must have relief from the rules controlling the employment of men, which are so restrictive as to prevent them from obtaining a sufficient number of employees in certain departments, thus interfering with output and causing delay to the movement of traffic;

(7) The agreements contain many rules which provide for payment for work not performed, and thereby cause many millions of dollars of unnecessary expense annually.

"The railroads do not object to schedules (the technical term for railway agreements) properly negotiated and entered into with their own employees," Mr. Whiter said, "as is evidenced by the fact that nearly all, if not all, of the roads represented by this committee, have had schedules with the various train service organizations for many years.

"Prior to federal control, some roads had schedules with other classes of their employees; many had no schedules with any crafts other than the train service organizations, but there were no so-called 'national agreements' which made all rules uniformly the same throughout the country. All roads that did have schedules directly negotiated them to fit their own conditions with their own men, and in every case the railroads had the undisputed right to negotiate their own schedules, which was denied during federal control.

"Under governmental control the railroads were unified, and the director general entered into so-called 'national

agreements' with the shopmen, maintenance of way employees, clerks, firemen and oilers, and signalmen. The first of these so-called 'national agreements' was made with the shop crafts less than six months, and the last, that with the signalmen, only a few days before the return of the roads to their owners. These agreements, which were of universal application for the period of federal control, were specifically recognized by the parties signatory thereto as effective during this period only, and contain nothing that would impose such obligation upon all roads alike after individual responsibility had to be assumed by the separate railroads for their successful operation as separate properties. Therefore, we contend that under private control consideration must necessarily be given to the conditions and peculiarities of operation on the individual properties in the preparation of any regulations governing the working conditions of employees of those properties. The only parties who are fully qualified to consider such regulations are the individual managements and their employees.

"Many of the rules in the so-called 'national agreements' are," he continued, "so ultra-restrictive that they positively prevent reasonably economical operations, and result in serious interference with efficiency and production. There should be no such interference with the responsibility of the managements as might unreasonably impair the efficient and economical operation of the properties, of which responsibility the managements cannot divest themselves, and which responsibility is specifically placed upon them by the provisions of the Transportation Act, 1920, in the following language:

The Commission \* \* \* shall give due consideration among other things, to the transportation needs of the country and the necessity (under honest, efficient and economical management of the existing transportation facilities) of enlarging such facilities in order to provide the people of the United States with adequate transportation.

"The responsibility upon the individual properties, and the variable conditions which are encountered in the different sections of a country so large as the United States, we hold makes impracticable the universal application of the provisions of the so-called 'national agreements.' We hold also that many of the rules are so worded that they are capable of various constructions and have resulted in so-called interpretations which are in fact new rules: others are impractical of application without incurring excessive penalties. Experience in trying to work under the rules has demonstrated that they have resulted in extraordinarily numerous questions from both the employees and the managements. This in itself makes the rules particularly objectionable. We respectfully ask, therefore, that this board leave the individual roads free to negotiate their own schedules, so as best to meet justly the widely varying conditions on the different roads. We hold that this principle is recognized in Section 301 of the Transportation Act itself, which provides that the railroads and their employees shall negotiate directly with each other to the fullest extent before referring questions at issue to other tribunals.

"The so-called 'national agreement' covering the shop crafts provides that the rules contained therein apply to all employees of any particular craft regardless of the department in which employed. Under these conditions portions of gangs are necessarily governed by one set of rules and other portions of the same gangs by another, which is obvi-

ously wholly wrong in principle and practice. Employees of each department should be separate and distinct from the employees of any other department, and should be governed entirely by the rules or schedules of the department in which they are employed. There should be no division of jurisdiction. It is true that certain mechanical work is required in the maintenance of way department. Nearly all of it is road work, performed under entirely different conditions than prevail in shops and shop rules are not applicable. The employees who perform this work must be trained, supervised and promoted by the officials of the department in which they are employed, in order to secure that efficiency, economy and despatch which is essential to good management and the proper discharge, by the railroads, of their duties as common carriers. Rules agreed upon by the individual railroads with their employees can be so constructed as to give employees who are members of the same craft, but employed in different departments, all of the protection to which they are justly entitled.

"Those roads, represented by this committee, which have been working on the eight-hour-day basis, will continue to do so unless changed by mutual agreement with their employees, but they must have the right to re-establish more efficient and economical practices, when it is found desirable and practicable to do so. We refer, among other things, to piece-work methods which were abolished. This action has cost many millions of dollars to the roads which had for years successfully produced much of their output by piece-work methods. The excess cost, which is really a loss to the railroads, is piling up day after day and will continue to do so as long as the railroads are prevented from re-establishing the piece-work basis and until the railroads are free to re-establish such former practices they will not be able to comply wholly with the requirements of the transportation act. By this method the output of the shop is increased, and the workmen on account of their ability and skill are afforded opportunity for receiving increased compensation over and above what they would receive working on the day basis. The piece-work method is well recognized as being the most efficient method of operation and proof of this is the large number of manufacturing plants throughout the United States which are working on a piece-work basis and further proof that many men desire piece work, is that, when this method of pay was abolished, a great many employees left the railroad shops and entered the service of car building and other manufacturing plants where the piece-work system of pay was in effect. Among the elements set forth in the Transportation Act for determining rates of pay is 'The training and skill required.' We hold that the piece-work system of pay affords a specific basis for compensating employees under this requirement, which at the same time is just and reasonable."

Mr. Whiter then pointed out the necessity for relief from the restrictive rules regarding employment which are interfering with output and causing delay to the movement of traffic and the fallacy of perpetuating national agreements with organizations which do not represent all the employees of a particular class on all railroads. In conclusion he said:

"We believe that the board should not approach this subject from the angle of a schedule with any organization; or that the board can properly say what organizations shall or shall not represent the employees. The subject should be dealt with from the standpoint of what are the proper regulations for the character of service under consideration, and that the question of whether they shall be applied on the individual properties, in the form of a schedule with certain organizations, depends upon the policy of the individual property and the desire of the majority of the respective classes of employees on that property.

"We firmly believe that the board will be convinced that

the widely varying conditions on the different railroads can be properly considered and disposed of only by direct negotiations on the individual properties, and will accordingly deny the request of the employees for continuation or perpetuation of the so-called 'national agreements,' together with the interpretations and rulings thereon."

### B. M. Jewell Attacks Railroad Managements

Prior to Mr. Whiter's opening statement, B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, read a statement on behalf of the employees charging that the railroads have broken faith with the public, violated the Transportation Act and defrauded the public of millions of dollars. Mr. Jewell's specific charges, which he promised to substantiate later, were virtually the same as those recently filed with the Interstate Commerce Commission by W. J. Lauck on behalf of the International Association of Machinists.

To these charges, Mr. Whiter replied as follows:

"The statement made on behalf of the labor organizations this morning consists of a series of reckless general charges which their spokesman says they will not attempt to substantiate at this time and which have no relevancy whatever to the question of the continuance of National Agreements or to any other question now pending before the board.

"The apparent purpose of the labor leaders in introducing such a statement is to divert public attention from the consideration of the matters actually in controversy and under consideration by the Railroad Labor Board.

"The very fact that they are trying in this manner to divert public attention from the matters actually in controversy leads to the conclusion that they have no confidence in the real merits of their case.

"To us it is a matter of profound regret that in a hearing so important there should be injected a series of charges admittedly unsubstantiated and that these charges should be coupled with the insidious intimation that unless this Board follows a course satisfactory to the employees 'the service rendered to the public will inevitably suffer.'

"The statement read into the record this morning will not divert us from the presentation in an orderly manner of the real question long pending before the Board."

Immediately after the hearing was opened by Chairman Barton, it was announced that several smaller organizations, not parties to the controversy which led to the Board's Decision No. 2, would be heard in the present case. Representatives of the "associated standard recognized railroad labor organizations" immediately protested against making these organizations, of which the Railroad Yardmasters of America is typical, parties to the present controversy or hearing from them during the progress of this case. However, the Board had already informed representatives of these smaller organizations that although they were not properly parties to this controversy they would be permitted to make presentations to the Board after the testimony on behalf of the organizations party to the dispute had been heard. The Board's decision was upheld by Chairman Barton, who stated that representatives of these organizations would be heard despite the opposition of the "standard" organizations.

L. E. Shepard, president of the Order of Railroad Conductors, speaking on behalf of the train service brotherhoods in Group 1, also requested the Board to give an immediate decision dealing only with the four transportation brotherhoods postponing the hearings, if necessary, to do so. This, according to Mr. Shepard, would enable these brotherhoods to promptly negotiate their contracts with the various roads and would serve to clarify the present case.

Mr. Whiter replied that, if the case of the train service brotherhoods was closed, his case would also be closed subject to the right to rebuttal statements. Mr. Whiter did,

however, request the Board to continue the hearings and render a decision for all organizations at once.

### Carriers' Testimony on Shop Crafts Agreement

In presenting the carriers' opposition to the perpetuation of national agreements and the reasons therefor, Mr. Whiter took up in consecutive order the rules contained in the agreement made with the Shop Crafts approximately six months before the end of federal control. In presenting this testimony, Mr. Whiter first quoted the rule, second, outlined the carriers' objection to it and the reasons therefor, and third, cited numerous examples, either from adjustment board dockets or from the actual experiences of individual roads in working under the various rules of this agreement. These actual cases showed the impracticability of the universal application of rules which do not take into account the varying conditions on different carriers.

The presentation of material of this character continued on January 11 and 12, Mr. Whiter reading with but few interruptions. The large volume of these examples prohibits their inclusion here. However, several of those which clearly show the punitive effects of certain rules contained in the National Agreement are given below to show the character of the testimony which is being made before the Board.

### How National Rules Prevent Efficient and Economical Operation

Regarding Rule 7, which provides that (1) for continuous service after regular working hours, employees will be paid one hour for 40 minutes' service or less, (2) they shall not be required to work more than one hour without being permitted to go to meals, (3) employees called or required to return to work will be allowed 5 hours for 3 hours and 20 minutes' service or less, and (4) they shall be required to do only such work as held or called for, Mr. Whiter showed the punitive effects of the rule by the following example:

"A machinist on the Florida East Coast was notified that he would be required to work overtime to finish up work already begun on an engine. He was allowed to go to his work at the proper time and upon returning found other mechanics working on the engine. Owing to the nature of his part of the work he could not begin until the other men were through. While waiting on them he was ordered to inspect another engine and make out report. This completed, he was allowed to return to the job for which he was held and complete it. He was then ordered by the foreman to complete the shift.

"The employee's position was that he is entitled to 6½ hours, 1½ hours for the first hour and 5 hours for returning for the job for which he was held over, and 5 hours (a second call) for the inspection job, with the differential of 5 cents per hour, then 5 hours (a third call) for completing the shift.

"The railroad's position was as follows: The machinist was instructed to finish the application of a pair of engine truck-wheels. He was held up by other workmen and had to wait some time. While waiting he was sent to make the usual periodical inspection on another engine. In the meantime it developed that one of the second-trick machinists did not show up and he was instructed to fill his place. We contend he is entitled to 5 hours for the engine inspection at the differential rate, and time and one-half up to 11 p. m., the finishing time of the second shift.

"The decision allowed the machinist not less than 16½ hours for the time in question, 5 hours of which will be paid for at the differential time."

Regarding this Mr. Whiter said:

"This decision penalizes the railroad for the time not worked. It will be noted that this employee was allowed three five-hour calls; also one and one-half hours' pay for

the ninth hour, a total of 16½ hours' pay for work performed within a spread of eight hours."

As an indication of the manner in which these rules operate to increase expenses and award labor an unreasonable wage for the service rendered, Mr. Whiter submitted statistics compiled by the Norfolk & Western showing the actual expense incurred under Rule 7 of the Shop Crafts Agreement. These statistics show that in the month of August, 1920, for instance, mechanics, helpers and apprentices on its lines received 4,944 calls, they worked 10,509 hours, they were paid for 24,720 hours and the punitive payments by the company totaled \$8,900.

Rule 10 of the Shop Crafts Agreement provides for the payments to be made to employees sent out on the road for emergency service. As evidence of the manner in which this rule operates to increase labor costs exorbitantly, Mr. Whiter cited the following instance which occurred on the Atchison, Topeka & Santa Fe:

On April 1, four carmen were sent from Newton, leaving at 8.25 a. m., arriving at Bader at 9.45 a. m., working from that time until 3.20 p. m., or four hours and thirty-three minutes each, renewing a truck body bolster. When the work was completed it was too late to catch a train to Newton, but by going to Strong City and awaiting the arrival of a train at 1.00 a. m., they were enabled to arrive back at Newton at 5.00 a. m., April 2. The time allowance for each man was 28 hours, or straight time from 8.00 a. m. to 5.00 p. m., time and one-half from 5.00 p. m. to 1.00 a. m., and double time from 1.00 a. m. to 5.00 a. m. The company was compelled to pay these four men a total of 112 hours at 67 cents per hour, amounting to \$75.04 for work which would have occupied the time of one man 18 hours and 12 minutes, which at 67 cents per hour amounts to \$12.20. This is a difference of \$62.84.

Regarding Rule 12 of the Shop Crafts Agreement, which provides for the payments to be made when it is necessary to fill temporary vacancies at outlying points, Mr. Whiter said in part:

"The railroads object to the interpretation of this rule which has been claimed on some roads, namely: That it is mandatory that men should be taken from their regular work in order to fill temporary vacancies at outlying points, even when such temporary vacancies might be filled by employing a man at such local point. It has been a common practice that when a man is obtainable at such outlying point, he may be employed to fill such temporary vacancy instead of sending a regular employee from the main point. There is no good reason why the employer should send a man from a home point to fill a vacancy at an outlying point and pay traveling expenses, etc., if the employer can get the work done by temporarily employing a man at the local point.

"As illustrative of the unreasonableness of this portion of the rule especially when considered in connection with the mandatory requirements that men must be sent from home station to fill a temporary vacancy, regardless of the widely varying conditions in different parts of the country and the ability at many points to have such work satisfactorily performed by the employment of men at such local points, the following is shown:

"Recently on account of a shortage of men and a heavy movement of traffic on the Norfolk & Western out of Williamson, W. Va., it was necessary to send 5 machinists from Bluefield, a distance of 101 miles. Each of these machinists worked 8 hours per day, first three days, for which they were each paid 72 hours at time and one-half for 24 hours' work, which gave to each man approximately \$52.00 for no service performed whatever, in addition to \$29.92 paid for the 24 hours' work."

Seniority shall rule in filling desirable vacancies according to Rule 18 of the Agreement. The manner in which this

rule impairs the efficiency of shop forces was shown by Mr. Whiter in reciting the following incident:

"At Havelock, Neb., on the Chicago, Burlington & Quincy, a man bid in on a machine. In about a week another machine was bulletined and this man exercised his seniority rights again. This slowed up the work on both machines. Another in the boiler shop at Havelock changed his job five times in three weeks. It should be strictly up to the foreman to fill these positions and not the crafts."

### Norfolk & Western Case Completed

Hearings on the controversy between the Norfolk & Western and its trainmen and conductors before Bureau No. 3 of the Board ended on January 6. The opening session of these hearings was outlined in the *Railway Age* of January 7. The first real point of difference between the Norfolk & Western and its yard employees was indicated early in the opening session when L. B. Going, attorney for the Association of Railway Trainmen, requested permission of the Board to be heard when certain portions of the controversy were discussed. This portion of the controversy, the request of the trainmen that only "promotable" men be employed in yard service, that members of the Brotherhood of Railroad Trainmen be given preference in employment of yard men and not less than 85 per cent of all yard men be members of that organization, actually came before the Board on January 4. Val Fitzpatrick, vice-president of the Brotherhood of Railroad Trainmen, told the Board that serious consequences would result if the colored organization was heard by the Board and allowed to interfere with the progress of the present case. After executive consideration, the Board issued the following statement in reply:

"Bureau No. 3 understands that the Transportation act of 1920 imposed upon the Railroad Labor Board the duty of hearing such cases as are formally brought to its attention by the parties directly interested. Such submissions having in this case been formally made, the hearings must necessarily be confined to the parties directly interested and no others can be permitted to intervene. This ruling of Bureau No. 3 is not understood to preclude any employees who have a bona fide dispute with the railroad from bringing it to the board in accordance with the procedure outlined in the Transportation Act of 1920. The Bureau must also recognize the right of contracting parties to legislate for and represent the class of peoples with whom such contracts are executed by the carriers."

The position taken by the management in this particular portion of the controversy was that it would not concede to the rule requested because it would place an undesirable restriction on the opportunities for employment of colored men in its yards and that incorporation of the proposed rule would already complicate an already embarrassing situation. Mr. Fitzpatrick contended on the other hand that the rule was proposed to require the company to handle efficient and competent men so that those white men now in yard service would not suffer from the act of inefficient and incompetent colored employees. In support of this contention, Mr. Fitzpatrick charged that discrimination had been and was being made against white employees inasmuch as negroes have not been and are not prosecuted for rule violations whereas white yardmen are immediately disciplined. Mr. Neill, speaking for the carrier, stated that the proposed rule is aimed solely at barring the negro from a railroad yard under the guise of his not being "promotable" even though many are efficient and capable of promotion. In reply to this contention, Mr. Fitzpatrick stated that a large majority of the negro yardmen were inefficient and incapable and totally unfitted in the interest of safety to perform yard service.

Many other points in the controversy between the carrier and its employees were discussed before the Board. These include the (1) employees' request for a new rule covering the handling of baggage and joint baggage and express; (2)

employees' request for rule governing leave of absence of trainmen; (3) request for a rule pertaining to the duration of agreement; (4) the request that yardmen handling work for wreck trains in yard limits be paid yard rates instead of road rates; (5) the seniority rights of foremen; (6) compensation for yardmen called to office to make reports for statement; (7) yardmen riding cars on hump or gravity yard will not be required to control more than one car unless coupled together; (8) preference in filling switchtender positions should go to partially disabled yardmen and train service employees; (9) claim of seniority rights for certain employees; (10) requests that trainmen be assigned as baggage men; (11) various claims for adjustment for overtime for individual employees, and (12) request for a new rule relating to motor or other cars operated on schedules and orders.

### Pullman Conductors Request Increased Wages

Hearings in the controversy between the Pullman Company and its conductors over wages and working conditions opened on January 5, before the full board. The employees, who are asking for an increase from the present step-rate basis of \$155.00 to \$190.00 per month for 240 hours or less in regular assignment to a step-rate basis of from \$200.00 per month or 83.55 cents per hour to \$225.00 per month or 93.75 cents per hour, were represented by M. S. Warfield, president of the Order of Sleeping Car Conductors. The company in this case was represented by F. L. Simmons, assistant to the general auditor.

During the hearing it developed that the Pullman Company had granted its employees a flat raise of \$30.00 per month following the increases awarded train service employees by the Board's decision of July 20. Mr. Warfield admitted that this increase placed sleeping and parlor car conductors on a par with other train service employees but contended that such a rate of pay does not consider the extra degree of responsibility placed upon Pullman conductors. In presenting this point Mr. Warfield said: "A higher percentage of pay for sleeping car conductors is believed to be justifiable owing to the fact that they have until September 3, 1919, the date of the application of Amendment 1 to supplement 17 to General Order 27, been the lowest paid classes in train service, their expenses away from home are heavier because their trips are longer and require a larger expenditure for food, because hotel accommodations are higher, personal attire being exacting according to the requirements of the company and because conductors are subject to call during their sleeping hours."

The statement made by Warfield during the course of the hearings that as far as he knew Pullman conductors were now operating under Amendment No. 1 to Supplement 17 to General Order 27 was challenged by Mr. Simmons, who stated that the Transportation Act continued the rates of pay of the Railroad Administration only until September 1.

The hearings in this case continued until January 6, when the Board took the case under advisement.

A "SCHOOL OF SIGNALING," maintained by the Lancashire & Yorkshire, has graduated in ten years 2,041 students, and at the end of the last term, December 16, the chairman of the company awarded 15 valuable prizes and 186 certificates to 201 graduates. The course, apparently, is not for signal maintainers or mechanics, but for signalmen (operators) in cabins; and a large proportion of the students appear to be station clerks, station helpers and various classes other than those who are directly engaged in signaling or are seeking employment in signal cabins. The total number enrolled in the session just closed was 1,421. The apparatus and methods of the school seem to be somewhat like American railroad schools—those on the Erie, the Pennsylvania and the New York Central, where telegraphy and station clerical work are taught.

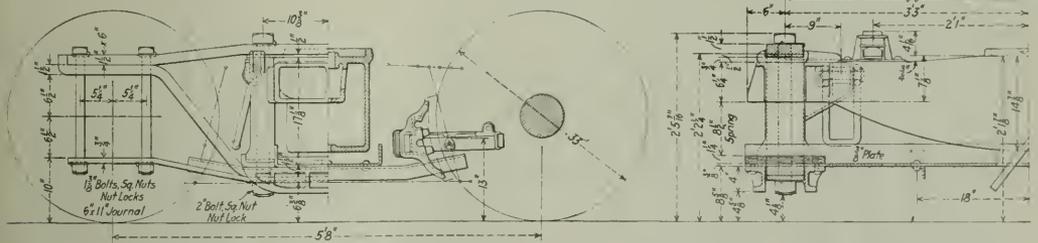

## Sulphuric Acid Tank Cars of 70 Tons Capacity

Tank Made with Three Longitudinal Sheets Is Feature of  
Equipment Built for General Chemical Company

THE TRANSPORTATION of dangerous chemical products in large quantities has become so common that it receives but little attention from the railroads that move this traffic. To build equipment which permits handling such commodities in regular service without extraordinary precautions requires a high degree of skill in design and high-class workmanship. This is well exemplified in the recent order of 70-ton tank cars built by the American Car & Foundry Company for the General Chemical Company.

Foundry Company and the General Chemical Company, the owner's arrangement of dome fittings and outlets being applied. The tank conforms to the A. R. A. Class III tank specifications and is built to withstand a pressure of 300 lb. per square inch. The diameter inside the sheets is 85¼ in. and the length between the outer rows of rivets is 32 ft. The cylindrical section of the tank is made up of three longitudinal courses, each in one piece. The length of riveted seams is reduced considerably by this design. The bottom sheet is

Arch Bar Truck Used with 70-Ton Tank Car

These cars have a capacity of 9,800 gal. of sulphuric acid. The concentrated acid is nearly twice as heavy as water and if any considerable quantity of water comes in contact with the liquid, a violent explosion will occur. For this reason, the tanks must be strong, absolutely free from leaks and the dome must be tightly sealed.

With the exception of two cars built for the General Chemical Company in 1916, the fifty cars on this order are, so far as known, the first 70-ton acid tank cars constructed. The design was worked up jointly by the American Car &

Foundry Company and the General Chemical Company, the owner's arrangement of dome fittings and outlets being applied. The tank conforms to the A. R. A. Class III tank specifications and is built to withstand a pressure of 300 lb. per square inch. The diameter inside the sheets is 85¼ in. and the length between the outer rows of rivets is 32 ft. The cylindrical section of the tank is made up of three longitudinal courses, each in one piece. The length of riveted seams is reduced considerably by this design. The bottom sheet is

# Car Loading Again Decreases

WASHINGTON, D. C.

THE NUMBER OF CARS loaded with revenue freight during the week ended January 1, 1921, which includes the New Year holiday, was less even than the loading during Christmas week, which was less than for any week in 1920 except one week during the switchmen's strike last April, according to the weekly report of the Car Service Division of the American Railway Association. The total was 598,905, as compared with 745,446 during the corre-

travel at all. In fact, the higher rates will have a healthy effect. It will possibly stop a lot of very useless travel, and help the great congestion on passenger trains so that legitimate travel can enjoy a reasonable degree of comfort. For the past four months I have been forced to travel a great deal. I can hardly secure a berth on a sleeper without reservation days ahead, and often have to stand in passenger cars. The slowing up of all kinds of business has reduced freight tonnage a great deal; the rate had nothing to do with this. If freight were hauled free now there would be no more tonnage. Harris is wrong; the rates should be slightly

L. C. L. merchandise loading figures for 1921 and 1920 are not comparable, as some roads are not able to separate their L. C. L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

sponding week of 1920 and 612,741 during the corresponding week of 1919 and 641,057 in 1918. During one week of April, 1920, the loading fell to 584,000 and during one week of December, 1918, it was only 550,000. With those two exceptions, the loading for the week ending January 1 was the lowest that has been recorded for three years. The summary as reported by the Car Service Division is given in the table.

advanced in both passenger and freight. Railroads must be efficient and give service and they can't do it and pay the high union wages they have to pay without higher rates."

\* \* \* \* \*

## One View of the Rate Question

THE INTERSTATE COMMERCE COMMISSION is receiving a good many letters of complaint from various persons that freight and passenger rates are too high. In a recent issue we published some extracts from correspondence between Senator Harris of Georgia, who expressed a desire to see lower rates, and Chairman Clark of the commission, who pointed out to the senator some of the reasons why rates had to be advanced. The commission has since received a letter from one of the senator's constituents, N. K. Smith, president of the Golden Rule Case Stores, Milledgeville, Ga., who disagrees with the senator on the subject. He says: "I note that Senator Harris is in favor of lowering freight rates. I beg to state he is in error. Freight and passenger rates are if anything too low yet. The freight rates do not now affect the price of goods hardly to any perceptible degree. And passenger rates are not high enough to retard

The M. K. & T. Station at San Antonio, Texas

# General News Department

The Buffalo, Rochester & Pittsburgh has discontinued its Employee's Magazine with the January issue in the interest of economy.

Colonel Frederick Mears, chairman and chief engineer of the Alaska Engineering Commission, in charge of the Government railway in Alaska, is to address the Western Society of Engineers, Chicago, on January 20, on Alaska and Alaskan railways.

The Interstate Commerce Commission has ordered a proceeding of inquiry and investigation as to the cost of railroad fuel in 1920 in response to a Senate resolution directing it to report the increased cost of railroad fuel in 1920 over that for 1919.

Appropriate legislation making it possible for the railroads to collect immediately a portion of the \$400,000,000 due them under the guaranty provisions of the Transportation Act is urged in a resolution adopted by the board of directors of the Chamber of Commerce of the United States.

The next regular meeting of the New York Railroad Club will be held at the Engineering Societies' Building, New York City, on Friday evening, January 21, 1921, at eight o'clock. Samuel O. Dunn, editor of the *Railway Age*, will address the club on the subject of "Is the Railroad Problem Really Being Solved?"

The Atchison, Topeka & Santa Fe on January 10, withdrew from its joint use of the Oakland Mole terminal of the Southern Pacific, and its trains now run to and from its own terminal at Ferry Point, Richmond. The withdrawal was made possible by the revocation of the order of the Railroad Commission of the state of California that the Santa Fe must remain at the Oakland Mole.

Senator Trammell, of Florida, on January 10 introduced in Congress a bill to require a reduction in rates charged by the railroads by amending Section 15-a of the interstate commerce act to provide that the fair return, which under the law is 5½ per cent, with a possible addition of ¼ per cent, in the discretion of the Interstate Commerce Commission, shall not exceed 4 per cent on the aggregate value of railroad property.

The directors of the American Railway Association, at a meeting in New York on January 6, elected Daniel Willard (B. & O.), chairman of the board and re-elected R. H. Aish-ton president of the association. W. G. Besler (C. of N. J.), was chosen first vice-president, in place of W. T. Tyler, and Hale Holden (C. B. & Q.), second vice-president in place of E. H. Coapman. J. E. Fairbanks is general secretary and treasurer.

Peter Bronski and S. Kalonowsky, section men on the Chicago & Erie, were presented with \$50 each as a reward for their honesty in turning over to the proper authorities four bags containing Liberty Bonds, drafts, leases, wills, notes and certificates of deposit valued at approximately \$500,000, which they found near the track at Highlands, Ind. The property had been stolen from the National Bank of Clifton, Ill., on the night of November 19.

The record of efficiency tests and observations in the Eastern Region of the Pennsylvania for October shows an average of 99.9 per cent perfect; number of tests 37,427; failures, 40. Five divisions—Cumberland Valley, Tyrone, Trenton, Norfolk and Elmira—with a total of 8,189 tests, had a perfect score; seven divisions—Cresson, Juniata, Atlantic, Baltimore, Delaware, Schuylkill and Philadelphia Terminal—had one failure each out of a total of 12,946 tests.

Senator Robinson of Arkansas on January 11 introduced in the Senate a bill providing that after July 1, 1924, all cars or parts of cars used for transporting baggage and express in interstate commerce shall be of such construction and character and furnished in such manner as shall be required by the Interstate Commerce Commission. The bill also provides that after that date the commission shall not allow to be used any full railway baggage or express car which is not constructed of steel or of steel underframe or equally indestructible material.

Wisconsin is the first state to get to the Supreme Court of the United States in an effort to overturn the decisions of the Interstate Commerce Commission ordering increases in intrastate passenger fares to correspond to the increases in interstate rates allowed by the Interstate Commerce Commission. The Public Service Commission and the attorney general of the state have filed an appeal from the decision of the United States Court for the Eastern district of Wisconsin, under which the railroads of the state obtained an injunction to prevent state interference with the federal commission's order.

Surpluses of freight cars in the United States, as reported to the Car Service Division of the American Railway Association, for the week ending December 31, amounted to 197,733 cars, this being the daily average for the six days. It is almost four times as large as the average one month previous. For the same period the average number of cars short—total deferred car requisitions—was 3,808, which is less than one-fifth the reported averages one month before. The surpluses largely exceeded the shortages in all classes of cars; but in the week ended December 23 the balance of gondola cars was the other way, to give the exact figures 4,711 surpluses and 6,974 shortages.

Employees of the Atlanta, Birmingham & Atlantic, following a conference of their representatives with B. L. Bugg, president, say that they will insist on having a proposed general reduction in wages passed on by the government labor board. President Bugg told them that the reduction in wages which had been announced by the company on December 29 must be put into effect on February 1, the reduction to be a sum equal to one half of the total advances which have been made in wages of employees since December, 1917. He said that the reduction would affect operating expenses to the extent of \$100,000 a month, and presented a statement showing that in September, October and November the road had failed to meet operating expenses by about \$98,000 a month.

President Samuel Rea, of the Pennsylvania Railroad, has issued a circular to employees to whom annual or other passes are issued, reminding them that the privilege of free transportation carries with it a duty to surrender seats in crowded trains to pay passengers. Even with a slackening of traffic, says the circular, the passenger facilities will in all probability continue to be somewhat overtaxed for some time to come. This duty may be performed without embarrassment to any one, and without attracting needless attention, by simply arising and moving to another part of the car or train. "Patrons, on all occasions, should be treated as guests, and whenever any question arises, we should sacrifice our own individual comfort for theirs. The railroads are judged in the public's mind as much by the conduct of their employees as by any other single factor. What the public thinks of the railroads, whether good or evil, will inevitably in its turn react upon the welfare of every one of us. It is, therefore, to our direct personal interest to give every passenger the best possible impression."

Automobile drivers to the number of 3,886 were warned during the month of October by Pennsylvania Railroad watchers, assigned to grade crossings to check up careless people. These warnings were served through officers of the states of New Jersey and Pennsylvania. These watchers consumed a total of 3,043 hours of time in their work, and it appears that 87 per cent of all automobilists driving over grade crossings failed to observe proper caution. The railroad's campaign was begun in July and has been conducted in co-operation with the commissioner of highways of Pennsylvania and the commissioner of motor vehicles of New Jersey. On the evening of November 29, an automobile disregarded a watchman's signal at the gas house crossing at Carlisle, Pa., although the warning was given when the automobile was 300 ft. from the track. The driver attempted to cross; his motor stopped while he was on the tracks and a fatal accident was averted only by the prompt action of the watchman, who ran east along the track and flagged the approaching passenger train. During the first six months of last year 47 persons were killed and 162 injured in accidents to automobiles at grade crossings on the Pennsylvania system, while in the same period of the year before, 58 were killed and 146 injured.

### Reunion of Construction Division U. S. A.

The annual reunion of those who were identified with the Construction Division of the Army during the war will be held at the Morrison Hotel, Chicago, on February 25 and 26. The afternoon of the first day and the morning and afternoon of the second day will be devoted to business sessions, and the annual banquet will be held on the evening of February 26.

The membership of the Construction Division Association consists of those who served in the Construction Division of the Army during the war, either in uniform or as civilians. The officers are: President, Col. Clark C. Wright, of George C. Nimmons & Co., 122 South Michigan avenue, Chicago; vice-president, Col. J. N. Willcutt, of R. D. Willcutt & Sons Company, Boston, Mass.; secretary, Major George Gibbs, Jr., Washington, D. C.; assistant secretary, William Kennedy, officer of Col. Evan Shelby, 63 Wall street, New York; and treasurer, Major A. C. King, 8 South Dearborn street, Chicago. Col. E. C. Stockdale, of Page & Hill, 19 South La Salle street, Chicago, is chairman of the entertainment committee.

### Roads Must Have Legislation to Collect Guaranty

Chief Justice McCoy, of the Supreme Court of the District of Columbia, on January 3, rendered a decision sustaining the recent decision of the comptroller of the treasury that the secretary of the treasury may not make partial payments to the railroads, on account of their guaranty for the six months following the termination of federal control, in advance of a final audit by the Interstate Commerce Commission showing the entire amounts due. The court denied the application of the Grand Trunk Western for a writ of mandamus to compel the secretary of the treasury to honor a certificate for \$500,000 issued by the Interstate Commerce Commission. The application for the writ was filed as a test to determine the rights of the railroads generally to whom between \$300,000,000 and \$400,000,000 is due on account of the guaranty. The court disagreed with the contention of counsel for the railroad company that the expression "several amounts" in the transportation act indicated that Congress intended that partial payments might be made. The court construed the word "several" as meaning respective payments to the several roads, not several payments to a single road. An effort will be made to expedite the payment of the guaranty by seeking legislation such as is recommended by the Interstate Commerce Commission in its annual report to provide clearly that partial payments may be made without awaiting the long process of final adjustment of the exact amount.

### Railway Executives Meet

The member roads of the Association of Railway Executives met on January 7 in the board room of the New York, New Haven & Hartford, Grand Central Terminal, New York. A resolution was adopted endorsing the Frelinghuysen bill to amend Section 10 of the Clayton act so as to exempt inter-company transactions within a given railroad system from

the competitive provisions of the act. Counsel A. P. Thom was instructed to lend his support toward securing the passage of the bill presented by Representative Winslow amending the Transportation Act so as to authorize the Treasury Department to make partial payments on account of the six months' guaranty to the carriers in advance of final payments.

W. J. Harahan, president of the Chesapeake & Ohio, and E. J. Pearson, president of the New York, New Haven & Hartford, were elected to the standing committee. The election of R. H. Aishton as president of the American Railway Association was approved, as was also the decision of the American Railway Association to continue the Car Service Division with W. L. Barnes as manager. A report on the American Railway Express Company was read which had to do with the form of contract between that company and the carriers. The framing of tariff regulations governing the prepayment of charges on freight shipments to Canada was discussed and referred to the Railway Accounting Officers' Association for adjustment.

Howard Elliott, chairman of the board of directors of the Northern Pacific, on behalf of the members of the Association of Railway Executives, presented T. DeWitt Cuyler, chairman of the association, with an old English silver salver and a letter testifying to his accomplishments as chairman, as a token of appreciation of his services "to the American railroads and the American public."

### A. R. E. A. Nominates Officers

The nominating committee of the American Railway Engineering Association has selected the following candidates for officers for the ensuing year:

President, L. A. Downs, vice-president and general manager, Central of Georgia, Savannah, Ga.; vice-president, E. H. Lee, vice-president and general manager, Chicago & Western Indiana, Chicago; secretary, E. H. Fritch, Chicago; treasurer, G. H. Bremner, district engineer, Bureau of Valuation, Interstate Commerce Commission.

Directors (three to be elected): A. M. Burt, assistant to vice-president—operation, Northern Pacific, St. Paul, Minn.; C. F. W. Felt, chief engineer, Atchison, Topeka & Santa Fe System, Chicago; J. V. Hanna, chief engineer, Kansas City Terminal, Kansas City, Mo.; F. G. Jonah, chief engineer, St. Louis-San Francisco, St. Louis, Mo.; B. H. Mann, signal engineer, Missouri Pacific, St. Louis, Mo.; G. J. Ray, chief engineer, Delaware, Lackawanna & Western, Hoboken, N. J.; A. O. Ridgway, assistant chief engineer, Denver & Rio Grande, Denver, Col.; H. L. Ripley, valuation engineer, New York, New Haven & Hartford, Boston, Mass.; Geo. H. Webb, chief engineer, Michigan Central, Detroit, Mich.

Members of Nominating Committee (five to be elected): J. R. W. Ambrose, chief engineer, Toronto Terminals, Toronto, Ont.; R. H. Ford, assistant chief engineer, Chicago, Rock Island & Pacific, Chicago; E. A. Hadley, chief engineer, Missouri Pacific, St. Louis, Mo.; C. P. Howard, senior civil engineer, Bureau of Valuation, Interstate Commerce Commission, Chicago; R. H. Howard, chief engineer, maintenance of way, Wabash, St. Louis, Mo.; C. E. Johnston, general manager, Kansas City Southern, Kansas City, Mo.; A. Montzheimer, chief engineer, Elgin, Joliet & Eastern, Joliet, Ill.; J. V. Neubert, engineer, maintenance of way, New York Central, New York; Frank Ringer, chief engineer, Missouri, Kansas & Texas, St. Louis, Mo.; A. F. Robinson, bridge engineer, Atchison, Topeka & Santa Fe System, Chicago.

### November Earnings \$41,544,063 Short of Estimate

Reports made by the railroads to the Interstate Commerce Commission show that the net railway operating income for November of the Class I railroads was \$57,741,937, which is \$41,544,063 or 41.8 per cent below the amount which it was estimated would be earned under the increased rates fixed in August by the commission in accordance with the Transportation Act.

The tabulation is based on reports received from 200 railroads with a total mileage of 229,754 miles.

Upon the basis of this operating income, the carriers would earn annually approximately 3½ per cent on the value of their properties as tentatively fixed for rate making purposes by the commission, says a statement issued by the Association of Railway Executives. This is 1.1 per cent below that

estimated on the basis of October earnings. To have realized a return of 6 per cent on their valuation as provided by the Transportation Act, the railroads should have earned \$99,286,000 as their November quota.

Total operating revenues for November were \$568,697,087, or an increase of 34.6 per cent over those for the same month last year, which, however, was marked by the coal strike. Total operating expenses were \$485,466,885, or an increase of 29.2 per cent compared with the same previous month. While the net railway operating income is an increase of 170.8 per cent over that for November 1919, this increase is principally due to the strike of bituminous coal miners during that month one year ago, which greatly reduced the freight tonnage.

Compilations show, however, that for the first quarter since the expiration of the guaranty period on September 1, the net railway operating income totals \$219,507,735, which is \$101,449,265 less than was estimated would be earned under the rates fixed by the commission and effective on August 26 last. On the basis of that net operating income for the three months' period, the carriers would earn 4.1 per cent annually. To have earned 6 per cent upon their tentative valuation, their net operating income should have been \$320,957,000 during that period.

As in the case of September and October, the net operating income in every district fell below the 6 per cent return during November. Calculating on the basis of the showing for November, the railroads in the Eastern district would earn 3.06 per cent upon their tentative valuation, the Southern district 3.12 per cent and the Western district 3.96 per cent.

### A New Year's Greeting

President Samuel Rea, of the Pennsylvania Railroad, has addressed to the public a New Year's message in the form of a poster which appears on all public and employees' bulletin boards on the road. This bulletin says, in part:

More than 250,000 men operate this railroad. It is the largest public service institution in the world. It represents more than two billion dollars of the invested savings of our citizens. The Pennsylvania Railroad Company has 131,115 stockholders, of whom 62,795 are women. Nearly every insurance policy holder or saving-fund depositor in this country has a personal stake in its welfare, through the investments of our banks and protective institutions. Many educational and charitable organizations, as well, have their endowments in its securities. The public service rendered by it in the movement of passengers and freight is equivalent to one-eighth of that of the combined railroads of the United States. The road has 27,000 miles of track, 8,000 locomotives and 300,000 cars. These are of the highest standard, and designed to promote public safety and convenience.

But it is the men of the Pennsylvania Railroad who, by ability, loyalty, initiative and faithful work, make the service what it is. The tasks of these men are not easy, and are seldom showy. They must be performed day and night, weekdays and Sundays, in storm and in cold and regardless of difficulties. Since the company resumed the management of its property the percentage of passenger trains arriving on time has been constantly increasing and the average speed of the movement and delivery of freight has steadily improved. The aim of the management is to promote the enthusiasm of every officer and employee in behalf of a high standard of public service.

That there may be progressive improvement in the service rendered to the public, our passengers, shippers and friends are invited to commend directly to the men notably praiseworthy acts upon the part of the railroad employees, and to bring such acts in detail to the attention of the management.

CANADA AND ITALY.—A new direct steamship service between Montreal and Italian ports, using St. John in the winter, is announced by the Canadian Pacific Ocean Services; an arrangement with the Navigazione Generale Italiana for sailings to Genoa and Naples, the latter to be the terminal point. The Navigazione Generale Italiana will employ one of its finest passenger ships, in conjunction with a German vessel, recently acquired by the Canadian Pacific, to be renamed the "Montreal."

## Traffic News

### Southeastern Express Company

Since the Interstate Commerce Commission has approved the merger of the express companies into the American Railway Express Company and the form of contract proposed by the express company and offered by it to the railroads to provide for the division of earnings and expenses on express business, there has been some speculation as to the intentions of the Southeastern Express Company, which was incorporated in Alabama on October 6, 1920, "to own and operate a railway express business in the Southeast and elsewhere." This company has for directors and officers men connected with some of the strongest banks in the South, some of whom are directors of leading railroads. While no announcement has been made, it is known that some of the Southern roads were opposed to signing the contract proposed by the American Railway Express Company, claiming that some of its provisions are unfair to the railroads, and that they were especially opposed to the unification of the express business and it is believed that the new Southeastern company may shortly enter the field as a competitor of the American Railway Express.

### Passenger Traffic in September

More passengers were carried by the railroads in September, 1920, after the increase in passenger fares, than were carried in September, 1919, according to statistics just issued by the Interstate Commerce Commission, but the average journey was slightly shorter. The number of revenue passengers carried was 104,351,950, as compared with 103,204,614 in September, 1919, but the average journey per passenger was only 41.25 miles, as compared with 41.84. As a result the passenger-miles decreased from 4,318,000,000 to 4,294,000,000. The average fare paid by each passenger was \$1.23, as compared with \$1.06 in September, 1919, and the average per mile was 2.99 cents, as compared with 2.54.

On the other hand, the number of tons of freight offered the railroads for transportation during September was slightly less than in September, 1919, 203,913,000,000, as against 207,000,000,000, but the average haul on each railroad was longer, 186.06 miles as against 173.33 miles. The average revenue per ton per mile was 1.15 cents as against .95 cents in 1919. This represents an increase of 20 per cent, showing that a considerable volume of freight was handled in September that had been given to the railroads before August 26, when the rate increases of 25 to 40 per cent went into effect.

### Operating Statistics for October

The Interstate Commerce Commission's summary of operating statistics for October shows a slight decrease in some of the factors measuring the operating efficiency of the railroads as compared with the returns for September and August, although the average mileage per car per day for the month, 28.6, exceeded that for any preceding month in 1920. The net ton miles, including non-revenue freight, totaled 42,252,000,000, which represents an increase of 4.7 per cent over October, 1919. The average train load was 756 tons as compared with 753 in October, 1919, but in September the average had been 767 and in August 788. The net ton miles per car day average 564 as compared with 526 in October, 1919, but in September the average was 568. The average car load, 30 tons, was one-tenth of a ton less than the average for August and September, but it exceeded the average for October, 1919, by 1.8 tons. The percentage of unserviceable cars was 7.3, which is the same as was reported in October, 1919. The average cost per freight train mile, selected accounts, for the month was \$2.15 as compared with \$1.60 in October, 1919. The cost per passenger train mile, selected accounts, was \$1.16 as compared with 90 cents. The average cost of coal per net ton was \$4.77 as compared with \$3.16 in October, 1919.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF NOVEMBER AND ELEVEN MONTHS OF CALENDAR YEAR 1920

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, (Inc. total), Maintenance of Way and Equip., Traffic, Trans-portion, General, Total, Operating ratio, Net railway operation, Operating income (or loss), Net after interest, Increase comp. with last year.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF NOVEMBER AND ELEVEN MONTHS OF CALENDAR YEAR 1920—(CONTINUED)

Name of road.	Average mileage operated during period.		Operating revenues.		Total maintenance of way and structures.		Operating expenses.		General.	Total.	Operating railway operation.	Net from operating (or loss).	Net operating income (or loss).	Increase or decrease comp. with last year.

## Equipment and Supplies

### Locomotives

THE BOSTON & MAINE is contemplating converting 18 Consolidation type locomotives to switching type locomotives. The company will not carry out the work in its own shops.

### Freight Cars

THE CANADIAN NATIONAL RAILWAYS are asking for prices on 5,000 freight cars.

THE EGYPTIAN STATE RAILWAYS will inquire soon, through the car builders, for 50, 10,000-gal. tank cars.

THE RHODESIAN RAILWAYS, reported in *Railway Age* of November 26, as inquiring for 100 gondola cars, have ordered this equipment from German builders.

THE LOUISVILLE & NASHVILLE, reported in the *Railway Age* of December 24, as contemplating the purchase of 2,700 additional freight cars, is now inquiring for 2,000, 40-ton box cars, 300, 55-ton gondola cars, 300, 40-ton coke cars, and 100, 40-ton stock cars.

### Passenger Cars

THE ANN ARBOR is inquiring for 8 all-steel passenger train cars.

THE MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE has ordered 3 steel dining cars from the American Car & Foundry Company.

THE SOUTHERN RAILWAY, reported in the *Railway Age* of October 15, as inquiring for 50 passenger cars and 50 baggage cars, has renewed its inquiry for this equipment.

SPANISH GOVERNMENT.—A cablegram from Commercial Attache Cunningham, Madrid, Spain, reports that bids will be opened by the Spanish Government on February 14, in Madrid, for 119 passenger cars and 152 baggage cars.

### Iron and Steel

OKURA & Co., 30 Church street, New York, has ordered from the United States Steel Products Company 8,750 tons of 100-lb. rails for use on the South Manchurian Railway.

### Signaling

THE NEW YORK, NEW HAVEN & HARTFORD has ordered an 80-lever style "A" mechanical interlocking machine from the Union Switch & Signal Company, for installation at the west end of the New Haven station.

THE NEW YORK CENTRAL has ordered an electro-pneumatic interlocking machine from the Union Switch & Signal Company, for installation at Mott Haven Junction, New York City; 22 working levers, model 14 type, fitted with illuminated lever light indicators.

RESEARCH GRADUATE ASSISTANTSHIPS, maintained by the Engineering Experiment Station of the University of Illinois, Champaign, now number sixteen, including two which have been established under the patronage of the Illinois Gas Association. These assistantships, for each of which there is an annual stipend of \$600, are open to graduates of approved American and foreign universities and technical schools, and applications should be sent to Dean C. R. Richards before March 1. Preference is given to applicants who have had some practical engineering experience following the completion of their undergraduate work. Appointments are made in the spring, and they become effective the first day of the following September.

## Supply Trade News

E. M. Blake, production engineer of Charles R. McCormick & Co., San Francisco, and president of the National Association of Railroad Tie Producers, died suddenly at San Francisco on January 12.

The Regan Safety Devices Company, Chicago, proprietor of the automatic train stop which is in use on the Chicago, Rock Island & Pacific, has been incorporated in the state of New York; James S. Regan, president; capital, 500,000 shares of no par value.

George E. Tebbetts, formerly with the construction and engineering division of Stone & Webster, Boston, Mass., and previous to that time bridge engineer of the Kansas City Terminal, has become associated with the railroad department of the Roberts & Schaefer Company, engineers and contractors, Chicago.

D. E. Sawyer has been re-elected general sales manager of the Pollak Steel Company, Cincinnati, Ohio, with office at 120 Broadway, New York; S. K. Morrow, manager of operations, has been appointed manager of sales for its three plants, with office at the Cincinnati works; C. G. Talbott, assistant manager of operations, has been appointed manager of rolled products for the Marion plant; A. C. Wehl, superintendent of the Cincinnati plant, has been appointed general works manager in charge of operations and productions of the Cincinnati, the Chicago and the Marion plants, and V. W. Prather, cost auditor for the Cincinnati plant, has been appointed auditor of the three plants. R. A. Mitchell has succeeded Mr. Wehl as superintendent of the Cincinnati plant; J. H. Deickman has been appointed manager of materials and inspection of its three plants; W. P. Woods has been appointed auditor and G. H. Tallaksen, superintendent of the Chicago plant. The company has recently distributed a unique souvenir; it is a pen made in the form of a miniature standard M. C. B. car axle, with mechanical wheel seat and journal and rough turned center.

### Verona Tool Works

The Verona Tool Works, Pittsburgh, Pa., has been re-organized, Alex Laughlin buying the controlling interest of the company from Harry S. Paul, who has retired. The officers of the new company are: William F. Hart, president; Emanuel Woodings, vice-president and general manager, and

F. G. Magnus, secretary and treasurer. John B. Seymour has been appointed district sales manager at Chicago, succeeding Howard C. Mull, who has resigned to accept service with another company, and Porter L. Laughlin has been appointed assistant district sales manager at Chicago, effective January 1.

William F. Hart, the president of the company, entered business with the Lorain Steel Company at Lorain, Ohio, then a part of the Federal Steel Company, in 1899. In 1904, this plant was made a part

W. F. Hart

of the National Tube Company and at that time Mr. Hart was transferred to the Pittsburgh office of the latter company, where he remained until 1909. Upon the latter date he

entered the service of the Central Tube Company, Pittsburgh, Pa., which company he was serving as vice-president at the time of his appointment to the presidency of the Verona Tool Works in November, 1920. Previous to 1909 Mr. Hart was in the operating and manufacturing end of the steel business but since that time his experience has been entirely executive, embracing both manufacturing and sales.

**Emanuel Woodings**, vice-president and general manager of the company, entered upon his thirty-fourth year of service with the company on January 6, 1921. His service began in the machine shop of the company in 1877, and he has served successively as

foreman, superintendent and general manager. He was promoted to the latter position in 1904, and upon the reorganization of the company, was elected vice-president.

**John B. Seymour**, who has been appointed district sales manager at Chicago, was born in Newburyport, Mass., in 1877, and was educated at Yale, graduating in the class of 1899. He immediately

entered the engineering service and, until 1904, was employed by different roads in the Middle West. During that year he became connected with the National Lock Washer Company as sales agent, being promoted to western manager in 1911. In 1917 he resigned to enter the second officers' training camp at Fort Sheridan and during the war served as a lieutenant in the infantry. Upon his return from abroad and since his discharge, Mr. Seymour has been engaged in exploration and development work upon various different projects.

**Porter L. Laughlin**, assistant district sales manager at Chicago, attended Washington and Jefferson College and in 1913 became connected with the Central Tube Company, Pittsburgh, Pa. He served this company successively as purchasing agent, assistant to the general manager and special representative from January 1, 1912, to December 1, 1920, except for the period from September, 1917, to February, 1919, when he served in the army as a lieutenant in the infantry.

**C. E. Adams**, vice-president of the Air Reduction Sales Company, New York, has been elected president to succeed A. F. Blagden, who has resigned to become associated with the American Dyewood Company, New York. **John McHugh** has been elected a director to succeed H. R. Hoyt, deceased.

**George A. Post** will retire from the presidency of the Standard Coupler Company, New York, on January 31, having notified the directors of the company in November last of his desire to devote his time and energies to other interests with which he is identified. Mr. Post has been president of the Standard Coupler Company since its organization in

1894. His successor will be **Edmund H. Walker**, who has been associated with Mr. Post as vice-president of the company for the past 15 years.

**R. J. Hinkle**, whose appointment as railroad representative of the Garlock Packing Company, Palmyra, N. Y., for the territory embracing eastern and southern railways, with headquarters at Philadelphia, Pa., was announced in the *Railway Age* of December 31, began railroad work as a machinist apprentice in the Frankfort (Ind.), shops of the Toledo, St. Louis & Western. He later was mechanical draftsman in the office of the superintendent of motive power at Frankfort until 1908, and he then served as mechanical draftsman on power and transmission machinery during the construction of the Argo (Ill.) plant of the Corn Products Refining Company. From 1910 to 1913 he was chief mechanical engineer for Armour Car Lines at Chicago, and in 1914 served as special representative of the Railway Terminal Commission of Chicago. He was appointed general manager of the Hill City Railway Company in 1915, in which position he served to date with the exception of a period during the war, when he served as first lieutenant in the Engineer Corps in connection with the office of Director General of Military Railways at Washington, D. C. He is a son of **C. L. Hinkle**, general manager of the Chicago Great Western.

## Obituary

**William H. Sayre**, president of the American Abrasive Metals Company, New York, died suddenly at his home in Glen Ridge, N. J., on January 6. He was born at Mauch Chunk, Pa., in 1865, and graduated from Lehigh University as a mechanical engineer in 1886, and since that time has been actively engaged in some line of business in which his engineering ability was applied. He began his practical experience in railroad building in the Northwest. Mr. Sayre later became president of the International Contracting Company, executing many dredging contracts in New York and other harbors, and also served as a consulting engineer on the Cape Cod canal. He was among the first to apply electric welding commercially, having organized the Federal Electric Welding Company, New York, and the Anthracite Electric Welding Company, Wilkes-Barre, Pa. In 1911 he organized the American Abrasive Metals Company, of which he was president until the time of his death.

## Trade Publications

"WINTER IN CANADA."—The Canadian Pacific has issued a 32-page attractively prepared booklet, which shows by word and pictures something of the charm of the Canadian winter from coast to coast.

**DUFF JACKS.**—The Duff Manufacturing Company, Pittsburgh, Pa., has issued a new catalog of 140 pages listing its complete line of jacks, including track, car, locomotive, bridge, journal, trench brace and cable reel jacks. The first pages of the catalog are devoted to illustrations, tables and descriptions of the individual jacks, and the latter portion to illustrations and lists of the parts of all jacks.

**ENGINEERS' AND SURVEYORS' SUPPLIES.**—A 40-page catalogue of field and office supplies has been recently issued by the C. F. Pease Company, Chicago. This book lists drawing, profile and cross-section papers; tracing cloths; blueprint papers and blue-inking machines; drafting-room furniture and such field supplies as transits, levels, ranging poles, leveling rods, etc. The book is well illustrated, while prices and descriptions of each article are given.

**TUBULAR STEEL POLES.**—Bulletin No. 14-C of the National Tube Company, Pittsburgh, Pa., is an attractive 48-page booklet which sets forth the advantages of tubular steel poles. The application of this type of support to high automatic or manual signals, trolley wires, telegraph and telephone lines, transmission lines and lighting fixtures, is illustrated and described. A tabulation of sizes, weights, etc., facilitates the selection of the pole best suited for the particular service. The closing pages of the bulletin are devoted to tables, giving the properties of steel pipe.

## Railway Construction

**ANN ARBOR.**—This company has awarded a contract to the American Bridge Company for the erection of a bridge over the Raisin river at Dundee, Mich.

**ATCHISON, TOPEKA & SANTA FE.**—This company is accepting bids for the construction of a one-story brick addition to its machine shop at Argentine, Kan. The structure will be 102 ft. by 115 ft. in area and will cost about \$45,000.

**ATLANTA & ST. ANDREWS BAY.**—This company has applied to the Interstate Commerce Commission for authority to abandon service on a branch from its mail line just north of Panama City, Fla., to St. Andrews, Fla.

**ATCHISON, TOPEKA & SANTA FE.**—This company, which was announced in the *Railway Age* of November 26 (page 951), as contemplating the construction of a coaling station at Shawnee, Okla., has awarded the contract for this work to Fairbanks, Morse & Co., Chicago.

**CHESAPEAKE & OHIO.**—This company contemplates the construction of a new passenger station at Covington, Ky.

**CHESAPEAKE & OHIO.**—This company contemplates the construction of a new roundhouse at Peru, Ind.

**DULUTH & IRON RANGE.**—This company will rebuild its station at Allen Junction, Minn., which was recently destroyed by fire.

**FORT WORTH & DENVER CITY.**—This company contemplates extensions and improvements to its shops and engine house facilities at Fort Worth, Childress and Amarillo, Tex.

**GOLDEN BELT.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a line to cost \$64,000,000 from Great Bend to Buckeye Township, Ellis County, Kan.

**ILLINOIS CENTRAL.**—This company, which was announced in the *Railway Age* of December 10 (page 1044), as accepting bids for the strengthening and raising of its levee at Helena, Ark., at a cost of approximately \$30,000, has awarded the contract for this work to M. J. Roach, Memphis, Tenn. The company has withdrawn its inquiry for bids for the construction of frame freight and passenger stations at Sarpy, La., to cost approximately \$20,000, and at Dowell, Ill., to cost about \$8,000, and will construct these stations with company forces.

**LOUISVILLE & NASHVILLE.**—This company, which was announced in the *Railway Age* of December 3 (page 997), as contemplating the construction of a 600-ton coaling and sanding station at Loyall, Ky., has awarded a contract to the Roberts & Schaefer Co., Chicago, for a reinforced concrete gravity sanding plant at Loyall.

**LOUISVILLE & NASHVILLE.**—This company, which will construct a 600-ton coaling station at Loyall, Ky., with company forces, has ordered the automatic coal elevating machinery for this station from the Ogle Construction Company, Chicago.

**MISSOURI, KANSAS & TEXAS.**—This company contemplates extensions to its freight house and rearrangement of its yard facilities at Kansas City, Mo., at an approximate cost of \$100,000.

**MORGANTOWN & WHEELING.**—This company has awarded a contract to B. M. Chaplin & Co., Morgantown, W. Va., for the construction of a second main track from Randall, W. Va., to Osage, a distance of one mile. The work will involve the construction of two small steel bridges.

**POTATO CREEK.**—The Interstate Commerce Commission has issued a certificate authorizing this company to construct an extension of 2.22 miles to a connection with the Pennsylvania at Hamlin, Pa., and to abandon 13.49 miles of its present line between Keating Summit and Norwich.

**TEXAS MIDLAND.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the construction of a line between Greenville and Commerce, Texas, a distance of 14 miles.

## Railway Financial News

DIVIDENDS have been declared by the following roads:

Central of Georgia.—Common, 2½ per cent preferred, 3 per cent; payable December 31 to holders of record December 31.

Nashville, Chattanooga & St. Louis.—¾ per cent semi-annual payable to holders of record January 22.

Pere Marquette.—First preferred, 1¼ per cent quarterly, payable February 1 to holders of record January 15.

Pittsburgh & West Virginia.—Preferred, 1½ per cent quarterly, payable February 28 to holders of record February 1.

**ANN ARBOR.**—The Interstate Commerce Commission has approved a loan of \$400,000 to this company to aid the carrier in meeting maturing indebtedness aggregating \$620,000. The company itself is required to finance \$320,000 to meet the loan of the government.

**BANGOR & AROOSTOOK.**—This company has been authorized by the Interstate Commerce Commission to issue \$320,000 of equipment trust certificates to be sold at not less than 95.5 per cent of their face value and to pledge the deferred lien equipment trust certificates, together with certain bonds, with the Secretary of the Treasury as security for a loan from the United States government.

**BOYNE CITY, GAYLORD & ALPENA.**—This company has applied to the Interstate Commerce Commission for authority to issue short term notes amounting to \$250,000 for two years at 7 per cent.

**CHESAPEAKE & OHIO.**—This company has been authorized by the Interstate Commerce Commission to procure the authentication and delivery by corporate trustee of \$2,502,000 of its first lien and improvement 20-year, 5 per cent, mortgage bonds and to pledge \$2,206,000 of this amount, together with \$1,553,000 of the bonds as part security for a loan from the government.

**CHICAGO & EASTERN ILLINOIS.**—The foreclosure sale of this road, set for January 11, has again been postponed until February 8.

**FEDERAL VALLEY.**—This company has been authorized by the Interstate Commerce Commission to issue \$24,940 of promissory notes at 7 per cent, payable to the order of the Lima Locomotive Works, and \$3,000 of promissory notes at 7 per cent to the Ohio National Bank of Columbus, Ohio.

**HUNTINGDON & BROAD TOP MOUNTAIN.**—The Interstate Commerce Commission has approved a loan of \$60,550 to this company to aid it in the construction of a modern bridge on its main line at or near Saxton, Pa., at a total estimated cost of \$150,000. The company itself is required to finance about \$60,500 to meet the loan of the government.

**LEHIGH & HUDSON RIVER.**—The stockholders of record September 10, 1920 are given the right to subscribe at par between January 10 and February 10 to \$2,987,000 capital stock to the extent of 173.7 per cent of their holdings. All payments of subscriptions shall be made at the office of the treasurer on or before February 10. After February 10 fractional receipts, resulting from the payment of fractional warrants, will not be converted into stock, but will be redeemed in cash, at said office, at rate of \$100 per whole share. The stockholders on September 10, 1920, increased the authorized capital stock from \$1,720,000 to \$5,000,000. The proceeds of the above \$2,987,000 stock will be used to pay off the \$2,587,000 mortgage debt and the \$400,000 debentures which matured July 1, 1920. The balance of the increased stock, \$293,000 will be held in the treasury.

**MARION & RYE VALLEY.**—This company has applied to the Interstate Commerce Commission for authority to assume liability as guarantor and endorser of a note to be issued by the Virginia Southern for a loan of \$38,000 from the United States Government.

**MORE HAVEN & CLEWISTON.**—This company has been authorized by the Interstate Commerce Commission to issue \$50,000 of first mortgage 6 per cent gold bonds.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.**—This company has filed an application with the Interstate Commerce Commission for

authority to issue and sell \$495,000 of its first consolidated mortgage 5 per cent gold bonds now nominally issued under the mortgage of April 2, 1888, which are due on April 1, 1928, to reimburse the treasury for expenditures and furnish it with working capital. It is proposed to sell the bonds at not less than 86 2/4 to the Harris Trust & Savings Bank, Chicago.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.**—The stockholders will vote March 7 on authorizing the directors to take all necessary steps to legally consummate the execution, issuance and sale of \$1,000,000 first consolidated mortgage 5 per cent gold coupon bonds of 1883, or any portion thereof.

**PENNSYLVANIA.**—The resignation of A. W. Mellon, of Pittsburgh, as a director of this company, was accepted at a meeting of the board on January 12. Mr. Mellon's resignation was presented so as to save both himself and the Pennsylvania Railroad from any embarrassment that might arise because of Section 10 of the Clayton Act, which became effective January 1, 1921, respecting so-called interlocking directors. Mr. Mellon has been a director since February, 1920.

The stockholders will vote March 8 on the following propositions:

(1) Authorizing an increase of the indebtedness to be made when and as prescribed by the directors; (2) of changing the date of the annual meeting of, and the annual election of directors by the stockholders. (3) Leases of the railroads, property and franchises of the following companies, now operated as part of the system, viz.: Cincinnati, Lebanon & Northern; Cleveland, Akron & Cincinnati; Cumberland Valley & Martinsburg; Englewood Connecting; Grand Rapids & Indiana; Indianapolis & Frankfort; Louisville Bridge & Terminal; New York Bay, New York, Philadelphia & Norfolk; Ohio Connecting; Ferth Amboy & Woodbridge; Pittsburgh, Cincinnati, Chicago & St. Louis; Pittsburgh, Ohio Valley & Cincinnati; South Chicago & Southern; Toledo, Columbus & Ohio River; and Wheeling Terminal. It is stated that the company has not yet determined the amount of increase in indebtedness which stockholders will be asked to authorize at the annual meeting on March 8. It is understood that at the present time there is indebtedness authorized of \$65,000,000 which has not been availed of. The amount of increase sought above this \$65,000,000 available will be announced later. The fact that an increase in indebtedness is authorized does not mean that the company will issue bonds or notes up to the full amount of the authorization, but it gives the company leeway to meet financial requirements when needed.

**PITTSBURGH & LAKE ERIE.**—This company has applied to the Interstate Commerce Commission for authority to issue promissory notes aggregating \$1,500,000 for six months at 6 per cent, payable to the order of the applicant at the Union Trust Company of Pittsburgh in renewal of outstanding notes.

**RICHMOND TERMINAL.**—This company has applied to the Interstate Commerce Commission for authority to issue two time notes for \$12,500 each, one to the Richmond, Fredericksburg & Potomac and one to the Atlantic Coast Line, dated January 1, 1921, payable on or before January 1, 1924, at 6 per cent.

**SOUTHERN.**—This company has been authorized by the Interstate Commerce Commission to issue \$5,900,000 of development and general mortgage 4 per cent bonds and to pledge them with the Secretary of the Treasury as security in part for a loan of \$3,825,000 from the government.

**WATERLOO, CEDAR FALLS & NORTHERN.**—The Interstate Commerce Commission has approved the making of a loan of \$60,000 to this company to aid the company in meeting its maturing indebtedness in a total principal amount of \$144,325. The company itself is required to finance \$84,325 to meet the loan of the government.

**WESTERN MARYLAND.**—This company has been authorized by the Interstate Commerce Commission to issue \$2,700,000 of first and refunding mortgage 5 per cent gold bonds and to pledge them with the Secretary of the Treasury as security for a loan from the government of \$2,122,800.

**WHEELING & LAKE ERIE.**—The Interstate Commerce Commission has approved a loan of \$500,000 to this company to aid it in meeting its maturing indebtedness, amounting to \$1,008,800. The carrier itself is required to finance \$508,800 to meet the loan of the government.

**WILMINGTON, BRUNSWICK & SOUTHERN.**—This company has applied to the Interstate Commerce Commission for a loan of \$200,000 to be used in paying off certain bank loans and for the purchase of ten 40 ft. box cars, fourteen 40 ft. flat cars, one freight locomotive, 70 pound rail for two miles of line, and additional dock facilities at Southport costing \$35,000.

## Railway Officers

### Executive

**H. W. Miller** has been appointed vice-president in charge of operation of the Southern, succeeding E. H. Coapman, deceased.

**T. S. Davant**, who retired as vice-president in charge of traffic of the Norfolk & Western on January 1, was born at Gillsonville, S. C. He entered railway service in 1865. In 1869 he became station agent for the Charlotte & South Carolina (now part of the Southern) at Ft. Mills, S. C. The same year he became chief clerk of the consolidated agency of the Charlotte, Columbia & Augusta (also now part of the Southern) at Columbia, S. C. In 1871 he became chief clerk in the office of the general freight and passenger agent of the same road. From 1874 to 1877 he was general freight and passenger agent for the Port Royal (now a part of the Charleston & Western Carolina). During the latter year he became assistant general freight and passenger agent of the Memphis & Charleston (now a part of the Southern). In 1886 he became general freight agent of the East Tennessee, Virginia & Georgia (now a part of the Southern) and remained in that position until 1892, when he went to the Norfolk & Western in the same capacity. In 1903 he was promoted to freight traffic manager, and in 1907 to vice-president and traffic manager. Mr. Davant became vice-president in charge of traffic in 1912.

### Operating

**J. D. Beaver** has been appointed superintendent of transportation of the Pittsburgh, Shawmut & Northern, with headquarters at St. Marys, Pa., effective January 1.

**F. M. Metcalfe**, superintendent of the safety section of the Northern Pacific, with headquarters at St. Paul, Minn., has been appointed assistant to the general manager, with the same headquarters, effective January 1.

**H. A. Adams**, who has been appointed assistant to the general manager of the Union Pacific, with headquarters at Omaha, Neb., with jurisdiction over all safety work, effective

H. A. Adams

January 1, entered railroad service in 1885 as a brakeman and conductor on the Kansas City, Fort Scott & Gulf, now a part of the St. Louis-San Francisco. During the next 20 years he was employed as brakeman and conductor on the Southern Pacific, with headquarters at Los Angeles, Cal., and later in the same capacity with the Atchison, Topeka & Santa Fe, with headquarters at Kansas City, Mo. In 1905 he was appointed inspector of safety appliances and accident investigation by the Interstate Commerce Commission, and was associated with the Commission until 1917, when the government took over the operation of the railroads. During the period of federal control, Mr. Adams was regional supervisor of safety of the Central Western region, with headquarters at Chicago. He returned to the Interstate Commerce Commission on March 1, 1920, taking up his former work, which he continued until December 31, 1920, when he resigned to accept his appointment with the Union Pacific.

**Peter Groome**, general safety agent of the Union Pacific, with headquarters at Omaha, Neb., has been appointed assistant superintendent on the Colorado division, with headquarters at Denver, Colo., effective January 1.

**Allan Pollok** has been appointed manager of dining cars, hotels and restaurants of the Southern Pacific, with headquarters at San Francisco, effective January 1, succeeding **S. M. Estabrook**, who has been appointed assistant manager of dining cars, hotels and restaurants.

**A. Allerton**, manager of the Algonquin Hotel, St. Andrews, N. B., and the Place Viger Hotel, Montreal, both hotels of the Canadian Pacific, has been appointed manager-in-chief of hotels of that company, effective January 1, succeeding **F. L. Hutchinson**, who has resigned to engage in other business.

**W. R. Hensley**, trainmaster of the Louisville, Henderson & St. Louis, who has been on a leave of absence since August 28, while serving as vice-chairman of the sub-committee on car service at Louisville, Ky., assumed his regular duties on December 15 upon dissolution of the sub-committee. Acting trainmaster **J. S. Moorman** has again become assistant trainmaster and car accountant.

**F. M. Metcalfe**, superintendent of the safety section of the Northern Pacific, with headquarters at St. Paul, Minn., who has been appointed assistant to the general manager, with the same headquarters, effective January 1, has spent his entire railroad career in the service of the Northern Pacific. From 1907 to 1917, he was successively chief clerk to the general manager and representative of the vice-president in charge of operation. When the government took over the railroads Mr. Metcalfe was made superintendent of safety, the position which he held at the time of his recent appointment.

### Traffic

**G. A. Harrison**, general agent, passenger department of the Grand Trunk at Portland, Me., will also act in the same capacity for the Canadian National effective January 1.

**J. D. Anderson** has been appointed commercial agent on the Hocking Valley, with headquarters at Toledo, and **H. E. Todd** has been appointed commercial agent with headquarters at Columbus, Ohio.

**J. A. Werne**, general agent on the Great Northern, with headquarters at Boston, Mass., has been transferred to New York, succeeding **A. D. Mercer**, who has resigned, effective January 1. **Charles H. Walker** succeeds Mr. Werne.

**Henry Blakely**, general freight agent of the Northern Pacific with headquarters at St. Paul, Minn., has been promoted to freight traffic manager, effective January 1, succeeding **John B. Baird**, who has retired from active service.

**T. B. Montgomery**, assistant freight traffic manager of the Northern Pacific with headquarters at St. Paul, Minn., has been appointed general freight agent, effective January 1, succeeding **Henry Blakely**, who has been promoted to freight traffic manager.

**J. B. Baird**, freight traffic manager of the Northern Pacific, who retired on January 1, was born June 21, 1855, at Woodlawn, Md. He began railway work in 1876 as a clerk in the general offices of the Pennsylvania at Philadelphia. Later he went to the Chicago, St. Paul, Minneapolis & Omaha, as a clerk in the general manager's office, and was subsequently employed as rate clerk in the general freight office of the Northern Pacific. Mr. Baird was in time promoted to assistant general freight agent and served in that capacity until May 1, 1903. He was then appointed general freight agent and served in that office until his appointment as freight traffic manager, which came November 1, 1913.

### Mechanical

**Paul Lebenbaum** has been appointed assistant electrical engineer of the Southern Pacific, with headquarters at San Francisco, Cal., effective January 1, succeeding **F. E. Geibel**, resigned.

**W. J. Robieder**, general master car builder of the Canadian Pacific, has retired and the position has been abolished. The duties of general master car builder have been assumed by the assistant chief mechanical engineer.

**R. Preston**, assistant superintendent of motive power of the Canadian Pacific, with headquarters at Winnipeg, Man., has been promoted to superintendent motive power and car department, Eastern Lines, with headquarters at Montreal, effective January 1.

**H. H. Stephens**, master mechanic of the Pecos division of the Atchison, Topeka & Santa Fe with headquarters at Clovis, N. M., has been promoted to mechanical superintendent of the Southern district with headquarters at Amarillo, Tex., effective January 1, succeeding **W. D. Deveny**, assigned to other duties. **W. D. Hartley**, general foreman, locomotive department, at Richmond, Calif., succeeds Mr. Stephens at Clovis.

### Engineering, Maintenance of Way and Signaling

**P. C. Connelly**, roadmaster on the Western Pacific, with headquarters at Oakland, Cal., has been appointed general roadmaster, with the same headquarters, with jurisdiction over the entire line, effective January 1.

**L. A. Guthrie**, signal inspector on the Canadian National, with headquarters at Winnipeg, Man., has been promoted to signal supervisor, with jurisdiction over the lines between Winnipeg and Watrous, Sask. He will retain his former headquarters.

**A. H. Porter**, engineer of roadway of the Charleston & Western Carolina, with headquarters at Augusta, Ga., has been promoted to valuation engineer, with the same headquarters, and **L. S. Jeffords**, formerly assistant engineer on the Atlantic Coast Line, with headquarters at Savannah, Ga., has been appointed engineer maintenance of way, with headquarters at Augusta, Ga., the positions of engineer of roadway, assistant engineer and general roadmaster having been abolished.

### Obituary

**John W. Daly**, general Western agent of the New York Central with headquarters at Chicago, fell dead at the entrance to the Muchlebach Hotel, Kansas City, Mo., on the evening of January 12.

**Robert C. Sattley**, valuation engineer of the Chicago, Rock Island and Pacific, died suddenly at his home in Chicago on December 31. He was born in Ferrisburgh, Vt., on November 26, 1856. He was educated at the University of Vermont, graduating in the class of 1879, and entered railroad service in the same year as assistant engineer on the Northern Pacific. He was made superintendent of bridges and buildings in 1894, and served in this capacity until 1905, when he became division engineer. In 1907 he was appointed assistant engineer on the Chicago & North Western, and after a year of service as locating engineer on the Denver, Laramie & Northwestern, he accepted an appointment as valuation engineer on the St. Louis-San Francisco. In 1910 Mr. Sattley was appointed valuation engineer of the Chicago, Rock Island & Pacific and served continuously in this position until his death.

R. C. Sattley

One tendency in railway tie purchases during recent years has been toward a greater dependence on supplies obtained off the line, the reason given for this being the depletion of local woodlots along the right-of-way. This is obviously a natural consequence of the reduced forest areas in the more densely settled portions of the country, but it would be well to ascertain if other influences have not been at least partially responsible. Owing to the fact that the small tie producers, farmers and others who deliver ties in small quantities along the right-of-way, have no ready market for their product other than that afforded by the railway, these men are required to sell their ties at the prices fixed by the roads. In at least a few instances railways have been accused of establishing schedules of prices without a proper regard for the cost of production and there is a feeling on the part of some students of tie marketing that this condition has had a pronounced influence in reducing local tie production. One authority on this subject declared recently that if the railways which formerly obtained ties along their own lines would make suitable adjustments of the prices offered to the local tie producers large supplies of ties could be developed along their lines for less money than they are now paying in the open market. In view of the present need for the most scrupulous economy, it would be well for railway officers to study this situation carefully.

That British railway supply manufacturers have made great progress during the past year toward regaining their export trade is shown by the reports of the Board of Trade for the eleven months ending November 30. The exports of locomotives during the period were valued at \$18,192,387 (on the basis of \$3.50 to the pound) as against \$4,898,330 for the similar period in 1919. The improvement in the export figures for rails and freight cars, while marked, was not in as great proportion. The exports of rails were valued at \$8,555,614 for the first eleven months of 1920 and \$6,400,068 for the 1919 period. Similar figures for freight cars are \$18,245,839 and \$7,093,527 respectively. This increase in British exports is no greater than could well be expected upon the gradually returning pre-war production of British industries, especially in view of the heavy investments of British capital in foreign railways and the large orders for railway materials which are placed by the British colonies, the bulk of which under normal conditions are naturally diverted to concerns in the mother country. British manufacturers are, moreover, in a relatively more favorable position in the export trade than their American competitors because of the almost world-wide premium on the dollar. We have heard a great deal during the past five or six years of industrial disorganization in Great Britain and the improbability of an early return of pre-war production in that country. It was even predicted in some quarters that Britain would be a negligible factor in the export trade for many years to come. The 1920 figures, however, prove that British manufacturers have been able to increase their railway exports

to the point where they can supply an increasingly large part of the demands of the colonies and of the British-owned roads in South America and elsewhere. In view of the great improvement shown in 1920 it is apparent that the famous skill of the Britisher in export trade was not irreparably lost during the recent world conflict.

A general movement to abandon the block-signal rule "stop and proceed" and to allow trains to pass an automatic signal (set in the horizontal position) without stopping, would inflict a severe jar on a custom of 60 years' standing; the custom of requiring enginemen to bring their trains to a full stop—a stop prima-facie unnecessary—in circumstances where (according to the general opinion among railroad officers) there is no other way to make sure that the engineman can and will stop, if and when a stop is found to be necessary. But a rule is not necessarily good because it is sixty years old, and the plea of our New Jersey correspondent, printed in another column, is deserving of attention. He wants the opinion of the up-to-date operating officer. That is easily stated; the officer will say that his enginemen are not sufficiently well disciplined; if you give them an inch they will take an ell; on up grades, where excessive speed is impossible, the stop may be omitted with safety, but everywhere else it is as necessary as it is to have derrails at the ends of side tracks or to have various other safeguards predicated on the assumption—or, rather, the fact—that good men make mistakes. But unnecessary stops do cause a great variety of difficulties and losses, especially on very busy lines; and it is mortifying to reflect that the biggest reason why we tolerate them is that we have not been able to educate our enginemen as well as we should like to. The superintendent who shall have the boldness to allow enginemen everywhere to pass automatic stop signals at five miles an hour, at all times when a clear road ahead is plainly visible, and maintain the practice with success for a reasonable length of time, will deserve a medal.

It is perhaps proper to remind the reader that in arguing in favor of hastening trains past stop signals, we have not forgotten the value of a stop to aid the dull or shortsighted engineman in learning that it is for his own interest to slacken speed enough to increase the distance between himself and the preceding train. In the great majority of cases it is desirable to let the train ahead get far enough away to give a clear distant indication; and it would be a good thing if enginemen were disciplined to do this much more than they do. The main reason, however, for abolishing the stop is to save the cost and avoid the contingent dangers of stopping, and to avoid delays which are otherwise unnecessary. Some roads have already adopted the rule that on passing a signal giving the caution indication, the enginemen shall shut off steam, even when it is entirely safe not to shut off.

### The Use of Block Signals as Teachers

simply an element of discipline. Perhaps, when this feature of discipline has been carried out long enough, and its value has become generally appreciated, the same principle can be adopted in connection with signals giving the stop indication.

South America generally does not offer the most promising field to American manufacturers of railway supplies who are seeking foreign markets because the railway lines in most of the countries are owned in large part by British and other foreign capitalists who naturally are prejudiced in favor of products from their own countries. Chile, however, is a notable exception to this general rule; the Chilean railways are for the most part state-owned and are not dominated by foreign capital. The Chilean railways are, therefore, freed from prejudice against American supplies and offer one of the most promising markets in South America for American equipment. American goods must, of course, be able to compete in price and quality with those of foreign manufacturers and arrangements must be made whereby credits at least as liberal as those offered by other countries can be extended when purchases are made. The general railway situation in Chile, a detailed discussion of which will be found elsewhere in this issue of the *Railway Age*, is such that rather extensive construction will probably be undertaken before a great while and consequently the market for materials will become correspondingly more important. It is understood that an effort will soon be made by the Chilean government to place a substantial loan in this country. The outcome of these negotiations will be awaited with considerable interest in view of the fact that the large part of the proceeds of this issue will probably be devoted to the purchase of equipment for the government railways.

Any consideration of ways to increase the productive capacity of railroad shops involves a study of the three important component factors in shop operation: namely, machinery, men and methods.

#### Why New Shop Machinery Is Needed

As conditions now stand the first of these factors offers a fertile field for improvement either by the purchase of new machinery and equipment or by obtaining more effective service from that already in use. Present arrangements for replacing worn out shop machinery are entirely inadequate, as shown by the relatively small amounts of money set aside each year for depreciation. In fact, these amounts are so small as to indicate that depreciation must be figured on a basis of thirty or forty years' useful service for each tool. Admitting that some tools now operating in railroad shops have already exceeded this estimated life, their continued use undoubtedly costs the railroads much more than would their retirement. Cars and locomotives have increased both in size and number and it is obvious that they cannot be kept in good repair with the same shop facilities used when equipment was lighter. In addition, many locomotives ten years old and over need the application of modern capacity increasing improvements in order to earn greater revenue. Both repair work and reconstruction programs are being delayed because many railroad shops operate under the handicap of worn out, inefficient machinery, too light for the work. Still further evidence of the need for better shop facilities, including machinery, is afforded by the large amount of locomotive and freight car repair work which has been performed for the railroads recently at outside shops. An informal investigation and checking up of accounts by the Interstate Commerce Commission has apparently shown that this work costs more than when done in the railroad's own shops. The commission asked the roads for an expla-

nation and some of the presidents replied that they felt justified in incurring the additional expense because they needed to have repairs made and were not able to perform the work promptly themselves. Is not this a serious indictment of present conditions and an indication of the immediate need for more and better shop machinery.

Along with the stringent economies that are now being prosecuted so diligently and effectively in all branches of the railway service, there is ample opportunity to investigate certain methods and changes in the maintenance field that will bring about marked economies. As the maintenance of way organization stands today, it has certain faults, somewhat inherent but not by any means incurable, that are exceedingly expensive. Briefly they are concerned with waste labor effort through lack of proper supervision and looseness of organization, the difficulties attendant to the distribution of materials and supplies, the uncertainty as to exactly what the year's work will be, and others, all tending toward an accumulative waste of materials and labor.

It is true that this condition has been alleviated in part on some roads by the adoption of various well-thought-out and modern methods with the result that certain phases of the work have been better co-ordinated to the financial advantage of the road. Much, however, remains to be done—in fact, little more than a start has been made so far toward putting the maintenance of way department upon a really constructive and systematic basis. The outstanding need is for a broader view of this question. To illustrate, a certain road has developed an excellent method, including a diagrammatical representation for the efficient handling, purchasing and renewing of rail. Another road has instituted somewhat similar ideas but on a different phase of maintenance work. Both systems have been comparatively successful but neither road has gone beyond its own individual developments, believing in each case that the method will only apply to the one thing. Yet practically every branch of maintenance work can be systematically planned, even diagrammatically represented, with the result that the work will be performed better and cheaper through the tightening-up of the organization, the closer supervision of men and materials and the increased opportunity for more positive and co-ordinated planning. The more thoroughly the work is visualized the more thoroughly it will be done, and thoroughness denotes economy.

The reduction of operating expenses, desirable at all times, is absolutely necessary for many roads just now. There is

#### Real Economy Versus Mere Retrenchment

an easy way to improve the operating ratio temporarily by making drastic reductions in maintenance expenditures. This is a pit that is always open and the usual number of railroad officers will fall into it in the search for economy. It must be admitted that the necessity for reducing expenses in all departments exists and no argument can be advanced against a general curtailment of expenditures but on the other hand the theory that operating expenses cannot be reduced when traffic is declining and that all savings must be effected in maintenance expenditures is fundamentally wrong. Maintenance work on track and structures is necessarily curtailed at this season and this matter will very largely take care of itself during the winter months. In the equipment department, however, the condition is quite different. At the present time on the majority of roads the percentage of locomotives and cars in unserviceable condition is abnormally large. It would be a great mistake to

reduce forces to the numbers required to do only current maintenance work so long as this situation continues. Under the circumstances, the most desirable method of effecting a saving would be by reducing the cost of transportation. The expenditures included under this one classification make up from 45 to 55 per cent of all operating expenses. There are further opportunities for reduction in wages and fuel costs but the problem is one that requires careful study and close co-operation by the operating and mechanical departments. While many of the factors of expense are governed by local conditions, there are certain fundamental principles that can be applied on all roads and a series of editorials will discuss the application of these principles of efficiency to the reduction of the expense of conducting transportation.

## Purchasing and Stores Progress

THERE IS NO DEPARTMENT of the railroad that is developing with greater rapidity than the Service of Supply. In reviewing the progress of other departments it is possible to point to the acquisition of new equipment or the improvement of existing facilities as an indication of the advancement that has been effected. But with the Service of Supply, the structure is an organization wherein the physical equipment is altogether secondary. It would not be difficult to find improvement in material handling facilities, particularly in the more extensive use of tractors and other mechanical means for handling material, or in the completion of new stores facilities as in connection with the new locomotive terminals on the Pennsylvania Lines; but the real progress has been effected in a return to normal operation under private management and in the development of a more definite objective, broader policies and a stronger organization for the purchase and handling of supplies.

During the brief period in which the Stores Section of the Railroad Administration attempted to standardize stores practices throughout the country it was discovered that based upon the performance of the thoroughly efficient railroad, a vast opportunity existed on less efficiently managed railroads for effecting economies in the handling of supplies. While the return to private management has enabled each railroad to resume the pursuance of policies best suited to individual requirements, there is hardly a supply organization on any of the railroads that did not gain something from the earnest work of a few men in Washington who held a very high conception of the Service of Supply. It is a remarkable testimonial to the work of the Stores Section that one of the largest and most progressive eastern railroads should not only alter its stores organization in conformity to the suggestions of the Administration but that the president of this railroad should insist upon a continuation of the new organization plan upon return to private management.

Another interesting development within the year has been undertaken by an important western system in the direction of standardizing stores methods with a view to realizing some of the potential economies attached to the handling of 40,000 different items of material involving many millions of dollars. The task of purchasing these materials and holding stocks to a minimum has become increasingly difficult during a year of price readjustment. Any purchase that could be duplicated a few weeks later at a lower price is often the subject of criticism and many railroad officials who can understand why a retail merchant must reduce his stock at the present moment do not appreciate the fact that a railroad storekeeper must keep his stocks as low as possible for the same reason. One of the encouraging developments of the year, however, has been the growth of a better spirit of co-operation between all departments and the Atlantic City convention which brought the Stores and the Mechanical Sections of the American Railway Association together did much to bring these two departments into closer touch.

## How the "National Agreements" Rob the Public

THE EVIDENCE which E. T. Whiter, chairman of the Committee of Managers representing the railways, is submitting to the Railroad Labor Board in the hearings regarding "national agreements" shows that they are the most rotten and indefensible agreements ever entered into by any employers and employees.

They were made by the director general and certain labor unions under government control. Mr. Whiter is cramming the record of the proceedings with cases of employees who, under the agreements and the interpretations of them made by the Railroad Administration's National Boards of Adjustment, have got large amounts of money for which they never did any work, or have got several times as much money as was justified by the work they did. The fact that leaders of the labor brotherhoods are seeking to have perpetuated these robber agreements and the many millions of "honest graft" extorted under them should be sufficient evidence to the public of the sincerity and public spirit which caused them to open the hearings before the Labor Board with wholesale charges of waste and speculation against the managements of the railways.

In his sworn testimony Mr. Whiter has shown that the Pere Marquette Railway was compelled to pay \$9,364 in back pay to four employees because their titles under these agreements were changed by a decision of the director general. A car repairer on the Virginian Railway was paid \$1,000 for work he never did. He was laid off with other employees because there was no work for him to do. When he became entitled under his "seniority rights" to be re-employed the road refused to take him back because his eyesight was defective. The road was compelled to pay him from the time his "seniority rights" would have entitled him to re-employment because he had not been told his eyesight was bad when it laid him off!

A train on the El Paso & Southwestern was delayed one hour and thirty minutes and an employee was paid *five hours' time* for making repairs to a window which took *thirty minutes*, when a foreman who was present could have done the work without delaying the train.

A machinist on the Santa Fe for 77 days performed the duties of a night roundhouse foreman while the foreman was sick. The foreman's pay for this time would have been \$665, but the machinist for substituting for him received \$921.

Four car men on the same road were sent out on the line to do a piece of work that took 4 hours and 33 minutes. The company was compelled to pay these men for 112 hours' work.

Five machinists on the Norfolk & Western were sent to an outlying point where they actually worked eight hours per day for three days. Each of them had to be paid straight time for the 24 hours they did work, and time and a half for 72 hours they didn't work.

The Shop Crafts Agreement provides that when employees are required to check in and out on their own time they will be paid for one hour extra at the close of each week, no matter how few hours they may have worked. This rule in the first six months of 1920 cost the western roads \$2,730,166, the eastern roads \$2,913,548, and the southern roads \$801,944, a total of \$6,445,658 for work which never was done. In an entire year the amount paid under it for work not done would be \$14,500,000. And this is but one of the 182 rules in the Shop Crafts Agreement!

Examples of this kind have been cited almost without number. The public naturally will ask how rules governing working conditions and wages which would produce such results could ever have been put into effect, and how they

can possibly be defended. Anybody who will wade through the mass of technical details which is being presented before the Railroad Labor Board can find out. But the fact is, it makes no difference how the rules came into existence or what technical defense of them may be made. They resulted under government control in many millions of dollars being given to the employees for work that never was done. They are having the same effect under private operation, and will continue to have until they are set aside. The public has been and is paying the bill. The farmer who works ten, twelve or sixteen hours a day is paying it. Men who do eight hours' work for eight hours' wages and ten hours' work for ten hours' wages in other industries are paying it. Whatever technical defense may be offered, there cannot be, in the court of reason or fairness, any valid defense made for agreements which result in railway employees getting many millions of dollars a year for work they do not do from people who get paid only for work that they do.

It may be said that outrageous payments for work not done, such as those cited, might be eliminated by revising the national agreements and rules. But one of the main reasons why the national agreements produce such outrageous and indefensible results is that they apply throughout the country regardless of differences in local conditions on the various railways. A rule which is fair on a railway in New England, for example, may be wholly unfair, and produce outrageous results, on a railway in Arizona where the local conditions are wholly different.

The only way to eliminate the enormous wastes caused by the national agreements is to abolish them. The only way to establish rules and working conditions which will be fair to the employees, the railways and the public is to let the individual railways and their own employees make agreements which will be applicable to local conditions. This is what the railways are contending for, and they ought to have the support of the public. The farmer, shipper and consumer are interested in this and all questions relating to railroad costs, because the cost is what makes the rates which all the public have to pay, directly or indirectly.

## Baltimore & Ohio

**D**URING FEDERAL CONTROL the operation of the Baltimore & Ohio was so divided that the properties of that system, constituting over 5,000 miles of line, were under the jurisdiction of six federal managers reporting to the directors of four different regions. These federal managers also had jurisdiction over lines other than parts of the Baltimore & Ohio System. Because of its position with respect to the large coal fields of Pennsylvania, West Virginia and Ohio the Railroad Administration, as a part of its policy of unified operation and control, essayed to utilize the Baltimore & Ohio as a coal carrier and it gave preference to that traffic to the detriment of more lucrative general traffic. These changes naturally had a tendency to upset the normal methods of operation over the system to the extent that some parts of the line were over-burdened with business, while other parts were called upon to handle considerably less business than usual, the decrease being in business carrying higher rates. These considerations, combined with the fact that the latter part of the period of federal control was characterized by high prices for material and labor and a policy of watchful waiting on the part of the Railroad Administration, show that the results of operation by the Railroad Administration of the Baltimore & Ohio for 1919 cannot be taken as an indication of what that system may do now that it has been returned to its owners to be operated under the new conditions.

The task that Daniel Willard has had before him as president of the Baltimore & Ohio has been—to state the

matter in its broadest terms—to build up the Baltimore & Ohio system. The progress that he and his fellow officers have made, both with respect to the physical development of the property and the adjustment of its position from a traffic standpoint, has been pointed out in these pages on more than one occasion as most noteworthy. While the balanced development was interrupted during federal control, this period was not without some notable achievements; more than \$21,000,000 was expended upon the property largely in the extension of yard and terminal facilities including two large new repair shops, and the addition of approximately \$18,000,000 worth of equipment; the company demonstrated an exceptional ability to produce and handle coal, more than 4,993,684 tons having been originated on its lines or those of immediate connections in the peak period of October, 1919, and there was handled over the line between Cumberland and Martinsburg, which might be termed the eastern throat of the road, a total tonnage of 26,925 tons per mile of line in the same month. Notwithstanding these achievements the Baltimore & Ohio traffic was seriously dislocated and there is now before the company two tasks: to resume the definite program for physical betterment, and also to re-establish its trade position, which was seriously disarranged during federal control.

The physical progress that the Baltimore & Ohio has made under Mr. Willard's administration has been very great and full details concerning it may be obtained from review of the 1916 annual report which appeared in the *Railway Age* of August 17, 1917, page 265. In this connection, it should also be noted that the Baltimore & Ohio has devoted no small amount of attention to building up a diversified business along its lines. The Baltimore & Ohio is primarily a coal road, the proportion of bituminous coal tonnage to total tonnage carried ranging about 45 to 47 per cent. This has possibly been something of a disadvantage because of the amount of traffic carried has varied too closely with the fluctuations in the coal industry. From the standpoint of the industrial department, however, it is an advantage because a new industry proposing to establish itself on the lines of the system can be assured under normal conditions of a cheap and steady fuel supply from the mines served by the Baltimore & Ohio system. Inasmuch as the system extends from Baltimore inland to Chicago and St. Louis with numerous branches to other important industrial centers and traverses some of the richest sections of the United States, it was to have been expected that this industrial development work should have been successful and have brought much high-grade traffic to the road. The fact that Baltimore is one of the country's leading export cities has also had its effect, although just at present export trade in general commodities has fallen off considerably from the war period.

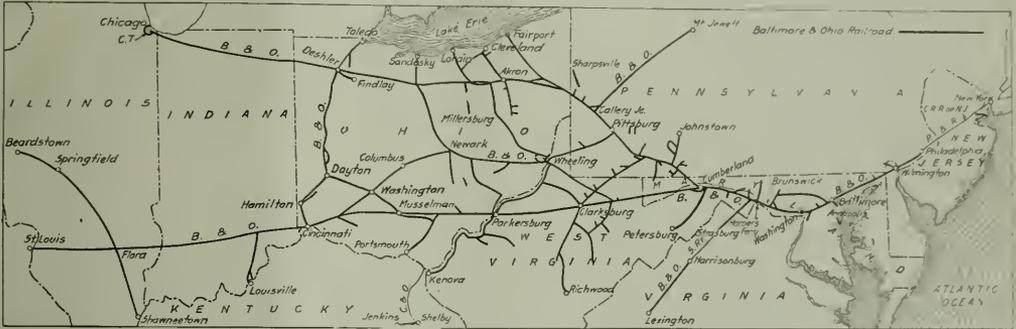

Nevertheless, despite the increase in general business, the Baltimore & Ohio is still primarily a coal road. One of the largest factors in export trade at present is coal. There are many countries of Europe and also in South America that used to depend on Welsh coal. The lack of shipping during the war and the lessening of output because of strikes and other action on the part of the British miners have tended to eliminate this supply so that today America has a splendid opportunity to compete in furnishing the world's coal. Through its up-to-date Curtis Bay pier at Baltimore, the Baltimore & Ohio is in a strategic position to secure its share of this export trade in coal. More export coal is handled through Hampton Roads than through Baltimore, but it will be borne in mind that at the latter place there are the Chesapeake & Ohio, the Norfolk & Western and the Virginian, whereas at Baltimore there are, practically speaking, only the Baltimore & Ohio and the Western Maryland. The dumpings at Curtis Bay are of interest; the figures include bunker and coastwise coal as well as export. For 1915, a pre-war year, the total was 2,600,000 tons; for 1919,

1,900,000 tons. For the first ten months of 1920 it has been approximately 4,000,000 tons. The month of October this year broke all records and was at the rate of over 7,000,000 tons for the year.

It is interesting to sketch the manner in which coal is handled on the Baltimore & Ohio, not only because coal constitutes nearly half the tonnage, but also because it shows in what a favorable position the road is to handle coal, economically. Coal from the Baltimore & Ohio territory comes from five important fields. The West Virginia or Fairmont field supplies approximately one-third of all the coal from these fields; about 75 per cent of the coal from this field moves east. The Meyersdale or Somerset district supplies about 18 per cent, nearly all of which moves east. The Pittsburgh or Youghiogheny district supplies about 13 per cent and about half of this moves east and half west. The Cumberland or Piedmont district, which is the district from whence comes the George's Creek coal, supplies about 8 per cent, nearly all of which moves east. The fifth field, the Ohio or No. 8 field, supplies about 26 per cent, nearly all of which moves west. In addition to this a large quantity of coal is obtained from the Kentucky fields served by the Sandy Valley & Elkhorn. This road is owned by the Balti-

trains are combined into 7,000-ton trains whence they run to Brunswick. They are classified at this point and 5,000 ton trains are run to the tidewater coal pier at Curtis Bay. Like the coal roads at Hampton Roads, the Baltimore & Ohio handles its coal at tidewater with the assistance of a pooling arrangement. Thus cars are classified at Curtis Bay into 29 classifications, of which 14 are pool and 15 non-pool classifications. Under the pooling arrangement a shipper is credited with the coal as soon as it is loaded at his mine. He can then draw upon the particular pool to which his coal is assigned whether the coal he loaded has been received at tidewater or not. The saving in car supply and the facility of operation can readily be appreciated.

The figures in the annual report of the Baltimore & Ohio for 1919, as is customary with the reports of this road, are shown in much more detail than is common with most roads. They show that the total freight revenue in 1919 was \$136,802,852 as compared with \$129,877,038 in 1918; the number of revenue tons carried in 1919 was 88,862,248 as compared with 95,346,229 in 1918. The increase in revenue with a decrease in tonnage is explained by an increase in the earnings per ton mile from .0763 cents in 1918 to .0795 cents in 1919 and an increase in the average haul from

The Baltimore & Ohio System

more & Ohio but does not connect with it. Coal from it moves over the Chesapeake & Ohio to Cincinnati and thence north over the Baltimore & Ohio, Toledo & Cincinnati Division to Toledo. There is sufficient coal from this field so that combined with the large amount of other traffic interchanged with Southern lines at Cincinnati it makes the line from Cincinnati to Toledo one of those of greatest traffic density on the Baltimore & Ohio system.

A study of the map of the Baltimore & Ohio will show that the Fairmont field has a fairly direct route to the lakes at Lorain and the Somerset field a similar route through the Pittsburgh district to the lakes at Fairport. It has been noted, however, that most of the coal from these fields moves east. Inasmuch as the lines from these fields meet near Cumberland, it results that the section from Cumberland east is the portion of greatest traffic density on the Baltimore & Ohio system. The traffic to Curtis Bay moves over the line to Baltimore. A considerable portion of the traffic northbound, however, does not go through Baltimore, but reaches the Philadelphia & Reading at Shippensburg, going over the Western Maryland from Cherry Run or over the Cumberland Valley from Martinsburg.

The line from Grafton east to Cumberland is also of more than ordinary interest. Coal from the Fairmont region is assembled at Grafton. Coal leaves Grafton in 3,750-ton trains, three heavy Mallet locomotives being used to haul these trains up the 2.2 per cent grade to the summit at Terra Alta. At Keyser, a short distance west of Cumberland, these

179 miles to 194 miles. The passenger revenue in 1919 was \$31,724,006 as compared with \$30,871,710 in 1918.

The total railway operating revenue for the year was \$182,620,016 as compared with \$175,259,575 in 1918. The railway operating expenses for the year were \$169,869,125 as against \$161,792,511 in 1918. The net railway operating income for the year was \$5,055,991 as compared with \$7,080,814 in 1918. The standard return for the system was \$30,035,093.

It is noteworthy in this connection that the expenditures for maintenance of way showed practically no increase in 1919 over 1918. The facts in the report show that the road was unquestionably undermaintained, particularly during the late part of federal control. The new steel rail put in track in 1919 amounted to only 28,262 tons, and in 1918 to 40,314 tons; in 1917 the total was 72,263 tons and in 1916, 77,150 tons. Expenses for roadway maintenance and for track laying and surfacing in 1919 also show considerable decreases as compared with 1918, despite increased costs. The road is now busily engaged in making up these deficiencies in maintenance and such figures as man hours for maintenance of way, material applied, etc., for 1920 will show great increases over the period of federal operation.

It is hardly possible this early to essay to determine how the Baltimore & Ohio will fare under the new rates. Nevertheless, it is worth noting that the figures for revenues and expenses for the month of October, 1920, may be said to show a really remarkable change as compared with October,

1919. We give herewith a few of the important items selected from the figures for October.

	October, 1920	October, 1919	Increase
Freight revenues.....	4,614,952	15,087,094	5,527,858
Passenger revenues.....	2,986,463	2,331,643	654,820
Railway operating revenues.....	25,015,395	18,917,768	6,097,627
Maintenance of way and structures.....	3,045,010	2,412,293	632,717
Maintenance of equipment.....	6,000,369	4,904,080	1,096,289
Transportation.....	11,124,014	7,481,750	3,642,264
Railway operating expenses.....	21,101,431	15,413,104	5,688,327
Net railway operating income.....	2,881,282	1,531,457	1,349,825

It is, of course, not advisable to make too much of the figures for one month but it certainly is worthy of comment that the net railway operating income in October, 1920, was nearly double that for October, 1919, despite increases of one-quarter in expenses for maintenance of way and of one-fifth in expenses for maintenance of equipment.

One of the interesting features of the finances of the railroads at present is the use of the revolving fund provided by the Transportation Act. The Baltimore & Ohio was included in the roads whose applications were passed upon by the special committee appointed for this purpose by the Association of Railway Executives. The application of the company was for \$7,087,000, including \$5,000,000 for additions and betterments and \$2,087,000 for improvements to existing equipment. The Interstate Commerce Commission has approved a loan of \$3,000,000 for additions and betterments. It is understood also that the company is expecting to finance the purchase of equipment to a value of approximately \$13,000,000, through the National Railway Service Corporation, headed by S. Davies Warfield, and in that connection the Interstate Commerce Commission has approved a loan of \$5,200,000 from the revolving fund. The Baltimore & Ohio secured from the Railroad Administration 100 Mikado, 30 Pacific, 26 Mallet and 40 switching locomotives and 500 fifty-ton box, 500 seventy-ton gondola and 1,900 fifty-five-ton hopper cars, which allocated equipment was financed through the equipment trust agreement made in January, 1919, between the director general of railroads, the Guaranty Trust Company of New York and the carriers.

It was noted above that the standard return for the Baltimore & Ohio system was \$30,035,093. This figure was inclusive of the compensation for the Baltimore & Ohio itself, and also of the Staten Island Rapid Transit, the Coal & Coke, the Sandy Valley & Elkhorn, and the Baltimore & Ohio Chicago Terminal. The corporate income for the system shows other corporate income of \$3,441,088, this representing chiefly dividend income from shares in companies not included in the Baltimore & Ohio system and the item of miscellaneous rent income. The gross corporate income was \$33,476,181. The net corporate income in 1919 was \$8,580,022, as compared with \$5,042,106 in 1920, the difference in these figures being explained chiefly by the difference in the figures of revenues and expenses applicable to the period prior to January 1, 1918, settled for account of the corporation by the Railroad Administration. The 4 per cent dividends were paid on the preferred stock but no dividends were paid on the common stock both in 1919 and 1918. The 1919 figures include an item of \$1,750,000 income appropriated for additions and betterments to road. The balance transferred to profit and loss in 1919 was \$4,428,088 and in 1918, \$2,656,061.

The following table shows the principal figures for operation under the government in 1919 and 1918. The figures given are for the Baltimore & Ohio system:

	1919	1918
Mileage operated.....	5,154	5,152
Freight revenue.....	136,802,852	129,877,038
Passenger revenue.....	31,724,006	30,871,710
Total operating revenues.....	187,620,016	175,259,575
Maintenance of way and structures.....	26,168,745	26,038,246
Maintenance of equipment.....	56,264,804	49,285,380
Traffic expenses.....	1,886,255	1,979,542
Transportation expenses.....	79,727,341	79,344,095
General expenses.....	4,389,465	4,070,420
Total operating expenses.....	169,869,125	161,792,511
Taxes.....	4,872,096	4,829,146
Operating income.....	7,857,724	8,618,088

## Letters to the Editor

### "Keep Trains Moving"

LAWRENCE, N. J.

TO THE EDITOR:

Your distinguished advertiser who rings the changes on "Signals Keep Trains Moving" is doing a very good thing for those thoughtless operating officers whose spirit of enterprise has been deadened by their worship of the Standard Code, and other ancient formulas; and these behind-the-times members of the railroad profession will be awakened, after a time, let us hope.

But this slogan does not wholly cover the case. The *man who rules the signals* ought to do a little more effective thinking on the subject of keeping trains moving. You spoke recently of the "tonnage signal," an automatic block signal freed from the absurd rule that when the signal is set against a train the engineman must come to a full stop, even if he can see a clear track for two miles ahead. Why call this a "tonnage" signal? What does "tonnage" mean, anyway? If it is right that the stop rule should be suspended for one train, why not for all trains? If the restriction can be removed at one place, why not at all places? The "tonnage signal" is found mostly on steep grades, but, with the hundred-car trains now in vogue, an ascent of 15 feet to the mile may become a steep grade. In short, this relaxation of the stiff rule of the ancients is needed everywhere.

This rule requiring an engineman to stop his train for no other reason than to convince the officers, or their spotters, that he *can* stop it, was introduced in the old days of hand brakes and of drawbridges not signaled; and it would seem that we have kept it in force simply because we are too dull to see its absurdity and wastefulness; too slow to use modern facilities and methods which are fairly forcing themselves on our attention.

What can the up-to-date operating officer say against a general movement to abandon the stop-and-proceed rule?

R. H. A.

### A Passenger Awards First and Second Prizes for Rough Handling

BOSTON, MASS.

TO THE EDITOR:

Through your columns I wish to ask if, as a penalty for the use of steel cars and heavy locomotives, passengers are forever to be subjected to the jerking of trains when starting. If we are, I think that here is an opportunity for the booster.

It appears to be almost the rule now that a locomotive cannot start a train without backing and creating slack, and this operation and the following start is of the slam-bang order, nerve racking, and when it occurs with sleeping cars, is not conducive to sleep.

In my observation the \_\_\_\_\_ road is the worst offender and the \_\_\_\_\_ next.

Furthermore, I am led to think that the quick acting brake is not quick enough, for the brake application nearly always causes a car slam. Those who are studying the rehabilitation of our railroads will, in a consideration of the above features, find something to work upon. The present condition is not creditable.

# Train Handling with Electric Locomotives\*

## Passenger Service Requirements and Passenger Train Operation —Helpers Are Not Necessary

By W. S. H. Hamilton

Railway Equipment Department, General Electric Company

**P**ASSENGER TRAINS are run on a schedule which allows a certain running time over a division. This running time is based mainly on the average speed the motive power can make without too great an effort, the nature of the track and the country through which it runs. These last two items are especially important in mountain railroading. It is usually possible in reasonably good weather to make faster time than that called for by the running time without exceeding the limits of safety or comfort to passengers and this allows more or less time to be made up.

The requirements then for the motive power for passenger service are ability to handle certain train weights over a given profile at the speeds required by the schedule efficiently and smoothly, maintaining quite closely the schedule speeds at all times with the trains on time and with them late, to handle them on all parts of the run at the maximum speed permitted by the safety and comfort of the passengers in order that the maximum amount of time may be made up. A large amount of time may be made up by taking advantage of the profile and holding the maximum permissible speed at all times and skillful engineers can make up considerably more time with the same motive power than unskilled or inexperienced ones, simply by taking advantage of conditions.

Electric locomotives for such service are shown in Figs. 1 and 2. The principal dimensions are given in Table I. There are five of the General Electric locomotives which at present are in service on the coast division and ten of the Westinghouse type handling the passenger trains on the Missoula and Rocky Mountain divisions. The original 42

General Electric locomotives are now used to haul freight on all three electrified divisions.

### Locomotive Characteristics

The speed tractive effort curves on resistance when motorizing for the gearless locomotive are shown on Figs. 4 and 5.

TABLE I—PRINCIPAL DIMENSIONS OF PASSENGER LOCOMOTIVES

	General Electric	Westinghouse
Total weight	821,200 lb.	550,000 lb.
Total weight on drivers	457,680 lb.	336,000 lb.
Non-spring-borne weight per driving axle	9,500 lb.	7,800 lb.
Length over-all	76 ft. 0 in.	88 ft. 7 in.
Height over cabs	14 ft. 11 1/2 in.	14 ft. 6 in.
Height over pantograph, locked down	16 ft. 8 in.	16 ft. 7 1/2 in.
Total wheelbase	67 ft. 0 in.	79 ft. 10 in.
Maximum rigid wheelbase	13 ft. 9 in.	16 ft. 9 in.
Diameter of driving wheels	44 in.	68 in.
Diameter of idle wheels	36 in.	36 in.
Heater capacity	4,000 lb. steam	4,000 lb.
Water capacity	per hr. 30,000 lb.	25,500 lb.
Oil capacity	6,000 lb.	750 gal.
Compressor capacity	150 cu. ft. per min.	150 cu. ft. per min.
Number of motors	12	12
Type of motor	(Bi-polar) GE-100	(Twin) 4-pole
	General Electric	
	Tapped field	Full field
Locomotive rating	3,480	3,380
Total tractive effort one-hour motor rating	36,000	46,000
Speed, miles per hour	36.2	27.5
Total horsepower continuous	3,200	3,200
	Westinghouse	
	4,200	
	66,000	
	33.8	
	3,360	

It will be noted that there are a total of eight running speeds provided; four full field and four tapped field. The four full field speeds can be used anywhere including mountain grades (1.5 per cent or over), but the four tapped field speeds only on lighter grades or with light trains on mountain grades. The highest full field speed is sufficient to take the maximum train up a grade at a speed slightly

\*This is the first of a series of three articles on this subject. The second will deal with freight train operation and the third with the use of helpers in freight service. The author acted as an instructor to engineers on the locomotives used on the C. M. & St. P. from December, 1915, to August, 1917, and from December, 1919, to April, 1920.

faster than the schedule speed and there is another running speed slightly lower which is about right for just making running time. The maximum speed up grade selected for electric locomotives is usually between 25 and 30 m.p.h. on mountain grades and is in excess of that which is made by steam engines when double heading.

In descending mountain grades regeneration is used to control the speed. Two connections of regeneration are available, one covering the range from 20-65 m.p.h. and the other from 10-30 m.p.h. The first connection is the one ordinarily used. The speeds permissible when descending mountain grades (1.5 per cent and over) vary from 20 m.p.h. on grades having bad curves, rocks, etc., up to 35-40 m.p.h. for open straight track. The first limit is set by the ability to stop within a limited distance on account of vision and the second represents about the maximum speed from which the air brakes can be safely relied on to stop the trains. On lighter grades higher speeds may be made but the maximum is usually 50-60 m.p.h.

**Regenerative Braking**

Regeneration saves the wear and tear on brakes, shoes, etc., and also the jar to the train caused by the repeated applications of the brakes. When operating with steam power on grades with numerous curves the trains are taken down by means of successive applications and releases of the air brakes, never making a heavy application and only occasionally releasing them entirely. This results in a fairly even speed. On the heaviest grades this method cannot be used because of the tendency to gradually apply the brakes hardest on the cars at the rear of the train and put most of the work on those brake shoes. This is the reason for the occasional complete releases referred to above. They are usually made when the train is entirely in a curve or just entering one so that the train will not speed up too much while the brakes are entirely released.

The practice on the heaviest grades, particularly when nearly straight, is to allow the train to accelerate to the maximum speed, say 35-40 m.p.h., allowed on that grade, then a fairly heavy application of the brakes is made and the

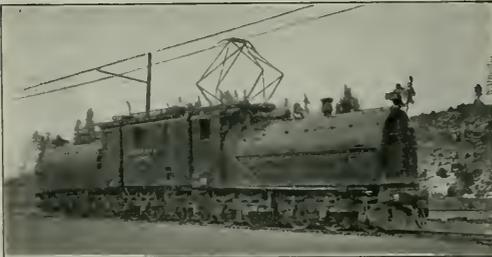

Fig. 1. The Bi-Polar Gearless Passenger Locomotive Built by the General Electric Company

brakes are kept applied until the train slows down to about 15-20 m.p.h., when the brakes are entirely released and the train is allowed to run free until the maximum speed is again reached, which gives time enough for recharging the brake pipe. This results in considerable jar to the train but makes the brakes on all cars apply uniformly. Retainers are not ordinarily used on passenger trains.

This jar is eliminated by the use of regeneration and the train may be held at a uniform speed. Within the capacity of the locomotive this speed may be varied to obtain the maximum desirable for any given part of the grade. This variable speed regeneration is especially desirable when handling train weights less than the maximum, as then a

wide range of speeds can be obtained. Stops for cooling brake shoes and wheels are also eliminated which are required on some grades when operating with steam power.

**Little Helper Service Required**

The electric locomotive has a big advantage over steam power in that it is entirely feasible to build a locomotive big enough to go over the entire profile and thus eliminate helpers on the heaviest grades. This is best shown by Table II.

With electric operation helpers are not used at all on the passenger trains. The locomotive shown in Fig. 1 weighs

Fig. 2. The Quill-Gear Passenger Locomotive Built by the Westinghouse Electric & Manufacturing Company

265 tons and is capable of handling a 960-ton train, trailing (13 cars) on a maximum grade of 2.2 per cent. This

TABLE II—HELPERS ON C. M. & ST. P. RWY. STEAM OPERATION

Eastbound Passenger Trains					
Division	Helper station	Helped train to	Distance	Helpers	Distance
Coast	Cedar Falls	Rockdale	19.2	Rockdale	19.2
	Kittitas	Boylston	10.5	Beverly	29.3
Missoula	Avery	Roland	21.7	Haugan	37.8
Rocky Mountain	Butte	Donald	14.9	Donald	14.9
Total miles electrified divisions..... 646.2					
Total miles helpers required..... 66.3					
Percentage of miles helper required to total miles electrified divisions 10.2					
Total helper district miles..... 101.2					
Percentage of helper district miles to total miles electrified divisions. 15.7					

Note—With trains more than 10 cars or about 735 tons trailing, it was customary to provide helpers on the coast division from Renton or Maple Valley to Cedar Falls in addition to that shown. On the Rocky Mountain division it was customary to double head the train over the entire division from Deer Lodge to Harlowton under this condition.

Westbound Passenger Trains					
Division	Helper station	Helped train to	Distance	Helpers	Distance
Rocky Mountain	Lennep	Loweth	9.7	Loweth	9.7
Rocky Mountain	Piedmont	Donald	20.7	Donald	20.7
Missoula	Avery	Haugan to East			
		Portal	14.1	Avery	37.8
Coast	Beverly	Boylston	18.8	Kittitas	29.3
Total miles electrified divisions..... 646.2					
Total miles helpers required..... 63.3					
Percentage of miles helper required to total miles electrified divisions 9.8					
Total helper district miles..... 97.5					
Percentage of helper district miles to total miles electrified divisions. 15.1					

Note—The double heading on eastbound trains on the Rocky Mountain division frequently required considerable double heading on the westbound trains in order to return the engines to the proper terminals.

permits it to operate on any grade between Harlowton and Seattle. The elimination of helpers saves considerable time previously required by stops and delays incident to cutting helpers in and out of the trains. Where helper districts form a considerable portion of the division it is certainly best to make the locomotive large enough to handle the train over the entire division alone.

very noticeable in handling passenger trains on light grades, either ascending or descending. A steam locomotive when shut off at once shoves back against the train and tends to bunch the slack. When making slow-downs for curves it is necessary to keep working a small amount of steam to prevent this action even while the brakes are applied on the train. With the electric locomotive this is no longer necessary, as when power is shut off there is little or no tendency to bunch the train slack.

On grades of about .4 per cent maximum descending the electric locomotive will coast with the train very easily and seems to have about the same friction as the train. On grades of about .6 per cent maximum it is possible to regenerate a little. Steam engines on these grades would require working a small amount of steam (drifting throttle).

**Starting on Grades**

When standing on mountain grades the train is held by keeping the independent brakes applied on the locomotive with brakes released on the train. When it is desired to

is usually as close to the wheel slipping point as can be held.

In stopping on an ascending mountain grade the controller is eased off a couple of notches or so at a time until it reaches the second or third notch. With the controller in this position the train is allowed to "stall," the independent brakes are applied and the controller is then shut off.

When taking a siding on an ascending mountain grade the controller is shut off slowly to a notch in which the train will just keep moving. This allows the brakeman to get off

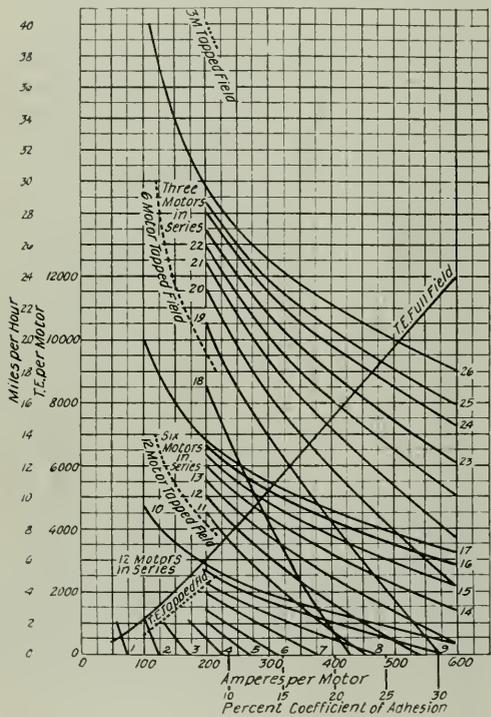

Fig. 4.—Speed-Tractive Effort Curves on Resistance with 12, 6 and 3 Motors in Series for the Gearless Locomotive

start the train, the controller is pulled out two or three notches and the brakes released, the controller being then brought out notch by notch until the train either moves or the locomotive slips its wheels. An experienced engineer keeps close watch on the ground while doing this to see exactly when the train first starts, although he also manages to watch the ammeters so as not to apply too much current. As soon as the train has started moving the controller is held in that notch until the locomotive has moved a few feet, and then the acceleration is continued at the desired rate. This

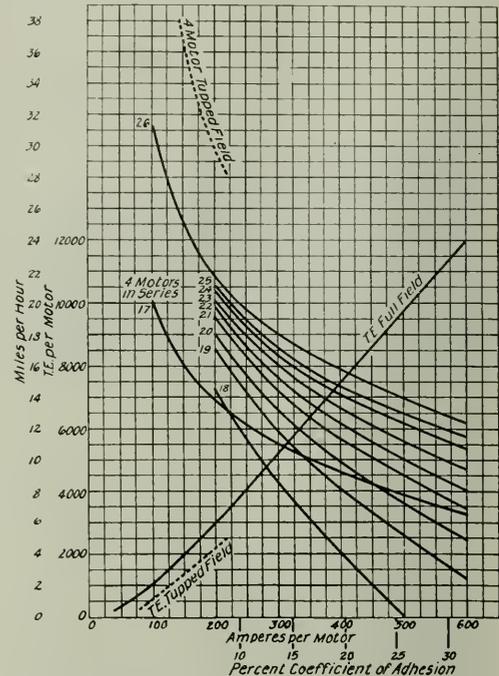

Fig. 5.—Speed-Tractive Effort Curves on Resistance with 4 Motors in Series for the Gearless Locomotives

and run ahead to open the switch and allow the train to head in on the passing track without actually stopping. The train is then speeded up by bringing the controller out a few notches, but when the rear of the train is nearly over the switch it is necessary to move the controller back several notches again in order that the rear brakeman may get on after closing the switch without having to stop the train.

**The Use of Regenerative Braking**

During regeneration four of the motors are used to excite the fields of the other eight which return energy to the line. A separate handle on the controller is used to control the regeneration and this is known as the braking handle to distinguish it from the main handle which controls the acceleration and motor grouping.

Two methods are provided for commencing regeneration. The first method permits of commencing regeneration without interrupting the motoring current entirely although reducing it in amount. This method is very desirable when tipping over the summit of a grade, as then the locomotive passes over into regeneration very easily. Furthermore, some of the grades tip over very sharply, and it is necessary to

keep power applied to the train until it actually gets on the down-grade and begins to speed up. This can be done very conveniently by this method.

The second method was intended for use when starting from rest on descending mountain grades. It allows regeneration to be commenced without any motoring current being applied first. When using this method the train is allowed to start from rest and run free until a speed of 5 to 10 m.p.h. is obtained, depending upon the grade, the independent brakes on the locomotive being used to some extent to control this speed. Regenerative braking connections are then applied, and after they have been fully established, the operation is the same as with the first method. Theoretically, this should allow better train handling than the first method, since there is no motoring first to pull out the train slack.

Practically no difference was found by several months' experience, and the first method is used almost entirely now. From this it may be concluded that any method of applying regeneration to a passenger train will be successful providing that there is not too much motoring at first. In passing it may be noted that in the older geared passenger locomotives supplied the C. M. & St. P., it was necessary to apply full motoring connections before regeneration could be commenced, and these locomotives were very successful in service for several years. They were finally converted into freight locomotives by changing the gear ratio. This was done because at the time they were purchased it was considered desirable to have only one type of locomotive for both freight and passenger service and not to adopt a purely passenger type until more locomotives were required.

When descending a mountain grade regenerating, if it is desired to stop the regeneration is slightly decreased by moving the braking handle back one or more notches, the automatic brakes are applied with a light service application of about 10 lb., and when the line ammeter indicates that the current returned to the line is nearly zero both handles are shut off and the application of the automatic brakes is continued to the desired degree to stop the train. The independent brakes apply on the locomotive as soon as the controllers are shut off. As soon as the train comes to rest the automatic brakes are released on the train and the independent air brakes are applied on the locomotive to hold the train.

In starting again, the independent brakes are released and power is applied to start the train. The controller is brought out to the position where regeneration can be commenced and regenerative braking connections are established as previously outlined.

It is sometimes necessary when regenerating to make slow downs at a faster rate than the regeneration will make them. This is done by applying the automatic air brakes on the train, the independent brakes being kept released automatically. In case the speed should be reduced too much the locomotive will commence to motor and if this becomes objectionable in amount the controller is shut off until the brakes are released and full speed can be resumed. There is no difficulty in using the air brakes and regeneration at the same time.

### Kind of Control Required

In order to meet the conditions of train handling as described above successfully, especially those for mountain grade operation, the control equipment of the locomotives must be so designed that power may be applied gradually both to prevent wheel slipping of the locomotive and also to prevent jolts to the train. This requires an ample number of steps of resistance and proper proportioning of the same. The accelerating curves on resistance are shown in Figs. 4 and 5. The increments of tractive effort between steps when accelerating to a maximum of 25 per cent coefficient of ad-

hesion are about 22,000 lb. for the 12 motors. This is about the maximum increment between steps that should be applied to a passenger train. The change in coefficient of adhesion between steps is about 5 per cent, which represents somewhere near the maximum for this weight of locomotive which should be allowed if the wheels are not to slip too easily when going from one resistance step to the next.

Furthermore, if the train is to be handled smoothly the same steps should be obtained when turning off the controller as when turning it on. This bars out arrangements such as used on some trolley cars where the power circuit is opened as soon as the controller is started back toward the off position.

Ample capacity should be provided in the rheostats. The above locomotive can be worked at 300 amperes, corresponding to 14 per cent coefficient of adhesion for about 10 minutes or at 485 amperes corresponding to 25 per cent coefficient of adhesion for about 5 minutes without overheating the rheostats. These values represent approximately the capacity required for mountain grade service.

## Regulations for Competitive Bidding Under Clayton Law

THE REGULATIONS issued by the Interstate Commerce Commission on October 6, 1919, governing the method for obtaining competitive bids on transactions covered by the Clayton law, which became effective on January 1, are as follows:

1. When any carrier, subject to the act to regulate commerce, is required by section 10 of the Clayton Anti-trust Act to call for bids for securities, supplies, or other articles of commerce, or for the construction or maintenance of any kind or part of its carrier property such carrier shall prepare specifications, form of proposals and contract, setting forth clearly and so far as applicable in each case in detail a description or descriptions of the matters and things for which bids are requested, the terms, times and conditions of delivery and payment, the place or places where delivery or performance is to be made, the character, amount, and terms of securities offered or sought, and a full description of the supplies or other articles required or offered for sale, hypothecation, or purchase, and shall make and attach to such specifications such maps, drawings, and illustrations and state such other substantial facts or conditions as are or may be necessary to a full understanding of the premises and procedure by bidders. Such specifications, drawings and illustrations in each case shall be kept open at the principal office or offices of the carrier for full examination, free of charge, by persons desiring to examine the same with a view to bidding, and, upon request, such carrier shall furnish to any person or persons desiring the same true and accurate copies of such specifications, maps, drawings and illustrations; provided that the carrier may make a charge for such copies so furnished, the charge not to exceed the reasonable cost of making and forwarding the copies requested.

The carrier shall publish in each case a request for bids in at least two daily newspapers of general circulation, at least two publications in each week for two weeks, the first publication to be at least two weeks immediately preceding the day when the bids are to be submitted; one such newspaper shall be published or shall be of general circulation in the city or town where the principal operating office of the carrier is located and the other newspaper shall be published in one other of the following cities nearest to the operating or financial office of the carrier or the place where the contract is to be performed, namely: New York, N. Y., Boston, Mass., Chicago, Ill., St. Louis, Mo., Atlanta, Ga., San

Francisco, Cal., and Portland, Ore.; and a printed copy of the published notice in each case shall be posted in plain view, for two weeks immediately preceding the day on which bids are to be received, on a bulletin board, designated for that purpose, in a public and conspicuous place in the building where the principal operating office of the carrier is located. Such published notices shall describe in general but intelligible terms the proposed contract, giving its serial number, and the special matter or things for which bids are requested, and the date on or before which the bids must be submitted, and the person by whom and the office at which the bids submitted will be received and opened as herein provided. The carrier may in said notice reserve the right to reject any and all bids and may, at its option, require each bidder to tender a bond in a reasonable sum to be therein named, with sufficient surety or sureties conditioned upon the faithful and prompt performance of the terms of the contract.

2. Every bid to receive consideration shall be submitted at the place specified in the notice on or before noon of the day on which the bids are to be opened and the bids shall be opened after noon and before six o'clock, on the day and at the place and by the person or persons designated in the notice. Each bidder may attend in person or by duly authorized representative at the opening of the bids, and shall be afforded an opportunity to do so and to examine each bid. The bids shall forthwith be tabulated in conformity with the form of proposal prepared and a copy of such tabulation shall be promptly furnished to any bidder or his authorized representative upon application thereof.

When required by the notice, each bid shall be accompanied by tender of a bond in the amount specified in the notice with sufficient surety or sureties conditioned upon the faithful and prompt performance of the proposed contract. A bond shall be required only in cases where the notice for bids expressly calls for a bond.

Each bid shall be enclosed with accompanying papers in a plain envelope securely sealed bearing no indication of the name of the bidder or the amount of the bid, and shall be marked "Bid under proposed contract No. —," and shall be addressed to the officer of the carrier designated in the notice to receive the same.

Each bid shall state the name and address of the bidder and, if the bidder be a corporation, the names and addresses of the officers, directors and general manager thereof and of the purchasing or selling officer or agent in that transaction and, if the bidder is a firm, partnership or association, the bid shall give the names and addresses of each member thereof, and of the manager, purchasing or selling officer or agent in that transaction.

3. After receiving and opening bids as aforesaid, the carrier receiving the same shall within 48 hours in cases where the sale or purchase of securities is the undertaking, and within ten days where bids are for supplies, equipment, other articles of commerce and for construction or maintenance work, accept the most favorable bid considering (1) the lowest price or prices for the supplies, equipment, and other articles of commerce, and for the construction or maintenance work, described in the advertisement, and the highest price or prices offered for any securities or property, so described, for sale by the carrier, and (2) the ability and reliability of the bidder, financial and otherwise, to deliver the property or to perform the work or transaction, or to pay for the securities, described in the advertisement, giving due consideration to any bond or security tendered by the bidder. If the right be reserved in the notice all bids may be rejected and the carrier may readvertise for bids. The carrier shall notify the successful bidder of the acceptance of his or its bid, and the bidder shall within ten days execute the required contract, and, if required by the notice, execute a

good and sufficient bond for the faithful and prompt performance of the contract. In case the successful bidder shall neglect or fail within said time to execute the contract or bond as aforesaid the carrier may within five days award the contract to the next most favorable bidder, ascertained as herein provided for determining the most favorable bidder. If neither the most favorable bidder nor the next most favorable bidder shall execute a contract and qualify as aforesaid, the carrier shall readvertise for new bids.

4. Each carrier after having made and executed a contract as and in the manner above specified shall within 30 days after the execution of such contract file with the Interstate Commerce Commission a statement of the transaction giving, (a) a copy of the published notice; (b) the names of all bidders, and, if the bidder be a corporation, the names and addresses of the officers, directors and general managers thereof and of the purchasing or selling officer or agent in that transaction, or if the bidder be a partnership or firm, the names and addresses of the members of the firm, the general manager and purchasing or selling agent thereof, and the total amount of each bid; (c) the name of the bidder to whom the contract was awarded together with a copy of the contract; and (d) if any other than the lowest or the highest bid, as the case may be, is accepted as being most favorable to the carrier, the reasons for such acceptance. The statement shall be made in typewriting, in pamphlet form on pages not less than 8 by 10½ in. in size nor greater than 9½ by 12 in. in size, bound on the longer edge of the page, the paper to be of durable quality fit for permanent record.

5. [As amended October 4, 1920.] In the case of each bid so taken as aforesaid, the carrier shall preserve and keep open for examination by the Interstate Commerce Commission or any duly authorized examiner thereof, (a) a copy of the resolution or order of the board of directors, executive committee, or officers of the said common carrier specifying the purposes and terms of the contract for which the bids were invited; (b) a copy of the specifications, maps, drawings, and illustrations upon which bids were made; (c) copies of the notices published, sworn to by or on behalf of the publisher of each paper, respectively, giving the dates and times of publication; (d) the original bids received, designating the bid accepted and giving a statement of the reasons for accepting the same; (e) a copy of the contract entered into between the carrier and the accepted bidder, together with a copy of the bonds if any; (f) references by number of volume and page to the records of proceedings of the stockholders, directors, or executive committee of the carrier. The files in each transaction shall be securely fastened together and given the contract number and each document therein shall be numbered consecutively and at the conclusion there shall be a sworn statement by the president, a vice president, or the general manager of the carrier, stating that the files in No. — contain true and complete records and statements of all the negotiations had in connection with the contract therein set forth. Such files shall not be broken or any part destroyed by the carrier or any officer or agent of the carrier without written authorization from the Interstate Commerce Commission.

SOUTH GEORGIA has been brought into closer touch with North Georgia and the cities of the North, East and West, through the establishment by the Southern Railway of an over-night freight service between Atlanta and South Georgia points. The new train is "The Wiregrass Special." It will leave Atlanta every night at 7 o'clock and Macon at 2 o'clock the following morning, carrying through carded freight to Macon and South Georgia points and making delivery from Atlanta at most of these points the following day. The train will be run over the Georgia Southern & Florida.

# Legislation Urged to Require Payment of Guaranty

Railway and Supply Representatives Show Carriers  
Seriously Handicapped by Treasury's Stand

THE PRECARIOUS SITUATION in which the railroads have been placed as the result of the ruling of the comptroller of the Treasury, which prevents the Secretary of the Treasury from honoring certificates of the Interstate Commerce Commission for partial payments on account of the nearly \$400,000,000 still due the railroads of their guaranty for the six months following the termination of federal control, was explained on January 14 before the House committee on interstate and foreign commerce by Alfred P. Thom, general counsel for the Association of Railway Executives; Thomas DeWitt Cuyler, chairman of the association; Samuel Rea, president of the Pennsylvania; M. L. Bell, general counsel of the Rock Island and the Minneapolis & St. Louis; Daniel Willard, president of the Baltimore & Ohio, and others. Frank W. Noxon, secretary of the Railway Business Association, also showed how the resulting delay on the part of the railroads in paying their bills and the curtailment of purchases are hurting the supply industry and business generally. The hearing was on the bill introduced by Representative Winslow to amend the guaranty provisions of the transportation act so as to provide clearly what the railroads and the Interstate Commerce Commission had construed it to mean and to require the Treasury to make partial payments without waiting for the months or years required to make the final adjustment of the accounts necessary to an exact determination by the commission of the final amounts due the roads.

Mr. Thom said the situation faced by the roads for the lack of the cash which they supposed they had been guaranteed is so serious as to make it necessary to appeal to Congress for legislation to interpret clearly what it had meant in the law. He said he personally had no doubt that the law as written permits partial payments. A final accounting to determine the exact amounts, which the treasury officials hold is necessary, might take years and it was the purpose of Congress to make the funds available to the roads in the transition period so they could properly perform their duty to the public. The supreme court of the District of Columbia has sustained the Treasury department and the case has been taken to the district court of appeals, but Mr. Thom said the situation will not wait until it can go through the supreme court.

Representative Sims of Tennessee said the Treasury was empty and the money with which to pay the railroads was not there to be paid out.

"I do not understand that we are dealing with an insolvent government," Mr. Thom replied.

## No Rich Carriers in Country Today

Thomas DeWitt Cuyler, chairman of the Association of Railway Executives, said in part:

"There is no such thing as a rich carrier in this country today, because balances are held up to the extent of millions of dollars; supplies from material men are unpaid for; most of the carriers have no means of securing further money; they have exhausted their borrowing powers on the securities such as they would have gotten from their strong boxes; exhausted their resources and find themselves in a position where they cannot carry on unless they have some relief under the workings of this act. It is important that this transportation act be applied as stated on its face rather than to be held up for months and months, and possibly years, until these balances are ascertained and then paid. I cannot

impress upon the committee too strongly the situation of the carriers today. It is no fault of the transportation act, except this construction of it by the secretary of the Treasury. I feel justified in saying that it is a very, very serious condition and one that Congress should settle. Congress has stated how the transportation business of this country should be carried on and how can the secretary nullify what Congress has said? It is admitted that large sums are due the carriers and why should not a partial payment certificate be filed which would permit the carriers to at least have something of the amount which is owing to them? Now, a carrier can only borrow for the purpose of paying its fixed charges and operating expenses; it cannot borrow for the purpose of paying dividends. The Pennsylvania Railroad, for instance, has actually earned its dividends but has no cash with which to pay them and it cannot go to the government and get cash; it has exhausted practically all of its resources and cannot go to the banks and borrow money from them."

"What amounts, would you say, are the railroads unable to pay?" asked Representative Barkley of Kentucky.

"I know of one road where there is over 20 millions due now and it might run up into the hundreds of millions," said Mr. Cuyler. "The roads have not the credit and are cutting down to a minimum and ordering just enough equipment for safety and not any for renewals."

Asked if the credit of the railroads is actually exhausted, Mr. Cuyler said: "I did not mean to say actually exhausted, but rather in great jeopardy."

"Do you mean to say that the railroads are potentially insolvent?" was asked.

"No sir; but if the railroads are not granted this relief of these partial payments they will be in a very bad situation," Mr. Cuyler said. "If the bill had been followed out, the terms carried out as meant, the railroads would be in a satisfactory condition and if the railroads can receive partial payments as authorized by the Interstate Commerce Commission the financial difficulties of all the railroads would be greatly benefited. This is neither a charity nor a gift. I think we are entitled to these sums because the government used the railroads and we are entitled to pay for the loss we suffered by reason of the government's use of the railroads."

Mr. Cuyler said the Southern Railway, which did not accept the guaranty, is preparing to sue the government for \$84,000,000 on account of claims resulting from federal control.

## Statement by Samuel Rea

Samuel Rea, president of the Pennsylvania Railroad, said in part:

"Since the conclusion of the guaranty period, and although traffic rates have been increased, the resulting net earnings have not at all produced the results anticipated when the rate increases were granted, and although for many of the roads the last four months of the year should produce the largest proportion of their net income for the entire year, that result has not been realized. Consequently, the railroads of the country being unable to obtain payments on account of the amounts due them for the guaranty period, and having no material relief or net earnings resulting from the months following the guaranty period, find themselves very short of cash, so that they are unable either to pay their

current bills for fuel, materials and supplies or to settle their accounts among each other, many of these bills and accounts being long past overdue.

"Applying the situation to the Pennsylvania Railroad system, which carries about 12 per cent of the entire railroad business of the country, there was due for the guaranty period to cover operating expenses and compensation a total of over \$99,900,000, of which there was advanced to it during the guaranty period \$59,100,000, leaving a balance due for the guaranty period of over \$40,800,000. The consequence of this situation is reflected in the position of the Pennsylvania system, where a very large amount of vouchers, due and payable, are being withheld owing to inability to pay the same, and at the same time there is due the Pennsylvania system about \$10,000,000 in traffic balances from other railroad companies, and they for the same reason are unable to make payment. When the condition of all the railroads of the country is considered, it will be seen how largely their inability to pay their current bills is causing financial distress to their creditors and the financial institutions that have been called upon to assist in carrying the burden.

"The remedy for this situation is the passage of the legislation recommended by the Interstate Commerce Commission so as to require the certification and payment of partial amounts due to the carriers for the guaranty period. Further, to authorize the Interstate Commerce Commission in the case of deferred claims, or deferred debits or credits, to railway operating income, which cannot presently be definitely determined, to make reasonable estimates and when agreed to by the carrier to use the same in certifying the amount as final settlement of the guaranty period. This recognizes the fact that special claims for loss or damages to property, or personal injuries, etc., cannot be currently ascertained, and that it is essential, rather than to hold up the final settlement for the guaranty period, to dispose of the same by making a reasonable estimate which can be gaged by experience."

#### Rock Island Situation Explained by M. L. Bell

Mr. Bell said the Rock Island had no cash when its property was returned by the government except \$4,000,000 for working capital received from the Railroad Administration in accordance with a provision of the transportation act. It got along, however, during the guaranty period, without asking for an advance, assuming that it could get one whenever it was needed, but the back wages took about \$4,000,000 and left it in a position where it could not pay current bills. It owes \$6,000,000 for materials and supplies and about \$6,000,000 on traffic balances, while other roads owe it about \$8,000,000. The company's estimate of the guaranty indicates that \$12,346,000 is clearly due it but no one can say for several months what the exact amount will be. The company has a loan of over \$10,000,000 from the War Finance Corporation which was called for December 1. On explanation of the inability to pay the time was extended and it was suggested that the company try to collect something from the Railroad Administration. It is, however, unable to force a settlement with the Railroad Administration and it is paying about \$2,000 a day interest on its loan while it receives no interest on the delayed guaranty.

The Minneapolis & St. Louis had to ask for an advance on its guaranty every month. Mr. Bell said, and therefore has only \$300,000 to \$400,000 due, but the Rock Island is penalized because it tried to adopt a conservative policy.

#### Secretary Houston Suggests Other Methods

Chairman Esch of the committee read a letter from Secretary of the Treasury Houston opposing the Winslow bill but suggesting, if Congress desired to hasten the payments to the railroads, that the object be accomplished in another way. For example, he said, the law might be changed to

provide for advances up to July 1, 1921, in the same way it provided for advances on applications filed before September 1, 1920, under which \$264,000,000 has been paid. Or the law might provide for partial payments with a provision that the final claims of the railroads should be filed by September 1, 1921. He took the position that the slowness of the railroads in filing their claims with the commission was the principal cause of delay, entirely ignoring the claims still to be made against the railroads and the adjustment of the maintenance accounts.

"As to the propriety of allowing partial payments of public money to the carriers to sustain them while they prepare additional claims for losses incurred under their own management," he said, "I do not venture to express an opinion, but the government should have a protection not afforded by this bill. The amount of the government's obligations should be ascertained at the earliest possible moment. I should suppose it to be in the interest of the carriers to present their final claims as early as possible."

The plan proposed by the Winslow bill, he said, would cause an unwarranted disturbance of the present financial methods of the government. "The guaranty does not represent compensation for any service rendered to the people of the United States and I can think of no reason why the claims of the carriers under this bountiful provision should be made without proper safeguards." He also objected to the use of estimates by the commission in making certificates, saying that under such a method the commission could not make a certificate which would be final against a subsequent claim of the carrier.

#### Roads Not Asking for Special

##### Consideration, Says Mr. Willard

Daniel Willard, president of the Baltimore & Ohio, said the roads are not asking for alms or a bonus or any special consideration. The government is not asked to give the railroads a present. The guaranty was provided because the railroads were required to do business for six months at rates that were admittedly inadequate. The deficits during that period, he said, were due to that fact, to the heavy expenditures necessary to repair the equipment, which was in bad condition, and to the \$200,000,000 or more of back wages which the roads had to pay for the period May 1 to August 31.

The Baltimore & Ohio, he said, has its accounts in such shape now that it could make a settlement with the commission for the amount due except certain items which are indeterminate because claims against the road have not yet been settled. These, he said, would probably be between \$500,000 and \$1,000,000, but there is certainly due the road \$12,000,000 to \$14,000,000 concerning which there is no possible question. This amount should be paid now as a partial payment and the indeterminate amounts adjusted later.

The Baltimore & Ohio owes \$6,000,000 to \$7,000,000 for supplies and has had to practically stop purchases because it cannot see how to pay for them. He had instructed the purchasing agent not to buy any materials without his personal approval. The company is not paying dividends and is not earning its interest. The rates are not compensatory now, he said, but he was hopeful that when business picks up again they will be found to be adequate and said he expected that when conditions become more normal rates can come down again.

#### Situation a Serious Obstacle to Business Welfare

William J. Hobbs, vice-president of the Boston & Maine, said his road owes \$5,000,000, largely overdue, for materials and supplies, including coal; it has owed over \$7,000,000 to other roads for several months, and over \$1,000,000

of its taxes are overdue. "The situation is extremely acute," he said, "and we are at our wits' ends as to how to meet our obligations or as to how we are to get supplies in the future. The situation is a serious obstacle to the welfare of our business community because people with whom we have contracts find it difficult to meet their own obligations."

#### Chairman Clark Explains I. C. C.'s Attitude

Chairman Clark of the Interstate Commerce Commission said the commission had never questioned its power to issue certificates for partial payments until the Secretary of the Treasury declined to honor a certificate of that nature. It only asks authority to issue certificates for amounts due beyond peradventure, so that the government will be amply protected, leaving the balance for later adjustment. The commission has certified advances amounting to \$264,000,000 on applications filed before September 1, leaving approximately \$367,000,000 still unpaid, including some \$32,000,000 to the express company, although the exact amount will be affected by claims still to be presented to the railroads which affect their operating expenses for the guaranty period and by the commission's decision as to the amounts which may be charged for maintenance.

"The guaranty was provided," Chairman Clark said, "because it was obviously impossible for the railroads to earn operating expenses, taxes and fixed charges under the rates and wages, which had been fixed by the government, in effect at the end of federal control. It was provided so the roads, during the six months before the rates could be readjusted, could have the same return they would have received if they had remained under federal control. The commission has no choice as to the exact method but it is of the opinion that legislation should be enacted to provide for the payment of sums clearly due and we see no reason why business principles should not apply here as they do elsewhere where people make partial payments on account."

When Mr. Sims asked if it would be necessary for the commission to make further advances in rates, Mr. Clark said that the rate-making rule of the transportation act does not require any given scale of rates but that the railroads shall receive as nearly as may be a certain sum of money. If rates are advanced too much they would tend to reduce the amount of traffic and consequently the earnings. The commission is not required to advance rates to a point where they will not produce revenue.

#### Effect on Supply Industry

Explained by Frank W. Noxon

Frank W. Noxon, secretary of the Railway Business Association, appeared before the committee on January 15 to explain how the situation is affecting the railway supply industry. He said in part:

"Information began coming to us sometime ago that many railways were holding up accounts due our members and giving as their reason that they could not collect large sums certified as owing to them by the government. The same reason was said to have been given by some roads for not ordering supplies or for requesting manufacturers to delay delivery of goods already ordered.

"Members communicating with us in many cases refrained from stating the amounts overdue them, and in other cases specified the amounts but requested that their names be not published as it might injure them to have their embarrassment become known. It is proper to say, however, that distress attributed to this cause is widespread, that amounts due 60 days or more apparently aggregate several hundred millions and that consequent industrial shutdown and unemployment of labor involve very large numbers of men.

"One large company normally employing in its main works and several subsidiaries many thousand men has fur-

nished us with a comparison of collections now and a year ago, as follows:

"January, 1920, collections, 47 per cent of accounts receivable, indicating a turnover or average collection period of 70 days.

"December, 1920, collections, 23 per cent of accounts receivable, indicating a turnover or average collection period of about 130 days.

"The sales terms of that company are 30 days. On this basis as of December 1 about 66 2/3 per cent of its railroad accounts receivable were overdue. The amount was about \$4,000,000. Accounts due 60 days or more were 40 per cent and totalled \$2,400,000, and accounts due 90 days or more were 12 per cent or \$720,000. The figures quoted are for the parent company. We are informed that a less favorable showing would be reported for the subsidiaries. The interest here referred to sells its appliances to all the railroads throughout the country and its situation may be taken as typical.

"It is clear from what our members tell us that this strain is greatly aggravating their difficulty in keeping labor at work. Many report that they are wholly or partly shut down and others that they fear they soon will be.

#### Tends to Spread Unemployment

"Members advise that they have been obliged to fall back upon their local banks to carry them. This increases the credit strain on the community and tends to spread unemployment. It also costs the borrower interest which he can never recover. Some members say that the railway accounts overdue them equal from a quarter to a third of their capital. A company which does a business of \$15,000,000 a year, half of it with railroads, declares that it now has to provide \$2,000,000 more working capital than a year ago, and each month of laggard railway remittances adds nearly a million to this.

"One result of the tying up of these payments is that those to whom the roads owe money cannot pay cash for materials and so lose the discounts which they are accustomed to earn.

"Some of our members in the South who deal in lumber say that there is hardship among farmers who are accustomed to cut railway ties but find this market largely or wholly closed to them. Postponement and cancellation of orders has piled up ties and other lumber supplies in the hands of dealers."

Mr. Noxon said that if the railroads should receive their guaranty the effect would be much greater than that represented by the amount of money involved, because a large part of it would be paid to companies that have had difficulty in meeting their own bills and would be passed on to many people. It would greatly stimulate new business and assist materially in relieving the business depression. He said the people he represented did not feel that the present depression will be protracted as a result of economic causes, but that it will only be of short duration unless serious mistakes are made. He said he did not ask that novel or indulgent methods be improvised, but merely that the usual business method of paying on account be followed. "We defer to lawyers," he said, "as to the precise method. What we want is that the situation be met. If money is to be borrowed, it should be borrowed by the government, which can get the lowest rate. Thousands of people are now suffering. These companies are doing their utmost to keep the business depression from becoming worse by keeping their organizations together."

#### Short Line Railroad Situation "Most Serious"

Bird M. Robinson, president of the American Short Line Railroad Association, said that the situation among the short line railroads is most serious. If a majority do not

secure some relief in the near future a great many will go into bankruptcy. The money due the railroads under the guaranty provisions, he said, is not a contribution but constitutes funds which the government legally and morally owes them. The short line railroads are in dire need of the funds, Mr. Robinson said.

Mr. Robinson said the Interstate Commerce Commission has interpreted Section 204 to mean that only railroads which had an actual deficit could get the benefit of it, but he hoped that after a hearing the commission could be induced to change its interpretation. Very few of the short lines, he said, have filed their claims with the government for the guaranty period because they have had to do so much work to bring their accounting methods within the requirements of the commission and they had received very little benefit from the loan fund. The commission had allocated \$12,000,000 to the short lines at their request, but so far they have received less than \$1,000,000 from the fund because they are not in a position to obtain loans unless a more liberal attitude as to the security requirements is assumed by the commission.

### Coal Companies Represented

Charles D. Drayton appeared on behalf of several coal companies, to whom railroads owe three and a quarter millions of dollars for fuel, of which two millions became due in December. The coal companies, he said, in turn owe the money for supplies, so that 400 or 500 concerns are interested. They have been unable to obtain further banking accommodations, and if the fund could be paid to the railroads and in turn distributed through the business community it would have a very important effect in relieving the depression.

Otis B. Kent, general solicitor of the Merchants and

proposed that partial payments be made of amounts declared to be certainly due by the Interstate Commerce Commission so that there was no possibility of overpayment. He said that the Secretary of the Treasury seems to think that the railroads are delaying the presentation of their claims. This is not the case, he said. The railroads want their money as soon as they can get it, but there are many items which enter into the accounts which cannot be known at this time. He suggested that provision might be made in the law that the Interstate Commerce Commission shall prescribe a time within which claims must be presented.

Representative Winslow has introduced a new bill to provide that the American Railway Express Company may receive partial payments on account of its guaranty. A bill has also been introduced in the Senate by Senator Townsend to accomplish the same purpose as the Winslow bill, that is, to authorize the Secretary of the Treasury to honor certificates for partial payments.

## Operating Statistics for November

WASHINGTON, D. C.

THE NET TON MILES of freight handled by the railroads in November aggregated 37,458,624,000, according to the monthly summary compiled by the Bureau of Railway Economics. This was approximately 5,000,000,000 less than the total for October, but was about 5,000,000,000 more than that for November, 1919, when the coal strike was in progress, 2,000,000,000 more than that for November, 1918, and 1,000,000,000 more than that for November, 1917.

The average mileage per car per day for November was 26.8, which was greater than that for November of the three

Region	Average miles of road operated	Net ton-miles (thousands)	Freight car-miles (thousands)		Freight cars on line daily		Efficiency ratios

Miners Transportation Company, asked that Section 209 be amended to apply to his company so that it might receive the same guaranty as the railroad-controlled water lines and the other coastwise lines that were relinquished before the end of federal control.

### A Concluding Statement by Mr. Thom

Mr. Thom made a concluding statement to reply in brief to the letter of the Secretary of the Treasury. He denied that the provisions of the Winslow bill would upset the time-honored methods of the Treasury Department. He made the point that Congress has made the Interstate Commerce Commission the auditing body for the guaranty payments on the ground that it is the most expert authority on railroad accounting. The Treasury Department had referred the certificates to its auditor, who had held that the Treasury should not honor the certificates, not after an audit of the accounts, but on a construction of the law. He said that in several other instances Congress has prescribed a method of audit independent of that of the Treasury department and that where Congress has provided some other method of audit the accounts need not be further audited by the Treasury department. He pointed out that it was only

preceding years, but was less than the average made in August, September or October, 1920. The average carload, however, established a new record, 30.5 tons. The best previous record for the year was 30.1 tons in September. The Railroad Administration had reported an average of 30.4 in August, 1918.

STOCK DIVIDENDS aggregating \$775,875,932 in par value have been declared since the United States Supreme Court handed down its decision last March that stock dividends are not taxable.

THE WOOD OF THE MANGROVE TREE which is found in French Guiana, is considered by the French as a wood that will not rot. All exposure and efforts to break down its fiber in four years' experiments by the French railway service, have been useless. The grain of the wood is so close as to practically exclude all moisture. Its density is placed at 110, as against 40 for fir and 70 for oak. In addition to this closeness of fiber the mangrove has a large amount of tanning in its composition. This protects it from insects and such blights as mold and damp. While not as brittle as oak, it has twice the resistance to flexion and has about the same potency against crushing and twisting.

The Reconstructed Consolidation

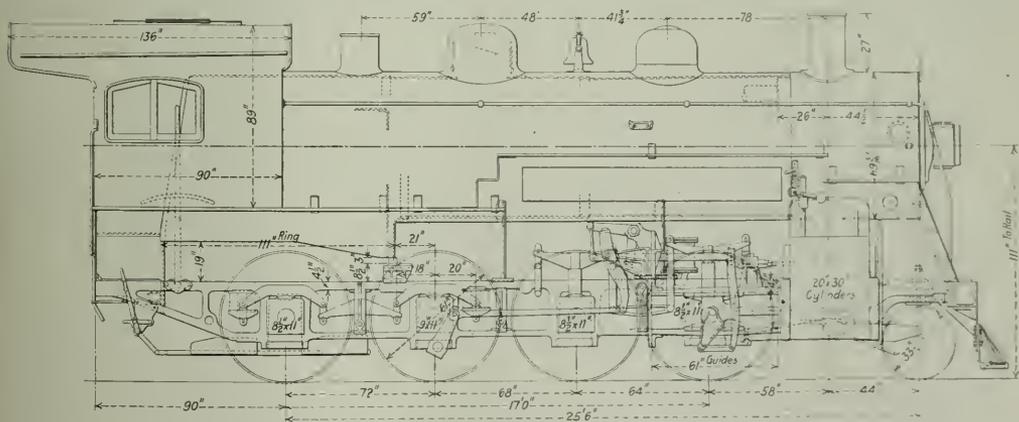

## Practical Reconstruction of Old Locomotives\*

One of the Most Obvious Steps Contributing to More Intensive  
Operation of Motive Power

THE PROBLEM OF ENLARGING the capacity of motive power to meet the ever increasing traffic demands is universal, but the railroads are very rapidly approaching the time when the mere addition of new locomotives will not suffice. It is first necessary for the railroads to get the utmost service out of every locomotive they have. This phase of the subject has already

immediate and obvious solution to a given problem; to neglect the full utilization of what we have, before we ask for more. So it is with locomotives, and many railroads that are perpetually struggling with the financing of locomotive purchases are neglecting the latent possibilities in the power which they have.

One of the reasons why railroads have overlooked the full

Up-to-Date Consolidation Reconstructed from a Cross-Compound Locomotive

been touched upon in articles which the *Railway Age* has published in regard to the locomotive terminals and it will be dealt with at greater length in a subsequent article. The next step must be that of raising the capacity and efficiency of every existing locomotive to the highest pitch. It is a very human inclination to overlook the most

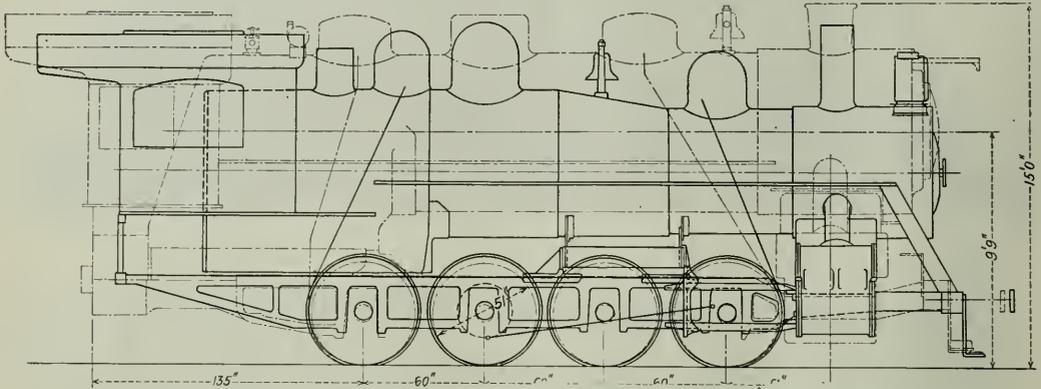

development and utilization of existing locomotives is that they have permitted the very department responsible for this development to go into a partial eclipse. Thus decisions relating to new locomotive details and the disposition of old locomotives are often made by men who are not thoroughly familiar with mechanical matters.

If there is any doubt as to what the mechanical department can accomplish with existing power a survey of what

\* The first of a series of articles which the *Railway Age* is planning to publish dealing with the problem of intensive motive power management.

is being done in this direction on a few railroads will prove convincing. The description that follows relates to an important work that is being executed under the direction of the mechanical department of the Boston & Maine. It is not claimed that what has been accomplished on this railroad has not been duplicated elsewhere nor that the mechanical department of this railroad occupies a more enviable position than elsewhere, but the old locomotive problem is an

The motive power problem on the Boston & Maine differs from that of many railroads on account of a large mileage of secondary or branch lines on which there is no occasion to operate very heavy locomotives even if the roadbed and structures would permit. A glance at the map of this railroad reveals a complex network of lines, but aside from a few main freight and passenger arteries, these lines afford no opportunities for a reduction in operating expenses by the

View of Proposed Reconstructed Eight-wheel Switcher Compared with the Standard Eight-wheel Switcher

important one with the Boston & Maine and fortunately the good judgment of the mechanical department has been largely relied upon in the solution of this problem.

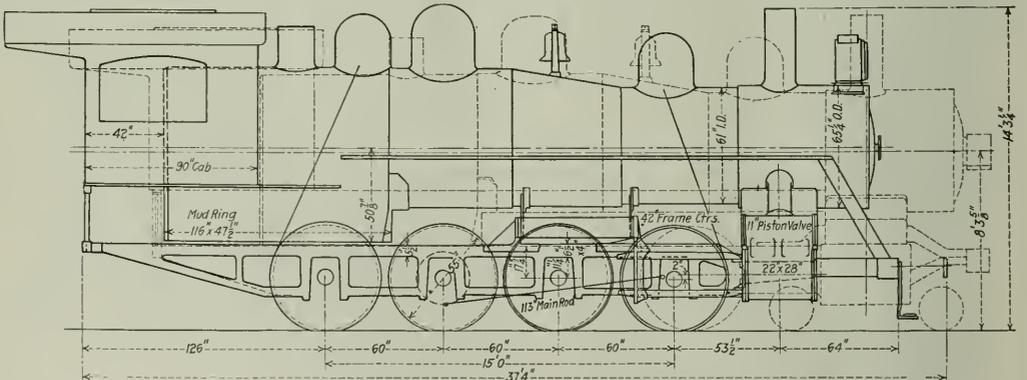

**What the Mechanical Department Can Do**

In a paper on the subject of increasing the capacity of old locomotives, C. B. Smith, mechanical engineer of the Boston & Maine, recently outlined to the American Society of Mechanical Engineers some of the broad principles ap-

introduction of new and heavier locomotives. But where the motive power cannot be increased in size there is still the opportunity to save in operating expenses by the introduction of more economical locomotives and to reduce maintenance costs by improving the design of motive power.

**Situation on the Boston & Maine**

There were two ways in which this could be accomplished on the Boston & Maine. The replacement of old locomotives

Eight-wheel Switcher to Be Reconstructed from Twelve-wheel Locomotive (shown in broken outline)

plying to the reconstruction of old locomotives but did not outline the extent to which this work has progressed on the railroad with which he is connected. Some idea as to the breadth of this undertaking may be inferred from the statement that the conversion of more than 250 locomotives was originally contemplated and that nearly 100 of these have now been raised to a standard of efficiency that compares favorably with the most modern power.

with new locomotives, modern in design and equipment, would have effected the desired result so far as the operating and maintenance results were concerned but would have added considerably to the fixed charges which have long been a serious problem with New England railroads. On the other hand the reconstruction of many existing locomotives afforded the same opportunity for reducing operating and maintenance costs and it was found that this could not

only be accomplished with less money than required by an investment in new locomotives but in this way the problem of the old locomotive, uneconomical and difficult to maintain, was disposed of.

**Problem of the Old Locomotive**

Every railroad has its old locomotive problem and many have in a measure done what the Boston & Maine is doing; but for those railroads with which the old locomotive, relegated to branch line service, is still a white elephant, the following outline of the locomotive reconstruction work undertaken on the Boston & Maine should prove helpful. The reconstruction program of that road has included principally the saturated steam Consolidation type locomotives purchased in 1911 under the direction of the New Haven management, and locomotives of the same class acquired prior to that date.

In all, approximately 150 Consolidation and 40 Pacific type locomotives are involved. Subsequently, the Boston & Maine purchased locomotives of the same type and practically the same weight but equipped with superheaters and other modern appliances. These locomotives have proved to be ideal for many divisions of the railroad and the first step towards reconstruction was obviously in the direction of equipping the locomotives purchased in 1911 with superheaters which is all that is necessary to raise their efficiency and capacity to the standard of the more recent Consolidation and Pacific type locomotives.

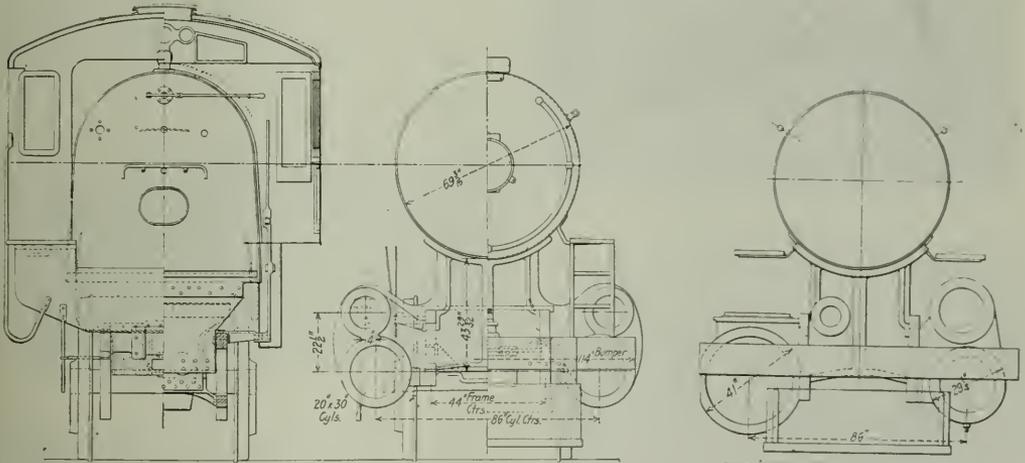

The next step was gradually to extend the application of superheaters to the older Consolidation type locomotives of which there were 110 susceptible to reconstruction. These

the conversion of 10 Cross-compounds with cylinders 22 in. and 35 in. in diameter and 32 in. stroke into modern single expansion, superheater locomotives. The principal dimensions of the original and the reconstructed locomotive are given together with the corresponding dimensions of the more modern Consolidation locomotives which were the first to be constructed.

Flues...	2,717 sq. ft.	1,380 sq. ft.	2,986 sq. ft.	1,567 sq. ft.
Firebox...	143 sq. ft.	143 sq. ft.	180 sq. ft.	172 sq. ft.
Arch tubes...	143 sq. ft.	143 sq. ft.	25 sq. ft.	25 sq. ft.
Total...	2,860 sq. ft.	2,060 sq. ft.	3,189 sq. ft.	1,833 sq. ft.
Superheater...	431 sq. ft.	431 sq. ft.	591 sq. ft.	591 sq. ft.

It can easily be imagined just how unsatisfactory a saturated steam cross-compound Consolidation type locomotive

Sections of the Original Cross Compound Consolidation (right) and Reconstructed Consolidation (centre and left)

locomotives, which have been appropriately referred to as being of the "early-modern" design, all have over 30,000 lb. tractive power but lack the refinements that are now recognized as essential to efficiency and capacity. They are arranged in six groups differing in design, according to the date purchased. As the older designs were encountered, it was found necessary to broaden the work of reconstruction so as to include many changes in addition to the application of superheaters.

**Reconstruction of Consolidation Type Locomotives**

The most interesting development in connection with the reconstruction of the Consolidation type locomotives involved

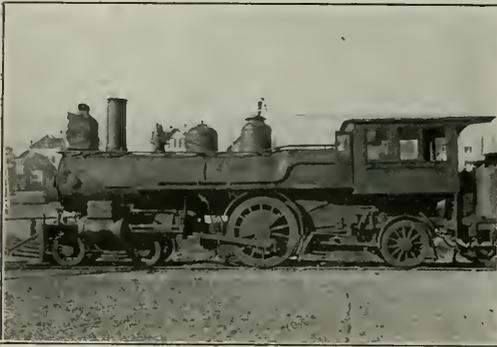

of these dimensions would prove under modern conditions both from an operating and maintenance standpoint. But it will be observed from the dimensions and drawings of the reconstructed locomotive that this locomotive now compares favorably with the more modern Consolidation engines. The work of reconstructing six of these old locomotives was recently completed at the Schenectady works of the American Locomotive Company and the cost to the railroad was less than half of what new locomotives of similar weight and capacity would have cost.

In the execution of this work, it has been the policy of the Boston & Maine to regard one locomotive as a standard to which older locomotives would be made to conform. In

the case of the Consolidation locomotives, those purchased in 1913 and at a later date were regarded as a standard for efficiency to which the locomotives of the same type acquired in 1911 and prior to that date were made to conform. Having decided upon a standard, the locomotives which required the least alteration were first taken in hand. With the Pacific type locomotives and some of the Consolidations, the installation of superheaters alone sufficed to bring these locomotives up to the desired standard. This has involved a regular program of superheater installations for old locomotives which is still actively under way.

#### Reconstruction of Other Locomotives

But as the work on locomotives most susceptible to improvement is nearing completion, the reconstruction of types that involve considerable changes is under consideration. The most interesting example that can be cited in this connection is the projected reconstruction of 18, Twelve-wheel type freight locomotives into Eight-wheel switchers. A diagram submitted in connection with this article not only shows the character of the reconstruction work involved but indicates an interesting similarity between the proposed Eight-wheel switcher and the standard locomotive of the same type developed under the direction of the Railroad

An Old B. & M. Locomotive with Polygonal Faced Driving Wheels Designed to Increase Adhesion (Now Converted Into Standard Eight-wheel Passenger Locomotive)

Administration. This diagram also illustrates the manner in which the wheel loads have been re-distributed. The principal items entering into the reconstruction of these locomotives will be new frames which will be slightly heavier in section and new cylinders that will be correctly proportioned in accordance with the new design which will take into account the installation of a superheater.

It is anticipated that the new Eight-wheel switcher will prove a very useful and economical locomotive, whereas the old Twelve-wheel locomotives have demonstrated the reverse and have proved very extravagant in maintenance costs.

Another interesting phase of this work is presented by a large number of small Eight-wheel passenger locomotives which from a capacity standpoint are entirely adequate for the branch line service in which they are engaged but are both uneconomical in operation and maintenance. The policy with respect to all of these locomotives having 18 in. by 24 in. cylinders, or larger, is to replace the old crown-bar boilers with new radial stayed boilers somewhat larger in dimensions and equipped with superheaters.

THE NASHVILLE BOARD OF TRANSPORTATION TRUSTEES has adopted resolutions urging the sale of the Tennessee Central Railroad.

## Pennsylvania Joint Reviewing Committee

THE NEW AGREEMENT between the officers of the Pennsylvania Railroad System and representatives of its train service employees, which was described in the *Railway Age* of January 7, page 106, was completed at a meeting in Columbus, Ohio, on January 13, when members of the joint reviewing committee, representing the whole of the railroad system, were chosen. The chairman is R. V. Massey and the vice-chairman H. R. Karns. It was voted to have a new election for these officers every six months so that each office should be held, in turn, by a representative of the management and a representative of the employees. The permanent headquarters of this committee will be at Pittsburgh, Pa., and regular meetings will be held there on the second Thursday of each month.

The names of the members of the joint committee are given below. It will be seen that each of the four regions of the System is represented. On the part of the employees there are nine members, this because the locomotive engineers have three general chairmen on the Pennsylvania System, instead of two as in the case of the other brotherhood; but it is arranged that one of the enginemen shall drop out whenever a vote is taken, thus preserving the equality of voting power, eight on each side. Not less than a two-thirds vote is required to decide any question presented. Each of the employee representatives is a general chairman of the union to which he belongs. The names are as follows:

#### MANAGEMENT REPRESENTATIVES.

R. V. Massey, Philadelphia, assistant general manager, Eastern region; H. A. Enochs, Philadelphia, superintendent labor and wage bureau, Eastern region; N. W. Smith, Pittsburgh, assistant general manager, Central region; H. K. Brady, Pittsburgh, superintendent labor and wage bureau, Central region; W. M. Wardrop, Grand Rapids, Mich., general superintendent, Michigan division; W. W. Burrell, Chicago, superintendent labor and wage bureau, Northwestern region; W. C. Downing, Indianapolis, general superintendent, Indiana division; E. B. Dithridge, St. Louis, assistant to general manager, Southwestern region.

#### EMPLOYEE REPRESENTATIVES.

H. R. Karns, Pittsburgh, Brotherhood of Locomotive Engineers; William Park, Sunbury, Pa., Brotherhood of Locomotive Engineers; H. W. Fleming, Pittsburgh, Brotherhood of Locomotive Engineers; S. C. Coven, Philadelphia, Order of Railway Conductors; W. T. Saul, Pittsburgh, Order of Railway Conductors; H. E. Core, Philadelphia, Brotherhood of Locomotive Firemen and Enginemen; D. D. Miller, Pittsburgh, Brotherhood of Locomotive Firemen and Enginemen; R. A. Knoff, Pittsburgh, Brotherhood of Railroad Trainmen; C. E. Musser, Philadelphia, Brotherhood of Railroad Trainmen.

Under the plan, as adopted, there will be "Men and Management" meetings once a month on every division; another for every grand division and also one for each of the four general operating regions.

## The Chilean State Railways an Open Market

American Supply Exporters Compete on Equal Terms Owing to  
Lack of Foreign Domination

Part II

By John P. Risque

**I**N PART I of the discussion of the Chilean State Railways, which appeared in the *Railway Age* of last week, a general outline of the railway situation in the country was given, together with the opinion of the correspondent concerning the possibilities of the government lines as a market for American railway supplies. The second part of this article is in-

previously pointed out the Longitudinal Norte, in connection with British interests in control of the connecting Nitrate Railways, constitutes what may be called a local zone. These lines are almost wholly engaged in carrying nitrate from inland fields to the several ports on the coast. The Red Central Norte is in the same category, the only difference being that with no nitrate fields to provide it with profitable traffic, it, in comparison with the remunerative activities of the Longitudinal Norte, is nearly starved to death. This brings us to Valparaiso. Looking back over the ground just traversed and considering it for temporary convenience as an uninterrupted system, it is pertinent to point out the existence of another factor which has rendered the northern section of the Chilean government lines almost impotent as far

Bella Vista Station, Valparaiso

A German Compound Ten-Wheeler in the New Shops at San Bernardo

tended to give the reader a more complete idea of the size, importance and peculiarities of the Chilean state railways. Reference to the map published with Part I of this article will probably be helpful.

The government railways of Chile can be most easily visualized by dividing them into two sections. The first of these embraces the lines north of the La Calera, Aconagua (near Valparaiso), and the second takes in all the government lines south of La Calera. The northern section is composed of two systems: the Longitudinal Norte which extends from Pintados, Tarapaca, to Pueblo Hundido, Atacama, and the Red Central Norte which extends from Pueblo Hundido to La Calera. The southern section (south of Valparaiso) is known as the Central Sur. The northern section may appear to be an important traffic artery from north to south. In reality, it is nothing of the sort. As has been

as the long haul is concerned. This factor is the existence of several lines of efficiently run steamships which transact practically all of the local as well as the through business between the numerous ports on the coast as well as the transportation of nitrates to foreign markets.

From a standpoint of military strategy the usefulness of the northern lines, in connection with the lines south of

Valparaiso, would show itself of tremendous value in making possible the relatively quick mobilization of troops along the entire coast line, and it is even claimed that those lines were originally conceived with that sole idea in view.

On the Red Central Norte some very heavy grades are encountered which necessitate the use of rack rail, of which there is about 28 miles in use on grades as heavy as 6 per cent. There are some long tunnels on the route, where the line traverses country that has presented severe obstacles to the builders.

The Central Sur system of the state railways, 744 miles long, is more popularly known as "Chile's main line," because of the density of traffic arising from the concentration of population in the districts of Valparaiso and Santiago, as well as the appearance of the fast and good sized trains that run on its 5 ft. 6 in. track. This system has numerous branches, prominent among which are those running to San Antonio, Talcahuano, Concepcion, Curanilahue, Valdivia, Constitucion and other points and, last but not least, the busy branch from Llai-Llai, on the main line between Valparaiso and Santiago, to Los Andes, where passengers en route to Argentina by way of the celebrated Transandine Railway, spend the night whether they wish to or not. The Central Sur is a very busy line with both passengers and freight, particularly between Valparaiso, Santiago and Concepcion, to which points fast and frequent express trains are run daily over its broad gage track.

Rolling stock on all of the Chilean lines presents a picture that is almost as varied as the scenery. Car characteristics on both narrow and broad gage lines follow our own designs. On the cars of the broad gage lines, in and about Valparaiso and Santiago, can be found the names of American manufacturers. Freight cars seem to hail from everywhere. Some are four-wheel and some eight-wheel styles and they are built of wood, pressed steel, or steel skeletons with wooden linings. Chain and hook couplers are generally used but here and there on some new equipment—and very generally on the wide gage passenger cars—automatic couplers appear. These are indications of the Chilean railroaders' attitude of mind, for they are thinking seriously of standardization and modern methods, and progress along these lines is being made regularly.

Locomotives are of an infinite variety of types and sizes and sufficiently different one from another as to discourage the most ambitious advocate of standardization known. They are of all sizes and makes—French, German, English, American. Chile's collection of motive power is comparable to a permanent international locomotive exposition; but the varied assortment makes good advertising for the manufacturers, because all the engines seem to be running "square." Their appearance, too, is interesting; some have bright red driving wheels and many brass trimmings and others fewer decorations, but all of them are spick and span.

Valparaiso's congested and ancient shops will soon be relieved by the opening of the new and elaborate repair plant at San Bernardo, a suburb within 10 miles of Santiago where it is planned to take care of all the repairs in that section and to manufacture everything possible on the job. The buildings for these shops have been completed and are being rapidly equipped with the American machinery, the deliveries of which were interfered with during the war. The shops are expected to be in operation by the early part of this year. Track conditions along the Longitudinal Norte and the Red Central Norte are fair; on the Central Sur, excellent.

After Uncle Sam's recent experience with government operated railways, almost any American taking the fast run from Valparaiso to Santiago will pause to admire the Chileans' success with state ownership and operation. Evidence of the Chileans' determination to stop at nothing short of bringing their lines to a state as nearly perfect as possible is shown by the railway officers' intense interest in new meth-

ods which vitally affect the welfare of the lines. A general installation of signals is on the program, together with other improvements. In this connection it is worth while mentioning that representatives of the Chilean State Railways have maintained headquarters in the United States for three years and that there are 15 young Chileans engaged in railway work here, and that, furthermore, the Chilean government plans to send 10 men here annually to study our roads.

In the library of the state railway headquarters in Santiago, can be found "estudios," studies of almost every conceivable method of operation, finance and equipment of lines; some are studies of various organizations, some of proposed extensions and new lines, some are histories of certain divisions. In fact, there seems to be, neatly bound and easily available for the investigator, a volume on pretty nearly any subject of importance to efficient railway operation. One of the most interesting and typical of these is "Folleto Num. 3," bearing the mark of the state railways printing plant and dated 1912. It gives the details of the various systems of administrative organizations of railways in use in the principal countries of the world. Another volume of 114 pages sets forth in in-

Las Palmas Tunnel, Near Valparaiso, on the Valparaiso-Santiago Line

teresting detail the details of planning, surveying, constructing, and equipping the Arica-LaPaz Railway. The work is illustrated by photographs and outline drawings of locomotives, stations and shops along the line. Still another volume deals with the intricacies of car lighting equipments.

Reference to the subject of nitrate, Chile's thermometer of financial temperature, is timely here. On June 1, 1920, encouraging reports from Santiago stated that the Nitrate Producers' Association had made it known officially that the total tonnage of that commodity exported for the year had reached 95,000 tons, as compared to 55,000 tons the preceding year, and added that the prosperity of that industry means a solid financial situation for the government, an abundance of work and the increased welfare of the community.

It will probably be remembered that in 1919 the government of Chile sent a commission to the United States to seek a loan of about \$30,000,000 with which it proposed to make additions to its railway equipment, but that the commission, empowered to negotiate at 5 per cent, made no progress when it was found impossible to float the loan at less than 6 per cent. When Chile finally succeeds in obtaining the much needed funds—and the improved nitrate situation encourages hope in that direction—the long delayed plans of her railway administration will take definite shape.

The third and concluding part of the discussion of the railways of Chile will appear in an early issue of the *Railway Age*.

# How "National Agreements" Cause Huge Wastes

Multitude of Examples Cited Before Labor Board Show  
How Employees Get Millions for Work Not Done

THAT THE RAILROADS of the country are fighting for the right to operate their properties economically and efficiently in accord with the specific requirement of the Transportation Act and demand of the public has been brought out during the past week in the hearings before the Railroad Labor Board at Chicago on the demand of the various railway brotherhoods for continuation of the National Agreements adopted under government control and standardizing the working conditions of railway employees throughout the country.

The carriers, represented by E. T. Whiter, chairman of the Conference Committee of Managers of the Association of Railway Executives, are opposing the continuation of these National Agreements solely on the ground that the most economical and efficient operation is impossible so long as they exist. Mr. Whiter has emphasized several times during the presentation of his testimony that a fight is not being made upon agreements between railroads and their employees but upon agreements which are national in scope and therefore do not and cannot allow for widely varying local conditions which make their strict and uniform interpretation and application often produce results which are outrageous or ludicrous. They result in a great many cases, in seriously impairing the efficiency of working forces and in causing large amounts of money to be paid to employees for work which is not done.

Mr. Whiter's presentation on behalf of the carriers has thus far dealt exclusively with the carriers' objections to the agreement with the railway shop crafts, the reasons for their opposition, and the manner in which the application of each rule operates to impair efficiency and destroy economy. The bearing this case has on (1) the transportation rates and (2) the relations between employers and employees in other industries has, therefore, not been emphasized. However, as the real issues in the fight are being brought to light, there are indications that business men are beginning to see the probable indirect effect on their own fields of the application of these agreements in the railroad field. For instance, if all employers were forced to pay their employees a bonus of one hour's pay each week for checking in and out on their own time, as the shops crafts agreement forces the railways to, the economy of operation of every industry would be impaired. Furthermore, under the terms of the Transportation Act the public is required to pay rates sufficiently high to cover operating expenses and allow a fair return on the value of the carrier's property. This means that the public must pay for the unnecessary expense caused by these national rules.

The ridiculous and outrageous results the application of the National Agreements is constantly causing have been illustrated by Mr. Whiter by a multitude of specific examples, some of which were given last week and others of which are the following:

One of the rules in the shop crafts agreement requires that when employees are called or required to return to work, they will be allowed 5 hours' pay for 3 hours and 20 minutes' service or less. The Norfolk & Western carefully figured the actual cost of the punitive payments made under this rule on its line and found that in the first eight months of 1920 they totaled \$42,142.44. During this period the company made 22,758 "calls" (requests for additional work) upon its shop employees. In response to these "calls" the employees worked 49,718.9 hours and were paid for 113,756 hours of service. A further check disclosed that 94.5 per cent of these

"calls" were merely continuous service, the requirement to finish tasks already begun and which it was in accord with efficient and economical practice to continue to completion.

A machinist who had been employed by the Baltimore & Ohio was taken out of service after a medical examination had revealed the fact that the employee was afflicted with a communicable disease. The organization of which he was a member contended that his dismissal was in violation of one of the rules of the National Agreement, and after some controversy the road was forced to pay the employee \$1,155.30 regardless of the fact that the employee was in the meantime employed in outside industries, earning in one position alone, \$532.20.

The Chicago & Eastern Illinois discharged a locomotive inspector for failure to report defects in accordance with the Interstate Commerce Commission's rules and instructions. A controversy ensued, the employees maintaining that one of the rules of the National Agreement had been violated in discharging the inspector. As a result of this controversy it was ruled that he should be reinstated and paid for time lost. The Chicago & Eastern Illinois was forced to pay him \$1,612.31, although it was known that the man was working for a coal company while out of the employ of the railway.

Another of the rules of the shop crafts agreement provides that when employees are required to check in and out on their own time they shall be paid one hour extra at the close of each week regardless of the number of hours worked during the week. The application of this rule during the first six months of 1920 cost the railroads \$6,445,658.73. This total includes the hourly rate increases provided by the Board's recent wage award for but two months, May and June. Therefore, the total would be increased during future periods to the extent of the increases awarded shop employees for four of the six months. This would make the total annual cost to the railroads of this one rule more than \$14,500,000.

The Michigan Central is now faced with a claim involving nearly \$2,000.00 in pay for a carman's helper who had been straightening bolts. The brotherhood claimed that the man was entitled to a blacksmith's rating and pay because he had been doing work which is listed in the National Agreement as blacksmith's work. If the brotherhood's contention is carried, it will mean that reclamation of work of this character will have to be discontinued because the cost would be prohibitive.

Traffic demands on the Long Island require the operation of certain sub-stations 16 to 18 hours of the 24, commencing at 5:30 a. m. Prior to the execution of the shop crafts agreement the first shift at these sub-stations started work at various times between 5:30 a. m. and 7:00 a. m. and each shift worked eight continuous hours, or longer if required, time and one-half being allowed for more than eight hours work. Under present conditions the men must be paid a minimum of five hours' pay for 3 hours and 20 minutes' work or less in advance of 7:00 a. m. As a result the Long Island is paying \$4.25 per man to operate each sub-station one-half hour from 6:30 a. m. to 7:00 a. m.

On the Midland Valley after December 26, 1918, three coach repair men, the first man working from 6:00 a. m. to 2:00 p. m.; the second working from 2:00 p. m. to 10:00 p. m., and the third working from 10:00 p. m. to 6:00 a. m., were employed by the road at one of its terminals. Under the terms of the National Agreement the road was later required to pay each of these employees five hours' pay for

the work each performed in advance of the starting time provided by the agreement, notwithstanding the fact that only eight hours of actual service was required of each shift. In other words, because the starting time of each of the shifts was one hour in advance of the starting time set by the agreement it was necessary for the road to pay each employee 13 hours' pay for but eight hours of actual service.

A mechanic employed by the Cincinnati, Indianapolis & Western was recently required to make a trip to an outside terminal. The train arrived there at 2:10 p. m. and his actual work required about one hour. The man was relieved before 4:00 p. m. However, it was necessary for him to remain at the terminal all night as there was no returning train until 5:00 a. m. the following morning. After sleeping all night and upon his return to his home station he requested the payment of \$34.84 for the one hour of actual work in accordance with the rules of the National Agreement.

At the close of a regular working day of eight hours, the testing of an engine on the Chicago, St. Paul, Minneapolis & Omaha, was not completed. This work would have been completed in the following hour but a leak developed which necessitated some additional work, and consequently the task was not completed until 30 minutes past the ninth hour. Under the provisions of the National Agreement this resulted in paying six men five hours' pay each for one-half hour's work.

On the same road it became necessary to send a sheet metal worker from Hudson, Minn., to Minneapolis to repair some water tanks. In order to reach Minneapolis early enough to make these repairs he left Hudson at 6:30 a. m. The regular starting time for this employee under the terms of the National Agreement is 7:00 a. m. Consequently he submitted a claim for five hours' pay for the 30 minutes from 6:30 a. m. to 7:00 a. m., a large part of which was spent on the train.

The Cincinnati, Indianapolis & Western recently reported that on two different occasions employees have been called for work outside of their regular hours and the call cancelled before they left home. Acting in accordance with an interpretation of the shop crafts agreement these employees requested the payment of five hours' pay for being called.

The Atchison, Topeka & Santa Fe in June conducted a test in its shops at Shopton, Iowa, and found that there were 34 cases where employees worked over the ninth consecutive hour to complete necessary work to put engines in service. The actual time worked in all 34 cases was 46.2 hours, and for this work the men were paid for 170 hours, making a punitive payment for 123.8 hours. The same road has reported that there have been many cases where, on account of a second shift man not reporting for work, a first shift man has been requested to continue work in the former's place. One man who performed such work on the second shift recently claimed five hours' pay for each job performed during the second shift. This would mean that the employee would be paid, in addition to his regular hourly pay, for 20 hours of work for being requested to perform four different tasks in the second shift.

At Strong City, Kansas, a Santa Fe train left at an hour that necessitated having a carman start his work at 6:45 a. m., or 15 minutes in advance of the time for the remainder of the carmen to commence their day. Under the terms of the National Agreement the road was compelled to pay five hours' pay per day for this 15 minutes of service, or \$90.50 for a total of 7½ hours' work per month. It was impossible to effect any other arrangement without placing an entire night force in service and it was therefore necessary to change the departing time of this train.

The Norfolk & Western recently had a case where a machinist, whose regular reporting time was 7:00 a. m., was at the shop 15 minutes early. An engine which was ready to leave the terminal, had a broken water glass. The machinist

was requested to apply a new water glass, and for this 15 minutes of initial overtime the company was required to pay for 5 hours' work.

One of the rules of the shop crafts agreement provides that when employees are changed from one shift to another they will be paid overtime rates for the first shift of each change. This rule, according to the Atchison, Topeka & Santa Fe, cost, in September, 1920, on the western district of its eastern lines alone, \$593.98, for which no service of any kind was received. As a matter of fact, the changing of employees from one shift to another in the exercise of their seniority rights caused a reduction in efficiency and lowered production.

A car repairer employed by the Norfolk & Western recently requested a transfer from the third shift to the first shift. The railroad contended that the transfer being made upon the employee's request he was not entitled to the overtime allowed by the National Agreement. This contention was overruled and it was necessary to pay this employee time and one-half for the entire first day of the new shift.

A steel car repairer in the freight car department of the Atlantic Coast Line at Waycross, Ga., received in that capacity 67 cents per hour. Having had some previous experience in repairing steel passenger cars and locomotive tender frames he had been called from time to time to assist in this work when the regularly assigned passenger repair men were unable to keep up with the requirements of the work. When so called this repairer had been paid at the rate of 72 cents per hour for each hour that he worked on steel passenger cars or locomotive tender frames. The brotherhood of which he is a member contended that under the National Agreement, he was entitled to the permanent rate of 72 cents per hour regardless of the particular class of work upon which he is engaged. The railroad contended that the employee had been paid the rate applicable to each class of work for the actual number of hours of service rendered, and that he had therefore been adequately compensated for his services. Although it was pointed out that the assistance of this man in working on passenger equipment and locomotive tender frames was required only in emergency cases, it was ruled that he should, according to the rules of the National Agreement, be paid the higher rate continuously because of the emergency work which he had performed.

The Chicago Great Western, because of a train delay recently, was not able to distribute its pay checks until 20 minutes after the ending of the first shift at one of its shops. The employees who were forced to wait the 20 minutes for their pay checks requested, under certain rules in the National Agreement, overtime for all of the time detained after the completion of their regular assignments.

A boilermaker employed by the St. Louis-San Francisco left the service of that road on October 31, 1919. He did not receive his pay check until November 7 because of poor mail service. Acting under one of the provisions of the shop crafts agreement, he demanded and was awarded pay for six out of the eight days after he quit work that elapsed before he received his check.

One of the rules of the shop crafts agreement provides that "should an employee be assigned temporarily to fill the place of a foreman he will be paid his own rate, straight time for straight time hours and overtime for overtime hours, if greater than the foreman's rate." A later interpretation of this rule provides that when employees are temporarily filling a foreman's position they will work the same number of hours as the foreman whose place they are filling is required to work and will be paid for overtime accordingly. The Atchison, Topeka & Santa Fe requested a machinist to take the place of a foreman who was off duty on account of sickness for 77 days. The regular foreman's salary was \$265 a month and during the 77 days in question he would have earned \$664.53. The amount paid the machinist's substitute at his

hourly rates during this period was \$921.30, an increase of \$256.77 over the foreman's regular rate for a period of 77 days.

Under this same interpretation it was necessary for the Michigan Central to pay one of its machinists, whose regular tour of duty is from 8:00 a. m. to 4:00 p. m., and who was temporarily to relieve a foreman whose regular tour of duty was from 7:00 a. m. to 6:00 p. m., five hours for the work he performed in filling the foreman's place between 7:00 a. m. and 8:00 a. m., the machinist's regular rate of 72 cents per hour for the time worked from 8:00 a. m. to 4:00 p. m., time and one-half for the hour between 4:00 p. m. and 5:00 p. m., and five hours for the hour between 5:00 p. m. and 6:00 p. m. In other words, the mechanic was paid 19½ hours for 11 hours of service and his daily earnings averaged about \$5 per day more than the average daily earnings of the man whose place he was filling regardless of the fact that he could not, because of lack of experience, fill the position with the same degree of efficiency as the regular foreman.

So far all of these examples of the manner in which the National Agreements work out in actual practice have dealt with their interference with operating economy. It is also true that other of the rules operate to seriously interfere with the efficiency of working forces. For example the following cases have been reported:

The Norfolk & Western recently advertised a stoker repair job which was requested by a machinist who had been operating a lathe for a number of years but who knew nothing of stoker repair work. He was assigned to the new work, continuing until he had become fairly efficient. Soon after he returned to the lathe work when a vacancy occurred. In the meantime the railroad suffered by not receiving the amount of work that it rightfully expected from a capable stoker repair man and an efficient lathe man.

The Virginian Railway discharged a car repairer in February, 1919. When his turn came to be reemployed in accord with his seniority, the company refused to reinstate him on the ground that he was afflicted with very poor eyesight and was therefore in constant danger in the shops. The man's brotherhood took up his case and obtained a ruling under one of the clauses of the shop crafts agreement that, inasmuch as he was not advised at the time of his discharge that his eyesight was defective, he should be reemployed and paid not only for the time lost from the date his seniority would have required his reemployment, but for all of the overtime his shift had worked during this period. The total payment that had to be made under this interpretation for work not done was over \$1,000.

It recently became necessary for the Cincinnati, Indianapolis & Western to reduce forces about 35 per cent because of a decline in business. The employees were informed of this necessity and their shop committee suggested that half of the men be worked for three days and the other half the remaining three days of each week in order that all might be employed and earn enough to live. When the general officers of the brotherhood were informed of this plan it was immediately rejected and the company was forced to make a 35 per cent reduction in the shop force regardless of the fact that they could have reached an agreement with their own men which would have reacted to the men's benefit.

An engine on the El Paso & Southwestern was ready to go to its train recently when it was discovered that a window light was broken in the engine cab. The locomotive engineer insisted that it be replaced. There was no engine carpenter on duty at that time and it was therefore necessary for the foreman to call one, although he could have performed the work in a few minutes. The result was that the train was delayed for one hour and 30 minutes and the employee called

to do the work was paid for five hours time, although the work took only 30 minutes.

At an outlying point on the Buffalo, Rochester & Pittsburgh four inspectors and one foreman are employed. Prior to the execution of the National Agreement the foreman also inspected cars in conjunction with his supervisory duties. Since then this man cannot do any car inspecting himself but must devote his entire day to supervising the work of the other four men; an extravagant, unnecessary and unbusinesslike arrangement.

Section men employed by the Bangor & Aroostook removed some damaged parts of a section motor car and applied them after they had been welded in the company's shop. This led to a dispute and it was ruled that this had been done in violation of the National Agreement and should not be done again even though these cars are scattered all over the road's lines.

Another of the rules in the shop crafts agreement provides that employees serving on shop committees shall be paid for time spent in conferences with company officers. The Atchison, Topeka & Santa Fe was recently requested by a shop committee to conduct an investigation regarding trouble between a car foreman and a car repairer. This investigation extended one hour and 22 minutes beyond the regular tour of duty of one of the committeemen and he accordingly made claim for and was paid six hours and 30 minutes' pay for the extra one hour and 22 minutes which this investigation had taken.

The Chicago, St. Paul, Minneapolis & Omaha recently scrapped an engine at its St. Paul shop. Skilled mechanics were used for the entire work in accord with the provisions of the National Agreement. Machinist helpers and laborers could have performed this work as satisfactorily as mechanics and effected a saving of at least one-third in the cost of labor, in addition to releasing skilled mechanics for more essential service.

As a result of the strict interpretation of one of the rules in the shop crafts agreement the Pere Marquette was recently compelled to pay a total of \$9,363.94 in back pay to four employees because their titles were changed although their work had remained the same.

As stated before, the carriers' fight is against the continuation of National Agreements, and not against agreements between the managers and employees on individual railroads. These examples taken from Mr. Whiter's testimony show the impracticability of economically applying national rules to working conditions of railway employees regardless of the varying conditions under which these employees work.

The testimony presented to the Board from the opening of these hearings on January 10 to January 12, was reported in the *Railway Age* of January 14 (page 199). Subsequently, Mr. Whiter continued the presentation of a mass of evidence and specific cases to show that economical and efficient operation are impossible as long as the Shop Crafts Agreement is continued in effect. Mr. Whiter's testimony regarding this agreement was completed on January 18, following which representatives of several of the larger carriers presented detailed statistics to show that the abolition of the piece work system of pay in railroad shops has resulted in serious decreases in the efficiency of the individual worker and consequently in the output of the shops. A more complete report of this testimony will be included in the next issue of the *Railway Age*.

So far there has been little discussion during any of the Board's hearings. Mr. Whiter has been permitted, by both the brotherhood's representatives and the members of the Board, to continue his testimony without interruption. The character of the evidence and specific cases placed before the Board is shown in the preceding examples which are based entirely upon the testimony already submitted.

# Freight Car Loading

WASHINGTON, D. C.

**T**HE NUMBER OF CARS loaded with revenue freight during the week ended January 8 was 706,413, as compared with 830,673 in the corresponding week of 1920, 723,801 in 1919 and 696,907 in 1918. While the total was greater than for either of the two preceding weeks, which included the Christmas and New Year holidays, it was about 90,000 cars less than for the week ending December 18. The summary as compiled by the Car Service Division of the American Railway Association follows:

## REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts, Comparison of Totals This Year, Last Year, Two Years Ago, for Week Ended Saturday, January 8, 1921

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mdse. L. C. L.	Miscellaneous	Total revenue freight loaded			Received from connections

The freight car surplus for the week ending January 8 had increased to 258,678 cars, of which 171,214 were box cars and 38,722 were coal cars. The shortages reported amounted to only 1,929 cars.

The percentage of freight cars on their home lines, which was so reduced by the pooling of the cars during federal control, has been restored to nearly a normal condition since the business depression has relieved the demand for cars. On January 1, 45.2 per cent of the cars were at home, as compared with only 21.9 per cent on February 29, 1920, when the roads were returned. When the roads were taken over on January 1, 1918, about 44 per cent of the cars were on home lines. On May 1, 1917, the percentage was 52.8.

### Summary of General Conditions

The Car Service Division has issued the following summary of general conditions as of January 12:

**Box Cars.**—Reports show that requirements for box cars are being satisfactorily protected. To stimulate continued progress in the return of cars to home roads, it is important that all concerned co-operate to the fullest possible degree in facilitating the return of cars to owners in anticipation of heavier demands later on.

**Auto Cars.**—Demand for auto cars is being fully met. Cars in excess of requirements should be disposed of in accordance with Car Service Rules. Where loading is available, cars should be forwarded into auto-manufacturing territory in preference, precaution being exercised to avoid loading with cement, flour and other commodities leaving a residue which will damage the finish of autos.

**Stock Cars.**—Practically all requirements for stock cars are being filled.

**Refrigerator Cars.**—Orders for refrigerator cars are being filled currently in all sections. It is anticipated, however, that the demand for refrigerators will be somewhat more active at an early date, making it expedient that cars be handled with despatch. Permission has been given temporarily to load refrigerators with dry freight in direction of the empty movement.

**Open Top Cars.**—The end of the first 15-day period of the new year finds the railroads, with some few isolated exceptions, distributing a full supply of open top cars to all commodities requiring this class of equipment. In fact a virtual surplus exists and a few of the large coal loading lines

are experiencing difficulty in currently absorbing the return movement of empties. The production of bituminous coal is being fully protected so far as car supply is concerned; the limiting factor at this time is a rapidly softening coal market with a relatively reduced demand for transportation facilities. This may be considered an opportune time for an active drive to relocate open cars on the principle of ownership. Some instances of refusals to accept cars in accordance with Car Service Rules have been brought to our attention. Without the unqualified co-operation of all lines in strict observance of the Car Service Rules as they now exist, we cannot hope to make reasonable progress in getting cars back to the home roads. It is manifestly necessary that cars be kept moving without restrictive measures that might militate against the attainment of the desired objective.

**Flat Cars.**—The demand for this particular type of equipment at this time would indicate that the carriers have sufficient supply generally to protect their requirements.

### Seven Embargo Districts

The Car Service Division has issued a circular announcing a reduction in the number of embargo districts from 10 to 7 and a re-grouping of the roads in the districts. The new district headquarters will be at Atlanta, Ga., Boston, Mass., Chicago, Ill., Fort Worth, Texas, Montreal, Que., Philadelphia, Pa., and Winnipeg, Man.

A considerable reduction in force was made by the Car Service Division on January 1. D. E. Spangler, who has been in charge of open-top car distribution, has returned to the Norfolk & Western as general superintendent of transportation.

# Railway Water Treatment Pays Large Returns

Results Obtained on Rock Island Point to Advantage of Investment in Softening Plants

By Paul M. LaBach

Engineer of Water Service, Chicago, Rock Island & Pacific, Chicago

THE ROCK ISLAND SYSTEM serves a territory of which the outlying points are Chicago; Memphis, Tenn.; Fort Worth, Tex.; Santa Rosa, N. M.; Denver, Colo., and Minneapolis, Minn. On its lines there are 412 water stations, or one about every 20 miles. The spacing of these stations is not dependent upon whether they are convenient places to get water, but upon the needs of the locomotives.

The best water supplies are found in Minnesota, Missouri, Arkansas and Louisiana. But even in these states, if wells are resorted to they will frequently give hard water. In addition the surface water usually carries silt for part of

steam except where the exhaust can be utilized for heating or other purposes.

Chemical analyses are made at intervals of all water used by locomotives. Before any prospective supply is used an analysis is first made. A tabulation of these analyses shows that out of 412 sources of supply, 290 furnish water of over 10 grains hardness per gallon. Of the 117 stations which take water from streams, all may be said to carry large quantities of silt part of the year and a number practically all of the year.

## Started in 1904

In 1904 the executive officers became interested in the softening of water by the Porter-Clark process. The first plants built were of the gravity-flow intermittent type. These were followed by the repumping intermittent variety and finally by the continuous type of steel construction. Since its introduction, the continuous type has been used in the majority of cases except where special circumstances have favored the gravity intermittent type. The lack of available funds for this, as well as other construction work, in the last 10 years has prevented any large program being carried out, the policy generally being to pick out the isolated points where the money returns were the greatest at the time. These comparisons were made by multiplying the number of thousands of gallons of water used by the number of pounds incrustants removable per 1,000 gal.

At the present time this has resulted in plants scattered pretty generally over the system and a change in policy has consequently been adopted, the aim being to fill in the "blank" points and thus secure engine districts on which all the water requiring it will be treated. Another point of view has also entered into the subject, that is, the clarifying of water. Muddy water does more damage than is ordinarily appreciated. As mud is readily removed in a softener, the muddy water territories with hard water are to be handled with reference to both the suspended and dissolved solids.

With this object in mind the worst bad water territories (quantity and quality both being considered) naturally divide themselves into two areas, which are somewhat different in character, but of equal importance from an operating point of view. The first of these is on the line extending from Chicago to Valley Junction, Iowa; from Davenport, Iowa, to Trenton, Mo. (between Princeton and Wabash Crossing), and from Bureau, Ill., to Peoria. This is heavy traffic territory in which delays due to locomotive boiler troubles would be of prime importance. As explained in a previous paragraph the water is hard and, in wet weather, the streams carry a large amount of mud.

The second territory referred to extends from Kansas City to Santa Rosa, N. M.; from Herington, Kan., to Fort Worth, Tex., and from Shawnee, Okla., to Sayre. This district is different in character from the first. The water carries somewhat greater quantities of incrustants, but muddy streams are fewer in number. In addition to this the water towards the southwest is higher in the sulphates of lime and magnesia and various alkali salts are present. The result of this is that corrosion and pitting are found. It has been

Water Softening Plant at Armourdale, Kan.

the year at least. In Illinois, Iowa, Nebraska and Kansas the water is either muddy or hard, usually both. In the southwest it is scarce and contains another class of impurities which are known by the general term, "alkali."

In the development of water in this large area many methods have been followed. The easiest is to buy of a municipality, and this is done at 25 per cent of the stations. The balance is handled by company forces. About 50 per cent of the water comes from open or tubular wells, 25 per cent from streams, 10 per cent from impounding reservoirs and the balance from lakes, springs, etc. From these various sources over eight billion gallons are pumped by company forces per year and over one billion gallons are purchased from others. The methods of pumping the water are as varied as the sources of supply. Steam, internal combustion engines, electricity and gravity stations are found. However, the policy of late has been to use other power than

generally known for some years that this trouble is due to electrolytic action and in this case is superinduced by the large amount of sulphates in the water. It is thought that the best method of remedying this will be to have all water in these districts under chemical control. This will give an opportunity to work out such methods as scientific investigation may make available from time to time.

#### Results Obtained

In one year the total amount of water given complete treatment was 1,642,510,000 gal., and the amount given partial treatment with soda ash was 311,460,000 gal.

Computations based on the A. R. E. A. formula of 10 cents saved through the removal of each pound of incrusting solids give the total of \$358,552 saved per year, not including interest, repairs or depreciation of plant. The total cost of plants was \$305,587. This gives a gross operating saving of 117 per cent. If the interest on the cost of plant is 6 per cent this will be reduced to 111 per cent. Depreciation and repairs will subtract another 8 per cent and thus leave the net profit at 103 per cent on invested capital. In this computation no credit has been taken for mud removed, although a large quantity has been taken out at many of these points. The saving due to the elimination of mud must be estimated in each particular case. No formula of general applicability has been devised.

In this accomplishment two elements have entered into the result, namely, supervision and design. The two operating districts of the Rock Island each have a supervisor of chemical tests and a supervisor of water stations, in addition to the division forces, whose duties require them to follow the daily operations of each station. By the follow-up methods installed, satisfactory treatment is secured with all the different types of plants when operated properly. When in good working order the question of operating capacity is the principal element of difficulty. The capacity varies even with apparatus of the same design and any crowding or hurrying the process produces much harm. The "intermittent" and "soda ash" apparatus is home made. With a few exceptions the tubs are wooden. The "continuous type" machines are of the general type made by the patentees at the time of installation, with such variations as were thought to best suit local conditions.

#### Softener Installations

Among the continuous type machines there are several different varieties. At Burr Oak the water is treated and stored in one tank.

The tank is 50 ft. in diameter by 50 ft. high, with a 12-ft. downtake and has a rated capacity of 50,000 gal. per hr. Some changes have been made since its installation which

softeners. In order to conserve labor they are all installed adjacent to the pumping plants so that the pumper can operate and care for them. At three of the stations, owing to the extreme distance from the pumping plants to the storage tanks, it was found necessary to repump the treated water. These plants are all of the type K-Graver construction with a quartz filter in the top and double agitators in the downtake. One pump forces the water into the softener and another of the same capacity takes the water after it is filtered and sends it through the long pipe line to the storage tank. One of the photographs shows the treating plant at

Water Treating Plant at Geneseo, Ill.

Geneseo, Ill., where a pipe line two miles long is required. This plant has a rated capacity of 15,000 gal. per hour.

The most recent type is shown in photograph of the softener at Armourdale, Kan., the engine terminal at Kansas City. It was built in two steel standpipes which had been erected some years before, the machinery in Graver Type K. The treating tank at the left has a downtake with a set of double agitators driven by a water wheel. This is the only machinery on top, the balance being on the ground. When the water rises to the top of the softener, it is carried down

#### SUMMARY OF RESULTS OF WATER TREATMENT ON THE ENTIRE SYSTEM

	Cost of plants	Total M. gal. treated	Cost chemicals	Labor and supervision	Total	Incrustants lb. removed	Saving at 10c. a lb.	Net saving
First District .....	\$180,203	803,600	\$22,539	\$6,933	\$29,472	1,577,660	\$157,766	\$128,294
Second District .....	125,384	1,150,370	not given	not given	67,986	2,982,540	298,245	230,258
System .....	305,587	1,953,970			97,458	4,560,110	456,011	358,552

Net saving equivalent to 111 per cent on investment.

have added to the amount of agitation, both for chemicals and mixing with raw water. A water wheel drives the agitators in the downtake. An electric motor drives the chemical mixers and pumps on the ground level. The control apparatus is of the Booth make.

With this machine hardness has been reduced from 21 to 4 gr. per gal. and averages 5. The cost is much lower than some others due both to the design and a favorable market, the plant having cost \$17,205 while the gross saving per annum is \$24,021.

On the Illinois division there are four continuous type

again by a 12-in. pipe to the bottom and across to the storage tank. The outlets in the latter are at an elevation of 22 ft. By this means the water is given 2½ hours more time to settle after leaving the softener. The apparatus has no filter.

PASSENGER TRAIN PERFORMANCE, as reported by the Pennsylvania for the first ten months since the termination of Federal control, shows an increased percentage of trains on time from 77.4 per cent in March to 82.3 per cent in December. The number of trains making schedule time increased from 87.8 per cent in March to 92.3 per cent in December.

## Railroad Brief Advocates Partial Payments of Guaranty

WASHINGTON, D. C.

A BRIEF HAS BEEN FILED by counsel for the Association of Railway Executives and for the Grand Trunk Western in the court of appeals, District of Columbia, in connection with the appeal from the decision of the Supreme Court of the District of Columbia denying a writ of mandamus to compel the Secretary of the Treasury to honor a certificate of the Interstate Commerce Commission in favor of the Grand Trunk Western for \$500,000 as a partial payment on account of its guaranty for the six months following the termination of federal control. This is a test case which involves nearly \$400,000,000 due the railroads of the country.

Answering a rule to show cause why the writ should not issue, the brief says the secretary did not deny any of the allegations of the petition, but made two points in defense:

1. The secretary contended that paragraph (g) of section 209 of the Transportation Act, 1920, contemplated and authorized only one payment in the case of each carrier, such payment to be made only after the Interstate Commerce Commission had ascertained the entire amount due; that he was not required to pay the amount stated in the certificate of the commission in the case at bar, because of the qualification in paragraph three thereof reserving to the commission the right to certify "additional amounts found due to said Grand Trunk Western Railway Company to make good to said carrier the guaranty of section 209 of the Transportation Act of 1920." As an aid to his construction, the secretary called attention to paragraph (h) of section 209 of the act, providing for advances during the guaranty period of such sums, not in excess of the estimated amount necessary to make good the guaranty, as were necessary to enable the carrier to meet its fixed charges and operating expenses, and providing that the United States receive security against the contingency of such advances being in excess of the amount of the guaranty as finally determined by the commission.

2. As a further defense the secretary quoted several sections of the revised statutes and of general legislation relating to the powers and duties of the secretary, treasurer, comptroller of the Treasury, and auditors, and stated that the comptroller had rendered a decision against the payment of the certificate and that the auditor for the State and other departments had made a certificate "finding the sum of \$500,000 due the petitioner under paragraph (g) of section 209."

To this answer the relator demurred. The court overruled this demurrer and dismissed the petition, from which the relator prosecutes this appeal. The brief says in part:

Clearly paragraph (g), read in its ordinary meaning, authorizes the commission to issue more than one certificate. The commission is to certify the several "amounts." This "amounts" cannot mean amounts to all the carriers, for the paragraph says "the several amounts (in the plural) necessary to make good the foregoing guaranty to each carrier." Also, the secretary is directed to draw "warrants" (in the plural) in favor of "each" carrier (in the singular). There is, of course, to be but one warrant for each certificate, so the words "for the amount (in the singular) shown in such certificate (in the singular) as necessary to make good such guaranty," are entirely consistent with the petitioner's theory.

Manifestly, Congress was not concerned with the number of payments to be made, but merely with establishing an absolute safeguard against overpayment by requiring certification by the Interstate Commerce Commission. Congress could safely leave to the commission the details incident to ascertainment. There was no intent to place any limitation upon the time at which payments definitely ascertained to be due might actually begin. The prime purpose of the act, insofar as the guaranty provisions are concerned, being to assure the carriers a "railway operating income," and the ascertainment and certification by the Interstate Commerce Commission (the body equipped to check with absolute accuracy the railway accounts) being for the purpose of precluding any payment in excess of the amount necessary to make good the guaranty, the restriction to one payment becomes entirely foreign to the Congressional intent. The obvious in-

tervention of Congress was that there should be ascertainment and certification in such form as satisfied the Interstate Commerce Commission, and as many certificates and warrants thereon as might be necessary to make good to the carriers the guaranty of "railway operating income."

Congress did not intend to penalize the carriers which did not during the guaranty period apply for advances. A carrier might have been so possessed of funds prior to September 1, 1920, as not to have been able to bring itself at that time within the terms "necessary to enable it to meet its fixed charges and operating expenses," and yet on December 1, 1920, because of increased operating costs and decreased revenue, he desperately in need of amounts ascertained to be due it by the United States under the guaranty provided in the transportation act. The failure to ask for a mere advance on a sum of money estimated as hereafter possibly to become due, can certainly have no relation to the right later to collect an amount definitely determined and past due.

The amount due under the guaranty is to be ascertained by reference to the difference between the transportation receipts of the carrier during the guaranty period and the expenses during that period properly chargeable to operation in arriving at net railway operating income. Thus an increase in receipts or a decrease in expenses would decrease the amount of the guaranty, whereas a decrease in receipts or an increase in expenses would increase the amount of the guaranty.

But since the guaranty period, from March 1 to September 1, 1920, has been completed, the receipts are now definitely known and were known when the commission's certificate was issued on November 24, 1920, and, although these receipts may be decreased by some bills proving uncollectible, they cannot possibly be increased. The exact expenses of the guaranty period are not yet known. There are outstanding law suits, for example, which may increase the expenses, but a part of the expenses are now certainly known. Under paragraph (i) (3), section 209 of the act, the commission, in arriving at the amount of the guaranty, is to fix the amount to be allowed for maintenance expenses under a definite rule set out in the statute. That rule is that the commission shall allow the same amount of maintenance expenses as is provided for "in the proviso in paragraph (a) of section 5 of the standard contract." This proviso requires the allowance of the same maintenance expenses as during a corresponding period of the test period, plus additional amounts made necessary by the increased cost of labor and materials during the guaranty period over what they were during the comparable part of the test period.

It is, therefore, manifest that it is possible now to ascertain a minimum amount for these maintenance expenses, to-wit: what they are already known to be for the test period, and for the commission to know, not to guess, that at least that amount is to be allowed for expenses, and that this amount of expenses may be increased, but cannot be decreased.

There is nothing in the Transportation Act, 1920, which suggests that the secretary has any discretionary power. Assuming that the relator's construction of the act is correct, the duty of the secretary to draw the warrant is purely ministerial. None of the statutes quoted in the answer of the secretary by the language used in them, expressly limits the duty of the Secretary of the Treasury to draw a warrant under paragraph (g) of section 209 of the Transportation Act, 1920, and none of them enables him, by referring the question of his prospective act to the Comptroller of the Treasury, to convert a ministerial duty into a discretionary power. So to hold would be to say that the Secretary of the Treasury may, at his election, always subordinate the mandate of the Congress to his will.

If his power be one of discretion to draw warrants or not as he is advised by the Comptroller of the Treasury, after the certification by the Interstate Commerce Commission, under paragraph (g), of section 209 of the Transportation Act, 1920, there must disappear the right to compel him to draw a warrant no matter what the form of the certificate. In other words, if the statutes quoted in the answer as affecting the disbursement of the public funds by the Secretary of the Treasury are so general and all embracing in character that they make the decision of the Comptroller of the Treasury binding in all cases involving the payment of money from the Treasury, then all the power respecting payment of moneys expressly appropriated is in the hands of the secretary and the comptroller. And if this is so, then until the Congress repeals these general statutes (useful and necessary in connection with the disbursements to which they really apply), any special appropriations for the public welfare may fail of realization, and the courts of the United States will be powerless to enforce the deliberate and lawful Congressional intent.

But the answer of the secretary is not the law. A clear and simple distinction exists between two classes of payments to be made from the public funds. There are other payments to be made from the public funds than those to which these statutes refer. For example, the comptroller cannot decide that a federal

judge should have certain deductions made from the salary provided for him by the Congress. Such a contention has been expressly denied.

Congress has under the Constitution the full power to appropriate the public funds. It may make a special appropriation for a definite and lawful public purpose and direct its payment forthwith from the Treasury, or it may appropriate for the payment of unascertained amounts for a definite and lawful public purpose and create a special body with full discretionary power to ascertain the amounts lawfully due under the appropriation. In neither of these cases could the Comptroller of the Treasury change the amount of the appropriation definitely made by Congress or definitely determined by the body authorized to ascertain such amount.

By the Transportation Act, 1920, Congress expressly named the Interstate Commerce Commission as the body which should "ascertain and certify to the Secretary of the Treasury the several amounts to make good the foregoing guaranty to each carrier," and directed the secretary to draw warrants thereon and appropriated "an amount sufficient to pay such warrants." Consequently, in the words adopted by the Supreme Court in *Smith v. Johnson*, supra, "the opinion of the Comptroller of the Treasury was extra-official, was not required by law, and constituted a purely gratuitous act." If by the proper construction of the act as determined by the court the relator is entitled to a warrant, no adverse decision by the comptroller can prevent the court from issuing its writ of mandamus to compel the Secretary of the Treasury to draw such warrant.

The comptroller and the treasurer are not made parties to this proceeding because they have not as yet failed in the performance of any duty. The relator does not admit that there is any necessity for the comptroller to sign a warrant issued by the Secretary of the Treasury under section 209 (g) of the Transportation Act, 1920, but if it is necessary for the comptroller to countersign it he obviously cannot do it until the secretary has first drawn the warrant. When the secretary has drawn the warrant it is then a mere ministerial act for the comptroller to countersign it.

## Hearing on Proposed Amendment of Clayton Law

WASHINGTON, D. C.

HEARINGS BEFORE THE SENATE committee on interstate commerce on the proposed amendment of Section 10 of the Clayton law relating to railroad purchases were concluded on January 14. Chairman Clark of the Interstate Commerce Commission in continuing his testimony, which was reported in last week's issue, said the commission recommended the addition of two paragraphs to the bill, to provide that it shall be unlawful for any officer, director or agent of a carrier to receive, directly or indirectly, any benefit or profit in respect of the negotiation, hypothecation, purchase or sale by the carrier of any stocks, bonds or other evidences of interest or indebtedness issued by a carrier or non-carrier corporation, also to require reports to the commission of any such transactions. Mr. Clark said that Section 20-a of the act contains a similar provision with relation to securities issued by a carrier and that the proposed amendment would apply to the sale by a carrier of securities that are not issued by it.

Senator Smith took occasion to question Chairman Clark regarding the surcharge for Pullman passengers authorized by the commission in connection with the general rate advance. Senator Kellogg asked if it is not right that the Pullman passenger pays more to the railroad than the coach passenger. The commission thinks so, said Mr. Clark, because the Pullman car is much heavier than the coach, while it accommodates less than half as many passengers, and the commission thinks it is a sound proposition that the railroad is entitled to more for the more comfortable and more expensive service it furnishes for Pullman passengers. Senator Smith insisted that the passenger pays the Pullman Company for that service when it buys a Pullman ticket, but Mr. Clark said it is a question whether he is paying enough for it. He also said that the commission felt it was not either fair or wise to place the entire increase on the

freight rates without any increase on passenger rates because that might have made the freight rates so high as to tend to reduce traffic. Senator Townsend asked whether the increase in passenger fares had actually resulted in an increase in revenue, and Chairman Clark produced the figures to show that while in September, 1919, the passenger earnings were \$110,000,000, in September, 1920, they were \$129,000,000, and whereas in October, 1919, they were \$99,000,000, in October, 1920, they were \$114,000,000.

S. W. Brookhart, representing the Iowa division of the Farmers Educational and Cooperative Union, appeared before the committee to urge that Section 10 of the Clayton law be kept in effect, that is, that no effort be made to pass the existing bill over the President's veto. He said the railroads should be held strictly to the provisions of the Clayton law, but he had no suggestions to make as to whether it should be amended.

Glenn E. Plumb, representing the organized railway employees, read a long statement to the committee, in which he cited examples of so-called interlocking directors, in support of his contention that both the railroads and the supply companies are controlled by the great financial interests. He commended the suggestions for an amendment of the Clayton law proposed by the Interstate Commerce Commission, but declared that neither the Frelinghuysen bill nor the Clayton law is sufficient to reach what he considered to be the real evil in the situation. He said the law was intended to regulate transactions between companies which have common directors or officers, but that the bills do not get at the situation where the directors and officers of a railroad and of an equipment company or banking institution are separate, but are appointed by the same financial power. He said that while the railroads are regulated, the locomotive companies are not, and when the financial interests cannot get enough profit from the railroads they take it out of the locomotive companies by charging the railroads excessive prices. Mr. Plumb said the Frelinghuysen bill contains so many exceptions as to permit it to be wholly evaded by a selfish board of directors.

## Exchange Surcharge on Shipments Between U. S. and Canada

THE BOARD OF RAILWAY COMMISSIONERS FOR CANADA has issued a general order by which the railway companies subject to its jurisdiction are permitted to publish and file tariffs, effective January 22, providing for an exchange surcharge on international shipments, other than coal and coke; to be added to the total through charges including advanced charges payable to United States carriers, when payable and collected in Canada, as follows:

1. A surcharge of 60 per cent of the rate of exchange, arrived at in accordance with the provisions of this tariff, will be added to the total through charges, including advanced charges payable to United States carriers, on all shipments between Canada and the United States, in both directions, when such charges are payable and collected in Canada. When all charges are paid at United States points in United States funds, this surcharge will not be added.
2. On shipments from Canada, the surcharge must be collected at the rate governing on the date of the bill of lading; and on shipments to Canada, at the rate governing on the date of advice note of arrival at the Canadian destination. Such surcharge will accrue entirely to the Canadian carrier.
3. Telegraphic advice will be sent to railway agents in Canada on the last day of each month, specifying the surcharge to be collected from the first to the fourteenth (inclusive) of the following month; and on the fourteenth day of each month, specifying the surcharge to be collected from the fifteenth to the last day (inclusive) of such month. Agents must file such telegraphic advice with this tariff. The surcharge must be shown as a separate item on all bills of lading and waybills for outbound shipments and on all freight expense bills.

*Exception.*—This tariff does not apply to export and import traffic from or to points of origin or destination in the United States via Canadian ports, on which all charges must be collected in United States currency or its equivalent.

*Note.*—In arriving at the surcharge, the rate of exchange quoted for New York funds by the Bank of Montreal at noon in Montreal on the last day of each month will govern from the first to the fourteenth (inclusive) of the following month; similarly, such quotation at noon on the fourteenth will govern from the fifteenth to the last day (inclusive) of such month. Should the governing date fall on a Sunday or Canadian or United States legal holiday, the noon quotation of the preceding day will govern.

In determining the surcharge, fractions less than one-half will be disregarded and fractions of one-half or over will be counted as one per cent.

The rate of exchange quoted for New York funds by the Bank of Montreal at noon, in Montreal, on the 21st January, will govern from the 22nd to the 31st, inclusive.

The board further orders that, until otherwise ordered, the companies make monthly returns to the board showing the amount of surcharges collected.

About a year ago, complaints were made to the board, by exporters to the United States, that they had been prevented by the Canadian railway companies from prepaying the freight through to the point of destination in the United States in Canadian money. A hearing was held at Ottawa on March 16, 1920, at which practically all exporters were represented, and it was stated that, before the rate of exchange between the two countries became abnormal, practically all the commodities exported had gone forward collect. The board held that, under the railway act, a Canadian railway company could not be compelled to accept prepayment of freight.

Shortly thereafter, the American railways began demanding the prepayment of international freight to Canada, the result being that, with very few exceptions, the freight on all international traffic between the two countries was paid in the United States in United States funds, and the Canadian importers began pressing for relief.

At first the exporters demanded the right to prepay the whole rate in Canadian funds, which would give them an advantage in that they would be able to pay the American end of the haul in Canadian funds, which were then as now worth less than the American dollar. Shortly thereafter, however, the demand from all classes of business men was that the Canadian end of the haul should be paid in Canadian funds. This was vigorously opposed by the railway association and the railway companies on the ground that shippers both ways would naturally forward their goods by that route the longest possible portion of which would be in Canada. In other words, the American roads would be short-hauled in practically every international transaction in Canada, excepting possibly exports from the greater portion of the Maritime provinces, and, while this would be good business from the standpoint of the Canadian railways, it was argued that, in a very short time, it would result in complete disruption of the whole international rate structure which has been laboriously built up during the past 35 or 40 years.

On December 21 last, the railway companies were told that a solution of some kind must be found for the difficulty, and one which would in the end practically amount to paying the Canadian end of the haul in Canadian funds. On January 6, at a conference with representatives of the railway companies of Canada, a proposal was made which was accepted in principle, and on January 11 a written statement was furnished the board by the Railway Association of Canada, which was the result of extended negotiations between that body and the Board, proposing the plan which has just been approved.

This arrangement will also apply to the American roads, which, while not compelled to send their freight forward collect, have given assurance that they will do so because they will hold the Canadian railways responsible to repay them their share in "American funds, and arrangements are now

being made by the Canadian roads to have the goods forwarded collect, thus giving both the Canadian importer and exporter the right to pay the whole freight rate on international business in Canadian funds.

"It is quite evident that the Canadian road which has a short Canadian haul and a long American one is at a disadvantage," says Chief Commissioner F. B. Carvell, in a report on the subject, "whereas the road which possesses a long Canadian haul as compared with the short American one has a distinct advantage in this arrangement, but it was frankly admitted both by the railway companies and the board that whatever was done must be on the broad principle of averages, and, therefore, some roads as well as communities must be benefited to a greater extent than others.

"Without going into details we found, after a very careful consideration of the total international traffic carried by the railway companies of Canada, based upon their respective divisions with American connections, that the traffic on the Canadian Pacific would be more nearly divided equally between Canadian and American hauls respectively than any other of the large systems, and their figures showed the American end to be somewhat larger than the Canadian. The Canadian National figures showed a slightly increased Canadian haul on an average over the Canadian Pacific, but the Grand Trunk showed quite a large percentage of the American haul greater than the Canadian. Putting together the business of the Canadian National and Grand Trunk systems, they average practically the same as the Canadian Pacific business. When we come, however, to roads such as the Quebec, Montreal & Southern and the Toronto, Hamilton & Buffalo, there we find that from two-thirds to three-quarters of their international business is on the United States end, the Toronto, Hamilton & Buffalo showing about 72 per cent, and, of course, as they will only receive a surcharge of 50 per cent, they will lose to quite an extent on all international traffic. However, as before stated, I have concluded that the principle of average is the only feasible method under present conditions by which this difficult problem can be solved at the present time, and, therefore, think that a surcharge of 60 per cent of the total rate of exchange is the figure which will on an average place the Canadian roads in a position to pay the American connections in American funds and yet leave them Canadian funds for their own portion of the haul.

"It will be observed that this arrangement does not apply to the rate on coke and coal, the reason being that these commodities move practically altogether on local rates breaking at the border, and, as the Canadian importers have since May last been allowed to pay the Canadian end of this business in Canadian funds, no change is necessary.

"Neither does it apply to export and import traffic from or to points of origin or destination in the United States via Canadian ports, which still must be paid in United States currency, because, were this allowed to be paid in Canadian funds, it would practically mean that goods originating in the United States, exported through Canadian ports, would pay a less freight rate than if exported from American ports. This would be discriminatory as against the American railroads and would break up parity of export rates between Canadian and United States ports now in existence.

"While these arrangements are not perfect, yet, in my opinion, it is the best solution of the problem so far advanced by any person, and I feel sure it will grant a great measure of relief to the business interests of Canada."

EXTRA SLEEPING CARS required on the Pennsylvania Railroad for the movement of passengers in the week of December 17-24 numbered 322, the largest demand on any one day being for 161 cars. During the same week the loading of mail-storage cars—cars loaded solid with mail—increased by 537 per cent.

## Service Tests of a Substitute Tie

**T**HE FACT THAT CONSIDERABLE attention has been given of late to the study of substitute ties and to estimates of the available supplies of timber in our forests lends interest to the service record of a substitute crosstie that has been subjected to tests under actual service conditions in a heavy traffic main line for a period of four and one-half years. Based on the results secured with this installation, various other railroads of this country have contracted for crossties of this type, one installation of three-quarters of a mile having been recently placed in service.

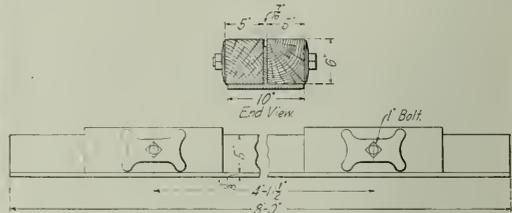

This tie comprises a combination of steel and wood known as the "Peerless" steel tie manufactured by the Tri-City

structural steel portion of these ties is of uniform section throughout its length, but the ties may be had with portions of the base cut away between the rail bearings with a view to obviating possible center binding. The rail bearing consists of a pair of treated timber blocks resting on the base and clamped on either side of the stem. These blocks are 6 in. by 5 in. by 18 in. and are held securely in place by a one-inch bolt equipped with forged steel plate washers with large bearing areas. With the use of treated timber, an estimated life for these blocks equal to or better than the demonstrated life of treated ties is considered conservative, but whenever renewals of these blocks are required for any reason, such renewals may be made at an expense of time and labor that is insignificant compared with the operations involved in renewing a crosstie of the ordinary type. Owing to the greater bearing area of these substitute ties as

Inspection Party Examining an Installation of Steel Ties Near Parkesburg, Pa.

Steel Company, St. Louis, Mo. The principal advantages to which attention has been drawn with respect to this design of crosstie, in addition to provision for adequate strength and ample bearing surface on the ballast, include: A rail bearing of wood affording positive insulation, the employment of ordinary cut and screw spikes for the rail fastening, simplicity of design and ease with which the wooden portions of the tie may be replaced when necessary. The tie consists of a rolled T-section placed in track with the stem up. The base is 10 in. wide by  $\frac{3}{8}$  in. thick and the stem is 5 in. high by  $\frac{7}{16}$  in. thick. The length is ordinarily 8 ft. but may be varied as desired. As a rule the

Typical Details for a "Peerless" Steel Tie

compared with the usual size of wooden ties some saving could be accomplished by the use of a smaller number of the ties in track.

The original installation of these ties was made on the Chicago & Alton in May, 1916, when one of the tracks across the Robey street subway, at Chicago, was equipped with them. Subsequently 250 more of these ties were placed on the subway at Twenty-second street and Canal street, both of these subways being ballasted structures. Special observations have been made of these installations from time to time and recent inspections disclose no appreciable deterioration of any kind and no expenditures have been made for line and surface on the portions of the track equipped with these ties during the period of service. A more recent installation of the ties embraces three-quarters of a mile of track on the Pennsylvania system low-grade freight line, near Parkesburg, Pa., about 40 miles west of Philadelphia.

# General News Department

The Louisville & Nashville, according to a statement credited to R. R. Hobbs, superintendent of telegraph, has bought wireless telegraph apparatus to be installed at Louisville, Ky.; New Orleans, La.; Mobile, Ala., and Pensacola, Fla.

The session of the Telegraph and Telephone section of the American Railway Association which was to have been held at Atlanta, Ga., on March 22, has been cancelled in the interest of economy. The section will hold no committee meetings until April 1.

President Obregon, of Mexico, according to a press despatch, has decided, following a conference with his cabinet, to appoint a commission to investigate the general railroad problem, with a view to formulating propositions for the re-turn of the railways, by the government, to their owners.

The Associated General Contractors of America will hold their second National Conference at New Orleans, La., on January 25, 26 and 27. In order that the various types of construction may be fully covered, the papers and subsequent discussion will be carried on simultaneously in four groups—building, highway, public work and railroad.

The Eastern Railroad Association announces that E. N. Bessing has been elected secretary in place of D. G. Stuart, deceased; and that on March 1 Melvin H. Coulston, who now is first assistant commissioner of patents, will become assistant counsel of the association; headquarters, of both secretary and counsel, 614 F street, N. W., Washington, D. C.

The House committee on interstate and foreign commerce has announced a hearing, to begin January 20, on the bill introduced by Representative Esch to amend the railroad valuation act by striking out the provision requiring the Interstate Commerce Commission to ascertain and report the cost of acquisition of land in addition to its original cost or present value.

## Baltimore & Ohio Safety Rallies

Twenty-four safety rallies are being held by the Baltimore & Ohio, in 24 different cities, beginning with New York (St. George, Staten Island), on January 17 and ending at Jenkins, Ky., on February 24. John T. Broderick, superintendent of the Safety Department of the road, makes the principal address at each meeting, and large halls are utilized in each place. Employees are invited to bring their wives and sons and daughters, and Marcus A. Dow's motion picture "Bulletin 70," is shown. Musical entertainment is provided.

## Presentation to R. C. Richards

One thousand safety workers on the Chicago & North Western, members of 83 safety committees of the road, gathered at luncheon on January 15 in Chicago, to honor R. C. Richards, general claim agent, and chairman of the Central Supply Committee of that road. Mr. Richards, who is 66 years old, is the pioneer in "safety first" on American railways, having inaugurated safety work on the Chicago & North Western in 1910. He has since taken a leading part in safety work on American railways. At the luncheon Mr. Richards was presented with a silver service by his associates.

## Resume Separate Operation

The Boston & Maine and the Central Vermont have resumed the separate operation of their single-track lines between Brattleboro, Vt., and East Northfield, Mass., ten miles. Under government operation these two lines were operated together as a double track railroad; but business is now

light, and the Boston & Maine, which carries the larger part of the business, believes it will be more economical to keep its trains on its own line.

The New York, New Haven & Hartford now runs freight trains over its line from Northampton, Mass., northward to Turners Falls, 20 miles. This line, which is parallel to the Boston & Maine, was closed during federal operation.

## Safety Appliances for Cars of Special Construction

The Interstate Commerce Commission at a conference held on December 6 adopted the following ruling regarding the application of safety appliances on cars of special construction:

Cars of special construction, as contemplated by the commission's order of March 13, 1911, are cars which can not be equipped with safety appliances as prescribed in the order for any specified classes enumerated therein. In the construction of new equipment which does not conform to the specified classes designated in the order, plans shall be submitted to the commission prior to construction of such cars for the purpose of determining the location and application thereto of all safety appliances required by statute and the order of the commission of March 13, 1911.

## Accident Bulletin No. 76

The Inter-state Commerce Commission has issued Accident Bulletin No. 76, dated December 7, 1920, containing statistics of railway accidents in the United States during April, May and June, 1920.

Twenty-nine passengers, 93 employees and six other persons were killed in train accidents during this quarter and 1,271 passengers, 690 employees and 23 other persons were injured; a total of 128 persons killed and 1,984 injured. Adding casualties in train service accidents—1,323 killed and 12,383 injured; and those in non-train accidents—112 killed and 25,398 injured—we have a total for the quarter of 1,563 persons killed and 39,765 injured.

The number of collisions reported in this quarter was 2,189 and of derailments 4,952. Adding miscellaneous accidents to trains we have a total of 7,883 accidents with total damage to cars and roadway of \$7,762,500.

## The Pullman Company Wage Reduction

Conflicting reports resulting from an account of a so-called voluntary wage cut of 20 per cent by employees of the Pullman Company at Chicago, have simmered down to two or three authoritative outstanding facts.

In the first place, the suggestion of a wage cut was made by J. B. Weaver, vice-president in charge of construction of the Pullman Company, who advised the employees at the Pullman Car Works, which is an open shop employing 9,000 men, that a decrease in their pay was necessary. The matter of reductions in pay at the Pullman repair shop, which is unionized, has not yet been brought up.

At present, the company is restoring its men at the Pullman repair shop to the basis of a nine-hour day, as against the eight-hour day under which they have been working. The nine-hour day will apply five days a week, with a five-hour day on Saturday.

## Automatic Train Control

The Interstate Commerce Commission has issued a notice to the press that in the administration of Section 26 of the Interstate Commerce law, the commission has invited the co-operation of the American Railway Association, and that a joint committee on automatic train control has been appointed by the association.

The Bureau of Safety and the A. R. A. committee have

taken preliminary steps, with a view of conducting more extended service tests of automatic train control devices than have heretofore been made under official supervision, for the purpose of determining the relative merits of various types of devices, as well as the availability for general practical use of selected devices. Locations for test installations are now under consideration, and specifications and requirements are in course of preparation. Announcement of the locations selected and of the specifications and requirements applying to each of such locations will be made in due course.

The selection of devices for these test installations will be made in each case by the A. R. A. committee and the railroad company on whose line the installation is to be made, subject to approval by the Interstate Commerce Commission. These selections will be made upon the basis of plans filed with the Bureau of Safety, Interstate Commerce Commission. All meritorious devices which have heretofore been considered, or which may hereafter be submitted, will be given due consideration. With respect to devices heretofore considered, it is important that accurate and up-to-date plans should be on file for consideration.

### Bertrand's Cab Indicator

Among numerous cab signal experiments now being tried on French railroads—all of the companies having been informed that the government desires decisive action in this direction—is an apparatus which was devised by U. Bertrand, formerly principal overseer on the Paris, Lyons & Mediterranean and is described in a recent number of *Genie Civil*.

In a box fixed in the cab and connected by a transmitting mechanism with an axle of the locomotive, is a speed indicator actuating a pointer on a dial, and also controlling a movable diagram of the road, showing the location of every roadside signal. This is printed on a ribbon, sections of which are successively brought before a glass-covered opening as the locomotive proceeds.

On beginning a trip, the engineman sets the apparatus at a prescribed starting point (corresponding to the actual starting point of the train) so that a bell, connected with the indicator, will be sounded at the proper time to warn him of his approach to the next fixed signal. The movement of the pointer on the dial, the sounding of the bell and the appearance of the signal location on the movable diagram (at the proper point under the glass, for the engineman's eye) are produced in unison.

After passing a signal the engineman must reset the apparatus for the repetition of the same operation in relation to the signal next to be encountered.

The inventor proposes that the apparatus be used for other purposes; as, for example, by an engineman not well acquainted with the line to give him warning, at the proper time, of his approach to a steep grade, or to a curve where speed must be slackened.

The descriptive account, reprinted in the Bulletin of the International Railway Association for November, page 799, gives no indication as to the extent to which this apparatus has been used or tested.

### The Proposed Hudson River Bridge at New York City

The Hudson River Bridge Corporation has been organized, in New York, and incorporation papers were filed in Albany on January 18. The capital, for the present, is \$251,000, and the directors are George A. Post, R. A. C. Smith, John H. Love, Henry D. Walbridge, Thomas H. Simpson, Fulton MacMahon, W. J. Amend, George T. Smith and George F. D. Trask. The corporation has been organized to promote the construction of a bridge from the design, familiar to our readers, which has been made by Gustav Lindenthal, designer of the Hell Gate bridge. An organization committee of 85 members has been formed, with a view to securing the co-operation of capitalists. The entire plan, which includes terminals in Manhattan and large railroad yards in New Jersey, it is estimated will cost \$200,000,000. Among members of the organization committee are T. DeWitt Cuyler, Julius Kruttschnitt, L. F. Loree, Ira A. Place, Ralph Peters, George A. Post, Samuel Rea, John F. Wallace and Roberts Walker.

The proposed bridge would accommodate both railroad and highway traffic; it would have 14 tracks and a capacity equal to that of 20 tunnels, while its estimated cost is less than one half as much as the cost of that number of tunnels.

The announcement which is now issued gives a brief history of the proposal for a bridge across the Hudson, which, it is said, has been seriously contemplated for 30 years. But for the panic of 1893, the recent World War, and other unavoidable obstacles, it is declared that a bridge would in all probability have been built long before now.

The proposed site of the bridge is about opposite 59th street, Manhattan, and the plans show a main span which in the center would be 165 feet above the water. Its estimated capacity would be 600,000 persons an hour, as compared with 700,000 aggregate capacity of all four of the present bridges across the East river.

### Cleveland Over-and-Short Bureau

At Cleveland, Ohio, the seven principal railroads have established an over-and-short bureau, to which all local freight agents of the city are to report, and where freight astray on one road can be connected with way bills containing "short" items on other roads. The bureau is in charge of the car service committee, H. F. Dunkle, chairman. At Pittsburgh, Pa., a bureau of this kind is said to have found way bills for about three-fourths of all of the "over" shipments reported.

### Retrenchment on the Pennsylvania; 20 Per Cent

The Pennsylvania Railroad, which made extensive reductions of forces in November, throughout the System, intended to equal 10 per cent, whenever possible, has this week ordered a further reduction of the same extent, and the "lay-off" will be enforced in clerical and official departments, as well as others, wherever practicable. President Samuel Rea on Wednesday issued a statement saying:

"There is no arbitrary rule adopted. The principle on which the reduction will be made is to secure the utmost economy consistent with safety and efficiency. The vice-presidents, however, have been directed that in carrying out these instructions they should do so in the manner best adapted to avoid, so far as possible, unnecessary disruption of the organization, or individual hardships.

"It is to be hoped that the deduction in business will continue for only a brief period. The management sincerely regrets that uninterrupted employment cannot be assured to every faithful man on its payroll. But the situation is a practical one and no way has as yet been devised in such circumstances as those now existing to avoid a reduction in expenses and working forces.

"The Pennsylvania Railroad system now has on its lines 58,000 idle freight cars, which is about 20 per cent of the number owned, and the idle cars are increasing daily. Freight traffic has declined 20 to 22 per cent, as compared with the early fall, and all available information as to the prevailing conditions in the productive industries and general commerce indicate that a further slowing down in the freight movement must be anticipated before recovery can be reasonably expected. \* \* \*

Plans are being considered at Pittsburgh for effecting the necessary reduction in expenses by the adoption of a rule for each employee, in a given department, to lie off one day in each week.

At various points yard switching crews are laid off, storehouses temporarily closed and roundhouse forces reduced.

The Long Island road has within two months laid off about 800 men.

### Post Office Needs Additional Appropriation for Railroad Mail Pay

The Postmaster-General has asked Congress for a supplemental appropriation to meet a deficiency of \$35,840,000 in the appropriation for the transportation of the mails by railroad routes for the fiscal year ending June 30, 1921. The item is necessary by reason of the application of the increased rates for mail transportation fixed by the Interstate Commerce Commission in its order No. 6200 of December 23, 1919.

For the June, 1920, quarter, the Postmaster-General says in his letter, the value of the regular service will be approximately \$20,269,557.90, and the emergency service \$2,373,679.21, a total of \$22,643,237.11, or an annual rate of \$90,572,948.44. The annual rate of the service authorized on June 30, 1920, was \$83,731,068.47. Upon this basis the actual payments for the entire service amounted to \$6,841,879.97 (or 8.17 per cent) over and above the annual authorized rate.

"The annual rate authorized September 30, 1920, was \$81,212,343.61," he says. "Increasing this amount by 8.17 per cent we have an estimated annual expenditure for the current fiscal year of \$87,847,392.08, to which should be added 1,250,000 for the transportation of periodical matter by freight; \$800,000 (estimated) for the Air Mail Service, and \$5,830,000 (estimated) for side, terminal, and transfer service. The latter item is based upon an estimate of \$253.50 for each of the 23,000 points, approximately, where the department must provide for the handling of the mails between railroad stations and post offices under the commission's order. The foregoing items aggregate \$95,727,392.08, or \$35,840,570.08 over and above the current appropriation of \$59,886,822. It is therefore recommended that an additional appropriation of \$35,840,000 be asked of Congress to pay for the transportation of the mails by railroads for the fiscal year ending June 30, 1921."

A deficiency of \$94,700 will also be created with regard to the appropriation for the transportation of the mails by electric and cable cars for the fiscal year ending June 30, 1921, as an effect of the Interstate Commerce Commission's order of August 7, 1920, fixing the rates for the transportation of the mails by urban and interurban electric railway common carriers, which order became effective December 1, 1920. The authorized annual rate on December 1 was \$561,542.86. The estimated annual rate for the performance of side, terminal, and transfer service is \$145,950. The combined annual rate is therefore \$707,492.86, or \$162,492.86 over and above the current appropriation of \$545,000. It is therefore recommended that an additional appropriation of \$94,700 be granted to pay the increased compensation for this service for the seven months from December 1, 1920, to June 30, 1921.

### The Long Island and Its Patrons

The Long Island Railroad, "to promote a better understanding of local and general railroad problems among patrons and employees," issues periodically an information bulletin, in the last number of which is a very terse, lucid and illuminating explanation of why the railroads must raise fares and freight rates. Some of the salient points of this manifesto follow:

The year 1920, with all its hopes, difficulties, disappointments and experiences, is now behind us. It was a prosperous year for the employees of the Long Island Railroad, the United States Railroad Labor Board having added over three million dollars per annum to the payrolls. Judging by statistics, Long Island generally had a prosperous year. The railroad carried approximately 73,000,000 people in 1920, an increase of about 9,000,000 over the previous year. Of the 73,000,000 passengers commuters numbered 33,563,000, and paid fares at the average rate of 0.74c. per mile. The average rate per mile paid by each passenger (all passengers), was 1.5 cents, while the actual cost to handle each passenger was 1.8 cents per mile. Both the freight tonnage and volume of passenger traffic increased very satisfactorily, and from this standpoint, the management is pleased, because a growing, prosperous territory is what it is striving for at all times. The financial results from operation, however, were highly disappointing. The gross earnings were \$25,913,000; operating expenses were \$25,116,000, leaving net revenue from railway operations \$797,000. After paying taxes, car hire and miscellaneous charges there was a deficit in railway operating income of \$833,000. Other income (non-operating) aggregated \$800,000, leaving a net loss from operation of \$33,000, while fixed charges amount to \$3,800,000, and six per cent return on capital stock amounts to \$2,040,000.

The United States Government assumed the losses up to September 1, 1920, so that the actual results to the corporation for the year 1920 will be a deficit in meeting all obligations, of about \$750,000. The present basis of rates will not enable the company to pay its way and rigid economy will necessarily have to be employed in all departments, and many little conveniences will have to be curtailed for the time being.

\* \* \* \* \*

If it had not been for the war and the abnormal conditions affecting cost of operation which came from the war, the Long Island road today would be a paying proposition, and could command new capital necessary to keep ahead of the growth in population.

The management, while temporarily discouraged and in a

quandary as to where money can be secured to pay interest on the road's debts, nevertheless is not disheartened as to the future. The public bodies who hold in their hands the destinies of the transportation facilities of the country, will be compelled to act. While we shall be compelled to slow down and economize for a few months, eventually the rates will be increased, improvements will go on, the railroad will earn a return on the money invested in it, and then prosperity will abound on Long Island. \* \* \* \* \*

### Testimonial to Chairman Cuyler

The meeting of the Association of Railway Executives which was held in New York City on January 7 was followed by the presentation to Thomas DeWitt Cuyler, chairman of the association of an Old English silver salver; and with it a letter saying, on behalf of his associates:

"More than two years have now elapsed since you became chairman of this association. The future of rail transportation in America was enveloped in grave doubt and uncertainty. The railroads were confronted by many special embarrassments and complications; notably by—

A substantial conflict of public opinion as to private ownership or government ownership; a system of regulatory legislation which contained provisions for repression and restraint, but little of encouragement or support; the diverse and unco-ordinated policies and powers of many regulating authorities, State and Federal; impaired and inadequate credit growing out of the uncertainty in the minds of the investing public as to the future policies of the Federal and State governments \* \* \* ; and the constant menace of labor disturbances.

It was in these circumstances that you undertook your responsible duties. The problems pressing for immediate solution were perhaps the gravest which ever arose in respect to any industry, and, in magnitude, were second only to the problems of the war. The government having, as a war measure, taken possession and control of the railroads, it was necessary:

To negotiate a standard form of contract, fixing the compensation of the carriers and providing for the preservation and upkeep during, and for the orderly return after, Federal control of the carrier properties, and for a due accounting between the parties;

To oppose the effort of the railroad administration to extend Federal control for an additional period of five years;

To place at the disposal of Congress and the public the results of the experience and thought of the railway executives of the country to the end that legislation should be adopted providing for the return of the properties to their owners, with adequate guarantees during the reconstruction period, and introducing into the system of governmental regulation constructive principles of protection and support;

To present to the Interstate Commerce Commission and the public the then existing financial conditions and tendencies of the railroad industry to the end that there should be established a system of rates sufficient to provide a credit basis for adequate and efficient transportation facilities;

To effect by the general voluntary action of the various individual managements that degree of harmonious co-operation and co-ordination of the instrumentalities of transportation necessary to provide adequate and efficient service for the public;

To establish and promote a relationship of mutual helpfulness, confidence and understanding between the carriers and the departments of government charged with the duties of regulation; and

To promote the development of a more co-operative spirit between the managements and employees of the railroads.

Under your leadership, a measure of success, in respect to the accomplishment of these and other essential purposes, has been attained, which constitutes a new and creditable chapter in the economic history of our country, furnishing encouragement and hope to those who believe that the progress and welfare of mankind are promoted best by keeping the door of opportunity open to private enterprise and effort."

The committee arranging the gift consisted of Howard Elliott, (N.P.); S. M. Felton, (C. G. W.); Hale Holden, President, (C. B. & Q.); R. S. Lovett, (U. P.); C. H. Markham, (I.C.); Samuel Rea, President, (Penn.); Alfred P. Thom, General Counsel, Association of Railway Executives; W. H., Truesdale, (D. L. & W.); H. Walters, (A. C. L.), and Daniel Willard, (B. & O.).

## Traffic News

C. A. Cairns, passenger traffic manager of the Chicago & North Western, has been elected chairman of the Western Passenger Association, succeeding L. M. Allen, vice-president and passenger traffic manager of the Chicago, Rock Island & Pacific.

The Effingham, a vessel of the United States Shipping Board, has sailed from Vancouver, British Columbia, with grain for Europe, a cargo of 2,000 tons of No. 1 Northern wheat. A further shipment of 5,000 tons of wheat for the United States Government and 3,000 tons for Havre will be made soon.

Commercial travelers, claiming to represent 700,000 traveling men, appeared before the general passenger agents of the railroads at Chicago, on January 7, to ask for the introduction of an interchangeable mileage ticket at a reduction of 20 per cent under the regular fares. They said that the present high fares were taking men off the road and consequently the railroads as well as the commercial interests were losing in freight and business.

Five general division officers of the Baltimore & Ohio are spending two weeks in an intensive course of getting acquainted with shippers and other patrons in Youngstown, Ohio, and vicinity, at the same time inspecting all of the railroad company's facilities in that region. These officers are O. S. Lewis, general freight agent; E. A. Peck, general superintendent; C. M. Gosnell, industrial agent; D. F. Stevens, superintendent, and A. L. Doggett, division freight agent.

The Shipping Board has adopted a resolution calling for the appointment of a joint committee made up of three members of the Shipping Board and three members of the Interstate Commerce Commission for the purpose of considering various provisions of the Transportation Act, 1920, as well as rates, regulations and other practices. The members appointed from the Shipping Board were J. N. Teal (chairman), F. I. Thompson and Guy D. Goff. The members from the Interstate Commerce Commission are C. C. McChord, Henry C. Hall and Mark W. Potter.

The Interstate Commerce Commission has vacated, as of January 15, its Service Order No. 19, which gave priority for certain coal commandeered by the Navy. The President, by the Secretary of the Navy, has certified to the commission that in view of the adequate coal car supply prevailing at present in Pennsylvania and Maryland fields, it is believed that the interests of the government no longer require preference and priority in transportation of coal commandeered by the Navy from mines located in those fields as required by Service Order No. 19, entered October 1, 1920.

### The Southeastern Express Company

Express business over the lines of the Southern Railway and the Mobile & Ohio is to be handled, after March 1, by the Southeastern Express Company. This new company has been organized under the laws of Alabama for the purpose of conducting an express business in the Southeastern states. It will have a capital of \$1,000,000, owned by Southern business men, and will have headquarters in Atlanta, Ga. John B. Hockaday, formerly vice-president and general manager of the old Southern Express Company, will be president. Officers of the Southern Railway believe that the South should have an express company of its own, engaged primarily in handling business originating or terminating in the South. The new company will establish offices at all stations on the Southern and the Mobile & Ohio and will operate on about 10,000 miles of railway.

Mr. Hockaday has had over 40 years' experience in express service in the South. He was located in Savannah for 10 years as superintendent of the Florida division of the Southern Express Company and later was in Atlanta 10 years.

## Commission and Court News

### Interstate Commerce Commission

John E. Benton, solicitor for the National Association of Railway and Utilities Commissioners, has filed a motion with the commission for a reargument and an order setting aside the recent decision of the commission approving the continued consolidation of the transportation interests of the express companies into the American Railway Express Company.

The Interstate Commerce Commission has suspended from January 13 until May 13, 1921, proposed cancellation of the existing proportional rates of 14 and 15½ cents per 100 pounds on grain to Louisville, Ky., and Cincinnati, Ohio, respectively, from St. Louis, Mo., in instances where such shipments do not consist of grain originating at stations in Missouri within the 100 mile zone, and only when the inbound rate to East St. Louis, Ill., exceeds the rate to St. Louis, Mo., and on grain originating at such stations when handled under transit rules and regulations lawfully on file with the commission.

The commission has considered with the United States Shipping Board the question as to the application to import and export rates in connection with the provisions of section 28 of the merchant marine act of the well established principle that under the interstate commerce act a rate upon a given shipment cannot be changed while the shipment is in transit, and the common understanding has been reached that in the event the provisions of section 28 of the merchant marine act should become effective they will not apply to import shipments which, prior to that effective date have completed their ocean voyage and been turned over to the rail carriers, and will not affect export shipments which, prior to that effective date, have been delivered to, and received for, by the rail lines.

The commission has issued a notice saying that information received by the commission indicates a lack of uniformity by carriers in accounting for certain interroad items pertaining to the guaranty period with respect to the rendition and settlement of bills and other accounts as between carriers which accepted the provisions of section 209 of the Transportation Act, 1920. Some roads apparently have proceeded on the assumption that the preparation of certain interroad accounts and corrections pertaining thereto is unnecessary in view of the fact that the net effect to the government will be the same, as between roads accepting the guaranty whether or not interroad settlements are effected.

No instructions have been issued by the commission which would warrant such an interpretation and in the interest of uniformity and continuity of the accounts it is the intent that interroad bills and accounts and corrections thereof—with the exception of those covering per diem reclaims and per diem discrepancy claims between carriers accepting the guaranty provisions—shall be prepared and settled between all roads in the usual manner, whether or not the carriers are subject to the guaranty provisions of the statute.

### United States Supreme Court

#### Mail Cranes—Danger from Them Obvious

Action was brought against the Southern Pacific for the death of an engineman who had been struck by the end of a mail crane, or a mail sack, that had been placed on it to be picked up by a following train. The crane stood at the same distance as all the others along the road, and its end, when elevated, was 14 in. from the train. It was supposed that the engineman was looking out of the side window to look at the main driving pin, which had been getting hot. The question was whether the railroad was liable under the federal Employers' Liability Act, or whether it is consistent with its duty to employees to erect cranes so near the track. The Texas courts found the railroad liable. The Supreme Court of the United States reverses the judgment for the plaintiff, saying:

"It is impracticable to require railroads to have no structures so near to their tracks as to endanger people who lean from the windows. Most passengers are familiar with cautions against putting out heads or arms. The farthest point at which a bag could be picked up is 29 in., and it requires a less distance than that to be sure of getting the bag. In short, it would be impossible to use the contrivance with absolute certainty that no accident would happen if a man put his head out at the wrong moment. It equally is impossible to condemn railroads as wrongdoers simply for adopting the device with the conditions imposed by the Post Office Department. When a railroad is built it is practically certain that some deaths will ensue, but the builders are not murderers on that account when the foreseen comes to pass. The adoption of an improvement in the public interest does not throw the risk of all incidental damage upon those who adopted it, however fair it may be to put the expenses of insurance upon those who use it. \* \* \*

It was to be presumed that the engineer perfectly well knew of the existence and location of the crane. Confining itself to the case of postal cranes, the court was of opinion that to allow the jury to find a verdict for the plaintiff was to allow them to substitute sympathy for evidence and to impose a standard of conduct that had no warrant in the common law.—*Southern Pacific v. Berkshire*. Decided January 3, 1921. Opinion by Mr. Justice Holmes. Mr. Justice Clarke dissents.

### Limitation of Initial Carrier's Liability

On June 10, 1918, a shipper delivered to the San Antonio & Aransas Pass, at Ingleside, Tex., a carload of vegetables consigned to himself at Dallas, a point off its lines. He accepted a bill of lading having printed on its face "For use only between points within the state of Texas." The car moved to Waco and then over the M., K. & T. to Dallas, whence, on the shipper's request, the M., K. & T. forwarded it to Kansas City over its own lines, took up the original bill of lading and issued a new one acknowledging receipt of the vegetables at Dallas. When the car reached Kansas City the contents were in bad condition and the shipper sued the San Antonio & Aransas as the initial carrier, claiming a right to recover damages under the Carmack Amendment. The court below held that the provisions in interstate tariffs permitting reconignment or change of destination did not apply, that the railroad only agreed to transport to Dallas and was not liable for damage sustained beyond that point.

The Supreme Court of the United States affirms this decision for the reason that the railroad's contract related only to a movement between points in the same state. It had no notice or reason to suppose that the freight would pass beyond the destination specified. Neither shipper nor railroad had in contemplation any movement beyond the point specified and the contract between them must be determined from the original bill of lading and the local laws and regulations.—*Bracht v. S. A. & A. P.* Decided January 3, 1921. Opinion by Mr. Justice McReynolds.

### A Prohibitive Classification of Freight;

#### Exclusive Initial Jurisdiction of I. C. C.

Silk, artificial and natural, had been accepted by the railroads of the country for transportation as freight for many years at first class rates, when, on January 21, 1920, the Director General authorized a rule including silk among articles not to be accepted for shipment. The Viscose Company, a manufacturer of artificial silk, obtained an injunction from the Federal District Court in Pennsylvania forbidding the carriers to refuse to accept silk for transportation as freight. On appeal, the Supreme Court held that the District Court did not have jurisdiction to decide the matter. Classification in rate-making practice is held to be grouping. To exclude a commodity from all classes is classification of it. To strike artificial silk from the first class and to include it in the "prohibited list," classifies it and sets it apart in a group subject to special treatment, as much as if it had been changed to the second class. The attempted change of regulation, when challenged by the shipper, presented a question for decision within the exclusive initial jurisdiction of the Interstate Commerce Commission. The importance to the commerce of the country, the court said, of the exclusive initial jurisdiction which Congress has committed to the commission, cannot be overstated.—*Director General of Railroads v. Viscose Company*. Decided January 3, 1921. Opinion by Mr. Justice Clarke.

## Foreign Railway News

### Central of Brazil to Electrify

Some time during the current month the Central of Brazil will ask for bids for the electrification of its double-tracked line from Rio de Janeiro to Desdoro, a distance of 14 miles, according to reports received by the Bureau of Foreign and Domestic Commerce. Bids for further electrification will be called for later.

### Indian Railway Officer Dies

Neville Priestley, of London, England, managing director of the South Indian Railway, died on December 13, at the age of 59. Mr. Priestley was born in India and had been connected with Indian railway affairs all his life. In 1903 he visited this country and made a valuable report for the government of India on the organization and working of American railroads.

### Construction on Portuguese Railways

LONDON

The Companhia Sintra-Atlantico, of Lisbon, is proposing the construction of an electric railway from Sintra to Estoril, Vascas, and Boca to Inferno. Bids are being called for the work of laying down the necessary line and for its working during a term of 75 years.

### Queensland Railways Inquiring for Rolling Stock

LONDON

The government of Queensland, Australia, is asking for estimates for the supply of thirty-five 12-wheeled locomotives for 42 in. gage, cylinders to be 19 in. by 23 in. The tenders are to have two 4-wheeled trucks each. The approximate weight of the locomotive and truck empty is to be 66 tons, and the maximum length, 49 ft. 3/4 in. The estimates are to be delivered by March 15.

### Swiss Mails and Railways to Be Combined

LONDON.

A suggestion has been made in connection with the proposed reconstruction of the Swiss public services calling for the unification of the staff of the state railways with the staff of the federal post and telegraph offices. This means that the station-masters in smaller places would become the heads of the local post and telegraph offices, while the trainmen of local trains would look after the mail bags.

### A New Road for Ecuador

A road is projected from the port of Esmeraldas, Ecuador, in the direction of Quito. The proposed line will connect with a road already constructed from Quito to Santo Domingo de los Colorados and will thus open up a short route from Quito to the coast. The projected road will tap a fertile area of some 1,000,000 acres. The railway has been granted by the government a concession of about half of this land. Several valuable water power sites also will be acquired by the company under its concession. All details of this work can be secured from any of the offices of the Bureau of Foreign and Domestic Commerce by reference to file No. 17,821.

### Railway Developments in Newfoundland

LONDON.

A plan of railway extension in Newfoundland proposes the construction of a through line from St. John's to Ships' Cove or St. Alban's on the south coast with a junction on the main line at Bishops' Falls or Grand Falls. A concession has been obtained from the government and progress has been made with the organization of a company and, should sufficient financial support be forthcoming, it is thought that the scheme will involve no cost.

to the government. A line of steamers will be instituted from St. Alban's to North Sydney on Cape Breton Island in place of the present service from Port aux Basques, thus enabling Canada and the United States to be reached twelve hours earlier than at present. The proposed scheme also intends to include the Botwood railway which will connect the north and south coasts of the island and thus the inconvenience under which Newfoundland has suffered of having winter ports on the two extreme ends of the island only will be removed. The new line, which will run through a valley for some distance will be much less likely to be blocked up by snow or ice than the main line. The most difficult portion of the main line will be avoided and the rail haul reduced by about 200 miles. It is anticipated that the new branch line will be operated electrically from water power available near the southern terminus.

### Receipts and Expenditures of English Railways

LONDON.

The Ministry of Transport has issued a statement regarding the financial results of the working of the railways during the six months ended September 30, 1920. The total revenue earned was \$453,501,111. The total expenditure was \$415,866,636, leaving a balance of revenue earned over expenditure of \$37,634,475. The standard year proportion of net receipts under the given guarantee was \$88,581,500, to which is added for interest on capital works brought into use \$2,026,500. Thus the net government liability for the six months ended September 30, 1920, is \$54,741,928. The traffic revenue earned was distributed roughly as follows: passenger traffic, \$223,982,885; freight traffic, \$247,562,711. For the month of September there was a net government surplus of \$799,697. This is the first surplus shown in any monthly return for the railways of Great Britain. The passenger receipts for September were \$38,923,500, or 17¼ per cent higher than those for the same month of 1919. Freight traffic for the month of September increased 124 per cent as compared with the receipts for the same month of the previous year. Tonnage has increased by about 14 per cent. The coal strike is estimated to have caused a loss in the revenue of the railways of approximately \$28,000,000.

### London & North Western Manager Retires

Sir Thomas Williams, general manager of the London & North Western since March, 1919, retired from that position on December 31, and has accepted a seat on the board of directors. Sir Thomas joined the staff of the company mentioned in 1876. After holding railway positions in south and central Wales, he was appointed district goods manager at Warrington. He was appointed traffic superintendent of the metropolitan area in 1907. Four years later he became assistant to the general manager, with headquarters at Euston station to deal with labor questions and the work in connection with conciliation boards. On January 1, 1914, he was appointed chief goods manager. In February, 1917, the directors appointed him acting general manager and, in March, 1919, general manager. In August, 1919, he received the honor of knighthood. He has been a member of the railway executive committee and the railway advisory committee associated with the Ministry of Transport. He was especially successful in connection with labor questions, and took a keen interest in all matters pertaining to the welfare of the staff.

Sir Thomas Williams is succeeded by Arthur Watson, C. B. E., M. Inst. C. E., general manager of the Lancashire & Yorkshire, who now simultaneously fills the position of general manager of both the London & North Western and Lancashire & Yorkshire. Mr. Watson, after being associated with the engineering department of the Lancashire & Yorkshire for a number of years, was appointed, in 1905, chief assistant engineer. Six years later he was appointed superintendent of the line. In April, 1918, he was appointed assistant general manager in combination with the position of superintendent of the line. In January, 1919, the directors of the Lancashire & Yorkshire Railway appointed him general manager. Mr. Watson attended the International Railway Congress at Berne, Switzerland in 1910. He visited the United States and Canada in 1912, and while in this country studied the working of American railroads.

## Equipment and Supplies

### Locomotives

THE MONTOUR RAILWAY is inquiring for 3 Mikado type locomotives.

THE NORTHWESTERN PACIFIC is inquiring for from 4 to 6 locomotives.

THE PITTSBURGH & WEST VIRGINIA is inquiring for 3, 10-wheel switching type locomotives.

THE NEW YORK, NEW HAVEN & HARTFORD is inquiring for 10, 8-wheel switching locomotives.

RICHMOND, FREDERICKSBURG & POTOMAC is inquiring for one 8-wheel switching type locomotive.

### Freight Cars

THE PEKIN-MUKDEN is inquiring through the car builders for 300 or more 44-ton capacity gondola cars.

THE ANGLO-BRAZILIAN COMMERCIAL & AGENCY COMPANY, Rio de Janeiro, Brazil, is inquiring through the car builders for 300 low side freight cars.

### Passenger Cars

THE LAKE ERIE & NORTHERN has ordered 3 coaches from the Preston Car & Coach Company, Preston, Ont., Canada.

THE GRAND RIVER RAILWAY has ordered 6 coaches from the Preston Car & Coach Company, Preston, Ont., Canada.

### Iron and Steel

THE VIRGINIAN RAILWAY has ordered 8,000 tons of rail from the United States Steel Corporation.

### Signaling

THE PENNSYLVANIA has placed an order with the General Railway Signal Company, Rochester, N. Y., for 84 position-light signals, 112 track transformers, and 180 relays, to be installed (by railroad forces) between Downingtown, Pa., and Atglen, 14½ miles.

Railway Station at Point Isabel, Tex., Where President-elect Harding Spent Part of His Vacation

## Supply Trade News

**John T. Reagan**, for several years in the sales department of the P & M Company, has been appointed assistant general sales manager of the **Creep Check Company** with offices in the terminal building, **Hoboken, N. J.**

**C. L. Mellor**, manager of sales of the **Barco Manufacturing Company**, Chicago, has been elected secretary of this company. Mr. Mellor will continue his duties in charge of sales in addition to his duties as secretary.

**R. W. Levenhagen**, secretary of the **Sherwin-Williams Company**, Cleveland, Ohio, has been elected vice-president in charge of auxiliaries of the **Glidden Company**, Cleveland.

Mr. Levenhagen has spent the greater part of his life in the paint and varnish industry, having started with the **Sherwin-Williams Company** 25 years ago. He held various positions in the service of the **Sherwin-Williams Company** and rose steadily until he became secretary, which position he held until his recent election as vice-president of the **Glidden Company**. Besides serving as secretary of the **Sherwin-Williams Company**, he was vice-president and general manager of the **Detroit White Lead Works**,

**Detroit, Mich.**, and vice-president of the **Martin-Senour Company**, **Chicago**, for a number of years.

**John R. LeVally**, formerly sales engineer of the **Locomotive Superheater Company**, at **Chicago**, has been appointed district sales manager of the company at **Pittsburgh, Pa.**, with offices in the **Union Arcade building**.

The **Austin Machinery Corporation**, of **Chicago**, has purchased the plant of the **Fairmont Mining Machinery Company**, at **Fairmont, W. Va.**, and will continue to manufacture this company's line of mining equipment.

The **Whiting Foundry Equipment Company**, **Harvey, Ill.**, has changed its name to **Whiting Corporation**. The **Whiting Corporation** remains under the same management and will make no change in its established operations or policies.

**Martin J. Root**, formerly of the **Fairbanks Company**, **New York**, has been elected president of the **United States High Speed Steel & Tool Corporation**, which has been reorganized. The headquarters of the company are at **489 Fifth avenue, New York**.

**George H. Grundy**, for many years connected with the **Crucible Steel Company of America**, as manager of its **New York branch**, is now associated with the **Poldi Steel Corporation of America**, **115 Broadway, New York**, as general sales manager, with headquarters at **New York**.

The **Black & Decker Manufacturing Company**, **Towson Heights, Baltimore, Md.**, has opened a new branch office and service station at **75 Fremont street, San Francisco, Cal.** This office will have jurisdiction of the company's business over the entire **Pacific coast territory** and will be in charge of **M. A. Johnson**.

The **National Railway Appliance Company**, **50 East Forty-second street, New York**, with branch offices in **Boston** and **Washington**, and the **Hegeman-Castle Corporation**, **Chicago**, announce that the selling agency for the **Clapp Fire Resisting Paint Company**, **Bridgeport, Conn.**, has been discontinued, effective **January 14**.

The **Howlett Construction Company**, **Moline, Ill.**, has taken over the selling and contracting end of the **Bay City Foundry & Machine Company's** coating station business. **W. L. Johnson Company**, **St. Paul, Minn.**, will handle the sales in the **Minnesota territory**, while **F. H. Hopkins & Co.** will have charge in the **Montreal, Quec.** district.

**F. L. Cook**, sales representative, and also in charge of the publicity department of the **Chicago Bridge & Iron Works**, at **Chicago**, is now in charge of the **Pacific Coast territory** of this company, with offices in the **Rialto building, San Francisco, Cal.** **Charles H. Sheldon** is the **Southern California** representative, with headquarters in the **Wright-Callender building, Los Angeles**.

The **Great Western Contracting Company**, **Kansas City, Mo.**, has changed its name to the **Rawlings Industrial Equipment Company**. This organization is sales engineer for various manufacturers of power plant machinery and is the representative of the **Conveyors Corporation of America**, **Chicago**, handling its coal and ash conveyors. The company also represents the **Springfield Boiler Company**, of **Springfield, Illinois**, and the **Cooling Tower Company**, of **New York City**.

On **January 1** the **Chambers Valve Company, Inc.**, of **New York**, was taken over by the **Bradford Draft Gear Company**, with offices at **23 West Forty-third street, New York**; **Munsey building, Washington, D. C.**, and **McCormick building, Chicago**. **Frank H. Clark**, formerly president of the **Chambers Valve Company**, becomes vice-president of the **Bradford Draft Gear Company**, with headquarters at **New York**, while the **Washington office** will be under the direction of **Harry F. Lowman**, vice-president.

**Edmund H. Walker**, who will be elected president of the **Standard Coupler Company**, **New York**, effective **February 1**, on the retirement of **George A. Post**, as was announced

in the **Railway Age** of **January 14**, has been connected with the company since **February, 1905**, and at present is first vice-president. Previous to his connection with the **Standard Coupler Company** he was engaged in railroad work with the **Great Northern, the Atchison, Topeka & Santa Fe, the Chicago, Burlington & Quincy, and the Minneapolis, St. Paul & Sault Ste. Marie**, in various departments. Mr. Walker was president of the **Railway Supply Manufacturers' Association** for the years **1917, 1918 and 1919**.

At the annual election of the **Union Railway Equipment Company**, **Chicago**, the following officers were elected: **W. B. Hall**, president and treasurer; **G. W. Clark**, controller and secretary; **A. F. O'Connor**, mechanical engineer; **E. S. Jubell**, superintendent; **H. O. Comstock**, sales agent. Mr. Jubell was formerly in charge of the forge department for the **Haskell & Barker Car Company**. The company's new forging plant, located on the **Indiana Harbor Belt, at Hammond, Ind.**, is now in operation.

R. W. Levenhagen

E. H. Walker

### American Brake Shoe & Foundry Company

William F. Cutler, president of the Southern Wheel Company, St. Louis, Mo., has been elected vice-president of the American Brake Shoe & Foundry Company, with headquarters at New York, and William B. Given, Jr., assistant vice-president at New York, has also been elected a vice-president, effective January 1.

William F. Cutler was born on March 5, 1888, at Washington, D. C., and was educated at Hill School, Pottstown, Pa., and was in the class of 1909, at Sheffield Scientific School, Yale University. He began railway work as an apprentice in the Altoona (Pa.), shops of the Pennsylvania Railroad, and later served in the shops of the Hale & Kilburn Company, Philadelphia, Pa. In 1912, he entered the service of the American Brake Shoe & Foundry Company, at New York, and subsequently held various positions until 1914, when he went to St. Louis as vice-president of the Southern Wheel Company, a subsidiary of the American Brake Shoe & Foundry Company. In 1917, he was elected president of the Southern Wheel Company, which position he still retains, in addition to his new position as vice-president of the American Brake Shoe & Foundry Company. He is a son of Otis H. Cutler, chairman of the board of the American Brake Shoe & Foundry Company.

William B. Given, Jr., was born on December 7, 1886, at Columbia, Pa., and was educated at Yale University. He has been in the service of the American Brake Shoe & Foundry Company since 1911, with the exception of two years, when he served in the United States Army. He held various positions with the American Brake Shoe & Foundry Company, until 1915, when he was appointed assistant to president. From May, 1917, to May, 1919, he served as a captain of infantry in the Rainbow Division of the United States Army, and then returned to the American Brake Shoe & Foundry Company as assistant vice-president, which position he held until his recent election as vice-president of the same company as above noted.

### Obituary

Harry L. Marsh, vice-president of the Thompson-Starrett Company, building construction, New York, died on January 13, at Overlook Hospital, Summit, N. J. Mr. Marsh had been connected with the Thompson-Starrett Company since 1912,

and had been one of its vice-presidents since 1915. He was born on July 23, 1875, at Ithaca, N. Y., and was educated at Cornell University. He began work as a draftsman in an architect's office at Ithaca. He went to Chicago in 1893 and served in the engineering department of the Chicago & North Western. He then served with the architectural firms of Frost & Granger and Holabird & Roche, Chicago, and in this connection was associated with the design and construction of the Rock Island terminal, the Chicago & North Western terminal, and the Chicago & North Western office building, and many other public buildings. In 1912 he joined the staff of the Thompson-Starrett Company, in its New York office as general superintendent, and in 1915 was promoted to vice-president. As such Mr. Marsh was head of the construction department and supervised all the construction work of the Thompson-Starrett Company, including the construction of the Woolworth, Municipal and Equitable buildings, the Hotel McAlpin, in New York, the Hotel Ambassador, at Atlantic City, the passenger station

H. L. Marsh

of the New York, New Haven & Hartford, at New Haven, and other buildings. During the period of the war he directed the work on the construction of Camp Upton, Yaphank, L. I., and the Fox Hills hospital, Grasmere, Staten Island, N. Y. He also acted in an advisory capacity during the construction of the large powder plant for the United States government, known as the United States Explosive plant C, at Nitro, W. Va.

Harry R. Warnock, vice-president in charge of mechanical matters of the Standard Stoker Company, New York, and formerly general superintendent of motive power on the Chicago, Milwaukee & St. Paul, died suddenly of heart failure at Hagerstown, Md., on January 19. He was born at Newcastle, Pa., on July 16, 1870. He began railway work as a freight brakeman with the Pennsylvania Lines West of Pittsburgh in June, 1889, and in the same year went to the Pittsburgh & Lake Erie as a brakeman. In September, 1891, he was promoted to locomotive fireman and later was locomotive engineer, which position he held until May, 1900. From that date until July, 1904, he served consecutively as engine despatcher, roundhouse foreman and general foreman, resigning on the latter date to become master mechanic of the West Side Belt, Pittsburgh, Pa., where he remained until October, 1905, when he became master mechanic of the Monongahela Railroad. He remained in this position until September, 1913, when he was appointed superintendent of motive power of the Western Maryland, which position he held until December 15, 1917, when he was appointed general superintendent of motive power of the Chicago, Milwaukee & St. Paul. In July, 1920, he became associated with the Standard Stoker Company and at the time of his death was vice-president in charge of mechanical matters, as above noted.

H. R. Warnock

### Trade Publications

EVERY DAY YOU USE AN EXIDE BATTERY.—The Electric Storage Battery Company, Philadelphia, Pa., has recently issued a 32-page illustrated booklet showing various uses of exide batteries. The object of the pamphlet is to suggest by means of artist's drawings the more important ways in which exide batteries serve in the industrial and social life of the nation.

OSGOOD RAILROAD DITCHERS.—The Osgood Company, Marion, Ohio, has recently issued a 16-page illustrated bulletin descriptive of the railroad ditcher manufactured by this company. The data includes the specifications of the ditcher, both for clamshell bucket and crane work, while line drawings show the principal dimensions, etc. The text is devoted to describing the various parts of the equipment, such as the frame, axles, boiler, hoisting machinery, etc., while illustrations show the completed equipment in operation, as well as the individual parts.

BURROWS DEFECTOSCOPE AND MAGNETIC ANALYZER.—Holz & Co., Inc., New York, has recently issued a 20-page illustrated bulletin—No. 41—describing the use of the Burrows defectoscope for the detection of internal defects in iron and steel. The history and principles of magnetic analysis are discussed in the text, the major portion of which, however, is devoted to the construction of the instrument and the manner in which it is used when making an inspection of steel rails, rods, cables or other iron or steel material. The illustrations are composed of numerous curves, diagrams and photographs covering the results of actual tests, as well as showing the manner in which the instrument is employed.

## Railway Construction

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company has awarded to the Roberts & Schaefer Company, Chicago, a contract for the installation of hoisting equipment in the company's coaling station at Selden, Kan.

**MINNEAPOLIS, NORTHFIELD & SOUTHERN.**—This company contemplates the construction of a 12-mile extension of its line from Northfield to Faribault, Minn.

**MISSOURI, KANSAS & TEXAS.**—This company is accepting bids for the construction of a roundhouse at Smithville, Tex.

**PERE MARQUETTE.**—This company, which was noted in the *Railway Age* of December 17 (page 1089), as receiving bids for the construction of a frame freight and passenger station at Clifford, Mich., has awarded the contract for this work to Spence Brothers, Saginaw, Mich.

**TENNESSEE.**—The Interstate Commerce Commission has issued a certificate authorizing this company to construct a branch line for a distance of 6 miles from a connection with its main line at the mouth of Beech Fork of New River in Tennessee.

**TEXAS & NEW ORLEANS.**—This company contemplates the construction of repair shops at Houston, Tex., to replace the buildings destroyed by fire on December 7.

**THE CALIFORNIA RAILROAD COMMISSION** has granted the Western Pacific permission to abandon that portion of the Tesla Branch lying between Moy and Carnegie.

**TORONTO, HAMILTON & BUFFALO.**—The Department of Public Highways, Toronto, Ont., is advertising for bids for the construction of a subway under the tracks of this company at Binkley's Corners, Ont.

**UNION PACIFIC.**—This company contemplates the construction of a roundhouse, blacksmith shop and repair shop at Fremont, Neb.

**UNION PACIFIC.**—The Interstate Commerce Commission, which on November 13 issued a certificate authorizing the construction of an extension in Scotts Bluff and Goshen Counties, Wyo., with the condition that the construction should be completed on or before December 31, 1921, has issued a further order extending the time to September 30, 1922.

**WABASH.**—This company contemplates the construction of a station at Macon, Mo., to cost approximately \$31,000.

## Railway Financial News

**AKRON, CANTON & YOUNGSTOWN.**—This company has applied to the Interstate Commerce Commission for a loan of \$356,000, for 15 years, to be expended in the improvement of its facilities.

**ANN ARBOR.**—The Interstate Commerce Commission has approved a loan of \$250,000 to this company to enable it to provide itself with additions and betterments to way and structures at a total estimated cost of \$500,000. The applicant itself is required to finance \$250,000 to meet the loan of the government.

**CHICAGO & EASTERN ILLINOIS.**—The Interstate Commerce Commission has announced a hearing before Director W. A. Colston, of its Bureau of Finance at Washington, on January 20, on its application for authority to issue securities for the purpose of acquiring the properties now owned by the Chicago & Eastern Illinois Railroad in reorganization.

**CHICAGO & NORTH WESTERN.**—This company has applied to the Interstate Commerce Commission for a loan of \$3,000,000, for 10 years, to enable it to complete the purchase of new equipment to the amount of \$9,684,093 through an equipment trust. It is proposed to apply the \$3,000,000 toward the cash payment and to issue \$6,630,000 of equipment trust certificates in accordance with its application filed with the commission on November 29, for permission to issue \$9,630,000 of 7 per cent certificates.

**DENVER & RIO GRANDE.**—The Stockholders' Protective Committee has appealed to the directors of the company to remove A. R. Baldwin as receiver of the road. The request was made in a letter which read in part as follows: "In view of the fact that Alexander R. Baldwin is vice-president of the Western Pacific Railway Company, and is thereby connected with the Western Pacific interests, which are seeking to wreck and destroy the Denver & Rio Grande Railroad Company, and in view of Mr. Baldwin's refusal to take any steps to protect the interests of the Denver & Rio Grande or its stockholders in this great emergency, the committee believes it to be your plain duty to take immediate steps to cause the removal of Mr. Baldwin as such receiver." Mr. Baldwin was asked by the stockholders to protect their interests, but is alleged to have replied that he had nothing to do with the pleadings in the case.

**DIVIDENDS** have been declared by the following roads:

Central of New Jersey.—\$2, quarterly, payable February 1 to holders of record January 27.

Huntingdon & Broad Top.—Preferred, 75 cents per share (1½ per cent), payable February 15 to holders of record February 1.

**EL PASO & SOUTHWESTERN.**—This company has applied to the Interstate Commerce Commission for authority to convert its present authorized capital stock, consisting of 350,000 shares of a par value of \$100, to 1,000,000 shares of stock without par value, of which 750,000 shares are to be exchanged for the \$25,000,000 par value of shares outstanding and 250,000 shares which are to be held in the treasury. The application says that the Transportation Act provides for the distribution of net profits in proportion to the value of the property irrespective of the par value. The general valuation of the railroads by the Interstate Commerce Commission is under way, and the value of the railroad will change from time to time with changing conditions and with additions and betterments. It will be impracticable to allow the outstanding stock issue to conform to these changes, and the issue of stock of no par value will enable the stock issue to conform closely to the actual value as it changes from time to time. It is stated that the company has for many years put large sums of money into the property without issuing stock against it, and it is believed the present par value has no relation to the actual value of the road. The commission has ordered a hearing on the application at Washington on January 24.

**GRAND TRUNK.**—Dillon, Read & Co., formerly Wm. A. Read & Co., are offering \$12,000,000 15-year 6½ per cent equipment

Photo from Underwood & Underwood, N. Y.

**The Metlac Bridge on the Line from Meixco City to Vera Cruz**

trust certificates, guaranteed by the Canadian government, at 95.40, yielding 7 per cent. The certificates are to be issued under the Philadelphia plan and will cover equipment costing \$16,000,000. The indenture creating these certificates provides for a sinking fund of \$400,000 annually, beginning the date of issue, which is February 1, 1921, which fund must be used for the purchase of certificates at or under par if obtainable. The balances of the sinking fund instalments not so used must be devoted to the purchase either of certificates of this issue or of Canadian government obligations maturing before the maturity of these certificates.

**HOCKING VALLEY.**—This company has applied to the Interstate Commerce Commission for an order authorizing the authentication and delivery of \$2,037,000 of its general mortgage bonds and the pledge of \$2,220,000 of its general mortgage bonds to secure a loan of \$1,665,000 from the United States government.

**KANSAS, OKLAHOMA & GULF.**—This company has been authorized by the Interstate Commerce Commission to issue \$2,744,750.11 of series A 6 per cent bonds, \$82,000 of series B 6 per cent cumulative income bonds, and not exceeding \$6,120,500 of series C 6 per cent cumulative income bonds, not exceeding \$9,120,500 of preferred stock, not exceeding \$729,640 of common stock; \$51,378.50 of 6 per cent equipment trust notes in procurement of equipment furnished by The Barney & Smith Car Company, and \$346,645.71 of 6 per cent equipment trust notes in procurement of equipment furnished by the American Car & Foundry Company.

**MAINE CENTRAL.**—The Interstate Commerce Commission has approved a loan of \$320,305 to this company to aid the company in meeting its maturing indebtedness. The company itself is required to finance \$80,000 to meet the loan of the government.

**MINNEAPOLIS & ST. LOUIS.**—This company has been authorized by the Interstate Commerce Commission to issue promissory notes to the amount of \$230,000 in connection with the purchase of five passenger locomotives

**MISSOURI PACIFIC.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing it to purchase the stock of the Little Rock & Argenta Railway.

**SACRAMENTO NORTHERN.**—The special committee, which was appointed to consider the offer made by the Western Pacific to purchase the road, has recommended against the terms of the sale, holding that the Western Pacific price was inadequate and any better offer could not be obtained.

**SOUTHERN.**—This company has applied to the Interstate Commerce Commission for authority to issue and sell \$950,000 of its first consolidated mortgage 5 per cent gold bonds, payable July 1, 1994, to provide funds for the redemption of a like amount of serial mortgage 5 per cent, Series D, bonds of the Virginia Midland, maturing March 1.

**THE TREASURY DEPARTMENT** has announced the payment of loans of \$3,759,000 to the Chesapeake & Ohio, \$500,000 to the Wheeling & Lake Erie, and \$5,200,000 to the National Railway Service Corporation from the \$300,000,000 revolving fund, on certificates of the Interstate Commerce Commission, since the issuance of the list published in the *Railway Age* last week. These bring the total of loans actually made up to \$175,904,937.

**WESTERN MARYLAND.**—The Interstate Commerce Commission has approved a loan of \$622,800 to this company to enable the carrier to provide itself with additions and betterments to ways and structures.

**WICHITA FALLS & NORTHWESTERN.**—This company has applied to the Interstate Commerce Commission for a loan of \$684,000 to be used in putting its track in condition, and also for authority to issue \$855,000 of first mortgage bonds to be pledged as collateral for the loan.

**WILMINGTON, BRUNSWICK & SOUTHERN.**—The Interstate Commerce Commission has approved a loan of \$90,000 to this company to aid in meeting its maturing indebtedness and providing itself with additions and betterments to way and structures at a total estimated cost of \$125,000. The carrier itself is required to finance about \$35,000.

## Railway Officers

### Executive

**E. S. Taylor**, assistant to the president of the Pullman Company, has been appointed director of purchases in addition to his regular duties, with headquarters at Chicago, effective January 14.

**L. E. Johnson**, who retired on January 1 as chairman of the board of directors of the Norfolk & Western, was born at Aurora, Ill. He first entered railway service in 1866 as a

locomotive fireman on the Chicago, Burlington & Quincy, and remained with the mechanical department of that company until 1886, having held various positions, including that of master mechanic at Aurora. In 1886 he was appointed superintendent of the St. Louis division and two years later was transferred to the Chicago division in the same capacity. In 1890 he went to the Montana Central (now a part of the Great Northern), as superintendent. Three years later he became superintendent of the Michigan division of the Lake Shore & Michigan Southern. In 1897 he went to the Norfolk & Western as general superintendent. In 1902 he was elected vice-president and general manager, and in 1904 president and general manager. Mr. Johnson was elected chairman of the board in 1918.

L. E. Johnson

### Operating

**George W. Holdrege**, whose portrait is published herewith, retired as general manager of the Chicago, Burlington & Quincy—lines west of the Missouri river—with head-

quarters at Omaha, on January 1, as announced in our issue of December 24. A short sketch of Mr. Holdrege's railway career was published in the issue mentioned. As stated then, he retired after fifty-one years of continuous service with this one road. The mere chronological details of Mr. Holdrege's career do not, however, give an adequate idea of his railroad life. He had an important part in the early construction of the Burlington lines west of the river. It was throughout his long career his policy

G. W. Holdrege

to encourage by all legitimate means every industry on the road, especially agriculture, and to his efforts were largely attributable the growth of the road's traffic. It is a notable fact that the work of constructing the Burlington's western lines, of which Mr. Holdrege was in charge, was never

abandoned, even during the hard times of the nineties, and that between 1892 and 1894, a period of general suspension of railroad building, the line from Nebraska to Billings, Mont., was built. In the years when the railways were active participants in politics he was a great political power in Nebraska. Mr. Holdrege's first position with the Burlington was as a paymaster and storekeeper in the office of the Burlington & Missouri River Railway at Plattsmouth, Neb., which position he took in 1869. A year later he was transferred to the offices of the company at Burlington, Iowa, and afterward entered the train service, serving for one year as a conductor. He was then made superintendent of construction of the Chariton branch westward from Chariton, Iowa. In 1872 he was made trainmaster at Burlington, and the next year assistant superintendent at Plattsmouth. He became general superintendent of the lines west of the river in 1878, assistant general manager in 1882, general manager of the Burlington & Missouri River railway in 1884, and general manager of the Chicago, Burlington & Quincy lines west of the river in 1903.

W. L. White, whose appointment as general manager of the Yosemite Valley was announced in the *Railway Age* of December 31 (page 1183), was born in Bevier, Mo., on December 8, 1885, and entered railway service in 1905 with the Chicago & Eastern Illinois. In 1907 he left the service of the Chicago & Eastern Illinois to accept a position in the operating department of the Chicago, Rock Island & Pacific, where he served until 1909, when he took service with the Northern Pacific, also in the operating department. In 1911 he was employed in the traffic department of the Oregon Short Line, and after two years' service with that company, he entered the traffic department of the Southern Pacific. In 1915, after a year of service with the Sierra Railroad of California, Mr. White was appointed traveling freight agent on the Salt Lake & Utah. He was promoted to general freight and passenger agent of that road in 1917 and in 1920 he was made assistant general manager of the Yosemite Valley, with headquarters at Merced, Cal., the position which he held at the time of his recent promotion.

### Financial, Legal and Accounting

J. H. Howard, general claim agent of the Chicago & Alton, with headquarters at Chicago, has been appointed assistant controller on the Chicago, Milwaukee & St. Paul, effective

January 20. Mr. Howard was born at Cincinnati, O., in 1879, and entered railroad service in the accounting department of the Cincinnati, New Orleans & Texas Pacific, now a part of the Southern Railway System. In 1898, he entered the service of the Chicago & Alton, being employed in the accounting department of that road in Chicago. During the next 10 years he was made station agent, traveling auditor, freight auditor, freight claim agent and general claim agent. In 1908, he left the service

of the Chicago & Alton to take a position on the Chicago Great Western at St. Paul. He remained with that road for five years and in 1913, returned to the Chicago & Alton as general claim agent. During the war Mr. Howard was called to Washington as manager of the Claims and Property Protection Section of the United States Railroad Administration. He returned to the Chicago & Alton as general claim agent in March, 1920, and was serving in that position at the time of his recent appointment.

J. H. Howard

C. F. Clement, treasurer of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Minneapolis, Minn., has retired after 34 years of service with the Soo Line, effective January 1. H. M. Paist, assistant treasurer, has been elected treasurer, succeeding Mr. Clement.

Frank Nay, vice-president and controller of the Chicago, Rock Island & Pacific, with headquarters at Chicago, has resigned to become controller of the Allied Chemical & Dye

Frank Nay

Corporation, of New York, effective February 1. Mr. Nay was born on April 19, 1861, near Columbus, Ohio, and entered railway service in April, 1883, as a statistical clerk in the office of the general auditor of the Missouri Pacific. From April, 1884, to April, 1887, he was employed as a clerk in the accounting department of the Texas & St. Louis, now the St. Louis Southwestern. On the latter date he was made traveling auditor on the same road, a position which he held until January, 1889, when he

was made chief clerk in the general auditor's office. He was appointed auditor on the Minneapolis & St. Louis in April, 1889, and in April, 1902, he was made auditor on the Iowa Central, in addition to his duties with the Minneapolis & St. Louis. Mr. Nay was appointed assistant controller on the Rock Island in April, 1903, and after a year and a half in this position he was made general auditor. He served as general auditor until December, 1909, when he was appointed controller. He was elected vice-president and controller in May, 1919. As chairman of the rate committee of the Association of Railway Executives, Mr. Nay had charge of securing statistical data furnished Congress during the preparation and discussion of the Esch-Cummins Bill.

### Traffic

Homer Cain has been appointed general agent for the Nashville, Chattanooga & St. Louis, with headquarters at Kansas City, Mo.

C. W. Brosius has been appointed general freight agent on the Texas & Pacific, with headquarters at New Orleans, La., effective January 1.

F. G. Stebbins has been appointed district freight agent on the Baltimore & Ohio with headquarters at Dallas, Tex., and C. W. Browder has been appointed district freight agent with headquarters at Kansas City, Mo.

W. M. Knapp has been appointed general freight agent of the Central of Georgia in charge of freight traffic agencies, with headquarters at Savannah, Ga. C. D. Chancellor has been appointed assistant general freight agent, with the same headquarters. These appointments were effective January 1.

W. R. Callaway, passenger traffic manager of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Minneapolis, Minn., has retired, effective January 1. H. M. Lewis, general passenger agent, has taken over the duties of the passenger traffic manager, that office having been discontinued.

F. E. Lewis has been appointed assistant general freight agent on the New York Central, with headquarters at Detroit, Mich., with jurisdiction over the city of Detroit and the Detroit branch to and including Wyandotte, Mich. The office of general agent at Detroit has been abolished. E. G. Howard has been appointed division freight agent on the New York Central with headquarters at Hillsdale, Mich.

**R. R. Hollinger**, general agent on the Texas & Pacific, with headquarters at Pittsburgh, Pa., has been transferred to New York, succeeding **C. W. Brosius**, who has been promoted to general freight agent, with headquarters at New Orleans, La. **G. C. Whitney**, general agent, with headquarters at Kansas City, Mo., succeeds Mr. Hollinger. **O. I. Shannon** succeeds Mr. Whitney. **H. A. Lowry**, general agent, with headquarters at Birmingham, Ala., has been transferred to New Orleans, La., succeeding **J. L. Hogan**, who has been promoted to foreign freight agent, with the same headquarters. **T. C. Taylor** succeeds Mr. Lowry. The appointments and changes were effective January 1.

**W. H. Wharton**, general northern agent of the Nashville, Chattanooga & St. Louis, with headquarters at Chicago, has been promoted to assistant general freight agent, with headquarters at Nashville, Tenn., effective January 1. Mr. Wharton entered the service of the Nashville, Chattanooga & St. Louis in 1900 as a stenographer in the offices of the company in Nashville, and has spent his entire railroad career with this road. After being made soliciting agent, he was promoted to traveling freight agent and in 1907 became commercial agent with headquarters at Chicago. During the war Mr. Wharton was commissioned a lieutenant in the Ordnance Reserve Corps. **E. J. Stegner**, general agent, with headquarters at Kansas City, Mo., succeeds Mr. Wharton at Chicago.

### Mechanical

**J. W. Chandler** has been appointed master mechanic of the Kansas City Southern, at Pittsburg, Kan., effective January 1, succeeding **C. J. Burkholder**, resigned to enter the service of another company. **C. L. Adair** succeeds Mr. Chandler as master mechanic at Shreveport, La.

**W. L. Robinson**, master mechanic of the Baltimore & Ohio with headquarters at Washington, Ind., has been appointed superintendent fuel and locomotive performance with headquarters at Baltimore, Md., succeeding **E. E. Ramey**, who has been assigned to other duties.

**F. N. Pease**, chief chemist of the Pennsylvania, with headquarters at Altoona, Pa., retired from active service on January 1, in accordance with the pension regulations of that company. Dr. Pease has been succeeded by **M. E. McDonnell**, who was assistant chief chemist, and **T. W. Fisber** has succeeded Dr. McDonnell as assistant chief chemist.

### Engineering, Maintenance of Way and Signaling

**D. Fairchild** has been appointed acting supervisor of bridges and buildings on the Puget Sound division of the Northern Pacific, with headquarters at Seattle, Wash., succeeding **W. E. Bradley**, who has been granted a leave of absence, effective December 1, 1920.

### Railroad Administration

**J. G. Code** has been appointed staff officer of the Railroad Administration, vice **W. J. Harahan**, resigned to become president of the Chesapeake & Ohio. **R. J. Turnbull** and **C. T. O'Neal** have been appointed assistants to the staff officer. The staff officer with his assistants will, in addition to the general matters heretofore handled by that office, adjust all claims remaining unadjusted by Railway Adjustment Boards Numbers 2 and 3 after January 10.

### Purchasing and Stores

**Edmund T. Burnett**, whose retirement as general purchasing agent of the Norfolk & Western was announced in the *Railway Age* of December 24 (page 1138), was born in Philadelphia, Pa., and was educated at Saunders Institute. He was engaged in mercantile pursuits for several years after he had completed his schooling and first entered railway service in 1882 as chief clerk to the purchasing agent of the Norfolk & Western. In 1891 Mr. Burnett was appointed assistant purchasing agent, with headquarters at Roanoke, Va. In 1893 he was promoted to purchasing agent with headquarters

at Philadelphia. When the road was reorganized in 1896 Mr. Burnett transferred his headquarters to Roanoke. When the government assumed the operation of the railroads Mr. Burnett was appointed, first, an associate member of the Eastern Regional Purchasing Committee and, later, regional purchasing agent for the Pocahontas region. When the roads were returned to their owners Mr. Burnett was appointed general purchasing agent of the Norfolk & Western.

### Obituary

**David L. Bush**, assistant to the vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, whose death was announced in the *Railway Age* of December

D. L. Bush

31 (page 1184), had been in the service of the St. Paul for more than 45 years. Mr. Bush was born on July 31, 1855, at Sharon, Wis., and entered railway service in December, 1872, as a night operator on the Western Union Railroad, now a part of the St. Paul system. In 1875 he was made chief operator in the train despatcher's office at Racine, Wis., and served there until January, 1877, when he was made train despatcher. On May 1, 1877, in addition to his other duties, Mr. Bush was made superintendent of the Western Union and the Sabula, Ackley & Dakota Railroad, which has also been taken over by the St. Paul. In September, 1880, he was made superintendent of the Racine and Southwestern division of the Chicago, Milwaukee & St. Paul, and continued to serve in that capacity until July, 1887, when he was transferred to the James River division. In February, 1888, Mr. Bush was made superintendent of the Southern Minnesota division, in 1890 he was transferred to the Hastings and Dakota division, and in 1894 he became superintendent of the River division, with headquarters at St. Paul, Minn. In April, 1898, Mr. Bush was promoted to assistant general superintendent, with headquarters at Milwaukee, Wis., and three years later he became general superintendent. He served as general superintendent until October 1, 1909, when he was promoted to general manager, with headquarters at Chicago, and in January, 1913, he was elected vice-president in charge of operation. During the period of federal control, Mr. Bush served as assistant to the federal manager of the St. Paul, having been appointed to that position in August, 1918. In March, 1920, he was made assistant to the vice-president, and was serving in that position at the time of his death.

WESTERN PROGRESSIVISM and eastern conservatism are said to have clashed sharply at the annual convention of the American Economic Association in Atlantic City, N. J., on December 27. C. O. Ruggles, professor in the University of Iowa, took issue with Prof. Frank H. Dixon, of Princeton University, who declared that the nation had been carried dangerously near paternalism through some features of the Transportation Act, 1920. "We have reached a point in the line of inquisitorial supervision where we may well stop and take account of stock. If we insist upon carrying regulation to a point where capital rebels, then there will be a decline in the character of service." "We have not gone even half way to the danger point of regulation," replied Prof. Ruggles. "We shall not get the right kind of service until terminals are controlled by one terminal corporation. It is about time to apply the law of eminent domain in clearing up that situation. Do this and we may eliminate the problem of government ownership."

The divisional form of organization presumes an adequate degree of supervision by the system officers to insure uniformity of practices on the several divisions. In the maintenance of way department this implies the employment of staff officers possessing thorough familiarity with the physical conditions of the entire system, whose duty it is to supervise and inspect the work being done on the various divisions. That the value of this supplemental supervision is recognized is demonstrated by its adoption in one form or another by practically all roads committed to the divisional organization. Such supervision was never more important than at present when the greatest economy must be practiced. Steps to curtail expenditures always meet with direct or indirect opposition from the divisional or subdivisional officer who brings forth every evidence to demonstrate the dire need of his own territory in an effort to obtain some measure of relief from the operation of the orders for retrenchment. It is only through a detailed knowledge of the entire property by staff officers with special training and time to look after such matters that the management can be enabled to enforce a uniform practice of economy on the entire system.

As stated elsewhere in this issue, the plans for the convention of the American Railway Engineering Association are nearing completion. The convention will be held in Chicago during the third week in March according to the precedent established by this organization during the 22 years of its existence. By the same token the officers of the National Railway Appliances Association are perfecting all arrangements for the exhibit which will be held at the Coliseum and annex simultaneously with the association convention. The fact that the Signal division of the American Railway Association has decided to abandon its one-day stated meeting scheduled for March 14 will in no way affect the plans of the other two organizations for "Engineering Week" at Chicago. Officers of the American Railway Engineering Association have stated that there is absolutely no ground for the rumors that this association has planned to abandon its three-day meeting scheduled for March 15-17, inclusive, while the records of the National Railway Appliances Association show that the members have already contracted for nearly all of the display space available.

During the past few weeks several railroads have sent out inquiries regarding substantial lists of railroad shop equipment, particularly machine tools, and this fact indicates a growing appreciation of the urgent need for such new equipment. There is little question as to the placing of large orders when the financial situation clears at Washington and the railroads are enabled to obtain partial payments on their guaranteed returns. Pending the installation of new machinery, however, much can be accomplished to increase the

efficiency and output of railroad repair shops by making better use of present equipment. The output of many heavy repair shops is limited by the capacities of the respective machine departments and it is here that a little attention will pay the largest returns. Many old machine tools are too hopelessly out of date to be renovated or modernized, but in some cases desirable results can be secured by providing a more powerful drive, increasing the speed or feed range, or possibly strengthening the machine at a weak point. In any case, it is advisable to develop in every shop a competent repair gang charged with the duty of carefully and periodically inspecting all machines and keeping them keyed up for maximum production. In this way weak points in the machinery will be discovered and many breakdowns, with their resultant delays, prevented. Perhaps the most prolific source of increased machinery output with present equipment is in the design and application of time-saving jigs and fixtures. Careful attention to the individual job will show what operation consumes the most time and in many cases a little ingenuity will suggest some simple jig or fixture capable of reducing the time required for the operation by fifty per cent or more. In this connection a word of warning should be uttered against the man who would spend *all* his time designing time-saving devices. Common sense will show where to draw the line between efficient devices and complicated ones which cost more than they save.

No opposition developed at the hearing in Washington on Monday on the application of the El Paso & Southwestern Company to the Interstate Commerce Commission for permission to increase the company's authorized capital stock from 350,000 shares of \$100 par value to 1,000,000 shares of no par value, and to issue of the latter stock without par value 750,000 shares in exchange for the 250,000 shares of stock of \$100 par value now outstanding. The novelty of the plan proposed will undoubtedly attract no small amount of attention. The use of stock without par value is a new development as far as railroads are concerned. A number of industrial companies have issued such stock. The Federal Securities Commission of 1910 endorsed the idea in its report and gave extensive reasons for its endorsement. The reason given in the railroad's application was briefly that inasmuch as the value of the road is changing from time to time, as additions and betterments are made, etc., if the outstanding stock is without par value, it will conform more closely to the actual value of the road at all times. The application, however, did not state any particular reason the company may have had in mind for taking its proposed action at this particular time. The El Paso & Southwestern Company is controlled by the Phelps-Dodge interests. It is a holding company and owns directly or through subsidiaries or leases the lines which make up the El Paso & Southwestern system. The stock of the El Paso & Southwestern Company outstanding is \$25,000,000; it has no bonded debt, although there are bonds outstanding of various of the subsidiary companies. The investment in road and equipment as of December 31, 1919, is given as \$712,471,500, the invest-

ment in affiliated companies as \$34,156,431 and other investments, \$1,423,990, a total of \$42,705,136. On December 31, 1919, there was a corporate surplus of \$16,327,599. A perusal of these various facts fails to show what the company may have in mind, unless it be to capitalize its surplus as the Burlington and Lackawanna are proposing to do. That, however, will probably be brought out in later developments as well as some interesting discussion, no doubt, on the idea of railroads issuing stock without par value.

The series of articles by J. P. Risque on the railways of Chile which began in the *Railway Age* of two weeks ago has proved more timely than was perhaps expected. Press despatches from Chile this week are authority for the statement that the Chilean government is renewing its attempt to place a loan for \$25,000,000 to be used principally for additions and betterments to the state railways. The Minister of Finance is quoted as saying that the loan will bear interest at not more than 8 per cent and will be repaid by a fund created by setting aside 15 per cent of the gross revenues of the state railways. He is also quoted as saying that negotiations are going on in Europe as well as in New York and that the loan will be placed, naturally, in the place where the best terms are offered. The Chilean government has had this loan in mind for some time, and its progress or rather lack of it has been watched with interest. The friendship of the Chilean railway men for American railroad methods is well known and has been already pointed out in Mr. Risque's articles. The placing of the loan, however, is perhaps a more substantial factor, for it is generally the case that orders for equipment and supplies go to the country which supplies the funds. There can be little doubt, in other words, that if the Chileans can come to terms with the New York financial interests, there will be compensating orders for American railway material. Conversely if the loan is placed in Europe the Chilean requirements will presumably not be placed in this country despite the underlying friendship for American ways of railroading.

A year or two ago when the people of the various States authorized enormous bond issues for highway construction no little anxiety was felt by many railway engineering executives in anticipation of the depletion of their staffs in consequence of the opening up of such a large field of employment for engineers. Fortunately for the railroads, this competition has not materialized. Subsequent developments have resulted in delaying the full force of the wholesale highway construction but facts more recently brought to light are most illuminating in disclosing the real reason why railway engineers as a class have not been attracted to highway construction. The answer is an old one—inadequate compensation. This has been brought out emphatically in a bulletin issued by the American Association of Engineers calling attention to the fact that the salaries being paid by the various State highway commissions to their engineering employees and officers are woefully out of proportion to the responsibilities of the positions. A study of tables showing salaries paid in the various States shows that the rates are appreciably below those paid by most of the railroads for corresponding positions. This is particularly the case with the executive officers. The average salary paid to chief highway engineers in the 48 states is \$5,372, with a maximum of \$10,000 and a minimum of \$3,000. Bridge engineers in

only four States are paid in excess of \$4,000. Construction engineers receive from \$2,400 to \$5,000, and district engineers from \$1,800 to \$5,000. But even in the lower positions of inspector and instrumentman the scale is generally below that of the railroads. While these facts will be pleasing to the railway managements, they offer no excuse for an attitude of complacent assurance. The present rates paid the engineering staffs on railroads are in large measure the result of circumstances obtaining during the period of government control and with the present period of reduced construction activities, there will be an unquestioned tendency to reduce the average compensation to the engineering forces. A pursuance of this policy would soon wipe out the differential between railway and highway work and result in harm that would far exceed the saving in salaries.

## The Port of New York — A National Problem

GENERALLY STATED the great majority of the American people are unaware of the bearing which the Port of New York has upon their affairs either in a business or a personal way. Fully one-half or more of the import and export traffic of the entire country passes through this port—a port where freight handling costs are manifestly too great. The problem is essentially a national one. Any solution that will reduce operating and freight handling costs will not only benefit the people in the immediate locality and the twelve large railroads entering the port, but will eventually benefit industry the country over.

The railroads in this district are actually losing money on the freight handled by car ferries or lighters. According to the studies of the New York-New Jersey Port and Harbor Development Commission, whose report is abstracted elsewhere in this issue, the average terminal allowance at New York is from 60 cents to 80 cents per ton while it actually costs from \$2.25 to over \$3 per ton to handle freight from the New Jersey yards to Manhattan piers. While the present system does move the freight in a fashion it is far from satisfactory or economic. The realization of this was one of the causes underlying the appointment of the Commission in 1917 to study the situation and to report a plan to remedy it. The system proposed by the Commission after three years of study and field work has many strong points, besides the fact that it can be built and placed in operation without any disturbance of existing methods. Under its operation the present average of 3½ days per car from the New Jersey yards to Manhattan and return will be reduced to 36 hours or less, an estimated saving of about one and one-half million car days under present traffic conditions. Better use of cars will result from the use of the joint yard to be built in New Jersey, while the movement of empty cars across the river—about 25 per cent of the total cars moved—will be automatically obviated. There are also other advantages that should have a marked bearing on the adoption of the plan. On the other hand, the greatest difficulty probably is that it will be necessary to overcome that of gathering together all of the loose strings of municipal authority scattered throughout the New York-New Jersey port district into one centralized directing management or port authority as the Commission calls it. Politics and petty municipal jealousies have undermined many other plans and it is probable that they will be once more at work in this instance. Yet this difficulty does not appear insurmountable by any means in this case for the legislatures of the two states seem to have realized at last that something vital must be done and done soon.

For the physical plan, certainly one feature, that of the

automatic-electric subway system, will receive its share of comment, discussion and, no doubt, disparagement. While a radical departure in port methods, it is not entirely new. In London, England, the post office department is now completing a similar installation,  $6\frac{3}{4}$  miles long, to operate at speeds up to 35 miles an hour and for which equipment is now being purchased. The studies and tests for this London project extended over a period of ten years before it was finally adopted. The Commission in evolving its plan received the advice and assistance of the leading electrical engineers, transportation and conveyor men of the country as well as the indorsement of leading electrical manufacturing companies as to its practicability. While an innovation it is exceedingly well planned out, its cost is lower than any of the other proposed systems, and its capacity in tonnage is far greater. It is easily capable of expansion and offers numerous possibilities for the efficient rearrangement of present steamship facilities and distributing centers. It is independent of weather, harbor strikes, and, to a far greater degree than ever before, to labor difficulties in general. Taken altogether it is worthy of the closest study and consideration for it is the most comprehensive plan that has as yet been evolved.

## One Reason Why Railway Expenses Are So Enormous

WHILE THE RAILWAYS are fighting before the Railroad Labor Board against continuance of the efficiency destroying national agreements made by the Railroad Administration with certain labor brotherhoods, the Interstate Commerce Commission has made public some statistics which would have been issued in the ordinary course of events but which have a very direct bearing upon the matters immediately in issue before the Labor Board.

The statistics of the commission show, for one thing, that in the first eleven months of 1920 the railways spent \$813,500,000 more for the maintenance of their locomotives and cars than in the same months of 1917. The cost of maintenance of equipment in the first eleven months of 1917 was \$630,000,000, while in the first eleven months of 1920 it was \$1,443,500,000, or 130 per cent more. Almost simultaneously the commission made public statistics showing that in March, 1920, the Class 1 railways had 2,009,948 employees, or 277,012 more than in 1917.

What bearing have these figures upon the subject of national agreements? In the first place, witnesses for the railways before the Labor Board have shown that under the operation of the rules of the national shop crafts agreement they are being compelled to pay employees in the shops many millions of dollars annually for work which is not done. This partly accounts for the enormous increase in the cost of maintaining locomotives and cars. In the second place, witnesses for the railways in every section of the country have been showing for a week how the abolition of piece work in the shops, and the substitution of the hourly basis of pay which the national agreements would continue, has resulted in reductions in the amount of work done per employee of from 10 to 50 per cent.

Some of the facts regarding the reduction in the efficiency of labor which followed the abolition of piece work which have been given in the testimony before the Railroad Labor Board are positively startling. It has been testified, on the basis of careful statistical studies, that in the shops of the Chesapeake & Ohio the output per man declined from 11 to 40 per cent. In the main shops of the Union Pacific it declined from 21 to 29 per cent. In the shops of the New York Central, between 1917 and 1920, the number of hours of work for which the railway paid increased 53 per cent.

while the total output of the men who did the work increased only 14 per cent. The time required to perform certain operations in the locomotive erecting shop and foundry of the Baltimore & Ohio at Newark, Ohio, and in its shops at Baltimore, Md., increased from 6.7 to 200 per cent. In the shops of the Pennsylvania the abolition of piece work has reduced the average output per man almost 27 per cent. In the car repair shops of the Chicago & North Western the decline in efficiency was 36 per cent.

The necessary effect of the establishment of the eight-hour day and decline in the efficiency of labor was to cause a large increase in the number of men who had to be employed to do the same amount of work. It is not, therefore, surprising to find from the statistics of the commission that while in 1917 the railways had 264,586 machinists, boiler makers, blacksmiths, painters and upholsterers, electricians, air brake men, car inspectors, car repairers, and machinists' helpers and apprentices, in March, 1920, they had 378,238 of these classes of employees, an increase since 1917 of 113,652. The percentage of increase in all the employees of the railways between 1917 and 1920 was 16 per cent, while the percentage of increase in the number of shop employees of the classes just mentioned was 43 per cent.

Here, then, are the facts briefly summarized. The employees in the shops in 1917 were working on a ten-hour basis, while in 1920 they were working on an eight-hour basis. For working on an eight-hour basis they are now receiving 72 per cent higher average monthly wages than they received in 1917 on a ten-hour basis. The abolition of piece work has resulted in a heavy reduction in the average work done per man, not only per day, but per hour; and because of this and the eight-hour day the railways are being obliged, or were when business was heavy, to employ 43 per cent more men in their shops than in 1917. Nor is this all. In spite of the great increase in the number of men employed in the shops, the railways were unable in 1920 to do in their own shops all the repair work on locomotives and cars required, and consequently had to send a substantial part of their equipment requiring heavy repairs to outside plants, which further greatly increased the expense of maintenance of equipment.

Is it any wonder, in view of such facts as the foregoing, that the cost of maintenance of equipment increased 130 per cent within three years? Largely because of this increase in the cost of maintaining equipment the public is today paying higher freight and passenger rates than ever before, and yet the railways are failing to earn the average return of 6 per cent on their valuation which the Interstate Commerce Commission has held they need. The public caused the railways to be returned to private operation because it believed that under private management they would be more economically operated than under government management, but the railways cannot be more economically operated under private than under government management unless they are given the opportunity to adopt the methods which are absolutely essential to increasing economy and efficiency. The national agreements, by forcing the railways to pay out many millions of dollars for work which is not done, by preventing them from establishing piece work in their shops, and by interposing other formidable obstacles in the way of increasing efficiency, are among the things which thus far have rendered it impossible for the managements to effect the large economies which they ought to effect, and are seeking to effect, not only in their own interest but in the interest of the public which pays the passenger and freight rates.

The railroads in this matter really are fighting the battle of the public, because unless operating expenses can be reduced it will be impossible for freight and passenger rates to be reduced, and they may have to be increased. In this fight, therefore, the railways ought to have the backing of an aroused and effective public sentiment.

## Supreme Court on the Paterson Crossing Case

THE SUPREME COURT of the United States, in its decision holding that the Erie Railroad must obey the order of the New Jersey Public Utility Commission to elevate its tracks in Paterson at great expense to cross fourteen streets, says that intelligent self-interest should lead the state to consider carefully what the road is able to do without ruin; but that this is not a constitutional duty. The court below approved the conclusion of the public utility commissioners that the expense would not be ruinous. "It is difficult to avoid the apprehension that the officers of the state hardly gave due weight to the situation of the company as a whole," but they did not exceed their constitutional powers, says the court. For delicate shadings of opinion, this wording would be hard to beat. The state puts a very large special financial burden on the railroad company, at a time when, because of state-limited fares and freight rates, its every-day expenses are abnormally burdensome, and the only comfort our nine impartial arbitrators can offer to the railroad is that the state is not bound by the constitution to exercise intelligent self-interest! The authorities of the state must know that the people need the railroad, but there is no obligation resting on them to refrain from starving it to death. It is difficult not to see that the state, in its blindness, has oppressed the railroad; but there is no law to remedy matters.

This decision comes very near paralleling the colloquialism that there is no law forbidding a man to make a fool of himself. It would be interesting to be able to put in words the thoughts of the three minority judges—who dissented without saying why they did. The "apprehension" that the state had been unreasonable with the railroad company evidently was, in their minds, very well-defined. It is a familiar fact that a good many public servants—congressmen, for example—consistently follow the theory that full justice will be done by giving the railroads a little real nourishment after it has become indubitably apparent, to the blindest person in America, that they are actually starving to death—not merely threatened with death. This has been the case for years. The disturbing fact today is that, in spite of the enlightening experiences of the past three years, the exponents of this theory often manifest as vigorous a life as ever they did in the past; and that our democratic constitutional ideals, as expounded by our court of last resort, seem to afford no relief. General Grant said that, to get rid of a bad law, enforce it—often a very slow process. To get rid of a fault in the constitution is still slower.

### What Is the Service of Supply?

IT IS WITHIN the recollection of many that the purchase and distribution of supplies required by the railroads was entrusted to the departments who made use of the materials. The stores department was then the logical outcome of an attempt to specialize on the distribution of supplies and as railway purchases grew to enormous proportions the purchasing department became an obvious necessity. But to assign to them merely these routine functions is to lose sight of one of the most potent possibilities for improving the management of our railroads. This lies in the execution of a policy that will insure the full utilization of every single item of material. The purchase of an article at the lowest price quoted and its delivery to any point on the railroad with the least expense is a comparatively simple matter to which good judgment, good organization and scientific methods all contribute. But to know that this article is actually needed, that it will be used to the best advantage

within a short interval after it is purchased and that there is not a surplus of the same article at some other point on the railroad that will obviate the necessity for purchase, calls for broader and more comprehensive action.

It may be argued that the department which uses the material is best qualified to estimate its future requirements. But is this a fact? Today, it is almost impossible to find a large railroad on which there are not quantities of materials which will last for months or years that the mechanical, the engineering or some other department *thought* they would need at once. These departments are not to blame; they were expected to have all the supplies they needed and they invariably ordered enough to be on the safe side. Now they are not expected to order anything and eventually the scarcity of many materials will become as deplorable as the present surplus. The truth is that few railroads analyze their local conditions and base their estimate of future needs upon careful study of fundamental conditions rather than upon a temperamental Wall street. The growing boy who receives a new suit of clothes during every interval in which he gains a few inches in height is fortunate but the "feller" who is showered with clothes only when his dad has a lot of surplus cash "needs a friend."

It should be somebody's business to study the recurring needs of every railroad and to map out a program for material purchases that is based on the actual growing needs of the property rather than upon earnings. The supply department through its extensive organization should be able to gage the future needs of every railroad just as the traveling salesmen of some of many progressive mercantile concerns estimate and report upon the consuming capacity of territory with which they are intimately acquainted. The purchasing department through its knowledge of market conditions should know when and how the railroad can buy to the best advantage. Hence the service of both of these departments is indispensable to a logical determination of the material requirements of a railroad. It is only by the association of these two departments presided over by a chief supply officer that a real service of supply can be established. It would be impossible to describe the service of supply to better advantage than outlined in the article on "The Service of Supply as a Business Institution," appearing elsewhere in this issue.

### New Books

*Proceedings of the American Society for Testing Materials for 1920. Two volumes 6 in. by 9 in., 1,360 pages. Bound in cloth. Published by the American Society for Testing Materials, 1315 Spruce Street, Philadelphia, Pa.*

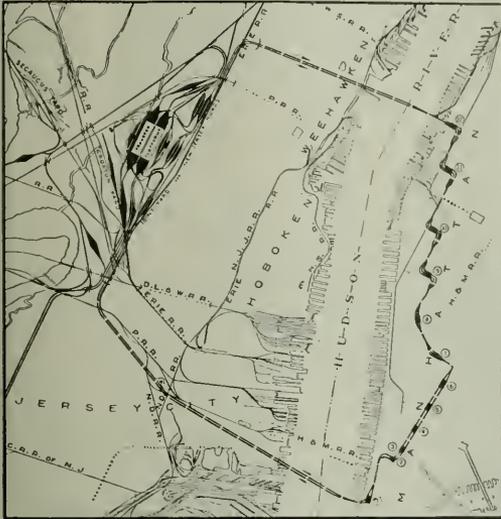

These volumes contain the proceedings of the twenty-third annual meeting which was held at Asbury Park, N. J., on June 22-25, 1920. The first volume contains the committee reports and tentative standards. Among the reports of particular interest to railway men are those on the Proposed Revisions in Standards and Tentative Standards for Steel, Corrosion of Iron and Steel, Cement, Reinforced Concrete, Concrete and Concrete Aggregate, Preservative Coatings for Structural Material, Methods of Sampling and Analysis of Coal, and Shipping Containers. Among the tentative standards incorporated in this volume are those for steel, tie plates, boiler and firebox steel for stationary service, carbon tool steel, low carbon steel track bolts, non-ferrous alloys for railway equipment, bronze bearing metals for turntables and movable railroad bridges, and babbitt metal. The second volume contains the technical papers presented before the convention, including one on The Shattered Zone in Certain Steel Rails with Notes on the Interior Origin of Transverse Fissures by J. E. Howard and another on the Effect of Hydrated Lime.

# Proposed Reorganization of the Port of New York

## Special Automatic-Electric Subway System Feature of the New York-New Jersey Commission Report

**A**FTER MORE THAN THREE YEARS' intensive study and planning the New York-New Jersey Port and Harbor Development Commission has completed its plan for the reorganization of the Port of New York and has submitted it to the state legislatures. The report covers not only the plan recommended but also contains the results of studies relative to possible solutions to the problem by means of overhead and underground systems connecting New York and New Jersey for the use of standard equipment; motor truck service; cableway truck conveyor service and improved

and New York belt systems, at first by car ferry and ultimately by tunnel under the Upper Bay; operating all of these lines jointly and operating jointly, through new joint railroad terminals, all railroad marine service not replaced by other service; and building an underground railroad system carrying special electrically operated cars, connecting with all of the railroads of the port, serving virtually all of Manhattan and enabling the railroads to discontinue their pier stations and consequently release the waterfront to other uses.

Initial Development of the Automatic-Electric System

water transfer service, all of which however were found unsuitable.

The New York-New Jersey Port and Harbor Development Commission consists of William R. Willcox, chairman; J. Spencer Smith, vice-chairman; Eugenius H. Outerbridge, DeWitt Van Buskirk, Murray Hulbert and Frank R. Ford. Major-General George W. Goethals is consulting engineer; B. F. Cresson, Jr., chief engineer; Julius Henry Cohen, counsel; William Leary, secretary, and C. A. Ruhlmann, assistant secretary.

### The Comprehensive Physical Plan

A complete reorganization of the railroad terminal system is the most fundamental physical need, such a reorganization involving new methods of handling freight from the break-up yards of the railroads. The plan recommended calls for improving and opening up for joint use the existing belt-line links in New Jersey and constructing other belt lines along navigable New Jersey waters and farther inland; building similar marginal railroads along navigable waters adjacent to Brooklyn, Queens, Staten Island and the Bronx and utilizing with them the Long Island and the New York Connecting Railroad to form a belt-line system in New York; connecting the New Jersey

### Present Railroad Operations

Twelve railroads, exclusive of purely local enterprises, come to the Port of New York. Nine of these enter the district from New Jersey, and are referred to as the New Jersey railroads. The remaining three enter from New York, terminate in New York and are referred to as the New York railroads.

The commission's analysis, which it believes to be more accurate than any previously attempted by any agency, gives the following figures for operating costs in 1914: For goods handled at Manhattan car-float pier stations or inland rail stations, \$1.60 per ton; for goods handled at Brooklyn, Harlem or Bronx stations, \$1.48 per ton; for goods lightered, \$2.14 per ton.

On the basis of 1918 prices, which are obviously much higher than those of 1914, the commission estimated that the total terminal costs to the railroads were about \$2.25 per ton for freight handled to or from Manhattan stations, \$2.08 for that handled to or from Brooklyn, Harlem or Bronx stations and \$3.01 for freight lightered. Considering the tonnage at the Manhattan stations alone, which amounted in round numbers in 1918 to 8,500,000 tons, the cost of the terminal operations at \$2.25 per ton was about \$19,125,000. Assuming an average terminal allowance for this freight of 75 cents per ton, the total allowance would be \$6,375,000 and the deficiency of the terminal charge in the single year on the one class of freight would be \$12,750,000.

### Initial Development of Automatic-Electric System

In the initial development it is proposed to link up the New Jersey railroads by a belt line along the eastern margin of the Hackensack Meadows and build a joint railroad yard in New Jersey east of the Croxton yard of the Erie. The automatic-electric tracks will start from this joint yard in New Jersey, pass under Bergen Hill and the Hudson River to a point in Manhattan at about Forty-seventh street, thence turn southerly and pass under certain streets suitable for the location of convenient terminals, turning back to the joint yard via another set of tunnels in the vicinity of Battery Place.

A consignment of freight for one of the Manhattan terminals, coming in a train with freight for other parts of the port district, will enter the existing break-up yard of the railroad company. Here the standard railroad cars will be classified as at present, and the car containing this shipment together with others containing other freight for Manhattan will be delivered to the public or private company operating the terminal system at the intersection of its belt line with the railroad company's line. The standard railroad cars will be hauled to the joint yard and placed in a

receiving yard, whence they will be switched to tracks alongside the inbound ends of long transfer platforms.

Each of these platforms, 24 in number, will have a standard-equipment track on one side and an automatic-electric track on the other side. The freight will be unloaded from the standard railroad car upon trailers about 3 ft. by 6 ft., and the trailers will then be hauled by tractors or by hand along the platform and placed upon one of the automatic-electric cars, which will hold 12 trailers. The standard railroad car will be pushed along the platform to the outbound end and reloaded with outgoing freight from other trucks, whence it will pass into an advance yard and be despatched to the railroad from which it came, or to any other railroad to which it is to be delivered.

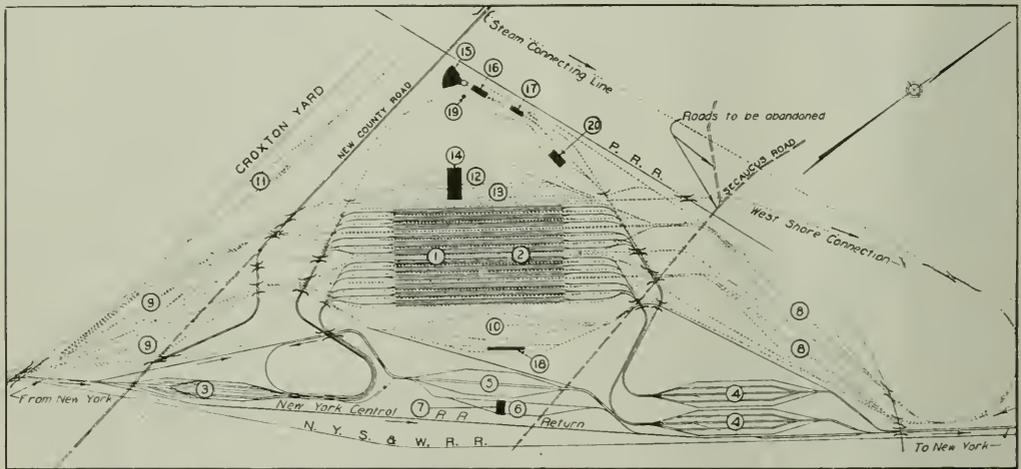

The consignment of freight will meanwhile have been loaded upon one of the special electric cars—a car somewhat larger than the ordinary box car, with a roof to protect its contents, but roll sides to permit trailer trucks to be wheeled upon it at any point.

This car, controlled from alongside by a switch on the car within reach of an operator on the transfer platform or

each car will remain alongside the platform a minimum of 12 minutes, affording ample time for the wheeling off of the trailer trucks and the wheeling on of empty trucks. The consignment will be placed on the platform to be called for, as at the ordinary freight house, or removed to storage if the consignee fails to call for it within the free time limit.

The automatic-electric cars, having discharged their loads and received empty trailers, will be advanced one by one to a second elevator, which will lower them one floor to the outbound platform at the basement level. Here the cars, after having again at least 12 minutes in which to unload their empty trailers and receive loaded trailers with outbound freight, each car receiving freight for a single railroad, will proceed back to the original elevator shaft. The cars will then be run upon the first elevator and be lowered to the track level, this elevator having meanwhile made several trips and brought other cars to the inbound level.

Running off the elevator at the side-track level, the automatic-electric cars will be held until eight have accumulated, when they will be coupled and despatched as a train by exactly the same process as from the New Jersey yard, an

General Plan of Steam and Electric Joint Yard in New Jersey

Nos. (1) and (2) designate inbound and outbound transfer platforms; (3) outbound electric receiving yard; (4) inbound electric forwarding yards; (8) inbound steam receiving yards; (9) outbound forwarding yards; (10) electrified storage yard.

on the ground, will move from the platform at a low rate of speed (from 2.2 to 6.6 miles per hour) and be switched to a track assigned to the particular terminal to which the freight is destined, freight for only one terminal having been placed on the car. When sufficient automatic-electric cars have been accumulated, eight will be coupled together and despatched in a train. This train, with no other manual direction than the throwing of the track switch, will be accelerated to a speed of 1,200 ft. per min. (13.2 miles per hour) and take its place at not less than an established distance behind another train probably destined for a different terminal. The train will bear a distinctly visible indication of its destination, and when it reaches the entrance of its terminal an operator will throw a switch and divert it to a siding, where brakes will automatically be applied and it will come to a stop.

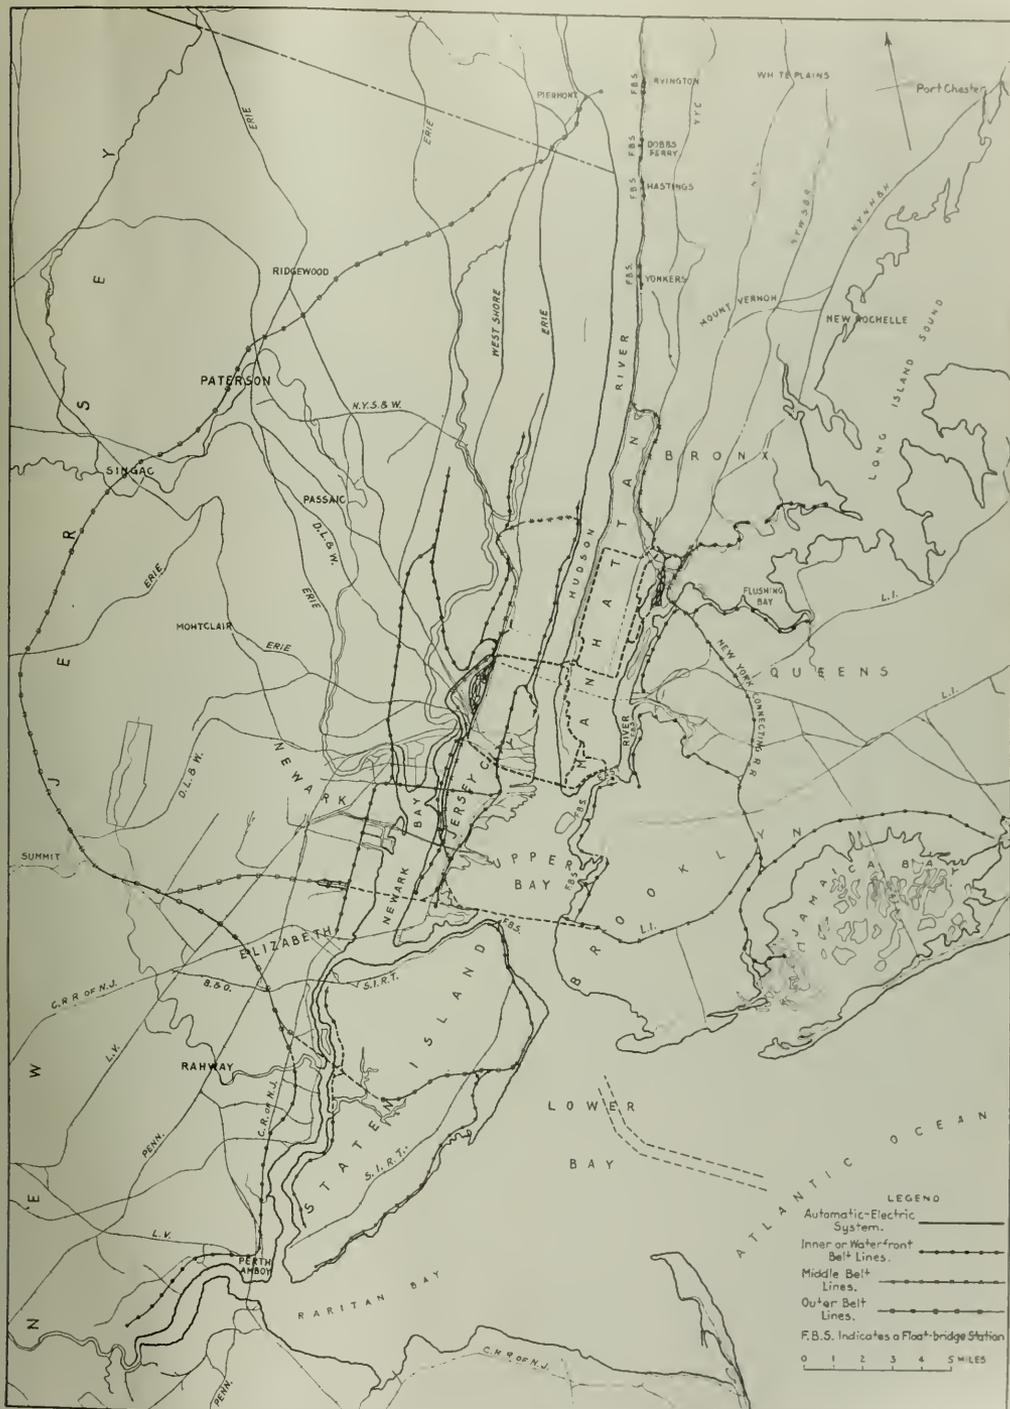

From this siding the automatic-electric cars will be run singly at slow speed upon an elevator. The elevator will raise the cars one at a time to an inbound platform at the street level and the cars will be run off under their own power. This platform will be the length of several cars, and

interlocking signal system controlling the time when the train shall enter the main-line system.

Arriving at the joint yard, the train will be switched to one of the tracks of a receiving yard, where it will be brought to a stop automatically as before. Here the automatic-electric cars will be cut off one at a time, and started by an operator walking alongside, the cars moving at a speed of 2.2 miles per hour. They will proceed over a series of switches and crossovers, controlled from a central tower, by which they will be diverted to the proper tracks at the transfer station.

The cars will be stopped at the outbound ends of the transfer platforms. The loaded trailers will be removed and transferred to standard freight cars, other trailers previously emptied will be hauled by tractors along the platform to the inbound end of the platforms, the empty automatic-electric cars will be advanced to the inbound section of the transfer station to receive new loads, and the cycle will have been completed.

An important feature of the automatic-electric system is the contemplated trailing dead section of track, which will

make it impossible for one train to come closer than a certain safe distance from the train preceding.

A special connection is required in the initial development to accommodate the New York Central. It is proposed to establish at the New York Central's Sixtieth Street yard a transfer station similar in character to that in New Jersey, from which will be constructed a double-track connection to the main loop.

Incoming New York Central trains of automatic-electric cars will enter the main system at this junction and pass south into the terminal system in the same direction and in the same manner as New Jersey automatic-electric trains until they reach the desired terminal. Outgoing New York Central automatic-electric trains will continue south, follow the south tunnels to New Jersey, be detoured around the joint yard, come back upon the main system at the north end of the joint yard, move east through the main system and be switched to the spur running to the Sixtieth Street yard.

Inasmuch as the Manhattan terminals and main line of the proposed automatic-electric system are to be located inland from the waterfront, and the New Jersey belt line and joint yard will be on ground at present unoccupied in the Hackensack Meadows, the initial development of the automatic-electric system as outlined in the preceding paragraphs can be constructed, equipped and placed in operation without in any way hampering the operation of present facilities. The importance of this feature will be realized when it is considered that the estimated period required for the construction of this system under the most favorable circumstances is three years.

### The Manhattan Terminals

Twelve Manhattan terminals will be required immediately. Five more, it is estimated, can subsequently be added before the terminal capacity reaches the capacity of the joint yard and main tracks. Much depends upon the design of the terminals in Manhattan. Abundant driveway and platform space have been provided, inbound and outbound freight will be handled at different levels, and the arrangement of the driveways is such that there will be no conflict of trucks coming to the terminal for different purposes, the traffic on certain of the adjacent streets being restricted to one-way operation. To provide ample space for holding inbound freight awaiting consignee, and storage space as well for spare trailer trucks, it is proposed to build a floor above the inbound level as a part of each terminal. Above that it is proposed to build two additional stories for warehouse purposes, and it is estimated that the revenues that can be obtained from these additional floors will contribute materially to a reduction of the fixed charges against the system. Besides the two warehouse floors incorporated in the design, estimates have been made of the extra cost of and revenues obtainable from two additional floors per terminal for loft, manufacturing or office purposes.

Assurance against complete suspension of service through accidents is important in a system such as the automatic-electric. This is provided in large measure by the division of the plant into two separate and parallel systems. There are two main tracks, each with its own tunnels, each with its terminals complete as to sidings, elevators and platforms.

### The New Jersey Joint Yard

There will be three principal elements in the New Jersey joint yard: A steam section for standard railroad equipment, an electric section for the automatic-electric cars, and a series of platforms for the transfer of freight by trailer or otherwise between the two kinds of cars. Standard freight cars handled by yard locomotives will be put through the steam section from north to south without back-up movement, first discharging their freight and then reloading, while the automatic-electric cars will pass through in the opposite direction, also without back-up movement. Grade

crossings of steam and electric tracks will be avoided by the elevation of the electric tracks at the crossing points beyond the ends of the platforms.

The steam section of the yard will have three main units—a group of inbound receiving yards, a transfer-platform unit and a group of outbound forwarding yards—in addition to which there will be miscellaneous facilities incidental to most large railroad yards.

The electric section of the yard will also consist of three main units—an outbound receiving yard, transfer-platform tracks and inbound forwarding yards—in addition to which there will be miscellaneous facilities within the yard proper, and bypass tracks alongside the yard for New York Central outbound trains. The automatic-electric cars will have to be classified twice, once to reach the proper platforms for discharging their outbound loads, and once after receiving inbound loads to be made into trains.

### Comparative Capacities and Costs

With twelve Manhattan terminals the initial development of the automatic-electric system, normally operated ten hours a day, has an estimated capacity of 10,000,000 tons yearly, the tonnage expected in 1929. The estimated yearly capacity of the steam belt line, joint yard and Hudson River

TABLE 1—ESTIMATED MAXIMUM CAPACITY

	Tons of Freight per Year	
Automatic-electric system .....	14,260,000	
Present car float-pier station system .....	8,000,000	
Added capacity .....	6,260,000	77.8 per cent
Standard-equipment elevated system .....	6,115,000	
Standard-equipment underground system .....	6,115,000	

tunnels is 14,260,000 tons, and the capacity of the entire system can be brought to that figure by building five additional terminals. The capacity of the present facilities is indeterminate, but the congestion at times indicates that it is not in excess of the present peak loads. Table 1 compares the capacities of the recommended system and the present facilities, the capacity of the latter being assumed as that of the maximum short-period traffic found by the clockings sustained for a year.

The capacities of the elevated and subway systems for

TABLE 2—ESTIMATED COST OF CONSTRUCTION AND EQUIPMENT AT 1918 PRICES

Automatic-electric system .....	\$201,190,000
Standard-equipment elevated system .....	241,131,000
Standard-equipment underground system .....	255,009,000

standard equipment which were studied by the commission but rejected, are also shown for comparison. They, moreover, are based on operation for 24-hour days.

Table 2 shows for comparison the estimated costs of construction and equipment, ready to operate, of the automatic-electric, the standard-equipment elevated and the standard-equipment underground systems. The automatic-electric figure covers 12 Manhattan terminals. All three figures

TABLE 3—ESTIMATED COST OF MOVING 10,000,000 TONS OF FREIGHT FROM BREAK-UP YARDS TO MANHATTAN STATIONS AT 1918 PRICES

	Per Ton	Ten Million Tons
Present car float-pier station system .....	\$2.25	\$22,500,000
Automatic-electric system .....	1.82	18,200,000
Saving, automatic-electric system .....	\$0.43	\$4,300,000
Standard-equipment elevated system .....	\$3.47	\$34,700,000
Standard-equipment underground system .....	3.66	36,600,000

are based on 1918 prices, which the Commission deems as nearly normal for the future as can be obtained. Amortization of the entire investment in 50 years is provided in all of the automatic-electric estimates that follow, but not in those for the other systems.

Table 3 shows the estimated cost per ton of operating

each plant, and the costs at those rates for moving 10,000,000 tons of freight per year. The automatic-electric system alone has a 10,000,000-ton capacity, but to show the other systems as favorably as possible this fact is disregarded. Expanding them to the desired capacity would require much new construction, entailing additional fixed charges that would undoubtedly keep the unit costs of operation, which include both direct costs and fixed charges, at least up to the figures recorded.

Thus the advantage of the automatic-electric system over either standard-equipment system is overwhelming in capacity and cost of operation, with less capital investment, and consequently the standard-equipment system can be excluded from further consideration.

### Expansion of System

The initial development of the automatic-electric system described in the foregoing paragraphs solves the West Side problem south of Fifty-ninth street and gives adequate relief where it is most necessary. It leaves to be provided for by expansion of the system the inclusion of the New York, New Haven & Hartford and the Long Island and the removal of the New York Central tracks through Riverside Park. The comprehensive plan recommended by the Commission meets both of these points by means of an additional loop in upper Manhattan connecting with the initial development and also with a second joint yard on the East River to serve the three New York railroads. This expanded system, with a line on the West Side, another on the East Side, and a third auxiliary loop on the lower East Side, makes it possible to build additional stations in territory not now served by rail, at the same time admitting the New Haven and Long Island railroads and giving all railroads equal opportunity at all stations.

The amplified plan offers the one full solution of the problem of the New York Central's West Side tracks from Spuyten Duyvil south. The plan contemplates bringing the New York Central's general-merchandise freight, perishable foodstuffs and express business along the Harlem river from Spuyten Duyvil on additional tracks to the proposed East River yard. Any other classes of New York Central's freight can then be handled either over the West Shore system or at a new waterfront yard east of the Hudson.

The additional tracks between Spuyten Duyvil and the proposed East River yard should be built as a part of the comprehensive plan, and should be available on equitable terms to all railroads of the port.

### The Proposed Belt-Line Railroad System

The plan of service calls for the use of the Long Island and the New York Connecting Railroad from Bay Ridge to the Bronx by all railroads on equitable terms, and by marginal lines, not necessarily continuous but reached by float bridges or by spurs from the Bay Ridge-Hell Gate line, from which spurs are to run to Jamaica Bay and Flushing Bay. Marginal lines are to skirt the Harlem and East rivers in the Bronx from Spuyten Duyvil to Throgs Neck, and other lines are virtually to encircle Staten Island. Yonkers and the communities north are to be served by joint-car-float stations reached from Piermont. For some time to come connections between New Jersey and the Long Island belt system can be afforded by a car-float line from the Bayonne section to Bay Ridge. Running between two fixed points, with full loads at all times, such a ferry will not be expensive to operate. Ultimately, when the traffic warrants, the ferries can be replaced by a tunnel under the Upper bay.

In New Jersey the commission recommended that there be three classes of belt lines, designated as inner, middle and outer belt lines—all joined in a comprehensive and flexible whole.—Nuclei for two inner belt lines already exist—one the fragmentary Brooklyn marginal railroad, the

other the National Docks Railway, the New Jersey Junction Railroad and the Erie Terminals Railroad, which collectively extend along the east base of Bergen Ridge and the Palisades from Bayonne to Edgewater.

There should be one middle belt line on each side of the Hudson. The Long Island-New York Connecting Railroad and the line recommended along the Harlem River from Spuyten Duyvil to the East River will constitute the middle belt line for New York. That for New Jersey will have to be built, and should extend along the east side of the Hackensack Meadows as shown on the comprehensive plan, connecting with all of the railroads. The primary purpose of the middle belt lines is to afford a means for the direct interchange of cars between railroads and a throughfare for all of the railroads of the port to and from joint car-float and joint lighterage stations. Because these cars almost invariably require classification at the break-up yards, the proposed belt line in New Jersey is located wherever possible just east of those yards.

The third class of belt line, the outer belt, is at first required for New Jersey only. It should encircle the entire western half of the port, from tidewater on New York Bay to tidewater well up the Hudson River, passing outside of the break-up yards. The line as located will begin at Piermont, N. Y., on the Hudson River, pass southwesterly to the west of Paterson, N. J., and the Orange Mountains, come through the Orange range near Summit and continue in a generally easterly direction of termini on deep water, reached by short branches.

Steamship terminals will naturally be built at each of the southern termini, and a Barge Canal terminal at Piermont. A large classification yard will be required on this outer belt line, probably in the vicinity of Newark Bay, and the middle and inner belt systems should be connected with the outer belt near that yard. In a relatively short time the railroads will need to add to their break-up yard facilities, and the additions will presumably be built at the junctions of their lines with the outer belt. These additions will enable the outer belt to serve more and more as a relief to the middle belt. All of the new belt lines will open up new territory for industrial development, and should in time handle a large amount of local industrial traffic.

### Consolidation of Railroad Marine Operations

Consolidation of fleets is recommended, to make it possible to operate with a much smaller total of boats at a higher load factor. Joint car-float and joint lighterage receiving stations, separated to avoid congestion, should be built at new railheads on shallow waters not suited to shipping, thereby releasing the present railhead occupancy for steamship terminal development and at the same time giving steamship companies and private terminal companies throughout the port the great advantage of receiving and delivering their railroad goods at possibly six points instead of nearly twenty.

### Measures for Immediate Relief

While the automatic-electric system, the belt-line system and the joint car-float stations and lighterage stations can all be built and put into operation without interfering with present operations, several years will be required to do this. Meanwhile two steps can be taken at once to bring about partial relief in the face of the growing congestion. One of these is the consolidation of marine equipment, the other is the inauguration of "voluntary store-door delivery."

Consolidation of marine equipment need not await consolidation of terminals at any point. The advantages of a single large fleet of tugs, car floats and lighters in place of a number of independent fleets can be realized immediately.

"Voluntary store-door delivery" offers a still better opportunity for relief. Investigation has shown that probably

30 per cent of the railroad business of Manhattan is in car-load lots, and a considerable amount of that of the other sections of the port is in large consignments. To avoid rehandling of the freight there should be a considerable number of detachable truck bodies with a comparatively small number of chassis, so that goods could be transferred from the car to the truck body at the transfer platform and delivered direct to the consignee. These measures for immediate relief involve no expenditures not utilized in the ultimate plan other than the construction of a few transfer platforms—for the motor-truck chassis, detachable bodies and voluntary store-door delivery should remain as auxiliaries to the automatic-electric stations.

## Railway Mail Pay

WASHINGTON, D. C.

**A** GOOD MANY PEOPLE, in Washington and doubtless elsewhere, have been expressing some curiosity as to why, after the Interstate Commerce Commission last January announced an increase in the rates which the Post Office Department must pay the railroads for the transportation of the mails, effective on March 1, 1920, and a readjustment retroactive to November 1, 1916, the Post Office Department has not found it necessary to ask Congress for an appropriation for the money. It was estimated at the time that the increase in mail pay for the future would amount to about \$35,000,000 a year, and that the retroactive payments would amount to nearly \$95,000,000. Possibly some who read Postmaster General Burleson's annual report for the fiscal year ending June 30, 1920, in which he attributed part of a deficit of \$17,000,000 for the year to the commission's decision, thought he had done very well under the circumstances, which perhaps is what they were intended to think. The report, however, mentioned no such large sum as had been estimated for the retroactive payments, although it did mention \$14,633,607 as having been paid for the transportation of mail in prior years.

Congressman Steenerson of Minnesota is one of those who have been curious as to how the \$95,000,000 has been taken care of, or if not why it has not been provided for. In a recent speech in the House he presented some evidence on the subject which indicates that unless something is done before March 4 the next Republican postmaster general is likely to have a very large deficit to account for.

It will be remembered that on July 28, 1916, Congress passed a law fixing tentative rates for the transportation of the mails, on the space basis, but directed the Interstate Commerce Commission to investigate the matter and prescribe the rates and the basis for the future, as well as a readjustment of the rates back to the date when the tentative rates were put into effect, November 1, 1916. The commission not only found the rates too low and ordered considerable increases for the period November 1, 1916, to December 31, 1917, but a further increase of 25 per cent effective January 1, 1918, because of the increased cost of operation after the government took over the roads. That meant that the increase from November 1, 1916, to December 31, 1917, would go to the railroad companies, that for the 26 months of federal control would go to the Railroad Administration, and the railroads after March 1, 1920, would be paid the new rates.

The Railroad Administration put an estimate in its January, 1920, income account of \$54,000,000 for increased mail pay, which incidentally represents nearly all the net operating income which the railroads had for 1920, but when it came time for the Post Office Department to ask for its appropriation for the year ending June 30, 1921, it asked for nothing on account of the increased pay to the railroads on the ground that it had applied to the Interstate Commerce Commission for a rehearing and expected to have the rates

reduced. Later it did apply for a deficiency appropriation for \$8,000,000 to cover the increase for the balance of the fiscal year ending June 30, 1920, and recently it has asked for another appropriation of \$35,000,000 to represent the increase for the present fiscal year ending June 30, 1921, but it has continued to say nothing publicly about any need for money to make the readjustment for the three years and four months since November 1, 1916, although at the time the \$8,000,000 was asked it was suggested that the department, "at the suggestion of the Railroad Administration," had under consideration the settlement of the increased amounts due the administration during the period of government control "by a transfer of funds."

By inquiry at the Railroad Administration, Congressman Steenerson got a copy of a letter written by Postmaster General Burleson to John Barton Payne, director general of railroads, which stated that an understanding had been reached between the Post Office Department and the Railroad Administration that the approximate amount due the Railroad Administration for the 26 months from January 1, 1918, to February 29, 1920, is \$65,575,832. Mr. Burleson suggested that "fiscal credit may appropriately be taken in the amount of \$65,575,832.03 (should that sum be agreed upon finally) as being the balance due the Railroad Administration" and that all accounts be closed on that basis, in other words that the amount be taken care of by a book entry. In support of this suggestion Mr. Burleson quoted a statement by Chairman Good of the House appropriations committee that as the money does not go to the railroad companies it should not go to the Railroad Administration because it had already received its appropriation for all it needed. Swagar Sherley, director of the Division of Finance of the Railroad Administration, replied to this letter pointing out that the appropriation which was made to the Railroad Administration was made upon an estimate which carried as a collectible asset the moneys due it from the various departments and that the other departments had obtained appropriations from Congress and settled in cash. He suggested that the Post Office Department should make its own request for a deficiency appropriation. He also added that the Railroad Administration had also estimated that some \$4,000,000 was due it from the Post Office for side and terminal service, in addition to the \$65,000,000, but that the amount had not yet been agreed to by the Post Office Department. Congressman Steenerson also read another letter from E. M. Alvord, assistant to the director general, dated December 30, 1920, saying that Chairman Good had misunderstood the situation and that the Railroad Administration appropriation was estimated on the assumption that the Post Office would ask for the \$65,000,000 as a deficiency appropriation and pay it to the Railroad Administration as has been done by the War Department in similar cases. "If the Post Office Department does not ask for this appropriation and pay the Railroad Administration," he said, "then the latter will probably be compelled at some time in the future to ask for additional appropriations to cover that amount."

Mr. Sherley's letter had suggested that the dispute as to the amount for side and terminal service be settled before asking for the appropriation, but the expiration of the present Congress is only about a month away and the request for the appropriation has not yet been made. Mr. Steenerson also said that the testimony of the Post Office Department officials showed that a sum of \$16,000,000 had been settled upon as due the railroad companies for the period from November 1, 1916, to December 31, 1917, and that it had been stated a deficiency appropriation would be asked for that amount. Whether this sum has yet been paid to the railroads does not clearly appear, but at any rate there has been no appropriation for it nor for the \$69,000,000 due the Railroad Administration.

# Is the Railroad Problem Really Being Solved?\*

## Reduction of Expenses to Enable Net Earnings of Six Per Cent Requires Readjustment of Wage Scales

By Samuel O. Dunn  
Editor of the *Railway Age*

**A** I LEAST ONCE in each year every well managed business concern takes an inventory. It does so to find out exactly what stocks it has on hand and what is its financial position. Inventories have been very important this year. Most of the business concerns of this country which recently have taken them have found that their stocks of goods have greatly depreciated in value and that their financial position has changed greatly for the worse since a year ago.

It is almost a year since the railways were returned to private operation. Many changes have occurred since then. It is time that a comprehensive inventory should be taken to find out whether as a result of these changes the situation of the railroads has been made better or worse. I do not mean by this merely an inventory of the stocks in the storehouses. The business condition of a merchant is determined largely by what his inventory shows regarding the amount and value of the stocks of goods he has on hand. An inventory of the railroads to determine what their situation is involves the taking of stock regarding many things, including the condition of their physical properties, the morale of their officers and employees, their present and prospective traffic, their present and prospective earnings and expenses, the regulation to which they are subjected and the attitude of the public and public men towards them.

It would be impossible in a short address to take stock regarding all these matters. It is, however, possible to present briefly certain important concrete facts relative to them and to draw the conclusions suggested by these facts. If the facts are truly stated and the conclusions drawn are correct some light will be thrown on the question whether any progress is being made in solving the railroad problem.

### Present Situation Shows Many Improvements

A partial statement of developments within the last year could be made which would imply that the present situation and future prospects of the railways are very happy. They have been returned to private operation. The physical condition of the properties has been substantially improved. The morale and efficiency of the organizations have been somewhat bettered. The efficiency with which locomotives, cars and other facilities are used has been increased, and it has been shown that the carriers can handle more traffic than ever before. Legislation has been enacted requiring the Interstate Commerce Commission in regulating rates to give due consideration to the country's need for the adequate development of its transportation facilities, and to let the railways earn for two years an average return of 5½ or 6 per cent, and subsequently such return, assuming economical management, as they may need to provide adequate service. Under this legislation the Interstate Commerce Commission has authorized the fixing of rates which it estimated would yield a return of 6 per cent on a valuation of \$18,900,000,000. A Railroad Labor Board has been established to which all controversies arising between the railways and their employees which might lead to an interruption of transportation must be referred. The Board is authorized to

determine reasonable wages, giving due consideration to the cost of living, conditions of employment and other pertinent matters, and it has awarded the largest advance in wages ever made at one time to the obvious satisfaction of railway employees.

### Situation Worse Than Ever in Other Respects

Surely these developments indicate that the railroad problem is being solved. And yet it is no exaggeration to say that seldom has the railroad situation been worse in many respects than now. Several months ago the railway executives started to reduce the number of freight cars in bad order to 4 per cent of the total, but it still exceeds 7 per cent. They started to put their locomotives in good condition, but an ominously large part of them are still in bad condition. One of the principal causes of the unpopularity of government operation was that under it a large deficit was incurred which had to be paid from taxes. During the first six months of private operation, when the government's guarantees of net return to the companies were continued, a further large deficit was incurred which the taxpayers must pay, and which has not tended to heighten the popularity of private operation. The government still owes the companies about \$400,000,000 on account of this deficit, no part of which apparently will be promptly paid to them unless special legislation is enacted by Congress. The inability of the companies to get this money has caused them to accumulate a vast current liability to concerns from which they have bought equipment and materials and has brought many railways face to face with a very acute financial situation.

### Roads Not Earning Six Per Cent

To have put their net operating income on an annual basis of 6 per cent on their valuation the railways should have earned in September \$109,220,000, in October \$112,709,000 and in November \$99,598,000, a total of \$321,000,000. The net operating income actually earned in these months was: September \$75,310,000, October \$86,456,000, and November \$57,741,000, a total of only \$219,507,000, or but 67 per cent of the return expected. At this rate the railways would earn only 4 per cent annually on their valuation, instead of 6 per cent, and these were months of large business. Their freight traffic has declined 30 per cent since October, and on January 1, instead of a large shortage of cars, such as had prevailed so long, they had a net surplus of 257,000 cars.

It was claimed that the advances in rates granted by the Interstate Commerce Commission would cause an increase in prices and in the cost of living. They were speedily followed, however, by unprecedented general declines in prices, and in spite of the fact that the new rates are not yielding to the railways anywhere near the net return expected loud complaints regarding them have begun to be made, especially by farmers and other classes of persons who are suffering from the declines in prices which have occurred. Therefore, although the railways in 1920 handled a record-breaking business with an efficiency which in many respects was unprecedented, and although the advances in rates did not

\*A paper read before the meeting of the New York Railroad Club on January 21.

cause any increase in the cost of living, it is obvious to every student of public opinion that, because of the large deficit incurred before the advance in rates was made, and because of the large advances in freight and passenger rates granted private management of railroads is not as popular in this country now as it was a year ago. Perhaps it is largely due to this that the spokesmen of the railroad labor brotherhoods have considered the present an opportune time to send broadcast wholesale charges of mismanagement and waste against the railway companies in connection with repairs made to locomotives and cars outside of their own shops.

#### Difficult to Reach Conclusion That

##### Problem Is Really Being Solved

When one surveys and weighs facts such as these I have just mentioned he is likely to have difficulty in reaching the conclusion that the railway problem is really being solved at the present time.

If we regard the situation from the standpoint merely of the legislation which has been enacted we are likely to draw conclusions which are too optimistic. Legislation and the decisions and orders of regulating bodies are mere "scraps of paper" until they have actually been given effect.

On the other hand, if we consider only the poor showing of earnings that the railroads have made under the new rates, the enormous decline of traffic which has recently occurred, the attacks upon the railway companies which have been made by spokesmen of the labor brotherhoods, and the slight but easily perceptible and unfavorable change in public opinion which has occurred, we shall draw conclusions that are too pessimistic.

The railroad problem was acute before this country entered the war. Our participation in the war and government operation caused many important developments affecting the railroads adversely which greatly increased the difficulty of the problem. They made it a problem of tremendous complexity and difficulty. Therefore, there is no occasion for great surprise and disappointment because the final solution of it is still far off. It cannot be solved unless the public and public men can be made to understand what the problem is at present and why it is what it is. Therefore, it is our duty not to repine or grumble because faster progress has not been made, but to state the problem and its causes clearly over and over again until the public and public men do understand it and its causes. It does not seem unreasonable to believe that once they have got a correct understanding of it and its cause they will act fairly and wisely.

I need hardly recall to you that even before we entered the war the development of the railroads had been practically stopped by adverse regulation and that they had become unable even then to handle satisfactorily the commerce of the country. In the years 1914 and 1915 the average net return earned by them had declined to only about 4 per cent on their property investment. Suddenly, late in 1915, there came a great increase of traffic with the result that for about a year and a half before we entered the war there were constant congestions and shortages of cars. In the years 1916 and 1917 earnings were very large and the companies made unprecedented expenditures for maintenance. In consequence when at the end of 1917 government control was adopted the companies turned over to the government a plant which, while it was inadequate to the demands of business, was probably in the best condition it ever was.

#### President Wilson's Proclamation

It was a momentous event in the history of the railroads and in the history of the country when on December 26, 1917, President Wilson issued his proclamation announcing the adoption of government control. It is important to recall what the President said at that time because it has a direct

and important bearing on subsequent developments and the present situation. The President said:

Investors in railway securities may rest assured that their rights and interests will be as scrupulously looked after by the government as they could be by the directors of the several railway systems. Immediately upon the assembling of Congress I shall recommend that these definite guarantees be given:

*First*—Of course that the railway properties will be maintained during the period of federal control in as good repair and as complete equipment as when taken over by the government.

*Second*—That the railroads shall receive a net operating income equal in each case to the average net operating income of the three years preceding June 30, 1917, and I am entirely confident that the Congress will be disposed in this case as in others to see that justice is done and full security assured to the owners and creditors of the great systems which the government must now use under its own direction or else suffer serious embarrassment.

#### Solemn Obligation to Railroad Owners Not Kept

There can be no doubt that President Wilson desired and intended that the solemn obligation to the owners of the railroads, to which he committed the government under powers vested in him by Congress, should be kept. He recommended and Congress passed legislation designed and appropriate to fulfilling these obligations. It is, however, susceptible of proof that this solemn obligation on the part of the government has not up to the present time been fulfilled, and it is largely because it has not been fulfilled that our railroad problem is what it is today. The government did not "maintain the railroads in as good repair and as complete equipment as when taken over." For example, it did not put in their tracks anywhere near the number of new ties and rails necessary to maintain them in accordance with its obligation. Even in the year 1919, after the war was over, it placed in their tracks the smallest number of tons of new rail that had been laid for 22 years. It bought in the 26 months of government control only as many freight cars as the companies had actually scrapped and retired from service annually during the preceding five years. It bought no passenger cars at all. It repaired and maintained their locomotives and cars so inadequately that when the railways were returned to private operation their equipment was in the worst condition ever known.

Nor did the government keep its promise to investors in railway securities that "Their rights and interests would be as scrupulously looked after by the government as they could be by the directors of the several railway systems." The year before the government took over the railroads they earned a net operating income of \$975,000,000. To have fulfilled its obligations to investors the government should not only have guaranteed to them the same return as had been earned in the three years ending June 30, 1917, but it should have returned their properties with the same relationship existing between earnings and expenses as existed when they were taken. On the contrary, enormous increases in expenses occurred, corresponding advances in rates were not made, and when the properties were handed back the net operating income had been absolutely wiped out. The complete destruction of the net operating income had caused a decline in the value of railway securities which meant a loss of billions of dollars to those who held them.

#### In Striking Contrast to Other Industries

While the government did not adequately maintain the properties as it had obligated itself to do, it did pay war prices which, of course, were unprecedentedly high prices, for all the additional facilities it provided. Many of these additional facilities were provided to further the Director General's scheme of permanently "unifying" all the railroads—a plan absolutely inconsistent with the obligations to the

owners of the properties into which President Wilson had solemnly entered on behalf of the government. Since government control was a war measure, and since many of the capital expenditures made under it were made to carry out a scheme of unification to which the owners of the railways had never consented and to which they were opposed, it would have been only fair for the government to have assumed and written off as one of the costs of the war a large part of the capital expenditures it made, just as it assumed a large part of the capital expenditures made in many other industries for war purposes. On the contrary, the Railroad Administration has sought throughout to compel the railway companies to assume the entire burden of all this class of war expenditures and to add them to their capital accounts, on which a return must be earned and paid in perpetuity.

The government's treatment of the railroads in these respects is in striking contrast to its treatment of other industries. Whatever else may be said of government control, it cannot be said that under it the railways failed to render the service for which they were taken. They handled every soldier and every ton of freight for which transportation was needed in order to win the war.

### No "Railroad Millionaires"

The government, however, paid to the railway companies for the use of their properties a rental equal only to the returns they had earned before the war. There was no profiteering by the railways. The war made no "Railroad Millionaires."

In the coal industry, on the other hand, the government fixed prices which enabled producers and dealers to make profits surpassing the wildest dreams they had ever had.

It spent hundreds of millions of dollars for aeroplanes which never flew. Those who made these aeroplanes derived large profits from making them, and they have got their money.

It spent hundreds of millions of dollars for ordnance which never fired a shot. Those who made this ordnance derived large profits from making it, and they have got their money.

It spent hundreds of millions of dollars for millions of tons of shipping which never carried a pound of freight during the war. Those who built these ships made large profits, and they have got their money.

### Deficit in First Six Months of 1920

#### an Aftermath of Government Control

The railroads, as I have said, rendered all the service for which they were taken and their owners during government control and during the first six months of private operation following government control were guaranteed only the same return that actually had been earned during the three years before the war; and yet today the government owes their owners \$400,000,000 which is almost five months overdue. The companies are in dire need of this money, and yet the Treasury Department and one federal court have held that no railway company can get any part of its share of what remains due it until it has made a complete settlement with the government, which in most cases will take months. It may be said in extenuation of the government's course in delaying payment of this part of its indebtedness to the railways that it was not incurred under government control but is due to a deficit incurred under private operation. That is true, but it is easily demonstrated that the deficit incurred in the first six months of private operation was the direct aftermath of government control. It was due to the following facts:

*First*—Under government control the net operating income of the companies was wiped out by increases in expenses.

*Second*—The government failed to make the advances in

rates which were needed to restore the net operating income to its former basis.

*Third*—The government did not adequately maintain the properties, which rendered it necessary for the companies after the railways were returned to them largely to increase maintenance expenditures. It was this condition which forced them to give large amounts of repair work to outside plants.

*Fourth*—The Railroad Administration left pending huge demands for advances in wages, which a government body, the Railroad Labor Board, met by awarding advances amounting to \$620,000,000 a year.

These things made it inevitable that unless a large advance in rates was granted by the Interstate Commerce Commission immediately after the railways were returned to private operation a huge deficit would be incurred, and no advance in rates was granted until after six months of private operation.

### A Breach of Faith to Withhold Payments of Guarantee

The government in the exercise of its war powers treated other essential industries not only fairly but generously. The railways, one of the most essential of all industries, it did not treat generously or even fairly during the war and it is now adding another wrong and injury to those it already has done them by withholding from them the large amount of money due them. It would be another breach of faith on its part for it to continue to withhold this money any longer than is absolutely necessary.

If this money should be paid to the companies in the near future it would relieve their present pressing necessities. It would also relieve the pressing necessities of the many concerns to which they owe many millions of dollars. It would enable the railways to begin making the larger purchases which they ought to make to put their facilities in better condition. But while it would relieve the present situation it would not by any means solve the acute railroad problem now confronting us.

### Net Returns Not Sufficient Under New Rates

The Interstate Commerce Commission has recognized the principle that the railways must earn 6 per cent on a valuation of \$18,900,000,000 to enable them to raise enough capital to expand their facilities sufficiently to give the public adequate service. The commission and most other students of the subject believed that the advances in freight and passenger rates granted about five months ago would enable the railways to earn 6 per cent. The time has come when we should squarely face the manifest fact that the railways cannot with existing rates and existing wages and other costs earn 6 per cent. As I have shown, they earned at the rate of only 4 per cent in the months of September, October and November, when they handled more business than ever before in those months. Their failure to earn the return expected is partly due to the fact that in many states advances have not been made in state rates corresponding to those made in interstate rates. But, it is evident that even if all rates were advanced as much as the Interstate Commerce Commission held was necessary the railways could not earn the return estimated by the commission. The commission recognized, however, that if they did not earn 6 per cent they could not raise the capital required adequately to enlarge their facilities. If they cannot do this they cannot provide good and sufficient service for the public. We should not allow ourselves to be in the least deceived by the fact that the demands of traffic are at present not equal to the capacity of the railways. We have had many commercial depressions and declines of traffic before, and they have always been followed by periods of industrial and commercial activity in which the traffic offered has exceeded

anything ever known before. We shall see history repeat itself in this respect.

### Reduction of Expenses Only Alternative

The net operating income of the railways can be made sufficient by further advancing their rates or by reducing their expenses. Undoubtedly the public would strongly oppose a further advance in rates under present conditions, when the prices of most commodities, especially of farm products, are declining. The only alternative is to reduce operating expenses. The large items of operating expense are roughly divisible into three classes—cost of fuel, cost of material and supplies, and cost of labor. Prices of fuel and of materials and supplies have been extremely high, but developments are occurring which are reducing them and undoubtedly should and will reduce them further in a short time. The present very high operating expenses of the railroads are, however, chiefly due to their enormous payroll. This enormous payroll is due to the granting of the eight-hour day under government control, which has caused a large increase in the number of employees; to the fact that the efficiency of labor is much lower than before the war; and to the large advances in wages made by the Railroad Administration and by the Railroad Labor Board last July. The operating expenses of the railways are now running at the rate of about \$5,950,000,000 a year, or over \$3,100,000,000 a year more than in 1917. Of this increase in expenses since 1917 almost \$2,000,000,000 is due to increases in the payroll.

### Reduction of Payroll Necessary for Reduction of Expenses

It seems evident that no sufficient reduction of expenses can be secured without a reduction of the payroll.

The advance of \$620,000,000 a year in wages awarded last July by the Railroad Labor Board was made when the cost of living was the highest ever known, being 104.5 per cent more than in 1914. Since then the cost of living has declined, and is estimated by the National Industrial Conference Board to be now only 90 per cent more than in 1914. The present annual average wage of railroad employees for working eight hours a day is 125 per cent greater than it was in 1914 for working ten hours a day. The employees have benefited both by a substantial reduction in their working hours and by large advances in their average wages, and under the national agreements made by the Director General of Railroads with various organizations of employees many millions of dollars are being paid them annually for work that is not done. In 1914 the railways had 1,700,000 employees and paid them \$1,337,000,000. In 1917, although they handled a very much larger traffic, they had about the same number of employees and paid them \$1,740,000,000. Today, because of the establishment of the eight-hour day and the advances in wages which have been granted they have about 1,950,000 employees who are being paid about \$3,600,000,000 a year. While the increase in the average annual wage per employee since 1914 has been about 125 per cent, the increase in the total payroll has been about 170 per cent.

### The Attitude of Farmers and Business Men

The farmers and business men of the country recently have lost many hundreds of millions of dollars because of declines in prices. Wages already have been reduced in many industries. The Railroad Labor Board in granting the advance in wages last July based it largely upon the high cost of living prevailing at that time. No injustice would be done railway employees by making some reduction of their wages at this time. In view of developments since the present wages were fixed a rehearing of the wage case

should be held and wages fixed which will be more in harmony with existing conditions.

As I have already remarked there is much complaint from many sources regarding the present freight and passenger rates. The necessity for the present rates is created chiefly by present wages and unless there is a great increase in the efficiency of railway employees, which their organizations are not only not trying to promote but by opposing piece work and other efficiency methods are actually trying to prevent, either wages must be reduced or freight and passenger rates must be further advanced. The farmers, shippers and consumers are all deeply interested in the question of railroad costs because the cost is what makes the rates which all the public have to pay directly or indirectly, and the railway payroll at present constitutes 60 per cent of all operating expenses. All present railway costs should be reduced, but the payroll is so large a part of total operating expenses that no substantial relief to the railways, which are not earning an adequate net return, or to the public, which has to pay present freight and passenger rates, probably can be obtained without a substantial reduction in wages.

### With Care and Discrimination

Any reduction in wages which is made should be made with care and discrimination. It should be made with due regard to the cost of living and to the value of the service actually rendered by different classes of employees. It should recognize the fact that most supervisory officers were paid too little as compared with most classes of employees before the recent advances were made and that the advances granted to them have been relatively less than those given to the employees. Therefore, it is very doubtful if any reduction in the compensation of supervisory officers should be made. Account should be taken of the fact that many unfair relations between the wages of different classes of employees exist and that therefore while some classes of employees could in fairness have their wages sharply reduced some other classes, such as section foremen and signalmen, should have theirs reduced much less, if at all. But, it has become manifest that the railroad payroll, in the aggregate, should and must be substantially reduced, and steps in this direction should be taken in the near future.

### Inability to Earn Proper Return Creates a Serious Situation

The demonstrated inability of the railways to earn the return provided by the Transportation Act, even when handling a maximum traffic, and the tremendous decline of traffic which has occurred, are creating a serious situation to which not only railway managers, but business men, the Railroad Labor Board and the Interstate Commerce Commission and Congress should give early attention.

The return of the railways to their owners was made in obedience to a public sentiment which unmistakably favored private ownership and management. The passage of the Transportation Act was a long step toward the solution of the railroad problem under private ownership and public regulation, provided it is to be treated not merely as a "scrap of paper," but is to be carried out in the spirit of a constructive measure designed and intended to enable the railways to be rehabilitated and expanded to meet the social, commercial and industrial needs of the country. Because it has not yet produced all the beneficial results which its advocates and authors expected is no reason for saying that it is not adapted to solving the railroad problem.

But neither it nor any other piece of legislation, however skillfully designed and constructed, will accomplish its purpose unless it is fully carried out in the spirit in which it is drafted and enacted.

The Transportation Act imposes upon the managers of the railways the duty of operating and developing them as economically and as efficiently as they can. It imposes upon the Railroad Labor Board, in case of a controversy between the companies and the employees that may interrupt transportation, the duty of establishing working conditions and wages which will be fair to the employees, but which at the same time will be such that the companies can operate and develop the properties efficiently and economically. It imposes upon the Interstate Commerce Commission the duty of seeing that the railways are efficiently and economically managed and developed, and of fixing rates which will be fair to the public, but which at the same time will be sufficient to enable the railways to provide adequate service.

The failure of the government thus far to make good on its guarantee of standard return during the first six months of private operation has created an extremely embarrassing and critical situation, but the good faith of the government is pledged to remedy this condition promptly, and doubtless it will do so. The railway managers, the Railroad Labor Board and the Interstate Commerce Commission thus far undoubtedly have tried to meet the obligations and perform

the duties imposed upon them by the Transportation Act. That their united efforts have thus far failed to advance the solution of the railroad problem as much as was hoped is due mainly to the complexity and difficulty of the problem and to conditions beyond their control. The complexity and difficulty of the problem are still as great as ever, but today the problem should be better understood by those who are wrestling with it than it was a year ago.

We do not know as yet whether it is really being solved, but we soon shall know. We shall soon know whether the railway managers, the Railroad Labor Board, the Interstate Commerce Commission and Congress have the intelligence, the ability and the courage squarely to face the facts, and to do the things in their several spheres which the facts clearly indicate they must do if the plain spirit and intent of the provisions of the Transportation Act regarding the wages and conditions of work of the employees, the regulation of rates and the development of the facilities of the railways are to be carried out. If the plain spirit and intent of the provisions of the Transportation Act regarding all these matters are carried out, I have no doubt we shall be able to decide that the railroad problem is being solved.

# The Service of Supply as a Business Institution\*

## Conservation of Material by Application of Business Principles Is Essential to the Railroads

By H. C. Pearce

General Purchasing Agent, Seaboard Air Line

**T**HE REAL PURPOSE of the service of supply is to provide needed materials for the economical maintenance and operation of the railroad, where they are wanted, of the most suitable quality for the purpose for which they are required, and at the lowest net cost to the railroad. The supply officer is charged with the responsibility of expending monies for materials and supplies for the railroad as carefully as he would for a mercantile establishment, with this difference, a merchant buys to sell, the supply officer buys to use.

### Principles of Organization

The first underlying principle of an organization to carry out the real purpose of the service of supply is the means of knowing accurately, at all times, that the need exists, what the resources are to meet the demands, and the monies available. It will be admitted without question, that every organization must have one directing mind to co-ordinate the different elements which must enter into a department of a railroad. There is undeniably an inseparable connection between the officer that procures the material and the officer that distributes and accounts for it.

An organization is not so much a matter of titles as of purpose and the understanding of its responsibilities. An organization must be built for the purpose, and not to fit around the individual. The ideal supply organization would have as its head a chief supply officer, with whatever title conditions and individual opinions may determine. This officer should have entire charge of the service of supply, and as many officers reporting to him as the extent of the property may require. Broadly speaking the organization would consist of a chief supply officer, purchasing agent,

general storekeeper, tie and timber agent, fuel agent, engineer of tests, supply train storekeeper, district division and local storekeepers. It will be apparent that under this broad plan of organization there are many properties where the purchasing agent, general storekeeper or storekeeper can assume the duties of chief supply officer and carry out the full purpose of the organization.

### Policies Governing Purchases

Many splendid businesses have been wrecked by injudicious buying; the difference between a purchase and an order means the difference between success and failure, and when we consider the enormous sums of money which our railways expend annually, it must be apparent that next to the need, the expenditures of these monies is of primary importance.

Materials should be arranged for before they are needed, for obvious reasons. I am a strong believer in the plan, known generally as the "Thorne" system, introduced by the late W. V. S. Thorne, and carried out most successfully on the Harriman lines. The plan is simple; the first requirement being to definitely determine what is the most desirable material to purchase, based on service, source of supply and price. This having been definitely determined, a "running agreement" is made for the requirements, subject to cancellation by either party giving 30, 60 or 90 days' notice. This ensures a fixed source of supply, a quality of material that is best suited for the requirement, and enables the manufacturer to produce it at the lowest cost. It eliminates the expense and delay incidental to the sending out of inquiries, receiving proposals, tabulating bids, etc. Each day's delay between the time the need develops and the delivery is made represents a loss, either in interest on capital (as stock must be maintained to provide for all lost motion)

\*From an address on "The Service of Supply" delivered before the New England Railroad Club on January 11.

or a loss through lack of delivery, due to the time used in negotiating the purchase. The purchasing agent must be responsible for deliveries of materials to the railroads, and this is a very important factor in determining the inseparable connection between the procuring and the disbursement officers.

One of the very important duties of the purchasing agent, and one which is not nearly as well understood as it should be, is the disposition of salvage, not merely of scrap, but of all second hand, obsolete and unneeded materials and equipment that is acquired for any reason. The experience and acquaintance of the purchasing agent together with the machinery of his office, should be utilized by the management of our railroads to the fullest extent in the sale of all unneeded materials, tools and equipment.

### Specifications Are Vital

Broadly speaking, all material should be bought to specifications. I know it will be contended that this is not always practical. Manufacturers' agents who wish to sell some special brand, or mechanics and others who prefer to criticize the quality of something, rather than write a specification, will not approve the plan. Our technical officers should be able and should be required to put all their knowledge of what is required into a specification. Three factors should be taken into consideration in preparing a specification—(a) the service required, (b) the source of supply, (c) the cost. If representatives of each of these factors, i. e., the user, the manufacturer and the buyer, were consulted in their preparation, more than 90 per cent of the materials used on our railroads could be covered by practical and economical specifications.

Specifications without tests are worthless; and how is any buyer to know what he is getting unless the material he received is tested, and how can it be tested unless it is built to a specification? It is the only practical plan either for the manufacturer or buyer. It is to be hoped that the minimum specifications will be adopted by the American Railway Association. With minimum specifications the manufacturers have a base to work to; any railroads or service requiring something better than the minimum specification can procure it at the lowest cost, because there is a base to work to. It is the only way to obtain honest and necessary competition. Because railroads have not followed generally the plan of buying material to specifications in competition, is one of the principal reasons why we have been saddled with Section 10 of the Clayton anti-trust act.

The engineer of tests should report to the chief supply officer, for the reason that it is desirable that materials should be arranged for in advance of the need. The engineer of tests on our railroads should be investigating, developing and reporting on the requirements, source of supply, conditions, and facilities of manufacturers at all times; if this were done, as it should be, there would be very little inspection required at destination, and none of the long, tedious and expensive delays due to receiving material that fails to conform to the specifications being held up and determined upon by long and many times useless correspondence.

It will be said that the engineer of tests should either be an independent department, or report to the using departments, on the ground that they are responsible for the kind of material that is used. My answer to this statement is that the using departments are responsible for the specifications, and the supply department is responsible for furnishing material to the specifications.

### The Distribution of Materials

The distribution of materials to the users is easily one of the most important functions of the service of supply.

Material has no value, either to the railway company as capital, or to the using departments as service, until it reaches the points where it is needed to be used. It is essential, therefore, to determine upon methods which will best enable the railway company to conserve its assets and make them available where wanted in the least possible time. Material must be first assembled and maintained at as few points as possible for distribution, for the reason that it represents money which must be as closely guarded and conserved as if it were in the bank. The desirability of this practice is based principally upon the following facts:

(1) Generally there is only one place on a railroad where there is sufficient organization for the thorough inspection, test, check and care of materials.

(2) That materials can be inventoried, guarded, cared for and disposed of, if necessary, more readily where centralized.

(3) By restricting the number of places where stock is carried, a smaller fixed investment will be found sufficient to adequately protect the general needs of all departments.

The shops, representing the largest users of classes, if not values of materials, must first be considered and a practical plan is for the stores department to deliver material to the users in the shops. This keeps high priced mechanics at their work and their machines in operation during a period which otherwise would cause them to be absent securing needed materials and it enables the supervising forces to keep in touch with the progress of the work and the actual needs of the mechanics.

The shop delivery system assures accuracy in accounting by requiring that all material orders be revised and the proper description entered thereon by the store delivery supervisor before they are delivered to the office. It provides the means for obtaining a material order for all material issued; it enables the store department employees to observe the use of material by coming in personal touch with the men who are actually using it, and it provides a method by which they can intelligently anticipate and provide for the needs and satisfy themselves that the material will be utilized as intended. Moreover, it results in delivering material to points required in less time than other systems now in effect and at less expense. It also ensures an opportunity for locating and returning to stock, materials drawn for use and not applied; it ensures proper supervision over the manufacture of materials and the return of the finished or repaired product to the stores when completed. It encourages the use of serviceable second hand and repaired material in lieu of new and, by co-operation, provides for the disposition of shop worn material in proper sequence, thus avoiding the inadverted disarrangement of stock.

### Merits of the Shop Delivery Plan

The plan is very simple; it merely consists in establishing certain stations in the shops and grounds where material requisitions are received and materials delivered; usually a box marked in some specific manner, with a small shelf. These stations should, of course, be located as conveniently to the work as circumstances and conditions will permit. Material requisitions are prepared by the man who wishes to use the material, and either signed by him or by the foreman, as may be determined by the using departments. They are placed in the box and the material is delivered where directed by the delivery forces. The force consists of a store delivery foreman and as many men and boys as are necessary to give prompt and efficient service, which, of course, must be measured by the location of the material, facilities for delivery, distances, volume of work, etc.

The piece work basis for the delivery of material is not satisfactory, for the reason that it places a premium on getting material out of the store, whereas the object should

be to deliver only what is actually needed and to return whatever is not needed for any reason. As the mechanic and deliveryman should work together with the object of utilizing what is available by substitution and otherwise, this requires both intelligent and close co-operation between the section storekeeper and the mechanic.

The saving which can be made by applying this plan to its fullest degree of usefulness is obvious, and by improving the system by the introduction of automobile trucks and trailers, under an intelligent dispatching and supervising system, the cost of delivering materials can be tremendously reduced. But the real merit of the plan is not in the actual difference in the cost of delivering material; it rests upon the fundamental fact that the storekeeper must have some means of knowing accurately, at all times, what is needed, that nothing is available that can be used, that the material furnished is giving the best service, that the demands are met, and that nothing is wasted. The store delivery system is a link in the service of supply, and is based on the theory that supply officers must know what is needed before they invest the railway company's money.

### Origin and Purpose of the Supply Train

The supply train serves the same purpose for the line that the store delivery does for the shops, and in precisely the same way. It places the representatives of the stores department in personal connection with the users on the line; it places the storehouse at the disposal of the men on the line that use the material; it establishes the closest relations between the two, which, when coupled with a thorough inspection by the supervisory officers, as it should, furnishes the ideal method of distributing material on the line.

The supply train is the outgrowth of the supply car, it is the only economical and systematic method of distributing supplies to sections, agencies, signal towers, etc. A supply train should make about one freight division of 110 miles in 8 hours; it offers the only practical and economical method of making a thorough inspection of all the smaller stations and junction points; it is the only way that division officers can come into personal contact regularly with such officers as agents, signal maintainers, section foremen, etc. The average cost of delivery, based on the issues, is 11 per cent, but service of this kind cannot be measured by costs; its economy consists in providing a plan whereby all outside points may be reached at regular intervals, and the actual demands determined and cared for. The supply train affords a systematic means of keeping the road clean of surplus, obsolete and scrap materials; it offers the only means by which general and division officers can and will make a thorough inspection and come in personal contact with agents, section foremen, signal maintainers, etc.

The reason why the supply train has not been generally adopted on our railroads is due to the fact that there has not been a sufficiently broad conception of what the service of supply should embrace. The supply, or what is commonly known as the stores department, has been looked upon as merely the depot where supplies should be procured when ordered by the users, and the storekeeper in charge merely as the man who hands them out over the counter. It has occurred to few that the service of supply must be based on broad enough lines so that its agents should know what is actually needed; what gives the best service for the purpose, and have means at their disposal whereby they can come in personal contact with the users on the ground. The supply department is responsible not merely for having materials, but also the quantity and quality, and must also dispose and market the salvage.

A supply train may consist of from 15 to 30 cars, according to the size and location of the division. The train is made up of an office, dining and cook car, where the sup-

ply train crew lives and does its work and where the train crew eats; a stationery car fitted up with compartments for each standard form used, with drawers and apartments for all other stationery supplies; a miscellaneous supply car with station, operators and signal supplies; a bulk car for package and extra supplies, a tool car for track tools; an oil car with tanks sufficient to take care of the requirements of lubricating and illuminating oils; one or more tank cars with gasoline; one or more cars with frogs, switches, spikes, bolts, etc., one car for trucks, wheel barrows, and material of this character, and as many other side boarded flats as may be necessary to take care of the serviceable second hand and scrap materials picked up.

### How the Supply Train Operates

The crew should consist of a supply train storekeeper, in entire charge, except of the movement of the train, which is, of course, in charge of the conductor; about three assistants, one in charge of miscellaneous supplies, one in charge of stationery and one in charge of track tools and roadway materials. The train moves on a schedule, prepared at least a month in advance by the superintendent and general storekeeper. While the purpose is to change the schedule as little as possible, it is necessary to change it at different seasons of the year, in order to take advantage of traffic conditions by using light power.

Everything is prepared between stations, that is, requisitions for agent's supplies are checked and the material got ready to deliver; stationery is got out in the same manner, oil cans filled and everything made ready to issue promptly when the train stops. The supply train storekeeper and the conductor know the location of each station and where the stops will be made. Usually the first stop is made with the miscellaneous supply car, tool car and track material opposite the tool house. The man in charge of the miscellaneous supply car with the section foreman, delivers the tools and supplies required; at the same time the stationery clerk is delivering the stationery, the man in charge of the oil car is delivering the oils and drawing off the gasoline. The section crew is unloading frogs, switches and other heavy material; exchange tools for repairs are checked and delivered into the tool car; surplus, second hand and scrap material is loaded and classified; stationery is checked and such as is required delivered, whatever is on hand that should not be for any reason, is taken up and returned. In the meantime a thorough inspection is being made of all station buildings and grounds by the superintendent, division engineer and division storekeeper; investigations are made on the ground regarding the service of tools and supplies; if additional supplies are needed that are not called for by the requisition, they are delivered and the requisition approved by the ranking officer on the ground. Items not needed are eliminated. A memorandum has been prepared in advance by the section foreman of second hand tools requiring repairs. The weight of the different classes of scrap is estimated, receipts exchanged, and the work completed on the ground. It is astonishing how quickly all this work can be accomplished when properly organized.

### Distribution Through Division Stores

Generally speaking, material can be moved from the general to division stores in car loads on sailing dates or schedules; that is, there should be a specific time each month for the requisitions to come to the general store, they are made up in sections, the cars are marked as per schedule, loaded and shipped on regular dates. In a well organized general store, requisitions for material on hand should be shipped in not to exceed 24 hours from the time they are received. Deliveries to local stores, round houses, junction points, etc., should be made from the division stores via

local freights and be directed and controlled by the division storekeeper.

Materials should preferably be moved in car loads in through freight trains, but recognizing the need of having fast service, it is recommended that a certain number of baggage cars be assigned, operating between the general store and the various division stores; where baggage cars for this service are not available, then baggage cars on the regular trains can be used, but special service is recommended.

The principal inspection points and terminals should be provided for through the division stores, although there are many railroads where this is not practical, and provision can be made from the general store. The reason why it is more desirable to protect these points through the division stores is that the division storekeeper is and should be in closer touch with the division officers.

### A Broad Conception of Reclamation

Reclamation in its broadest sense has been largely misrepresented and misunderstood. Reclamation means the reclaiming or making useful that which has been discarded. The reclamation of material on a large and systematic scale by the supply department was first introduced by the Santa Fe about 10 years ago. The fundamental principle underlying reclamation is that nothing must be reclaimed that will not be needed for future use or that cannot be reclaimed at a saving, and in order to guard against losses or incorrect conclusions, an accurate record must be kept covering each operation, from which a monthly statement should be compiled showing the net results (savings or loss) on each item of material reclaimed.

The salvage department on a railroad should be organized for the purpose of salvaging discarded and worn out material of all kinds, including equipment. This department should be in direct charge of the general storekeeper, reporting to the chief supply officer; this is based on the principle that the chief supply officer is responsible for providing suitable materials at the lowest net cost, and must have at his command an organization capable of following material from the time it is ordered until it is salvaged and disposed of.

There is one feature of this work which operating and maintenance officers seem to lose sight of, and that is that the supply department is not taking over any of the functions of the maintenance department in salvaging materials, they are taking over this work after the using departments have finished with it. The using departments are expected and should be required to get the utmost service out of their materials and tools, and not permit them to be turned over as scrap to be salvaged until they have performed their full service. Materials which cannot be recovered, reclaimed, or repaired must then be classified into what is commonly known as scrap, according to the official classification, for the purpose of obtaining the highest market prices. The following outstanding features of this work must appeal to all practical men:

(1) That the supply department is organized for the purpose of supplying materials, and the reclaiming of materials is one of its sources of supply.

(2) That the work of dismantling, disposing, and sale of all materials, including released equipment, is one of the duties of the supply department.

(3) That this work can be done more economically in conjunction with the handling and marketing of scrap, of which it is a part.

Very great savings can be effected on our railroads by organizing and operating a large well equipped reclamation plant, for the broad purpose of thoroughly inspecting, recovering, reclaiming, repairing, sorting and disposing of all salvage.

### Conclusion

All primary accounting should be done at the division stores and consolidated at the general stores. In no other place can basic accounting be done as economically and accurately as at the storehouse. All materials must be received and checked by the storekeeper; the same material must then be priced and either invoiced to the using department or charged direct to the primary accounts. In no other way can the storekeeper keep control of the stock and control his business. The supply officer is the fiscal agent of the company. The money invested in material is enormous, every dollar tied up unnecessarily in materials and supplies is unliquid and unworking capital. The railway storehouse is not a reservoir for material, but a bank; material is not junk, but cash, and must be as safely guarded and controlled as cash in the treasury.

## Amendment of Valuation Act Proposed

WASHINGTON, D. C.

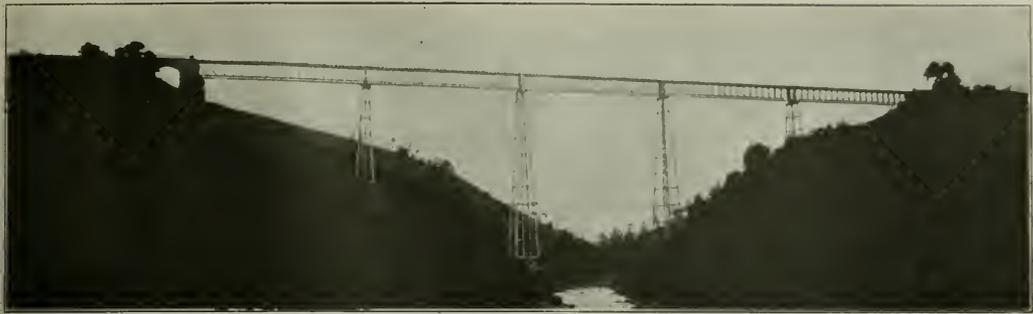

**A**N AMENDMENT to the valuation act of 1913 by striking out the words instructing the Interstate Commerce Commission to ascertain and report the original and present cost of acquisition of railroad land was advocated before the House committee on interstate and foreign commerce on January 20 by P. J. Farrell, chief counsel for the Interstate Commerce Commission, and John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, at a hearing on the bill introduced by Representative Esch. The bill would also make the provision of the act requiring the commission to report the cost of reproduction new apply only to property other than land.

Mr. Farrell said that since the decision of the Supreme Court in the Kansas City Southern case the commission's Bureau of Valuation has undertaken to find out what the carriers have had to pay in the past in order to get some estimate of what it would cost to re-acquire the land, but it believes that the estimate would not be worth anything when made. "The commission is doing its best to perform an impossible task," Mr. Farrell said, "but no man on earth can do anything but make a guess and he might just as well stay in Washington and guess as to incur traveling expenses and make his guess in the field." He said there is no basis for an assumption of what proportion of the land would have to be acquired by purchase or by condemnation or how much would be donated, and that unless the law is amended so it will not be necessary to make an estimate it will result in a farce because the commission would be driven to use a multiple.

# The Chilean State Railways Are an Open Market

## Part III—Conclusion of a Discussion of Chile as a Prospective Purchaser of Railway Supplies

By John P. Risque

**T**HE FIRST TWO PARTS of this article were devoted principally to a description of the Chilean government lines already in operation. This part of the discussion deals primarily with projects for new railways which are now under discussion in Chile.

As set forth previously, it is the intention to restrict this account of the Chilean railways to the state owned and

nels, more than 100 bridges and a string of snow sheds mark this stretch of track, the costs of operation of which frequently exceed the revenue. Passengers constitute the main traffic. Most of the freight traffic between Chile and Argentina is carried in ships south through the Straits of Magellan.

Southern Chile's winter months of June and July almost invariably shut the "Transandino" down with a snow-fall sufficiently heavy to obliterate the railway, snow sheds and all, and travelers' plans for crossing from Chile to Argentina via this line should always provide for these conditions.

If the picturesque scenery along the entire route from the quaint junction at Llai-Llai and the excitement attendant upon the departure of trains at Llai-Llai in three different

Combined Rack and Rail Locomotive on the Chilean Transandine

operated lines, but any reference at all to Chile's railways which omitted a description, however brief, of the Transandine Railway, famous all over the world, would possibly bring forth comment on the omission.

It is just as natural to open up a reference to a privately owned and operated line in South America with the statement that it is English as it is to buy a ticket before getting on a train, for, with few exceptions, such is the situation. The Chilean Transandine is British up one side, and its extension, the Argentine Transandine, is British down the other side. Both of them are of meter gage and contain frequent and long stretches of rack rail. The Chilean Transandine starts at Los Andes, the terminal of the 28 mile, broad gage branch of the Central Sur from Llai-Llai, between Valparaiso and Santiago, and runs 43 miles to the Argentine frontier, at an elevation of 10,459 ft. It is said that the grade of the last 7 miles of the climb averages 8 per cent. The rise is more than 3,000 ft. Twenty-five tun-

Transandine Train at Paradero Vilcuya, Chile

directions—all at about the same time—could be turned into revenue, the Transandine could sit back and take it easy; for of all the tourist's delights on a South American trip the novelties of this Transandine ride are the most enjoyable. Arriving at Llai-Llai from either Santiago or Valparaiso, the passenger is greeted by an array of women fruit sellers in white uniforms, lined up behind high banks of Chile's various delicious fruits, among which grapes figure prominently. In the pleasant excitement of rushing around to load up with fruit, it is quite possible to miss a train in

spite of repeated warnings from a hurried brakeman who claps his hands vigorously as he walks up and down the platform. When he has "clapped" the passengers all on board, the conductor acknowledges the fact by a shrill note from his pocket whistle. The engineer then climbs aboard and contributes his foot—and the stage is all set for the departure which duly follows.

The ride to Los Andes is generally made in the evening. Rolling stock on that branch consists of three or four of the broad gage day coaches from the Santiago and Valparaiso trains and an inside connected British 0-6-0 type locomotive, the rather high drivers of which were found to be too strong for work as a switcher. At Los Andes, where the gage changes from 5 ft. 6 in. to meter, there is a warm welcome for the tired traveler, who is, by necessity, going to patronize the hotel in an enforced lay-over for the night.

At seven the next morning he will be on his way in diminutive meter gage cars, with seats on which the upholstery is so rigid that the traveler will be quite stiff and weary upon his arrival at Mendoza in the Argentine foothills of the Andes at the end of the day. The cars in use on this road resemble large trolley cars such as are in

extension of the engine's frame. Two sets of single expansion engines drive the machine, the one in front propelling 3 outside cranks, in the center of the axles of which, between the frames, are mounted the pinions referred to. The rear engine of six coupled drivers is an ordinary rail engine. But the combination looks like a miniature Mallet in action—that is, when both engines are running. But when the locomotive is traversing sections devoid of rack rail, the front engine is stationary; while the rear set of pistons, rods and wheels are running fast and the railroader will probably look twice at a new species of Mallet, the like of which he never saw before—and probably will never see again.

#### Other Proposed Transandine Routes

Due to the difficulties of this Transandine Railway all of the way across, the change of gage from 5 ft. 6 in. to meter in Chile and back to the former in Argentina, together with the understanding that it would require a million and a half dollars to put the road in a position to earn money, of which about \$650,000 would have to be spent upon the Chilean section alone to provide additional protection from snow-slides as well as for additional rolling stock,

Yards on the Central Sur South of Valparaiso

service on suburban lines in this country; some have entrances at one end only and the absence of foot plates on platforms over the couplers makes passage from one car to another an undertaking worthy of some deliberation. The magnificence of the scenery is indescribable—particularly in the vicinity of Juncal where the actual origin of the Mendoza river of the Argentine can be seen in the melting snows of mountain peaks which seem miles above the car window. Perhaps the prominence of this line in travelers' minds has been attained by the glowing descriptions of the ride from friends who have taken it.

An American railroader with his neck out of the window along with the rest of the crowd will sense a slight halt, like "taking up slack," as the train arrives at the foot of a section of rack rail. This precaution attends the engagement of the pinions on the axles between the frames of the rack rail engine, with the teeth in the rack rail in the middle of the track. At a station, an inspection of the locomotive on the head end of the train will reveal some interesting novelties among which will be noted the side-tank feature for water, so tenaciously adhered to by the Briton in his locomotive designs. The coal bin, as is usual in these side-tank types will have been built on behind the cab over an

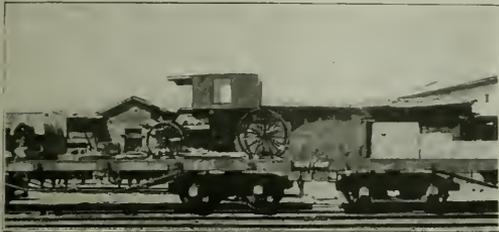

sidings, and shops, considerable interest has manifested itself for years in proposed new Transandine routes.

About fifteen of these projects have come to light at one time or another. Most of them are planned to lie south of the present transcontinental line. The nearest actual approach to such a competitor is the San Martin line in the far south. This line runs from Colillelfu, east of Valdina, on the Central Sur, to Huidif, 19 miles inland. From there a highway transportation service is operated for 6 miles to Rinahue. Thence transportation is effected by steamer across Lake Rinahue, 19 miles, 27 more miles by road to Lake Llacar, 30 miles across that lake to San Martin in Argentina. All of this route in the intentions of the company will be served eventually by a railway.

Informed Chileans, however, believe that the first practical solution of a successful new Transandine project will make its appearance in the extension of a line to the Buenos Aires Great Southern's line which is in operation from Bahia Blanca on the Atlantic coast bay of that name to Neuquen, which lies on the boundary between the Argentine province of Rio Negro and Neuquen. This line is already built out to Zapala which is within 50 miles of the Chilean frontier. An extension westward through the Lonquimay

Pass would reach Curacautin on the eastern end of a branch line from the station of Pua on the Central Sur. The connecting of the gap between the latter point and Los Sauces will then provide an all rail transcontinental route from Bahia Blanca to the Port of Lebu, using the existing line from Los Sauces to the latter point. Considerable interest was manifested in the activities of the Buenos Aires Great Southern in the shipment of construction materials to Neuquen last March.

In the extreme north another important project is a subject of much discussion in the town of Antofagasta, where the citizens seem to be very earnestly behind a move to in-

Typical Chilean Flat Cars Typically Loaded

duce the Chilean congress to aid them in their ambitions to build a new line from Salta, Argentina, to either Antofagasta or the nearby superior harbor of Mejillones, 43 miles north. This proposed new transcontinental line has much to recommend it, particularly since it would permit the transportation of food and livestock from Argentina to the barren nitrate fields of northern Chile. The possibilities of such an undertaking have appealed to the president of Argentina, who has asked his congress to consider the proposition of extending the state railways from Salta west to the Chilean border to connect with the line which the Chileans propose to extend to meet it. The nearest port by

On a Rack Rail Section of the Transandine Near Juncal

rail from Salta is Santa Fe, 300 miles north of Buenos Aires, on the Paranaun river, and incidentally the administrative center of the Argentine Government Railways which radiate from that point in all directions but east.

The new line is estimated to bring Salta within 350 miles of a Chilean port and save the 350 miles of railroad haul from Santa Fe. The latter city is approximately 6,300 miles from New York; Antofagasta is 4,370 miles from the same point, thus offering a saving in the water haul of about 1,930 miles. New York freight for Santa Fe is at present routed to Rosario, where trans-shipment to smaller boats is

necessary. The time required for the run from New York to Rosario is in the neighborhood of 24 days; from Rosario north to Argentine Andean points, including the Salta district, consumes from three to four days more. Cargo boats, on the other hand, from New York to Antofagasta, make the distance in 16 days. Adding two more days for the estimated time from the latter port to the Salta district, brings that region within 18 days of New York, thus cutting the time nearly in half.

The region in northern Argentina which will most benefit by the proposed new railway is said to contain an abundance of untouched natural resources including copper, gold, silver, alum, sulphur and soda, while the soil in this part of the country is rich, aided by a semi-tropical climate, tempered with varying degrees of altitude and suited to the easy cultivation of nearly all agricultural products. Fruits, vegetables, meats and sugar, the production of which is expected to be increased by the advent of the line, are some of the principal agricultural products of the territory referred to.

The total cost of the project is estimated at \$25,000,000 and various plans for financing the line are under discussion, including interesting arguments relating to the gage to be used and the most suitable point for crossing the

Rio Blanco Station on the Transandine

Andes. The consensus of opinion favors meter gage and this is considered logical, due to the fact that that gage is used by the Argentine government lines as well as by most of the roads in the district of Antofagasta. Gossip among the interested ones in northern Chile frequently refers to an alleged objection to the building of the line by the southern Chilean farmers who claim to see in its construction a loss in their present shipments of cattle and food products by steamer from their rich fields in the south to Antofagasta and the nitrate regions beyond.

THE MAINE CENTRAL is giving service at less than cost. When the revenues received fail to cover necessary costs, a railroad cannot continue to give good service and cannot expand to meet the growing needs of the public. Increases in expenses in 1920 over 1917 amount to \$9,000,000 for wages, \$2,174,000 for coal and for other operating expenses in proportion. These increased costs have not been wholly covered by the increase in rates granted by the Federal and State commissions. The Maine Central has a low capitalization, all representing cash paid in, dollar for dollar. The Government appraisal of the property will show a value greater than the capitalization. The railroad is honestly and efficiently operated. The company is making and will continue to make every effort to increase efficiency and reduce the cost of operation, but it is evident that we cannot continue to give service below cost and live. This situation is against the interest of the people of Maine.—From Maine Central Time Table signed by Morris McDonald, president

# New York Public Service Commission—Annual Report

THE PUBLIC SERVICE COMMISSION of New York, second district, has sent to the Legislature its fourteenth annual report, which is for the calendar year 1920. The first subject discussed is the action of the Interstate Commerce Commission in ordering an increase of passenger fares to 3.6 cents a mile, generally throughout the state, for intrastate travel, to correspond with the rate allowed for interstate fares. Reviewing the litigation by which the state has taken action in the courts to contest the federal orders, the present report says that the Transportation Act passed by Congress fixes a basis of rate-making for the railroads which is inconsistent with the standard of New York law, which contemplates rates based on what is just and reasonable in each particular case; and the state commission argues that passenger fares should not be uniform throughout the state; this for the reason that the service is not uniform.

"The fixing of such rates rests upon the assumption that the quality of the intrastate service, taken as a whole, is equal to the quality of the interstate service. Such is not the fact. The passenger service on the branch lines penetrating all parts of the state is notoriously not of the same quality as to speed, or wholesomeness, or comfort, or reliability, or value to the passenger. On these lines the freight traffic is too often given preference over passenger trains. The order of the federal commission compels the great mass of intrastate passengers to pay a first-class rate for a second-class or a third-class service."

The Commission does not wish to enter a contest with the federal government, but deems it its duty to have this issue settled by the courts. It proposes also to test in court the power of the federal government to regulate the issue of capital by the railroads, in disregard of the laws and the powers of the State of New York.

The police power of the Commission has not been affected by federal legislation and under this head the Commission has investigated automatic train control; and at the invitation of the New York Central it has created a joint committee of representatives of the Commission and of the railroad company to report on available devices and as to

the selection of a section of road where devices can be tested. The Commission has recommended that some form of apparatus be installed on 50 miles of the main line of the New York Central, including all of the passenger locomotives on such section and 25 freight locomotives. It is hoped to report conclusively on train control before the end of 1921.

Grade crossing elimination has proceeded slowly because of unsettled financial conditions; but in Watertown and Rochester further appropriations are recommended; for important work has been begun and should not be dropped.

Inspection of railroads has shown serious problems in connection with deferred maintenance.

The number of accidents at highway grade crossings has increased, but the number of casualties resulting therefrom has decreased. Considering the vast number of automobiles using the highways during the summer, it is deemed remarkable that the number of accidents is so small. Increased protection has been ordered at certain crossings. The audible-visible signal is regarded as particularly well adapted to important highways in outlying districts. More extended use of this type is making motorists more familiar with them, so that they are observed and respected. Such signals are not infallible, but it is believed that the fact that they give practically continuous service, and that the times when they are out of service are infrequent and relatively short, makes such a signal highly desirable on main thoroughfares carrying a relatively dense traffic. The report is signed by the five commissioners, Charles B. Hill, Frank Irvine, John A. Barhite, Joseph A. Kellogg and George R. Van Namee.

## Freight Car Loading

WASHINGTON, D. C.

THE NUMBER OF CARS OF revenue freight loaded during the week ending January 15 as compiled by the Car Service Division of the American Railway Association shows an increase of over 3,000 as compared with the previous week, but is still considerably lower than for the corresponding weeks of the past two years. The total was 709,888, as compared with 840,524 in 1920, 758,609 in 1919 and 612,576 in 1918. The report follows:

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts, Comparison of Totals This Year, Last Year, Two Years Ago. For Week Ended Saturday, January 15, 1921

L. C. L. merchandise loading figures for 1921 and 1920 are not comparable, as some roads are not able to separate their L. C. L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

# How to Increase the Average Loading of Cars

Pertinent Suggestions from Railway Officers Who Have Given  
This Subject Close Study

**M**AXIMUM CAR LOADING is a matter of dire necessity during periods of car shortage. It is also an essential to the economical conduct of transportation. Although the necessity for conserving cars has been temporarily decreased, the requirement of economy is now more imperative than at any time in the last 12 months. Therefore, the suggestions offered by railway officers and others who contributed articles in a contest on "Means of Increasing the Average Loading of Cars" should be of distinct value to the railway managements in the herculean efforts which they are now making to conduct the operations of their properties with utmost economy.

The 25 papers received in this contest were referred to a committee of judges consisting of L. W. Baldwin, vice-president, Illinois Central, Chicago; F. T. Bentley, traffic manager, Illinois Steel Company, Chicago, and C. E. Spens, vice-president, Chicago, Burlington & Quincy, Chicago. These judges awarded the first prize to the paper submitted by G. D. Brooke, superintendent of transportation, Baltimore & Ohio, Cincinnati, Ohio, and the second prize to the paper prepared by O. C. Castle, superintendent of transportation, Southern Pacific Lines, Houston, Tex. Other papers received which merit special attention are those submitted by C. F. Balch, assistant general auditor, Chicago & North Western, Chicago; P. W. Coyle, traffic commissioner, St. Louis Chamber of Commerce, St. Louis, Mo.; E. H. Shaughnessy, American Petroleum Institute, New York; C. W. Hoisington, San Francisco, Cal.; J. L. Coss, train dispatcher, Chicago, Rock Island & Pacific, Haileyville, Okla., and D. J. Stevens, division superintendent, Baltimore & Ohio, New Castle, Pa. The prize winning papers and three others are presented below:

## First Prize—Use Large Capacity Cars in Heavy Loading Service

By G. D. Brooke

Superintendent of Transportation, Baltimore & Ohio, Cincinnati, Ohio

It is of prime importance that the marked capacity of each car be the highest consistent with the requirements of safe operation. General practice permits the loading of cars 10 per cent in excess of the marked capacity. There are great possibilities in the utilization of this margin, for with many classes of loading advantage can be taken of it to gain one car in every ten and to increase the average carload correspondingly.

With the cars properly rated the next step towards increasing the average loading is to distribute the equipment so that cars of high capacity will be used for long haul traffic and where practicable loaded in both directions. If we can add to these two conditions of service, that of prompt loading and unloading, a maximum efficiency will be obtained. A familiar example of such utilization is the placing of high capacity coal cars in the lake coal and ore service. Light capacity cars should be used for moving coal from the mines to inland points close by the mining districts. High capacity box cars can be used to good advantage in the long haul movement of heavy commodities, such as grain and lumber, while the light capacity cars are assigned to the movement of light bulk freight, like straw, paper stock, etc., and to short haul business, trap-car load-

ing, inter-terminal movements, package locals and similar service to which are attached inherent delays and slow movements.

Certain kinds of freight are peculiarly adapted to heavy loading both on account of the great weight per unit of volume and the large quantities offered for shipment. Ores, pig iron, mill products, stone, gravel and sand are good examples. With these and other similar freight the problem of maximum loading is simple. With bituminous coal skillful loading is required in order to take advantage to the fullest extent of the cubical capacity of the cars. Coke should be loaded to the full cubical capacity of the car and a generous crown added to compensate for the shaking down of the load when the car is set in motion.

The railroads load a large number of cars daily with their own forces. This loading can be divided broadly into two general classes—company material and commercial l.c.l. freight loaded at freight houses. The former consists both of c.l. and l.c.l. freight and the same general methods of loading are applicable as with commercial business. Commercial l.c.l. freight requires for its movement a very considerable percentage of the available box cars. Taken on the whole it is of light weight and the load of the average l.c.l. car is doubtless considerably under eight tons. This freight is for the most part loaded by the railroads themselves and the opportunities for increasing the car load are many. With proper care in stowing, the loading of merchandise cars to the full cubical capacity of the car should not increase the breakage and other damage and any delays to freight in holding it for full carloads are overcome by through movement when the car is started. When the tonnage for a single destination is not of sufficient volume for a daily car then resort can be had to such expedients as bi-weekly, tri-weekly and other periodic cars, loading cars to two or more destinations and loading on transfer stations. It is important to establish a minimum weight limit for carloads to apply unless the cubical capacity of the car determines the load.

The multiplicity of activities on a great railroad system is such that specialists are often required to direct the efforts of officers and employees in obtaining certain desired results. This applies to increasing the car load. For unless some individual or bureau is charged with the responsibility of keeping the question alive it will be lost sight of from time to time and much progress which has been made will be lost. A bureau consisting of a small office force and two or three traveling inspectors or instructors, in charge of an officer of suitable experience, can accomplish much in increasing the carload. The traveling instructors should visit large shippers and stations, instill and foster interest in heavy loading, assist in instructing employees and offer helpful suggestions regarding methods of loading. The office force should obtain such records as to enable it to compare the monthly performance of the various stations and of industries, including railroad store houses and other plants where the loading is heavy.

Suitable statements embodying these comparisons when placed in the hands of the superintendent will show him what progress is being made at the stations and industries on his division and will enable him to take steps to correct backward tendencies and to offer encouragement where the showing is good.

The chief duties of the bureau are to maintain interest

in the campaign for increased loading, to establish for the several divisions standards adapted to their loading conditions, and to see that the same general methods are used over the system. But the brunt of the campaign must of necessity be borne by the operating and traffic officers, the agents and other employees—the rank and file of the division organization. The superintendent who takes an active interest in the carload will infuse his entire organization with a like interest by discussions at staff meetings, by personal talks with officers and agents and by suitable written instructions. He should not fail to take advantage of the experience and ability of the personnel of the traffic department in dealing with the public but should lean heavily on that arm of the service in placing the problem before the shippers. The agent has a most important part to play in applying the cars at his station where best adapted to the loading offered, in watching his l.c.l. loading, and in obtaining the co-operation and assistance of the shippers with whom he comes in daily contact. The assistant superintendent, the train master, division engineer, master mechanic, yard master, all division officers, have their parts to play in direct supervision, in instruction of their employees and in their relations with the shipping public. Thus the concerted efforts of the officers, of a large number of employees and of many shippers are brought to bear on the problem, not to the exclusion of but in conjunction with the other important phases of efficient transportation, and there can be no results other than the attainment of creditable car loads.

## Second Prize—Keep a Close Watch on the Loading

By O. C. Castle

Superintendent of Transportation, Southern Pacific, Texas Lines, Houston, Texas

A celebrated statesman once said "The way to resume is to resume," and in connection with the campaign for increased efficiency we may well paraphrase this and say "the way to secure heavier car loading is to load cars heavier." Like the "miles per car per day" problem the solution depends largely on the co-operation of the public. The public, divided generally into two parts, forms with the railroad a triangle, the three sides of which are:

(A) the carrier, (B) the consignor and (C) the consignee.

To follow the geometrical figure, we may call our triangle a right angled triangle with the consignee the hypotenuse, the square of which is equal to the square of the other two sides. To elucidate: In general the consignor is as much interested in loading to capacity as is the carrier. It is safe to assume that his gains are related to the volume of his shipments. The consignee, on the other hand, may have

therefore, be disregarded or at least deferred in the consideration of means for accomplishing immediate results.

Turning then to practical and practicable plans, the problem reduces itself into one of supervision over actual loading of the individual car under existing conditions. For this purpose, the first essential is a system of complete and accurate reports. Loading stations should compile weekly reports showing their car loading in detail, the following items being suggested as a basis: Date, car initial and number, destination, contents, car capacity, weight of contents and remarks. Station reports should be assembled currently and checked in division and general transportation offices. Examination of these reports will develop instances of light loading, or the use of cars of greater capacity than necessary for particular commodities. Attention of loading agents and car distribution forces should be called currently to such instances. Monthly compilations should be made of car loading reports; averages of tons per car and per cent of capacity utilized being extended, separated by principal commodities and for operating divisions. Comparisons with previous periods should also be shown. These statements should be sent to interested officers, who should be required to study the performance and concentrate on the weak spots as developed by the statistics. The following form is suggested.

From the general office, letters and circulars should be issued from time to time outlining the performance. Good results may be secured by the use of graphic charts indicating the standing of the divisions in order to introduce the competitive feature.

The selection of a particular commodity, one which moves in large volume, during a certain period, and an analysis of the conditions surrounding its handling can be made productive of results. Experiments should be made in intensive loading of such a commodity and the method of loading demonstrated to be the most economical, reduced to charts or blueprints, for circulation among those interested. Where marketing conditions or commercial units affect the size of the load, conferences should be held with individuals, firms or associations interested in the particular commodity in an effort to secure co-operation in improved loading.

But while much may be achieved in the handling in wholesale, the real effective work must be done in the retail realm. Constant supervision over the loading of the individual car, and close following of shipping points must be supplemented by missionary work directed at the consignee whose light order is often responsible for a light load. For this purpose, a report should be required from destination points, showing all cars received with loads that do not utilize either the weight or space capacity of the car. These reports should give the name of shipper and consignee as well as the point of origin, and destination. They should

Divisions and commodities	CARS LOADED AT STATIONS												Sheet No. _____
	Cars loaded		Freight Capacity of cars—tons		M. nth of		Weight of contents—tons				Percentage of contents to capacity		
	191— 2	191— 3	Total 191— 4	Average per car 191— 5	Total 191— 6	Average per car 191— 7	Total 191— 8	Average per car 191— 9	Total 191— 10	Average per car 191— 11	Percentage of contents to capacity 191— 12	Percentage of contents to capacity 191— 13	
1													

many reasons for purchasing in small quantities, and his attitude toward the heavy car load is, therefore, in natural opposition to that of the carrier and the consignor. The most logical and simple expedient to correct this tendency on the part of the consignee is a proper adjustment of car load minima. Some progress is being made along this line, but it requires time to correct iniquitous practices that have developed over long periods. This direct method must,

also show the commodity, car capacity, weight of shipment and per cent of capacity utilized (both weight and space). The supervisory officer may then handle by correspondence or otherwise, with either the shipper or consignee for an increase in the weight of future shipments.

There are many commodities, the nature of which will permit of "double loading" by which is meant the consolidation in a single car at point of origin of two minimum car

load shipments for different destinations or consignees. Such loading should be limited to shipments moving in the same general direction, and the handling should be covered by special instructions to avoid delays and mixing of shipments. Checking of such reports with car distributors daily will suggest means for inducing a better utilization of cars through regulation of the supply.

Contests between loading stations with cash prizes for excellence in car loading is an effective means of stimulating interest. To insure fairness and to give the widest possible range to the contest, the prizes should be fixed by commodities with possibly an additional prize for the best record in loading all classes of freight.

While the shipper and consignee are the partners of the carriers in loading of car load freight, the carriers have within their control, a large item in the merchandise loading, which by its nature makes for light loading. This traffic constitutes possibly 10 per cent of the loading on many large roads. To supervise this item properly, the transportation office in conjunction with the traffic department should carefully analyze the merchandise traffic and establish l. c. l. schedules, scheduled cars should be run regularly, and loading stations prohibited from running unauthorized cars. Daily reports of tonnage should be required, the figures tabulated and carefully analyzed to detect schedules which are not justified by the traffic offered, or to indicate where schedules may be changed to the advantage of the service.

If a program based on the methods suggested in the foregoing is undertaken by the transportation organization, with the co-operation of the traffic department and the support of the management, and if intensive supervision is applied to the fulfillment of the program, a marked improvement in loading is almost certain to follow.

## Watch the Loading at Every Angle

By J. L. Coss

Train Dispatcher, Chicago, Rock Island & Pacific, Hailville, Okla.

The railroads and shippers should take measures to induce the Interstate Commerce Commission to authorize general increases of minimum car load weights and no effort should be spared to increase the loading of less than car load freight. A vigorous campaign should be waged by the representatives of the railroads among the shippers through the different shippers' associations, chambers of commerce and also through the newspapers.

Every time a railroad representative, regardless of his position, is within reach of a gathering of business men he should take advantage of any possible opportunity to talk on the subject of loading cars to capacity, or rather—10 per cent above capacity. He should also make it a point to enlist the attention and kindly feeling of the draymen, truckers and others who actually load the cars in such a way as will cause them to take a personal interest in this important matter. It is the fellow that does the actual work who can sometimes help out in more ways than one.

Articles by recognized authorities on transportation appearing from time to time in the leading newspapers will have a tendency to encourage shippers and railway men toward the loading of cars to capacity. The magazines published by the railroads should contain articles on heavier car loading together with statements showing tonnages loaded in cars for a certain period. The agent obtaining the best record in car loading should be very strongly commended in the magazine. The managements should take the employees into their confidence, telling them of the results secured, thus creating in them an interest in the matter.

The station agent is one of the most important factors in

the matter of producing the capacity loading of cars and he should be dealt with in a way that will insure such loading of all cars from his station. At transfer points he can work miracles by looking after the cars which are interchanged. By exercising a little diplomacy he will gain the good will of the shippers who will be more than glad to assist him in making his record for full car loading complete. The "sailing day" plan for handling merchandise should be adhered to; this makes for a larger amount of l. c. l. merchandise loading per car. However, with this practice in effect too many local merchandise cars leave the terminal each morning in the local freights; many of these cars could have been consolidated into a less number.

At all staff meetings general talks on the subject of car capacity loading will have a tendency to stimulate the employees in general and especially agents and local trainmen whereby they would be induced to watch the matter closely.

Conductors should be appealed to in the matter of setting out cars for loading and especially at blind sidings and set out the kind of car applicable to the commodity to be loaded and obtain a capacity load. Chief dispatchers and car distributors should familiarize themselves with the class of loading at different points on their divisions and give conductors such information as will be of benefit to them in furnishing the cars which can be utilized to advantage in securing heavier loading. If a small car is ordered for a station it should be furnished instead of a large one, because the larger car can better be used somewhere else. This is a matter which should be watched closely by all supervisors when making trips over the road.

At small stations, where beginners in the station service are generally placed, and some of the larger stations as well, the agent as a rule does not look personally after the loading of cars but leaves it to the shipper and the latter generally leaves it to the drayman. Where such conditions exist the trainmasters and other supervisors can do some good missionary work both with the agents and the shippers. But this must be done in a diplomatic way.

Trainmasters and other supervisors should spend more of their time visiting stations in the interest of heavier car loading, and they should by no means miss the blind sidings where considerable loading is done at certain times of the year by farmers and teamsters who do not appreciate what capacity loading means. Here is where the supervisors can make a good showing by teaching these men what is desired and how to get it.

Co-operation among the shippers and their forces and the representatives of the railroads will do more to produce capacity loading than anything else. However, when good results have been reached do not allow empty cars to stand idle on the side tracks under the eyes of the shippers who have been urged to load cars to capacity.

At coal mines, rock quarries, lumber mills, and similar places, where there are no track scales for weighing cars, many cars go out light loaded. If such industries cannot be prevailed upon to install scales it would pay the railroad company many times over to put them in.

It is impossible, in many cases, to load lump and nut coal to capacity in the ordinary coal car because the sides of the car are not high enough. In order to secure capacity loading of this commodity the railroads should equip such cars with side boards six or eight inches high with hinges and stakes.

At points where bulky freight such as furniture and similar commodities are loaded special care should be exercised by agents and yardmasters and engine foremen to see that the proper sized cars are set which will admit of loading as near as possible to capacity and the shippers prevailed upon to load every pound they can in the cars. Many times the shippers can be induced to knock down bulky freight, with a very little labor on their part, thereby loading more

in the car and at the same time secure a reduction in rate as against the rate they would pay for the freight in a set up condition. Here is where the station agent and the traffic man can use his influence to advantage with the shipper.

## Organize a Car Loading Bureau

By C. F. Balch

Assistant General Auditor, Chicago & North Western,  
Chicago

The fundamental principle upon which we are to proceed is that in order to secure heavier loading, we must solicit the interest and effort of the man who is loading the car. This man is the shipper, so far as all c. l. traffic is concerned, and the freight house force, so far as the l. c. l. traffic is concerned.

The l. c. l. traffic is a large factor inasmuch as on the average railroad, possibly one-half or more of all box cars are engaged continuously in this traffic. The l. c. l. freight originates in the principal cities and distributing points, and in a general way, moves opposite to the general direction of traffic. Many cars, if not used in l. c. l. traffic, would move empty to the points where car load traffic originates.

This consideration has probably had much to do with the light loading of merchandise traffic, inasmuch as the loaded car moving considerably more promptly than the empty car, finds itself out of the large city where it is needed for car load loading, and the movement of the car to this point is more to be desired than to secure a maximum load of l. c. l. freight. Therefore, a large portion of l. c. l. freight traffic, principally that which is local, originating and terminating on the one line, is excluded from interest. It does not, however, apply to freight traffic destined to points on connecting lines unless it is desired to secure a movement of foreign empties to points of destination.

As c. l. freight is loaded by the shipper, it is necessary to interest him in the question of increasing the loading. When cars are scarce the shipper should load a maximum load whenever he secures a car for the transportation of his commodity. At such times, minimums are ignored, and are not a governing factor. A little intelligent propaganda placed in the hands of shippers will have a very large influence in securing their interest in a maximum load. Shippers, however, are confronted always with the difficulty of receiving from their customers orders for a maximum car load, because by loading a minimum car load, they can secure a car load rate. The only way to overcome this tendency of the shipper is to *increase the minimum*.

The United States Railroad Administration did much to help this situation, but with the return to private control, and the restored authority of the state commissions there have come into being many minimum weights and rates applying to intra-state freight traffic, which should be raised to the standard set by the Railroad Administration.

Freight traffic includes certain commodities which cannot well be loaded heavier than at present. The livestock traffic is an example of this, the nature of the commodity forbidding heavier loading. Certain other commodities are being loaded as heavy as practicable, and yet are far below the average load of all cars. Coal and ore are examples of commodities which are already being loaded to the maximum capacity. It is, therefore, necessary to direct special attention to those commodities which are susceptible to heavier loading, and which may well respond to an intelligent effort.

A study of commercial conditions which have been governing factors in determining the practicable minimums heretofore, would disclose opportunities for raising many of the low minimums which now exist.

This subject is worthy the entire attention of a special staff, and it is suggested that a heavier loading bureau be

established either in the office of the superintendent of transportation, or the chief operating officer, as may be deemed advisable. The duties of this bureau would be to study the subject and assemble and disseminate such information as is necessary to carry on an intelligent propaganda.

Emphasis is here placed upon the necessity of showing the loss of revenue to the carriers which results from underloading. To illustrate: A car loaded with 20 tons of freight, moving at 15 cents per cwt., would aggregate revenue of \$60. If loaded to capacity of 40 tons (presuming the capacity of the car is 80,000 lb.) it would yield revenue of \$120. The loss of revenue in this case is \$60. This fact, brought to the attention of the agent, or the shipper, would impress on him that if he desires low freight rates, he must co-operate with the railway to produce the largest revenue from the use of each unit of equipment.

It is suggested that an examination be made of way bills when received by the auditor of freight accounts; that comparisons be made between the actual load and the capacity of the car, and wherever the car is underloaded, a record be taken showing the description of the load and the facts which will indicate the underloading. This information should be used by the officer of the car loading bureau to direct the attention of the agent to the fact of underloading and to point out to him the loss of revenue accruing to the carrier through that condition.

## Take Photo-Records of Light Loads

By D. J. Stevens

Division Superintendent, Baltimore & Ohio, New Castle, Pa.

The success which any railway division secures in increasing car loading is largely controlled by the amount of effort that the division superintendent puts into the work, in planning a campaign for his staff, and outlining a policy which is workable and practicable. The methods employed vary largely with the commodity to be loaded. For example, I have found in the coal fields that a camera is an extremely helpful instrument in increasing the tons per car. My method has been to have a man with a kodak go through the mine districts periodically to take pictures of any cars which do not show full loading. These pictures, with the name of the mine, date and car number written on the face, are shown the mine owner or operator personally or are sent him with a letter. His attention is directed to the empty space in the car, and to the fact that his light loading of the car is depriving him of the additional loading space.

Careful records maintained daily of our ore loading at the docks, making comparison with the loading for the previous month and same month previous year, and placing these figures in the hands of the superintendents of the docks, as well as their superior officers, has resulted in a net gain of approximately 20 per cent.

The two remaining items which I have dealt with have been that of persuading the big industry and the small individual car loader to increase his load per car. Frankly, I have found that the big industry is not only desirous of assisting but has co-operated even more than I expected.

My staff officers and myself, in going over the division, stop and visit the officers of the industries having charge of this phase of the plant operation, discuss with them the car situation, call to their attention how many more cars are available for their loading by increasing their load per car, and we have asked them to have their salesmen co-operate to the extent of asking the consignees to buy in car-load lots. The real hard job in the campaign has been with the men who load two or three cars a week. They have not grasped the idea as quickly as have the big shippers and we have not made the gain with them up to the present time that we have with the big shipper.

# Outside Repairs to Railway Equipment Justified

## Statements of Various Railroad Executives Prove That Conditions Warranted Repairs by Contract

**F**ACTS CONCERNING THE LETTING of contracts for repairs to railway rolling stock to outside concerns, which have been made public in statements of several railway executives, prove conclusively the fallacy of the contention of W. Jett Lauck of the International Association of Machinists that the big railroads "are closing their repair shops and giving repair work at extortionate rates to large private equipment companies." These charges are being investigated by the Interstate Commerce Commission.

Mr. Lauck attempted to show by figures of his own compilation that the average cost of repairs made by private equipment companies was considerably higher than repairs made in the railroads' own shops. He did not, it is pointed out by several of the executives, take into consideration that the repairs made under contract were of much greater extent than those taken care of in the railway shops nor did he allow for overhead charges in his estimates of costs for repairs in railway shops. The executives draw attention to the fact that the overhead costs are included in the charges made by equipment companies for these repairs. They also show that the severe congestion of traffic last year, resulting in heavy losses to business, made it imperative that all available equipment be put into service as rapidly as possible. They feel that this fact alone would seem to justify almost any step taken by the railroads to relieve the situation.

### How the Traffic Congestion Was Met

A statement given out by T. DeWitt Cuyler, chairman of the Association of Railway Executives, is quoted herewith in part:

"In the inquiry before the Interstate Commerce Commission the railroads are prepared to show:

"1. That on the return of the railroads on March 1, 1920, there was an abnormal number of locomotives and cars in bad order requiring repair and an abnormal number of locomotives then in operation which would nevertheless require 'shopping' at an early date.

"2. That it was impossible to take care of all of these repairs, immediate and prospective, within any reasonable length of time in railway companies' shops.

"3. That at the time most of this equipment was sent to outside shops for repairs there was one of the worst traffic congestions in the history of the country, and that the railway companies were properly under the pressure of the Interstate Commerce Commission, the Car Service Division of the American Railway Association, and of their shippers, to use any and every available means to restore this equipment to service at the earliest possible date.

"4. That generally when equipment was sent outside it was to the company which had originally constructed it, for the obvious reason that the original manufacturer had the patterns, extra parts and machinery which would enable him to effect these repairs more promptly than could be done elsewhere; that if for any reason the original manufacturer could not accept such cars, then the nearest available shop having adequate plant and available capacity was chosen; and that these were the considerations which controlled the choice of outside shops, and not any alleged dual interest between equipment and railroad companies.

### Non-Comparable Figures Compared

"5. That with regard to cost, the comparative figures given are entirely misleading, as so-called cost figures in

railway shops cover substantially only cost of material and labor, most of the expense—overhead, supervision and maintenance—being carried in other railway accounts, and being further misleading because cost in outside shops necessarily includes a reasonable profit.

"6. Furthermore, that the comparisons of cost given are erroneous and misleading because in many cases the equipment sent outside required the heaviest kind of repairs, sometimes amounting to substantial rebuilding, frequently including additional improvements, and in general not being comparable to the normal classified repairs in a railway company's shop.

"7. That, as additional proof that the companies had no ulterior purpose in sending this equipment to outside shops for repair, the companies were merely carrying on the practice of following the precedent established by the United States Railroad Administration during similar but lesser emergencies.

### Employees' Responsibility for Situation

"8. That certain organizations of railroad employees, through the Shopcraft Agreement signed by them with the United States Railroad Administration, are themselves in part responsible for the inability of the railway managements to expand the capacity of railways' shops. Reference will be made particularly to Rule 153 of the National Agreement with the Shopcrafts, by which the railroads are precluded from employing upon the repair of cars any men who have either not served an apprenticeship or have not had four years' previous employment in car repair work. Under this provision the railway companies at the time of their greatest need were prevented from adding to their forces competent and available painters, carpenters, machinists, blacksmiths and others necessary to increase the capacity of their car repair plants.

"9. That the equipment sent to outside shops constituted only a small part of the equipment in need of repairs.

"10. That nevertheless the value of the equipment imperatively demanding repair and beyond the capacity of railway companies' shops in the spring of 1920, represented an investment of many millions of dollars, and that the contention that this equipment should have been held out of service for months or even a year until it could be repaired in railway shops, is a proposition in violation of all respect for the public's right to service and of good business and sound management.

"The truth is that the effect of the rules and working conditions still controlling the repair of equipment in railway shops has been disastrous to efficiency and output, and is in itself one of the causes of the abnormal number of cars and locomotives out of repair.

"Insofar as the organizations of railway repair employees have helped to produce a situation in which all of the railway repair work could not be taken care of in railway plants, or where outside plants can now do the work more economically and speedily than railway shops, they have only themselves to blame.

### The Public's Own Stake in the Case

"The real point of public concern at the present time is not the measures taken by the railway companies for the repair of cars and locomotives in 1920, but is the question now before the United States Railroad Labor Board at Chi-

Chicago, as to rules and working conditions in railway companies' shops.

"This involves millions upon millions of dollars, which, in the last analysis, are a charge to be paid by the public for its railroad service. These costs, often for work not even performed, result from unjust and burdensome regulations, which the railroads are seeking to have changed."

Mr. Cuyler in connection with his statement included the following quotations from letters of several executives.

H. E. Byram, president, Chicago, Milwaukee & St. Paul, said:

"Work done on twenty locomotives at Baldwin Works was not ordinary repair work, but complete rebuilding of locomotives and converting them from compound to simple type. This involved almost as much work as building a new locomotive. The converting of these engines from one type to another involved a class of work which could not be done as economically in our own shops as at shops of Baldwin Works, where these locomotives originally were built and where the necessary facilities were available for rebuilding them in most economical manner. These locomotives were obsolete type, several of which had not been used for several years, and when turned out of shops were practically new engines and cost less than one-half the price of new locomotives."

Relative to work done in outside shops for the Chicago, Burlington & Quincy, President Hale Holden said:

"The only arrangements of this character made by this company were with Baldwin Locomotive for seven and with Davenport Locomotive Works for seventeen. It was after careful survey of our power. Situation indicated that during previous two years the condition of engines was below normal and so many required overhauling we would be unable with our own facilities, and considering limitations as to employing machinists provided by schedules with labor organizations made during Federal control, to have sufficient power to satisfactorily handle the heavy traffic through winter months."

W. H. Finley, president, Chicago & North Western, is quoted as follows:

"At the beginning of Federal control we had 175 engines out of service for repair. At the end of Federal control there were 386 engines out of service, and the number of engines that were good for but sixty to eighty days' more service was as much greater at the end of Federal control than at the beginning as the number actually out of service.

"Have had repairs made by American Locomotive Company. The first locomotives so repaired were sent to outsiders during Federal control by Railroad Administration. The company has continued sending locomotives at same cost. Railroad Administration sent thirty-five. Company has sent thirty."

#### Lacked Capacity to Do Work in Own Shops

The following statement was made by J. R. Kenly, president of the Atlantic Coast Line:

The Atlantic Coast Line has been mentioned as one of the roads having equipment repaired in outside shops, with the intimation that some of its officers or directors were personally interested in such outside shops. The Baldwin Locomotive Works has practically rebuilt 20 A. C. L. locomotives and is rebuilding 10 more. Two were sent to the American Locomotive Works for repairs. The contract for the first 10 was made during federal control, with the full concurrence of the regional director, and the work upon them was begun before the end of federal control. No cars have been repaired at outside shops.

We estimate that the efficiency of the A. C. L. shops was decreased not less than 30 per cent during the period of federal control by the reduction of the work day from 10 to 8 hours, by the forced abandonment of piece work, by the forced obligation of the closed shop, and by successive federal interpretations of the rules and regulations governing shop control and operations.

It was the result of these conditions which made the regional director recognize the necessity for this outside work.

Bids for rebuilding were requested from the Baldwin and from the American Locomotive companies and the contract made with the lowest bidder.

No director or other officer of the A. C. L. has any direct or indirect interest in either the Baldwin or the American Locomotive companies.

When the federal government took over the railroads on December 31, 1917, there were 112 engines out of service requiring

repairs. At the end of federal control on March 1, 1920, there were 202. A locomotive is supposed to be near the time of shopping for major repairs when it has made 100,000 miles. On December 31, 1917, the following was part of the locomotive record:

Locomotives having made less than 40,000 miles.....	297
Locomotives having made more than 100,000 miles.....	93

On March 1, 1920, when the railroads were returned to their stockholders:

Locomotives having made less than 40,000 miles.....	246
Locomotives having made more than 100,000 miles.....	118

Add to this condition a decreased shop capacity of not less than 30 per cent and you have the reason why the Atlantic Coast Line was forced to employ outside shops if it was to meet the demands of the public for transportation service.

It is true that it costs a railroad company more to have its locomotives repaired outside than in its own shops.

A locomotive builder must make a profit which is not included in the cost of a home shop.

It is, however, untrue that the Atlantic Coast Line is paying for repairs or rebuilding in outside shops four or five times what it would cost to repair or rebuild at home.

The difficulty in the case of the Atlantic Coast Line was that it could not rebuild at any cost these 30 locomotives in its own shops for the reasons stated.

Since federal control ended the Atlantic Coast Line has ordered over \$1,000,000 of modern shop tools and machinery and has increased its motive power organization and it hopes to be able under changing conditions to meet future repair and rebuilding equipment requirements without the assistance of outside shops.

#### The Lehigh Valley

E. Loomis, president of the Lehigh Valley, in a statement issued to the press, lays the necessity for resort to outside help in repairing cars at the door of the Railroad Administration because of its failure to maintain a sufficient number of cars in repair and, moreover, because of reduced shop efficiency resulting from the abolition of piece work and the enforced continuance of the national wage agreements which were entered into by the Administration.

#### Returned in Condition to Make

##### Outside Repairs Necessary

J. M. Kurn, president of the St. Louis-San Francisco, likewise blames the Railroad Administration for returning the rolling stock to the roads in such condition that outside repairs were made necessary. He states further that "work done in the contract shops has cost and is costing less than similar work" in the company's shops. He calls attention to the apparent policy of some of metal craft unions to curtail production, thus making necessary resort to outside shops in order that a high percentage of equipment be kept in service.

# Cause of the Present Condition of Freight Cars\*

## Pooling, Deferred Retirements, Labor Conditions and Abuse in Service; the Remedies Suggested

By J. C. Fritts

Master Car Builder, Delaware, Lackawanna & Western, Scranton, Pa.

WHEN A BAD CONDITION is found an effort should first be made to find the cause and then work out some method by which the evil can be combated. So much has been said in regard to tightening nuts, opening cotter keys, measuring piston travel, etc., that I thought we might pass that part of car maintenance tonight, assuming that it was being well taken care of, and go a little deeper, with a view of suggesting something constructive.

In order to properly analyze the present unsatisfactory condition of freight cars, it will be necessary to go back two or three years and ascertain what has occurred during that period that would contribute to the present situation. If this can be determined with any degree of accuracy, then we should be able to suggest something that will give us relief.

### Effect of Pooled Equipment

Formerly it was common practice to maintain the majority of cars on home lines, but during the war the pooling of freight cars was deemed necessary, and cars on home rails in many instances were reduced to ten per cent of the equipment owned. It does not seem at present that we are going to get back to previous conditions in this respect for some time to come, if ever. The result has been, and still is, that a very large percentage of cars in bad order are of foreign ownership, for which the handling line does not carry in stock standard material, except a few M. C. B. parts. Therefore, in lieu of repairing in kind, improper and temporary repairs have been made in order to return the cars to service.

All railroads throughout the country have been repairing cars in this manner. It was the best they could do under existing conditions. Such methods are responsible in a very great measure for the condition of freight car equipment at this time.

A check and inspection of system cars received home at interchange points developed that a very large percentage were in need of extensive repairs and a large number had defects that could have been repaired by using standard material. This would seem to indicate that returning equipment to owners only when it has become unserviceable is being practiced to a very great extent.

Imagine what is going to happen with 75 per cent or more of all cars in the country on other than owning lines with conditions of this kind existing. I do not mean to say that there has been willful neglect on the part of railroads in general, but an analysis of the situation shows that these things have been forced upon them by the scarcity and mixing or pooling of equipment.

Repairs to cars have been retarded:

First, because the car department forces have not been familiar with the class of cars they have been required to repair and necessarily have consumed more time than was customary on home line equipment.

Second, it was formerly customary to manufacture parts for system cars in large numbers which were placed in stock and could be used as needed. They were made with standard patterns, formers, dies and other labor saving devices, at the minimum of time and expense, but with foreign

cars in the majority on shop tracks this practice could not be continued, as there was not a sufficient number of system cars received to warrant the manufacture of various parts in any great amount. Practically all such parts for cars of foreign ownership require special operations through the manufacturing section of our shops, thereby losing the benefits of the labor saving devices that were previously in use. This has resulted not only in reducing the shop output, but has greatly increased the cost of production.

### Old Cars the "Weakest Link"

Train tonnage is being increased from day to day; heavier locomotives are built with greater drawbar pull, and two or more are coupled together on heavy grades, or where it may be necessary to maintain fixed tonnage; heavy rails with rock ballast have been laid; new and stronger bridges have been constructed and all modern appliances for transportation have been adopted. The freight car from 15 to 20 years old is expected to take its place in this line of modern improvements and successfully perform service that is two or three times greater than was originally intended when the car was built. It is unreasonable to expect the old freight car to function efficiently against such odds.

If we were handling the same train tonnage with the same locomotives that were used when the cars that are failing were built less trouble would be experienced. The sooner railroads strengthen the weakest link in transportation, which is the car, the quicker results will be obtained. Many of these cars are of old and weak construction and their failure not only results in damage to themselves, but frequently causes serious damage to other good cars that are being handled with them. The majority of these cars are repaired in kind instead of being dismantled, as was formerly the practice.

Cars with short draft timbers, extending from end sills to body transoms, of which there are many thousands in service, cannot be handled with any degree of success with present transportation methods. Cars of this construction that have had new sills and ends applied and generally repaired, in many instances have them torn out and destroyed within a few miles of the shop where repairs were made. A number of railroads, however, have started to apply reinforcements, some of which are of substantial construction, while others are little improvement, if any, over repairing in kind, and seem to have been contrived to reduce the expense of application rather than to give service. The result of such a practice is, that the expense of upkeep, not considering service, will soon equal the cost of proper reinforcements and the weak cars will still be on your hands. This is false economy, and it would seem that the design of reinforcements for freight equipment is not being given the thought its importance deserves.

If this is true, and we all know it is, then surely something should be done to eliminate or prevent repairs of this character.

The labor situation has also contributed very largely to present conditions. Many of the old employees have worked faithfully and endeavored to produce an honest day's work, but as a whole they have not manifested the same interest or

\*Presented before the Western Railway Club, Chicago, January 17, 1921.

given the same loyal support as was formerly their practice. There seems to have been a spirit of getting by with the least possible amount of work and indifference as to the quality as well.

### Effect of Labor Conditions

The leveling of rates for all mechanics in the carmen's craft has reduced shop output instead of increasing the production, as was expected by some of the advocates of this system. All men are not of the same ability, and the highly skilled mechanic feels that he should not produce more than one of lesser skill because he is receiving the same rate of pay. This is human nature, and we cannot expect a change in these principles until a different method of compensation has been inaugurated.

Railroad shops are among the very few manufacturing plants throughout the country where all mechanics are placed in one class regardless of skill, and where the thrifty and industrious employee is supposed to produce a sufficient amount of work without extra compensation as compared with the man with a shiftless and lazy nature. Such a system is wrong, as it not only works an injustice and hardship upon the employee, but the employer as well. The right of every man to earn in accordance with his skill and ambition to produce, should not be denied him. It is one of the fundamentals upon which the Constitution of our country is based.

Rules and regulations that required years to work out and establish for the other crafts, were put into operation at once in car department forces, with the result that there was a lot of confusion which finally was adjusted with not enough men in the country with the experience required by the rules, to cover the work then on hand. There was no method of creating more until three years had elapsed, and then only through the helper apprentice system. The duties of carmen are so varied and cover so many distinct lines of work that rules which govern blacksmiths, machinists and some of the other crafts cannot be applied to carmen in so short a period and meet all of the various conditions of car work.

The rules insofar as they refer to supplying carmen are not workable because they have closed the door on increasing the number of men that can be employed at this work. On account of the centralizing of authority, the former close personal contact between the employee and those in charge has ceased to exist; supervisors are not free to settle questions that may come up from time to time, but must be governed by decisions handed down by men who are many hundred miles away and who perhaps never have been on the grounds and certainly are not familiar with the local conditions. Ability cannot be considered and is not a factor in promotion at this time. Seniority governs in all cases, at least to the extent of a trial, with the result that there are entirely too many trials and very little production in the meantime. All of these things and perhaps many others that could be mentioned have all had a tendency toward a general lowering of the employees' morale.

The effect of such a condition is reflected in the present condition of freight car equipment. These restrictions have affected shop operations to such an extent that it has been found impossible to maintain bad order cars within a reasonable percentage.

### The Misuse of Equipment

We hear much in regard to speeding up and increasing efficiency in operation; that more cars must be loaded and carry a greater tonnage; that the miles per car per day should be increased. But those in charge seem to have lost sight of the fact that a great factor in bringing about these results is keeping the greatest possible number of cars in service, and that this in a great measure depends upon the

manner in which they are handled. Very little, if any, attention or consideration is given to the misuse of equipment. The only thought seems to be of delivery and loading or unloading, and if damaging or mutilating the car would in any way assist in this operation, there is no hesitancy in doing so. It is not uncommon, however, to receive complaints about the large number of cars it becomes necessary to bad order after receiving usage of this nature.

These destructive methods have been gradually on the increase for the last two or three years, and have not been confined to hump and classification yards. At piers and wharves, and in fact, at all loading and unloading points, the abuse of cars is always in evidence. It has become almost impossible to maintain cross ties, brake staffs and wheels, where clamshell unloaders are in use, notwithstanding the fact that these must all be replaced before the car can be returned to service.

Roofs, doors, door tracks and fixtures, flooring, lining, and in fact any part of the car that might affect the unloading operation, are torn off and destroyed, apparently without the least thought of the important position the freight car holds in relation to moving the country's traffic.

Many thousands of cars are thus damaged and sent to shop tracks daily, which otherwise could be loaded again without repairs, not only reducing the cars out of service on account of bad order but greatly assisting in increasing car mileage and the number of cars loaded.

### Material Shortage

While the material situation has improved during the last two or three months, it has contributed its share in full measure to the difficulties that have been experienced in properly maintaining cars in serviceable condition. Manufacturers have received orders in excess of their capacity to produce, and when finished, the scarcity of cars very often prevented prompt shipment of the material. This and embargoes placed on company material from time to time made proper and prompt repairs impossible even though other facilities were adequate.

With all of these conditions existing, is it any wonder that we find freight cars run down and worn out and need those in charge of car maintenance feel that they have fallen short in the performance of their duties? I believe you will all agree with me in stating that they have done well, all things considered.

### What Are the Remedies?

The following suggestions will assist in relieving the present unsatisfactory condition of freight cars throughout the country.

When possible from a traffic standpoint, cars should be returned to owning lines where repairs can be made. The old and light constructed cars could then be dismantled or assigned to special home line service and those that warrant being continued in service should receive substantial reinforcements that would be in keeping with the service they are required to perform.

All railroads are under moral obligations to do this, because they expect such cars to be accepted and handled in through line traffic by other railroads. Under the present system of pooling equipment through Commission orders, etc., a railroad that builds and reinforces in line with good practice will receive very little benefit from so doing, unless all other roads do likewise, because the exchange of cars between railroads has increased to an extent that 75 per cent of equipment on line is of foreign ownership and cars that receive extensive repairs today will probably leave the home line tomorrow and not return for several years. Therefore, there should be some agency established between rail-

roads that will prevent the application of reinforcements or the perpetuating and offering of cars in interchange traffic that are unfit from a standpoint of strength for general service.

All railroads have had sufficient experience to indicate to them that cars with short draft arms extending from end sill to body bolster cannot be handled with any degree of success, especially on trunk lines in heavy tonnage trains, and after a reasonable length of time has been given, they should be refused in interchange regardless of type or capacity. A very large percentage of the present bad order equipment can be confined to approximately 400,000 cars in the United States. All that the majority of these cars need to make them serviceable for many years to come is the application of proper reinforcements.

If the pooling of cars is to continue and it becomes impossible to return them to home rails, then so far as it may be practical, certain common standards applicable to the most of this equipment should be adopted. These should be applied regardless of where the cars may be. This would not only hasten placing them in proper, serviceable condition, but would very materially assist in their future maintenance.

The General Committee of the mechanical division of the A. R. A. should appoint a committee for this purpose, and work out a system that would enable all railroads to reinforce such cars when placed on shop tracks for extensive repairs, regardless of ownership.

The condition of many cars received home shows that repairs for which standard material could have been used have not been made, indicating that cars of foreign ownership are not receiving the attention that present conditions would warrant or permit.

Under the present arrangement a railroad should, so far as possible, give the same consideration to foreign cars that it does to its own cars, and the failure to do so will react against the proper maintenance of freight equipment as a whole.

It has been stated that the writer is in favor of no labor unions and low wages, and that in saying so, he has voiced the sentiments of the "higher-ups." Nothing could be further from the facts. I believe in labor organizations that are conducted on just and moral principles, and that every man is entitled to fair and just treatment and his day in court. No superior of mine has ever suggested or even intimated to me what my views should be on this subject. Employees are entitled to safe and sanitary working conditions and regardless of the class of work a man performs, if he is willing to produce an honest day's work, he is entitled to a good living wage—by that I mean, enough for himself and family to live comfortably, to educate his children and, without extravagance, to lay away something besides. And treating this as a basis, every man should be paid according to his ability and willingness to produce. It is the only fair and just method of compensation, and a system that would make this possible should be inaugurated.

Rules that have been found to be unworkable and those that have inflicted unjust and unreasonable penalties on employers should be replaced with others that will equitably and fairly meet the conditions they are intended to cover. Men who are thoroughly familiar with their class of work should be placed in charge. They should understand human nature and the difficulties under which employees must at many times perform their work; men that will keep in close personal contact with those under their charge and who are quick to see and correct a wrong, regardless of where it may exist. No man feels satisfied to perform his duties from day to day without some recognition from his superior outside of the salary he may receive. Every faithful employee is entitled to this consideration. It not only creates a relation-

ship of good will and loyalty, but inspires the employee to do better and more efficient work.

Supervisory officers of this type with proper authority ought to be able to meet and settle questions that may arise from time to time without the necessity of referring them to higher authority. If this is done, we should get back the morale and co-operation of our employees, which is very necessary in order to build up our production to a normal output.

So many cars are being damaged through carelessness, in many instances bordering on malice, that something should be done to prevent the destruction of company property by the misuse of equipment. I am somewhat at a loss for a proper and effective solution of this problem, but some sort of a campaign is necessary, because in many instances those in charge appear to give this very important question no more thought than the employees they supervise. Much money could be saved if it could be instilled in the minds of those handling them, including some transportation officers as well as dock foremen and yardmasters, that cars are constructed, not to be damaged and mutilated, but to perform a very important service in connection with the life of our nation.

In view of the fact that a very large percentage of the damage to freight cars is caused by shock, draft gear maintenance is worthy of serious consideration at this time. The question of type or style of gear must be left open for further tests and investigation, but I believe that we should get the best out of whatever type we have in service. They perform more work and receive harder usage than any other device on a car, and it is the only one for the inspection and maintenance of which there are no specific rules laid down.

The function of a draft gear is primarily to keep down the pressure in the car underframe when under impact, which is done by increasing the length of time the forces are distributed through the car during such impact—in other words, by draft gear travel. It should always be remembered that none of the forces resulting from impact or collision are destroyed, but all remain in the car underframe to be disposed of or dissipated in one way or the other. Any wear or broken part that causes slack, reducing the effective travel of the gear, hastens the closing point, after which the pressure in car sills or underframe increases very rapidly.

If the function of the draft gear is as important as I believe we will all admit, then surely some systematic method of inspection and repairs should be installed on all railroads. We find that this is necessary in the maintenance of air brakes, wheels, and couplers. The cost to make such inspection or adjustments would not necessarily be greater than the expense of cleaning and repairing the air brakes, which the law compels railroads to do at least once a year, and I feel sure that the saving would be many times greater than the cost.

A periodical inspection should be arranged for and the dates should be stenciled on the car in a manner similar to the present practice with respect to air brakes.

### Discussion

The paper drew forth a discussion on a wide range of subjects pertaining to the maintenance of freight cars. Several speakers referred to the frequency with which draft gears and attachments and box car ends were damaged and the suggestion of the writer of the paper that standard repairs generally applicable to all old equipment be developed by the mechanical division of the American Railway Association was favorably received, particularly as to standard car ends and draft reinforcements.

Several speakers called attention to the extent to which old cars with wood draft arms extending only as far back as the body bolster are receiving extensive repairs, as much

as \$1,200 being expended on heavy repairs to such cars, which are liable to fail immediately on being placed in service. Although the retirement of such cars was advocated several times during the discussion, it is evident that Rule 120 of the interchange rules has not accomplished its purpose.

C. N. Swanson (Atchison, Topeka & Santa Fe) strongly advocated fixing the A. R. A. prices for labor and material so high that owners would be forced to take proper care of their own equipment and that when cars are repaired on foreign lines the repairing road would be able to do the work at a profit.

C. J. Wymer (C. & E. I.) also advocated the policy of setting A. R. A. prices high enough to include a profit. In this connection Mr. Wymer also advocated making all defects owner's defects and balancing this with a rental charge high enough to reimburse the owner for the upkeep of the equipment.

The effect of the present condition of freight cars on operating costs was touched on by D. I. Bergin (Wabash), who stated that hot boxes and bad orders created enroute were prolific causes of excessive fuel consumption and crew overtime. He called attention to the fact that all a railroad has to offer in competition is the service it can render; weak equipment which causes delays in the movement of traffic seriously affects the quality of this service.

In closing, Mr. Fritts called attention to the 40-ton cars with short draft timbers, many of which are in service, as needing equally as much attention as the 30-ton cars frequently referred to in the discussion. These cars, from the very fact that they are permitted to carry heavier loads, may be even a greater menace than the similar cars of lighter capacity.

## Plans for Helping New England Roads Considered

WASHINGTON, D. C.

HEARINGS on the application of the New England railroads for an order by the Interstate Commerce Commission giving to the lines east of the Hudson river large divisions of the through rates to and from New England were resumed at Washington on January 24. At the same time a renewed effort on the part of the commission to induce the railroads to reach an agreement among themselves which would make it unnecessary for the commission to prescribe the divisions made by Chairman Clark, who called to Washington for a conference the committee of executives representing the New England, the Trunk Line and the Central Freight Association roads which was appointed at the suggestion of the commission before the hearings were begun, to try to work out a basis for a voluntary agreement. Chairman Clark strongly urged upon the executives that they should settle this case themselves, pointing out that Congress and the commission have been trying to deal with the railroad problem in a broad way and that here was an opportunity for the railroads themselves to do something in a spirit of co-operation in the general interest. He also took the position that the railroads ought to be able to handle the matter in a practical way which would lead to more satisfactory results than a determination by the commission. Chairman Clark had made similar statements at an informal conference held to consider the New England situation on November 23 when the executives' committee was appointed to try to reach a solution without allowing the case on the formal complaint of the New England roads to come to trial. The committee held several meetings but failed to accomplish anything. The commission had also suggested that the railroads try to reach an agreement on divisions which would

give some relief to the New England lines, in its decision in the general rate advance case, after the New England roads had suggested that they be placed in a rate district separate from the Eastern lines generally, because of their needs.

Commissioner Eastman also was present at the conference. After hearing Mr. Clark the executives conferred among themselves for an hour or more and then adjourned for another meeting at which it is understood that a plan was tentatively agreed upon which was to be put up to the trunk line executives at a meeting in New York early next week.

While members of the committee declined to talk for publication, it is reported that the committee agreed to recommend that the trunk lines give the New England roads about \$15,000,000 a year. An offer of \$12,000,000 had previously been made and refused and it is understood that the representatives of the New England roads have not definitely agreed to accept \$15,000,000 but have shown more disposition to accept a compromise than they did when the lower figure was suggested. It is also understood that one of the plans proposed contemplated a voluntary assessment of a percentage of the freight earnings of the eastern roads outside of New England to constitute a pool which would be divided in some way among the New England lines without readjusting the divisions.

The New England lines have taken the position that the trunk lines received approximately \$25,000,000 a year from the rate decision by the inclusion of the New England lines in the Eastern group, which was allowed a 40 per cent advance in freight rates. The trunk lines, while recognizing the needs of the New England carriers, have taken the position that they have made out a better case for an advance in their local rates than they have for increased divisions, also that the results of the rate advance to the Eastern lines were disappointing and that they cannot afford to give up any of their revenue to the New England roads. Some of the executives have taken the position that even if they were willing to do so they should not be asked voluntarily to give up money belonging to their stockholders without an order from the commission. It is understood that some sort of a pooling arrangement has been considered.

Robert C. Wright, general traffic manager of the Pennsylvania, was the first witness for the trunk lines when the hearing was resumed on Monday. Mr. Wright insisted that the New England roads had received generous treatment at the hands of the trunk lines in the fixing of divisions and he presented a series of exhibits to show that the New England lines receive a larger percentage of the through rates than if the divisions were fixed on a mileage proportion calculated by 50 mile blocks, with an allowance of 50 constructive miles for terminals. He said every traffic man east of the New England junctions has always considered the percentages high and he characterized the suggestion for a 15 per cent increase in the arbitraries accruing to the New England roads as a "hold-up." He was cross-examined by Charles F. Choate, counsel for the New England lines, who endeavored to bring out that the divisions, many of which were fixed 40 or 50 years ago, do not take into consideration the increase in terminal costs.

D. T. Lawrence, general freight agent of the Delaware, Lackawanna & Western, also cited many examples of the methods of fixing the divisions which accrue to the New England lines on traffic to and from his line. He said the New England roads are already getting much more than a mileage prorata and more than they should expect and that the Lackawanna for several years has been endeavoring to get better divisions from the New Haven.

Similar testimony was given by Henry Adams, general freight agent of the Erie; W. G. Story, general freight agent of the Delaware & Hudson; A. J. Anderson, general freight agent of the Baltimore & Ohio, and W. S. Kallman, assistant to the president of the New York Central.

# Results of the Abolition of Piece Work Pay

## The Hourly Rate in Railroad Shops Has Decreased Efficiency and Output and Increased Operating Costs

PAYING RAILWAY SHOP EMPLOYEES solely according to the number of hours worked, instead of on the piece work basis according to the class and amount of work done has resulted in greatly reducing the efficiency of the individual shop worker and consequently in increasing the number of men that must be employed, decreasing the possible output of the carriers' existing shop facilities and greatly increasing their expenses, according to the testimony which has been presented to the Railroad Labor Board on behalf of the railroads during the past week. Proof of this contention, in the form of detailed statistical studies, was presented to the board by representatives of several of the larger carriers. This evidence constitutes part of the railroads' presentation in opposition to the employees' demand for the continuation of national agreements, one of which, the shop crafts agreement, on which the Board has been holding hearings since January 10, prohibits paying shop employees on a piece work basis.

The decrease in the efficiency of the individual shop worker, after he began to be paid by the hour, varied between 10 and 50 per cent. The actual production of the shops cited in this testimony decreased from 5 to 30 per cent following the abolition of the piece work system of pay, in spite of the fact that more men were employed.

The progress of the hearings on national agreements has been reported in the *Railway Age* of January 10 (page 199) and of January 21 (page 243). On January 18, E. T. Whiter, chairman of the Conference Committee of Managers of the Association of Railway Executives, completed his presentation in opposition to the shop crafts agreement. The following day officers of the motive power and car departments of several of the larger trunk lines began the presentation of wage, time and production studies made in the shops of their respective lines. It is not practicable to present all of the testimony given but the following conclusions drawn from the various studies, indicate the manner in which the substitution of hourly rates of pay for piece work rates has affected the cost of maintaining equipment and consequently the amount necessary to pay operating expenses.

### Some Chesapeake & Ohio Examples

The same freight car repairers doing the same work in the Huntington (W. Va.) shops of the Chesapeake & Ohio during the last four months of 1918—when they had a guaranteed hourly wage—did 41.4 per cent less work than in the corresponding period of 1917, when they were on an exclusively piece work basis. This was due to the fact that, although nominally piece work was continued, the hourly wage had been raised so high that the incentive to obtain a higher wage under the piece work rates was destroyed because of the slight difference between the guaranteed rate and the rate which might have been earned by increased efficiency.

At the Russell (Ky.) shops of the same road, freight car repairers—the same men doing the same work under the same piece work rates—did 35.3 per cent less work the last four months of 1918, when they were guaranteed an hourly minimum, than they did during the corresponding period of 1917.

Again, at the Silver Grove (Ky.) shops of the same road, the car repairers did 29.5 per cent less work than in the same period of the previous year.

During the same two periods air brake repairers employed

by the Chesapeake & Ohio at Huntington and Silver Grove did respectively 32.4 per cent and 33.4 per cent less work on the guaranteed hourly basis than they did in the corresponding period of the previous year solely on piece work.

Similarly, passenger car painters at Huntington did 25.07 per cent less and engine painters 15.33 per cent less per hour than they had when the difference between the hourly rates and the piece work rates was such as to provide an incentive to increase production.

Chesapeake & Ohio employees in the brass foundry at Huntington, during the months of March, April, May, June, July and August, 1917, under piece work rates earned an average of 45.15 cents per hour. If the same piece work rate had been applied to the work done by the same men in the corresponding period of 1920, after the guaranteed hourly rate was established, they would have earned an average hourly rate of but 40.27 cents. This represented a decrease in efficiency of 10.8 per cent due entirely to the substitution of the hourly basis of pay for the piece work basis of pay.

During the months of April, May, June, July and August, 1917, employees in the Huntington brass foundry bored 3,016 car brasses during each 48-hour period, or one brass per minute under the piece work rates. At present the same employees are boring but 2,996 car brasses during each 52 hours, taking one and a half minutes for each operation. This represents an increase of 50 per cent in the time required to perform this particular operation by the same men working under hourly rates over the time required when the same men were working under piece rates.

The average number of man hours (a man hour is equivalent to one man working one hour) required to paint a passenger car in 1917 under piece work rates was 237.04. At the present time the average number of man hours required to paint a car has increased to 264.93, or an average increase per car of 27.89 man hours.

In the Chesapeake & Ohio's tin shop at Huntington during the months of April, May, June, July and August, 1917, under piece work rates, 94 7-in. smoke jackets were manufactured in 52 hours, or at the rate of 33 minutes per piece.

During the same period in 1920, under the hourly rate, it took 85 hours to manufacture 96 similar smoke jackets, or at the rate of 53 minutes per piece. The percentage of increase in the time required for this particular operation over 1917 is 60.6 per cent.

During the months of April, May, June, July and August, 1917, the average number of wheels bored per hour in the wheel rooms of the Chesapeake & Ohio's Huntington shops was 8.78. During the same period of 1920 the efficiency of the individual workers had so declined that but 4.65 wheels were bored each hour, a decrease of 47 per cent in the shop's production.

### Time Required Increased 6.7 to 200 Per Cent on B.&O.

The time required to perform certain operations in the locomotive erecting shop and foundry of the Baltimore & Ohio at Newark, Ohio, and in the shops at Baltimore, Md., increased by from 6.7 per cent to 200 per cent after the piece work system of pay was abolished and the hourly wage system substituted. Of 52 operations in these shops not one requires the same or less time than was required under piece work rates.

In the Union Pacific's main shops at Omaha, Neb., and Denver, Colo., comparing periods when piece work rates were

in effect with periods when hourly rates were in effect, the total average increase in man hours—representing the longer time required to perform the same operations—was 36 per cent. Simultaneously the output at these shops decreased 26.5 per cent. This represents in general the detrimental effect of the change from the piece work basis of pay to the hourly basis.

### Union Pacific

The man hours in the Union Pacific's boiler shop at Omaha have increased 31.4 per cent while the output has decreased 23.9 per cent; the man hours in the blacksmith shop at Omaha have increased 35.5 per cent while the output has decreased 26.2 per cent; the man hours in the wheel shop at Omaha have increased 31.9 per cent while the output has decreased 24.2 per cent; the man hours in the wheel shop at Denver have increased 40.5 per cent while the output has decreased 28.6 per cent; the man hours in the paint shop at Omaha have increased 42.4 per cent while the output has decreased 29.8 per cent; the man hours in the passenger repair shop at Omaha have increased 32.5 per cent while the output has decreased 24.6 per cent; the man hours in the freight car repair shop at Omaha have increased 26.4 per cent while the output has decreased 20.9 per cent; and the man hours in the coach cleaning yard at Denver have increased 38.6 per cent while the output has decreased 27.9 per cent.

### Decreased Efficiency in New York Central Shops

Comparing a seven months' period in 1917 in which locomotive repairs were paid by the piece with similar periods in 1918 and 1919 when they were paid by the hour, it was found that in the locomotive repair shops of the New York Central the man hours in 1919 increased 26 per cent over 1917 whereas the actual number of engines repaired decreased 11.9 per cent. Again, in 1920 the man hours increased 52.9 per cent over 1917, but despite this large increase the number of engines repaired increased but 13.7 per cent. Comparing similar periods in 1919 and 1918, the man hours were increased 5.9 per cent while the production decreased 26.6 per cent. Again, comparing 1920 with 1918 the man hours increased 28.6 per cent and production decreased.

The average total number of hours spent in repairing a locomotive in 1917 on the New York Central was 2,185 hours and in 1918, 2,165 hours. This was under the piece work basis of pay. In 1919 under the hourly system of pay the average total number of hours expended upon the repair of a locomotive had increased to 3,129 hours. In 1920 the average was 2,938 hours. This increase in the number of hours spent on repairing a locomotive, 30 per cent in 1919 and 26 per cent in 1920, is due wholly to the decreased efficiency of the individual locomotive repairmen, which is due to the absence of an incentive to work efficiently.

When piece work rates were paid on the New York Central a pump was repaired in 4 hours and 50 minutes. Now that the shopmen are paid solely by the hour it takes the same men 11 hours to repair a pump. Similarly, when piece work rates prevailed, a driving box was bored and faced in 46 minutes; now under hourly rates it takes 1 hour and 25 minutes to perform the same operation.

### The Pennsylvania's Experience

On July 25, 1918, shop employees were granted an hourly guarantee which was near the average hourly wage which the efficient piece workers had been making. This resulted in an immediate drop in the productiveness of the piece work repairmen. For instance, on the Pennsylvania 3,159 car repairers employed from July 1 to July 15, 1918, earned under the piece work rates \$0.501 per hour. From August 1 to August 15, 1918, the same men did only enough work to have earned \$0.443 per hour under the same piece rates. In other words their efficiency in terms of output per hour,

decreased 11.6 per cent when the basis of pay was changed. During the period from January 15 to January 31, 1919, their efficiency had further decreased to 26.7 per cent below the period from July 1 to July 15, 1918.

The average earnings under piece work rates of car repairmen on the eastern lines of the Pennsylvania from August 31, 1917, to July 31, 1918, was \$0.48 per hour. From August 1, 1918, to January 31, 1919, these men, paid on the guaranteed hourly basis, performed only sufficient work to have earned \$0.372 per hour at piece work. In other words, the average individual efficiency, as shown by the hourly output, decreased 22.5 per cent after the abolition of the piece work.

Computed in a similar manner the average efficiency of air brake repairers employed by the Pennsylvania decreased 7.4 per cent in the period from August 1 to 15, 1918, and 23.2 per cent in the period from January 15 to 31, 1919, as compared with their efficiency from July 1 to 15, 1918.

The efficiency of the locomotive repairmen employed by the Pennsylvania at its shops at Renovo, Trenton, Wilmington, Altoona, Columbus, Terre Haute, Olean, Verona, South Pittsburgh, and Fort Wayne has decreased 35 per cent on the basis of their average hourly output before and after the substitution of the hourly basis of pay. Where their average earnings under the piece work rates were \$0.524, they would now earn under the same rates but \$0.341.

Likewise the efficiency of molders in the Pennsylvania's South Altoona foundry has decreased 14.1 per cent. In August, 1918, under piece work rates they actually earned \$0.616. If they had been paid the same rates in August, 1920, they would have earned but \$0.529.

### Norfolk & Western Car Repairers

Freight car repairers on the Norfolk & Western have so decreased in productive efficiency that the number of cars repaired per employee decreased 43 per cent in the last six months of 1919 as compared with the corresponding period of 1917. During this period in 1917, 92.9 man hours were expended for each car repaired. During the corresponding period of 1919, 163.1 man hours were expended per car.

### Other Roads

As a result of the abolition of piece work the efficiency of the freight car repairers of the Chicago & North Western has decreased 35.6 per cent per hour. Similarly the efficiency of passenger car repairers per hour had decreased from 20 to 40 per cent, of cabinet workers from 20 to 23 per cent, of planing mill workers from 27 to 29 and of blacksmiths 44.

The efficiency of individual mechanics on the Chicago, Burlington & Quincy as indicated by their output decreased from 36.2 to 46.7 per cent after they were paid by the hour instead of by the piece. The efficiency of mechanics in the West Burlington, Iowa, shops decreased 36.2 per cent, that of mechanics in the Hannibal, Missouri, shops 46.7 per cent, of locomotive mechanics in the Aurora, Illinois, shops 37.1 per cent, of mechanics in the Havelock, Nebraska, shops 46.4 per cent and of blacksmiths and boiler makers 39.7 per cent.

### The Louisville & Nashville

Following the abolition of piece work in the shops of the Louisville & Nashville the time required to manufacture certain articles increased from 6.7 to 50 per cent. For example, under the piece work system of wages an iron slab was made in 10 minutes. Under the hourly basis of pay, on the other hand, it took 15 minutes to make the same slab, an increase of 50 per cent. Likewise, under the piece work system, iron axles were made in 45 minutes, while after wages were put on the hourly basis the same work required 60 minutes, an increase of 33.3 per cent in the time required.

Besides the railroads mentioned, testimony showing similar reductions in the output of workmen, due to the abolition of piece work, has been given for the Chesapeake & Ohio, the

Union Pacific, the New York Central, the Baltimore & Ohio and the Norfolk & Western. This testimony regarding conditions in the shops of railways in every section of the country shows a reduction in the productive efficiency of employees, due to the abolition of piece work, of from 10 to 50 per cent.

The specific examples cited are but a few picked at random from the volumes of statistical studies presented to the Board. However, they show in general the effect that has been produced by the action of Director General McAdoo and the Railroad Administration in abolishing the piece work method of fixing employees' compensation and substituting therefor the hourly wage regardless of the class and work done.

The Chesapeake & Ohio presentation was made by E. V. Ratcliff, general car foreman; the Union Pacific by W. I. Langford, assistant general time and work inspector; the New York Central by W. L. Hazzard, supervisor of the routing system, and E. J. Thill, assistant to the general superintendent of rolling stock; the Pennsylvania by A. C. Davis, superintendent of motive power, and R. L. Kleine, assistant chief of motive power (car); the Norfolk & Western by J. M. Thomas, mechanical inspector; the Baltimore & Ohio by E. P. Poole, supervisor of shops, and F. H. Lee, supervisor of freight car maintenance; and the Chicago & North Western by G. E. Collins, supervisor of car repairs.

Following the completion of testimony regarding the detrimental effects of the abolition of the piece work system of pay, Mr. Whiter resumed his presentation on behalf of the carriers, taking up the agreement made during federal control with the maintenance of way employees. This testimony will be outlined in the next issue of the *Railway Age*.

## Annual Meeting of the American Society of Civil Engineers

THE SIXTY-EIGHTH ANNUAL MEETING of the American Society of Civil Engineers was held on January 19 and 20 at the headquarters of that society at 33 West Thirty-Ninth street, New York. Of the business before the meeting the annual election of the officers for 1921 held the interest and attention of the members most, for an opposition or second ticket had been nominated and presented. The results of the election gave a majority to the original ticket out of a total vote counted of 7,008. The officers elected and the votes cast for them are as follows: President, George S. Webster, Philadelphia, Pa., 4,036; vice-presidents, Andrew M. Hunt, New York, 3,947, and Edward E. Wall, St. Louis, Mo., 4,003; treasurer, O. E. Hovey, New York, 4,093; for directors, Dist. 1, J. P. Hogan, 6,243, and Ira W. McConnell, New York, 4,052; Dist. 4, R. L. Humphrey, Philadelphia, Pa., 4,001; Dist. 9, B. L. Brown, St. Louis, Mo., 3,883; Dist. 10, F. T. Darrow, Lincoln, Neb., 6,689, and Dist. 11, G. G. Anderson, Los Angeles, Cal., 4,046.

The committee on Stresses in Track presented only a progress report stating that the committee had been engaged in a series of tests, experiments, etc., on the effect of curvature on the stress in the rail as compared with tangents. Though the greater part of the work had been done, the data as yet had not been collected and worked up in its final form. The work has been conducted chiefly on the Illinois Central, the Lackawanna and the Santa Fe, using various types of engines and varying degrees of track curvature. Other special committees also presented reports varying in degree from work just started to work ready for release.

The question of external relations was discussed to some extent, the general opinion being that in the future the board of direction should act as a committee on this question, appointing local chairmen and committees throughout the various districts in order to coordinate the work properly and without undue expense. Under this arrangement the board will keep in close touch with other organizations, as, for

instance, the Federated American Engineering Societies, keeping itself informed as to any work under way of interest to engineers as a whole or to the society.

The committee on amendments reported that the amendments under consideration were similar to those defeated previously and recommended the ones under consideration be sent out with an adverse report. It was voted that still more recent amendments also on similar lines be referred to this committee and that they be sent out to letter ballot with an adverse report.

## How the Interstate Commerce Commission Fixed the Valuation

WASHINGTON, D. C.

THE METHODS by which the Interstate Commerce Commission arrived at the figure of \$18,900,000,000 as the aggregate value of the railroad property of the United States for the purposes of the 1920 general rate advance case were outlined by Chairman Clark of the Interstate Commerce Commission in connection with his testimony last week before the Senate committee on manufactures, which is holding hearings on a bill to regulate the coal industry.

"Stocks and bonds were not considered at all," said Mr. Clark in reply to questions. "The question of capitalization was not thought of. It is the fair value as closely as could be estimated and approximated at that time of the physical property which was devoted to the transportation service. We had a mass of information gathered in our valuation work, which is not in complete form to be given out in the form of reports and findings, and the transportation act specifically authorized us to avail ourselves of that information. We availed ourselves of all the information we could."

"Does that \$18,900,000,000 include the percentage arising from the increase in the value of materials and property in recent years, since the roads were constructed?" asked Senator Jones of New Mexico.

"No, it does not attempt to equate the values," said Mr. Clark. "The principal figures that we used in our value are as of 1913 and 1914. We fixed the price units on a given railroad valuation as of June 30, 1914. Those price units we think were accurate, and they were based on experience of a series of years in the past up to that date, and the prices then prevailing, for the determination of what was up to that time the normal price for fixing the value of a box car, a piece of track or anything else. If, on a given railroad, we had made our figures on the basis of the valuation established, say, of June 30, 1913, we then computed the value of what the railroad had at that time. All that had been put in since that time, added, has been computed on its cost."

"Then the valuation which you have put upon the railroads is based more largely on cost than on present value, is it not?" asked Senator Jones of New Mexico.

"Yes, sir," replied Mr. Clark. "It is based on three different values that we determined. First, the cost of reproduction as of the date of valuation, then upon the cost of reproduction less depreciation, which represents the depreciated condition of the property as of that date, and then the actual cost to date."

Commissioner Clark said that it would be idle to talk of making rates that would yield a return of 5½ or 6 per cent on a valuation of \$40,000,000,000 because the traffic would not bear such rates. If the value of the roads in 1915 had been \$20,000,000,000 and prices increased 100 per cent between that date and 1920, the value on the roads would be \$40,000,000,000.

"We did not have any mathematical rule in getting the valuation," he added. "We made every human effort by investigating carefully through a series of years prior to 1914 to arrive at a fair, normal value in normal times."

# General News Department

The thirty-fifth annual meeting of the Engineering Institute of Canada will be held in Toronto on February 1, 2 and 3.

The Chicago, Milwaukee & St. Paul has posted framed notices in stations on its system advocating the "ship now" policy. The public is advised that for the first time in five years the railroads are able to handle more freight than is offered.

The directors of the American Railway Association have denied the request, presented by certain railroads, that action be taken looking to the temporary reduction (or even suspension), of the charge of one dollar per car per day for freight cars interchanged.

The rate of premium to be used in computing freight bills when paid in Canada on shipments to or from the United States has been fixed by the Canadian Board of Railway Commissioners, for the first half of February at 13.75 per cent, and the surcharge on freight bills will be 8 per cent.

The Signal Section of the American Railway Association will hold no meeting in March. This decision was reached by the directors of the association last week. For the annual meeting of the section, the date has been tentatively fixed for Monday, June 6, the meeting to continue through three days.

The Senate Committee on interstate commerce has held several meetings to consider the Frelinghuysen bill, which is a substitute for Section 10 of the Clayton law, and it was expected to order a favorable report on Thursday on the bill as amended in accordance with the suggestions made by the Interstate Commerce Commission. Chairman Clark has conferred with the committee and it has also considered some suggestions made by Senator Cummins.

The House Committee on interstate and foreign commerce has submitted a favorable report on the bill introduced by Representative Winslow to specifically authorize the Secretary of the Treasury to honor certificates of the Interstate Commerce Commission for partial payments to the railroads on account of their guaranty for the six-months' period following the termination of federal control. A minority report was filed by Representative Sims.

The Veteran Employees' Association of the Philadelphia & Reading held its thirteenth annual banquet at Philadelphia on Saturday evening, January 22, about 1,400 members being present. This association, composed of employees who have been in the service 25 years, now numbers about 1,900 members. The president for the ensuing year is W. U. Barr, assistant trainmaster at Reading. The retiring president, H. S. Fisher, was presented with a grandfather's clock.

The United States Civil Service Commission advertises for candidates for the position of chief statistician for the United States Railroad Labor Board, Chicago; also for a schedule expert, class A, and a schedule expert, class B, for the same board, the salaries for the three places being respectively \$4,300, \$4,200 and \$3,600. Applicants must be between 25 and 60 years of age and must have had extensive experience in work on railroad wage schedules. Applications will be received until March 1.

Alaska, its geography and resources, with particular relation to the influence of the government railway, now nearing completion, was the subject of an address presented before the Western Society of Engineers at Chicago on January 20 by Colonel Frederick Mears, chairman and chief engineer of the Alaskan Engineering Commission, which is responsible for the construction of the railway. The talk was illustrated by slides and motion pictures illustrating the mining and

agricultural developments, and also the progress in the construction of the railway. The views also brought out the physical features of the country through which the railroad is being built and indicated the wide variety of engineering problems encountered.

The Pennsylvania will not coerce any of its employees to join, or not to join, against their will, any organization whatever. This is the salient point in a bulletin which has been posted by General W. W. Atterbury, vice-president in charge of operation, because of communications received by some of the employees in certain departments to the effect that the road proposes to reduce the rates of pay of all employees who are not members of a labor organization and that those who desire to retain their present rate of pay must join labor organizations. "If anyone tells you that your present rate of pay depends on membership in a labor organization, or that the company proposes to pay a different rate to members and non-members, deny it," says the bulletin. The employee's present position with its rate of pay or the exercising of seniority rights in no manner depends on membership or non-membership in any association or organization.

## Prices to Be Printed on Pennsylvania Railroad Tickets

Printing the price on the face of tickets is now the regular practice on the Pennsylvania Railroad, and as fast as the present supply of tickets is exhausted, new tickets will show the amount of the fare. One of the first of the new forms is for transportation between Elmira, N. Y., and Altoona, Pa. At the bottom of each ticket is printed, "(Fare, \$6.08; War Tax, \$0.49)." Where necessary, because of changes in tariffs, the tickets on hand will be stamped with the new price, and agents will be instructed to show passengers the tariffs in the event that the new charge is questioned.

## Robbers Increasingly Bold

Automobile bandits held up an automobile coming up-town from the Union Station at Toledo, Ohio, at noon on January 17, and seized \$10,000 in ticket office receipts belonging to the New York Central. Two railroad patrolmen who resisted the highwaymen were killed and the robbers escaped with the money.

At Chicago, about two o'clock on the morning of January 18, four robbers held up railway employees and two post office men who were unloading a mail truck at the Union Station, and carried off a wagonload of mail. Holding these men at the point of their guns, the robbers entered the truck, seized registered mail sacks, deposited them in a waiting automobile, and got away. Numbers of persons witnessed the transfer of the bags, not realizing that it was a robbery.

## The June Conventions

The Railway Supply Manufacturers' Association on January 10 sent out its official circular No. 1 extending the invitation to railway supply concerns to exhibit at the Atlantic City conventions in June. The date of the convention of the American Railroad Association, Division V—Mechanical, is June 15 to 22, American Railroad Association, Division VI—Purchases and Stores, will meet June 20-22. The circular gives the preliminary details concerning the exhibit and with it were enclosed space diagrams and forms for application for space. It is noted that the space will be assigned by the exhibit committee at the office of the Railway Supply Manufacturers at Pittsburgh on March 1.

The circular says: "Our annual convention in June, 1920, as generally known, was unusually successful and from the interest shown at this early date, it is expected to have even

a more successful convention this year, and with that in view a greater area of exhibit space has been provided. It is suggested that applicants for exhibit space request the minimum amount of square feet to meet their actual needs."

The address of J. D. Conway, secretary of the Railway Supply Manufacturers' Association, is 1841 Oliver building, Pittsburgh.

### Railway Revenues and Expenses for November

The Interstate Commerce Commission has issued the following summary of revenues and expenses for 187 Class I roads and 15 switching and terminal companies for November:

Item	November		Eleven Months	
	1920	1919	1920	1919
1. Average number of miles operated.....	235,394.87	234,405.51	235,251.49	234,194.41
<b>Revenues:</b>				
2. Freight .....	\$437,007,964	\$303,489,474	\$3,937,234,790	\$3,251,802,951
3. Passenger .....	106,829,660	92,475,222	1,173,385,680	1,079,654,919
4. Mail .....	8,536,089	4,283,363	141,383,863	47,731,158
5. Express .....	10,890,721	14,756,277	133,826,976	111,633,334
6. All other transportation.....	15,622,527	10,843,071	148,619,234	115,259,063
7. Incidental .....	12,740,573	11,855,109	136,934,898	118,560,811
8. Joint facility—Cr.....	720,406	585,975	7,092,838	6,266,333
9. Joint facility—Dr.....	217,222	185,274	2,103,904	1,968,276
10. Railway operating revenues.....	592,130,728	438,105,217	5,672,374,375	4,728,939,293
<b>Expenses:</b>				
11. Maintenance of way and structures.....	81,358,609	66,670,888	961,624,407	713,997,432
12. Maintenance of equipment.....	139,203,191	112,211,521	1,443,448,099	1,115,488,463
13. Traffic .....	6,197,612	4,000,139	66,081,139	42,872,861
14. Transportation .....	263,306,365	192,403,904	2,639,757,880	1,978,245,455
15. Miscellaneous operations.....	5,017,852	4,378,915	56,480,320	44,021,073
16. General .....	15,524,873	10,706,520	154,791,261	114,152,007
17. Transportation for investment—Cr.....	707,150	480,397	4,778,401	5,424,304
18. Railway operating expenses.....	510,501,352	389,890,950	5,317,404,705	4,003,353,077
19. Net revenue from railway operations.....	81,629,376	48,214,267	354,969,670	725,586,216
20. Railway tax accruals.....	22,561,753	18,679,783	250,922,303	177,450,924
21. Uncollectible railway revenues.....	56,668	143,505	925,207	809,861
22. Railway operating income.....	59,010,955	29,390,979	103,122,160	547,325,431
23. Equipment rents (Dr. bal.).....	3,427,515	5,955,762	30,644,809	30,849,928
24. Joint facility rent (Dr. bal.).....	1,239,647	1,405,410	17,242,682	13,984,006
25. Net of items 22, 23 and 24.....	54,243,793	22,025,807	55,234,669	502,491,497
26. Ratio of operating expenses to operating revenues, %.....		88.99	93.74	84.66

NOTE: (a) Federal lap-over items settled during the month are included in the above compilations for those roads that have indicated that estimates were not included for substantially all unaudited corporate items.

(b) The amount of war taxes included in November, 1920, is \$2,033,600 and for period, March to November, 1920, \$28,380,348.

(c) Report of the Duluth, Winnipeg & Pacific Ry. Co. not received.

c Credit item. d Debit item.

### Employees' Service and Compensation for First Quarter of 1920

The Interstate Commerce Commission has issued a statistical summary giving the number of employees in service, the number of hours or days worked, the total compensation and the average compensation per day or hour for Class I roads for the first three months of 1920. This represents the effect of the wages in effect at the time of the award made by the Railroad Labor Board in July. For January the number of employees in service at the middle of the month was 2,000,105, for February 1,970,525 and for March 2,009,948, making an average for the quarter of 1,993,524. The total compensation for the quarter was \$795,616,330.

For engineers and trainmen the summary gives the number of hours on duty, the miles run and the average compensation per mile.

### The Tie Supply of the Future

"The Tie Supply of the Future" was the subject of an address given before the Western Society of Engineers on Friday evening, January 14, by John Foley, forester, Pennsylvania System. This meeting constituted the initial step in the tour being made by the members of the American Wood-Preservers' Association on their way to the convention of that association, which will be held in San Francisco on January 25, 26 and 27. The meeting was attended by a considerable number of the members of this association. Mr. Foley's paper covered the relation of timber supply to timber consumption and voiced the opinion that while great inroads have been made in the original forest resources in this country, the perpetuation of reasonable timber supplies is a matter

of conservative and prudent use rather than the development of substitutes. Following this line of thought he pointed to opportunities for development in timber preservation and in the care, use and purchase of ties by the railroads.

### Railroad Retrenchment

The Erie Railroad, on January 22, issued a general order for reductions in the operating forces similar to that of the Pennsylvania which was noted in our last issue. The Erie order says that as far as possible forces shall be worked five days a week except where the safety of property may necessitate an exception to the rule. This is done with a view to

meeting the situation in a more humane way than to lay off large numbers of employees.

The Baltimore & Ohio has furloughed between 7,000 and 8,000 shopmen with the expectation, however, that the suspension of work will not be of long duration.

The Pennsylvania this week has discontinued 15 long-distance trains which have been run exclusively for express matter, and 18 local passenger trains to and from Pittsburgh. At Northumberland, Pa., suspension of work on this road last Sunday was almost complete, passenger trains and freights carrying perishable goods being the only ones attended to.

The Lehigh Valley has reduced by about 16 per cent the forces in its shops at Sayre, Pa., and the men who work will report only five days a week.

The Norfolk & Western has laid off about 2,000 employees, mostly shopmen.

The Louisville & Nashville has suspended the movement of coal from mines on the Owensboro & Nashville branch with which it has fuel contracts, and consequently seven mines in this district have laid off about 800 miners.

### I. C. C. Getting Data as to Cost of Repairs in Outside Shops

The Interstate Commerce Commission has sent to all carriers a questionnaire on which the railroads are required to furnish detailed information by March 1 regarding all their contracts for the construction and repair of cars and locomotives in outside shops since March 1, 1920, for the use of the commission in connection with its investigation which was instigated by the charges made by the machinists' union that the railroads have been paying excessive prices for work done in outside shops. The infor-

mation called for by the commission includes the terms of the contracts, the cost in outside shops in comparison with what it would have been if the work had been done in railroad shops, whether the costs shown include an allowance for supervision, depreciation, interest on investment and other overhead expenses, the proportion of the number of cars repaired under contract in outside shops, specific information as to the conditions which required the company to have repairs made at outside shops, a statement as to whether the facilities of the railroad plants had been utilized to full capacity, and the average number of men employed in the car departments each month. The questionnaire states that the commission is desirous of securing full information regarding these matters as well as the reasons actuating carriers in entering into these arrangements and the benefits to be derived therefrom.

### Prizes for Reducing the Accident Record

The Chicago Great Western is to award prizes to the divisions of the road making the best record in its accident prevention campaign. Two banners, a flag and a silver cup will be presented for the best performances in 1921, on the following basis:

- (1) To the division having the lowest number of reportable train and train service casualties per 100,000 engine miles, a banner.
- (2) To the division having the lowest number of reportable industrial casualties per 1,000,000 man hours (excluding shop accidents), a banner.
- (3) To the division having the lowest number of reportable casualties per 1,000,000 man hours in shop accidents (Oelwein shop to rate as a division), a flag.
- (4) To the division (excluding Oelwein terminal and shop) having the lowest number of days lost per 1,000 man hours, due to all classes of reportable casualties, a silver cup.

The records are to be kept and prizes awarded by a committee selected by the general safety committee; and each month the committee will issue a bulletin announcing the standing of the contestants.

### Forest Products Section to Be Formed by American Society of Mechanical Engineers

Mechanical engineers interested in the engineering branches of forest products, and organizations and individuals in the woodworking industries have begun a movement to establish a Forest Products Section of the American Society of Mechanical Engineers.

The consideration of various aspects of the woodworking industry especially in relation to the engineering applications of wood and to engineering methods of preparing wood for use in the industries at the symposium held at the recent convention of the society in New York focused the attention of prominent members of the society on the value a Forest Products Section would be to the woodworking industries.

The society's Committee on Professional Sections, which supervises such professional groups developed within the main organization, has looked with favor upon the establishment of the section, and it is planned to make it available as soon as possible.

### Plans for Engineering Convention and Exhibit at Chicago Nearing Completion

While the signal division of the American Railway Association has decided to abandon its one day stated meeting in Chicago on March 14, no changes will be effected in the arrangements for the convention of the American Railway Engineering Association at the Congress hotel on March 15-17, inclusive, and for the simultaneous exhibit of the National Railway Appliances Association at the Coliseum. With reports of practically all committees of the A. R. E. A. in the hands of the secretary, the bulletins of technical information to be presented at the March convention will soon be sent to the members for study. C. W. Kelly, secretary of the National Railway Appliances Association, reports that 5,500 square feet of additional space has been made available for the exhibits this year and that all but 12 spaces of the total display area available have been contracted for by the members of the association. In view of the number of applicants for the remaining space it is anticipated that the entire exhibit area will be taken up within the next week.

## Traffic News

The Royal Mail Steam Packet Company is going to give a monthly service from Vancouver, B. C., and the Pacific coast to Europe, and will use ships fitted with 3,000 tons of space refrigerated.

An increasing movement of grain has been noted on several western roads within the past few weeks. Pressure by the banks has compelled the liquidation of grain by the farmers, and the resulting movement has caused a demand for grain cars. The Burlington and the Chicago, Milwaukee & St. Paul report that while a large surplus of other equipment exists, there is an actual shortage of grain cars.

The Dominion Express Company, which operates on the lines of the Canadian Pacific, announces that in conjunction with Aircraft Transport and Travel, Limited, it has inaugurated a continental aerial service, twice daily between London and Paris and daily between London and Amsterdam. The fare charged on both lines is £10 10s. single, or £18 18s. return, including motor car service at both ends. Parcels are taken at the following rates: Shipments up to 10 lb. 2s. per lb., over 10 lb. 1s. 3d. per lb. The express company has arranged for this service a special insurance—life and accident—to cover risks up to £5,000. Parcels for Canada from Paris can leave Paris by airplane a day before the steamer leaves Liverpool.

### Coal Production

Production of soft coal continued to decline during the week ended January 15, according to the weekly bulletin of the Geological Survey. The total production is estimated at 9,937,000 tons. The bulletin says that labor and car supply were sufficient and the chief factor limiting output was lack of orders.

### Anthracite Shipments in December

The shipments of anthracite in December, as reported to the Anthracite Bureau of Information, amounted to 6,436,320 gross tons, against 5,765,347 tons in November, an increase of 670,973 tons; 24 working days; average daily shipment, 268,180 tons; November daily average, 274,540 tons, with 21 days worked.

Shipments by originating carriers were as follows:

	December, 1920	November, 1920
Philadelphia & Reading.....	1,324,004	1,238,994
Lehigh Valley.....	1,161,305	1,002,329
Central of New Jersey.....	497,735	453,139
Delaware, Lackawanna & Western	940,515	792,157
Delaware & Hudson.....	896,475	814,167
Pennsylvania.....	437,242	424,745
New York, Ontario & Western...	164,557	175,074
Erie.....	675,979	603,766
Lehigh & N. E.....	318,508	260,976
Total .....	6,436,320	5,765,347

### "Building Demand Accumulates"

The Universal Portland Cement Company has issued a circular entitled, "Building Demand Accumulates," which cautions users of cement against waiting to come into the market when transportation demands are at a maximum. Attention is called to the fact that the supplying of this product is not a question of manufacturing capacity, but of the available car supply and general business conditions. Thus the most cement ever used in the country in any year was about 94 million barrels, in 1916, or approximately 470,000 carloads; on the other hand, a conservative estimate of the productive yearly capacity for all cement mills in the country is 125 million barrels, or approximately 625,000 carloads. "If everybody wants cement," the circular goes on to say, "and the farmer turns loose his grain, and business in general quickens, all at the same time, a lot of people are going to be disappointed by delays in their work."

## Commission and Court News

### Interstate Commerce Commission

The commission has issued its decision in the Iowa and Montana passenger rate cases ordering the railroads to increase their intrastate fares and charges by the amount of the increase applied on interstate traffic. The commission has also issued a decision ordering increases in the passenger and baggage charges and the rates on milk and cream applicable between points in Ohio by the amount of the increases applied to interstate traffic.

The commission has denied the motions for a reconsideration and reargument on the application for a consolidation of the express companies, which was recently authorized by the Interstate Commerce Commission. The motions were filed by John E. Benton, general solicitor of the National Association of Railway & Utilities Commissioners, and Charles E. Cotterill, representing the Southern Traffic League.

### State Commissions

In the Federal Court at Detroit, Mich., on January 24, at the suit of thirteen railroads, the Michigan Public Utilities Commission was permanently enjoined from reducing railroad passenger fares below three cents a mile.

Suit was filed in the United States District Court at Chicago on January 26 by E. J. Brundage, attorney-general of Illinois, to have an order issued by the Interstate Commerce Commission giving Illinois railroads permission to advance passenger rates to 3.6 cents a mile, set aside on grounds of unconstitutionality of certain provisions of the Esch-Commins Law. The suit seeks to determine whether the Commission has power under the Esch-Commins Law to advance fares in Illinois.

The order of the New Jersey Board of Public Utilities, requiring the Erie Railroad to eliminate fifteen grade crossings in Paterson, has been held valid by the Supreme Court of the United States. The order of the board affected also "any telegraph, telephone, gas, electricity, water and other property," which would have to be altered as a result of the elimination of the crossings. The Passaic Water Company, Western Union Telegraph Company, the Public Service Railway Company and several private concerns joined with the railroad in appeals from lower court decisions, which decisions are now sustained.

### Court News

#### Securing Railroad Employment by Fraud, Bars Recovery for Injury

In a recent action by a brakeman for personal injury, a special plea of the railroad company presented, as Judge Dayton of the federal district court for the Northern District of West Virginia said, such an extraordinary statement of facts as to render the legal questions involved in the plaintiff's motion to strike out the plea extremely perplexing. The defendant, the Baltimore & Ohio, had established certain rules governing employment of brakemen. They had to undergo a physical examination to show them physically fit for their duties. Plaintiff, the company alleged, being over the required age and physically unfit, got another man to assume his name and be examined and secure the medical examiner's report, on which plaintiff got the employment of brakeman, in which employment, fraudulently obtained, he was injured. The court considered the question a new one, that of a man over (not under) age, charged to be physically incompetent under the company's rules, securing by the fraudulent personation of another a service of danger and responsibility, and, notwithstanding his fraud and deceit,

seeking to hold the defrauded company responsible for an injury sustained by him in a place where he had no legal or other right to be. The plaintiff's motion to reject the plea was overruled. Following the filing of this opinion the case was dismissed on plaintiff's motion and at his costs—Stafford v. Baltimore & Ohio, 262 Fed. 807.

### United States Supreme Court

#### Railroads Not Bound to Operate at a Loss

In an action seeking prohibition of an order of a Florida state court confirming a sale at foreclosure of the Ocklawaha Valley for the purpose of being dismantled by the purchaser, judgment granting the prohibition being affirmed on another ground, Mr. Justice Holmes said: "Apart from statute or express contract people who have put their money into a railroad are not bound to go on with it at a loss if there is no reasonable prospect of profitable operation in the future. (Brooks-Scanlon Co. v. Railroad Commission of Louisiana, 251 U. S. 396). No implied contract that they will do so can be elicited from the mere fact that they have accepted a charter from the state and have been allowed to exercise the power of eminent domain. Suppose that a railroad company should find that its road was a failure, it could not make the state a party to a proceeding for leave to stop, and whether the state would proceed would be for the state to decide. The only remedy of the company would be to stop, and that it would have the right to do without the consent of the state if the facts were as supposed. Purchasers of the road by foreclosure would have the same right."

The state court's judgment was affirmed because the prohibition excluding from the decree the words purporting to authorize dismantling the road did not cut down the future purchaser's rights, any more than did the presence of those words enlarge them. Therefore the action of the State Supreme Court was not open to objection under the federal constitution, although it may be that it hardly would have been taken if the authority to dismantle had not sounded more absolute than it could be in fact, considering the nature of the proceeding. Without previous statute or contract to compel the company to keep on at a loss would be an unconstitutional taking of its property. But the prohibition did not compel the company to keep on; it simply excluded a form of authority from the decree that gave the illusion of a power to turn the property to other uses that could not be settled in that case.—Bullock v. State of Florida. Decided January 17, 1921.

#### State Power to Abolish Grade Crossings

The Supreme Court of the United States has affirmed judgments of the New Jersey Supreme Court and Court of Errors and Appeals (89 N. J. L. 57, 90 N. J. L. 672), sustaining an order of the Board of Public Utility Commissioners of New Jersey, of April 20, 1915, directing a change in 15 places in the city of Paterson, where the Erie now crosses streets at grade, by carrying 14 of the crossings under, and one, at Madison avenue, over the railroad, at the railroad's expense.

"Grade crossings" the court says, "call for a necessary adjustment of two conflicting interests—(a) that of the public using the streets and (b) that of the railroads and the public using the railroads. Generically the streets represent the more important interest of the two. There can be no doubt that they did when these railroads were laid out, or that the advent of automobiles has given them an additional claim to consideration. They always are the necessity of the whole public, which the railroads, vital as they are, hardly can be called to the same extent. \* \* \* It is said that if the same requirement were made for the other grade crossings the company would soon be bankrupt. That the states might be so foolish as to kill a goose that lays golden eggs for them, has no bearing on their constitutional rights. If it reasonably can be said that safety requires the change, it is for them to say whether they will insist upon it, and neither prospective bankruptcy nor engagement in interstate commerce can take away this fundamental right of the sovereign of the soil. To engage in interstate commerce the railroad must get on to

## Foreign Railway News

### China to Buy Cars and Locomotives

Twenty-seven Chinese banks have agreed to loan \$6,000,000 Mexican to the Ministry of Communications for the purchase of cars and locomotives, according to a cablegram received from Commercial Attache Julean Arnold at Peking. The Chinese banks will control expenditures and will make cash payments to the manufacturers of the equipment. Bids will be called for in about three months.

### New Road from Black Sea to Baltic

The construction of a new railway from the Baltic to the Black Sea will be financed by the Baldwin Locomotive Company, according to a press despatch from Warsaw. Agreement for the building of the line was reached at a conference attended by Premier Stamboulini of Bulgaria, President Pilsudski of Poland and representatives of the Baldwin company and the Morgan firm. It is said that the formal contract will be signed within a month and the actual construction will be undertaken by the close of the year. The proposed line will open up the great oil fields of Eastern Galicia and Bessarabia.

### November Export of Cars

Exports of cars in November show the same reduction over the large shipments of previous months as did the totals for October. Only 3 passenger cars, valued at \$30,000, were exported. Freight car exports totaled 949, valued at \$1,608,474, and car parts exported were valued at \$478,617. The detailed report by countries as compiled by the Bureau of Foreign and Domestic Commerce follows:

Countries	Passenger, freight and other		Parts of cars	
	Number	Dollars	Number	Dollars
France	320	600,530	2,874	1,571
Italy	.....	.....	.....	6,943
Norway	.....	.....	.....	38,629

### Track Material Shortage Postpones

#### Construction in South Africa

The South African Railways had, on March 31 last, 1,700 locomotives, with 104 still on order in foreign countries. The acquisitions for the year ending on that date totaled 95. There were also 122 main line coaches, 77 suburban coaches, 996 freight cars with trucks and 1,326 four-wheeled freight cars on order from overseas concerns on that date. These totals are in addition to some 174 passenger cars and 927 freight cars which were under construction in the company shops. The administration has had to abandon any

the land, and to get on to it must comply with the conditions imposed by the state for the safety of its citizens. Contracts made by the road are made subject to the possible exercise of the sovereign right. If the burdens imposed are so great that the road cannot be run at a profit it can stop, whatever the misfortunes the stopping may produce. Intelligent self-interest should lead to a careful consideration of what the road is able to do without ruin, but this is not a constitutional duty. In the opinion of the courts below the evidence justified the conclusion of the board that the expense would not be ruinous. \* \* \* If we could see that the evidence plainly did not warrant a finding that the particular crossings were dangerous, there might be room for the argument that the order was so unreasonable as to be void. The number of accidents shown was small, and if we went upon that alone we well might hesitate. But the situation is one that always is dangerous. The board must be supposed to have known the locality. \* \* \* Upon the whole matter, while it is difficult to avoid the apprehension that the state officers hardly gave due weight to the situation of the company as a whole in their anxiety for the well being of the state, we are of opinion that they did not exceed their constitutional powers.—*Erie v. Board of Public Utility Commissioners*. Decided January 3, 1921. Opinion by Mr. Justice Holmes. The Chief Justice, Mr. Justice Van Devanter and Mr. Justice McReynolds dissent.

### Order Requiring Restoration of

#### Train Service Held Invalid

The St. Louis-San Francisco main line extends from St. Louis to Memphis—305 miles. As originally constructed it turned sharply southeastward at Hayti, Missouri—220 miles from St. Louis—ran thence seven miles to Caruthersville, a city of 4,000 people, thence northwestward nine miles to Grassy Bayou and thence south. A cut-off between Hayti and Grassy Bayou—six miles—became part of the main line in 1904 and thereafter through freight and freight-passenger trains passed that way. The through day passenger trains—Nos. 801 and 802—continued to move along the old line until August, 1913, when they were routed over the cut-off. At the same time two new daily passenger trains were put on and operated between Blytheville, Ark., and Cape Girardeau, Mo., by way of Caruthersville. The Missouri Public Service Commission directed the railroad to restore trains 801 and 802 to the route followed prior to 1913 and the State Supreme Court approved this action. The Supreme Court of the United States was asked by the railroad to declare the order invalid because it unduly burdens interstate commerce. The court considers the point well taken.

Fourteen local daily passenger trains move in and out of Caruthersville—seven each way. Some of these make close connections with all through trains at Hayti. The cars in these locals are not of the highest class, but apparently the trains afford fair facilities for reaching and leaving Caruthersville without serious delay or great inconvenience. But if service is deficient there is an easy remedy by means other than detours of the through trains. Applying the well established principles announced in *C. B. & Q. v. Wisconsin*, 237 U. S. 220, 226, to these facts, the Supreme Court considers that the fourteen trains meet the reasonable requirements of Caruthersville and that the commission's order unduly burdens interstate commerce. Compliance with it would require the railroad to maintain sixteen more miles of track at the high standard essential for the through trains, and to move these trains ten miles further. The burden certainly would not be less serious than those which were condemned in some if not all of the following cases, in which the United States Supreme Court has made a similar decision: *Gladson v. Minnesota*, 166 U. S. 427; *Lake Shore v. Ohio*, 173 U. S. 285; *A. C. Line v. N. C.*, 206 U. S. 1; *Mo. Pacific v. Kansas*, 216 U. S. 262; *Cleveland, C. C. & St. L. v. Illinois*, 177 U. S. 514; *Mississippi R. R. Com. v. I. C.*, 203 U. S. 335; *A. C. L. v. Wharton*, 207 U. S. 328. The judgment of the lower court was therefore reversed. Mr. Justice Pitney and Mr. Justice Clarke dissented, without opinion.—*S. L. & S. F. v. Mo. P. S. Co.* Decided January 17, 1921. Opinion by Mr. Justice McReynolds.

comprehensive plans for new construction of any considerable importance in the immediate future because of the impossibility of getting materials, particularly rails and ties.

### November Exports of Steam Locomotives

The figures for the exports of steam locomotives in 1920 are available for only eleven months, but these totals exceed those of any previous year. The exports for November were 116, valued at \$2,909,204. Cuba was the destination of a large part of these shipments. The total of exports to that country was 47 locomotives valued at \$1,275,830. The next largest shipments were to Brazil, to which country 28 locomotives valued at \$786,529 were consigned. The detailed figures as compiled by the Bureau of Foreign and Domestic Commerce are as follows:

Country	Number	Value
Canada	8	\$115,359
Nicaragua	1	7,400
Mexico	1	7,500
Cuba	47	1,275,830
Dutch West Indies	1	3,114
Argentina	1	13,850
