*Commodities imported via Pacific coast.*—The following list of articles imported from the Orient via ports on the Pacific coast destined to all territory in the United States east of the Rocky Mountains: Antimony ware and other antimony products, bamboo, rattan, fiber; brooms, brushes, bristles; bulbs, plants, and stems; buttons, agate or porcelain; camphor, crude, and camphor oil; chinaware, glassware, earthenware, porcelain; coconut, concentrated or desiccated; coffee, green, in bags; copra, copra cake, and copra meal; eggs, dried, shelled, and albumen; fiber, flax, jute, or straw, hemp, sisal, rice straw, flax, tow, and waste; glassware, glasses, jars; gums, all kinds; hides, cattle, sheep, goat; peanuts; oils, vegetable; palm kernels; rubber, crude; sago, sago flour, tapioca, tapioca flour, cassava flour, and potato flour; silk; silk, vegetable tallow; skins and hides; rugs and mats; tea, tea dust, siftings, sweepings, and waste; tin, bar, block, pig, or slab; toys, all kinds.

*Item 38.*—Reduction on manganese and chrome ore throughout eastern territory, 28 per cent.

*Item 39.*—Sand and gravel and crushed stone and other highway construction materials in Ohio, Michigan, Indiana, and parts of Illinois, 15 per cent reduction.

*Item 40.*—Reduction of half of the ex parte 74 increases on grain, grain products, and hay west of the Mississippi, amounting to at least  $\$35,000,000$ .

# "Satisfactory Settlement" Ends Threatened Strike

Labor Board's Efforts to Avert Walkout Successful—Brotherhoods' Threats Again Win Concessions

WITHIN A FEW HOURS after the last issue of the *Railway Age* was on the press, leaders of the five train service brotherhoods, assembled at Chicago, voted to recall their orders for a strike which was to have started on October 30. This action was taken as the result of a combination of circumstances, the most important of which were: (1) the attitude of the Labor Board as indicated in the memorandum handed down by the Board and reproduced in part in the *Railway Age* of October 29, page 821; (2) the "peace" efforts of B. W. Hooper, member of the public group on the Board; (3) the preparations which had been made by the government to combat the strike; (4) the attitude of W. G. Lee, president of the Brotherhood of Railroad Trainmen, who opposed the calling of the strike at this time; (5) the plans formulated by the carriers for preventing any serious interruption of traffic, and lastly the general disapproval of the public.

In a reference in last week's *Railway Age*, page 823, to the statement of the Board on October 25 (the statement in question appeared on page 821) it was pointed out that this statement said definitely that no further reductions for any group of any employees would be considered by the Board until rules and working conditions for that group were disposed of. It was also noted that as to overtime pay, in the cases of the shop crafts rules already promulgated, overtime provisions were retained to a large extent. Mr. Cuyler, it was further pointed out, had informed the Board that none of the carriers had any intention of making further changes in wages or working conditions without submitting controversies to the Board. The reference to the Board's statement continued, "These facts are pointed out as constituting what might be taken as a 'satisfactory settlement' by the leaders of the labor organizations." It developed that the Board's memorandum of October 25, together with the statements of representatives of the carriers at the hearings on October 26, did actually constitute a "satisfactory settlement" to the brotherhood leaders.

It was evident at Wednesday's inquiry as Mr. Hooper questioned the heads of the five train service brotherhoods regarding their reasons for calling this strike that, with the exception of the Brotherhood of Railroad Trainmen, the strike vote was taken ostensibly in protest to the wage reduction of last July but in reality to place a club in the hands of the labor leaders with which they might ward off further reductions in wages or changes in working conditions, especially the punitive overtime provisions in the brotherhood's schedules. The strike vote of the Brotherhood of Railroad Trainmen was taken solely on the wage cut of last July and it was noticeable in this connection that Mr. Lee never openly favored a walk-out. When it was pointed out to the executives of the organizations that the Board's previous memorandum contained an assurance that the Labor Board would not "enter into a prolonged hearing on an application to reduce wages at this time," the memorandum was accepted by the labor leaders as a satisfactory settlement of one of the three major excuses for the strike call. It was probably recognized at the same time that the comparatively small wage reduction of last July did not, in itself, constitute a reasonable excuse for attempting to tie up the railroads of the country. Furthermore, the labor leaders were cognizant of the fact that the Labor Board has already ruled, in the case of the shop crafts, in favor of the principle of time and one-half for overtime except for Sunday and holiday work and has by other means indicated a disposition to con-

sider punitive overtime favorably where it does not constitute an undue hardship upon the carrier. The application of this attitude to the third excuse of the brotherhood leaders for ordering the walk-out, i. e., proposed changes in working conditions, would undoubtedly constitute a "satisfactory settlement" of that point. The net result then was practically a victory for the brotherhoods involved, inasmuch as all of the organization chiefs had stated bluntly that they could only call the strike off unless a "satisfactory settlement" had been reached, then 24 hours later announcing that "satisfactory settlement" by the recall order.

## B. W. Hooper Addresses Brotherhood Chiefs

The vote ending the strike came at midnight after an all-day session on October 27. Earlier in the day the general chairman of each of the five organizations conferred separately. In the afternoon a joint session was held which was addressed by Mr. Hooper. The latter's appearance before the Board is said by the brotherhood chiefs to have marked the turning point in their discussions.

Mr. Hooper presented to the brotherhood leaders the memorandum of October 25, which through some oversight had not been officially given to them before, and explained and emphasized the points contained therein which could be accepted by the brotherhood leaders as constituting a "satisfactory settlement." He also emphasized the announcement of representatives of the carriers at the Wednesday inquiry, that no changes in either wages or working conditions will be sought except as provided by the law through the Labor Board.

## Mr. Hooper Explains Visit to Labor Representatives

Upon returning to his offices, Mr. Hooper issued a statement in which he said in part:

The Labor Board did not send me before the brotherhood and only two or three members knew I was going. I went to talk to the representatives of the organization as a man, a citizen, and a member of the board, with the hope that I might make myself useful in averting the strike. Perhaps I went by invitation, certainly by agreement, and the brotherhoods sent Mr. Whitney, vice-president of the trainmen, to accompany me.

The immediate occasion of my appearance before the leaders of the employees was this:

Day before yesterday I submitted to the Labor Board a memorandum, bearing indirectly upon the strike situation, which was adopted. By an awkward oversight this memorandum did not reach the chief executives of the brotherhoods until last night and had not yet been presented to the committeemen and chairmen present in the city.

This memorandum was laid before the executives of the carriers on the day it was adopted. I read this memorandum to the several hundred officers of the brotherhoods this morning and, in addition, addressed them along general lines, urging every consideration possible against the strike.

Naturally, it was not within propriety for me to commit the Board or even myself to any given action on any question that may hereafter come before the Board further than the course of procedure set out in the memorandum referred to.

This memorandum, briefly stated, expresses the purpose of the Board to complete its consideration of the rules and working conditions of each class of employees before taking up consideration of any application affecting wages of that particular class, and give ample reasons for that course. These reasons it is, perhaps, unnecessary to recapitulate.

In my judgment that memorandum constitutes the only practical basis for an honorable adjustment of the present strike trouble and works no injury to anybody. It is well within the discretion and power of the Board to fix the order in which to dispose of matters before it.

If this memorandum has the effect of removing the principal

cause of friction from immediate operation, it has an additional virtue.

### Resolution Calling Off Strike Explains Brotherhood's Position

The text of the resolution calling off the strike adopted by the brotherhoods opened with a history of the recent events in the controversy. It called attention to the resolution of the Board ordering the inquiry on October 26 and said in discussing the testimony given at that time:

*Whereas*, at said hearing the Board was given full information as to the contentions and purposes of the organizations and the carriers in connection with the wage reduction provided by Decision 147 as to the intention of the carriers in reference to further reductions in the pay of employees, as to reductions in wages made by a number of carriers without authority of the Board and as to applications of carriers for the elimination of time and one-half for overtime and changes in agreements relating to working conditions of the employees; and

*Whereas*, the contention of the representatives of the employees before the Labor Board was that the proposed strike was voted for in opposition to Decision 147 of the Board and was justified upon the ground that no employee may be required to continue in the service of the employers on a scale of wages considered by said employee to be unsatisfactory; and

*Whereas*, the Board propounded numerous questions for the purpose of developing information as to what effect the statement contained in the ballot relating to the proposed further reduction in wages and changes in working rules had upon the employees in casting their ballots for or against a strike, in response to which the representatives of the employees expressed the opinion that the matters, referred to in the statement, were of vital concern to the employees, but that the ballot expressly stated that it was cast in opposition to or in favor of the acceptance of the decrease in wages, as provided in Decision 147; and,

*Whereas*, the representatives of the employees seriously objected to the criticism of the Board to the effect that in its opinion they were in violation of the law in declaring a strike upon matters not yet decided by the Board, and took occasion to call the Board's attention to the injustice of this criticism in view of the fact that 35 or 40 carriers, which were listed and made a part of the record, had violated Section 301 of the Transportation act, as well as the decision of the Board, by arbitrarily putting into effect reductions in wages and by making changes in working conditions without complying with the provisions of the act; and,

*Whereas*, After interrogating the representatives of the employees the Board interrogated the representatives of the carriers; and,

*Whereas*, In a reply to questions propounded to him, T. DeWitt Cuyler, chairman of the Association of Railway Executives, representing 95 per cent of the carriers cited to appear, stated that none of the carriers represented by his association would revise wages or change working conditions unless by agreement with their employees or by decision of the Labor Board, nor would they violate the Transportation Act in any particular in respect to any dispute between the carriers and the employees; and

*Whereas*, In reply to the questions propounded by the Board to the representative of one of the carriers a number of the Association of Railway Executives, who had reduced wages and changed working conditions without authority of the Board, he stated that such reduction in wages and changes in working conditions would be restored and that no further changes would be made except upon decision of the Board or by agreement with the employees; and

*Whereas*, We interpret this question and answer to mean that all carriers who have reduced wages or changed working conditions without authority of the Board will voluntarily cancel such reduction in wages or changes in working conditions or be called to appear before the Labor Board and show cause why they should not do so; and

*Whereas*, In reply to questions propounded to representatives of short line railways such representatives stated that they would comply with the provisions of the Transportation Act and that no reduction in wages or changes in working conditions would be made in violation of the law, and

*Whereas*, In view of the questions propounded by the Board to the carriers that reduced wages or changed working conditions are in violation of the law, there is every reason to expect early decisions requiring the cancellation of such reduction in wages and changes in working conditions.

### Board's Memorandum an Acceptable Basis

The Board's memorandum of October 25 is then quoted and the following comment made:

*Whereas*, we interpret the foregoing memorandum to mean a number of important things to the membership of our organizations. Among these things we mention:

*First*, it is evident that the Board has adopted a policy under which it will not be in a position to give consideration to any application, affecting the wages of transportation employees, for a considerable period of time.

*Second*, that it does not propose to take any action on wage applications, affecting any class of employees, until it is definitely known what working conditions apply.

*Third*, that the train and engine service employees will be given full consideration in view of the hazard, responsibility and other conditions peculiar to their employment; and,

*Whereas*, in paragraph 3 of the Board's memorandum and during the progress of the hearing the Board announced that owing to the failure of the carriers and their employees to agree upon the organization of voluntary adjustment boards, provided for by law, the docket of the Labor Board has become so seriously congested as to make it impossible to give proper and full consideration without extended delay to important questions submitted for its decision; and

*Whereas*, we construe this paragraph and announcement to mean that the Labor Board will lend its support to the organizations in their efforts to induce the carriers in different regions to speedily organize such adjustment boards in order that the Labor Board may comply with the provisions of the law, that it shall receive for hearing and as soon as practicable and with due diligence decide disputes, involving grievances, rules and working conditions, which are not decided as provided in Section 301 and for which such adjustment boards would be required to receive for hearing and decision under the provisions of Section 303; and

*Whereas*, in addition to the foregoing it has become apparent to your representatives that the powers in control of railways have so arranged conditions as to shift the burden and expense of a strike to the shoulders of the people; and,

*Whereas*, with this information before us, we feel that a solemn obligation rests upon us to forego the full satisfaction of our demands rather than to cause loss and suffering to the people by carrying on a strike, the expense and hardships of which would fall upon the public instead of upon the railroads; and,

*Whereas*, as a result of the activities of these organizations since July the public is assured a reduction in freight and passenger rates, which would not otherwise have been made, and which should be reflected in a substantial reduction in the cost of living that will in a measure compensate the employees for the reduction in wages imposed upon them; and,

*Whereas*, we are not unmindful of the public concern in the issues involved in the strike, but point out that the public is not correctly informed upon these issues. The representatives of the employees have found it impossible, in view of the attitude of the press, to get their case properly presented to the American people; therefore, the people have formed conclusions upon the matter from information wholly inaccurate and misleading as published from day to day in the newspapers; we believe that if the public knew the facts we could with entire confidence rely upon its decision; and,

*Whereas*, the employers of labor, except in the railway service, consider it a reasonable and fair policy to make term agreements with their employees, and every adjustment of wages is made for a period of one, two or three years; and,

*Whereas*, it was one of the aims of the employees in this dispute to secure a settlement of the railroad wage controversy for at least a period of one year, in order that the business interests of the country might not be disturbed at frequent intervals by serious disputes between the railroads and their employees, too often reaching the point of a threatened cessation of work by the employees, and that the employees would not be obliged to assume the enormous expense incident to conducting repeated hearings before the Labor Board involving their wages and working conditions, and because the employers as well as the public are entitled to settled conditions in respect to these important matters; and

*Whereas*, we here take occasion to inform the public that as a result of the World War railway employees were the last to receive increases in wages and among the first to have a reduction of wages imposed upon them; therefore, be it

*Resolved*, That we, the Executive Committees and General Chairmen representing the organizations named herein, are sincerely of the opinion that the memorandum announcing the policy of the Board, and the pledges of the railway executives, made to the Board, constitute an acceptable basis of settlement, justifying the calling off of the strikes, which were authorized by a vote of members of our organizations.

And we hereby call off such strikes, having confidence that good results will follow the adoption of the memorandum by the Labor Board and the pledges of the railway executives made to the Board at public hearing on October 26; and, further, to afford

an opportunity for reduction of freight and passenger rates to correspond with existing reductions in wages, to determine what effect such reductions in freight and passenger rates will have upon the cost of living.

### Labor Board Renders Decision on Strike

The Labor Board's decision finally disposing of the principal questions involved in the strike situation was handed down by the Board on October 29. According to the terms of this decision, railroad unions calling strikes in the future in violation of the Board's decisions will be outlawed, and furthermore, will lose all benefits and rights to protection and appeal to the Board under the Transportation Act. At the same time, the Board definitely ruled that no changes in working conditions or wages may be made until duly authorized by the Board. The decision says in part:

The subject and impelling cause of the inquiry was the threatened general strike of the employees comprising the membership of the above named labor organizations on practically all the first class railroad lines in the United States, which, if it had culminated, would have resulted in a national calamity of incalculable magnitude. It was the purpose of the Board to develop the causes and true facts and conditions to the end that all possible measures might be taken to avert the disaster. It was shown that a vote had been taken and a strike called on all the roads, and as to the Brotherhood of Railroad Trainmen, had gone into effect on one, the International and Great Northern, on account of dissatisfaction with Decision No. 147 of the Board making a reduction in wages. Since the hearing and as a result thereof the strikes have all been called off by the officials of the organizations and the danger of an interruption of traffic removed.

The representatives of the carriers and the representatives of the employees have announced their intention and purpose to conform to the law, and abide by the orders of the Board. These facts render it unnecessary for the Board to make any further orders on or about this matter, and move it to congratulate the parties directly interested and the public most vitally and profoundly interested on this return to industrial peace, triumph of the reign of law and the escape from this national disaster.

But at this time, and while the matter is so intensely before the minds of all, the Board deems it expedient and proper to make its rulings and position on some of the points involved so clear that no ground for any misunderstanding can hereafter exist.

First, when any change of wages, contracts or rules previously in effect are contemplated or proposed by either party, conference must be had as directed by the Transportation Act, and by rules or decisions of procedure promulgated by the Board, and where agreements are not reached the dispute must be brought before this Board, and no action taken or change made until authorized by the Board.

Second, the ordering or authorizing of the strike by the organizations of employees parties hereto was violation of Decision 147 of this Board, but said strike order having been withdrawn, it is not now necessary for the Board to take any further steps in the matter.

The Board desires to now point out that such overt acts by either party tending to and threatening an interruption of the transportation lines, the peaceful and uninterrupted operation of which are so absolutely necessary to the peace, prosperity and safety of the entire people, are in themselves, even when they do not culminate in a stoppage of traffic, a cause and source of great injury and damage.

The Board further points out for the consideration of employees interested that when such action does result in a strike, the organization so acting has forfeited its rights and the rights of its members in and to the provisions and benefits of all contracts theretofore existing, and the employees so striking have voluntarily removed themselves from the classes entitled to appeal to this Board for relief and protection.

### Strike "Settlement" Represents Truce

Now it is possible to appraise the developments of the past few weeks correctly and it is generally agreed that, although a serious crisis has been averted, the "settlement" is but temporary and that the issues which led to the polling of a strike vote have not been settled definitely and will again become of major importance at a time when a threatened walk-out may be fraught with much more danger than at the present time. It is plain, for instance, that the so-called "settlement" of the strike does not obligate the carriers in any way except perhaps not to arbitrarily reduce wages or change working conditions until all of the terms of the

Transportation Act have been complied with. In this connection, Samuel M. Felton, president of the Chicago Great Western, said recently: "Our program for the immediate future, as announced on October 14, remains unchanged. This program includes plans to ask the Labor Board for permission to make further reductions in wages and to pass the savings made in this manner to the public in the form of reduced rates."

The position of the labor organizations as to this program indicates that they are depending upon the assurances contained in the Board's memorandum of October 25 and the statements of Mr. Hooper. This is indicated by the remark of Mr. Lee, who, upon being told of Mr. Felton's announcement, said, "Of course, they will continue to ask for the 10 per cent reduction. The Board's docket is crowded, however, Mr. Hooper told us, and there is no chance of immediate action."

### I. & G. N. Strike Called Off

The other remaining issue in the strike situation is the situation on the International & Great Northern, where the trainmen walked out on October 22. The progress of this strike up to October 26 was described in the *Railway Age* of October 29 (page 823).

Conflicting reports have been circulated regarding the strike situation on the International & Great Northern and as a result Thornwell Fay, executive officer for the receiver, was asked to make a statement as to developments from October 25 to date. In reply Mr. Fay said:

Report splendid progress from October 25. All embargoes were raised on October 27, and since then we have been in position to handle promptly all traffic offered. I understand Labor Board states strike called off, and I am informed President W. G. Lee of the Brotherhood of Railroad Trainmen concurs. General chairman on International & Great Northern did not so advise his men, and vice-president of trainmen's organization now here in an endeavor to have strikers restored. To this end he has taken subject up with United States court at Houston, Texas, and matter heard November 2.

## Emergency Organization for Meeting Strike Situation

WASHINGTON, D. C.

PLANS WHICH had been made by the Department of Commerce for mobilizing the nation's food, fuel and other supplies in the event of a strike and an outline of a federal emergency organization which had been formed were made public by Secretary Hoover on October 27 following the calling off of the strike. The emergency organization included Secretary Hoover as chairman, with an assistant and an executive secretary, and divisions, consisting of a chairman and assistant, on railway transportation, motor transport, breadstuffs, meat, livestock, dairy products, canned goods and milk; fruits and vegetables, coal and oil. C. E. Spens, vice-president of the Chicago, Burlington & Quincy, was named as chairman of the rail transportation division, and E. S. Gregg, head of the transportation division of the Bureau of Foreign and Domestic Commerce, as assistant. The organization also included liaison officers of the War Department and J. W. Powell, president of the Emergency Fleet Corporation, as liaison officer of the Shipping Board. In order to facilitate contact, the country was divided into regions under regional representatives centering at Boston, New York, Chicago, Houston, San Francisco, Washington or Pittsburgh, Aberdeen or Pierre, Seattle, Atlanta and Kansas City.

The organization set up in Washington was to have as its primary object the handling of interstate and inter-

regional problems, all other questions being left to local initiative of governors' organizations.

The plan of operation and a statement of the general situation was outlined as follows:

### I. Determination of Fact

1. To determine the primary, secondary and tertiary stocks of food, fuel and feed throughout the country—*Primary* stocks being those available within state radius; *Secondary* being those within interstate water and motor radius; *Tertiary* being those within interstate rail and water radius.
2. To determine the areas dependent upon interstate movement for supplemental supplies.
3. To determine the character of movement, whether by water, rail or truck, required or available.

### II. Administrative

1. To assist the governors and their state organizations in securing interstate movement of the supplemental necessities that they require.
2. To set up relations with food and fuel industries to assist in interstate or inter-regional movements of supplies.
3. To secure co-ordination of railway and water movement in delivery of these necessities to points in need.

### III. State Activities

The whole supply problem is largely primary for the first 30 days and secondary for the next 60 days.

In addition to the federal survey, each locality will make its own survey of commodities and the transportation problem comprising:

1. Commodities: a. breadstuffs, b. sugar, c. meats, d. milk, e. groceries, f. potatoes, g. other perishables, h. feed, i. coal, j. gasoline.
2. Transportation: a. trucks, b. water, c. amount of railway movement that develops.
3. Local Resources: a. town stocks, b. immediate surroundings, c. secondary reserves.

In making these surveys, two alternatives will be apparent: 1. That the railways cease operation and that reliance must be placed solely upon trucks and water. 2. That limited operation of railways is maintained.

### The Present Situation as to Supplies

The food situation is generally good. Stocks are well distributed and the movement to secondary reserves already brought about by federal action should prevent any hardships for four to six weeks in any section, even though all rail transportation should stop—providing motor and water transportation is fully utilized.

### Assuming that Railway Operations Entirely Cease

In case of complete stoppage of the railways, there are available in all towns and cities, supplies for about 30 days or more.

All towns and cities outside of the "dense area" can supply themselves by motor or water for at least 60 days without any consequential interstate movement.

In the "dense area" (New England, New York, New Jersey, Delaware, Maryland, Pennsylvania, Ohio, Indiana, Illinois) certain commodities exist or can be supplied by water and motor movement alone for 60 days. There are few exceptions, which will be provided for.

The supplies of coal throughout the country are generally satisfactory.

All public utilities are supplied with coal for approximately 75 days.

Owing to the almost universal pipe line supply or refineries of their location at points available to water transport, there will be no difficulty in maintaining the crude oil supply, and consequently wide distribution of gasoline. Steps have been taken in anticipation of any difficulties to provide supplies where necessary.

### If Railways Are Operated 20 Per Cent.

The public can be supplied with all essentials indefinitely by a series of priorities.

### Preparedness

The public should be informed that it can be of assistance in the emergency by confining purchases to daily requirements. Hoarding of any commodity is to be carefully avoided—so as to prevent undue price advances and profiteering.

The department will supply graphic maps to state committees showing primary reserves of each commodity available without movement; secondary reserves available by water and motor without rail movement; tertiary reserves available with 20 per cent railway operation; lines of railways to be

operated in first instance; priorities to be established between commodities; shipping and barge arrangements; truck transport available; truck mobilization for long and local hauls.

Organization is complete for reports of volume and character of traffic moving by rail and water and for co-ordination of such traffic.

Complete information will be sent out to governors' committees the first day of the strike.

It is not expected that interstate movement will be undertaken before the fifth day, by which time the amount of railway movement available will be evident.

Two primary changes in the situation from pre-war conditions are to be noted:

1. By war experience the country understands the whole process of civilian and industrial organization to meet emergencies.
2. The motor truck has given every town an extended radius of food supplies by some 50 miles and thereby protects such vital matters as milk and perishables against the first shock.

One phase of the government's plans for dealing with a strike if it came was revealed by the instructions sent to the district attorney in Texas, which the attorney general said would be a model for similar orders to other district attorneys. As an initial step the local federal courts were to be called upon to issue a proclamation setting forth the inherent power of the government to intercede to prevent the disastrous effect upon the community of interference with interstate commerce. It was also understood that plans had been made for obtaining injunctions against the leaders if a strike had been called.

## Train Service Board of Adjustment For Southeastern Territory

IN COMPLIANCE with an agreement entered into some time ago between 16 railroads in southeastern territory and the Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen and Enginemen, Order of Railway Conductors and the Brotherhood of Railroad Trainmen, a board to be known as the Train Service Board of Adjustment for the Southeastern Region, has recently been organized at Washington, D. C., with the following personnel: Representing the railroads, Col. Albert B. Bayless, Louisville & Nashville, chairman; W. T. Caldwell, formerly general superintendent, Southwestern District, Southern Railway; W. A. Durham, formerly member Railroad Adjustment Board No. 1, and E. W. Grice, assistant to president, Chesapeake & Ohio; representing the organizations, F. A. Burgess, B. of L. E., vice chairman; W. N. Doak, B. of R. T.; C. J. Goff, B. of L. F. & E., and W. C. Turner, O. R. C. The office of the Board is at 1319 F Street, N. W., Washington, D. C., and John L. Mindling has been appointed secretary.

The jurisdiction of the board is confined to the adjustment of disputes growing out of personal grievances or out of the interpretation or application of the schedules, agreements or practices now or hereafter established on the railroads named which cannot be adjusted by direct conference between representatives of the individual railroads and their respective employees. All decisions of the new board shall be final and binding upon both sides if approved by a majority of the full membership. The board will have no jurisdiction over disputes involving rates of pay, or in rules covering working conditions, jurisdiction over such matters being vested in the Labor Board. The roads involved are:

Atlantic Coast Line  
Atlanta & West Point and the Western Railway of Alabama  
Central of Georgia  
Charleston & Western Carolina  
Chesapeake & Ohio  
Florida East Coast  
Georgia  
Gulf & Ship Island

Louisville, Henderson & St. Louis  
Louisville & Nashville  
Nashville, Chattanooga & St. Louis  
Norfolk Southern  
Norfolk & Western  
Richmond, Fredericksburg & Potomac  
Seaboard Air Line  
Winston-Salem Southbound

# America's Wealth Due Largely to Railway Expansion

Increased Population, Production and Wealth Have Followed  
Closely Railroad Expansion

By Dr. J. M. Goldstein,

Professor of Economics, Institute of Industry and Trade and University of Moscow

TRAVELING IN 1913 over the United States and Canada, the writer was struck by the truly phenomenal influence produced upon the economic growth of these countries by railroads only recently built. Endless prairies or deserts, containing a few years before only rare settlements with a few scores of inhabitants, had within five or ten years changed into endless pastures and smiling fields, with numerous herds of cattle and prosperous farms. And what used to

How rapidly some of the cities were increasing their population under the influence of newly built railroads in the above mentioned sections of the United States may be seen from the figures of the last three censuses in the preceding table covering the 20-year period from 1900 to 1920.

In this connection it is highly interesting to note the fact that in spite of the tremendous development of economic life in the United States under the influence of the war, and the ensuing progress of agriculture and industry after the conclusion of peace, the increase in the population of the cities enumerated above was, during the period from 1910 to 1920, not only in its relative but in its absolute volume as well, considerably slower than during the period from 1900 to 1910, as shown by the following comparison:

	Increase of population	
	1900-1910	1910-1920
Absolute increase.....	898,200	844,900
Ratio of increase.....	141%	62%

Comparing these figures with the increase in the railroad

Fig. 1

be only straggling little settlements of a few houses had changed within some ten years into prosperous towns with tens of thousands of inhabitants with immense grain eleva-

	POPULATION			Per cent of increase
	1900	1910	1920	
Tacoma, Wash.....	37,700	83,700	97,000	158
Portland, Ore.....	90,400	207,200	258,300	186
Houston, Tex.....	44,600	78,800	138,300	210
San Antonio, Tex.....	53,300	96,600	161,400	213
Oakland, Cal.....	67,000	151,200	216,300	223

tors and stockyards, splendid stores and numerous huge factories and mills.

As an illustration, it will be sufficient to call attention to the development of agricultural areas and cities in the states of Washington, Oregon, Texas, Oklahoma, California and the western provinces of Canada—Manitoba, Saskatchewan, Alberta and British Columbia.

Figs. 2 and 3

mileage of the states in which these cities are situated, the following results are obtained:

	Increase of railroad mileage	
	1900-1910	1910-1918
Absolute increase.....	12,768 miles	4,507 miles
Ratio of increase.....	57%	13%

The total railroad mileage in these five states in 1900 was 22,426 miles, in 1910 it was 35,194 miles and in 1918, 39,791 miles.

Population Increase Parallels Increased Construction

A rapid increase in the population is, therefore, observed not during the last decade, but during that of 1900 to 1910, when an enormous amount of railroad construction was going on in these sections. At what an accelerated rate it was proceeding at that period in these states is to be seen from the fact that during the same period of 1900 to 1910 the increase

in the railroad mileage of the other 43 states was nearly 3 times slower, being only 20%.

It is understood, of course, that an important share is due to the wealth of the natural resources of these states, such, for instance, as oil and mineral deposits; to the proximity of convenient ocean routes, etc. Nevertheless it should not be forgotten that all these factors *existed* already before the construction of the railroads, but that they could never have been effectively utilized without the latter.

Especially characteristic instances, showing the effect of railroads upon the economic growth of the country, are given in the accompanying diagrams which show the increase of the railroad mileage, the population and crops in those regions of the United States and Canada in which railroad construction began to develop comparatively late.

The first diagram (Fig. 1), which consists of two parts, shows the growth of railroad mileage and the increase of population in the states which had no railroads at all or almost none in 1860. The first part of the diagram shows the development of the railroads and the increase of the popula-

Fig. 4

tion in a group of states that had no railroads at all in 1860. To this group belong Colorado, Idaho, Arizona, Kansas, Minnesota, Montana, Nebraska, Nevada, New Mexico, North and South Dakota, Oklahoma, Oregon, Utah, Washington and Wyoming.

The second part of the same diagram shows the development of the railroad net and the growth of the population in the above mentioned states, together with those states in which more important railroad lines had at that time only commenced to make their appearance. So, for instance, California had in 1860 only 23 miles of railroad, Arkansas 38 miles, and the immense state of Texas, with a territory  $5\frac{1}{2}$  times larger than that of the state of New York, had only 307 miles. Studying this diagram we will find the increase in the population to be nearly parallel with the increase of railroad mileage. Quite naturally, the increase in the population, which was caused by increased railroad facilities, created in turn a new incentive for further railroad construction.

## Increased Railroad Mileage

### Brings Greater Grain Production

Figs. 2 and 3 show the relation between the increase in the length of the railroads and production of grains in the North Central part of the country and in the Western states from 1850 till 1910.

The figures of the last census for all the states of this group were not yet published at the time this diagram was prepared.

Fig. 5

The group of the North Central section is composed of the following states: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North and South Dakota, Ohio and Wisconsin. The Western group embraces Mon-

Figs. 6 and 7

tana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon and California.

In both the North Central and Western sections of the country the development of the cultivation of grains followed almost parallel the increase in railroad mileage. This could be seen even more clearly from a diagram showing the railroad mileage in the United States for the same years in percentage of the average for the above mentioned years in

relation to cultivation of grains in percentage of the average for the same years. This diagram as the others showing these percentages have been omitted for future publication.

Figs. 8 and 10

A similar close interdependence between the increase in railroad mileage and the growth of agriculture is shown by Fig. 4, giving the figures for railroad mileage and the increase in the area under field crops for the whole of Canada since 1900, i.e., from the time railroad building in Canada had begun to expand rapidly, traversing many immense territories which had had no railroads previously. It was only owing to the enormous increase in railroad mileage during the last decade that Canada was enabled to utilize the splendid opportunities in the world market for agricultural products after 1915. From 1900 to 1919 the railroad mileage of Canada increased more than 21,000 miles, having grown from 17,660 miles in 1900 to nearly 39,000 miles in 1919.

Passing by a multitude of important facts disclosed by the detailed study of the development of one or another branch of economic life in the several sections of the United States and Canada following railroad development, I shall give here only three diagrams which tend to show the influence of the railroads upon the development of the economic life of the United States as a whole.

The first of these diagrams, Fig. 5, shows the relation between the growth of railroad mileage and the increase in grain crops in the United States. Looking over this diagram we will see that the grain crops, calculated in percentages of the average for the years mentioned in the diagram, had been fluctuating almost parallel with the increase of railroad mileage.

### Our Importance as Exporter of Food-stuffs Increases

The same holds true for Fig. 6, showing the value of exports of agricultural products from the United States. The only seeming exception are the years following the outbreak of the World War. I say "seeming" because actually the increase in the value of exports for the period 1915-1919 was caused by inflated war prices. Taking in consideration that the average inflation for the five year period 1915-1919 amounted to approximately 50 or 60 per cent, it will be seen that even during the period from 1910 to 1919 the growth of exports actually followed the increase in railroad mileage for the last decade. Not to mention the fact that if

Fig. 9

the United States had not had a highly developed system of railroads, this country could, of course, never have played such a tremendous part, both in the prosecution of the war as well as in the adjustment of the world's economic life after the war.

### Other Industries Also Benefit

No less marked has been the influence of the railroads upon the growth of the United States manufacturing industries, as will be noted from Fig. 7. In studying this diagram we will see that the value of the products of American manufacturing industries also kept pace with the increase of railroad mileage.

### Wealth Increases Most in States

#### Where Railroads Increase Greatest

Considering this powerful influence of the railroads upon the development of agriculture, industry and trade, it is not to be wondered at if the national wealth of the country increased most rapidly in those states which had the most railroads and other means of communication. This is perfectly obvious from Fig. 8, which shows the increase in the national wealth from 1850 to 1912, in accordance with the investments made by each particular group of states in railroads, as these investments are shown by the railroad mileage per hundred square miles operated in 1912 in each state.

The states are ranked in accordance with the railroad mileage per hundred square miles of their territory in 1912. The first group embraces the following states: Wyoming, Arizona, Nevada, Utah, New Mexico and Oregon. The second group is composed of Montana, Idaho, California, South Dakota and Colorado. The third group embraces Texas, North Dakota, Maine, Washington, Nebraska, Florida and Oklahoma. The fourth group consists of Kentucky, Tennessee, Mississippi, Arkansas, Alabama, North Carolina, Minnesota, Kansas, Virginia, South Carolina, Vermont and Missouri. The fifth group embraces Georgia, Louisiana, Wisconsin, New Hampshire, Maryland, Michigan, West Virginia, Delaware, Iowa, New York, Rhode Island, Indiana, Connecticut, Illinois, Ohio, Pennsylvania, Massachusetts, New Jersey and District of Columbia. These groups were formed so as to allow each as far as possible an equal area. In dividing the states by groups, in accordance with the absolute investments in railroads, street car lines, shipping, telegraphs, telephones, etc., as well as in grouping them in accordance with the investments for these purposes per 100 square miles, or in accordance with the mileage of railroads per 100 square miles in each state, as shown in diagram 8, we obtain the same picture, although the rank of the various states will be somewhat changed. In these calculations the figures given are those for the taxable wealth of the nation.

Studying this diagram we will observe that in the first group of states, where the investments in railroads up to 1912 have been lowest, both the absolute amount of the national wealth and its increase from 1850 to 1912 have been comparatively insignificant. And, on the contrary, in each of the epochs shown, the national wealth was mainly concentrated in the fourth, and especially the fifth group, containing the states which had made the largest investments in railroad development and in the advance of other means of communication, particularly ports for foreign trade; and, moreover, most of the railroads in those states, having been operated for many decades, their influence was consequently more pronounced.

Still clearer can the close relation between the increase in the railroad net and the development of the economic life of the United States be seen from Fig. 9, drawn in such a way as to bring forward for each decade the states showing an increase in their railroad mileage, both above and below the average increase throughout the country during the given decade.

This diagram shows that in each decade that group of states which showed an increase of railroad mileage above the average increase for the entire country, had a considerably larger increase in population, number of farms, value of farms, primary horse power used in industry, capital invested in manufacturing industries and national wealth.

No matter how severely we may condemn the mistakes, abuses, corruption and even criminal acts committed by one or the other promoter or financial group standing at the head of various American railroads, we should still never overlook the undeniable fact that in spite of all such mistakes and abuses the railroads have created both the economic

Fig. 11

wealth and political power of the United States, having made this country for many years to come the arbiter of the world's economic destinies.

### A Comparison With Russia

As a Russian whose country has both during and after the war suffered so severely from the inefficient policy of the old regime in developing transportation facilities, I can only envy the achievements of the United States in this domain. For within a period of about five years the United States constructed a larger amount of railroad mileage than did Russia throughout more than 75 years of her railroad construction. This can be seen from the following data: A maximum increase of operated railroads was noted in the United States during the following years: 1871, 7,379 miles;

1886, 8,018 miles; 1881, 9,846 miles; 1882, 11,569 miles and 1887, 12,876 miles. The total increase in these five years was 49,688 miles. The total railroad mileage of Russia, however, equalled in 1916 only 48,955 miles.

#### A Note of Warning

Figs. 10 and 11 will, however, demonstrate that even the United States should not regard this problem as finally solved. These diagrams show quite clearly that agricultural production as well as that of all kinds of raw materials, both in the United States as well as in Russia, which were before the war the main sources of supply for such products in the world market, are in great danger from the competition of Canada, Australia and Argentina, where the railroad mileage during recent years, particularly when expressed in percentage of the total length of railways in the world, has been growing much more rapidly than the railroads of the United States.

To illustrate this fact, it will suffice here to point out that in the beginning of the forties of the nineteenth century the railroad mileage of the United States exceeded 56 per cent of that of the whole world, while the railroads of Canada, Argentina and Australia, were then almost equal to zero. In 1918, on the contrary, the railroad mileage of Canada, Argentina and Australia, growing rapidly had already reached 12 per cent of the world's total mileage and almost one-third of that of the United States, whereas the United States ratio, gradually decreasing, had fallen to 36 per cent of the world's total.

If that old famous saying "Procrastination is death" has any meaning at all, then it is undoubtedly true in the domain

of transportation, since at this epoch of sharp competition for the world markets no rapid progress is possible unless extensive and continuous improvements in transportation are made.

How slowly the railroads of the United States have been growing in recent years may be seen from the fact that from 1914 to 1918 the railroad mileage of the country increased only 686 miles, i. e., on an average of 172 miles, or 0.06 per cent annually, whereas the average annual increase of the operated railroad mileage for the period from 1900 to 1914 amounted to 4,613 miles or 2.3 per cent. From 1916 to 1918 the operated railroad mileage, as a result of discontinuance of the operation of some lines, even decreased considerably (from 266,381 miles in 1916 to 264,233 miles in 1918), so that the total mileage about the middle of 1921 was probably smaller than that of 1916.

The United States, therefore, if it wants to retain the economic and political supremacy it has won in recent years, will again have to devote a great deal of attention to the development of means of communication which have suffered severely both from the results of not always successful internal legislation as well as from the war and the terrible complications it has caused throughout the world.

As far as Russia is concerned, I hope that after a strong and really democratic government will have replaced the Soviet rule, the long and splendid experience of America in railroad construction and American skill and capital will assist my country, not only in restoring its old and now badly deteriorated railroad system but also in the building up a large new mileage—thus giving a powerful impulse to the development of Russia's tremendous natural resources.

## Railroad Securities Bill Reported to Senate

Committee Passes Favorably on Winslow Bill, Which Has Been Approved by House

WASHINGTON, D. C.

CHAIRMAN CUMMINS of the Senate committee on interstate commerce on October 27 presented to the Senate the favorable report of the committee on the bill to provide for the sale of the railroad securities held and to be acquired by the Railroad Administration (the so-called funding bill) with amendments made by the committee to the bill as passed by the House. With the report was a statement by Director General Davis estimating the amounts to be paid to the carriers as of October 1, if all the remaining settlements could have been made as of that date, as \$779,851,593.55, of which \$279,851,593.55 represents the amount that would be paid in final settlement if \$500,000,000 of the indebtedness of the roads to the government for additions and betterments were offset against the amounts owed by the government to the roads. Up to October a total of \$17,715,840 had been paid to the roads in settlements and \$60,925,000 of additions and betterments had been funded, exclusive of the \$381,000,000 equipment trust.

On July 27 Senator Townsend introduced a bill (S. 2337) substantially similar to the bill H. R. 8331. That bill was considered by the committee on interstate commerce, and on August 19 it was reported favorably with amendments. Since the report of the Senate bill, the House passed the bill (H. R. 8331) covering the same subject. It seemed wise to the committee that the Senate should act upon the House bill for the reason that there was no other practicable way in which the two houses could act upon the same bill. The committee therefore took up the House bill, and the report explains its action thereon.

The measure has been misnamed and misapprehended both in the incidental discussions which have taken place upon the floor of the Senate and in the newspapers.

It is generally referred to as the funding bill or refunding bill, and it has been treated both in debate and in the public press as a bill which proposed a plan for funding or refunding certain of the indebtedness which, during the period of federal operation of railroads, was created from the railroads to the government. Nothing could be more erroneous than this idea. The bill has nothing whatever to do with the authority to fund indebtedness of any kind or character. It neither enlarges nor diminishes the authority of the President in that regard. The matter of funding was completely covered in the Transportation Act, 1920.

This is the existing law upon the subject of funding indebtedness due from the carriers to the United States, and neither the Senate bill nor upon the calendar nor the bill which we are now reporting makes any change whatever in the present law upon the subject. The sole purpose of this bill and its only possible effect is to confer upon the President the authority to sell the securities which have come, or may hereafter come, into his hands in his dealings with the railroads, in order that he may be able to pay to the railroads whatever sums may be found to be due to them upon the final accounting which, under the Transportation Act, 1920, it is his duty to reach as speedily as possible. It is obvious that the extent to which he has funded, or may hereafter fund, indebtedness due from the railroads to the government for expenditures made for additions and betterments during federal operation and properly chargeable to capital account will affect the amount due and immediately payable to the railroads, but with respect to his discretion in funding or declining to fund within the limits of the law any such indebtedness this bill has no application.

The two questions which this bill presents are: First, shall the President be authorized to sell some or all of the securities which he has taken from the railroads, without loss to the government

and without recourse, in order to pay admitted indebtedness to the railroads; and, second, whether the War Finance Corporation shall be authorized to buy from the President a limited amount of these securities.

It is difficult to conceive any reasonable objection to these proposals. Congress has already provided for the system of accounting and the methods through which the amounts, if any, due from the government to the railroads shall be ascertained. When the amounts are thus ascertained it may be assumed they ought to be paid. If they are paid, the money must come either from the Treasury or from money derived from the disposition of the securities in the hands of the President. With these alternatives, one of which we must adopt, the propriety of raising the money by sale of the securities without loss to the government and without recourse does not admit fair difference of opinion. Before leaving this subject it may be well to remark that the President already has the authority to sell the securities referred to in paragraph (c) of section 207, Transportation Act, 1920, known as car-trust certificates, this authority having been given to him in an act approved November 19, 1919, and further to suggest that under this authority the President has already disposed of such securities to the amount of about \$100,000,000.

### Amendment Recommended

With these general observations we proceed to the amendments which the committee recommends to the House bill (H. R. 8331).

The first amendment is as follows:

The President is hereby authorized to sell any bonds, notes, or other securities acquired by him either before or after this section takes effect, under authority of the Federal control act, the Transportation Act, 1920, or the act entitled "An act to provide for the reimbursement of the United States for motive power, cars, and other equipment ordered for railroads and systems of transportation, and for other purposes," approved November 19, 1919, and the proceeds of all bonds, notes, or other securities sold by the President shall be a fund to be used by the President for the purposes described in section 202 of the transportation act, 1920. Any balance not so required shall be paid into the Treasury of the United States as miscellaneous receipts. Any such sale or sales must be made at a price which will save the United States from loss in the transaction and without recourse.

This amendment is intended to give to the President the authority to sell the securities to any person or corporation and relieve him from the restriction of selling only to the War Finance Corporation. There can be no possible good accomplished in limiting him in making such sales to a single organization, and that is especially true when we consider that the War Finance Corporation is purely a governmental body. He has already sold \$100,000,000 of the car trust certificates under the power heretofore mentioned in the absence of any authority on the part of the War Finance Corporation to buy, and it may very well be that he will find it desirable to sell other securities in a like manner. It will be noted that this amendment specifically provides that the sales must be made at a price which will save the United States from a loss in the transaction and without recourse.

### Second Amendment

The second amendment is as follows:

In making settlements with the carriers under the Transportation Act, 1920, no payment or allowance shall be made to any carrier on account of the so-called inefficiency of labor during the period of Federal control; and no final settlement between the United States and any carrier shall be made which does not forever bar such carrier from setting up any further claim, right, or demand of any kind or character against the United States growing out of or connected with the possession, use, or operation of such carriers' property by the United States during Federal control, except a claim specified in clauses (1), (2), or (3) of paragraph (b) of section 2 hereof.

This amendment does two things. The important differences between the House text and the amendment are that the House bill deals with the use of any fund or moneys available under any act, and declares that no payments or allowances shall be made from any fund or moneys on account of the so-called inefficiency of labor during the period of federal control. The amendment puts this prohibition immediately upon the President and the director general and declares that in making settlements with the carriers no allowance shall be made on account of the so-called inefficiency of labor. It can not be the intention of Congress to attempt to deny to any carrier its constitutional right of resorting to the courts for such relief as the laws of the country may afford them. We can impose such restrictions as are thought best upon the President and the director general in making settlements, but we ought to go no further. It is thought, also, that the effect of the House text would be to forbid the director general from making partial payments to any given railroad when the final settlement is delayed, and it is plain, from the government standpoint that something is due to it.

Second, the House text provides that no settlement shall be made between the

United States and any carrier which does not forever bar such carrier from setting up any further claim, rights, or demands of any kind or character

against the United States growing out of or connected with the possession, use, or operation of such carrier's property by the United States during the period of Federal control.

The amendment makes an exception in the following words: "except a claim specified in clauses (1), (2), or (3) paragraph (b) of section 2 hereof." It is believed that the failure on the part of the House to make these exceptions was due to an oversight. It will be remembered that the House bill provides as follows:

(b) Every claim of a carrier against the United States arising out of or incident to Federal control shall, if not filed within one year after this subdivision takes effect, be thereafter barred, and the carrier shall be considered as having waived the claim.

There are certain claims which the carriers may have against the government which can not be presented within a year, and these claims have, according to the uniform practice of the director general, been excepted from all the final settlements which he has hitherto made with the railroads, and there have been many of them. These claims may be in a general way described as claims arising in favor of third persons, some of which may finally result in liens upon the railroad property.

The third amendment is of a similar character, and excepts the claims which have been already described from the operation of paragraph (b) of section 2, which bars all claims not presented within one year.

The fourth amendment strikes from section 3 of the bill, page 3, line 2, the words: "and the President may sell to the corporation." The first amendment, already mentioned, gives to the President the authority to sell securities to any person or corporation, and therefore when we come to deal with the War Finance Corporation act it is unnecessary to provide that the President may sell to that particular corporation.

### Appendix to Report

Appended to the report is the following:

*Statement Furnished by Director General of Railroads Showing Definitive Securities Taken and Held*

Definitive securities on hand Aug. 1, 1921, shown on page 86, Committee on Interstate Commerce, S. 2337, part 2.	\$438,577,238.08
Additional securities taken up to and including Oct. 1, 1921:	
Equipment trust certificates	\$11,590,800
Other securities	3,550,000
	15,140,800.00
Total	\$453,718,038.08
Less securities sold up to and including Oct. 1, 1921:	
Equipment trust certificates	99,662,000.00
Definitive securities on hand Oct. 1, 1921.	\$354,056,038.08
<i>Claims Settled to October 1, 1921</i>	
Total claims of carriers settled.	\$387,017,099.12
Amount paid in settlements	117,715,840.43
Percentage paid in settlements	30.416
Mileage of roads settled	90.944

#### *Additions and Betterments*

Gross advances for additions and betterments	\$1,144,681,582.39
Less equipment trust (engines and cars)	381,649,957.12
Net additions and betterments, advances not including equipment trust	\$763,031,625.27
Less additions and betterments funded	60,925,000.00
Balance	\$702,106,625.27
Amount to be funded not to exceed	500,000,000.00
<i>Estimated Amounts to be Paid Carriers October 1, 1921</i>	
Final settlements, exclusive of funding	\$279,851,593.55
Amount to be paid by funding not to exceed	500,000,000.00
Total	\$779,851,593.55

### Amount of Money Needed

In a letter to Senator Cummins, Director General Davis said that it is somewhat difficult to estimate the amounts to be paid carriers in final settlement. In testifying before the committee on August 9, 10, and 11, he had stated that the Railroad Administration then had cash available aggregating \$149,000,000, and that it would require \$200,000,000 in addition to complete the settlements, excluding any general funding of additions and betterments. Since that date it had paid out in final settlements, up to October 1, about \$70,000,000, so that his estimate is that it will require to complete the payment of the obligations of the Railroad Administration something in excess of \$279,000,000, to which must be added whatever amount of the additions and betterments debt is funded.

# Plan for Electrifying Sections of 11 Railroads

## Superpower Report Provides for Consolidation of Power Supply in Region Between Boston and Washington

A REPORT called the Superpower Survey will be transmitted to the President today (November 5) by Secretary of the Interior Fall. It is the result of an investigation of the possible economy of fuel, labor and material resulting from the use of a comprehensive system for generating and distributing electricity to transportation lines and industries. The investigation was made by a staff of engineers working under the direction of W. S. Murray, consulting engineer, New York; in preparing the report they have endeavored to show how the economies of a power system on so large a scale will affect not only coal, but capi-

watts. This limit has been determined by considering on the one hand the ability to transmit energy away from the plant and on the other the hazard incident to the possibility of destruction through unusual catastrophe. A steam pressure of 300 lb. would be used at the turbine throttle with a superheat of 230 deg. F. Proposed coal delivery routes are shown in one of the illustrations and six months' storage capacity for each plant is recommended.

Hydro-electric plants will be limited in size by steam flow and storage capacity. The principal developments are located on nine rivers, but as proposed the estimates for 1925

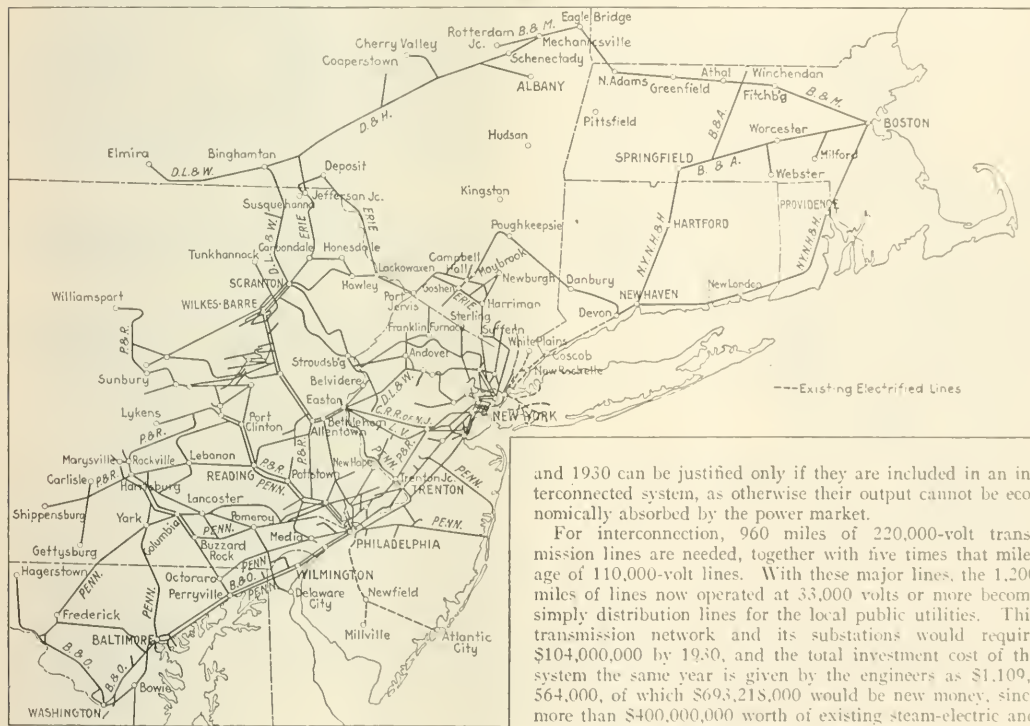

Fig. 1. Map Showing Class 1 Railroads Within the Superpower Zone for Which Electrification Is Recommended

tal expenditures as well, and especially the output of human energy.

The plan provides for the interconnection of a large number of existing plants in the area shown in several of the illustrations by high voltage transmission lines. These lines would include and be extended to other points at which large power plants could be located advantageously at the mouths of mines, at tidewater, or along rivers suitable for hydro-electric developments. It would be necessary to derive more than 80 per cent of the power from coal. The maximum size of steam-electric stations has been fixed at 360,000 kilo-

watts. This limit has been determined by considering on the one hand the ability to transmit energy away from the plant and on the other the hazard incident to the possibility of destruction through unusual catastrophe.

For interconnection, 960 miles of 220,000-volt transmission lines are needed, together with five times that mileage of 110,000-volt lines. With these major lines, the 1,200 miles of lines now operated at 33,000 volts or more become simply distribution lines for the local public utilities. This transmission network and its substations would require \$104,000,000 by 1930, and the total investment cost of the system the same year is given by the engineers as \$1,109,564,000, of which \$693,218,000 would be new money, since more than \$400,000,000 worth of existing steam-electric and hydro-electric plants are retained in service.

### Electrification of Heavy Traction Railroads

The section of the report devoted to the electrification of the heavy-traction railroads was compiled under the direction of Cary T. Hutchinson and N. C. McPherson; it presents results of even more general interest than the detailed analysis of the industrial use of electric power. The question of railroad electrification must be decided according to density of traffic; on this basis of the 36,000 miles of main line, yards, and sidings in this superpower zone, about 19,000 could be profitably electrified. This electrification would cost nearly half a billion dollars, but it is estimated that it would save from 11 to 19 per cent on the investment, or an average of 14 per cent per year. The following paragraphs

contain an outline of the salient points brought out in this part of the report:

A consolidation of the roads within the district in question is first suggested which would make it possible to reroute much of the traffic as now handled. Unified operation by electricity would give much better conditions than any that could possibly be attained under unified operation by steam. There would be a new motive power, in which all units or parts designed for similar service would be identical and interchangeable. There would be a pooling of all power, with great reduction of reserves. Repair shops would be consolidated, and maintenance would become a standardized manufacturing job. Track capacity would be greatly increased, and certain tracks would be allocated to freight or passenger service exclusively. All freight trains would be run on schedule; the average speed would be more nearly the same and would be increased to at least 12.5 miles an hour needed to avoid the present punitive overtime payments. Enginehouse facilities would be much simplified by consolidation.

The great expense of any large increase in trackage

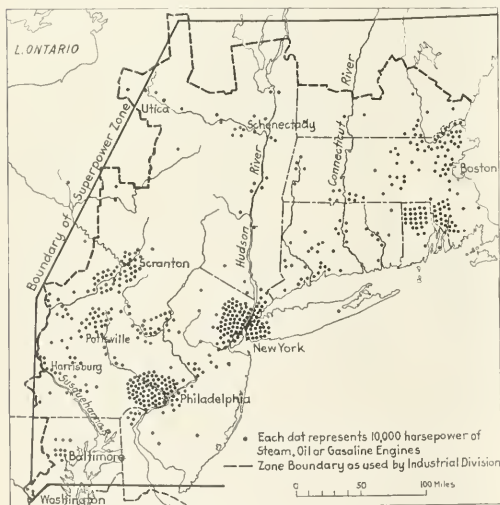

Fig. 2. Isolated Industrial Plants in the Superpower Zone

should of itself force electrification; the total cost 20 years hence will be less if electrification is begun now than the cost of the added track and terminal facilities necessary under steam operation to provide for the inevitable 100 per cent increase in traffic within that time.

#### Motive Power

The entire freight service in the superpower zone can be handled by electric freight locomotives having two articulated two-axle trucks, each carrying two motors geared to the axle, the mounting being essentially the same as that in a number of locomotives now in use and similar to the usual street-car mounting. There would be two classes of locomotives of this type—a light one carrying 80 tons on drivers and having a continuous drawbar pull of 22,000 lb. at 25 miles an hour, and a heavy one carrying 110 tons on drivers and having a continuous drawbar pull of 30,000 lb. at the same speed. These units can be combined in any reasonable number; the total load on drivers can be made equal to 80, 110, 160, 190, 220 tons, or as much more as may be desired, being limited only by the strength of the draft rigging. A train can, of course, be double-headed, and a total tractive

pull up to the maximum now in use can be obtained, with at least double the present speed.

For passenger service a similar arrangement would be used; that is, two articulated two-axle trucks, with one motor geared to each axle. The motors may be practically

Fig. 3. Estimated Unit Performance of One of the Base-Load, Steam-Electric Plants; Plant Uses Bituminous Coal, Stokers and 20-Tube High Boilers

the same as those in the freight locomotives, the only difference being a change in gear ratio. The passenger locomotive, however, would have leading and trailing trucks, with either two or four wheels, and the total weight would be

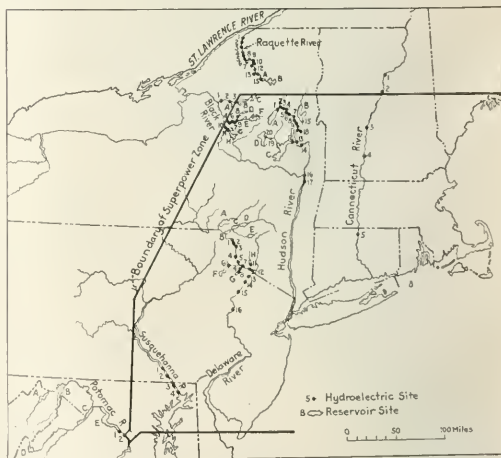

Fig. 4. Principal Hydro-Electric Resources of Superpower Zone

redistributed. This passenger locomotive would be of two weights, the light one having 60 tons on drivers, and the heavy one 90 tons. These also may be combined, like the freight locomotives.

For the switching locomotives, one size will be adequate, with 70 to 75 tons on drivers, of the same type as the freight locomotive. Substantially the same frame and running gear can be used, with motors of less capacity.

All three types of locomotives will have the usual overload

tion within the superpower zone are the 3,000-volt direct-current system and the 11,000-volt (or higher) alternating-current system, both with overhead distribution circuits and rail return. Both of these systems are in successful use, and both can no doubt be designed and constructed to give satisfactory service in the zone.

### Systems of Electrification

In order to avoid some uncertain elements in the estimates of the cost of the alternating-current system it was decided to base all estimates, both of operation and of construction, on the 3,000-volt direct-current overhead system. Substantially the same results in money could, however, be obtained with the alternating-current system, certain gains being offset by certain losses.

It was evident at the outset that it would not be adequate to study the roads as units, but that a study should be made

Fig. 5. Location of Principal Coal-Delivery Routes from Bituminous Regions to Base Load Steam-Electric Plants in 1930

capacity, and all will be able to operate in starting and accelerating at 25 to 30 per cent adhesion. These suggested sizes and types of locomotives can, of course, be varied

CLASS 1 RAILROADS WITHIN THE SUPERZONE	
Boston & Maine	Erie
Boston & Albany	Delaware, Lackawanna & Western
New York, New Haven & Hartford	Lehigh Valley
New York Central	Central of New Jersey
Delaware & Hudson	Long Island
Ulster & Delaware	Pennsylvania
New York, Ontario & Western	Philadelphia & Reading
Lehigh & New England	Western Maryland
Lehigh & Hudson River	Baltimore & Ohio

of the operating divisions of the railroads. A study of a railroad system as a whole, even if it lay entirely within the zone, would yield only average results, which might make a poor showing, whereas some of the divisions treated separately might make a good showing. It was, therefore, decided to ask each of the Class 1 railroads within the superpower zone, of which a list is given below, to answer questions asking for certain fundamental data as to roadbed, equipment and traffic. This information, as with all other information sought, was to cover the year 1919.

In addition to the data from the railroads, two large companies, the General Electric and the Westinghouse, were asked to prepare estimates of cost of substation equipment, of electric locomotives, of catenary construction, and of other facilities—all as of the year 1919. Similar data were also asked of the Ohio Brass Company and one or two other companies.

### Electrical Energy Required

The electric energy required for the railroads is determined from the records of lines already electrified, with proper allowance for variations in the conditions of operation, and from calculations based on the profile and the alignment of the roads considered and the efficiency of their locomotive and distribution systems.

In fixing the units of energy for the different operating divisions much weight is given to the results of the New Haven service modified as required by profile and alignment after examination.

Other records of electric energy for locomotive drawn trains, both freight and passenger, were obtained from the

Fig. 6. Saving Effected by Electrification of Heavy-Traction Railroads in Percentage of Construction Costs, Not Including Saving in Wages

greatly without sacrificing the advantage of unified electric operation, but identity of types for the same service throughout the superpower zone is essential.

The only two systems that are applicable to general trac-

Chicago, Milwaukee & St. Paul, New York Central and the Pennsylvania. Tables published in the report show the amount of power used on these roads for freight, passenger and switching service.

Electrical Energy Required

The second method of determining electric energy required consists in calculating, from profile and alignment, the work due to normal train resistance and adding to this the net work done against gravity, plus the work due to curvature, plus the work due to acceleration.

The quantity of coal burned by a steam locomotive necessary to do one kilowatt-hour of work at the rim of the drivers is estimated at 7.5 lb. Equivalent coal for electric locomotives is uniformly taken at 2 lb. per kilowatt-hour for energy delivered at the substation. All losses of energy in transmission and conversion from the power station to the substation are included in this figure. To make the costs justly comparable throughout, a unit price was adopted for railroad coal in each section: the cost per ton as thus fixed for the several sections of the zone is \$5, \$5.50 and \$6 for the south, central, and northern sections, respectively. These costs include the prorated cost of fuel and water stations.

It is assumed that the railroads will purchase electrical energy delivered at high pressure at substations on or near the railroad right-of-way at the flat rate of one cent per kilowatt-hour.

Maintenance of the electric distribution systems, is taken at \$600 per mile for main track and \$400 per mile for yard track. The cost of operation and maintenance of substations is based on \$1.50 per kilowatt per year of capacity, giving 0.7 mill per kilowatt-hour for a capacity factory of 25 per cent.

It is assumed that there will be an increase in ton-miles per electric locomotive-hour of 33 per cent and a consequent reduction in crew wages per ton-mile of 25 per cent. For passenger service no data are at hand; a general consideration of the subject does not indicate a material saving in wages necessary on account of train crews and therefore none is assumed.

It is estimated that the electric switchers will do 50 per

Fig. 7. Saving Effectuated by Electrification of Railroads, in Percentage of Construction Cost, Including Saving in Wages

cent more work per hour than the steam switchers, and that consequently the wage account for the same service will be reduced by 33 per cent.

In table No. 1 are listed the costs of electric equipment necessary to make the savings possible with electric operation.

Following the procedure outlined in the preceding paragraphs, a study was made for all the Class I railroad systems within the superpower zone except the Ulster & Delaware, the New York, Ontario & Western, and the Western Maryland. The first two were omitted after a preliminary examination because their traffic was too light to warrant electrification. The Western Maryland was omitted because only a small part of its traffic is within the zone; the preliminary examination, however, indicates that the Western Maryland traffic would justify electrification. This left a remainder of 13 railroads in the zone that were studied. The Boston & Albany was included with the New York Central and the Long Island with the Pennsylvania. It was not possible in this study to adhere strictly to the limits of every operating division reported by the railroads, and some divisions were therefore consolidated into routes. The number of divisions or routes range from one on the Boston & Maine to nine on the Pennsylvania and aggregated 40 for the 13 roads.

TABLE NO. 1  
COST OF CATENARY SYSTEM AND ELECTRIC EQUIPMENT

(1) Catenary system:		Miles	Cost
(a) Single track.....	175	\$2,013,000	
(b) Double track.....	68	1,700,000	
(c) Three-track.....	9	251,000	
(d) Four-track.....	42	1,625,000	
(e) Yards and sidings.....	221	1,658,000	
(2) Total.....			\$7,287,000
(3) Substations.....	82,100		4,926,000
(4) Locomotives:			
(a) Freight.....	43	\$3,440,000	
(b) Passenger.....	55	4,576,000	
(c) Switcher.....	41	2,657,000	
(5) Total.....	139		10,673,000
(6) Sum of specified items.....			\$22,886,000
(7) Allowance for unspecified items, 10 per cent of (6).....			2,288,600
(8) Overhead, 20 per cent of (6).....			4,577,200
(9) Total gross cost.....			\$29,751,800
(10) Credit for released steam locomotives.....	30,300		*6,060,000
(11) Net cost.....			\$23,691,800

\*Present value.

The results of the study are given in Figs. 6 and 7 which show for each of the 40 divisions the annual saving, in percentage of the net cost of electrification, plotted against the energy required, in kilowatt-hours per year, together with the accumulated average percentage of saving for the divisions as grouped. Fig. 6 shows the saving exclusive of the saving in crew wages, and the divisions are arranged in the order of percentages. With these results as a criterion of economical electrification the "selected divisions" are assumed to be all that show a saving of nine per cent or more. The group of divisions thus selected shows an average saving of 11.4 per cent. It includes 30 of the 40 divisions examined, comprised in 11 of the 13 systems. The saving, including the wage saving, for the 40 divisions, is shown in Fig. 7. For the "selected divisions" these savings range from 10.6 to 19 per cent and average 14.2 per cent. The total energy required annually for these 30 divisions would be 4,400 million kilowatt-hours, and the maximum demand approximately 850,000 kilowatts.

The low percentage of saving shown by the divisions not

Fig. 8. Growth of Steam Railroads in the Superpower Zone, 1900 to 1919

included in the selected group, except those of the New York Central, is due to light traffic. On the New York Central the train cost of transportation, the cost of maintaining steam locomotives and the cost of coal per mile are lower than on any other system, owing in part to the fact that this is a water-level road with a large amount of through traffic; these are favorable conditions for economical steam operation and, therefore, afford less opportunity for saving by electrification.

The amount of electrification recommended includes 48 per cent of the route miles, 53 per cent of the main track miles, 64 per cent of the yard track and 58 per cent of all track owned by the 11 selected roads in the district. The net cost of electrification of all the selected divisions would be \$570,000,000, and the net annual saving in operation, including the saving in wages, \$81,000,000 equal to an average of 14.2 per cent of the entire group, ranging from 10.6 per cent for the New York, Susquehanna & Western

division of the Erie to 19 per cent for the New Haven-Boston route of the New Haven.

Tables are included in the report which itemize values under headings as follows: Track mileage of selected divisions, data of steam operation on selected divisions, data of electric operation on selected divisions, coal saved by electric operation on selected divisions, energy required for electric operation on selected divisions, cost of electric track facilities and equipment of selected divisions and comparative cost of steam and electric operation on selected divisions. Another table is included which gives the comparative data for steam and electric operation for all the selected divisions within the zone, aggregated into one operating system. The growth of traffic, both freight and passenger, of track, and of tractive power for the Class 1 railroads in the superpower zone from 1900 to 1919 is shown in Fig. 8. The annual rate of growth has been 5.3 per cent in passenger-miles, 4.5 per cent in ton-miles, 0.75 per cent in all track, and 6.6 per cent in tractive power of locomotives.

The amount of money required for electrification is \$570,000,000. This figure is based on costs prevailing in 1919, but at costs as of June, 1921, it would be reduced by 18 per cent, to approximately \$467,000,000, and before this construction can be undertaken there would be further material reductions. Probably five years from now the entire work outlined could be done for not more than \$400,000,000. Good railroad authorities have stated repeatedly that more than \$1,000,000,000 a year is needed by the railroads of the United States for extensions and betterments. The part of this total to be allocated to the superpower zone, as determined by the number of locomotives, would be \$150,000,000. The amount required for normal extensions and betterments for three years would, therefore, be sufficient to electrify the 30 selected divisions of the railroads in this territory, with an annual saving of more than 14 per cent. The most valuable feature of the change, however, is not the amount saved, but the great increase in maximum capacity of existing trackage and general advantages of electric operation.

These figures indicate that with a return of normal financial conditions all these lines should be electrified before further great expenditures have been incurred to increase in a minor degree the capacity of the existing tracks and yards. Steam operation cannot satisfactorily meet the conditions of the crowded terminals herein described as the superpower zone; electric operation can easily do it.

## Amendments to Transportation Act Likely to be Considered in Congress

WASHINGTON, D. C.

THE SITUATION created by the threat of a railroad strike has now been added to the demand for rate reductions, the campaign of the state railroad commissioners for a restoration of their powers to reduce rates and the railroad "funding" bill as reasons which are likely to stir up Congress to consider amendments to the Transportation Act. In fact the insistence of the agricultural bloc had already made it certain that the Senate would be called upon to vote on amendments to the rate-making sections and the opening of the subject on any point is likely to be the entering wedge for the consideration of several other points. The House, which has no element corresponding to the Senate bloc, at least as far as its power is concerned, is less likely to act, and the committee on interstate and foreign commerce had decided not to take up railroad legislation at this session, but events are shaping themselves in such a way that the House will probably be brought into the discussion by the next session.

The Senate committee on interstate commerce, or a few members of it, has been holding daily hearings on the Capper bill since October 24 and one state commissioner after another has appeared to complain that the orders of the Interstate Commerce Commission requiring advances in the state rates to correspond to the interstate advances of Ex Parte 74 have practically deprived the states of power to regulate their own local rates and have also required unreasonable advance when applied to rates which for one reason or another were already higher than the ordinary level. They have objected especially to what they termed undue centralization of authority at Washington but they have also protested a good deal against the plan of directing the commission to fix rates to produce a fixed percentage return by groups.

The various state commissioners have reviewed before the committee the history of the advanced rate case proceedings affecting their states that have arisen since Ex Parte 74, and John E. Benton, solicitor for the National Association of Railway and Utilities Commissioners, has given more general testimony, laying particular stress upon the "generosity" to the railroads displayed by many of the states. The burden of the complaint was that the railroads had ignored the state authority and had shown undue haste to get the cases before the federal commission or courts and that the Interstate Commerce Commission had stretched its authority virtually to the point of extinction of state authority. Among those who testified were Carl D. Jackson of Wisconsin; L. P. Hale of New York; R. Hudson Burr of Florida, and J. F. Shaughnessy of Nevada.

Senator Cummins agreed in general with the contention of the State representatives that Congress had not intended to broaden the Interstate Commerce Commission's authority over state rates beyond the principle of the Shreveport decision and that the railroads and the Interstate Commerce Commission had misconstrued the law in holding that the federal commission was authorized to act to correct discrimination against the entire body of interstate commerce. He took issue with several of the witnesses, however, on some of their statements regarding Section 15-A. He denied that this represented a guaranty, showed that it had never been operative, since the roads have never earned  $5\frac{1}{2}$  or 6 per cent under it, and also pointed out that the percentage named in the law expires on March 1. The 6 per cent rule, therefore, he said, has become "wholly immaterial" so far as its use is concerned because any further changes in rates probably will be reductions. When it was pointed out that the commission is authorized to fix the percentage of a fair return

after March 1, he said the commission had always been required to allow the roads a fair return. The railroad officers had attached considerable importance to the setting up of a specific percentage standard which should represent a legal fair return. Mr. Jackson declared that the percentage rule was unworkable, whereupon Senator Cummins said that a consolidation of the roads would represent a solution for part of the difficulty.

In reply to Mr. Shaughnessy, Senator Cummins said: "I do not agree with you that Section 15-A increased rates. They would have been increased just as much without the law and in spite of it the railroads this year probably will not earn more than enough to pay their bond interest, if they earn that much."

He said that Congress had not intended to make any change except as to procedure in the Shreveport principle, but he added: "Somebody has got to see that the railroads have enough revenues to keep running." He also said it is impossible to give the states the authority to remove discriminations against interstate commerce.

Mr. Shaughnessy said that there is a feeling in his state that "things are pretty well frozen up" because the Interstate Commerce Commission order has prevented the state commission from exercising its function of regulating local rates and the federal commission is slow to act. He said the commission's order had added the usual percentage increase to rates which were already high; for example, passenger fares of 4 and 5 cents on main lines had been increased to 4.8 and 6 cents and branch line fares of 5 and 6 cents had been increased to 6 and 7.2 cents. He said that at the recent Atlanta convention of the state commissioners' association there were many in favor of memorializing Congress to go so far as to abandon the Shreveport doctrine, but it had been finally agreed to ask only for a greater limitation of the powers of the Interstate Commerce Commission.

Mr. Benton submitted to the committee a draft of amendments to the law which the state commissioners ask. This would eliminate the provision under which railroads may file complaints with the Interstate Commerce Commission asking the removal of a discrimination caused by a state rate and it would also limit the Interstate Commerce Commission to the removal of discriminations in particular rates after an investigation of the reasonableness of both the state and interstate rates.

# Strike Settlement Leaves Many Issues Confused

## Necessity Seen for Improving Machinery for Dealing with Recurrence of Similar Situation

By Harold F. Lane

WASHINGTON, D. C.

WHILE THE NEWS that the strike had been called off was received with universal satisfaction in Washington, there were divergent opinions as to the method by which it was averted and as to how long it would stay settled. Gratification that a disturbance of transportation had been prevented was tempered to some extent by the question as to the effect of a postponement of the wage issue upon the campaign for further rate reductions. The policy of the administration had succeeded in preventing a strike, and it had accomplished that object without having played all of its cards, although the fact that it held some high ones up its sleeve had been allowed to become apparent. However, the fact that the Labor Board had felt it necessary to speak more softly than is the ordinary habit of one who carries a big stick, was regarded as of sufficient importance to suggest the desirability of further legislation upon a subject with which Congress has been struggling without complete success for many years; and it was recognized that the settlement left many things unsettled to bob up again in the future.

While plans have not yet become crystallized and while some of the opinions expressed within the last few days may lose some of their strength now that the crisis has been postponed, it is certain that Congress will be called upon to consider some means of defining more specifically the powers which the Supreme Court has held it possesses with a view to removing for the future some of the doubts that existed as to the efficacy of the means at its command on this occasion. It is proposed to provide some penalty for violation of orders of the Labor Board; talk of anti-strike laws is being renewed; there is much discussion in vague terms of some way to co-ordinate more closely the functions of the Board that fixes wages and the Commission that determines rates, and if nothing more is done the Labor Board is likely to be removed from Chicago, its present statutory headquarters, to Washington, where it will be in closer touch with the Interstate Commerce Commission and other government agencies, including the President.

### President Declines to Comment

President Harding, who was not apprised of the calling off of the strike until Friday morning, as his train neared Washington, expressed his gratification that the matter had been settled but declined to comment further. As he shook hands with the members of the train crews, he said: "I'm glad the strike is off and so are you, aren't you?" The men smilingly nodded assent. Later it was stated at the White House that the President was naturally pleased that there was to be no tie-up of transportation and that he had not yet received a report which was on its way to him from the Labor Board. The Board does not regularly report to the President but it had done so on this occasion because he had consulted with the members of the public group and had charged the Board with the responsibility for dealing with the situation. No effort has been made at the White House to attribute the credit for the settlement to the President. It was said that the responsibility was that of the Board.

The President would not indicate whether he considered that he had received an answer to the question as to whether the Labor Board was "a perfectly futile agency" and he

did not express his opinion as to the lessons that have been learned as a result of the experience through which the country has passed, but it was learned that he regards the subject of a modification of the present law as "a live question" and that he expects some recommendations for the future will grow out of the situation.

### Mistake to Locate Labor Board in Chicago?

It is also known that members of the Labor Board, in addition to believing the Board ought to be given some "teeth," feel that they ought to be located in Washington and that the President himself thinks it was a mistake to locate them in Chicago out of touch with the other branches of the government. The selection of Chicago as the headquarters of the Board was made by Congress at a time when its members had been besieged for weeks with a labor lobby of unusual proportions which had tried to prevent the return of the roads to private management and when there was a feeling that labor had been unduly influential in the government. In addition to the fact that Chicago is centrally located one purpose was to get them out of Washington.

Chairman Cummins of the Senate committee on interstate commerce said he was glad there was to be no strike but said he did not care to comment on the method of settlement or on the functioning of the Labor Board "as a board of mediation and conciliation."

A prominent member of the cabinet expressed the opinion that the whole question would come up again about next spring, because, he said, the situation logically calls for a reduction of railroad wages. He said the rate question had been confused and that it now probably would be necessary to await the reports of railroad earnings for a couple more months to find out more definitely their financial condition under an increased volume of business.

### Labor Board Has Recovered Prestige

The Labor Board has recovered some of the prestige which it had been gradually losing (partly because it had so far been unable to assert itself effectively in the case of violations of its orders by certain railroads and partly because it had not done more to help get rates reduced) but while the Board and particularly its vice-chairman, Mr. Hooper, achieved a reputation as a mediator, more credit for the result that has been accomplished is given to the President than to the Board. The President declined to dignify the strike leaders by inviting them to the White House for a consultation over the advisability of defying the orders of a branch of the government and he let it be known that he felt confident that public opinion was back of him in making every preparation for dealing firmly with a strike if it should occur. However, while his support gave force to the insistence of the Board that there should be no strike, it is recognized that the virtual promise of the Board not to reduce wages for several months was undoubtedly more effective than any moral influence possessed by the Board. In other words its strength on this occasion was derived from its weakness.

### Unfavorable Criticism for Board's Statement

The Labor Board statement which told the labor leaders that there was no occasion for a strike on account of the proposed new reduction in wages because it could not reach

a decision for some time, when coupled with the suggestion that no action could be looked for until next July, aroused a great deal of unfavorable criticism. It was compared to the surrender of President Wilson and Congress in 1916 when the Adamson law was passed "at the point of a gun" and it was regarded as particularly surprising in view of the uncompromising attitude that had been displayed and of the business-like activity of the Department of Commerce, the War Department and Attorney General Daugherty and his district attorneys. The statement of the Board came as a shock to many of those who have been active in seeking a way to reduce freight rates but have found the wage question a serious obstacle. This includes certain members of the Interstate Commerce Commission who recognize the need for rate reductions but also have some regard for the need of the carriers for revenue. More deliberate consideration softened the criticism, however, in view of the manifest fact that the Labor Board docket is still overloaded with questions pertaining to rules and working conditions, which involve almost as much money as a 10 per cent wage cut, and that the Board, even without any stipulation on its part, could hardly be expected to dispose of a new question ahead of the other cases on its docket, without dealing in a purely emergency way with a subject which has already been seriously complicated by the necessity for handling it as an emergency proposition so many times before.

### Brotherhoods Win Temporarily

The fact that the Board had told the brotherhood leaders, as an inducement to call off the strike, that it would not consider a request for wage reductions in the case of any class of employees until it had first disposed of the rules and working conditions for that class appeared somewhat more reasonable than the suggestion that the railroads agree to withhold their requests for wage reductions. It sounded more like a statement of a condition than a compromise. It also made it unnecessary for the railroads to make a concession, which they undoubtedly would have been most reluctant to make in the face of the suggestion that has frequently been made, even by a former railroad president now a member of the Interstate Commerce Commission, that the railroads cannot excuse high rates by high wages unless they make every effort to get wages reduced.

### No Complete Victory for Anybody

A truce has been made without a complete victory for any party to the controversy. The railroads are so far unscathed, because the grain rate decision would undoubtedly have come anyway, but they have not been given any additional assistance in their efforts to meet the public demand for lower rates. The government has won a point by the yielding of the labor organizations to its insistence that there should be no strike. The brotherhoods have lost the point on which their strike vote was technically based, the demand that the 12 per cent reduction be rescinded, but they have won for the time being the object for which it is well understood they were actually striving, that is to stave off another wage reduction and the modification of some of their rules and have declared that the plan constitutes "an acceptable basis of settlement." In view of the statement made by W. S. Carter that he doubted whether 20 per cent of the men had read the statement on the strike ballot and his further statement that the labor organizations were "playing a game of poker without cards" and always asked for more than they expected to get, it would appear that the kind of bluff represented by a strike threat is still about as potent as the influence of an order of the United States Railroad Labor Board.

### Further Freight Rate Cuts

One difficulty about the situation from the viewpoint of the railroads is that the Labor Board and the Interstate

Commerce Commission are not so closely co-ordinated that the promise of the former that wages will not be reduced for at least several months may be taken to mean that the Interstate Commerce Commission will postpone consideration of its docket of petitions for rate reductions for a similar period. It is believed that the Commission will undoubtedly feel it necessary to go slow in ordering further rate cuts, because it realizes that it is charged with a degree of responsibility for the adequacy of railway revenues and no one credits it with a desire to injure the roads, but it is under a tremendous pressure and it has on several occasions prior to its recent decision in the grain rate case displayed a willingness to discount an optimistic view of the future in reaching its decisions.

The earnings of the railroads have been making a comparatively good showing for August, September and October, the three best months of the year, and while they will undoubtedly begin the usual seasonal decline about the first of November, the earnings figures for the better months will be the only ones available to the public until about the first of the year, when the November reports come out. This will afford an excuse for continued agitation for rate reductions based on the kind of reasoning that was used in 1919 when some of the advocates of government control proclaimed that the Railroad Administration was earning at the annual rate of four times the earnings of the three best months of the year, although most of the months had shown deficits.

### Anti-Strike Legislation Considered

Many members of Congress who are getting tired of having the country stirred up by strike threats every year or two are becoming strong for anti-strike legislation, such as has been passed by the Senate on two recent occasions, but which the House has been unwilling to accept. Others more conservative feel that no law absolutely prohibiting strikes could actually be made effective in case the employees involved really felt so dissatisfied with the wages or working conditions fixed for them that they were unwilling to work under them longer. It is argued, for example, that if the decision of an impartial board really appeared to the men so intolerable that they would be willing to risk the chances of a strike there would not be jails enough to hold them, or they could bring about the practical effect of a strike by simply quitting their jobs without a tangible conspiracy to do so.

On the other hand, it is contended that an anti-strike law might not meet such a condition but that it would eliminate the potency of the strike bluff which has usually been so effective in the past. It is recognized that men cannot be forced by law, in time of peace, to work for a given wage against their will, and that if a large majority of the railroad men of the United States are actually determined to strike rather than accept the terms of employment offered them, the shippers and passengers of the country will have to pay rates sufficient to hold them, whether the roads are run by private companies or by the government. However, a law penalizing a conspiracy to strike, would tend to reduce strike threats to the irreducible minimum. Some of the patrons of the railroads recently have displayed some signs of a willingness to strike themselves rather than be bluffed into paying wages higher than they think are necessary.

The outcome of the conferences at Chicago has also suggested the possibility of enacting something like the Canadian Lemieux law, which prohibits a strike until after a tribunal has passed on the controversy and stated its view of the merits to the public. In the present case the strike threat collapsed after a public discussion of the issues had shown that the principal grievance of the brotherhoods was in anticipation of something which had not occurred, because the railroads had not filed their requests for wage reductions, the Board could not pass upon them promptly if they were filed and no one knew what its decision would be anyway.

The discussion of the case had also shown the brotherhoods that their bluff was being called and the hearing before the Labor Board gave them an opportunity to withdraw with some appearance of honor, from a position from which stubbornness might easily have made it difficult to retreat.

### Greater Co-Ordination With I. C. C.

Much is heard of the suggestion that there ought to be greater co-ordination between the Labor Board and the Interstate Commerce Commission, but there has thus far been no explanation as to how this could be accomplished except by giving the functions of the Board to the Commission and making the board itself a bureau of the Commission. It is more frequently suggested that the board be abolished and its functions conferred upon the Commission. At the time of the eight-hour basic day demand in 1916 the railroads strongly urged that the question be arbitrated by the Interstate Commerce Commission, the body that has the last word as to rates. This suggestion was inspired in part by the experience of the railroads in advancing wages or having them advanced by arbitration boards, and then finding it somewhat difficult to convince the commission without long delay that rates would have to be advanced correspondingly. In one decision written by Commissioner Prouty it was suggested that the commission would not feel called upon to recognize as reasonable rates that might be made necessary by unreasonable demands of a "labor trust" or of any "trust" that supplied materials and equipment to the roads.

### I. C. C. Does Not Want Jurisdiction Over Wages

At the time the transportation act was in the process of making, it was often suggested that if wages were to be fixed by the government they ought to be fixed by the same body that fixes the rates. The commission strongly opposed this, however, on the ground that it would be difficult to determine either one unless the other were somewhat fixed. Chairman Clark, in discussing the views of the Commission before the House Committee on Interstate and Foreign Commerce, said he knew of no reason why the Commission should be considered better qualified to exercise the functions of mediation, conciliation and arbitration than other officers of the government to whom those duties might be committed.

"But above all that," he said, "we think it would be an unsound public policy to place in one body the duty of regulating activities of the carriers and their rates and charges, from which their revenues are derived, and also the fixing of the largest item in the operating expenses of the railroads, to wit, the wages of the employees."

Mr. Clark said he believed it would be developed in a few years that this would be destructive of the influence and standing and opportunity for good of the entire plan and of the body that administers it. Applicants for increased wages would say that the Commission could give the wages and increase the rates if necessary. If that were done the tribunal would be accused of playing to popularity among labor forces and disregarding the interests of the public. If it were refused, and a strike occurred they would say, on the other hand, that the Commission was so niggardly about increasing rates that it had precipitated all the trouble. He did not question the advisability or the propriety of the government doing all it possibly can to adjust disputes affecting, or even regulating, the question of the wages of the employees of the carriers, but he urged that whatever is done in that line be placed in the hands of a tribunal that has that question to deal with and, he said, "our Commission will deal with the questions committed to it in the light of what is done in a legal way by another tribunal that considers matters without having always to bear in mind that if we do this we must do that."

It has now come about, however, that the Labor Board is unable to readjust wages rapidly enough to meet the demand

for lower rates and the Commission, impatient to perform its duty to give the shippers what it considers reasonable rates, is encountered by the obstacle of high wages, which it is powerless to change. The Commission has not indicated in any way what it thinks of the present wages. It generally refers to them only by including them in "operating costs" and when it ordered the grain rates reduced it did so by discounting further reductions in such costs without saying whether or not it expected further reductions in wages. Commissioner Potter was more explicit in his opinion in the grain case, when he said that if the question as to what the shippers can afford to pay is to be determined by the commission in fixing rates, the Labor Board must take its finding into consideration in fixing wages. If the Labor Board fails to do so, however, a deadlock results somewhat resembling the situation that might exist within the commission if it had both functions to perform, except that the Commission could reach a decision by a majority vote and having determined that wages should be at a certain level would naturally find it necessary to try at least to make rates that would support them, or having fixed rates would try to find what wages could be paid out of them.

### Western Roads Seek Modification of Grain Rate Reduction

The announcement of the Labor Board that wage reductions cannot be considered for a long time has apparently put a crimp in the efforts of many interests to induce the railroads to make voluntary rate reductions. Traffic executives of the Western roads have been in Washington this week conferring among themselves and for the purpose of seeking a conference with the Interstate Commerce Commission with a view to asking a modification of its decision in the Western grain rate case, in which the roads were told to reduce the rates on grain, hay and grain products by November 20, but in which the commission has not yet issued a formal order. A conference with the commission was planned for Wednesday but was postponed until Friday. It is understood that one proposal which was to be made to the commission was that a general 10 per cent reduction in the rates on agricultural products be substituted for the larger reductions which the commission proposed on grain. This is on the ground that there is now no prospect for an early wage reduction, although there was one at the time the commission reached its decision, and that a reduction in the grain rates would only invite demands for similar reductions in many other rates.

An informal conference between representatives of the railroads and the shippers on the rates on fish and sea foods was held under the auspices of the commission on Tuesday and a similar conference with representatives of the iron and steel shippers was proposed for Friday or Monday.

THE RESCINDING of the strike order was an impressive exemplification of the great power of enlightened public opinion, which in this instance so unmistakably demonstrated that the majority of the people throughout the country believed the threatened strike was a grave menace to business and absolutely unjustified.—*Guaranty Surveys*.

THE STATE EQUALIZATION BOARD of Tennessee has made the following reductions in tax assessments. Southern Railway, one lot in Memphis, assessed \$500,000, reduced to \$400,000; Nashville Union Terminals, assessed at \$600,000, reduced to \$500,000; Kansas City & Memphis Bridge Co., assessments fixed at \$1,250,000; Harrison City and Memphis Bridge Co., assessed at \$25,000, reduced to \$18,000; C. N. O. & T. P. Railroad, assessment fixed at \$96,000 per mile. These substitutions the only changes in the assessments as sent up to the board by the public utilities commission.

# The Requirements for a Modern Car Repair Shop

## Type of Building, Character of Tools and General Plan for Both Steel and Wood Equipment

By H. H. Dickinson and Paul Schioler

The Arnold Company, Chicago

THE INADEQUACY of facilities for the repair and maintenance of cars creates one of the most important problems which now confronts the executives of American railways. The enormous amount of capital tied up unprofitably in bad order cars is already a serious matter in railway economics and is growing worse through the increased unit costs of rolling stock. Furthermore, during repeated periods in more recent years, every railroad has been seriously hampered in its operations because the facilities for car repairs have not kept pace with the increase in equipment.

In planning a modern car repair shop the main points of consideration are the location, the site, the type, size and number of buildings, and the equipment, i. e., cranes, machinery, power, etc. Location and site are matters of local determination but in the selection and grouping of buildings

- 1—planer and matcher, motor driven.
- 1—24-in. rip saw table, motor driven.
- 1—16-in. rip saw table, motor driven.
- 1—36-in. swing cut-off saw, motor driven.
- 1—24-in. cut-off saw table, motor driven.
- 1—vertical boring and mortising machine, motor driven.
- 1—car gainer, motor driven.
- 1—12-in. mitre saw table, motor driven.
- 1—24-in. jointer, motor driven.
- 1—48-in. band saw table, motor driven.
- 1—saw gumming machine, belt driven.
- 1—vertical car tenoner, motor driven.
- 1—wood lathe, belt or motor.
- 1—three-spindle vertical and radial car borer, motor driven.
- 1—flexible single spindle post borer, belt driven.

It is recommended that this machinery be housed in a separate building, or at least segregated in a room at one

A Steel Car Repair Shop with a Longitudinal Arrangement in Two 44-ft. Aisles

and their equipment with apparatus, labor saving devices and machinery, certain specific recommendations and suggestions may be made.

The work of repairing railway cars falls naturally in two main divisions; wooden cars and steel cars, with the intermediate one of cars with steel underframes and wooden tops. For wood car repairs frame buildings will usually answer the purpose in a satisfactory manner. It is true that they are not fireproof, but this does not add to the fire hazard from within, as the contents of such a shop are inflammable anyway, and the custom of supporting the roof in mill buildings on intermediate columns will, in fact, make them more desirable in this respect than steel truss buildings, as steel trusses collapse promptly under an inside fire. If it is desired to protect against fire danger from adjacent lumber yards, storehouses, etc., a fireproof roof covering may readily be provided.

The saw and planing mill operations involved in the preparation of material for wood car repairs are in reality a separate industry from car repairing. The following list of machinery is recommended for the average requirements:

- 1—four-cylinder sill and timber dresser, motor driven.
- 1—double-cylinder surfacer, motor driven.

end of the car repair shop. The necessary system of shafting and pulleys, individual motor installations, ducts for the removal of sawdust and chips, and the whole organization of the millwork, are best handled in this manner. The efficient transportation and handling of material from car to pile and through the mill, and thence to the cars undergoing repair, is quite as important as is material handling in any industry, and it is best accomplished by properly arranged industrial tracks and yard cranes. Overhead crane service cannot be very well arranged in a mill constructed building, but for wood work only it may be dispensed with in most cases.

Work on steel cars and on cars with steel underframes as a rule compels the selection of steel frame structures, for the double reason that these are easily made fireproof throughout and they allow the proper installation of overhead crane service as well as the attachment of jib cranes in the most efficient manner. Moreover, steel trusses and steel sash, being of smaller dimensions than wood, allow a better diffusion of exterior light. Wherever climatic conditions permit, the sawtooth form of roof should be carefully considered, as it gives excellent light between cars standing on repair tracks. At any rate, the monitor sash or roof lighting should

be placed crosswise over the tracks. Monitor sash should be arranged for ventilation and the side wall sash should also be provided with ventilated sections. Factrolite glass is recommended because of its superior diffusion of light and the elimination of shadows. Artificial lighting is best obtained by using tungsten lamps with enameled steel reflectors; the distribution of lamps must provide for full illumination of the spaces between cars on tracks.

The best artificial heating system is a combination of direct radiation and indirect or fan blast heating, the direct radiation to be distributed along the building walls in proper quantity to compensate for the glass area exposure, and the fan blast outlets to provide heat for the center area of the shop and to take care of the requisite air circulation. If because of the character of the ground or for other reasons, underground ducts are undesirable, individual motor-driven fan heating units may be used to advantage.

### Either Longitudinal or Transverse

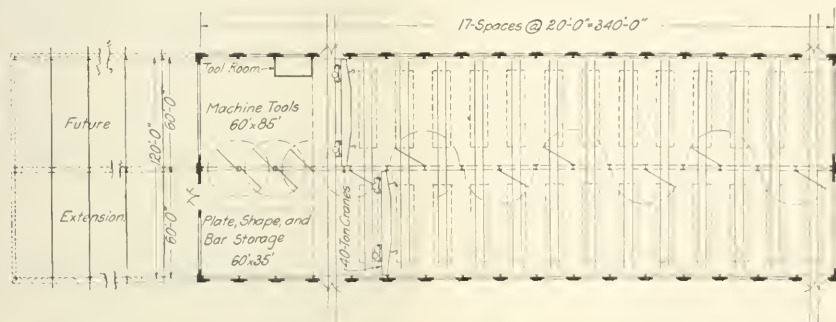

No universal choice can be made between the longitudinal and the transverse type of shop. If the former is decided upon, a unit span of about 84 ft. between crane rails permits of a good crane arrangement and allows for four through tracks, 20 ft. center to center, and a 12-ft. space between each outside track and the wall. From 60 to 65 ft.

the shop is the relative adequacy of the general stores, and it will be well to make ample provision for all materials and supplies required in overhauling all the types of cars for which the shop is intended.

To permit full use of tracks for the spotting of cars under repairs and to have the receiving and unloading of material interfere as little as possible with the car repair work in the shop proper, it is recommended that, where possible, material be received on a track outside of the walls. In such a layout a six or eight-ton crane, supported partly by yard columns and partly by the building columns and spanning the material track, is a profitable investment and should be installed.

Repairs and overhauling of cars result in the accumulation of a large amount of sheets, plates, bars, rods, etc., all partly damaged but having considerable reclamation value. It is good economy to provide, in the machinery equipment, suitable tools, such as straighteners (plate and bar), furnaces, bulldozers, bolt threading machines and nut tapping machines, in order that salvaged material may be reclaimed on the spot and either used immediately in the shop or turned over to the stores department.

The widest possible application of crane service is advocated as the most fruitful way of securing an intensive utilization of the plant as a whole. The maximum load to be handled by cranes is usually between 25 and 35 tons,

Plan for a Steel Freight Car Repair Shop with a Transverse Layout, Two 60-ft. Aisles

of track should be allotted to each car spot and the length and number of building units determined accordingly. Machine tools should be installed on one side of the shop, leaving out a portion of the through track at this point. In a transverse type of shop the cranes will have a span of about 65 ft. and the machine tools will be placed at one end of a shop unit. The height of the crane runways should be 25 ft. and the clear height under trusses 32 or 33 ft. The building should be piped for air and acetylene, a double air outlet to be provided for every car spot and an acetylene outlet for every two car spots. The building should also be wired and have a contact at each car spot for the attachment of modern electrical tools.

The best flooring for car repair shops is creosoted wooden blocks on a concrete base. This is usually preferred by mechanics where nothing in the industry militates against its adoption, and in work of this nature there are no objections to this floor. It is durable, sanitary, non-conducting as to heat and cold and affords a satisfactory foothold.

Adjoining the machine tool area racks for the storage of a reasonable quantity of large sheets and plates should be provided as well as storage facilities for bars and shapes. Storing this material inside the building not only permits unloading and storage by crane and provides crane conveyance to machines without extra handling, but it also eliminates deterioration from rust and other defects occasioned by continued exposure. An important factor in the efficiency of

but the average load is much lighter. Two cranes of 15-ton capacity each may readily be operated together to handle a maximum load when occasion demands, and for general purposes they serve the shop better than it is possible to do when the crane capacity is concentrated in one machine of, say, 30 tons size.

It has already been stated that truss spans giving approximately 84 ft. between crane rails are desirable in longitudinal shops. For flexibility of crane service it is best to substitute for this two bays of 44 ft. each. The use of center columns should enable the designer to lighten the steel work in the roof trusses and provide good support for jib cranes. It will be less expensive to install two 42-ft. cranes and equip each one with a 15-ton hoist and an auxiliary rapid hoist of smaller capacity, than it would be to put in one crane of 84 ft. span, and they will serve the shop more efficiently. It is recommended that the lengthwise travel of cranes be limited to 300 ft., preferably about 250 ft., so that a shop unit from 500 to 600 ft. long should have at least two cranes, or sets of cranes. Jib cranes of the portable type, or attached to steel columns are an excellent means of handling work at car spots and at certain of the machine tools. They release the overhead cranes for general transportation and material handling through the whole shop. The jibs should have about a 20-ft. swinging arm and should be of at least one ton capacity.

The painting in a modern car repair shop should be done

by pneumatic sprays. This applies to wood and steel work alike. It may be desirable to have the plant equipped with a sand blast outfit, so that when steel cars or underframes require thorough cleaning the work may be disposed of in the most efficient manner. However, only a fraction of the cars passing through the plant will need this treatment, and unless the capacity of the plant calls for at least 20 cars per day, a sand blast equipment can hardly be installed advantageously.

The wheel and axle work must be handled by a wheel lathe, an axle lathe, a wheel press and a wheel boring machine, and if the shop is about 84 ft. by 600 ft., or its equivalent, these tools are best placed among the other machine tools and the work organized to co-ordinate with the other shop operations. If, however, the layout provides for two or more shop units, then the work on wheels and axles is best done in a separate department located adjacent to the shops and operated in conjunction with them, leaving the shops proper to handle repairs to car bodies

ing laid out to handle principally the repairs of one type of steel cars, some of the tools mentioned may well be omitted and several others added; indeed these notes do not represent an attempt to design in detail any one particular car repair shop.

A number of railroads have experienced considerable annoyance and suffered a large aggregate loss as a result of too frequent loss of identity of freight cars undergoing repairs. A timely reform in the operation of car repair shops would be the adoption of uniform methods of checking the number on a car brought into the shops, preserving it upon the car while it is under repairs and checking it out again, but such a reform, to have the desired effect, would have to be universal in the shops of all railroads.

When a modern car repair plant is contemplated it is almost invariably the intention to provide steady employment for a number of workmen. Therefore it is advisable to provide a service building, located as conveniently as possible to the plant entrance. This building need not be elaborate,

A Steel Freight Car Repair Shop with a Longitudinal Arrangement in an 84-ft. Aisle

and underframes exclusively. One wheel and axle department will, of course, serve a steel car and a wood car shop.

### Tools for Steel Car Work

The following machine tool equipment is recommended for a car repair shop which is to handle the variety of types of steel cars used on the majority of railways:

- One single end punch (24 in. throat), motor driven.
- One double punch and shear (30 in. throat), motor driven.
- One double horizontal punch and bending machine, motor driven.
- One 8-ft. gate shear (cap.  $\frac{3}{4}$  in. plate), motor driven.
- One 6-in. by 6-in. by 1-in. angle shears, motor driven.
- One alligator bar shear, motor driven.
- One plate straightening press, pneumatic.
- One 9-ft. by 14-ft. plate heating furnace, oil and gas burning.
- One 12-ft. flanging clamp, pneumatic.
- One 7-ft. by 10-ft. plate heating furnace, oil or gas.
- One heavy duty bulldozer, motor driven.
- One 5-ft. by 8-ft. furnace, oil or gas.
- One 2-in. bolt heading, upsetting and forging machine, motor driven.
- One forging furnace, oil or gas.
- One  $2\frac{1}{2}$ -in. double head bolt cutter, motor driven.
- One 300-lb. power hammer, motor driven.
- One 30-in. by 3-ft. furnace, oil or gas.
- One 1,000-lb. steam hammer, steam.
- One 3-ft. by  $4\frac{1}{2}$ -ft. furnace, oil or gas.
- One 6-ft. radial drill, motor driven.
- One 4-spindle drill press, belt driven.
- One 4-ft. drill press, belt driven.
- One 20-in. drill press, belt driven.
- Two heavy emery wheel stands, motor driven.

This list is in addition to any tools for reclaiming materials and does not contain the wheel and axle tools referred to in a preceding paragraph. The list is necessarily empirical and must be reviewed and compared with the individual requirements of any one shop under consideration. It is manifest that when, for instance, a shop is be-

but it should contain a requisite number of steel lockers, lavatories and toilets and also some shower baths of approved sanitary design. There should also be a room where the men can eat their lunch during cold weather.

These suggestions and recommendations, although specific and based on examination of actual conditions on the roads and in existing shops, will only be found of value when carefully considered with all the local conditions and circumstances bearing upon the individual project of any railroad.

Thus, the question of location and site, as regards labor conditions, topography of the prospective site, climatic conditions, fire protection facilities and proximity to railway terminals from which empty cars would be received must be gone into and decided upon in every instance, and the foregoing notes must be considered with the questions of the volume and class of work, frequency and season of maximum demand, average daily requirements and desirability of provisions for future extensions.

The three typical layouts shown embody some of the general desirable features mentioned. They are, of course, not intended to serve even as finished sketches of any one specific project, but they may form a basis for study and discussion and a nucleus around which layouts may be developed for particular conditions affecting car repair shops with the contiguous building for mill, wheel shop, store house and other accessory departments.

State laws already passed which deal with car repair shops and sheds give ample proof that the development of such buildings is anticipated by interests outside the railway executive offices. Such legislation is largely fostered by labor organizations and the efforts have been to provide the best working conditions and physical protection for the men employed. However, to obtain the best results the planning

should be on a broader basis than this and the matter of proper protection for workmen should be viewed simultaneously with consideration of efficiency and economy in the operation of railroads.

In conclusion, attention is drawn to the fact that in comparison with the investment in modern power repair facilities the sums expended to date in car repair shops are but small—probably less than 20 per cent of the former—and yet the annual expenditures for maintenance of rolling stock usually greatly exceed the cost of maintaining locomotives. It has been demonstrated that it has not been possible to realize the ultimate efficiency of the modern locomotive equipped with superheater and mechanical stokers, because

repair shops have not kept pace with improvements in the locomotives. It is logical to conclude that the enormous investment in cars may be made more profitable by providing the means for keeping them in shape. By planning car repair shops with some consideration for the observations made above, the results will certainly make for increased efficiency of the mechanics, whose work will, in fact, be changed from an open air occupation, with all the elements of uncertainty peculiar to such work, to modern shop employment of the highest and most satisfactory type. The roads will profit through better workmanship, less frequent delays; improved scheduling of car repairs and lower costs of maintenance.

# Freight Car Loading Continues to Increase

## Strike Talk Partly Responsible for Increase—Principal Increases in Coal and Merchandise

WASHINGTON, D. C.

THE loading of revenue freight during the week ended on October 22 totaled 962,292 cars, or 56,258 cars more than during the previous week, according to reports received by the Car Service Division of the American Railway Association. This was within 46,526 cars or 96

was the largest since October 30, 1920, and presumably includes some increased shipments made in anticipation of a strike.

The gain over the week before was due principally to the increased movement of coal and also merchandise and miscellaneous freight, which includes manufactured products, although increases were reported in the loading of all commodities.

Loading of merchandise and miscellaneous freight amounted to 575,625 cars or 24,817 cars more than during the previous week and 15,787 cars more than were loaded during the corresponding week in 1920. Coal loading totaled 212,219 cars or 20,713 cars more than were loaded during the preceding week. It was, however, 13,731 cars under the total for the corresponding week last year.

There was an increase, compared with the week before, of 3,978 cars in the loading of live stock, the total being 40,188 cars, which was 5,000 more than the total for the corresponding week in 1920 but 1,388 below that for the corresponding week in 1919. Loading of grain and grain products was 51,001 cars, an increase of 2,629 over the week before and 11,521 cars greater than the total for the same week last year. It also was 6,980 cars in excess of the total for the same week in 1919. Ore loadings also increased

per cent of the number loaded during the corresponding week in 1920 and only 14,759 cars less than were loaded during the corresponding week in 1919. The loading for the week

\*Grain and total figures revised due to correction on D. L. & W. report.

3,397 cars over the previous week, the total being 23,186, while loading of forest products amounted to 53,426 cars or an increase within a week of 409 cars. A total of 6,647 cars were loaded with coke, an increase, compared with the week before, of 315 cars.

Compared by districts, increases were reported in the loading of all commodities in all except the Northwestern district while the Pocahontas, Southern, Central Western and Southwestern districts reported increases compared with the corresponding week last year.

The summary is given in the preceding table.

The weekly information bulletin published by the Car Service Division includes the following information:

Bituminous coal moving beyond the lakes via Lake Erie docks aggregated for the season to and including October 15 the total of 20,282,948 tons. This is substantially the same as the record of 1919, a season of similar conditions, and about 1,800,000 tons in excess of the same period in 1920. The indications are that the total for the season will run about up to the record of the past two years.

The bituminous movement via ocean to New England—a real problem if the bulk of the movement is deferred to the winter months—was 5,461,163 tons for the nine months end-

indicate that the 1921 movement is probably ample. The anthracite movement to New England is substantially normal on the basis of past years' records.

There is continued heavy demand for refrigerator cars in the West and Northwest where new records in quantity loading and movement are being made. The following comparisons of loading of perishable commodities by districts for the first nine months this year, compared with the same period last year and with the total for 1920, will be of much interest:

District	Jan. 1, 1921, to Oct. 1, 1921	Jan. 1, 1920 to Oct. 1, 1920	Year 1920
	1921	1920	1920
California .....	136,083	104,638	138,477
Washington & Oregon.....	32,987	19,946	43,666
Colorado, Utah and Idaho.....	20,916	13,306	19,679
Total .....	189,986	137,890	201,822

Box car supply is equal to current demands in all sections, although in the last two weeks there has been a further

marked reduction in the number of serviceable cars reported as surplus. Local shortages that have occurred in sections of the West and Southwest have been reduced by the distribution of cars from other sections.

There have been some shortages of equipment for coal loading caused by the increasing demands of the past few weeks and cars recently loaded not having had sufficient time as yet to be returned to the mines for further loading. Special attention is being directed to the loading, unloading and movement of open top cars, in view of the demand for coal which is in part seasonal and possibly affected to some extent by the threatened interruption of transportation.

The number of bad order freight cars on October 15 was 354,996 or 15.5 per cent, as compared with 15.8 per cent on October 1. The percentage of gondola cars in bad order was 15.6, the same as it was two weeks before. Of all freight cars 284,149, or 12.4 per cent, required heavy repairs and 70,847, or 3.1 per cent, light repairs.

The freight car surplus for the week ending October 23 was 99,971, of which 49,908 were coal cars and 26,624 were box cars.

FOUR MEN WERE KILLED and two were injured when a Canadian-Pacific freight train was caught by falling rock in a tunnel a mile east of Palliser, B. C., on the night of October 20. Heavy rains had caused a movement on the mountain above the tunnel, resulting in extreme pressure on the roof and sides of the tunnel and this is said to have caused the cave-in. The escape of oil from the tender of one of the damaged engines was followed by a fire which destroyed four freight cars. The accident made necessary the construction of a temporary line to detour trains around the tunnel.

ing September 30, 1921, as against 7,124,314 tons in the same period last year. The rail movement to October 15, 1921, was 122,517 cars as against 172,432 in the same period in 1920. It seems reasonable to assume that the much heavier movement a year ago contributed to excessive stocks on hand at the first of the year and this, with the industrial depression which has existed for much of the time since would seem to

# Oldham Sponsor for New Rail Consolidation Plan

## Boston Banker Presents Details to Investment Bankers' Meeting at New Orleans

JOHN E. OLDHAM, of the Boston banking firm of Merrill, Oldham & Co., is sponsor for a new plan of railroad consolidation. Mr. Oldham's plan was presented at the convention of the Investment Bankers' Association of America at New Orleans, La., on November 1. It has also been published by that organization in a booklet of 64 pages illustrated with 13 insert maps in colors.

The plan differs greatly from that presented in Professor W. Z. Ripley's report on consolidations to the Interstate Commerce Commission which report was abstracted in the *Railway Age* of October 1, page 609. It likewise differs to a considerable extent from the original plan presented by Mr. Oldham which was published in the Nation's Business of February, 1920 and later reproduced in pamphlet form by the Chamber of Commerce of the United States.

Mr. Oldham suggests, in his new plan, the formation of 13 systems. A distinguishing feature of his proposals is the formation of a New England system owned by the four trunk line systems which it is purposed to establish.

"Consolidations," Mr. Oldham says, "are necessary in order to establish the finances of the railroads as a whole upon a sound basis. The primary purpose of making the railroads financially sound is to enable them to obtain capital readily and economically. To accomplish this fully other requirements must be met."

"It will be of no avail," Mr. Oldham continues, "to consolidate the railroads in such a way that each road hereafter existing will be enabled to receive, under a uniform rate, its fair return in a competitive field, unless each road is assured of a credit position clearly recognized by the investing public."

Mr. Oldham further says:

### Regulation Necessary to Credit

The requisites of credit are not only financial soundness but a reputation based upon conservative financial policies and management. This reputation at present is possessed only by the strong roads. It will not be secured readily by the weak roads merely by their financial reorganization, although, logically, this is all that is needed to insure the investment integrity of their securities.

Furthermore, if capital is to be obtained upon the most advantageous terms by these roads, their securities must be made available for investment on the part of savings banks, insurance companies, and other semi-public institutions. Their securities, accordingly, must conform to the requirements governing the eligibility of such investments, and these requirements quite universally include, as an essential factor, dividend payments at given rates extending over a considerable period of time. The institutional markets will not be available for the securities of roads which have found it necessary to readjust their capitalization in order to meet sound standards of credit until these roads have established for themselves the necessary record for dividend payments; nor will they be available at any time for the securities of the smaller systems, for these institutions, either because of legislative restrictions or of investment policies, for the most part confine their investments to securities of the larger systems.

To establish the necessary credit position and to give access to the most favorable security markets the strong roads must be used as the backbones of the new systems.

### Consolidation Would Not Destroy

#### Credit of Strong Roads

Much of the opposition to consolidations has been and will continue to be based on the theory that their purpose is to strengthen the weak by weakening the strong roads, and that the credit of the strong roads will thereby be impaired. If this result is to follow, it goes without saying that voluntary consolidation in a large way will never take place.

This conception of the problem, however, proceeds largely on the assumption that the weak roads generally are less favorably situated. It does not take into account the fact that approximately 25 per cent of the country's traffic is handled by systems which are weak only in their capitalization, but are similar to the strong roads both in operating conditions and in favorableness of location, and, if similarly capitalized, would have similar financial strength.

### Sound Financial Structure a Prerequisite

The contention that the credit of the so-called strong roads will be impaired by merging with the weak roads, insofar as it applies to such systems as are here referred to, can be upheld only on the theory that the amount of existing capitalization rather than property value, is to be the controlling factor in determining the basis of consolidations, and that adjustment of capitalization to conform to property value is not to be made at the time or before consolidations take place. Such readjustments, however are required by the provision of the Transportation Act which stipulates that "the bonds at par of a corporation which is to become the owner of the consolidated properties, together with the outstanding capital stock at par of such corporation, shall not exceed the value of the consolidated properties as determined by the Commission." Thus in the process of consolidation over-capitalization will be eliminated wherever it is found.

The problem of consolidations, therefore, has to do largely with the merging of roads whose main difference is a matter of capitalization, inasmuch as the remaining roads—the less favorably situated—handle not over 15 per cent of the country's traffic.

Even the absorption of these roads need not prove a burden, provided proper recognition is given to the property values and relative earning capacity of the several companies involved.

### Difficulties Overestimated

While the complexity of the problem of harmonizing the many interests concerned is fully appreciated, it is sufficient here to say that, if the public interest requires that such consolidations be made, the difficulties of making them on a basis which will fully recognize the rights of all parties appear to be no greater than those which have been met successfully many times heretofore in railroad and industrial consolidations.

### The Thirteen Systems Proposed

Mr. Oldham proposes the formation of 13 systems as follows:

#### 1—NEW YORK CENTRAL SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
New York Central	6,073	\$203,066,842	\$33.423
Cleve. Cin. Chi. & St. Louis	2,483	\$2,904,858	18.000
Michigan Central	1,855	41,756,671	22.512
Pittsburgh & Lake Erie	234	2,550,224	91.545
Toledo & Ohio Central	439	5,736,686	13.078
Cincinnati Northern	246	1,850,991	7.452
Kanawha & Michigan	177	3,297,455	18.672
Lake Erie & Western	940	6,850,306	7.292
Central of New Jersey	683	32,400,917	47.586
New York, Ontario & Western	368	8,854,797	15.611
Ulster & Delaware	127	1,023,519	7.942
	13,678	\$368,354,866	\$26.932

#### Lines at Present Controlled by Twelve Other Systems

*Lehigh & Hudson	97	\$2,053,781	\$21.261
**Memphabala	92	1,690,183	18.260

#### NEW ENGLAND SYSTEM

to be jointly controlled by four of the trunk line systems

Rutland	463	\$3,831,743	\$8.254
Boston & Maine	2,286	51,813,306	22.677
Maine Central	1,220	12,328,910	10.099
Bangor & Aroostook	632	2,955,357	4.676
New York, New Haven & Hartford	1,999	54,700,000	27.348
Central New England	303	4,810,100	15.911
	6,903	\$151,776,614	\$21.988

\*Also in Systems 2, 3, 4.

\*\*Also in System 3.

## 2—BUFFALO SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Erie.....	1,988	\$62,401,580	\$31,392
Chicago & Erie.....	269	7,455,155	27,657
New York, Susque. & Western.....	139	3,340,399	24,075
Wabash**.....	2,519	34,270,522	13,606
Wheeling & Lake Erie.....	512	8,179,049	15,971
Pere Marquette.....	2,273	20,843,657	9,176
New York, Chicago & St. Louis.....	570	13,947,626	24,479
Delaware & Hudson.....	883	25,411,263	28,764
Delaware, Lackawanna & Western.....	956	48,923,528	51,161
Buffalo, Rochester & Pittsburgh.....	586	11,667,747	19,894
Hessamer & Lake Erie.....	205	16,362,886	50,642
Pittsburgh & West Virginia.....	63	1,080,449	17,066
Edgin, Joliet & Eastern.....	789	12,192,426	15,457
Buffalo & Susquehanna.....	253	1,604,078	6,351
	12,004	\$261,680,365	\$20,966

LINES AT PRESENT CONTROLLED BY TWO OR MORE SYSTEMS

*Lehigh & Hudson.....	97	\$2,053,781	\$21,261
-----------------------	----	-------------	----------

## NEW ENGLAND SYSTEM AS ABOVE

to be jointly controlled by four of the trunk line systems

\*Also in Systems 1, 3, 4.  
 \*\*Lines west of St. Louis in Gr. Northern-St. Paul System.

## 3—PENNSYLVANIA SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Pennsylvania Railroad.....	4,559	\$215,428,766	\$47,249
{ Pennsylvania Co.....	1,757	67,119,283	38,206
{ Pittsburgh, Cin. Chi. & St. Louis.....	2,398	59,450,509	24,792
{ Phila., Balt. & Washington.....	717	24,001,572	33,460
Grand Rapids & Indiana.....	573	5,716,575	9,971
Long Island.....	397	14,284,869	35,962
New York, Phila. & Norfolk.....	124	4,620,775	37,246
West Jersey & Seaboard.....	359	7,355,513	20,485
Cumberland Valley.....	164	3,528,025	21,555
Balt. Chesapeake & Atlantic.....	88	1,200,911	13,707
Toledo, Peoria & Western.....	248	1,220,565	4,927
	11,384	\$403,933,363	\$35,481

LINES AT PRESENT CONTROLLED BY TWO OR MORE SYSTEMS

*Lehigh & Hudson.....	97	\$2,053,781	\$21,261
**Monongahela.....	92	1,690,183	18,290
†Richmond, Fred. & Potomac.....	88	3,475,207	39,635
††Washington Southern.....	36	1,647,852	46,327

## NEW ENGLAND SYSTEM AS ABOVE

to be jointly controlled by four of the trunk line systems

\*Also in Systems 1, 2, 4.  
 \*\*Also in System 1.  
 †Also in Systems 4, 5, 6, 7.  
 ††Also in Systems 4, 5, 6, 7.

## 4—BALTIMORE—READING SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Baltimore & Ohio.....	4,540	\$168,665,110	\$37,935
Staten Island Rapid Transit.....	24	1,551,246	65,898
Philadelphia & Reading.....	1,105	55,803,929	49,614
Port Reading.....	21	1,818,575	85,944
Atlantic City.....	170	2,566,796	15,083
Coal & Coke.....	197	1,100,109	5,576
Ann Arbor.....	296	2,661,519	9,001
Cincin. Indianapolis & Western.....	322	2,427,850	7,703
Western Maryland.....	494	10,791,912	15,539
Toledo, St. Louis & Western.....	454	5,560,324	12,260
Lehigh Valley.....	1,443	47,023,053	32,576

†Richmond, Fred. & Potomac.....	88	3,475,207	39,635

## NEW ENGLAND SYSTEM AS ABOVE

to be jointly controlled by four of the trunk line systems

\*Also in Systems 1, 2, 3.  
 \*\*Also in Systems 3, 5, 6, 7.  
 †Also in Systems 3, 5, 6, 7.

## 5—NORFOLK &amp; WESTERN—CHESAPEAKE &amp; OHIO

Name	Mileage	Gross Earnings	Gross Per Mile
Chesapeake & Ohio.....	2,375	\$46,322,284	\$19,504
Hocking Valley.....	351	7,632,572	21,763
Norfolk & Western.....	2,062	53,800,498	26,090
Virginia.....	507	7,949,455	14,945
Carolina, Clinchfield & Ohio.....	271	2,853,624	10,517
	5,566	\$118,180,293	\$21,233

LINES AT PRESENT CONTROLLED BY TWO OR MORE SYSTEMS

*Washington Southern.....	36	\$1,647,852	\$46,327
†Richmond, Fred. & Potomac.....	88	3,475,207	39,635

\*Also in Systems 3, 4, 6, 7.  
 †Also in Systems 3, 4, 6, 7.

## 6—ATLANTIC COAST LINE—LOUISVILLE &amp; NASHVILLE SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Atlantic Coast Line.....	4,718	\$39,464,175	\$7,517
Louisville & Nashville.....	5,052	60,597,491	11,994
Nashville, Chattanooga & St. Louis.....	1,233	12,613,336	10,232
Charleston & West Carolina.....	342	1,925,040	5,631
Louisville, Henderson & St. Louis.....	290	1,655,678	8,287
Georgia.....	330	3,100,457	7,583
Atlanta & West Point.....	93	1,373,126	14,746
*Chicago, Indianapolis & Louisville.....	327	3,836,962	11,734
	12,295	\$120,716,949	\$9,819

LINES AT PRESENT CONTROLLED BY TWO OR MORE SYSTEMS

**Washington Southern.....	36	\$1,647,852	\$46,327
†Richmond, Fred. & Potomac.....	88	3,475,207	39,635
††Western Railway of Alabama.....	133	1,341,130	10,061

\*\*Also in Systems 3, 4, 5, 7.  
 †Also in Systems 3, 4, 5, 7.  
 ††Also in System 13.

This road will be jointly controlled by the Atlantic Coast Line-Louisville &amp; Nashville System and the Southern System, one-half of the mileage and figures being used in each system.

## 7—SOUTHERN SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Southern.....	7,018	\$71,974,418	\$10,256
Mobile & Ohio.....	1,135	11,903,351	10,487
Alabama Great Southern.....	138	3,585,318	17,986
Southern Railway in Mississippi.....	280	3,100,457	3,933
Cincinnati, New Orleans & Texas Pacific.....	337	10,983,183	32,565
New Orleans & Northeastern.....	204	3,859,727	18,946
*Chicago, Indianapolis & Louisville.....	327	3,836,962	11,734
Alabama & Vicksburg.....	142	3,761,714	11,024
Vicksburg, Shreveport & Pacific.....	171	1,667,937	9,729
Florida East Coast.....	741	7,206,392	9,725
Seaboard.....	3,446	24,926,111	7,234
Georgia Southern & Florida.....	400	2,486,248	6,218
	14,512	\$147,231,863	\$10,145

LINES AT PRESENT CONTROLLED BY TWO OR MORE SYSTEMS

**Washington Southern.....	36	\$1,647,852	\$46,327
†Richmond, Fred. & Potomac.....	88	3,475,207	39,635

\*\*Also in Systems 3, 4, 5, 6.  
 †Also in Systems 3, 4, 5, 6.

This road will be jointly controlled by the Southern System and the Atlantic Coast Line-Louisville &amp; Nashville System, one-half of the mileage and figures being used in each system.

## 8—GREAT NORTHERN—ST. PAUL SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Great Northern.....	8,094	\$78,548,635	\$9,704
*Spokane, Portland & Seattle.....	277	2,569,401	9,264
Chicago, Milwaukee & St. Paul.....	10,222	103,164,598	10,093
Wabash.....	390	10,552,080	77,052

Duluth & Iron Range.....	279	6,043,443	21,697
St. Louis-San Francisco.....	4,751	47,113,030	9,917
St. Louis, San Francisco & Texas.....	239	1,165,568	4,869
**Chicago & Alton.....	526	8,318,512	15,817
	24,778	\$257,475,267	\$10,391

This road will be jointly controlled by the Great Northern-St. Paul System and the Northern Pacific-Burlington System, one-half of the mileage and figures being used in each system.

This road will be jointly controlled by the Gr. Northern-St. Paul System and the Union Pacific-North Western System, one-half of the mileage and figures being used in each system.

Lines of this system west of St. Louis. Lines east of St. Louis and total figures are shown in the Buffalo System.

## 9—NORTHERN PACIFIC—BURLINGTON SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Northern Pacific.....	6,502	\$74,857,279	\$11,514
*Spokane, Portland & Seattle.....	277	2,569,401	9,264
Colorado & Southern.....	1,100	8,810,988	8,012
Fort Worth & Denver City.....	454	5,797,831	12,767
Chicago, Burlington & Quincy.....	9,650	103,814,782	11,091
Colorado Midland.....	338	1,615,559	4,875
Trinity & Brazos Valley.....	351	1,002,119	2,853
Wichita Valley.....	257	1,001,372	3,903
Chicago Great Western.....	1,460	15,157,101	10,383
Denver & Rio Grande.....	2,574	21,763,649	9,621
Western Pacific.....	945	7,458,061	7,894
Kansas City Southern.....	836	11,023,296	13,185
{ Texasiana & Ft. Smith.....			
	24,454	\$257,872,438	\$10,545

This road will be jointly controlled by the Great Northern-St. Paul System and the Northern Pacific-Burlington System, one-half of the mileage and figures being used in each system.

## 10—UNION PACIFIC—NORTH WESTERN SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Union Pacific.....	3,619	\$61,986,599	\$17,126
Oregon Short Line.....	2,335	24,780,279	11,087
Oregon-Washington & Navigation.....	2,032	11,075,453	8,829
Los Angeles & Salt Lake.....	1,158	11,075,453	9,566

St. Joseph & Grand Island.....	260	1,908,985	7,340
*Central Pacific.....	471	4,194,169	11,391
Chicago & North Western.....	8,108	91,542,024	11,391
Chicago, St. Paul, Minneapolis & Omaha.....	1,753	19,506,801	11,129
**Chicago & Alton.....	526	9,318,512	15,817
Missouri, Kansas & Texas.....			
Mo., Kans. & Tex. of Texas.....	3,865	35,340,021	9,144
Wichita Falls & Northwestern.....			
	23,556	\$272,398,836	\$11,564

\*The Central Pacific has been placed with the Union Pacific-North Western System, but the figures of the Central Pacific are included with those of the Southern Pacific System.

\*\*This road will be jointly controlled by the Union Pacific-North Western System and the Great Northern-St. Paul System, one-half of the mileage and figures being used in each system.

#### 11-ATCHISON SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
Atchison, Topeka & Santa Fe.....	8,627	\$114,019,747	\$13,217
*Northwestern Pacific.....	471	4,194,169	9,989
Panhandle & Santa Fe.....	709	5,387,362	7,592
Gulf, Colorado & Santa Fe.....	1,937	16,296,448	8,411
*Chicago & Eastern Illinois.....	567	8,178,620	14,415
Texas & Pacific.....	194	19,834,671	10,199
New Orleans, Texas & Mexico.....	244	1,503,574	6,167
St. Louis, Brownsville & Mexico.....	548	3,221,309	5,876
International & Great Northern.....	1,160	10,107,915	8,718
Missouri Pacific.....	7,348	66,076,724	8,992
St. L. Iron Mt. & Southern.....			
	23,557	\$248,820,539	\$10,562

\*This road will be jointly controlled by the Atchison System and the Southern Pacific System, one-half of the mileage and figures being used in each system.

#### 12-SOUTHERN PACIFIC SYSTEM

Name	Mileage	Gross Earnings	Gross Per Mile
*Southern Pacific.....	6,991	\$115,870,170	\$16,575
Arizona.....	374	3,304,083	8,835
Galveston, Harlingen & San Antonio.....	1,356	14,167,759	10,450
Houston & Texas Central.....	893	7,022,858	7,863
Texas & New Orleans.....	468	4,683,962	9,998
Houston East & West Texas.....	191	1,532,556	8,027
Louisiana Western.....	208	2,580,656	12,422
Morgan's Louisiana & Texas.....	403	4,999,346	12,398
Kansas City, Mexico & Orient.....	738	2,522,892	3,420
San Antonio & Aransas Pass.....	728	4,003,622	5,500
Chicago, Rock Island & Pacific.....	7,821	74,724,444	9,554

#### Joint Control of New England System

One of the important features of the grouping of the eastern roads in Mr. Oldham's plan is the provision for the joint control of the New England railroads by the four principal eastern systems, all of which reach the New England gateways. On this point, Mr. Oldham says:

The division of the New England roads among the various trunk lines (for example, assigning the Boston & Maine to the proposed New York Central System or the Buffalo System; or the New York, New Haven & Hartford to the Pennsylvania System or the Baltimore-Reading System) would greatly restrict if not entirely eliminate competition and create a monopoly in the respective parts of New England. To preserve and to promote competition to the fullest extent among the roads in the Eastern district west of the Hudson River, with which traffic is interchanged, as well as to maintain the existing routes and channels of trade and commerce,

which these roads offer, a common use of all railroad facilities within New England must be preserved for all these systems without discrimination. While the joint ownership or control of the New England lines is not essential in order to maintain the common use of these facilities, so far as competition is concerned, it is essential, nevertheless, to assure facilities adequate to meet the transportation requirements of the district of which they are a part, for sound credit is necessary to maintain adequate facilities, and sufficiency and stability of income are equally necessary to maintain sound credit.

The number of roads involved, the variety of the tonnage interchanged, the differences in the length of haul, and countless other factors make a satisfactory determination of the fair division of the compensation received from this traffic a problem so complex as to be impossible. To what extent the income of the New England roads falls short of an amount sufficient to provide a fair return on their property values, because of unsatisfactory division of joint rates, and to what extent this shortage is due to other factors, it is impossible to say; nor would it be a matter of consequence if there were a common ownership of these properties by all the remaining roads in the same rate-making district, for by the provisions of the Transportation Act it is not essential that all parts of each system, if commonly owned, should be equally self-sustaining, for rates are designed to meet the combined requirements of all systems in the district considered as a whole.

#### Control of New England Roads

##### No Burden to Controlling Systems

The ownership and control of the New England roads by these systems—each participating in the ownership in proportion as it benefits by including the New England roads in the district for rate making purposes—would prove no burden to these systems, for the dividends on the additional stock, which it would be necessary to issue to acquire control, would be provided by the increased income received through rates, which are higher because of the inclusion of the factors of cost and property values of the New England roads in the determination of the rates for the whole.

Such a solution of the problem would be the most effective means of preserving and of promoting competition; of maintaining the existing routes of commerce; of providing the credit necessary to assure such facilities as would enable the New England roads to perform the service required of them, not only for New England but for the country at large.

#### Practicability of Plan

This is not the place to discuss a detailed plan for the transfer of the control of New England roads to these systems. A brief statement will, however, show its practicability. First of all, it would be necessary to determine the equitable interest of each of the New England roads in a unified New England system, and to make such readjustments of capitalization as are necessary to establish substantial uniformity in the financial structures of each of the New England roads. The next step would be to form a holding company, whose stock would be used to acquire the stocks of the New England roads. These stocks could in turn be exchanged by the holding company for stocks of the four systems which are to participate in the joint ownership, the extent of participation of each system being determined largely by the benefit which it would receive by including the New England roads in the same rate-making district. As owners of the stocks of these four systems, the holding company would receive income with which to pay dividends to its own stockholders, the original holders of the New England railroad stocks.

This method of meeting the New England problem has been referred to as remote, inasmuch as the systems which are to purchase control exist only on paper and there is no assurance that the proposed consolidations will ever take place. Pending such consolidations a similar plan of ownership could become operative by dealing with the nine trunk line systems with which business is interchanged. The freight revenues of these nine systems are over 80 per cent of the total of the district, excluding the New England and Louisiana district. These roads are the principal ones concerned in the division of joint rates, and are also the largest beneficiaries of the higher rates which are made to cover the requirements of the New England roads. The exchange of stocks with these roads on the basis outlined would involve less than 20 per cent of the stocks of the New England roads in the treasury of the holding company unexchanged, this stock could be held until such time as the remaining roads in the district were absorbed by the various systems, and then exchanged on a similar basis.

# Railway Statistics for Year Ending August 31, 1921

WASHINGTON, D. C.

STATISTICS for the 12 months ending August 31, 1921, compiled by the Bureau of Railway Economics from the returns of the Class I railways to the Interstate Commerce Commission, afford some interesting comparisons of the experience of the first full year under the increased rates put into effect by the Interstate Commerce Commission on August 26, 1920, and also the first year during which the roads operated on their own financial resources after their return by the government, with the previous 12 months, during which the roads were operated by the Railroad Administration for six months and were guaranteed at the same rate for another six months. These statistics show that while, because of the slump in traffic, the full benefits of the rate increase were not realized, the roads still earned more than they did before under the lower rates, and that while they were unable to reduce expenses in proportion to the reduction in traffic, partly because of the wage increase, the expenses were less than they were the year before.

## Public Pays Less

They also show that while the operating results were more favorable than during the preceding year (taking the figures as they stand and without considering the amount of deferred maintenance) and although freight rates were approximately 33 per cent and passenger rates 20 per cent higher, so that the earnings of the roads were greater, the public actually paid about \$558,000,000 less to the railways during the year ended August 31, 1921, than during the year before. During the previous year in addition to the rates for freight and passenger service the public was paying, largely out of the proceeds of taxation, a guaranty of some \$906,000,000 a year in addition to the \$5,725,000,000 represented by the total operating revenues of the carriers. The freight and passenger service rendered by the roads was, however, less than for the year before.

For the year ending August 31, 1921, during which there was no guaranty, the total operating revenues of the Class I roads were \$6,045,338,100 as compared with \$5,724,912,265 for the year before, an increase of \$320,425,835 or 5.6 per cent. Freight revenues were \$4,279,028,733, an increase of 9.6 per cent, and passenger revenues were \$1,258,394,376, an increase of 2.8 per cent. The railways actually earned greater revenues during the first full year in which the advanced rates were in effect than they did the year before, in spite of the decrease in traffic, although when the months of 1921 alone are taken into consideration, omitting

the heavy traffic months of August, September, October, November and December, 1920, the revenues were somewhat less than during the corresponding months of 1920.

## Operating Expenses Reduced

Total operating expenses for the year were \$5,161,760,829, a reduction of \$218,876,981 as compared with the preceding year, or 4.1 per cent. Expenditures for maintenance of way and structures decreased 12.3 per cent and for maintenance of equipment 7.1 per cent, while transportation expenses were reduced only 1.1 per cent and traffic expenses increased 33.8 per cent and general expenses increased 12.8 per cent. The net operating revenue, \$883,577,271, showed an increase of \$539,302,816, or 156 per cent, but

REVENUES, EXPENSES AND NET RAILWAY OPERATING INCOME

Nov., 1920....	592,130,728	310,301,352	54,547,793
Dec., 1920....	550,582,381	303,206,889	10,225,583
Jan., 1921....	470,148,124	443,700,662	Def. 958,399
Feb., 1921....	405,784,852	385,479,607	Def. 7,378,307
Mar., 1921....	459,262,510	400,429,308	30,695,192
April, 1921....	433,357,199	375,698,986	29,448,874
May, 1921....	444,875,089	380,041,234	37,080,654
June, 1921....	461,562,317	380,927,429	51,641,014
July, 1921....	462,849,446	362,841,183	69,298,521
Aug., 1921....	505,508,274	382,279,070	90,241,103
	\$6,045,338,100	\$5,161,760,829	\$530,655,927
			2.9

taxes took \$283,331,368, an increase of 10.4 per cent, and the net railway operating income was \$530,655,927 as compared with only \$28,548,077 in the previous year. The operating ratio for the year was 85.38 as compared with 93.99 the year before.

Although the net railway operating income represented less than half of the 6 per cent return contemplated by the law, the results show that the relation between expenses and earnings was far better than it was in the previous year, during half of which time the roads were being operated by the government and the other half they were under the six months' guaranty provided by the Transportation Act.

The difference between the \$28,000,000 which was actually earned in the year ending August 31, 1920, and the approximately \$906,000,000 which was guaranteed by the government, or \$878,000,000, therefore has to be made up by taxation and may be added to the \$5,725,000,000 which was paid to the roads for service to ascertain what railroad service actually cost the public for that year.

## Net Return 2.9 Per Cent

The net return earned by the roads for the year ending August 31, 1921, was 2.9 per cent on the investment, as

a Mail revenue affected in 1920 period of approximately \$60,000,000, representing back railway mail pay. d Decrease. \*More than one thousand per cent.

compared with only a fraction of 1 per cent the year before. This was \$571,342,073 less than the amount needed to produce a 6 per cent return. For September, 1920, the first month under the new rates, the net railway operating income was on an annual basis of 4.1 per cent. For October it was 4.6 per cent but it then decreased until for January there was a deficit and in February there was a larger deficit. Since then the rate of return has been gradually increasing and for the month of August it was on a 5 per cent basis. For no month since the rates were increased has the rate of return reached a 6 per cent basis, although the volume of traffic for the last four months of 1920 was greater than it had ever been for the same period of the year.

#### Maintenance Expenditures Held Down

The net operating income for the year was, however, greater, than it was during either 1918 or 1919 while the roads were under federal control, although during those years the companies were guaranteed. The reduction in operating expenses of \$218,876,981 was made in spite of the fact that the increased wages awarded by the Railroad Labor Board in 1920 were in effect until July 1, 1921, when there was a reduction of approximately 12 per cent effective for two months of the 12 here being considered.

The lesser volume of traffic naturally tended to reduce

expenses somewhat, although the figures show that there was very little saving in transportation expenses as the percentage of increase in wages was greater than the percentage of decrease in traffic. The reduction in maintenance alone was \$225,000,000 and if this had not been made the net return would have been nearly cut in two.

Traffic and operating statistics for the year ending August 31, 1921, are not yet completely available. The train miles showed a decrease of 9.6 per cent and the total car miles a decrease of 6.4 per cent. The loaded car miles decreased 14.8 per cent and the empty car miles increased 14.8 per cent. The net ton-miles of freight, 377,873,635,000, show a reduction of 14 per cent. The average number of cars per train was 36.8 as compared with 35.6 the year before but the average train load was only 671 as compared with 705, although the net tons per loaded car showed an increase from 28.4 to 28.8. The percentage of loaded to total cars was 63.2 as compared with 70 the year before. The car miles per car day also were less than the year before, 23.5 as compared with 24.3. The passenger and passenger mile figures have not yet been compiled but the passenger train miles decreased 2.2 per cent and the passenger car miles increased 5 per cent. For the first seven months of 1921 the passengers carried one mile decreased 17.2 per cent as compared with 1920.

## Designing Locomotives for Economical Operation\*

### Avoiding Waste by Reducing Fuel Consumption and Repair Costs and Eliminating Unnecessary Weight

By James Partington

Estimating Engineer, American Locomotive Company

IT SEEMS advisable to consider this subject from the constructive standpoint of indicating what constitutes good design as demonstrated by locomotives in actual service, rather than to attempt to point out the defects in locomotives which do not show maximum efficiency. If any power plant or engine is not properly proportioned for the work it has to do, the most expert skill in operation can reduce only in part the waste resulting from having such equipment in service.

First, considering the design of steam locomotives from the standpoint of new equipment, when a railroad company is in the market for new locomotives its requirements may

be met sometimes by duplicating locomotives in service on their road, but adding newly developed attachments which make for increased efficiency and economy. More frequently, however, it will be found that increased traffic, change from wooden to steel cars, improvement in track, roadbed and bridges, etc., will justify and make advisable the adoption of locomotives of a larger and more powerful type.

Then careful consideration must be given to service requirements—maximum loads to be hauled, capacity of cars, approximate proportion of loaded to empty cars per train, grades, curves, running time over divisions, maximum allowable load per axle, location of coal chutes and water tanks, clearances, conditions under which trains must be started, and any other special requirements of the service.

Having determined the drawbar pull necessary, it remains

\*A paper to be presented at the meeting of the Railroad Division of the American Society of Mechanical Engineers at New York City on December 9, 1921.

Experimental Pacific Type No. 50,000, Which Established New Records for Power per Unit of Weight

to design a locomotive that will have the following efficiency requirements:

- 1 A drawbar horse power for the minimum amount of fuel.
- 2 A drawbar horsepower for the minimum amount of weight of locomotive and tender.
- 3 A drawbar horsepower for the minimum cost of repairs.

### Fuel Economy

As standard practice in modern locomotives, a sectional brick arch in the firebox and a fire-tube superheater should be applied as a means of saving fuel in any class of service. A sectional brick arch is low in first cost, easily applied and easily renewed. It usually accomplishes a fuel saving of from 10 to 12 per cent in coal-burning engines, and about 5 per cent in oil-burning engines.

The very general use of superheaters has gradually brought about improved conditions of cylinder lubrication which now make it possible and desirable for the greatest economy to use a high degree of superheat, 250 to 300 deg. F. now being considered the best practice. A saving of 25 to 30 per cent can be obtained.

The use of feedwater heaters will further conserve fuel, and these are now in general use in continental Europe and are gradually being applied to locomotives in the United States. The saving that can be realized is as much as 12 per cent. The initial cost is considerable, but the effect of

The arrangement of deflector plates and netting in the smoke-box should be carefully adapted to the fuel and combustion conditions, to provide minimum fuel waste and minimum back pressure in the cylinder-exhaust passages with proper provision against fire hazards which might obtain by the throwing of sparks.

The boiler being designed to produce steam at a minimum cost, it is now necessary to design the engine to use this steam with maximum economy.

The cylinder proportions and diameter of the drivers should be such as will develop maximum horsepower at the ruling speeds for train movements. The greatest horsepower of locomotive cylinders will usually be developed within a piston speed ranging from 700 to 1000 ft. per min. Therefore, if other traffic conditions will permit, the operation of trains within these limits should show the greatest economy.

### Minimum Weight of Motive-Power Equipment

The weight on the locomotive drivers gives an engine friction, independent of other factors, of 22 lb. per ton. The desirability of avoiding excess weight on the drivers from this standpoint alone is therefore readily apparent. When the type of engine will permit, this weight should not exceed what is necessary to give a satisfactory factor of adhesion; this is usually  $4\frac{1}{4}$  times the maximum tractive power. All weight in excess of this and all other excess weight and excess tender weight should be eliminated, as far as this can

Virginian 2-10-10-2 Type, the Most Powerful Locomotive in the World

the feedwater heater in operation, aside from fuel economy, will be to help reduce other boiler-maintenance charges.

The general proportions of the boiler should also receive careful consideration. For the best results with bituminous coal, the length of the boiler tubes should be approximately within the following limits:

Size of tube, in.	Distance over tube sheet
2	18 ft. 0 in. to 19 ft. 6 in.
$2\frac{1}{4}$	22 ft. 6 in. to 24 ft. 6 in.
$2\frac{1}{2}$	28 ft. 0 in. to 30 ft. 0 in.

For many designs of locomotives, a combustion chamber can be provided, and this will help further in the economical production of steam. A generous steam space should be provided, and the throttle designed and located to secure dry steam. The evaporative capacity of the boiler should be as nearly 100 per cent of the maximum steam requirements of the cylinders as the type of locomotive will permit. Based on 100-per cent boiler, the grate area should be sufficient to prevent the maximum coal consumption per sq. ft. of grate per hour from exceeding, for bituminous coal, 120 lb., and for anthracite coal, 55 to 70 lb., depending on size.

When the total coal consumption exceeds 6000 lb. per hr., it is generally necessary to apply an automatic stoker. These have now been so adapted to locomotive requirements that a properly designed stoker will show economy over hand firing, aside from the necessity of its use on account of the coal consumption being greater than the physical capacity of one fireman if the boiler were hand-fired.

be done without detriment to the design of engine and tender. This applies with particular force to the machinery parts of the engine, especially those parts which affect the counterbalance. All saving in weight in these parts usually produces a similar saving in counterbalance weights and a reduction in the dynamic augment, which is very desirable from the standpoint of track and roadbed maintenance.

The use of special materials to keep down weight is often amply justified if repair parts can be obtained promptly when required. This, in the past, has often been the cause of delay, but it can be guarded against by carrying a few spare parts in stock ready for renewals. High-tensile alloy steel can frequently be used to advantage for driving axles, crank pins, main and side rods, piston rods, etc.

Occasional steel grades or hard starting conditions at stations may cut down the hauling capacity of locomotives over a division to a serious extent. In such cases, the utilization of the weight on trailer trucks for additional tractive power in starting and at slow speeds may increase the capacity of the locomotive from 10 to 25 per cent, depending on the number of driving wheels and working pressure. It has been demonstrated that a separate steam engine or booster geared to the trailing axle will give this additional traction, and that it can be cut in or cut out very satisfactorily as occasion may require.

This is an item in economical operation worthy of consideration where hauling capacity is restricted by such limitations, and the use of an independent booster may often permit the satisfactory operation of considerably lighter locomotives for service of this character.

Within the limits of this paper, only the major features of design can be outlined briefly, and only such devices as have been carefully tried out and are in successful operation are cited. The writer believes the savings mentioned are well within what may be obtained in practice.

Many other improvements promising further economy in the generation and use of power in the steam locomotive are contemplated and in the experimental stage, but these do not properly come under the scope of our subject as here treated.

### Cost of Repairs

It has been pointed out that locomotives and tenders should be designed to produce the required drawbar horsepower with as little excess weight as possible. In this connection, however, due consideration must be given to the question of repairs.

The design of boilers from the standpoint of weight is practically fixed by existing boiler regulations, which provide that locomotive boilers must be operated with a factor of safety of not less than four. Practically all boilers at the

conditions of individual railroads is necessary to secure equipment best suited to the needs of each.

### Old Motive-Power Equipment

Much waste in locomotive operation can be avoided by making a careful survey of present motive-power equipment which is not giving as economical or efficient service as could be obtained if the engines were modernized. This applies particularly to locomotives where the service conditions demand more power than the present equipment can economically produce. All the suggestions made in regard to the design of new equipment are applicable to a greater or less degree to old equipment, providing the old equipment is not meeting the demands of the service from a power standpoint, or is not furnishing this power economically.

In making a survey of this character care should be taken to determine accurately whether the old equipment will warrant the additional cost of changes and betterments necessary to convert it into up-to-date power. This can be decided by taking the number of years the engines will be retained in

Pennsylvania Decapod with Short Maximum Cut-off, Which Shows Remarkable Economy Over a Wide Range

present time are designed with a factor of safety of  $4\frac{1}{2}$ , which leaves a comfortable margin between this and the minimum allowable operating factor.

The maximum stresses in other parts of the locomotive must also be carefully considered, and the parts must be designed to keep these stresses within limits which will eliminate costly failures in service.

Aside from the consideration of stresses, much repair cost can be avoided by adopting designs which reduce the number of parts, as far as reasonably may be, especially where these parts must have bolted connections. Here, however, care must be taken to avoid construction which cannot readily be removed for repairs or renewals or repaired in place with reasonable facility.

Many roads today are giving a great deal of thought to locomotive design along these lines, having especially in mind the desirability of making the engine parts accessible for oiling and inspection; easily removable with proper shop facilities; of the minimum number of pieces and interchangeable with equipment now in service.

The repair-shop facilities must, of course, be kept abreast of the requirements; i. e., as new and larger locomotives are put in service, turntables, cranes, machine tools, etc., must be of sufficient capacity to handle the larger equipment economically.

The repairs of locomotives can often be facilitated and the necessary shop equipment kept down to the minimum by securing from the locomotive builder many parts which he is able to turn out more accurately and more economically than the average railroad shop would be equipped to do. Such parts include: flanged sheets for boiler repairs; flexible and ordinary staybolts; finished bolts and nuts; drop forgings; packing rings for pistons and piston valves and special equipment which requires special tools for its production.

Without attempting to pursue further the design of new locomotives it may be remarked that a study of the special

service and the increased net return or saving for this period as against the cost involved for changes, interest on the additional investment, increased maintenance, etc.

A comparison should also be made with the results that could be realized by the purchase of new equipment best adapted for the service, as against the cost of contemplated changes in the old equipment.

If these comparisons show a saving in favor of modernizing the old equipment or the purchase of new equipment, every month that the engines are kept in service without doing this will result in a loss that is not recoverable. A few concrete examples of what has been accomplished in service by locomotives designed to yield maximum efficiency may be of advantage. Notable designs, for which data is available, are as follows:

Pacific type passenger locomotive No. 50000 built by the American Locomotive Company; decapod type freight locomotive, Class Hs; built by the Pennsylvania Railroad and heavy Mallet special service locomotive built for the Virginian by the American Locomotive Company

### American Locomotive Company Engine No. 50000

Locomotive 50000 was built by the American Locomotive Company in 1910. It was designed and constructed at the builder's expense to demonstrate the maximum tractive power with adequate boiler capacity that could be obtained while keeping the adhesive weight below 60,000 lb. per driving axle.

Untrammelled by any outside specifications or the necessity of conforming to any railroad's existing standards, the builders had a free hand to embody in this design their ideas of the best engineering practice. To accomplish the purpose of the design—the maximum capacity per pound of weight—the largest boiler capacity within the predetermined wheel loads was the essential feature.

This end was obtained by eliminating every pound of

of this engine, made on the testing plant at Altoona. (Bulletin 31, P. R. R. Testing Plant 1919, copyrighted.) This test shows a water rate of 15.4 lb. per i.h.p. hour with a total i.h.p. of 3,080 at 40 per cent cut off and a coal consumption of 2.9 lb. The lowest coal consumption recorded is 2.00 lb. per i.h.p. hour, obtained at an output of 1,777 i.h.p. and a cut off of 30 per cent.

The thermal efficiency of the locomotive is also high and well sustained over a large range, a maximum of 8.1 per cent being attained at an output of 1,777 i.h.p., and the range being from 6.1 per cent at 776 i.h.p. to 5.3 per cent at 3,486 i.h.p. with an average of over 7 per cent for the usual operating conditions.

The highest drawbar pull recorded in these tests is 76,211 lb. at a speed of 7.4 m.p.h., but in road service a pull of 80,640 lb. has been recorded at 7.2 m.p.h. The indicated tractive effort plotted from a card taken at 7.4 miles per hour at 55 per cent cut off is slightly over 90,000 lb.

This design gives a calculated figure of 88.9 lb. per cylinder horse power, the lowest on record. During the tests an indicated horse power of 3,486 was developed, giving a weight of 106.2 lb. per horse power. The weight per boiler horse power does not compare as favorably, however, as it is 145.4 lb. The Belpaire firebox contributes materially to this excess.

### Virginian 2-10-10-2 Type Locomotives

The large 2-10-10-2 Mallet engines for the Virginian were designed to meet their unique conditions. This road was built as an outlet to certain bituminous coal fields of West Virginia. Practically the entire revenue business is confined to hauling coal to the shipping docks at Sewall's Point, the west-bound revenue freight being negligible in amount, as only one town of any importance, Roanoke, is located on the line. As the development of the coal fields proceeded the tonnage to be handled increased rapidly, rising from 2,141,009 in 1911 to 7,621,555 in 1920, and in order to handle the business at a profit the maximum attainable capacity in motive power was demanded. Having fixed on 100 cars as the maximum number that could safely be handled in a single train, the car capacity increased to 120 tons, it was estimated that a locomotive of 147,000 lb. tractive power would be needed to haul the train from Princeton to tidewater, a helper being used for a grade of .6 per cent ten miles long over the Alleghenies. The 2-10-10-2 Mallets were designed to meet these conditions and their operation has been very successful. They have handled trains of 16,000 tons on a .2 per cent grade with the lowest consumption of coal per ton mile ever recorded. Unfortunately, accurate tests of coal and water per dynamometer horse power are not available owing to the fact that there is no dynamometer of adequate capacity to be had at present.

However, on May 25, a train of 15,725 tons behind the tender was hauled from Princeton to Roanoke at a rate of 26.9 lb. of coal per 1,000 ton-miles, and on May 27 a 75 car train of 12,070 tons showed the same figure for coal per thousand ton-miles.

One of these engines has hauled a train of 110 cars weighing 17,250 tons from Victoria to Sewall's Point, which is believed to be the heaviest train ever handled by one engine. The ruling adverse grade was .2 per cent.

The principal dimensions of the three locomotives cited and a comparison of the horse power characteristics—calculated by the American Locomotive Company's method—are embodied in the following table:

MODERN MAXIMUM EFFICIENCY LOCOMOTIVES

Road	No. 50000	Virginian	Pennsylvania
Type	Erie 4-6-2	2-10-10-2	2-10-10-2
Fuel	Bituminous coal	Bituminous coal	Bituminous coal
Boiler, type	Conical connection	Extended wagon	Conical connection
Boiler, diameter	76½ in. 87 in.	105½ in. 118½ in.	87-90½ in.
Weight on drivers, lb.	172,500	617,000	342,050
Weight on truck, lb.	49,000	29,750	32,000

Road	Virginian	Pennsylvania
Type	2-10-10-2	2-10-10-2
Fuel	Bituminous coal	Bituminous coal
Boiler, type	Conical connection	Extended wagon
Weight, total, lb.	269,000	371,800
Driving wheel diam.	79 in.	56 in.
Cylinders	27 in. by 28 in.	30 in. and 48 in. by 32 in.
Boiler pressure, lb. per sq. in.	185	215
Tractive power, lb.	40,600	147,200
Factor of adhesion	4.5	4.68
Cylinder horse power	2,427	5,040
Grate, length and width	114 in. by 75½ in.	144 in. by 108½ in.
Tubes, number	59	381
Tubes, length	22 ft. 0 in.	25 ft. 0 in.
Tubes, spacing	14 in.	7½ in.
Tubes, thickness	No. 11 B.W.G.	No. 11 B.W.G.
Tubes, diameter	2¼ in.	2¼ in.
Flues, number	36	70
Flues, diameter	5½ in.	5½ in.
Flues, thickness	3/16 in.	No. 9 B.W.G.
Combustion chamber—length	Nine	36 in.
Brick arch	Security	Gaines
Heating surface—firebox, sq. ft.	248	532
Heating surface tubes—water side, sq. ft.	2,672	5,592
Heating surface flues—water side, sq. ft.	1,136	2,511
Heating surface total, sq. ft.	4,056	8,635
Boiler horse power	2,250	4,800
Steam rate, lb. per hp. hour	20.8	19.7
Coal rate, lb. per hp. hour	3.25	3.1
Superheater, number of units	36	70
Superheater, diameter	1½ in.	1½ in.
Superheater, heating surface	879	2,120
Tender weight in running order, lb.	161,500	214,300
Tender capy. coal, ton	14	12
Weight of locomotive in lb. per cylinder hp.	110.6	135.7
Weight of locomotive in lb. per boiler hp.	119.6	142.5
Steam rate—lb. per hp. hour	16.5	15.4
Coal rate—lb. per hp. hour	2.12	2.0

Can't Expect Much Rhythm of the Dancers Until the Orchestras Get Together

# How to Better Bad Railroad Conditions

## Do Railway Officers Spend Too Much Time Lobbying in Washington and Not Enough in Managing the Properties?

By George N. Brown

Formerly Chief Examiner of the Interstate Commerce Commission

**H**ABIT, or state of mind, is responsible for many things in the conduct of the daily lives of men. So with the railroads of the country. Their managers have acquired the habit of going to the government for everything they desire. In carrying out that state of mind railroad managers, during the past decade have stood about the street corners in the region of the Interstate Commerce Commission or the Capitol in Washington with hats in hand asking for more.

The trouble with the railroad transportation systems of the country is that the managing heads have lost their initiative. They refuse to do anything, or even to propose to do anything, to relieve a particular situation that may exist on their lines without first consulting some administrative authority. No one has ever computed the time and money that the railroads of the country have expended in the last ten years in attempts to get their Uncle Samuel to dole out to them some law which would yield them more money.

At one time, a few years ago, I counted over 100 railroad officials, from presidents down, sitting about the hearing room of the Interstate Commerce Commission for a period of 10 days listening to experts explain figures as to past and prospective railroad earnings. There is no other business in this country that would think of allowing so many of its directing officials to remain absent from business for so long a period of time. It has become the settled habit of many railroad officials to spend most of their time in Washington, or in riding to and from Washington. This habit has grown in spite of the fact that the Interstate Commerce Commission has all along insisted, and the courts of the country have repeatedly held, that the management of the railroads has not been committed by the Congress to any administrative body.

Some time ago an employee of the Interstate Commerce Commission, in a responsible position, told me that he had become, as a practical matter, traffic manager of at least three of the more important railroad systems of the country; and that the habit of many railroad officials was to come to him in person, or write him at length, with regard to substantially every tariff or transportation problem that confronted them.

It may be of interest to investigate how the habit that now controls the railroads originated. Previous to the year 1910 the Interstate Commerce Commission had very limited powers respecting the control of rate initiation by the carriers of the country. It is true that beginning July 1, 1907, the commission was given the right to employ examiners who could hear and take evidence in formal complaints, and that orders by the commission with respect to the justness and reasonableness of rates and rules were to be observed under heavy penalties. About that time complaints by shippers began to increase rapidly and the commission was continually engaged in adjusting rates and rules, and rate relationships.

It became the habit of railroad managers to advise complaining shippers that they were powerless to remedy alleged injustice because the Interstate Commerce Commission would not permit them to do so. Thus the "buck was passed" from railroad managers to the commission. When informal complaint was made to the commission, and there were untold thousands of them immediately after the passage of the amendments of 1906 to the Act, the shippers were advised,

in most instances, that the subject matter was one over which the commission had no control in the first instance. A few carriers of the country accepted the law of 1906 in its true intent and spirit, but many of them were antagonistic, and set deliberately to work to make it unpopular with shippers. They placed the blame for their own shortcomings with the Interstate Commerce Commission, and in every way possible delayed righting manifest wrong in rules, regulations, and rate adjustments.

The same attitude was assumed with respect to tariff publications. Rules issued by the commission were either misconstrued by many carriers, or their rate and tariff experts spent much time and energy in endeavors to convince the commission that rules should be modified or abrogated. It became the habit of traffic managers and rate experts of the carriers to journey to Washington to dispute a ruling or insist that a particular construction should be put upon it.

### Executives Haunt Washington

When the law of 1910 was passed, which gave the commission power to suspend a rate or schedule of rates for a maximum period to ten months the railroad managers became much concerned. The fact that they brought the law upon themselves made no difference in their consternation at its passage. The fact was that just before the Congress adjourned in the year 1910 railroad managers announced publicly that they proposed to make a general increase of freight rates throughout the country. Thereupon Congress passed the law giving the commission suspension power. When that law was passed railroad managers at once surrendered all their independence of action, and the habit of coming to Washington on every imaginable pretext that had been growing all these years became a fixed and unchanging state of mind.

"But, what else is there for us to do?" exclaimed a freight traffic manager of a western railroad when an Interstate Commerce Commissioner told him the matter he had come 2,000 miles to talk about could have been settled without any action of the commission. This commissioner replied: "I say to you that wherever your rules and regulations, or your rates, are unjust and unfair you have the undoubted right to change the same. Make the proper change and advise the commission why you did it. The commission is entitled to the presumption that it has some sense of what is right and proper."

Impetus was given to the habit of haunting Washington by railroad managers when state railroad commissions became numerous and active. It was assumed by railroad managers that the Interstate Commerce Commission was constituted as their special guardian against what they termed was unjust treatment by state commissions. The tune changed a bit but the song was the same. That is to say, the managers were in no way to blame for any situation, because they were bound, as they asserted, hand and foot by the laws of the states and the nation. They ceased to function as railroad managers. They became special pleaders before the Washington authorities. Instead of honestly making efforts to right real wrongs, or straighten out complainants who had fancied grievances, they shifted the entire burden to Washington. It presented an easy way out for them. The habit once formed has grown until it has come to govern the railroad managerial conduct. The effort has

not been to insure adequate and efficient service, but to convince some people that the Congress which passed regulatory laws was really ignorant of the true situation, and that the Interstate Commerce Commission was a parsimonious and arbitrary administrative body. One-half the time and effort spent in this mode of procedure, if expended in honest effort to conduct a good railroad, with a view to render patrons adequate and efficient service, would have brought great results. Such a thing never seems to have occurred to the railroad managers who had acquired the habit of laying all their troubles before Washington authorities.

No consistent or persistent effort seems to have been made to meet state commissions in any spirit of co-operation. Where certain railroads did not openly treat such commissions with contempt, they resorted to court proceedings before the Interstate Commerce Commission to block all orders made by them. Is it any wonder that state commissions have grown to be antagonistic in their attitude toward representations made to them by the railroads?

### Executives Have Become Expert Lobbyists

The trouble with the railroads of the country today is that the managing heads are not and have not been engaged in railroad business. They have become expert lobbyists, and put in their time seeking concessions from constituted authorities.

What is the remedy? Has the habit become so fixed that it is now impossible for our railroad managers to conduct their railroad business independently of governmental suggestion? I do not think so. Railroad managers should get back to their jobs and stay there. Continued waiting about Washington for governmental favors can lead to but one thing, and that government ownership and control. In my opinion that would end in disaster, and would be destructive of all advancement in our transportation facilities.

It rests with railroad managers whether that shall be the result of present tendencies and methods. It is true that railroad managers can not under existing law continue old methods. No sensible railroad man believes that there will ever be a return to unbridled, cut-throat competition, and midnight tariffs; and none of them desire a return to such days. The broad-minded and far-seeing managers, and there are a few of them, admit that many of the regulatory provisions of the law have resulted in good. It was only when the managers began to supinely abdicate their functions as directors of the policies of the different carrier systems that there arose a manner of doing business that has resulted in inefficiency. There must come a complete change in the state of mind of the railroad managers of this country. Their first thought should be satisfaction of patrons. As a class the shippers of the country are just and reasonable men. They know that they must depend on transportation to insure that their products shall reach markets. They stand ready to render assistance to all earnest, honest efforts of railroad managers to give them adequate facilities and service.

It is a law that pervades our entire social fabric that honest effort will be encouraged and rewarded. The man who fails in business, but who takes off his coat and goes honestly to work to retrieve his fallen fortunes will find helping hands extended to him in every direction. On the other hand, if an individual meets adversity with downcast countenance, and gives up all effort, he will be shunned by his fellows and hurried to the poorhouse.

What evidence in the past decade have our railroad managers given to the public that they were really engaged in trying in good faith to conduct efficient railroad transportation? Haunting the halls of Congress and those of the Interstate Commerce Commission is not the business of railroad managers. Many of the railroads do not reach Washington by more than a thousand miles of intervening territory. Has it ever occurred to these men that the millions of money they have spent in propaganda, and in the em-

ployment of attorneys to represent them in Washington might have been spent on the railroad systems to better advantage? As a matter of fact the energies and much of railroad money has been expended in recent years in forcing the camel's head further into the public tent. Having a taste of the food stored in the tent they divested themselves of their managerial functions, and ceased to run their railroads.

### The Alternative

The alternative is to take the public into their confidence. Convince the people of America that honest efforts are being made to serve the public and there can be no shadow of doubt of the result. The average citizen is fair-minded and just. He only needs to be shown. A fraction of the time and money that has been expended in Washington, if used to show the people the true situation, would be an effective means of changing conditions for the better. The business men, the industrial managers, the farmers, and all others who use transportation, are not railroad haters at heart. A few men prominent in political life have made considerable noise in recent years, and like the lone coyote on a hill have scared some people. They do not, and they have not represented the calm current of public opinion.

I doubt if there are many men in this country who know personally so many railroad officials, from presidents down, as I do. I count them all my friends. In saying what I have said I am only administering a jolt that I hope may help to throw railroad machinery into gear again. That it is sadly out of gear now no posted man will deny. The extent to which the loss of initiative and the failure of railroad managers to assume and perform their function is responsible for the grind in railroad machinery but the remedy is at hand. The proper spirit and the honest effort is bound to make conditions better.

I have not discussed the question whether the laws that have been passed provide too much regulation by federal power, and leave too little freedom to railroad managers. There were no need to do that. The laws are on the statute books, and must be obeyed. The only hope of their modification is in a change of public sentiment that gave them birth. Public sentiment can only be properly directed when it is apparent that our railroad managers are really at work trying in good faith to give adequate and efficient service. Neither have I mentioned the saturnalia of railroad regulation that took place during the war. It was all of it unnecessary, and much of it disastrous to the morale of railroad organization. But that state of chaos has passed into history leaving behind a long train of evil effects. Supineness on the part of those who now have our railroads in charge will not avail anything, and will inevitably lead to worse conditions to come.

Railroad managers everywhere must get back on the job. Serve the people who live along the rails the best that can be done with what facilities are at hand. Keep in close touch with the public and evince a sympathetic interest with their troubles connected with transportation. In a very short time support will come where there is now indifference or actual antagonism. Managing a railroad is a man's sized job, and it cannot be well performed in whole or in part, from Washington. Effort should be made to correct conditions at the foundation. Work from the top down is ineffective, and the results disappointing. Railroad managers everywhere will find enough to do if they will stick to the job of managing. Washington affairs can well be left for the adjustment that is bound to come from an enlightened public conscience.

• Attend to the railroads as managers there should and treat the patrons as fellowmen of a common country should be treated, and for well directed, earnest effort the railroads are bound to experience an indulgent public sentiment which in due course will serve to secure to them as much every return which they can rightfully demand.

# General News Department

The Senate on October 27 adopted an amendment to the tax bill providing for a flat 15 per cent tax on the net income of corporations as a substitute for the excess profits tax on net incomes above 8 per cent on their capital.

A bill to require 12 months' notice before a line of railroad can be abandoned has been introduced in the Senate by Senator Harris of Georgia, who said that several hundred miles of short lines in his state were being abandoned or were in danger of being junked.

The directors of the National Railway Appliances Association will meet in the office of the secretary, C. W. Kelly, Peoples' Gas building, Chicago, on Tuesday next, November 8, to assign exhibit space for the eleventh annual exhibit, which will be held in the Coliseum, Chicago, on March 13-16, 1922, at the time of the convention of the American Railway Engineering Association.

The Chicago, Rock Island & Pacific has started preparations for the celebration of its seventieth anniversary which occurs on October 10, 1922. Inquiries have recently been sent to the various employees associations and officers of the company asking that suggestions and plans be submitted for a fitting commemoration of the occasion. It has already been suggested that the first Rock Island train, which made its initial run between Chicago and Joliet, Ill., in 1852, be re-constructed.

J. E. Fairbanks, general secretary, has sent out a blank for the letter ballot under which members of the American Railway Association are to vote for members of the board of directors; and in connection therewith, by circular No. 2200, the directors recommend, for the better geographical representation of members on the board, that the number of directors be increased from 18 to 21. This involves changes in article 7 of the constitution and sections 3, 5 and 19 of the by-laws.

The Elmira Division of the Pennsylvania Railroad reports that for a period of 56 days, August 13 to October 7, there was not a single minute's detention to a passenger train on the division due to engine failures. For a period of 39 days, August 28 to October 6 inclusive, there were no delays from car failures. In making this record 752 trains were operated a total distance of 69,154 miles. Ninety-seven per cent of the trains maintained schedule time. This division is 143½ miles long, and contains many sharp curves. There are two long and steep grades of two per cent each, in both directions.

An attempt to wreck passenger train No. 5 on the Grand Trunk on October 29 near Lapeer, Mich., nearly succeeded when a section of rail was removed and but for the alertness of the engineer in slowing down a serious wreck would have occurred. All cars except the Pullmans were thrown from the track and one man was seriously injured. A car at the head of the train containing horses went over the embankment, as did two baggage cars following, the first day coach stopping on the edge of the embankment. It is believed the track was torn up shortly before the train arrived and a crazed individual taken in custody near the wreck admits attempting to ditch the train.

Samuel M. Felton, president of the Chicago Great Western, on November 1, issued a signed bulletin to farmers in the district served by the Great Western, stating that the farmers have a real grievance under present conditions of railroad transportation and at the same time are placed in a position much the same as that of the railroads. In the bulletin Mr. Felton said: "The farmer has a real grievance because the prices he receives for his products have declined more than have the prices he must pay for almost everything he buys. Some blame their troubles largely on the railroads. Freight rates, they say, are the cause of low prices for grain and live stock. The real cause lies much

deeper. The decline in the prices of farm products began before freight rates were advanced and would have occurred if rates never had been advanced. It is due to world-wide changes resulting from the transition from war to peace." Continuing, he says: "The railways have the same grievance as the farmers. The rates the railways are getting, although they have been advanced, are much lower in proportion than the cost of almost everything the railways must buy." In closing Mr. Felton said: "The managements of the railroads are making every effort to reduce expenses so that rates can be reduced later. Some reductions of rates already are being made. There is no other way than by reductions in expenses to secure general reductions in rates that will not be ruinous to the railways and make them unable to render to the farmers the transportation service they need. Those who obstruct reduction of expenses not only hurt the railroads but the farmers as well."

## Central Railway Club's Annual Dinner

The Central Railway Club will hold its thirty-first annual dinner at 7 o'clock Thursday evening, November 10, at the Hotel Iroquois, Buffalo, N. Y.

## Atlantic City for 1922 A. S. T. M. Meeting

A questionnaire recently sent out by the executive committee of the American Society for Testing Materials to ascertain the wishes of the members regarding the 1922 meeting, resulted in the selection of Atlantic City, N. J., for the place of the annual meeting, to be held sometime in the latter part of June provided suitable arrangements could be made for that time.

## September Earnings

The net railway operating income of the Class I roads for September apparently will be less than that for August, when the roads earned \$90,000,000. Returns thus far available for 183 roads show a net of \$79,484,869, an increase as compared with September, 1920, of 13.5 per cent. The total operating revenues were \$462,213,000, a decrease of 19.5 per cent, and the operating expenses were \$351,977,000, a decrease of 26.2 per cent.

## American Society of Civil Engineers' Nominees

The nominating committee of the American Society of Civil Engineers has presented the following nominations for officers to be elected at the annual meeting: President, J. R. Freeman, Providence, R. I.; vice-presidents, C. E. Grunsky, San Francisco, Cal., and Robert Ridgway, New York City; treasurer, O. E. Hovey, New York City; and directors, C. M. Holland, New York City; J. J. Yates, bridge engineer, Central of New Jersey, Jersey City, N. J.; F. E. Winsor, Providence; J. N. Chester, Pittsburgh, Pa.; A. J. Dyer, Nashville, Tenn., and W. L. Huber, San Francisco.

## Kansas City Southern Holds

### Freight Claim Prevention Conference

Approximately 125 officers and employees of the Kansas City Southern attended the fifth annual freight claim prevention conference at Sulphur Springs, Ark., on October 15, every department of the railroad being represented. Papers were presented on a wide variety of topics having to do with the reduction of claims, these papers being discussed at length. Among the topics considered were: The operation of warehouses and the proper storing of freight in cars; the detection and prevention of robberies; the co-ordination of activities of connecting line roads; defective equipment; elimination of rough handling and dealing with the public.

## Reclamation Savings on the Rock Island

The Chicago, Rock Island & Pacific has effected a saving of \$1,301,970 through its general reclamation plant at Silvis, Ill., during the three years ending with 1920. From each ton of scrap the Company was able in 1918 to reclaim \$6.75 worth of useful material, the entire saving for that year amounting to \$467,947; in 1919, \$8.10 in value was reclaimed from each ton of scrap, and the year's saving was \$473,623; in 1920, \$6.07 represented the value gained from each ton and \$360,398, the total amount saved during that year. The amount and value of the material reclaimed at the general reclamation plant is steadily decreasing, according to C. H. Rost, general storekeeper, because of the work of committees on each division; a large amount of the reclamation work is now done locally. While the savings have thus been increased, no definite figures have been compiled to show the total secured in this manner.

## A. S. M. E. to Publish Life of George Westinghouse

The American Society of Mechanical Engineers has announced that the biography of George Westinghouse, published under the auspices of the society, will be completed before the end of the year. The story of Mr. Westinghouse's rise from a modest early environment to the leadership of many great industrial enterprises and the position of acknowledged pre-eminence among American engineers is told by Colonel Henry G. Prout, a former business associate who was well acquainted with him for nearly 30 years and was an intimate friend during the last 12 years of his life. A limited number of copies of the special subscription edition will be issued early in December. Following it, the publishers will issue a popular edition that will be out about February, 1922.

## Operating Statistics for August

The Interstate Commerce Commission's monthly bulletin of operating statistics for 165 Class 1 roads for the month of August shows a total of 30,387,000,000 net ton miles of freight handled, as compared with 42,734,000,000 in August, 1920. The average miles per car per day was 22.7 as compared with 27.5, the net tons per loaded car averaged 27.4 as compared with 29.8 and the net ton miles per car day 400 as compared with 558. The net tons per train averaged 670 as compared with 762. The train speed was 11.6 miles per car as compared with 10.3. The traffic density was 4,200 net ton miles per mile of road per day as compared with 5,917 in August, 1920. For the eight months ended with August the traffic density was 3,922 as compared with 5,179.

## Gompers Criticizes Strike Settlement

Samuel Gompers, president of the American Federation of Labor, attacked bitterly the settlement of the railroad strike, declaring that "the cards had been stacked against the workers." He especially attacked Attorney General Daugherty for statements indicating that recourse would be taken to the courts if the strike order became effective. Mr. Gompers said "the strike will not take place—now." Mr. Gompers declared that the statement of the Labor Board that there are 1,300 cases still pending before it is one of the worst indictments that could be brought against the Esch-Cummins law and he contended that there should be a revival of the old system where employer and employee got together to adjust grievances without interference by a government tribunal. "Introduction of government machinery," he said, "means introduction of the element of force and compulsion, which is half the difficulty at present."

## Railroads Protest Increased Tax Rate

Seven of the nine railroad companies protesting against increased tax assessments in the state of Iowa, as noted in the *Railway Age* of September 24 (page 589), were upheld in every contention made before the Federal Court, at Des Moines, on October 28. Adjustment injunctions were denied in two cases, those of the Wabash and the Atchafalaya, Topeka & Santa Fe. The court in the seven successful complaints ruled out the entire increases in taxes ordered by the state executive council in 1921, and ordered a further reduction

of 10 per cent in the assessed valuation in force during the previous year. The reduction in the assessed valuation ordered by the court totals in excess of \$14,000,000 or equivalent to more than \$55,000,000 on the actual valuation as fixed by the executive council. The court ruled that "intentional, deliberate assessment of different classes of property at different percentages of actual valuation results in inequality of treatment." The roads' contention that land assessments, as compared with railroad assessments, are too low, was upheld. The roads which won their contentions and the maximum amounts per mile which can be assessed, are: the Chicago & North Western, \$8,730; the Chicago, Burlington & Quincy, \$7,650; the Chicago, Milwaukee & St. Paul, \$7,335; the Chicago, Rock Island & Pacific, \$6,975; the Minneapolis & St. Louis, \$4,140; and the Ft. Dodge, Des Moines & Southern, \$3,330.

## Norfolk & Western Safety Record

The Norfolk & Western reports the total number of persons killed on that road in 1920 as 84; a figure which marks a remarkable decrease from 1912, when the total was 229; while at the same time there has been a steady increase in the volume of freight traffic. These data are shown in the figures below, taken from a graphic diagram issued by the Safety Commission of the road:

Year	Millions of ton miles	Persons killed
1912.....	9,021	229
1913.....	9,883	193

C. H. Blakemore, chairman of the Safety Commission, in addressing this circular to employees, says: "Had the number of persons killed increased in exact proportion to the increase in the volume of business, the year 1920 alone would have seen 296 persons killed—instead of 84. Does the safety movement deserve your personal support?"

C. H. Blakemore, chairman of the Safety Commission, in addressing this circular to employees, says: "Had the number of persons killed increased in exact proportion to the increase in the volume of business, the year 1920 alone would have seen 296 persons killed instead of 84. Does the safety movement deserve your personal support?"

## Railway Development Association

### Semi-Annual Meeting

J. F. Jackson, Savannah, Ga., secretary of the American Railway Development Association, announces the semi-annual meeting of the association, which is to be held at Hotel Sherman, Chicago, on Thursday and Friday, November 10 and 11. As in the case of former meetings, the industrial section and the agricultural section will meet separately for some of the sessions; and roundtable discussions will fill up a large part of the program. The principal speakers on Thursday morning are S. R. Guard, J. F. Jarrell and J. D. McCartney. On Thursday afternoon the industrial section will have roundtable discussions on shippers' guides; how should they be made and what is their value; and on industrial surveys, what they ought to include and whether the information should be published. The immigration and colonization specialists will listen to the "Wisconsin plan" of colonization, described by B. G. Packer, and to other papers on immigration and land settlement.

On Friday morning, Hon. C. S. Ucker will speak on government land reclamation, and the industrial section will discuss community development, with special reference to the Newsho plan, and the Hub Club plan.

The agricultural roundtable on Friday morning will be presided over by J. M. Jones. On Friday afternoon the industrial roundtable will listen to a report on conferences with the American Railway Engineering Association as to sidetrack leases, etc.; and there will be a marketing roundtable presided over by L. D. Fuller. H. B. Rogers will describe the produce market of New York City, with illustrations by motion pictures.

## Floods Damage Canadian Roads

Canadian railroads in the vicinity of Vancouver, B. C., following heavy rains during the week of October 23 in the Cascade Mountains, have suffered heavy flood damages. The most serious damage to the Canadian Pacific was at Coquitlan, B. C., 17 miles east of Vancouver, where two 80-ft. spans across the Coquitlan river were carried out. The Coquitlan terminal, which is the freight terminal for Vancouver, was entirely under water, making it impossible to use yard or engine house facilities, while slides and washouts in the Fraser river canyon held up transportation through the canyon. Other damage occurred at Yale creek, where one pier of a bridge crossing that stream was carried out, while 17 miles east of North Bend a small lake in the mountain overflowed and sent a stream down across the tracks, carrying out the fill for a distance of 200 ft. to a maximum depth of 110 ft. It was necessary to detour traffic over the Great Northern, to Huntington, B. C. With the exception of the crossing of the Coquitlan river the line should be in operation by November 2. On the Kettle Valley line washouts and slides in Coquihalla Pass held up transportation from October 28 until the night of November 2. Slides and washouts in the Fraser Valley held up operation on the Canadian National on October 29, the most serious damage being done at Lytton, B. C. Operation on this road is expected to be resumed by November 3. It is reported that serious damage to the Pacific Great Eastern between Clinton, B. C., and Squamish, will make that line impassable for from one to two weeks.

## Walker D. Hines Returns From Europe

Walker D. Hines, formerly director general of railroads, recently returned to this country after having spent over 16 months in Europe as the arbitrator to decide upon the distribution, ownership and valuation of shipping on the principal rivers which were covered by provisions of the peace treaty. Mr. Hines has rendered decisions on the shipping on the Danube, Rhine and Elbe rivers and they have been received with satisfaction by the different countries and interests involved. Most of the work has now been completed, except for some final details, and excepting the questions relative to the Oder river, on which a decision is delayed because of questions involved in the Upper Silesian controversy. Mr. Hines has opened an office in New York for the general practice of law and has left his executive assistant, Brice Claggett, in charge of the remaining work abroad, but he retains his position as arbitrator and expects to return to Europe to make the final decisions. Mr. Hines has been in Washington this week and has been familiarizing himself with the railroad situation as it has developed in his absence; but he declined to discuss the subject for publication at this time. He went to Washington to represent the Western Union Telegraph Company in the valuation case of the Kansas City Southern, but the case was postponed.

Mr. Hines said that railroad transportation conditions had been improved much more in France than in eastern Europe, where there has been much confusion resulting from the delays in allocating the rolling stock that was seized and otherwise scattered during the war. This has led to much trans-shipment at the frontiers and has resulted in stimulating the river traffic.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION. F. M. Nellis, 165 Broadway, New York City. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION. Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEBURRAGE OFFICERS.—F. A. Porteous, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—L. A. Stone, C. & E. I. Ry., Chicago.
- AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 63 E. Adams St., Chicago.
- AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. L. Duncan, 332 So. Michigan Ave., Chicago. Next meeting, November 16-18, San Antonio, Tex.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Ilope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting,

November 14 and 15, French Lick Springs Hotel, French Lick Springs, Indiana.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rohlsheid, Room 400, Union Station, St. Louis, Mo. Next convention, August 23-25, 1922, Kansas City, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—J. W. Welsh, 8 W. 40th St., New York.

AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Borchardt, 202 North Hamlin Avenue, Chicago, Ill.

AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, Waldorf-Astoria, New York.

Division I—Operating.  
Freight Station Section (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section. J. C. Caviston, 75 Church Street, New York.

Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association). J. C. Caviston, 75 Church St., New York, N. Y.

Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y. Next meeting, March 21-23, Richmond, Va. Annual meeting, September 20-22, 1922, Colorado Springs, Colo.

Safety Section. J. C. Caviston, 75 Church St., New York.  
Division II—Transportation (including former activities of the Association of C. Transportation and Car Accounting Officers). G. W. Cover, 431 South Dearborn St., Chicago, Ill.

Division III—Traffic. J. Gottschalk, 143 Liberty St., New York.

Division IV—Engineering. E. H. Fritch, 431 South Dearborn St., Chicago, Ill. Next convention, March 14-16, Chicago. Exhibit of National Railway Appliances Association, March 13-16.

Construction and Maintenance Section. E. H. Fritch, Electrical Section. E. H. Fritch.

Signal Section (including former activities of the Railway Signal Association). H. S. Ballet, 75 Church St., New York, N. Y.

Division V—Mechanics (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Annual convention, June 14-21, 1922, Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.

Equipment Painting Section (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.

Division VI—Refrigerators and Stores (including former activities of the Railway Storekeepers' Association). J. E. Murphy, General Storekeeper, New York Central, Collinwood, Ohio.

Division VII—Freight Claims (including former activities of the Freight Claim Association). Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 Waller Ave., Austin Station, Chicago. Exhibit by Bridge and Building Supply Men's Association.

AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—J. F. Jackson, Central of Georgia, Savannah, Ga. Next meeting, November 10 and 11, 1921. Hotel Sherman, Chicago. Annual meeting, May 10-12, 1921, Denver, Colo.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 14-16, Chicago. Exhibit by National Railway Appliances Association, March 13-16.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.

AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eisman, 4600 Prospect Ave., Cleveland, Ohio.

AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

Railroad Division, James Partington, American Locomotive Co., 30 Church St., New York. Next meeting, December 9, 1921, 29 W. 39th St., New York.

AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, Northern Pacific Ry., Spokane, Wash.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis. Next meeting, January 24-26, Hotel Sherman, Chicago.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morris, Northern Pacific R. R., St. Paul, Minn. Next meeting, May 17-19, 1922, Montreal.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreacetti, C. & N. W. Ry., Room 411, C. & N. W. Sta., Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.

ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division 1.)

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division II.)

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—A. J. Filkins, 3346 S. Atlantic. Meeting with convention of American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—W. A. Booth, 53 Rushbrooke St., Montreal, Que. CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 636 North Pine Ave., Chicago. Regular meetings 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.—Thomas B. Koeneke, 604 Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

**CENTRAL RAILWAY CLUB.**—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September. Hotel Statler, Buffalo, N. Y. Annual dinner, Thursday evening, November 10, at 7:30 p. m.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.**—W. P. Elliott, Terminal Railway Association of St. Louis, East St. Louis, Ill.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

**CINCINNATI RAILWAY CLUB.**—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio. Next meeting, November 8, Hotel Sinton, Cincinnati, Ohio.

**EASTERN RAILROAD ASSOCIATION.**—E. N. Bessling, 614 F St., N.W., Washington, D. C. Annual meeting May 11, 1922, New York Railroad Club.

**FREIGHT CLAIM ASSOCIATION.**—(See American Railway Association, Division VII.)

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.**—George P. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1922, Chicago. Exhibit by International Railway Supply Men's Association.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Win. Hall, 1061 W. Wabasha Ave., Winona, Minn.

**INTERNATIONAL RAILWAY SUPPLY MEN'S ASSOCIATION.**—W. Sullivan, Garlock Packing Co., 326 W. Madison St., Chicago. Meeting with International Railway Fuel Association.

**MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.**—E. E. Martin, Union Pacific R. R. Room No. 19, Union Pacific Bldg., Kansas City, Mo. Annual convention, 1922, Buffalo, N. Y.

**MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 26 Cortlandt St., New York City. Next convention, May 23-26, 1922, Hotel Sherman, Chicago.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.**—(See A. R. A., Division V.)

**MASTER CAR BUILDERS' ASSOCIATION.**—(See A. R. A., Division V.)

**NATIONAL ASSOCIATION OF RAILWAY TIE PRODUCERS.**—Warren C. Nixon, Western Tie & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo. Annual meeting, January 26 and 27, Hotel Sherman, Chicago.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition, March 13-16, Chicago, at convention of American Railway Engineering Association.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 3d Friday in month, except June, July and August, at W. 39th St., New York.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Building, Washington, D. C.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, American Club House, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—(See Am. Ry. Development Assn.)

**RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—R. J. Himmelfright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

**RAILWAY REAL ESTATE ASSOCIATION.**—R. H. Morrison, C. & O. Ry., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION.**—(See A. R. A., Division IV, Signal Section.)

**RAILWAY STOREKEEPERS' ASSOCIATION.**—(See A. R. A., Division VI.)

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with A. R. A., Division V.

**RAILWAY TELEPHONE AND TELEGRAPH APPLIANCE ASSOCIATION.**—G. A. Nelson, 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. L. McAndrews, C. & N. W. Ry., Sterling, Ill. Annual convention September, 1922, Chicago. Exhibit by Traveling Engineers' Association.

**ST. LOUIS RAILWAY CLUB.**—W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.

**SOCIETY OF RAILWAY SIGNAL OFFICERS.**—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—J. S. White, N. Jefferson St., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ruppel Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, 117 East 98th St., Cleveland, Ohio. Exhibit by Railway Equipment Manufacturers' Association.

**WESTERN RAILWAY CLUB.**—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Regular meetings, 3d Monday each month except June, July and August.

## Traffic News

### Coal Production

Apprehension of consumers over the effects of a possible railroad strike is named by the Geological Survey in its weekly bulletin as no doubt the chief cause of sharp increase in coal production in the week ended October 22. The total output of bituminous is estimated at 10,993,000 net tons, an increase of 1,302,000 tons in a single week. A further sharp increase was indicated by telegraphic reports of loadings on October 24 and 25.

### National Industrial Traffic League's Annual Meeting

The program has now been completed for the annual meeting of the National Industrial Traffic League which will be held at the Hotel Sherman, Chicago, on November 9 and 10. Among the reports to be presented will be those by (1) the Executive Committee, on the proposed consolidation of the carriers; the railroad funding bill; the liability clause in railroad leases and sidetrack agreements and the policy of the United States Railroad Administration respecting payment of reparation awards; (2) the Car Demurrage and Storage Committee, on proposed changes in demurrage rules and uniform storage rules; (3) the Classification Committee; (4) the Bill of Lading Committee, covering changes in the proposed uniform bill of lading and the proposed through export bill of lading; (5) the Express Committee, discussing the showing of the valuation on packages, receipts for charges collected from consignees, perfect package month and the period for filing claims for loss and damage; (6) the Rate Construction and Tariffs Committee, on the simplification of tariffs, delay in receiving tariffs from the carriers and the publication of rates on net ton vs. gross ton basis; (7) the Inland Water Ways Committee; (8) the Freight Claim Committee, on the six months' provision in the bill of lading for filing loss and damage claims, uniformity in handling concealed loss and damage claims, perfect package month and (9) the Legislative Committee.

A number of regular and special committees will also present reports, in addition to which F. E. Winburn, special representative, Bureau of Claims Prevention, American Railway Association, will discuss claims prevention.

### New England Roads Request

#### Re-Argument of Division Case

Counsel for the New England roads have filed a petition with the Interstate Commerce Commission requesting an opportunity to reargue before the commission the case involving their application for an order requiring the roads west of New England to increase the divisions of through rates accruing to the New England lines. The petition says that it was never anticipated that the commission would deny the relief asked on such an interpretation of the transportation act, because it runs contrary to the broader view which the commission has always taken when similar questions have arisen in general rate advance cases. If the commission has the power to make general rate advances, although some of the individual rates may thus be made unreasonable, it is contended that the commission has the power to require a general readjustment of divisions. It is also declared that Congress has provided no method of helping weak roads to earn a living rate except by readjusting their divisions.

"The commission, through the increase of rates in the eastern rate group," the petition declares, "has taxed the public for the support of an efficient transportation system, and the public is paying the tax; but the majority of the commission finds itself helpless to make the second part of the act work; and while it has raised the necessary fund to maintain an efficient transportation system in the eastern rate group, it declares it is unable to so apply this fund as to accomplish the only result which it is raising it."

The petition says that the trunk lines will not voluntarily give up anything, and if divisions can be readjusted only one by one, then the act is unworkable; and the New England roads have failed to find the relief that Congress intended for them.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until March 1, the operation of a supplement to a New York, New Haven & Hartford tariff, which provides for the cancellation of joint through class rates between points in Connecticut, Massachusetts, New York, and Rhode Island, and points on the Long Island Railroad, within the borough of Brooklyn, N. Y., leaving combination rates applicable instead, and resulting in increasing certain rates.

The commission has further suspended until December 19, the operation of certain schedules which propose to eliminate the application of the present rates on coal from Western Maryland mines to points on the Baltimore & Ohio and its connections over the route through Cherry Run, W. Va., and Westport, Md., making applicable instead combination of locals via these routes, and establish instead, in connection with the present through rates, specific routing via Cumberland and Bellington, W. Va.

The Interstate Commerce Commission has issued a decision approving a revision of class and commodity rates in the territory west of the Cascade mountains, extending from Portland, Ore., on the south to Vancouver, B. C., on the north, except as to the proposed cancellation of carload commodity rates and certain relationships previously approved by the commission as to classes c, d, and e. The proposed rates were filed by the railroads to become effective May 27 and were suspended. Of the 7,152 class rates named in the schedules, 50.1 per cent represented increases, 34.3 per cent remained unchanged and 15.6 per cent represented reductions. Most of the class rates are for intrastate application between points in Washington. An order will be entered requiring the cancellation of the suspended schedules and discontinuing the proceeding without prejudice to the establishment on five days' notice of rates in conformity with the findings of the commission.

### Missouri Rates Increased

The Interstate Commerce Commission has issued its decision in the Missouri intrastate rate case, in which the Missouri commission, while authorizing increases in the state rates to correspond to the general advance made by the Interstate Commerce Commission last August, excepted the rates on coal, coke, brick and articles basing thereon, sand, gravel, stone, crushed rock, cherts, cluders, lime, cement plater and articles basing thereon, and petroleum oil and its products. The Missouri commission limited the increases to 70 per cent over the rates in effect on June 24, 1918. The federal commission finds this a discrimination against interstate commerce and orders the railroads to make increases to correspond with the increases in interstate rates.

### Personnel of Commissions

Theodore F. Laist, architect in the Bureau of Valuation, Central District, Interstate Commerce Commission, has resigned, and has taken a position as Chicago representative of the National Lumber Manufacturers' Association, No. 111 West Monroe street, Chicago.

A. C. Hasbrouck, head of the division of accounts and statistics of the New York State Public Service Commission, at Albany, for many years, has resigned, to take a position with H. C. Hopson, accountant, 61 Broadway, New York City. Mr. Hasbrouck has been on important committees of the National Association of Railway and Utilities Commissioners, and was chairman of the committee which prepared the uniform system of accounts for electrical and gas companies last year.

## Foreign Railway News

### Increase in Value of Exports of Electric Locomotives

During the first nine months of 1920, electric locomotives valued at \$844,130 were exported from this country, according to Commerce Reports. In 1921 for the same period the value of electric locomotives exported was \$1,506,877.

### Batignolles Tunnel at Paris to Go

The Batignolles tunnel in Paris, which is the approach to St. Lazare station, will be opened into a deep cut which will necessitate the building of walls over 50 ft. in height and ranging from 10 ft. to 14 ft. in thickness, according to The Engineer (London).

### Australian Railway Officers in America

Alfred D. J. Forster, assistant chief mechanical engineer of the New South Wales Government Railways, and William H. Armstrong, assistant to the locomotive superintendent of the same line, are in this country for the purpose, it is said, of arranging for the purchase of American railway supplies.

### German Rolling Stock Allocated to Danzig Territory

The following German rolling stock has recently been definitely allocated to the Danzig territory by the Interallied Commission sitting in Berlin, according to a report from Consul William Dawson: locomotives, 116; passenger cars, 172; baggage cars, 35; freight cars, 1,950; and electric locomotives, 2.

### England's Minister of Transport to Resign

LONDON.

Sir Eric Geddes, Minister of Transport of Great Britain, resigned from his position on October 15. Sir Eric is still to work as chairman of the committee charged to reduce government expenditure in all departments, which task is a heavy one under present conditions.

### A Correction

In the *Railway Age* of October 18 (page 694) some statistics of railway mileage in Spain were given, as appearing in Commerce Reports. These figures were in error, according to A. G. Goldsmith, chief of the Western European Division of the Bureau of Foreign and Domestic Commerce. The mileage, according to Mr. Goldsmith's corrected figures are:

Five ft. 6 in. gage, single track.....	6,773 miles
double track.....	243 miles
Meter (39.37 in.) gage, single track.....	2,119 miles
double track.....	16 miles

### Jamaica Railway Extension Offers Opportunity

#### For Sales of American Supplies

The government of Jamaica has, according to the American consul at Kingston, authorized the government railway to extend its line a distance of nine miles from Chapelton, exclusive of sidings. The director of the railway, it is said, will be glad to receive bids from American concerns for construction materials. Some materials needed include a steam shovel, shovels, picks, track jacks and various track tools. The Jamaica Government Railway is, it is pointed out, a standard gage line built by an American firm and much of the equipment is of American manufacture. The consul urges that a representative of any American concern interested in the contract be sent to Jamaica, as the island is relatively close to the United States. Further information can be secured by addressing Major Lewis Thomas, Director of the Jamaica Government Railway, Kingston, Jamaica.

## Equipment and Supplies

### Freight Cars

THE ILLINOIS CENTRAL is inquiring for 2,000 composite gondola cars.

THE PAULISTA RAILWAY (Brazil) is inquiring for 180 underframes for freight cars of 30 metric ton capacity and 1.60 meter gage.

THE PENNSYLVANIA TANK LINE, Sharon, Pa., has ordered 200 tank cars of 10,000 gal. capacity from the Pennsylvania Tank Car Company.

THE DENVER & RIO GRANDE, reported in the *Railway Age* of September 17 as inquiring for 1,000 70-ton gondola cars, has ordered 700 of these cars, with an option of 300 additional, from the Pressed Steel Car Company.

THE CHICAGO, MILWAUKEE & ST. PAUL, reported in the *Railway Age* of October 8, as inquiring for 2,500 gondola cars of 50-ton capacity, has ordered 1,000 of these cars from the Bettendorf Company and 1,500 from the Haskell & Barker Car Company.

THE SIAMESE STATE RAILWAYS will receive bids until 2 p. m., January 16, 1922, at the city of Bangkok, Siam, for 20 flat cars of 28 metric tons capacity. Bids are also wanted until 2 p. m., February 1, 1922, for 500 pairs of wheels and axles. Specifications and drawings may be obtained from C. P. Sandberg, 143 Liberty street, New York.

### Passenger Cars

THE NEW YORK CENTRAL is asking for prices on the repair of 100 passenger cars.

THE NEW YORK, ONTARIO & WESTERN is inquiring for from 20 to 25 steel passenger coaches, 3 baggage cars and 3 combination baggage and mail cars.

### Iron and Steel

THE SOUTHERN PACIFIC has ordered 44,600 tons of open hearth rails from the Tennessee Coal, Iron & Railroad Company, most of which is to be 90-lb. rail.

### Machinery and Tools

THE NILES-HEMENT-POND COMPANY, New York, has received an order for machine shop tools to cost about \$70,000, from the Central Railway of Brazil.

### Miscellaneous

THE NEW YORK, NEW HAVEN & HARTFORD is having 15 Mountain type and 15 Santa Fe type locomotives equipped with closed type feed water heaters made by the Superheater Company, New York.

THE JAMAICA GOVERNMENT RAILWAYS will shortly require a steam shovel of 1 or 1½ yd. capacity; shovels; picks; track jacks; rail tongs and other track tools and construction materials for a line extension involving an expenditure of some \$688,000. For further details see item under Foreign Railway News on another page of this issue.

THE EMPRESS OF JAPAN, one of the Canadian Pacific steamers, last week began her 155th voyage across the Pacific. She has covered 2,500,000 miles in the Canadian Pacific Service, equal to nearly one hundred times around the earth. This does not include her four years' war service.

## Railway Construction

AMERICAN RAILWAY EXPRESS.—This company will construct an addition to its stable at Tulsa, Okla., and remodel its present structure, at an estimated cost of \$16,000.

ATLANTIC, TOPEKA & SANTA FE.—This company will accept bids until November 13, for the construction of an addition to its Alvarado Hotel at Albuquerque, N. M., to cost about \$300,000.

BOSTON & MAINE.—This company has awarded a contract to the Ogle Construction Company, Chicago, for coal handling machinery to be used in connection with a coal station which will soon be erected at Concord, N. H., by company forces.

GALVESTON, HARRISBURG & SAN ANTONIO.—This company contemplates the enlargement of its shops at El Paso, Texas, in connection with the installation of new equipment in these shops.

GREAT NORTHERN.—This company has been petitioned by the Greater Rosebud Association, representing four counties in Southern South Dakota, known as the Rosebud Area, to extend its line from Huron, S. D., about 150 miles in a southwesterly direction, across the Missouri river, into this area.

ILLINOIS CENTRAL.—This company has applied to the city council of West Frankfort, Ill., for permission to construct a freight depot and remodel its present passenger station at that city. This work is estimated to cost about \$60,000.

MISSOURI, KANSAS & TEXAS.—This company has awarded a contract to H. D. McCoy, Cleburne, Tex., for the re-construction of its freight station at Oklahoma City, Okla., which was recently destroyed by fire.

MISSOURI, KANSAS & TEXAS.—This company has awarded a contract to T. L. Johnson, Sedalia, Mo., for the reconstruction of its reclamation plant at Parson, Kan., which was destroyed by fire on September 17, at an estimated loss of \$85,000.

NACOGDOCHES & SOUTHEASTERN.—This company contemplates extending its line 28 miles southwest from Nacogdoches, Texas, to a junction with the Atchison, Topeka & Santa Fe.

NEW YORK, NEW HAVEN & HARTFORD.—This company has contracted with the American Creosoting Company, New York, for the treatment of its cross-ties and other timber. The plant will be provided by the latter company adjacent to the Cedar Hill terminal of the New Haven at New Haven, Conn., and will have a capacity of about 1,500,000 ties a year.

PENNSYLVANIA.—The Eastern Coal Dock Company, Cleveland, Ohio, is building a coal thawing plant for this company at South Amboy, N. J.

PORTLAND, ASTORIA & PACIFIC.—This company, a subsidiary of the Oregon-American Lumber Company, Portland, Ore., control of which has been acquired recently by the Central Coal & Coke Company, Kansas City, Mo., is constructing, through its parent company, a railroad line 32½ miles long, extending from Wilkesboro, Ore., into a large timber tract owned by the above company. Work is expected to be completed early next year. It is estimated that the entire cost, including equipment, will be approximately \$2,000,000. The Portland, Astoria & Pacific is a corporation organized under the laws of Delaware, with a capital of \$2,500,000.

SOUTHERN PACIFIC OF MEXICO.—This company contemplates the extension of its line from Tepic, Cal., to Guadalajara, Mex., a distance of about 100 miles. This extension will afford a connection with the National Railways of Mexico.

ST. LOUIS-SAN FRANCISCO.—This company which was noted in the *Railway Age* of October 1 (page 646), as receiving bids for the construction of a one-story machine shop, 103 ft. by 40 ft., at St. Louis, Mo., has awarded a contract for this structure to the Globe Construction Company, St. Louis, Mo.

TEXAS & PACIFIC.—This company, in conjunction with the Missouri Pacific and the Kansas City Southern, has prepared tentative plans for a union station at Texarkana, Ark.

## Supply Trade News

**R. A. Ogle**, president of the Ogle Construction Company, Chicago, died on November 2, at his home in Chicago from the effects of an operation.

**Ben L. Whitney**, formerly with the Byers Co., has opened an office at 528 Detroit Savings Bank building, Detroit, Mich., and will represent the **Orten & Steimbrenner Company** in that territory.

**Walter C. Carroll**, assistant general sales manager of the American Sheet & Tin Plate Company at Pittsburgh, Pa., has been appointed vice-president of the Inland Steel Company, Chicago, effective November 10.

**C. H. Hobbs** has been appointed assistant general manager of sales of the Detroit Seamless Steel Tube Company of Detroit, Michigan. Mr. Hobbs was in the service of the Lackawanna Steel Company for over 14 years and for the last five years was district representative in charge of its Detroit office.

**Morris B. Brewster** has formed a corporation under the name of **Morris B. Brewster, Inc.**, with headquarters at 332 South Michigan boulevard, Chicago, to handle metallic packing, mechanical devices, such as Edison diaphragm pumps and similar articles. Associated with Mr. Brewster in the new company are **W. B. Leach**, **J. G. Platt** and **F. M. Weymouth**, of Boston.

The **Bucyrus Company**, South Milwaukee, Wis., announces the removal of its New York City office to suite 728, 30 Church street, with **E. G. Lewis** in charge as eastern sales manager, effective December 1. **M. J. Woodhull** has been appointed Central sales manager to succeed Mr. Lewis in charge of the Chicago office, 622 McCormick building, and **E. R. Weber** has been appointed northern sales manager, at Minneapolis, 1224 McKnight building, to succeed **J. N. Gawthrop**, who will become associated with Mr. Lewis in New York.

**F. L. Kellogg**, manager of the New York branch at 25 West Forty-third street, New York City, of the **Electric Storage Battery Co.**, Philadelphia, Pa., has been appointed district manager of the North Atlantic district, with headquarters at 25 West Forty-third street, New York. **F. F. Sampson**, manager of the Exide depots and garages, succeeds Mr. Kellogg as manager of the New York branch, with **D. P. Orcutt** as assistant manager. The entire sales organization in New York City was recently consolidated and Mr. Sampson was appointed manager and Mr. Orcutt assistant manager.

## Obituary

**James B. Rider**, vice-president and general manager of the Pressed Steel Car Company, died on November 3, at Pittsburgh, Pa., after an illness of four months.

**Charles A. Lindstrom**, assistant to the president of the Pressed Steel Car Company, died at his home in Pittsburgh, Pa., on September 2. Mr. Lindstrom was born in Sweden where he received his technical and engineering education. He came to this country in 1876, and shortly thereafter entered the employ of the Pennsylvania as draftsman and subsequently became chief draftsman. About 1900 he left Altoona to go to the Chicago & Alton as mechanical engineer. In May, 1902, he was appointed chief engineer of the Pressed Steel Car Company, and in May, 1913, was made assistant to the president of that company, which position he held at the time of his death. Mr. Lindstrom served in 1917, as a member of the sub-committee on Military Equipment Standard of the Special Commission on National Defense of the American Railway Association.

## Railway Financial News

**CENTRAL OF NEW JERSEY.**—*Extends Time for Bids on L. & W. B. Coal Stock.*—The directors have extended until November 15 the time within which bids will be received for the purchase of the road's holdings of \$8,849,000 Lehigh & Wilkes-Barre Coal Company stock. The following statement was given out after the meeting of the directors on Wednesday:

The time within which proposals for the Central Railroad Company of New Jersey holdings in the stock of the Lehigh & Wilkes-Barre Coal Company will be received and considered was by action of the board of directors of the Central Railroad of New Jersey, extended to November 15, 1921, and in order that all proposals may be on a comparable basis and clearly within the provisions of the court decree, the committee, comprised of Messrs. Stotesbury, Willard and de Forest, have given notice that the proposals must be upon the basis of not less than 20 per cent payment in cash, the remainder in cash payable (in whole or in instalments) within a period of 11 months from the date of acceptance of any proposal.

**CHESAPEAKE & OHIO.**—*Authorized to Acquire Chesapeake & Ohio Northern.*—The Interstate Commerce Commission has issued an order approving and authorizing the proposed acquisition by the Chesapeake & Ohio of the railroad and property of the Chesapeake & Ohio Northern and also authorizing the Chesapeake & Ohio to assume the obligation of the Northern company to pay the principal of \$1,000,000 of its first mortgage 5 per cent 30-year gold bonds and interest thereon.

**CHICAGO, PEORIA & ST. LOUIS.**—*Court Decision on Issuance of Receivers' Certificates.*—The appellate court for the Third district of Illinois on October 25 handed down a decision disapproving a receivers' certificate order made in an inferior state court on the ground that Interstate Commerce Commission approval was not made a necessary prerequisite of the issuance and sale of receivers' certificates. The receivers had been granted authority in the lower court to issue 335,000 receivers' additional certificates of indebtedness, due in one year with interest at 7 per cent. The appeal was brought by trustees of the first and second mortgage bonds who protested against the mortgage liens being made subordinate to the receivers' certificates.

The appellate court said in its decision:

The order appealed from was an unconditional grant of authority to the receivers to issue and sell the certificates and did not require them to first obtain the approval and consent of the Interstate Commerce Commission, and, in so doing, was erroneous.

The rules of the commission, however, require that there shall be filed with the application for authority to issue securities an opinion of counsel that the issue or assumption in respect to which authority is applied for under said section 20-a, is or will be legally authorized and valid if approved by the commission.

This opinion of counsel must have some existing basis in fact, and the only valid basis for such an opinion in case like the present would be an order of the court authorizing the issuance and sale of the certificates provided such issuance and sale shall thereafter be authorized by the Interstate Commerce Commission in accordance with the provisions of said Section 20-a.

The order is, therefore, reversed and remanded with directions to the circuit court to modify said order in conformity with the views expressed in this opinion.

**DELTA SOUTHERN.**—*Authorized to Abandon Lines.*—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon three branch lines, in Mississippi, from Percy to Richey, 10.45 miles; from Elizabeth to Kergs Junction, and Angosta, 14.47 miles, and from Itta Bena to Belzoni, 27.19 miles.

**HAWKINSVILLE & FLORIDA SOUTHERN.**—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing the receiver to abandon the line of this company extending from Hawkinsville, Ga., to Worth, Ga., 42.32 miles, and from Ashburn to Camilla, Ga., 50.67 miles. The Georgia Railroad Commission has asked that the application be denied. The federal commission expressed the opinion that the receiver should first offer for sale the entire railroad as a going concern and if no satisfactory bid is received he should offer the road for sale in sections for continued operation. If no satisfactory bid is received then he should offer any unsold sections as scrap or junk. At competitive points opportunity should be afforded shippers and connecting carriers to purchase the spur tracks and other terminal facilities.

**TENNESSEE, ALABAMA & GEORGIA.**—*Application to Scrap.*—Executors of the Russell Sage Estate, owners of this road, filed an application in the Federal Court at Chattanooga, Tenn., on

October 28, for permission to scrap the line. The road has been a losing venture since its organization and has never paid interest on its bonds since their creation in 1911. It owns 88 miles of track, all in Alabama. The date of sale of the road was postponed three times, the next date being fixed as November 15.

**TOLEDO, ST. LOUIS & WESTERN.—Bond Suit Settled.**—J. S. Bache, chairman of the Stockholders' Protective Committee, announced on October 31 that the litigation involving the legality of the company's A and B bonds had been settled. A report of the committee was mailed to the depositors under the protective agreement.

Mr. Bache's statement outlining the settlement was as follows:

The litigation involving the Toledo, St. Louis & Western Railroad Company, commonly called the "Clover Leaf," has been pending for seven years in the United States District Court at Toledo.

The controversy in the litigation was with reference to the legality of \$11,527,000 par value of what are known as the A and B bonds issued by the Clover Leaf in payment for the controlling stock of the Chicago & Alton Company acquired by the Clover Leaf in the year 1907.

The bonds were contested by the stockholders' protective committee on the grounds, first, that the bonds were given for the purchase of the controlling stock of a competing road, and, second, that fraud was practiced by the parties concerned in the transaction, so that all of the bonds were tainted. A very large amount of testimony was taken and this testimony was filed in the court in August last.

A settlement has been effected which results in the surrender and cancellation of the entire issue of A and B bonds with all of the interest coupons.

The A and B bondholders take back all of the Chicago & Alton stock and the Clover Leaf pays in cash \$1,130,000 to the bondholders' committee, and the stockholders turn over to the bondholders' committee 10 per cent of the common and preferred stock of the Clover Leaf. The total stock of the Clover Leaf outstanding is \$10,000,000 of common and \$10,000,000 of preferred.

The result of the transaction is that the property is restored to the Clover Leaf stockholders free of A and B bonds which at this time with interest amount to practically \$16,000,000. The only funded indebtedness against the Clover Leaf is \$10,000,000 of prior lien 3½ per cent bonds and \$6,500,000 4 per cent bonds, making a total mortgage indebtedness of \$16,500,000. This funded debt is the only debt of the Clover Leaf excepting equipment trust obligations which are being paid out of the current earnings, and receivers' indebtedness of approximately \$1,000,000 which it is expected will be paid from the sale of some treasury assets or from the operations of the property.

The settlement leaves the company in substantially the same financial condition that it is its unfortunate purchase of the Chicago & Alton stock and the physical condition of the property has been greatly improved during the receivership.

**UTAH RAILWAY.—Asks Authority to Acquire Utah Terminal Railway.**—This company has applied to the Interstate Commerce Commission for authority to acquire by lease the property of the Utah Terminal Railway.

### Treasury Payments to Railroads

The United States Treasury Department announces the payment of a loan of \$50,000 to the Norfolk Southern from the revolving fund on a certificate of the Interstate Commerce Commission. A total of \$21,105,033 loaned to 12 railroads from the revolving fund has been repaid by the companies.

### Dividends Declared

Cleveland & Pittsburgh.—Guaranteed, \$87½, quarterly; special guaranteed, \$50; both payable December 1 to holders of record November 10.  
Elmira & Williamsport.—Common, 2.26 per cent, payable November 1 to holders of record October 20.  
Nashua & Lowell.—4½ per cent, payable November 1 to holders of record October 15.

UPON THE COMPLETION of a timber treating plant at New Haven, Conn., the New York, New Haven & Hartford will take up extensively the use of treated cross-ties, switch ties, lumber and piling. The plant which is to be provided by the American Creosoting Company, New York, will be erected adjacent to the north end of the Cedar Hill freight terminal, will form a part of it and have a capacity of 1,500,000 ties annually. The tie requirements of the New Haven in the past have averaged about 2,000,000 annually but with the disappearance of chestnut and other desirable woods, the annual needs were tending to increase to about 3,000,000. Heretofore, it has been necessary to ship ties and timber which were produced locally and which it was desired to treat, to distant points for that treatment. With the inauguration of a treating plant at New Haven it will become possible to utilize many of the cheaper grades of timber now easily available locally with the result that it probably will not be necessary to ship in any ties from outside territories.

## Railway Officers

### Executive

**J. M. Herbert**, president of the St. Louis-Southwestern, has also been elected president of the Dallas Terminal Railway & Union Depot Company, with headquarters at Dallas, Tex.

**H. B. Hull**, general claim agent of the Illinois Central, with headquarters at Chicago, has been promoted to assistant to the president with the same headquarters. Mr. Hull was

H. B. Hull

born on March 11, 1870, at Chamois, Mo. He entered railroad service in 1895 in the passenger traffic department of the Chicago, Burlington & Quincy, with headquarters at St. Louis, Mo. On November 1, 1898, he left that road to become claim agent of the Louisiana division of the Illinois Central, with headquarters at McComb, Miss., and four years later he was transferred to the Springfield division, with headquarters at Springfield, Illinois. On August 1, 1904, he was promoted to district claim agent, with headquarters at Memphis, Tenn., which position he held until May 1, 1909, when he was promoted to assistant chief claim agent of lines South of the Ohio River and the Yazoo & Mississippi Valley, with the same headquarters. On July 1, 1911, he was transferred to Chicago and placed in charge of claims on the Northern lines. On March 13, 1913, he was made chief claim agent of the entire system, which position he was holding at the time of his recent promotion.

### Financial, Legal and Accounting

**W. E. Fitzgerald**, whose appointment as auditor of the San Antonio & Aransas Pass, with headquarters at San Antonio, Tex., was announced in the *Railway Age* of September 24 (page 600), was born at New Orleans, La., on June 11, 1870. He entered railroad service with the Galveston, Harrisburg & San Antonio on June 1, 1885 and remained with that company until October 1 of the same year, when he left to become a clerk in the Southern Pacific's office at New Orleans. On October 1, 1890, he entered the service of the San Antonio & Aransas Pass as a clerk in the general offices at San Antonio. He was appointed chief clerk in charge of disbursements of the Houston & Texas Central on October 1, 1894, and held this position until June, 1909, when he was appointed auditor of the Railroad Commission of Texas. In June, 1920, he was appointed assistant auditor of the San Antonio & Aransas Pass, which position he was holding at the time of his recent promotion.

### Traffic

**W. I. Chudleigh** has been appointed import freight agent of the Canadian Pacific; the Duluth, South Shore & Atlantic, and the Minneapolis, St. Paul & Sault Ste Marie, with headquarters at Chicago.

**J. T. Wray**, division freight agent of the Pennsylvania, with headquarters at Erie, Pa., has been transferred to Louisville, Ky., succeeding F. G. Maus, who has been transferred

to the Central region, with headquarters at Cleveland, Ohio. G. Berg will succeed Mr. Wray at Erie.

**F. L. Hanna** has been appointed assistant general freight and passenger agent of the Atchison, Topeka & Santa Fe with headquarters at Phoenix, Ariz., succeeding F. P. Cruice, assigned to other duties. **N. H. Asp** has succeeded Mr. Hanna as division freight and passenger agent with headquarters at Fresno, Cal. **W. J. Shattuck** has been appointed division freight agent with headquarters at Oakland, Cal., succeeding Mr. Asp. These changes were effective November 1.

**A. S. Edmonds**, whose appointment as traffic manager of the Oregon-Washington Railroad & Navigation Company, with headquarters at Portland, Ore., was announced in the *Railway Age* of September 24 (page 600), was born at Louisville, Ky., on July 7, 1881. He entered railroad service in July, 1899, as a messenger boy on the Southern at Louisville and until 1903 served successively as correspondence clerk, assistant rate clerk, rate clerk, and assistant chief rate clerk. He left the Southern in September, 1903, to become traveling freight agent of the Mallory Steamship Company, with headquarters at Atlanta, Ga. He re-entered railroad service in June, 1908, as general agent of the Missouri Pacific, with headquarters at Birmingham, Ala. In February, 1911, he was transferred to Philadelphia, Pa., where he remained until May, 1915, when he left the Missouri Pacific to become traffic manager of the Chesapeake Steamship Company, with headquarters at Baltimore, Md. He returned to the Missouri Pacific in July, 1917, as assistant freight traffic manager, with headquarters at St. Louis, Mo., which position he held until August, 1918, when he was appointed assistant chief of the inland traffic service of the war department at Atlanta, Ga. From January, 1919, to March, 1920, he was an assistant in the division of traffic of the Railroad Administration, with headquarters at Washington, D. C. On March 1, 1920, he was appointed general traffic manager of the Los Angeles & Salt Lake, which position he held at the time of his recent appointment.

### Operating

**J. O. Jones** has been appointed supervising agent of the Bessemer & Lake Erie. He will exercise supervision over all employees in station and transfer service.

### Mechanical

**A. H. Powell** has been appointed superintendent of the Jeffery Shops of the Western Pacific, with headquarters at Sacramento, California, effective November 1.

**C. M. Hatch** has been appointed mechanical engineer of the Missouri, Kansas & Texas with headquarters at Parsons, Kansas, succeeding W. H. Maddocks, retired, effective October 1.

**F. M. Mozley**, roundhouse foreman of the Gulf, Colorado & Santa Fe at Gainesville, Tex., has been appointed master mechanic of the Southern division with headquarters at Temple, Tex.

**M. B. McPartland** has been appointed superintendent of motive power of the Western Pacific with headquarters at Sacramento, California, and the position of general master mechanic has been abolished. These changes were effective November 1.

**L. E. Fletcher** has been appointed acting master mechanic of the New Mexico division of the Atchison, Topeka & Santa Fe with headquarters at Raton, N. M., succeeding T. T. Ryan, who has been granted a leave of absence on account of illness.

**J. McKenzie** has been appointed shop superintendent of the Pere Marquette at Ionia, Mich., succeeding J. Speckin, assigned to other duties. **W. F. Crowder** has succeeded Mr. McKenzie as general car inspector. These changes were effective November 1.

**C. E. Brooks**, traveling engineer of the Chicago, Milwaukee & St. Paul, with headquarters at Miles City, Mont., has been promoted to master mechanic of the Bellingham division, with headquarters at Bellingham, Wash., succeeding C. E. Cessford, assigned to other duties on account of ill health. **W. M. Anderson** has been appointed master mechanic of the Northern Montana division, with headquarters at Lewistown, Mont., succeeding O. A. Coltrin, who has been assigned to other duties.

### Engineering, Maintenance of Way and Signaling

**Z. A. Green** has been appointed division engineer of the Gulf, Colorado & Santa Fe with headquarters at Galveston, Tex., succeeding **W. W. Wilson**, who has been transferred to the Southern division with headquarters at Temple, Texas.

**K. F. Wakeman**, assistant supervisor of the Toledo signal district of the New York Central, Western Lines, with headquarters at Toledo, Ohio, has been promoted to signal supervisor of the Franklin signal district, with headquarters at Ashtabula, Ohio.

**A. Craine**, whose appointment as district engineer, maintenance of way, of Missouri district of the Chicago, Burlington & Quincy, was announced in the *Railway Age* of October 15 (page 774), was born in England in 1883. He entered railroad service in 1905, as a rodman on the Missouri Pacific. In 1908, he left to become a rodman on the Chicago, Burlington & Quincy and, through various promotions, he became division engineer, with headquarters at St. Joseph, Mo., which position he was holding at the time of his recent appointment.

### Purchasing and Stores

**A. Ross** has been appointed division storekeeper of the Erie with headquarters at Jersey City, N. J., and **M. H. Keyes** has been appointed to a similar position with headquarters at Buffalo, N. Y., effective October 1.

### Obituary

**L. F. Timmerman**, secretary and treasurer of the Western Maryland, died on October 31 at Paris, France.

**D. J. McCoy**, formerly resident engineer of the Atchison, Topeka & Santa Fe at Willard, N. M., died recently at Los Angeles, Cal.

**A. Jackson**, agricultural agent of the Chicago, Rock Island & Pacific, with headquarters at Chicago, died at his home in that city on October 30.

**Charles E. Oakes**, shop superintendent of the Kansas City Southern, with headquarters at Pittsburg, Kansas, died on October 13, as a result of injuries received in an automobile accident on October 8.

**Frank T. Dolan**, formerly general superintendent of the Southwestern district of the Chicago, Rock Island and Pacific, with headquarters at Topeka, Kansas, died at his home in that city on October 25. Mr. Dolan was born in Illinois in 1867 and entered railroad service in 1882 as an agent with the Chicago, Burlington & Quincy. In 1884, he entered the employ of the Atchison, Topeka & Santa Fe as a dispatcher, which position he held for six years. From 1890 to 1892 he was chief dispatcher of the Union Pacific, and from 1892 to 1897, chief dispatcher and train master of the Atchison, Topeka & Santa Fe. From the later date until 1903, he was superintendent of different divisions of that road, and from August 1, 1903, to August 1, 1905, he was general superintendent of the Colorado & Southern and the Fort Worth & Denver City, resigning to become general superintendent of the Southwestern district of the Chicago, Rock Island & Pacific. He was granted an indefinite leave of absence, due to ill health, on Sept. 10, 1906, and since that time he has been inactive in railroad work.

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulation (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada, \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue, 8,750 copies were printed; that of these 8,750 copies 7,881 were mailed to regular paid subscribers, 52 were provided for counter and news company sales, 10 were mailed to advertisers, 65 were mailed to employees and correspondents, and 416 were provided for new subscribers, sample copies lost in the mail and office use; that the total copies printed this year to date were 426,700, an average of 9,482 copies a week.

Wherever accuracy must be the first consideration rely on the Ryerson-Conradson Lathe to do the job without sacrificing production.

## Boring Air Cylinders

*"Well done is twice done."*

This applies most forcibly to locomotive repairs.

Many roads are decreasing maintenance costs by the better workmanship made possible by Ryerson-Conradson Machine Tools.

"The air cylinders bored on the Ryerson-Conradson Lathe have stood up a great deal longer than similar cylinders bored on other lathes. With a cylinder bored absolutely straight, the wear on the piston rings is practically imperceptible."

—General Shop Foreman

Accuracy with rapid production for emergency or regular work is characteristic of Ryerson Railroad Lathes.

Herringbone gear drive to the spindle, extra large bearing surfaces and broad ways combine to provide a foundation for accurate work.

Jobs done on Ryerson-Conradson Lathes stay done. This means lower maintenance costs.

The discontinuance of the piecework system of payment by the Railroad Administration was brought about principally through the opposition of the unions.

### Unions Consider- ing Acceptance of Piecework

The direct result was a serious reduction in the output of many shops and an increase in the cost of repairs. Perhaps the leaders of the organizations convinced the workers that this action would be beneficial for the employees. If so, they were soon undeceived. Many roads found the cost of work in their own shops was higher than if performed under contract and consequently sent the work elsewhere. The unions offered bitter opposition to every proposal to restore piecework, but the Labor Board has now changed the working rules to permit it. Apparently the unions are learning that they cannot work contrary to economic laws and are ready to conform to the spirit of the order issued by the board. On at least one road representatives of the shop crafts organizations have approached the management to learn what proposal the road had to offer for the re-establishment of piecework. Now that negotiations have been opened, it is to be hoped that they can be brought to a successful conclusion, for an equitable system for payment according to the output of the individual would benefit both the railroads and the employees.

The promotion of business ventures by labor organizations is neither novel nor unusual. The path of unionism is lined

### When the Employee Be- comes Employer

with the wreckage of one such project after another. Most recent is the fiasco of the maintenance of way brotherhood which sunk large sums in the purchase of knitting mills a couple years ago to make garments for its members "at cost." In spite of all these experiences of the past, new projects continue to present themselves. The latest development of this kind is a coal mining project promoted by officers of the Brotherhood of Locomotive Engineers. A letter addressed "to all railroad men" under date of September 15, 1921, and over the signature of Warren S. Stone, "chairman, Board of Directors" urges railroad men to buy stock in this new venture, (maximum subscription \$5,000). The affiliation of the Brotherhood of Locomotive Engineers is shown further by Mr. Stone's statement that they "will be glad to have the Board of Directors authorize the Brotherhood of Locomotive Engineers' Co-operative National Bank to act as depository for all subscriptions for stock and also the funds of the corporation." An accompanying statement expresses the "hope for a giant corporation with a big soul full of human interest, for the benefit of our stockholders, and welfare of our employees." A further appeal for popular support of the brotherhood members is made in the statement, "No financial pirates, no preferred stock, no bonds—All common stock and non-assessable." Thus, Mr. Stone appears in a dual capacity, as a representative of the employees, charged with the responsibility of protecting their interests, as opposed to those of their employers on the one hand, and a representative employer in his duty to his stockholders on the other hand. It remains to be seen whether he can lead his followers in railway service into the broader field

of financial speculation and promotion; and if so whether they will be different from other employers in their new role. The experience workingmen will get as capitalists and employers is bound to make more tolerant their attitude toward capitalists and employers.

It is frequently possible to effect economies through the application of automatically-controlled, electrically-driven machinery to air compressors, coal chutes,

### Isolated Plants Electrically Operated

pumping stations and isolated plants that have long aggravated the problem of reducing the expenses and forces of the railroads. As an example of what can be accomplished, one road recently replaced a steam-driven air compressor plant with modern electric equipment which made it possible to dispense with the services of three licensed stationary engineers and two firemen. The cost of the electric power used is about one-half as much as the cost of the coal formerly required. It is conservatively estimated that the saving produced will pay for the new installation in three years. Another road has investigated the cost of the fuel and labor used in the operation of its water pumping plants as a result of which it has determined that whenever power is available at or below a certain figure, automatic electrical machinery is to be installed. At one pumping station alone the services of two men were eliminated recently. Since automatic control will reduce the labor necessary for the operation of isolated plants, it would appear advisable for the railroads to investigate thoroughly the possibilities of the application of such equipment to outlying stations where the large part of the operating expense is for the wages of the attendant.

Why has the impression become so general that railroad shops and enginehouses are dirty, dangerous and undesirable places

### Keep the Shops and Premises Clean

in which to work? Is not this due to the fact that everything about locomotives, and to a lesser degree cars, is more or less covered with grease, dirt and dust and unless exceptional care is taken the repair shops and enginehouses soon reach a condition for which "dirty" is too mild a term? Fortunately not all shops are in this condition, because someone in authority makes a hobby of shop cleanliness and sees to it that both the shops and premises are kept properly cleaned. It is undoubtedly true, however, that the visitor at far too many shops receives a distinctly unfavorable impression. Greasy, dirty locomotive and car parts are everywhere in evidence; the floors have acquired several thicknesses of grease; windows are smoky; and soot-covered ceilings strive in vain to reflect light. Corners are filled with debris and passageways are blocked with all sorts of material. It is impossible to touch a bench, machine or article of any kind without getting dirty, and darkness and congestion make passage through the shop dangerous. Is it any wonder that men do not want to work in such a place and, when compelled through force of circumstances to labor there, find little incentive for thoroughness and efficiency? It may be that the picture painted is

an extreme case but, in varying degrees, it is all too common. The remedy for the situation has already been worked out in certain modern shops. The first essential is to clean locomotive and car parts thoroughly in lye vats or by washing before going into the shop. Shop floors and premises are kept clean by an adequate force of sweepers under the direction of someone who sees to it that the work is properly done. Passageways between departments, also track safety zones, are indicated by lines painted on the floor within which no material may be placed. Windows are washed periodically; walls and ceilings are white-washed and machinery is kept scrupulously clean. And what is the result? Men employed in a shop of this kind no longer need work in overalls which will stand alone; there is ample light to see the work, increase production and avoid danger; and there is quite an appreciable improvement in morale due to the natural pride which men take in working in a clean, up-to-date production shop.

Hale Holden, president of the Chicago, Burlington & Quincy announced on Monday that the directors of his company had

### Better Equipment Business

authorized the expenditure of \$15,000,000 for new equipment. The understanding was given that immediate arrangement was to be made for the purchase of 7,300 freight cars, 55 locomotives and 127 passenger cars. This announcement is the most encouraging thing that has been evident in the railway supply field for a long series of months. It follows closely enough upon the Baltimore & Ohio's recent order for 2,000 freight car bodies and the Chicago, Milwaukee & St. Paul's recent order for 2,500 cars to indicate that there is very much of a changed feeling insofar as the purchase of cars and locomotives is concerned. The equipment companies, even with the large amount of repair work which they have been called upon to do, have found 1921 a rather meagre year. This will be borne out by the following table which shows the orders for new cars and locomotives as they have been reported in the Equipment and Supplies column of the *Railway Age*. It will be seen that in the first 10 months of 1920 only 143 locomotives were reported as ordered for domestic service and only 62 passenger cars. The freight car orders in the first 10 months totaled 9,320. The change which has come over the equipment market is apparent from the fact that of the 9,320 in the 10 months, 3,720 are credited to October. In addition, November is credited with 3,400 cars—those reported in last week's issue. Besides the new feeling which has made itself apparent, attention should be paid to the orders for export locomotives. The total is 388, of which 95 were reported as ordered in October. The orders—domestic and export alike—are not yet large, but it is quite plainly evident that a marked change has been made for the better.

## The Public Utility Commissioners

THE APPEARANCE of John E. Benton, general solicitor of the National Association of Railway and Utilities Commissioners, before the Senate Committee on Interstate Commerce recently, follows closely upon the successful annual meeting of the important organization which he represents, held at Atlanta, beginning October 11. Mr. Benton expressed his objection to the centralization of regulatory authority in Washington. He contended that the Interstate Commerce Commission had misinterpreted the Transportation Act and that "chaos" in regulation had resulted. He further read the resolutions which were adopted after a lively discussion at the state commissioners' convention. These resolutions were reproduced in the *Railway Age* of October 22, page 777. They urged the immediate enactment of legislation amending the Transportation Act so as to define and limit the powers of the Interstate Commerce Commission over intrastate rates. They also condemned the rate making provisions of section 15-a of the Interstate Commerce Act and urged the repeal of the provisions whereby the Interstate Commerce Commission is required to establish rates which will yield 5½ per cent on the aggregate value of the property of the carriers used in the service of transportation.

It is not necessary to repeat Mr. Benton's argument as it will be found in the reports of the hearings which have appeared in recent issues of the *Railway Age*. Several of the state commissioners have also appeared before the committee. They have presented similar points of view. Reference to their testimony will be found in the *Railway Age* of November 5, page 886.

The state railway and utility commissioners are in the somewhat unhappy position in arguing in favor of states rights. This is an issue which has existed since our federal idea of government was formulated in our constitution. It is an issue which, in many ways, is a losing one, for the reason that the tendency towards which our form of government has always worked is centralization of power in the federal government. The state commissioners are further confronted with the argument that regulation of commerce by some 49 or 50 commissions has hardly justified itself. The unfairness and severity of such divided regulation and responsibility was recognized before the Transportation Act was passed. The recognition of it was one of the causes for the passage of the Transportation Act in the form in which it was passed.

One can, however, readily appreciate what must be in the minds of the state regulatory commissioners. The Interstate Commerce Commission has so construed the Transportation Act as to mean that state rates which are lower than interstate rates are a discrimination against interstate rates, which construction of the act we believe to be the proper one. The state commissioners, however, have fought the Interstate Commission's decisions raising intrastate rates to interstate levels and have thus far come out very much second best, particularly in view of the restraining court injunctions. The matter is now in the courts but in view of the Supreme Court's recent decision, that there should be a rehearing in the Wisconsin case, final decision is still in the future.

It is natural for any man and equally natural for any organization not to desire to give up power and prestige which it already has. The feeling of the state commissioners against giving up their jurisdiction over railroad regulation to the federal commission is exactly a case in point. We feel that in this case the state commissioners are being governed too much by their pride and too little by a real desire to see justice done to the railway carriers. Yet one cannot but feel that the commissioners are very much influenced by a desire to treat the utilities they regulate fairly. The

unpopularity which they have secured for themselves in raising street car fares, gas and electric light rates, etc., should be an indication of that.

The point might also well be made that the state regulatory commissions have a large task before them. The regulation of the electric light companies, the gas companies, the street railway companies, etc., of a state would seem to be a sufficiently large task for any body of men. The competition of the jitney, the new task of regulating motor truck transportation and similar like developments do not seem to represent a group of duties that may be regarded lightly.

But, it is also true that even if the regulation of railroad rates is taken away from the state commissioners and put in the hands of the Interstate Commerce Commission, the duties of the state commissions in the matter of railroad regulation will not cease. The state commissions must still be called upon to assist the federal commission in matters relating to their individual states. They should, it would seem, be prepared to watch out for their state interests in hearings before the federal body. At any rate, it would appear that the duties which would remain to the state commissioners should be great enough in volume and complexity so that the state regulatory bodies would be required to play a busy part and one of great importance in the general scheme of railway regulation.

The present attitude of the state commissioners, it may be said in conclusion, is a natural attitude for men or organizations in their position to take. One cannot help but feel, however, that they are presenting themselves in a wrong light. Besides failing to realize that they should be able to play a real part in the present scheme of things, they are acting the part of reactionaries and opposing progress that it has taken many years to bring about.

## "When Doctors Disagree"

THE RAILWAYS ARE SICK. Their sickness is infectious. It has spread disease through general business. Continuance of it will do more harm to general business in the future than it has in the past.

The railways are being treated by two doctors. They did not choose them. The doctors were assigned to them by the federal government. These doctors are the Interstate Commerce Commission and the Railroad Labor Board. If the doctors long disagree, and one gives the patient one kind of treatment and the other an exactly opposite kind of treatment, the patient is sure to get sicker and sicker.

Certain statements made by Ben W. Hooper, a public member of the Labor Board, in an address before the Traffic Club of Chicago, on November 3, when contrasted with statements which have been made by members of the Interstate Commerce Commission, show that the two doctors do wholly disagree as to how the patient should be treated. In his address Mr. Hooper said: "It may be and doubtless is true to some extent that the fixing of freight rates is partially controlled by the carriers' operating expenses, but the converse of this proposition is by no means correct. *The fixing of wages cannot be made to depend upon freight rates.* . . . The wages of the employees must be just and reasonable based upon the elements set out in the statute. When these matters have been properly considered by the Labor Board, and the wages fixed, *then the Interstate Commerce Commission will know as well what the railways are paying in wages as if they established the wages.*"

The purport of this seems clear. Mr. Hooper's position apparently is that the Labor Board should determine what are reasonable wages, and that the Interstate Commerce Commission must accept the wages fixed by the Labor Board as a basis in regulating rates.

We now quote the following from the concurring opinion of Commissioner Potter of the Interstate Commerce Commission

in the recent decision in the grain rate case: "Some urge that we must take wage conditions as we find them, and not contemplate further wage reductions in dealing with rates. *On the argument it was pointed out to us by the representatives of the petitioners that such is not the law.* They urged upon us that it was the duty of the Commission to consider the broad economic question as to what rates the industry of the country could stand, and that our finding in this regard should be taken into consideration in the fixing of wages. . . . I am inclined to the view that the opinion thus urged upon us by counsel for the petitioners is sound. . . . *In considering what railway employees should receive, regard should be had for what the shippers can afford to pay.* . . . *If the broad economic question as to how much shippers can afford to pay is a question to be determined by us when we fix fair and reasonable rates, it will follow that the Labor Board, in considering wages, would regard our finding as one of the relevant circumstances to be taken into consideration in fixing wages.*"

The purport of this also is quite clear. It means, unless we entirely misinterpret it, that Commissioner Potter believes it is the duty of the Commission to fix rates which will be reasonable for the shippers to pay, and that the Labor Board must accept the finding of the Commission as one of the "relevant circumstances which the Transportation Act requires the Labor Board to consider in fixing wages.

In other words, Mr. Hooper says that the Commission should accept the findings of the Labor Board regarding wages as reasonable, and make rates accordingly, while Commissioner Potter says that the Labor Board should accept the findings of the Commission regarding rates as reasonable, and make wages accordingly.

Now, suppose that the Interstate Commerce Commission refuses to accept as reasonable the wages fixed by the Labor Board, and the Labor Board refuses to accept as reasonable the rates fixed by the Commission. The Commission puts the rates down to where it thinks they will be reasonable for the shipper, the Labor Board keeps the wages up to where it thinks they will be reasonable for the employees, and, in consequence, the railways are deprived of opportunity to earn a "fair return." But the law under which both bodies act says that the railways must be given opportunity to earn a "fair return." The result of each body so interpreting the law as to make it paramount in its own field is disregard and defeat of plain provisions of the very law from which both derive their authority.

This is not mere conjecture. It is what is actually occurring, and has been for months. The railways never have earned the net return the Transportation Act says they should be allowed to earn until March 1, 1922, and yet we now have presented the spectacle of the Commission ordering reductions of rates in anticipation of reduction of wages, and a member of the Labor Board plainly indicating that the Labor Board will give little or no weight to rates fixed by the Commission in fixing wages.

Mr. Hooper, in his address, said that advocacy of the policy of uniting the regulation of rates and the regulation of wages in the same body "involved a glaring fallacy." He could not, however, have used language which would have made clearer than that he did use, the "glaring fallacy" and danger of the present plan of regulation. Whether any other changes ought to be made in the Transportation Act or not, it certainly has become plain that it ought to be so amended as specifically to provide either that the Labor Board, in fixing wages, shall accept as binding upon it all findings of the Interstate Commerce Commission regarding rates, or that the Commission, in fixing rates, shall accept as reasonable the wages paid in accordance with orders of the Labor Board.

Doctors that disagree should not be allowed to give a patient two kinds of treatment so different that, whatever might be the effects of either alone, the two are sure to kill him sooner or later.

## Too Much Regulation of Railway Labor

ONE OF THE WORST mistakes made in framing the Transportation Act was that of subjecting to government regulation the wages and working conditions of railway employees who are not directly concerned with the operation of trains.

The Newlands mediation and arbitration act, which was in effect prior to government control, applied only to controversies between the railways and employees directly concerned with the operation of trains. There was sound reason for the distinction thus drawn between employees directly concerned with the operation of trains and all other classes of employees. This reason was that employees directly concerned with the operation of trains, and they alone, could, by a strike, immediately and seriously interrupt transportation.

There is still, and always will be, adequate ground for subjecting the wages and working conditions of employees directly concerned with train operation to government regulation, and even for absolutely prohibiting strikes by them. The public should not be subjected to the suffering and loss of an actual interruption of transportation. To prevent this special means should be provided by the government for settling controversies arising between railways and employees directly concerned with train operation. The right to strike should be entirely taken away from such employees, and there should be maintained some government tribunal to which all controversies arising between them and the railways should be carried.

As to other classes of railway employees, there is no more reason why their wages and working conditions should be subject to regulation by the Railroad Labor Board, or any other government body, than why the wages and working conditions of mechanics in factories, or clerks in stores, or laborers on farms should be subjected to such regulation. The only ground upon which special regulation of the wages and working conditions of any class of railway employees can be defended is that a strike by them would seriously interrupt transportation; and such effect would not be produced by a strike of any class or classes of employees except those directly concerned with the operation of trains. A strike of employees in the shops would be embarrassing and expensive; but it would not cause an immediate interruption of transportation, and would not seriously interfere with transportation unless quite protracted. It would not bring about an actual interruption of transportation as soon as a general strike of the coal miners, who are not railway employees at all, and whose wages and working conditions are not regulated by the government. No conceivable strike of other classes of employees, such as those employed in maintenance of tracks, would cause an interruption of transportation.

The application of government regulation to the wages and working conditions of employees not directly concerned with the operation of trains has been harmful, and will become more harmful if it is continued. It is practically impossible for a single body, such as the Railroad Labor Board, to fix the wages and working conditions of all classes of railway employees throughout the country without standardizing their wages and working conditions on all the important railroads throughout the country. This is inequitable to the employees and imposes undue burdens on the railways and the public. Employees doing similar work, but living in different parts of the country under different conditions, should not be paid the same wages.

Standardization of the wages and working conditions of each class of employees throughout the country renders it impossible to make their wages conform to those of men doing similar work in other industries, although this is one of the requirements of the Transportation Act. We believe the railways in each community should pay for any given class of labor as high wages, if not higher, as are paid by any

other industry in the same community. But why should the railways be subjected to a system, as they are now, under which in some communities they cannot get the best labor of certain kinds because the wages paid by them are not as high as the wages paid by other industries for the same kinds of labor, while in other communities they are required to pay twice as much for certain kinds of labor as are being paid by other industries?

It may be contended that the wages and working conditions of all railway employees should be regulated for broad social reasons. But if the wages and working conditions of all railway employees should be regulated, not for reasons peculiar to the transportation industry, but for broad social reasons, then so should the wages and working conditions of men employed in all other kinds of industries. If the wages and working conditions of mechanics employed by railways should be regulated for broad social reasons, then for the same reasons the wages and working conditions of mechanics in all manufactories should be regulated. If the wages and working conditions of common laborers on railways should be regulated for broad social reasons, then so should the wages and working conditions of all common laborers employed by other industries. There is no peculiarity, either legal or economic, of the railroad business which justifies special regulation of the wages and working conditions of any of its employees except those directly concerned with the operation of trains.

All employees of railways except these should have the same right to make demands upon their employers, and even to strike, that employees of other industries have. Likewise, the railways should have the same right to deal, without government interference, with all their employees except those directly concerned with the operation of trains that any other employers have.

The labor organizations unanimously opposed the adoption of the present labor provisions of the Transportation Act, and therefore it seems reasonable to assume that they would gladly see these provisions so amended that they would cease to apply to most classes of railway employees. The employees directly concerned with the operation of trains are only about 25 per cent of all railway employees, and the entire problem of useful government regulation and efficient management of railways would be greatly simplified by withdrawing all regulation from the wages and working conditions of the other 75 per cent of the employees.

## Boiler Compounds and Treating Plants

ELSEWHERE in this issue will be found an article entitled "Interior Treatment of Boiler Waters" to which the attention of railway officers, having occasion to interest themselves in the subject of locomotive water supplies, may well be directed. Specifically, this article concerns itself with boiler compounds and points out the possibilities of this much applauded and berated and withal too little understood method of improving locomotive performance in bad water areas.

Because of the decided views that obtain among railway men on the subject of boiler compounds, it is but reasonable to suppose that the author's ideas will not meet with universal approval, and it is possible even that criticisms will be voiced which will not be entirely wanting in justification. But it is not this feature of the article as much as the fact that it has been written by an advocate of exterior treatment that constitutes the primary point of interest in it, for it is an indication of the growing tendency of advocates of treating plants on the one hand to see merit in boiler compounds and of advocates of boiler compounds on the other hand to see justification in treating plants.

This change of attitude places the boiler water problem

where it should always have been, on a purely scientific basis, and the effects of this are bound to be salutary. It will do much to dispel that skepticism regarding water treatment in general which many executive officers have entertained as a natural result of the controversial attitude which one school of thought has manifested towards the other and will prepare the way for programs of water treatment more nearly in keeping with the possibilities for savings that lie in them for many roads. It will also cause water service engineers to give more thought to finding the best solution of the problem instead of limiting their efforts to the promotion and maintenance of one method of treatment.

The problem of improving boiler waters, in short, is no longer one of arbitrarily installing a treating plant or of prescribing a preparation for locomotive boiler or tender treatment, but rather that of choosing that method which is best adapted to solve a particular problem, whether it be a particular kind of interior treatment alone, a special kind of exterior treatment alone, or a combination of the two.

While a roadside installation designed and operated to meet the conditions of a particular water should afford the best accurate treatment possible, as pointed out in the article referred to, there are many places where the water is not sufficiently bad or the consumption great enough to warrant the investment necessary for such a plant. There are many other points where the quality and consumption of the water are such as to warrant the expenditure for a treating plant, but the funds are not available. It is in such places that Mr. Knowles advocates the use of boiler compounds rather than continuing without relief until a treating plant may be secured. This policy rather than being prejudicial to the interests of the one school or the other is beneficial to both.

## Nashville, Chattanooga & St. Louis

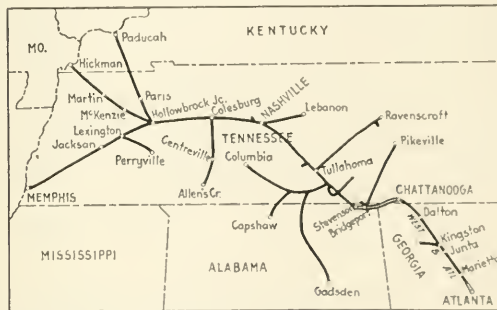

IN AN ARTICLE on another page of this issue entitled, "Delivering Train Orders Without Getting Signatures," Harry W. Forman devotes several paragraphs to the Nashville, Chattanooga & St. Louis. He refers to the efficient manner in which train operation is conducted on that road with the use of No. 19 train orders. Among other things, he says: "The many fast freight trains which are run daily between St. Louis and Atlanta, as well as numerous pineapple and peach specials between Atlanta and Nashville have always made remarkable records for expedition movement. This is so well known that the fact is generally commented upon by dispatchers throughout the country."

In the perishable fruit season of 1921, the Nashville, Chattanooga & St. Louis moved north from Atlanta some 10,000 cars of fruits and vegetables. This total included about 4,800 cars of watermelons, 2,000 cars of pineapples, 1,400 cars of fresh vegetables, 25 cars of cantaloupes and about 1,800 cars of citrus fruits. The manner in which the pineapples were moved over the road approaches the spectacular. There were run 61 solid trains of pineapples, a total of 1,756 cars being handled on these trains. The trains averaged 29 cars each, of which an average of 16 cars were delivered to the Illinois Central at Martin, Tenn. These trains averaged 23 hours and one minute from Atlanta to Martin, a distance of 430 miles and passed through three terminals. The average time the cars were on the N. C. & St. L. rails was but 25 hours and 10 minutes. In the distance of 430 miles, there are but about 40 miles of double track. The trains, however, were moved over the road at a speed which would go credit to a double track road.

One of the busiest sections of the N. C. & St. L. is the district between Atlanta and Chattanooga. This line, 137 miles in length, is known as the Western & Atlantic. It is owned, incidentally, by the state of Georgia and leased to

the Nashville, Chattanooga & St. Louis. Between Junta, Ga., and Atlanta, 48 miles, the rails are used also by the Louisville & Nashville. This section is understood to be probably the busiest stretch of single track in the Southeast. In rush periods some 10 passenger trains are handled each way daily and a total of about 60 passenger and freight trains in all in both directions. Operation between Atlanta and Junta is controlled by manual block signalling.

The Nashville, Chattanooga & St. Louis is controlled by the Louisville & Nashville, through majority stock ownership. The road, for the past several years, has been paying  $3\frac{1}{2}$  per cent dividends semi-annually on its common stock. Its total mileage is 1,247, of which 856 is owned and 391 is leased. There is a total of 59 miles of double track, of which the most important part is the 38 miles from Chattanooga north to Stevenson. The road's traffic is rather diversified. In 1920 products of agriculture made up 22 per cent of the total tonnage; products of animals, 3.4 per cent; products of mines, 31.8 per cent; products of forests, 13.1 per cent, and manufactures, 21.7 per cent. Bituminous coal in 1920 made up 1,293,557 tons or 17.8 per cent of the total. Of this, 925,809 originated on the N. C. & St.

The Nashville, Chattanooga & St. Louis

L's own lines in the Tennessee fields. The total tonnage of all freight handled in 1920 was 7,254,047, which compared with a total for 1919 of 5,808,714 tons, or for 1918, of 7,050,961 tons.

The Nashville, Chattanooga & St. Louis' standard return for operation by the government was \$3,163,576. In 1918 the road had a net railway operating income of slightly over \$4,000,000. In 1919 it earned about \$1,000,000 and in 1920 the net railway operating income was but \$20,000, there being in that year several months in which the road operated at a deficit. The year 1921 has been characterized by the small amount of business handled as compared with last year. In the first seven months of 1921, the latest figures at present available, there were handled 600,298,000 net ton-miles of freight, including revenue and non-revenue, as compared with 869,044,000 net ton-miles in the first seven months of 1920. In March, April and May, 1921, operations resulted in a deficit, but there has since been a progressive improvement. In August the net railway operating was \$372,397. The net railway operating income for the first eight months of 1921 was \$441,685. In the first eight months of 1920 operation showed a deficit of \$154,849, this being the result of poor earnings in July and August of that year.

The road's average revenue train load in 1920 was 352, as compared with 345 in 1919 and 344 in 1918. The average revenue tons per loaded car in 1920 were 2145. The miles per car per day were 26.6 and the net ton-miles per car per day were 456. What must be a disconcerting feature to the officers of the road at present is its percentage of bad order cars, which was 30.9 on October 15.

## Letters to the Editor

*[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]*

### From a Conservative Fireman

DELAWARE, Ohio.

TO THE EDITOR:

A reading of the letters which have been published from railroad trainmen in connection with the strike agitation prompts me to give my experience. During the war, though several years over age, I was employed as fireman on one of our railroads having a heavy coal traffic together with mixed freight.

Where train crews are made up by call in turn and a fireman seldom runs twice a month with the same engineer, one soon learns the varied dispositions and habits of the men. I found that the worst howlers and complainers were also the roughest handlers of their trains. The safe and steady engineer, who made trip after trip without damaging a drawbar, no matter how heavy the train, invariably was the man who had the best disposition towards the management and towards the people at large. A fireman was sure to find these men congenial cab mates, not constantly primed to jump on him for trifles. The impetuous engineer who was always damaging drawbars was the same who quarreled with his fireman and kicked at the management or the public.

G. P. WILLIAMS.

### Train Dispatcher Takes Exception To Locomotive Engineer

TEXAS.

TO THE EDITOR:

Your October 22 number has an article signed "A Locomotive Engineer" that reeks with vituperation against all railroads and employees, especially train dispatchers. No doubt he is a good engineer and deserves all the money he earns, but the way he expresses himself reminds me of a story about a boy and a dog. The little boy was sitting by the side of the road when an engineer came by, stopped and asked the dog's name. The boy replied, "Engineer." When asked why he gave the dog such a name, he replied, "Well, he is just like an engineer, just sits around and growls all the time."

As a train dispatcher of 12 years' experience on single-track lines with divisions of from 100 miles to 180 miles in length, I wish to take exception to the statement that "the poorest brakeman on the division could have handled the situation better than the dispatchers did."

There must have been several contributing causes for the excessive delays over which no one man had control, such as congested terminals, which we had in Texas about two years ago during the oil boom that came unexpectedly upon the Texas roads when their terminal facilities were inadequate to handle the enormous business that was dumped upon them at a time when they were not prepared to care for it.

Every man on our division made every effort to get trains over the road but there were times when we had to hold them out of terminals or set them out. I have seen four and five trains set out in passing tracks because of having to get power into terminals and get a train out before we could take the trains in; we had redball or important trains held out and would have sent relief crews out to get them rather than set

them out, owing to the fact that they were high-class trains.

There is no man on the division who likes to see trains get over the road any better than a train dispatcher, but delays frequently occur which are beyond his control. Successful operation of a division requires hearty co-operation and teamwork on the part of all concerned.

A TRAIN DISPATCHER.

### A Comptroller on the Wage Question

OUT-WEST.

TO THE EDITOR:

I have noted with interest the letter in your issue of October 22 by "Locomotive Engineer." It contains many points of value but is chiefly noticeable for the half truths, or what it leaves unsaid.

It is not my purpose to launch an attack against labor organizations, as they could, if they would get the right perspective, become valuable allies to the management and by proper co-operation materially reduce the operating expenses without reducing the rates of pay. The accounting officer is rather in the position of an umpire analyzing the results by the cold facts at hand rather than argumentative premises.

Consider "Locomotive Engineer's" remarks relative to propaganda. The writer follows both sides of the question, reading the various labor organization journals, and it is hard to find more insidious propaganda than is contained therein. Much of it is written by men of such apparent intelligence that we can only conclude that the statements made are deliberately misleading, such as many of the comments made during the time that the "Plumb plan" was to the forefront, or figures given out as facts relative to the cost of overhauling equipment in outside shops, etc.

The most glaring example of misleading information given the public is the rates of pay for men in train service. The statement is often made, quoting from the schedules, that the rate of pay for a freight brakeman is only \$4.68 for a day's run, or for a locomotive engineer is \$7.20, and so on. As a matter of fact the published rate of pay has very little to do with the amount of remuneration received. The so-called "working conditions" are not working conditions at all for the most part, but are pay additions that add about 100 per cent to the rate of pay. There is no possible condition in actual practice under which an engineer could draw only the day's rate of pay; if he made a run in four hours he would get the rate for eight hours and in addition would get 45 minutes preparatory time before starting the run and quite likely 30 minutes' detention at the end of the run, although the entire time on duty was less than six hours. This is only one instance of perhaps 25 different situations that daily arise that add to the rate of pay. On the road with which the writer is connected the schedule rates of pay for passenger engineers vary from \$5.56 to \$6.29, or theoretically something less than 60 cents per hour; the amount actually paid was \$1.33 per hour for the year 1920. It is possible under many conditions for an engineer to draw two days' pay for six hours work under existing schedules.

Why not in a straightforward manner make the "rates of pay" state the compensation actually and entirely paid for given services rendered so that no one would be misinformed; why not have the "working conditions" deal with working conditions only, such as the various provisions now in effect that engineers shall be furnished places to sleep at distant terminals with ample blankets, bedding, etc., and the various other conveniences that the railways are glad to provide but which travelling employees in other lines of work do not get the benefit of.

Another point brought out by "Locomotive Engineer" with reference to delays and getting over the road was good as far as he went, but the question as to the cause and prevention of

these delays should have been gone into further. He charges that the delays *per se* to the management, but let us follow one of these freight trains through a typical run. It arrives at a station about noon and stops for 30 minutes to unload way freight; it goes on a few miles and the engine crew stops 40 minutes to eat at a station where there is no work to do. This time is absolutely lost whereas with a little co-operation between the conductor and engineer the engine crew could have eaten while the way freight was being worked a few miles back. The conductor with running rights between two stations is for the time being practically general manager of this territory and by handling the situation in co-operation with his engine crew, as if it was his own business in which he was vitally and financially interested, about all of this delay could be avoided. There are many times when a conductor can anticipate closely how much time will be required for several stations ahead and likewise an engineer can reasonably figure ahead where he will require water, coal, meals, etc. If the dispatcher is advised well in advance he can arrange movements without delay, but if he expects a train to make usual running time, and it is suddenly held up somewhere 30 minutes there may be several trains following it and superior class trains meeting it, and there is bound to be some time lost on single track mileage.

If "Locomotive Engineer" could just reverse the sentiment expressed in the next to the last paragraph of his letter and instead of saying that a bunch of railroad men can "gyp" a railroad more ways than a farmer can come to town, state and follow up the statement by example, that a bunch of railroad men by hearty co-operation can eliminate half the delays to trains, so that it would not be necessary to reduce wages to make both ends meet.

COMPTROLLER.

## Mr. Ford's Methods of Operating a Railroad

BUFFALO, N. Y.

TO THE EDITOR:

The numerous contributions which have recently appeared in the *Railway Age* commenting on Henry Ford's operation of the Detroit, Toledo & Ironton are interesting, but as Goldberg would say, "They don't mean anything." It is unfortunate for purposes of analysis of Ford's railway methods that as a shipper he has been able to so greatly increase the gross volume of business done by his railroad. It was a well-known fact that it never had been worked anywhere near capacity and the increased business has totally obscured any net results which his rather radical departure from the usual methods of running a railroad may have produced. As the *Railway Age* suggests, it would be fortunate if his methods could be tried out on a larger and more typical railroad system, and one on which his ability as a shipper to divert traffic would not be a controlling factor.

It must be admitted that the railroads are a fertile field for trying out some of the methods of operation, handling and developing personnel, etc., which have proved so successful in his automobile factory, as well as in many other progressive industrial concerns. On the other hand, granted that a new broom sweeps clean, it seems a little far-fetched that he should claim that factory executives with absolutely no practical knowledge of railroading would be preferable for his purposes on the D. T. & I. Surely, in an industry as large as transportation, there must be a few trained railroad officers thoroughly grounded in the fundamentals of their calling who are not so perfectly satisfied with themselves, or so steeped in tradition, as not to be willing to try new methods which give promise of greater operating efficiency.

There is, of course, nothing new in Ford's methods of diverting traffic, securing a larger percentage of the through

rate, etc. Industries have operated railroads as a part of their plant facilities for many years, but just why it is legal for an industry to control a railroad, but illegal for a railroad to own a coal mine, is one of the vagaries of the law.

When we turn to Ford's operating policies, we find much to commend. His insistence on the prompt movement of traffic from interchange connections, prompt movement over his own road, and a full day's work from each employee for a day's pay, are all features in which many railroads could follow him to advantage. His side tracking the ridiculous train service agreements and putting that service on a straight hourly basis is a healthy development, and while the monthly rates he established for men in train service appear on the surface unduly high, it is my opinion that they will be found on investigation to be not far out of line with the earnings of train and enginemen on other railroads for the same service rendered.

But probably Mr. Ford's greatest contribution to the service of railroading to date is a demonstration of the fact that it is possible to operate a railroad without having any of the employees work an excessive number of hours. Several years ago, while in charge of a construction gang, the writer made an interesting discovery: The gang had been working every day for three months when the policy was inaugurated of not working Sundays. It was discovered, however, that the men continued to do practically as much work in six days as they had been doing in seven, due to the fact that they were in better condition from having proper relaxation and rest. In other words, so far as the railroad company was concerned, the pay for Sunday work had been simply money thrown away.

On the other hand, there seems to be considerable ground to play about Ford's operation of the D. T. & I. A minimum wage of \$6 a day for all classes of railroad labor is certainly unjustified and unfair to railroad workers having the greater responsibilities. I have particular reference to inexperienced junior clerks and section and shop laborers. Just how Ford expects to induce a likely section hand to assume the responsibility of a foreman for 50 cents more a day is one of the things not explained.

On the other hand, it is evident that Mr. Ford intends to give attention to the building up of personnel and that no slackers will be tolerated. It must be said in criticism of some of the old line railroad managements that they number many men in their employ that no up-to-date industrial organization would tolerate. It seems sometimes that if a man hasn't brains or common-sense enough to get a position elsewhere, he has no trouble in attaching himself to the payroll of a railroad, where his tenure of employment seems to be in inverse ratio to his ability and the interest he takes in his job.

As a former railroad supply representative calling on railroad officers in all parts of this country, the writer used to stop at times to wonder just where we were heading, because of the attitude which seemed to be held in common from some of our highest executives down to the most lowly employees, that the railroads were run for their special benefit, rather than to make money for their stockholders and serve the public. If Mr. Ford can secure the good will and whole-hearted co-operation of his employees on the D. T. & I. and show us the way out of the present position of stagnation—somewhere between army regulations and civil service practice—into which our railroads have fallen he can at least be considered enough of a public benefactor to counteract his inflicting us with his infernal divver.

In this connection it seems only right to give credit where it is due. The Erie Railroad has apparently secured a remarkably strong organization under the regional plan of operation it adopted some months ago, and while none of the regional managers are personally known to the writer, it is refreshing to note with what marked success they have been able to secure the interest of their subordinates in the well-

fare of the railroad. The remarkable spirit of co-operation existing on this particular railroad between officers and employees of every grade, and between the various departments of the railroad is in sharp contrast to conditions existing on that particular railroad a decade ago, or for that matter on many other railroads today, where they seem to be entirely lacking in a knowledge of the fact that successful railroad-ing requires first of all a well developed spirit of team work.

CHARLES C. HENKEL.

## Do the Railroads Really Want College Men?

GREENVILLE, Pa.

TO THE EDITOR:

I have been following with considerable interest the discussion created by my letter in the *Railway Age* of June 17, 1921, on the subject "Do the Railroads Want College Men." The subsequent articles and letters showed more interest in the subject than I had expected or hoped for. The article by Mr. Hanson, *Railway Age*, September 10, 1921, and the one by Mr. Ennes, *Railway Age*, August 20, 1921, brought out a number of points that should be considered by both the railroads and the colleges. I have also received several personal letters that bring up points that were not discussed in any of the letters or articles published in the *Railway Age*. It is evident that both the railroads and the colleges are anxious to do something. The question in my mind now is, how are the two interested parties going to get together, and who is going to do it?

If no action is taken by someone in authority, all the discussion on the subject will avail us nothing. It appears to me, after all the interest that has been shown, that it is the business of the American Railway Association to see that some step is taken towards the proper solution of the problem. In my previous letter I proposed some possible solutions. Perhaps they are not feasible. Before any college can introduce such a course as proposed by Mr. Ennes, for example, it is essential that the railroads and the college have a thorough understanding of each other's requirements and also the problems involved in the successful maintenance of such a course. Is not now the proper time for the American Railway Association to make the settlement of this important question a part of its program?

MARION B. RICHARDSON.

## What Makes a Good Chief Clerk?

DALLAS, TEXAS.

TO THE EDITOR:

After nearly 15 years' service, 10 of which have been in transportation work and with the same road (M. K. & T.), I want to express an opinion as to what makes a good chief clerk, based on experience as a chief clerk in division and general offices.

The essential prerequisites of a 100 per cent chief clerk are many, and among them I consider experience, relationship and appearance paramount.

Experience means having a thorough working knowledge of office details, both in the immediate office and in the offices under his jurisdiction; this necessarily is gained by "working up."

Relationship comprises several qualities—the ability to keep in personal contact with subordinates and at the same time maintain proper discipline, to be on a cordial footing with other offices, to do business in such a way as to leave no question of doubt in the minds of those concerned of one's good intentions, creating thereby a feeling of reliance. The relationship between a chief clerk and his "boss" must

be close and there must exist a mutual friendly feeling if the chief clerk is to perform his duties and look after the interests of his boss 100 per cent.

Appearance, in my opinion, comprises the ability to meet the public and transact business in a manner that will leave a kindly feeling for the road and the man he is working for, regardless of the action involved, be it favorable or unfavorable.

These qualities are essential and must be supported by the ability to profit by criticism from superior officers.

K. WILLIAMSON,

Chief Clerk to General Manager, M. K. & T. Ry. of Texas.

## A Plea for the Senior Clerks

ALTOONA, Pa.

TO THE EDITOR:

Your editorial in the *Railway Age* for October 29, entitled, "How Railroad Wages Should Be Readjusted," has struck a responsive chord in the hearts of many employees. It states in general terms facts that are so unfair and so harmful, not only to the affected employees themselves but to the railroads as well, that wide publicity, embodying actual cases and figures for comparison, is fully justified.

One does not have to go to the conductors and engineers only to find a class of men who fared poorly at the hands of the Railroad Administration and the Labor Board. There are to be found even more flagrant cases among the experienced salaried clerks. Many of them have served longer periods of training to qualify for the positions they now hold than did these roadmen and, like the roadmen, would be in many cases unsuited for any other vocation in life. Yet these experienced clerks in general received but two increases during government control, and these were the same, and in some cases even less, than those granted the newest and most inexperienced clerks in the service.

From the present payrolls, as compared to those of December, 1917, one would believe that these senior clerks were intentionally singled out for neglect. To make this unfortunate condition even worse the first meager increase given to the clerks was made so that the major portion of it took effect eight months after the vast majority had received theirs.

These employees were, prior to government control, paid in proportion to the responsibility of their work, their salaries comparing very favorably with the recognized supervisory classes. For example, they were being paid approximately \$100 to \$120 per month and, with the addition of the last award by the Labor Board, were boosted to approximately \$150 and \$170 per month, or an average of 47 per cent. To readily see how glaring this comparison of increases is with other classes of shop employees, study the following table:

PERCENTAGE OF INCREASES GRANTED JANUARY 1, 1918, TO MAY 1, 1920

Shop craftsmen .....	96 per cent
Shop laborers .....	94 per cent
Junior clerks .....	88 per cent
Assistant foremen .....	83 per cent
Gang foremen .....	75 per cent
Foremen .....	72 per cent
Senior clerks .....	47 per cent

As will be seen, the experienced clerk received less than half the percentage the craftsmen received, and a goodly portion of that, as stated, eight months after the said craftsman had his! The human power of expression is utterly inadequate to give anything but a vague idea of the depth of feeling which permeates the hearts of these particular clerks because of this unfair treatment. The blame for this cannot be placed on any man or any set of men but against a huge, top-heavy and unwieldy system, totally incapable of dealing in general rules with such complex conditions.

How now are these inequalities to be smoothed out? How can not only this experienced clerk, but in some cases the minor chief clerk, the roadman, the telephone operator and

many other classes who have fallen behind in momentary recognition, have this recognition restored? How are they to be recompensed for the money lost because of this lack of recognition? As you state, "some are overpaid, some not much overpaid and some very much underpaid." Those in the first class profited, those in the second kept even and those in the third lost.

The period of deflation is at hand and underway. This is necessary if our country and the world wants to resume business so that all persons can work and earn a living. In this deflation in wages and salaries it could hardly be called fair to deflate all alike—"those who were overpaid, those who were not much overpaid and those who were underpaid." Surely the wisdom of the railroad managements will assert itself and speedily remedy the grave injury done to a class of employees than whom there is none more loyal, more faithful nor more efficient.

A. C. MYERS.

## Objects to Being Classed As an "Official Goat"

SOUTHWESTERN DISTRICT, U. S. A.

TO THE EDITOR:

I have read with interest the indictment against executive officers of our railroads in your issue of September 24, entitled "The Official Goats" and written by one presumably a secretary to a general manager.

I have been a secretary for the past nine years, part of it in railroad work. During my railroad experience I have yet to be "bawled out" by the GM or any other official, at the breakfast table or any other place, either for my own failures (and there have been a few, I admit) or for the failure of any of my fellow employees to "deliver the goods." It is true that sometimes things do not go just right (and this applies to other lines of endeavor than the railroads) and the boss gets sore at things in general, and I imagine, myself included. I have never, however, been unfortunate enough to meet or work with one who took it out on his secretary, or heard of one on this railroad (and I believe we have officials who might be termed "hard guys" at that—they have to be). As a matter of fact, had I been the recipient of some of the remarks attributed to the crank in question, I would probably have felt much less chagrin and embarrassment than I did (and do) at the silence which greets a mistake or failure which I may happen to make.

A successful secretary to any high railroad official must be enough of a student of human nature to know and understand the mood of the man he is working with and for, and cater to him as much as does the chef on the car who likes and wants to make a success in his line of work. If a secretary is unfortunate enough to be continually in the position which our friend describes, I blame the secretary as much, or more, than I condemn the man who puts it over on him; if the secretary had not, at some time or other, and probably frequently placed himself in position to merit the remarks in question, he would not have received them as a part of his daily menu. It is up to the secretary to see that there is good ham and coffee and to see that it is correctly served; to see that the mail is there; to see that the car is placed in a quiet place at night, for a secretary likes to sleep just as much as does the GM; and, if possible to do so—subject, of course, to the facilities and work to be done—see that the car is not switched at inopportune times.

You wouldn't throw ashes on the floor in your own home, why do it on the car—it's your home when you are on the road. I have been on the road many times when the "morning reports" failed to arrive; in some instances, when possible to do so, I have planted myself at the elbow of an operator and have seen to it that the report was received.

Another thing which our friend takes exception to is not having the mail ready. Why not have it ready and not let the boss have to ask for it. True, sometimes files are not at hand when wanted; if there is time, wire for them, and if not, take the blame for the failure if you were told beforehand to have the files with you. I have always found it to be a good rule not to leave the vicinity of the car until I see the GM leave; then I feel free to go uptown or anywhere else my fancy may dictate without having to ask him and risk a refusal in the terms quoted.

This letter is not meant as a defense for the railroad official, but as a defense for the secretaries who are classed involuntarily as "The Official Goats." There are none of us on this railroad, and we number considerably more than a score, who are forced to put up with this abuse.

It is true that present-day railroadng offers little future for the secretary. He must be a little above the average or he could not hold the position he does. Too generally, this above the average does not mean in railroad knowledge, practical or theoretical, but in the profession of stenography. To the railroad executive who has worked his way from the ranks, a man who understands only stenography does not mean much as a possible future railway executive. It is discouraging to a secretary to spend, as our friend recites, years on the road, in the office, up at all and any hours of the day or night, and who must understand all phases of railroadng from maintenance to operation and accounting, to see when there is an opening which he might, by reason of his experience and knowledge fill to entire satisfaction, a man appointed who is probably not and never has been an employee of the road in question. However, there is such a thing as going out and getting the place you want, and if I did not think that being a secretary would enable me to reach a higher step in railroad life much quicker, I am frank to say I would not spend nine years finding it out.

A SECRETARY

## Convention Reforms Suggested

CHICAGO

TO THE EDITOR:

On page 355 of your issue of August 20 you quote a resolution of the Association of Railway Executives as follows: "Whereas, in view of the imperative need for the exercise of all possible economy, it is

"Resolved, that annual or special meetings or conventions of all organizations under the supervision of this body be indefinitely postponed or curtailed in every possible way."

It is logical to deduce from this, for example, that the meetings of the American Railway Master Mechanics' Association and the Master Car Builders' Association and their successor were not profitable to the railway companies. Such is, of course, far from the fact. In my opinion, however, a number of changes are needed in the attitude of the railroads and of association members toward these meetings. These are:

First, a broader representation by most roads.

Second, see that representatives are instructed to give freely all information at their command and to enter into the discussions with vigor. Representatives should be instructed to attend each session, whether or not they think they will be interested in a particular part of certain sessions.

Third, all entertainment should be paid for personally by the representatives, not by the companies they represent, and should be in charge of a committee of railroad men exclusively. It can, of course, be accepted as axiomatic that the Atlantic City expenses ultimately are paid by the roads at the purchase price of materials and while this does not amount to much to an individual road, the principal is bad.

ONE WITH CONVENTION EXPERIENCE.

*New Coal Cars for the Austrian State Railways*

## Central Europe's Roads Need Fuel and Equipment

Political Considerations the Greatest Obstacle, but Rolling Stock and Fuel Are Inadequate

By W. B. Causey

Technical Advisor to Austria

THE RAILWAY LINES of what was formerly the Austro-Hungarian empire are all intact and are in the main in excellent physical condition, but, as was emphasized in a previous article (*Railway Age*, October 15, page 705) normal traffic will never be resumed until the new states which were formed out of the former Austro-Hungarian empire are willing to co-ordinate their resources and facilities. Naturally there is a shortage of rolling stock, both motive power and cars, but, for the present, it would not be necessary to build a single new locomotive or a single new car if the bad order locomotives and cars which have been standing around for three years were repaired and put in service. It is not necessary to state that these bad order locomotives and cars could be available for service at a fraction of the cost of purchasing new equipment.

In 1919 and the first half of 1920 shortage of coal was a bad handicap to railroad operation in all the succession states. During the past six months there has been a considerable increase in coal production, or at least in the allocation of coal for transportation purposes, and now the principal trouble is shortage of locomotives and cars.

Since the dissolution of the old monarchy the rolling stock of the Austrian State Railways has been known as "common" or "pool" stock. The peace treaties provide that this common stock shall be divided among the new states by a commission composed of representatives of each of the new states, presided over by an Allied official. This commission was duly organized late in 1919 and has been presided over by an English railroad manager, a man well known to the railroad world in the United States, Sir Francis Dent, but up to the present time repartition of rolling stock has been only partially made. The failure to repair and put in service more of the bad order locomotives and cars has been largely due to the deferred action of the Repartition Commission, as the

various states did not want to repair rolling stock until its ownership had been settled. Sir Francis Dent probably has had one of the most trying assignments made by the Peace Conference.

### What Co-ordination Can Do

What centralization of authority and co-ordination of resources and facilities can accomplish in the movement of

*Bridge and Tunnel on the Tauern Railway*

traffic was shown in the early spring of 1919 when the first foodstuffs were sent from America for the relief of Czechoslovakia and the other states. The ships were discharged at Trieste and, owing to the lack of co-operation of the Italians, Jugoslavs, Austrians and Czechs, only 250 tons of flour were

being moved daily out of Trieste until the Allied Railway Mission was brought into existence by the Supreme War Council in Paris and a mandate given the president of the mission to disregard political boundaries, to use the railroad personnel of one country in another country if necessary, to mark locomotives and cars for relief work only and to give the relief traffic priority over all other except that for military operations.

The Allied Railway Mission was organized about March 20 and within 10 days 1,000 tons of flour were being moved daily out of Trieste and at the end of 30 days this movement had increased to 3,000 tons daily. During the 10 months' life of the Allied Railway Mission something like 500,000 tons of relief traffic was moved. This illustrates what can be done by co-operation and properly exercised authority.

There is no lack of technical skill or intelligent personnel on these railways. Dr. Burger, minister of railways in Czechoslovakia; Dr. Pesta, minister of railways in Austria and his general manager, Bruna von Enderes, and President Kelety of the Hungarian State Railways were the technical directors of the old Imperial Austrian State Railways and Hungarian State Railways and they are experienced, practical railroad men. The State Railways of the Kingdom of the Serbs, Croates and Slovenes—Serbski, Hrvatski, Slovenski or S. H. S. as it is usually called—also have thoroughly competent technical directors. These Yugoslav railroad men have a most difficult task in co-ordinating and rearranging the railroad lines of the territory constituting the new kingdom. The closing of Fiume to all traffic during the past 18 months has been a serious handicap to Yugoslav commerce and has greatly retarded the work of the railway administration.

#### Rumania Needs Assistance

In Rumania railroad administration seems to have broken down entirely, and it is very evident that the Rumanians

proved a liability because they clog their side-tracks and yards and interfere with even the partial operation of some of their main lines.

The locomotives and about 70 per cent of the cars were owned by the Hungarian State Railways and about 30 per cent were owned by the Austrian State Railways, and,

In Upper Austria

therefore, all of this equipment was the common and undivided property of the succession states. Notwithstanding this common ownership, the Rumanians have paid no attention to the demands of the Paris conference or of the other succession states for the return of this equipment and for its proper division and, notwithstanding the vast number of loco-

motives and cars in Rumania, practically all of this equipment has become unserviceable by reason of Rumanian inefficiency. The Rumanians are buying new locomotives instead of reorganizing their shops and repairing the equipment already in their possession.

In Poland it was necessary to organize the railroad administration. The Poles have worked under great difficulties but they are gradually bringing their railroad system into efficient working condition.

A definite settlement between the Germans and the Allies will immediately go a long way towards stabilizing not only political but economic conditions in Central Europe, and until the German question is settled but little improvement in the Central European situation can be expected. Moreover, unless the issues with Germany and with Central Europe are settled soon there will be danger of much greater social dis-

order than has yet been seen in Europe. If this state of affairs should come about, it is hard to see how America could hope to escape contamination.

The lack of coal has been one of the most serious obstacles to the proper functioning of the railroads in practically all the territory of the old empire since the revolution. The

In the Semmering Alps

must secure foreign talent to re-organize their transportation system, and especially to organize and operate their repair shops. Because of the entire breakdown of the Rumanian railroad organization, the 2,000 locomotives and the 50,000 cars which the Rumanians took out of Hungary in 1919 have not only been of no service to them, but have actually

principal supply of railroad coal was obtained from the mines in Upper Silesia and from the mines in the Ostrau-Karwin (Teschen) District. The new state of Austria produces only about 10 per cent of its fuel requirements and this in the form of lignite of low calorific value. Austria has been, therefore, entirely dependent on importation of transportation coal. Programs for distribution of the Upper Silesian and Teschen coal have been under consideration by the Paris conference for more than a year and a half and still no solution has been reached. This has resulted not only in making it impossible to run enough trains to take care of the needs of the country, but it has more than once been necessary to suspend all passenger traffic for more than 10 days at a time and to suspend all freight traffic except coal and the necessities of life.

### Increasing Traffic

Hungary produces a much larger quantity of fuel but practically all of it is also a poor grade of lignite. Neither

senger tonnage during the past 12 months and this increase would have been much greater had more coal, more locomotives and more cars been available. In a general way the freight traffic is about 60 per cent and the passenger traffic about 40 per cent of that of pre-war days. Business conditions have improved slowly and are continuing to improve, and as these conditions improve there is a great demand for more and better transportation facilities and until it is possible to meet these demands there cannot be a return to normal trade conditions. In some of the states, especially in S. H. S., considerable new construction is necessary and has been planned. In most of the states, however, very little new construction will be needed.

### The Future of Vienna

There has been some talk of Vienna losing its commercial and transportation prominence as well as its political supremacy. But, notwithstanding the dismemberment of the Austro-Hungarian Empire, Vienna will always retain its im-

Principal Railways of Central Europe Before the War, Showing Importance of Vienna as Railway Center

Austria nor Hungary produces gas coal or coking coal. In Hungary the operation of the lignite mines has been badly handicapped at times by the inability of the Hungarians to provide themselves with props and other mine timbers. When the new frontier of Hungary was established the timberlands were given to Czechoslovakia and Rumania. There must be a definite and equitable distribution of coal by authority of the Allied governments in order that the railroads may properly function and this control must continue until return of normal interchange of business makes it possible for the new states to enter into agreements with the coal producing districts for the direct purchase of coal in the open market.

There has been a large increase in both freight and pas-

portance as a transportation and commercial center. Railroads as a rule, follow the lines of least resistance. Consequently, because of its geographical location as well as because of its importance as a great capital and a great financial and industrial administrative center, Vienna is the axis to which railroads from all directions converge and from which they radiate.

Even though Vienna has lost its political supremacy, it will probably continue to be the gateway to the East. It is not even among the probabilities that the traffic of the Channel ports and the Baltic en route to the Black Sea and Southeastern Europe will ever be diverted from Vienna by the building of new railroad lines across country, which,

speaking from an engineering point of view, is almost impossible. Nor is it likely that new railroad lines will be built to handle the traffic from the Galician oil fields and from the immense coal fields of Upper Silesia and the Ostrau-Karwin district in Czechoslovakia, which traffic now moves over the double-track railway system from those great producing centres to and through Vienna. Neither is it probable that another line of railroad will be built to compete with the double-track Southern Railway from Vienna to Trieste, with its well constructed branch lines to Jugoslavia, to Hungary and to Italy.

The topography of the country is such that the great railroad lines from west to east must pass through Vienna, Budapest, Belgrade, Sofia and Constantinople to the southeast, and Vienna and Budapest to the east and northeast. It does not require an expert engineer to verify these statements. A glance at a topographical map would at once convince even an unpracticed eye of the impracticability of building new railroads to divert traffic from Vienna.

Besides having these well-built lines of travel, Vienna has all the commercial and physical facilities for handling the

A Scene in Vienna

traffic and the trained official and clerical personnel for its administration and manipulation. It is not likely that sane business men would throw away such assets to build new routes of travel, simply for the purpose of avoiding Vienna.

The interested reader is invited to make a careful inspection of the railroad map of Central Europe and compare the statements herein contained with the railroad lines now in existence which connect the great commercial centers. An intelligent inspection of the map will corroborate the statements.

In addition to its importance as a railroad center Vienna is also an important river port. The trans-shipment from rail to river and vice versa in 1912 was 1,460,000 metric tons. The port is excellently equipped with both locomotive and stationary cranes for transferring freight from cars to barges and steamers, and the most important inland navigation company in Central Europe has its headquarters in Vienna. The extensive port facilities attract traffic from the interior for the territory served by the Lower Danube and the most excellent railroad facilities bring to Vienna return traffic from the agricultural country between Budapest and the mouth of the river. The trans-shipment traffic at the port of Vienna was increasing at the rate of about 10 per cent per year when the war came. British business men have purchased a large interest in Danube river shipping and the return of normal conditions in this part of the world will give a great impetus to river traffic and will thus add to Vienna's importance as a transportation center.

## Automobile Freight Carriers In New England

GERRIT FORT, vice-president of the Boston & Maine, in an address before the Associated Industries of Massachusetts in Boston, October 27, reviewed the whole question of automobile truck competition, as affecting the railroads, and told his hearers that the recent action of his road in reducing freight rates to meet automobile competition had thus far proved encouraging. He said, in part:

Local express companies operating in freight service have been working on the Boston & Maine for more than 30 years and their service has come to be regarded as a useful public facility. They furnish door-to-door service comparable with that provided by the motor trucks, and the railroad is relieved of all station expense. Our commodity rates applicable to this local freight have been increased from time to time in the same measure as all other rates, and as a consequence a substantial part of the traffic they formerly handled has been diverted to the motor trucks. Believing that if we removed a part of the more recent increases we could recover some of the traffic which had gone to the highways, we reduced rates about sixty days ago.

About the same time we reduced our ferry car minimum from 12,000 lb. to 8,000 lb. The business depression, as well as motor truck competition, had made it very difficult to load ferry cars to the 12,000 lb. minimum. We found that shippers who were unable to furnish 12,000 lb. at one time put their shipments on trucks, and instead of taking them to the freight house, moved them through to short-haul destinations, saving the loading and unloading expense at the freight terminals. We discussed the matter frankly with the representatives of organized industry, and, before reducing the minimum, secured an understanding, so far as it was possible to arrive at an understanding in advance, that if and when business increased to such an extent as to result in a shortage of cars, the ferry car minimum would be increased without the opposition of these organizations. The results under this plan have been entirely satisfactory.

We also established rates on sand, gravel and crushed stone to meet truck competition, and thereby materially increased our tennage in these commodities. Great quantities of wood were moving over the highways from Boston to the mills in outlying manufacturing towns, and in the hope of reclaiming a part of this traffic we restored the rates which were in effect prior to the 40 per cent increase of August, 1920. This arrangement has been in effect but a brief time and we cannot say whether it will accomplish the hoped for result. We have made, and will continue to make, other rate reductions on specific traffic where it appears that we can successfully compete with the trucks and get back a new dollar for an old one.

Today terminal expense constitutes the most important item in the cost of handling traffic on the Boston & Maine, and there is some doubt whether the burden of transportation charges is equitably distributed between carload freight. If the truck can furnish better transportation than that provided by the railroad at the same cost, or as good at less cost, it is bound to get the business. Service and rates being fairly equal, I think the shipper ought to prefer, and I believe will prefer, the railroad, for the sphere of the truck is, after all, limited, while the railroads will continue to be a vital necessity, and in order to function must be supported.

The astonishing development of the use of motor trucks has been so rapid that its history is hard to trace. As the demand for raw material and finished products increased during the war on a constantly ascending scale, the traffic followed the line of least resistance, and the use of motor trucks was stimulated to a remarkable degree and was accelerated by the increases in freight rates. In Massachusetts in 1915 were 12,053 trucks and in 1920 there were

52,968. In little Kuode Island the number of truck registrations increased from 1,629 in 1916 to 9,768 in 1920. The other New England states have had a corresponding increase in registrations.

Today there are plenty of idle trucks in New England and plenty of idle men to man them. Many of the operators regard as profitable any earnings which will pay the cost of gasoline and labor, and little attention is given to depreciation or interest on the investment. Most truck operators are making their rates strictly on their conception of what the traffic will bear, and are changing them at will to meet situations as they find them. Contrast, for a moment, the different situation of the railroads; in a recent case in Massachusetts, where we proposed to reduce our local express rates on short notice, the Commission declined to give the necessary authority, and we had to wait 30 days before making the reduction effective. In this rigidity of railroad rates lies one of the most important reasons why the railroads cannot at this time successfully meet motor truck competition. Let me compare the registration fees which the trucks pay and the taxes which the owners of homes are required to pay. In seven selected towns in the suburban district of Boston the tax rate on real estate averages \$27 per \$1,000. The man who owns a modest home, assessed at \$5,000, is subject to an annual tax of \$135. A 3½-ton truck, delivered in Boston, would cost approximately \$5,000, and the present annual registration fee for such a vehicle would be \$40.

The state generously maintains excellent highways, practically free to the use of trucks. It cannot be said that this is fair to the taxpayers, including the railroad which bears its fair share, and a large one, of the burden of taxation. However, suitable laws will, no doubt, soon be enacted by the various states.

The truck has come to stay. There is no use fighting it. What railroad men should study is the best way to co-ordinate their own facilities with those afforded by this new factor.

## Statistics on the Preservation of Timber for 1920

**D**URING 1920 so decided an advance was made in the amount of timber preservation carried on in the United States as to more than wipe out the lead which had been maintained by the pre-war record, according to statistics prepared by the United States Forest Products Service in co-operation with the American Wood Preservers' Association and published in the annual proceedings of the latter organization. As shown by the report, a total of 173,309,505 cu. ft. of wood was subjected to preservative treatment. This figure is larger than that reported for 1919 by 27,248,511 cu. ft., or 18 per cent, and 13,726,866 cu. ft. larger than the figure for the banner year of 1914. Consistent with the record of previous years, cross ties again constituted the bulk of all the wood treated, the number reported for 1920 being 44,987,532. This is 7,419,605 more than were treated in 1919 and represents 80 per cent of all the wood treated in 1920. The remaining 20 per cent treated includes 11,965,912 lin. ft. of piling, which is a decrease of 1,591,607 ft. over the quantity in 1919; 585,781 poles, which is an increase of 207,300 over the number for 1919; and 2,568,156 sq. yd. of wood blocks, which is an increase of 772,469 yd. over the number in 1919.

This preservative work was done by 112 treating plants as compared with 108 for 1919. The number of treating plants in the country is now 124 of which 27 are railway owned, 80 commercially owned, and 17 privately owned. The majority of all of these plants and all of the railroad

plants are of the pressure cylinder type. Only one railroad plant was reported idle during the year.

With reference to the amount of preservatives used by the plants during the year, the report shows a consumption of 68,757,508 gal. of creosote, 1,084,911 gal. of paving oil, 1,772,084 gal. of miscellaneous preservatives and 49,717,920 lb. of zinc chloride. The quantity of creosote used represents an increase of 3,201,261 gal. over the quantity used during 1919, but is still much less than that consumed in 1913 when the consumption exceeded 108,000,000 gal.

As of the total amount used during 1920, 9,575,680 gal. was imported, a considerable increase having taken place in the importation of oils with the resumption of ocean transportation.

In contrast with creosote the zinc chloride figure now only shows an increase of 6,234,795 lb. over the figure for 1919, but represents the largest amount of this preservative thus far used by the industry.

The report is particularly interesting with respect to cross tie preservation. Of the number of cross ties treated during the year 33,300,339 were hewed and 11,687,193 sawed and the total number treated for the steam railroads was 42,676,739. Yellow pine ties again rank first, the number treated being 16,621,773, while oak ties and Douglas fir rank second and third, the number of these ties which were treated being 14,531,848 and 3,861,514 respectively. Of the total number of ties treated for the railroads 1,579,552 were reported as having been adzed before treatment, 295,577 bored, 8,249,591 both adzed and bored and 32,552,019 neither adzed nor bored. The number of cross ties treated with zinc chloride in 1920 was 29,132,720 while less than half as many or 13,711,517 were treated with creosote. The number of cross ties now being treated exceeds the number of any previous year.

CONSUMPTION OF WOOD PRESERVATIVES BY THE TREATING PLANTS OF THE UNITED STATES, 1909 TO 1919

Year	Active plants	Creosote (a), gallons	Zinc chloride, pounds	Other Preservatives (b), gallons
1909.....	64	51,431,212	16,215,107	(c)
1910.....	71	63,266,271	16,802,532	2,333,707
1911.....	80	73,027,335	16,359,797	1,000,000
1912.....	84	83,666,490	20,751,711	3,072,467
1913.....	93	108,373,359	26,466,803	3,885,738
1914.....	94	79,334,606	27,212,259	(9,429,444)d 2,486,637
1915.....	102	80,859,442	33,269,604	(3,205,563)d 1,693,543
1916.....	117	90,404,749	26,746,577	(5,675,095)d 582,754
1917.....	115	75,541,737	26,444,689	(7,579,819)d 137,361
1918.....	107	52,776,386	31,101,111	(4,057,862)d 28,013
1919.....	108	65,556,247	43,484,134	(2,412,592)d 102,011
1920.....	112	68,757,508	49,717,929	(1,848,911)d 1,772,084

(a) Includes coal-tar creosote and water-gas tar.

(b) Includes refined coal-tar, corrosive sublimate, and carbolineum oils.

(c) Statistics not available.

(d) Paving oil.

## Correction

**I**N THE ARTICLE on "Railway Statistics for Year Ending August 31, 1921," published in last week's issue, page 898, it was erroneously stated that the net operating income of the railroads for that year, \$530,000,000, was greater than it was during either 1918 or 1919, while the roads were under federal control. The statement was true as to 1919, when the net operating income was \$5,600,000, but not for 1918, when it was \$690,000,000.

# Labor Board Hands Down Significant Decision

## Carriers "Ability to Pay" Recognized as "Secondary" Factor in Fixing Wage Scales

A significant decision accompanied by two highly significant dissenting opinions was handed down by the Railroad Labor Board recently in a dispute between the New Orleans Great Northern and its train and engine service and maintenance of equipment employees, station agents, assistant station agents and telegraph operators. The majority decision of the Board recognizes for the first time that "the ability of the carrier to pay" is even a "secondary consideration" in determining wage scales. The two accompanying dissenting opinions are significant in that they are both filed by members of the labor group on the board. A. O. Wharton, formerly connected with the Railway Employees' Department of the American Federation of Labor, filed a long dissenting opinion having particular reference to "the manifestly unjust and unreasonable treatment accorded shop employees in this decision and the indefensibly low rate established for labor." W. L. McMenimen, formerly connected with the Brotherhood of Railroad Trainmen, stated briefly that he could not accord with the majority decision and would not concur in the dissenting opinion of Mr. Wharton because "it contains many misleading and greatly exaggerated statements." Referring to this brief statement of Mr. McMenimen, Mr. Wharton said: "A mere declaration without supporting data or facts represents nothing and needs no other reply."

The statements contained in this decision and the dissenting opinions indicate, first, that the Board, despite its previous stand that the "ability of the carrier to pay" is not a factor in determining just and reasonable wage scales, is now of the opinion that this condition is at least a factor of "secondary consideration," and furthermore that testimony regarding the ability of the carrier to pay cannot be considered henceforth as irrelevant testimony; second, that there has been a definite break in the ranks of the labor representatives on the Board similar to the break between the train service and other organizations formerly included within the "associated standard recognized railroad labor organizations."

### History of the Controversy

The New Orleans Great Northern was not a party to Decision 147, which ordered decreases in rates of pay last July, and upon the request of this carrier hearings were held before the Board on September 15 at which it presented data and arguments in support of its requests for wage decreases and revisions of rules and working conditions. This decision deals only with wages and reserves the question of rules and working conditions for further hearings.

The carrier testified at the September hearings to an operating deficit of \$500,000 for the year 1920, a further operating deficit of \$95,000 for the first half of 1921, together with deferred maintenance totaling \$400,000 accumulated since the end of federal control. The testimony presented by both sides in this controversy is summarized by the Board in part as follows:

The carrier's presentation showed in detail the effect of the various wage increases upon this situation since December, 1917, and also a comparison of existing rates of wages with lower rates paid similar positions in outside industries.

The exhibits filed by the carrier show that generally speaking the carrier is without through traffic and its local traffic is at a low ebb due to commercial inactivity in the territory it serves; that the train service provided is only that necessary to meet actual needs and the requirements of the various state public service commissions exercising jurisdiction; that

the property is being economically administered as far as may possibly be done under existing conditions; and that the cost of substantial necessities, i. e., groceries, meats, dry goods, and wearing apparel, March, 1921, as compared with July, 1920, shows an average decrease of 35 per cent. It is a matter of common knowledge that in the territory served by this carrier the question of rent does not bear the same excessive relation to the living budget as is evidenced in large centers, and it is worthy of note that none of the employees here involved are required to live in large centers.

Notwithstanding that there were present at the hearing of this application local representatives of some of the organizations involved, who might reasonably have been expected to be thoroughly familiar with the existing local questions presented, no submission was made by them taking issue with the statements made by the carrier's representative.

The Board is sympathetic with the principle that "the ability of the carrier to pay" is not a controlling factor in fixing wages, but recognizes that it is entitled to secondary consideration with a certain type of carrier dependent almost entirely on local business, or whose principal function in the final analysis is the development and upbuilding of a new or comparatively new country.

### Labor Board Reduces Wages

The Board then ruled that, effective November 1, 1921, the following rates are authorized on this carrier:

- (1) Agents and telegraphers—from \$115 to \$120 per month, depending upon duties, stations and usual differentials.
- (2) Train and Engine Service Employees—the rates in effect 12:01 a. m. March 1, 1920.
- (3) Shop Crafts and Roundhouse Labor—here the Labor Board says:

"Special consideration has been given to the rates paid for similar service in other industries in the centers where the carrier's men are employed and the following rates are authorized which, though substantially higher than those paid in outside industries, are felt, under all surrounding conditions, to be fair, just and reasonable."

	Rates per month
Roundhouse foreman .....	\$250.00
Night watchman .....	90.00
	Rates per hour
Machinist .....	\$0.60
Machinist helper .....	.62
Boilermaker foreman .....	.65
Boilermaker .....	.60
Boilermaker helper .....	.42
Boilerwasher .....	.42
Blacksmith foreman .....	.65
Blacksmith .....	.60
Blacksmith helper .....	.42
Hammersmith .....	.60
Heavy fire blacksmith helper .....	.45
Pipefitter .....	.60
Pipefitter helper .....	.45
Tinner .....	.60
Engine inspector .....	.60
Welders .....	.65
Carpenter .....	.60
Painter foreman .....	.65
Painter .....	.60
Electrician .....	.60
Car inspector .....	.50
Car repairer .....	.50
Car repairer helper .....	.35
Foreman car department .....	.65
Alchabrone .....	.60
Foreman coach carpenter .....	.65
Milburn .....	.55
Engine wiper .....	.50
Cinder-pit laborer .....	.45
Machinist apprentices .....	
First six months .....	.30
Second six months .....	.28
Third six months .....	.26
Fourth six months .....	.33
Fifth six months .....	.36
Sixth six months .....	.38
Seventh six months .....	.40
Eighth six months .....	.42

Boilermaker apprentices:	
First six months...	.26
Second six months...	.28%
Third six months...	.31
Fourth six months...	.33%
Fifth six months...	.36
Sixth six months...	.38%
Seventh six months...	.41
Eighth six months...	.43%

Mr. McMenimen's dissenting opinion said in full: "I am not in accord with the majority decision and cannot concur in the dissenting opinion as it contains many misleading and exaggerated statements."

#### Dissenting Opinion of A. O. Wharton

The dissenting opinion of Mr. Wharton, longer than the Board's decision, says in part:

"It is to be noted that the majority decision states that 'the inability of the carrier to pay is not a controlling factor in fixing wages but recognizes that it is most persuasive, etc.' (After this dissenting opinion was filed, the majority decided to strike out the words 'most persuasive' referred to above, inserting in lieu thereof the words, 'entitled to secondary consideration.' In the opinion of the undersigned the change in language represents no change in the principle involved, neither did it affect the decision as promulgated by the majority.)"

Mr. Wharton then launches into an argument on the validity of the "carrier's ability to pay" as a factor in determining wage scales, citing the statement of the Board in denying the petition of the Association of Railway Executives on January 31, in which the request was made for an immediate reduction in the wages of common labor. The Board at that time said: "All questions involving the expense of operation on necessities of railroads and the amount of money necessary to secure the successful operation thereof are under the jurisdiction not of this Board but of the Interstate Commerce Commission." Mr. Wharton also said that "numerous opinions of courts and boards of arbitration specifically excluding 'financial ability' of the carrier from consideration as a 'relevant circumstance' in wage fixing are filed with this board."

Mr. Wharton then attacked the data presented by the carrier relative to the rates of pay in outside industries along its lines as compared with those which the carrier is compelled to pay. Regarding these data, he said: "The rates paid employees in the service of the lumber company (the Great Southern Lumber Company, Bogalusa, La., whose rates of pay were cited by the carrier) are not rates established by organized employees in negotiation with the employer."

No unbiased mind would consider or use the wages and working conditions of unorganized workers as the basis for fixing wages and working conditions of organized workers, who by organized efforts established the right of collective bargaining and who by years of constant effort and the expenditure of substantial portions of their earnings reached a level approximating decent wages and working conditions."

#### Mr. Wharton Attacks Cost of Living Data

Regarding the cost of living data submitted by the carrier, Mr. Wharton said: "The cost of living data submitted by the carrier is very similar to the mass of data filed with the Board preceding its wage reduction Decision 147, and under no circumstances is it entitled to greater consideration." He then pointed out that "the most authentic and uniformly accepted authority on living costs, i.e., the Bureau of Labor Statistics, United States Department of Labor," states that living costs have decreased 18.1 per cent during the period from June, 1920, to September, 1921, and but 1.7 per cent from May, 1921, to September, 1921.

"It is worthy of note," Mr. Wharton adds, "that there has been but 1.7 per cent reduction in the cost of living from May to September, 1921, the period during which the Board

had under consideration the general request for wage reductions, and its findings are set out in Decision 147."

The exact effect of this decision upon the pay of the employees involved was pointed out by Mr. Wharton with a series of tables and analyses which show in general that the minimum daily wages under this decision of machinists, machinist inspectors, boilermakers, boilermaker inspectors, blacksmiths, hammersmiths, electricians and oxy-acetylene welders and carmen will be from \$2.00 to \$2.80 less per day than they were under the rates in effect under Decision No. 2. Likewise, he shows the minimum daily wages of helpers and apprentices will be decreased from \$1.28 to \$2.16 below Decision No. 2 levels.

"It is generally known and recognized that the wages of these skilled workers," Mr. Wharton continues, "practically all of whom are required to serve an apprenticeship of four years prior to receiving the rate of a journeyman, were, prior to January 1, 1918, unjustifiably low. This proposed decision establishes a daily rate for journeymen mechanics that is only 18.5 per cent above the daily wage effective as of December, 1917."

"The majority of the Board, on the same evidence and affecting employees living in the same town, have decided that the employees who receive the highest compensation and who have received the largest money increase, shall be paid the wage rates that were in effect immediately prior to the effective date of Decision No. 2; in other words, one class of employees is to retain all of the increases accruing to them during the entire period of federal control, while another class, admittedly underpaid prior to federal control, are expected to accept a decision that takes from them practically all the increases received during that period. Is it just or reasonable that a journeyman mechanic who is required to serve a four year apprenticeship before receiving the journeyman rate, shall have his earnings for a full month's service (25½ eight-hour days) cut from \$173.40 to \$122.40 or just \$19.12 per month more than he would have earned at his December, 1917, rate, while certain other classes of employees, some of whom are unquestionably less skilled, retain all of the increases granted them during the period of federal control, and which in some cases represent a monthly wage increase approximating 50 per cent greater than that granted journeymen mechanics by this Board's decision?"

Mr. Wharton's next table shows that in the case of train service employees in passenger service, the reductions in the daily rates of pay range between \$.80 and \$1.00.

Other conditions established by this decision and termed "unwarrantable" by Mr. Wharton are, in his words:

1. Hammersmiths, heavy-fire blacksmiths and other blacksmiths are placed on the same rate. There is not an employer of blacksmiths in this country who has not always recognized and paid higher rates for hammersmiths and heavy fire blacksmiths than that paid other blacksmiths.

2. Practically every railroad in this country has established a rate higher than the minimum boilermakers' rate to men assigned as boiler inspectors or flangers and layers-out.

3. Differentials have been established for mechanics in the car department that are not justified; for instance—

- (a) The Board says it is just and reasonable that a car inspector formerly paid the same rate as the passenger-car men is now not entitled to the higher rate; his rate is cut from 85 cents to 50 cents per hour, or 10 cents per hour less than the rate established for the carpenter. No man can be a competent inspector unless he first learns the trade and becomes competent to determine whether or not a car is in a safe and suitable condition to make a trip.

- (b) A millman who has heretofore generally received the same rate as that of the passenger-car men and car inspectors now finds himself defined as not being quite so valuable as that portion of his fellow craftsmen designated as carpenters, and yet by the same authority he is considered more valuable than the car inspector; and the car inspector who, if he is anything, must be competent to judge whether the work of his fellow craftsmen is properly and safely constructed, is decided to be less important than either of his associates.

4. This Board now establishes a rate of pay for these mechanics which in some instances is less than the rate it has established for mechanics' helpers of these crafts in this same territory.

5. By this decision the Board, charged with the solemn duty of establishing just and reasonable wages and working conditions, has decreed that a laborer who has heretofore generally received a rate higher than that paid section labor, shall now be paid a rate of 20 cents per hour. On an eight-hour basis, these men, practically all of whom are able-bodied adults, many of them men of family, are now awarded a rate that will net them, barring accidents, lay-offs, sickness, etc., a wage of \$9.30 per full-time week—a wage that is below the minimum established by various agencies and tribunals as being sufficient to support one worker.

In closing, Mr. Wharton said: "In answer to the reference made to the dissenting opinion by Board Member McMenimen, it is sufficient to say that a mere declaration without supporting data or facts represents nothing and needs no other reply."

### Board Disposes of Several Cases

Comparative quiet in the railroad labor situation has been the order of the past week. Since the settlement of the recent strike issue the Railroad Labor Board has been continuously either in executive session or occupied in hearing testimony in several cases involving individual roads and particular classes of their employees. As evidence of the work which is now being done by the Board, it was announced recently that consideration of the shop crafts' rules would be completed in three weeks. This means that the Board will promulgate such additional general rules as it may deem just and reasonable to be included in all of the individual agreements between the carriers and their own shop crafts' employees, and that the disputes which have been certified to the board as a result of the recent negotiation of new agreements will be decided. In this connection, it was announced that 15 disputed rules have been disposed of by the Board since October 30, the date of the strike crisis. On November 4 the Board disposed of 50 grievance cases in two sessions. The majority of these cases, however, were disposed of by the simple expedient of citing that the Board had no jurisdiction over the subject matter or by referring the dispute back to the interested parties with recommendations.

Three members of the board, G. W. W. Hanger of the public group, J. H. Elliott of the railroad group and W. L. McMenimen of the labor group, began hearings on November 7 at Nashville, Tenn., in a dispute between the Brotherhood of Railway and Steamship Clerks and the Nashville, Chattanooga & St. Louis Railway Clerks' Association, both organizations claiming the right to represent the clerks on the Nashville, Chattanooga & St. Louis in negotiating wages, rules and working conditions with the company. After the Nashville hearings the Board members will go to Chattanooga, Tenn.; Atlanta, Ga.; Dalton, Memphis, Tenn.; Paducah, Ky., and possibly to St. Louis, Mo., to conduct further hearings.

### Brotherhoods Revive Strike Talk

From Cleveland comes the statement that the train service brotherhoods will revive the strike vote and use it if necessary if the "promises" of the Labor Board which led to the recent recall of strike orders are not carried out. The threat is contained in a memorandum mailed to the general and local chairmen and members of the five organizations involved.

The threatened strike was called off, the memorandum asserts, when it became known that unless that action was taken, not only the executive officers of the brotherhoods but the general chairmen and local chairmen would be arrested on charges of conspiracy.

"Due to the memorandum of the Labor Board (abstracted in the *Railway Age* of October 29, page 821) and the further fact of the imminent arrest of the leaders, it was deemed best that the strike be called off," says the circular.

"We think you can readily understand what the effect would be if a strike were put on and all the executive officers, general chairmen and local chairmen were arrested and no one left to direct the movements of the men nor to advise them.

"It may be claimed by some that the promises made by the Labor Board will not be carried out," the circular continues, "due to coercive influence, and, in case this should come to pass, we would be in exactly the same position that we were in after the enactment of the Adamson law in 1916, and the strike vote which is called off at the present time will be revived and used if necessary."

Members of the Board, commenting on the press reports of this circular, pointed out that the Board had made no "promises" officially to the train service employees. No notice would be taken of this latest threat, it was added.

One member of the Board, in discussing the brotherhoods' latest move, deplored the continuance of strike talk on the grounds, not only of its effect upon the transportation industry, but upon business conditions in the country generally. In discussing this point, he emphasized the uncertainty and hesitancy of general business conditions today, attributing this condition largely to such statements as those of the labor leaders in this case.

Speaking more specifically of the Board's memorandum, this member said that every railway executive with whom he had talked since its announcement had heartily agreed in the principle outlined therein, namely, that the disputes over rules and working conditions should be disposed of before the hearings on a further wage decrease are held. In this connection he pointed out that the carriers had variously estimated the savings which might be derived from the abrogation of the National Agreements at from \$300,000,000 to \$500,000,000, and it was furthermore pointed out that the Labor Board's statistician recently estimated that the savings to the carriers from the application of nine of the new rules promulgated by the board would result in a saving of at least \$25,000,000 per year. These estimates indicate the importance of disposing of controversies over rules and working conditions, he said.

### I. & G. N. Trainmen to Return

The United States District Court, at Houston, Tex., in an order issued by Judge J. C. Hutcheson, Jr., on November 2, has authorized J. A. Baker, receiver of the International & Great Northern, to take back the trainmen who recently struck, provided he needs them, up to November 25. After that date all of them, except the four members of the General Committee who called the strike, "shall be permitted to return to the service of the receiver on probation for a period of 30 days." Full reinstatement, with former seniority and contract rights, will be dependent on satisfactory behavior during the probationary period.

Judge Hutcheson finds that the strike was called on October 22, eight days before the intended general railroad strike, when the I. & G. N. general committee knew that the larger strike had been ordered; and that they (the committee) ought to have changed the date of their local strike. For mismanagement in this connection the court excepts the four committeemen from this general order of amnesty; the receiver may do with them as he pleases; but if they are taken back they should not again be allowed to represent the trainmen. The judge thinks that the rank and file of the members of the brotherhood did not realize the illegality of their action; but they have applied for reinstatement, coming before the court in an attitude of supplication, and they promise to give good service. New employees who have been taken on should be kept until November 25, at least. If any disputes or disagreements arise in the reinstatement of the strikers, each individual may have the privilege of appealing directly to the court, and individuals may be represented by the brotherhood.

## Ben W. Hooper Talks On Relation of Wages to Freight Rates

THE FIXING OF WAGES cannot be made to depend upon freight rates and the proposal to transfer the functions of the Railroad Labor Board to the Interstate Commerce Commission involves "a glaring fallacy" according to Ben W. Hooper, member of the public group on the Labor Board. In the course of a recent address before the Traffic Club of Chicago, Mr. Hooper said:

"Occasionally it is suggested that the functions of the Railroad Labor Board should be transferred to the Interstate Commerce Commission. The advocacy of such an idea involves a most glaring fallacy. The line of argument brought to bear is that the adjustment of freight rates and the adjustment of wages are mutually dependent upon each other, and that the jurisdiction over both matters should be vested in the same body.

"The unsoundness of this position is easily discernible. It may be and doubtless is true to some extent, that the fixing of freight rates is partially controlled by the carriers' operating expenses, but the converse of this proposition is by no means correct. The fixing of wages cannot be made to depend upon freight rates. Because there has been a reduction in wages, it necessarily follows that the carrier is thereby enabled to stand a reduction in rates. It does not necessarily follow that a reduction in rates justifies a reduction in wages. It may or it may not.

"It must be remembered that the carrier gets the direct benefit of every cent of a wage reduction. But the carrier's employees do not get the direct benefit of a rate reduction. This is not given to them. It is given to the public. The only benefit the employees get from a rate reduction is the indirect benefit derivable from such decreases in the cost of living as may result from the rate reduction.

"The wages of the employees must be just and reasonable, based upon the elements set out in the statute. When these matters have been properly considered by the Labor Board, and the wages fixed, then the Interstate Commerce Commission will know as well what the railroads are paying in wages as if they established the wages. If the Interstate Commerce Commission were empowered to fix wages, it would have to do it on the same basis upon which it is now done by the Labor Board, and not upon the basis of freight rates."

Touching on the recent strike threats, Mr. Hooper said: "Upon the theory that the railways are public utilities, enjoying under their franchises a practical monopoly, the right of eminent domain and other great powers, the government has assumed the right to regulate the carriers in numerous particulars. It seems to me that this theory is just as applicable to the employee of the railway as it is to the railway itself. Does he not share with the railway executive the great responsibility of public service?

"While the government has granted to the carrier immense powers and privileges, it has also in the Transportation Act, bestowed upon the employees the highest dignity and power ever conferred upon labor in any land. The old common law doctrine of master and servant has been wiped out by the Transportation Act in so far as railway employees are concerned. That statute places the carrier and its employees in a contractual relationship. The representatives of the employer now sit down at a table and negotiate with their employees their wages and working conditions, with the right of an appeal to an impartial governmental tribunal.

"It is this recognition of the rights of railroad labor, coupled with a guaranty of judicial protection against arbitrary and unfair treatment, which, in my judgment, makes it as morally obligatory upon the employees to give the public efficient and uninterrupted service as it is upon the railway management."

## Ford's Railroad Must Report Statistics of Employees

WASHINGTON, D. C.

THE INTERSTATE COMMERCE COMMISSION has declined to allow the Detroit, Toledo & Ironton to simplify the work of its accounting department by omitting monthly reports to the commission showing the number of employees, the hours or days worked and their compensation. In his recent interview Henry Ford said that "the bookkeeping of railroads is complicated far beyond all necessity" and that "the amount of unnecessary work you can find in the accounting system of even a little railroad is almost beyond belief." W. C. Cowling, of the executive department of the D., T. & I., wrote to the commission suggesting a way to reduce some of the "unnecessary work" which elicited a reply from M. O. Lorenz, director of the Commission's Bureau of Statistics, as follows:

Your letter of October 24 requesting that you be relieved from furnishing the monthly report of employees' service and compensation has been considered by the Commission. I am directed to say that there does not appear to be good grounds for relieving the Detroit, Toledo & Ironton Railroad Company from the requirements applicable to Class I roads generally. The very fact that you adopted a method of payment different from that prevailing on other roads makes the Detroit, Toledo & Ironton report all the more instructive. It is important that your statistics be comparable with those of other roads. Under the Transportation Act, 1920, public opinion is relied upon to enforce the findings of the United States Railroad Labor Board. A full and unquestioned statement of facts regarding wages and hours of service should assist in forming an enlightened public opinion.

I may add that a plan has been under consideration for reducing the cost of compiling these statistics for possible adoption beginning with 1922, although it has not yet been determined whether this can be done without impairing the usefulness of the report. I should be pleased to have you indicate what part of the report you consider most troublesome. I assume that you would in any case keep some record of the number of employees by classes and the compensation paid each class. The Interstate Commerce Act specifies that such information shall be contained in annual reports to the Commission.

Mr. Cowling has also written other letters to the commission, which have not yet been answered, asking to be relieved from filing other information which the commission requires of the Class I railroads. For instance, it is understood that he has suggested that a number of items might be omitted from the monthly report of revenues and expenses. Reports for the six months during which the Ford management had had charge of the road up to August showed a constantly decreasing net operating income each month after the large increase shown in April.

Car in Which the Armistice Was Signed Being Placed in the Invalides Museum at Paris

# Delivering Train Orders Without Getting Signatures

Personal Experiences of a Veteran Dispatcher in the South,  
the Middle States and the Far West

By Harry W. Forman

Assistant to General Manager, Western Pacific

IN TWO PRECEDING articles I have made suggestions as to the use of the 19 order, with some explanation of how to go about installing a somewhat more liberal train dispatching system without risk of collision or criticism. Responding to the further requests of the editor, I will give a few of my personal experiences with the unsigned order, dating from 1875, when I began dispatching trains in a small way.

At that time, on the Atchison & Nebraska Railroad, now a part of the Burlington System, an order was first given to hold the ruling train, No. 4, for example, for orders; then at the meeting point the operator was ordered to display a red flag

"Hold Nos. 3 and 4 for each other." This was followed by "Repeated" orders to Nos. 3 and 4 (such orders being so designated because signatures were not required). This method of handling the orders was continued in effect until 1889, when the Standard Code was adopted; then the 19 form was authorized. From that time on, meeting points were fixed by addressing a 19 to the operator at the place of meeting and to the trains concerned so that they would get it before arrival at such point. In repeating the order the operator at the meeting point would first repeat, next the operator who held the order for the ruling train, after which "Complete" was given to these two simultaneously; then the operator holding the order for the inferior train repeated, and he was given complete last. There were no accidents chargeable to this method of handling.

About 1894 a faster mail service was inaugurated, trains No. 7 and No. 8 being used. This service was everything that the name implies, the trains being scheduled in places at 60 miles an hour. In order to keep on time they often ran, on favorable stretches, at a much higher rate, as there were grades where a speed of even 40 miles an hour was too much for the engines. These trains were made superior to everything, including first-class trains, except that No. 7 was inferior to No. 8. Therefore, every train order delivered to them had to be of a restrictive nature. At first No. 7 did not do very well, and it was necessary to issue numerous train orders to it. It never occurred to me to address a 31 order to this train, as this would have delayed it too seriously; and it was handled for five or more years between Chariton and Pacific Junction, with only the 19 form of order. So fast and important were these trains that they were allowed only two minutes to change engines; and at some stops a switch engine was used as a booster for No. 7, to push until it could no longer keep up.

The record-breaking Mayham Special, which averaged nearly 60 miles an hour from Chicago to Denver, 1,034 miles, was moved entirely under 19 orders on the division where I was working at the time. There was an engine failure which required changing their orders; this was done by the use of the 19 form.

## Lively Work on the Burlington

Many of the incidents of that period cannot be recalled, but three somewhat exceptional cases occur to me which should convince anyone that to undertake the expeditious handling of heavy business under a system which would require stopping all superior trains to secure signatures to

No 94 Eng 270 were  
Held main track and  
meet no 97 Eng 139  
at Vinings. Held  
Main track and meet  
No 93 Eng 234 at Lena.  
Held main track and  
meet No 93 Eng 265  
at Hales.

Sample of N. C. & St. L. 19 Order, Reduced One-Half in Width and Height

for Nos. 3 and 4 to meet at his station. After this, instructions were sent to Nos. 3 and 4 to meet. All of these orders were signed by the conductor, the numeral "12" being used to inquire how the conductor and the engineman understood. In signing such orders the conductor endorsed the symbol "13," meaning "I (or we) understand;" then, this having been sent to the dispatcher, O. K. was given.

In 1882 I entered the service of the Burlington as dispatcher at Ottumwa, Iowa. This was on a single track line having many heavy grades; and as the engines were largely of the "quill-wheel" type, a great many freight trains were run, the average being about sixty a day, although a maximum of 75 was not exceptional; nor was it unheard of to run 90.

There were operators at every siding, and the middle order was invariably used. The train dispatching art had by that time so far advanced that the middle order was worded,

orders, would be altogether impracticable. On one occasion because of unusual detentions the operator at Afton within 40 minutes reported 12 westward freight trains passing his station, each of which was handed a 19 order as it passed. At another time, for a similar cause, there were 14 freight trains to be moved ahead of passenger train No. 4, from Afton to Osceola, a distance of 24 miles, with no place to get out of the way because all sidings were full of opposing trains; and to meet these the 14 freights were given orders in 19 form. No. 4 was delayed 20 minutes.

On another occasion when I "sat in" there were wrecks and water failures which blocked things so that every siding was full of trains between Creston and Chariton, a distance of 60 miles; and there were others on the main track. The moment the track was cleared, Form 19 was let loose and many of these trains got under way immediately. What chance would a dispatcher have had of raising this blockade and moving trains that night had he been compelled to get signatures for his orders?

On the Burlington, on one occasion, a check was made which showed 50 orders of Form 19 had been issued before finding it necessary to use a Form 31.

During these years the destinies of the Burlington were in the hands of such able and farsighted men as T. J. Potter, C. M. Levey, W. F. Merrill, W. C. Brown and F. C. Rice, who were always on the lookout for more efficient means whereby traffic could be handled with greater celerity without any sacrifice of safety. It has never been my practice to use other than the 19 form at dispatcher's headquarters when orders were delivered in person by the dispatcher on duty.

In 1901 I entered the service of the Union Pacific, and assisted in preparing a book of rules which provided for the "middle order." At that time there was some doubt in the minds of a few of the officers of that company as to the feasibility and safety of this method of handling; but with the help of such broad-minded men as W. L. Park and R. W. Baxter, a fairly liberal use of the 19 form was secured. However, no one was entirely satisfied with the immediate results. In time this form of order became more popular and was extensively used. I feel warranted in saying that in the light of past experience the present officers of that company would not think of curtailing its present field of usefulness.

My next undertaking was to install a book of rules on the Colorado & Southern, which book provided for the liberal use of the 19 order. Incidentally, this was the first book of rules ever printed in this country, so far as I know, which recognized the present Code principle that unless work trains were directed not to protect against extra trains they must do so at all times.

Later, two years' experience as a dispatcher on the Denver & Rio Grande only strengthened my faith in the 19 order. It was while I was working for this road that "Rights of Trains on Single Track" was written. While the book contains several regrettable errors, the chapter recommending the use of the 19 order has never been challenged.

With J. W. Thomas, Jr.

In 1905 I entered the service of the Nashville, Chattanooga & St. Louis for the purpose of installing the Standard Code. This, at the time, was a single track road with a main line 460 miles long, from Hickman, Ky., to Atlanta, Ga. Here one met with every possible obstacle in the matter of grades, heavy traffic and limited knowledge of code principles, as up to that time the trains were being handled on the greater part of the main line under a so-called single-order system, dating back a quarter of a century. It may have been intended at the beginning to secure signatures, but when I went there it was found that most of the divisions had been successfully handled for many years by the exclusive use of unsigned orders.

If, as was true, this method of handling could be made successful on that road, no other road need have a fear of the 19 order, as the N. C. & St. L. was an extremely busy single track line. In addition to its own heavy freight and passenger traffic, it handled the trains of the Southern, the Louisville & Nashville and the Alabama Great Southern on two districts. It was not uncommon to start from five to ten extras in one bunch from Atlanta or Chattanooga. The coal trains from the L. & N., particularly on Monday morning, were delivered in groups of from 10 to 15. (In Georgia non-perishable freight could not be moved on Sunday.) Notwithstanding these handicaps the 19 order was and is now used there much the same as on the Burlington, and with a high degree of success.

It would be interesting to see anyone attempt to handle trains on this road under these conditions, by a system making it necessary to stop a majority of them to secure signatures to orders. The many fast freight trains which are run daily between St. Louis and Atlanta, as well as numerous pineapple and peach specials between Atlanta and Nashville, have always made remarkable records for expeditious movement. This is so well known that the fact is generally commented upon by dispatchers throughout the country. No one would claim that the record made by these trains could have been accomplished had they been hampered by train orders requiring signatures. On certain parts of the main line there were thirty regular trains, the freight schedules being represented by several sections, this in addition to a great number of extra trains which were run daily.

Six sets of main line dispatchers were required between Nashville and Atlanta, a distance of 280 miles.

No one claims to accomplish the impossible by the use of train orders or by any other system. While the records of the N. C. & St. L. here referred to are made under the best available train dispatching plan, it must be remembered that written orders are not the last word in train operation. On the first district north of Chattanooga, from 80 to 100 trains were run daily under the "Thomas semi-manual block system." It would not have been possible to keep these trains moving on single track under written train orders, and therefore the orders were dispensed with and the trains were moved under the supervision of a train dispatcher who instructed operators to "hold for," "head in," or "clear" trains. There was a bell in each tower by which to give warning in case the operator attempted to clear a train without proper authority. In the dispatcher's office an instrument made a Morse record of all instructions issued. So successful was this method of handling trains that there was only one collision during a period of twenty years; and in this the damage (to the engine pilot) amounted to \$6.25.

I have often wondered what the ultra-conservative element among railroad officers, who so strenuously object to a reasonable use of the 19 form of order, would have said had they been given an opportunity to note the manner in which trains were moved on this section of single track.

### A Constructive Suggestion

One would seem to be warranted in contending that any system as relatively imperfect as this and which was found to be so successful on six miles of unbonded track, might, with the later modernizations, be made use of profitably on a much more extensive scale. J. W. Thomas, Jr., who was the chief operating officer of this road until 1914, was both fearless and progressive. When convinced that a proposition had merit and was safe, some of the so-called safety theories of long standing were often ignored by him; and latter discoveries were given painstaking tryouts.

Since 1916 it has been a part of my duty to look after the dispatching on the Western Pacific. This company has adopted a number of short cuts, principally in wording of orders, and everything is running as smoothly here as on

other lines where the 19 order is sensibly but liberally used.

The Western Pacific has had some peculiar problems. Up to the time that dispatching by telephone was installed, there was an atmospheric condition across the Great Salt Lake and on the 30-mile salt bed west of there, which would at times cause all wires to stop working. No one, so far as I know, has ever discovered the actual cause of these failures. Had we been forced there to always use 31 orders, many trains would have been seriously delayed at times. When necessary to so handle, the trains were kept moving by the use of 19 orders. A period of six years has passed without a collision which could be charged to the 19 order. I have been allowed to handle matters of this kind somewhat more liberally on this road than on some others and naturally have not forgotten my old friend the 19 order; neither has it risen up to mock me.

In summing up I may say: Use the 19 order in a reasonable, sensible manner. The main points have been outlined in the several articles which have appeared in the *Railway Age*. This will facilitate the movement of traffic. In other words, why stop or delay a train unnecessarily on your road through fear, or out of respect for a long standing custom, when it has been demonstrated to you that others have not found this to be necessary, and their immunity from collision has clearly proved that they have not erred.

On a road where there is enough traffic to justify having 24-hour offices at all sidings at which trains must meet or pass, why should their movements be hampered by written train orders at all? Why not look beyond this and perfect a system which would amply safeguard operation by the exclusive use of home, distant, and "take siding" signals, placed at each station?

## The Interior Treatment of Boiler Waters

### Proper Supervision in Use of Compounds Results in Large Economies in Locomotive Operation

By C. R. Knowles

Superintendent Water Service, Illinois Central, Chicago

IT IS NOT THE INTENT of this article to advocate any specific remedy for boiler troubles caused by objectionable waters, or any particular method of treatment to the exclusion of others. The object is rather to point out the possibilities of boiler water treatment through treating the water as it enters the boiler by what may be termed interior treatment as distinguished from exterior treatment.

Interior treatment involves the introduction of substances into the boiler for the purpose of preventing scale, corrosion, foaming or other ill effects of bad water. This method is probably as old as boilers themselves and has included many different substances, some of which were designed to work mechanically and others chemically.

Exterior treatment involves the treatment of the water before it enters the boiler. This treatment, as applied to locomotive boiler waters, usually consists of adding lime and soda ash to the water, which is then allowed to stand until chemical reaction has taken place and the substances acted upon by the lime and soda ash have been precipitated.

Some of the advocates of exterior treatment have shown little tolerance for the interior method of treating boiler waters, insisting that proper results can be obtained only by complete treatment of the water before it enters the boiler. The expressions commonly used in offering objections to interior treatment are: "A boiler is designed to produce steam, not to produce chemical reactions," and "The only thing that should be put into a boiler is pure water." While these statements are true, they can rarely be followed in practice as it is almost impossible to obtain a pure water for boiler purposes, in the fullest sense of the word "pure," since, even with the best treated water, some chemical reaction is bound to take place within the boiler.

Well designed treating plants using lime and soda ash for the thorough treatment of water, followed by sedimentation and filtration, are highly desirable and many such plants are giving satisfactory results. An increased tendency to cause foaming is characteristic of all water treated with soda ash, and nearly every railroad using the lime and soda treatment finds it also necessary to apply interior treatment to the softened water to prevent foaming. It follows therefore that certain waters cannot be used successfully after exterior

treatment without interior treatment to prevent foaming.

Many have accepted the erroneous view that all interior treatment is a hit-and-miss proposition, this impression evidently having been gained from experience with some of the many so-called "boiler compounds" that do not take into consideration the character of water to be treated but consist of one standard compound designed to fit any and all water conditions. As stated before, a great many different substances have been used as compounds in boilers, a few of which have shown good results but the majority of which have been ridiculous and some of which have been actually dangerous remedies. It is characteristic of interior treatment that the incrustants are not actually removed from the water before it enters the boiler. Chemical reaction takes place in the boiler between the ingredients in the interior water treatment and the salts carried in the raw water. These salts are precipitated, forming a sludge which is blown out with the judicious use of the blow-off cocks.

The same objection applies to exterior treatment to a certain extent, for while exact treatment to remove the carbonates will leave no dissolved residue treatment for sulphates, nitrates and chlorides leaves sodium sulphate and other sodium salts. Consequently if the raw water contains a large amount of sulphate hardness with or without considerable quantities of alkaline salts, it can be used after treatment only by blowing off the boiler frequently or by additional interior treatment to prevent foaming. Less solids will, of course, be introduced into the boiler if the water is properly treated outside on account of the removal of the carbonate hardness but it is apparent that the same methods must be followed ultimately in the use of water treated by either method, namely, the removal of these solids by blowing down the boilers. The correct application of either form of treatment is of course essential to its success. There is no doubt that much of the existing prejudice to interior treatment has arisen because of neglect to apply it properly rather than to the failure of the treatment itself.

If the same supervision were given interior treatment that is devoted to exterior treatment there is no doubt that the results obtained would prove quite as successful as exterior treatment within the limits of the field of each treatment.

The following examples are quoted as typical of results that it is possible to obtain when the interior treatment is applied strictly in accordance with instructions.

In one case an increase of 428 miles per boiler washout was secured, effecting a saving of 450 lb. of fuel, 8 locomotive hours and \$6.86 in labor for boiler washing, the cost for treatment being \$2.50. The record of another engine showed 872 miles increase between washouts with 1,770 lb. of fuel, 12 locomotive hours and \$9.80 in boiler washing expense saved, all accomplished at a cost of \$2 for treatment.

On one railway, in a bad foaming district, before using anti-foaming treatment it was necessary to do so much blowing out to keep the concentration below the foaming point, that it amounted to changing the water in the boiler several times over the division. The use of the anti-foaming treatment entirely overcame the foaming, and the blowing out was reduced to a point where the quantity of water used in this way was negligible.

On a freight division 103 miles long on another railway, it was necessary to wash out the engines at each end of the division to handle a tonnage train over the road. Through the use of the anti-foaming treatment five round trips were possible without a washout, and the blowing off was reduced to three times over the division, the blow-off cocks being open only five to ten seconds each time.

As another illustration of what anti-foaming treatment will do in lessening the amount of blowing off, a test was made on a district where treated water caused excessive foaming trouble. An engine was run for 24 days, making 3,960 miles without washout or water change, and no blowing out was done on the road, and only three to six inches at terminals. The compound cost 80 cents per round trip, whereas washing the boiler each round trip would have cost \$3.10.

The excessive blowing out of boilers necessary when using soda ash alone, leads to a great waste of fuel. With proper treatment, this excessive blowing out can be eliminated and a consequent saving in fuel effected. On one road where the proper interior treatment superseded soda ash, records were kept at two roundhouses, each blowing out about 100 engines every hour. With the interior treatment it was necessary to blow off a much smaller quantity of water to relieve the mud and sludge, so that there was a saving over the use of soda ash of from 8 to 10 in. of water on each engine blown out, while the coal saved amounted to approximately 150 lb. for each operation. At these two roundhouses alone this equaled a saving of 5,500 tons of coal per year. The saving in water was also a considerable item, the supply being obtained from the city. When using soda ash trouble was also experienced with foaming while after changing the treatment foaming trouble was almost entirely eliminated.

In another test as against the use of soda ash alone for scale removal, the advantage in fuel saving amounted to \$12.18 per 1,000 locomotive miles. On a road averaging 6,000,000 locomotive miles, this item alone would amount to over \$70,000. The saving in roundhouse repairs also showed a large percentage in favor of the interior treatment. There was a 65 per cent decrease in the item of valve stem packing, 73 per cent in the number of checks ground, 50 per cent in packing necessary to be done to steam rams and cocks, 46 per cent in the grinding of cocks, and 84 per cent in cylinder packing. There was a decrease of 26 per cent in the number of flues leaking and caulked. There was also a benefit in that there was less trouble from foaming. At another terminal approximately the same benefits were shown. In the handling of 1,487 switch engines and 719 road engines the coal saving amounted to over 242 tons per month.

As an example of the results obtained from the interior treatment of water in stationary plants the life of the flues in a tubular boiler used for heating a large passenger station and coach yard was increased from two years to six years, while the fuel saving amounted to about 15 per cent.

In another instance an accumulation of scale averaging 3/16 in. in thickness was removed from the flues of a battery of two 100 hp. boilers in a pumping station, resulting in a saving of 20 per cent in fuel and greatly increased life of flues. The treatment of water within the boiler is not a hit-and-miss proposition by any means if carried out intelligently, but is based upon scientific principles and takes into account the objectionable matter carried by the water as determined by an analysis of each water so treated.

It is not the purpose of this article to in any way oppose the treatment of water outside the boiler in properly designed treating plants or to discourage the construction of additional plants as the success of such treatment is too well established to permit of any argument against it.

It has been estimated that 50 per cent of the boiler water used on American railroads is of such quality that treatment would show economy in locomotive operation and that of this amount only 6 per cent is being treated by exterior method. There would appear to be no reason why the other 94 per cent should not be treated by the interior method, as even with the most intensive construction of treating plants for the purpose of treating the water before it enters the boiler, it would be years before sufficient plants could be constructed to treat all water requiring treatment.

With the present financial condition of the railroads the construction of water softening plants is going to be slow and more attention should be given to the interior method of treatment as no initial investment is necessary other than the cost of the treatment. Probably many of the waters are of such a nature that the interior treatment will prove more economical and at the same time just as satisfactory as exterior treatment, as, for example, waters of too high purity containing but very small quantities of solids. Such waters often induce corrosion and in many cases the trouble may be corrected more economically by interior treatment.

Darling, in the Chicago Pest

The Owner of the Car Pauses to Remark—

*Mikado Type Locomotive for National Railways of Mexico*

## New Motive Power for Railways of Mexico

Large Order for Pacific, Mikado and Consolidation Locomotives—  
Interchangeable Parts to Facilitate Maintenance

THE BALDWIN LOCOMOTIVE WORKS has recently completed a group of locomotives of various types for the railways of Mexico, which are of interest not only from an engineering standpoint but also because their construction represents an important item in the plans now being carried out for the rehabilitation of these lines. The locomotives referred to include 83 for the National Railways of Mexico and 11 for the Mexican Railway, besides a number of others built for industrial companies.

The locomotives for the National Railways are of three types: 20 Pacific (4-6-2) for passenger service, 23 Mikados

per cent. Ten of the Pacific type locomotives and 15 of the Mikados are equipped with the Young valve gear, and the remaining 10 Pacifics and 8 Mikados with the Baker valve gear. Ragonnet power reverse mechanism is used on all these locomotives.

With the exception of such changes as are necessitated by the differences in wheel arrangement, the Pacific and Mikado types are practically duplicates. The following are among the parts that interchange: The boilers, with principal internal and external fittings, including oil burning equipment and firepans. Machinery details, including cylinders, piston

*Pacific Type Locomotive for National Railways of Mexico*

(2-8-2) for heavy freight service and 40 Consolidations (2-8-0) for lighter freight service. These locomotives all use a heavy grade of Mexican oil for fuel, and are of standard gage with the exception of 20 of the Consolidations, which are of 3 ft. gage.

### Pacific and Mikado Types

The Pacific and Mikado type locomotives are of special interest because of their weight and capacity, and also because they have been designed with an exceptionally large number of interchangeable detail parts. The passenger locomotives are operating on curves of 16 deg. (10 deg. metric) and grades of 2.2 per cent; and the freight locomotives on curves of approximately 23 deg. (14.3 deg. metric), and grades of 3

valves, valve rods and valve-rod crossheads, pistons and piston rods, crossheads, main rod straps, keys and brasses and valve gear details, excepting the lengths of certain members. Running gear and frame details, including driving axles, boxes, shoes and wedges, driving and engine truck wheel hub liners, front engine truck boxes, wheels and axles, trailer trucks complete, frame pedestal binders and cross-ties, frame filling pieces for brake hangers, back foot plates, back equalizing beams, front bumpers and pilots, driving springs and spring saddles. Other parts, including cabs, running boards and brackets, air reservoirs and supports, air tanks and supports, handrails and columns, steps and step hangers, cab fittings, furniture and tenders complete.

The boilers are of the extended wagon-top type, having 2

outside diameter of 76 in. at the front end and 86 in. at the dome ring. The firebox is of the radial stay type, with flexible bolts in the breaking zones and three rows of Baldwin expansion stays supporting the front end of the crown. All the tubes are welded into the back tube sheet, and the crown-bolts are flush on the inside of the firebox, in view of the use of oil for fuel.

The tractive effort of the Pacific type is 40,000 lb. and of the Mikado type 53,000 lb., the ratio of adhesion being practically 4 in each case; the average load per pair of driving wheels is nearly the same in the two designs. The trailing trucks are of the Hodges type, with cast steel boxes, the

The light Consolidation type locomotives are 3 ft. gage and develop a tractive effort of 26,600 lb., with a ratio of adhesion of very nearly four. They operate on grades as steep as 4.53 per cent and curves of approximately 21 deg. (13 deg. 40 min. metric).

These locomotives are so designed that they can, if desired, be subsequently rebuilt for standard gage track; with this end in view, and also to provide sufficient stability in a narrow gage locomotive of this size, the frames are placed outside the wheels. Each main frame is cast in one piece with a slabbed rear section, and has double front rails bolted to it. The equalization is arranged in the usual manner, the front

Standard Gage Consolidation Locomotive for National Railways of Mexico

wheels having cast steel centers, fitted with bronze hub liners. The front truck wheels are of rolled steel. The similarity of these two types shows the extent to which interchangeable details can be used in certain types carrying approximately equal wheel loads.

#### Standard and Narrow-Gage Consolidations

The standard gage Consolidation locomotives develop a tractive effort of 34,300 lb. and carry an average weight of 39,500 lb. per pair of driving wheels, the ratio of adhesion being 4.6. These locomotives are specified for operation on

pair of drivers being equalized with the leading truck, while the remaining pairs are equalized together on each side of the locomotive. The frames are braced transversely between adjacent pairs of drivers.

The boiler has a straight top and a wide firebox, which is placed back of the drivers and over the slab frames. This construction necessarily involves a considerable overhang, which, however, is kept within a reasonable length by placing the cab forward over the firebox. The latter is supported on each side by a sliding bearing of ample length.

Saturated steam is used, and the steam distribution is con-

Narrow Gage Consolidation Locomotive for National Railways of Mexico

the same grades and curves as the Mikado type. They have straight top, wide firebox boilers and are equipped with superheaters. The firebox is stayed with flexible bolts in the breakage zones, and the tubes are welded in the back tube-sheet. The steam distribution is controlled by 11-in. piston valves, and the valve motion is of the Baker type, controlled by Ragonnet power reverse mechanism. The tenders, as far as trucks and frames are concerned, are practically duplicates of those used with the Pacific and Mikado type locomotives, although the tank capacity is less.

trolled by balanced slide valves operated by Walschaert motion. The links are placed outside the second pair of driving wheels and are supported on longitudinal bearers of cast steel, which also serve to strengthen the frame bracing. Each driving crank has a counterbalance weight cast in one piece with it.

Should it be necessary at any time to rebuild these locomotives for standard gage, the wheels will be mounted on longer axles, thus bringing them outside the frames, which are so spaced transversely as to make this possible. As now

built, the locomotives have a maximum width of 9 ft. 11 in., and a height over-all of 12 ft. 9½ in. In view of the severe grades on which they operate, they are fitted with the Le Chatelier cylinder water brake in addition to air-brake equipment.

Consolidations for Mexican Railway

The Consolidation locomotives for the Mexican Railway are of standard gage and of special interest because of the character of the line on which they are used. The main line of this railway extends from Vera Cruz, on the coast, to Mexico City, a distance of 264 miles, and abounds in curves and grades. One of the most difficult sections occurs in a tunnel, where there is a curve of 100 meters radius (328 ft. or 17½ deg.) in combination with a grade of 3 per cent. uncompensated; the maximum grades on which the locomotives are used are 4½ per cent. To facilitate free curving, the two middle pairs of driving wheels have plain tires. The Le Chatelier water brake is applied to supplement the air brakes when operating on steep grades.

These locomotives develop a tractive effort of 43,000 lb.,

the Western Maryland which were built early in 1921 by the Baldwin Locomotive Works.

These locomotives were urgently needed and were built in a remarkably short space of time, as the order was received on May 23, 1921, and the last of the 11 engines was shipped on July 1.

The table at the bottom of this page contains further particulars of the locomotives described above.

If Ford Ran the Railroads

WASHINGTON, D. C.

HOW HENRY FORD would operate a large railroad system such as the Pennsylvania or the New York Central is outlined in an authorized interview with the flivver magnate and new-ledged president of the Detroit, Toledo & Ironton published in the current number of The Nation's Business. If he were the president of a large railroad instead of only a little one, Mr. Ford says that he would immediately set about accomplishing four things, although

Standard Gage Consolidation Locomotive for Mexican Railway

with a ratio of adhesion of very nearly four. They have straight top, wide firebox boilers and are equipped with superheaters. The piston valves are 14 in. in diameter, and are operated by Walschaert motion. The cab fittings include a "breather pipe" which is connected with the air brake system and has several outlets for the purpose of supplying air to the crew when passing through tunnels. A similar device was applied to the heavy Consolidation type locomotives for

only in the most general way does he illustrate his points by examples from his eight months' experience with the D. T. & I. He would "reorganize to get rid of the unproductive stockholder" whom he also refers to as a "parasite," and get the ownership into "the proper hands." After removing this "dividend drain" his second step would be to redesign the rolling stock, "the great physical burden of the railroads." Then he would "expedite the delivery of

freight" by keeping the men, cars and locomotives moving.

He does not explain in detail just how, but on the D. T. & I., he says, no idle men, idle cars or idle engines are tolerated and by speeding up the freight on the preliminary part of its journey he claims to have shortened the time of its delivery by periods ranging from 7 to 14 days, making it possible for the Ford Motor Company to carry on its books \$30,000,000 less undelivered product. He would also discharge the surplus and inefficient employees, paying particular attention to the legal and accounting forces. To illustrate this point he says: "When we acquired the D. T. & I. there were 2,600 people on its payroll. We found almost immediately that by cutting out the lost motion we could reduce that number to 1,500." The reports show that in September, 1920, when the road handled 48,000,000 ton-miles of freight, the number of employees was 2,599 and that in February, when the traffic had fallen off to 9,789,000 ton-miles, the number of employees was 1,328. Mr. Ford was the owner of the road during this time but he was elected president and put his new organization in charge in March, 1921. By June the ton-mileage had again increased to 38,589,000 and the number of employees to 1,649 and in July it was 1,822.

Mr. Ford in the interview does not make this comparison between tonnage and the number of employees but when asked his answer to the argument that his success was due to his ability to divert Ford traffic to his railroad, he is quoted as saying: "How can that be true when the road handled more tonnage the year we took it over than it has hauled since we have had it? The figures are all at Washington, why doesn't someone look them up?" The Nation's Business also publishes an article by a railroad president quoting the figures which had been looked up in Washington to show how coal and other low grade traffic had been replaced with automobiles, trucks and other manufactures that take a much higher rate per ton-mile, thus increasing the revenues of the road, while the expenses had been reduced in proportion to the decrease in tonnage.

### Why the Stockholder?

"The real purpose of a railroad," Ford says, "is to serve the public. There is no reason why it should be diverted from that service and set to doing an entirely different thing—putting money into the pockets of stockholders who make no contribution to the road's actual operation. Paying dividends to these people is a burden which should be lifted from the railroads. The greater the overcapitalization, the heavier the overcapitalization, the heavier the burden. It bears them down and prevents them from serving their purpose. In the end the public pays these dividends. They are a tax on the whole people.

"There is a possible and practicable system of financing railroads by which those contributing the money will be in position to aid directly to the success of the undertaking. If the brakeman on a railroad owns stock in it, he has an additional inducement to competent service. Better service is a valuable by-product which will come from his ownership of stock. If the railroad is a success, it is due to him and his fellow-workmen, and they are entitled to the profit.

"Railroads should not have to go to banks for money. They can be otherwise financed. In fact, finance is the wrong term to use. We talk too much about finance. The first thing is to make a railroad work. Make it possible for people to use it as much as they want to. Then there will be no trouble about finances. The trouble is that we start with finance and expect finance to make the road go. Finance can't do that. Finance is a failure.

"Of course, if such a course were attempted, we could expect a great outcry for the protection of invested capital. It would be said that people had bought these stocks for the financial protection of their families, their children. Pro-

tection from what? From the necessity of earning their living.

"Proper financing would, of course, be easier on new roads. On the old ones, however, it should be possible to retire the parasite, the non-contributing stockholder and get the ownership into the proper hands.

### Lighter Cars and Locomotives

"Overweight of rolling stock is the prime mistake on the mechanical side of railroading. Engines and cars are four or five times as heavy as they should be. A freight train is several times the weight of the load it carries, and a passenger train is 20 times as heavy. This dead weight must be moved whether a train is loaded or empty. The cost of pulling empty trains is needlessly large. Contrast this with the efficiency of the bicycle which weighs 20 lb. and will carry a man who weighs 200 lb.

"On the Detroit, Toledo & Ironton we are using up the old types of engine and car, but they will be displaced by better types. We will patent our new designs where they are patentable, but we will do this only to prevent someone else from doing so. We will never proceed against anybody for infringement of our patents.

"If a car takes more time than it should to deliver its load at its destination it is not, of course, earning as much as it should for the road. It is just as much waste as it would be for a man to take two days on a one-day job. It is more so, because that car is likely to hold another car back. But here is another point. It is lengthening the time of the turnover of the shipper—and that, too, is a waste of money and everything else.

"Our experience illustrates this excellently. The road we have acquired runs north and south and crosses most of the transcontinental lines. By speeding up our freight on this preliminary part of its journey our product gets to the people to whom we sell it from 7 to 14 days quicker than it used to.

"Most railroads have enough lawyers working for them to operate them if they were engaged in useful work. One of the first things is to dispense with the legal staff. We did just this on the Detroit, Toledo & Ironton. The lawyers are mostly in the claims department, which is one of the most wasteful branches of railroad operation.

### Simplify Accounting

"The bookkeeping of railroads is complicated far beyond all necessity. I don't want to go into detail, but the amount of unnecessary work you can find in the accounting system of even a little railroad, the amount of duplication and red tape, is almost beyond belief. We have simplified this department, reduced its cost, and have transformed it into an actual help to the railroad instead of a vexation and a burden. How did we do it? By viewing the whole proposition as a service to the users of railroads and making everything fit into that, instead of having the fear of stockholders and dividends before our eyes.

"We don't claim to have done anything new in railroading—yet. We have only taken the old system of operation and cut off its obvious absurdities. Even the old system of railroading, brought up to efficiency, would be an immense change for this country. We have simply cut out the loafing of men, the loafing of engines and the loafing of cars. The result seems to have surprised many people. But there is no mystery or magic about it. Anyone can do it.

"I don't like to appear as criticizing any railroad manager, for I have never done so. With their stockholders on their backs and their banker bosses who don't know anything about railroading, what can they do? They must be liberated from the present system. And you can't do that by giving them \$500,000,000 to perpetuate the present bad system, either."

*Illinois Central Suburban Cars, Adapted for Electric Operation*

## Illinois Central Steel Suburban Coaches

Designed for Future Electrification—Doors Electrically Controlled  
—Total Weight 92,100 Pounds

THE ILLINOIS CENTRAL has recently received from the Pullman Company 20 new steel suburban coaches which have been placed in service in Chicago, the design of which has been influenced in numerous details by the prospective electrification of this road within the Chicago terminal district. The cars are completely equipped for

axle generator and battery equipment for electric lighting; this equipment in both cases follows the standard of the road for passenger coaches in main line service. The conversion for electric service will consist of the substitution of electric heaters for the present steam heat equipment and the removal of the axle generator equipment, the current for lighting then being obtained from the power source. The vestibules have been arranged to facilitate the installation of multiple unit control apparatus, brake valve, gages, etc., and with this in view the hand brake, staff and handle have been placed on the left side instead of the right side of the vestibule platform.

The cars have a coupled length overall of 72 ft. 2 in. and are 60 ft. 6½ in. long over the body and sills. A seating capacity of 84 is provided for by 17 transverse seats on either side of the car and four longitudinal seats 4 ft. 9 in. long, one on either side at each end of the car. Sliding doors are used throughout. Those at the ends of the seating compartment close from either side toward the center, while the end and side vestibule doors are each single units, the former opening toward the left while the latter slide back into the side walls of the car body. The end doors of the car and the vestibule side doors provide a clear opening of 4 ft. in each case, while the vestibule trap doors are 3 ft. 4 in. in width. The floor plan shows the proposed arrangement of the control apparatus for electric operation and the way in which the right side of the vestibule will be closed off to form the motorman's compartment.

In working out the seating arrangement, particular attention has been given to provide ample room between the seat and ample height of back for the comfort of passengers. No ends are provided on the seats, in order that the passengers may enter quickly and leave them quickly and conveniently. The width of the aisle at the seat end is about 31 in., increasing to 36 in. at the edges of the seat backs.

The interior finish is steel throughout, with the exception

**Interior View, Showing Open-End Seats**

steam train service, in which they are now operating, and have been designed primarily for trailer service after electrification has been completed, although the car bodies are of sufficient strength to be equipped with motor trucks, and other electrical apparatus should this later seem desirable. The weight of the cars equipped for steam operation is about 92,000 lb.

At present the cars are equipped with steam heat and with

**Floor Plan, Showing Provision for Motorman's Compartment**

of the single sash, which are of mahogany. Above the side lights the finish is in white, including the fixtures. The sides and the seat ends are finished in mahogany color.

With the exception of the longitudinal sills and a few details of the vestibule ceiling construction, the frame members are practically all of pressed steel. The cars are carried on four wheel trucks with cast steel frames and the usual type of equalizing arrangement, fitted with 33-in. rolled steel wheels mounted on axles with 5-in. by 9-in. journals.

### Door Operating Mechanism

All doors on these cars are of steel construction. The double doors at the ends of the car body are geared so that they operate together. They are arranged to lock both in the open and closed position.

The vestibule side doors are operated by air engines, one for each door, taking air from a reservoir under the car maintained at main reservoir pressure by direct connection with the locomotive. Each end of the car is fitted with one of these reservoirs, which has sufficient storage capacity to

which prevents further movement it automatically opens about 36 in. then reverses and moves toward the closed position again. This movement is kept up automatically until the obstruction is removed.

A feature of considerable interest in connection with steam operation is an electric starting signal operated automatically by the closing of the doors. A green light mounted in the cab of the locomotive is connected to a series circuit carried back through the train by electrical connectors between the cars. This circuit is broken by the opening of any vestibule side door in the train and is closed only when all of the doors are closed. Closing the doors thus causes the lighting of the green lamp in the locomotive cab, which serves as a starting signal following station stops. This circuit receives its energy from the headlight generator of the locomotive.

## Telephone Train Dispatching in Canada

ON THE RAILWAYS of Canada the telephone is used for the transmission of train orders on 15,956 miles of road, or about 45 per cent of the whole mileage. This includes the following: Canadian Pacific, 7,522 miles; Grand Trunk, 1,447 miles; Canadian National, 6,365 miles; Michigan Central, 298 miles; Temiskaming & Northern Ontario, 324 miles. These and other interesting facts concerning the telegraph and telephone were given by W. J. Camp, assistant manager of telegraphs of the Canadian Pacific, in a paper read before the Canadian Railway Club at Montreal, in September. Mr. Hulatt, of the Grand Trunk, in the discussion of the paper, gave additional data; and these speakers, with others, agreed that the telephone is 50 per cent faster than the telegraph for the work of the train dispatcher. The telephone was at first introduced, in most cases, because of the increased facility of securing operators, as compared with the Morse telegraph; for with the latter it is essential to have operators of long experience; but substantially all railroads now use the telephone because of better speed and efficiency, regardless of the labor question.

Mr. Camp gave a brief historical sketch of the telegraph from 1815, when Ronalds was able to send a message some distance by using 24 wires, one wire for each letter of the alphabet. One wire of the Canadian Pacific, between Halifax, N. S., and Bamfield, B. C., 4,404 miles, on which the automatic printing telegraph is now in use, is believed to be the longest commercial telegraph circuit in the world. This circuit is leased to the British Pacific Cable Board. In the through traffic between Australia and Great Britain messages are repeated without being written out; the receiving tape at the relay station is gummed on blanks and the sending operator at that station punches another transmitting tape by reading from the one received. On this 4,400-mile land line the average speed is 125 letters a minute; good work has been done at 300 letters a minute.

The Canadian Pacific has printer apparatus in use in all parts of Canada on long circuits and also on many short circuits. All of these are worked duplex.

The first regular telephone train dispatching circuit of importance was that of the New York Central (October, 1907), between Albany and Fonda, 44 miles. The Burlington road installed a circuit of 106 miles, single track, a few months later; the Canadian Pacific opened a circuit in June, 1908.

Marconi's wireless telegraph was used between a Grand Trunk train and a station in October, 1902; and the wireless telegraph stations of the Delaware, Lackawanna & Western were established in 1913. Mr. Hulatt expects great things from the wireless carrier system of General Squier.

Telephones for messages, as distinguished from train orders, are now in use over long distances by the most enterprising railroads; the printing telegraph is also used on the large railroads both in the United States and Canada.

Air-Operated Sliding Doors Are a Feature of the Vestibule Design

permit the operation of the doors 10 or 12 times after the locomotive has been cut off. These reservoirs are directly connected to the main reservoir of the locomotive by a  $\frac{3}{4}$ -in. train line. No signal air line is used in suburban service.

The door operating engines are located under the longitudinal seats at the ends of the car. The operation of the air valves of this mechanism is electrically controlled by double lever switches which are mounted in cast iron boxes, secured to the outer faces of the vestibule door posts at both ends of the car. There are two levers, both arranged to lock in the neutral position, one for opening and closing the door and one neutral. As a further safety feature there is a collapsible arm on the engine shaft so that the door can be opened about 6 in. from its closed position. Each switch box controls both of the doors on one side of the coach, an arrangement which permits one guard to operate all of the doors on two cars. In event of an electrical failure the air valve may be operated by hand. In case a door is closed on an obstruction

## C. P. R. Turntable Departs From Usual Practice

## Design Is Lighter and Shallower Pit Lessens Danger of Running Engines Into It

THE RAILWAY TURNTABLE is probably subject to more variations in practice and differences of opinion than any other phase of the bridge engineer's work. Some authorities favor the deck turntable; others the through table. Those who prefer roller bearing centers are just as positive in their views as those who believe that a disc center gives the best results. For this reason the 90-ft. Canadian

strated that a shelf angle properly supported on stiffeners forms an effective bearing for the ties and gives no trouble in maintenance. The girders are 7 ft. 6½ in. deep, back to back of angles at the center, this depth being reduced at the ends to 5 ft. 8¼ in. The backs of the upper flange angles are 2 ft. 6½ in. above the base of rail.

The turntable is well braced by a double system of later-

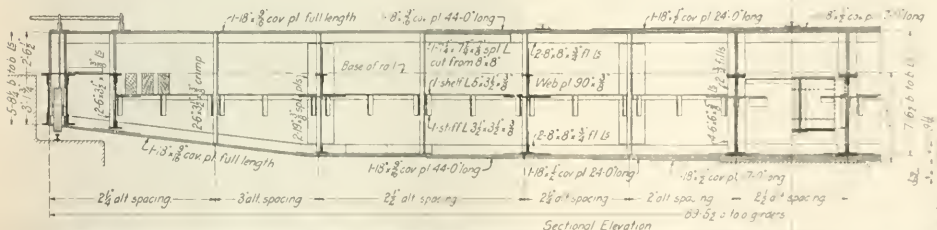

Section of a Typical Turntable Pit

Pacific turntable, which embodies a number of variations from current practice, will be found worthy of study.

This turntable is of the half-deck type with 8-in. by 16-in. ties supported on 5-in. by 3½-in. by 5⅝-in. shelf angles at about the mid-height of two girders, spaced 13 ft. center to

als, one in the plane of the shelf angles and another in the plane of the bottom flanges. Cross frames are provided at alternate stiffeners and by arranging to have them come up between the ties they have been made almost five feet deep. To stiffen the ends of the table and provide for the applica-

### Structural Plan of the Turntable

center. Preference for this design is based on two considerations. It is lighter than the through type with a beam and stringer floor and it permits of a shallower pit and affords much less opportunity for running a locomotive into the pit in case of derailment than does a deck-table.

Long experience with this form of construction has demon-

tion of the load to the end wheels, end loading girders are provided, these being protected from derailed wheels by a deck plate 4 ft. wide riveted to their top flanges.

The loading arrangement at the center consists of two cross girders spaced 6 ft. 9 in. center to center, carrying two longitudinal loading beams between them, spaced one foot

each side of the center line of the table. These loading beams are equipped on their lower flanges with cast steel bearings. The center used is of the conical roller type.

These turntables are commonly turned by a tractor operated by compressed air. The air is supplied in a pipe line suspended from a steel cable to a point directly over the center of the table and thence through an overhead U-frame to an air drum supported outside one of the girders. From this a pipe line runs to the tractor.

The turntable pit also presents some details of interest. The center pedestal and circle wall are made entirely of concrete with an eight-inch coping of oak or Douglas fir on top of the circle wall. The timbers in this coping are made in segments, in two layers with joints lapped. Wrought iron cramps for dogs are used to hold the timbers in place, supplemented by anchor bolts one inch in diameter and 60 d wire nails. The circle rail rests directly on the concrete and is held in place by anchor bolts imbedded in the concrete and fitted with bolts and eccentric washers that permit of a variation of  $\frac{3}{4}$  in. in the width of the rail base.

Special attention is given to drainage of the turntable pit. In all cases where the ground requires drainage, the pit is paved with 4 in. of concrete or brick laid in mortar on broken stone, cinders or porous material and this paving is sloped to a catch basin at the end of a line of drain pipe.

We are indebted for the above information to J. M. R. Fairbairn, chief engineer, Canadian Pacific, Montreal, Que. P. B. Motley, engineer of bridges, was responsible for the design.

## Railroad Bill Taken Up in Senate

WASHINGTON, D. C.

THE railroad bill to provide for the disposition by the government of the securities accepted from the railroads for indebtedness to the government for additions and betterments made during the period of federal control was made the unfinished business of the Senate on November 8 on motion of Senator Cummins, and on November 9 Senator Cummins made a speech explaining the bill, after which its consideration was postponed until Monday, November 14.

Senator Cummins said that his experience had led him to the conclusion that the Senate was able to deal adequately with any subject on which senators would take the trouble to familiarize themselves, but that unfortunately many were not willing to devote the time and labor to informing themselves on many of the subjects they were called to vote upon and that he knew of no question on which there had been more misunderstanding both in the press and in the Senate than on this bill. He began by pointing out what the bill does not contain, saying it does not extend the President's power to fund the railroad indebtedness as provided by the transportation act; it does not involve any appropriation or any future demand upon the treasury; rather it is intended to make such an appropriation unnecessary; it does not affect the settlements made by the Railroad Administration except to provide money with which to make them by selling railroad securities held or to be acquired by the government; it does not represent a gift, gratuity or loan to the railroads and it does not in any way affect rates. The only authority given to the President by this bill, he said, is to sell the railroad securities. Senator King asked if it does not provide for paying the government indebtedness to the railroads in cash while allowing the roads credit for their indebtedness. Senator Cummins said that is provided for in the transportation act. He also said in reply to Senator King that it in no way provides for a guarantee of the railroad securities by the government. He said he could not conceive why anyone who understood the bill and its purpose could possibly object

to it, because if it is desired to withdraw from the President the power to fund the railroad indebtedness it would be necessary to repeal parts of the former act rather than oppose the bill. Senator Cummins then entered upon a detailed explanation of the accounts between the Railroad Administration and the railroads, during which he was frequently interrupted by questions from senators who had difficulty in following the figures.

A large amount of opposition to the bill is developing in the Senate. In addition to the members of the agricultural bloc, who are objecting to the bill with the general purpose of doing anything to embarrass the railroads until or unless they can obtain legislation to repeal the rate-making sections of the transportation act, there is also much opposition on the part of those who believe, or profess to believe, that the bill provides for additional aid to the railroads from the federal Treasury, whereas the purpose of the bill is to enable the Railroad Administration to pay what it admittedly owes the railroads without the necessity for another appropriation from the Treasury. It is proposed to sell the securities offered by the railroads as evidence of their indebtedness to the government in order to provide the funds with which the government may pay the railroads. While it is proposed to sell some of the securities to the War Finance Corporation, it is only for the purpose of having that corporation hold them temporarily until market conditions are such that they may be sold to private investors, and the President is also authorized to sell securities directly to private investors in the way that \$109,000,000 of the equipment trust certificates have been sold. The result of the plan would be that the government would settle its accounts with the railroads and the railroads' ten-year notes for the additions and betterments would be held by private investors rather than by the government.

But the Railroad Administration accounts are so complicated that it is difficult for anyone to understand them and many speeches have been made on the subject. And those whose political purpose is suited thereby much prefer to describe all payments made by the government to the railroads as gifts whether they consist of payments of rental for the period of federal control, the guaranty for the six months following federal control or loans from the revolving fund. Except the loans from the revolving fund, the payments made by the government to the roads during the past year have been on account of the 26 months period of federal control or the six months guaranty, which expired a year ago, but all of which has not yet been paid. But the issuance of cumulative statements by the Treasury Department from time to time gives rise to many newspaper articles which give an impression that the government is still paying out large sums to the railroads. Moreover, the provisions of the bill, while in themselves comparatively simple, are somewhat complicated by the frequent reference in the bill to provisions of the federal control act, the transportation act and the War Finance Corporation act.

CRUCIFIXION OPPOSED.—Edgar E. Clark, former chairman of the Interstate Commerce Commission, speaking at the dinner of the Boston Chamber of Commerce on November 7, on the railroad problem, and referring to the unwise and indefensible things that have been done by railroad managements in the past, said "But are those of today to be crucified because of the shortcomings of their predecessors? The people have made it manifest that they have had enough of government operation. There are those who desire and hope for governmental ownership and operation. They are working earnestly and industriously to that end, seeking in every way to embarrass and discredit the existing status. The selfish interests of most of them are apparent. Their success will be prevented only if those who do not accept their theories bestir themselves to live interest and helpful activity in the matter."

# I. C. C. Accident Bulletin No. 78—Annual Report

## Persons Killed in Train Accidents Total Same as 1919—Train Accident Losses Increase

THE INTERSTATE COMMERCE COMMISSION has issued Accident Bulletin No. 78, containing the record of collisions, derailments and other accidents on the railroads of the United States for the last quarter of 1920, and also for the 12 months ending with December. The number of passengers killed in train accidents in the twelve

comparisons shown in the present table are not specially striking; and the number of persons killed in train accidents and train-service accidents, a total of 6,495, is exactly the same as the total for the same items in 1919.

The number of trespassers killed, 2,166, it will be seen, is 387 less than the number in 1919; for 14 years this item ran about 5,000 a year; but since 1916 there has been a steady diminution to the number here shown.

The bulletin contains tables showing some of the principal totals for each year back to 1889, with others of varying value. As in the preceding annual bulletin, the causes of train accidents and of train service accidents are classified in extreme detail. Twenty-three pages are given to tables showing total casualties, classified, for each road (but confined to roads of Class 1); and the casualties resulting from different classes of accidents are shown also in tables giving the total for each state in the Union.

The total number of train accidents during the year was 36,313 and the damage to cars, engines and roadways was \$34,129,860, divided as follows: Collisions, 10,110,

months was 95, as compared with 110 in the preceding year; and of employees, 430 as compared with 366. These and other figures from the principal table in the yearly section

CASUALTIES TO PERSONS IN RAILROAD ACCIDENTS: TWO YEARS

	1920		1919	
	Killed	Injured	Killed	Injured
Passengers				
In train accidents.....	95	4,631	110	4,549
In train service accidents.....	169	3,825	191	3,598
Total.....	264	8,456	301	8,147
Employees on Duty				
In train accidents.....	422	3,385	359	2,955
In train service accidents.....	1,685	43,535	1,334	33,325
Total.....	2,107	46,920	1,693	36,280
Total passengers and employees in duty.....	2,371	55,376	1,994	44,427
Employees not on duty.....	91	314	66	321
Other Persons, not Trespassing				
In train accidents.....	11	86	9	61
In train service accidents*.....	1,856	5,044	1,873	5,134
Total.....	1,867	5,728	1,882	5,195
Trespassers†				
In train accidents.....	48	77	32	63
In train service accidents.....	2,118	2,291	2,521	2,595
Total.....	2,166	2,368	2,553	2,658
Total of the above.....	6,495	63,786	6,495	52,601
Non-train accidents.....	463	104,522	483	96,452
Grand total.....	6,958	168,308	6,978	149,053

\*Includes persons struck by trains at highway crossings, of whom, in 1920, there were 1,790 killed, including 100 classed as trespassers. The total in the year preceding was almost the same—1,784.

†A small percentage of the persons classed as trespassers represented employees.

‡Of the 63,786 persons here recorded as injured, 529 were reported by the railroads as having subsequently died.

of the Bulletin, are shown in the table given below. It will be recalled that in 1919, the record of which was given in the *Railway Age* of November 19, 1920, page 894, there were many remarkable decreases, as compared with 1918. The

damage, \$9,078,110; derailments, 22,477, damage, \$22,987,790; others, 3,726, damage, \$2,063,960. The total damage in 1919 was \$22,675,820. Thus it appears that in 1920 the damages under this head, from derailments alone, amounted to more than the total from all classes of train accidents in 1919.

The totals of some of the annual tables are shown in graphs, two of which we reproduce. That which shows the total number of persons killed in train and train service accidents is accompanied in the bulletin by a similar one

showing the number of persons injured, but the drawing is on a different scale.

The graph comparing the number of casualties to passengers with the number of passenger miles is of interest mainly as showing the considerable decrease in non-fatal injuries since 1912, while at the same time the number of passengers carried has increased from about 35 billion (passenger miles) to upward of 45 billion.

Another diagram shows the percentage of automobile casualties at grade crossings as compared with the total casualties including those to pedestrians and occupants of other vehicles. The data contained in this diagram, showing large increases in four years, are condensed below:

CASUALTIES AT GRADE CROSSINGS OF RAILROADS IN THE UNITED STATES—  
TOTALS FOR FOUR YEARS

Year	Total casualties			Occupants of automobiles	
	Killed	Injured	Total	Casualties	Percentage of total
1920.....	1,791	5,077	6,868	5,250	76
1919.....	1,784	4,616	6,400	4,790	73
1918.....	1,852	4,683	6,535	4,240	63
1917.....	1,969	4,764	6,733	4,083	59

It will be noted that the total number of persons killed, all causes, on crossings, has decreased steadily since 1917. This would seem to indicate that some of the persons who risk their lives at crossings by reckless management of automobiles, would perhaps have found some other way to indulge their habit of recklessness if the automobile had never been invented.

The statistics of trainmen include tables showing the proportion of persons killed or injured to the total number employed; and other tables show casualties, per thousand hours worked, for shopmen, trackmen, etc. For example, of enginemen of passenger trains there were, in 1920, a total of 190 men employed to each one killed; and 16 employed to each one injured; on freight trains the proportion was 538 employed to each one killed and 16 employed to each one injured; in yard service there were 2,547 employed to each one killed and 22 employed to each one injured. Similar statements are shown for firemen, conductors and brakemen; and for all these classes the tables cover five years, 1916-1920. In the fourth quarter of 1920 there was one shopman injured for every 27,000 hours worked, and one killed for every 14,549,000 hours worked.

## Northern Pacific

### Illuminated Highway Signs

THE NORTHERN PACIFIC has placed in service to date about 100 illuminated highway crossing signs of special construction and type which give a continuous illuminated warning, day and night. These signs consist of two red lights in a horizontal line and an illuminated word, "Stop," and are designed to be attached to the post of the ordinary highway crossing sign.

The new sign consists of two oil lamps with large founts and long time burners, spaced 27 in. center to center of lenses and connected with a square sheet-iron box, on the front side of which the letters S-T-O-P are cut out. These letters are 6 in. high. Back of them is placed a translucent glass on which light is thrown from the two lamps by mirrors, set at an angle, which make the word stop visible about 200 ft. away, both day and night. The lamps are supported on two standard R. S. A. lamp brackets. These are mounted on a casting which is designed to be placed on either a wooden or an iron post. The casting is attached to the round iron post by U-bolts. It consists of two pieces which fit together

on a slightly curved surface to provide proper adjustment of the rays of the lamps in the vertical plane. Adjustment in the horizontal plane is obtained by loosening the U-bolts and shifting the entire sign the desired distance to line it up properly with the highway. The centers of the lenses on the sign are 7 ft. 6 in. above the base casting of the post. The lenses are hooded so that the red lights will not be visible to any train approaching from either direction on the

Illuminated Highway Crossing Signals at Livingston, Montana

railroad. The oil containers hold a gallon of oil and the lamps will burn continuously for about a month with a long-time burning oil. The lamps are cared for by the section men in the course of their daily work.

The idea back of the use of this sign, which was developed by C. A. Christofferson, signal engineer of the Northern Pacific and is made by Adams & Westlake, Chicago, is to warn the traveler that he is approaching a railroad crossing, by reinforcing the present sign with the red lights.

An installation of two of these signs at a crossing costs about \$100.

ABOUT A YEAR AGO five foundries which specialize in the manufacture of small steel castings established a plan for co-operative research and obtained the services of Major R. A. Bull, Sewickley, Pa., to carry on the work. The companies represented include the Lebanon Steel Foundry, Lebanon, Pa.; Fort Pitt Steel Casting Company, McKeesport, Pa.; Michigan Steel Casting Company, Detroit; Electric Steel Company, Chicago, and the Sivyer Steel Casting Company, Milwaukee, Wis. Under the co-operative plan uniform standards of inspection were established by these companies and investigations of operating practices were delegated to the individual plants. At a recent meeting of the co-operating companies, the plan for obtaining uniform and satisfactory products was approved unanimously. The standards were revised in the light of experience gained during the past year, reports of investigations were received and plans laid for continuation of the policies established.

# Freight Car Loading Shows Slight Decrease

Decrease More Apparent Than Real—Heavy Loadings of Previous Week Due to Strike Threat

WASHINGTON, D. C.

**F**REIGHT car loading during the week ended October 29 was the largest that has been reported in a year with the exception of the week before, when there was a sudden increase of over 50,000 cars due to preparations for an anticipated railroad strike. Also, for almost the first time

expected, and in the past two years the seasonal drop after the peak of the fall traffic has occurred about October 22. Whether the peak has been reached for this year, however, remains to be seen. There were decreases as compared with the week of October 22 in the loading of grain and grain

Revenue Freight Car Loadings for the Past Four Years

this year the loading exceeded that for the corresponding week of 1919, although about 3 per cent below that for 1920. The number of cars loaded with revenue freight, according to the weekly report of the Car Service Division of the American Railway Association, was 952,621, as compared

products, livestock, coal, ore and miscellaneous freight, but increases in coke, forest products and merchandise.

There were 578,578 cars loaded with merchandise and miscellaneous freight, including manufactured products, which not only exceeded the total for the preceding week by

Total Cars Loaded at Mines, Including Bituminous, Lignite, Anthracite, Commercial and Railroad Fuel

with 962,292 the week before, 981,242 during the corresponding week of 1920 and 955,479 during the corresponding week of 1920. A slight drop as compared with the week before, which was abnormal because of the strike threat, was

2,953 cars, but was 34,682 cars more than were loaded during the corresponding week in 1920 and 49,274 cars above that for the corresponding week in 1919. Loading of coke increased 692 cars, compared with the previous week, the

total being 7,339, while forest products amounted to 54,348 cars, compared with 53,426 cars the week before.

Coal loadings were 207,693 cars or 4,526 cars less than the week before and 15,293 cars under that for the corresponding week in 1920. Reports showed 37,505 cars loaded with live stock, which was a decrease of 2,683 cars compared with the total for the preceding week, but an increase of 4,638 cars compared with the corresponding week last year.

Loading of grain and grain products was 48,949 cars, 2,052 cars under the week before, but 11,453 cars more than

## Shipping Board Asks Conference with Railroads on Foreign Contracts

WASHINGTON, D. C.

THE UNITED STATES SHIPPING BOARD has announced that all railroads having traffic contracts with foreign steamship lines will be invited to a conference with members of the board at Washington on December 1 to discuss the nature of the contracts and their abrogation if they are found to be detrimental to the development of an American merchant marine. The Interstate Commerce Commission recently called upon the railroads to file with it copies of such contracts, and this was done by some 28 railroads. There has been much criticism of the contracts by certain members of Congress because in them the railroads frequently made exclusive traffic agreements and extended various privileges to foreign lines which are now regarded as prejudicial to American shipping, although most of the contracts were made many years ago at a time when there was little American shipping.

While some of the speeches regarding these contracts have accused the railroads of alining themselves with foreign interests as against the American shipping, the members of the board, in making the announcement, were careful to refrain from criticizing the roads and stated that the roads were to be "invited" to the conference and approached in a spirit of co-operation. It was recognized that the contracts were entered into before this government had adopted a policy of building up a merchant marine and it was stated that it was not expected there would be any difficulty in getting together with the railroads upon a plan for co-ordinating American ocean and rail transportation. If it is found that the contracts are detrimental to American interests an effort will be made to substitute contracts with American ships. The Shipping Board will be represented at the conference by Commissioners Thompson, Plummer and Lissner, who are members of the joint committee on interstate commerce and railroad relations of which members of the Interstate Commerce Commission are also members. Commissioner Thompson proposes to consult with Chairman McChord of the Interstate Commerce Commission and the members of the commission will be invited to attend the conference if they desire. Chairman Lasker of the Shipping Board has conferred on the subject with the President.

Now that there are plenty of American vessels it is hoped to evolve a policy by which a greater proportion of the country's foreign commerce may be carried in American bottoms. The question of enforcing Section 28 of the Jones act, under which the Interstate Commerce Commission is authorized to confine preferential export or import rail rates to traffic carried in American-owned ships when requested to do so by the Shipping Board, is also involved.

A discussion of the railroad contracts was precipitated in the Senate on November 8 by the introduction of a resolution by Senator Jones requesting the commission to furnish the Senate with copies of the railroad contracts with foreign steamship lines. The resolution was adopted after Senator Jones had charged that the railroads have conspired with foreign interests that are hampering and seeking to cripple the American merchant marine. Senator La Follette also announced that he hoped to call up at once his pending resolution for an investigation of the Shipping Board. Senator Jones said he had not had time to examine the contracts personally, but he read a letter from the National Merchant Marine Association purporting to describe the principal features of the contracts, by which the railroads agreed to co-operate with the foreign shipping lines. Among the features in the various agreements are free wharfage and dockage, special piers set aside for foreign lines, exclusive use of facilities without charge, reduced rates, special demurrage agreements, pledges to work together against competitors, etc.

The Freight Car Situation, Showing Surpluses, Bad Order Cars, Total Cars in Use and Total on Line

were loaded during the same week in 1920 and 9,165 more than during the same week in 1919.

A decrease of 4,977 cars was reported for ore, the total for the week being 18,209 cars.

Compared by districts, the Eastern and Allegheny regions were the only ones to report increases in the loading of all commodities compared with the week before, but the Eastern, Southern, Central-Western and Southwestern reported increases over the corresponding week last year.

THE PARAMOUNT PROBLEM, however, for the public, is not whether the railway employees are justified—although it is essential that justice be accorded to both sides in every such dispute—but how to prevent the periodic recurrence of the threat against the economic life of the nation which has characterized the differences between railroad labor and the railway managers for a number of years.—*Guaranty Survey*.

# Changes Ordered in Panama Railroad Operation

## Changes in Direction of Open Shop, Reduced Wages, Fewer Passes and Revised Train Schedules

WASHINGTON, D. C.

**A**CTING upon recommendations made by the Special Panama Canal Commission, with some modifications, the Secretary of War has recently issued a series of directions to the governor of the Canal Zone providing for numerous changes in the administration of the canal and the operation of the Panama Railroad, intended to place the affairs on a more business-like basis. In some cases to carry the directions into effect will require the issuance of executive orders by the President. Among the changes ordered are the following:

A careful study shall be made of the cost of the canal, in order to establish, if possible, a capitalization to determine a fair commercial value for the canal and its various allied activities. When this has been arrived at the actual cost of the canal and its activities be written down to this figure, which should thereafter be used in the operation and official reports as capital account upon which returns and expenditures should be justified. Having arrived at this figure, it will be subdivided and an allocation be made to each auxiliary activity under the canal administration, and thereafter the sum allotted to each of these activities shall be the one that must be used in justifying the continued existence of the activity concerned. By capitalizing the canal and its various subdivisions, as recommended, it is believed that many desirable results will obtain, for thereafter not only the canal as a whole but each of its auxiliary activities will be given a measure by which the efficiency of its operations should be determined.

The rates of pay, fixed by law, of not to exceed by 25 per cent the rates paid for similar service in the government service in the United States, will be used for both canal and railroad employees. There are certain rates (notably bases fixed for railroad employees, for building trade rates, and for rates derived from the latter) which are now too high, and for which a new rate should be fixed.

The bases upon which wages are determined shall be gone over carefully and be readjusted along the lines above indicated.

Hereafter no agreement will be entered into which cannot be terminated at any time upon 30 days' notice by the governor when in his judgment considered advisable.

The so-called union rate in the United States shall not necessarily be followed in fixing the wage scales, but the wage scale, when not fixed on a government rate, shall be derived from the wage actually paid for similar services in various representative parts of the United States, whether it be a union rate or a non-union rate.

The employees, whether union or non-union, shall be dealt with openly, through committees or representatives composed of employees, whether representatives of labor organizations or not.

It is the intent to give the employees the right to lay all proper claims or complaints before the governor or the agencies he may constitute for wage or complaint adjustments, through their representatives, and to accord to all employees fair and equitable treatment, whether they be members or non-members of a labor organization.

All steam railroad tracks on the Isthmus shall be transferred to the railroad company and be included in its assets, operation and maintenance.

The tracks put in and owned by the Army, for its own convenience, shall be regarded as industrial tracks, built by the Army for its own convenience, but operated by the rail-

road, the actual cost of maintenance if done by the railroad to be billed against the Army.

About 35 miles of side tracks shall be taken up and salvaged.

One of the bridge and building gangs shall be abolished, the remaining one to be placed in boarding cars if advisable to avoid unnecessary expense.

Section forces shall be immediately furnished with track motor cars.

Many cars of all types in storage at the present time, as well as all other stored equipment which requires other than the lightest repairs, shall immediately be scrapped and salvaged, and equipment in use, reaching the stage of major repairs, shall be retired and scrapped, until the number of cars required for service has been reached.

The motor car shop shall be turned over to the supply department.

All the railroad employees on the Isthmus shall be rated in accordance with the decisions of the United States Railway Labor Board. In case that average earnings of a class in the United States be used in determination of a base rate, additional earnings made for overtime shall not be used in the base to any greater extent than overtime is made on the Isthmus.

There shall be a revision of the passenger service, three trains to be run in each direction each day, and the Saturday and Sunday night passenger service shall be discontinued.

The amount of passenger equipment being used shall be reduced, and the parlor cars carried only on steamer trains.

A revised freight train scheduled, substantially as outlined, shall be installed.

Four of the silver men at the station at Colon, six of the silver men at the station at Panama, and six of the silver men employed by the local freight agent at Panama should be dispensed with.

A rearrangement of the relief service shall be effected enabling the railroad to discontinue one of the relief agents.

The helper employed at Balboa Heights shall also act as porter, thereby eliminating one job.

The crossing watchman at Pedro Miguel shall be taken off, and the crossing protected for trains by one of the two station helpers.

In rearranging the rates for station employees, difference shall be made in the wages paid agents at the larger and more important stations.

Whatever action necessary to authorize the establishment of a warehouse for goods in transit in Cristobal shall be taken.

The indiscriminate use of the pass privilege should be called to the attention of the administration with a view of placing a reasonable restriction upon the issuance of passes, and the practice of giving canal employees and their families monthly passes should be modified.

Serious consideration should be given to the practicability of the operation of the Cristobal and Balboa plants on an eight-hour per day basis, and making the price of coal the same at Balboa as at Cristobal, northbound ships being permitted to transit the canal and coal at the northern terminus (Cristobal), and, likewise, southbound ships proceeding through the canal and coaling at the Pacific terminus (Balboa).

The stables should be contracted or leased out to individuals from whom sufficient rental can be realized to relieve

the management of the railroad completely from stable operations.

The baggage transfer operated in Colon and Panama should be dispensed with as soon as a responsible transfer company undertakes business in either or both of these cities.

## Amendment of Rate Law Urged

WASHINGTON, D. C.

**H**EARINGS before the Senate committee on interstate commerce on the Capper bill to amend the Transportation Act have been continued during the past week. Following the testimony of the state commissioners, the committee allowed a half hour to Benjamin C. Marsh, managing director of the Farmers' National Council, who said the only solution for the transportation problem is the immediate restoration of the railroads to unified government operation. He was shut off rather abruptly after declaring that the committee had suspended its general railroad investigation in July after hearing the representatives of the railroads and of the security owners and had refused to hear other witnesses. Senator Cummins told him he was making untrue statements regarding the reason for the suspension of the hearings and said that the brotherhood witnesses had asked for a postponement of their testimony.

S. W. Cowan, representing the Texas cattle raisers, appeared before the committee on November 3 and made a lengthy argument against the whole theory of the Transportation Act, urging a repeal of the rate-making and labor provisions. He said the act was intended to give the roads a 6 per cent return after having the wages fixed by the Labor Board but that it had failed because it contemplated that the money should be taken from "Jones" and Jones' pocket was not deep enough. He urged a return to the principle that rates shall be just and reasonable for the service performed, while not confiscatory to the railroads. He said the passage of the Esch-Cummins act was the "worst crime ever committed in public." On November 4 Mr. Cowan declined to continue with his statement because there were only four members of the committee present and an adjournment was taken to November 7, when Clifford Thorne was heard.

Mr. Thorne, as counsel for the American Farm Federation, urged that Congress should restore the full powers of the state commissions and should strike from the act those clauses which direct the Interstate Commerce Commission to make rates sufficient to produce any given percentage. Section 15-a, he said, has greatly retarded the readjustment of railroad rates in conformity with the reductions in prices which have been effected in practically all other lines of industry. A proviso in the section may warrant reductions on a few commodities, he said, but many have a grave doubt whether the commission has authority to make general reductions unless the railroads should earn their statutory rate of return and this doubt should be removed by an immediate repeal of the section. He said that during the last 30 years the commission has allowed the railroads to build up a sufficient surplus to tide them over the emergency and that they added to their surplus last year \$129,000,000.

Mr. Cowan completed his statement on November 9 and Alfred P. Thorn, counsel of the Association of Railway Executives, was expected to appear before the committee on November 14.

THE MOBILE & OHIO has opened a passenger and ticket office in the Battle House, at the southeast corner of Royal and St. Francis streets, Mobile, Ala. H. E. Jones is division passenger agent; G. W. King, city ticket agent, and C. W. Smith, assistant ticket agent. The office of the Southeastern Express Company will be at the same place.

## A New Type of Crawling Tractor Crane

**T**HE INDUSTRIAL WORKS, Bay City, Mich., has recently enlarged its line of industrial cranes by the development of a crawling tractor type of machine. As the name implies, this machine is equipped with revolving treads, and as such finds its field of service on railroads in the handling of rail, ties, spikes, lumber, etc., around storage yards and similar locations inaccessible to the railroad type crane or where power equipment capable of operating independently of rails is more to be desired.

This crane has a lifting capacity of 20,000 lb. at a 12-ft radius and can be equipped to handle a hook and block, grab bucket, drag scraper bucket, wood grapple, electric lifting magnet, shovel dipper, or pile driver lead with drop hammer. It is operated by means of an internal combustion engine which is said to have the advantages of constant readiness for immediate use, together with the means it affords of saving fuel and of dispensing with the licensed engineer.

The propelling mechanism is powerful, allowing it to travel up steep grades and over heavy going. The large tractor belts distribute the weight so that it travels with equal facility over

The New "Industrial" Crane

city pavements, ordinary dirt roads and industrial storage yards. These belts allow the crane to pass over railroad tracks and large obstructions, and to propel itself up an inclined skidway onto a flat car on which it may be transported without dismantling further than to remove the boom and the projecting muffler. The overall height of the crane with muffler removed is 12 ft. 6 in. The width over tractor belts is 9 ft. 9½ in. The rear end will slew within a circle of a 9 ft. 6 in. radius from the center of revolution.

The crane beam is a structure 30 ft. long, consisting of two channels latticed with angles and tie plates, and the entire machine is designed to operate in a complete circle. The steering of the crane is controlled from the revolving platform by manipulating friction clutches and brakes which control the motion of each tractor belt. By means of these clutches and brakes either tractor belt may be disconnected from the motor while the other belt continues traveling. Also the tractor belt when disconnected may be held stationary by applying the brake or may be allowed to coast, an arrangement which permits an operator to turn sharply or otherwise as he sees fit. This propelling and steering mechanism enables the operator to propel and steer the crane independently of the machine operation. For this reason work may be performed while it is in motion or stationary. The crane is said to afford a means of handling bulky materials speedily and economically and to afford any combination of slewing and hoisting of loads up to the capacity of the machine.

# General News Department

A fire at Mobile, Ala., on October 26, destroyed 21 cars in the Mobile & Ohio yard. Estimated loss, \$25,000. Sparks from a locomotive are given as the cause.

The House Committee on Interstate and Foreign Commerce is to hold a hearing on Tuesday, November 15, on the bill to strike out of the railroad valuation act the requirement that the Interstate Commerce Commission ascertain and report the cost of acquisition of land in excess of the original cost of present value of the land itself.

## C. M. & St. P. Officers Fined

H. E. Byram, president of the Chicago, Milwaukee & St. Paul and three other officers were fined one hundred dollars on November 8 on each of 25 charges brought by employees who claimed that their wages were docked when they left work in order to vote. The officers were granted sixty days to file a bill of exception and make an appeal. The execution of the fine will be postponed pending the outcome of the appeal.

## Revised Interchange Rules Effective January First

The General Committee of the Mechanical Division, A. R. A., in Circular No. D. V.-219, announces its intention to re-print the Rules of Interchange as revised this year, including recent interpretations, and issue them to go into effect on January 1, 1922. Until then the 1920 rules with supplement No. 1 will continue in effect. The revised rules will be printed and ready for distribution about December 10.

## Hoover Studies Coal Situation

Secretary Hoover of the Department of Commerce is making a survey of coal stocks as of November 1 with the co-operation of the Geological Survey in order that the country may be better informed as to the situation and consumers and producers alike may make intelligent plans. It is hoped to complete the canvass and publish a preliminary report within 30 days; and the survey will probably be repeated from time to time as the situation requires.

## Tentative Valuations

The Interstate Commerce Commission has issued tentative valuations of the property of the following carriers:

	Date	Amount
Angola Transfer Company.....	1917	\$160,000
Augusta Union Station Company....	1916	245,331
Cape Charles.....	1915	143,412
Chesapeake Western.....	1916	758,837
Munsey & Western.....	1916	42,500
Rosslyn Connecting.....	1915	264,245

New York, Philadelphia & Norfolk, 1915, \$10,976,927; Sandy River & Rangeley Lakes, 1916, \$1,359,427; Union Point & White Plains 1916, \$100,500.

## New York Railroad Club Meeting

Howard Elliott, editor-in-chief of the Traffic Club Bulletin, will speak on Passing the Buck—Perhaps the Dividend—at the meeting of the New York Railroad Club in the Engineering Societies building, New York, on Friday evening, November 18. Incidentally, the first clause of the subject refers to the passing of the buck from the railways to the commissions and boards, a procedure authorized by law, which is in part responsible for the passing of the dividend. There is also much buck-passing between officers and employees in matters over which the railways have full and exclusive control, and particularly in the matter of cultivating better relations with the public and with the government.

## American Society for Testing Materials Development

An analysis of the replies to a questionnaire conducted recently by the Executive Committee of the American Society for Testing Materials showed the preference of the membership for Atlantic City as the location and the latter part of June as the date for the annual meeting. The Executive Committee is now endeavoring to carry out the expressed wish of the membership.

A committee has been appointed to conduct an investigation of the physical properties of plain and deformed concrete reinforcement bars, the committee consisting of: E. E. Hughes, Franklin Steel Company; R. L. Humphrey, consulting engineer; A. E. Lindau, Corrugated Bar Company; C. F. W. Rys, Carnegie Steel Company; W. A. Slater, United States Bureau of Standards, and J. J. Yates, bridge engineer, Central Railroad of New Jersey.

As announced recently the United States Department of Commerce has translated and published English-Spanish and English-French editions of some 61 specifications of the society, particularly applicable to export trade, and these are now available for distribution by interested organizations.

## Short Lines Present Compensation Case to I. C. C.

Bird M. Robinson, president, and Ben B. Cain, general counsel, of the American Short Line Railroad Association, presented arguments before the Interstate Commerce Commission on November 4 in opposition to the construction placed on Section 204 of the transportation act by the commission, that the short lines taken over and later relinquished by the government are not entitled to reimbursement for the federal control period unless they sustained an actual deficit during that portion of the control period during which they operated their own railroads. The hearing was called to determine the proper meaning of the use of the word "deficit" in Paragraph A of the section, which was intended to provide for the losses sustained by the short lines by reason of federal control after they had been relinquished. The representatives of the short lines argued that Congress could not have intended by the use of the word "deficit" to limit the reimbursement to those roads which had no net operating income, but that it intended, as indicated in other paragraphs, to pay the carrier the amount of its losses as compared with what it had earned during the test period.

## Plumb Plan Has a Rival

A rival of the Plumb plan for operating the railroads has appeared in the bill introduced in the House of Representatives on November 2, by Speaker Gillett by request of Conrad Reno of Springfield, Mass. It is entitled: "A Bill to Keep the Railroads in Operation" and provides "that the capital and labor engaged in each interstate railroad corporation or system are hereby constituted a capital and labor partnership with limited liability, composed of the stockholders as capital partners and of all of the hand workers and brain workers engaged in the business, except the executive officers, as labor partners." It also provides that the "joint earnings" shall be divided between the labor partners and the capital partners in the ratio of 50 to 50 in the following manner: The labor partners shall receive living wages as the work progresses, as a first charge upon the industry. If the joint earnings for the quarter amount to more than the aggregate of living wages for the same quarter, the capital partners shall be entitled to the excess up to an amount equal to the total living wages as living dividends for the capital partners. If the joint earnings exceed the sum of living wages plus living dividends, the excess or good-will earnings shall be equally divided between the two sets of partners.

The rates of wages fixed by the Railroad Labor Board are declared to be living wages within the meaning of the bill, but the Labor Board would be empowered to fix the rates of living wages without any previous conferences between the parties

themselves. The bill would also direct the Interstate Commerce Commission to lower the rates on all farm products, coal, lumber, building materials and other necessities of life. The chairman of the Interstate Commerce Commission, the chairman of the Railroad Labor Board and a third person to be appointed by the President would constitute a board of examiners to determine the amounts of the joint earnings, the living wages and the living dividends, to regulate the accounts kept by the carriers, and otherwise to exercise a general superintendence over the capital and labor partnerships.

### Disastrous Fire at Weehawken, N. J.

The freight piers of the Erie Railroad, on the Hudson river, at Weehawken, N. J., about a half mile south of the West Shore Railroad passenger terminal, were damaged by fire on November 3 to the extent of about \$2,000,000, the loss including 15 freight cars and great quantities of merchandise

Photo by International

### Fighting the Flames Twelve Hours After Fire Started

in the storehouses and in the cars. Of the seven piers at this place, only three are left standing. The fire started on pier D and this with piers A, B and C was destroyed with its contents; also a four-story brick warehouse. The freight destroyed consisted largely of oil, salt, lumber and flour. Eleven lighters and barges lying close to the piers were damaged, some of them badly.

### House Approves Alaska Railroad Appropriation

The House of Representatives on November 2 passed a bill authorizing an additional appropriation of \$4,000,000 to complete the construction of the Alaska railroad. The original appropriation for the road, based on estimates made before the war, was \$35,000,000. Later an additional appropriation of \$17,000,000 was made to meet the increased costs and the additional authorization would bring the total up to \$56,000,000. An estimate made last December by the Alaskan Engineering Commission was that \$3,110,210 would be required, but before the bill could be passed it was found necessary to increase the figure to \$4,000,000.

The bill was only passed after considerable debate, during which many remarks were made, particularly by those who had opposed the bill for the construction of this road in the first place, regarding the necessity for additional appropriations. Many, however, took the position, that in any event, after \$52,000,000 has been expended the additional appropriation should be made to complete the work.

The \$4,000,000 is to standardize 57 miles of narrow gage road, using 70-pound rail; for the construction of two steel and concrete bridges, for certain additional rolling stock and to complete certain terminals. It is now estimated that the road will be completed some time in 1923. The bill was passed by a vote of 198 to 78.

### Railroad Earnings for September

The net operating income of the Class I railroads for the month of September as reported to the Interstate Commerce Commission was less than that reported for August. Returns for all the Class I roads except the Detroit, Toledo & Ironton, whose report has been delayed, show a net operating income for the month of \$87,174,064. This is an increase of 9.4 per cent as compared with September, 1921, and is on the basis of an annual return of 4.6 per cent. The net operating income for August was \$90,000,000, or at the rate of 5 per cent on the value. The exclusion of the Detroit, Toledo & Ironton does not materially affect the result. Its net operating income for August was only \$70,000.

The total operating revenues of the 200 Class I roads for September was \$497,653,746, a decrease of 19.6 per cent, and the operating expenses were \$377,106,272, a decrease of 26 per cent as compared with September, 1920. A summary of the reports of the 200 roads is as follows:

District	1921	1920	Per cent of increase 1921 over 1920
Total operating revenues:			
Eastern District	\$216,588,515	\$286,366,686	d 24.4
Southern District	72,164,836	89,304,631	d 19.2
Western District	208,504,395	243,256,449	d 14.1
United States	497,653,746	618,927,766	d 19.6
Total operating expenses:			
Eastern District	170,720,518	243,107,204	d 29.8
Southern District	58,385,892	77,576,414	d 24.7
Western District	147,999,862	189,024,996	d 21.7
United States	377,106,272	509,708,614	d 26.0
Net railway operating income:			
Eastern District	31,425,613	28,726,388	9.4
Southern District	10,251,415	9,876,311	3.8
Western District	45,404,036	41,083,822	10.7
United States	87,174,064	79,689,521	9.4

### An Epidemic of Train Robberies

Six daring robberies, were committed on western trunk lines during the three days following November 4. Of the six hold-ups three occurred on the Illinois Central. The most notable robbery occurred on the night of November 7, at Paxton, Ill., on the Illinois Central, 20 miles north of Champaign, when six bandits shot three members of the train crew and one passenger, slugged two other men, dynamited and burned the mail car, and then made their escape. The train was the New Orleans Limited, No. 3, which left Chicago at 6.15 p. m., and the robbery occurred shortly after 9 o'clock. At Paxton, two men boarded the tender, unseen by the train men. Crawling over the tender they ordered the engineman to stop the train with the passenger coaches standing on a bridge. As the train came to a stop four accomplices immediately took charge of the engine crew as they were ordered from the cab. Two of the robbers were refused admittance to the mail car, whereupon they resorted to dynamite and stink bombs, driving the clerks from the car and slugging them as they came out. In the meantime a running battle was taking place between the train crew and two of the bandits standing on a high bank. Gaining admittance to the mail coach, the robbers blew open the safe and immediately gathered up all the registered and first class mail matter they could find and made their escape in a waiting automobile. The robbers injured six of the train crew, one of whom, a Pullman porter, died the next day. The burning of the mail car seems to have disconcerted the robbers, and it is believed that they carried away little property of value; but much may have been destroyed in the burning car.

Of the other robberies which occurred on the Illinois Central, one was the looting of a mail car of pouches containing parcel post and second class mail matter and the other the robbing of a dining car conductor of \$300 and other valuables by two negroes who boarded the dining car of a train from the south as it arrived at the 43rd Street station, Chicago.

The three other robberies occurred on the Oregon Short Line, the Chicago & North Western and the Atchison, Topeka & Santa Fe. In the first, a lone masked bandit held up west-bound passenger train No. 17, near American Falls, Idaho, robbing the passengers in the observation car of \$434 and considerable jewelry. On the Chicago & North Western, a merchandise express car en route between Chicago and Milwaukee, Wis., was entered as the train left Chicago and valuable merchandise was seized. The robbery was not discovered until the train reached Milwaukee. The sixth robbery occurred on an Atchison, Topeka & Santa Fe passenger train near Ottawa Junction, Kan., on November 5, when a masked man looted the mail car of the train,

after compelling one of the mail clerks to bind six of his fellow workers. Eight sacks of mail were split open and the contents rifled, no estimate of the loot having as yet been reported.

### Bureau of Explosives—Quarterly Accident Bulletin

Colonel B. W. Dunn, chief inspector of the Bureau of Explosives, 30 Vesey street, New York City, has issued Accident Bulletin No. 53, dated October 1, and giving various instructive notes concerning accidents in which explosives were involved, occurring on the railroads of the United States within the three months past.

The most prominent item is the report of an explosion of dynamite that occurred on June 14, 1921, which wrecked two locomotives and nine cars and caused an estimated total loss of \$141,625. This item refers, evidently, to the collision of freight trains on the St. Louis-San Francisco, near New Albany, Miss., on the date mentioned, when a northbound and a southbound freight collided, because of misunderstanding of orders on the part of train No. 135. One trainman was killed and three were injured. The accounts published at the time indicated that the explosion was caused by the collision; but Colonel Dunn's bulletin says that the explosion did not occur until about ten minutes after the collision, and that it was due to hot coals from the firebox of one of the locomotives. The explosive was in the car next to the locomotive; 600 cases of gelatin dynamite, 35 per cent. The car was badly splintered and the damaged cases of dynamite, with loose dynamite cartridges, were thrown about on the ground; yet there was no immediate explosion. The underlying cause was the improper position of the car next to the locomotive, the men who were in charge of making up and running the train having neglected four important rules about placarding and inspecting, and placing the car in the train as far from the locomotive as practicable.

The bulletin's summary of items for the quarter contains the following:

Trespassers fared badly in their proximity to tank cars of inflammable liquids. Six men were burned to death in two tank-car derailments that were followed by fire.

Twelve tank car wrecks and derailments involving gasoline and petroleum oils were immediately followed by fire.

Leakage of inflammable liquids from tank car bottom outlet valves occurred in 27 instances.

Lighted lanterns used near tank cars of gasoline caused two fires.

Strike-anywhere matches caused 21 fires. Fortunately, most were of a minor character.

Charcoal shipments caused 10 fires, principally of spontaneous origin due to shippers' violations.

Six persons were injured in connection with the handling of acid shipments.

Four fires occurred in shipments of nitric acid, three of which were in improperly packed express shipments.

## Traffic News

The Canadian Pacific recently sent east from Winnipeg, Man., in a period of 24 hours, 41 train-loads of grain, 1,579 cars.

The Yazoo & Mississippi Valley announces reductions in the freight rate on Louisiana sugar from stations on its line between Baton Rouge and New Orleans to Mobile.

The Baltimore & Ohio has re-opened its Memphis (Tenn.), commercial office, with temporary quarters in the Exchange Building. Louis T. Smith has been appointed district freight representative in charge.

The Erie Railroad has reduced the price of meals in its dining cars. Special combinations are served, breakfast for 60 cents; others for 75 cents and one dollar. For luncheon or dinner, there is a combination for a dollar.

P. C. Sprague, heretofore general freight agent of the Southwestern region of the Pennsylvania, with headquarters at St. Louis, has been appointed manager of the traffic department of M. A. Hanna & Company, Cleveland, Ohio, effective November 15.

The Detroit, Toledo & Ironton filed an application with the Ohio Public Utilities Commission on November 8, seeking to reduce passenger rates by 0.6 cents a mile. The rates would affect both interstate and intrastate traffic and become effective on November 20.

Through freight train service has been established from Chicago to Atlanta, Macon and Albany, Ga., Jacksonville and Tampa, Fla., and to Havana, Cuba, over the Illinois Central, the Nashville, Chattanooga & St. Louis, the Central of Georgia, the Atlantic Coast Line and the Florida East Coast.

The Oklahoma State Agricultural College, in conjunction with the Chicago, Rock Island & Pacific, will conduct an extensive educational campaign for the purpose of increasing the number and improving the quality of poultry, dairy cattle, hogs and sheep. Five meetings are to be held during the week which began on November 7.

The Louisville & Nashville announces reductions in the freight rates on oranges from stations between Venetia and Grand Bay to Ohio river cities beginning November 28. The following reductions will be effective: St. Louis, from 99 to 87½ cents; Cincinnati, from 96 to 84½ cents; Louisville, from 89½ to 78 cents. Other cities in that territory are included in the reduction.

At the annual meeting of the Oklahoma Industrial Traffic League at Oklahoma City, Okla., on October 17, E. N. Adams, secretary and traffic manager of the Tulsa Traffic Association, was elected president and F. J. Wright, assistant to the manager of the Oklahoma City Traffic Association, was elected secretary-treasurer.

Eighty-six box cars, carrying 345 automobiles, together with parts sufficient to build 50 additional machines, were shipped on October 20 from the plant of the Willys-Overland Company, Toledo, Ohio, to Los Angeles, Cal. West of Chicago these cars went over the Chicago, Rock Island & Pacific, the El Paso & Southwestern and the Southern Pacific.

Existing rules governing the furnishing of free transportation for care-takers in charge of live stock returning to their starting point after having accompanied stock to its destination, will be revised by the Southern Pacific, beginning with January, 1922, so as to permit the drovers to remain five days at the market points before returning, instead of only 72 hours as at present.

An informal conference was held before Traffic Director Hardie of the Interstate Commerce Commission at Washington on November 7, between representatives of the railroads and of iron and steel shippers, at which representatives of the blast furnaces in the Buffalo district urged a reduction in the rates on coal and coke to their furnaces to meet the advantage of their com-

petitors, the inland furnaces, by the reduction in the rates on ex-lake iron ore. The reduction in coal and coke rates was urged on the ground that it was necessary to equalize the assembling costs of the competing furnaces.

The privilege of stopping over at Philadelphia, recently restored by the Pennsylvania and the Baltimore & Ohio, in connection with tickets for passage through that city (after suspension during the period of the war), has resulted already in a marked increase in the business of that city, more than 10,000 visitors having stopped off there. This information is given out by the Chamber of Commerce, based in part on data received from the railroad companies.

Steamers operating on the Sacramento and San Joaquin rivers, were authorized by the Railroad Commission of the state of California, on November 1, to make immediate reductions in rates on many commodities including beans, flour, grain, rice and hay. The reductions range from 27½ cents to \$1 a ton and follow the suggestion made by the commission in its decision of October 6, stipulating that the carriers make a voluntary reduction of 20 per cent on the chief commodities handled. The present reductions do not carry out the recommendations of the commission fully but it is expected that lower rates will be extended to other articles to meet economic conditions.

The Senate on November 4, rejected an amendment to the tax bill proposed by Senator McKellar, of Tennessee, to require railroads to issue interchangeable 2,000-mile mileage books at the rate of 2½ cents a mile. The senator contended that this was germane to the bill because he added it to the section relating to the transportation tax on mileage books. There was some debate, during which several senators expressed their belief that the railroads should issue mileage books at a reduced rate, but they objected to the consideration of the subject as a part of the tax bill; and there were also objections by Senator Cummins, Senator Pomerene and others to Congress definitely fixing the rate.

At the annual election of the Traffic Club of Wichita, Kan., held on October 6, the following officers were elected: president, J. H. Wilcox, traffic manager, Johnston-Larimer D. G. Company; first vice-president, F. E. Walling, district freight and passenger agent of the Missouri Pacific; second vice-president, George R. Graves, traffic manager of the Dold Packing Company; directors, G. P. Nissen, traffic manager Sterling Oil & Refining Company, C. M. Morrison, traffic manager, Arkansas Valley Interurban Ry., H. L. Reynolds, traffic manager, White Eagle Oil & Refining Company; secretary H. G. Watts, Wichita Freight Audit Company; treasurer, F. L. Partridge, traffic manager Otto Weiss Milling Company.

A special communication has been sent to more than 3,000 employees of the Chicago, Rock Island & Pacific, directly interested in the handling of l. c. l. freight, by T. H. Beacom, vice-president and general manager of the road, urging each employee to suggest to the management better and more economical methods of handling this kind of freight. Mr. Beacom points out that a saving of only 5 cents a ton on this traffic will be of material benefit to the railroad, saying: "The man who can quickly find and then practice the most efficient way of doing a thing is invaluable to the railroad and his good work will be recognized. Find a quicker and better way to handle the freight than you have in the past or better than the other fellow is doing now."

At the annual meeting of the Traffic Club of St. Louis, Mo., the following officers were elected: president, S. S. Butler, freight traffic manager, St. Louis-San Francisco; secretary, Sherman E. Wilson, assistant traffic manager, W. C. Ferguson Lumber Company; treasurer, George S. Siddons, general western agent, Atlanta, Birmingham & Atlantic; vice-presidents, John C. Iselin, traffic manager, The Blackmer Post Pipe Company; O. Van Brunt, traffic manager, Certainated Products Corporation; C. W. Clarke, general agent, Erie; B. H. Dally, assistant general freight agent, Pennsylvania, and H. C. Mitchell, treasurer, Bolz Cooperage Corporation. Board of directors for two years: A. F. Versen, J. L. Power, E. W. Shrimpf, C. P. Bowsher, and A. L. Browne. The new officers will be installed at a meeting to be held on December 6.

## Coal Production

Coal produced decreased slightly during the week ended October 29, after having shown a large increase during the previous week, which was attributed to apprehension of a railroad strike. The output for the week was 10,951,000 tons, a decrease of 107,000 tons, as compared with the previous week. The daily loading reports show that the production started downward even before the news that the strike had been averted was definitely received. Production began to slacken on Tuesday and Wednesday instead of keeping up late into the week as it had done before and the strike was called off late on Thursday. The decline apparently continued into the first of the week ending November 5.

## Annual Meeting of National Industrial Traffic League

The National Industrial Traffic League opened its two-day annual meeting at the Hotel Sherman, Chicago, on November 9, with a registration of approximately 450 members and guests. After J. H. Beek, executive secretary of the League, had reviewed the work of the executive committee, work was started on the general docket of the business session. At the start of the afternoon session on Wednesday all of the general officers, with the exception of a few regional vice-presidents, were re-elected for the ensuing year. The report of the special committee on legislation was discussed on Thursday morning and will be submitted to Congress in the form of constructive suggestions. The suggestion for a three-dollar flat rate for demurrage was tabled.

## Perfect Package Month

The Buffalo, Rochester & Pittsburgh, announcing to shippers the plans for "Perfect Package Month" emphasizes especially the importance of full and correct marking and billing. Its circular says:

A "Perfect Package" may not reach destination unless the billing thereof is likewise perfect, and this applies to the billing department of the shipper as well as to that of the carrier. Illegible billing usually results from speed; speed usually results in abbreviations; abbreviations usually end in trouble. Shipping clerks can hardly be blamed for having impressed on their minds the trade name of the article they are handling, but it is very difficult for the railroad man in checking such freight. A case of "Fairy" may mean a box of soap to one railroad man and almost anything to another. If it is soap, bill it so. Show street address at all times. Show initials of destination road if certain delivery is required. Show "FROM" or "MANUFACTURED BY" preceding shipper's name and address. Name and address of shipper and that of consignee on inside of package will insure delivery in case outer markings become obliterated or removed. Use marking pot and brush for packages having uneven surfaces. *Do Your Best; the Carriers Will Do the Rest!*

## Chicago Shippers' Conference

At the annual meeting of the Chicago Shippers' Conference Association, held at Chicago on the afternoon of November 2, J. J. Wait, retiring president of the association, opened the conference with a review of the work accomplished by the several committees of the association. He told of the work of the express committee in trying to obtain the adoption of a uniform express receipt, and of the legislation committee which has been working for the railroad passage of the funding bill in Congress, also giving attention to the work of the legislature of the state of Illinois. Other committees reviewed were the rate committee and the service committee. The switching committee, Mr. Wait said, had discovered a movement on the part of some of the carriers to require \$50 per car minimum revenue before allowing any switching absorption and to apply plus rates to goods delivered within the Chicago switching district.

The principal speaker of the conference was H. R. Kurrie, president of the Chicago, Indianapolis & Louisville, who spoke on "The Present Railroad Situation." Mr. Kurrie said that in his belief the solution of the wage problem on the roads would be the education of the employees to see the needs of the carriers, that is, the relation between income and outgo, and realize it to the extent of co-operation. "Shippers," he said, "have come to a clearer understanding that the railroads are merely industries like their own and they have helped in the emergency by putting

the carriers on their feet." Continuing, he said, "As I view it, it is largely up to the shipper, the user of transportation, whether he wants service or lower freight rates. He can't have both. The reduced revenues with continued high operating costs have put the railroads in a situation where they cannot stand the loss of revenue which would follow a general reduction in freight rates. I think that as a result of the recent strike order, the men have more thoroughly calculated their situation in the light of other industries around them and I think that after taking stock of their particular situation, they are persuaded that the reduction was justified and that they are in a frame of mind more disposed to listen to reason than they have been since before federal control."

The following officers were elected by the association for the ensuing year: president, J. A. Brough, traffic manager, Crane Company; vice-president, Robert C. Ross, general traffic manager, Joseph T. Ryerson & Sons; secretary, W. M. Lahl, traffic manager, American Seating Company; treasurer, J. A. Ronan, traffic manager, American Meat Packers Supply Company. The following were elected directors for three years: J. J. Wait, manager traffic department, Hibbard Spencer, Bartlett & Company, and E. L. Dalton, traffic manager, American Radiator Company.

### Further Reduction in Livestock Rates Asked

The Interstate Commerce Commission heard oral arguments at Washington on November 8 on the application of the American Farm Bureau Federation and other agricultural interests for a reopening of the case in which the Interstate Commerce Commission recently recommended to the railroads a 20 per cent reduction in livestock rates on the western roads, applicable to the longer hauls where the rates exceed 50 cents. The application seeks a like reduction on the shorter hauls and, whereas the railroads put into effect the rates recommended by the commission with the understanding that the reduction remain in effect only until January 1, the shippers desire the reduction made permanent. Clifford Thorne, who appeared for the Farm Bureau Federation, said that the former reduction aggregated approximately \$10,000,000 a year and if the additional application is granted it will mean an additional reduction of approximately \$24,000,000 a year. He made much of the point that the prices of agricultural products have come down and argued that there was no reason for protecting the railroads against reductions in their revenues. He said the reduction in rates exceeding 50 cents has no significance to the states of Illinois or Iowa and has very little significance to the entire states of Nebraska or Kansas, he said. He also said that as the rates were increased on a percentage basis, they should be decreased on a percentage basis so that the same percentage should apply to all the rates. He called attention to a publicity bulletin issued by the railroads listing a large number of reductions in rates in the eastern territory and asked why it was not as important to reduce the western livestock rates. In reply to the suggestion that Mr. Thorne was now advocating the policy of making the rates in accordance with what the traffic will bear, he said the commission has always considered this principle in classification cases in which the rate is made to depend in part on the value and also in other cases.

S. H. Cowan, representing the Texas cattle raisers, said that 75 per cent of the livestock men in the country are "broke."

Kenneth F. Burgess, general solicitor of the Chicago, Burlington & Quincy, presented the argument for the railroads, opposing any further reduction in the livestock rates. He said that in the presentation of the original case the railroads thought they had proved beyond a doubt that if there was any traffic on which a reduction in rates was not justified by transportation conditions it was livestock. The commission, however, recommended a reduction on account of economic conditions and the needs of the agricultural industry, and he thought that if the commission intended to take so many million dollars from the railroads to give to the farmers they had chosen the proper rates on which to make the reduction when they selected the long haul rates, but now the shippers ask for further reductions on the same record and without any new testimony. The commission, he said,

has gone so far as it is proper to go, whether from a transportation or an economic standpoint. Mr. Burgess also contended that any possible reduction in the short haul livestock rates would not be of material benefit to the livestock industry because to carry livestock free from Missouri river points to Chicago would make a difference of less than one-half a cent per pound in the wholesale price. The average freight rate on livestock in the western district, he said, is less than \$60 a car, while the average value of a carload at the market is \$1,500 or more.

He said that the livestock industry is suffering from the curtailment of foreign credits and a decrease in meat eating in the United States, neither of which can be relieved by reducing freight rates. On the other hand, a freight rate reduction will further curtail the buying power of the railroads and add to a further stoppage of industry. He said that during the first nine months of 1921 the western railroads were forced to reduce their expenditures for maintenance by \$183,000,000 and that during these nine months their net operating income was \$188,000,000, or \$156,000,000 below the amount expected to be earned under the rates fixed by the commission. Mr. Burgess said that the railroads are facing a serious situation and are obliged to oppose any extensive reductions in rates. They have made many reductions where conditions justified it and they are trying to go on and do the best they can without doing any serious injustice to anyone.

### Reductions in Transcontinental Rates

Transcontinental carriers, following conferences of traffic officers at Chicago, stated on November 3, that freight rate reductions ranging from 20 to 50 per cent on shipments from Chicago to the Pacific Coast, would become effective as soon as tariffs can be printed. Action of a similar nature by roads east of Chicago is predicted in the near future. The proposed rate cuts require but a few formal actions and approvals and the tariffs are expected to become effective in the order of their release. R. B. Robertson, assistant freight traffic manager of the Union Pacific, has prepared the following tabulation of changes to be made in transcontinental east and west bound rates per 100 lb. between Chicago and points taking the same rates and north and south coast and intermediate points which are being recommended by the carriers:

TO THE PACIFIC COAST		
	Present	Proposed
Glucose, etc.	\$1.50	\$1.30
Mach., taking class "A"	2.95 1/2	2.53
Hardwood lumber	1.06 1/4	.80
Dowel pins	1.92	1.58 1/4
10re froth	3.08	2.50
Fire fighting apparatus	5.00	4.16
Paper filler	1.83 1/4	1.08
Cereal, beverages non-intoxicating, etc.	1.85 1/2	1.50
Lime, phosphate of	2.25 1/2	1.82
Talc, to California only	1.50	1.25
Pianos, organs, etc.	3.83 1/2	3.58
Automobile wreking trucks, California	2.66 1/2	2.75 1/2
Intermediate	5.66 1/2	2.38 1/2
Lard in tank cars	2.42	2.33 1/2
Wooden kegs	2.75 1/2	2.55 1/2
*Blacksmithing coal	16.20	12.50
Counters, heels, soles or taps, etc.	3.56 1/4	2.33 1/2
Paper cups, dishes, etc.	2.33 1/2	2.5
Malted milk	2.50	2.25
Cyanamid	2.92	1.16 1/4
Fertilizer	.86 1/2	1.04 1/4
Oyster, clam shells, etc.	.62	.75
Cash registers	4.08 1/4	3.63 1/4
Motor truck seat cabs	2.95 1/2	2.66 1/4
FROM PACIFIC COAST		
Fruit syrup and juices	1.83 1/4	\$1.42
Pickled herring	1.42	.35
Chocolate creams	4.38 1/4	3.58 1/4
Honey, strained	1.55 1/4	1.35
Honey, comb	1.35 1/4	1.25
Feldspar (cents tons)	58.40	12.50
Plugs (wooden), etc.	2.95 1/2	1.0
Sugar coated peanuts	4.08 1/4	2.86 1/4
Empty ammonia cylinders	1.83 1/2	1.78 1/2
Lumber for sound boards for pianos	1.00	.90
Sugar	1.53	1.00
Wooden crates	5.00	4.16 1/4
Trailers	1.92	.75
Cabin stock	1.83 1/2	1.05
Stone, natural taking class "C" or "D"	1.25 1/2	.65
Fruit, vegetables waste	1.48 1/4	.90
Cement, oxy-chloride or sord.		

\*Per net ton. \$60.00 minimum, \$1.05.

†To McMill, Nevada.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until March 1, the operation of schedules which provide increases and reductions in rates on lumber from Morehead, Ky., to eastern cities and interior eastern points, all rail.

The commission has further suspended until December 17, the operation of certain schedules published in supplements to Atchison, Topeka & Santa Fe tariffs which propose increased freight rates between El Paso, Texas, and stations in New Mexico and Arizona.

The commission has further suspended until December 12, the operation of certain schedules which propose to reduce the free time allowance for unloading certain carload traffic destined to go by water from California ports, originating in California, from five days to 48 hours.

The commission has suspended until March 1, the operation of certain schedules which propose reductions in the proportional all rail, rail-lake and rail, and rail-lake and canal rates on grain from Minneapolis, St. Paul, etc., to Eastern Seaboard and interior eastern points.

The commission has suspended until March 1 the operation of certain paragraphs published in a supplement to the American Railway Express Company's tariff which require that when a shipper requests goods stopped in transit he shall execute an agreement to indemnify the carrier.

The commission has further suspended until December 12, the operation of certain schedules published in a Chicago & Eastern Illinois tariff which propose to increase switching rates between junctions with connecting lines and team tracks at stations between Dolton & Chicago, inclusive.

The commission has further suspended until December 30, the operation of certain schedules published in a Michigan Central tariff which propose to increase from \$3.40 to \$4.06 per net ton the rates on sand and gravel from Michigan City, Ind., to Blairsville, Connellsville and other points in Pennsylvania.

The commission has suspended until March 27, the operation of certain schedules published in a supplement to a Missouri, Kansas & Texas tariff which propose reductions of 28½ cents a ton on bituminous coal from mines in Missouri, Kansas, Arkansas and Oklahoma to Kansas City, Mo., and contiguous points.

The commission has further suspended until December 27, the operation of schedules which provide for the cancellation of the existing commodity rates on woolen yarn from Skowhegan, Maine, to Boston, North Andover and Lawrence, Mass., and other points in New England and Trunk Line territory, leaving class rates applicable instead by an order previously entered.

The Kansas Utilities Commission and a number of other western state commissions have filed petitions with the Interstate Commerce Commission asking it to reopen and amend its orders in the intrastate rate cases to authorize the reduction of intrastate freight rates on grain, grain products and hay to correspond with the reductions prescribed by the commission in the interstate grain rate case.

The commission has further suspended until January 7, 1922, the operation of certain schedules published in Agent W. J. Kelly's Exception to the Official Classification which propose to change the rules applicable at primary markets in central and trunk line territories governing the substitution of single-deck cars for double-deck cars ordered by shippers for loading with hogs to provide that if more than 20 double-deck live stock cars are ordered, sufficient number of single-deck cars will be furnished to take care of the stock that could be loaded in the double-deck cars ordered, the operation of which was suspended until December 8, 1921, by an order previously entered.

The commission has suspended until March 8, the operation of certain schedules published in a Wabash tariff which proposes to make a rate of 98 cents a ton on sand and gravel from Wolcottville, Ind., to Chicago, for Wabash Ry., deliveries only, 126 cents for delivery to industries on connecting lines, and 140 cents for delivery on team tracks of connecting lines, in lieu of the existing rate of 112 cents a ton, now indicated as applicable to Wabash deliveries only.

A petition has been filed with the Interstate Commerce Commission by the Southern Pine Association, the Georgia-Florida Saw Mill Association and the North Carolina Pine Association, asking that in any action which may at this time or in the immediate future be taken by the commission as to the reduction of freight rates on so-called basic commodities the rates on lumber originating in the territory represented by the petitioners be given consideration.

### State Commissions

The Wisconsin Railroad Commission has ordered a hearing to determine whether or not freight rates on coal within the state are excessive.

The Bingham & Garfield on October 30 filed an application with the Public Utilities Commission of the State of Utah seeking permission to discontinue passenger service on its lines, asserting that it is operating one coach over its line daily at a loss of \$1,000 a month. The copper mines in the Bingham district are not expected to resume operations for several months.

The Corporation Commission of Oklahoma on October 20, 1921, authorized the carriers in that state to re-establish the increase in rates, with certain modifications, which was granted by the Interstate Commerce Commission on July 29, 1921. The state commission on June 7, 1921, had withdrawn its permission for the carriers to maintain the increase in rates, feeling that the rates were a discrimination against the state of Oklahoma and its shippers.

The first general order regarding milling in transit in the state of California was made by the State Railroad Commission of that state on October 29, following an investigation of the subject on the commission's own motion. Under the decision a mileage scale of 100 miles for out-of-line haul with graduated rates is established as follows: 45 miles and under, 2 cents per 100 lb.; over 45 under 60 miles, 3 cents; 60 to 80 miles, 4 cents; 80 to 100 miles, 5 cents. Prior to federal control the carriers opposed the milling in transit privilege in California, but recently the railroads voluntarily granted these privileges at out-of-line points to South Vallejo, Colusa, Stockton and Los Angeles. The commission held that the transit privilege is a service that the carrier may establish voluntarily but when once established the commission has jurisdiction to prevent discrimination.

### Court News

#### Grant of Easement Held to Include

##### Railroad's Successors and Assigns

The California Supreme Court holds that the provision, in a grant of an easement for railroad purposes, "so long as the said company shall actually maintain, use and operate its road upon the premises aforesaid, but not longer," means so long as the company, its successors and assigns, shall operate its road upon the premises. — *Northwestern Pacific v. Humboldt Milling Co.* (Cal.) 200 Pac. 9.

#### Shipper's Contract to Feed and Care for Stock

##### Defense to Action for Lost Stock

In an action for damages, claimed to have resulted from the railroad's negligence in leaving open the gates of its feed lots at Shoshone and permitting plaintiff's sheep to escape and be lost, the Idaho Supreme Court holds that the following contract was a sufficient defense: "The shipper will, at his own risk and expense, load, unload, care for, feed and water the stock until delivery of same to consignee at destination, and will furnish to go with the stock for that purpose one or more attendants." — *Crabill v. Oregon Short Line* (Idaho) 200 Pac. 121.

## Foreign Railway News

### Rates Increased in Germany

LONDON.

The German Minister of Transport announces a 30 per cent increase in railway rates to be applied on November 1 to merchandise and on December 1 to passengers.

### Jugoslavia to Build Railways

Bids have been called for by the ministry of communications of the Kingdom of the Serbs, Croats, and Slovenes for the construction of five short railway lines to link up existing roads in that kingdom, for which purpose an internal loan of 500,000,000 dinars (roughly, \$2,000,000) has been floated, according to Commerce reports. Three of these projects are for narrow-gage lines and two for standard gage, and the total length is 94 miles.

### Reduced Freight Rates in Great Britain

LONDON.

The railways of Great Britain have decided to assist the iron and steel industry of Great Britain by granting a temporary reduction in rates for raw materials used in the iron making trade. It is reported that the reduction amounts to 25 per cent on iron-ore and limestone, coke rates being left untouched. It is, apparently, a well accepted fact in England that freight rates must come down before industry can progress.

### Nigerian Railways Need Cars and Locomotives

LONDON.

In the Times' (London) Trade Supplement, E. M. Bland, general manager of the Nigerian Railways, in his administration report for 1920, calls attention to the fact that the railways are under-equipped in both locomotives and freight cars. Orders were placed with an English locomotive builder for 42 locomotives in May, 1919, but in May of this year, only five had been received. The builders have charged this default on their part to labor troubles.

### Japan's Railways

The program for Japan's government railways calls for an expenditure of \$278,000,000 for new construction and \$432,500,000 for improvements during the next ten years, according to the British Board of Trade Journal. During the past year some 200 miles of new line were built and during the present fiscal year it is estimated that an additional 260 miles will be built.

On January 1 of this year freight rates were increased by 28 per cent. The gross revenue for the fiscal year 1920 totaled some \$102,500,000 from passenger traffic and \$66,000,000 from freight traffic. Privately owned railways have increased greatly. In June of this year 2,021 miles were in operation, while the government has granted permits for the construction of some 3,000 miles.

### Proposed That Italy Take German

#### Indemnity in Railway Electrification Material

Reports forwarded by Assistant Commercial Attaché Osborne, of Rome, and made public in Commerce Reports indicate that the director general of the Italian State Railways is suggesting that the government have the reparations account settled in part by requiring the Germans to hand over material which could be used in electrifying government railways. The office of the auditor general is said to oppose this means of settlement and to consider it preferable to have the adjustment of reparations made on a strictly money basis.

The reports state that plans have been completed for the electrification of the Bologna-Verona-Brenner, Pisa-Leghorn, and Venezia Giulia lines, as well as for a shortened route between Rome and Naples. Studies are being made for the possible electrification of the Naples-Reggio, Calabria, and Paola Cosenza lines.

In order to carry out this extensive program the director of railways is negotiating with the ministry of the treasury in order to obtain the necessary funds. According to information just received from Commercial Attaché H. C. MacLean, of Rome, the Official Gazette of October 1 published law decree Number 1298, whereby the state railways administration is authorized to expend the sum of 160,000,000 lire (about \$6,400,000 at present exchange) for the purchase of 120 electric locomotives.

### Exports of Car Wheels and Axles in September

In August the value of exports of these materials was \$255,752. In September this figure slumped to \$90,575. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Dollars	Countries	Dollars
Canada .....	51,842	China .....	6,329
Costa Rica .....	553	Chosen .....	3,390
Honduras .....	318	Japan .....	13,744
Mexico .....	2,869	Australia .....	586
Jamaica .....	40	Philippine Islands .....	7,114
Cuba .....	3,044		
Argentina .....	320	Total .....	90,575
Colombia .....	426		

### Exports of Steam Locomotives in September

Thirty-six steam locomotives valued at \$1,493,050 were exported from this country in September, as compared with 66, valued at \$2,334,737, in August. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Canada .....	1	4,500
Mexico .....	19	793,250
Argentina .....	2	108,400
Colombia .....	2	74,000
Peru .....	1	30,900
China .....	11	482,000
Total .....	36	1,493,050

### Service Resumed on Hedjaz Railway

Announcement has been made of the reopening of service on the Hedjaz Railway between Haifa, an important port on the Mediterranean, and Amman, the capital of Transjordan, 162 miles distant, according to Consul A. E. Southard, Jerusalem. Trains are now running for the first time since the beginning of the war. The reopened line passes through an important grain-producing territory, and will open up a profitable market for goods of foreign manufacture, particularly agricultural hardware and textiles. Haifa itself, besides being a port of call, is the terminus of five railways, and is being considered as the terminus of a proposed oil pipe line from Mesopotamia.

### New South Wales Railways

#### Overburdened by Unfinished Lines

The railways of New South Wales, Australia, according to the Times' (London) Trade Supplement, suffered a deficit of some \$2,600,000 last year. Practically all of this deficit can be charged to interest on capital sunk in additions and betterments, which have not yet been brought into use and are, consequently, not bringing in any revenue. It is estimated that about \$15,000,000 will have to be spent in order to complete these projects already begun and, as a matter of fact, the expenditure of about half of this sum is contemplated at an early date. Large orders for rails, bridge steel and other construction materials can, therefore, be expected soon.

### English Road's New "Articulated" Train

The Great Northern (England) has recently placed an "articulated" train in its London-Leeds service, according to the Railway Gazette (London). The train consists of five cars. At the head end of the first car there is a truck as well as at the rear end of the last car. Each remaining truck is so placed as to carry the weight of the ends of two cars and only one truck is provided at such places. Consequently the cars are carried on six four-wheel trucks and the train is really railway more than a long car in five movable segments which can run

be uncoupled. Additional cars can be added at the head or rear ends in the usual fashion.

The advantages claimed for this style of construction are: easy riding because of practically complete avoidance of oscillation; considerable reduction in weight; permanent connections between cars can be made weatherproof; absence of noise and clatter of ordinary couplings.

This is not the first articulated train on the Great Northern, it is said, but it is the newest and best equipped. The middle "car" of this train is a kitchen car, with a dining car at either end of it. The head and rear cars are coaches.

## Germany Considering Denationalization of Railways

LONDON.

Brig.-General Sir Henry W. Thornton, general manager of the Great Eastern Railway, has recently returned from a trip to Germany and brings the information that whereas the Germans found it possible to operate the railways economically as a nationalized system under the monarchy, it has been found impossible under the present form of government to approach anywhere near the satisfactory results previously obtained. Serious consideration is therefore being given to turning the railways over to private interests for operation. Various press dispatches have indicated the likelihood of Hugo Stinnes, Germany's great industrial magnate, taking over the entire railway system.

## August Car Exports

In August freight car exports totaled 360, valued at \$470,001, showing a decline from the July total. The totals by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Passenger		Freight and other		Parts of
	Number		Number		
France .....	.....		.....		\$350
Germany .....	.....		.....		348
Spain .....	.....		.....		1,100

Total .....	5	\$24,522	360	\$470,001	\$358,495

## British Roads in Argentina

### Have An Unsatisfactory Year

The Railway Gazette (London) has published in one of its recent issues editorial reviews of the operations of four British railway companies doing business in Argentina for the fiscal year ended June 30, 1921. The result on none of them was highly satisfactory.

Of the Buenos Ayres Great Southern and the Buenos Ayres Western it was said that the year was the most unsatisfactory in the history of the companies. The former company was forced to draw some \$2,500,000 from reserve to pay its 4 per cent dividends on its common stock and the latter drew approximately \$2,000,000 for the same purpose. Gross receipts of both companies fell off compared with the previous year while expenses such as fuel, taxes and wages increased. The operating ratio of the former company was 84.3 and of the latter company 90.8.

The Buenos Ayres & Pacific earned only enough to pay operating expenses, fixed charges, 5 per cent on its first preferred stock

and some \$125,000 for reserve. For the previous year earnings were sufficient to pay all these charges and 5 per cent on the common stock as well. The operating ratio was 85.7.

The Central Argentina fared somewhat better. Its gross receipts were practically the same as the previous year. Expenses, however, such as labor and fuel, mounted. Net earnings were 38 per cent less than those of the previous year. Dividends on the consolidated common stock were reduced from 6 per cent to 4 per cent and holders of deferred common shares who last year received 6 per cent of this year received nothing.

## English Railway Union's Finances

LONDON.

The National Union of Railwaymen of Great Britain is suffering a loss in membership and heavy drains on its capital according to a report published in the Railway Review, the official organ of that union. Before the war the society was able to meet its obligations mainly out of the interest from its invested capital. At the present time its capital has been reduced by £262,000 (\$1,310,000) from £1,221,000 (\$6,105,000) to £958,000 (\$4,790,000). In donation benefit alone no less than £481,000 (\$2,405,000) was paid out between February 1 and September 1 of the present year. "Unless we do something now to meet the exceptional strain upon our finances," says the report, "another couple of years will find us heading for bankruptcy."

## Canadian Tank Cars for Soviet Russia

Five hundred tank cars built in Canada will immediately be placed on Canadian steamers for transportation to Novorossiisk, a Russian port on the Black Sea, according to a report from Consul Felix S. S. Johnson, at Kingston, Ontario. Four of the largest Canadian government freighters will be employed to carry the cars to Russia, and it is expected that the final shipment will be made before the close of navigation.

The contract for the manufacture of the tank cars was

Photo by Kadel & Herbert

## Canadian Tank Cars Being Loaded for Shipment to Soviet Russia

secured through the Soviet Trade Commission, London, at a price of \$2,000,000. The cars, which are being built to the Russian gage of 5 feet, will be used in Russia's extensive oil fields. A technical expert representing the Soviet government is now in Canada testing the completed cars, and as these are approved they are placed on board the two government ships which will carry the first shipment to Russia. The remainder of the cars will follow aboard two other government vessels before the close of navigation.

THE SELF-CONFESED WRECKER of the Grand Trunk passenger train near Lapeer, Mich., on October 29, who gave the name of Henry W. Gates, 59 years old, of Huntington, Ind., was sentenced to life imprisonment on November 3.

## Equipment and Supplies

### Burlington Authorizes Equipment

The Chicago, Burlington & Quincy, on November 7, authorized the expenditure of \$15,000,000 for the purchase of 7,000 freight cars, 55 heavy freight and passenger locomotives and 127 all-steel passenger cars, to be used on the three lines operated by the company.

### Locomotives

THE SEWELL VALLEY is inquiring for 1 Mikado type locomotive, to weigh about 120 tons.

THE CUMBERLAND & MANCHESTER has ordered 2 locomotives, from the American Locomotive Company.

THE SOUTHERN PACIFIC has ordered 50 Santa Fe type locomotives from the Baldwin Locomotive Works.

THE ALABAMA, TENNESSEE & NORTHERN has ordered two 2-8-0 type locomotives from the Lima Locomotive Works, Inc.

R. C. HARRIS, commissioner of works, Toronto, Ont., will receive bids until 12 o'clock, noon, November 15, for 3 locomotives.

THE YEUN HAN RAILWAY (China) reported in the *Railway Age* of October 22, as expecting to order 2 Mogul type locomotives through Mitsui & Co., New York, has ordered these locomotives from the American Locomotive Company.

### Freight Cars

THE LONG ISLAND is inquiring for prices on 10 caboose cars.

THE DIERKS LUMBER & COAL COMPANY, De Queen, Ark., is inquiring for 10 flat cars.

THE H. C. FRICK COKE COMPANY, Pittsburgh, Pa., is asking for repairs on 1,200 hopper cars.

THE WARASHI is asking for prices on the repair of 500, 50-ton all steel drop bottom gondola cars.

THE LIVE POULTRY TRANSIT COMPANY, Chicago, is inquiring for prices on from 100 to 300 poultry cars.

THE ERIE will have repairs made to 100 50-ton steel coal cars at the shops of the Pennsylvania Tank Car Company.

R. C. HARRIS, Commissioner of Works, Toronto, Ont., will receive bids until 12 o'clock noon, November 15, for 20 dump cars.

THE BENGAL & NORTH WESTERN (India) is inquiring for prices through the car builders on 250, 4-wheel, covered goods wagons.

THE CHICAGO & ALTON has awarded a contract for the repair of 200 gondola cars to the Mount Vernon Car Company, Mt. Vernon, Ill.

THE ATCHISON, TOPEKA & SANTA FE has awarded a contract for the conversion of 50 box cars into cabooses to the American Car & Foundry Company.

THE CHESAPEAKE & OHIO is inquiring for 500 70-ton hopper cars and 500 50-ton hopper cars, and is also asking figures on the repair of 1,000 hopper cars.

THE ATCHISON, TOPEKA & SANTA FE has awarded a contract for 1,250 refrigerator cars to the American Car & Foundry Company and 1,250 of the same type to the Haskell & Barker Car Company.

THE ILLINOIS CENTRAL, in addition to the inquiry for 2,000 gondola cars, noted in the *Railway Age* of November 5 (page 911),

has under consideration a possible inquiry for 500 convertible cars and 500 flat cars.

THE ILLINOIS CENTRAL has awarded a contract for 350 40-ton refrigerator cars to the General American Tank Car Company and for 650 of the same type to the Haskell & Barker Car Company, inquiry for which was reported in the *Railway Age* of October 29 (page 854). Delivery is to be started by February 1, 1922, and is to be completed not later than March 10, 1922.

### Passenger Cars

THE SALT LAKE, GARFIELD & WESTERN is inquiring for from 10 to 12 passenger coaches.

THE MISSOURI, KANSAS & TEXAS is inquiring for 20 passenger cars and 10 baggage cars.

### Iron and Steel

THE CHICAGO & ALTON has ordered 10,000 tons of rail from the Illinois Steel Company.

THE CHICAGO, BURLINGTON & QUINCY has awarded a contract for girder I-beam spans for bridges at Wichita Falls, Tex., and Denver, Colo., aggregating 126 tons, to the American Bridge Company.

### Miscellaneous

THE GREAT NORTHERN has ordered 30 complete steel dining car underframes from the Commonwealth Steel Company, St. Louis, Mo., which inquiry was reported in the *Railway Age* of October 8 (p. 695).

THE GREAT NORTHERN is inquiring for 1, 40-ton steam locomotive crane mounted upon a 24 ft. car having telescopic outrigger system and equipped with 40 ft. radius straight boom, pile driver truss and leaders, special horizontal fire box type boiler double acting steam hammer, and 2,750 lb. drop hammer.

### Railway Construction

ALASKA ANTHRACITE RAILROAD.—This company has asked for permission to extend its main line from its present terminus on Canyon Creek to a point 1¼ miles in a northeasterly direction, now designated by the Alaska Pacific Coal Company as a loading point.

ATCHISON, TOPEKA & SANTA FE.—This company has awarded a contract to Jerome Moss, Chicago, for alterations and repairs to its grain elevators at Chicago.

BELT RAILROAD (INDIANAPOLIS).—This company, in conjunction with the city of Indianapolis, contemplates elevating its tracks from the White river on the northwest side of that city to Michigan street, on the east side of the city.

CANADIAN NATIONAL.—This company contemplates the construction of the tracks of the Canadian National and the Grand Trunk Pacific on a common level entering Edmonton, Alta. If this work is undertaken, the Grand Trunk's tracks are to be lowered 16 ft. from the east end of the trestle at 58th Street to 74th Street, and the Canadian Northern's tracks will be raised 7 ft. for a distance of 2,000 ft. Subways will be provided at Fort Trail and Norton streets. The estimated cost of this work is about \$250,000. The company also contemplates the construction of a new station at Edmonton, Alta. The tentative plans provide for a site east of 101st Street, extending for two blocks giving a three-way approach. Freight sheds will be located west of 101st Street. This will mean the closing of three streets and the construction of two subways.

CHESAPEAKE & OHIO.—This company will construct an embankment and track, 1,695 ft. long at Huntington, W. Va., for the storage of steel car parts. This company also contemplates the erection of a steel shed and platform for the storage of material at Huntington.

**CHICAGO & ALTON.**—This company which was noted in the *Railway Age* of October 29 (page 854), as building a second track from Godfrey, Ill., to Brighton, a distance of 6 miles, at an estimated cost of \$256,000, and from Roodhouse, Ill., to Manchester, a distance of 5 miles, at an estimated cost of \$96,000, awarded the contracts to Mulville Bros., Alton, Ill.

**DALLAS-TERRELL.**—This company has awarded a contract to Allhands & Davis, Kansas City, Mo., for grading and bridge work on its new line between Dallas and Terrell, Tex., a distance of about 34 miles.

**FARMINGTON-GALLUP LINE.**—A Los Angeles syndicate contemplates the construction of a railroad line between Farmington, N. M. and Gallup. Citizens in this territory, known as the San Juan Basin, are to furnish land amounting in value to \$2,500,000, while the syndicate will contribute \$1,500,000 in cash, all of which is in return for stock in the new road. The agent of this company at Durango, Colo., the principal city to be benefited by this new line, reports that 60 per cent of the required land has already been pledged and the balance is expected within a short period of time. Mr. Chandler, managing editor of the *Los Angeles Times*, Los Angeles, Cal., and General Sherman of that city, are members of this syndicate.

**GRAND TRUNK PACIFIC.**—This company will construct an earth dam at Rivers, Manitoba, and a water reservoir at Edson, Alberta.

**ILLINOIS CENTRAL.**—This company will enlarge the drying facilities of its elevator E at New Orleans, La., at an estimated cost of \$20,000, the work to be done by company forces.

**ILLINOIS TERMINAL.**—It has been recommended by an examiner in his report to the Interstate Commerce Commission that this company be permitted to extend its line from Formosa, Ill., to O'Fallon, a distance of 14 miles.

**MINNEAPOLIS & ST. LOUIS.**—This company contemplates the construction of a one story repair shop at its Cedar Lake shops, Minneapolis, Minn.

**MISSOURI, KANSAS & TEXAS.**—This company has awarded a contract to H. D. McCoy, Cleburne, Tex., for the construction of a one-story machine shop, 30 ft. in width by 50 ft. long, at Houston, Texas.

**MONTANA, WYOMING & SOUTHERN.**—This company has awarded a contract to the W. L. Johnson Company, St. Paul, Minn., for a 50-ton single track reinforced concrete coaling station to be equipped with Howlett Construction Co. machinery.

**SAN ANTONIO & ARANSAS PASS.**—This company which was noted in the *Railway Age* of October 1 (page 646) as contemplating the erection of a freight and passenger station at Poth, Tex., has awarded a contract for this work to W. H. Orth, San Antonio, Tex.

**SEWELL VALLEY.**—This company, reported in the *Railway Age* of October 1, as contemplating the erection of a shop building at Rainelle, W. Va., has placed an order for this building with the Truscon Steel Company, Youngstown, O.

**ST. LOUIS-SAN FRANCISCO.**—This company, through its Employees' Hospital Association, contemplates the construction of a new hospital at Springfield, Mo. The plans under consideration provide for a three-story brick, stone and reinforced concrete building, to cost about \$200,000.

**ST. LOUIS-SAN FRANCISCO.**—This company will receive bids until November 19, for the remodeling of its Harvey Eating House at Sapulpa, Okla.

**ST. LOUIS-SAN FRANCISCO.**—This company has awarded a contract to the Howlett Construction Company, Moline, Illinois, for a 300-ton reinforced concrete coaling station to be erected at Newburg, Mo.

**WASHINGTON, BRANDYWINE & POINT LOOKOUT.**—This company will begin at once the construction of a 12-mile line from Mechanicsville, Maryland, to Hollywood. The new line will be laid with 80-lb. steel and the work will be done by company forces.

## Supply Trade News

The **United Railway Signal Company**, formerly of East Providence, R. I., is rebuilding a new track torpedo plant and locating at Woodbridge, N. J. Five small buildings have already been completed and as many more planned.

**G. H. Jones**, vice-president and one of the founders of the **Inland Steel Company**, Chicago, will retire from active service in the company about Jan. 1, 1922. Mr. Jones will retain his interest in the company and will continue as a director and a member of the executive committee.

The **Decatur Bridge Company**, Decatur, Ill., have moved its Chicago office from 110 South Dearborn street to the Continental & Commercial Bank building, 208 South La Salle street. **Carl R. Dick** is district sales engineer at the Chicago office and **H. H. Cosley** is contracting engineer.

**M. E. Gregg** has been appointed district sales manager for the **Lackawanna Steel Company** at Detroit, Mich., succeeding **C. H. Hobbs**. Mr. Gregg has been connected with the general sales department of the Lackawanna for the past two years, prior to which time he was Buffalo district manager for the Republic Iron & Steel Company.

The **Virginia Car Corporation**, Alexandria, Va., has been organized in Virginia with a capital of \$100,000. The officers are **E. A. Morse**, president, Washington, D. C.; **L. D. Christie**, treasurer, Alexandria, Va.; **S. A. Aplin**, secretary, Washington. The company will build and repair railroad cars and will lease part of the Virginia Shipbuilding Corporation's plant at Alexandria.

## Obituary

**Robert A. Ogle**, president of the **Ogle Construction Company**, who died on November 2, as noted in the *Railway Age* of November 5, was born at Spalding Springs, Mo., on

November 16, 1865. He was engaged in general building contracting at Monroe City, Mo., until 1898, when he organized and became director of the **Safety Fund Life Association**, subsequently the **Missouri State Life Insurance Company**. In 1903 he became affiliated with an engineering and construction company at St. Louis, Mo., specializing in the railroad construction field. He left that company in 1906 to enter the service of the **Otto Gas Engine Works** with headquarters in Chicago. While with this

company he was mostly engaged in water service and coaling station construction. In 1911 he organized the **Ogle Construction Company** at Chicago, and since that time he has been actively identified with the development of coaling station construction and equipment.

**Frank P. Smith** for over 20 years identified with the **Hancock Inspirator Company**, sales department of **Manning, Maxwell & Moore, Inc.**, New York, died on November 3, at his home at Manhattan Beach, N. Y., at the age of 66 years. Mr. Smith was in railroad service previous to entering the railway supply field.

R. A. Ogle

William E. Baker, a civil and electrical engineer and member of the firm of W. E. Baker & Co., consulting engineers, New York City, died on November 7, at his home in New York, at the age of 65. Mr. Baker was born on October 18, 1857, at Springfield, Mass., and graduated from Lafayette College, Easton, Pa. He entered railway service in 1877, and served consecutively as engineer of the St. Paul & Pacific, civil engineer of the St. Paul, Minneapolis & Manitoba and the Canadian Pacific. In 1884 he became resident engineer of the International & Great Northern and from 1889 to 1892 was superintendent for the Thomson-Houston Electric Company. From 1895 to 1899 he served as general superintendent of the Metropolitan West Side Elevated of Chicago and then became general superintendent of the Manhattan Elevated, New York. In 1902 he resigned to become a consulting engineer.

## Trade Publications

**HAMMER-WELDED STEEL PIPE.**—The National Tube Company, Pittsburgh, Pa., has recently issued Bulletin No. 13, 36 pages illustrated, descriptive of the hammer-welded pipe manufactured by this company. The method by which the steel plate is bent to tubular form with overlapping edges which are welded by hammer forging is described in detail in the text as well as by numerous diagrams and illustrations. The bulletin also contains views of actual installations and data, formulae, curves and tables dealing with the flow of water and the strength of materials.

**TIPS FOR THE TOOL HARDENER.**—A handy reference card entitled, "Tips for the Tool Hardener—Suggestions of a Practical Man of Long Experience," has recently been issued by the Vanadium Steel Company, Latrobe, Pa. It is 8½ in. by 11 in., is made of heavy cardboard provided with a cord for hanging on the wall of the hardening room or the tool room, and is printed on both sides. On one side of the card the various grades of tool steel made by the company are shown, while on the other side, thirty-seven practical points for the tool hardener are given.

F. G. Cooper in the Chicago Post.

You Know, Mother, That Sort of Thing Can Be Overdone

## Railway Financial News

**CAROLINA, CLINCHFIELD & OHIO.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$7,000,000 of 7½ per cent, 30-year first and consolidated mortgage gold bonds, series A, and also \$7,369,000 or 6 per cent, 50-year, first and consolidated mortgage gold bonds, series B, for which the series A bonds are to be interchangeable. This company proposes to sell \$6,000,000 of the series A bonds at 92¼ to Blair & Co., and to issue \$1,000,000 in exchange for an equal amount of first mortgage, 5 per cent, 30-year gold bonds and to deposit the bonds so received as additional security under the mortgage securing the series A bonds. The series A bonds are to be held in the Treasury for sale from time to time. The proceeds of the \$6,000,000 of bonds to be sold are to be used to refund a similar amount of 5 per cent Elkhorn first mortgage gold bonds.

**CENTRAL OF GEORGIA.** *Annual Report.*—The income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Railway operating revenues (March 1 December 31) .....	\$20,676,551	.....
Railway operating expenses (March 1 December 31) .....	21,102,368	\$52,859

**CHICAGO & ALTON.**—*"Clover Leaf" Settlement.*—See Table, St. Louis & Western.

**CHICAGO & NORTH WESTERN.**—*Asks Authority for Trusts to Deliver Bonds.*—This company has asked the Interstate Com-

merce Commission to authorize the trustees under various mortgages to authenticate and deliver to the company bonds to reimburse the treasury on account of expenditures in 1921 and previous years.

**CHICAGO, BURLINGTON & QUINCY.**—*New Director.*—Charles I. Sturgis, secretary and treasurer, has been elected vice-president and director.

**CHICAGO, MILWAUKEE & ST. PAUL.**—*Authorized to Assume Liability of C. T. H. & S. E.*—This company has been authorized by the Interstate Commerce Commission to assume as lessee the obligation or liability of the Chicago, Terre Haute & Southeastern in respect of the payment of the principal and interest for \$310,571 of first and refunding mortgage gold bonds, the issue which the Commission has also authorized in accordance with the terms of a lease of that road by the C. M. & St. P. The bonds are to be issued to the St. Paul to reimburse it for the payment of certain other obligations of the C., T. H. & S. E.

**CHICAGO, NEW YORK & BOSTON REFRIGERATOR COMPANY.**—*Not Entitled to Guaranty.*—The Interstate Commerce Commission has issued a decision holding that this company, whose stock is owned by the Grand Trunk, is not a carrier by railroad and is, therefore, not entitled to the six months' guaranty provided by the Transportation Act, although its property was under federal control.

**EL PASO & SOUTHWESTERN.**—*Asks Authority to Acquire Arizona & New Mexico.*—This company has applied to the Interstate Commerce Commission for authority for the acquisition of control of the Arizona & New Mexico by the purchase of stock and otherwise, also to issue \$3,500,000 of short term notes which with \$1,000,000 in cash are to be used to purchase the stock and bonds of the Arizona & New Mexico. A joint application has also been filed for authority for the El Paso & Southwestern to lease and operate the Arizona & New Mexico property.

**KNOXVILLE, SEVERVILLE & EASTERN.**—*Resale.*—Confirmation of the sale of this 30-mile road to L. C. Gunter, president of the Stony Fork Collieries Company and of the Southern Appalachian Coal Operators' Association, for \$50,000 was agreed to before Chancellor Charles Hays Brown at Knoxville, Tenn., on November 1, by counsel for the Merchants' and Mechanics' bank, the largest creditor of the road. New bidding on the property followed opposition to the confirmation of the sale to W. B. Townsend, on October 5, for \$30,000.

**LIBERTY-WHITE.**—*Sold.*—This company's 24-mile line between McComb, Miss., and Liberty, has been sold by the receiver, K. G. Price to Hugh L. White, of Columbia, Miss., for \$30,000. The sale included the equipment and other property. The road was ordered abandoned by the Interstate Commerce Commission, as noted in the *Railway Age*, September 10, 1921, page 512.

**NASHVILLE, CHATTANOOGA & ST. LOUIS.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**NEW YORK CENTRAL.**—*Authorized to Pledge Bonds.*—This company has been authorized by the Interstate Commerce Commission to issue \$19,500,000 of 6 per cent refunding and improvement mortgage bonds and to pledge them with the director general of railroads as security for a demand note for a like amount given in payment of the applicant's indebtedness to the United States for additions and betterments made during federal control.

**SARATOGA & ENCAMPMENT.**—*Taken over by Union Pacific.*—See Union Pacific.

**SOUTHERN PACIFIC.**—*Asks Authority to Guarantee Certificates.*—This company has applied to the Interstate Commerce Commission for authority to guarantee \$600,000 of equipment trust certificates issued by the Anglo-California Trust Company for the purchase of equipment for the San Diego & Arizona.

**SOUTHERN RAILWAY.**—*Bonds Sold.*—J. P. Morgan & Co. have sold \$5,655,000 first consolidated 5 per cent mortgage bonds, at 85 to yield 5.90. The proceeds are to be used to refund a like amount of Georgia Pacific first mortgage 6 per cent bonds, maturing January 1, 1922.

**ST. LOUIS-SAN FRANCISCO.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$2,122,000 prior lien 6 per cent gold bonds dated July 1, 1916, and maturing July 1, 1928, to be sold at not less than 90 or to be pledged at not less than 75 as collateral security for short term notes. It is stated that the bonds cannot now be sold on reasonable terms.

**TOLEDO, ST. LOUIS & WESTERN.**—*Bondholders Approve Settlement.*—The bondholders' committee has approved the proposed settlement of the controversy, which was noted in last week's *Railway Age*, page 913, concerning the company's collateral trust 4 per cent series A and B 1917 bonds. Announcement to this effect was made by Edwin G. Merrill, chairman of the committee, in a notice to the holders of certificates of deposit for series A 4 per cent bonds.

In his statement Mr. Merrill said, in part:

Under the terms of that settlement the bondholders' committee will receive the stock of the Chicago & Alton Railroad, now held as collateral for the bonds (of both series), together with payment of \$1,130,000 in cash and approximately 9,500 shares of preferred stock and 9,500 shares of common stock of the "Clover Leaf" company.

The committee has made a favorable adjustment with the holders of the entire issue of series B bonds and with certain holders of series A bonds involving the distribution to them of their pro-rata share of Chicago & Alton preferred and common stocks only. The committee estimates that after this adjustment and the payment of all expenses in connection with the committee, there will be available for distribution on each certificate of deposit representing a \$1,000 series A "Clover Leaf" bond, with all unpaid coupons attached, approximately (1) in cash \$150; (2) in "Clover Leaf" preferred stock \$180, par amount; (3) in "Clover Leaf" common stock \$180, par amount; (4) in Alton preferred stock \$360, par amount, and (5) in Alton common stock \$1,250, par amount.

As soon as this settlement is carried out and the cash and securities become available, the distribution will be made by the New York Life Insurance & Trust Company.

The bondholders' committee is of the opinion that this settlement is fair and satisfactory. By it protracted litigation is avoided and the bondholders will receive promptly their full pro-rata share of Chicago & Alton stock, both preferred and common, together with a substantial cash payment and a share in the equity of the "Clover Leaf" Company.

**UNION PACIFIC.**—*Control of the Saratoga & Encampment.*—The Union Pacific has taken over this road on a tentative plan, the terms of which have not been announced, for a minimum period of three years. The road operates between Encampment, Wyo., and Walcott, 45 miles.

## More Equipment Trust Certificates Sold

The director general of railroads announced on November 5, that he had, with the consent of the President, confirmed additional sales, at par plus accrued interest, of railroad equipment trust certificates now held by the government, as follows:

To Salomon Brothers & Hutzler, and Kidder Peabody & Co.:

Louisville & Nashville, 1922 to 1924, inclusive.....	\$2,011,700
Great Northern, 1922 to 1924, inclusive.....	858,900
Illinois Central, 1922 to 1924, inclusive.....	1,941,300
New York Central, 1922 to 1924, inclusive.....	2,768,100
Nashville, Chattanooga & St. Louis, 1922 to 1927, inclusive.....	519,000

To Bernard Scholle & Co.:

Buffalo, Rochester & Pittsburgh, 1922 to 1924, inclusive....	1,039,200
Michigan Central, 1922 to 1924, inclusive.....	400,800

Total amount of these sales is.....\$9,539,000

The sales were arranged by Eugene Meyer, Jr., managing director of the War Finance Corporation. Total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$109,338,800.

## Dividends Declared

Cripple Creek Central.—Preferred, 1 per cent, quarterly, payable December 1 to holders of record November 15.

New Orleans, Texas & Mexico.— $\frac{1}{4}$  per cent, quarterly, payable December 1 to holders of record November 15.

Pittsburgh, Youngstown & Ashtabula.—Preferred,  $\frac{1}{4}$  per cent, quarterly, payable December 1 to holders of record November 21.

AMERICAN COMPANIES are meeting with hard competition in China, especially from British companies, for British laws have recognized the special requirements of the China situation and made it possible for British companies operating in China to do so without paying corporate taxes in England. American companies are at a distinct disadvantage in competition with such British companies, and apparently are at a similar disadvantage in comparison with French companies and Japanese companies.—*Foreign Commerce Department, U. S. Chamber of Commerce.*

## Railway Officers

### Executive

**Charles I. Sturgis**, secretary and treasurer of the Chicago, Burlington and Quincy, with headquarters at Chicago, has been elected vice-president and director, with the same headquarters. A photograph and sketch of Mr. Sturgis were published in the *Railway Age* of June 10, 1921 (page 1378).

**R. C. Morgan**, superintendent of terminals of the Canadian Pacific at Winnipeg, Manitoba, has gone temporarily to the Reid Newfoundland Company, St. John's N. F., as chairman of the management committee. The other members of this committee are **R. G. Reid** and **J. M. Forbes**. This committee will have charge of the general management of the company and is expected shortly to bring out a new plan for the permanent operation of the railway.

### Financial, Legal and Accounting

**Charles M. Sheafe, Jr.**, whose appointment as general solicitor for the New York, New Haven & Hartford was announced in the *Railway Age* of October 8 (page 698), was born at Holden, Missouri, on August 14, 1874. He attended Leland Stanford Jr. University in 1893 and 1894 and thereafter attended Harvard University, from which institution he received the degree of bachelor of arts in 1898 and bachelor of laws in 1901. He entered railway service on May 1, 1905, as assistant attorney for the New York, New Haven & Hartford at New York. In 1908 he was promoted to attorney and, in 1914, to counsel for the same company with the same headquarters. This latter position he was holding at the time of his recent appointment.

Chas. M. Sheafe, Jr.

**L. G. Lind** has been appointed auditor of disbursements of the Wabash with headquarters at St. Louis, succeeding **A. L. Fallier**, resigned.

**A. T. Williams**, assistant secretary and cashier of the Chicago, Burlington & Quincy, with headquarters at Chicago, has been elected assistant treasurer.

**R. B. Williamson**, superintendent of claim prevention of the Missouri Pacific, with headquarters at St. Louis, Mo., has been promoted to freight claim agent with the same headquarters, succeeding **T. S. Walton**, deceased. **T. F. Scruby** will succeed Mr. Williamson as superintendent of claim prevention.

**W. Wamsley**, chief clerk to the assistant to the auditor of revenues of the Grand Trunk, Canadian lines, with headquarters at Montreal, Que., has been promoted to assistant auditor of revenues with the same headquarters, succeeding **G. A. Godfrey**, whose promotion was noted in the *Railway Age* of September 10 (page 515).

### Operating

**N. W. Smith** has been appointed assistant to the general manager, Eastern region, of the Pennsylvania, effective September 1.

**O. M. Higgins**, night chief dispatcher of the Canadian National has been promoted to chief dispatcher, with headquarters at Saskatoon, Sask.

**J. D. Fraser**, chief dispatcher of the Esquimalt & Nanaimo, with headquarters at Victoria, B. C., has been promoted to acting superintendent, with the same headquarters. **F. E. Tebo**, dispatcher, will succeed Mr. Fraser.

**W. L. Hack**, whose appointment as superintendent of the Salt Lake division of the Southern Pacific, with headquarters at Ogden, Utah, was announced in the *Railway Age* of October 15 (page 743), was born at Vallejo, Cal., on October 10, 1880. He entered railroad service in July, 1896, in the shops of the Southern Pacific, since which time he has been successively employed in a roundhouse for two years; as road fireman for four years; engineer for the next ten years; fuel expert on the Los Angeles, Tucson and San Joaquin divisions, with headquarters at Los Angeles, Cal., for three years; road foreman of engines of the Tucson division, and district road foreman of engines of the Northern district. On September 1, 1918, he was promoted to assistant superintendent of the Sacramento division, with headquarters at Sacramento, Cal., which position he was holding at the time of his recent promotion.

**A. J. Hancock**, whose appointment as supervisor of transportation of the Southern Pacific, with headquarters at San Francisco, Cal., was announced in the *Railway Age* of October 15 (page 743), was born at Frankfort, Kentucky, on March 4, 1880. He entered railroad service in September, 1901, as a clerk and telegrapher for the Postal and the Western Union telegraph companies, working at various stations on the Louisville and Nashville, the Louisville, Henderson and St. Louis, the Union Pacific, and the Kansas City Southern, until July, 1903, when he became a stenographer in the office of the superintendent of telegraph of the Southern Pacific, with headquarters at San Francisco, Cal. He left railroad service in January, 1904, to become cashier of the United States Life Insurance Company, but re-entered railroad service in August of the same year as a telegrapher, and was soon appointed a clerk for the division superintendent of the Southern Pacific at San Francisco, being promoted later to chief clerk. From September, 1905, to December of that year, he was employed by that company in its Sacramento telegraph office. In February, 1906, he entered the service of the Kansas City, Mexico & Orient, of Texas, and served successively as dispatcher and chief clerk to the general manager. In September, 1912, he returned to the Southern Pacific as assistant chief clerk to the vice-president and general manager, which position he held until March, 1913, when he was promoted to chief clerk to the general manager. In January, 1917, this position was abolished and Mr. Hancock returned to his former position which he held until September 1, 1918, when the position of chief clerk to the general manager was re-established. He was holding that position at the time of his recent promotion.

A. J. Hancock

### Traffic

**E. S. Brissey** has been appointed commercial agent of the Kansas, Oklahoma & Gulf with headquarters at Chicago. **W. D. Lambert** has been appointed general agent with headquarters at Pittsburgh, Pa.

E. P. Bass has been appointed commercial agent of the Georgia & Florida with headquarters at Valdosta, Ga., succeeding H. K. Wilkinson, division freight agent, who has resigned and whose office has been abolished, effective with his resignation.

R. E. Greene, general passenger and freight agent of the Salina Northern, with headquarters at Salina, Kan., has been promoted to traffic manager with the same headquarters; and the office of general passenger and freight agent has been abolished.

H. J. Dymond has been appointed general agent of the Georgia & Florida with headquarters at Cincinnati, Ohio, succeeding D. W. Agnew, general western agent, who has resigned and whose position has been abolished. E. W. Dodge, Jr., has been appointed commercial agent at Savannah, Ga., succeeding W. C. Duggan, resigned.

### Mechanical

O. S. Jackson has been appointed assistant superintendent of motive power of the Union Pacific, with headquarters at Omaha, Neb.

J. W. Keppel, general foreman of the Canadian Pacific, with headquarters at Vancouver, B. C., has been promoted to master mechanic of the Regina division, Saskatchewan district, with headquarters at Regina, Sask., succeeding W. G. McPherson, promoted, as noted in the *Railway Age* of October 22 (page 806).

G. H. Likert has been appointed fuel engineer of the Union Pacific with headquarters at Omaha, Nebr. B. E. O'Neill has been appointed fuel supervisor of the southern district with headquarters at Kansas City. A. L. Coey has been appointed fuel supervisor of the northern district with headquarters at Cheyenne, Wyo., and P. C. Coats has been appointed fuel inspector with headquarters at Omaha, Nebr. These changes were effective October 1.

### Engineering, Maintenance of Way and Signaling

Dougald Cameron, whose appointment as district engineer, maintenance of way, of the Iowa district of the Chicago, Burlington & Quincy, with headquarters at Burlington, Iowa, was announced in the *Railway Age* of October 15 (page 774), was born at Aberdeen, Scotland, on August 26, 1884, and educated in the public schools and at Robert Gordons College there. He entered railroad service as a rodman and instrument man on the Chicago, Burlington & Quincy, in September, 1909, and was successively a draftsman and assistant engineer up to 1918. In July, 1918, he was appointed roadmaster of the Chicago division, with headquarters at Chicago, which position he held until February 6, 1920, when he was transferred to Beardstown, Ill. On April 24, 1920, he was promoted to assistant to the general inspector of permanent way and structures, with headquarters at Chicago. He was holding this position at the time of his recent promotion.

Howard M. Smitten, assistant engineer in the valuation department of the Southern Pacific, has been appointed bridge engineer of the Western Pacific, with headquarters at San Francisco, Cal. He was born at San Jose, Cal., on February 8, 1878. He entered railroad service in May, 1900, as a rodman on the Southern Pacific and held this position until 1902, when he was made structural draftsman in the maintenance of way department. A short time later he left railroad service and was employed by various architects in San Francisco as a structural engineer and draftsman. In June, 1906, he re-entered the employ of the Southern Pacific as a structural engineer. From May, 1917, to March, 1919, he served in the United States army successively as captain, major and lieutenant-colonel, in which capacities he had charge of various engineering details at Camp Lewis, and was assistant depot engineer in charge of railroad shops at Sievers, France. At the close of the war he was in command of the 37th engineers. He again re-entered the service of the Southern Pacific in January, 1920, as an assistant engineer in the valuation department, which position he was holding

## Obituary

Albert S. Johnson, general manager of the Terminal Railroad Association of St. Louis, died at his home in that city on November 8 as a result of an acute heart affection.

E. A. Chenery, superintendent of telegraph of the Missouri Pacific with headquarters at St. Louis, died on November 8 in the Missouri Pacific Hospital in that city from a stroke of apoplexy.

George H. Webb, chief engineer of the Michigan Central, with headquarters at Detroit, Mich., died at Newton, Mass., on November 3. Mr. Webb was 61 years of age. Upon graduating

Lt. Col. G. H. Webb

from the Pennsylvania Military Academy in 1880, he entered railroad service as a rodman on the Somerset & Cambria branch of the Baltimore & Ohio, and was later levelman and transitman on the Pittsburgh Southern and on the Pittsburgh & Western (both now parts of the Baltimore & Ohio). In 1883 he became city engineer of Johnstown, Pa., and later engineer of the Johnson Steel Rail Company. From 1885 until the Spring of 1888 he was assistant engineer and locating engineer on several branch lines of the Chicago, Burlington & Quincy. During 1888, he located and constructed portions of the Seattle, Lake Shore & Eastern (now a part of the Northern Pacific) and the Puget Sound, Skagit & Eastern. In 1889 he went to Chile in charge of the construction of government railroads. He was appointed division engineer and superintendent of construction of the Summit division of the Central Railway of Peru in 1891. He built that division through the main range of the Andes. This work was in high altitude with heavy grades and high curvature and many tunnels. He returned to this country in 1893 and was engaged in private engineering practice for four years, after which he was appointed chief engineer of the Cincinnati, Georgetown & Portsmouth. In 1899 he became a roadmaster for the Cleveland, Cincinnati, Chicago & St. Louis, later holding the same position on the Chicago & Alton. In 1901 and 1902 he was engineer in charge of construction of the Baring Cross shops of the St. Louis, Iron Mountain & Southern at Baring Cross, Ark., and in 1903 he entered the service of the Michigan Central in charge of location work. He was promoted to engineer of the Middle division in April, 1903, and assistant chief engineer in charge of surveys, construction and maintenance of way, in November, 1903, which position he held until June 16, 1905, when he was promoted to chief engineer. In June, 1911, Mr. Webb was also appointed chief engineer of the Detroit River Tunnel Company. In June, 1917, he was commissioned lieutenant colonel, in the Sixteenth (Railway) Engineers, the following year was promoted to colonel. He spent approximately two years in service in France in recognition of which he was awarded the Distinguished Service Medal, decorated by the president of France, made an officer in the order of the Black Star, and a member of the Legion of Honor. He resumed his duties as chief engineer of the Michigan Central in May, 1919.

Who is going to buy from us, with the foreign exchanges in their chaotic position? Let the United States, which has the world's gold, come to the world's aid! It is a fact that the unemployment problem in the United States is greater than in this country (England) although she has all the gold. Countries cannot afford to buy from the United States, consequently the United States cannot export. Where there is no export trade there is no production, and no production means unemployment. —Sir Robert Hadfield in the *London Chronicle*.

Ryerson machinery reduces the costs of spring repairs in any shop.

## Output Increased 52%

Some roads repair springs at home instead of shipping them hundreds of miles and back.

They find it saves time, money and locomotive delays.

One such road repairing its own springs installed improved Ryerson machinery and increased its output 52% with the same number of men.

Perhaps Ryerson machinery can cut your labor costs in half. It will pay you to investigate—and of course there is no obligation.

The members of the American Railway Development Association, although they devote their attention exclusively to the development of such things as farming, live stock raising, the colonizing of unsettled lands, the improving of settled districts and the establishment of industrial enterprises, are very much a part of the country's transportation system. Traveling extensively as they do, lecturing to agricultural communities, helping immigrants to improve their conditions, co-operating with commercial clubs, chambers of commerce, college extension departments, marketing associations and other agricultural and business organizations, these men are in a most strategic position through their personal contact with the public to establish good-will towards the railroads. Theirs is an opportune position and an immensely worthwhile mission.

### Developing Goodwill Toward the Railroads

The New York, New Haven & Hartford, in September of this year, inaugurated a tractor and trailer system at two of the outbound houses in its Boston freight terminal where the maximum haul rarely exceeds 100 ft. This installation, and the methods of handling the freight, are described in detail on

### Tractors and Trailers for Short Haul

other pages of this issue. It will be noted that the tractors were employed only after the congestion, which, years ago, had been relieved by the substitution of manually operated four-wheel trucks for the usual two-wheel trucks, had again become acute. The underlying conditions—the necessity of handling through 20 doors to the cars all freight received from the driveway side through 52 doors—which led to experimenting with tractors at this point are approximated at the outbound houses of many other railways. The success that the New Haven has had in reducing delays to shipments as well as the reduction in the cost per ton of handling freight at Boston, through this radical departure from usual methods, may well point the way for like economies at the outbound houses of other roads where conditions are somewhat similar.

The London School of Economics is doing a remarkable work in training promising railway employees in the larger aspects of the railway business. A wide range of interesting courses in railway economics, operation, law and accounting is offered and classes are held for the most part in the early evening in order

### England and Railway Education

not to interfere with the students' regular work. Such educational facilities can only prove effective when there is hearty co-operation on the part of the railways whose employees are to be trained. When the students realize that the officers of their companies are interested in their efforts to become of greater service and are watching closely the records they are making in their studies, the effect is that they derive the utmost benefit from the opportunities afforded them. Trained men are as necessary to the railroads of this country as to those of England. There has been much discussion on the place of college men in the railroad organization. Does not this English plan offer a possible solution? That is to say

that making college men out of railroad employees ought to be at least as feasible as making railroad men out of college students. Practically all of the larger cities of the country have their institutions of higher learning which could be made available during certain hours of the day for the instruction of ambitious railroad men. All that remains is for some one to take the initiative. The success of the movement in England proves its feasibility.

The analysis of the authority and responsibility of the federal government in the case of a railroad strike, made by

### Strike Powers of the Federal Government

James C. Davis, director general of railroads, in an address at Kansas City and published elsewhere in this issue, is of particular interest in view of the experience through which the nation has recently passed, because (although he does not say so in the speech) it is an exposition of the legal theory on which the Harding administration was preparing to deal with the strike if it had not been called off. Mr. Davis shows clearly how the lack of "teeth" in the labor provisions of the Transportation Act, which many have deplored, may be supplied readily from the general powers to protect the interests of the public, which the government has been declared to possess by the Supreme Court decisions in both the Debs case and the Adamson law case. While the Transportation Act provides no penalties for violation of the orders of the Railroad Labor Board, Mr. Davis shows clearly how the new law has made a strike against the orders of the board an act against the government rather than against the corporations and how the Department of Justice may, as it was actually prepared to do in this case, proceed against the leaders of a strike by the injunction process and if they fail to obey the injunction arrest them for contempt. Mr. Davis' explanation of the legal points involved is of particular significance because there was no clear public explanation given at the time of the policy which the government proposed to follow if it became necessary. The fact that the Labor Board was first used as a mediator, and that the brotherhood leaders were given an opportunity and a plausible reason for withdrawing their strike order before the Board issued its order forbidding a strike left some confusion at the time in the public mind as to whether the strike was settled by the announcement of the Labor Board that it could not consider further wage reductions before disposing of other cases on its docket or whether the firmness displayed by the Washington administration had thoroughly convinced the strike leaders that they had made a serious mistake.

The co-ordination of the activities of all branches of railway service makes a smoother working machine, increases efficiency and promotes economies. It

### The Transportation Engineer

is necessary in order to accomplish this to the fullest extent that a liaison be established between the division and the general officers. Some roads already have felt it desirable to study this subject and others no doubt could benefit by such an investigation. For example, on the Chicago & North Western the signal

engineer acts as the chairman of a system committee, which studies such problems as the causes of delays to cars passing through terminals to ascertain where such delays occur in interchange movements or yard switching and initiates the proper steps to eliminate them. The value of such a study is obvious, particularly in a time of car shortage. Again, the location of division facilities and their effect on operation, and other subjects of like importance, may well receive careful study. On the Pennsylvania a mechanical department officer is in charge of such work. The location of terminals and classification yards presents problems which frequently cannot be solved by division officers alone, because their viewpoint is limited to their own territory, yet their recommendations largely determine the character and location of the improvements made. By proper classification at the starting point it may be found that there is no need for an intermediate classification yard and train operation may be materially benefited by its elimination. It is thus evident that the co-ordination of the activities of different departments offers possibilities which the railroads can well afford to develop. The man assigned to such work may well be called a "Transportation Engineer." Such a man should have broad vision and an analytical mind as well as a general fund of knowledge pertaining to the work of the various departments. Thus equipped, and reporting direct to the president or vice-president, he should be in a position to produce results not possible by the busy general or division officer, provided, of course, that he is permitted to devote all of his time to his work and is given a competent staff of assistants.

Closely allied with the question of order and cleanliness in railroad repair shops is that of scheduling various repair operations. In fact the same factors which stimulate certain managements to keep shops clean, orderly and well lighted, also cause them to install schedule or routing systems whereby

the order of detail operations is known in advance and confusion avoided. The converse of this statement also is true. It is significant to note that almost invariably the dirty, congested shop has no schedule system and, with the possible exception of a weekly calendar of outgoing cars or locomotives, has no means of knowing in what order work will be needed. Unfortunately there are still many shops of this latter type and the truth of the matter is that these simply reflect the individual preferences of higher shop and mechanical department officers who fail to appreciate the value of systematic, planned work. A shop schedule system is not difficult or expensive to install and time and again its installation has been promptly followed by important increases in shop output. It is time that every important railroad shop in the country should be provided with a shop schedule fitted to its individual needs. Not only should ordinary repair operations be scheduled, but many shops handle a large amount of miscellaneous machinery repairs and outside work which also should receive the attention of the schedule supervisor, to be handled in order of its importance, thus interfering with the regular work as little as possible. Shop orders are generally issued for work of this kind, and it is to be hoped that not many shops handle these orders in the haphazard manner recently noted by a visitor at one point. The shop in question was badly congested with new work, general locomotive repairs, and outside machinery repairs to be done on shop orders, and the only guide for under-foremen and shop employees was the weekly calendar of outgoing locomotives. Impressed with the congestion of machinery, stock and unfinished machine parts, the visitor asked a foreman how he knew which shop order to work on first. The reply was, "We wait until somebody needs the order so much that he tele-

graphs for it." Is any comment on such a practice necessary? It is earnestly believed that a simple, workable schedule system applied in this shop under the direction of a capable schedule man and backed by the general foreman and shop superintendent would relieve the congestion in a short time, increasing the output and enabling shop orders to be completed in a reasonable time, without the formality of a telegram to start work on them.

## A Recent Wage Decision of the Labor Board

THE DECISION recently rendered by the Railroad Labor Board in the controversy between the New Orleans Great Northern Railroad and the organizations representing its telegraphers and train service and shop employees seems to be of much significance. It seems significant not only because of the wage reductions authorized, but also because of the reasons given for authorizing them.

The wages of the train and engine service employees were reduced to the same amounts that they were on March 1, 1920—that is, when the railways were returned to private operation. This is what the railways intend to ask the Labor Board to do with respect to the wages of all train and engine service employees. The wages of shop employees were even more sharply reduced. According to statistics given by A. O. Wharton, a member of the board, in a dissenting opinion, the new wages of the shop employees are 30 to 40 per cent less than those fixed for them by the board in Decision No. 2 on July 20, 1920.

The board authorized larger reductions in the wages of shop employees than in those of train service employees, apparently because the increases granted to the former were relatively larger. It authorized relatively larger reductions in the wages of comparatively unskilled than of skilled employees, partly, no doubt, because the former were given larger increases and partly because it believed that the differentials between skilled and unskilled workers ought to be larger.

The board said it was "sympathetic with the principle that the ability of the carrier to pay is not a controlling factor, but recognizes that it is entitled to secondary consideration with a certain type of carrier dependent almost entirely on local business or whose principal function in the final analysis is the development and upbuilding of a new, or comparatively new, country." This is the situation of the New Orleans Great Northern, which it was shown has been operating at a heavy loss. In spite of the guarded language used by the board, however, its statement is clearly a recognition of the principle that a road's earning capacity is one of the "relevant circumstances" which must be considered in determining what wages it can be required to pay. Now the Transportation Act makes no distinction between railways serving only a few communities and railways serving many, and if this principle is applicable to one railroad then it is applicable to all.

The board gave weight to evidence "that the cost of substantial necessities, i. e., groceries, meats, dry goods and wearing apparel, March, 1921, as compared with July, 1920, shows an average decrease of 30 per cent" in the territory of the New Orleans Great Northern. It added the following significant statement: "It is a matter of common knowledge that in the territory served by this carrier the question of rent does not bear the same excessive relation to the living budget as is evidenced in large centers, and it is worthy of note that none of the employees here involved are required to live in large centers." It said that the wages authorized by it for the shop crafts and roundhouse labor are "substantially higher than paid in other industries," but that

"special consideration has been given to the rates paid for similar service in other industries in the centers where the carriers' men are employed."

The result of the weight given by the board to this railroad's earning capacity and to the cost of living and the wages paid in other industries in its immediate territory was a decision authorizing the payment to all the classes of its employees involved of wages substantially lower than those being paid to employees doing the same classes of work on other railways.

The precedent established may mean one or both of two things: First, it seems to mean the board recognizes the principle that railway wages should not be standardized throughout the United States, but that as nearly as practicable they should be adjusted according to the cost of living and the wages paid in other industries in the various communities in which the employees live and work. This is a healthy sign since nothing is more needed, in justice to the employees, the railways and the public, than the breaking down of the present arbitrary standardization of wages throughout the country regardless of local conditions. Secondly, while it cannot be taken to indicate the board believes the wages of all employees should be reduced, it certainly does suggest the inference that when the railways generally bring new wage cases before the board it will not be found entirely inhospitable to the argument that railway labor costs should be readjusted downward in proportion to the need of the country for lower rates and to the changes in wages in other industries, as well as in the cost of living.

## Stop, Look and Listen!

FAMILIARITY breeds contempt. The man who does not own an automobile, or the one who is but a recent purchaser, feels a genuine concern whenever he rides over railway tracks, but this feeling soon becomes dulled and the average seasoned driver does not suffer any particular anxiety when he approaches a crossing. Eventually he becomes more or less careless or perfunctory in his observance of the ordinary rules of safety. Then there is the dare-devil who will always take a chance; nor must we forget the drunken joy-rides.

Through the combined effort, or rather lack of effort, on the part of these classes of automobile drivers we are confronted with an appalling casualty record in grade crossing accidents. The accident report of the Interstate Commerce Commission for 1920 shows that 6,868 persons were killed or injured at grade crossings, and of these 5,250 were occupants of automobiles. The investigation of such accidents and traffic studies at crossings shows that fully 95 per cent of the casualties are clearly the fault of the automobile driver. It is well known that in many of the collisions which occur at grade crossings the automobiles or trucks run into the side of trains.

This situation has long been a source of great concern to the railroads, the insurance companies and the National Safety Council. The public, on the other hand, except when aroused by some particularly gruesome accident, has taken but little interest in the subject, about the only manifestation being agitation for grade separation or for an additional safeguard at the crossing. In spite of the fact that the chief need is for greater care on the part of the driver, about the only agencies which have endeavored to promote caution are the National Safety Council and the individual railroads. Public authorities in general have had but little part in such preventive measures. It is, therefore, of particular interest to note that the state of North Dakota, through its railroad commission, is now carrying on an intensive state-wide campaign of public education. This will be directed primarily toward a greater spirit of caution in approaching and driving

over tracks at highway crossings and is the result of a series of thorough investigations of the causes of several recent collisions between trains and automobiles in that state.

This is but a start. The benefits to be secured will be measured almost directly by the extent to which other states lend their efforts to this end. There are many ramifications of this problem which cannot be solved without the assistance of the public bodies. Adequate warning signals at an effective distance from the tracks, the use of speed restricting humps and the elimination of view obstructions, are typical of matters largely within the province of the public authorities rather than the railways. But of greatest importance is the campaign for careful driving, which obviously should be much more effective when promoted by the state than when carried on in the name of the railroad.

## Why Tinker With An Inefficient Machine?

"SHOULD WE CONTINUE to tinker with an old and inefficient machine when it is impossible to escape the installation of the modern and efficient one?" This sentence is quoted from the superpower survey report. The "old and inefficient machine" referred to is the steam locomotive. The reference is but one among several like it which appear in Professional Paper 123 entitled, "A Superpower System for the Regions between Boston and Washington." The sentence is indicative of the broad-minded attitude with which the investigators of the superpower survey did *not* approach the question of railroad electrification in the so-called superpower zone.

The superpower survey report was presented to the President on November 5. An abstract of the parts of it relative to electrification appeared with editorial comment in last week's issue of the *Railway Age*, pages 862 and 881. Briefly, the report presents a plan for a correlation of the electric power units in the so-called superpower zone, included roughly between Washington and north of Boston and extending about 150 miles inland. Large expenditures are admitted to be necessary to put the several plans in effect, but the savings claimed put to shame the promises of a salesman of oil securities.

The parts of the report dealing with electrification are, of course, the ones in which readers of the *Railway Age* are primarily interested. The investigators ascertained that there are included in the superpower zone some 36,000 miles of railroad, including main line, additional tracks, sidings and yards. Of these it is shown, to the satisfaction of the investigators at least, that 19,000 miles could profitably be electrified. The electrification of these lines will cost only about \$500,000,000, but it is estimated that the savings over the present methods of steam operation will be from 11 to 19 per cent on the investment, or an average of 14 per cent per year.

It will have to be admitted that the method whereby the investigators prove that these startling savings of 14 per cent will be made is not quite as clear as might be desired. Apparently they expect almost unlimited savings in locomotive maintenance. They count further on a decrease of some 25 per cent in crew wages. They rival even the previous most ardent advocates of heavy electrification in claiming a saving in fuel of no less than 66.8 per cent.

In an editorial on the superpower survey which appeared in last week's *Railway Age*, objection was made that the report suffered from its partisanship. It is very evident that the investigators tackled the problem of electrification with a decided prejudice against steam operation. A careful perusal of the report, and more particularly of that section dealing with electrification, Appendix C, may possibly ex-

cuse them. It is only too apparent that they were not sufficiently familiar with railway operation to be at all interested in its favor. A statement to the effect that no more skill is required to operate an electric locomotive than is demanded of an ordinary chauffeur does not indicate else than a marked ignorance of railway-operating conditions. The following quotation is possibly even more indicative of lack of knowledge of how our railways are run:

The reason for this reduction in crew wages per ton-mile is clear: if a steam locomotive pulls a train 100 miles in 10 hours and an electric locomotive pulls it 100 miles in 8 hours, the use of the electric locomotive will save 33 per cent in crew wages (as 2 hours of the 10 would be paid for at double-time rates); and if the train pulled by the electric locomotive is 25 per cent heavier, the saving in wages will be 46 per cent. Such a saving is easily made.

As has been said in these columns again and again, there are presumably few railway men left who do not believe that electrification is the proper development in situations suitable for it. The electrification advocates do not seem to realize that the electric locomotive has not proved itself the panacea for all the railroad ills. On the other hand, they seem to have little or no comprehension of the fact that the steam locomotive of today is a quite different motive power unit from the locomotive of a decade ago. This probably explains why they do not hesitate to compare operation with the most modern up to date electric locomotive working on mountain grades with the operation of the old steam locomotives displaced on these electrified sections.

Further than that, electrification will cost enormous sums of money. Money is not easily obtainable by American railroads under present conditions. We submit that the burden of proof is still on the electrification advocates to show that enormous expenditures will be worth while in the present state of the art of heavy electric traction. All these facts are omitted from consideration in the superpower survey report. Admitted always that electrification has proved itself worth while in the conditions suited for it, we assert that a general plan for electrification such as is proposed in this report is visionary and not sufficiently supported by facts.

The *Railway Age* has always contended that electrification must be "sold"—to use a merchandising term—not to the electrical engineers nor to the public. It must be sold first to the hard-headed practical men who operate our railways. We do not feel that such arguments as the following will get far with men who have been brought up with steam operation.

The normal amount demanded annually for extensions and betterments for the railroads within the superpower zone is approximately \$150,000,000, an amount which even in the face of present construction prices would suffice in three or four years to cover the cost of electrifying all the mileage mentioned. *Should we continue to tinker with an old and inefficient machine when it is impossible to escape the installation of the modern and efficient one?*

Possibly the following remark will appeal to steam railroad men:

These improvements in operation can be made more readily under electric service than under steam, for a change in the power system would bring fresh minds into the service and would consequently liberate the mental operations of the average railroad man from their conventional routine.

As was stated in last week's issue there is much of value in the superpower report. There is much said in favor of electric operation that is correct and fair. There is much less said of steam operation that can be so termed. The report insofar as electrification is concerned partakes altogether too much of unfair propaganda in favor of steam railroad electrification. The propriety shown in putting this propaganda in an official government document prepared with the assistance of an appropriation of \$125,000 from Congress is, however, not evident.

## New Books

*The American Railroad Problem*, by I. Leo Sharfman, Professor of Economics, University of Michigan, 5½ in. by 8½ in. 474 pages. Bound in cloth. Published by the Century Company, New York.

This book is first a summing up of recent railroad history and as such is an important contribution to railroad literature. In addition it is an able analysis of the present railway situation and in this, perhaps, lies its greatest value to the railroad man and lay reader alike. Professor Sharfman gives first a brief summary of railroad history prior to 1914 and then goes into considerable detail concerning the railroads under pressure of war, both previous to and during federal control. Several chapters are devoted to the accomplishments and shortcomings of the railroad administration and then the writer launches into the discussion of the present railroad situation. Theoretical questions of private versus public ownership, unification of service, rates, credit and earnings and the attitude of labor are dealt with from an impartial viewpoint to provide a background and then the writer takes up the Transportation Act.

The author's conclusions are interesting—"it is very questionable, therefore, whether relief can be expected through further extension of the scope of regulation. The continuance of private ownership must be accompanied by a reasonable degree of independence in management," and "unless the railroads accept the plan of consolidation now being formulated by the Commission, it will doubtless be deemed essential to render the extensive emergency powers over traffic and 'car service' continuously applicable, in order to secure the benefits of informal operating unity. Such developments must ultimately bring public ownership." With these and other statements throughout the book there will not be universal agreement, yet if such a grasp of the railway situation as Professor Sharfman has been general among the leaders of the country's thought, the railroads and their managements would find their problem greatly simplified. The book recommends itself to the attention of all who would be intelligently informed about our national railroad policy.

*Railroad Shop Practice*. By Frank A. Stanley. 331 pages, 5 in. by 9 in. Bound in cloth. Published by McGraw-Hill Book Company, New York.

The purpose of this book as outlined in the preface is to show typical methods and appliances adapted to the work of various repair shops. It contains 23 chapters, covering in a general way practically all phases of locomotive repair shop operation. Data for the preparation of the book was secured from railroads in various parts of the country and the methods shown, therefore, are not simply local. The description of methods is written primarily from the standpoint of general machine practice and in many cases the author shows lack of familiarity with railroad shop methods. The author has given little consideration to the problem of repairs in its general aspect, but has treated each operation as practically unrelated to other work. Consequently, the book is more in the nature of a collection of shop kinks than a treatise on general shop practice. A very large portion of the entire book is devoted to machine shop practice, although short sections dealing with blacksmith shop, boiler shop and car department practice are included. Some of the methods described are probably the best in their respective lines, but other methods included would be classed as obsolete in the majority of shops. The value of the book would have been increased if greater care had been taken to give each important division of railway shop work the attention which its relative importance would warrant and if more discrimination had been used in selecting the examples of shop practice described in the work.

# The Case of the Detroit, Toledo & Ironton

Between June and August Net Operating Income Declined  
70 Per Cent; For Class I Roads Increased 75 Per Cent

By Harold F. Lane

THE INTERVIEW with Henry Ford, published recently in *The Nation's Business*, telling how, he would operate a big railroad if he owned one, instead of a little one, suggests that as a railroad operator Mr. Ford is a good press-agent for the Ford Motor Company, but who is not always as careful as he might be as to his facts. But following his advice to look up in Washington some of the figures reflecting the operation of the Detroit, Toledo & Ironton, which he does not find it necessary to use in illustrating the various points made in his interview, one comes to the further conclusion that as the head of the motor company he is also a good traffic solicitor for the D., T. & I. Having such a traffic solicitor, the D., T. & I. is this year making some money, whereas last year it made deficits; but the recent reports of the road to the Interstate Commerce Commission, which apparently were not made by a press-agent, fail to maintain the same improvement in net earnings which earlier in the year filled the newspapers with accounts of Ford's "railroad miracle."

The credit which the Ford management received for the results of suddenly placing on this road a large amount of Ford tonnage was based largely on comparisons between the earnings of April and the immediately preceding months, and those of the year before when (before the general rate advance) most of the railroads of the country were showing deficits. The reports on file with the Interstate Commerce Commission show a decrease in every month since April in the net operating income, as compared with the preceding month, and for August it was lower than it was during March, the month in which the Ford management took charge. While there has been a large increase as compared with the corresponding period of the year before, before the 40 per cent rate increase of August 26, 1920, the reports show that this is largely due to the increase in gross earnings, the reduction in expenses having been only slightly greater than that made by the railroads of the United States as a whole.

## Net Lower Each Month from April to August

For the six months from September, 1920, to February, 1921, after Mr. Ford had bought the road but had not yet installed the new management, the D., T. & I. had a constant succession of deficits. For March the net operating income was \$77,985. By April the effects of the Ford traffic or the Ford genius were made apparent in a net operating income of \$276,452, which resulted from an increase in revenues of \$258,439, while the expenses increased only \$42,846.

Month	Operating revenues	Operating expenses	Oper. ratio, per cent	Net operating income
March, 1921	\$439,052	\$352,970	80.4	\$77,985
April	697,491	395,816	56.7	276,452
May	744,466	427,338	56.7	263,293
June	713,527	376,383	52.7	261,250
July	744,368	434,294	59.7	187,295
August	763,860	548,246	71.8	70,613
	\$4,101,814	\$3,540,537	61.9	\$1,137,027

The report for April became available about July 1, or about the time Mr. Ford announced his increase in wages and proposed reductions in rates and led to the wide publicity given to statements that Ford had shown an increase in net while increasing wages and reducing rates. For May there was a further increase in revenues, but the expenses also went up and the net was lower than in April; and in each

month since the net has been lower than it was the month before until in August it was only \$70,613, or less than it was in March, although the revenues were greater than in any preceding month and \$324,000 greater than in March. The revenues, expenses and net for the six months of Ford management are shown in the accompanying table.

The report for September is not yet available. All of the other Class I railroads except the Detroit, Toledo & Ironton had submitted their September reports to the commission by November 9, but the road has had some correspondence with the commission asking to be relieved of reporting some of the information called for, in accordance with Mr. Ford's policy of simplifying the accounting.

For the six-months period, it is true, the net operating income was \$1,137,027, as compared with a deficit of \$1,003,-804 for the corresponding months of 1920, but it is also apparent that various factors other than the mere change in management or the application of "common sense principles" were at work. The operating revenues had increased 58.36 per cent, the rates in eastern territory having been increased 40 per cent, and the expenses had decreased 24.2 per cent. The railroads of the United States for the same period showed a reduction in expenses of 22 per cent, but traffic in general did not increase under the new rates like the "flivver" traffic of the D., T. & I., and they had a reduction in revenues. If the 20 per cent reduction in rates which Mr. Ford proposed had been applied to his earnings for the six months they would have been reduced by some \$800,000 and his net would have been reduced to about \$300,000; while the net for July and August would have been completely wiped out, unless, of course, it is to be assumed that Mr. Ford as a shipper would have given his road more traffic at lower rates, in which case his expenses would have been greater than they were.

The reduction in expenses consisted of a decrease of 40.28 per cent in maintenance of way, 34.75 per cent in maintenance of equipment, 9.75 per cent in traffic expenses, 6.50 per cent in transportation expenses, and, strangely enough, an increase of 0.21 per cent in general and other expenses. The increases in wages were in effect during July and August, and the number of bad order cars was greatly reduced in August.

Mr. Ford in his interview says: "We don't claim to have done anything new in railroading—yet," and doubtless he is not personally responsible for all the foolish claims that have been made for him. He says: "We have only taken the old system of operation and cut off the obvious absurdities. We have simply cut out the loafing of men, the loafing of engines and the loafing of cars. The result seems to have surprised many people. But there is no mystery or magic about it. Anyone can do it."

The chief mystery seems to be as to what Mr. Ford means by the "result." The thing that surprised everybody was the statement that for the month of April the road had shown an increase in net income of \$200,000, and the publication of that fact in such a way as to indicate that it had been done under rates reduced by 20 per cent and an increase in wages, when neither had then taken place. The reduction proposed in interstate rates is still under suspension by the Interstate Commerce Commission and the reduction in local rates in Ohio affects very little of the D., T. & I.

traffic. The results that appear in the reports of the road do not reflect the cutting out of any considerable amount of loading, lost motion or "absurdities," although of course the reports do not show everything.

Mr. Ford probably would not like to have his record judged simply from the standpoint of earnings. What the D., T. & I. makes or loses is of comparatively little importance as compared with the part it may play in the development of the motor business. But "almost anyone" could show an increase in net out of an increase of 58 per cent in gross earnings. If he were operating a railroad such as the New York Central or the Pennsylvania, Mr. Ford says, he would immediately set about accomplishing four things. He would "reorganize in such a way as to get rid of the unproductive stockholder," which he has done on the D., T. & I. by taking the stock himself. He would "redesign the rolling stock" and he has conducted some experiments along that line from which he promises some "revolutionary changes." He would "expedite the delivery of freight," and he claims that "by speeding up our freight on this preliminary part of its journey we have been able to shorten the time of its delivery by periods ranging from 7 to 14 days," but apparently there is some question as to whether the speeding up has been done by the D., T. & I. or by its connections.

He would also "discharge unnecessary employees" and he says that "by cutting out the lost motion" the 2,600 people on the payroll of the D., T. & I. had been reduced to 1,500. The record shows that while the road was still under the old management there was a reduction in the number of employees from 2,677 in October, in which month the road handled 55,901,000 ton-miles of freight, to 1,328 in February, when the ton-mileage was only 9,789,000, but that there has since been an increase from 1,326 in March to 1,751 in July, the ton-mileage having increased to 38,217,000. The Interstate Commerce Commission has recently declined a request of the D., T. & I. that it be relieved from filing the usual statistical reports on employees, service and compensation.

Mr. Ford's proposal to "retire the parasite non-contributing stockholders and get the ownership into the proper hands," in order to remove the "dividend drain" is not so easy of accomplishment in most cases as in his own. He suggests that the stock ought to be owned by employees, and many roads have encouraged their employees to acquire stock just as we understand the Ford Motor Company has, but any prominent railroad that showed profits comparable to those of the Ford company would speedily have the dividend drain reduced by regulation; and stockholders who are so "productive" in the way of tonnage as the present owner of the D., T. & I. are not available to every road.

Mr. Ford says that "overweight of rolling stock is the prime mistake on the mechanical side of railroading," that "engines and cars are four or five times as heavy as they should be" and that "a freight train is several times the weight of the load it carries." If the weight of rolling stock were as great as this, the results of his experiments in building a lighter freight car would be awaited with much interest, but the condition is hardly as bad as Mr. Ford pictures it. The latest report of the Interstate Commerce Commission giving operating statistics for Class I roads shows that for eight months of 1921, when the train loading has been less than it is in a year of heavy traffic, the gross ton-miles, including the weight of the locomotive and tender, totaled 559,749,000,000, while the net ton-miles were 222,345,000,000, which would indicate that the cars and engines weigh a little over one and a half times the weight of the load. Excluding the locomotive and tender, the gross ton-miles were 489,402,000,000.

### As To Speeding Up Freight

Neither do all roads enjoy the peculiar opportunity that Mr. Ford does for "expediting the journey of the freight

carrier." He says that "on the D., T. & I. we tolerate no idle men, idle cars or idle engines," and that "freight can be kept moving." This would suggest that he had found a way to improve on the average mileage per freight car per day shown by the railroads generally, which many critics of the roads have often called unduly low. The reports of the D., T. & I. to the Interstate Commerce Commission do show an improvement in this respect this year as compared with last year. From September, 1920, to February, 1921, the average mileage per car per day was 19.2, 17.2, 17.9, 12.1 and 15.8. From March to August, 1921, it has been 27.8, 26.3, 27.3, 25.1, 21.6 and 20.7. For all the roads the average for August was 22.7, which was less than it was a year ago. The decrease from 27.8 in March to 20.7 in August on the D., T. & I., however, does not indicate a speeding up of the delivery of freight on the "preliminary part of its journey." It indicates rather that Mr. Ford's traffic manager is giving his freight to the connecting roads that will deliver it the quickest, and the D., T. & I. is in an excellent strategic position to stimulate competition among them in this respect. A locomotive cannot always be sent to pick up a single car of freight without delay, but most any road is glad to keep one waiting a short time to get a train load.

A newspaper man who is "touring on Henry Ford's railroad" for the Scripps-McRae papers, and telling how Mr. Ford is accomplishing wonders "by common sense and work," explains it this way: "Ford simply plays one line against the other. He says to one big trunk line, 'Give me service and I will give you freight. No service, no freight. I will give it to another line.' The D., T. & I. is such a big feeder that there isn't a single big trunk line that can afford to loaf on the job."

Mr. Ford says that "one of the first things is to dispense with the legal staff" because a "well-managed road needs less of that sort of service" and that this was done on the D., T. & I. "The lawyers are mostly in the claims department," he said, and as the Ford company has its own lawyers and as Mr. Ford is his own largest shipper, we can easily understand why he could reduce the claim department of his railroad.

Mr. Ford greatly prefers to have it believed that the conversion of a deficit into a net operating income represents his improvements on the "present bad system of railroading." In reply to a suggestion that his success was due to the fact that he was able to divert Ford traffic to the D., T. & I., Mr. Ford said: "How can that be true when the road hauled more tonnage the year before we took it over than it has hauled since we have had it? The figures are all in Washington; why doesn't some one look them up? The great majority of the freight which goes over our roads goes over other roads, too." This entirely ignores the fact, which is shown by the figures in Washington, that while the tonnage this year has been less than it was last fall, much of it is a kind of tonnage which the road did not have last year and which but for the Ford Motor Company it would not have this year. While the coal traffic this year has been greatly reduced on the D., T. & I., as on other roads, Mr. Ford has not only given it an automobile tonnage which it did not have before, but the new tonnage pays a much higher rate per ton-mile. The average receipts per ton-mile increased from 1.331 cents in January to 1.833 cents in March and were 1.893 cents in July, as compared with 1.254 for the railroads as a whole.

Mr. Ford says he "doesn't like to appear as criticizing any railroad manager" and that he has "never done so." He is merely criticizing "the present bad system." We have no desire or occasion to criticize Mr. Ford either as a manufacturer or as a railroader. We only wish he would be more particular to tell the truth or to find it out if he does not know it, before he attempts to compare with so much pub-

licity his own "good management" with the "bad system" of the other railroads.

### In a Nut Shell

Comparing Mr. Ford's railroad with all the Class I railways of the United States is like comparing a mouse with a hippopotamus. Since, however, the propaganda regarding the "miracle" worked on the D., T. & I. has invited the comparison, the following facts are presented for what they are worth: Between June and August when Mr. Ford made

his famous changes in rates and wages the total earnings of the D., T. & I. increased 7 per cent, while those of all the Class I railways increased 9.3 per cent. Meantime the operating expenses of the D., T. & I. increased 46 per cent, while those of the Class I railways increased less than 1 per cent. In consequence the net operating income of the D., T. & I. declined over 70 per cent, while that of the Class I railways increased from \$51,640,000 to \$90,241,000, or almost 75 per cent. The increase in net operating income of the Class I roads was mainly due to the reduction of wages of July 1.

## Hearings on Capper Bill in Senate Committee

### Carriers Testify Against Legislation Designed to Destroy Protection of Adequate Revenues

WASHINGTON, D. C.

THE PRESENTATION of testimony on behalf of the railroads in opposition to the Capper bill and other bills proposing the amendment of the Transportation Act to limit the authority of the Interstate Commerce Commission to regulate state discrimination against interstate commerce was begun before the Senate committee on interstate commerce on Monday, November 14. Fred H. Wood, general attorney and commerce counsel of the Southern Pacific, was the first witness for the carriers, taking up the question of the jurisdiction of the Interstate Commerce Commission over state rates. He was to be followed by Alfred P. Thom, counsel for the Association of Railway Executives, and H. A. Scandrett, commerce counsel of the Union Pacific.

The National Association of Owners of Railroad Securities also expects to present testimony and has retained Edgar E. Clark, former chairman of the Interstate Commerce Commission, to represent it in defending the rate-making provision.

Mr. Wood said he did not think the Interstate Commerce Commission had misinterpreted the act or overstepped its bounds in ordering increases in certain intrastate rates; that neither Section 15a, the rate-making section, nor the provision of the Transportation Act relating to state rates increased the commission's authority; that the latter only clarified it and that even had these sections not been enacted, the commission would have been justified in making the orders it did under the doctrines of the Shreveport case. In that case, the Supreme Court held that the Interstate Commerce Commission has authority to regulate intrastate rates where they are found to discriminate against interstate commerce.

"I don't think that there is anything in the law as it stands today or in the administration of that law by the Commission as evidenced by its decisions which would warrant the assumption that the state commissions today are not as a whole perfectly free to adjust individual rates on traffic moving within their own borders to the reasonable requirements of purely state traffic," said Mr. Wood.

In considering the state rate cases, Mr. Wood said the commission had required the introduction of evidence similar to that presented in the Shreveport rate case.

"I shall subsequently review," said Mr. Wood, "one or two of these cases, in a sufficient way to put before the committee the character of the evidence and the contentions that were made. Those cases I think were typical of all and from what I know of the cases in which I participated and of the cases in which I did not participate, but with which I am familiar, I think that without any amendment to the law every one of these orders would be sustained—must be sustained—under the doctrine of the Shreveport case itself.

"My opinion is that neither the general advance rate case before the Interstate Commerce Commission in Ex Parte 74 or these state rate cases would have been fundamentally

different in any particular even if Section 15a had not been enacted.

"The emergency for the general advance in rates in order to restore the credit of the carriers and insure adequate transportation facilities would have been just the same. That emergency would have applied just as acutely to the state traffic as to the interstate traffic with or without the provisions of Section 15a and these resulting discriminations growing out of the advance in the interstate rates and the failure to advance state rates would have been just exactly the same.

"I am safe in saying that, whether the Interstate Commerce Commission was mistaken or not, in every one of these cases it believed that the evidence before it, taken as a whole, was sufficient to justify the order that it made even if there had been no amendment to the Interstate Commerce Act through the operation of the Transportation Act."

Mr. Wood testified that, at the invitation of the Interstate Commerce Commission three members of state commissions, selected by the National Association of Railway and Utilities Commissions participated in the hearings which resulted in the commission's order making a general increase in freight and passenger rates effective on August 26, 1920. He read a letter sent by these commissioners to their national organization in which they reported their concurrence in the commission's action.

"The letter shows," the witness said, "that the decision was just as much the decision of these state commissioners as it was that of the Interstate Commerce Commission."

The real question before the committee, he said, is whether the exercise of jurisdiction by the commission is consistent with public policy and the practical requirements of public regulation. He said that previous witnesses on behalf of the shippers and the state commissions had suggested that the commission found its jurisdiction over state rates in the provisions of Section 15a, but that this was not a fact. In each case the commission did examine the effect on the revenues of the carriers of action or non-action on the part of the states, because the effect on revenues is always a pertinent question in a discussion of the cases, and it had also reviewed its own action in Ex Parte 74 which was based on Section 15a, but this was in accordance with the policy of considering the attendant circumstances.

The commission also had to consider the purpose of the statute as a whole, but it did not rest its control over state rates on Section 15a. It was impossible to present evidence as to each specific rate and cases which have arisen under the Shreveport doctrine have always been based on representative rates. The commission had evidence of specific rates on specific relationships which were representative, and in no case was there contradiction of that evidence, except

as to a few particular rates on which issue was joined. In some cases the commission found that as to these rates the carriers were right and in some that they were wrong and it excluded the particular traffic involved from its order.

The Supreme Court, Mr. Wood said, has not undertaken to define the limitations of the commission's jurisdiction as it existed before the new law. The prohibition against discrimination against persons, localities and descriptions of traffic, he had always thought was all-embracing. The new law simply added the words "or interstate commerce." This he considered a valuable addition even if there was no intention to add to the commission's jurisdiction because it indicated the intention to make it clear that the prohibition against discrimination was all-embracing. If the previous language was not all-embracing, the new language in Section 13 was wise, because it is unthinkable that we may have effective regulation of commerce unless the federal tribunal does have power to remove any discrimination against interstate commerce which it finds.

Senator Cummins suggested that the state commissioners and those who agree with them say that no evidence was presented to the federal commission except that the state rates were lower than the interstate rates. Mr. Wood said that such a statement is most incorrect and that he would endeavor to show before he concluded his testimony that the facts regarding the various state rate cases were not as they had been represented to the committee by previous witnesses.

To take away from the Commission its existing authority to deal with the transportation question as a national problem and prevent discriminations against interstate rates would result in chaos, inadequate revenues for the carriers and in inadequate transportation at a time when the country is undergoing economic readjustment, Mr. Wood said:

"The suggestion," said Mr. Wood, "that by reason of the provisions of the Transportation Act state rates have been frozen and the states deprived of the power to adjust individual rates within their own borders to the legitimate requirements of state commerce is without foundation.

"Regulation of interstate commerce and its instrumentalities presents a national problem. As to it, there are certain fundamental matters which must be decided by the national government as a national policy. These are the general level of rates necessary to provide adequate transportation for the country as a whole and the prevention of undue discrimination in favor of the persons of one locality or state as against another. There is no more loss of dignity or of states' rights in a statute which requires the states to conform to these fundamental requirements according to the national standard, leaving to the states the adjustment of rates within the states where they do not impugn the national program, than there is in the supervision exercised by the federal courts over the action of state courts on matters likewise arising under the Constitution.

"The removal of the commission's power would also retard the orderly liquidation of freight rates in response to such reduction in operating costs as may be brought about and in thus extending to the country the maximum benefit of downward revisions of rates in the necessary economic readjustment. With the carriers' wage bill alone for the past year substantially equivalent to the entire gross revenues of 1916 or 1917, a restoration of a pre-war level of rates as a whole cannot be expected for a long time to come. The nation's economic readjustment requires that such reductions in rates as may be possible in response to reduced operating expenses should be placed where they will do the most good. By the restoration of pre-war statutory passenger fares or by reduction in passenger fares to a lower level than now exists the opportunity to reduce freight charges in the interest of commerce and of the people as a whole would be greatly diminished. This is one of the results that would follow by withdrawing from the commission its existing authority

or requiring a cancellation of its orders by legislative enactment. To the extent that state commissions whittle away revenues from freight traffic by reductions in rates the opportunity in an orderly way to make such reductions on interstate traffic in basic commodities is likewise diminished.

"If reduction in freight rates is to be made an effective instrument in the economic readjustment orderly and harmonious action looking towards placing of these reductions where they will do the most good is necessary and cannot be accomplished as long as a large proportion of the states insist upon the maintenance of rates which reduce revenue and result in discrimination against interstate commerce.

"The carriers are already assuming as much of the burden of the economic readjustment as they can stand. By loss of traffic and by many reductions in rates to meet economic conditions their revenues are today far below the standard required for the maintenance of adequate transportation facilities. It is as essential that they should come out of this period of economic readjustment as solvent institutions and with a reasonable assurance of established credit as it was at the time that the Transportation Act was passed.

"No single act upon the part of Congress would be as severe a blow to the rational regulation of transportation charges for these purposes as the removal from the Interstate Commerce Commission of the existing power to bring into harmony that which ought to be brought into harmony, to see that out of all of its traffic the carriers' revenues reach that standard which, when the economic readjustment is complete, the interests of the country demand they should reach, and to remove the undue discriminations against interstate commerce which would result from freeing the states from all supervising control or limiting the jurisdiction of the Commission so that it could not act as the practical requirements of the situation demand."

From the New York Tribune

Isn't It Rather Dangerous Not Having the Two Hitched Together Some Way?

*Large Modern Tunnels Have Been Constructed*

## C. & O. Improves Line and Grades at St. Albans, W. Va.

### Increased Coal Traffic Necessitates Rebuilding of Important Branch for Mallet Operation

**T**HE CHESAPEAKE & OHIO has, for some time past, been facing the problem of handling efficiently the increasing traffic originating in those sections where coal is almost the only tonnage moved. This is particularly true in the vicinity of the more newly developed fields of the Kanawha and Logan districts where a major portion of that road's coal traffic is obtained. This condition is now being remedied, in accord with the more pressing needs, by con-

in each direction. This replaces an old line having grades of one per cent against loaded traffic and 2.0 per cent against empty movement and also shortens the haul by about three-quarters of a mile. In place of the nine highway crossings on the old line, all of which were at grade, there are now only two, neither of which is at grade. These necessitated the construction of one under crossing and one highway bridge. Two tunnels, one 1,500 ft. long and the other 300 ft., were required.

**Permanence in Construction Marks This Highway Under-Crossing**

siderable grade and line revision and some double tracking, all of which will materially speed up the movement through this section. It will then be possible to use Mallet locomotives, to secure longer hauls and heavier train loads and to dispense with helper service.

The construction described in this article is concerned with the revision of the grade and line on a part of the Coal River branch connecting with the main line at St. Albans, W. Va., near which city most of the work was done. Slightly less than four miles of new single track line has been constructed with maximum grades of 0.20 per cent compensated

The Coal River branch serves a part of the Kanawha district, the territory often being designated as the Coal River district. It extends south from the main line for a distance of approximately 60 miles and contains about 164 miles of line. Leaving St. Albans, the line follows Coal river to the town of Sproul, W. Va., about 15 miles distant and a junction point for two lines running back into Boone, Logan and Raleigh counties. The river also splits at this point into two streams known as Big and Little Coal rivers along which the two branch lines follow generally. The Kanawha and Logan fields, of which this section is a part, are the newest fields along the Chesapeake & Ohio. The coal produced is highly volatile and makes up about 60 to 65 per cent of the road's total coal tonnage. The development in this territory in the past has been chiefly of an extensive nature. The growth of the traffic in this district has been rapid with the result that the existing line was offered, under ordinary circumstances, as much or more traffic than it could handle. Of the various sections lying within the district mentioned the resources of Boone county are perhaps the least developed and as a future source of supply are of immense importance. Areas containing many thousands of acres have not as yet been touched and tests in these areas have shown them to contain coal in abundance and of the finest grade.

Today about 71 mines along the lines of the Coal River branch deliver coal to the Chesapeake & Ohio, all of which must pass out onto the main line at St. Albans. In addition

brought along with the heading. At the same time a heavy cut leading to the west end was excavated to grade and carried up practically to the location of the west portal. The finishing of these two pieces of work left a wall of sandstone running from side to side of the cut and up to the height of the tunnel springing line. This was removed last. In bringing the bench through from the east, considerable difficulty was experienced with the large amount of water which seeped out of the tunnel walls. On the morning following

The Portal at the St. Alban's Tunnel Where the Old and New Lines Diverge Before Entering the Town

the removal of the rock at the portal, no signs of water were seen. The unusual character of this development brought about a hurried inspection of the situation which disclosed the fact that the steam shovel in the tunnel was tipped partly on one side and was leaning against the wall plates and also that about 320 ft. of the west end of the tunnel had been subjected to a severe strain. The 12-in. by 12-in. segments on the arch of the tunnel timbering had been sprung or bent, some were even broken and nearly all in the 320-ft.

Clearing Out the Bench in the St. Alban's Tunnel

section showed that they were under heavy pressure. The springing lines had been squeezed in about 6 in. and tests revealed that they were still moving slightly. The hard sandstone subgrade of the tunnel had been heaved up about 1½ ft. and was also moving slightly.

As in the case of the short tunnel, cross bracing was installed and, believing that the removal of the rock across the entrance had in a measure been the cause, the men in charge started immediately on the construction of the portal. The portal was excavated down to a depth of about 6 ft. below

subgrade and when it was poured, a 4-ft. by 6-ft. concrete beam, reinforced with old rails and tied in with the side walls, was poured integrally with it. When this was completed all movement ceased. Two additional reinforced beams of the type used at the portal were poured at the west end in conjunction with the lining of the tunnel while the remainder of the 320-ft. section was reinforced by the construction of a concrete "invert" having a maximum depth of 2 ft. 2 in. and a minimum depth of 1 ft. 6 in. under the wall plates. This required an excavation of about 4 ft. by drilling and dynamiting as the heaving did not seem to have disturbed the formation of the rock. The invert as well as the arches of the lining were reinforced with wire mesh extending up into the side walls which were given a batter of one ft. inward as an additional precaution. This batter is shown clearly in one of the photographs. Because of the way the old timber lining was being stressed at many spots the concrete was poured around the cross bracing which was left in place until the concrete had set. They were then cut out and the holes filled.

The tunnel on the old line had a clear width of 16 ft. between side walls and an overhead clearance of 16 ft. above top of rail. It was also on an eight-degree curve and this factor, in connection with the measurements, made it unsafe to operate Mallets through it. The new tunnel section measures 18 ft. between side walls and 23 ft. above subgrade or approximately 21 ft. above the top of rail. Except where the "squeeze" occurred the concrete was poured one foot thick over the timbers, which were almost uniformly 12-in. pieces backed by 4-in. lagging, thus giving a maximum thickness of concrete of about 2 ft. Where the "squeeze" occurred the width or thickness of the wall at the subgrade was increased to give the one foot batter mentioned. The pouring of the portals and the tunnel lining was handled from concrete plants set up near one portal of each tunnel. The concrete was carried in and placed from scaffold cars.

Other work in connection with this grade and line revision included the construction of a steel overhead bridge, a concrete undercrossing carrying both a street and an electric car line, a drainage system, a four-track yard adjacent to the present station facilities and a new highway to follow certain stretches of the old roadbed.

The work was planned by and carried out under the direction of the engineering department of the Chesapeake & Ohio, C. W. Johns, engineer of construction, and E. G. Rice, resident engineer, in direct charge of the field work. The Boxley Brothers Company, Orange, Va., was the contractor for the construction.

## Freight Car Loading

WASHINGTON, D. C.

THE VOLUME of railroad freight traffic, as measured by the weekly car loading reports compiled by the Car Service Division of the American Railway Association, has apparently passed its peak for this year, after having exceeded that for the corresponding weeks of 1919 for two weeks although not having quite reached the figures for 1920. The curves showing the loading for the past four years show a steady increase from spring to fall ending during the last week of October in the last three years, although the decrease began considerably earlier in 1918.

Loading of revenue freight totaled 829,722 cars during the week ended on November 5, compared with 952,621 cars during the previous week or a reduction of 122,899. This was 85,893 cars less than were loaded during the corresponding week of 1920 but 2,998 cars more than were loaded during the corresponding week in 1919.

While there was a reduction in the loading of all commodities compared with the week before, the principal de-

crease was in coal and merchandise and miscellaneous freight, which includes manufactured products. The decrease in traffic was to some extent due to the observance of two church holidays during the week.

Loading of merchandise and miscellaneous freight amounted to 515,894 cars which was 62,684 cars less than during the week before but was 10,000 cars in excess of the loading of that commodity during the corresponding week last year. It was, however, 16,778 cars less than were loaded during the corresponding week in 1919.

A decrease of 34,818 cars, compared with the week before, was reported for coal, the total being 172,875 which was, however, 30,945 cars less than were loaded during the same week last year but 60,758 cars more than during the same week in 1919. Ore loadings also dropped off 7,230 cars within a week, the total being 10,979.

Grain and grain products, according to the report, amounted to 40,921 cars, a reduction of 8,028 cars compared with the week before but 4,698 cars more than were loaded during the corresponding week last year and 1,700 in excess of that week in 1919. Livestock also declined 6,379 cars to a total of 31,126 which was, however, only slightly under the total for the corresponding week last year while forest products with a total of 51,188 cars was 3,160 less than the week before.

Coke loadings were 6,739 cars, 600 less than the previous week.

Compared by districts, reductions in the loading of all

commodities were reported both compared with the week before and the corresponding week in 1920.

The number of surplus freight cars for the week ending November 1 averaged 80,203, a reduction of 19,768 as compared with the week before. This included 22,628 box cars, a reduction of 3,996, and 33,643 coal cars, a reduction of 16,265.

Refrigerator equipment continues to be in strong demand. Loading in the Puget Sound district, principally apples, is in excess of last month and much in excess of last year. Other Western districts continue active loading. Citrus fruit is moving from Florida in increasing volume. All car requirements are being satisfactorily met. The box car supply is ample at all points to meet requirements, which remain comparatively heavy and the coal car supply is about equal to the requirements. Shortages which existed during the past few months of exceptional demand have been eliminated almost entirely.

The number of bad order cars on November 1 was 345,201, or 15 per cent, a reduction of one-half of 1 per cent as compared with October 15.

The number of surplus cars for the period November 1 to November 8, however, shows an increase to 93,172, of which 34,737 were coal cars and 32,747 were box cars. There were shortages amounting to 4,600 as compared with over 11,000 the week before.

The summaries for the weeks of October 29 and November 5 follow:

#### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

# The Legal Status of a Railroad Strike\*

## Interference with Service Under Present Conditions Is Against the Government Instead of Against Corporations

By James C. Davis  
Director General of Railroads

IN PRESENTING THIS PAPER it should be distinctly understood that it is done in a wholly personal way, and is not in any wise connected with any official position I may hold, and whatever opinions I express or statements I make are entirely on my own responsibility. It is further only fair to say that in some 20 years of railroad corporate service I have always maintained the most liberal and progressive ideas in the matter of the rights of organized labor, firmly believing in the same right of labor to organize for the protection of all lawful rights, by either defensive or offensive action, that capital might have, and that I freely subscribe to the doctrine that "the labor of a human being is not a commodity or article of commerce." But, over and above all these considerations, I have an abiding belief in the settlement of all disputes, especially those involving the rights and responsibilities connected with public service, by some legally constituted authority, with power on the part of the government to enforce the orders and findings of those public tribunals charged with the power to settle disputes arising between employers and employees, where these employees are engaged in the service of what might be termed public service corporations.

### Transportation Act Marks a New Era

The passage of the Transportation Act of 1920 marks a new era in the great question of the public control of our national system of railroad transportation. While this law may perhaps be subject to just criticism in some particulars, taken as a whole it is the most constructive piece of legislation ever enacted by Congress on this subject.

In considering the railroad question in any of its phases, the rapid growth of this great industry, and the varied aspects of public opinion and public legislation as the industry has progressed, must always be considered. Next to agriculture, it is the greatest commercial activity of this country, practically brought into existence within the memory of men now living.

It was in the experimental stage from 1830 to 1850. From 1850 to 1875 the science of railroad building was rapidly developed; great projects were created and executed, and during practically all of that period the railroads were generally recognized as private property, there being little or no regulation by either state or national governments. During that period the construction of new roads was aided and encouraged by the federal and state governments, counties and cities, and in every other form of possible public and private aid. In 1876 the United States Supreme Court sustained the right of the national and state governments to control, in the matter of charges, public service corporations, the states being limited to local and intrastate service; the federal government being supreme in the realm of interstate commerce.

From that time down to the period of federal control there was a perfect flood of state and national legislation, much of it enacted without any fair consideration, and the regulation of railroads by the various governmental bodies in the states and in the nation became so multiplied that by the

commencement of federal control the railroads were engaged in a desperate struggle for existence.

Following the 26 months of federal control ending February 29, 1920, and as a preface to the return of the property to its owners, Congress enacted the Transportation Act of 1920 (approved February 28, 1920). This enactment may be fairly described as the only real constructive legislation attempted by Congress in the matter of railroad regulation which in any substantial way contained provisions looking to the property rights of the owners of the interstate lines of transportation, all former legislation having for its object the regulation of rates and operation in the interest of the public and the railroad employees.

This act in great detail increased the specific authority of government control. In the matter of rates, the power to reduce charges as well as increase them is taken from the carriers. A substantial control over local or intrastate commerce is granted to the Interstate Commerce Commission, when such local rates made by state authorities cause an undue or unreasonable preference or prejudice as between persons or localities engaged in interstate commerce, or discriminate against interstate commerce. The commission is given very wide authority in the matter of permitting pooling of earnings, distribution of freight equipment, consolidation of companies, and joint use of terminals; in fact, control in the most minute details of operation is granted to the commission under this law.

In other sections of the law there is created a national "Railroad Labor Board." This board is composed of nine members—three members selected by the President from nominations made by the organizations of labor; three members appointed by the President from nominations made by the carriers, and three members appointed by the President as representatives of the public.

This board is given general authority to hear "and with diligence decide" disputes growing out of rules of working conditions, and is further authorized to hear "and with diligence decide" all disputes with reference to the wages and salaries of employees and subordinate officials.

The Labor Board has construed its power under this act to extend to the control of all changes in wages, and that no changes in existing contracts or rules can be made by the interstate carriers under its jurisdiction except upon approval of the board. In the recent strike controversy in which the principal railroad labor organizations were engaged, the Railroad Labor Board made, in part, the following order:

But, at this time, and while the matter is so intensely before the public, of all, the board deems it expedient and proper to make its rulings and positions on some of the points involved so clear that no ground for any misunderstanding can hereafter exist.

First—When any change of wages, contracts or rules previously in effect are contemplated or proposed by either party conference must be held as directed by the Transportation Act, and by rules or decisions of the board promulgated by the board, and where agreements are not reached dispute must be brought before this board, and no action taken or change made until authorized by the board.

By this plain and unequivocal language the Labor Board assumed complete control and jurisdiction over all changes in wages, rules, or working conditions.

If the language of the Transportation Act receives the construction which these words seem to imply, and the construction which the tribunals charged with its enforcement

\*Address before the Knife and Fork Club, Kansas City, Mo., November 18, 1921.

have placed upon it, then, since the return of the railroad property at the end of federal control to the several corporations owning same, the interstate carriers have absolutely no power over the rates they can charge for services or the wages they shall pay out in operation, and any complaint as to rates or wages is a complaint against governmental authority rather than against corporate action, and, if the complaint is as to rates, it is lodged directly against a finding of the Interstate Commerce Commission, while if the complaint is in the matter of wages, it is lodged directly against rules or orders of the Railroad Labor Board.

### Strikes Against Government, Not Corporations

Therefore, a strike against rates, if a strike of this kind could be possible, is against the rules and regulations of the Interstate Commerce Commission, and a strike against wages or working conditions and rules is likewise a strike against rules or decisions of the Railroad Labor Board. In other words, future strikes are directly against orders or findings of the government, represented by the Railroad Labor Board, and are strikes against a situation for which the corporations are not responsible, and which the corporations are absolutely helpless to correct.

In considering the rights of the public in a railroad strike, and especially the duties and obligations of the men engaged in railroad service, a sharp distinction must be drawn between men engaged in private service and those engaged in what might be termed quasi-public service. The latter would include men employed in railroad transportation, street railways, public lighting and water companies, and perhaps those engaged in the production of essentials to the life of the nation, such as coal. These men are quite comparable, as to the nature of their employment, to mail carriers, firemen and policemen.

In the case of interstate railroads, the public, represented by the United States government, has such an interest in the continued and uninterrupted operation of these public ways, involving not only the comfort of all the people and the existence of commerce, but the lives of many helpless men, women and children, that no organized or combined effort to interfere with or block the channels of interstate commerce should be permitted, and, in addition to the foregoing considerations, it is the public that eventually pays the bill for the expenses necessarily incident to railroad operation, an item of importance which, in wage controversies, is ordinarily given scant consideration.

The Supreme Court of the United States, in the case popularly known as the Adamson Law Case (*Wilson vs. New*, 243 U. S., 333), clearly recognized and announced the doctrine that men engaged in railroad operating service were subject to certain public duties and obligations not present in private employment, and could not, by combined organization, interfere with the freedom of interstate commerce, or the transportation of the United States mail. Commenting on the power of Congress to regulate carriers, the court held that there also existed the same power of Congress to regulate employees engaged in such service, the court saying, in the course of the opinion:

As to the employee. Here again it is obvious that what we have previously said is applicable and decisive, since whatever would be the right of an employee engaged in a private business to demand such wages as he desires, to leave the employment if he does not get them and by concert of action to agree with others to leave upon the same condition, such rights are necessarily subject to limitation when employment is accepted in a business charged with a public interest, and as to which the power to regulate commerce possessed by Congress applied and the resulting right to fix in case of disagreement and dispute a standard of wages as we have seen necessarily obtained.

In other words, considering comprehensively the situation of the employer and the employee in the light of the obligations arising from the public interest and of the work in which they are engaged and the degree of regulation which may be lawfully exerted by Congress as to that business, it must follow that the exercise of the lawful governmental right is controlling.

This opinion definitely declares that the obligations to the

public of the railroad corporations and their employees are alike, in that both the corporations and the employees are bound to recognize and respect the public nature of their employment, and these public obligations are emphasized when we consider that the public service corporations are obliged to continue to furnish services whether they make or lose money, and that the great and controlling interest in the operation of interstate transportation plants is the duty to the public rather than the interests of either the corporations, as such, or the men who are in the service of such companies, and it is this controlling and paramount interest of the public which up to this time in many railroad strikes has either been ignored or given slight consideration.

I believe it is a fair statement of the law to say that railroad corporations having been entirely deprived of the right to fix their own compensation for services, or the right to adjust the cost of operation in the way of wages or working rules or conditions, railroad strikes in the future are against the government, by reason of the fact that such strikes will be directly against rules laid down by public tribunals over which the corporations have no control, and, in this situation, it is of paramount interest at this time to consider the power which the government has to protect this authority which it has undertaken, and the responsibility which the government should exercise in seeing that the orders of the Labor Board are respected and carried out.

### The Debs Case Decision

In 1894 there was a strike in the Pullman Company. The employees of the great interstate railroads hauling sleeping cars, in sympathy with this strike, refused to handle Pullman cars. Richard Olney, the then attorney general of the United States, under the direction of the then President, Grover Cleveland, obtained an injunction in the United States district court at Chicago against Eugene Debs and other controlling officers of the labor organizations engaged in the strike, enjoining Debs and his associates from interfering with the operation of the railroads engaged in carrying the mails and in interstate commerce. The officers of the various unions refused to obey the decree of injunction. They were found guilty of contempt by the court issuing the decree, and sentenced to imprisonment in the county jail for periods ranging from three to six months.

A writ of *habeas corpus* was sued out to test the legality of this punishment, and in an opinion of the Supreme Court of the United States, announced by the late Justice Brewer, the conviction and punishment of these men for violating the injunctive order of the court was sustained.

In the light of the present situation, this opinion of the court is very illuminating. The court, in sustaining the conviction, not only sustained it because of statutory provisions, giving the government power over the transportation of the mails and interstate commerce, but also rested its opinion upon the broad ground of the power of the government to protect the exercise of governmental functions, and further decided that there was a governmental duty to see that the great highways of interstate commerce were kept open and free from interference, and that the United States mails could be carried without interruption.

The court, in the course of its opinion (in *Re Debs*, 158 U. S., 584), said:

Every government, entrusted, by the very terms of its being, with powers and duties to be exercised and discharged for the general welfare, has a right to apply to its own courts for any proper assistance in the exercise of the one and the discharge of the other, and it is no sufficient answer to its appeal to one of those courts that it has no pecuniary interest in the matter.

Again, the court said:

It is obvious from these decisions that while it is not the province of the government to interfere in any mere matter of private controversy between individuals, or to use its great powers to enforce the rights of one against another, yet, whenever the wrongs complained of are such as affect the public at large, and are in respect of matters which by the Constitution

are entrusted to the care of the Nation, and concerning which the Nation owes the duty to all the citizens of securing to them their common rights, then the mere fact that the government has no pecuniary interest in the controversy is not sufficient to exclude it from the courts, or prevent it from taking measures therein to fully discharge those constitutional duties.

Again, the court said:

The national government, given by the Constitution power to regulate interstate commerce, has by express statute assumed jurisdiction over such commerce when carried upon railroads. It is charged, therefore, with the duty of keeping those highways of interstate commerce free from obstruction, for it has always been recognized as one of the powers and duties of a government to remove obstructions from the highways under its control.

This opinion definitely decided that the government has the right to appeal to its own courts in the protection of proper governmental rights, and that the duty of keeping the interstate highways free from obstructions and in operation is a governmental duty which should be recognized and enforced.

### Clayton Act

Following this decision, many conflicting decisions were made by state supreme courts and some federal courts as to the facts and circumstances which justified a court of equity in issuing the extraordinary writ of injunction in controversies growing out of labor strikes. This led to the enactment by Congress of what is known as the Clayton Anti-Trust Act (approved October 15, 1914). This act was amendatory of the Sherman Anti-Trust Act, and contained the oft repeated declaration that "the labor of a human being is not a commodity or article of commerce." It in effect legalized "labor, agricultural and horticultural organizations instituted for the purpose of mutual help," and further prohibited restraining any such organizations "from lawfully carrying out the legitimate objects thereof," and also contained the following provision:

Nor shall such organizations be held or construed to be an illegal combination or conspiracy in restraint of trade, under the anti-trust law.

Section 20 of this Clayton act, in effect, practically prohibited the issuance of a writ of injunction in dispute between employers and employees.

It must be noted as very controlling that the restrictions of the Clayton act in favor of labor organizations apply only to direct controversies between employers and employees, and do not apply when the controversy is with a third person, other than the employer or the employee.

Therefore, in controversies which are instituted by parties other than employers or employees, as to the issuance of injunctions, the provisions found in the anti-trust laws will apply.

An important proposition as to the jurisdiction of cases brought under the provisions of this law is that an action may be commenced in any district where one or more of the defendants can be found, and, upon proper order of the court, persons residing in other districts may, by subpoena, be made defendants and brought within the jurisdiction of the court.

The Supreme Court of the United States, as late as January 3, 1921, construed the Clayton act as applied to the issuance of injunctions against labor organizations. The Duplex Company, a manufacturer of printing presses, located in Battle Creek, Michigan, brought an injunction suit against the International Association of Machinists and Michael T. Neyland, business agent and representative of Local Lodge No. 328, with headquarters in New York. A strike of machinists, members of this national association, had been in progress at the Michigan plant, and this action was brought in the state of New York to prevent members of the same order from carrying on what is termed a "secondary boycott," in the way of interfering with the installation of the Duplex Company's printing presses in New York City.

The court sustained the injunction (*Duplex Co. vs. Decring*, 254 U. S., 443), and in the course of the opinion, re-

ferring to the provision of the Clayton act exempting labor unions from injunction, said:

But there is nothing in the section to exempt such an organization or its members from accountability where it or they depart from its normal and legitimate objects and engage in an actual combination or conspiracy in restraint of trade, and by no fair or permissible construction can it be taken as authorizing any activity otherwise unlawful, or enabling a normally lawful organization to become a cloak for an illegal combination or conspiracy in restraint of trade as defined by the anti-trust laws.

The court further held that the act did not apply because the controversy in question was not directly between employer and employee.

### Government Responsible

It would, therefore, seem quite clear that, in the event of a general strike, where any combination of members in a great, powerful railroad labor organization seeks, by an organized cessation of labor, to paralyze the service of railroads engaged in interstate commerce, and prevent them from complying with their public duties in the matter of carrying mails and interstate commerce, the United States government, at the relation of the attorney general or other proper governmental representative, has the right to apply to a court of equity for a writ of injunction, enjoining such employees from combining and conspiring to interfere with interstate commerce, and, upon violation of such orders, the court may inflict punishment upon those guilty of disobedience of same, by fine and imprisonment, as was done in the Debs case.

It further seems entirely clear that the government, having deprived the carriers of the right to adjust on their own motion, these disputes, the dispute arising solely because of governmental action, the controversy then becomes one for which the carrier is not responsible, and that the responsibility not only of adjusting the controversy but of protecting the public right of operation rests with the government, and the government must of necessity assume the burden of the settlement of the dispute, and that strikes in the future on all interstate railroads become controversies between the government and the organizations bringing about the strike.

There must be no misconception of this power of the government, or the circumstances under which it should be exercised. There is not now and never will be involuntary servitude in this country. The right of an individual to quit work upon his individual responsibility, should not be questioned. The legality of labor organizations, as such, is fully protected, but when such organizations, in combinations or conspiracy, seek to interfere with and prevent the free exercise of governmental functions,—and the duty to carry the mails and to protect the free and uninterrupted flow of interstate commerce are public duties and functions,—then the rights of the great helpless public intervene, and the government, as the representative and trustee of these rights, must assume the responsibility of protecting them, and take the proper measures to enforce the freedom of the performance of governmental duties by interstate carriers.

On the other hand, the carriers should be held to the same measure of obedience and respect for the findings of duly authorized public tribunals as is required of employees, and the authority of the government should in every instance be exercised to the limit to bring about such obedience and respect.

It appeals to me that this is a logical and fair interpretation of the law as it is now written.

In recovering from the devastating effects of the World War, civilization may well be said to be on trial. No greater catastrophe can be imagined in this country than a prolonged and concerted railroad strike. It means not only the entire disorganization and paralysis of business, with the irreparable financial loss attending same, and this loss must be met by persons who are not responsible for the strike, but, if carried on for a sufficient length of time, it means suffer-

ing, starvation, and often death to the helpless, especially women and children.

Should there not be in this country a sufficient respect for law and order to prevent misfortunes of this character? Is there not sufficient patriotism in all classes of our citizens to say that America will show not only to herself but to the world that civilization in this country is not a failure; that the power of the law is supreme, and that in these controversies, involving so vitally the public interest, we are and will be a government of law and order, and not go back to the wager of battle, to trials of strength, to the tooth, the claw, and the club?

I am always an optimist. I know the people of this country will never write "failure" as to our form of government. What we need in these labor controversies is patience and courage,—a struggle by all good citizens to see the very right of these things while these intricate propositions are being worked out.

I have an abiding faith that the same courage, patriotism, spirit of sacrifice, and love of country and fair play that saved civilization in the great World War will again assert itself, and that the American spirit of love of fair play and respect for law and order will in the end prevail.

## Executives Propose a Temporary Freight Rate Reduction

THE ASSOCIATION OF RAILWAY EXECUTIVES has been proceeding with the plan announced after its meeting in Chicago on October 14, of seeking further wage reductions with a view of reducing freight rates by a like amount, just as if no obstacle to the carrying out of the plan had been interposed by the methods used by the Labor Board to induce the brotherhood leaders to call off their threatened strike. Although the Board has indicated that no consideration can be given to further wage reductions until other matters on its docket have been disposed of, and although the labor leaders have chosen to represent this to their members as a sort of promise that nothing further will be done to their wages for several months, the railroads have announced their plans for taking the formal steps to initiate a wage controversy to be later submitted to the Board in a way to indicate that if there is any delay it will not be their fault. They have also resumed their negotiations with the Interstate Commerce Commission regarding the rate situation, in accordance with their promise to translate at once any wage reductions that may be allowed into rate reductions with the concurrence of the Interstate Commerce Commission. While the labor leaders have referred to a "promise" by the Labor Board, the Board's own public utterances have gone no further than a statement of fact regarding the condition of its docket; and no one at Washington knows of any promise or pledge having been made by anyone. Moreover the demand for rate reductions has been by no means abated because of the Board's announcement that it cannot take up a wage case for some time.

At a meeting of executives in New York on November 10, Alfred P. Thom reported the results of his conferences with the commission, and on Saturday, November 12, the executive committee of the association, accompanied by a number of traffic executives, held a four-hour conference at Washington with the commission. After meeting together for some time the railroad men withdrew for a brief conference among themselves, and after they had rejoined the commissioners the latter in turn withdrew for a short time. The joint conference was then resumed; but neither the railroad men nor the commissioners would give any information of its nature. Evidently all decisive action was deferred pending further conferences this week.

On Wednesday the executives met in New York and at the close of the meeting Chairman T. DeWitt Cuyler announced a temporary reduction in freight rates and a proposal for a general reduction in employees' wages. He said:

"The executives of the railroads of the United States have determined to make for a period of six months an immediate reduction of 10 per cent in carload freight rates on farm products, any reduction in such rates made since September 1, 1920, to be constituted a part of such 10 per cent., this reduction to be put in effect without waiting for a reduction in wages (except on traffic moving wholly within New England).

"The reductions already made since August, 1920, involve an estimated loss of revenue at the rate of \$175,000,000 to \$200,000,000 annually. . . . The railroads are awaiting decisions of the Labor Board which it is hoped will relieve the companies from the expense of many onerous and uneconomical working conditions.

"The railroads are not in a financial position to make this sacrifice. Unless there should be some revival in business the entire immediate loss involved in this proposed reduction would be taken from net earnings. . . . The railroads are relying upon the public for effective aid in bringing about the necessary reduction in labor and other costs, and are hoping for the co-operation of labor itself to that end. They have taken the first step in relieving existing business depression and have given an earnest of their fixed purpose to reduce rates and to relieve at the earliest practical moment, as far as reasonably possible, the transportation burden on the public."

The resolution covers carload rates on wheat, corn, oats, other grain, flour and meal, hay, straw and alfalfa, unmanufactured tobacco, cotton, cotton seed and products (except cottonseed oil and cottonseed meal), citrus fruits, other fresh fruits, potatoes, other fresh vegetables, dried fruits and vegetables and live stock.

If a general reduction of wages and labor expenses is put into effect prior to the expiration of the experimental period, the limitation of six months is not to apply.

### Action to Reduce Wages

The proposed general reduction in wages of employees was announced in notices sent out this week by each road to the chairmen of the different employees' organizations. The notices call for a conference between officers of the roads and representatives of the employees' organizations, and say that the date of the conference is to be fixed later.

There is a general impression that the reduction to be proposed by the roads will be 10 per cent; but nothing has been said as to what classes of employees this rate will apply to, or what differences may be proposed as between the train service men and those engaged in work requiring fewer skilled men. The resolution as adopted requires the necessary steps under the law to be taken as promptly as possible "with the understanding that concurrently with such reduction in wages the benefit of the reduction thus obtained shall, in a manner approved by the Interstate Commerce Commission, be passed on to the public in the reduction of existing railroad rates except insofar as such reductions in rates have been made in the meantime."

The executives also voted to ask the Interstate Commerce Commission for a rehearing of the hay and grain case and for a general inquiry to ascertain whether until a substantial reduction can be secured in the labor and other costs of operation any further reduction in rates could lawfully be required, or, with due regard to the transportation industry, is possible.

RECENT CENSUS STATISTICS in England show that 79 per cent of the population lives in urban districts.

# An Analysis of the Freight Car Situation

It Would Appear That the Pooling of Freight Car Equipment  
During Federal Control Was Anything But a Success

By John E. Muhlfeld

IN A LETTER under date of April 29, 1920, written by L. F. Loree, president of the Delaware & Hudson Company, to E. N. Brown, chairman of the committee of the Association of Railway Executives (of which committee Mr. Loree was a member) appointed to recommend to the Interstate Commerce Commission the purposes for which loans should be made from the \$300,000,000 fund created by the Transportation Act of 1920, Mr. Loree set out many pertinent facts relating to the then ineffective loading, movement and upkeep of existing freight train equipment as an argument against the expenditure of large sums for the purchase of additional

with what obtained prior and subsequent thereto. Summing the figures in their entirety, they would seem to indicate that the roads as a whole, while they have made great progress, have not as yet recovered from the effects of government control and the many inequities permitted thereby. The following brief analyses of the graphics show that these improper practices were directly reflected with the return of the roads to corporate control and that the carriers are now bearing the burden of the United States Railroad Administration having fooled not only itself but everyone else who believed in its methods.

**Per Cent Loaded to Total Cars.** This factor shows decidedly in favor of corporate control. The low marks in May, June and July, 1918 and 1919, can be attributed to the practice of the U. S. R. A. rushing cars promiscuously to points of loading to take care of seasonal movements, disregarding largely the demand for such equipment in territories where it might be loaded, and entirely the factor of car efficiency. The low point in December, 1918, and January, 1919, can be attributed to the falling off in loading after the Armistice during the readjustment period, as per diem was abolished and there was, therefore, no necessity for moving cars when not needed unless upon orders of the Car Service Section. The extremely low figure in January, 1921, was the result of business depression and the relocation of equipment by corporate management to avoid the payment of per diem and is emphasized by the fact that this line crosses the line of "Per Cent of Ownership Cars on Home Lines" in the latter's ascendancy.

**Per Cent of Ownership Cars on Home Lines.** We have here a very clear illustration of what the effect of government ownership and the abolition of per diem would result in; this particular factor means a tremendous financial loss to the carriers of the country in the way of service performed in empty car mileage made necessary to favorably influence per diem balances and to secure return of equipment to owner's rails. On March 1, 1920, when the roads were returned to corporate management, there were only 21.9 per cent of ownership cars on home lines and coal cars needed for loading on ownership lines in the East were held empty on foreign lines in the West, while box cars needed on ownership lines for loading in the West were held empty on foreign lines in the East. Only the business depression that was experienced in the forepart of 1921 enabled the cars to get home. Had traffic held up, they would still be badly scattered and in even a more deplorable condition of upkeep. While a car pool such as established by the U. S. R. A. might be worked out under certain practical conditions, the government made a decided failure of its venture in that direction.

**Average Car Capacity.** This line merely shows the natural increase in the average car capacity of the country that can be expected for some years to come and against which, as the use of 120-ton capacity coal cars on the Virginian Railway has demonstrated, no reasonable argument can well be advanced.

**Tons per Loaded Car.** Corporate management has no apologies to offer when compared with government control in this regard as with all the influence and effort of the latter, in combination with the movement of heavy war materials and supplies, the U. S. R. A. was unable to bring and hold the average car loading up to the figure that should have been

freight cars at extraordinarily high unit costs and the resulting prohibitive interest and retirement charges. In closing his letter, Mr. Loree stated: "Conditions are now very abnormal in that during federal control all restrictions of ownership were ignored and the cars were scattered throughout the country and their repairs sadly neglected. Efforts should now be made to bring them back as promptly as possible to the owning line and every effort should be made to as rapidly as possible put them in proper repair."

An examination of the chart, prepared from the data set up in Tables I and II and showing the "Performance of Freight Train Cars in Service of Class I Railways" during the period January, 1917, to September, 1921, will not only confirm the soundness of Mr. Loree's judgment, but it also shows the relationship of the freight car situation during the federal control period, January 1, 1918, to March 1, 1920,

**Conclusion.** For the past 20 years the freight cars ordered by all steam roads and private car lines and industrials in the United States has been about as follows:

1901.....	193,439	1911.....	133,117
1902.....	195,248	1912.....	234,758
1903.....	108,936	1913.....	146,732
1904.....	136,561	1914.....	80,264
1905.....	341,315	1915.....	109,792
1906.....	130,315	1916.....	170,054
1907.....	151,711	1917.....	79,367
1908.....	62,609	1918.....	123,770
1909.....	189,360	1919.....	25,899
1910.....	141,024	1920.....	84,207

During 1920, according to the *Railway Age*, the cost for maintenance of 2,382,212 freight cars in the United States totaled \$626,746,636, or an average of \$265 per car.

When the President of the United States took control of the railroads he promised the owners that their properties would be returned in as good repair and with as complete equipment as when taken over by the government. To date this has not been done and the operations of the Class I railroads for 1920 realized a net operating income of only sixty-two million dollars, without any allowance for either interest or dividends, but which included approximately sixty-four million dollars of back mail pay from the government. This sixty-two million dollars represented the earnings upon nineteen billion dollars of property investment, which valua-

## Passenger Traffic Association Meets at French Lick

THE ANNUAL convention of the American Association of Passenger Traffic Officers was held on November 14 and 15 at French Lick, Ind., with an attendance of about 150 passenger traffic representatives from this country and Canada. The convention was opened by W. A. Russell, president of the association and passenger traffic manager of the Louisville & Nashville.

Various subjects pertaining to passenger traffic were discussed, among them being the reports from the various standing committees. Matter was submitted by the Committee on Safety Ticket Paper, the Committee on Official Digest of Fares and Divisions and the Committee on Standard Forms of Interline Tickets. Included in this report were findings relative to an improved baggage storage check and on an inexpensive method of attaching seals to trunks and valises for the purpose of preventing thefts from baggage. The latter part of this report was deferred for consideration to the annual convention of the American Association of General Baggage Agents to be held shortly at San Antonio, Texas.

The question of advertising mediums for securing publicity

TABLE II  
FREIGHT TRAIN CARS (OWNED OR LEASED BY CLASS I LINES) IN SERVICE OF CLASS I RAILWAYS IN THE UNITED STATES  
(From Information Compiled by Bureau of Economics)  
As of December 31

Freight train cars in service	1916	1917	1918	1919	1920	As of month of July, 1921
Box .....	1,021,757	1,040,818	1,038,751	1,050,296	1,048,762	.....

Total freight-carrying cars.....	2,253,233	2,302,059	2,325,673	2,261,102	2,321,517	2,440,796
Locomotive cars.....	27,722	28,064	28,571	28,758	.....	.....
Total freight train cars.....	2,280,955	2,330,123	2,354,244	2,389,860	.....	.....

NOTE.—Figure for July, 1921, not strictly comparable with other data as it includes cars owned by Class II and III railways as may be on Class I lines. Comparable figure for December, 1920, would be 2,396,768.

tion has been approximated by the Interstate Commerce Commission for rate making purposes. During the latter part of 1920 a more rigid policy of economy was enforced to offset the abnormal labor rate increases as established by the Railroad Labor Board as of July 20, 1920. As a result during the first eight months of 1921, even in the face of business depression, the net railway operating income, exclusive of any provision for interest or dividends, was greatly improved but even then amounted to a rate of only 2.5 per cent per annum on the nineteen billion dollars of valuation as compared with the 5½ to 6 per cent rate of return as fixed by the Transportation Act for the March 1, 1920, to February 28, 1922, two-years' period.

While the United States Railroad Administration has for all time demonstrated in its operation of the railway systems of the country, and in fact in the existing freight car situation alone, the delusion that burdens can be indefinitely passed along, still the experiment of government control in the United States has not been without some benefits to the carriers and their owners.

KENTON, OHIO, by action of its city council, has ordered the speed of all railroad trains moving in the city to be limited to eight miles an hour. This action has been taken, it is said, with the purpose of compelling the railroads to furnish what the citizens consider adequate and necessary crossing protection. Railroads affected by the ordinance are the Erie, the Big Four and the Toledo & Ohio Central.

was discussed but owing to the varying conditions in the several sections of the country it was concluded that it would be impossible to obtain uniformity in this respect. In this connection suggestions were offered for reducing the heavy cost of printing folders and improving the present method of their distribution. It was decided that hereafter more careful supervision should be given to this problem. Suggestions were also offered by the representatives of carriers in the various sections of the country for the construction of joint passenger tariffs and the elimination of the so-called free mailing list.

The most important business conducted at this convention was a change in the by-laws of the association which provided for a standing territorial committee, the composition and functions of which are as follows:

"Standing territorial committee—to be composed of the chairman or other administrative officer of each territorial passenger association, together with not more than five members from each local passenger association territory, and three members representing water lines, whose duty it shall be to make recommendations from time to time either direct to the association or to the several territorial passenger associations on such subjects as the committee may initiate or which may be referred to it for consideration by this association or the territorial association. It shall also be the duty of this committee to present the recommendations of this association thereon and report the result to the secretary of this association."

Under the above action periodical meetings of the com-

mittee will consider questions of interterritorial concern, their recommendations to be immediately submitted to the territorial passenger associations without waiting, as formerly, for the annual meeting of the association. This will not only enable preliminary consideration by a committee representative of the entire country, but it is also certain to effect an earlier disposition of interterritorial traffic problems.

Among the subjects referred to the interterritorial committee for consideration were the following:

Minimum requirements for exclusive occupancy of drawing rooms, compartments, and sections of sleeping cars and drawing rooms in parlor cars; interterritorial clergy arrangements; parking charges for special passenger cars and coaches in use and in transit, method of computing time to be charged; uniform rule for redemption of wholly and partially unused tickets.

The following officers were elected to serve for the coming year: president, John Frances, general passenger agent, Chicago, Burlington & Quincy; vice-president, A. B. Smith, general passenger agent, New York, New Haven & Hartford; secretary, W. C. Hope, passenger traffic manager, Central of New Jersey. Following the adjournment a meeting of the fraternal section of the association was held during which a report was presented setting forth its financial status.

## Developments in the Railroad Labor Problem

WHILE comparative calm prevailed during the past week in the railroad labor situation there have been several significant developments which indicate to some extent what may be expected in the near future. Foremost among these developments are: (1) the preparation of the railroads' case in favor of a further wage reduction averaging approximately 10 per cent and the steps which are being taken to bring this case before the Railroad Labor Board; (2) the presence of leaders of the engineers' and firemen's organizations "on the carpet" before their general chairmen at Chicago, explaining why and how the recent strike orders were recalled, and (3) the continued application of the Labor Board to the question of rules and working conditions.

The first development, the preparations which the carriers are making in behalf of their requests for a further wage reduction, will undoubtedly be the means of again focusing attention on the railroad labor problem. While statistics and other material are being compiled, railroads throughout the country are notifying their employees of the proposed wage reductions, conferences between representatives of the individual carriers and their own employees are in order and the individual disputes will probably be certified to the Railroad Labor Board within the next 30 days. It is expected that the whole controversy will be placed in the hands of the Board before the end of the present year and then the Board's action in docketing and providing for hearings in these disputes will be watched closely by both the carriers and the employees involved. It will be recalled in this connection that the train service organizations have already interpreted a memorandum, issued by the Board and used to bring about the recall of the recent strike order, as promising that no further wage reductions would be considered for a time, variously estimated at from eight months to a year. In this connection, also, members of the board have pointed out that no definite promises of any kind have been made to the men, and this fact, coupled with the progress which is being made by the Board in disposing of disputes now before it relating to rules and working conditions, naturally leads to the conclusion that hearings on further wage reductions are not far off. The reactions of the labor leaders then will command the interest of railway officers and the public.

The second development indicates at the same time that the organization leaders involved in the recent threatened strike are meeting with certain difficulties within their own organizations. On November 14 more than 600 general chairmen of the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Enginemen and Firemen met at Chicago behind closed doors to ask W. S. Stone, grand chief of the engineers, and W. S. Carter, head of the firemen's organization, why the strike scheduled for October 30 had been called off at the last minute and what assurances were given railway workers against further wage reductions and interference with existing working conditions. Extensive plans were made to keep these sessions and the proceedings therein secret, but the reports which "leaked" out indicate clearly that the brotherhood leaders were "on the carpet." None of the other three organizations, the Brotherhood of Railroad Trainmen, the Order of Railway Conductors and the Switchmen's Union of North America, parties to the recent strike threat, were represented at the meeting. Their absence, according to rumor, is due partially to factional feeling among the leaders of the five train service organizations as a result of the "satisfactory settlement" of the recent threatened strike. The effect that this development will have on the future of the railroads' labor problem can be estimated when the question of a further wage cut comes before the Labor Board and the attitude of the various brotherhood chiefs is analyzed.

Following the conference of brotherhood general chairmen, Mr. Stone announced that meeting was held to determine the future policy of two organizations in regard to wage reductions and working conditions. Mr. Stone was credited with the statement that a plan for meeting any efforts to revise existing rules and working conditions or to reduce wages had been agreed upon.

The third development of significance, the work of the Labor Board in disposing of controversies over rules and working conditions now on its calendar, is leading to much speculation as to the length of time in which the Board will take to dispose of all questions of this character.

As announced in last week's *Railway Age*, the Board recently announced that it would probably dispose of the remaining disputes as to shop crafts rules within three weeks. This statement has been interpreted by some as indicating that the Board will be ready to hear requests for reductions in the wages of all employees soon after. The Board, however, has specifically said that it would consider requests for further reductions in the pay of any class of employees only when it had disposed of the disputes over the rules and working conditions of that particular class. This means, of course, that insofar as those organizations which recently threatened a strike are concerned, the Board has not indicated what progress it has made on disputes involving these classes and consequently conjecture as to when the Board will consider further reductions in the pay of these classes is futile.

---

NEWSPRINT PAPER, made in Canada, amounts to 1,000,000 tons a year, according to A. L. Dawe, secretary of the Canadian Pulp and Paper Association. He says that in the United States the quantity used is 2,500,000 tons annually.

FARM LABOR will be the subject of questionnaire forms issued by the Dominion employment service, to elicit as far ahead as possible the requirements of farmers in the harvest season in order to facilitate through this co-operation the movement of farm labor next year from the east and other points.

A large volume of grain is still to come out of the Canadian prairie provinces, the crop having been larger than seemed probable two months ago. The wheat crop in the Prince Albert district is the best for 30 years; 40 bushels to the acre being quite common.

# American Railway Association—Annual Meeting

## Comprehensive Round-Up of Varied Activities of Eight Divisions —Important Work Laid Out

THE ANNUAL meeting of the American Railway Association was held at the Waldorf-Astoria Hotel, New York, on Wednesday, November 16, with an attendance of about 200 and R. H. Aishton, president of the association, in the chair. The membership now includes 391 full members and 345 associate members, operating 314,019 miles of road. The board of directors reported that since the last meeting a Safety Section had been created within the Operating Division; and that M. J. Gormley has been appointed chairman of the Car Service Division at Washington.

The board has taken appropriate action in connection with the ninth session of the International Railway Congress, to be held in Rome, Italy, in April, 1922. The chairman, the president, the general secretary and five other persons (yet to be selected) will represent this association at Rome, and an appropriation was made for establishing suitable headquarters there.

Reports recounting the activities of the past 12 months were received from the seven Divisions—Operating, Transportation, Traffic, Engineering, Mechanical, Purchase and Stores and Freight Claims—and from the committees on automatic train control and fuel conservation.

Most of the material in these reports has been covered in accounts published in the *Railway Age* from time to time in connection with the meetings of the Divisions and Sections of Divisions; and the significant parts of the present report are those which tell of the approval, by the Association, of matters sent up from the Divisions in the form of recommendations.

The Association adopted the recommendation of the Operating Division covering rules for the draining or filling of gasoline tanks of automobiles and the loading and unloading thereof in railroad cars or on railroad premises, and amendments to the standard rules covering the use of dimmers on electric headlights of locomotives. Numbers of proposed changes in the Standard Code of Train Rules are still under consideration.

On the recommendation of the committee on grade crossing protection and trespassing the Association adopted a resolution recommending that highway crossing watchmen be deputized with police authority at crossings where such authority is desirable.

The committee on Safe Transportation of Explosives and other dangerous articles, N. D. Maher, chairman, supervises the work of the Bureau of Explosives, and its report deals largely with the doings of the Bureau (which have already been reported in the *Railway Age*). The chief inspector of the Bureau is now the agent of the railroads for filing the regulations for the transportation of explosives, etc., as a tariff, under the rules of the Interstate Commerce Commission.

The function of the Bureau has been expanded so as to enable it to formulate a code of standard specifications for containers, not only of explosives and dangerous liquids, but also for all classes of freight. In this work, the chief inspector will consult with other Divisions of the association and with associations of shippers, etc.; and his inspection force has been increased by the addition of four engineers, for the purpose of investigating present conditions.

The Medical Sections recommended a Standard Railway Sanitary Code and 'Railway Hospital Standards were approved.

The Protection Section's recommendations of a federal law to cover trespassing on railroad trains and also that individ-

ual roads consider the advisability of bonding receiving and delivering clerks, were approved.

The Safety Section reported that plans for a national campaign for the prevention of grade crossing accidents were being prepared. The Telegraph and Telephone Section submitted a list of specifications which have been considered and approved by the Section covering the work of the telegraph and telephone departments of the railroads.

### The Transportation Division

The General committee of the Transportation Division, C. W. Crawford, chairman, presented a long report covering the work which has been done during the past year by regular and special committees of the division, no annual meeting having been held. The subjects covered are: (1) Code of car service rules; various revisions and recommendations. (2) Restoration of old car service rule 20. (3) Computing average miles per car per day; an amendment approved by the board of directors. (4) Car service and per diem agreement. (5) Code of per diem rules; changes approved July 1, 1921. (6) Per diem forms. (7) Uniform abbreviations in interchange reports. (8) Cancellation of claims during the period of federal guaranty. (9) Settlement for car hire with short-line railroads. (10) Assignment of reporting marks. (11) Mileage allowance on private cars. (12) Railroad business mail; amended regulations. (13) Car seals; rules. (14) Demurrage and storage rules. (15) Revision of storage rules. (16) Rules for loading package freight. This code of rules fills nearly 100 pages and includes 75 photographs illustrating right and wrong ways of loading freight. This code was first adopted in November, 1914, and the present report includes amendments to date. (17) Rules for loading carloads of news print paper. (18) Rules for packing and marking household goods. These rules have been printed on a placard and it is recommended that all railroads secure copies of this placard for distribution and to be posted in freight stations. (19) Reports of arbitrations under per diem rules. (20) Statistics showing the cost of owning freight cars.

The General Committee expects soon to make a report on a uniform plan to govern settlements for car hire with non-member roads; also a revision of the switching reclaim rules.

The Association approved the recommendations of this Division covering the revision of Car Service Rule 20; revision of the regulation for the handling of railroad business mail; a code of car-seal rules; rules governing the loading of package freight, and of paper, and the revision of the storage rules. The latter rules, if approved by the National Industrial Traffic League, will be submitted to the Interstate Commerce Commission for its tentative approval before being made effective.

The Traffic Division reported that a number of topics had been received from the other Divisions of the Association and had been handled by standing committees.

The Engineering Division reported a number of engineering specifications and principles of practice, which were approved. The report also included recommended principles of practice from the Electrical Section and the Signal Section.

The Mechanical Divisions' recommendations concerning the rules of interchange, loading rules and tank car specifications were adopted. The Purchases and Stores Division has distributed numerous reports to the membership on reclamation of material and material accounting; on purchase, in-

spection and distribution of cross ties; on scrap classification and on purchasing agents' office records.

The Freight Claim Division reports that the Freight Claim Association has been formally abandoned and that the experience of several months' operation as an integral part of the American Railway Association has proved eminently satisfactory. The Division has held profitable conferences with the National Industrial Traffic League, the National Association of Wholesale Grocers, and other organizations.

The Joint Committee on Automatic Train Control reports that its inspectors, working jointly with a similar inspector of the Bureau of Safety, I. C. C., has been making daily observations of the installation on the Chicago, Rock Island & Pacific, and the Chesapeake & Ohio. The final results will be used as a basis for the proposed requirements to be prepared jointly with the Interstate Commerce Commission for the installation of automatic train control devices, some 165 of which have been brought to the committee's notice.

The Joint Committee on Fuel Conservation has distributed 35,000 copies of its rules for fuel economy on locomotives. On the recommendation of the committee, plans for the organization for fuel conservation, for inspection of fuel at source of supply and preparation of a fuel schedule, and the methods of conservation were adopted.

The following have been elected by letter ballot as members of the board of directors for the ensuing three years: J. H. Hustis (B. & M.); C. R. Gray (U. P.); W. G. Besler (C. N. J.); W. R. Scott (S. P.) and W. H. Truesdale (D. L. & W.); W. L. Mapother (L. & N.).

The next annual meeting will be held in November, 1922, the place to be selected later by the board of directors.

## Malleable Castings

### Improved by Research

THE American Malleable Castings Association inaugurated an intensive research program a few years ago to improve the quality and reliability of its product, which at that time was unfortunately frequently of a very uncertain character. A central laboratory was established and Enrique Touceda, Albany, N. Y., was engaged as consulting engineer and metallurgist. With the aid of a corps of assistants and inspectors investigation was made of the

A bulletin just issued shows the most marked advance in development has been made in the past three and one-half years, during which period the product of association members as a whole has increased from an average somewhat under 49,000 lb. per sq. in. ultimate tensile strength to over 53,000 lb. and from an average elongation under 10 per cent in two inches to nearly 16 per cent.

The bulletin includes the report of bars tested for the month of June, 1921, when the highest average percentage of elongation of the association as a whole was attained, namely 15.77 per cent in two inches, or over twice the elongation,  $7\frac{1}{2}$  per cent, required by the American Society for Testing Materials in its standard specification for malleable cast iron. The June value for ultimate tensile strength was 53,038 lb., or 8,000 lb. in excess of requirements.

A reference to the chart showing average ultimate tensile strength and elongation for the product of the membership as a whole for 1918, 1919, 1920 and the first six months of 1921, indicates clearly how these two properties have increased during this interval despite the addition of many new members.

An interesting fact is the high percentage of perfect scores made by the members of the association. By a perfect score is meant the ability of every bar submitted by a member to equal or surpass the A.S.T.M. standard specifications of 45,000 lb. tensile strength and  $7\frac{1}{2}$  per cent elongation in two inches. In June of the present year 87 per cent of the contributors made perfect scores. Comparing this record with those for the same month of the previous years, it is found that perfect scores were attained by but 29 per cent of the contributors in June of 1918, 57 per cent in 1919, and 74 per cent in 1920. Out of a total of 31 contributors in June, 1918, of whom 29 per cent attained perfection, all but one made perfect scores in June of the present year. Only 2.53 per cent of all bars cast and submitted for test during June failed to pass the standard A.S.T.M. specifications as against 15.12 per cent for June, 1918.

This general improvement of the product of all members is reflected in the number of certificates that were awarded for the quarter ending June 30; sixty-one plants having been awarded the coveted certificate, the highest number yet issued for any one quarter. The awarding of a certificate is not based upon the test bar record alone, the general plant practice as reported by the consulting engineer's corp of inspectors being considered in its effect upon the product. Through

Average A. M. C. A. Ultimate Tensile Strength and Elongation by Months

f foundry practices of the different members and improvements made as rapidly as investigation demonstrated their value. Test bars were regularly submitted by all manufacturers.

As a result of this work malleable castings as at present manufactured in conformity to association standards, instead of being of uncertain quality are of the highest quality and integrity. They are on a plane of dependability with the best mild steel castings or forgings, while they can be machined at almost double the speed of either.

this safeguard, the purchaser is assured that the test bar record of each day's production can be considered as truly representative of the castings. Castings furnished by certificate holding plants are designated as "certified."

Nothing could more clearly indicate the value of a research program consistently carried out and rigidly applied than a comparison of this most recent report with those that have preceded it. The net result of this work has been to raise to a high level the standards of the industry, and to increase materially the commercial applications of its product.

# Selecting Designs for Electric Locomotives\*

## Merits of Various Wheel Arrangements of Steam and Electric Locomotives Determined by Tests

By A. W. Gibbs

Chief Mechanical Engineer, Pennsylvania

THERE ARE CERTAIN questions as to electric locomotives such as the transmission of power from the motor to the driving wheels and the behavior of the complete locomotive considered as a vehicle, particularly with reference to its effects on track structure, which have not received adequate attention. These problems may best be studied with reference to approved types of steam locomotives and this paper deals especially with the results of a comparative trial of steam and electric locomotives which was made in 1907 to secure information in connection with the design of electric locomotives for the Pennsylvania terminal in New York City.

Fig. 1. Columbian Type (2-4-2) Locomotive

It should be understood that at that time but a limited number of types of electric locomotives were available for comparison.

The greatest difficulties of the electric locomotive, other than financial, are mechanical rather than electrical. None of the mechanical arrangements to be described are ideal by any means, and we must not mistake the absence of heavy repairs in the early years of an installation as truly representative of the expenses which will be met later on.

At first blush it would seem that nothing could be more ideal than the connection of a revolving armature and a revolving driving axle. As a matter of fact, it is not at all simple for the reason that the driven axle not only revolves but is displaced bodily as well as angularly in the vertical plane. Moreover, these displacements of axles and wheels, which are not spring supported, occur suddenly, due to irregularities in the track, hence it is desirable to reduce the unsprung weight to a minimum.

The difficulties from these various disturbances are encountered principally at the higher speeds and are those with which we shall mainly deal. The different methods of communicating motion from the motor to the driving axle may be considered under the following designations:

A. That in which the armature is carried directly on the driving axle, the axle boxes sliding in vertical pedestals and the face of the field coils being parallel vertically on each side of the armature. In this construction the whole of the field coils can be rigidly secured to the frame and above the supporting springs. This arrangement permits the easy removal of the driving axles and wheels with the least dis-

turbance of other parts. The disadvantages are the increase in the unsprung weight on the axle and the low center of gravity of the entire motor. So far this drive has been confined to direct current operation.

B. The geared drive, with the gear on the driving axle engaging a pinion on the motor, one end of the motor frame being carried in bearings on the axle, the other by proper nosing on the truck frame. The disadvantages of this arrangement are the low center of gravity of the motor as a whole, the considerable unsprung weight and the gear wear, principally that of the pinion. Usually the motors are in pairs between pairs of axles, and in consequence the gyratory disturbance is less than where the motor center coincides with that of the axle. This general type of drive, which is in common use in street car operation is, undoubtedly, the one having the widest application and operates with both alternating and direct current.

C. The quill arrangement in which the whole motor is concentric with the axle in its normal position, but is not directly connected, the axial opening of the armature being larger than the diameter of the axle. The physical connection between quill and axle is by springs interposed between pockets in the periphery of the driving wheel center and the arms of a revolving spider connected to the armature. These springs not only transmit the driving torque, but also compensate for the axial disturbance of the driving axle. In some installations the motor frame as a whole is spring-supported, so as to assist in assuming a position concentric with the axle. The objections are the low center of gravity of the motor, the distance between the motors measured from the center of the truck, the fact that the motor can be removed from the axle only by drawing one of the wheels, and that

Fig. 2. American Type (4-4-0) Locomotive

any lack of concentricity between the quill and the driving axle puts a continued and varying inertia stress on the torque springs.

Both arrangements "A" and "C" have the further disadvantage that the ratio of the speed of the motor to that of axle is unity, thus involving higher motor weights than when this ratio is greater.

D. A modification of the quill arrangement in which the quill is driven by one or more motors through spur and pinion arrangement. The advantage of this is that the motor parts are much more accessible than in the concentric type, and that the speed ratio of motor armature to driving axle may vary through a fairly wide range, and that where two

\*Abstract of a paper read before the Franklin Institute, Philadelphia, Pa.

motors drive the same quill the tooth load is that of a single motor. The disadvantage is the increased axle distance due to the width over two motors.

E. That in which one revolving element is a jack shaft driven by one or more motors and coupled by crank pins and rods to the crank pins of driving axles. The jack-shaft when placed in the horizontal plane of the driving axles maintains a fixed position relative to the driving motor or motors. The relation between them may be a second set of rods coupling the jack-shaft cranks to a similar pair on the motor; or the jack-shaft may be driven through spur or herring-bone gears cut on the periphery of the disk engaging pinions of one or more motors. These rod connections have been used more largely in Europe than here. The jack-shaft and rod combination is an exceedingly rigid one and the wheel arrangement forms a more rigid connection than in the case of steam driving through pistons. The advantages are that the removal of driving wheels does not involve electric complications, and that all driving wheels in the group act together, so that the full adhesion of the group is secured, and it is probable that a higher total adhesion will be available from groups than from single units where the slipping of one unit reduces the total adhesion. The disadvantages are mechanical complication involving exact quartering of all wheels and jack-shafts, the necessity of equal diameter of all driving wheels, and the heating of pins and maintenance of rod bushings. Contrary to expectation the maintenance of jack-shafts involves no great difficulty.

In no type of electric locomotive drives are there counterbalance disturbances due to counterweights, as only rotating masses are in motion.

### Starting Power of Locomotives

As governed by adhesion the motor-driven axle in starting has a relatively high adhesion because of the uniform torque of the motor. It is a well-recognized fact that static weighings of locomotives show considerable discrepancies on individual axles. How this discrepancy varies in moving locomotives is not known.

Assuming that the motor torque is greater than adhesion

Fig. 3. Assembled Recording Tie

resistance, we have, where axles are individually driven, the adhesion of the axle with the lightest loading governing the adhesion of the group. Where, on the other hand, there is a rod connection between the various axles, we utilize the full adhesion of the group. The presence of the coupling rods does not preclude the application of power to any axle or number of axles, though the usual practice has been to apply all the power to one or more jack-shafts and from them to a group of axles. This utilization of the full adhesion in starting is a matter of importance in any type of locomotive, as usually they will pull heavier trains than they will start.

In the earlier days of steam locomotives the aim was to keep the vertical center of gravity low with the idea that this was conducive to stability. Not until the Reading Railroad in its introduction of the wide firebox type of locomotive was

forced to elevate the boiler so that the firebox would clear the driving wheels, was it recognized that this change had materially improved the steadiness of the locomotive as a vehicle. The reason, of course, was that the center of gravity of the parts above the springs acting as an inverted pendulum failed to respond to the many small disturbances which would otherwise have produced side shocks. Since that time designers have not hesitated to raise the center of gravity of the parts above the springs, and the present limits are chiefly those of overhead clearance.

One other steam locomotive lesson that seems to have been forgotten was that with a short symmetrical wheel arrangement with heavy overhanging weights distributed longitudinally

Fig. 4. Metal Strip Used in Recording Tie, Showing Impressions

of the whole machine, excessive lateral oscillations were set up which endangered the track and locomotive. Figs. 1 and 2 show locomotives of the Columbian or 2-4-2 type and the American or 4-4-0 type. Here are two types of almost the same total wheel-base with nearly the same height of boiler above rail. The weight of the 4-4-0 type was but 7 per cent greater than that of the 2-4-2 type. The 2-4-2 type was so unstable that it was soon condemned. The 4-4-0 type is notably a steady-running one and its performance will be graphically shown later. The reason for the difference in performance is probably that the wheel arrangement of the 2-4-2 was symmetrical, while that of the other was not.

When it became necessary to design locomotives to operate the New York terminal of the Pennsylvania Railroad two electric locomotives were designed and built.

Both consisted of two four-wheel trucks with motors for each axle. In both cases the trucks were articulated at the center and carried the necessary draft gear at the ends, thus the pull was transmitted through the frames of the trucks and not through the superstructure.

In one of these locomotives the motor drive was by gear, the second method referred to. The other was driven by four concentric motors through quills.

The wheel-base of both were identical, that of the trucks 8 feet 6 inches and the total 26 feet 1 inch.

Both operated by direct-current at 650 volts through third rail.

About the time that they were completed reports of troubles elsewhere made it very desirable that we should ascertain their performance before constructing the large number of locomotives necessary for the operation of the tunnels.

### Method of Determining Lateral Impact

The line of the West Jersey was available for track and current, and it was decided to construct an experimental track with ties which would make some permanent record of the lateral impacts of the locomotives. As it was expected that the bad oscillations would occur on curves, if anywhere, only one end of each of the ties was arranged to register.

Fig. 3 shows one of these ties, the end at the outer rail being so constructed that the rail was free laterally, resting on rollers, resisted against outward movement by a bracket carrying a strip of boiler plate, movable longitudinally at will. Against this strip rested a one-inch steel ball which in turn bedded in a plunger bearing against the outside face of rail. (Fig. 4 shows one of the impression plates carrying the record of 30 runs.)

The record obtained with this device was a species of glorified Brinell test, the depth of the impressions of the one-

inch ball in the boiler plate being taken as a measure of the impact. After each run the plates were slipped longitudinally and adjusted to touch the ball, each single plate taking the record of 30 or more runs. It is to be clearly understood that this method carries with it some decided limitations which must not be overlooked. Each run, whether with one or more vehicles, made a single impression on each plate. While it was assumed that the indentation was that of the heaviest impact, it is possible that two or more impacts occurred on a single point with some cumulative effect. In some of the runs it is believed that this was the case. There was also some question as to the interpretation of the impressions. They were calibrated by static loading in the testing machine and also dynamically by falling weight.

The recording ties, 80 in number, extending over five rail lengths, or a total distance of 165 feet, were laid on a one-degree curve in the southbound track, near Franklinville, N. J., in 1907. There were 16 of the recording ties to each rail-length and at every splice on both rails the two ties at the splice were so located that the joint between the rails came between the ties, which at this point were 20 inches apart. The other 14 ties were spaced as uniformly as possible, taking into consideration the necessities for spacing at the rail joints. Tie No. 1 was placed about 28 ft. south of the point of curve. The super-elevation of the outer rail of curve was 3 in. and the elevation of the rail began at a point about 250 ft. north of the point of curvature.

Tie plates were used on wooden ties immediately south of the test track for one-quarter of the distance around the curve. The ballast used at the curve was gravel and cinder.

The rails were P. R. R. section, 100 lb., to the yard, in good condition. It was specified in arranging the experimental track that it should be lined up in about the best average condition of track used on this piece of road.

The tangent track approaching the curve from the north consisted of 100-lb. rails supported by wooden ties, single spiked. The substructure was of broken stone ballast with the exception of about 1,500 ft. north of the test track, in the vicinity of Clayton, where most of the runs were started and where cinder and gravel ballast were used.

After the completion of the runs on the curve, the recording ties were removed to the tangent north of Franklinville station, where the trials were completed. At this location the track consisted of 100-lb. rail with broken stone ballast. The speed record was obtained by means of a series of trips, operated by the locomotive passing over them, which broke and I made the circuit going to the chronograph. These trips were located such distance apart that at a speed of 100 miles per hour the time between trips would be one second. Four trips were used for the tests on the curve and seven for those on the tangent, the idea being that failure of one or two trips would not vitiate the record of the run.

Other apparatus used in the tests consisted of speed recorders on the locomotive, which were used only to obtain approximate speeds; and in some of the runs, there was placed on the locomotive a seismograph having three pendulums, giving vibrations in vertical, transverse and longitudinal directions.

*The second and concluding part of this article will include descriptions of the locomotives tested and the results of the tests.*

## “Passing the Buck—Perhaps the Dividend”

Lessons of Experience for the Operating Officer Who Would Not  
Be a Slave to the Typewriter

AT THE MEETING of the New York Railroad Club, in New York City, on November 18, the address was by Howard Elliott, editor of the New York Traffic Club Bulletin and formerly Inspector of Transportation on the San Pedro, Los Angeles & Salt Lake Railroad. Mr. Elliott was for 16 years in the railroad service, but during the past four years has been in other business. The spirit and tone of what he said may be guessed from the title. Following is an abstract of the address.

Two tendencies are doing incalculable harm to the railways' best interests; one the hostility to suggestions for improving the service and the other the disposition to shift responsibility, especially in matters of public relations. Quoting the views of William Howard Taft, Louis D. Brandeis, W. Jett Lauck and Henry Ford, the speaker declared unwise the general attitude of railroad officers toward criticisms such as those made by these men. Instead of admitting that there might be a modicum of truth in what Mr. Brandeis said, railway men set their faces like flint against his suggestion that large savings could be made in railroad operation; this merely because it came from a man who had had no experience in the business. To admit error would have done violence to long established theories of railroad pride; but it is along the pathway of criticism that real progress lies. The railways replied to Mr. Lauck that two wrongs would not make one right. This, however, did not settle anything. What was needed for general enlightenment was a frank statement that there was a kernel of truth in Mr. Lauck's criticisms and that many savings could be made. Even Mr. Ford may have some ideas that can be copied with profit. We must get away from the idea that

an admission of error is a confession of weakness; throw off the cloak of infallibility.

The speaker next discussed a parasite which he called the “red-tape-worm.” This, said he, is one of the worst evils in railroad operation. It is gnawing at the vitals of railroad efficiency. Everybody admits its existence, but usually they call it a necessary evil. In discussion with a prominent operating vice-president the speaker said, “I ventured the suggestion that if I were placed in charge of a railroad I would make all of my employees ‘generals,’ and I would charge them all with the responsibility of producing dividends. I expressed the belief that the most logical method of accomplishing real efficiency was by consolidating offices and by making such changes in the organization as would allow officers to broaden the scope of their authority without fear of criticism. As for employees, each one should take a deeper interest in the company's affairs and pass on to others only those things which he is sure that he himself cannot perform. I cited sample of daily report I believed any division official could make if clothed with the proper authority and inspired with interest. The report read as follows:

1. Rode fruit train from A to B. Encountered wreck at X. Interviewed the injured passengers and settled with each of them for \$10. Looked after the transfer of damaged freight, wiring freight claim agent and agents at origin and destination.
2. I find trainmen are not keeping in touch with interpretations of the 16-hour law as rendered by the I. C. C. Pested 6 of them while waiting for the wreck.
3. At C, a blind siding, found three misplaced cars. I consulted a Chicago telephone directory, found names of consignees, and immediately wired freight claim agent. Cars were disposed of same day.
4. On No. 9 were only 15 pay passengers. On No. 10 there were 20. Recommended conference to consider taking these trains off. See accurate report of revenues and expenses, and suggestions as to handling mail and express on other trains, also proposed line of defense in case we are called upon to restore them.
5. While at X, went through the ships. Notice 16 employees who need

safe-guarding. See separate report. I find that reports of trivial accidents are going by telegraph, thus tying up a hundred-dollar operator at each end of the line. Suggest central committee consider having such reports come by mail. I attended meeting of Division Safety and Efficiency Committee, and participated in the discussions.

"I rode No. 1 from E to F. While in diner overheard drummer tell of five cars canned goods just sold, and the routing of which he controlled. At favorable opportunity, told him of the advantages of our line, secured some of his firm's letter heads, borrowed dining conductor's typewriter, and after making three copies, handed him my fountain pen with which he signed routing order. Forwarded the original in one of his own envelopes to the shipper, officer copies to general freight agent. Estimated revenue, our proportion, \$50."

I may add that I have done practically all those things myself except to settle with passengers injured in a train accident."

Mr. Elliott here referred to the notable case of the late Thomas J. Potter, the former well known general manager of the Chicago, Burlington & Quincy, who secured early promotion because he took it upon himself to settle claims, after a collision, without waiting to get authority.

However, said the speaker, his argument did not convince his friend the vice-president. He said: "I don't believe in your general idea. If men would use their heads it would work, perhaps; but nothing is so disastrous as the control of technical specialists by ignorant generalists; and the same is true of intermeddling. There is an immense desire for dominion among all men. A friend of mine three years ago organized his work so that every superintendent was to be supreme on his division; but after three years he has reorganized it. The superintendents are now supreme with respect to the function that belongs to them, the *conduct* of transportation. They no longer play with the mechanical matters, and they could not do else because they didn't know how; and if they had known they might better do something else and leave technical details to others. There must be the closest co-operation. The superintendent *should* be the chief man on the division. The mechanical man *should* be his loyal lieutenant and all that, but the superintendent *should not* interfere with the prerogatives of the mechanical specialist. I've tried both plans, and I have seen both tried in dozens of cases. One tends to the glory of men, the other to the welfare of the stockholders. Both things can be accomplished. The man can have his glory, the stockholder his dividends."

Yet, said the vice-president, this man made the mistake of introducing a special design of locomotive without taking the advice of his trainmasters, and the experiment was a failure. It is true that the trainmaster cannot design a locomotive; but he is the man who uses the engines, and by all rules of reason the opinion of transportation department officers should have been sought and carefully considered. The highly trained ultra-specialist is no more efficient than the specialist with a broad general basic education; but he is apt to be less efficient because of the monotony which a repetition of the same tasks invariably develops. Again, one disadvantage of the departmental system is that it fails to train men for those positions where authority is converged.

#### Bad Influence of the Typewriter

The vehicle for red tape and shifting responsibility, said Mr. Elliott, is the typewriter, a small manually operated machine which repeats parrot-like anything it is told. Typewriters move no freight, yet there are on some roads as many typewriters as locomotives. The typewriter is the buck passer's chief ally. One of the best things which could happen to a railroad would be to reduce the inter-office correspondence. Officers now tied to their desks handling papers would be released for road service.

Mr. Elliot said that he was interested once in listening to the dictation of a clerk in a general manager's office sending contracts to the auditor, each with a letter of transmittal. Wishing to avoid monotony he varied the form of his letter. One read "with this I hand you," and others, "with this you have," "enclosed please find," "attached hereto is," "I enclose herewith," and "I beg to send you." There was no necessity for any letter of transmittal.

While on the Salt Lake Route Mr. Elliott drew up a form which avoided the necessity for letters and yet kept the general manager's files complete. It was called "Disposition of papers memo." There was a blank space for file number and subject, followed by the words: "Papers to Mr. \_\_\_\_\_ today with request that he—

- (a) Note and return.
- (b) Confer with the general manager.
- (c) Approve as to form, legality, description.
- (d) Take necessary action and advise result.
- (e) .....

Then a date line, and place for initials of the person handling the file.

Letter writing is expensive. According to the figures of a prominent paper manufacturer, the cost of producing an average business letter, using a good grade of paper and envelope, is a little over 18 cents, itemized as follows.

Labor; stenographic service.....	\$0.6727
Office overhead .....	.9727
Postage .....	.02
Printing or lithographing letters and envelopes.....	.0062
Paper and envelopes.....	.0126
Total .....	\$0.1842

In the office of a general superintendent on one occasion the first 100 letters in the copy book showed:

Plain letters of transmittal referring the matter to others for attention..	40
Asking or answering simple routine question.....	20
Enclosing agreements to heads of departments in same building for approval .....	20
Approving train service, details of which had been arranged by division officers .....	10
Definite rulings on sundry matters.....	10
	100

Most railroad letters are written by clerks who sign the name of their chief. This system has many stout defenders, but it seems to me that it breeds disrespect for signatures, and that it places officers of one unit below clerks of the next higher unit. The chief clerk who is qualified should, said Mr. Elliott, have a title and do business in his own name.

#### Relations With the Public

There is much passing of the buck in matters of public relations, the speaker continued. There are many popular vagaries which need explanation, and every railroad officer has a serious duty in this respect. It is not a valid excuse to say that you cannot write well; or that you cannot talk effectively. The officer who feels incompetent to present the facts about the railroad situation truthfully, interestingly and effectively, should study the problem and then try his hand at writing and speaking. A man can do almost anything if he will try. Two men were talking one day about a fox hunt. One of them said: "The dogs pursued the fox, and when they got close enough to snap at his heels the fox climbed a tree." "Hold on," said the other, "foxes don't climb trees." "But," answered the first, "this fox had to."

The superiority of the Allies over the Germans was due, in no small part, to the aptitude of the Allied soldiers in "carrying on" in new and strange situations. The railroad officer should practice putting his thoughts in writing. To write on any subject, the important point is to begin; having begun, then the process of amplification, elimination and revision comes easier. The magazines published by different railroad companies now furnish a golden opportunity for employees to show their ability in writing; writing where the superior, and frequently the public, will see what is written. Perhaps an employee thinks he cannot discuss capitalization and freight rates; but at least he can write or speak on better packing and marking of freight.

This educational work presents a stirring appeal, said the speaker. "The railroad business is fascinating. It has splendid traditions which need to be maintained. The railroads are rich in history and romance, and I am hopeful that they will continue to attract the youth of our land."

# Utilizing Tractors and Trailers for 100 Ft. Hauls

The New Haven Railroad Departs from Usual Methods in  
Handling L. C. L. Freight at Boston

THE USE of tractors and trailers for hauls which rarely exceed 100 ft. is the outstanding feature of the methods followed by the New York, New Haven & Hartford in the operation of the outbound houses of its Boston, Mass., freight terminal. Ordinarily, operating officers associate the use of the tractor-trailer system of handling freight with long hauls. Therefore, considerable interest is attached to the Boston installation, where the hauls are decidedly short.

The Boston freight terminal is almost exclusively a city freight proposition, the transfer tonnage amounting only to a negligible 3 per cent of the total tonnage handled. In

When Long Hauls Are Necessary, the Trailing Method of Handling Is Used

normal times the operation of this terminal involves five outbound houses containing 111,000 sq. ft. and seven inbound houses having 234,000 sq. ft., and four piers with 650,000 sq. ft., an approximate total of 1,000,000 sq. ft. of floor space for the entire terminal. A 300-car set-up can be taken care of readily at the five outbound houses and, at various times, more than 400 cars have been loaded through the outbound houses and piers in one day, while 200 cars were unloaded into the inbound house in the same time.

Tractors and trailers are used only for the handling of outbound freight. At present, owing to the business depression, all such freight is handled through houses No. 1 and No. 6, the largest of the five outbound houses. Each of these two houses is 810 ft. long and 40 ft. wide, with platforms 150 ft. long and 175 ft. long, respectively, provided at one end. These platforms are utilized in the receipt of freight, the total area of the platforms being 7,800 sq. ft.

No. 1 house is served by four tracks and No. 6 house with five tracks. The present daily set-up at No. 1 house consists of 76 cars with an average daily tonnage of 530 tons, while at No. 6 house the daily set-up involves 120 cars and 800 tons of freight.

Each of the two houses is provided with 52 doors on the driveway or the receiving side, and 20 doors on the track or loading side of the houses. Thus it will be seen that the operation is funnel shaped, with the small end towards the cars, making it necessary to handle through the 20 rear doors, and into the cars, the tonnage unloaded by teamsters through the 52 front doors.

The plan of operation in the two houses is predicated on securing a direct haul from the teamster's trucks, through the house and into the proper car, avoiding longitudinal move-

ments through the house wherever possible. To this end cars for a particular destination are always spotted at the same location and directly across the house from the door or doors assigned for the receipt of shipments for the particular destination. In other words, No. 1 house is designated as the house which will receive shipments for certain destinations, while No. 6 receives only freight for certain other destinations. Outbound shipments must be delivered to designated houses at points within a reasonable distance of the proper door. In this way confusion and congestion resulting from crossing traffic are eliminated. Sufficient variation in deliveries is, of course, permitted to avoid the stopping of teams at an excessive number of doors. The arrangement is subscribed to by the drivers who co-operate by loading their trucks by house and door destination, as far as possible, following instruction books furnished by the railroad.

It is obvious that with the short hauls from the point where freight is delivered to the railroad to the destination car, which result from this plan, the arrangement is advantageous to the shipping public inasmuch as it is possible to receive freight until a late hour in the afternoon and still get it loaded for movement that night. But, formerly, even with this apparently desirable arrangement doors and floors become blocked with freight, especially in the late hours of

The Trailers Are Loaded at the Receiving Doors by Teamsters and One Freight House Man

the afternoon, since approximately 60 per cent of the outbound tonnage is offered between 2 p. m. and 5 p. m.

The former method of receiving freight, in effect prior to July, 1918, was to accept all outbound freight at the assigned doors as dropped on the floor by the teamsters. The freight was then checked up by the receiving clerks who signed the bills of lading. In order to keep the doorways clear it was necessary to move the freight back into the house to await rechecking and loading. This moving back of the freight was done by the doormen who used hand trucks for this work. The loading into the cars was done by the so-called gang system after a rechecking of the shipment against the shipping order.

Two distinct operations were involved in this method as well as much lost motion occasioned by the necessity of moving the freight back to the center of the freight house

floor. The delivery of shipping orders to the billing department was also delayed until late in the day.

In July, 1918, the operating plan was changed and manually operated drop-trucks were installed. Under this plan four-wheel trucks were provided and placed at the receiving doorways. This enabled the teamsters to unload from their trucks direct to the drop-trucks, thus keeping the freight off the house floor. Doormen, reduced 50 per cent in number, kept a sufficient number of trucks at the doors while a tallyman checked the number of packages, chalked the freight with the number of the outbound car and signed the bill of lading, thus eliminating one check and one handling of

new plan and a substantial saving in wages paid to labor has also been effected. Furthermore, the likelihood of loss and damage incident to the pulling down and overhauling freight standing on the floor in order to load complete shipments without splitting them up, has been obviated. A decided improvement also has been made possible in the billing department through the ability to deliver shipping orders earlier, thus reducing the likelihood of error and omission resulting from the hurry incident to train departure. In addition the cost of handling outbound tonnage has decreased from 67 cents per ton in July, 1921, to 50 cents per ton as a result of the tractor-trailer operation.

With the tractor-trailer operation in the two 40 ft. wide houses which load to four and five strings of cars, with the freight received nearly opposite the car, and with an approximate haul of 100 ft. the houses have at all times been kept clear of congestion and there is no freight on the floor to run around except certain bulky articles which the present 15 in. high trailers cannot accommodate. Trailers 11 in. high from floor have been ordered to afford lower trucks on which to handle such bulky freight as barrels, bales, etc.

The house equipment includes a charging station in each house operated. The tractors are put on charge by a freight house man at the close of the day. A second class electrician, reporting at 11 p. m., is responsible for their proper operating condition. No. 1 House, handling 530 tons of freight, requires two tractors and 120 trailers while No. 6 House, with 800 tons, has three tractors and 180 trailers.

Empty trailers are always kept at the freight house doors and are loaded by the teamsters and one freight house man. A separate trailer is given each shipment regardless of size and, after the block number has been chalked on the freight, the truck is moved by the tractor to designated car.

There are two men on the tractors; a driver and helper. The latter makes the hitches and steers the trailer when it is being pushed. At Boston pushing, rather than trailing, is the prevailing method of procedure because of the short haul and the absence of any turn around platform on the farther side of the cars. The tractor will turn in a car but the push method has been found expedient as the tractor, after pushing the load into the car, backs out and repeats, keeping busy all the time in one part of the house or another. Steve-dores, one for each ten cars, unload the trailers and push the empties back into the house.

The Boston freight terminal is operated under the general supervision of G. Marks, assistant to the general manager, and F. S. Hobbs, superintendent. William King, agent, is in direct charge.

**Because of the Short Hauls, It Is Generally Advantageous to Push the Trailers**

freight. The loaded trucks were then pushed away from the doorway and subsequently were pulled into the cars by laborers assigned to that duty.

While the drop-truck method proved greatly superior to previous methods it was still impossible, during the late afternoon when the heavy flow of freight was offered, to keep abreast of receipts with the loading. Consequently, it was decided to replace the man power trucks with tractors and trailers. These were placed in service on September 1, 1921.

#### Results of Tractor-Trailer Operation

While prior to the introduction of the present system approximately 10 per cent of the outbound freight was held over daily because of the inability to clean up, it has been possible, since the installation of the tractors and trailers, to keep the floor free of freight. The necessity of pushing freight back into the house has been eliminated under the

••• ••

**Consolidation Freight Locomotive for Huntingdon and Broad Top Mountain**

Two of these locomotives have lately been delivered by the Baldwin Locomotive Works. They are designed for coal traffic in western Pennsylvania on a road having 18-deg. curves, 1.86 per cent grades and 85-lb. rails. The locomotives weigh 190,700 lb., of which 170,100 lb. are on the drivers, have a tractive effort of 40,600 lb., cylinders 22 in. by 28 in., 51 in. drivers, boiler pressure 190 lb., evaporative heating surface 2,237 sq. ft., superheating surface 503 sq. ft. and grate area 46.7 sq. ft.

# Railroad Bill Discussed on Floor of Senate

## Skepticism About Passage of Bill at This Session Due to Tactics of Senator La Follette

WASH. POST, D. C.

SENATOR CUMMINS' SPEECH in the Senate in explanation of the bill to authorize the Railroad Administration to sell its railroad securities was completed on Monday, November 14, and general debate was begun on the following day. Both at the White House and among the Senate leaders the hope was expressed that the bill could be passed at this session and in time for an adjournment of Congress by Thanksgiving Day, but it is apparent that Senator La Follette will lead a fight against the bill that will consume so much time that there is much scepticism as to the possibility of any action on the bill before the next session, which begins on December 4. As was expected, Senator La Follette and others have taken advantage of the opportunity to propose as amendments to the bill various changes in the Transportation Act.

Senator La Follette introduced three amendments, one of which would repeal Section 15a, the 5½ per cent rate-making section of the interstate commerce act, another of which would amend the provision under which the Interstate Commerce Commission has ordered increases in intrastate rates, and another which would provide that all funds made available under the bill shall be expended only in payment for labor and materials for the maintenance, repair and renewal of equipment, roadway and structures of the carriers and that all labor shall be performed in the shops or on the roadway or on the structures of the carriers making such repairs. This is designed to prevent contracts with outside companies.

Senator Kendrick also submitted an amendment to substitute for paragraph 3 of Section 15a a provision that the commission shall from time to time determine what percentage constitutes a fair return, such percentage to be uniform for all groups or territories, and adding to the considerations which shall govern the commission in making rates, the following: "In order not to prejudice the interests of, impose an unreasonable burden upon, or discrimination against, shippers, producers and consumers."

Senator Jones of New Mexico also introduced an amendment to eliminate the proviso of the fourth section and make the long and short haul rule absolute.

### Senator Cummins Explains

Senator Cummins said that when the President comes to determine whether in the case of a particular railroad he will fund any part of the indebtedness of that railroad to the government he will consider its financial condition and if he finds that it is not necessary to extend the time on any part of that indebtedness he will not extend it, but he assumed that in the future as in the past he will find some railroads which do need that indulgence and he will fund a part of that indebtedness within the range of \$500,000,000. If he pursues the plan he has hitherto pursued, the amount funded would not be great. At any rate, he thought it would be found in the public interest to fund at least from \$75,000,000 to \$150,000,000. Suppose it were \$100,000,000, he said, that would have to be added to the \$279,000,000 which the government owes the railroads above what the railroads owe the government and to pay this amount the President must either sell railroad securities or go to Congress for an appropriation. If he does not exercise his judgment in favor of funding at all, the Railroad Administration will be \$125,000,000 or \$130,000,000 short of funds necessary to pay the admitted debts to the railroads.

Some of the railroads, Senator Cummins said, have plenty of money. They were prosperous up to the first of September,

1920, when the government guaranty expired, but since that time the roads have earned less than enough to pay the interest on their bonds and he ventured to predict that when this calendar year closes, if the rates which are in existence now be maintained, the railroads will not have earned more than enough to pay the interest upon their bonds.

In reply to a question as to whether the President will be expected to sell railroad securities to anybody but the War Finance Corporation, Senator Cummins said that it may not be necessary to use the War Finance Corporation at all. The President in the last two months has disposed of over \$100,000,000 of equipment trust certificates to private investors merely with the assistance of the War Finance Corporation, but without the War Finance Corporation buying them. The bill provides that the President may sell other securities in a similar way.

One of the amendments to the bill as passed by the House, Senator Cummins said, is intended to provide for partial payments to the railroads because the bill in the form as passed by the House would prohibit such payments.

### Advances Only to Needy Roads

With regard to the railroads which have accumulated a surplus and can pay the government the advances made for capital expenditures during federal control, the President will not fund the indebtedness. "The act," he said, "is only intended to give that measure of relief which I think every reasonable man will approve as necessary to keep our railroads in operation."

"The fact is that at the close of federal control the government owed the railroads, from its present point of view and its present interpretation of the contract, a sum approximating \$1,400,000,000; and from the railroads' point of view, with their interpretation of the contract, and after giving credit to the government for all the amounts due from them to the government, the government still owed them more than a billion dollars. The uncertain part of it all has been in the claims of the railroads for undermaintenance; for the failure, as they allege, on the part of the government to maintain the properties in as good condition as they were in when they were taken.

"There has been no controversy with regard to the amount of compensation. Under the bill that was passed in March, 1918, we agreed to pay the railroads as a whole more than \$900,000,000 a year, and that and the money taken over at the time the railroads were surrendered to the government and the admitted undermaintenance make up chiefly the sums of money due from the government to the railroads; but you can take it as absolutely true that on October 1, as nearly as could be estimated, if the government shall in the future require the payment of all the money now due from the railroads on account of additions and betterments, we would still owe the railroads more than \$279,000,000. We have not the money with which to pay it, and we shall either have to dispose of a part of the securities which the President now holds or we must make an appropriation with which to pay it; and, as I remarked the other day, in that alternative I think there can be no difference of opinion as to the wisdom of disposing of the securities, assuming that the President can and does, as the bill provides, dispose of them without loss; that is, at the par at which the government took them and without recourse upon the government."

All of the Senate committee amendments to the bill as passed by the House were agreed to on November 15, but

on November 16 the bill was displaced to give way to the Newberry controversy.

Senator Cummins put into the record a letter from Director General Davis explaining in detail how the balance in cash which will be required to complete the final settlements between the Railroad Administration and the carriers as of October 1, \$279,851,593, is arrived at, as follows:

In the accounts which the Railroad Administration has with each carrier, the amount due the administration for additions and betterments appears as a charge against such carrier, so that estimates made by the Railroad Administration as to the funds necessary to complete final settlements have always been based upon collecting from the carriers the amount of the additions and betterments, and the sum stated as necessary to conclude final settlements is in excess of the balance due for additions and betterments.

Explaining somewhat in detail, March 1, 1920, at the close of Federal control, the addition and betterment account of the Railroad Administration and the carriers aggregated \$1,144,681,582.39. The expenditure for equipment aggregated \$381,649,957.12. As this expenditure was taken care of in the equipment trust certificates, this amount should be deducted from the aggregate expenditure, and leaves a balance of additions and betterments to be otherwise disposed of aggregating \$763,031,625.27.

Prior to any final settlements, and largely in the earlier part of Federal control, there was special assistance given some of the carriers in the way of funding (Baltimore & Ohio, \$9,000,000; Boston & Maine, \$8,000,000; Erie, \$3,500,000; New York, New Haven & Hartford, \$17,000,000) aggregating \$37,500,000, which deducted from the \$763,031,625.27, leaves a balance of additions and betterments of \$725,506,625.27.

Up to October 1, 1921, final settlements were made of claims aggregating \$387,017,099.12, and in these settlements \$170,756,035.16 of additions and betterments were disposed of, \$137,313,035.16 being collected from the carriers—that is, this amount was charged to them and deducted in the final settlements—otherwise the cash payment to the carriers would have been increased by the amount of additions and betterments so collected, and \$33,443,000 was funded as a part of and in connection with the final settlements.

These two items make an aggregate of \$170,756,035.16, which, deducted from the \$725,506,625.27, above stated, left a balance, as of October 1, 1921, of \$554,850,590.11 of additions and betterments to be disposed of in final settlement.

It is estimated by the Railroad Administration that, as of October 1, 1921, there is due the carriers from the Government on final accounting, and this includes compensation, money taken over, maintenance of way and structures, maintenance of equipment, depreciation, and all other items, exclusive of additions and betterments, \$834,702,183.66. Deducting the balance of additions and betterments undisposed of, as of October 1, 1921, \$554,850,590.11, leaves a balance of cash required for the completion of final settlements, based upon collecting from the several carriers the amount charged against them on account of additions and betterments, \$279,851,593.55.

In all estimates of amounts necessary to conclude final settlements, such estimates have always been based upon the assumption that the additions and betterments, which, exclusive of the equipment trust certificates, aggregated \$763,031,625.27, would be collected from the carriers in final settlement.

I am always apprehensive that some confusion may exist because of differences in aggregate amounts given at different times. For instance, comparing the statement I made before the Interstate Commerce Committee of the Senate, the statement herewith submitted, as of October 1, 1921, and subsequent statements that I have made, as of November 1, 1921, it must always be borne in mind that in the progress of liquidation these balances are constantly changing from month to month by reason of the fact that final adjustments are being completed almost daily.

In this particular statement I am calling attention to a specific item of \$37,500,000 which represents funding completed by the Railroad Administration before my connection with it. In some statements heretofore made we have included this \$37,500,000 in the aggregate of funding made. This does not change the balances in any particular, but, as a matter of fact, the \$37,500,000 was funded prior to final settlements, and to be exactly accurate should receive the special consideration which I have given it.

#### TOTAL AMOUNT NECESSARY TO COMPLETE FINAL SETTLEMENTS BETWEEN THE RAILROAD ADMINISTRATION AND THE CARRIERS, AND HEREIN THE EFFECT OF CLAIMS FOR ADDITIONS AND BETTERMENTS, PROPERLY CHARGEABLE TO CARRIERS' ACCOUNT, IN SUCH FINAL SETTLEMENTS

Total amount expended by the Railroad Administration for additions and betterments during 26 months of Federal control.....	\$1,144,681,582.39
Of this amount there was expended for equipment (100,000 freight car and .000 locomotives), which expenditures are represented by 10-year equipment trust certificates, and are therefore eliminated from the account.....	381,649,957.12
Leaving balance of account for additions and betterments, less equipment trust certificates.....	763,031,625.27
Under special administration made by the Railroad Administration prior to final settlements, funding for individual roads (Baltimore & Ohio), \$9,000,000; Boston & Maine, \$8,000,000; Erie, \$3,500,000; New York, New Haven & Hartford, \$17,000,000) aggregated a total of.....	37,500,000.00
This left a balance of additions and betterments to be adjusted in final settlement of.....	\$725,506,625.27
Up to October 1, 1921, final settlements were made of claims presented by the carriers in the aggregate sum of \$387,017,099.12. In these settlements \$137,313,035.16 of additions and betterments were charged to the carriers, and \$33,443,000 of additions and betterments were paid as a part of and in connection with such final settlements. These settlements have, therefore, reduced the addition and betterment claims by the sum of.....	170,756,035.16
Leaving a balance of additions and betterments to be adjusted in future final settlements of.....	\$554,850,590.11

It is estimated by the Railroad Administration that, as of October 1, 1921, there is due the carriers from the Government, on accounts growing out of Federal control, and this includes compensation, money taken over, maintenance of way and structures, maintenance of equipment, materials, and supplies, depreciation, and all other accounts, exclusive of additions and betterments.....	834,702,183.66
Deducting the balance of additions and betterments undisposed of October 1, 1921.....	554,850,590.11

Leaves the balance of cash required for final settlements, based upon the estimate of the Railroad Administration as above set forth, and further based upon collecting the balance due on additions and betterments as shown above.....	\$279,851,593.55
--	------------------

#### EXPLANATION.

In all estimates of the amount necessary to conclude final settlements, same have been based upon the assumption that the additions and betterments would be collected from the carriers on final settlement, as the amount of such additions and betterments was charged in the accounts against the carriers at the time of the completion of same.

In comparing these estimates with estimates heretofore given, it must always be borne in mind that, because of adjustments that are being constantly made, balances are continually changing. The foregoing estimate is as of October 1, 1921.

## Railroad Ticket Protective Bureau Still Fighting Scalpers

THE RAILROAD TICKET PROTECTIVE BUREAU, which was first established in February, 1903, and was disbanded during the period of federal control, was again organized in November, 1920, and since that time has been particularly active. Its object, as stated in its articles of organization, is the "detection and prosecution of forgers, counterfeiters, and unlawful manipulators of railroad tickets." During federal control the duties of the bureau were taken over by the Property Protection department of the U. S. R. A.

Since its reorganization, the bureau has made an extended investigation of railroad ticket scalping throughout the country, as a result of which it has found that scalping has increased to a much greater extent than was in evidence prior to 1918. This is especially the case at suburban points where low monthly rates are made on 60 or 25-ride tickets. The Long Island recently estimated its loss from suburban ticket scalping to exceed \$100,000 per year. The New York Central, on September 1, inaugurated the plan of requiring a photograph of the purchaser pasted on his monthly ticket and, by that means of identification, prevent its re-sale.

Commuters have protested strongly against the inconvenience of this regulation and several attempts were made to have the ruling revoked before it became effective on October 1. The New York Central reports that one of the first effects of the new ruling was a tremendous decrease in the sale of commutation tickets at a small station on the West Shore division. Although this station has only a handful of commuters it always sold at least 40 commutation tickets each month. This was explained by the fact that the commutation rate from this station is only 32 cents, whereas the regular round trip fare is \$2.70.

Scalping of other than suburban tickets has also been uncovered in the process of the Ticket Protective Bureau's investigation. It was found that the low-priced week-end and Sunday excursion rates brought about the resumption of curbstone ticket scalping in the vicinity of the depots. Sunday excursionists are openly importuned to buy and sell the return coupon of a ticket. This is easily accomplished by the scalpers as excursion tickets are usually issued in non-signature form and are not protected by former state and federal court injunctions. Of the 48 states in the Union, only 16 have attempted to enact anti-scalping legislation and in some of these states the bills have been carelessly drawn, while in others riders and amendments have been added to the bills, practically destroying their effect. To remedy this situation, C. A. Fox, chairman of the Railway Ticket Protective Bureau, and an advisory board are now working on several plans which are designed to curb, if not entirely eliminate, this drain on passenger earnings.

# Railway Development Association Meets in Chicago

## Agriculturists and Industrial Agents Discuss Transportation Business from Interesting Angles

THE American Railway Development Association, organized in 1906 and consisting of about 200 land commissioners; agricultural, real estate, tax and industrial agents; immigration inspectors; horticulturists and colonization agents of railroads in the United States and Canada, held a semi-annual meeting at the Hotel Sherman, Chicago, on November 10 and 11. The convention was opened by the president, G. E. Bates (D. & H.), and was conducted in two separate sections, one agricultural and the other industrial, except when giving attention to matters of mutual interest. One such occasion was the tribute paid to the dead soldiery of the world war when at 11 a. m. on November 11, the assembly discontinued its deliberation for a moment while the members stood silently facing east.

A variety of topics received consideration during the convention. Addresses were delivered by C. S. Ucker, vice-president, Southern Settlement and Development Organization, and Samuel O. Dunn, editor of the *Railway Age*, and many excellent papers were presented on the several phases of the agricultural, industrial and marketing problem.

### Publicity Came First on the Program

That the association entertains a very favorable opinion of the value of publicity work in railway development and a desire to familiarize itself with the various ramifications of the problem was indicated by the large amount of time allotted to the consideration of this subject. S. R. Guard, director of publicity, American Farm Bureau Federation, speaking first on this subject, dwelt somewhat on what he considered the underlying principles of successful publicity methods and concluded his talk with a description of the methods of the American Farm Bureau Federation. From this description it appeared that while the Farm Bureau Federation has no official publication, it accomplishes a great deal through the medium of a weekly news letter which is made available to newspapers and is distributed to the officers of the state and county agricultural offices who adapt the information to the local situation.

Z. G. Hopkins (M. K. & T.) followed Mr. Guard with a spirited talk on the subject of railway publicity methods.

Since the railway industry is of such importance to the public that the newspapers will say things about it whether the carriers themselves like it or not, Mr. Hopkins said, it is highly important for the roads to see that the public is not misinformed about what the railway situation is and what the roads are trying to do. To do this, in Mr. Hopkins' opinion, is the primary object of railway publicity at the present time. He pointed out that while the dissemination of absolutely correct information by a definite organ of publicity and the close surveillance given to newspapers by publicity men can accomplish considerable along this line, it is desirable that railway men should not lose sight of their own opportunity to do effective work when in personal contact with the public and to this end he urged the members of the association never to fail to throw their weight on the railroad side of the argument during their extensive travels.

Responding to a request from the chair, J. F. Jarrell (A. T. & S. F.) strongly indorsed the remarks of Mr. Hopkins and along with C. S. Hatfield (secretary, St. Louis Convention, Publicity and Trade Bureau), placed special emphasis on the merit in the idea of localized publicity as introduced by Mr. Guard. Mr. Jarrell in his remarks on the latter point referred particularly to the value of cultivating the good will of newspaper men and Mr. Hatfield illustrated the point by reference to the Neosho plan of community advertising, described elsewhere in this article.

### Samuel O. Dunn Addresses the Convention

Appearing before the joint session of the association on Thursday and addressing himself to the railway and general economic situation, Mr. Dunn brought home to the association forcibly a pressing phase of development work. The most important problem confronting the railroads at the present time, he pointed out, does not lie so much in getting more business as in getting ready to handle it, for as he stated the present predicament of the farmers, though a serious one, is the result of a temporary under-consumption throughout the world which condition is even now righting itself, while, on the other hand, the condition of the railroads is one of under-development. The difficult thing about this latter

phase of the problem Mr. Dunn said, is that the railroads are powerless to solve it alone; since the public fixes the freight rates on the one hand and the pay of the labor on the other, as a result of which it necessarily follows that if the problem is going to be solved correctly the public must understand what the situation is. As a class of railway men who are in constant touch with the public, it devolves upon the members of the association to overcome the erroneous ideas entertained by the public regarding the railway business and meet false propaganda; and, by co-operating with the public in problems of mutual interest, to acquire its confidence and good will.

#### Railroads Have an Immediate Interest in Colonizing

When Mr. Dunn had concluded his address the association undertook the consideration of the immigration and colonization question. This session was conducted under the direction of H. W. Byerly (N. P.) and involved the presentation and discussion of three papers, the first of which was by B. G. Packer (commissioner of immigration of Wisconsin) on the Wisconsin plan of colonization. In his talk Mr. Packer described fully the origin and operation of Wisconsin's effective organization for clearing and populating its hitherto sparsely settled and cut over lands. The success of the Wisconsin plan, Mr. Packer pointed out, is based on the personal interest which is taken in each settler before and after his connection with the land, this interest manifesting itself through liberal financial support given to the settler while improving his land, protection extended against unscrupulous real estate men and the educational service rendered.

Among other things of which the settler is apprised, Mr. Packer said, is the fact that the railroads are themselves rendering material help to the farmers by colonizing undeveloped lands, equipping trains with products for exhibition in other states, working with the agricultural department in holding meetings among settlers, furnishing speakers for farmers' institutes, advertising agricultural meetings, helping farmers to secure better markets for their products, co-operating with the state department in operating land clearing specials, etc. In discussing this paper, D. W. Foster (Canadian National) deplored the fact that whereas 73 per cent of the population was on the land a few years ago only 27 per cent is so situated at the present time and stated that there are thousands of farmers in cities who ought to be back on the land.

The second paper presented during this session of the association was one by J. M. Jones (S. A. L.) on the subject of immigration methods in the west and the northwest. After dwelling upon the importance to any railroad of a well-settled and thriving country tributary to its lines and calling attention to the vast areas of sparsely inhabited lands which the Seaboard Air Line traverses, Mr. Jones told of a trip which he recently made through the west and northwest in search of methods and practices applicable to the Seaboard Air Line's problem. Visiting in Michigan, Wisconsin, Minnesota, Montana, Washington, Oregon, California, Utah, Colorado, Kansas and Oklahoma, Mr. Jones observed a wide variety of colonization programs in various stages of completion and of more or less merit. Prominent among the projects visited and studied were those near Marquette, Mich., the projects of the Chippewa Valley Colonization Company, the Wisconsin Colonization Company and the Tomahawk Land Company in Wisconsin, the Huntley Irrigation Project in Montana, the Yakima and Wenatchee projects in Washington, the Hood River project in Oregon, the Dwinell and Forkner projects in California and the Red Lands project in Colorado. As a result of his study Mr. Jones concluded that settlement work to be successful must afford (1) a legitimate profit to the man who is selling the lands, (2) an opportunity for the settler to work, to gain

a living while working, to establish a happy home and to pay for his property within a reasonable time, and (3) the means to improve social conditions and advance the interests of citizenship.

"Land selling against land settling" was the subject of the final paper presented on the question of colonization. In this paper H. M. Madison (S. A. & A. P.), portrayed the evils of colonization which goes no deeper than the selling of the land. "With some notable exceptions and a few partial successes," Mr. Madison said, "land settling methods have been largely an orgy of reckless advertising and expenses," with permanent profit to nobody. "The payments made by purchasers have seldom been used," he said, "to improve land or develop production, neither have much of them gone to land owners or served to accumulate assets for land selling concerns." It is not the amount of land sold but the percentage of farms in cultivation, Mr. Madison explained, that determines the success or failure of railroads serving agricultural sections, and it is a significant fact that a railroad serving an agricultural country is seldom able to meet its operating costs and fixed charges alone until one-third of the territory it serves is under cultivation. If this were more generally known and understood by railway investors and managements, Mr. Madison said, less reliance would be placed in mere land selling methods and more attention given to the cultivation and proper financing; for, as Mr. Madison further pointed out, failures in land selling not only result in immediate losses to railroads but give the land an unfavorable reputation which is difficult to overcome. The policy of a railroad, therefore, in Mr. Madison's opinion, should be one of land settlement as against land selling and this policy, to be effective, should rest upon the following rules:

1. Refuse to list, advertise, sell or help sell any improved farm—leaving such work to real estate men.
2. Refuse to help sell or encourage any farmer to buy raw or unimproved land.
3. Refuse to lend any assistance or to encourage any concern to simply sell raw or unimproved lands.
4. Encourage local organizations to improve land.
5. Offer assistance in finding farmers to purchase newly improved farm lands.
6. Help farmers get money to improve larger percentages of their farms.
7. Point out the desirability of better plans in subdividing and improved tracts of land.
8. Point out the adaptability of soils to particular kinds of crops, and otherwise.
9. Encourage better farming methods.

In discussing this paper C. L. Seagraves (A. T. & S. F.) emphasized the importance of getting co-operation from the state in the development work and of interesting the various chambers of commerce in disseminating full information about the farms as well as the products. He further pointed out that colonization plans to be successful should provide a means by which farmers might obtain comforts in their homes comparable to those in the cities. The fact that surveys show that people who left the smaller towns and the farms four or five years ago and moved into the larger cities now want to return, Mr. Seagraves contended, made it apparent that, if reasonably comfortable homes could be provided on the farms, little difficulty would arise in populating unsettled regions.

As an additional item on this subject F. McCabe (C., St. P., M. & O.) briefly discussed the situation along the Omaha Line in northern Wisconsin. In order to populate this section, he pointed out, the road has found it advisable to make a thorough study of every element entering into the development work, including the banks and the real estate men. A clear-cut distinction is made between land sellers and land settlers, he pointed out, and deserving agencies are given free transportation in connection with their promotion work.

## Helping the Farmer Improve His Business

The extent to which the association considers it profitable for the railroads to go into development work, was brought out Friday morning when the agricultural section, under the direction of J. M. Jones (S. A. L.), devoted its time to the consideration of such subjects as the raising of live stock and potato loading. On the live stock subject E. J. Leenhauts (N. Y. C.), after dwelling on the decided economic advan-

### How the Railroads Helped the Farmer by Encouraging the Organization of Commodity Marketing Associations

tages to a community of the well bred over the scrub stock, described how the New York Central had co-operated with various agricultural organizations, including the Michigan Agricultural College, in introducing pure bred livestock in northeastern Michigan. In the particular campaign in question it developed that a special train of 9 cars, carrying stock and various educational exhibits, and accompanied by the agricultural agents of the road as well as representatives of

Poorly Sewed Sacks Cause Large Annual Losses

other organizations, made an 18-day trip throughout this section coming into contact with 15,000 people.

During the discussion of this paper it developed that similar campaigns had been conducted by other roads. H. G. Schweiter (I. C.) told how the Illinois Central has gone to the extent of including an educational motion picture in its itinerary, and T. S. Acheson (C. P. R.) said that dairying is made quite as important a subject as live stock on such trains sent out by the Canadian Pacific.

A particularly interesting presentation was made by E. G. Reed (C. & S.) on the subject of potato loading. Mr. Reed

telling how, in order to reduce the annual losses which both farmers and railroads experienced from improper potato loading, a campaign was conducted over the Chicago, Burlington & Quincy and the Colorado & Southern lines in Wyoming, Colorado and Nebraska, in co-operation with agricultural agents and colleges to teach the farmers, station agents and any other interested parties, the right and the wrong ways of loading this produce.

In discussing Mr. Reed's work F. Benz (N. P.) emphasized the value of the correct sorting and loading of potatoes in establishing a reputation with buyers, and made a special point also of the losses which a railroad can avoid either from injury in shipment or practices of unscrupulous buyers, by inspecting carefully the potatoes which are loaded in these cars. It is highly essential, Mr. Benz said, that the railroad must not only know how to load cars but what to load. E. G. Wade (I. C.) called attention to the fact that this statement applies even more directly to the loading and handling of sweet potatoes, neglect in culling out diseased and otherwise defective specimens invariably giving rise to immediate or ultimate losses.

### Discussion of the Marketing Problem

Turning its attention finally to the marketing phase of railway development work, the agricultural section of the association with L. D. Fuller (Erie) in the chair, concluded its session with the consideration of three subjects,

The New York Central's Live Stock Special Aroused the Communities

the first of which was the produce market of New York City. This included a motion picture portrayal of the various operations of marketing farm products in that city from the time the freight cars were ferried across the river, or sold from the farmers' carts in the market-place, to their final disposition. This picture was presented by H. B. Rogers (Erie).

Following this picture, V. B. Farrar (St. L. S. W.) presented a paper on the organization of commodity marketing associations. In this paper Mr. Farrar referred to associations of farmers in certain sections of the country for the purpose of marketing their products as distinguished from organizations for buying, as the most important agricultural development which has grown out of the depression of the last two years. He described the nature of these organizations and enumerated their apparent advantages. Under this plan of organization, Mr. Farrar showed, producers of certain commodity combine together on a purely business basis whereby they are able to eliminate competition between various communities, to protect themselves more effectively against calamity in shipping and marketing and stabilize their business. Along the Cotton Belt Route the railroads have been instrumental in establishing a number of flourishing organizations of this kind, one of which is the Texas Tomato Growers Association.

The third and final presentation made before the Agri-

cultural Section was a paper on the state inspection of perishables prepared by W. C. Andreas (State Bureau of Markets, Nebraska). In the absence of Mr. Andreas this paper was read by J. B. Lamson (C. B. & Q.). While confining itself to the potato situation in Nebraska and in this respect consisting more or less of a reiteration of what was said on potatoes during the discussion on potato loadings, this paper also brought out the advantages of state inspection of such produce. In Nebraska, Mr. Andreas pointed out, state inspection was inaugurated in 1919, when it was made compulsory for the department of agriculture to inspect and grade each carload lot of potatoes originating in the state. The results of this inspection has been very satisfactory, the Nebraska potatoes now receiving due consideration in terminal markets where during the war period the food administration had difficulty in protecting the Nebraska potato from discrimination on the markets.

### Industrial Development Considered

While the Agricultural Section of the association considered railway development work from an agricultural standpoint, the Industrial Section, meeting elsewhere under the direction of J. M. Mallory (C. of Ga.), applied itself to a more or less informal discussion of such subjects as shipper's guides, industrial surveys, community development programs and property leases. Shipper's guides were subjected to a particularly thorough discussion, it developing that such a book was in the process of preparation on the Delaware & Hudson under the direction of G. E. Bates and that other roads were contemplating the preparation of similar books. The book now under preparation by the D. & H., Mr. Bates pointed out, will list all industries and wholesale companies either on the D. & H. tracks or with which the D. & H. has switching arrangements. These industries, he said, will be listed both by stations and with respect to the products they manufacture or handle. The first pages of the book will be devoted exclusively to all information of interest and value to the public and shippers regarding the Delaware & Hudson road and the book will provide advertising space for any industry desiring to use it. E. S. Center (A. & W. P.), when called on for comment on this subject, made the statement that a road should have a guide if for no other purpose than to keep the traffic department in close touch with the revenue tonnage produced by the industry.

On the subject of industrial surveys the association appeared particularly interested in the system on the Baltimore & Ohio. This system, as H. O. Hartzell pointed out, was inaugurated in 1916 and had for its goal the making of an industrial survey of every town along the line. The underlying principle of this survey was solely one of providing a fund of preliminary information for prospective industries to the end of which data was appended on labor conditions, power, coal supply, housing conditions, railroads, business sites, distances to waterfronts, large cities, etc. This sort of information is of material value to the prospective industrial firm and has justified itself on the B. & O.

While the entire assembly appeared to indorse the idea behind industrial surveys, many differences of opinion arose as to the mechanics of the work and its application. J. C. Emig (C. C. C. & S. L.) voiced one of the differences when he expressed his disapproval of permitting too free use of this material by commercial clubs, to which A. G. Moore (L. & N.) responded with the opinion that the railroads had little to lose and a great deal to gain by extending such services as well as others to these organizations.

Taking up the subject of community development, the association devoted its attention to a discussion of the Neosho plan of community advertising. As described by J. B. McCartney (C. of Ga.), this plan, which derives its name from the Missouri town in which it originated, is one whereby all markets in the community set apart a sale day once a month

on which non-competitive bargains, which had been advertised by co-operative advertising, are offered. On the same date an auction sale is held at which farmers may dispose of their goods; and finally as a third feature of the plan, monthly visits are made by the merchants to selected farms. The entire plan directs itself to the increasing of business and through the mediums of personal contact and clean advertising. These organizations are adapted to towns of from 1,500 to 15,000 population, Mr. McCartney pointed out, and are functioning successfully in many places where railroads have helped to institute them.

The final subject discussed by the industrial section of the association was that of side-tracks and industrial leases. At this time report was made by a special committee which conferred with the American Railway Engineering Association as to uniform terms and contract for the lease of railroad property to industries and individuals and of the construction and maintenance of private industry tracks. As the committee's report was in the nature of a progress report, no final action was taken and the remainder of the session was devoted to the informal discussion of a variety of points incident to the making of contracts, the handling of taxes on industrial property, the limitation placed on the amount of property which any industry may lease, etc.

### Railroads Urged to Encourage Reclamation

Appearing before the association on the last day of its session, C. S. Ucker (Southern Settlement and Development Association) delivered a forceful address on the subject of the land reclamation by the United States government in which he developed the importance of the work to the country, making special reference to the beneficial results accruing to railroads, and urged the roads to lend their support in effecting the passage of the Bankhead bill now pending in Congress. There are at present in the country vast stretches of land which can be made available for agricultural purposes and it is highly important, Mr. Ucker pointed out, both from economic and social standpoints that they should be prepared for settlement. The problem of putting much of this land in shape, however, is one requiring federal aid and since there is no longer a fund from the sale of public lands to support projects of this kind, such work must be carried on with funds taken from the public treasury. To this end the Bankhead bill, as Mr. Ucker explained, seeks authority for the appropriation of a revolving fund of \$500,000,000 to provide for the construction of reclamation projects and the improvement of lands otherwise for settlement, not only in the west, as the earlier reclamation acts provided, but wherever else such work is needed, including 100,000,000 acres of land in the south.

# Traffic League Holds Annual Meeting at Chicago

## Important Action Included Consideration of Reports on Legislation, Demurrage and Claim Prevention

ABOUT 350 members attended the annual meeting of the National Industrial Traffic League at the Hotel Sherman, Chicago, on November 9 and 10. Committee reports were presented and discussed. Action on the report of the special committee on legislation was deferred to a special meeting to be held later. The league endorsed the continuance of the government barge line.

W. H. Chandler, manager of the transportation bureau of the Boston Chamber of Commerce and president of the association, called the meeting to order on Wednesday morning. J. H. Beck, executive secretary, then presented the report of the executive committee. He discussed the necessity of continuing the Interstate Commerce Commission as it has been in the past, free from all outside influences and also told of the projected removal of the suspension of section 28 of the Jones act, stating that his committee would watch the matter closely and undoubtedly take action if the removal of the suspension is threatened.

### Report of Special Committee on Legislation

R. C. Fulbright presented the report of the special committee on legislation. He suggested that a special meeting be called in February to act on the report. It was decided to distribute the report among all of the members, action to be taken not later than February, 1922. The report is summarized as follows:

Generally speaking, the Transportation Act has demonstrated its importance and efficacy in solving many of the difficult problems of transportation. This committee has only found a few features which in its judgment should be changed at this time; but some of these are of basic importance. The future operation of the bill may justify the League in proposing further changes or additions, but for the present, this committee has sought to confine its recommendations to those cases where some urgent necessity seems to dictate the change. For the most part it has avoided the recommendation of additional regulation of common carriers, and on the contrary has recommended the elimination of several features which require additional regulation which have been productive of discontent. It has sought to take from rather than to add to the present common carrier law.

1. *The Six Per Cent Clause.*—This provision has been productive of so much litigation because of its having been construed to give complete power over intrastate rates, and has aroused so much prejudice against the railroads that it has worked to their detriment rather than to their benefit. It is the belief of the League that if the Interstate Commerce Commission is to succeed as an administrative tribunal it must be left unfettered by hidebound rules in determining the lawfulness of rates. The committee is also opposed to the socialistic principle of the recapture of excess earnings, whereby the earnings of one carrier may be taken from it and applied directly to the betterment of others. Such a precedent in legislation is most dangerous and may be followed by legislation which will be disastrous to other lines of business. It is therefore recommended that Section 15-a be repealed.

2. *Jurisdiction Over Intrastate Rates.*—The committee recommends that the power of the state regulatory bodies over the common carriers be preserved subject only to the right of the Interstate Commerce Commission to remove unjust discrimination upon specific complaints as to specific rates. It further recommends that no order of the Interstate Commerce Commission as to the removal of such discrimination should be permitted to have the effect of raising an intrastate rate until the matter has been presented to the state regulatory body which should be allowed time to review the reasonableness of the rate. Should the state regulatory body refuse to act, the act should most certainly not operate to prevent the Interstate Commerce Commission from thereafter prescribing the method by which such discrimination may be removed.

3. *Consolidation of Railways.*—It is recommended that subdivisions 4, 5, 6 and 8, of Section 5 of the Act be repealed, and that, in lieu thereof, the Interstate Commerce Commission be given the authority to authorize consolidation upon application of the interested lines, provided that such consolidation, in the judg-

ment of the commission, will be in the public interest and will not substantially lessen carrier competition.

4. *Telegraph, Telephone and Cable Companies.*—It is recommended that the Interstate Commerce Act be amended so that all of the provisions of the act will apply to telegraph, telephone and cable companies engaged in interstate commerce, in so far as the provisions are pertinent to such companies. Telegraph companies should be subject to the Cummins amendment to the extent that there should be no limitation of liability for repeated messages and the Commission should be given authority to prescribe reasonable limitations of liability as to other classes of service.

5. *Suspension Period.*—The committee recommends that the suspension period be restored to the period of 120 days with the power in the Commission to extend same for an additional period of 6 months as was formerly provided.

6. *Claims Against the Director General.*—The committee recommends and reaffirms the decision reached at the Cleveland meeting of the League authorizing the counsel for the League to draw an amendment to Section 206 providing that orders entered by the Commission awarding reparation against the Director General shall be paid promptly by the treasury department without compelling the claimant to bring suit thereon.

7. *Jurisdiction of the Commission Over Reparation.*—It is recommended that the Interstate Commerce Commission be not deprived of jurisdiction over reparation as the Commission affords a method so much more satisfactory to the shippers. Therefore the League opposes taking this jurisdiction from the Commission and placing it in the hands of the court.

8. *Shippers Right of Appeal.*—The committee recommends that the act be amended to give to shippers the same right of appeal to the court now enjoyed by the carriers.

9. *Labor Board.*—The committee advocates that the Labor Board should be an unbiased, independent agency not constituted of persons directly interested in the controversies and it should have the right to hear important controversies and inform the public as to the merits or demerits thereof; it is of profound importance that the public be advised of the issues in any serious controversy. To this end the committee recommends the amendment of Title 3 of the Transportation Act to provide: a. The Labor Board to consist of five public representatives to be appointed by the President and confirmed by the Senate. b. The Labor Board shall consider the issues involved in such disputes as may be brought before it, in the manner hereinafter described and to make public its findings and recommendations. c. At the written request of any carrier or a prescribed number of employees thereof, the board shall hear any dispute or grievance as to wages, salaries, rules or working conditions with respect to such employees and not only shall the carriers' representatives and the employees' representatives be entitled to be heard but also the representatives of the shippers, or organizations of the public likely to be affected thereby. The statute in describing the number of employees necessary to sign a request for a hearing should be so drawn as to prevent the submittal of minor matters. d. The act should clearly state that the findings and conclusions of the Labor Board are not enforceable or binding on any party in the controversy but simply represent an unbiased judgment as to the merits of the controversy. e. The so-called national agreements should be abrogated, and the Act should provide for the treatment of wage questions and working conditions by each individual carrier or individual groups of carriers under the same management and control. f. Adjustment boards may be established by agreement between an individual carrier, or a group of carriers operated as a single system, and any number of employees thereof, with such power to decide any dispute as the parties to the agreement shall confer upon such board.

10. *Anti-Strike Measures.*—The committee recommends the enactment of adequate legislation which will provide penalties for interference with the movement of passengers or property in interstate commerce or with any person engaging in or seeking to engage in employment connected with common carriers' service or for any conspiracy to do any of the foregoing things.

11. *Construction of New Railroads.*—The Interstate Commerce Commission has construed paragraphs 18 to 22, inclusive, of Section 1 of the Act as amended in 1920, as not requiring a certificate of the Commission or to the public convenience and necessity in the case of the projection or construction of new railroads which are not a part of existing railroads. The committee recommends that the Commission be given jurisdiction over the

of such new lines or railroads, independently owned, except that where new lines or new extensions are to be located wholly within one state and have no financial connection with any railroads located in other states.

### Report of Standing Legislative Committee

The report of the standing legislative committee which was adopted opposed the bills requiring mileage books at reduced rates, providing for the creation and organization of a national railway corporation, seeking the retention of emergency powers of the commission, limiting salaries of railroad officers, establishing standards of work and duty for common carriers, proposing the abolishment of "Jim-Crow-cars," seeking to prescribe rates, fares and charges of railroads in the United States. It recommended the endorsement of the bill for protection of trade and commerce against unlawful restraints and monopolies insofar as affects transportation, and of the bill requiring the prompt payment and adjustment of claims, say within 60 days.

### Car Demurrage and Storage Report

After considerable discussion of the projected charge of a \$3 flat demurrage rate, which this committee was instructed to secure at the Cleveland meeting of the league, which rate was to apply both during periods of car surplus and car shortage, the question was tabled. W. H. Day, traffic manager, Chamber of Commerce, Lynn, Mass., chairman of the committee, stated that although the recommendation had been adopted by the Cleveland meeting by a vote of 145 to 90, a referendum taken had resulted in 360 votes against and only 152 in favor of the flat charge.

The recommendations regarding changes in demurrage rule 3, section B, paragraph 2, and section 6, paragraph 1, were adopted as follows:

"Several of our members have long felt that when forwarding directions on outbound cars were mailed by shipper to billing agency of carrier, cars should be considered as released at 7 a. m. date forwarding instructions are received by carrier, provided postal date shows same was deposited in the mail prior to the date received. To cover this situation the following note is suggested.

"(Note.—Except as otherwise provided in rule 6, section C, paragraph 1, this will also apply to forwarding directions on outbound cars when mailed by consignor to the agent of this railroad at point of shipment.)

"Demurrage rule 3, section C, paragraph 1. There seems to be a lack of uniformity in computing free time on cars placed on public delivery tracks which the consignees begin to unload sometime between midnight and 7 a. m. and before notice of arrival has been sent or given. Some carriers compute the time on such cars from the first 7 a. m. following removal of a part of the contents of a car, although the removal has occurred on the same calendar day. This practice is based on the theory that a demurrage day runs from one 7 a. m. to the next 7 a. m., so that while the removal of the contents of the car may have occurred say at 5 a. m., it occurred on the demurrage day immediately preceding the 7 a. m., from which time should be computed, and consequently under demurrage rule 4, section D, which provides that such removal shall be considered as notice of arrival, the first 7 a. m. after removal constitutes the first 7 a. m. after the demurrage day on which the notice was consummated by consignee's beginning to unload the car.

"Other carriers compute the free time from the second 7 a. m. after the consignee begins to remove the contents, on the theory that rule 3, section C, paragraph 1, does not specifically state that the day on which notice of arrival is sent or given means a demurrage day running from 7 a. m. to 7 a. m., and therefore means a calendar day. Consequently, the first 7 a. m. after the day on which the consignee begins unloading the car would be 7 a. m. of the next calendar day. In order to overcome this difficulty and to assure uniformity, the American Railway Association recommends that the following note be added to rule 3, section C, paragraph 1:

"(Note.—On cars subject to rule 4, section D, time will be computed from the first 7 a. m. following removal by consignee of any part of the contents of the car.)"

The recommendation of the committee to secure uniformity in the application of demurrage charges on cars placed on public delivery tracks, opposite consignees' oil tanks, coal bins, elevators or warehouses, did not meet the approval of

the meeting. Although the wording of the committee's note had been approved by the American Railway Association's demurrage committee, the following change suggested by J. L. Roberts was substituted:

When any railroad owned track or portion thereof, is leased or assigned to one or more consignees or consignors, the track or portion of track so leased or assigned will be treated as a "private track" only when used for the handling the business of consignees or consignors to whom track or portion of track is leased or assigned; but the track or portion of track so leased or assigned will be treated as a "public delivery track" when used for the handling of business of consignees or consignors other than those to whom the track or portion of track is leased or assigned.

### Diversion and Reconsignment

Four changes were proposed by H. D. Rhodehouse, traffic manager, Chamber of Commerce, Youngstown, Ohio, chairman of this committee and the meeting ratified the report and changes with wording as follows:

A joint conference of diversion and reconsignment committees representing the National Industrial Traffic League and the carriers in Official, Southern and Western Classification territories was held in Chicago, July 12, 1921. Discussion was had with respect to changes in the present rules, regulations and charges governing diversion and reconsignment of general commodities. The committees agreed on certain changes, with the understanding that such changes must be approved by the League and the railroad executives before they are published in carriers' tariff. The proposed changes are as follows:

Rule 2. Freight rate applicable.—These rules and charges will apply whether shipments are handled at local rates, joint rates or combination of intermediate rates. The through rate to be applied under these rules is the rate from point of origin via the diversion, reconsigning or reforwarding point to final destination in effect on date of shipment from point of origin. If the rate from original point of shipment to final destination is not applicable via the point at which the car is diverted, reconsigning or reforwarded, in connection with these lines, the tariff rate in effect to and from the diversion, reconsigning or forwarding point will apply, plus diversion or reconsignment charges, except that if a lower combination of rates is lawfully applicable over the route of movement such lower combination of rates, plus diversion or reconsigning charges, will apply.

Rule 4 (b) switching charges additional.—If diversion or reconsigning is made after arrival of car at billed destination and the car has been delivered to a connecting road, the switching charges of connecting road will be in addition to any other charges named herein, except that where combination of local rates is applied to and from the diversion or reconsignment point, switching charges will be added or absorbed to the same extent as on traffic moving locally to or from the diversion or reconsignment point.

Rule 8 (a) stopping in transit.—If a car is stopped for orders for the purpose of delivery or diversion or reconsigning or reforwarding prior to the arrival at original billed destination, or if such destination is served by a terminal yard, then prior to arrival at such terminal yard, on request of consignor, consignee or owner, a charge of \$..... per car will be made for such service and the point where the car is stopped will be considered the destination of the freight, and the party upon whose order car is held will be notified at the postoffice address designated by him. If the car is subsequently forwarded from point at which held, the provisions of rules 9, 10, 11 or 12, as the case may be, will also be applied. The service of stopping as provided in this rule will not prevent one change of destination under the provisions of rule 5.

Rule 11 (b) and (c). Diversion or reconsignment to points within switching limits before placement.—(b) At a charge of (\$2.50-\$3.00) per car, if, after arrival of car at destination, or if destination is served by a terminal yard, then after arrival at such terminal yard, such orders are received before the expiration of twenty-four (24) hours after the first 7 a. m. after the day on which notice of arrival is sent or given to the consignee or party entitled to receive same. (See note below.)

(c) At a charge of (\$6.50-\$7.00) per car, if such orders are received subsequent to 24 hours after arrival of the car at destination, or if the destination is served by a terminal yard, then subsequent to 24 hours after arrival at such terminal yard. (See note below.)

(c) At a charge of (\$6.50-\$7.00) per car, if after arrival of car at destination, or if destination is served by a terminal yard, then after arrival at such terminal yard, such orders are received subsequent to the expiration of 24 hours after the first 7 a. m. after the day on which notice of arrival is sent or given to the consignee or party entitled to receive same. (See note below.)

Note.—In computing time, Sundays and legal holidays (na-

tional, state and municipal) will be excluded. When a legal holiday falls on Sunday the following Monday will be excluded.

Proposals to change a number of other diversion and re-assignment rules were discussed, but no agreement could be reached. Those changes will be considered at future conferences with carrier's committees.

The changes made in the uniform code of storage rules and charges as agreed upon with the American Railway Association and presented by the committee in their new form were adopted.

At the opening of the afternoon session Mr. Beck told of the League's efforts to combat the position taken by Mr. Finerty, counsel for the director general, that all reparation, both because of discrimination and because of unlawfulness ought to be made on the basis of rates in effect subsequent to the operation of General Order 28, even though the shipments moved under federal control prior to the effective date of that order. Mr. Beck said that arguments were presented before the Commission early in October but that the Commission had done nothing about it and that the League counsel was now watching the matter. The executive committee's wage and rate resolution of September 23 was ratified.

The report of the classification committee on the proposed revision of rule 7 of Consolidated Classification was sent back to the committee for a minority report. In discussing the committee's report on uniformity of classification, President Chandler said that the matter had been under advisement by the executive committee and that it had been decided to ask the meeting to go on record as being opposed to further revision of the classification if made for uniformity only. He stated that an investigation would show that the advances have been made where they count most and that so far as uniformity was concerned, he thought it was just as easy to add second class to the river and third beyond, as it was to add second class to second class.

### Bill of Lading Committee Report

F. T. Bentley, traffic manager, Illinois Steel Company, Chicago, chairman of the committee, read the following report which was adopted:

Bill S2530, amending Pomereue bills of lading law.—As this bill is practically what was recommended to the Cleveland convention by the Bill of Lading committee, your Bill of Lading committee endorses it to the executive committee and recommends that appearance before the Senate and House committees by the League be made to further its passage.

Changes proposed in uniform bill of lading based on the Supreme Court decision in Mark Owen Company vs. Michigan Central.—In the summer the eastern section of the uniform bill of lading committee requested a conference with our committee for the purpose of considering the effect on the bill of lading of the Mark Owen vs. Michigan Central decision which definitely defined the liabilities of the carrier for delivery of earloads from public team tracks. Our committee could not meet the views of the railroad committee on this, and we agreed and reported to the executive committee at its recent meeting, that no action should be taken to change the present bill.

### Claim Prevention

The report of the special committee on claim prevention was adopted, following which the meeting was addressed in turn by Colonel B. W. Dunn, manager of the Bureau of Explosives, Fred E. Winburn, of the Freight Claim division of the American Railway Association, and W. H. Canavan of the Chicago post office, all of whom spoke on the perfect package campaign. The work of this committee is still in the formative period and it was not thought sufficient to warrant making any definite proposals.

A supplementary report of the claim prevention committee which was adopted follows:

The investigations of your committee have developed an apparent lack of authority that can be invoked in the direction of securing the active and hearty co-operation of railroad officers and local agents in this matter of claim prevention. Industry cannot and should not bear all the burden of effort in these conservation matters.

There seems to be a lamentable lack of what may be termed "a point of contact" within railroad circles—that is to say, there is an apparent lack of unity of purpose as between the traffic and operating units of the carriers, and it is the belief of your committee that proper, affirmative and positive influence in this regard can emanate only from the source of the highest railroad authority.

Your committee, therefore, recommends that the executive committee of this league bring such influence to bear on transportation executives as will create "points of contact" in transportation circles through which will be exerted a quality of authority to carry to a successful conclusion the co-operative principles which your committee believes essential to the conduct of this work.

### Other Reports

The report of the freight claims committee as presented by G. A. Blair, general traffic manager, Wilson & Co., Chicago, chairman, was adopted. A recommendation by G. T. Haynes of Sioux City, asking that further consideration of the McCaull-Dinsmore decision be tabled was also adopted. The weighing committee's report was accepted unchanged.

The meeting after hearing the report of the committee appointed to deal with the railroad traffic officers went on record with the following resolution:

It is the sense of this meeting that proposed reductions in strictly local rates having no influence on other rates should in the interests of expediency be handled by individual roads and not docketed.

The meeting also went on record by resolution as being in favor of the continued operation of the Mississippi—Warrior River barge line by the government until such time as it can be disposed of to private interests to fair advantage.

### Election of Officers

The following officers were elected for the ensuing year: president, W. H. Chandler, manager transportation bureau, Boston Chamber of Commerce; vice-president, Charles Rippin, traffic commissioner, Merchants' Exchange, St. Louis, Mo.; treasurer, E. C. Wilmore, traffic manager, Sefton Manufacturing Corporation, Chicago; executive secretary, J. H. Beck, Chicago; regional vice-presidents: F. H. Baer, Cleveland, Ohio; M. M. Caskie, Montgomery, Ala.; C. E. Childe, Omaha, Neb.; W. H. Day, Jr., Lynn, Mass.; G. S. Maxwell, Dallas, Tex.; Seth Mann, San Francisco, Cal.; R. J. Menzies, New York; board of directors: H. C. Barlow, Chicago; J. M. Belleville, Pittsburgh, Pa.; W. S. Creighton, Charlotte, N. C.; J. S. Davant, Memphis, Tenn.; C. B. Baldwin, Boston, Mass.; F. T. Bentley, Chicago; C. O. Bergan, Spokane, Wash.; C. S. Bather, Rockford, Ill.; H. E. Driscoll, Oklahoma City, Okla.; R. N. Field, Peoria, Ill.; R. L. French, Bridgeport, Conn.; R. S. French, Washington, D. C.; Carl Glessow, New Orleans, La.; E. P. Gregson, Los Angeles, Cal.; J. C. Graham, Jackson, Mich.; J. P. Haynes, Sioux City, Ia.; F. S. Keiser, Duluth, Minn.; J. C. Lincoln, New York; L. G. Macomber, Toledo, Ohio; J. D. Mansfield, Seattle, Wash.; C. D. Mowen, Fort Smith, Ark.; Herman Mueller, St. Paul, Minn.; U. S. Pawkett, San Antonio, Tex.; R. W. Poteet, New Britain, Conn.; F. M. Renshaw, Cincinnati, Ohio; J. T. Ryan, High Point, N. C.; M. H. Strothman, Minneapolis, Minn.; J. H. Tedrow, Kansas City, Mo.; T. H. Wallace, Lansing, Mich.; and G. P. Wilson, Philadelphia, Pa.

The executive committee for the new year is: chairman, H. C. Barlow, Chicago; vice-chairman, J. M. Belleville, Pittsburgh, Pa.; F. T. Bentley, Chicago; W. S. Creighton, Charlotte, N. C.; R. M. Field, Peoria, Ill.; J. P. Haynes, Sioux City, Ia.; F. S. Keiser, Duluth, Minn.; J. C. Lincoln, New York; Herman Mueller, St. Paul, Minn.; U. S. Pawkett, San Antonio, Tex.; R. W. Poteet, New Britain, Conn.; C. D. Mowen, Ft. Smith, Ark.; J. S. Davant, Memphis, Tenn.; R. L. French, Bridgeport, Conn.; Carl Glessow, New Orleans, La.

The next annual meeting of the league will be held in New York City November 15 and 16, 1922. During the last year the membership of the league has increased from 936 to 1,029 members.

*Mikado Locomotive Equipped with Booster*

## 2-8-2 Type Locomotives for the Nickel Plate

Design Based on U.S.R.A. Light Mikado with Improvements in  
Details—Booster Handles 22 Per Cent Additional Tonnage

THE NEW YORK, CHICAGO & ST. LOUIS (Nickel Plate) has lately received from the Lima Locomotive Works six Mikado (2-8-2 type) locomotives. The design was based largely upon the U.S.R.A. standard light Mikado, ten of which were allocated to the road, but a number of new and interesting features were added which make the locomotives among the best of this class.

One of the locomotives was equipped with a booster fur-

are not adjustable but are provided with solid round bushings pressed in the same as on the side rods.

Instead of six-feed lubricators with feeds to the cylinders, these locomotives use four-feed lubricators, the cylinder feeds being omitted in accordance with the standard practice on the Nickel Plate which has been found to be entirely satisfactory.

The boiler is of the conical-connection type with combustion chamber and is equipped with type A top header superheater, Security brick arch and butterfly type firedoor. A Duplex stoker is used and particular attention was given to the cab arrangement to locate all necessary piping and fittings for the greatest convenience of the engineer and fireman. The boiler pressure is 200 lb. The firebox is  $114\frac{1}{8}$  in. long by  $84\frac{1}{4}$  in. wide, which gives a grate area of 66.7 sq. ft. There are 216,  $2\frac{1}{4}$  in. tubes and 40,  $5\frac{1}{2}$  in. flues, 19 ft. long. The heating surface of the firebox, combustion cham-

Front View of Trailing Truck with Booster

nished by the Franklin Railway Supply Company and provision was made on the other engines for the ready application of boosters at some future time. The trailer trucks are of the Commonwealth Steel Company's outside bearing Delta type, equalized with the drivers. The booster and truck are shown in two of the illustrations.

These locomotives have a tractive effort of 54,700 lb. without the booster and 64,200 lb. with the booster, an addition of 17 per cent. The cylinders are 26 in. by 30 in. and the drivers 63 in. outside diameter. The total weight of the locomotive equipped with the booster is 307,000 lb., of which 226,500 lb. are on the drivers, 20,500 lb. on the front truck and 60,000 lb. on the trailing truck. The driving wheel base is 16 ft. 9 in. and the total engine wheel base 36 ft. 1 in. The frames are fitted with a cast steel cradle and Franklin automatic adjustable wedges are used on all drivers. The valve gear is of the Walschaert type and control is by a Ragonnet type B power reverse. Cylinder and steam chest bushings are of Hunt-Spiller metal. The front truck is of the constant resistance type. Okadee automatic cylinder cocks and White single sanders to the front drivers only are among the other specialties. The front end main rod brasses

Side View of Trailing Truck with Booster

ber and arch tubes is 280 sq. ft., the evaporative heating surface of the tubes and flues 3,497 sq. ft. and the superheating surface 882 sq. ft.

Special features include a cast steel ash pan, Woodard outside connected throttle with lever support designed to provide for expansion of the boiler, Nathan non-lifting injectors, Phillips top boiler check valves and Franklin power grate shaker.

The two center arch tube plugs in the throat sheet are located on the radius and in order to get good threads the holes in the sheet are tapped out  $3\frac{1}{2}$  in., steel bushings screwed in and then welded around the edge, the arch tube plugs being screwed into the bushings. This may be con-

sidered a minor detail but attention to such points can save much vexation in the roundhouse.

The grate arrangement is of an entirely different design from that used on the U.S.R.A. standard light Mikados. The U.S.R.A. box grate had a straight horn perpendicular to the grate on the longitudinal center line. With this arrangement when the grates are wide open the maximum distance between the top of one grate and the bottom of the next grate is  $4 \frac{5}{16}$  in. In redesigning the grate arrangement, a curved horn was used which threw the center of the grate connection pin about  $3 \frac{1}{2}$  in. ahead of the center. When these grates are wide open there is a maximum of  $7 \frac{3}{8}$  in. from the top of one grate to the bottom of the next. The difference in design is shown plainly in one of the illustrations.

Drop grates were used on the U.S.R.A. locomotives, but these were omitted on the new Mikados which have 10 rocking grates on each side of the firebox. With the large openings it is possible to dump the fire much more quickly and easily than with the old standard arrangement of drop grates and smaller openings in the rocking grates. The curved horn grate is not original on the Nickel Plate for it is the standard on the New York Central. However, the comparison be-

Grate Arrangement on Old and New Locomotive

tween the two designs is interesting, especially as it is in connection with such points as this that the U.S.R.A. standard designs commonly have been criticized.

As indicative of the value of the booster the record of a run made soon after the locomotive was received is of interest. This run was between Conneaut and Buffalo with a train of 50 loaded cars, 3 empty cars and 2 cabooses, the tonnage being 3,848. The regular tonnage for this class of power without a booster is 3,136. The excess tonnage handled was thus 712, or an increase of 22.7 per cent over the regular rating.

The train left Conneaut at 8:40 a. m. and arrived at Tift street yard, Buffalo, at 4:32 p. m. The time on the division was 7 hr. 52 min. and the actual running time 5 hr. 45 min., an average speed while the train was running of 19.9 miles an hour.

The booster was used eight times, as follows: Leaving Conneaut yard; on Springfield hill; pulling into and out of Girard siding; pulling into Cascade siding; pulling into and out of Pomfret siding; starting at D. A. V. & P. crossing, Dunkirk, and on Delaware hill. The approximate distance over which the booster was operated was three miles.

The maximum steam pressure was maintained over the entire division—even when the booster was operated the steam pressure did not fall and it was not necessary to lower the water level. In ascending Springfield hill the speed slackened to about seven miles an hour. The booster was

then cut in and the speed was accelerated to approximately ten miles an hour before the top of the grade was reached.

It was necessary to stop at the D. A. V. & P. crossing in Dunkirk. After the crossing was cleared the train, although standing on a heavy ascending grade combined with a slight curve, was started with the aid of the booster at the first attempt. This is considered one of the hardest places on the division to start a train, and demonstrated the added drawbar pull obtained from the booster.

## Obsequies for Steam Locomotive Will Not be Staged for Some Time

THE Superpower Survey report was discussed by W. J. Cunningham, professor of transportation, Harvard University, in an article which appeared in the New York Evening Post, November 15. In commenting on the position of the steam locomotive, he said:

"From time to time, as certain railroads have changed from steam to electrical operation for portions of their lines, the passing of the steam locomotive has been confidently predicted by experts who have been impressed with the superiority of electric traction, but the steam locomotive not only appears to be holding its own, but by notable improvements in design and appearances seems recently to have taken a new lease of life."

Professor Cunningham described the status of electric operation as follows:

"The typical railroad executive recognizes the advantages of electrical operation. He knows that it will eventually displace steam, at least on lines of heavy traffic and in congested terminals. For his own line under these conditions he would welcome the advent of electricity if a fairy godmother would provide the capital funds and make it possible to earn the additional carrying charges. The problem is not one of engineering. It is essentially one of finance."

His opinion of the value of the report follows:

"If the estimates of the Superpower Survey engineers as to savings in expenses and return on capital investment could be accepted without reservation the financial problem would be easier of solution. Unfortunately, however, this is not the case. The figures are subject to material qualification. There is evidence of an inclination to go out of bounds in making a case in favor of electricity and against steam. The zeal of the electrical engineer, who is firmly convinced as to the general soundness of his conclusions, is quite natural, but the report would carry much greater weight if it were less biased.

"For example, in the item of fuel the electrical engineers have assumed that a steam locomotive requires seven and one-half pounds of fuel for each kilowatt hour of work at the rim of the drivers. Against this they set an estimate of two pounds under electrical operation. From these data it is assumed that electrification will save two-thirds of the fuel bill.

"It is interesting to compare this theoretical saving of two-thirds of the fuel with the actual figures for the Norfolk & Western. In discussing the subject before a joint meeting of the Societies of Electrical and Mechanical Engineers in New York in October, 1920, the chief electrical engineer of that road stated that a comparison of fuel consumption on the electrified divisions with tests made with modernized Mallet type locomotives under similar conditions indicated that the saving in fuel by electrical operation was 29.5 per cent. This is less than one-third. If the Superpower Survey engineers had assumed a saving of one-third instead of two-thirds (the former is closer to the facts) the estimated fuel savings would be cut in two.

"As has already been stated, the problem is essentially one

of finance. In the case of a railroad that has an investment in road and equipment of, say, \$100,000 per mile, something more than a questionable return of 14 per cent is needed to induce recommendations for an investment, of, say, \$40,000 more per mile for electrification. On every hand there are needs for additional investments of other kinds which without question will yield more than 14 per cent.

"The Superpower Survey will probably stimulate further discussion of railroad electrification. Notwithstanding the defect which has been mentioned, the report is constructive and should be regarded as a valuable contribution to engineering and economic literature. When the railroads are again on their feet there will probably be further extensions of electrification where the conditions are most favorable.

"It is improbable, however, that electrification on any such scale as is recommended by the report will be attempted. It will come piecemeal and gradually"

## A New Overhead Handling System

IT IS GENERALLY conceded that mechanical methods of handling materials are more economical than manual.

Consequently, in the efforts towards reducing costs of operation, the railways are utilizing mechanical devices in increasing numbers. In numerous freight terminals, repair shops, machine shops, etc., where floor space is at a premium, the space overhead is little used. Under such conditions the overhead methods of handling cranes, monorails, tramrails, etc., offer a solution of the problem. The Cleveland Crane

The Tramrail as Applied to Freight Handling

and Engineering Company, Wickliffe, Ohio, has developed a tramrail for use in such localities for which important advantages are claimed.

In the freight terminal the tramrail makes a straight-line movement of outbound l.c.l. freight from a shipper's vehicle into any one of a large number of cars awaiting loading; for inbound freight, a similar movement from any car to some spot in the inbound house and thence, on call, to the consignee's vehicle. The system saves floor space and speeds up delivery. Its use on the railways is not restricted to the handling of freight as it may also be applied in railway shops in the handling of parts to and from the repair job and in the repair shop, machine shop, etc.

Flexibility of the installation of the rail, which can be attached to the purlins of a building or most any support avail-

able through the adaptability of the suspension fittings to varying conditions, is the feature of this tramrail. The entire system is standardized so that a mechanic possessing a common knowledge of machinery can layout, order and install the rail, rail fittings, switches, turntables, carriers, etc. By use of cold bends in the rail any curve down to a 4-ft. radius can be negotiated without a sacrifice of safety.

The sliding switch designed especially for this tramrail is a departure from the usual type of switch employed in overhead systems. Like the other units of the system the switch is standard and possesses distinct advantages. The same switch is installed whether for hand power or electric operation. This permits the hand power system to be electrified at any time. Both the stationary and movable rail in this switch are held in firm contact, eliminating the open space at the point where the rails join. Special attention has been given to safety at this point, with the result that the instant a switch is opened a safety stop drops on the rail, preventing the carrier from passing that point. When the switch is in position, it is automatically locked, thus preventing the carrier and its load from sliding the switch out of alinement. When desired, an additional safety feature, the installation of a trolley wire insulator, makes it impossible for an electrically driven carrier to run at full speed against a safety stop or open switch.

It is often found necessary to install the rail at different levels. This means that the carriers must negotiate a grade. The electrically driven carrier has ample power to operate with its full load up to a grade of 12.5 per cent. This makes the employment of a brake essential and a foot brake is provided on carriers which travel a grade. Where the difference in levels means excessive grades an ordinary freight elevator is installed with the tramrail.

By use of a central control system, one man can operate several carriers. Where an unobstructed view of the system is impossible, the operator is informed as to the location of the carriers he controls by signal lights on a board before him. With this arrangement the dispatcher can switch the carrier to any track or location desired.

Approximately 1,200 types of carriers are available through the combinations of the standard equipment. It should be noted that all working parts are fully enclosed as a protection from fumes, moisture and dirt. The ball bearings and other bearings, of bronze graphite inserted bushings with ample provision for self-lubrication are readily accessible if it becomes necessary to remove them.

Fighting the Erie Pier Fire at Weehawken, N. J.

# General News Department

## Western Railway Club

The next meeting is to be held on the evening of November 21 at the Great Northern Hotel, Chicago. N. D. Ballantine, superintendent of transportation of the Union Pacific, will read a paper entitled, "Does It Pay to Repair Foreign Freight Cars?"

## Tentative Valuations

The Interstate Commerce Commission has issued tentative valuations in which it states the final value of the used property of various roads as follows: Massillon Belt, 1916, \$19,123; Baltimore & Sparrows Point, 1915, \$429,327; Charleston & Western Carolina, \$10,509,027; Boston Terminal Company, \$19,910,500.

## Alaska Railroad Bill Passed by Senate

The Senate on November 14 passed the bill which had been passed by the House the week before, authorizing an additional appropriation of \$4,000,000 for the completion of the Alaska railroad. This is not a regular appropriation bill, but simply raises the limit on the cost of the railroad from \$52,000,000 to \$56,000,000, so that estimates may be sent to Congress; and actual appropriation made hereafter.

## Engineering Institute of Canada—Annual Meeting

The annual general meeting of the Engineering Institute of Canada will be held at Montreal on Tuesday, January 24, 1922. At this meeting the formal business of the Institute will be conducted, reports presented and officers elected. The meeting will then adjourn to Winnipeg, where it will convene on February 21, 22 and 23, and where the annual general professional meeting will be held under the auspices of the Winnipeg branch.

## American Society for Steel Treating Meeting

At the meeting of the board of directors of the American Society for Steel Treating held at Cleveland, Ohio, during the week of November 7, it was decided to hold two sectional meetings of the society during the coming year, one in New York during January or February, and the other in Pittsburgh, Pa., in May. These meetings, at which one or two well-chosen, pre-printed papers will be presented, will be of one or two days' duration and will be in addition to the annual convention and exposition which will be held at Detroit, Mich., September 25 to 30, 1922.

## Savannah Signal Section—A. R. A.

E. B. De Meritt, chairman of the Savannah Sectional Committee of the Signal Section of the American Railway Association announces that the committee will hold a meeting at the De Soto Hotel, Savannah, on Monday, November 21. J. W. Hackett, of the Okonite Company, will describe the manufacture of insulated wire, illustrating with motion pictures. W. D. Cloud, of the General Railway Signal Company, will speak on Power Interlocking; and there will be a motion picture illustrating the Use and Abuse of Drills and Reamers, presented by the Cleveland Twist Drill Company. All signal department men are invited.

## Numerous Subjects Discussed Before A. S. C. E.

The subject of the St. Lawrence Ship Canal and Power Project was presented Monday evening, November 14, before the New York Section of the American Society of Civil Engineers under the auspices of the New York sections of the four Founder Societies. Julius H. Barnes, president of the U. S. Grain Corporation, presided, the speakers being: Hon. Henry J. Allen, governor of Kansas; Hon. W. L. Harding, governor of Iowa; Dr. R. S. MacElwce, Washington, D. C., and H. I. Harriman, Boston, Mass. On Tuesday and Wednesday, November 16 and 17, a three-

session program, including a regular business meeting, was presented to cover the following subjects: A symposium on Stream Pollution and Sewerage Disposal; a paper on Odors and Their Travel Habits, published in the August proceeding and presented for discussion at this time, and a symposium on Water Supply and Water Purification.

## Western Union on the L. & N.

The long drawn-out litigation between the Louisville & Nashville Railroad and the Western Union Telegraph Company came up again in the United States Court in Kentucky on November 5, when there was filed a report by Special Commissioner John W. Menzies, finding that the sum of \$2,300,000 is due to the railroad company from the telegraph company for the use of the railroad right-of-way for a period of about nine years. It is said that this sum is based on a rate of \$73.06 annually per mile of line.

## Ben W. Hooper To Be Guest of

### The New York Railroad Club

Ben W. Hooper, a member of the public group of the Railroad Labor Board and former Governor of Tennessee, is to be the speaker and guest of honor at the third annual dinner of the New York Railroad Club, which will be held at the Commodore Hotel, New York, Friday evening, December 15. Mr. Hooper played a most important part in the recent wage controversy. Tickets for the dinner may be had by applying to W. J. Moody, treasurer, Erie Railroad, 50 Church Street, New York City.

## N. Y. C. Leases Shops

The New York Central has leased its car repair shops at East Buffalo, N. Y., to William J. Connors, a prominent business man of that city, and work was resumed this week after an almost complete suspension for about eight months. The lessee expects to employ from 1,500 to 2,000 men. The manager of the shops, under Mr. Connors, will be James J. Barrett. It is proposed to make the work-day ten hours.

It is understood that negotiations are pending for a similar disposal of the extensive shops at West Albany, N. Y.

It is reported that the shops at Collinwood, Ohio, (Cleveland), and those at Air Line Junction, near Toledo, have been leased to the A. S. Hecker Company, of Cleveland.

## Malaria Control on the Cotton Belt

The St. Louis Southwestern has carried on an extensive campaign for the control of malaria along its lines in Arkansas and Texas during the past five years. This company has just issued a complete report, consisting of a booklet of 66 pages, describing in detail the methods used and the results obtained. Typical of the latter is the statement that the man-hours worked by the section men for each hospital case of malaria in 1916 (prior to malaria control) was about 10,000, as compared with 100,000 man-hours in 1920 (under malaria control), while the average annual number of hospital cases of malaria for the years 1913-1916 was 602, as compared with 251 for the period 1917-1920. This campaign was described in an article in the *Railway Age* issue of July 5, 1918, page 23. Since that time it has been extended and a number of towns and cities along the route have co-operated with the railroad in controlling the disease, with benefit to the entire communities. An educational car has been equipped to demonstrate the source, effect and prevention of malaria to the people in the various towns on the system, while a tank car has been provided for the distribution of oil for fighting the mosquito. The extensive use of quinine to prevent malaria among the employees of the track and bridge departments has also been studied carefully.

MONTH OF SEPTEMBER AND NINE MONTHS OF CALENDAR YEAR 1921

### Addition to M. D. T. Company's Shop

The Merchants' Dispatch Transportation Company is making extensive additions to its car shop at East Rochester, N. Y. Approximately 125,000 square feet of space is being provided for repairs to steel cars. The shop is to be of steel frame construction with steel sash and will be fitted with modern equipment for repairing or rebuilding steel freight cars. In addition a new blacksmith shop of 10,000 square feet floor area has recently been erected.

### Illinois Central Expense-Reduction Campaigns

A campaign to prevent the killing of cattle by trains will be started by the Illinois Central on December 1. Section hands will be instructed to be on the lookout for broken fencing, gates and cattle guards, and farmers along the line are to be asked to co-operate. Some preventive measures are already in practice but the campaign will give wide publicity to the matter.

For September, the first month of the coal-saving campaign, a saving of 30,991 tons of coal as compared with September, 1921, and 25,187 tons as compared with August, 1921, has been reported. The estimated saving is based upon the reduced consumption per unit of service and the number of service units rendered during the month. The system actually burned 380,499 tons of coal in September, 1920; 324,314 tons in August, 1921, and 294,576 in September, 1921. The report shows that a saving was made in September as compared with the same month of last year of 6 lb. per 1,000 gross ton miles in freight service, 195 lb. per 100 passenger car miles, 10 lb. per switching locomotive mile, and a total of 3,147 tons in miscellaneous service.

### Annual Dinner of Central Railway Club

The Central Railway Club held its annual dinner at the Hotel Iroquois, Buffalo, N. Y., on the evening of November 10. About 300 railroad men and guests attended, a large number coming from other cities, including a delegation in two special cars from New York. W. H. Flynn, superintendent of motive power of the Michigan Central and president of the club, introduced Hon. Charles F. Moore, who acted as toastmaster. At the conclusion of the dinner Arthur T. Baldwin, vice-president of the McGraw-Hill Company, delivered an address.

Frank C. Pickard, a former president of the club, was presented with a testimonial in recognition of his work for the organization, the presentation being made by W. F. Jones, also a past president.

Announcement was made of the election of the following officers to serve for next year: President, George Thibaut, master mechanic, Erie railroad; first vice-president, W. O. Thompson, general superintendent rolling stock, New York Central; second vice-president, J. R. Schrader, general car foreman, New York Central; third vice-president, C. L. McIlvaine, superintendent motive power, Pennsylvania, Central region. Members of executive committee: A. N. Dugan, Bronze Metal Company; J. M. Gaiser, Erie, and T. J. O'Donnell, chief joint inspector, Buffalo.

### Thirty-six Roads Had Deficits for September

Thirty-six of the 200 Class 1 railroads that have reported had operating deficits for the month of September, according to a preliminary compilation of railway returns for that month made by the Bureau of Railway Economics. Of these, 18 were in the Eastern district, 10 in the Southern and 8 in the Western. Fifty-six roads had operating deficits in August. The net operating income for all of the Class 1 roads, except the Detroit, Toledo & Ironton, which has not yet reported, was \$87,174,000, or an annual rate of 4.6 per cent on the value. For the Eastern roads the net operating income was \$31,426,000, which would be at the annual rate of 4 per cent; for the Southern roads it was \$10,251,000, or at the annual rate of 4½ per cent; and for the Western roads it was \$45,497,000, or 5.2 per cent. Expenditures for maintenance, while considerably less than those for September, 1920, showed little difference from the amounts expended in August. The expenditures in September for maintenance of ways and structures amounted to \$72,556,000, a decrease of 23.3 per cent as compared with September, 1920, and approximately \$616,000 more than for August, 1921. Expenditures for maintenance of equipment were \$103,539,000, a reduction of 22.7 per cent as compared with September, 1920. For August the maintenance of equipment amounted to \$105,482,000.

## Traffic News

At the annual banquet of the Lansing Traffic Club of Lansing, Mich., on November 3, L. W. Landman, passenger traffic manager of the Michigan Central, Chicago, discussed the railroad situation from the viewpoint of the railroads. Sherman T. Handy, chairman of the Michigan Public Utilities Commission, spoke for that body, and Joseph H. Beck, executive secretary of the National Industrial Traffic League, presented the views of shippers.

Grain shippers have been informed that the expected reduction of grain and hay rates would not become effective on November 20; and the railroads are to ask for a rehearing before the Interstate Commerce Commission, as noted elsewhere in this paper. At the conference in Washington last week the commissioners indicated that an order would be issued "if necessary." Tariffs reducing the grain rates in accordance with the commission's opinion should have been filed with the commission by November 15 to make them effective by November 20; but they were not filed.

The Southwestern Industrial Traffic League, at its annual meeting at Fort Worth, Tex., went on record as favoring the repeal of Section 15a of the Transportation Act and recommended other changes in bills in force and certain of those proposed in line with the action of the National Industrial Traffic League at Chicago on November 9 and 10. The following officers were elected: President, H. J. Fernandez, traffic manager, Chamber of Commerce, Monroe, La.; vice-president, H. D. Driscoll, manager, Oklahoma Traffic Association, Oklahoma City, Okla.; G. J. Vizard, traffic manager, Board of Commerce, Little Rock, Ark.; G. S. Maxwell, manager traffic department, Chamber of Commerce and Manufacturers' Association, Dallas, Tex.; secretary and treasurer, F. A. Leffingwell, traffic commissioner, Chamber of Commerce, Waco, Tex.; directors, C. D. Mowen, E. P. Byars, U. S. Pawlett, F. E. Potts, H. G. Struble, Edgar Moulton and G. S. Gibson.

### Coal Production

Production of soft coal dropped back to 9,344,000 tons during the week ended November 5, according to the weekly bulletin of the Geological Survey. In comparison with the week preceding this was a decrease of 1,624,000 tons, or 15 per cent. The bulletin says that three factors entered into the decrease. The observance of All Saints' Day, a reaction in demand following the settlement of the railroad controversy, and mine strikes in Indiana and elsewhere.

### Anthracite Shipments—October, 1921

The shipments of anthracite for October, as reported to the Anthracite Bureau of Information, Philadelphia, amount to 5,872,753 tons against 5,519,412 for the preceding month of September, an increase of 353,371 tons, but show a decrease over October of last year of 368,118 tons, when 6,240,901 tons were recorded. October of this year can be considered a fair average shipment when consideration is given to the fact that a number of mines in the Scranton district were idle during the month owing to the fact that they could not operate under the provisions of the Kohler Act. Operations at these mines were resumed, however, on November 2. The total shipments for the coal year beginning April 1 have amounted to 40,223,367 tons as compared with 39,720,654 tons for the corresponding period last year, a gain of 502,713 tons.

Shipments by initial carriers were as follows:

	October, 1921	September, 1921
P. & R.	1,104,828	1,081,085
L. N.	1,048,996	966,600
C. of N. I.	570,189	576,875
D. L. & W.	759,492	736,571
D. & H.	898,376	711,499
Penna.	492,632	426,344
Erie	618,034	631,882
N. Y. O. & W.	126,925	123,742
L. & N. E.	253,311	265,114
	5,872,783	5,519,412

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission has announced the reopening of the New England rate division case for oral argument at Washington on November 29.

The commission has suspended until March 15 a supplement to Agent W. J. Kelly's tariff which proposes to establish a commodity rate of 32½ cents on sewer pipe from Cincinnati, Ohio; Lexington, Ky.; Louisville, Ky.; Maysville, Ky., and certain related points to Norfolk and certain other Virginia cities in lieu of the existing sixth class rate of 42½ cents.

The commission has suspended until March 15, the operation of schedules published in supplements to Agents E. B. Boyd's and F. A. Leland's tariffs which propose to prohibit the acceptance of shipments of petroleum by the Missouri, Kansas & Texas for routing via the Chicago & Eastern Illinois to certain destinations in Indiana and Michigan.

### Interlocking Officers and Directors Authorized

The Interstate Commerce Commission has issued a number of orders authorizing railroad officers and directors to hold positions with more than one railroad. Under Section 20-a of the interstate commerce act there is a prohibition against holding the position of officer or director of more than one carrier after December 31 of this year, except as authorized by the commission. Large numbers of applications for this permission have been filed with the commission and are coming in every day. It is understood the commission will shortly announce a hearing to consider some protests which have been filed against the applications. The orders so far issued authorize the officers and directors of the Chicago & Western Indiana to hold similar positions with the Belt Railway of Chicago, officers and directors of the Chicago, Milwaukee & Gary to hold similar positions with the Apalachicola Northern, officers and directors of the Waterloo, Cedar Falls & Northern to hold similar positions with the Kansas City Northwestern, and officers and directors of the Manufacturers Railway of St. Louis to hold similar positions with the St. Louis & O'Fallon.

## Court News

### Propensity of Mules to Kick

The Alabama Supreme Court holds, in an action for damages to mules in transit, that the disposition of mules to kick is too well known to be ignored by courts. Having regard, therefore, to the inherent nature and propensities of these animals, the mere fact that several individuals of the earload got down and received injuries does not authorize a finding of negligence on the part of the railroad. The rule of *res ipsa loquitur* cannot be here applied. —A. C. L. v. Carroll Mercantile Co. (Ala.), 89 So. 509.

### Railroad Agreeing to Reserve Steamship Space

#### Not Liable for Failure of Broker to Reserve It

A railroad company, receiving shipments to the coast over its line, was accustomed to ascertain from steamship companies whether they could book the shipments, and the clearance and rates. If accepted, it sent confirmations to its representatives on the coast, who exchanged confirmations with the steamship companies. The railroad company agreed with an exporter who had failed to get space, to reserve space from San Francisco to Japan for a cargo of pig iron at \$15 a ton. Finding it could not secure space directly, it booked it through brokers at this rate, which was cheaper than that asked by the steamship companies. The brokers failed to reserve space. The Circuit Court of Appeals, Ninth Circuit, holds that the railroad company was not liable to the exporter for breach of contract, the agreement being one of agency, although the railroad did not disclose to the ex-

porter the ship or line with which it had booked the freight, the name of which it had been unable to get from the brokers — Baldwin Shipping Co. v. Southern Pac. Co., 274 Fed. 374.

### Converting Public Track to a Private

#### One Is Not Discrimination

Missouri Rev. St. 1919, §9975, provides a penalty for discrimination in charges or facilities between (1) transportation companies and individuals, or (2) in transportation of freight between (2) "commission merchants or other persons engaged in the transportation of freight and individuals." The Springfield Court of Appeals holds that the statute does not authorize a penalty where a railroad converts a public team track to a private one for the use of an individual, compelling another individual to go to a more distant track. The statute does not cover cases of discrimination between individuals. Moreover, neither of the individuals in question, a lumber dealer and a sand dealer, was a transportation company, and hence was not within the first classification of the statute. The second classification "commission merchants or other persons" was held to include only commission merchants and the class of shippers similar to commission merchants. —Tacker v. St. Louis-San Francisco (Mo. App.) 233 S. W. 512.

## United States Supreme Court

### Director General Upheld

The Supreme Court of the United States, reversing the judgment of the Mississippi Supreme Court, holds that Order No. 18 of the Director General, prohibiting the institution of suits against railroads under federal control in the court for any district other than that in which the plaintiff had resided or in which the alleged cause of action arose, was within the powers conferred by Congress on the President and by him on the Director General, and is valid. —Alabama & Vicksburg v. Journey. Decided November 7, 1921.

### Reparation for Discrimination

#### in Allotment of Coal Cars

The Supreme Court of the United States has affirmed Weber v. Pennsylvania, 263 Fed. 945, and 269 Fed. 111, sustaining an award by the Interstate Commerce Commission of restitution to a coal mine owner against a railroad for discrimination in the distribution of coal cars in times of shortage. The discrimination condemned was the special allotment to the Berwind-White Coal Company of 500 cars daily, and the sale to it and to other companies of a large number of cars in times of car shortage. —Pennsylvania v. Weber. Decided November 7, 1921.

### Reasonable Rates on Tap Lines

The Supreme Court of the United States has sustained the order of the Interstate Commerce Commission, 53 I. C. C. 475, finding that an allowance of more than \$3 a car for hauling from Union Sawmill plant to Dollar Junction, would result in unjust discrimination. The plaintiff, the Louisiana & Pine Bluff, contended that it should be allowed to receive the division of 1½ cents per 100 pounds, or about \$9 a car, on the ground that its haul from the Union Sawmill plant to Dollar Junction was longer than three miles. If hauled direct, the cars would travel only 2.41 miles, but as they were taken first in the opposite direction to a track scale located on and controlled by the trunk line, they traveled 3.42 miles. The Supreme Court says, in part, by Mr. Justice Brandeis: "The commission finds that, 'The evidence does not show that it is necessary that the shipments be weighed by the tap line rather than by the trunk line'; and, 40 I. C. C. 470-471, that allowing the larger division on these facts would place the plaintiff in a more advantageous position than any other tap line in that territory performing a similar service and would open the way in the case of many tap lines for a relocation of the track scales so as to require a long back haul, and in that way to lay a basis for divisions or allowances very materially in excess of those fixed by the Commission for the distance covered by a direct movement from the mill to the junction." In other words, divisions that would operate as rebates. —Louisiana & Pine Bluff v. United States. Decided November 7, 1921.

## Foreign Railway News

### Russian Shipyard to Repair Locomotives

LONDON.

It is reported that the Balto-British Shipyard Company, Reval, Russia, has undertaken the repair of one thousand locomotives for the Russian railways during the next five years.

### German Locomotives for Spain

LONDON.

It is reported that four German-built locomotives, each of a total weight of 96 tons, have been delivered at Port Bon, Catalonia, Spain, for use on the Madrid, Saragossa & Alicante railway. Twenty-one similar engines are on order.

### Railway Accidents in Great Britain

LONDON.

A report recently issued by the Ministry of Transport states that 991 persons were killed in railway accidents in the year 1920, as compared with 932 in the year 1919. There was a total of 25,933 injured in the year 1920, as against 23,983 in 1919, an increase of 1,950.

### New Railway in Kenya Colony

A new railway line is to be built from Nakuru on the Uganda Railway, Kenya Colony, Africa, to Turbo, a distance of 148 miles, according to the Times (London) Engineering Supplement. The construction work will be done by British concerns and will total in the neighborhood of \$10,000,000. This line, it is said, will eventually be an important feeder to the Cape-to-Cairo line, when it is completed. The prime purpose of the new line will be to provide transportation for a large agricultural community.

The route chosen will make this line at its highest point 9,135 ft. above sea level. The maximum gradient will be 1.5 per cent and the maximum curvature about 10 deg. Fifty-pound rails will be used and maximum train loads will vary from 204 to 428 long tons. The gage of the new line will probably be one meter.

### Polish Government Places Orders

#### for Locomotives and Cars

The Polish ministry of railways has placed orders with Polish firms for 2,970 locomotives, 7,800 passenger coaches, and 70,000 freight cars, according to a report published in the Warsaw Polish Courier and transmitted to Commerce Reports by Consul General L. J. Keena of Warsaw.

The orders were distributed as follows: First Locomotive Construction Company, Chrzanow, 1,200 locomotives; Locomotive Construction Company, Warsaw, 360 locomotives; H. Cegielski Company, Posen, 1,410 locomotives and 4,400 coaches and freight cars; Wagon Car Factory, Ostrow, 2,800 coaches and 18,000 freight cars; Lipop, Rau and Loewenstein, Warsaw, 3,000 coaches and 20,000 freight cars; Boiler Manufacturing Company, Ostrowiec, 20,000 freight cars.

The contracts for locomotives run to 1932, and the contracts for passenger coaches and freight cars to 1922. Nearly 200 locomotives are to be delivered during the first two years.

### Rumanian Railway Reorganization

LONDON.

It is reported that a grant of 400,000,000 lei (approximately \$44,081,600 at the normal rate of exchange) has been made by the Rumanian government to the Ministry of Communications for alterations and improvements in transport services in Rumania. The greater part of this grant is to be devoted to the repair of the permanent way and material and to the enlargement and completion of railway workshops. Practically nothing has been done to replace the bridges destroyed

during the war, owing to which many branch and some main lines have been out of service. The rolling stock also is in a very bad condition, the passenger coaches being generally without windows and upholstery. Ten million lei (approximately \$1,927,040 at the normal rate of exchange) has been allotted to the standardization of railway lines in the newly acquired provinces of Bessarabia. The existing lines are built on the broad gage system used in Russia, to which Bessarabia formerly belonged.

### Car Exports in September

Eleven passenger cars and 488 freight cars, valued at \$55,000 and \$670,213 respectively, were exported from this country in September. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce follow:

Countries	Passenger		Freight and Other		Parts of cars
	Number		Number		
France .....	11	\$55,000	73	\$8,305	\$4,936

## Equipment and Supplies

### Locomotives

THE SEWELL VALLEY, reported in the *Railway Age* of November 12, as inquiring for one Mikado type locomotive, has ordered this locomotive from the Lima Locomotive Works.

### Freight Cars

THE GREAT NORTHERN is inquiring for 500 refrigerator cars and 1,000 box cars.

WHITTAKER-GLESSNER COMPANY, Wheeling, W. Va., is inquiring for five center dumping hopper cars, of 55-tons capacity.

THE WARASHI has given a contract to the Western Steel Car & Foundry Company for the repair of 250 hopper cars.

THE LEHIGH & NEW ENGLAND is asking for prices on 50 steel underframe, drop end gondola cars, of 50-ton capacity.

THE PERE MARQUETTE is asking for prices on from 500 to 2,000 steel underframe, double sheathed box cars, of 40-tons capacity.

THE ALABAMA, TENNESSEE & NORTHERN, reported in the *Railway Age* of October 8, as inquiring for 215 freight cars, has given an order to the Mt. Vernon Car Manufacturing Company for 300 standard freight cars.

THE CHICAGO, BURLINGTON & QUINCY, which recently authorized the purchase of new equipment, as mentioned in the *Railway Age* of November 12, has issued inquiries for from 1,000 to 2,000 freight cars and also has given a contract to the Western Steel Car & Foundry Company for repair work on 300 of its gondola cars.

THE ILLINOIS CENTRAL has awarded a contract for 350 40-ton refrigerator cars to the General American Car Company and not the General American Tank Car Company as incorrectly reported in the *Railway Age* of November 12 (page 959). The Illinois Central is now inquiring for prices on 500 46 ft. gondola cars with 12 drop doors and for 2,000 46-ft. gondola cars with 8 drop doors.

### Iron and Steel

mitsui & Co., New York, are inquiring for 300 tons of 60-lb. rail for export to Japan.

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS through Suzuki & Company, New York, have ordered 66,000 tons of 60 and 75 lb. rail, from the Consolidated Steel Corporation.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon November 25, for the requirements of the New York Central and subsidiary companies of rails, not to exceed 200,000 gross tons of open hearth steel rail of 120, 115, 105, 90 and 80 lb. Dandley sections and 100, 90 and 85 lb. ASCE sections, plus five per cent of second quality rails, and with the necessary angle bars.

### Miscellaneous

THE NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock, noon, November 30, for two lots of open hearth steel rails, one for 24,780 tons and the other for 15,220 gross tons; parts for electrical apparatus and 200 rolled steel wheels.

THE NEW YORK CENTRAL will receive bids until 12 o'clock, noon, December 1, for its present requirements on structural steel and castings for repairs to bridges on the Syracuse and Pennsylvania divisions; also galvanized fence and fence posts; trailer wheels and axles for repairs to 80 and 85 ft. turntable; splice bars for 80 and 100-lb. rail; rigid manganese frogs, and track switches.

## Supply Trade News

The United States Cast Iron Pipe & Foundry Company, Burlington, N. J., has opened a new office at 811 Dixie Terminal building, Cincinnati, Ohio. P. T. Laws, assistant works manager, now has his headquarters at the new office and Harold G. Henderson is in charge of sales from this office.

The final details of the merging of the Pullman Company and the Haskell & Barker Car Company, it is reported, were agreed on by committees representing both companies at Chicago on November 14. These committees are expected to report to their respective directorates within the next week and it is expected that the directors will then call for a special meeting to vote approval of the plan. The plan provides for the giving of 3 shares of the stock of the Pullman Company in exchange for 4 shares of Haskell & Barker.

Henry P. Hoffstot has been elected vice-president of the Pressed Steel Car Company in addition to his duties as president of the Koppel Industrial Car & Equipment Company. He was formerly manager of sales, central district, of the Pressed Steel Car Company, before assuming duties as president of the Koppel Company. C. W. Wrenshall, general superintendent and acting general manager, has been appointed general manager of the Pressed Steel Car Company and W. A. Chamberlain, formerly auditor, has been appointed comptroller, all with headquarters at Pittsburgh. Pa. C. E. Church, secretary and assistant treasurer, has been appointed secretary and treasurer with office at New York.

### Obituary

James Brown Rider, vice-president and general manager of the Pressed Steel Car Company and the Western Steel Car & Foundry Company with headquarters at Pittsburgh,

J. B. Rider

Pa., who died on November 2, as was noted in the *Railway Age* of November 5, was born at Morrison's Cove, Blair County, Pa., on September 10, 1879. He entered the service of the Pennsylvania Railroad in 1895, and remained with it until 1899, acting successively as messenger boy, shop order clerk, invoice clerk and stenographer. In 1899 he became connected with the Pressed Steel Car Company as stenographer and clerk to the general manager, being advanced to the position of assistant to the

vice-president in July, 1905. He was appointed general manager in July, 1909, and made a member of the board of directors in January, 1913. Mr. Rider was appointed general manager of the Western Steel Car & Foundry Company in August, 1913, and in December, 1915, he was elected a vice-president of the Pressed Steel Car Company and Western Steel Car & Foundry Company, with headquarters at Pittsburgh; he continued to perform the duties of general manager in charge of operations. Mr. Rider was also vice-president of the American Steel Company of Cuba.

GRAIN (in sacks) is now being shipped from British Columbia to Japan. Seven thousand tons of Canadian wheat have been booked for November shipment.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company contemplates the construction of 3 oil storage tanks at Argentine, Kan. The same company will also install an air compressor in its main power house at Cleburn, Tex.

**CHICAGO, BURLINGTON & QUINCY.**—This company has awarded a contract to the Materne Manufacturing Company, St. Louis, for the installation of a heating and washout system in its new engine house at Centralia, Ills.

**CHICAGO, OTTAWA & PEORIA.**—This company has been requested by the city of Ottawa, Ill., to abandon its bridge over the Fox River at Ottawa and to join the city in the rebuilding the city's bridge, which runs parallel to that of the railroad, the proposed city-railroad bridge to be constructed of a width equal to that of the street. This company has objected and the matter has now been brought before the Illinois Commerce Commission.

**CHICAGO, UNION STATION.**—This company will accept bids until November 17 for 2,600 sq. yd. of concrete track slabs.

**MISSOURI PACIFIC.**—This company, which was noted in the *Railway Age* of October 22 (page 804), as contemplating the construction of two brick car repair sheds, 46 ft. by 500 ft. at St. Louis, Mo., has awarded the contract for this work to Joseph E. Nelson & Sons, Chicago.

**NEW YORK, NEW HAVEN & HARTFORD.**—This company has contracted with the American Creosoting Company, Inc., Louisville, Ky., and not the American Creosoting Company, New York, as stated incorrectly in our issue of November 5, page 911, for the treatment of its cross ties and other timber in a plant to be built by the creosoting company adjacent to the Cedar Hill terminal of the railroad at New Haven, Conn.

**ST. LOUIS-SAN FRANCISCO.**—This company is accepting bids for the construction of a one-story express and baggage building at Okmulgee, Okla.

### Another Kind of Train Order

31 888 8/8/86  
Day & Night 1 R  
Run tied between State line and Jersey City  
until eight o'clock tomorrow am  
following Engine No 2 and sleep out the way  
of Expansion train with engine 101 which will  
leave State line at seven o'clock for Jersey City  
Engine six after arriving at Little Falls with  
train thirty five (35) Tonight will run tied to  
Pamilton Junction and engine seven (7) will  
then return from Pamilton Junction to Little  
Falls, Engine No 3 will leave Jersey City  
at six o'clock tomorrow morning for Orange  
Engine five (5) between four and five o'clock  
tomorrow morning will go from Pamilton  
Junction to Niagara sleep out of their way  
of all of the above tied trains and engine  
Engine 101 will couple in with you & sleep  
you from Jersey City to Cooper  
This show this to General 101  
As his Order

## Railway Financial News

**BANGOR & ARROSTOOK.**—*Asks Authority to Abandon Line.*—This company has applied to the Interstate Commerce Commission for a certificate of convenience and necessity authorizing the abandonment of its line from Brownville Junction to Katahdin Iron Works, Me., 9.4 miles.

**CAROLINA, CLINCHFIELD & OHIO.**—*Asks Loan from Revolving Fund.*—This company has applied to the Interstate Commerce Commission for a loan of \$6,000,000 for five years from the revolving fund, to enable it to meet obligations maturing on January 1, 1922, consisting of \$5,000,000 of 5 per cent Elkhorn first mortgage gold notes and a note for \$1,000,000 to the Secretary of the Treasury.

**CHICAGO & EASTERN ILLINOIS.**—*Sale of Brazil Branch Postponed.*—The public sale of the line between Mokenca, Ill., and Brazil, Ind., 130 miles, has been postponed until December 16. See *Railway Age*, April 8, 1921, page 913.

**COLORADO, WYOMING & EASTERN.**—*Foreclosure Proceedings.*—The Equitable Trust Company, as trustee of the general mortgage, has notified the bondholders of its intention to begin foreclosure proceedings and to ask for the appointment of a receiver in the Federal District Court of Wyoming. The general mortgage trustee states that it is informed that the company is in default on July 1 interest on both of the senior bond issues, for which reason the trustee has declared principal and accrued interest on the general mortgage bonds due and payable and has made a demand upon the company for payment. It anticipates that the company will be entirely unable to make such payment, hence the intention to begin foreclosure and ask for a receiver. The trustee expects that foreclosure of the other two mortgages will be sought at once.

The Colorado, Wyoming & Eastern operates between Coal-mont, Colo., and Laramie, Wyo., 111 miles. The company was organized in 1914 and took over the property of the Laramie, Hahn's Peak & Pacific, subject to mortgages. Its outstanding bond issues are \$240,000 Laramie, Hahn's Peak & Pacific first 6s, \$550,000 C. W. & E. first and refunding 6s and \$1,600,000 C. W. & E. general mortgage income 6s. It has \$2,000,000 6 per cent preferred and \$2,300,000 common stock.

**FORT WORTH & DENVER CITY.**—*Extend Bonds.*—J. P. Morgan & Co. and the First National Bank have underwritten the extension of the \$8,176,000 first mortgage 6 per cent bonds of this company, a subsidiary of the Colorado & Southern, which mature December 1. Holders are offered the right to extend the bonds for 40 years at 5½ per cent and to receive a cash payment of \$40 on each \$1,000 bond, but the extended bonds are to be subject to redemption as a whole at 105 and interest on and for five years following January 1, 1933, and at a price reduced by 1 per cent of par for each five-year term thereafter until a redemption price of 101 is reached, which governs until September 30, 1961. Holders of the maturing bonds who do not wish to extend may sell their bonds to the bankers at 100 and accrued interest on or prior to December 1, 1921. The plan has been approved by the Interstate Commerce Commission.

**NEW ORLEANS & NORTHEASTERN.**—*Annual Report.*—The income statement for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues (March 1-December 31).....	\$6,344,097	.....
Operating expenses (March 1-December 31).....	8,545,481	.....
Net revenue from operations.....	798,616	.....
Taxes.....	830,925	.....
Operating income (March 1-December 31).....	512,424	.....
Standard return (January and February; full year 1919).....	713,256	\$1,204,992
Non-operating income.....	702,607	32,324

Average net revenue per ton per mile (cents).....	0.297	0.617

## Railroad Administration Settlements

The Railroad Administration has prepared a statement showing the progress made in settling its accounts with the railroads as of November 1. Up to that date the total amount of claims presented by the carriers on final settlement aggregated \$882,429,605, representing 194,523 miles of road, or 80.65 per cent of the mileage under federal control. If the remaining roads file claims on the basis of those heretofore filed, it is estimated that the total amount of claims will aggregate about \$1,100,000,000. Included in the companies that have not filed their final claims are the Pennsylvania and the New York Central. The amount of claims on final settlement adjusted up to November 1 aggregates \$413,412,415, and the amount of cash paid in settlement of these claims aggregates \$127,429,839, or 30.8 per cent of the amount claimed. The claims settled represent 100,603 miles of road.

Director General James C. Davis of the Railroad Administration predicts that the entire business of the Railroad Administration will be wound up by December 31, 1923.

The Railroad Administration reports final settlements with the Pere Marquette for \$750,000 and with the Marquette & Bessemer Dock & Navigation Company for \$60,000.

## Dividends Declared

Alabama Great Southern.—Common, 3½ per cent, semi-annually, payable December 26 to holders of record November 30; preferred, 3½ per cent, semi-annually, payable February 17 to holders of record January 30.

Catawba.—First and second preferred, \$1.25, payable November 19 to holders of record November 3.

Delaware & Bound Brook.—2 per cent, quarterly, payable November 21 to holders of record November 11.

Mobile & Birmingham.—Preferred, 2 per cent, semi-annually, payable January 1 to holders of record December 1.

North Pennsylvania.—\$1, payable November 25 to holders of record November 11.

Pittsburgh, Bessemer & Lake Erie.—Preferred, \$1.50, payable December 1 to holders of record November 15.

Southern Pacific.—1½ per cent, quarterly, payable January 2 to holders of record November 20.

Union Pacific.—Common, ½ per cent, quarterly, payable January 3 to holders of record December 1.

Eight-Wheel Switchers on the Kentucky & Indiana Terminal

Five new locomotives enabled the Kentucky & Indiana Terminal to handle the largest number of cars in its history without an outlay for the past three years. These locomotives are of 49,700 lb. tractive effort, weigh 208,700 lb. on drivers, have 24 in. by 28 in. cylinders, 51 in. driving wheels, 2,443 sq. ft. heating surface, 41.7 sq. ft. grate area and carry 185 lb. boiler pressure.

## Railway Officers

### Financial, Legal and Accounting

**F. H. Jeffrey** has been appointed auditor of station accounts of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, succeeding **W. W. Scannel**, who has resigned.

### Operating

**F. W. Cowley**, passenger conductor of the Michigan Central, has been promoted to assistant trainmaster, with headquarters at St. Thomas, Ont.

**A. C. Becton** has been appointed general agent in the operating department, of the Missouri, Kansas & Texas, with headquarters at Fort Worth, Texas.

**J. A. Mathewson**, superintendent of the St. Louis Merchants Bridge Terminal, has been appointed general manager of the Terminal Railroad Association of St. Louis.

**H. R. Hughes**, chief clerk to the assistant general manager of the Southern Pacific, has been appointed trainmaster of the Los Angeles division with headquarters at Indio, Cal.

### Traffic

**L. H. Correll** has been appointed freight traffic agent of the Nashville, Chattanooga & St. Louis, with headquarters at Memphis, Tenn.

**E. H. Brinkmeyer** has been appointed commercial agent of the Tennessee Central with headquarters at St. Louis, effective November 15.

**F. M. Sublette**, commercial agent of the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., has been transferred to Louisville, Ky. He is succeeded at Mobile by **R. P. Tallman**.

**George E. Bunting**, Australasian manager for the Canadian Government Merchant Marine, Ltd., will also act as general traffic agent for the Canadian National Railways with headquarters at Auckland, New Zealand.

**B. A. Rodgers**, general agent of the Kansas City Southern, with headquarters at St. Louis, Mo., has been promoted to assistant general freight agent, with headquarters at Kansas City, Mo. He is succeeded at St. Louis by **C. W. Wheeler**.

### Mechanical

**M. H. Haig** has been appointed master mechanic of the Pecos division of the Atchison, Topeka & Santa Fe, with headquarters at Clovis, N. M., succeeding **W. D. Hartley**, who has been transferred to the New Mexico division.

**E. E. Machovec**, master mechanic of the Atchison, Topeka & Santa Fe, with headquarters at Argentine, Kan., has been promoted to acting mechanical superintendent of the Northern Lines, Western District, with headquarters at La Junta, Colo., succeeding **J. R. Sexton**, who has been granted an indefinite leave of absence due to ill health.

**M. C. M. Hatch**, whose appointment as mechanical engineer of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., was announced in the *Railway Age* of November 5 (page 914), was born at Chelsea, Mass., on March 14, 1882. After two years attendance at the Massachusetts Institute of Technology, and two years at the University of California, he entered railroad service in June, 1903, working in the Southern Pacific shops at West Oakland, Cal., and in the testing and signal departments for about 18 months and about six months in the Atchison, Topeka & Santa Fe shops at Needles, Cal., and San

Bernardino. In June, 1905, he became a draftsman in the motive power department of the Boston & Maine, and in December, 1906, he was promoted to chief draftsman of that road, which position he held until November, 1911, when he was appointed engineer of tests of the New England Lines. In June, 1912, he was appointed superintendent of locomotive fuel service of the Delaware, Lackawanna & Western, which position he resigned in February, 1917, to become assistant to the president of the Locomotive Pulverized Fuel Company. He held this position until January, 1920, when he left this company to become a representative of the Railway & Industrial Engineers. He re-entered railroad service in April, 1921, as assistant mechanical engineer of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., which position he was holding at the time of his recent promotion.

### Engineering, Maintenance of Way and Signaling

**James F. Deimling** has been appointed chief engineer of the Michigan Central with headquarters at Detroit, effective November 15, succeeding **George K. Webb**, deceased.

**George H. Harris**, engineer maintenance of way of the Michigan Central, with headquarters at Detroit, Mich., has been promoted to assistant chief engineer, with the same headquarters, succeeding **J. F. Deimling**, promoted.

## Obituary

**Axel S. Vogt**, formerly mechanical engineer of the Pennsylvania, died on November 11 of heart failure.

**Albert S. Johnson**, general manager of the Terminal Railroad Association, with headquarters at St. Louis, Mo., whose death was mentioned in the *Railway Age* of November 12 (page 964), was born at Seymour, Ind., on July 21, 1871. He entered railroad service in November 8, 1889, as a messenger boy in the St. Louis freight office of the Terminal Railroad Association, and he had been with that company ever since. He was appointed freight agent on October 13, 1903, was promoted to superintendent with headquarters at St. Louis on April 23, 1913, and was again promoted to assistant general manager with the same headquarters on December 13, 1917.

During the period of government control, Mr. Johnson served as terminal manager of the St. Louis district, and when the roads were returned to private control, he was elected general manager, which position he was holding at the time of his death on November 7.

**James D. Collinson**, formerly general master mechanic of the Atchison, Topeka & Santa Fe, died at his home in Houston, Tex., on November 9. Mr. Collinson was born in Manchester, England, on January 21, 1849. He first entered railroad service in the mechanical department of the Chicago, Milwaukee & St. Paul. In 1889 he left to become general foreman of the shops of the Atchison, Topeka & Santa Fe at Topeka, Kan., was thereafter promoted successively to master mechanic at Raton, N. M., and later transferred to Fort Madison, Iowa. He became superintendent of motive power of the Gulf, Colorado & Santa Fe in 1896, assistant superintendent of motive power of the main line, with headquarters at Topeka, in 1900, and general master mechanic in 1901, during which year he retired from railroad service.

For the quick repair of big locomotives—Ryerson-Conradson Railroad Radials.

## Are your shops ready?

A year and a half ago inadequate shop equipment handicapped locomotive repair work. Lack of locomotives handicapped the operating man.

Before the flood of repair work is again swamping you, fix your shops to handle it.

Every shop needs a modern Radial Drill.

Such a machine as the Ryerson-Conradson Radial, capable of drilling a 3" hole through the high carbon steel drawbar shown above at .025 feed and 89 R. P. M. speeds up this job and many others.

Do you know how the Ryerson-Conradson Radial reduces power consumption by 40%?

Write for bulletin 4,001.

Undermaintenance has been the complaint of the railroads for the last five years. It comprises a primary basis for claims

### What Is the Correct Standard of Maintenance?

against the Railroad Administration and is the note of caution often heard of late in the analysis of railway operating results. Therefore, to hazard the opinion that some lines are being over-maintained is to invite the skepticism of the practical railway officer. We, however, venture the suggestion that many railroads may find it profitable to study their operating expenses with the view to ascertaining whether instances of over-expenditure for maintenance of way exist on their lines. Transportation costs receive closer scrutiny than maintenance of way costs because they are more tangible. A heavy locomotive hauling a long train will produce more ton-miles per dollar than a small engine hauling a short train, and the returns are available at the end of each month. But the increased costs of maintaining the track in fit condition to carry the heavier locomotive are not so readily available and are spread over the entire year. This problem attains particular importance on branch lines which have a heavy seasonal traffic of short duration with only the lightest train movements during the remainder of the year. For instance, some of the lines in wheat growing regions are maintained to standards that will permit of the use of heavy power so that the annual crop may be handled expeditiously and at low cost insofar as the transportation charges are concerned. However, this implies that the track is in better condition than necessary for the traffic handled during the greater portion of the year. While it is entirely possible that this policy is economically sound, it is to be questioned whether a sufficiently detailed analysis has ever been made in most of these cases to determine the correctness of this assumption with reasonable accuracy.

One of the principal economies claimed for the proposed superpower electrification system is in the consumption of

### Extravagant Claims for Electrification

locomotive fuel. The investigators estimate that electric operation in this region would have saved 57.6 per cent per unit of work done, or 8,890,000 tons of coal based on the traffic of 1919. The cost of electrical energy is given as \$44,233,000 and the cost of coal as \$68,770,000, a saving of \$24,537,000. The economies due to the saving of fuel amount to about 38 per cent of the total estimated saving. Since this is such an important item, it will be given the closest scrutiny by all who are interested in electrification. It must be admitted that anyone familiar with the performance of modern steam locomotives will find the basis on which the fuel consumption has been computed very unsatisfactory. The coal used by the electric system has been assumed to be equivalent to two pounds per kilowatt hour at the sub-station. The efficiency of the sub-station is assumed to be 85 per cent, of the distribution system 90 per cent, and of the electric locomotive 82.5 per cent. The output of the electric locomotive is therefore 63 per cent of the sub-station input, making the equivalent coal rate 3.18 pounds per kilowatt hour. The coal consumption of the steam locomotive is assumed to be 7.5 pounds per kilowatt hour, which makes the saving for the

electric locomotive on this basis 57.6 per cent. This figure for locomotive coal consumption is altogether too high even for saturated steam locomotives, being almost identical with the value obtained under unfavorable conditions with saturated locomotives on the Chicago, Milwaukee & St. Paul. If the method used in computing the equivalent coal consumption under electric operation is applied to the steam locomotive, the result is quite different. An efficient modern locomotive uses about 2.5 pounds of coal per horsepower hour output while working. Standby losses, firing up, etc., increase this to 3.1 pounds per horsepower hour, or 4.14 pounds per kilowatt hour. On this basis the saving by electrification would be only 23 per cent. It is evident, therefore, that the section of the report dealing with the saving of fuel is open to serious question. In fact the failure to obtain accurate and up-to-date information regarding the steam locomotive wholly invalidates the conclusions regarding the possible saving of fuel.

There is no doubt of the existence of a large stock of used machine tools and, in considering machine tool requirements

### Second-Hand Machine Tools

for 1922, the railroads are facing the question as to what extent, if any, they should take advantage of these second-hand machines. Some officers take the stand that a second-hand machine ought never to be installed in a railroad shop and, while this is a somewhat extreme view, there are many arguments to justify it in part. It is a well-known saying that "The first use of any article is the best use." The purchaser of a used automobile, for example, takes a big risk that the trouble and cost of keeping his machine in repair will more than offset the saving in price unless, in buying, he has benefited by the advice of an automobile expert. This does not prove that there are not good bargains in used automobiles and the same is true of used machinery. Slightly worn machines have been bought at a considerable reduction in cost and have given satisfactory service over a period of years, but the point is that used or second-hand machinery should be bought only after the most careful inspection and trial to demonstrate its accuracy and ability to produce. In a particular instance, a reputable machinery dealer learned that a certain railroad was in need of a large boring mill and approached the purchasing agent with the proposition that he had a slightly used machine which would be practically as good as new and could be sold at a considerable reduction in cost. In examining the machine carefully from the under side, an inspector from the railroad discovered that the bed was badly cracked and had been clamped together by bolts and stay irons. The machinery dealer, with the most profound expressions of regret, insisted that the break was unknown to him and stated that the machine had been giving satisfactory service. Admitting that the dealer did not know of this defect, the fact remains that except for the acuteness of its inspector the railroad would have been fooled into buying a defective machine. It is practically impossible to make a thorough examination of any large machine without taking it all apart and even if there are no apparent defects or undue wear, the only way to make sure of its accuracy and productive capacity is to subject the machine to a thorough series of tests under actual shop con-

ditions. It would probably be unwise to make any hard and fast rule against the purchase of second-hand machine tools, but where such purchases are made the railroads should exercise the greatest care in inspecting and trying out machines before orders are placed. In by far the great majority of cases, the practice which will be most satisfactory in the long run is to purchase and install new machines, made by reliable manufacturers.

An article on page 471 of the October 22 issue of the *Railway Age* describes the method of operating the Cedar Hill,

### Freight House Operation

New Haven, Conn., freight transfer station of the New Haven. At this station 0.943 tons of freight per hour per man is being handled at an average cost per ton of less than 67 cents. Another article on page 991 of the November 19 issue tells how congestion in the outbound freight houses of the same railroad at Boston has been overcome and the cost of handling freight per ton decreased from 67 cents to 50 cents. The operating conditions at Cedar Hill are radically different from those at Boston. At Cedar Hill the hauls are long while at Boston they are decidedly short. Cedar Hill is a modern plant in all respects while the Boston station has remained unchanged, in physical characteristics, for years. In the face of these varying conditions the railroad is employing tractors and trailers in the operation of both stations with gratifying results. While the stations under discussion exemplify extremes of operating conditions it does not necessarily follow that tractors and trailers can be used successfully in the handling of freight at all points where operating costs are distressingly high. On the other hand the success that has followed these installations certainly may be said to be indicative of the wide range of conditions under which such devices may be put to work with legitimate expectations of satisfactory results, provided the plan of operation has been carefully worked out. Each freight house or freight transfer station presents a distinctive handling problem and no single handling system can be applied to all with success. The fact remains, however, that the opportunities for savings in freight handling, through the adoption of modern methods and appliances are of too great importance to be passed over lightly.

## Remarkable Reduction in Railway Accidents

THE RAILWAY MANAGERS have a right to be proud of the accident record made by the railways in 1920. The total number of persons killed, including employees killed in industrial accidents, was 6,958. This is the smallest number killed in 22 years, or since 1898, when it was 6,859. But the number of fatalities occurring has no significance unless related to the number of employees, the number of train miles run, the amount of service rendered, and other factors which necessarily tend to affect the number of accidents occurring. In relation to the number of employees, to the number of miles trains run, and to the amount of traffic handled, the accident record made in 1920, statistics for which year recently were made public by the Interstate Commerce Commission, is the best that ever has been made since statistics upon the subject have been kept.

The accident reports of the Interstate Commerce Commission relate to accidents on all the railways of the United States. The only statistics we as yet have regarding the total number of employees, the train mileage run and the traffic handled in 1920 are those for the Class 1 roads. Therefore it is necessary, in making comparisons, to use the

accident statistics for all the railways and the statistics of the Class 1 roads regarding number of employees, train miles run and traffic handled. It is impossible to make a ten-year comparison satisfactorily because in 1910 statistics regarding the number of trespassers killed were not reported. But by using the accident statistics of all railways in 1911 and 1920, and the statistics of the Class 1 roads regarding number of employees, train miles run and traffic handled in these years, we can make comparisons for a nine-year period, which, while not strictly accurate, show the increase in safety of operation as clearly and almost as accurately as would be done by more complete statistics. These comparative figures are given in the accompanying table.

	Year ended Dec. 31, 1911	Year ended Dec. 31, 1920
Total persons killed in train and train service accidents.....	10,396	6,958
Non-trespassers—		
Passengers.....	299	229
Employees on duty.....	2,871	2,167
Employees not on duty.....	292	91
Persons carried under contract.....	57	35
Other non-trespassers.....	1,154	1,867
Non-train accidents—		
Industrial accidents—employees and others.....	439	463
Trespassers.....	5,284	2,166
	1911	1920
Number of employees.....	1,599,854	2,031,927
Passengers carried one mile.....	32,371,444,793	46,724,880,000
Ton-miles.....	249,843,166,302	409,970,656,000
Passenger train miles.....	548,279,061	571,653,863
Freight train miles.....	608,678,284	633,972,312
Total train miles.....	1,185,632,129	1,205,626,175

It will be noted that in spite of the large increases in number of employees, in train miles run, and in amount of freight and passenger traffic handled, there was a decline in the number of fatalities to every class of persons, except those classified as "other non-trespassers." The increase in fatalities to "other non-trespassers" was chiefly due to a large increase in the number of persons killed at highway crossings, and this entire increase in the number of persons killed at highway crossings was due to an increase in the number of automobiles struck by trains or trains struck by automobiles.

In 1911 the number of employees for every employee killed was 444, while in 1920 it was 788. This increase of almost 78 per cent in the number of persons employed for each employee killed shows that there was a great decline in the hazards of the occupation of the average railway employee.

In 1911 the number of passengers carried one mile for each passenger killed was 108,265,701, while in 1920 it was 204,038,777. Stating the matter in another way, the average passenger, on the basis of the results of operation in 1911, could have traveled at the rate of 60 miles an hour for 206 years before being killed, while on the basis of the results of operation in 1920 the average passenger could have traveled at the rate of 60 miles an hour for 388 years without being killed. The danger of traveling by passenger train was reduced 47 per cent.

The measures of the public service rendered by railways are the number of passengers carried one mile and the number of tons of freight carried one mile. The number of passengers carried one mile in 1920 was 44 1/3 per cent more, and the number of tons carried one mile 64 per cent more than in 1911. On the other hand, the total number of persons killed in railway accidents of all kinds decreased 33 per cent between 1911 and 1920.

The total number of persons killed on the railways of this country was at its maximum in the years from 1911 to 1914, the highest figure ever reached being in 1913, when it was 10,964. While measures of various kinds to reduce accidents have been adopted on every railway for years, the "safety first" movement really was inaugurated in 1910. The "safety first" movement was different from measures which previously had been adopted, mainly because it was based on fuller and clearer recognition of the fact that most

accidents were due to carelessness and recklessness on the part of the personnel of the railways rather than to defects of their plant. The great reduction of accidents undoubtedly has been due principally to the educational work which has been carried on among employees by officers especially assigned to this duty, and to efforts of "safety first" committees composed of both officers and employees. Those who initiated and carried on this work deserve the greatest possible credit. The accident record of the railways can and should be further improved, and to that end the "safety first" movement should be given even more generous and energetic support by the managements than in the past. In the interest of humanity and in the selfish interest of the railways themselves nothing in connection with railway operation is more important than further increases in its safety.

## Proposed Changes in the Transportation Act

THE TRANSPORTATION ACT is the only really constructive legislation for the regulation of railroads ever passed in this country. This is true because it is the only example of such legislation which is in some measure designed to promote increases in railroad service as well as to prevent railroad abuses.

As yet, however, the Transportation Act has been of no benefit to the railroads. Every benefit conferred by it has gone to railway employees and the public. Under it the employees were given a large advance in wages and permitted to keep in effect for many months rules and working conditions which gave them large amounts of pay for work not done. Under it the public has escaped from the series of deficits incurred under government control, with the result, that including both what it has paid in rates and what it has paid in taxes, the total amount it has paid for railroad transportation has been hundreds of millions of dollars less than it would have been if government control had been continued.

The reason why the railways have derived no benefits from the Transportation Act is that certain of its provisions have not been carried out. The Act requires the Interstate Commerce Commission to so fix the rates that for two years ending March 1, 1922, the railways shall earn an average of not less than  $5\frac{1}{2}$  per cent or more than 6 per cent upon their combined valuation. On the rates fixed by the Commission the railways have thus far earned an average of less than 3 per cent. The first year the rates were in effect they earned about \$400,000,000 less net operating income than they were guaranteed annually under government control. On no possible construction of the Constitution of the United States could the Commission have restricted the railways to lower rates than those actually made by it if the rate-making provisions of the Transportation Act never had been passed.

Any benefit conferred by the Transportation Act upon the railways would have to be obtained by them in future. Curiously enough, however, while the public, under the provisions of this act, or in spite of them, has been saved hundreds of millions of dollars and the railways have lost hundreds of millions, Senator Capper of Kansas, Senator LaFollette of Wisconsin and others are urging the repeal of the rate-making provisions. This is what would naturally have been expected from Senator LaFollette. On the other hand, Senator Capper is a man who has grown very rich in the publishing business. One would naturally expect a man who has shown as much business ability in his own business as Senator Capper has to apply business sense to his work on behalf of the public.

Just what effect would be produced by repealing the rate-making provisions of the Transportation Act? The provision requiring the Interstate Commerce Commission to so regulate rates as to enable the railways to earn at least  $5\frac{1}{2}$  per cent has thus far been applied so that they have earned less than 3 per cent, and, furthermore, it automatically goes out of existence on March 1, 1922. The main provisions which would be left after that, if they were not repealed, are the following:

First, that the Commission shall fix such rates that the rates "will under honest, efficient and economical management and reasonable expenditures for maintenance of way, structures and equipment, earn an aggregate annual net railway operating income equal as nearly as may be to a fair return upon the aggregate value of the railway property of such carriers held for and used in the service of transportation."

Second, that the Commission shall from time to time determine what will be a fair return for the railways to earn, and "in making such determination it shall give due consideration, among other things, to the transportation needs of the country and the necessity of enlarging such (transportation) facilities in order to provide the people of the United States with adequate transportation."

Third, that any railway which earns more than 6 per cent in a year shall pay one-half of the excess to the government.

There are really but two things required in these provisions which are not required by the Constitution of the United States as repeatedly interpreted by the Supreme Court. All regulating bodies in fixing rates act under the constitutional requirement of so making them as to enable the railways to earn a fair return on the fair value of their properties. One thing this legislation requires which the Constitution does not require is that the Commission in fixing rates shall give due consideration to the transportation needs of the country and the necessity of enlarging transportation facilities in order to provide the people of the United States with adequate transportation. For Congress to repeal this provision would be tantamount to the adoption by it of an order to the Interstate Commerce Commission that in fixing rates in future it *should not consider the need of the country for adequate means of transportation*. Do Senator Capper and those who agree with him want the Commission to fix rates without any regard to the effect that the rates fixed may have upon the adequacy of the transportation furnished to the people of the United States?

The only other effect the repeal of the rate-making provisions would have would be to relieve railways which earn in any year an average of over 6 per cent on their valuation of the necessity of paying to the government one-half of what they earned over 6 per cent. The *Railway Age* would like to see that provision repealed. It would like to see every railway permitted to keep all it can earn. But why should Senator Capper and Senator LaFollette be so concerned lest some railway which earns over 6 per cent shall pay one-half of the surplus back to the government?

The answer is simple enough. This recapture provision is an integral part of the rate-making provisions of the law, and they want all the rate-making provisions stricken out so that the policy of regulation followed before government control, of making all rates as low as they can be made without being held confiscatory, shall be restored.

This "near-confiscation" policy of rate regulation which was followed prior to government control almost stopped the development of railway transportation. A revival of that policy will stop the development of railroad transportation. No industry can live and grow under such a policy. Cessation of the development of the railways under private ownership inevitably will result in government ownership.

The *Railway Age* never talks politics. It deals entirely with railroad affairs. There are times, however, when it is

necessary to refer to politics in order intelligently to discuss some railroad problem. There was a suspicion that certain leaders of the democratic party desired to fasten government ownership of railroads on the country. They brought about the adoption of government control of railroads. Public sentiment reacted against that policy powerfully, and the railways were returned to private operation under the Transportation Act. These democratic leaders in their zeal for promoting government ownership made its adoption impracticable for a time at least.

The republican party in its campaign hand-book in 1920 bitterly denounced the policy of government control carried out under democratic auspices. It opposed government ownership in its platform. Almost every public man, however, who is now advocating the repeal of the rate-making provisions of the Transportation Act is a republican. The revival of the old policy of near-confiscation would be as effective in promoting the cause of government ownership as the adoption of government control was in creating sentiment against it.

Is the country to be treated to the spectacle of leading democrats hindering government ownership by actively trying to promote it, and of leading republicans who pretend to be against it promoting policies directly adapted to bring it about?

## Reductions of Rates on

### Agricultural Products

THE INTERSTATE COMMERCE COMMISSION in a recent decision directed the western railways to make general reductions in the rates on hay, grain and grain products which would have averaged around 15 per cent and which would have cost about \$35,000,000 a year. The railways, after consultation with the Interstate Commerce Commission, have instead announced reductions on all agricultural products throughout the country averaging about 10 per cent and which will cost about \$55,000,000 annually.

The reasons why the railways have taken this step are easily discernible. The reductions in rates on hay, grain and grain products suggested by the commission would have been borne mainly by only part of the railways. The reductions the railways have decided to make on all farm products will not cost some of the railways so much and will be borne by all the railways. Furthermore, the reductions suggested by the commission would have conferred relatively large benefits on only a part of the farmers. The reductions actually to be made by the railways, while they will benefit grain producers relatively less, will benefit the farmers of the country as a whole to a larger extent. The farmers as a class have suffered the greatest reductions in the prices of their products within the last year and a half. Therefore, they have been the least able to pay the freight rates which were put into effect on August 26, 1920.

The wisdom of the action taken by the railways will be determined by future developments. If there was good reason for general reductions of the rates on any class of commodities this reason applied with special force to those on farm products. First, the farmers needed them more than any other class of producers; second, the Interstate Commerce Commission had decided that the rates on one large class of farm products ought to be reduced. It is very doubtful if the decision was warranted either by the facts or law, but the decision had been rendered and the railways could not disregard it or attack it in the courts without antagonizing the largest body of shippers and the most powerful regulating body in the country.

Already complaints are heard from some other classes of shippers, however, because the railways voluntarily have

given this reduction of rates to the farmers without giving corresponding reductions to other shippers. Most of these complaints are of very questionable validity. It is true that the prices of some other commodities have declined as much as those of farm products. Among the commodities which are selling for less than in 1913 are copper, tin, zinc, coffee and rubber. Other things which are selling at or very near their pre-war prices are steel billets, steel beams, wool, crude petroleum and sugar. Outside of farm products, however, the average wholesale price of all commodities is almost as much higher than in 1913 as is the average freight rate, and certainly there is no economic justification for the numerous producers whose average prices still are relatively as high when they are compared with the prices of 1913 as are the freight rates charged on their commodities, to demand reductions of rates.

The most important question raised by this reduction of rates is not whether it is fair to reduce the rates of some classes of shippers and not those of other classes, but whether, from the standpoint of the public welfare, it is expedient to reduce any rates under present conditions except those which can be shown to be hindering the movement of traffic. Any reduction of rates made for any purpose except that of moving traffic which otherwise would not move reduces the net operating income of the railways. Whatever reduces their net operating income will reduce their ability to buy equipment and materials and employ labor for the purpose of rehabilitating and enlarging their facilities. Whatever has this effect will tend to protract the industrial depression and to impair the ability of the railways to handle the country's commerce when general business revives. The very classes that will benefit most immediately by reductions in rates may in the long run lose the most if the railways are so crippled that next year or the year after they cannot handle all the traffic offered to them.

This reduction in the rates on farm products is made in the expectation of reductions in wages and other operating costs and will remain in effect only six months if these expected reductions in operating expenses are not secured. If they help the railways to obtain needed reductions in operating expenses they will serve a useful purpose both immediately and in the more distant future. If they do not have this effect they will do more harm than good.

## New Books

*Questions and Answers on the UC Equipment, 1921.* 72 pages, 5 in. by 7 in. Published by the Air Brake Association, 165 Broadway, New York. Price 50 cents.

The Air Brake Association has just added to its list of educational books, one on the Westinghouse UC equipment. The book is intended for those men engaged in railroad service who desire to inform themselves on the construction, operation and function of the new UC passenger air brake equipment. It is a radical departure from much air brake literature in that it does not necessitate an intimate acquaintanceship with ports and passages. Omission of a detailed consideration of the many intricate ports and passages of the universal valve should assist in readier comprehension of its general principles, of which the average reader should be informed. Based upon the foregoing, the subject has been covered not only by a text, but also by "Questions and Answers." For those readers who desire general information in a minimum of time, the first 50 questions and answers have been prepared. For those who prefer the regular descriptive form, a "Summary" has been included. Those readers who seek a more exhaustive treatment of the subject may find it in either the complete "Questions and Answers" or the complete text of the book.

## Letters to the Editor

*[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]*

### Sometimes It Is a Disgrace to Be Poor

NORTH PLEASANTON, TEXAS.

TO THE EDITOR:

I note a letter in your October 8 issue which appears under the head of "No Disgrace to Be Poor." I would take issue with "Subscriber." The difference between wealth and poverty is not measured by the gross incomes or amounts available to spend. Two families equal in size and with the same income live side by side. One family, due to its shiftless habits and poor management, is continually in debt, lives in poor quarters, wears poor clothes, and as a consequence is constantly dissatisfied and discontented.

The other family manages well, watches the small wastes and as a result lives well, owns its own home, dresses well and is generally pleased with life. In such a case it is a disgrace to be poor, and a large number of railroad mechanical departments are similar to the shiftless family. Before such organizations put up the plea of poverty, would it not be wise to make an inspection and ascertain if, without any changes in our plant, we could not prevent wastes in time of men and material which would, if conserved, soon equip our shops with the machines whose absence we now bemoan.

E. R. BREAKER.

### The "Big Stick" versus the Golden Rule

KANSAS.

TO THE EDITOR:

I have been an interested reader of your journal for a good many years and have been "hankering" for some time to say something through its columns. There has been much said about efficiency, co-operation and "get-together" movements, as between officers and employees, but little has been suggested as to how this co-operation could be brought about.

To my mind the greatest factor in the successful operation of railroads, or any other business for that matter, is the human element, and in railroading, at least, it has been given but little of the right kind of consideration. Officers are chosen mainly because of their knowledge of railroading and not because of their character; a big majority of them are men who, although they measure up to the average man of the world, are not men who through their character and habits inspire in the employees loyalty and efficiency towards the railroads or respect for the officers themselves. This may seem a hard thing to say, but it has been my observation from an experience of 30 years as a train dispatcher, a position just between that of officer and employee.

I have seen railroad unions grow from nothing to their present strength, largely, I believe, because officialdom has tried to handle men on the "big stick" principle instead of the "golden rule" plan—and it did not take a man of any great mental capacity to see where it was all leading. The catastrophe which has just been averted, for a time, is a sample.

To have a new era in railroading we shall have to get out of our hearts selfishness, greed and the domineering attitude, and establish the "brotherhood of man" idea, and to do this some one in authority will have to commence by doing "good for evil." Who will it be?

TRAIN DISPATCHER.

### The Rock Island Employees' Clubs

HAILEYVILLE, OHLA.

TO THE EDITOR:

The officers and the employees of the Rock Island Lines were glad to note that the *Railway Age* in its issue of November 5 took cognizance of the fact that their road was one of the three of the country's carriers which handled more net ton-miles of freight in August, 1921, than in August of last year. The editor remarked that he had been informed that the Rock Island had been favored with a considerably improved morale in recent months.

The morale of this system is being improved in various ways. One of the recent adventures in this direction was started last May under the direction of Hal. S. Ray, assistant to President Gorman, and who is known on the Rock Island as Hal "Service" Ray. Mr. Ray devotes his time to matters of personnel and public relations, and his work is directed toward bringing about a better spirit of friendship and co-operation among employees, increased efficiency and courtesy toward the public.

Rock Island employees' clubs have been formed at various terminals along the railroad and "get-together" meetings are staged each month which bring the employees, their families and the public together. As an illustration as to what these clubs do, the first meeting of the Haileyville club was held at Rock Island Lake near Haileyville on August 4 and consisted of an all-day picnic, and dancing and other pastimes in the evening. The second entertainment was an original play given by home talent at the local theatre. The third was an oldtime spelling match, card party and dance. The fourth was a general entertainment consisting of various indoor games to which everyone was invited. The next to be staged will be a negro minstrel show.

The active workers in the club, as well as others, have been encouraged by the presence of several of the officers of the system at each entertainment. All entertainments and meetings have so far been well attended by the railroad people and the public. Rock Island clubs at other points along the line are also, we understand, doing well. The results of such efforts will make themselves felt in more ways than one to the credit of the Rock Island Lines.

J. L. COSS,

Train Dispatcher, C. R. I. & P.

### Ford a Disappointment

ROCHESTER, N. Y.

TO THE EDITOR:

In an interview (*Railway Age*, November 12, page 939) which Henry Ford gave at Washington recently, he made some recommendations for improving railroad operation which were about as pertinent and would be just about as valuable for the purpose intended as his famous "Peace Ship" was in "getting the boys out of the trenches by Christmas."

To his suggestion that "the unproductive parasite stockholders" be eliminated, one cannot refrain from countering that no large railroad approaches the position of the Ford Motor Company as a close corporation. It takes the peculiar mental twist of a Ford to advance the opinion that the investors in railroad securities, most of them holders of small amounts, should be denied a return on their holdings, while the manufacturer of the Ford car is allowed to grow rich beyond the dreams of avarice.

On the other hand, Mr. Ford's suggestion to expedite the movement of freight is a sound one. The average operating officer's insistence on the maximum possible train load is all too frequently like the straw which broke the camel's back. Many, many times an engine will stall and tie up traffic which if one or two cars less had been placed in the train,

would have made the division in good time with consequent saving in fuel and wages.

Mr. Ford's ideas on railroad finance are truly remarkable; he seems to forget entirely that when talking of railroads he is not considering a gold mine like the business of making flivvers. He implies that the stock of the railroads should be owned by the employees, a very desirable condition, it is true. The writer is an employee of a very excellent railroad, the Erie, but he can hardly be censured for not caring to invest a large amount of money in its stock. Ford adds that a hue and cry would be raised if it were attempted to get the ownership of the railways into the hands of the employees because people had invested in them for the financial protection of their families, their children; he adds sarcastically, "Protection from what? From the necessity of earning their living?" I will wager that it is not Mr. Ford's intention that his son Edsel shall ever have to face the necessity of earning his living, and yet according to the old adage that charity begins at home, it would seem more fitting for him first to turn over the Ford plants to his employees before suggesting that the owners of the railroads be compelled to do so.

These are strange sentiments from our great apostle of thrift and industrial paternalism. Are we to imply that Henry has come out for the Plumb Plan? I quote Mr. Ford as follows: "If the brakeman on a railroad owns stock in it he has an added inducement to competent service. If the railroad is a success it is due to him (the brakeman) and his fellow workmen and they are entitled to the profit." Not a word is said about the executive whose guiding hand enables a great railroad system to function smoothly, or the trained engineers and designers who have planned the elimination of grades and have made such remarkable progress in effecting improvements in locomotive design in recent years, or of the division officers and senior clerks whose efforts to produce transportation at a minimum of expense are unceasing. As usual, Ford plays to the galleries, and the brakeman, who contributes less to the railroad organization than perhaps any other employee, and whose actions cannot affect operating results in the least, unless he fails properly to perform the comparatively slight service required of him, gets all the credit; the usual Ford propaganda, like the famous \$5 a day sweep-up men in his Detroit factory.

And in the one department of the science of railroading where we would expect the most from Ford, he fails us utterly. When he bought the D., T. & I. some of us had a suspicion that he would try to operate it with "flivvers." But now he makes the childish and inaccurate statement that a freight train weighs several times as much as the load it carries (a standard P.R.R. four-hopper coal car will hold 77 tons and weighs but 23 tons). It is a well-known fact that nothing contributes so much to the expense of operating a railroad as light equipment of insufficient strength. Ford refers to the fact that a bicycle weighing 20 lb. will carry a man weighing 200 lb., but a bicycle does not have to pull 100 other bicycles each with a man on it, or be subject to impact of hundreds of tons weight. It is true that lighter cars can be constructed but only at the expense of riding qualities and safety; one would hardly care to take a transcontinental journey at a speed of 60 miles an hour in one of the horse cars which navigated West street, New York, a few years ago. I used to be worried as to whether the originator of the "flivver" had to ride in one of his own instruments of torture on all occasions, but my mind was relieved by a recent press notice stating that Henry Ford had purchased one of the finest make European cars for his own use for \$15,000. Patriotic? So after all he does not practice what he preaches to the railroads.

After Ford has been running his railroad a little longer and knows more about the countless folks whose principal object in life seems to be to beat the railroads, he will have

no fault to find about the comparatively small legal forces which every railroad finds necessary to employ as a matter of self-preservation.

What Mr. Ford says about railroad bookkeeping and accounting being "complicated far beyond all necessity," is alas, only too true; but it is pertinent to remark in this connection that his railroad was called to account in no unmisgivable terms last month by M. O. Lorenz, director of the bureau of statistics of the Interstate Commerce Commission, in connection with its request to be relieved from making various reports required by the commission from Class I railroads.

It is quite evident that Mr. Ford is not the Moses to lead the railroads out of the wilderness, and into the promised land, that some of his admirers think him to be.

C. C. HENKEL.

## University of California Overlooked

BERKELEY, Calif.

TO THE EDITOR:

An "Ohio State University Student" says in your issue of November 5, apropos of university instruction in transportation: "The truth is that those universities which have a College of Commerce offer work in transportation as a matter of course. Such universities are Chicago, Yale, Leland Stanford, Illinois, Wisconsin, Harvard and a host of others."

I dislike to inject an irrelevant remark into a perfectly good discussion, but, if a university upon the Pacific Coast is to be selected for illustration, why pick Leland Stanford, which in spite of the writer of the letter referred to, has no College of Commerce, and omit the University of California, which has a large and flourishing one with courses in transportation well represented in its curriculum. Would you not suppose that a student of Ohio State University would be better informed after the football game at Pasadena last year?

STUART DAGGETT,

Dean, College of Commerce, University of California.

## Make Better Use of Freight Cars

WASHINGTON, D. C.

TO THE EDITOR:

The diagram on page 948 of the November 12, 1921, *Railway Age* indicated that the surplus freight cars decreased from 500,000 to 125,000 in the six-month period ending October 15, 1921. Bad order cars increased from about 280,000 to 350,000 in the same period. That the railroads have such a large number of bad order cars indicates inefficient operation, which is costly both to the railroads and the public which they serve.

Freight cars are built to transport certain materials and have a given capacity. Efficient operation depends upon their being loaded to or near capacity and moved as rapidly as can be done economically. When a loaded car in a train is side-tracked or held in a yard or is moved at a rate that averages 30 car miles per day, it is not being used efficiently.

My suggestion is to so rate the locomotives that they can readily handle their trains without strain or delay and thereby reduce the number of cars that are damaged in service.

I. C. C. Accident Bulletin No. 78 shows the cost of accidents in 1920 to have been 38 per cent greater than in the previous year. Much of this annual waste should be eliminated by efficient operating methods. Therefore, load the cars to capacity but reduce the number of cars in the train so that the locomotive is never overloaded. The net result would be decreased operating cost all along the line.

AN ENGINEER READER.

## Superpower Development Would Effect Much Needed Economies

NEW HAVEN, CONN.

TO THE EDITOR:

The Superpower Survey report sets forth facts from which certain conclusions can be demonstrated. One of these is that there is a great deal of capital, coal and labor going to waste in the development of electrical and steam energy at too high a cost in the Boston-Washington zone. There should be greater economy in the development, transmission and consumption of this energy. The increase of distance over which electricity may be practically transmitted, the fact that it is not substantially affected by the law of gravitation and that it is instantaneous in transmission, all indicate the economy of a tying together of the sources of energy in the Boston-Washington zone.

The superpower plan would result in a kilowatt hour created at less cost, in more kilowatt hours being produced with a less amount of capital and a better controlled consumption and consequently a better load factor for the producers of power. Here in New England he will be a public benefactor who can make one ton of coal do what now takes two tons and this is what the Superpower Survey apparently demonstrates.

E. G. BUCKLAND,

Vice-president, New York, New Haven & Hartford.

## Railway Storage Battery Cars

NEW YORK.

TO THE EDITOR:

In an article in the *Railway Age* of October 1, 1921, entitled "The Field for Gasoline Railway Motor Cars," by L. C. Josephs, Jr., the assertion is made that storage battery cars failed on railroads because of their limited radius of operation and inefficient transmission of power. The Edison storage battery car is not a failure in any sense and this statement is at variance with the experience of users of our car.

In justice to Mr. Josephs, we quote the following from his answer to a letter from us: "My ideas on this subject coincide with those set forth in the paper by Messrs. Dodd and Arnold, read before the International Railway Fuel Association, May, 1913, in Chicago." From this it would appear that his conclusions as to the storage battery car were based on a report made in 1913. Mr. Josephs apparently has not been in touch with the development of our industry since that date. While we do not concede that the storage battery car was a failure at that time, it would be just as useless to consider here the performance of the self-propelled battery car prior to that time as it would be to declare that the gasoline self-propelled car was a failure because prior to 1913 it had been tried on a number of railroads and discarded as an absolute failure and a dangerous fire risk as well.

In passing, let it be said that the Railway Storage Battery Car Company did not enter this industry until subsequent to 1913; that previous to that time builders of storage battery cars had entertained and followed the theory that a storage battery car must be of excessively light weight construction and that such oddities as loose wheels, stationary axles, and specially constructed light weight trucks and other unique members in the car body construction were considered essential. The Railway Storage Battery Car Company, however, in entering the field discarded both this theory and practice and adopted M. C. B. standard construction and has since developed and sold cars meeting this high standard in every particular.

There can be no question that the electric storage battery

car is the simplest, cleanest and easiest operating railway unit that has ever been invented, but in view of the fact that this article is written to controvert certain assertions and to disprove them by instances of actual operation, no enlargement will be made here on its numerous advantages, such as the few parts; the absence of any engine and the incidental and expensive wear on engine parts; the absolute elimination of any fire risk.

To meet the assertion that the storage battery car is a failure in general, due to its limitation of radius of operation and inefficient transmission of power, we cite the following actual records of cars that have been placed in operation since 1914, carefully tested as to the very two points alleged by Mr. Josephs:

### PENNSYLVANIA RAILROAD:

Philadelphia to Baltimore—92.4 miles, 1.1 k.w.h. current consumed p.c.m.  
Mechanicsville to Chambersburg, } 145 miles, 1.9 k.w.h. current c.m.  
Waynesboro to Richmond and return } summed p.c.m.

### CANADIAN NATIONAL RAILWAYS:

Between Trenton and Belleville—228 miles daily, 1.2 k.w.h. current consumed p.c.m.

Campbellton to Bathurst and return—126 miles daily, 1.2 k.w.h. current consumed p.c.m.

For details of continued successful economical operation proving the success of the storage battery car in general, reference is made to the following Edison storage battery cars in operation throughout the world: Long Island Railroad; Pennsylvania System; Chattahoochee Valley Railroad; Cambria & Indiana Railroad; Chicago, Terre Haute & Southeastern Railroad; Towson & Cockeysville Electric Railway; United Railways of Yucatan, Progreso, Mexico; Havand Central Railroad, Havana, Cuba; San Salvador & Santa Tecla Railroad, Salvador; Tranvia de Oriente, Bogota, Colombia; Tranvia de Guayaquil, Guayaquil, Ecuador; Tranvia de Pisco, Pisco, Peru; Tranvia de Merida, Merida, Mexico; Tranvia de Iquique, Iquique, Chile; Tranvia de Huacho, Huacho, Peru.

Particular attention is directed to the fact of the operation of the car on the Canadian National Railways between Trenton and Belleville, Ontario, making a total of 228 miles a day with this one car, which mileage is admitted to be a fair maximum of the average branch line mileage on a steam railroad. It should be further noted in connection with this record, that although this car had been in service elsewhere for four years before being placed in operation by the Canadian National Railways, up to the present it has performed this mileage consistently for 178 consecutive days without being out of service for any cause whatsoever, mechanical or otherwise.

In view of the fact that without a particularly low cost of current, the cost of operation of this car over this mileage is 3 cents per car mile (based on the power consumption of  $1\frac{1}{2}$  k.w.h. per mile at 2 cents per kw), there is no inefficiency of power transmission from the practical operating standpoint, and we confidently challenge not only the gasoline self-propelled unit but any other known unit of railway propulsion to show any such power economy in continuous operation, ton for ton.

The foregoing list comprehends cars in operation not only in the temperate but in the torrid zone near the equator; and since 1912 a storage battery car has been operated in Alaska. It must be remembered, however, that all of the foregoing are cars operated with the Edison storage battery, which is an alkali and not a lead acid battery. Too much stress cannot be laid upon this fact.

We seek no controversy with Mr. Josephs, because he probably has an erroneous belief that the development of the storage battery car had been arrested by the outbreak of the war in 1914 and that its use on railroads can only be judged by the certain failures prior to that time, losing sight of the fact that the very purpose of Mr. Edison in projecting an alkali battery was to overcome defects which were par-

ticularly responsible for these failures, and the further fact that the Edison storage battery car industry has been developed just as much, if not more, than the gasoline car, since 1914.

In the United States, this is an error into which motive engineering experts and engineers in general have been too prone to fall without investigation of the great progress we have made as demonstrated by actual tests and operations.

L. KLOPMAN,

General Manager, Railway Storage Battery Car Company.

## Long Sleeping-Car Runs

NEW YORK.

TO THE EDITOR:

That through sleeping car line from Aberdeen, Scotland, to Penzance, England, 785 miles, which you notice in your issue of October 29, page 846, is an interesting development (provided there are enough people in Scotland desiring to visit Land's End to make the business profitable); but the funny part of it is that, though there may be a through "line," there is no through sleeper. You must have read your London exchanges with insufficient care. Between Aberdeen and Penzance cars are attached to and detached from the train at a number of places; and, as I read the statements, a day coach is the only vehicle which runs through. The run takes some 22 hours, and passengers cannot find berths, on the southbound trip, until they reach Oxford; while on the northbound trip, leaving Penzance at 11 a. m., the sleepy passenger cannot refresh himself by complete and satisfactory recumbency until he gets to York at 11.15 p. m.

The published accounts would seem to indicate that an American passenger agent (of a former generation) may have had a hand in preparing them; for the fact that there is no through sleeper is obscured as skillfully as possible.

Would any American railroad, in its efforts to please the public, employ any such half-way measure? Probably not. However, it is not for us to criticize. Changing from one car to another (at a convenient place) at bedtime, is not an unmixed evil. Long journeys have elements of tediousness. The people of England are not much used to 700-mile journeys, and very likely they will prefer to educate themselves by degrees.

In this country the longest through-car runs have been those of "tourist" or second-class sleepers. Travelers who use the highest grade of sleeping cars may have reasons for not desiring to go to extremes in this matter. England is not so slow as she is often painted.

L. B. G.

## Why Employees Misunderstand Managements

TO THE EDITOR:

The greatest problem facing the railroads today is to create a feeling of understanding between the men and the managements. This can be accomplished by a policy of education coupled with complete frankness on both sides.

Why do the men feel the way they do towards the managements? Sometimes from observation of the lack of co-operation between departments and often even between heads of the same department; by failure of the operating officials to keep in close touch with the men and conditions; by officers following the course of least resistance instead of taking the initiative and changing methods and practices to agree with new conditions. Suggestions are often met with rebuff, or with the standpat reply "We can't vary our practice or we can't do that as it is out of the ordinary, etc."

The men are impressed and discouraged by the complete

failure in many cases to remedy the practices and conditions that were in effect 20 years ago, and have in other lines of business been superseded by modern methods; by criticism that is often unjust and technically critical, instead of being constructive; by lack of understanding by the men of the financial conditions of the roads, and mistaken impressions that no one takes the pains to correct; by the attitude of the management of making a good paper showing for one year at the expense of the future; by the management spending its best talents and abilities to evade issues and conditions that have to be met, which with the same expenditure of brains could be solved as easily; by taking away from the men their incentive and initiative in various ways and substituting "red tape" and too much system.

So much for criticism. What will change these conditions? Absolute confidence between the men and management, created by humanizing the latter; by personal relations that are closer; show the men that the management desires to meet them on a frank and open basis; let them know the exact financial status of the road; place before them the problems you face in operating the road. Let them know what the materials and supplies cost that they consume and have charge of. Explain what train and train loading statistics mean in dollars and cents; give them a financial interest in the company through the privilege of buying stock and equipment certificates; create teamwork between departments; make your plans for economies consistent—don't set the example of waste here and save there.

If possible help the men to build and own homes and show an interest in their welfare. Let the men be interested and they will eliminate the shirkers themselves. Show them the reasons for different acts that look trivial on the face but grow to be mountains by discussion without a basis of facts. Help the men to get over the road, to keep the cars moving, to make a success of economical practices and methods, to reduce damage and claims to lading and equipment, and help them to have an interest in keeping the physical property in the highest state of efficiency; make them feel that the management is interested in each man's personal efforts and that discipline will be administered without fear or favor.

Meet the men on this basis as "man to man" and you will find that the men will meet you in the same spirit, which is the only thing that can save the roads from going under with the present conditions. ONE WHO BELIEVES IN 50-50.

Going Up to Clark's Summit With Five Engines

# Lackawanna Success the Result of Supervision

Adequate Facilities, Good Morale and Careful Checking of  
Details Feature the Road's Operation

By Charles W. Foss and James G. Lyne

## Part I

THE DELAWARE, LACKAWANNA & WESTERN has been considerably in the public eye in recent months. This has been due to a variety of reasons, among which the most important are: (1) The declaration on July 28 of a 100 per cent stock dividend, following the approval by the Interstate Commerce Commission of this step to capitalize a portion of the company's surplus; (2) the segregation of the

sufficient so that the property had in September an operating ratio of but 69.4 per cent. Its net railway operating income in September was \$1,930,927 and for the first nine months of 1921, \$9,825,096, although a smaller amount of traffic was handled than in the first nine months of 1920 and in spite of increased rather than decreased expenses for maintenance.

The road has always been conservatively financed. It is

TABLE I—REVENUES AND EXPENSES OF OPERATION, 1912 TO FIRST SIX MONTHS OF 1921

1916	17,114,593	2,899,309	7,532,565	24,647,158	5,983,187	8,447,010	16,700,148	8,440,680	2 1/2	7,259,468
1917	15,940,064	4,321,268	8,800,963	24,741,027	6,777,192	9,370,831	15,370,197	9,499,560	22 1/2	5,870,637
1918	14,174,529	3,626,710	4,565,921	22,367,160	6,131,886	6,533,108	12,834,052	8,444,086	7 1/2	4,389,962
1919	17,334,424	4,689,682	3,565,541	25,874,647	6,126,908	6,808,447	16,072,200	8,444,455	7 1/2	7,627,745
1920	13,634,114	6,503,942	5,308,464	25,446,520	6,128,996	11,771,411	13,675,109	8,444,110	2 1/2	5,231,999

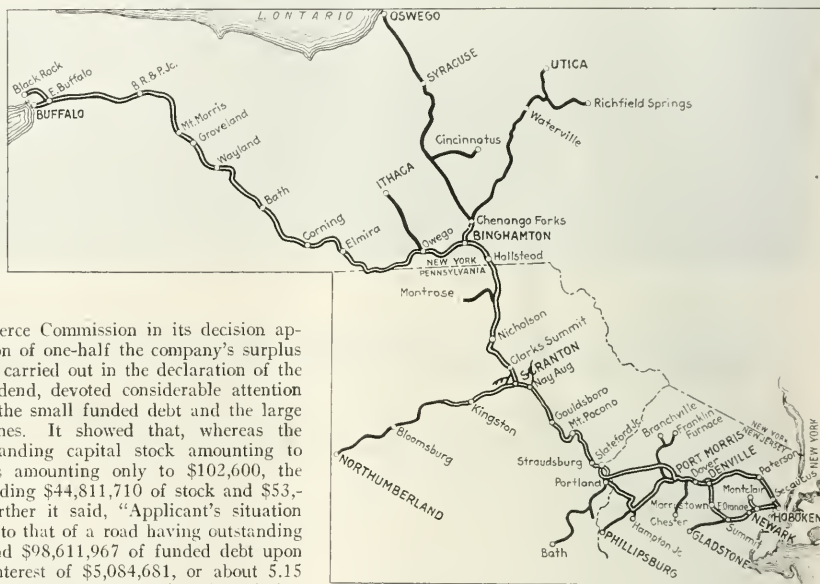

the property. The total interest on funded debt in 1920 was but \$6,156. This statement is made with due cognizance of the fact that payments to leased lines total over \$6,000,000 annually. Dividends have been paid at the rate of 20 per cent annually since 1905, with the exception of 1917, when 22½ per cent was paid, and of 1909, in which year the Delaware, Lackawanna & Western Coal Company was organized and cash dividends aggregated 75 per cent. A short while ago, as noted above, a stock dividend of 100 per cent was declared and the dividend rate on the increased capitalization has since been made 3 per cent quarterly, or 24 per cent annually on the former capitalization.

The Interstate Commerce Commission in its decision approving the capitalization of one-half the company's surplus of \$90,000,000, as later carried out in the declaration of the 100 per cent stock dividend, devoted considerable attention to the relation between the small funded debt and the large payments to leased lines. It showed that, whereas the Lackawanna had outstanding capital stock amounting to \$42,220,550 and bonds amounting only to \$102,600, the leased lines had outstanding \$44,811,710 of stock and \$53,697,657 of bonds. Further it said, "Applicant's situation is in a sense equivalent to that of a road having outstanding \$42,220,550 of stock and \$98,611,967 of funded debt upon which it pays yearly interest of \$5,084,681, or about 5.15 per cent, with a total capitalization aggregating about \$150,000 per mile of road and \$52,100 per mile of track."

### Segregation of Coal Properties

The Lackawanna was built primarily to handle anthracite coal and prior to about 1900 its traffic in other commodities was of comparatively small importance. The railroad owned the coal lands, mined the coal, transported it and sold it.

The selling activities, however, were dropped in 1909 upon the organization of the Delaware, Lackawanna & Western Coal Company. Effective September 1, 1921, the railroad divested itself of its coal properties—the mines and the business of working them being turned over to the Glen Alden Coal Company. The Lackawanna mined some 9,000,000 to

The Delaware, Lackawanna & Western

11,000,000 tons of coal annually, and derived from its coal department earnings of from \$1,500,000 to over \$6,000,000 yearly.

The Glen Alden Coal Company has been capitalized with 846,000 shares of no par value—this being the same number

Profile of Main Line and Important Branches

of shares of Lackawanna Railroad stock as were outstanding prior to the declaration of the 100 per cent stock dividend. The Glen Alden shares were offered to the railroad stockholders on record June 15 on the basis of one share of Glen Alden to one share of Lackawanna at a price of \$5 per share. The coal company has delivered to the railroad a mortgage of \$60,000,000 paying 4 per cent interest. It was further provided that the coal company must establish a sinking fund of \$1,500,000 annually, beginning September 1, 1926, to be continued until the \$60,000,000 has been paid; if the coal company mines more than 12,000,000 tons of coal in any year, the sinking fund must be increased to \$2,000,000. The Delaware, Lackawanna & Western Coal

future. It does not appear that it will be adverse. The important point, however, is that the coal properties have been segregated. It must be borne in mind in reading the remainder of this article that the Lackawanna Railroad—since September 1, 1921—no longer owns coal mines nor mines coal. It has now become a transportation company exclusively.

### Service Chief Asset in Competition

The Lackawanna has the shortest line between New York and Buffalo—396 miles. The total mileage of the system is 995. Of this total the Lackawanna owns but 277, leases 703 and has trackage rights for 15. Although the system

Some Scenes Along the Line Between Hoboken and Scranton

Sales Company has been continued as the sales agent of the Glen Alden Company.

The segregation of the Lackawanna's coal properties into the hands of a separate company will be most unlikely to affect measurably the movement of the coal from these mines over the Lackawanna Railroad. It will presumably have some result on the Lackawanna earnings—what result, however, can only be determined by the developments of the

is small, it has been able to compete quite handily with the larger trunk lines having through lines of their own between New York and Chicago. The road's largest single item of traffic is, of course, anthracite coal, which makes up normally about 40 per cent of the total tonnage. The Lackawanna, however, also carries a large tonnage of high class merchandise freight—its chief asset in the competition for which has been its service. The road is noted for its ability

TABLE III—TRAFFIC AND OPERATING STATISTICS

to operate fast manifest freight schedules and its record for making connections is an enviable one. This kind of service requires sufficient facilities for handling it, as also supervision and operating efficiency of the highest order, and of these the Lackawanna has had both.

As will be seen from the profile, the Lackawanna has on

TABLE IV—PASSENGER OPERATING STATISTICS

Year	Passengers carried	Passengers one mile	Rev. per pass. mile	Average distance	Cars per train mile	Pass. per train mile	Pass. per car mile
1912	25,462,301	505,585,264	1.53	30	..	..	..

its main line from Hoboken to Buffalo a number of rather heavy grades. The most important are those over the Pocono mountains east of Scranton and between Scranton and

Scranton Shops

Clark's Summit, west of Scranton. The opposing grade to westbound operation over the Poconos begins near the New Jersey-Pennsylvania state line, there being approximately 20 miles of  $1\frac{1}{2}$  per cent grade, or 78 to 80 ft. rise to the mile. From Scranton east to Nay Aug, about 6 miles, operation meets a grade of 75 to 77 ft. to the mile and from Nay Aug to Gouldsboro, about 14 miles, a grade of 51 ft. to the mile. From Scranton west to Clark's Summit there is another grade of about 75 ft. to the mile for a distance of about 7 miles. There is also an opposing grade to eastbound traffic between Groveland and Wayland, about 14 miles, averaging about 60 ft. to the mile. In addition, pusher locomotives are often used by westbound trains from Lincoln Park to Port Morris, 24 miles, 51 ft. to the mile, and by trains moving eastward over the New Jersey cut-off, 28.6 miles, in which section grades are met of 29 ft. to the mile.

#### Elimination of Grades and Curvature

Naturally, in view of the fact that the line goes through mountainous country where grades of 1 and  $1\frac{1}{2}$  per cent are met, it is to be expected that there should also be considerable curvature. The Lackawanna, however, is characterized by the extensive projects it has undertaken to eliminate curves and in general to secure a much improved alignment. There have not only been a large number of projects embracing a few hundred yards of track, but also the noted engineering achievements which are represented in the construction of the 28-mile cut-off from Port Morris, N. J., to Slateford Jct., Pa., reducing distance between Hoboken and Buffalo by 10 miles, and the 38-mile cut-off between Clark's Sum-

mit, Pa., and Hallstead. The former work was completed in 1911 and was carried out by the Lackawanna Railroad of New Jersey, a subsidiary company on the stock of which the Lackawanna guarantees annual dividends of 4 per cent. The project cost some \$11,000,000; one of its several distinguishing features is a fill some  $3\frac{1}{2}$  miles long, said to be the largest railroad fill in the world.

The cut-off between Clark's Summit and Hallstead was completed in November, 1915. As noted, it is 38 miles in length. It cost some \$12,000,000, procured through the sale of Lackawanna stock to the stockholders at par. The cut-off reduced the distance between Scranton and Binghamton nearly 4 miles and the saving in grades and curvature was such as to cut down the time of freight trains one hour. This cut-off likewise has several distinguishing features, the principal of which is the Tunkhannock Viaduct, 2,375 ft. long and 240 ft. high, said to be the largest concrete viaduct in the world. The old line which this cut-off replaced has been abandoned and is now being made over into an automobile highway—a part of the so-called "Lackawanna Trail."

The Lackawanna has been engaged in a continued and extensive engineering improvement program of many years' duration. In addition to the two cut-offs, this program has included new yards and terminals, new shops, new stations over a large part of the system, etc. Grade-crossing elimination has received particular attention. There is not a single grade-crossing on either of the two cut-offs; there is but one grade-crossing in the city of Scranton; with the completion of the East Orange track elevation project but very few grade-crossings will remain in the suburban zone. Work is now also proceeding on the elimination of two grade-

Keyser Valley Car Shops

crossings at Paterson, N. J., and one at Fox Hill, near Denville.

It is such developments as these which have induced the Lackawanna to use an expression such as "Mile for mile, the most highly developed railroad in America."

In comparatively recent years, the Lackawanna's improvement program has included the elimination of grade-crossings in the New York suburban zone, new stations at Buffalo and other points, etc. During federal control, the improvement program was deferred. At present two important projects are under way. The grade-crossing elimination work in East Orange, already noted, will cost about \$4,500,000. This is an elevation project; it will practically complete the program looking to the elimination of grade-crossings in the suburban zone, as above mentioned, and will facilitate train operation because of the addition of a third track 'as is already provided in Newark on the east, and Orange, etc., to the west.

The other project, estimated to cost about \$500,000, includes the preparation of a third track for passenger operation across the Hackensack meadows between the Hackensack river and Harrison. The work, now nearly completed, consists primarily of rock ballasting, etc., and the installation of color light signals on signal bridges in place of the present two-arm semaphore signals. An outstanding feature

The Lackawanna's Passenger Pacific

of these two projects is the fact that the Lackawanna is in a position to spend approximately \$5,000,000 in these times and without a bond issue. The next project in the Lackawanna's improvement program will probably be the electrification of the 1½ per cent grades between Gouldsboro and Clark's Summit, east and west respectively of Scranton.

#### A Striking Contrast

One of the striking things about the Lackawanna is the contrast that naturally results from the carrying out of projects of such extensive character. That is to say, in some places the facilities are adequate and show provision for many years of expansion. In others the opposite is true. Mention might be made of the yard facilities at Scranton. There the road is handling 70-car manifest trains in a yard, the longest track of which will hold but 48 cars. Another instance is the Hoboken passenger terminal which has had to meet an increase in business of 40 per cent in two or three years, but with facilities used to an extent which is rapidly

#### Pusher and Helper Service

The average revenue train load on the Lackawanna in 1920 was 814 tons; in 1919, it was 860 tons. Considering the Lackawanna's comparatively heavy grades and the large proportion of freight which moves in manifest trains and would presumably tend to reduce the average, it might be expected that an average train loading as heavy as this is probably secured through the use of heavy motive power. This, however, is not the case. The heavy train loading is due rather to the large amount of double-heading and pusher service. In 1920 the gross tons per train mile were 1,745; the gross tons per locomotive mile, however, were but 1,141. Operation is conducted over the Poconos and from Scranton west to Clark's Summit with double-headed trains having in addition two or three and, in winter, even four pushers. There is also a considerable amount of double-heading done

The Freight Pacific Type Locomotive

in passenger service; several of the rush-hour suburban trains are double-headed.

#### The Lackawanna's Locomotives

The Lackawanna's motive power standards are characteristic. This, however, is a development of comparatively recent years; even as late as 1914 through passenger trains were sometimes handled with a Ten-wheel locomotive double-headed with an Eight-wheel locomotive. Evidence of the progress that has been made up to the present time is per-

The Lackawanna's Heaviest Locomotive Is a Mikado Type

This locomotive has 28 by 30 in. cylinders; a weight on drivers of 253,500 lb. and a total weight in working order, engine only, of 328,000 lb. The maximum tractive effort is 57,100 lb. The fuel used is bituminous coal.

reaching the maximum. The general standard of excellence is so high that to the observer such things stand out in rather marked fashion.

The Lackawanna's standard rail section weighs 105 lb. to the yard. Creosoted ties exclusively have been put in main line track for some years past. Tie plates are used and screw spikes. The main line is ballasted with rock, except between Binghamton and Corning, where large-size washed gravel ballast is used. The Lackawanna has high standards of maintenance. So far in 1921 it has spent practically as much for maintenance of way as it spent up to this time last year.

haps best shown by the fact that it is hoped by next year to have applied superheaters to practically every locomotive in road service. The number of Eight-wheel and Ten-wheel locomotives in suburban service that have not been thus equipped can be counted on one's fingers.

The Ten-wheel locomotives are now being further modernized; the locomotives of this type that have been so treated compare favorably with many Pacific type locomotives. Mechanical stokers are a new development on the Lackawanna; they have been applied on about 14 Mikado locomotives and will shortly be applied to all Mikado type engines.

The Lackawanna's standard locomotives for freight serv-

ice are of the Mikado (1,200 class) and of the Pacific type (1,100 class). The Mikado locomotives have a total weight in working order of from 312,000 lb. to 328,000 lb.; a weight on drivers of from 236,000 lb. to 254,500 lb. and their tractive effort is 57,040 lb., the figures varying with the various orders. The Pacific type locomotives are intended primarily for fast freight and through passenger service. The Lackawanna's Pacifics are among the heaviest of their type used on any road. Those used in passenger service have a weight of 305,000 lb. and have 72 in. driving wheels. Those used in freight service have 69 in. driving wheels; have a total weight in working order of from 288,000 lb. to 291,000 lb.; a weight on drivers from 185,500 lb. to 188,000 lb. and a tractive effort of from 40,700 lb. to 43,116 lb.

Other locomotives used in freight service include the 300 Class Consolidations; the 500 Class Moguls; the 700 Class Consolidations and the 800 Class Twelve-wheelers. General details concerning the weights and tractive effort of these locomotives are given in the subjoined table. These various classes of locomotives are used principally in local freight service and as helper or pusher locomotives.

It is interesting to notice that in the years from 1912 to 1920 inclusive the Lackawanna acquired a total of 159 new locomotives. These included 74 Mikado, 69 Pacific type and 16 Eight-wheel and 1 Six-wheel switching locomotives.

The Lackawanna is termed "The Road of Anthracite." Anthracite coal is used exclusively as fuel for passenger

1912 to 1920 inclusive, the Lackawanna acquired some 7,800 new freight cars, inclusive of 800, 40-ton box and 800, 55-ton hopper cars allocated by the United States Railroad Administration.

The passenger equipment in through and suburban service alike is now largely of all-steel construction. Since 1910 the Lackawanna has acquired about 350 new passenger cars, all of all-steel construction and the most of them for suburban service.

As in the case of roadway and track, the Lackawanna is noted for its high standards of equipment maintenance. Its round-house facilities are unusually adequate and its shop facilities are rated among the best and most modern in the country. The main locomotive shops are at Scranton; the passenger car shops are at Kingsland, N. J., and the principal freight car repair shops are at Keyser Valley, not far from Scranton. With reference to the Lackawanna's stores department, it may be noted that the turnover in that department in the month of June was 40.2 per cent.

### How the Lackawanna Handles Its Coal

The nucleus of the Lackawanna's business is the transportation of anthracite coal. In 1920 the road carried 10,219,848 tons of this commodity; it carried 18,095,511 tons of other freight, and the total revenue tonnage was 28,315,359. On the movement of anthracite coal, the revenues in 1920 were \$20,228,484. Revenues on other freight were \$40,132,599. The coal tonnage in 1920 was 40 per cent of the total revenue freight tonnage and the coal transportation revenues were 33 per cent of the total freight revenues.

The business of transporting anthracite coal is rather more different from that of moving bituminous coal than might ordinarily be expected. The distinguishing features in the case of anthracite are the very small area in which the mines are to be found, the small number of mines and the large capacity of the individual mines. Thus the Glen Alden Coal Company—or its predecessor, the Lackawanna's coal mining department—mines and ships from 9,000,000 to 11,000,000 tons of coal annually. This coal makes up some 85 per cent of the total anthracite tonnage moving over the Lackawanna.

The coal is secured from but 17 mines and one-half of it from six mines. Some of these mines produce 4,000 and even 6,000 tons of coal per day. When one considers that the bituminous coal shipped over the Virginian Railway is less in tonnage than the anthracite coal mined by the Glen Alden Coal Company, but that the Virginian's coal is obtained from some 70 mines, the contrast between the anthracite and bituminous coal business from the railroad point of view will be apparent.

The reader should also be reminded that anthracite is classified not by mines or pools as in the case of bituminous, but by sizes. These sizes are separated in the breaker which is at the head of the mine shaft. There are 8 sizes; furnace, egg, stove, chestnut, pea, buckwheat, rice and barley. The first five are domestic sizes and the latter three commercial. The size of the breaker will be perhaps best evidenced not only by the tonnage of coal which it sorts by sizes—as noted, in some cases 4,000 to 6,000 tons daily—but by the fact that a modern steel breaker costs about \$1,500,000.

LOCOMOTIVES IN SERVICE—JUNE 1, 1921

Series	Type	Class	Number in service	Total weight in working order, engine only	Weight on drivers	Tractive effort

				305,500	197,300	44,079

This table gives only general details and is not meant to be a complete record of the Lackawanna's locomotives.

trains—through and suburban alike. During the war the road used in passenger service soft coal or a mixture, but it is now back to its former standard. The coal used in freight service is bituminous exclusively. Pittsburgh No. 8, the grade used, is obtained principally from mines on the Baltimore & Ohio and the Wheeling & Lake Erie.

### Freight and Passenger Cars

In the matter of freight equipment the Lackawanna has followed a conservative policy. For coal traffic the car most commonly used is a 50-ton or 55-ton steel hopper car. The box cars are mostly of 60,000 lb. and 80,000 lb. capacity and of steel underframe construction. In the years from

# The Trans-Continental Freight Rate Situation\*

## A Presentation of the Railways' Position on Pacific Coast Rates and on Panama Canal Tolls

By Edward Chambers

Vice-President Atchison, Topeka & Santa Fe

THE TRAFFIC directly involved is the westbound movement of highly manufactured articles, practically ready for the consumer, from Atlantic ports and from points in what is known as the seaboard territory to Pacific Coast ports and to points inland from the Pacific Coast, where the ship rate to the port plus the local rail rate is less than the normal all-rail rate. There is also involved traffic from points of origin westward from Atlantic seaboard territory up to and including Colorado common points, for throughout all this region there is strong competition of manufacturers seeking markets in the Intermountain and Pacific Coast territories. The great bulk of this traffic originates or terminates on rail lines inland from the ports.

When the Panama Canal was opened in 1914 it made a through direct sailing distance between New York and San Francisco of approximately 5,000 miles and avoided all transfers en route. After the payment of tolls the Panama Canal route was still very much cheaper than any of the other water routes, and, by the uninterrupted sailings, made the all-water service much more valuable and nearer the all-rail-service than it ever was before.

### The Policy of the Government

From the beginning up to 1918 the railroads enjoyed continuous permission, either by direct authority of law or ruling of the Commission, to publish rates which would enable them reasonably to meet the rates of these coast-to-coast water carriers at competitive points and continue to carry higher rates at intermediate points; and also to apply, in like manner, these all-rail water-competitive rates from points inland, such as Cincinnati, Chicago, St. Louis, Kansas City, Denver, and other points in the same territories to the same Pacific Coast competitive points.

It always has been the policy of the Interstate Commerce Commission to grant authority to apply from intermediate points of origin westward from the Atlantic seaboard territory to Pacific Coast ports the same rate that it determined necessary to meet the coast-to-coast water-carrier competition in the seaboard territory, when such rate was lower than the normal all-rail rate, and this has proven to be a very wise policy. It would be disastrous to the western manufacturing interests to prohibit such rate adjustment now, as it only assists the western manufacturer in maintaining his natural relation to the Pacific Coast territory, which relation is now seriously disturbed by the rates made via the Panama Canal route. It would also be just as disastrous to the all-rail carriers, as they would lose the Pacific Coast traffic from western points, which is the most profitable movement to them. The trans-continental railroads receive the greater benefit by applying their water competitive rates from intermediate points west of Pittsburgh.

With the opening of the European war, ships operating between Atlantic and Pacific ports began gradually to withdraw from that service and go into foreign or overseas serv-

ice, which was much more profitable to them. That demoralized more or less the coast-to-coast service by water. Shortly after our country entered the war our government began to commandeer the desirable privately-owned United States ships and place them in overseas transport service. As a result the beginning of 1918 found practically no coast-to-coast water carrier operations in general domestic traffic. This condition was called to the attention of the Interstate Commerce Commission early in 1918 by intermediate shippers, and the Commission, after hearing, withdrew from the transcontinental rail carriers permission to carry the lower rates at Pacific Coast ports and obliged them to apply the Pacific Coast port rates as maxima at intermediate points. In order to protect their revenue, the rail carriers extended the maximum rates to Pacific Coast ports, which increased the rates at the ports very considerably. During 1918-1919 there was, because of the slow return of ships to coast-to-coast service, little or no competition between coast-to-coast water and all-rail carriers, and the traffic was handled almost entirely by the all-rail lines.

In the latter part of 1919 water-carrier competition by the additional ships placed in service began to show itself in a rather small way at first, but it increased gradually so that by the latter part of 1920 competition of the water routes had increased to a very considerable extent. Since then it has been steadily increasing, so that today the competition of these water lines is a very serious matter to the trans-continental rail carriers.

The all-rail carriers have up to the present time been very conservative in the matter of reducing rates to compete with the water lines. They recognize the demoralized conditions on the water and the fact that large numbers of ships are idle, there being in operation today seeking domestic traffic a greater number of ships than can be profitably operated.

With the rail lines thus practically out of the competition at Pacific ports, the intermountain shipper is in precisely the same position today that he would be if the all-rail carriers had in effect a system of competitive rates meeting the water carriers' rates, and such rates were not applied as maxima at intermediate points. But while the intermountain shipper gains nothing by the exclusion of the rail carriers from this business, the rail carriers themselves lose heavily. There is no complaint from the interior territory of the present rates of the water lines from Atlantic to Pacific Coast ports. Were the rail carriers to meet the water carrier rates at Pacific Coast ports, the present rate relationships of intermediate points to such Pacific Coast ports, based on existing combination, would not be changed. I cannot see what is to be gained by the intermediate territory if its objection prevents the all-rail carriers from meeting the rates of the water carriers. The water carriers would continue to make the same low rates to the same Pacific Coast ports regardless of the higher rate adjustment of the trans-continental railroads, which must be maintained if they are forced to carry the same rates westbound at interior points as are carried to the ports.

### Competition of Markets

The cities upon the Atlantic seaboard, by virtue of the Panama Canal, secure a maximum enjoyment in the markets

\*From a statement presented before Examiner William Disque of the Interstate Commerce Commission at Chicago on November 17, 1921, in behalf of all transcontinental lines in an application to the Interstate Commerce Commission for permission to make rates by the railroads from the Atlantic Coast and nearby territory, from the Gulf Coast, and also from the interior manufacturing regions such as the Chicago territory, the Mississippi river territory, and the Missouri river territory to Pacific Coast points, which shall be lower than the charges on the same commodities to destinations east of the Pacific Coast.

afforded by the Pacific Coast cities. This naturally creates a market competition for the cities in the middle west from the Rocky Mountains to the Niagara frontier, which should not be denied, and under the policies of the government the all-rail carriers sought to and did establish carrying charges to the Pacific Coast cities from such interior cities upon a basis which permitted a participation in the markets of the Coast. The sections of the country in which such interior cities are located, through the medium of taxation, have contributed their full quota to the cost and the maintenance of the Panama Canal, and it is the contention of the sections and the cities in competition with the seaboard cities that the carriers should be permitted to establish a system of rates which would permit of their products or wares being placed upon the Pacific Coast on a reasonable parity with the cost of transportation so far as the seaboard cities are concerned. To deny the establishment of a basis which will permit of a reasonable participation on the part of such cities in the interior would discourage the growth and development of a very large and substantial part of the United States, and cause to be withheld from the carriers a revenue which would be theirs if the market competition of the various cities as to the traffic in question were fully considered and properly disposed of. The maximum development of country and transportation justifies a scattering of manufactories to all parts of the country rather than a concentration upon the Atlantic seaboard.

Up to the time of opening the Panama Canal the situation on the water was such as to enable all-rail lines reasonably to compete with the coast-to-coast water routes and secure a fair share of this traffic at compensatory rates; but after the opening of the Panama Canal route it became more difficult for the all-rail lines to meet the competition of these coast-to-coast water carriers. This condition forced the rates all-rail to a very low level. The reduction of cost to the ship by its not having to transfer its cargo en route and moving it all-water via the shorter, direct route, enabled the ship to make much lower rates than ever before and to reach farther inland for traffic, both at the Atlantic and the Pacific Coast, and thereby to take a greater proportion of the traffic than at any time in the past. This forced the rail rates down to a minimum figure, very close to the out-of-pocket cost of handling traffic.

If tolls on the Panama Canal were eliminated it would create a still lower basis for rates via water routes, which in turn would compel the lowering of the all-rail rates and place an additional burden on the western railroads and on western manufacturing interests. The steamship operations between Atlantic and Pacific ports have never developed any considerable amount of traffic. The bulk of the traffic which they now enjoy was developed by the all-rail lines.

Pacific Coast and Intermountain territories produce an immense volume of food products, perishable and non-perishable, such as citrus fruits, deciduous fruits, dried fruits, fresh vegetables, canned goods, beans, sugar, rice and live stock, which moves to markets east of Colorado and largely to markets in the territory east of the Mississippi River and north of the Ohio. This western territory also produces an immense tonnage of lumber which is marketed at points eastward. The rates applied to these eastern markets are not in all cases fully reasonable. Many rates have been made on the basis of what the traffic could reasonably bear in reaching markets. There is no departure from the long-and-short-haul clause of the fourth section on east-bound traffic, except sugar from California to Chicago and wool and dried hides from the Pacific Coast terminals to the eastern territory and no complaint of the relationship of rates.

The territory east of the Mississippi River and north of the Ohio produces the great bulk of the westbound tonnage

of manufactured articles consumed on the Pacific Coast. The movement of traffic eastward across the Mississippi River is much heavier than the movement westward. There is always need of additional westbound traffic for loading refrigerator cars. The lumber traffic, even under normal conditions, requires a large empty movement of box cars westward. There are now owned by trans-continental lines and in service for handling perishable food products from points in Pacific Coast and Intermountain territory approximately 50,000 refrigerator cars. The character of freight generally moving westbound is desirable for loading into returning refrigerator cars, as it causes the minimum damage to the car. There is at best under normal conditions a large empty westbound movement of refrigerator cars, so that whatever increases the loading westbound contributes just that much to the net earnings of the trans-continental carriers, and, to that extent, affects favorably, from the shippers' and receivers' viewpoint, the rates both east and west-bound, terminal and intermediate.

An adequate supply of refrigerator cars is important not only to the Pacific Coast territory but also to the intermountain region. The latter territory is as much interested in having the trans-continental railroads enjoy profitable operation and give satisfactory service as the Pacific Coast could be. The present rate adjustment on the traffic of western territory moving to eastern markets is low for the distance hauled in comparison with rates from other producing points. But it is necessary to carry such rates in order that western products may enter the trade in eastern markets in competition with other sources of supply. The trans-continental railroads need all the westbound traffic that it is reasonably possible for them to secure in competition with the coast-to-coast water carriers in order that they may make the rates which are indispensable to the development of western territory. The traffic most important in any section is that which it produces and ships to markets in other sections of the country. The volume on the whole shipped out of Pacific Coast and Intermountain territory to eastern markets is much greater than the inward movement.

It should not be overlooked that along the lines of the trans-continental railroads is an extensive area which produces practically no traffic, and also a very considerable territory which produces only a very light traffic. The rail lines through such regions must be largely supported by the traffic which originates or has destination beyond.

### Contention of Intermediate Territory

The contention of intermountain shippers is that no lower rate under any circumstances should apply at Pacific Coast ports than is in effect at intermediate points. This contention is based largely on the effect such rates may have upon distribution by interior jobbers of eastern manufactured articles in the Intermountain territory in competition with Pacific Coast jobbers, and not to any extent on any interference with manufacturing or production at intermediate points, as the question of raw materials westbound is not involved to any extent, nor is that of the great staples, such as coal, lumber, grain and its products, fruits and vegetables, and meats.

The rail carriers have no desire to make lower rates at Pacific Coast ports than apply at interior points, if it could be avoided. They would welcome a condition which would allow them to haul a reasonable share of Pacific Coast west-bound traffic under fully reasonable rates. Today the all-rail carriers have no rates in effect which meet the rates of the coast-to-coast water carriers, and there is therefore practically no competition between the carriers by rail and those by water.

If the rail carriers should be denied permission to make

lower rates at Pacific Coast ports and have higher rates at intermediate points, it would leave the water carriers without any competition except between themselves and to enjoy the haul of practically all westbound traffic to Pacific Coast ports and nearby points. The middle-west manufacturer would be unable to compete at Pacific Coast cities with the manufacturer in the territory Pittsburgh and east, who would enjoy the low water-route rates—less than the normal rates to the same points on the same commodities from the territory west of Pittsburgh, which is nearer to destination. The position of the western manufacturer in Pacific Coast markets is seriously endangered now by rates made by the coast-to-coast water carriers from eastern territory, as there are no corresponding rates made for the western manufacturer by the all-rail lines. The western manufacturer is unable to absorb the present difference between the freight rate paid by him to the Pacific Coast and that paid by his competitor from the Atlantic seaboard to the water carriers. This certainly is not in the best interest of the country as a whole. Today manufacturing is congested in the territory east of the Mississippi River and north of the Ohio, where, outside of cereal products and lumber, 85 per cent of the general manufacturing is done. What the all-rail lines are seeking to do is to hold the business from western points now on their rails and to secure a share of the traffic from the competitive eastern territory. Unless this is done the business will practically all go to the eastern manufacturers.

### Water Carriers Should Be Regulated

I have always been strongly of the opinion that the rates of water carriers in coast-to-coast traffic should be under the jurisdiction of the Interstate Commerce Commission. If this were done the Commission would prescribe reasonable rates for water service which would be stable and at a figure that would enable a regular, dependable operation of steamship lines, and avoid the disturbance and demoralization caused by what is known as the tramp ship, which often offers rates for cargo at almost any figure above the handling cost and usually takes on cargo without any intention of ever returning to operate in regular service. The public gets no benefit from fluctuation in water rates caused by such competition. I believe that, with coast-to-coast rates of the water carrier subject to the Interstate Commerce Commission, there would be removed much of the cause for complaint on the part of the intermountain shippers and there would be afforded more protection to the manufacturers in western territory in their natural relation to Pacific Coast markets. Such regulation would give to the shipper on the Atlantic seaboard a reasonable rate by water, and that is all he is entitled to have.

### Canal Tolls Should Be Paid

The Panama Canal cost in construction over \$400,000,000. The revenues from tolls are about equal to the operating costs. The people of the western states are taxed for the original cost of the canal. By giving to seaports the free use of the canal, the entire benefit of the waterway would go to seaport cities. It is an artificial waterway, built for the protection and advantage of the country as a whole. It shortens the all-water distance between the Atlantic and Pacific coasts by 10,000 miles, and it gives to those coasts an artificial advantage in trade and commerce. Like any other facility to promote commerce, it should carry itself. It should not be the means of entirely destroying the natural advantage in mileage to the coast which the interior city possesses over the seaport.

### The Application of Rail Carriers

The rail carriers have at present no relief from the requirements of the fourth section, so far as the traffic involved

is concerned. They feel that they cannot longer afford to ignore this coast-to-coast water-carrier competition, as it is seriously reducing their net revenues, and they are now asking the Interstate Commerce Commission in this case to grant them permission to meet the competition of the water routes so they may enjoy a reasonable share of this westbound Pacific Coast traffic which they have built up and participated in for many years. Their application, now before the Commission, asks for permission to make rates all-rail from Atlantic Coast and nearby territory to Pacific Coast points that will reasonably meet the rates made by the water routes from the same points of origin and not to be required to apply such rates as maxima to intermediate points. They desire also to make these water-competitive rates apply from manufacturing territory west of Atlantic seaboard territory to the same Pacific Coast ports under the same relief at intermediate points.

In previous cases inquiry has been made as to what the trans-continental carriers regard as a fair share of the traffic. Manifestly this cannot be stated in percentages. We do not assume it to be the function of the Commission to determine what percentage of the business should move by rail and what by water, any more than we assume it to be the business of the Commission, where it fixed a relation between rates from two points of supply, to determine what proportion of the business shall move from one point as compared with the other. The purpose in both cases is to afford a fair opportunity for both, and let the purchaser of transportation in the first case or of the commodity involved in the second case make his own choice. As applied to the situation in hand a fair proportion is that proportion which the carrier can get upon an equality of rates.

On an equality of rates the business will divide itself according to the desires and interests of the shippers themselves. The law looks to an adjustment of rates which will encourage both rail and water competition. This provision is fully satisfied by an adjustment affording equal opportunity for both. Neither has the right to demand that the other be excluded entirely from any competitive area in which they may meet, or that from such competitive area either should be given preference through the creation of an adjustment which will increase the opportunities of one and diminish opportunities of the other. The limits of this competitive area will and should depend upon the rates which these two agencies may themselves make with some profit to themselves in free and open competition. That share which either may get under such equality of opportunity is the fair share to which it is entitled.

The rates proposed are intended to afford to the rail lines that equality of opportunity to which they think they are entitled to the extent that in their judgment traffic may be secured in competition with ocean lines at some profit. This equality of opportunity requires the extension of fourth section relief to business originating at interior producing points, at Chicago, as well as at the Coast. Competition is between the goods delivered at Pacific Coast terminal points.

In reaching its conclusions in this case, the Commission should not establish any relation between rates on traffic at intermediate points other than that established, first by the maintenance of reasonable rates at interior points and the establishment at terminal points of rates shown to be necessary to participate in business in competition with the water carriers, subject to the qualification as to cost; and, secondly, by the effect on the intermediate rates of coast combinations as maxima. The present rates at intermediate points are those which would result from the application of a rigid fourth section and have been approved by the Commission as reasonably low. They are too high to permit free movement by the rail routes to the terminal points because of the ocean competition there encountered. They should be reduced at those points to meet that competition

and for reasons in no wise affecting the traffic to intermediate points or the reasonableness of the rates under which that traffic moves. To the extent that the intermediate territory is within the zone of this influence through coast combinations, its rates would be reduced below their present levels, which is the same level as would result from the application of a rigid fourth section. There is no reason why the zone of that influence should be extended further. If the rail lines by reducing their rates could regain a part of this traffic at rates which would yield them some profit, thereby increasing aggregate net revenues, it is clear to me, that then the Commission, whose duty it is to take such steps as may be proper to promote efficient operation, should permit them to do so.

## Carriers Want Commission to Announce Rate Policy

WASHINGTON, D. C.

COUNSEL for the carriers were at work during the first part of the week in preparing the form of the petition to be filed with the Interstate Commerce Commission asking for a rehearing of the Western grain rate case, and also for a general inquiry by the commission "to ascertain whether, until a substantial reduction can be secured in the labor and other costs of operation, any further reduction in rates could lawfully be required, or with due regard to the transportation industry, is possible," in accordance with the resolutions adopted by the Association of Railway Executives at its meeting in New York on November 16.

Meanwhile, the commission on Monday, November 21, issued a formal order in the Western grain rate case specifically directing the roads to put into effect the reductions named in its opinion in the case on October 20, to become effective on or before December 27. In the original opinion the commission found the reductions named to be reasonable and said that it would expect the roads to put them in effect on five days' notice on or before November 20. The commissioners probably knew as a result of their conference with the railway executives on November 12 that the carriers did not propose to put the reductions into effect, but that it was proposed to ask for a rehearing of the grain case and to substitute a 10 per cent reduction on agricultural products generally throughout the country except in New England. It is believed, therefore, that the formal order was issued to create a tangible legal status on which the roads could ask for a rehearing and it appears to be generally believed also that the commission will grant the hearing and permit the substitution of the 10 per cent cut for the larger reduction ordered in the grain case. The order directs the roads to establish on not less than five days' notice rates for the interstate transportation of wheat and hay in carloads between points in the Western and Mountain-Pacific groups, which shall not exceed the rates in effect on August 25, 1920, by more than 12½ per cent between points in the Mountain-Pacific group, 20 per cent between points in the Western group where the increase under Ex Parte 74 was 40 per cent, 17½ per cent between other points in the Western group and 16 2/3 per cent between points in the Mountain-Pacific group and points in the Western group. The carriers were also ordered to apply to coarse grains rates which shall not be in excess of 10 per cent less than the rates on wheat and rates on grain products that shall not exceed rates made by continuing the relationship that now exists between said products and the grains from which they are respectively made, except that differentials subject to the percentage increases in Ex Parte 74 shall be reduced proportionately with the rates.

While there has been no announcement of what took place

at the conference between the executive committee of the Association of Railway Executives and the commissioners on November 12, it has been assumed that some sort of an informal understanding was reached between the railroads and the commissioners which, while unofficial, gives each party some sort of assurance as to what to expect from the other. It is, of course, denied that any agreement was reached, but there are indications that the discussion was sympathetic and it was stated at the time of the conference that the executive committee was to take back to New York a proposal to be acted upon by the member roads. The member roads then announced their intention of making a six months reduction on agricultural products and of asking the commission for a rehearing in the grain case and a general inquiry. The language of the resolution regarding the general inquiry leads to a belief that the railroads are hopeful that the commission, after such an inquiry, will make some general statement of what it believes will be a proper rate policy for it to follow under present conditions.

The commission has been flooded with requests for more or less general advances in rates and for a reopening of Ex Parte 74, which it has not made public; but which have been given publicity in occasional instances by the authors. Apparently a very large number of shippers throughout the country believe that there is still a chance that the commission will, by reopening Ex Parte 74, order a general reduction in rates and it has frequently been stated that a clear statement by the commission as to whether rates generally should or should not be expected to come down in the near future would do as much as any other thing to revive business, because so many people are holding off orders in the hope that rates will be reduced.

Although it is understood that the railway executives in agreeing to a reduction on agricultural products were influenced by a belief that such a reduction is more justified by economic reasons than reductions on other kinds of commodities, because the prices of agricultural products have been deflated more than those of most other articles, there has been some criticism that the carriers singled out a particular class of commodities for this reduction. For example, it has been claimed that the roads were doing so to conciliate the agrarian element in Congress that has delayed the passage of the funding bill and that has been insisting on a repeal of the rate-making sections of the transportation act. W. H. Chandler, president of the National Industrial Traffic League, has written a letter to Chairman McChord of the commission, saying that "any preferential treatment of commodities will be resented by a large mass of shippers whose rates are still at the highest war peak." He has also telegraphed to Chairman Cuyler of the executives' association, saying that whatever reduction is made should be applied generally without discrimination just as the advances were applied.

THE UNITED STATES POSTOFFICE DEPARTMENT has been devoting particular attention to the "perfect package" campaign, along with the express and railroad companies. Employees of this department are putting forth every effort to induce mailers and shippers to give more attention to the manner in which their goods are packed, the kind of containers used, and the writing or marking of adequate and legible addresses.

TWENTY-SIX PEOPLE KILLED, 190 injured and 586 automobiles destroyed is the grade crossing record on the Southern Pacific for the past nine months. Nearly 300 drivers ran in front of or tried to beat the train to the crossing; 126 ran into trains, instead of trains striking them; 76 stalled on the track, largely the result of waiting until on the track before shifting gears; 55 ran into and broke down crossing gates; 28 approached the track at high speed; and five ran down and injured crossing flagmen.

# The Use of Wood in Freight Car Construction

## Is the General Use of All-Steel Construction Justified? The Advantages of Composite Design

By H. S. Sackett

Assistant Purchasing Agent, Chicago, Milwaukee & St. Paul

**T**HE MOST IMPORTANT feature of transportation in relation to commerce is naturally the freight traffic; thus, in the evolution of steam locomotion the problem always has been the construction of freight cars to meet the requirements of economic operation. From the first type of horse drawn freight car operated on the Baltimore & Ohio, antedating the steam locomotive and moved over timber rails, to the present quasi-standard 100,000-lb. capacity box car designed during the war, wood has maintained its important place because of its inherent suitability for the purpose which has been indisputably established not alone by its service record during the nearly 100 years of railroad history, but ever since merchandise was first transported on sleds; even before the invention of wheels.

A growth from 35 miles of railroad in 1835 to a total of 370,000 miles in 1918, and the development from locomotives of 15½ tons previous to 1850 to the electric "King of the Rails" of 1920 weighing 550,000 lb., and the Santa Fe type weighing over 400,000 lb., are graphic illustrations of progress fully comparable with the unprecedented commercial advance of the United States during the same period.

### Developments in Car Construction

Car construction cannot boast of such intense application. Looking back through this phase of railroad history one can hardly escape the impression, that generally speaking, freight cars "just grow'd" like Topsy, at least up to about 20 years ago when the pendulum started on the swing toward the present extreme of super-heavy construction.

In 1867 the Master Car Builders' Association accepted 20 tons as the maximum capacity of box cars. Today the indications are that cars of 100,000 lb. capacity will soon be the standard. These changes naturally made obsolete the older types of equipment as the lighter construction became

entirely inadequate to meet the requirements of modern traffic. Thus was developed the quasi-standard type of steel underframe construction as typified by the double-sheathed box car, developed during the past three years.

At the present time, to go beyond this to the all-steel closed-top freight car is hardly good, conservative engineering practice. All-steel cars can, at best, be considered but experimental, as only about ten years of worth-while experience has been had with such equipment and during this period such authentic evidence as is available points to excessive maintenance as compared with composite cars.

Up to this time, furthermore, the steel car has been developed mainly by the railroads which serve the steel districts, and this fact is undoubtedly responsible for their ultra-development by such roads. Likewise, railroads traversing forested regions have held more closely to the wooden or composite cars. The desire to aid in marketing a local product, therefore, has doubtless been a strong factor in the development of the all-steel car.

In this connection too it is of interest to note the recent announcement of the Pullman Company of a return to the composite sleeping car, one of steel understructure with steel skeleton superstructure insulated and finished with wood. This combination makes a safe, strong and comfortable car and one which is certainly superior in all respects to the all-steel type.

In 1918, Z. B. Wilson, of the Southern Railroad, in the *Railway Review* stated, "Nothing has occurred in the past decade that would justify spending \$2,500 for an all-steel box car, while we can build a composite box car with a substantial steel underframe, with superstructure and ends reinforced with steel for \$1,250. The writer desires to say \* \*, that he is very much in favor of composition cars for the following reasons: (1) A greater proportion may be re-

paired at other than steel car shops; (2) the initial cost is less; (3) the cost of maintenance is less than half of all steel; (4) the sides do not bulge as those of all steel; (5) composite cars can be repaired in half of the time required for the all-steel, thereby materially increasing car efficiency."

However, this controversy is not new. In 1870 the first earnest discussion of the steel car is recorded in the proceedings of the Master Car Builders' Association for that year. About thirty years later we find the fruition of these debates and early studies in the steel center sill, to be followed by the all steel underframe, both of which are justified by experience, but like many reforms that are aimed to achieve perfection over night there seems to be no happy medium and we are now presented with *all steel everything*. There is one consolation in this all-steel craze, that our inbred respect for cattle and hogs, which evidently outweighs consideration for mere human comfort, will prevent the all-steel stock car.

The demands made upon freight carrying facilities have entailed changes in construction to meet new requirements. Among these factors is the high speed with which trains of great tonnage are today moved across the continent. Tractive effort has increased 3,000 per cent and with the increased cost and scarcity of labor has come fly-switching and

tate transportation facilities and avoid the serious difficulties and losses occasioned yearly by lack of cars.

However, aside from the matter of expediency and present financial considerations the steel underframe, wood superstructure double-sheathed car (in some cases with metal carlines and steel ends for closed-top cars) presents physical and economic advantages, which quite distinctly identify it as the most suitable for modern conditions. These advantages may be summarized as follows:

- (1) It is sufficiently rigid to withstand modern mechanical shock.
- (2) It is adaptable to special conditions of lading, climate and traffic, varying with the respective territory involved, without sacrificing the standard interchangeable features of the steel substructure, trucks, draft rigging and appliances.
- (3) It may be fully assembled at railroad shops, from materials (such as the lumber for superstructure) often locally available.
- (4) Trained labor is more available and less costly, and can be more evenly distributed than were the construction of all steel cars concentrated in the present manufacturing centers, which alone can most economically produce the all steel car.
- (5) Repairs can be made more rapidly, at less cost and at any repair yard.
- (6) It provides greater protection to a majority of the various classes of lading.
- (7) It is more readily suited to interchanges as it meets most

Railroad Administration Double-Sheathed 40-Ton Box Car

the hump track. It would be unreasonable to expect the all-wood cars of 20 to 30 tons capacity, weighing between 22,000 lb. and 27,000 lb. and in their prime during the last decade of the nineteenth century, to meet these changed conditions. Efficiency dictates scrapping such equipment and its replacement with modern construction designed to withstand the wear of present traffic. Maintaining obsolete rolling stock is wasteful, and when certain roads spend roughly as high as 35 per cent of the total value of their rolling stock for its maintenance and repair in one year, it is time to establish with positive clarity just how much may be expended for maintenance with safety to financial soundness.

#### Relative Advantages of the Double and Single Sheathed Box Car

So far, all-steel equipment has not been proved to be the most economical. No attempt is made to prophesy future developments, but with a design adopted which meets all present and future requirements within the range of vision, sound conservation compels the building of the largest number of freight cars for the least money in order to rehabili-

effectively the requirements of climatic extremes encountered within the four boundaries of the continent.

(8) The initial cost is less. Although the reproduction value (M. C. B. Rules, 1920) is approximately nine per cent less than that of the all steel car the difference in first cost invested at six per cent compound interest for 20 years, still gives the composite car an advantage of five per cent after deducting such loss, providing maintenance of the all steel car is not greater than that of the steel underframe and wood superstructure car.

(9) The depreciation (M. C. B. Rules, 1920) is the same as for the all steel car, namely three per cent.

(10) Shippers prefer wooden superstructure as packing of lading is more convenient and less costly, because precaution need not be taken against rusted side sheets, bulging ends, condensation from roofs, or leaks of bulk lading occasioned by holes in corroded plates.

(11) It is lighter by upwards of 1,000 lb. and therefore costs less to haul.

The single-sheathed, steel superstructure outside frame car must likewise suffer by comparison with the double-sheathed car. Its chief weaknesses are unsightliness after short usage, due to the unavoidable perforating with nail holes of the single thickness of longitudinal siding, as well as the consequent exposure of lading. Where such cars are

used for valuable or semi-perishable freight, extra packing is required, and in some instances cars must be sheathed with tarred felt or waterproof paper by shippers; hence, the general unpopularity of this type of car. For such loadings as bricks, paving blocks, castings, etc., it will do unless because of poor loading the heavier pieces go through the side, or break up the siding. In addition, the first cost is greater, and the saving in volume of lumber used is offset by the higher cost of the grade and dimension required.

An average single sheathed car would require about 1,500

wood superstructure against the problematical performance of the steel frame.

### The Composite Gondola Car

Our discussion thus leads us to other types of cars, particularly, gondola, flat, stock and refrigerator cars. The latter are by their nature excluded from the possibility of all-steel construction. Gondola, coal and ore cars present different problems, but there is no question that the all-steel gondola still requires considerable development before it can

Modern Single-Sheathed, Steel Frame and All-Steel Box Cars

board feet of 1 $\frac{3}{4}$ -in. (rough 2-in.) dressed select, B and better, Southern pine sheathing; the double sheathed car requires about 1,700 board feet, No. 1 common, 1 $\frac{3}{16}$ -in. lining and 1 $\frac{3}{16}$ -in. B and better siding. The difference in quoted prices (September 1920) equals a saving of \$22.50 a car, which at 6 per cent compound interest during an average life of 20 years would represent \$72.15 per car. If applied to 100,000 box cars of the type recently ordered, this

be considered as a successful type. Flat cars are on the wane. Other types, such as tank cars and logging cars, are largely of private ownership and represent a comparatively small percentage of the total freight equipment, and do not materially affect the general question of efficiency in car construction.

Longer experience with all-steel gondola cars, particularly where used in bituminous coal service, indicates that de-

Composite Gondola Car

would amount to about \$7,215,000, enough to add over 2,000 double sheathed cars to the present equipment.

Whether the steel frame superstructure adds sufficient strength to the car, or materially increases its durability is largely guess work—a prophecy of future occurrences which the future alone can answer. At present it has not emerged from the experimental stage. Therefore, the problem is again one of comparative initial cost, and the known service of the

preciation is greater, maintenance more costly, and that they are consequently less economical than the composite car. In an article already referred to, Z. B. Wilson states that "the Southern Railway is operating a large number of both types (composite and all-steel coal cars) which were built in 1904 and 1905. These cars have been used almost exclusively in transporting coal. Both types are double hopper, and 100,000 lb. capacity. The average cost of repairs to 20 all-steel

cars was about \$666.31 while the average cost on the composite cars was \$240.97."

The Railway Mechanical Engineer of May, 1917, quotes the conclusions of William Queenan, assistant superintendent of shops, Chicago, Burlington & Quincy, as follows: "The composite type of car costs less to maintain than the steel gondola. The sides of composite cars do not bulge as do those of the steel car. Records show that while the composite car costs more to repaint than the steel car, it does not require painting as frequently. A large portion of the repairs to composite cars can be taken care of at other than steel car shops. Certain properties of coal cause corrosion to steel but do not affect wood."

In discussing freight car maintenance, L. K. Sillcox, then mechanical engineer of the Illinois Central, in the Railway Mechanical Engineer, October, 1917, stated: "It is simply a question of time until the greater part of a steel car must be replaced; renewals can only be economically and quickly carried out on a large scale for each car for the reason that corrosion is more or less uniform throughout each section of the structure and one part cannot be disturbed without equally effecting the adjacent one. As steel cars advance towards the time of their periodical overhauling many fail in service due to deterioration . . ."

Every road having steel equipment has had to deal with these conditions during the past decade. Even the most enthusiastic steel car men are now contemplating heavier construction and employing specially treated metal to counteract corrosion. The question again forces itself to our attention whether following this costly mirage much further is good practice when composite cars have proved their worth.

### Stock Cars

There can be no question that the composite stock car is both the most economical and most suitable. The wood superstructure presents sufficient protection to the lading and also a degree of comfort for the animals. There is the added advantage that all the wood in the superstructure may be thoroughly treated to make it both rot and vermin proof, and this feature permits the selection of lower grades of lumber which naturally adds considerably to the initial difference in cost between the composite type and an all steel car.

### The Refrigerator Car

Refrigeration of food products, both in storage and transit, has become the most important element in food distribution. Properly developed and applied, it unquestionably lessens

the average cost of food products and provides a normal flow of supplies to the nonproducing urban population, from the reserves accumulated from the surplus of seasonal production. Transporting perishable commodities in perfect condition would contribute greatly in cheapening the most necessary food products. Every dozen of eggs and each pound of meat, butter, fruit or vegetables spoiled in transit naturally

Longitudinal Section of Department of Agriculture Design of Refrigerator Car Insulation

increases the cost in proportion to the decrease in supply, as such loss must be equalized by higher prices for what is left in a salable condition. Therefore, the construction of a refrigerator car is perhaps of greater importance than any other type of car. As insulation is the most important requirement of a refrigerator car it is obvious that the wood body cannot be replaced.

The United States Department of Agriculture has done ad-

mirable work in its investigations into the subject, covering a period of over 15 years. Its efforts have finally resulted in a so-called standard refrigerator car, as represented by specifications formulated by the recent Railroad Administration. The conclusions arrived at by these exhaustive studies and the desirable features of an efficient refrigerator car were referred to in detail by Dr. M. E. Pennington, connected with the Food Research Laboratory, Bureau of Chemistry, United States Department of Agriculture, in a brochure in which are compiled a number of papers dealing with this subject.

The 4,000 new refrigerator cars recently built and placed in service by the Union Pacific, described in the *Railway Age*, issue of December 31, 1920, follow quite generally the details outlined by Dr. Pennington. In studying the details of construction it is interesting to note that the standard recommended by Dr. Pennington represents, excepting for a few innovations or improvements, practically the all-wood refrigerator car superimposed on the standard steel underframe. Thus we have complete co-ordination of wood and steel, achieving the maximum in efficiency and economy, under present conditions. This thought may well be applied to other equipment, and although there is no parallel in service conditions, there is a distinct analogy in construction costs and maintenance.

## Passenger Cars

Passenger equipment if discussed in proper detail is worthy of special treatment, and is largely a question of combining safety with comfort. Careful analytical review of the entire problem indicates that the most economical passenger car for use under present conditions is one of strong steel underframe with steel skeleton superstructure, insulated and finished with wood. It is believed that such construction will give the maximum safety in the present heavy trains as well as a high degree of personal comfort to the passengers.

## Greater Economy in Use of Wood

"Familiarity breeds contempt," is an oft repeated truism and possibly this explains the lack of more active interest on the part of car builders in the matter of using wood more economically and securing from it longer service in car construction. Ever since the first freight car—a hundred years ago—wood has been an inseparable and indispensable part of car construction, and because it was plentiful in the past and the best grades readily and cheaply available as was labor for repairs, little or no care has been used to protect it against the natural conditions of deterioration. All failures to this day are classed as mechanical where fully half of the light repairs could be avoided or retarded by employment of practical remedial measures.

On the basis of consumption previous to the war one and one-quarter billion board feet in round numbers were used for car construction annually, or about 3 per cent of the total annual production. This represents an average value of nearly \$45,000,000 at normal prices. A saving of about 25 per cent through increased service and decreased repairs would be a goodly item in addition to being real timber conservation.

Thus, in addition to the suggestion that elimination of wood in car construction is neither desirable nor practical, it may be said that lumber may be used more economically by paying closer attention to selection of grades and dimensions which fully answer the purpose but are cheaper, and protection of the lumber against such agencies as decay, insects, checking while in storage, etc. Timber conservation is vital to the nation, and most especially to the railroads, who, because of their prominent position, are obligated to lead in economic movements which are so potent in their beneficial influence. The basic principle of economic utilization—or popularly interpreted, timber conservation—underlies these suggestions of changes in specifications for car lumber which

being sound, bring with them profit in the form of equivalent service at a saving in cost of material and maintenance.

Standardization has proceeded to where there is practically a standard covering grades and dimensions for the various parts of cars, such as siding, lining, roofing, decking, framing, etc. These standards, however, have not taken full cognizance of the frequent difficulties manufacturers encounter in endeavoring to conform their practices accordingly, or their utter inability to do so. The manufacturer of lumber is limited entirely by the manner in which nature provides the raw material, or rather, how the trees grow. Lumber cannot be cast in a mold, nor can it be forged to a drawing. Yellow pine, however, is produced in sufficient variety of grades and sizes to provide perfectly good car lumber quite plentifully if reasonable flexibility is allowed with regard to dimensions.

A large yellow pine mill questioned on the matter replied, "On account of the great number of patterns required by car builders, this mill has never attempted to supply any of this material, as we have found that it required too much special work and too much cutting loss." Loss is waste of material and money, because it must be paid for; its elimination therefore, means economy and conservation.

One of the fundamentals of standardization is to adapt available supplies to the required conditions, thus widening the market of supply by standardizing manufacture and developing economies that effect a reduction in production costs, resulting in stimulating competition and lower prices.

Another manufacturer suggested, "The greatest possible service that could be rendered the car builders and lumber manufacturers would be to adopt a single pattern that would serve for car siding, car lining and car roofing, and then make this pattern in standard lengths; that is to say, all lengths, using what would cut up to best advantage for roofing and siding, and the lengths that would not cut up, on the inside of the car as lining."

Where would the cost of lumber for common building purposes be, and how much greater would be our loss in timber devastation and waste if the present standards had disregarded the availability of the grades and dimensions specified? In drawing specifications for building lumber the dominating factor is to produce the greatest volume of usable stuff at the lowest cost and with the least waste. Reforms are still possible in that field and improvements are frequently accepted.

Specifications for car lumber have changed slightly during the last 50 years, but if the progress were more in line with the conditions manufacturers must contend with in order to supply the lumber to meet some of the most stringent requirements, freight cars might be a little cheaper and at least a greater volume of suitable material would be more generally available. Some builders are more concerned with appearances than with the service to be rendered. A knot in a piece of siding can cause as much comment from a railroad president as a buckled-up steel car.

On the other hand, it is equally as important that the railroad engineers be allowed the opportunity of saying what grade and quality of material will be needed to meet their requirements. If the producers and consumers of wood used by the railroads in car construction, therefore, could thus get together on common ground, it is believed standard grades could be developed which would represent a big step of progress toward both conservation and utility—meeting the contingencies of the lumber manufacturer on the one hand and the exacting needs of the railroad engineer, on the other.

CLEARLY, if by our investments abroad and our purchases of foreign goods, we can help to provide the world with the means to pay for our raw materials, our food, and our manufactures, the course of trade will soon be quickened.—*Guaranty Survey*.

## Railroad Securities Bill

### Postponed Again

WASHINGTON, D. C.

THE BILL to authorize the government to sell its railroad securities, taken from the railroads for additions and betterments made during federal control, has been forced over into the next session of Congress, which begins on December 4, because of the extent of the opposition to the bill by those who wish to embarrass the railroads in any way possible as well as by those who proposed to use the bill as a vehicle for amendments to the transportation act designed to bring about reductions in rates. Senator Cummins, who after having had the bill made the unfinished business of the Senate and after all the committee amendments had been adopted in committee of the whole, allowed it to be displaced by the Newberry-Ford election controversy, announced on November 17 that he had given up his efforts to have it passed at this session.

A number of proposed amendments to the bill were mentioned in last week's issue. On November 18 Senator Hitchcock of Nebraska proposed an amendment which he had drafted several days before to provide that the act should not take effect unless and until the railroads shall put into effect the reduction of freight rates on grain, grain products and hay in the west as required by the findings and decision of the Interstate Commerce Commission of October 20. At the time this amendment was proposed the railroads had not filed the grain tariffs which to become effective on November 20 should have been in by November 15, but had announced their intention of substituting a 10 per cent reduction on agricultural products and of asking a rehearing in the grain case. On November 19 Senator Ransdell of Louisiana also submitted to the Senate a proposed amendment providing that no portion of the fund arising from the sale of the railroad securities shall be used to settle with those carriers which have preferential contracts with foreign ship companies, so long as the contracts continue in force.

A number of senators who have no particular objection to the railroad securities bill are very anxious to vote for a bill to repeal the rate-making section of the transportation act, while some who are in favor of the repeal in something like the form of the Capper bill, on which the committee on interstate commerce has been holding hearings, would prefer to take up such legislation in an orderly way instead of dealing with it as a rider on the so-called "funding" bill. Chairman Cummins of the interstate commerce committee has been anxious to pass the "funding" bill and he has also expressed himself as possibly inclined to be in favor of restricting somewhat the power of the Interstate Commerce Commission to change state rates, but he does not believe in combining the two subjects. He has not expressed himself very definitely as to the 6 per cent rate-making provision, but he did say during a hearing that perhaps it was now immaterial as the 6 per cent provision expires on March 1.

Although the President has said on several occasions that he hoped for the passage of the bill at this session, it was stated at the White House on Tuesday that he does not now care particularly about its passage at this time, because market conditions are now such that it is possible to sell car trust certificates and go ahead with the settlements with the railroads one at a time, so that if Congress is not ready to act that fact constitutes no present hindrance to the program. Additional sales of the car trust certificates were made last week and on November 21 additional sales amounting to \$4,911,900 were announced. The purchasers were Salomon Bros. & Hutzler and Kidder, Peabody & Company. This makes a total of \$114,250,700 certificates sold to date, but the total amount of the certificates is not sufficient to complete the settlements.

# M. K. & T. Reorganization Plan Announced

Common Stock Without Par Value Contemplated. Fixed Interest Charges Reduced to \$4,917,717

REORGANIZATION managers of the Missouri, Kansas & Texas Railway Company, J. & W. Seligman & Co. and Hallgarten & Co., have completed the definite plan for the reorganization of the property, which has been accepted by directors of the company and the 18 committees representing securities dealt with under the plan. The plan was formally announced on Tuesday. The stockholders' participation in the plan is to be underwritten by a syndicate which Speyer & Co., J. & W. Seligman & Co., Hallgarten & Co., and the Equitable Trust Company have undertaken to organize. The plan is to be declared operative by the reorganization managers when in their judgment a sufficient amount of securities has been deposited.

Preparation of this plan has probably involved dealing with more numerous interests than any reorganization since that of the Southern Railway in 1894. The road consists of 1,553 miles of main line and 1,590 miles of branches, a total of 3,143 miles of road, exclusive of 229 miles used under trackage agreements. It has been in receivership since September, 1915, in which year the old company failed in its efforts to refund \$19,000,000 short term notes, although it had continuously earned its fixed charges. Active plans for reorganization were interrupted by the war and federal control.

## Outstanding Features of Plan

The outstanding features of the plan include the following:

(1) Reduction of the fixed interest bearing debt of the railroad from \$146,543,142 to \$100,320,913, and of the fixed interest charges (including sinking fund payments)

to provide \$18,420,000 new cash for reorganization purposes, of which \$4,042,000 is to be used to pay off receiver's certificates and bank loans, \$1,275,000 to pay deferred interest under the plan, \$1,000,000 to meet next year's equipment trust maturities, \$4,000,000 to provide the new company with a working balance, and \$8,103,000 is reserved for additions and betterments, and the expenses of reorganization.

The financial structure of the old company was such that the reorganization plan has had to deal with the owners of 18 bond and two stock issues. Small issues aggregating \$7,247,951 are left undisturbed. Some idea of what the plan will accomplish toward simplifying and solidifying the road's financial organization may be had from the fact that it reduces 18 bond issues to two, except to the extent that holders of bonds issued under the old first mortgages, which are not foreclosed, do not elect to deposit them under the plan. Except for that contingency, the new prior lien bonds will be substantially a first mortgage on the entire system, including terminals and rolling stock. That is true of few existing railroad mortgages.

## Treatment of Existing Securities

For each \$1,000 of principal of and interest accrued on existing securities, the plan offers new securities and cash as shown in the accompanying table:

Holders of the existing preferred stock, on payment of \$20 a share, of which \$8 is to be paid at time of depositing the old stock, and the remainder in three equal installments at intervals of not less than 30 days, are to receive per share

Existing securities	Maturity	Principal amount outstanding Dec. 31, 1920	Prior lien mortgage bonds, 5 per cent 4 per cent	Prior lien mortgage bonds, 5 per cent	Adj. mortgage bonds, 5 per cent	Preferred stock	Common stock (number of shares)	Cash
MISSOURI, KANSAS & TEXAS RAILWAY CO.:								
First mortgage 4 per cent gold bonds.....	1990	\$39,999,500	\$500	\$500	.....	.....	.....	\$23.33

First and refunding mortgage 5 per cent gold bonds.....	1940	3,000,000	250	.....	812.50	187.50	.....	.....
SOUTHWESTERN COAL & IMPROVEMENT CO.:								
First mortgage 6 per cent trust bonds.....	1929	743,000	500	.....	800.00	.....	.....	.....
BOONVILLE RAILROAD BRIDGE CO.:								
First mortgage 4 per cent gold bonds.....	1951	897,000	.....	1,000	.....	.....	.....	.....

from \$7,429,376 to \$4,917,717. In addition, the new company is to have \$57,500,000 5 per cent convertible adjustment mortgage bonds bearing a contingent interest charge of \$2,875,000, cumulative from January 1, 1925.

(2) Total capitalization of the old company, stocks and bonds, of \$248,095,000 to be replaced by the new company's bonds and preferred stock aggregating \$182,320,000 and 783,155 shares of its common stock without par value.

(3) Assessments of \$20 per share on the \$13,000,000 old preferred and \$25 per share on the \$63,283,257 old common

\$14 in 10 year prior lien mortgage 6 per cent bonds, \$6 in adjustment mortgage 5 per cent bonds, and one share of new common stock.

Holders of existing common stock, on payment of \$25 a share, of which \$10 is to be paid at time of depositing stock and the balance in three equal installments at intervals of not less than 30 days, are to receive per share \$17.50 in 10 year prior lien 6 per cent bonds, \$7.50 in adjustment mortgage 5 per cent bonds, and one share of new common stock.

It will be observed that the plan offers holders of the old

first 4s an increase in their coupon interest rate of one-half of one per cent, besides a 40-year maturity instead of the present 1990 maturity, which together give an additional income yield of over three-quarter per cent. Of this issue \$39,999,500 are outstanding. Five issues aggregating \$12,289,000 of existing bonds receive 100 per cent in fixed interest obligations of the new company. With these exceptions the principal of existing issues is largely scaled down in the new bonds bearing fixed interest.

Deposits of securities for the purpose of participating in the reorganization plan must be made with the various respective depositories named in the plan on or before January 7, 1922. The reorganization managers in their absolute discretion may determine whether or when a sufficient amount of the securities of the various classes shall have been deposited to render it advisable to declare the plan operative.

### Security Issues of New Company

The prior lien mortgage bonds will be limited to \$250,000,000 at any one time outstanding. They may be issued in series with different maturities and rates of interest and with such redemption or conversion features as the directors may determine at time of issue. Bonds presently issuable under this mortgage for reorganization purposes are: Series A, 5 per cent 40-year, redeemable at 105 and interest, \$52,942,752; Series B, 4 per cent 40-year, redeemable at par and interest, \$27,236,000; Series C, 6 per cent 10-year, redeemable at 102½ and interest, \$12,894,570. Additional bonds under this mortgage may be issued to the extent that the additions and betterments made on the system during Federal control may be funded or other settlement made with the Director General. The receiver states the amount of such additions and betterments is in the neighborhood of \$8,000,000. Such additional bonds would presumably be of Series C.

The adjustment mortgage will authorize a total of \$100,000,000 bonds outstanding at any one time. Within a limitation of 7 per cent these bonds may bear such interest rate and have such maturity as the directors shall determine at time of issue of any series, but the interest shall be payable prior to maturity only out of net income of the new company as defined in the accounting rules of the Interstate Commerce Commission, but to the extent of not less than 50 per cent of such income prior to January 1, 1925, and shall be cumulative from and after January 1, 1925.

Presently issuable under the adjustment mortgage are the following: In respect of existing securities dealt with under the plan for settlement of secured claims, or for other reorganization purposes, \$51,973,756; to be offered to stockholders, \$5,526,244. These bonds will be Series A, 5 per cent ranking for interest from January 1, 1922, maturing January 1, 1967, redeemable in whole or in part at par and accrued interest and convertible prior to January 1, 1932, into 7 per cent Series A preferred stock, par for par.

Preferred stock is authorized to the amount of \$200,000,000, of which \$24,500,000 is issuable for reorganization purposes as Series A bearing 7 per cent interest cumulative from and after January 1, 1928, and if allowed by law will be made redeemable in whole or in part at \$110 a share.

Common stock is authorized to the amount of 2,500,000 shares without nominal or par value, of which 20,322 shares are issuable under the plan for exchange of securities or other reorganization purposes and 762,833 shares will be offered to stockholders under the plan.

### Earnings and Condition of the Road

The announcement of the plan contains a reference to a letter to the reorganization managers in which the receiver, C. E. Schaff, calls attention to the fact that during the receivership capital expenditures on the property have

amounted to \$17,550,000 on roadway and structures, and \$11,450,000 on new equipment and improvements to existing equipment, a total of \$29,000,000. In addition, operating expenses have included maintenance charges amounting for the entire period to 41.03 of gross revenues, a ratio considerably higher than for the railroads as a whole, and undoubtedly including recovery of considerable arrears of maintenance from previous years.

Mr. Schaff goes into the nature of these improvements in some detail, and the changes in the condition of the track, revision of grades and alignment and locomotive power are all reflected in the following comparisons of operating efficiency:

	1920	1915	Inc.	Per cent
Average tons per locomotive.....	498	353	145	41.19
Average tons per loaded freight car. 24.35	20.11	4.24	21.08	
Average tons per train inc. co. freight. 504	364	140	38.46	

The announcement of the plan gives also further details of the property as follows:

"The present excellent condition of the system, and the efficiency with which it is being operated is also shown by comparing its transportation ratio with that of other South Western Lines, such as the St. Louis-San Francisco, Missouri Pacific and the Rock Island. The comparative figures are:

	Three Months Ended Sep- tember 30, 1921	Six Months Ended Sep- tember 30, 1921	Twelve Months October, 1920 to September, 1921
M. K. & T. Lines.....	30.65	34.29	37.13
Frisco Lines.....	35.03	38.44	40.08
Missouri Pacific.....	36.25	38.87	41.47
Rock Island Lines.....	36.42	39.37	42.60

"Furthermore it should be noted that the transportation ratio (items resulting from federal operation excluded) for the Katy System for the twelve months ended September 30, 1921, as compared with the twelve months ended September, 1917, only shows an increase of 6.9 per cent, whereas the percentage of increase in the transportation ratios for the same period for the Rock Island Lines is 17.07 per cent; for the Frisco 21.97 per cent, and the Missouri Pacific 29.11 per cent.

"For the fiscal year 1915 the road's gross revenues were \$32,453,462, from which figure they have increased every year until for 1920 (calendar year) they stood at \$72,914,737, an increase in five and a half years of \$40,461,275, or 125 per cent. Much of this gain, of course, is due to higher rates, but the average density of freight traffic has also increased every year from 573,398 ton-miles per mile of road in 1915 to 873,342 in 1920, a gain of 52 per cent.

"Since the resumption of full private operation the road has shown an operating ratio of 80.19 per cent for the year ended August 31, 1921. In the same period the road earned, after deduction of expenses, taxes and rentals, a balance applicable to bond interest of \$9,715,009. This compares with the proposed fixed interest requirements of the new company, as stated above, of \$4,917,717, and with all interest charges, including that on the adjustment mortgage bonds, payable, if earned, of \$7,792,717."

Further details concerning the present status of the Missouri, Kansas & Texas were published in an article by Samuel O. Dunn, editor of the *Railway Age*, entitled "Progress of Missouri, Kansas & Texas Since 1913," which article appeared in two parts in the *Railway Age* of June 10, 1921, page 1321, and June 17, 1921, page 1385.

IN PART the present volume of business reflects merely seasonal production and trade, but when allowance is made for this condition it appears that substantial progress is being made toward normal business activity, which should be realized if the foreign and domestic clouds on the horizon are cleared.—*Guaranty Survey.*

A 2½-ton Truck and 4-ton Trailer

# A Formula Covering Costs of Heavy Motor Trucking

Shows the Superiority of a Time Basis Over Ton-Miles or  
Truck-Miles for Computing Expenses

By Colonel Charles Hine

Late Motor Transport Corps, American Expeditionary Forces, France

**A** MOTOR TRUCK with a cargo capacity of five tons costs about \$5,000 and has a life of about five years. Its expectancy of productive work cannot ordinarily exceed five days a week or 260 days per year, the other days being idle time due to Sundays, holidays, shop work, painting and business shutdowns.

Good business procedure demands the setting up of an amortization account for every capital expenditure. A \$5,000 truck should be amortized on the basis of \$4,600 as the tires, costing about \$400, are expendable and, therefore, chargeable to operation. Depreciation over five years means \$920 per year and the interest charge at 8 per cent is, for each of the five years in succession, \$368, \$294.40, \$220.80, \$147.20, \$73.60; total interest, \$1,104; total principal and interest, \$5,704. For the convenience of a uniform amortization charge it is sufficiently accurate to divide this last total by five years and then by 260 working days which gives \$4.38 as a safe charge for amortization for each working day.

The wise purchaser of a truck will, at once, insure it against theft, fire, accident and liability for damage done to others. Because of heavy claims paid by insurance companies this item is increasing rather than decreasing and may be put at \$416 per year or \$1.60 per working day.

Another charge that begins to run with ownership is that for taxes, including license or registration. This item is also on the increase owing to a public demand that motor trucks contribute a larger share of the cost of highway maintenance. This may be estimated at \$520 per year or \$2.00 per working day.

A garage of some kind, public or private, is essential and, including the washing and inspection of a truck, costs about \$30.00 per month, \$360 per year, or \$1.38 per working day.

Assuming the owner to have only one truck and to be his

own driver a headquarters' office with telephone service, through which orders may be placed and from which business may be solicited, is necessary. For the owner of one truck this may be arranged with some office existing for other purposes by paying the proprietor, or a clerk, to act as truck representative which, including the use of the telephone, will cost about \$45 per month, \$540 per year, or \$2.07 per working day. As the owner expands his business and increases the number of his trucks he will, sooner or later, need an office of his own with expense for rent, light, heat, telephone, furniture, stationery and clerk hire. The continued allocation of \$2.07 per working day per truck should be sufficient for this item.

The owner should allow himself driver's wages which, with overtime, will run about \$35 per week or \$7.00 per working day. A helper, or his equivalent in loaders and unloaders, is needed and will cost \$25 per week or \$5.00 per working day.

The wise owner-driver, on buying his second truck, will cease driving and become a supervisor. As a supervisor he should continue to receive driver's wages and as owner he should also receive owner's profit. This means that each of the two trucks should be charged with a supervision cost equal to one half of driver's wages or \$3.50 per working day. As the trucks expand in number to a fleet more supervisors become necessary as do runabout cars for use in supervision. A continued charge of \$3.50 per truck per working day should cover supervision.

Constant Elements of Cost May Be

Equated in Miles or Mile-Hours

All of the foregoing elements of cost are designated herein as constant elements because they are assumed as functions of

time and as being independent of miles run or tons hauled.

Amortization is allocated by time units rather than by distance units because of the wide variations in commercial mileage and of the still rapid development of a young art. A new truck, well housed and cared for, left standing idle for five years might be nearly as good as new and yet be much depreciated in value because of better trucks then on the market.

Insurance, taxes and garage are manifestly functions of time.

The elements of office, driver, helper, and supervision are allocated by time in the belief that no enterprise can long prosper where skilled and faithful men are ruthlessly laid off whenever business slows down. Society, for its own protection, is demanding that industry be so organized and profits be so adjusted as to insure continuity of employment to a normal number of tried and qualified employees.

These constant elements may, for convenience, in comparison, be equated in miles or mile-hours where warranted by sufficiently constant and uniform mileage performance.

### Variable Elements of Cost May

#### Be Equated in Days or Hours

The five remaining elements of operating cost—cargo insurance, fuel, lubrication, tires, and repairs—are designated herein as variable elements because they are assumed as functions of cargo and distance.

Cargo insurance, because of large claims paid by insurance companies, is increasing in rate. In some cases the rate is said to be nearly prohibitive. This element is the most difficult to estimate and is assumed at \$4.57 per working day.

Fuel consumption varies with highway, trucks, cargoes, repairs and drivers. It runs from 4 mi. to 7 mi. per gal. of gasoline at a cost of from 4 cents to 7 cents per mi., 6 cents per mi. being a safe normal.

Lubrication requires a gallon of oil costing about 80 cents for every 150 mi., which with some special lubricants gives a normal cost of something like 1/2 cent a mile.

Tires cost from \$400 to \$600 a set with varying guarantees by manufacturers as to mileage. Five cents a mile may be assumed as a safe normal.

Repairs, including a periodic overhaul, are found by experience to be about 2 cents a mile. In congested city districts, with many sharp turns and much stopping and starting, it may be found that repair cost increases relatively faster than mileage and varies with time rather than distance.

These five variable elements may, for convenience in comparison, be equated in days or hours where warranted by sufficiently constant and uniform time performance.

Intraurban trucks often make only 20 mi. or less per working day and often handle only 20 tons of cargo. Interurban and suburban trucks seldom exceed 100 mi. per day.

A trip of about 50 mi. and return, or a total of 100 mi., is normally the limit which can be undertaken and permit return to the home garage the same working day. Longer trips usually necessitate an allowance for garage en route and for meals, if not also lodging, for driver and helper. Traffic is seldom balanced in direction. A 5-ton truck is lucky to handle 8 tons in a trip of 50 mi. and return.

From these practical assumptions there is derived the table designated herein as a typical formula. It is intended as a rough guide in estimating costs of heavy motor trucking. Based on high, rather than on low, figures of cost it is offered as a safe maximum. Application in a given case with known and actual values substituted for the assumed values will perhaps show the total cost as 10 per cent to 25 per cent lower than the total of the typical formula.

TYPICAL FORMULA COVERING COSTS OF HEAVY MOTOR TRUCKING			
Conditions. \$5,000 Truck, 5 Tons, 5 Years, 5-Day Week, 260 Working-Days, 9-Hour Day			
	Dollars per working day (9 hours)	Cents per truck mile, 100 mi.-day (8 tons)	Cents per truck mile, 20 mi.-day (20 tons)
Amortization	4.38	4.38	21.90
Insurance	1.60	1.60	8.
Taxes	2.	2.	10.
Garage	1.38	1.38	6.90
Office	2.07	2.07	10.35
Driver	7.	7.	35.
Helper	5.	5.	25.
Supervision	3.50	3.50	17.50
Cargo insurance	4.57	4.57	22.85
Fuel	6.	6.	6.
Lubrication	0.50	0.50	0.50
Tires	5.	5.	5.
Repairs	2.	2.	2.
Total	45.	45.	171.
Per hour	5.	11.25	34.20
Per ton-mile	...	...	...

It is apparent that it is better for a truckman to base his costs on days than on miles. Neither the ton-mile nor the truck-mile is a safe unit for a truckman. As compared with a railway his tons and his miles are relatively too few to absorb the wide fluctuations in individual cargoes and hauls.

It is further apparent that any device like a demountable body or other form of unit container which reduces the standing time of truck must increase tonnage handled per truck per day, and therefore reduce the cost per ton.

Ten-Wheel Passenger Locomotive for Huntingdon & Broad Top Mountain

Two of these locomotives have lately been delivered by the Baldwin Locomotive Works. They are designed to make a 52-mile run on a road with 13-deg. curves and 1.86 per cent grades in two hours, making 20 intermediate stops. The locomotives weigh 175,000 lb., of which 132,000 lb. are on the drivers, have a tractive effort of 28,000 lb., cylinders 21 in. by 26 in., 66 in. drivers, boiler pressure 190 lb., evaporative heating surface 1,987 sq. ft., superheating surface 489 sq. ft. and grate area 42.5 sq. ft.

# Henry Ford Is Right—and Wrong\*

## Principal Change Made on D., T. & I. Is Increase in Earnings Derived from Motor Traffic

By Walker D. Hines

Former Director General of Railroads

**H**ENRY FORD'S attitude on railroad problems, as set forth in the November Nation's Business, appeals strongly to the American people. His face is turned towards the future, and he confidently proposes reforms which are in the public interest. But the beguiling charm of his genius makes it all the more important to weigh with care his criticisms and proposals.

At present we have the results of only six months of Mr. Ford's management of the D., T. & I., the months of March to August of the present year. It is impossible to formulate with certainty conclusions of controlling value from the six months' operation of any railroad, but as to Mr. Ford's railroad, the one thing about which we can be certain is that his small railroad has become an adjunct to his big motor plants, and that this has completely changed the railroad's earning capacity and has put it in a class entirely apart from railroads in general in this country.

### What Ford Ownership Meant

A favorable earning capacity for a railroad depends, of course, on its costs, but even before that it depends on an adequate volume of business that pays a satisfactory revenue and admits of being handled under favorable operating conditions. It is in these respects that Mr. Ford has wrought the one certain metamorphosis in the character of the D., T. & I., and he has done it simply because he has turned over to it the great and steady traffic to and from his factories. In addition to a large inbound movement, his plants give the D., T. & I. probably more than 5,000 cars of high-class outbound traffic per month—a traffic that earns an unusually good revenue and that has the rare advantage of being received, handled and delivered, in solid trainload lots, so as to minimize the heavy costs of terminal handling and so as to get the maximum service out of the train—and all this over the northern part of the railroad, which is understood to have the best operating conditions.

Mr. Ford denies that this change is important, because he says the railroad had an even greater tonnage in the past. But he strangely overlooks the fact that the tonnage in the past earned a much smaller rate and could not be handled from origin to destination on the Detroit, Toledo and Ironton in solid trainload lots.

In the past the traffic of the D., T. & I. has appeared to be peculiarly lacking in all good points, but overnight it finds itself blessed with a large additional traffic of extraordinary desirability which more than offsets the diminution in tonnage which the D., T. & I. has suffered during the present long and serious slump in business.

By purchasing this railroad Mr. Ford has done what was the equivalent of bringing practically every competing railroad system in the country to the door of his factory, and that is an advantage which no competing manufacturing plant enjoys. What he can do through this means in getting for his railroad increased divisions of through rates remains yet to be ascertained, because it is not at present known, but the impression prevails that he has secured increased divisions. A shipper who does not own a railroad must pay the published tariff rate which is known to his competitors, and he cannot lawfully get any concession from the carriers.

But when he owns his own railroad he can get in the shape of an increase in the division received by his railroad out of the through rate a concession which is not published in the tariffs or reported, unless in exceptional cases, to the Interstate Commerce Commission. Certainly there is a tremendous inducement for especially large divisions when the shipper can offer to a large number of competing railroads the tempting bait of high-class traffic in trainload lots.

There are probably other advantages for his railroad growing out of his position as a shipper. For example, it would be strange if Mr. Ford could not force his connections to take his desirable traffic at such hours in the day or night as to save his railroad (and as to put on the connecting railroad) the succeeding day's rental or per diem of \$1 per day per freight car. Likewise he is apparently able to force his connection to supply special service by accepting traffic from his road within a few minutes after they receive it.

The fact that under such circumstances the railroad has turned long-standing adversity into a certain measure of prosperity is the most natural thing in the world, and in itself proves nothing whatever for the Ford railroad policies, which are too new to admit of measuring their economic value—and indeed some of the most important and interesting of these policies did not become effective until the very end of the six-months period and even now some of them are still entirely in the realm of discussion.

Mr. Ford states that he has speeded up the movement of traffic on his railroad and that other railroads should do likewise. This brings into interesting relief the fundamental difference between the railroads in general and the D., T. & I. in its new role of Ford plant facility.

The great element in the slow movement of freight traffic is the time consumed in the terminals. It is highly important to reduce terminal work and to cut out delay in the terminals. The United States Railroad Administration gave special attention to this subject and found the most cordial attitude on the part of railroad officers generally to its efforts in this direction. It inaugurated in September, 1919, special local terminal committees, with representation of the shippers as well as of the railroads, and sought to put into effect all practical suggestions looking to the elimination of factors leading to delay or unnecessary work. Similar efforts have been continued since the resumption of private control.

### Better Ideas Welcome

Every additional impetus of improvement is to be welcomed, whether through consolidation of terminals or terminal handling, movement of trains without breaking them up at intermediate terminals, increased promptness in effecting deliveries between connecting railroads, elimination of delays as, for example, delays in loading or unloading, or on account of billing or because of slowness in repairing cars developing defects in transit. Any new thoughts which Mr. Ford can originate and justify will be gladly seized upon by the railroad fraternity, in my opinion. But apparently the principal way in which he copes with the terminal problem is to put the terminal burdens on his connections by requiring them to take the traffic off his tracks within 20 minutes. What happens after that is not his problem, but theirs. They are no doubt willing to do this as a special

\*Abstract of article in Nation's Business for November, 1921.

service in his particular case in order to get his traffic (and to maintain, if necessary, special terminal crews for this purpose), but it does not follow that they can do the same thing in all cases.

Mr. Ford also says that he has been able to speed up the delivery of the traffic from his factories by from 7 to 14 days. He says this enables him to reduce his working capital by about \$30,000,000.

It is clear he does not mean that he has reduced the time of movement over his own railroad by from 7 to 14 days. In fact, this traffic does not move on his own railroad except for a short distance in most cases—say from 70 to 100 miles. What he must mean is that he demands of his connections as the price of giving them his traffic that they speed up the delivery to final destination. Here again his connections may be willing to do this in order to get his traffic, but it does not follow that they can do the same thing for all of Mr. Ford's competitors or for the general public, and the question again arises whether the railroads may not at times be forced to delay other traffic in order to give Mr. Ford the special fast movement which he demands and which his special position enables him to obtain. It is clear that Mr. Ford's railroad does not supply the ideal field for experiment as to fast train movement, because the haul on his railroad is too short and his traffic is too special in character to present the problems which exist on the railroads generally.

#### Where Did the Speeding Up Occur?

If we were to judge by the average car miles per day, we would have some question as to whether he has made sustained progress in speeding up the handling of the traffic over his own line. These averages for the last six months, March to August of this year and last year, were as follows:

Month	1920	1921	Month	1920	1921
March	20.5	27.8	June	10.9	25.1
April	9.6	26.3	July	18.5	21.6
May	10.7	27.3	August	26.9	20.7

It is fair to say, however, that this average of car miles per car per day is by no means conclusive of the speed obtained in the movement of cars actually handling traffic, because the average is based on all the cars which happen to be on the railroad at the time, including surplus cars. Thus in the time of a slump in business such an average goes down, and in time of heavy business the average goes up, regardless of the actual speed of the cars containing loads.

However, despite the unique situation of the D. T. & I. at the present time, it is to be confidently expected that Mr. Ford will make numerous improvements in operation which can be followed to advantage on the railroads generally. The promotion of contentment, and consequently of increased efficiency on the part of the employees, the elimination of unnecessary employees (including lawyers), the resort to more direct action and the cutting out of lost motion in the settlement of claims, the getting rid of obsolete or needless reports and statistics, the development of the standing and authority of the local station agents, are all things which are pre-eminently desirable, and it is to be earnestly hoped that Mr. Ford can throw new light on how to accomplish them.

It must be again emphasized that it is yet too early to know what economies Mr. Ford can achieve even with all those advantages which put his railroad in a class entirely apart from the railroads in general. The results of operation for the six months, March to August, 1921, do not indicate a steady upward trend in his net. The figures are as follows:

	Operating revenue	Operating expenses	Operating income
March	\$439,052	\$352,970	\$76,252
April	697,491	395,816	291,905
May	744,406	422,328	311,302
June	713,527	376,383	327,003
July	744,498	444,794	285,329
August	763,840	548,246	197,234

These figures, in connection with those above given for the months of March to July, emphasize anew that the prin-

cipal factor in the net is the greatly increased gross, notwithstanding a smaller tonnage.

The country will certainly be the gainer if Mr. Ford can design lighter locomotives which will do the same work as the existing heavy locomotives, and if he can design lighter freight cars which will do the same work as the existing freight cars and which will be strong enough to be hauled and switched (as they would have to be) in the same trains and cuts of cars with the existing heavy equipment throughout the country, on all sorts of grades and curves and under all sorts of conditions.

It is not clear what Mr. Ford means by eliminating the unproductive stockholder. I cannot imagine he means that existing stock should be confiscated. If he means that for the future stock should not be issued except for appropriate value which has been or is to be put into the property, that seems to be assured by the Transportation Act. If he means that it is desirable to encourage the ownership of stock by employees and by people who live in the communities through which the railroads run, that certainly is an ideal which I believe the public and railroad people would like to see realized. The closer we can get to a condition where the people who use and work on the railroads themselves own the railroads and help to finance them, the better it will be for the country. If Mr. Ford can develop some new methods of accomplishing this result, he will certainly render an important service by doing so. It is seriously questionable, however, whether this movement ought to be carried to the extent of promoting the control of common carriers by large industrial enterprises.

While speaking of the promotion of the ownership of railroad stock and the financing of railroad necessities by the railroad employees and the people living in the communities along the railroads, I would like to suggest that in order to accomplish such an object it is most important that the government avoid making frequent and hasty changes in its railroad policy.

#### "Contrary to the Public Interest"

For example, it would be a detrimental move if the government in this difficult and transitional period should repeal the authority the Interstate Commerce Commission possesses for the protection of the interstate situation over intrastate rates, or should repeal the duty of the commission to fix rates sufficient, within practicable limits, to pay a fair return on railroad property. Through such repeals the chance of securing more widespread popular ownership of railroad securities and greater participation by the general public in railroad financing would be rendered much more remote, and the necessity for restoring at high cost to highly specialized financial experts for assistance in railroad financing would become greater than ever.

In conclusion I wish to express my personal opinion that it is contrary to the public interest for a large shipper like Mr. Ford to own and operate a railroad by means of which he has a powerful leverage for obtaining special consideration from the common carriers of the country. But as long as this is permitted by law, we can at least congratulate ourselves that the present combination is in the hands of a genius who is willing to turn his railroad into a laboratory for the making of the experiments and I shall be surprised if some of the experiments do not turn out to be valuable from the standpoint of railroad companies in general.

Surely with his remarkable record in economical production and with his extraordinary personality he can impress his spirit and his methods upon 450 miles of railroad with about 2,000 employees so as to obtain substantial economies. Some of them should be practical examples for the 250,000 miles of railroad with their 2,000,000 employees, but their problems are by no means as simple and they cannot enjoy the unique advantages which the Ford railroad enjoys.

deg.  $90^{\circ}$  between adjoining track centers. The distance from the center of the turntable to the line of the smoke jacks is 119 feet 6 inches. A full complement of modern wheel pits has been provided, the construction including a driver drop pit, an engine truck pit and a tender truck pit.

The two rear corners of the building have been utilized for the boiler and engine room layout and the machine shop and blacksmith shop. In the former case a room 42 feet 11 inches by 40 feet houses three locomotive-type boilers and a washout plant. Coal is supplied by a hopper track and trestle at the rear which discharges into a large concrete hopper directly adjacent to the boiler room. The pump or engine room adjoining this contains the water pumps, air compressors and electric generator for lighting current. The other corner contains an irregularly-shaped machine shop fully equipped with the latest type machinery necessary for making running repairs. Its maximum dimensions are approximately 74 feet by 40 feet. Other facilities include a locomotive foreman's office, an engineer's registering office, a general office, a locomotive supply room, an arch brick room, tool rooms and a modern lavatory and wash room, all within the walls of the building.

Ample ventilation and light are provided by the sash windows in the three monitors and by the numerous large windows in the side walls. The generator mentioned furnishes current for electric lights. Heating is provided by steam coils on the side walls and in the engine pits.

The Hornepayne enginehouse and terminal layout were constructed by the Canadian National's own forces, the design and construction being carried out under the supervision of George C. Briggs, then architect of the eastern lines and now architect of the western lines, to whom we are indebted for the information contained in this article.

## Freight Car Loading

THE NUMBER of cars loaded with revenue freight during the week ended November 12 shows another large drop, according to the weekly report of the Car Service Division of the American Railway Association, due largely to

Legend: Complete circle represents total loaded. Sectors of circle represent proportion of commodity indicated to total.

## Revenue Freight Loaded, Cumulative—January 1 to November 5

NOTE: In considering the trend of beehive coke production it should be borne in mind that the decrease in 1921 reflects not only the decreased demand, due to the depressed state of the iron and steel industry, but also the decrease of beehive coke oven operation of the last ten years, due to the rapid increase in the by-product coke ovens during the war period and since.

Cumulative Production of Coal—Tons, January 1, to November 5

the effect of the Armistice Day holiday and election day in several states. The total was 753,046, as compared with 829,722 the week before, 927,586 in the corresponding week of 1920 and 808,304 in 1919. There were decreases as compared with the preceding week in the loading of all classes of commodities except livestock, which increased from 31,126 to 34,269. There was also a large increase in the freight car surplus during the period from November 8 to 15 to 140,189, as compared with about 93,000 the week before. Of the total surplus 51,527 were box cars and 56,086 were coal cars.

## Sprague Train Control to be Tested On New York Central

A CONTRACT HAS this week been signed between the New York Central Railroad Company and the Sprague Safety Control and Signal Corporation for an intensive test of the latter's system of auxiliary train control on a section of main-line southbound express track No. 2 between Ossining and Tarrytown on the electric division.

This contract is the result of negotiations initiated last February by the Joint Committee on Automatic Train Control of the Bureau of Safety of the Interstate Commerce Commission and the American Railway Association, at which time President A. H. Smith, in response to a suggestion by the Joint Committee consented to a test of the system under suitable conditions provided details could be arranged to mutual satisfaction.

This proposal came at a time when the late Public Service Commission (Second District) of New York, had under consideration a proposal to inaugurate tests of a somewhat different character, and was the result of a decision by the joint committee, acting in view of the new conditions created by the mandatory power given to the Interstate Commerce Commission in the Transportation Act, 1920, to test a limited number of devices or systems.

Following the affirmative response of President Smith, the engineering representatives of the Interstate Commerce Commission, the American Railway Association, the New York Central and the Sprague Corporation held a number of meetings to determine the location, extent and character of the tests; and from the locations considered that on the main track between Signal 3002 at Ossining ("PF") and Signal 2652 at Tarrytown ("OW")  $3\frac{1}{2}$  miles, was selected for the installation of track apparatus.

The test determined upon is exceptional, in that instead of a number of equipments being mixed in with the regular traffic and normally subjected to only occasional operation, the experimenters will have a section of track all to themselves. A large number of tests covering every variety of operating conditions will be carried out, practically continuously, for several months, on a reserved section of main track where the highest speed is permissible, and where the equip-

ment can be subjected to a combination of adverse conditions.

While the details of the equipment have not been made public, it is understood that the system, which is of the intermittent magnetic impulse type, embraces in its track elements a series of brake application and differential brake determining magnets fixed in each block well below the heads of the running rails. From these magnets, under the control of the signals and hence of the traffic conditions, momentary magnetic impulses are transmitted to sensitive receivers on the locomotive to initiate primary and secondary brakings. The braking can be either service or emergency, and of varying degrees; under speed control, and with or without enforced stops.

The location selected and the methods prescribed for the tests will afford a critical test of the possibilities of automatic train control. Being in the electric division the running rails are used for power as well as for signal currents, and the track elements will be subject to whatever possible interference there may be, not alone from the direct current flowing in the running and third rails, but from any alternating currents used in the signal installation.

Over these tracks will operate not only the steam locomotive under test but likewise heavy electric locomotives and multiple unit electric trains, thus subjecting the track magnets to a variety of extraneous influences. Upon the present normal-clear alternating-current automatic block signal system will be superimposed a direct current "normal danger" track magnet system, the current for which will be derived from the alternating current transmission circuits.

The track on which the tests are to be conducted will normally be kept entirely free from all other traffic for eight hours a day, from 9 a. m. to 5 p. m., for not less than five days a week, during which time all traffic will be handled on the remaining tracks, this arrangement being, of course, subject to emergency traffic conditions. The setting aside of a section of main line track on a railroad of the first class, in its busiest zone, for several hours a day and for several months, and the tuning up of this track so that speeds as high as 70 miles an hour can be made during the tests, was so radical a departure that the contract was only finally concluded after it had been passed upon by the board of directors of the railroad company; an augury of the serious character of the tests to be undertaken. Preparations for the test have been under way for some time, and it is expected that operations can be begun early in January.

## Report on Gould (Ohio) Collision

**I**N A REAR COLLISION of westbound trains on the Pennsylvania Railroad in tunnel No. 5, at Gould, Ohio, seven miles west of Steubenville, on September 25, one engineer and one conductor were killed; six mail clerks and three trainmen were injured, and the road was blocked 28 hours. This collision was due to a false indication of a semi-automatic block signal, this false indication having been due to a ground in one of the wires controlling it. The Interstate Commerce Commission has issued a report, dated October 19, and signed by W. P. Borland, Chief of the Bureau of Safety, giving this as the cause, and detailing the surroundings and the circumstances.

The situation of the signals, as related to the tunnel, is indicated in the sketch below, in which WP indicates the western portal of the tunnel and EP the eastern portal. The signal stations between which the collision occurred are SX on the east and NA on the west, and the signal at fault was No. 13. The signalman at NA should have put the lever of this signal in the normal (stop) position after the passing of the leading train, and thereby he would have averted the collision; but he followed his usual practice of waiting until after the train should pass signal 16 (near his cabin, as

indicated in the sketch) before restoring the lever to the normal position.

NA	16	WP	EP	13	SX
----	----	----	----	----	----

The tunnel is 3,320 ft. long, and its eastern end is a half mile west of Gould station. Signal cabin NA is 1,350 ft. west of the western portal of the tunnel, and signal 13 is 2,275 ft. east of the eastern portal.

The leading train was a freight, extra 7468, consisting of locomotive, 32 cars and caboose. It passed SX at 11:01 a. m. and was moving, in the tunnel, at about seven miles an hour when it was struck, the grade in the tunnel being ascending at about 75 per cent.

The following train was No. 11, consisting of seven mail cars and one combination car (no passengers) hauled by two locomotives. It passed SX at 11:07 a. m., six minutes late, and collided with the freight at about 30 miles an hour, wrecking the caboose and seven cars of the freight train. The ventilating fan of the tunnel was not in operation, the power having been cut off to allow linemen to work on the wires, and there was considerable smoke in the tunnel. The marker lights on the caboose of the freight were not burning; but it is stated that probably they would have been invisible.

The testimony concerning the position of the arm of signal 13 would indicate that the abnormal condition was intermittent; but there is no doubt that it was in the 45-degree position for train No. 11, giving that train right to proceed expecting to be stopped at signal No. 16.

The report contains a diagram showing the signal circuits as far east as Mingo Junction. The false closing of the relay controlling signal 13 was dependent in part on the position of circuit closers on signals and signal levers at SX, which is more than two miles east of signal 13. As the circuit breakers changed position according to whether the signal (or the lever) was in the normal position or otherwise, the effect on signal 13 was intermittent.

About six minutes ahead of the freight train, westbound train No. 1219 had passed, and the operator at NA noticed that the repeater in his cabin moved from horizontal to clear while the train was in the tunnel. This had happened before, so he supposed that the instrument was out of order and sent for a repairman. On the approach of freight 7468 the repeater again seemed to be in normal working condition; but after about five minutes it again assumed the clear position wrongfully, the freight being still in the tunnel. The operator thought the trouble was with the repeater instead of the signal and it did not occur to him that he ought to restore the lever to its normal position and thus hold signal position of circuit closers on signals and signal levers at SX, 13 in the stop position. The interlocking at NA is inspected weekly, and the relays, electric locks, etc., are subject to an additional inspection monthly. The wiring at the cabin had been tested for resistance within two weeks.

Tests made by the road's signal department on the afternoon of the accident showed faulty conditions (grounds) in electric wires at five places, one of which was not located.

There was a severe electric storm at about 2 a. m. on the date of the accident and the assistant supervisor of signals thought it possible that some of the faults were due to lightning, the only protection against lightning provided in these circuits being pin-point arresters across the relay coils.

The conclusion of the report is not clear as to how far this view is accepted by the inspector, the report saying that "if these grounds existed for any considerable period of time prior to the accident, they should have been discovered by careful inspection and test, and corrected."

Rule 99 requires that when a train is liable to be overtaken by another train, the flagman must throw off lighted fuses at proper intervals; and the report says that if, when the freight reduced its speed in the tunnel, a fusee had been thrown off "it is believed that it would have provided a material safeguard."

# Hearings on Bills to Repeal Rate Making Rule

## Witnesses for Railroads and Security Owners' Association Oppose Efforts to Repeal Percentage Rule

WASHINGTON, D. C.

REPRESENTATIVES of the National Association of Owners of Railroad Securities have alternated with those of the Association of Railway Executives during the past week in testifying before the Senate committee on interstate commerce in defense of the rate-making provisions of the transportation act which have been under attack by the state railroad commissioners and by Clifford Thorne and S. H. Cowan, representing western grain and livestock shippers. Only a few senators have attended the hearing.

Edgar E. Clark, until recently chairman of the Interstate Commerce Commission, appeared as one of the witnesses for the Security Owners' Association on November 19 and strongly urged that the rate-making provisions of the act be given a fair trial. He also replied to some of the criticisms of the commission and of the law made by the previous witnesses who had demanded their repeal. "The act is a great big constructive piece of legislation," Mr. Clark said, "enacted by Congress in a broad spirit and a desire to be helpful. Insofar as it has had an opportunity to be tested it has been helpful. It has done no one any real harm and any fear of danger from it is apprehension as to what some one may do or say under it. This law is right, and deserves a fair trial. If it has been misconstrued there is a remedy for it, and that question is now before the Supreme Court."

### Edgar E. Clark's Testimony

"I want to make it clear, to begin with," said Mr. Clark, "that in requesting me to appear, Mr. Warfield has made no suggestion whatever as to what position I should take; he simply asked me to come here and say what I think.

"It is doubtful if any single piece of legislation has been the subject of more comprehensive, patient and exhaustive hearings by the committees of both houses of Congress or of more exhaustive analysis by the conferees, than this transportation act. It is a piece of constructive legislation. Two provisions of it are under attack here, as to which I have been asked to express my views. One is the so-called rule for rate-making, the other is the power of the Interstate Commerce Commission to remove discrimination against interstate commerce."

Mr. Clark gave an outline of the history of rate-making from 1887, when the government decided on the policy of regulation, down to the present time, and showed that prior to the passage of the transportation act the commission lacked power as an administrative tribunal to secure results such as can be accomplished under the transportation act. Turning to the rule of rate-making, he said: "The Constitution of the United States has never guaranteed any capital invested in a public utility, any particular percentage of return, or in fact any return whatever. But it has said and does say that the owners of that utility shall not be deprived of the opportunity to earn a fair return upon the value of the property which they devote to the public use. We have a long and unbroken line of decisions of the highest courts in the country that that is the law of the Constitution . . . The rule for rate making which is here under attack, is only a statutory declaration of that constitutional provision . . . Congress was, I think, very cautious and very conservative in determining what should be taken as a reasonable return on the value of the property for the two-year period succeeding the enactment of the law. It is significant that while fixing that return of 5½ per cent, with an additional authority upon the commission to increase it to 6 per cent, in the same act the Congress provided that the carriers should pay to the

government 6 per cent interest on money loaned by the government to the carriers, and should pay 6 per cent on the indebtedness of the carriers to the government which accrued during the period of government control."

Mr. Clark called attention to the fact that prior to the enactment of this law the association of security owners was anxious that Congress should declare a policy, as a rule of law to be followed by the Interstate Commerce Commission, and to control the commission in the performance of its administrative duties. "That rule of policy," said Mr. Clark, "laid down by the Congress, is in exact accord with a long line of decisions of the highest courts of the land, and in harmony with a long line of proceedings, with which the Congress was, of course, familiar."

Referring to the effort on the part of those criticising the act to repeal the principle of making rates based on the grouping of carriers, Mr. Clark asserted that this grouping had not only been established for years by the actual practice of the commission in the past in various cases, but was desirable as a general policy if Congress desired to sustain the agencies of transportation as a whole.

"The outstanding, fundamental purposes of Congress in enacting this legislation, as I see it," asserted Mr. Clark, "is that the public welfare should be paramount over all other considerations and so in the action of the commission that I have just discussed and in its other action the commission has, as directed by Congress, given special consideration to the necessities of the welfare of the commerce of the country, and of the public."

### Roads Await Normal Business

With reference to the attitude of the security owners Mr. Clark said: "Now, as I have come in contact with the members of this association of security owners, I have been impressed with their conservative views. They realize that even with that rate-making provision in the act, there is no possibility of the railroads getting that measure of return until the railroads of the country, and the business of the country, have adjusted themselves so that that can be done under reasonable rates."

Senator Poindexter asked Mr. Clark: "What justification is there, Mr. Clark, for the assertion that the present conditions are the result of that provision as to guaranty?"

Mr. Clark: "Absolutely none."

Senator Poindexter: "That has been asserted throughout the country, that there is this provision as to guaranty of a profit to this particular industry, while others do not have it."

Mr. Clark: "When that statement is made, Senator, I regard it as being made in the absence of a knowledge of the facts, or with the purpose to misrepresent the facts. That it is not a guaranty is evidenced by the phraseology of the act itself, to start with; and by the interpretation that has been placed upon the act by the commission and by the railroad owners."

Denying specifically that the transportation act required the making of any rate which is unreasonable in fact, Mr. Clark quoted qualifying provisions and asserted that those fully repudiate the suggestion that the act contemplated the increase of rates without reasonable reference to the movement of traffic under them and asserted that in no instance are the shippers required, because of anything in the act, to pay an unreasonable rate, either individually or as a whole.

The other point covered by Mr. Clark related to the proposal to deprive the Interstate Commerce Commission of

ment can be subjected to a combination of adverse conditions.

While the details of the equipment have not been made public, it is understood that the system, which is of the intermittent magnetic impulse type, embraces in its track elements a series of brake application and differential brake determining magnets fixed in each block well below the heads of the running rails. From these magnets, under the control of the signals and hence of the traffic conditions, momentary magnetic impulses are transmitted to sensitive receivers on the locomotive to initiate primary and secondary brakings. The braking can be either service or emergency, and of varying degrees; under speed control, and with or without enforced stops.

The location selected and the methods prescribed for the tests will afford a critical test of the possibilities of automatic train control. Being in the electric division the running rails are used for power as well as for signal currents, and the track elements will be subject to whatever possible interference there may be, not alone from the direct current flowing in the running and third rails, but from any alternating currents used in the signal installation.

Over these tracks will operate not only the steam locomotive under test but likewise heavy electric locomotives and multiple unit electric trains, thus subjecting the track magnets to a variety of extraneous influences. Upon the present normal-clear alternating-current automatic block signal system will be superimposed a direct current "normal danger" track magnet system, the current for which will be derived from the alternating current transmission circuits.

The track on which the tests are to be conducted will normally be kept entirely free from all other traffic for eight hours a day, from 9 a. m. to 5 p. m., for not less than five days a week, during which time all traffic will be handled on the remaining tracks, this arrangement being, of course, subject to emergency traffic conditions. The setting aside of a section of main line track on a railroad of the first class, in its busiest zone, for several hours a day and for several months, and the tuning up of this track so that speeds as high as 70 miles an hour can be made during the tests, was so radical a departure that the contract was only finally concluded after it had been passed upon by the board of directors of the railroad company; an augury of the serious character of the tests to be undertaken. Preparations for the test have been under way for some time, and it is expected that operations can be begun early in January.

## Report on Gould (Ohio) Collision

**I**N A REAR COLLISION of westbound trains on the Pennsylvania Railroad in tunnel No. 5, at Gould, Ohio, seven miles west of Steubenville, on September 25, one engineer and one conductor were killed; six mail clerks and three trainmen were injured, and the road was blocked 28 hours. This collision was due to a false indication of a semi-automatic block signal, this false indication having been due to a ground in one of the wires controlling it. The Interstate Commerce Commission has issued a report, dated October 19, and signed by W. P. Borland, Chief of the Bureau of Safety, giving this as the cause, and detailing the surroundings and the circumstances.

The situation of the signals, as related to the tunnel, is indicated in the sketch below, in which WP indicates the western portal of the tunnel and EP the eastern portal. The signal stations between which the collision occurred are SX on the east and NA on the west, and the signal at fault was No. 13. The signalman at NA should have put the lever of this signal in the normal (stop) position after the passing of the leading train, and thereby he would have averted the collision; but he followed his usual practice of waiting until after the train should pass signal 16 (near his cabin, as

indicated in the sketch) before restoring the lever to the normal position.

NA	16	WP	EP	13	SX
<p>The tunnel is 3,320 ft. long and its eastern end is a half mile west of Gould station. Signal cabin NA is 1,350 ft. west of the western portal of the tunnel, and signal 13 is 2,275 ft. east of the eastern portal.</p>					

The leading train was a freight, extra 7468, consisting of locomotive, 32 cars and caboose. It passed SX at 11:01 a. m. and was moving, in the tunnel, at about seven miles an hour when it was struck, the grade in the tunnel being ascending at about 75 per cent.

The following train was No. 11, consisting of seven mail cars and one combination car (no passengers) hauled by two locomotives. It passed SX at 11:07 a. m., six minutes late, and collided with the freight at about 30 miles an hour, wrecking the caboose and seven cars of the freight train. The ventilating fan of the tunnel was not in operation, the power having been cut off to allow linemen to work on the wires, and there was considerable smoke in the tunnel. The marker lights on the caboose of the freight were not burning; but it is stated that probably they would have been invisible.

The testimony concerning the position of the arm of signal 13 would indicate that the abnormal condition was intermittent; but there is no doubt that it was in the 45-degree position for train No. 11, giving that train right to proceed expecting to be stopped at signal No. 16.

The report contains a diagram showing the signal circuits as far east as Mingo Junction. The false closing of the relay controlling signal 13 was dependent in part on the position of circuit closers on signals and signal levers at SX, which is more than two miles east of signal 13. As the circuit breakers changed position according to whether the signal (or the lever) was in the normal position or otherwise, the effect on signal 13 was intermittent.

About six minutes ahead of the freight train, westbound train No. 1219 had passed, and the operator at NA noticed that the repeater in his cabin moved from horizontal to clear while the train was in the tunnel. This had happened before, so he supposed that the instrument was out of order and sent for a repairman. On the approach of freight 7468 the repeater again seemed to be in normal working condition; but after about five minutes it again assumed the clear position wrongfully, the freight being still in the tunnel. The operator thought the trouble was with the repeater instead of the signal and it did not occur to him that he ought to restore the lever to its normal position and thus hold signal position of circuit closers on signals and signal levers at SX, 13 in the stop position. The interlocking at NA is inspected weekly, and the relays, electric locks, etc., are subject to an additional inspection monthly. The wiring at the cabin had been tested for resistance within two weeks.

Tests made by the road's signal department on the afternoon of the accident showed faulty conditions (grounds) in electric wires at five places, one of which was not located.

There was a severe electric storm at about 2 a. m. on the date of the accident and the assistant supervisor of signals thought it possible that some of the faults were due to lightning, the only protection against lightning provided in these circuits being pin-point arresters across the relay coils.

The conclusion of the report is not clear as to how far this view is accepted by the inspector, the report saying that "if these grounds existed for any considerable period of time prior to the accident, they should have been discovered by careful inspection and test, and corrected."

Rule 99 requires that when a train is liable to be overtaken by another train, the flagman must throw off lighted fuses at proper intervals; and the report says that if, when the freight reduced its speed in the tunnel, a fusee had been thrown off "it is believed that it would have provided a material safeguard."

# Hearings on Bills to Repeal Rate Making Rule

## Witnesses for Railroads and Security Owners' Association Oppose Efforts to Repeal Percentage Rule

WASH. NEWS, D. C.

REPRESENTATIVES of the National Association of Owners of Railroad Securities have alternated with those of the Association of Railway Executives during the past week in testifying before the Senate committee on interstate commerce in defense of the rate-making provisions of the transportation act which have been under attack by the state railroad commissioners and by Clifford Thorne and S. H. Cowan, representing western grain and livestock shippers. Only a few senators have attended the hearing.

Edgar E. Clark, until recently chairman of the Interstate Commerce Commission, appeared as one of the witnesses for the Security Owners' Association on November 19 and strongly urged that the rate-making provisions of the act be given a fair trial. He also replied to some of the criticisms of the commission and of the law made by the previous witnesses who had demanded their repeal. "The act is a great big constructive piece of legislation," Mr. Clark said, "enacted by Congress in a broad spirit and a desire to be helpful. Insofar as it has had an opportunity to be tested it has been helpful. It has done no one any real harm and any fear of danger from it is apprehension as to what some one may do or say under it. This law is right, and deserves a fair trial. If it has been misconstrued there is a remedy for it, and that question is now before the Supreme Court."

### Edgar E. Clark's Testimony

"I want to make it clear, to begin with," said Mr. Clark, "that in requesting me to appear, Mr. Warfield has made no suggestion whatever as to what position I should take; he simply asked me to come here and say what I think."

"It is doubtful if any single piece of legislation has been the subject of more comprehensive, patient and exhaustive hearings by the committees of both houses of Congress or of more exhaustive analysis by the conferees, than this transportation act. It is a piece of constructive legislation. Two provisions of it are under attack here, as to which I have been asked to express my views. One is the so-called rule for rate-making, the other is the power of the Interstate Commerce Commission to remove discrimination against interstate commerce."

Mr. Clark gave an outline of the history of rate-making from 1887, when the government decided on the policy of regulation, down to the present time, and showed that prior to the passage of the transportation act the commission lacked power as an administrative tribunal to secure results such as can be accomplished under the transportation act. Turning to the rule of rate-making, he said: "The Constitution of the United States has never guaranteed any capital invested in a public utility, any particular percentage of return, or in fact any return whatever. But it has said and does say that the owners of that utility shall not be deprived of the opportunity to earn a fair return upon the value of the property which they devote to the public use. We have a long and unbroken line of decisions of the highest courts in the country that that is the law of the Constitution . . . The rule for rate making which is here under attack, is only a statutory declaration of that constitutional provision . . . Congress was, I think, very cautious and very conservative in determining what should be taken as a reasonable return on the value of the property for the two-year period succeeding the enactment of the law. It is significant that while fixing that return of 5½ per cent, with an additional authority upon the commission to increase it to 6 per cent, in the same act the Congress provided that the carriers should pay to the

government 6 per cent interest on money loaned by the government to the carriers, and should pay 6 per cent on the indebtedness of the carriers to the government which accrued during the period of government control."

Mr. Clark called attention to the fact that prior to the enactment of this law the association of security owners was anxious that Congress should declare a policy, as a rule of law to be followed by the Interstate Commerce Commission, and to control the commission in the performance of its administrative duties. "That rule of policy," said Mr. Clark, "laid down by the Congress, is in exact accord with a long line of decisions of the highest courts of the land, and in harmony with a long line of proceedings, with which the Congress was, of course, familiar."

Referring to the effort on the part of those criticising the act to repeal the principle of making rates based on the grouping of carriers, Mr. Clark asserted that this grouping had not only been established for years by the actual practice of the commission in the past in various cases, but was desirable as a general policy if Congress desired to sustain the agencies of transportation as a whole.

"The outstanding, fundamental purposes of Congress in enacting this legislation, as I see it," asserted Mr. Clark, "is that the public welfare should be paramount over all other considerations and so in the action of the commission that I have just discussed and in its other action the commission has, as directed by Congress, given special consideration to the necessities of the welfare of the commerce of the country, and of the public."

### Roads Await Normal Business

With reference to the attitude of the security owners Mr. Clark said: "Now, as I have come in contact with the members of this association of security owners, I have been impressed with their conservative views. They realize that even with that rate-making provision in the act, there is no possibility of the railroads getting that measure of return until the railroads of the country, and the business of the country, have adjusted themselves so that that can be done under reasonable rates."

Senator Poindexter asked Mr. Clark: "What justification is there, Mr. Clark, for the assertion that the present conditions are the result of that provision as to guaranty?"

Mr. Clark: "Absolutely none."

Senator Poindexter: "That has been asserted throughout the country, that there is this provision as to guaranty of a profit to this particular industry, while others do not have it."

Mr. Clark: "When that statement is made, Senator, I regard it as being made in the absence of a knowledge of the facts, or with the purpose to misrepresent the facts. That it is not a guaranty is evidenced by the phraseology of the act itself, to start with; and by the interpretation that has been placed upon the act by the commission and by the railroad owners."

Denying specifically that the transportation act required the making of any rate which is unreasonable in fact, Mr. Clark quoted qualifying provisions and asserted that those fully repudiate the suggestion that the act contemplated the increase of rates without reasonable reference to the movement of traffic under them and asserted that in no instance are the shippers required, because of anything in the act, to pay an unreasonable rate, either individually or as a whole.

The other point covered by Mr. Clark related to the proposal to deprive the Interstate Commerce Commission of

jurisdiction to remove undue preferences and prejudices and unjust discrimination against interstate commerce or interstate shippers or localities. After correcting various inaccurate suggestions and misrepresentations which had been made to the Senate committee, Mr. Clark said:

"I assert that in no case in which the Interstate Commerce Commission has been called upon to exercise that power—and there have been many of them from all sections of the country—has it failed or omitted to find specifically what would be a reasonable maximum interstate rate as a basis for the removal of the discrimination.

"So that all of these statements that have been made here that either affirmatively declare or intimate that the commission has been deciding these cases without consideration of the reasonableness of the rates, both state and interstate, are based in an entire misunderstanding of what has been done—they are inaccurate, erroneous.

"I want to say with emphasis, Mr. Chairman, that any insinuation that the Interstate Commerce Commission has decided any one of these cases without according a full hearing to the people who wanted to be heard, is very far from the fact.

"I want to correct another impression that seems to have been gleaned from what has been said here, that the Interstate Commerce Commission has held that a mere difference between the state and the interstate rates constitutes undue prejudice or undue discrimination. The commission never held it in any case."

#### Little Opposition to Increases When Ordered

Mr. Clark said that the commission in Ex Parte 74 had undertaken as best it could to meet the requirements of the law. Everybody knew, he said, that there must be a substantial increase in rates and there was no particular criticism of its action until it became apparent a few months later that the reaction from war conditions had set in so rapidly that liquidation must take place, and then there were complaints as to the rates. Mr. Clark said he had the greatest sympathy for the producers of agricultural products who blamed the rate increase for their troubles but "they were simply mistaken." He had no sympathy, however, for "the price profiteer hiding behind the camouflage of increased rates."

"What is to be gained by repealing this provision of the law?" Mr. Clark asked. Certainly, he said, Congress is not going to do a vain thing. He felt safe in saying that even if the rate-making provisions of the law had not been enacted and other conditions were what they were, the decision in Ex Parte 74 would not have been substantially different.

Mr. Clark pointed out that of the 13 men who acquiesced in the decision in Ex Parte 74 eight were or had been state commissioners. However, he said, there was no unanimity of opinion among the state commissioners and it seemed to him beyond room for argument that if chaotic and intolerable rivalry between the states is to be avoided there must be vested some authority to settle those controversies when they arise.

"I want to deny," he said, "that the Interstate Commerce Commission has ever acted with any thought or desire of extending its jurisdiction or of dispossessing the state commissions. It has plenty of work to do without looking for more. The act gave specific authority to the commission to co-operate with the state commissions as recommended in the annual reports of the commission to Congress, and it invited the state commissions to sit with it in the biggest rate case ever heard in the world. Why, then, is the Interstate Commerce Commission accused of trying to dispossess the state commissions?"

Referring to the charges that state rates were "frozen" as the result of the orders of the commission in the intrastate cases, Mr. Clark said that a two-year order did not indicate that the commission expected no change for two years. It

thought that if adjustments could be made that would remove the discrimination, he said, it would strike its order from the books. If a rate had no relation to interstate commerce, he said, and there is no discrimination, the commission will take its hands off. It has no intention of passing upon the reasonableness per se of intrastate rates. He added that in some cases the state commissions were restrained from changing their rates by court injunctions. If bills such as the Capper and Nicholson bills now before the committee were passed, he said, the effect would be to repeal the Shreveport case doctrine and every district court in the United States would become a regulator of rates.

#### H. A. Scandrett Testifies

Enactment of the Capper or similar bills repealing the rate-making section of the act and amending the statute so as to prohibit the Interstate Commerce Commission from adjusting state rates would nullify the Shreveport doctrine and repeal all orders involving intrastate rates that have been issued by the commission, thus resulting in general chaos so far as rates are concerned, Henry A. Scandrett, commerce counsel for the Union Pacific System, told the Senate committee.

Mr. Scandrett said the bills are revolutionary and if enacted would mean the complete reversal of the transportation act as well as the interstate commerce act and "deprive the Interstate Commerce Commission of any power over discriminatory state rates."

"Do you believe it would modify the doctrine laid down in the Shreveport case?" Senator Poindexter asked.

"It would absolutely nullify it," the witness answered. "Under the Supreme Court opinion in the Shreveport case, the commission has authority to adjust state rates where it is found that they discriminate against interstate rates," he said.

"Every order issued by the commission affecting state rates would be stricken off under the Capper bill if enacted and the present rates would be made unlawful," Mr. Scandrett said. "That is, every order would be thus nullified, no matter whether it was issued before or after the enactment of the Transportation Act."

"It would mean, then, 48 different commissions to create 48 different rates?" asked Senator Fernald of Maine.

"Absolutely and would create 48,000 discriminations," Mr. Scandrett replied.

#### Discrimination Against Interstate Traffic

Mr. Scandrett said that should the bills be enacted, interstate shippers would be powerless to obtain redress from discriminations. Indicating the importance of this to shippers, Alfred P. Thom, general counsel of the Association of Railway Executives, pointed out that interstate shipments constitute approximately 85 per cent of the total freight traffic carried by the railroads.

To repeal the orders of the Interstate Commerce Commission against discriminations in state rates would not only result in chaos but would also result in "guerrilla warfare" among the states in the matter of rates, with discriminations always being against the interstate shipper. Such proposed legislation if enacted, he said, would represent "backward steps, steps that should not be taken."

For a state to order the railroads, the witness said, to charge passengers one rate of fare when traveling within its borders and the Interstate Commerce Commission to permit carriers to charge another rate for interstate travel is a discrimination in violation of the Interstate Commerce Act.

"While there is competition between persons and localities," Mr. Scandrett said, "yet these advantages and prejudices would be undue and unreasonable even if it were otherwise. The burden imposed by the carrier is unequal and this the law forbids unless there is such dissimilarity in

the circumstances and conditions as warrants a difference in the fare.

"We are at a loss to understand the reason why the state commissions oppose action by the Interstate Commerce Commission, which placed state and interstate passengers' fares on a relatively fair basis. Some of the state commissions have undertaken to defend a situation which, if it arose within the state, would, I am sure, have received their very swift and very emphatic condemnation. If, for instance, with circumstances and conditions substantially similar, a railroad undertook to impose one basic fare between two points within the state and a substantially different fare between two other points also within the same state, it is inconceivable that it would be permitted to do so. The state commission would undoubtedly hold that the practice would be preferential and prejudicial as between both persons and localities. The situations presented to the Interstate Commerce Commission were on all fours with the illustration since these imaginary state lines afford no ground for distinction and there is no other difference. Just as the state commission would unquestionably say that the carriers' proposal could not be entertained, so was the Interstate Commerce Commission forced to say that the situation was intolerable and to order its correction.

### Transportation Act Unfairly Criticized

"No legislation of Congress has been more severely or more unfairly criticized than the Transportation Act. This criticism has been unfair because it has charged to that act all of the evils which were the necessary aftermaths of the great war. The act has been condemned without a fair trial and in fact without any trial.

"The charge that the provisions in the act on this subject are responsible for the very difficult times through which we are passing in so far as the transportation question is concerned cannot be sustained. On the contrary, I assert that these provisions in the law are in no wise responsible for our present troubles."

Mr. Scandrett denied that the Interstate Commerce Commission had misinterpreted the law. He said that the conferees on the bill had struck out the language authorizing the Interstate Commerce Commission to change rates which caused an "undue burden" on interstate commerce, but had adopted the much broader term "unjust discrimination against interstate commerce." While the bills on their face, he said, would leave the Interstate Commerce Commission some jurisdiction over state discriminations, he said, as a practical matter they are so drawn as to actually nullify any such power and one would even set aside all orders of the Interstate Commerce Commission superseding intrastate rates since the Shreveport decision.

### S. Davies Warfield's Testimony

S. Davies Warfield, president of the National Association of Owners of Railroad Securities, said that the proposed legislation, if adopted, would reopen the whole question of government ownership of the railroads. The security owners believe that this legislation, which includes the pending Capper bill and amendments which have been offered to the railroad securities bill, would destroy confidence in railroad securities and would defeat the purposes of the transportation act, one of which was to make possible the financing of the railroads other than by the government.

"If the great investing institutions," Mr. Warfield said, "are thus notified that Congress and the commission are not at least endeavoring to secure the stated reasonable return on public service property, taken in the aggregate, then the opportunity of the carriers to secure money from permanent investing sources to supply this public service will be greatly limited, and it is a grave question whether it will not reach

the extent of requiring government railroad financing through taxation.

"If Congress adopts the suggestion that regulated railroad freight rates shall go down as the unregulated prices of commodities go down, unaccompanied by the requirement that freight rates shall go up as the prices of commodities go up—impracticable of accomplishment—such a policy can only be adopted, if at all, by frankly adopting at the same time the policy of supplying the deficit by taxation. Would not the operation of the railroads under such a policy become a governmental function and inevitable losses be supported by taxing all the people? No such result can be attained under private investment in railroad securities and under private operation.

"If Congress shall decide that the bare requirements essential to the transportation of an article of commerce by rail are not to be regarded as a necessary part of its cost delivered at its destination or where sold then the government should sustain the loss incident to such a policy.

"If the farmer or the owner of a private business—unregulated and free to pursue any policy in management, distribution or competition, whether sound or unsound—can secure the declaration by Congress, in effect, that their products over which Congress has no control either as to production or price, shall be carried by a railroad, privately owned but regulated by the government in its every sphere of activity for less than will produce the reasonable return now contemplated by the act, such a declaration can only be considered as a notice that railroad properties can no longer be expected to be supported through the investment of funds held in trust or by private investors.

"If the conclusion is reached that the products of any particular section of the country or of any industry should be transported, without such products bearing their just proportion of the revenue essential to operate the transportation system, as a whole, it would appear that the time has come when the loss incident to such a policy should be met by taxation. The considerations underlying such a policy would be political in character and should be supported by political authority which would be responsible for results and for the waste incident thereto or impaired service that might result.

"If the pressure upon this committee by those opposing the transportation act should result in the destruction of the machinery provided in the act for the co-ordination of the work of state commissions with that of the Interstate Commerce Commission, no policy can be adopted by the latter under which any measure of return on the aggregate value of railroad property could properly be provided for, whether named in the act or left to be named by the commission. When the government has provided regulatory agencies to regulate rates and wages, not to provide at the same time for the adjustment of intrastate rates that burden the interstate structure, would produce conditions difficult to meet through means other than by taxation."

### Rates Still Being Lowered

Mr. Warfield pointed out that the railroads "have lowered and are still reducing rates, in the interest of reconstruction, not in the interest of the railroads, and when less than half the return called for by the act is realized." He said the shippers did not realize what substantial reductions are being made.

Continuing, Mr. Warfield said: "It is reliably estimated that on the volume of traffic handled last year the saving to shippers and the corresponding loss to the carriers will amount to approximately \$214,000,000 per annum, which is approximately two-fifths of the total net railway operating income of all Class I railroads for the year ended August 21, 1921. With an estimated increase of 5 per cent in the

volume of business for 1922, the total railway operating income would be approximately \$834,000,000 if these reductions had not been made; these reductions will, however, reduce this amount by \$214,000,000 or approximately one-fourth of what would otherwise have been paid by the shippers and received by the carriers. The figures named would result in a return of 3.3 per cent on the commission's tentative valuation of the carriers as a whole. Unless there are substantial reductions made in railway operating costs it is evident that sufficient net operating revenue would not be received to maintain transportation."

Officials of mutual savings banks, representing the various sections of the country, attended the hearing and filed a protest against changes in the transportation act which would repeal the financial rate-making provisions and the provision relative to the Interstate Commerce Commission having jurisdiction over intrastate rates conflicting with the interstate structure. The paper filed was read and put in the record by George E. Brock, president of the National Association of Mutual Savings Banks of the country and also president of the Home Savings Banks, Boston, Mass., who stated the action taken was on behalf of all the mutual savings banks. There were also present representatives of leading life insurance companies.

### Testimony of W. L. Fisher

"Does this committee propose to countenance conditions that will inevitably lead to government ownership of the railroads without at least an attempt to put in effect the program of intensive economies in railroad administration presented before this committee by representatives of the Association of Security Owners in January, 1919, and again in June, 1921, that will save hundreds of millions of dollars for the carriers?" asked Walter L. Fisher, of Chicago, who is one of counsel of the National Association of Owners of Railroad Securities.

"No expert is required," said Mr. Fisher, "to understand the proposals made by the security owners that by the use of the National Railway Service Corporation, organized by this association, great savings will be made that will mean substantial reductions in freight rates through the acquisition and handling of equipment for the railroads by the service corporation.

"You have asked the question," said Mr. Fisher, "how-can freight rate reductions be met? We answer, adopt the program of the security owners and the farmers of the country and shippers, through the hundreds of millions of dollars of savings to be gained thereby, will get what they want in reduced freight rates without bringing this country into government ownership.

"You have placed a measure in the Transportation Act to guide the commission in rate-making. Why has this committee not considered putting into effect the other suggestions of the security owners for economies which will make large savings in railroad operation?

"A board of competent engineers and experts has been at work for months for the association in amplifying the plans which were laid before this committee. Mr. Warfield yesterday stated that if the people of the country expect rate reductions every time prices go down, private ownership must cease and taxation of the people must supply this deficit.

"Do you propose to consider changes in the Transportation Act that the much worried shipper may ask until you have at least paid some attention to the offers of the security holders to raise great sums of money to help the situation in the public interest in reciprocation for your having adopted the suggestion of the measure of return which is now part of the transportation act?"

Mr. Fisher related the history of the terminal situation in Chicago and the difficulties there in getting the representa-

tives of the railroads to agree to joint facility uses which, he said, would mean millions of dollars saving to the railroads and hence to the shippers, and would give facilities in Chicago to which that city was entitled and had the right to demand.

### F. H. Wood Appears Before Committee

On November 22 F. H. Wood, of the Southern Pacific, continued his testimony, describing in detail the evidence presented by the roads in various state cases to show that they had specifically proved discrimination against persons, places and particular classes of traffic. Senator Cummins pointed out that there is no disposition on the part of the committee to change the rule of the law relating to state discrimination as the committee thought it had been written in the law, but it has been alleged that the commission has misinterpreted the law, and that it is the duty of Congress to redraft it so it cannot be misunderstood. "That is all there is in this hearing," he said, "the question whether there has been such a misinterpretation of our language that it needs clarification. We do not intend to change the doctrine of the Shreveport, Illinois and Nebraska cases, and I do not think there is now any disposition on the part of the committee to restrain the power of the commission to remove clear cases of undue discrimination."

Mr. Wood said that he was answering the claim that had been made that the federal commission before raising state rates had taken into consideration only the mere fact of a difference in rate levels. Mr. Wood denied that state regulation of intrastate rates has been "frozen" as claimed, except in states which insisted on independent action so strongly as to try to maintain a rate level lower than that for interstate traffic or in other states. In the states which recognized with the Interstate Commerce Commission the necessity for a general increase in rates without delay, he said, the state authorities are functioning as freely as ever in the adjustment of local rates and the other states have it within their power even now to get the Interstate Commerce Commission to withdraw its general orders if they will refrain from insisting on violating the law. He said the action of many states was as much a violation of the interstate commerce act of 1887 as of the transportation act of 1920.

# Selecting Designs for Electric Locomotives\*

Tests Indicate that Non-Symmetrical Wheel Arrangement  
Is Essential for Best Performance

By A. W. Gibbs

Chief Mechanical Engineer, Pennsylvania

THE EQUIPMENT available for testing included a wide variety of steam locomotives, and four electric locomotives.

The steam passenger locomotives selected were, one of the 4-4-0 or American type (Fig. 1), the other of the 4-4-2 or Atlantic type (Fig. 2).

The electric locomotives were Nos. 10,001 (Fig. 3) and 10,002 (Fig. 4) already described; No. 10,003, or American

as to facilitate its operation into Grand Central Terminal, New York.

Considered from various standpoints these locomotives ranked as follows:

As regards wheel-base:	Total wheel-base	Distance center to center of trucks
Electric loco. 10,003.....	20 ft. 7 in.	17 ft. 6 in.
Electric loco. 028.....	22 ft. 6 in.	14 ft. 6 in.
Steam, American type (4-4-0).....	22 ft. 9½ in.	19 ft. 6 in.
Electric, 10,001 and 10,002.....	26 ft. 1 in.	17 ft. 7 in.
Steam, Atlantic type (4-4-2).....	30 ft. 9½ in.	
Steam, Atlantic type (4-4-2).....	30 ft. 9½ in.	

As regards center of gravity:

	Vertically	Longitudinally
Electric loco. 10,002.....	42¼ in. above rail	3½ in. from center
Electric loco. 10,001.....	45¼ in.	Centrally
Electric loco. 028.....	35 in.	Centrally
Electric loco. 10,003.....	35 in.	1 in. ahead of front drivers
Steam, American type (4-4-0).....	63 in.	10¼ in. ahead of front drivers
Steam, Atlantic type (4-4-2).....	73 in.	41¼ in. ahead of rear drivers

Thus, if length of wheel-base is to govern, the Atlantic type steam locomotive is the best, and the American type electric, 10,003, should be the worst. If height of centre of gravity is to be the deciding factor, the Atlantic steam loco-

Fig. 1. American Type (4-4-0) Locomotive

type, that is, with two pair of driving wheels and a four-wheel truck (Fig. 5); and No. 028, a brand-new locomotive belonging to the New York, New Haven & Hartford, which consisted of two four-wheel trucks pivotally connected to the body which carried the draft attachments (Fig. 6).

The drives of Nos. 10,003 and 028 were very similar, consisting of a quill drive (type C).

Locomotive 10,003 was arranged for a.c. operation, which

Fig. 3. Electric Locomotive No. 10,001, Geared Drive, Type B

motive is still the best, and the articulated quill-drive electric 10,002 the worst.

As the object of the trials was to determine stability at express speeds, very few of the runs were made at lower ones, but it is fair to say that with any type of locomotive, steam or electric, not much disturbance should be expected at low speed, consequently progressive speeds were selected up to the maximum speed capacities of the various locomotives.

## Results of Tests

The runs with the steam locomotives went off very smoothly. Typical records are shown at different speeds for each type (Figs. 7 and 8). The maximum speed for the 4-4-0 type was 83 miles per hour, and for the 4-4-2 type, 95 miles per hour. It is not to be understood that these are practical operating speeds.

When the electric locomotives were run the story was very different, as will be seen from the diagrams (Fig. 9). The record for the geared locomotive, 10,001 (type B), shows severe oscillation with either end leading, there being three

Fig. 2. Atlantic Type (4-4-2) Locomotive

necessitated provision for d.c. control operation, which was placed in a separate car that always accompanied the locomotive.

No. 028 was arranged with double control, a.c.-d.c., so

\*This is the second and concluding part of an abstract of a paper read before the Franklin Institute, Philadelphia. The previous article in the issue of November 19, page 987, described the methods used for testing the locomotive and discussed electric locomotive drives.

rather pronounced peaks at about the same space interval.

The maximum depth of impressions would indicate a lateral severity about double that with steam locomotives. It is probable that had the ties been arranged to record impres-

Fig. 4. Electric Locomotive No. 10,002, Quill Drive, Type C

sions at each end, intermediate impacts would have been shown on the opposite rail.

With 10,002, articulated quill drive, the records both of

Fig. 5. Electric Locomotive No. 10,003, Quill Drive, Type C

depth of impressions and of the seismograph were decidedly the worst of all the locomotives under trial (Fig. 10). While runs were being made with this locomotive the tangent approach track began to spread, with results shown in Fig. 11.

Fig. 6. Electric Locomotive No. 028, Quill Drive, Type C, with Pivoted Truck

The greatest spread was  $\frac{7}{8}$ -in., which caused kinking of the rail and bending of the spikes as shown in Fig. 12. The same thing happened in varying degree where runs were made with different locomotives coupled together, but only when

locomotive 10,002 happened to be one of the combination.

With the non-articulated locomotive, 028, the readings both of the impressions (Fig. 13) and of the seismograph showed a very much better performance, and so far as this set of tests went, the locomotive could not be considered bad. It was, however, tried only on the tangent track after the completion of the tests on the curve. The subsequent history of this type of locomotive in service showed that as wear accumulated the lateral oscillation became serious, so much so that the locomotives were changed by the addition of a third carrying axle to each truck, thus forming a non-

Fig. 7. Record of Run Made with American Type (4-4-0) Steam Locomotive at a Speed of 83.5 Miles Per Hour on Curve

symmetrical arrangement and at the same time providing a longer wheel-base. It is probable that the smoothness of the diagram for this locomotive was largely due to the absence of end play of the axles in their boxes.

The last of the electric locomotives, 10,003, was in fact

Fig. 8. Steam Locomotive, Atlantic Type (4-4-2), Speed 95.7 Miles Per Hour on Curve

an eight-wheel American-type locomotive, and the records on both curve and tangent at once put it in the class of the best steam locomotives (Fig. 14). As originally constructed the leading truck had free lateral motion, and an extensive set of runs in both directions showed that while the free swing was an advantage when the truck led, it was a disadvantage when it trailed, and that the best compromise was with truck rigid laterally.

These Franklinville tests concluded with runs of different

combinations of locomotives coupled together. Apparently when the locomotives were coupled, the number of impressions was increased without material increase in the depth.

It appeared that in all combinations, including the articu-

Fig. 9. Electric Geared Locomotive No. 10,001, Speed 71.5 Miles Per Hour on Curve

lated quill-drive locomotive 10,002, the riding of the companion locomotive was worse than when operated by itself.

The influence of the approach track had a very marked effect on the results. It was evident that for best results the recording track should have been very much longer to record the resonant type of oscillations from their origin through

Fig. 10. Electric Locomotive No. 10,002, Speed 68.3 Miles Per Hour on Curve

their development to the final dampening. It was evident that ties should have been arranged to record on each end.

The severity of the impacts from the impressions measured statically is indicated by the following notes on rail pressures at speeds above 60 miles per hour:

GROUP A—STEAM LOCOMOTIVE  
No. 6034, Type D-16b (4-4-0)

Maximum readings of 6 runs, speeds between 60.07 and 83.2 M.P.H.  
At 60.07 M.P.H.—Impression .0135 in.—Pressure 7,250 lb.  
At 80.0 M.P.H.—Impression .0141 in.—Pressure 7,580 lb.  
Average—74.3 M.P.H.—Impression .0123 in.—Pressure 6,610 lb.

GROUP B—STEAM LOCOMOTIVE  
No. 6020, Type E-2 (4-4-2)

Maximum readings of 7 runs, speeds between 59.6 and 95.7 M.P.H.  
At 71.2 M.P.H.—Impression .0129 in.—Pressure 6,930 lb.  
At 80.8 M.P.H.—Impression .0159 in.—Pressure 6,550 lb.  
Average—74.4 M.P.H.—Impression .0123 in.—Pressure 6,500 lb.

GROUP C—ELECTRIC LOCOMOTIVE No. 10,001

Forward, No. 2 End Ahead

Maximum readings of 6 runs, speeds between 61.1 and 71.3 M.P.H.  
At 71.3 M.P.H.—Impression .0272 in.—Pressure 14,620 lb.  
At 67.9 M.P.H.—Impression .0193 in.—Pressure 10,370 lb.  
Average—64.5 M.P.H.—Impression .0165 in.—Pressure 8,500 lb.

Reversed, No. 1 End Ahead

Maximum readings of 4 runs, speeds between 60.9 and 70.1 M.P.H.  
At 62 and 70.1 M.P.H.—Impression .0289 in.—Pressure 15,530 lb.  
At 69.7 M.P.H.—Impression .0298 in.—Pressure 16,000 lb.  
Average—65.7 M.P.H.—Impression .0267 in.—Pressure 14,350 lb.

GROUP D—ELECTRIC LOCOMOTIVE No. 10,002

Maximum readings of 4 runs, speeds between 60.8 and 68.1 M.P.H.  
At 62.8 M.P.H.—Impression .039 in.—Pressure 20,960 lb.

Fig. 11. Tangent Track Kinked by Electric Locomotive No. 10,002

At 66.9 M.P.H.—Impression .0311 in.—Pressure 16,720 lb.  
Average—64.4 M.P.H.—Impression .0291 in.—Pressure 15,640 lb.

GROUP E—ELECTRIC LOCOMOTIVE No. 10,003 (4-4-0)  
Forward, Bolster Free

Maximum readings of 8 runs, speeds between 60.8 and 88.3 M.P.H.  
At 63.3 M.P.H.—Impression .0123 in.—Pressure 6,610 lb.

Fig. 12. Spikes Bent as Result of Lateral Impact on Tangent Tracks

At 72.38 M.P.H.—Impression .0125 in.—Pressure 6,720 lb.  
Average—74.1 M.P.H.—Impression .0113 in.—Pressure 6,070 lb.

Forward, Bolster Blacked

Maximum reading of 6 runs, speeds between 60.0 and 83.9 M.P.H.  
At 75.1 M.P.H.—Impression .0179 in.—Pressure 6,620 lb.  
At 83.9 M.P.H.—Impression .0193 in.—Pressure 10,370 lb.  
Average—73.5 M.P.H.—Impression .0149 in.—Pressure 8,010 lb.

Reversed, Bolster Blacked

Maximum readings of 6 runs, speeds between 60.0 and 83.9 M.P.H.  
At 65.8 and 70 M.P.H.—Impression .0115 in.—Pressure 6,180 lb.  
At 68.2 M.P.H.—Impression .0117 in.—Pressure 6,290 lb.  
Average—74.04 M.P.H.—Impression .0106 in.—Pressure 5,700 lb.

Reversed, Bolster Free

Maximum readings of 5 runs, speeds between 60.4 and 77.5 M.P.H.  
At 68.9 M.P.H.—Impression .0289 in.—Pressure 15,530 lb.  
At 70.2 M.P.H.—Impression .0281 in.—Pressure 15,100 lb.  
Average—68.9 M.P.H.—Impression .0236 in.—Pressure 12,700 lb.

## GROUP F—NEW HAVEN ELECTRIC LOCOMOTIVE No. 028

Maximum readings of 9 runs, speeds between 60 and 88.3 M.P.H.  
 At 70.7 and 72.6 M.P.H.—Impression .0197 in.—Pressure 16,370 lb.  
 At 70.8 M.P.H.—Impression .0180 in.—Pressure 10,000 lb.  
 Average—71.7 M.P.H.—Impression .0149 in.—Pressure 9,000 lb.

The outstanding fact seemed to be the superior performance of the locomotive with the non-symmetrical wheel arrangement over that with the double four-wheel motor-driven trucks. The articulated truck arrangement was undoubtedly the worst of the combinations, but how much was due to low centre of gravity and how much to the articulation setting up a snaking motion was not definitely shown.

It is to be noted that one of the double-truck motor-driven locomotives and one with two driven axles and leading truck had the same height of centre of gravity, and the latter arrangement was decidedly the better. The comparison is the more interesting because in both of these locomotives the same quill-drive type is used.

The action as the result of the tests was the condemnation

Fig. 13. Record of Impressions with Electric Locomotive No. 028 on Tangent, Speed 88.3 Miles Per Hour

of both types of articulated electric locomotives and the preparation of an entirely new design.

The new design consisted of two eight-wheel American-type locomotives coupled back to back, each driven by one motor in the cab and coupled by cranks and rods to a jack-shaft placed in the horizontal axis of the driving wheels, and coupled to them by rods, as in this case of steam locomotives (Fig. 15). In this design were embodied not only the non-symmetrical wheel spacing of each semi-unit, but also the elevation of the centre of gravity of the spring-borne portion. This design was completed and locomotives built and tested in time to start the operation of the New York

terminal in 1910, and the locomotives have satisfactorily performed that service ever since.

It is not claimed that the question of stability is fully understood. The selection of available wheel arrangements was very limited, but prompt decision was imperative. It is felt that this investigation should be considered as only a starting point for a much more extensive one, which should

Fig. 14. Record of Impressions with Electric Locomotive No. 10,003, Speed 82.6 Miles Per Hour

determine the most desirable arrangements of wheels, of height of centre of gravity, and method of motor drive.

So far as this particular investigation was concerned, the question of electric system was not involved, but, of course, a full discussion of the characteristics of steam and electric locomotives cannot ignore such questions.

Since this set of tests with single-ended ties, other series have been made in which the ties were arranged to record at each end. More ties were used so as to lengthen the test track. As for the equipment, the test included different methods of coupling the semi-units or electric locomotives; also studying the effect of depressions purposely placed in the approach track, the effect of different amounts of end clearance in the axle boxes, variation in the amount of counterbalancing in steam locomotives, etc. The whole accumulation of data is too voluminous to be included in one paper. Although considerable practical information of value has resulted from the various trials, there is much work yet to be done before the questions of stability are really understood. It is to be regretted that the selection of electric locomotives did not include greater variations in the wheel-base, the method of articulation and height of centre of gravity, but it is believed that the work already done is a very good starting point for future investigations.

Fig. 15. Chassis of Electric Locomotive Finally Adopted

# General News Department

The Chicago & North Western will charge the dependents of employees half the regular suburban fare, the new ruling becoming effective January 1. Dependents of employees heretofore have been given passes.

A deficiency appropriation has been reported to the House of Representatives which provides for an additional appropriation of \$300,181 for the Interstate Commerce Commission to enable it to carry out the additional functions imposed by the transportation act.

John Barry, identified as one of the principals in the Dearborn station mail robbery at Chicago, and believed to have been implicated in the hold-up of an Illinois Central train at Paxton, Ill., on November 7, has been taken into custody at Chicago and his capture, it is believed, will clear up many of the recent mail robberies in the middle west.

The Signal Section of the American Railway Association, according to an announcement of the Committee of Directors, is to hold its annual meeting next year on June 14, 15 and 16, at Monmouth Hotel, Spring Lake, New Jersey. Spring Lake is on the New York & Long Branch, 10 miles south of Long Branch and 55 miles from New York City.

## Hearings on Bill to Abolish Cost of

### Acquiring Land in Valuation Estimates

The House committee on interstate and foreign commerce has been holding hearings on a bill introduced by Representative Sweet to amend the valuation law to strike out the requirement that the commission report the cost of acquisition of land. Testimony has been given by representatives of the carriers and by John E. Benton, representing the state commissions. The hearings were postponed on November 22 until the next session of Congress.

## New Shop Craft Rules To Be

### Announced By Labor Board

New rules regarding the working conditions of shop employees are to be announced by the Railroad Labor Board in time to be placed in effect before December 1, according to a recent announcement made at the Board's headquarters at Chicago. The inclusion of these new rules in the agreements formed between the various carriers and their shop employees will end the long controversy over the shop crafts national agreement, all of the points in dispute having been disposed of by this and previous rulings of the Board.

## Five Santa Fe Officers Killed

In the derailment of a motor inspection car near Wickenburg, Ariz., on November 22, W. H. Oliver, engineer of the Coast Lines Grand Division of the Atchison, Topeka & Santa Fe, with four division officers was killed, and several persons were injured. The car is said to have been filled to its capacity of fourteen persons. The dead, besides Mr. Oliver, are: William Matthie, division superintendent; H. C. Storey, assistant division superintendent; William Bowman, roadmaster and J. A. Jaeger, assistant division engineer. The accident happened, according to those on board the car, when an axle broke at a curve. The car plunged down an eight-foot embankment and was overturned.

## Bangor & Aroostook Leases Car Shops

The car shop of the Bangor & Aroostook at Houlton, Me., which normally employs between 30 and 40 men, has been leased to A. E. Astle, Houlton, Me., who will make repairs to cars on a contract basis. This action was taken because output had been unsatisfactory and the size of the

shops did not warrant additional expense for supervision. The railroad estimates that the new arrangement will effect a saving to the company in labor costs of approximately 10 per cent.

## Urges Strike Referendum Among

### Women in Employees' Families

Following an address before the Ohio Newspaper Women's Association at the Hotel Sinton, Cincinnati, Ohio, on November 13, by Allen Rogers, publicity director of the Cleveland, Cincinnati, Chicago & St. Louis, the association passed a resolution directing the secretary of the organization to write to the railroad brotherhoods, the Railroad Labor Board and the railway executives as well as other bodies, presenting the plea that when strike questions arise the strike vote referendum should include the women members of the families of the union men involved, as well as the workers themselves.

## North Western Shop Employees

### Agree to Five-Day Week

The shop employees of the Chicago & North Western have agreed with officers of that carrier to accept a lay-off of one day each week in order to avoid a reduction in forces made necessary, according to the management, because of light business. The men were informed recently that a 10 per cent cut in the shop forces would be necessary and the men were offered an opportunity to choose between retaining a full force on a five-day per week basis or retaining 90 per cent of the force on a six-day per week basis. The employees voted to accept the five-day week.

## Hawkinsville & Florida Southern Discontinues

The Hawkinsville & Florida Southern Railway, which has been operated by R. B. Pegram, receiver, has discontinued business, passenger trains having been taken off on November 15, and freight trains on November 22. This discontinuance of operation was authorized by the Interstate Commerce Commission, as heretofore noted, and also by the Superior Court of Bibb County, Georgia. The line extends from Hawkinsville, Ga., southward to Camilla, Ga., 95 miles. Seven of the intermediate towns (as well as the terminus) have other railroad connections, as follows: Pope City, 18 miles from Hawkinsville; Pitts, 25 miles; Double Run, 31 miles; Worth, 42 miles; Ashburn, 46 miles; Sylvester, 63 miles and Bridgeboro, 76 miles.

## Clearing of Labor Board's Docket in Sight

The following announcement was made by the Railroad Labor Board on November 21:

"The Railroad Labor Board has disposed of exactly six times as many cases in the last few months as it did in the first period of its existence. The Board was organized in April, 1920. It disposed of 100 cases from April 15 to November 30, 1920. In the same period this year—April 15 to November 15, 1921—it disposed of exactly 600 cases. The round numbers, by an unusual coincidence, represent the actual number of cases carried through to a final decision.

"The increased number of cases disposed of indicates not only the greater rapidity of the Board's work but also how its volume has increased.

"With the recent disposal of 200 cases and the prospect that the new adjustment boards will handle a large amount of the grievance cases which have heretofore been brought before the Board, the clearing of the Board's docket may be said to be in sight."

## Seven Per Cent of Nation's Workers

### Engaged in Transportation

The Department of the Census has issued a summary of preliminary occupation statistics for the United States for 1920, which shows 3,066,305 persons in the United States as gainfully occupied in transportation industries or 7.4 per cent of the total persons gainfully occupied, of which 2,852,043 were males, or 8.6 per cent of the males gainfully occupied. The number of females engaged in transportation was 214,262, or 2½ per cent of the gainfully occupied females. The number of females occupied in the various transportation industries had increased 106,596 in 1910.

### Reopening of West Albany Shops

The New York Central has leased its repair shops at East Buffalo and at Toledo, as noted last week. No action has been taken toward opening the shops at Collingwood, Ohio.

The company has this week reopened the passenger car shops at West Albany, N. Y., a meeting of 616 employees having voted almost unanimously to accept the proposition of the company to resume work on a piece-work basis. These men evidently are convinced that they will do as well working directly for the company, or better, than if they were to go into the employ of a contractor. The employees have established a committee which is empowered to conduct any necessary negotiations with the superintendent of motive power.

It is understood that the piece-work rates will average about 25 per cent more than was paid, at piece-work rates, for similar work in 1917. These shops have been closed about 10 months.

### The Santa Fe's Safety Record

The Safety Department of the Atchison, Topeka & Santa Fe reported on October 31 that 35 men have been killed and 7,109 injured in the various departments of the system during the first nine months of this year. If the monthly average is maintained for the last quarter of this year the total killed will be 47, a marked decrease from the previous year regardless of the reduction in forces of last summer, for during 1920 66 were killed and 9,792 injured. The bulletin, in discussing the figures, says: "Aren't you willing to agree that it would be a wonderful thing if we can keep our 1921 total at not over 40? Is there anything in the world you wouldn't be willing to do to show a net saving of 26 lives under our best previous year? Are you going ahead doing things yourself and seeing your partner doing things you know are against rules and are not to be done, or are you going to stop both?"

### Pennsylvania Veterans

The Pennsylvania System Veteran Employees' Association, General Office, Philadelphia, organized in February last, with a membership of 1,335 officers and employees located in the General Office, Philadelphia, who have been in the employ of the road 21 years or more, held its first annual banquet at the Bellevue Stratford Hotel, Philadelphia, on Thursday evening November 17. Among those present were the president, vice-presidents and a large number of other officers of the Pennsylvania System, all of whom are members of the association. There were also representatives from upwards of 50 veteran employees' associations of the various divisions throughout the Pennsylvania system.

Addresses were made by Edward W. Bok, of Philadelphia, Elisha Lee, vice-president of the Pennsylvania, and James C. Rogers, president of the association. Charles Hanson Towne, of New York City, read a poem, written by himself for this occasion.

### Long, Runs of Passenger Locomotives

on the M. K. & T.

What is believed to be the longest regularly assigned run in the United States for steam passenger locomotives was inaugurated by the Missouri, Kansas & Texas on November 6, as a result of 11 months' experience in operating its oil burning locomotives in through runs of 400 miles each between Denison

and San Antonio, Tex. Oil fuel having recently been adopted on the line between Denison, Tex., and Parsons, Kan., the plan has been adopted of operating trains No. 5 and No. 6, two of the heaviest on the line, with a single locomotive each way between San Antonio and Parsons, a distance of 678 miles. These trains regularly handle from 10 to 12 cars and frequently are required to handle extra cars. They have been operated on time since the establishment of the long runs. Formerly, the locomotives were changed on these trains at Denison, Tex., and five locomotives were required to handle the runs. Under these conditions, the locomotives made a daily average of 266 miles each. Under the present plan, three locomotives are required to handle these runs, each making a daily average of 452 miles. Proper care of the locomotives at the terminals is considered the most important factor in insuring the success of the long runs, and in this case each locomotive has a minimum of 12 hours time at each terminal. The locomotives are required to take on fuel only once en route.

### Railroad Returns for September

The Interstate Commerce Commission's summary of returns for September for 200 Class 1 roads is as shown in the table. The Detroit, Toledo & Ironton is not included, its report not having been received.

	September		Nine months	
	1921	1920	1921	1920
Average number of miles operated.	234,938.36	234,685.81	234,818.11	234,220.55
Revenues:

NOTE.—Excludes Detroit, Toledo and Ironton, report not having been filed at date of compilation.

\*Includes \$2,941,179, sleeping and parlor car surcharge.

\*Includes \$2,179,734, sleeping and parlor car surcharge.

\*Includes \$24,694,452, sleeping and parlor car surcharge.

\*Includes \$2,436,898, sleeping and parlor car surcharge.

### Commission to Determine Construction of

#### Interlocking Directorate Clause

The Interstate Commerce Commission has announced a hearing at Washington on November 30 as to the construction to be placed on the clause in Paragraph 12 of Section 20-a of the commerce act, which authorizes the commission to permit railroad officers or directors to hold positions with more than one carrier after finding "that neither public nor private interests will be adversely affected thereby." The order for the hearing says that question has arisen regarding the construction of this proviso. The commission has already issued a number of authori-

zations to officers and directors to hold positions with more than one carrier where the other carriers are affiliated or subsidiary companies, but apparently it intends to reach some general decision as to the extent to which interlocking may be not opposed to the public interest.

E. N. Brown is authorized to hold until further order of the commission, the office of chairman and member of the board of directors of the St. Louis-San Francisco, Kansas City, Fort Scott & Memphis, Kansas City, Memphis & Birmingham, chairman and member of the executive committee of the St. Louis-San Francisco and chairman and member of the board of directors and executive committee of the Pere Marquette. Jules S. Bache has been authorized to hold office as officer and director of the Minneapolis & St. Louis; Ann Arbor, Manistique & Lake Superior, and Toledo, St. Louis & Western. Richard Billings is authorized to hold office as president and director of the Woodstock and director of the Boston & Maine. Charles H. Worcester has been authorized to retain his office as director and member of the executive committee of the Minneapolis & St. Louis, president and director of the Ann Arbor and the Manistique & Lake Superior, chairman of board and director of the Middletown & Unionville and director of the Tennessee, Alabama & Georgia. F. A. Chamberlin has been authorized to serve as director of the Minneapolis & St. Louis and president and director of the Minneapolis Eastern; A. F. Banks as president and director of the Elgin, Joliet & Eastern and other roads, and S. M. Rogers as director and vice-president of the Elgin, Joliet & Eastern and other roads. Other officers of the Elgin, Joliet & Eastern have been given similar authority. R. H. Kurrie has been authorized to act as president and director of the Chicago, Indianapolis & Louisville and the Kentucky & Indiana Terminal.

### Amendments to Mail Pay Orders

The Interstate Commerce Commission has issued an amendment to its order in the railway mail pay case in response to a petition filed on the joint behalf of the postmaster general and the railroads, in which it prescribes the rate of 40% cents for each mile of service by 70-foot storage car. The amendments are as follows:

It is ordered that there be added to Section 3 the following:

The fair and reasonable rate of payment for transportation of mail matter on and after December 1, 1921, for each mile of service by a 70-foot storage car is 40.5-6 cents. The rules governing service by a 60-foot storage car shall apply to service by a 70-foot storage car.

It is further ordered that the first paragraph of Section 4 be modified to read as follows:

Where authorizations are made for cars or apartments of the standard lengths of 60, 30 and 15 feet, and the railroad company is unable to furnish such cars or apartments of the length authorized, but furnishes cars or apartments of lesser length, but which are accepted by the department to be sufficient for the service payment shall be made only for the actual space furnished and used, the compensation to be not exceeding pro rata of that provided for the standard length authorized. The postmaster-general may accept cars and apartments of greater length than those of the standard requested, but no compensation shall be allowed for such excess lengths except that where an oversize car is furnished storage units may be authorized thereon on either on basis of actual measurement or on basis of space and outside packages, whichever may be more practicable, provided that in no case shall payment be made for more than the actual length of the car.

It is further ordered that Section 8 be modified to read as follows:

That during the fiscal year beginning July 1, 1921, and ending June 30, 1922, excepting the month of December, 1921, each carrier shall be paid for all emergency service required and performed on all trains having regular authorizations on each route, except emergency service required and performed in 30-foot and 60-foot authorizations, for which payment shall be made as at present provided, the same amounts each month as accrued on account of 3-foot, 7-foot and 15-foot units of emergency service, storage and closed-pouch, authorized and performed during the month of April, 1921, where the emergency authorizations were less than fifty per cent of the trips, and where the authorizations were for fifty per cent or more of the trips the appropriate higher unit shall be regularly authorized from July 1, 1921.

During the month of April, 1922, and in the same month for each succeeding year during the continuance of this order, a record of the emergency service, storage and closed pouch, actually performed in 3, 7 and 15 foot units on each train of each route shall be kept, and upon the basis of the same the emergency authorizations shall be made for each month of the succeeding fiscal year beginning July 1, excepting for the month of December in the same manner as prescribed above for the fiscal year beginning July 1, 1921, both as to payment of emergency service and increases to the higher regular units of service performed.

For the month of December in any year payments shall be made for sixteen days on the basis above prescribed at one-half of the monthly rate as above ascertained and for fifteen days beginning December 17 on the basis of the emergency service actually performed.

By mutual agreement between the postmaster-general and any carrier a different month than April may be selected as the basis for the pay for such emergency service required of and performed by said carrier.

## Traffic News

The Phelps Dodge Corporation, New York City, announces the appointment (effective December 1) of F. W. Pullen, as traffic manager in place of G. W. Feakins, resigned.

The National Association of Sand and Gravel Producers has asked the Interstate Commerce Commission to make an expedited investigation into the level of freight rates on sand, gravel and crushed stone between points in the western states.

The Transportation Club of Peoria, Ill., will hold its annual banquet at the Jefferson Hotel, on December 8. The speakers of the evening will be C. H. Markham, president of the Illinois Central and J. H. Beck, executive secretary of the National Industrial Traffic League.

Rates on tin plate from eastern points to the Pacific Coast will be reduced as soon as the tariffs can be published and made effective. The present rates of \$1.835 from New York, \$1.665 from Pittsburgh, and \$1.585 from Cincinnati will be reduced to \$1.20 from all points.

Shippers of Toledo, Ohio, have filed a petition with the Ohio Public Utilities Commission attacking industrial switching charges in the Toledo district, claiming that since 1915 the charges have been increased from 16 cents a ton to 42 cents or more than 200 per cent.

The West Coast Lumbermen's Association has applied to the Interstate Commerce Commission for lower freight rates and simplified tariffs, holding that the continued existence of the lumber industry of the North Pacific coast depends upon the ability of the industry to market its products freely.

The New England Homestead, a prominent agricultural newspaper, has sent to the Interstate Commerce Commission a telegram complaining of the reduction of freight rates for Western farmers. It says that New England farmers must pay high rates to get their products to market, while the West and South are subsidized to dump their surplus into New England at 10 per cent less cost. The dispatch says: "The excuse for not reducing rates on produce moving wholly within New England, is that our New England railways are so poor they can't afford it. Why are they so poverty stricken? Partly because for years they have been under an expense of \$25,000,000 annually in furnishing Eastern terminal service for Western lines."

### Coal Production

Observance of Armistice Day was the principal cause of a sharp drop in coal production during the week ended November 12, according to the weekly bulletin of the Geological Survey. The output of bituminous is estimated at 8,466,000 net tons, as against 9,315,000 tons the week before.

### Neosho Plan on Central of Georgia

Seventeen cities along the lines of the Central of Georgia have inaugurated the "Neosho or Golden Rule Sales Plan" of co-operative merchandising and community advertising. For the past two months representatives of the railway have accompanied Gurney R. Lowe, exponent of the plan, in establishing it in different progressive communities. In this plan there is a monthly auction sale of things the farmer wants to sell; and on the same day an offer of genuine bargains by the business houses of the city, on a non-competitive basis; the whole advertised co-operatively; the whole plan working toward a better relation between town and country. Cities adopting the plan are Rome, Carrollton, LaFayette, Newnan, Cuthbert, Americus, Statesboro, Millen, Waynesboro, Tennille, Milledgeville, in Georgia; Opelika, Alexander City, Andalusia, Eufaula, Sylacauga and Florala, in Alabama.

### Senators Enter a Rate Controversy

A protest, signed by 11 United States senators from the Middle West, against the alleged refusal of the eastern and western railways system to follow up their reduction of export rates on steel and steel products to North Atlantic ports by concurring in similar reductions to southern ports has been filed with the Interstate Commerce Commission. The petition was made in behalf of Middle Western shippers, and was signed by Senators McKinley and McCormick of Illinois, Willis of Ohio, Spencer and Reed of Missouri, Kenyon of Iowa, Townsend of Michigan, New and Watson of Indiana, and Capper and Curtis of Kansas.

In addition to protesting against the action of the roads in refusing to grant the same reduction to Gulf and south Atlantic ports, the petition also directs the attention of the commission to a reported plan of the roads to include other commodities in the "preferential" reductions, "thereby further injuring the shippers in the territory referred to." The action by the railways, the petition says, constitutes a grave menace to the commercial interests of the entire Middle West "that can only serve to cripple the expansion of the foreign trade of the United States." The commission is asked "to lend the full measure of its protection" to prevent the roads from carrying their program into effect.

### Rate Hearings Begin at Chicago

The transcontinental rate hearings opened at Chicago before Examiner Disque of the Interstate Commerce Commission, on November 17. Edward Chambers, vice-president in charge of traffic of the Atchison, Topeka & Santa Fe, was the first witness for the carriers and made a general statement of the history of transcontinental rates which is printed elsewhere in this issue. Mr. Chambers, on the completion of his statement, was cross-examined by attorneys for both sides. He held, under examination, that users of water routes should help bear the burden of up-keep of those routes of travel and stated that if Congress removed the Panama Canal toll, it would most certainly lead to another application for a hearing by the transcontinental carriers, providing that the boat lines passed the reduction on to the shippers. As Mr. Chambers left the stand he was asked by the examiner what the transcontinental carriers proposed to do in case the commission denied their application, and answered, that such a possibility had not been considered. Paul P. Hastings, member of the standing rate committee of the Transcontinental Freight Bureau, followed Mr. Chambers on the stand, and presented exhibits in support of the carriers' stand. In all cases, he said, the transcontinental carriers rates were somewhat higher than the port-to-port water rate plus the rail haul to the port and the switching movement, drayage, etc., to compensate the carriers for superiority in service. On the morning of the second day, Mr. Hastings discussed in detail each of the 80 items contained in Countiss' application No. 19. He presented his discussion with material showing the principal producing points, rail rates from those points to the Atlantic and Gulf ports and the water rates beyond to the Pacific coast. These rates were also shown to be above the rail and water rates. In some cases, however, as with canned goods from Pittsburgh and west, it was shown to be less. Mr. Hastings said that if the application before the commission seeking proportional rates from western trunk lines and southern territory to the Gulf ports should be granted, the transcontinental carriers would ask for a suspension.

Examiner Disque on November 15, took testimony for and against the fourth section application of the Transcontinental Freight Bureau. The first hearing was on the re-opened fourth section application, No. 8835, involving rates on sugar from California to Chicago, St. Louis and the Missouri river, in which the commission granted permission to the transcontinental carriers to disregard the fourth section of the act. J. F. Abbott, appeared as attorney for the applicants and T. J. Norton as counsel for the transcontinental carriers. Little was accomplished at the hearing and the way now points to the New Orleans, La., hearing which will be held later.

ONE HUNDRED AND FIFTY ADDITIONAL MEN are to be added to the New York Central locomotive shop forces at West Albany, N. Y., this increase in force to take place as fast as competent men can be obtained.

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission has rendered a decision in the complaint of the Arizona and other state commissions in which it finds that the passenger fares between points in Arizona, Nevada and New Mexico and between those points and points in other states are not unreasonable, unjustly discriminatory or unduly prejudicial.

The Interstate Commerce Commission has rendered a decision in part 2 of the case involving rates to, from and between points south of the Ohio river, including the Mississippi valley. Part 1 of this case related to class rates and part 2 to commodity rates. The proposed revision of commodity rates designed to eliminate deviations from the long and short haul provision of the fourth section in the construction of rates primarily affecting Mississippi valley points and Nashville, Tenn., is found not justified except as indicated more particularly in the decision. The railroads are required to cancel the suspended schedules in so far as they are found not justified and to file new schedules establishing rates in accordance with maximum bases prescribed in the opinion. The proceeding is discontinued. The commission has also modified its order in this case of October 10 to make the rates therein ordered effective on January 15, 1922, instead of January 1.

### State Commissions

The Illinois Commerce Commission completed hearings, November 19, on objections to the increase which became effective a short time ago in express rates on certain commodities, and granted leave to the American Railway Express Company to file an answer to the objections within 30 days.

The Public Service Commission of Alabama has received from the railroads their proposals for a general revision of freight rates in Alabama; and has set December 12 as the date on which testimony will be heard in support of the proposals. The main purpose of these new tariffs is to secure uniformity of bases as between different states and as between intrastate rates and interstate. It was stated in behalf of the railroads in the presentation of the tariffs that probably the new rates would make no material addition to the revenue of the carriers as a whole.

### Court News

#### Cattle Guard Statute—Injury to Cattle

The Idaho statute (Comp. St. 1919, § 4815) makes it the duty of railroad companies to maintain a cattle guard only where the railroad crosses a public highway or public traveled road. In an action for damages to live stock, alleging violation of the statute, the Idaho Supreme Court holds that it is not sufficient to prove that the railroad did not maintain such a cattle guard. In addition to that, it must be shown that because of such failure the cattle got on the track.—Bliss v. Oregon Short Line (Idaho) 200 Pac. 721.

#### Contributory Negligence at Crossing Not

##### Excused by Speed Ordinance

The Missouri Supreme Court holds that an automobilist who could have seen an approaching train for half a mile, had he looked, when 50 feet from a familiar crossing in a city, but did not look, after passing all obstructions to his view, until about 12 or 15 feet from the crossing, was guilty of contributory negligence, barring recovery, when struck by the train. He was not excused from looking or listening or entitled to rely on the presumption that the speed of the train would be reduced from 30 to the ordinance limit of 12 miles an hour as it approached the crossing.—Alexander v. St. Louis-San Francisco (Mo.) 233 S. W. 44.

## Foreign Railway News

### Australian Railways Show Deficit

The annual report of the government railways of South Australia for the fiscal year ended June 31, 1921, shows a deficit of \$2,733,550 (£ to \$ at par). This loss was due to increased costs—primarily wages—which increased rates were not sufficient to cover. The lines total 2,333 miles, of which some 1,209 miles are of 3 ft. 6 in. gage and 1,124 of 5 ft. 3 in. gage. The New South Wales Railways for the same period showed a deficit of \$2,200,653. The mileage of these lines is 5,043.

### Northwestern of Peru Taken Over by Government

By executive decree of August 31 the Peruvian Government will acquire the control and administration of the Northwestern Railway of Peru, the main line of which connects the towns of Ancon and Huacho—a distance of about 90 miles, according to Commerce Reports. The sum involved in the transaction is said to be approximately \$3,500,000. Two other short branches of the road run from Huacho to Sayan and from Huaral to Chancay—distances of 34 and 8 miles respectively. The road is now owned by a British company.

### German Rail Employees Object to Private Operation

The activities of Hugo Stinnes, the German industrial magnate, which have been directed toward bringing the control of the government railways into his hands, are objected to strongly by the German railway unions, according to the New York Evening Post. Stinnes promises to do away with thousands of superfluous employees if the railways are entrusted to him, abolish the eight-hour day and reduce wages so the railways will be operated at a profit. The unions have served notice on the minister of railways that such a change will not be permitted and that the Socialist party, which is in control in the Reichstag, will not sanction it.

### Gas to Be Abolished on French Trains

LONDON.

M. le Trocquer, Minister of Public Works of France, has sent a circular letter to all railway companies instructing them to take immediate steps to abolish the use of gas in the lighting of trains. Gas lighting, he says, must be abolished on all express trains by January 1, 1923, and on all suburban trains by January 1, 1924. Returns are to be called for from railway companies showing from time to time how far the transformation of the lighting system has progressed. Coal fires for the heating of trains are to be done away with within a period of two years. The letter concludes by asserting that the directors of the companies will be held personally responsible in the event of accidents in any way attributable to neglect of this admonition. This is a sequel to the Batignolles tunnel accident, in which several coaches of a train caught fire and many persons were killed.

### Improvement in Service on Italian Railways

Passenger-train service on the Italian State Railways is to be greatly improved, according to Commercial Attaché MacLean, Rome. Beginning with November, the railway administration announced marked improvement in the running time of trains between Rome and other principal cities of Italy. The number of trains has been increased and schedules have been adopted which will eliminate delay in making connections. Beginning October 26, communication between Rome and Berlin was shortened by six hours, two trains following the Bologna-Bremer route and covering the distance in 40 hours, instead of 46 as heretofore.

To stimulate passenger traffic, the railways have instituted the sale of a document authorizing the purchase of tickets at half price on special groups of railway lines and also on steamship lines managed by the railways. These tickets are valid for three, six, or twelve months and for journeys not

exceeding 62 miles; also for journeys having no fixed limits, at special rates. Tickets are issued to two members of one firm at an increased cost of one-third.

### Operating Results of French Railways for 1920

LOSS.

The 1920 operating results of the six important railway systems in France, namely: the Nord; Est; Paris, Lyons & Mediterranean; Paris-Orleans; Midi, and Etat, have recently been made public. They show a very disastrous deficit, the average operating ratio for the entire six roads being 135 per cent, that for the State Railway being 153 per cent, which is the largest of the six.

The ratio of charges on capital to expenses for this period was 12 per cent. For the year 1920 the gross deficit resulting from operation and charges on capital for all six roads amounted to 3,007,500,000 francs, which at a normal rate of exchange is \$901,300,000. For the seven years, 1914 to 1920, inclusive, the total gross deficit amounts to 5,574,400,000 francs, or \$1,114,880,000, there having been a loss during each year of that period.

The following table shows the relative increases in numerous items of expense for the year 1920 as compared with the year 1913:

Increase in number of operative locomotives.....	5.8 per cent
Increase in power of operative locomotives.....	17.5 per cent
Increase in number of freight cars.....	15.5 per cent
Increase in capacity of freight cars.....	22 per cent
Increase in operating ratio.....	116 per cent
Increase in traffic receipts.....	167 per cent
Increase in passenger receipts.....	106 per cent
Increase in operating expenses.....	470 per cent
Increase in cost of wages.....	340 per cent
Increase in number of employees.....	40 per cent

\*This does not include receipts from the handling of war traffic.

In commenting on the results as disclosed by this return, the Revue Generale des Chemins de Fer et des Tramways says in part:

"The financial situation of the railways is serious. What will happen to them in the future? Are we justified, under present conditions, in anticipating an early increase of receipts or a reduction of expenses?"

"As regards the (1920) receipts, these were affected very severely by the strike in the month of May, and later, in the last months of 1920, by the falling off in traffic which was the natural consequence of the decreased industrial and commercial activity of the country. Some day this situation must improve and then a considerable increase in receipts may be looked for. But when will this be? No one can tell, and it would be rash to prophesy at a time when there is no sign of recovery.

"It appears, however, that a decrease in costs may be expected from the alterations in the mode of applying the eight-hours act, which the railways, in agreement with the Minister of Public Works and in conformity with the wish lately expressed by the Finance Commission of the Senate, have decided to make.

"Taking everything into account, it seems clear that the chance of a reduction in expenditure is greater than the chance of an increase. But this improvement in the financial situation of the railways can only be pursued and obtained on one condition, namely, that the credit which the companies now enjoy is maintained and consolidated and that nothing should be done to injure it.

"This credit remained intact during the whole period of the war and continues to be excellent in spite of the deficit burdening the railways. It is indispensable to the state, since the companies borrow partly on its account, and it will in future be all the more necessary to the companies on account of the fact that they will have to have recourse to numerous emissions of shares in order to improve and strengthen their plant and undertake the electrification of their lines. Any measure which would weaken the credit of the companies, increasing their burdens, would have a disastrous effect on their financial condition.

"Now this credit cannot be maintained in its present favorable situation and cannot be improved except by passing promptly the bill for the reorganization of the railways, at present before parliament. This bill, by settling the difficulties created by the war and putting an end to the temporary system under which the railways are at present being operated, gives the companies security for the future, and by that fact alone strengthens their credit. This bill will give confidence to capitalists and enable the companies to obtain the enormous capital they will require in order to meet the demands of traffic in the future."

## Equipment and Supplies

### Locomotives

THE COPPER RIVER & NORTHWESTERN is inquiring for 5 Mikado type locomotives.

THE GREEN BRIAR & EASTERN has ordered 1 Mikado type locomotive from the Baldwin Locomotive Works.

THE TAIWAN ELECTRIC POWER COMPANY is inquiring through Mitsui & Company, New York, for 2 light locomotives.

THE PITTSBURGH PLATE GLASS COMPANY, Zanesville, Ohio, has ordered from the American Locomotive Company, 1, 4-wheel switching locomotive. This locomotive will have 13 by 20 in. cylinders, and a total weight in working order of 65,000 lbs.

THE MEXICAN PETROLEUM COMPANY, 120 Broadway, New York, has ordered from the American Locomotive Company, 1, 4-wheel switching locomotive. This locomotive will have 14 by 22 in. cylinders, and a total weight in working order of 79,000 lbs.

### Freight Cars

THE MISSOURI PACIFIC is inquiring for the repair of 1,000, 30-ton box cars.

THE GREAT NORTHERN is inquiring for 500, 50-ton composite cars and 1,000, 40-ft. stock cars.

THE BELT RAILWAY COMPANY, Chicago, is inquiring for repairs on 300 National dump cars.

THE AMERICAN REFRIGERATOR TRANSIT COMPANY is inquiring for 100 refrigerator car steel underframes.

THE CHICAGO GREAT WESTERN is inquiring for repairs on 100 refrigerator cars and 150 National dump cars.

THE CHICAGO & ALTON has awarded a contract for the repair of 150 gondola cars to the Streets Company, Chicago.

THE CHICAGO, BURLINGTON & QUINCY inquiries call for 2,500 box cars, 3,000 general service, 500 stock, and 1,300 refrigerator cars.

THE LIVE POULTRY TRANSIT COMPANY, Chicago, has given a contract for 100 poultry cars to the American Car & Foundry Company.

THE CHICAGO, BURLINGTON & QUINCY has awarded a contract for the repair of 300 50-ton gondola cars to the General American Car Company, Chicago.

THE DELAWARE, LACKAWANNA & WESTERN, reported in the *Railway Age* of October 29 as inquiring for 500 box cars has ordered this equipment from the American Car & Foundry Company.

### Passenger Cars

THE GREAT NORTHERN is inquiring for 35 passenger cars.

THE CHICAGO & NORTHWESTERN is inquiring for 9 baggage cars, 5 combination baggage and mail, 20 coaches and 10 smoking cars.

THE CHICAGO, BURLINGTON & QUINCY inquiries call for 54 passenger cars, 5 chair, 12 baggage, 22 mail, 19 mail and baggage and 12 dining cars.

### Iron and Steel

MITSUI & COMPANY, New York, are inquiring for 900 tons of 16-lb. rail, also for 1,200 tons of 60-lb. rail and another lot of 700 tons of 60-lb. rail, all for export to Japan.

## Supply Trade News

THE F. C. RICHMOND MACHINERY COMPANY, 117 West Second street, Salt Lake City, Utah, has been appointed representative of the **Orton & Steinbrenner Company**, Chicago.

F. T. Coup in charge of the Milwaukee, Wis., office of the **Wagner Electric Manufacturing Company**, St. Louis, Mo., has been appointed district manager, in charge of its Cincinnati, Ohio, office, 20 East Ninth street.

THE COMBUSTION ENGINEERING CORPORATION, New York, recently opened two branch offices, one at 216 Latta Arcade, Charlotte, N. C., in charge of T. E. Nott and the other at Seattle, Wash., where the company is represented by the **Fryer-Barker Company**, 1133 Henry building.

**Manning, Maxwell & Moore, Inc.**, New York, will remove its Philadelphia, Pa., office during November from the Lincoln building, to larger quarters in the Pennsylvania building at Fifteenth and Chestnut streets. The company will also remove its Boston, Mass., office about December 1 from 10 High street to the Textile building, 99 Chauncey street.

### Pullman and Haskell & Barker Merger

Stockholders of the Pullman Company will hold a special meeting in Chicago on December 20, to vote on the following amendments to the charter of the company:

Increasing the capital stock from \$120,000,000 to \$135,000,000 and increasing the number of directors from nine to twelve and electing the same. To authorize directors to purchase all assets of the Haskell & Barker Car Company, Inc., and pay therefor \$275,000 in cash and 165,000 shares of the capital stock of the Pullman Company, and in case of adoption of the amendment increasing capital stock, authorize the board to issue and deliver direct to the Haskell & Barker Company 150,000 shares of the increase.

The \$275,000 cash payment is equal to \$1.25 a share on the Haskell & Barker stock, which, it is expected, will be distributed as an extra dividend.

### Trade Publications

**HIGH SPEED METAL SAWS.**—The Peerless Machine Company, Racine, Wis., has recently issued a circular containing a complete revision of list prices of its line of high speed metal saws. These prices mark a return to the 1918 basis.

**AIR LIFTS.**—The Sullivan Machinery Company has issued bulletin No. 71-G describing air lift pumping systems manufactured by that company. This is a revision and explanation of the previous bulletin covering the same subject. In addition to describing air lift pumping equipment, the bulletin gives extensive tables relating to hydraulic constants, pipes, and other mathematical information of value in connection with the solution of hydraulic problems.

**RADIAL WALL DRILL.**—The Pawling & Harnischfeger Company, Milwaukee, Wis., has recently issued Bulletin No. 206, describing its No. 6 radial wall drill which has been designed to meet the demand for a simple and effective machine for drilling, reaming and countersinking large unwieldy pieces. Examples of interior and exterior drilling of large steel drums and the drilling and reaming of structural material are shown in the bulletin, also dimension drawings.

**RAILROAD TAXES** in New Jersey are this year so high that the principal railroad companies have filed with the State Board of Taxes and Assessment, formal objections to the valuations of the board upon first and second class property. The assessment, as established by the board is \$415,773,910, which the roads say, is excessive. The board will give a hearing, but not before December 15. The assessment of \$415,773,910 is an increase of \$25,544,-

## Railway Construction

**ALASKA RAILWAY COMPANY.**—This company has applied to the Interstate Commerce Commission for permission to issue 2,500 shares of stock to provide funds for the extension of its main line from the present terminus.

**AMERICAN RAILWAY EXPRESS.**—This company will construct a one-story express building, 21 ft. by 100 ft., costing approximately \$25,000 at Lima, Ohio.

**ATCHISON, TOPEKA & SANTA FE.**—This company will construct a coal chute at Amarillo, Tex.

**CANADIAN PACIFIC.**—This company has awarded a contract to Anglin-Norcross, Ltd., Quebec, for the construction of a 17-story addition to the Chateau Frontenac, its hotel at Quebec. The structure will be of brick, stone and steel—fireproof construction—and will cost in the neighborhood of \$3,500,000.

**CHICAGO, OTTAWA & PEORIA.**—This company, in conjunction with the Chicago, Rock Island & Pacific, LaSalle county and the state of Illinois, contemplates the construction of a viaduct over its tracks and those of the Rock Island at Moriarity Hill, near Ottawa, Ill.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company has awarded a contract to T. S. Leake & Company, Chicago, for the construction of a mill building at Pratt, Kan.

**CHICAGO UNION STATION CO.**—This company is accepting bids for four water tube boilers to be installed in its boiler house at Chicago, two boilers to have not less than 6,000 sq. ft. of heating surface and the remaining two not less than 3,000 sq. ft.

**ILLINOIS CENTRAL.**—This company received bids on November 17, for the construction of a freight house at West Frankfort, Ill., to cost about \$50,000.

**ILLINOIS CENTRAL.**—This company is receiving bids for the construction of a frame storehouse at Clinton, Ill.

**MISSOURI PACIFIC.**—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for the construction of a pumping station and water treating plant at Fort Scott, Kan.

**YUCCA—BOULDER CANYON LINE.**—The construction of an electric railway from a point on the Atchison, Topeka & Santa Fe Coast Lines, near Yucca, Ariz., north to Boulder Canyon on the Colorado river, via Oatman, Ariz., and Katherine, is contemplated. G. P. Mohler of Needles, Cal., is interested in the project.

The Chateau Frontenac, the C. P. R. Hotel at Quebec, As It Will Look When Addition Noted Above Is Completed

## Railway Financial News

**BALTIMORE & OHIO.**—*Annual Report.*—The corporate income account for the year ended December 31, 1920, compares with the previous years as follows:

	1920	1919
Railway operating income (September 1 to December 31) .....	\$6,977,754	.....
Compensation accrued for federal control period (January and February, 1920; year 1919) .....	4,803,697	\$28,031,147
Guaranty (March 1-August 31) .....	15,189,722	.....
Total other corporate income .....	5,399,859	5,221,419
Gross corporate income .....	31,834,154	52,266,717
Interest on funded debt .....	21,960,591	19,640,622
Total deductions from gross corporate income .....	24,588,673	23,686,695
Net corporate income .....	7,245,481	8,580,022
Income applied in redemption of funded debt .....	3,500,000	.....
Income appropriated for additions and betterments .....	.....	1,750,190
Dividends on preferred stock (4 per cent per annum) .....	2,354,531	2,354,531

**CENTRAL OF NEW JERSEY.**—*Sells Coal Stock for \$32,500,000.*—This company has sold its 169,788 shares of Lehigh & Wilkes-Barre Coal Company stock to a syndicate among whose members are a number of minority stockholders of the coal company, some independent coal interest, and the Burns Brothers interests. The syndicate manager is Jackson E. Reynolds, vice-president of the First National Bank, who is a director of the coal company and has been identified with it for 20 years.

The total consideration to be received by the seller is, in round figures, \$32,500,000. The dates of payment of the instalments are December 6, 1921, July 1, August 1, September 1 and October 1, 1922. The first payment will be about \$10,000,000.

The sale of the Lehigh & Wilkes-Barre coal stock was in accordance with the United States Supreme Court decree of April 6, 1920. This decree dissolved the combination of the Reading Company, the Philadelphia & Reading Railway, the Philadelphia & Reading Coal Company, the Central Railroad of New Jersey and the Lehigh & Wilkes-Barre Coal Company.

**CHESAPEAKE & OHIO.**—*Dividends Resumed.*—This company has declared a dividend of 2 per cent., payable January 3 to stock of record December 2. This is the first payment made since December 31, 1920. From 1917 to 1920 the road's regular rate was 4 per cent annually, but on May 30, 1921, the company deferred action on the regular 2 per cent semi-annual dividend, due June 30.

**CHICAGO & EASTERN ILLINOIS.**—*Reorganization Plan Operative.*—Kuhn, Loeb & Co., reorganization managers, have given notice that the plan and agreement for the reorganization of the Chicago & Eastern Illinois, dated March 31, 1921, are now operative. The details of the reorganization plan were given in the *Railway Age* of April 8, 1921, page 913.

**CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.**—*Dividends Declared.*—This company has declared a regular quarterly dividend of 1½ per cent on the preferred stock, payable December 1 to stock of record November 22. A semi-annual dividend of 3 per cent and an extra dividend of 3½ per cent were declared on the common stock, payable December 27 to stock of record December 6. This extra dividend compares with 2½ per cent paid last June.

*Annual Report.*—The income account for the year ended December 31, 1920, compares with the previous year as follows.

	1920	1919
Operating revenues (March 1-December 31) .....	\$17,580,902	.....
Operating expenses (March 1-December 31) .....	13,935,513	.....
Net revenue from operations .....	3,645,389	.....
Taxes .....	519,487	.....
Operating income (January and February, 1920; year 1919) .....	3,822,225	.....
Standard return (January and February, 1920; year 1919) .....	590,173	\$3,541,040
Total non-operating income .....	134,359	119,043
Gross income .....	4,546,757	3,651,082
Deduct—rent for leased lands .....	1,215,954	1,134,571
Interest on equipment obligations .....	175,040	140,413
Total deductions from gross income .....	1,818,122	1,649,616
Dividends .....	.....	.....
5 per cent on preferred stock .....	122,670	122,670
13 per cent on common stock .....	398,730	388,730
Balance carried to credit of profit and loss .....	1,267,265	800,000

The revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919 as follows:

OPERATING REVENUES			
	1920	1919	
Freight .....	\$15,347,954	\$11,871,984	
Passenger .....	4,369,250	3,598,768	
Total operating revenues.....	\$21,118,821	\$16,313,686	
OPERATING EXPENSES			
Maintenance of way and structures.....	\$2,406,504	\$2,610,342	
Maintenance of equipment.....	5,699,341	5,188,286	
Traffic .....	361,039	275,589	
Transportation .....	7,893,040	6,922,979	
General .....	490,794	413,699	
	\$16,993,255	\$15,499,095	
Net revenue from operations.....	4,125,566	814,591	
Taxes .....	595,559	652,310	
Total operating income.....	3,527,855	155,596	
Miles of road operated.....	338	336	
PASSENGER TRAFFIC			
Number of passengers carried.....	1,762,132	1,635,023	
Number of passengers carried one mile.....	149,359,030	132,047,224	
Average distance hauled per passenger (miles).....	84.76	80.76	
Average receipts per passenger per mile (cents).....	2.93	2.73	
FREIGHT TRAFFIC			
Number of revenue tons carried.....	6,695,999	4,682,999	
Number of tons carried one mile.....	1,425,608,322	1,094,293,911	
Average distance hauled per ton (miles).....	212.90	233.67	
Average receipts per ton per mile (cents).....	1.08	1.09	

**DENVER & RIO GRANDE.**—*Stockholders' Suit for \$200,000,000.*—The stockholders' protective committee has caused to be served on former directors and officials of the company summons in a suit in the Supreme Court of New York to recover \$200,000,000 for alleged losses to the stockholders growing out of misfortunes of the road extending over a period of five years and ending in the sale of the property to satisfy a judgment. The defendants named are George J. Gould, Edward T. Jeffery, Arthur Coppel, Edwin Gould, Kingdon Gould, Edgar L. Marston, Benjamin F. Bush, Edward L. Brown, Edward D. Adams, Finley J. Shepard, Harrison Williams, Benjamin B. McAlpin, George G. Haven, Henry U. Mudge, James Horace Harding, Harry Bronner, Charles C. Huit, John H. McClement, Alvin W. Krech, Alexander R. Baldwin and the Denver & Rio Grande Railroad Company.

The complaint among other things specifically charges the following:

That in February, 1915, the defendants entered into a conspiracy to wreck the Denver & Rio Grande, and to cause all its properties to be wiped out and absorbed by adverse interests. That as an initial step the conspirators caused and permitted a default to be made in the interest payable March 1, 1915, on Western Pacific first mortgage, and although the Denver had ample cash and other resources to protect Western Pacific against such foreclosure they interposed an answer on the same day as suit for foreclosure was filed, admitting all the allegations of the bill.

Judgment demanded in the complaint is as follows:

(1) That the defendant and each of them be required to account for and to make restitution of all the moneys, properties and funds of the Denver & Rio Grande Railroad Company, of which the Denver & Rio Grande Railroad Company has been wrongfully and unlawfully dispossessed and divested, and for all loss and damages which the Denver & Rio Grande Railroad Company and its stockholders have sustained in the premises, aggregating \$200,000,000; and that the defendants be adjudged to account for and to pay to the defendant, the Denver & Rio Grande Railroad Company, or to these plaintiffs for the use of the Denver & Rio Grande Railroad Company the amount of said loss and damages.

(2) That the plaintiffs have such other and further relief as may be agreeable to equity and good conscience, besides the costs and disbursements of this action.

The complaint was prepared by Arthur M. Wickwire and Daniel W. Blumenthal, counsel for the protective committee.

Alvin W. Krech, president of the Equitable Trust Company, who is named as one of the defendants in the action, brought by the stockholders, made the following statement:

So far as concerned the claim that I conspired with the directors of the Denver Company or the directors of the old Western Pacific Company to cause these companies or either of them to default in the performance of their obligations, or to accomplish anything else to the detriment of those companies, there is not only no foundation for the statement, but the circumstances under which it has been made are such that I have no doubt whatever that its falsity is known to the attorneys filing this suit. Most of the matters set forth in the complaint have been before the courts in various proceedings. The entire claim so far as I am concerned is predicated on the theory that obligations assumed by the Denver and the old Western Pacific Company were not valid. As a matter of fact the validity of these obligations has been established and finally determined by the federal courts of this circuit, of the ninth circuit and of the eighth circuit.

**EDMONTON, DUNVEGAN & BRITISH COLUMBIA.**—*New Director.*—Vernon W. Smith, minister of railways for the province of Alberta, was, on November 22, elected a director. Mr. Smith succeeds Charles Stewart, former premier of Alberta, who resigned from the directorate when his party was defeated in the provincial election.

**HOCKING VALLEY.**—*Dividends Resumed.*—This company has declared a dividend of 2 per cent, payable December 31 to stock of record December 9. Although not declared as for a stated period, this dividend corresponds to the dividend which had been declared semi-annually before last June, when the usual declaration was omitted.

**LIVE OAK, FERRY & GULF.**—*Authorized to Abandon Line.*—This company has been authorized by the Interstate Commerce Commission to abandon a branch of its line 2 miles long in Taylor County, Fla.

**MISSOURI, KANSAS & TEXAS.**—*Reorganization Plan.*—See article on another page of this issue entitled "M. K. & T. Reorganization Plan Announced."

## Payments to Railroads

Payments by the Treasury to railroads on account of federal control and the Transportation Act of 1920 from July 1 to October 31, 1921, amounted to \$37,949,751, as compared with \$264,040,418 in the corresponding period of 1920, according to a statement issued by the Treasury Department.

## Tentative Valuations

The Interstate Commerce Commission has issued a number of additional tentative valuations. It finds that as of 1916 the final value of the property used by the East Jersey Railroad & Terminal Company was \$475,890 and the owned property \$359,390. For the Paris & Mt. Pleasant the commission found a final value as of 1918 of \$813,771. For the Rock Island Frisco Terminal, 1915, the final value of owned property was given as \$2,035,988 and of the used property \$2,089,674. For the Pickens Railroad as of 1916, the commission found a final value of \$126,426 and of the Virginia Southern as of 1916 a final value of \$127,551.

The tentative valuation of the Chicago, Indianapolis & Louisville as of 1915 gives a final value of the owned property, 509 miles, of \$27,272,707 and of the used property, 583 miles, which includes 64.8 miles of the Indianapolis & Louisville and 9.4 miles of the Indiana Stone Railroad, a final value of \$31,495,358. The stock of the leased lines is owned by the Chicago, Indianapolis & Louisville. Its outstanding capitalization as of the valuation date was \$33,710,930. The investment in road and equipment as stated in the carrier's books was \$37,225,989, but the commission says that if certain readjustments were made this would be reduced to \$36,424,870, of which \$27,453,353 represents the par value of securities issued or assumed. The cost of reproduction less depreciation of the owned property was placed at \$22,938,569 and of the used property at \$25,393,900. The company also owned securities of non-carrier companies of a par value of \$5,832,353 and a book value of \$4,013,296.

## Dividends Declared

Canadian Pacific.—Common, 2½ per cent, quarterly, payable December 31 to holders of record December 1.

Chesapeake & Ohio.—2 per cent, payable January 3 to holders of record December 2.

Chestnut Hill.—\$0.75, quarterly, payable December 5 to holders of record November 20.

Cincinnati, New Orleans & Texas Pacific.—Common, 3 per cent; common (extra), 3½ per cent; both payable December 27 to holders of record December 6. Preferred, 1¼ per cent, quarterly, payable December 1 to holders of record November 22.

Hocking Valley.—2 per cent, payable December 31 to holders of record December 9.

Philadelphia, Germantown & Norristown.—\$1.50, quarterly, payable December 5 to holders of record November 20.

Trenton Railroad.—(Special), \$1, payable December 1 to holders of record November 19.

On July 31, 1921, the Interstate Commerce Commission had 1,919 employees under the classified civil service; the Railroad Administration had 1,327 and the Labor Board had 76.

**ASBESTOS ROCK** to the amount of 3,123,370 tons was mined in the province of Quebec during 1920, according to the annual report of the Department of Mines. From this quantity 170,500 tons of merchantable fiber was secured. Of this amount only 1,026 tons were rated as Crude No. 1, but this class alone was valued at \$1,513,439. The total value of asbestos products was \$14,749,048.

## Railway Officers

### Executive

**Edward W. Mason**, general manager of the Western Pacific, has been elected vice-president and general manager in charge of operation and maintenance. **Charles Elsey**, treasurer of the company, has been elected vice-president and treasurer in charge of finance, accounting, real estate and insurance.

**D. W. Pontius**, general manager of the San Diego & Arizona, with headquarters at San Diego, Cal., has been elected vice-president and general manager of the Pacific Electric, a subsidiary of the Southern Pacific, with headquarters at Los Angeles, Cal., to succeed H. B. Titcomb, who has been elected president of the Southern Pacific of Mexico and the Arizona Eastern, as noted in the *Railway Age* of September 24 (page 600). Mr. Pontius has been connected with the Southern Pacific for about thirty years, filling successively the positions of telegraph operator, station agent, trainmaster and district freight and passenger agent. From 1908 until February 1, 1911, he was traffic manager of the Los Angeles Pacific Railway, and then, with the consolidation of the seven electric lines in southern California to form the Pacific Electric, he became traffic manager of the latter company. In December, 1917, he was elected general manager of the San Diego & Arizona, which position he was holding at the time of his recent appointment.

### Financial, Legal and Accounting

**F. M. Angellotti** has been appointed general counsel of the Western Pacific, succeeding **A. R. Baldwin**, who has been elected president of the Western Pacific Railroad Corporation. **W. G. Bruen** has been appointed secretary, succeeding **Charles Elsey**, who has been elected vice-president.

### Operating

**A. W. Thompson** has been appointed car accountant of the Louisville & Nashville, with headquarters at Louisville, Ky., succeeding **Edward L. Hill**, whose death was noted in the *Railway Age* of October 29 (page 858).

**A. T. Mercier**, superintendent of the Portland division of the Southern Pacific, with headquarters at Portland, Ore., has been appointed general manager of the San Diego & Arizona, with headquarters at San Diego, Cal.

**B. B. Hickman**, general agent, freight department, of the Terminal Railroad Association of St. Louis and the St. Louis Merchants Bridge Terminal Railway, has been promoted to general superintendent of the latter company, succeeding **J. A. Mathewson**, promoted.

**C. H. Buford**, superintendent of the Sioux City and Dakota division of the Chicago, Milwaukee & St. Paul, with headquarters at Sioux City, Iowa, has been transferred to the Terre Haute division (formerly the Chicago, Terre Haute & Southeastern Railway), with headquarters at Terre Haute, Ind., succeeding **M. J. Griffin**, who has been appointed assistant superintendent of that division. **E. F. Rummel**, assistant superintendent of the Chicago Terminal division, will succeed Mr. Buford, and will be succeeded by **N. A. Meyer**, who is at present assistant superintendent of transportation of lines east of Moberidge, S. D.

**C. F. Donnatin**, whose promotion to superintendent of the San Joaquin division of the Southern Pacific, with headquarters at Bakersfield, Cal., was announced in the *Railway Age* of October 15 (page 743), first entered the service of that road as a call boy and was soon promoted to station agent and telegrapher. From that position he was transferred to the construction department as a brakeman. After

working in that department for some time, he was transferred to the operating department, and was later promoted to conductor. Since that time he has been promoted successively to yardmaster, trainmaster, and assistant superintendent of the Los Angeles division, with headquarters at Los Angeles, Cal., which position he was holding at the time of his recent promotion.

**John A. Mathewson**, whose appointment as general manager of the Terminal Railroad Association of St. Louis, was announced in the *Railway Age* of November 19 (page 1018), was born in 1866 at Sardinia, New York. He entered railroad service at the age of 15, in the machine shops of the Grand Rapids & Indiana. His next railroad position was with the Northern Pacific, for which road he worked as a switchman, and he held the same position at different times for various other roads, including the Michigan Central, the Grand Trunk and the Chicago, Rock Island & Pacific. He entered the service of the Terminal Railroad Association of St. Louis, 26 years ago as a switchman, and was promoted successively to yardmaster, trainmaster and, in 1918, to superintendent of the St. Louis Merchants Bridge Terminal Railway, a subsidiary company, which position he was holding at the time of his recent promotion.

### Mechanical

**G. W. Lillie** has been appointed superintendent of motive power of the Denver & Salt Lake, effective October 16, succeeding **M. B. McPartland**, resigned to enter the service of another railroad company.

**G. E. Passage**, assistant division master mechanic of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., has been promoted to master mechanic of the Terre Haute division, with headquarters at Terre Haute, Ind., succeeding **J. A. Richards**, who has been assigned to other duties.

### Engineering, Maintenance of Way and Signaling

**William Gerig**, assistant chief engineer of the Alaskan Engineering Commission, has resigned to engage in private engineering practice.

**George H. Harris**, whose appointment as assistant chief engineer of the Michigan Central, with headquarters at Detroit, Mich., was announced in the *Railway Age* of November

G. H. Harris

19 (page 1018), was born at Toledo, Ohio, on July 17, 1878. Upon leaving the University of Michigan in 1902, he entered the employ of the Pennsylvania on its Chicago Terminal division. He left that road in 1903 to become an assistant division engineer of the Michigan Central with headquarters at Jackson, Mich., and, in 1905, he was promoted to division engineer with headquarters at Niles, Mich. From 1907 to 1910 he was in charge of the grade separation work of the Michigan Central and the Chicago, Rock Island & Pacific, at Joliet, Ill. He was appointed division engineer at St. Thomas, Ont., in 1910, and was transferred to Detroit, Mich., in 1912. In 1914 he was promoted to engineer of track and maintenance of way and from 1917 to 1919 he acted as assistant chief engineer, with headquarters at Detroit, necessitated by **J. F. Deimling**, assistant chief engineer, becoming acting chief engineer during the absence of **Colonel Webb** in military service in France. He returned

to his former position in May, 1919, in which capacity he was serving at the time of his recent promotion.

**James F. Deimling**, assistant chief engineer of the Michigan Central, with headquarters at Detroit, Mich., has been promoted to chief engineer with the same headquarters, succeeding Col. Geo. H. Webb, whose death was noted in the *Railway Age* of November 12 (page 964). Mr. Deimling was born on November 18, 1867. He entered railroad service in March, 1886, as a rodman on the Missouri Pacific, which position he left in September of that year to become assistant engineer with the W. V. McCracken Construction Company. He re-entered railroad service in November, 1887, as assistant engineer of the Chicago & West Michigan, with headquarters at Grand Rapids, Mich., and in 1890 he was appointed assistant engineer of the Detroit & Lansing, which position he held until March, 1897, when he became engineer maintenance of way, of the Lake Superior & Ishpeming, and chief engineer of the Marquette & Southern. He entered the service of the Pere Marquette on June 1, 1904, and was, successively, track engineer with headquarters at Detroit, until July 1, 1905, and division engineer maintenance of way with headquarters at Grand Rapids, until February, 1906, at which time he was promoted to chief engineer with headquarters at Detroit. In October, 1912, he resigned to become engineer of construction of the Michigan Central, with headquarters at Detroit. In December, 1913, he was promoted to assistant chief engineer, which position he was holding at the time of his recent promotion. Mr. Deimling served as acting chief engineer from June, 1917, to May, 1919, during Colonel Webb's absence due to war service.

J. F. Deimling

### Traffic

**George F. Meighan** has been appointed traffic manager of the St. Louis & Hannibal, with headquarters at Hannibal, Mo.

**Charles Hamilton** has been appointed district passenger agent of the Wabash, with headquarters at Philadelphia, Pa., effective November 15.

**Charles W. Barber** has been appointed general agent in the traffic department of the Akron, Canton & Youngstown, and the Northern Ohio railways, with headquarters at Pittsburgh, Pa.

**S. R. Stevenson** has been appointed general agent, freight department, of the Terminal Railroad Association of St. Louis and the St. Louis Merchants Bridge Terminal Railway, succeeding B. B. Hickman, promoted.

**George Linn** has been appointed grain agent of the New York Central (Buffalo and East) with headquarters at New York. He will also be responsible for the operation of the New York Central and West Shore grain elevators in New York Harbor, effective November 1.

### Purchasing and Stores

**S. J. DeGraeff** has been appointed storekeeper of the Southern Pacific of Mexico with headquarters at Empalme, Sonora, Mexico.

**F. G. Prest**, purchasing agent of the Northern Pacific, with headquarters at St. Paul, Minn., has been made director of purchases, a newly created office, with the same headquarters,

and R. J. Elliott, assistant purchasing agent with headquarters at St. Paul, Minn., will succeed Mr. Prest.

### Obituary

**H. J. Phelps**, general passenger agent of the Illinois Central, with headquarters at Chicago, died at his home in that city on November 20.

**Axel S. Vogt**, formerly mechanical engineer of the Pennsylvania, Eastern lines, died on November 11 of heart disease. Mr. Vogt was born on January 19, 1849, at Christianstad, Sweden, and was educated in the public schools. He began railway work in June, 1874, with the Pennsylvania at Altoona and remained with that road until 1882, when he went with Schutte & Koehring, Philadelphia, Pa. In November, 1883, he returned to the service of the Pennsylvania as assistant engineer of tests. On March 1, 1887, he was promoted to mechanical engineer, and remained in that position until February 1, 1919, when he retired. Since his retirement he was connected with the Baldwin Locomotive Works for a short time in an advisory capacity.

Axel S. Vogt

**Edward A. Chenery**, superintendent of telegraph of the Missouri Pacific, with headquarters at St. Louis, Mo., whose death was mentioned in the *Railway Age* of November 12 (page 964), was born on the Atlantic Ocean on October 17, 1859. He entered railroad service as a telegraph operator on the Grand Rapids & Indiana in November, 1872. He continued in that capacity until January, 1879, when he entered the service of the Galveston, Harrisburg & San Antonio, with which company he was successively telegraph operator, dispatcher, car accountant and secretary to the general superintendent. In June, 1886, he resigned to become secretary to the general superintendent of the Union Pacific, with headquarters at Omaha, Neb. The following year he became superintendent of telegraph of the Terminal Railroad Association and the St. Louis Merchants Bridge Terminal Railway, with headquarters at St. Louis. In May, 1903, he left the above companies to become superintendent of telegraph of the Missouri Pacific, which position he was holding at the time of his death. During the federal control of the roads, Mr. Chenery was general superintendent of telegraph of all the lines in the southwestern region with headquarters at St. Louis. For many years, Mr. Chenery was actively engaged in the work of the Association of Railway Telegraph Superintendents and served as its president during the year 1905-1906. Since the activities of this Association have been incorporated under the Telegraph and Telephone Section of the American Railway Association, he has been a member of the Committee of Direction.

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, for the year other than New York, payable in advance at postage rates of the United States, Mexico and Canada, \$6.00. Foreign countries (except daily editions), \$8.00. Foreign subscriptions may be paid through our London office in 2 s. d. Single copies, 25 cents.

WE GUARANTEE that of this issue, 8,750 copies will be sent, that of the 8,750 copies 7,975 were mailed to regular subscribers; 54 were provided for counter and news company orders; 21 were mailed to advertisers; 65 were mailed to contributors; 337 were provided for new subscribers; 8,000 copies list in the mail and office use; that the total copies for the year is due were 483,003, an average of 8.75 copies a day.

The Ryerson-Conradson Motor Drive eliminates all belts, tension idlers and chain drives with their consequent trouble and inefficiency.

## A Flood of Repair Work

There are over 12,500 locomotives awaiting repairs that will take over 24 hours.

Are the shops ready to care for such a flood with increasing traffic and winter ahead?

In the Ryerson-Conradson Railroad Lathe is a modern tool such as every shop needs for quick, low cost locomotive repairs.

Rapidity of output is a controlling feature of design.

For example, all gears are constantly in mesh, so speed and feed changes can be made without stopping the machine or fear of stripping gears.

Such advantages speed locomotive repairs.

One problem confronting the executives of the small railroads and, in a certain measure, the heads of the large roads as well, is to find lines of advancement

**Are You Making  
A Place  
For Yourself?**

for men whose work has been confined to certain special fields. This predicament also arises with respect to the regular operating positions when a man of exceptional ability develops faster than the other members of the staff. Some executives have solved this problem by a ruthless elimination of the less brilliant superior to make room for his more intelligent and aggressive subordinate, but except in cases of demonstrated incompetency this policy cannot be pursued consistently without becoming a bad influence on the esprit de corps. A more reasonable way to extend opportunity for promising material is to afford a greater scope of usefulness by a gradual widening of authority and responsibility. In short, make the place fit the man. A trainmaster may be given the title of assistant superintendent; a roadmaster may take over the duties of trainmaster in addition to his own, or a bridge engineer may be made principal assistant engineer with certain added responsibilities. As a matter of fact, this is being done and has been done for a long time and explains in part the diversity in the forms of railway organization in this country. The lesson in this to the aspiring young officer who feels that he is hiding his light under a bushel is to take the initiative in widening his own responsibilities, by doing more than is expected of him whenever the opportunity offers insofar as this may be done without causing friction in the organization to which he belongs.

Among the remarkable figures given in the report on the proposed superpower system are those dealing with the maintenance of electric locomotives.

**Electric vs.  
Steam Locomotive  
Maintenance**

The cost of repairs, including engine-house expenses, for steam locomotives is assumed to average 42.6 cents per locomotive mile. For the electric locomotive equated to the same weight on drivers, a comparative figure of 8.26 cents per mile is given, or less than one-fifth the cost for the steam locomotive. The data from which the cost of maintenance of the electric locomotives was derived pertained only to direct current installations and included a total of but 196 locomotives. There is reason to doubt whether these figures are truly representative of what may be expected in extensive electrification. The conditions on the roads selected are probably unusually favorable for economical maintenance. This seems to be borne out by a comparison with roads whose maintenance figures are not given in the report. The maximum repair cost per mile shown for any of the electric locomotives included in the report is 16.7 cents, but for three roads not cited the cost in 1919 was 18.7 cents, 41.4 cents, and \$1.44 per mile, respectively. The last figure shows conclusively that electric locomotives are not always notable for their low maintenance costs. To use this as typical would be unfair, but it is likewise unfair to compare the maintenance of electric locomotives on short runs and in passenger service with that of steam locomotives in all classes of service. Most of the electric locomotives have been in use such a short period that

repairs are still lower than normal. It is difficult to prove just what the relative repair costs would be on a fair basis of comparison but the authors of the superpower survey must furnish additional evidence before their claim that the cost of maintenance of electric locomotives is one-fifth the cost for steam locomotives can be accepted as fact.

In dynamic times like the present, real accomplishment along lines not pressing daily for solution is only too likely to pass unnoticed. The improvement in dining car service on a number of roads in recent months is a case in point.

**Improved  
Dining Car  
Service**

The same or better meals at lower prices are being offered to the traveling public on a number of roads, so that now it is possible for a traveler to dine quite as well at the same or less cost than he could at the average restaurant of the better class. Few railroad officers are ignorant of the fact that good dining car service is a builder of business. They should not fail, therefore, in spite of the pressure of other business to recognize and appreciate improvement when their dining car departments bring it about. There seems to be a tendency in the direction of the table d'hôte and plate dinners and more moderate prices in place of the rather expensive à la carte service. The popularity of these innovations can easily be proved by talking with the passengers on any road where they have been put into effect. The interest and appreciation of superior officers doubtless have gone a long way in assisting the dining car departments to bring about these changes. Further improvement is possible on some roads and the subject is one which commends itself, at least from time to time, to the attention of every supervising officer.

During the last two weeks in October of this year the railroads of the United States handled over 95 per cent of the maximum number of car loads of freight they ever moved. In fact in the St. Paul-Minneapolis terminals and in numerous other areas, the traffic actually exceeded that of the record period

**The Lessons  
Of A Year  
Ago**

of a year ago. This traffic was moved with an ease which stood out in marked contrast with the congestion which threatened to paralyze the transportation industry of the country in the fall of 1920. This year's record was made with a much smaller number of cars in service and with a quarter of a million less employees. This indicates that the lessons of the congestion of a year ago have not been forgotten and that the measures which were introduced at that time are still effective. It would be unfortunate indeed if the roads should forget those lessons which they learned during the period of the most intensive operation in their history and lapse back into their old practices. Conditions then forced the roads to exert every effort to move traffic expeditiously to prevent blockades. Economical operation requires adherence to those same methods now. The increasingly urgent demand for the reduction in rates can be met only by the adoption of every possible means for promoting

economy in operation: Railway officers must of necessity keep their organizations on the alert during the period of normal annual seasonal decline in traffic, which we are now entering, to insure that equally economical operation is secured as the pressure of traffic is relieved.

Great Britain has little cause for complaint on the score of her exports of railway equipment and supplies. In September of this year her exports of locomotives were valued at \$3,843,896, while for the same month last year they totaled only \$1,913,965 in value. During the same month of the current year the exports of locomotives from the United States were valued at \$1,493,050 as against \$4,105,405 in September, 1920. Thus in the short space of a year Great Britain has, in the face of a world-wide depression, greatly increased her exports of locomotives while our exports, which a year ago were much greater than those of Great Britain, have fallen off sharply. In the matter of freight cars and trucks Britain has not been quite so fortunate—September of this year showing \$2,535,180 as against \$3,269,390 for September, 1920—but even in this the decline is much less marked than that in American freight car exports. The secret of Britain's success as an exporter of railway materials and supplies is not hard to find—British capital is invested heavily in foreign railways and British railway men operate a large proportion of the railway mileage in foreign countries, especially in South America. It would be difficult to persuade an American that our extensive methods of railroading, and equipment designed to meet such operation, are not better suited to most of these countries than are Britain's intensive methods and "dinky" equipment. British investors have not hesitated, however, to put their savings into foreign railways and it is fair to expect that these British owned and operated roads should purchase equipment of British design. Such action is, moreover, cumulative—in favor of the British manufacturer. Mere envy of the success of Britain's leadership in the foreign railway field, however, is valueless. What we must do if we want an extensive foreign business is to emulate her example in financing and operating railways in foreign countries.

The reorganization plan of the Missouri, Kansas & Texas announced last week (*Railway Age*, November 26, page

1043) reduces the fixed interest bearing debt of the old company from \$146,543,142 to \$100,320,913. The reorganization fixed interest charges are reduced from \$7,429,376 (inclusive of sinking fund payments) to \$4,917,717. The plan proposes, in addition, the issuance of \$57,500,000, 5 per cent, convertible adjustment mortgage bonds bearing a contingent interest charge of \$2,875,000 cumulative from January 1, 1925. This reorganization plan is regarded as conservative. It relates to a railroad the operations of which have been characterized recently by marked progress. It is hardly necessary to discuss of what this progress has consisted as an effort was made to point it out in the columns of this paper in the articles entitled "Progress of Missouri, Kansas & Texas Since 1913," which appeared in the issues of June 10, 1921, page 1321, and June 17, 1921, page 1385. It is interesting to bring the facts up to date in a measure by noting that the net railway operating income for the Missouri, Kansas & Texas itself in the first nine months of 1921 was \$4,490,887 as compared with \$3,285,619 in the first nine months of 1920. The Missouri, Kansas & Texas of Texas, which incidentally had a standard return of about \$600,000, in the first nine months of 1921 had a net railway operating in-

come of \$1,677,038. In the first nine months of 1920, the Texas lines had a deficit of \$6,616,599. The M. K. & T. itself, for the nine months had an operating ratio of 80.1; its transportation ratio was but 36.6. The road at present is handling considerably less business than it was handling at this time last year. Nevertheless, it has succeeded in keeping up its train load and even exceeding the average for 1920, the latter fact being particularly true of the Texas lines. Bad-order cars on November 1 averaged but 7.1 per cent as against an average for the country of 15.0 per cent. These are merely a few of the outstanding facts, but they are sufficient to augur well for the operations of the road under the proposed plan.

There is a wide field for the greater use of milling machines in railroad shops where the work involves duplicate machine operations on many locomotive and car parts. The milling machine is particularly adapted for this work because of the large proportion of power actually used in removing metal, the continuous cutting action, and the high production of milling cutters each of which has numerous cutting points and edges. Both high production and accuracy of work are features of the modern milling machine which is designed to stand up under heavy cuts at high speeds. A four-head, planer type miller recently installed in the Beech Grove shops of the Big Four is used for milling the shoe and wedge ways on locomotive driving boxes, an operation performed in one-quarter of the time formerly required on a planer. Crosshead shoes, assembled in the crossheads, are milled in approximately one-third of the time formerly required. Before installing the milling machine four planers were kept busy on driving boxes and crossheads, but this work is now done on the miller in three days a week, the machine being free the remainder of the time for other work. It is unnecessary to point out the resultant saving in labor cost and there is also a considerable saving in floor space. The results secured are a strong argument for the installation of milling machines in many shops where the machine departments are not only congested but prove the limiting factor in shop output. The above conclusions do not in any way indicate that the day of the planer as an efficient, effective tool for performing certain machine operations has passed. For many operations the planer is the more adaptable tool and in other cases it would be difficult to get milling cutters of the required shape to perform the particular operations desired. Then, again, where only a single part is to be machined or where possibly the number of duplicate machine operations is small, it would not pay to make or buy milling cutters and adjust them in a milling machine. Experience has demonstrated, however, that the use of planers in repair shops for planing large numbers of driving boxes, crossheads, shoes and wedges and similar work is decidedly uneconomical. For machining these parts in quantity at a minimum cost of labor and time the milling machine is by far the more efficient tool.

In view of the growing demand for electrical power for the illumination of stations, the operation of pumping plants and similar purposes, it is becoming increasingly advisable for the railroads to look well into the future when providing power. As an example, one road has designed its signal transmission line to provide sufficient additional power for the illumination of the stations in the smaller towns, the lighting of a number of the switch lamps and a reserve for emergency lighting at accidents and washouts. At another point

### Britain's Equipment Exports

### Production Milling Operations

### Electrical Power Distribution

on this same road a coal chute is operated by a 15 h.p. motor connected to the signal power line. If a transmission line is being planned it is necessary that these additional power requirements be considered to provide sufficient capacity to prevent an excessive reduction in the line voltage when the motor is starting, for otherwise the automatic block signals might be released momentarily to the "stop" indication. The load factor, the distance from the motor to the sub-station and the power capacity available, are all questions entering in the problem. The economies resulting from the use of automatic electrically-controlled machinery at isolated points are so large as to warrant thorough investigation. It would, therefore, appear advisable to call a conference of the several officers concerned before any transmission line is designed.

## The Railroads Must Defend Themselves Better

NO CAREFUL OBSERVER can doubt that public opinion is much less friendly to the railways than two years or even one year ago. The change which has occurred is illustrated by the alteration in the attitude of public men in Washington, by what many newspapers are saying and by what many people outside the railroad business are saying in private conversation.

Everybody is criticising the present rates of the railways. Some publications and persons recognize the fact that high labor and other high costs have made the present rates necessary, and that substantial general reductions of rates will be impracticable until costs of operation are reduced. Unfortunately, however, many publications and persons not only do not recognize the actual facts regarding the situation, but either willfully or ignorantly misrepresent them. Never in ten years has there been so much misleading or downright false propaganda disseminated against the railways as now. It is being charged throughout the country that the salaries of their officers are grossly excessive; that they are wasting hundreds of millions of dollars through grafting contracts with outside concern; that the valuation placed on their properties by the Interstate Commerce Commission is \$5,000,000,000 to \$7,000,000,000 too much, and that they are being guaranteed by the government, and are actually receiving a 6 per cent return on "watered" capitalizations and valuations. These and almost innumerable other fabrications have been put in circulation and are being persistently repeated. The effects being produced on public sentiment are bad.

This propaganda is coming mainly from two general sources. It is coming, first, from men like Clifford Thorne and Glenn E. Plumb who make a living by misrepresenting railway affairs, and from public men such as Senator La Follette whose political stock in trade consists of misrepresentations of all large industries, especially the railroads. It is coming, secondly, from the heads of the railway labor organizations and from literally hundreds of thousands of railway employees whose purpose is the promotion of the Plumb plan. Many persons who were not receptive to this kind of propaganda a few months ago have been made receptive to it by antagonism to the railways which they first began to feel because they believed that high railway rates were injuring them.

It is to the selfish interest of the entire nation that this malicious, false and selfish propaganda against the railways be refuted. It is especially to the interest of the owners and managers of the railways that it be refuted. And, in fact, it is being refuted. But, unfortunately, those who are engaged in spreading this propaganda are far more numerous, and are working actively in many more

communities, than are those who are answering it. Therefore, the propaganda is daily becoming more wide-spread and effective.

The *Railway Age* has said before, and now earnestly repeats, that the remedy is available to the managements of the individual railways and should be applied chiefly by them. Various organizations of the railways, most of them branches of the Association of Railway Executives, are engaged constantly in preparing data and arguments which completely refute the reckless calumnies constantly being circulated by those who desire to destroy private ownership and management of railways. The trouble is that not enough is being done through the organizations of most of the individual railways to get the facts about the railway situation presented to the people in their territories. Thousands of the employees of almost every railway are assiduously engaged in poisoning public sentiment in their various communities. In most cases the managements of the railways are doing little or nothing to supply an antidote for this poison.

There are railways in every part of the country which, through special departments established and maintained for that purpose, are doing effective work to nullify the effects of the anti-railroad propaganda being carried on. This ought to be true, however, not merely of only part, but of all of the railways. Not a single false or misleading statement regarding railway management or railway regulation should be allowed to be published anywhere without an answer to it being promptly sent to the paper in which it appears, with a request for publication of the answer. But there are literally thousands of such misrepresentations appearing in the press, not only every month or every week, but almost every day, and a few men scattered here and there cannot possibly answer them all. The amount of work done to get to the public the truth about the railroads ought to be equal to the amount of work done to get to it misrepresentations of them, but it is not anywhere near equal to it.

The preponderance of the propaganda against the railways over that being carried on in their defense is so great that it is becoming a serious menace to all fair and reasonable regulation, and to private ownership and management. The duty of the railway managements to the owners of their securities, and their duty to the public, demand that many of them shall awaken to the situation that is developing and deal with it more effectively.

## Tonnage vs. Net Earnings

THE MEASURE of success which a management achieves in the operation of a railway property is reflected in the minds of its stockholders and the public at large by its net operating income, rather than by the amount of traffic which it handles. Obviously this income is dependent upon the difference between the amount which the road receives for the transportation of the various commodities and what it costs to haul them. As a common carrier, a road must of necessity try to handle all traffic that is offered to it. However, a large part of the tonnage of almost every road is competitive and is secured by direct solicitation. It is in the selection of the traffic which it sets out to solicit that a road can exercise a discretion which will be reflected in its net earnings. The traffic department can do much to promote the interests of its road in such matters. Unfortunately, the success of this department as a whole and that of its individual solicitors is too often measured by the amount of tonnage secured rather than by the profit which the road can earn from it. One of the most marked evidences of this incorrect viewpoint prior to federal control was the active solicitation of traffic for movement over other than the most

direct or economical routes. From the standpoint of the public any such movement which adds to the cost of transportation constitutes an economic loss. While it is true that the out-of-pocket cost of handling such traffic, in addition to that already moving, is less than the average of all, an analysis of this indirect movement of traffic will show many instances where such freight is being hauled at an actual loss to the road on even this basis. With unified control and the elimination of competition during the war, the incentive for such routing was eliminated and it was greatly reduced. Since the return of the roads to individual competitive operation, this tendency has again asserted itself and the limited traffic during the current year has given it added impetus. The result is that some of the old practices are again in vogue. This condition calls for increased supervision by executive and traffic officers to eliminate this waste and to promote the interests of the roads themselves. It also calls for the recasting of the units of measure of the success of the traffic solicitors in order that profit from transportation rather than tonnage shall be the primary consideration.

## The Evolution of Contract Agreements

THE CONSTRUCTION contract is the product of evolution. In the early days of modern construction work, the contract form was the work of the individual and such semblance of uniformity as prevailed at that time arose from the fact that few men are of a truly original turn of mind with the result that they abstracted largely from each other's documents. As organizations of architects and engineers were formed, a natural development was the drafting of uniform contracts to meet the common opinion of the men engaged in a particular class of construction. Classic illustrations of this are the uniform contracts of the American Institute of Architects and of the American Railway Engineering Association. The best thought of groups of men interested in these two classes of work was brought to bear in establishing certain standards of practice and while the resulting instruments are not used in their entirety by all persons naturally falling within these two groups, they have had profound influence in thoroughly establishing certain usages.

A step further in advance has been the co-operation between builders and architects as carried out in some of the larger cities through the promulgation of uniform contracts which now have the formal recognition of established bodies representing both of the parties to such agreements, and because of the high degree of standardization now obtained as regards particular classes of work, the contractor is afforded a reasonably well-established understanding of what is expected of him.

A new situation has arisen because of the development in more recent years of a class of large contractors who engage in many kinds of construction. More recently the dearth of railway construction and the enormous growth of highway building has led many firms of railway contractors to take up highway work. As a consequence, many contractors are now compelled to deal with a variety of contract forms and have thus been brought face to face with a need for a still greater degree of standardization of contract agreements. This has given rise to the organization of a joint committee on standard contract forms to be comprised of representatives of both the designers and builders in all lines of work who will combine their efforts in an endeavor to formulate standards for those portions of the construction agreements which are applicable to all classes of work.

It is believed that representatives of the American Railway Engineering Association and the railway contractors will play an important part in this work. In no class of large scale construction has practice been more thoroughly established by accepted usage over a greater period of years.

The representation of railway men and railway contractors should, therefore, be of distinct value on this committee. At the same time, the railways can derive no small degree of benefit from the work that such a committee can do through the greater degree of uniformity in the contracts which individual railways now use in the carrying out of work of different classes.

## New Books

*Proceedings of the American Wood Preservers' Association for 1921.* 590 pages. Illustrated. 6 in. by 9 in. Bound in cloth. Published by the American Wood Preservers' Association, George W. Hunt, secretary, Madison, Wis.

This volume contains the proceedings of the seventeenth annual meeting which was held at the Hotel St. Francis, San Francisco, Cal., on January 25-27. Among the reports included in these proceedings which are of particular interest to railway men were those on the effect of the zinc chloride process of preservation on the strength of timber, the service tests on treated ties, the layout of switch-tie yards, and inspection. Of particular interest and value was the elaborate report on the San Francisco Bay marine piling survey in which were included the results gained up to that time from the detailed study of the action of various forms of wood-boring insects on piling in railway and other docks in that harbor. The proceedings also include a large amount of data regarding the quantity of wood treated and the preservatives used in the United States during 1920.

*Waste In Industry.* By the Committee on Elimination of Waste in Industry of the Federated American Engineering Societies. 409 pages, illustrated, 6-in. by 9-in. Bound in cloth. Published by the McGraw-Hill Book Company, New York.

As indicated by the title, this book deals with the problems of industrial waste, and includes in detail the report of the committee of the Federated Engineering Societies on this subject. The results of the committee's investigations and their findings are presented in three parts which consist of a summary of the reports; six chapters covering the six industries of building construction, men's ready-made clothing, boot and shoe, printing, metal trades and textile; and seven chapters dealing with various classes of labor problems, safety first problems, health conservation and other general matters. The reports indicate that wastes in industry are due chiefly to low production resulting from faulty management; interrupted production; restricted production brought about by labor or managements; and lost production caused by accident, ill health, etc. While not covering the railway field directly there is much of interest to the railway man for the reason that many of the wastes in each industry show somewhat of a general similarity, and thus may apply in varying degrees to conditions in the railway work.

*Code Numbers on Interline Forms.* December 1921 Edition. 20 pages. 6 in. by 9 in. Bound in paper. Published by Railway Accounting Officers Association, 1116 Woodward Building, Washington, D. C. Price 5 cents.

This booklet is a list of the code numbers devised by the Railway Accounting Officers Association and intended to be printed on the various interline forms just preceding the name of the carrier issuing the form. The code numbers assist in the sorting of interline forms and eliminate many possibilities for error which exist by reason of the similarity of names. The use of the code numbers will eliminate the labor of coding by those carriers that need such information when using mechanical devices and the code number of the carrier issuing the form, when printed as indicated, will tend to eliminate errors which might otherwise be made by code clerks.

## Letters to the Editor

*[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]*

### The Golden Rule in Railway Work

PENNSYLVANIA.

TO THE EDITOR:

The communication entitled "Big Stick vs. Golden Rule" which appeared in your issue of November 26, was read with much pleasure. In my opinion it struck the right note in the present industrial situation. The writer had the privilege, some weeks since, of addressing a meeting of subordinate officers, in which he talked about the labor troubles and discussed causes and possible remedies. After appealing for a restoration of the old spirit of a generation or two ago, the following was said in conclusion:

"How can this be brought about? By fair and equal treatment; even-handed justice; mutual confidence; faithful performance of duty with service cheerfully rendered, and finally, a spirit of uniform courtesy and of kindly consideration to be shown between and among all classes of workers—management as well as rank and file. The common principles of Christian charity properly applied could easily accomplish all this.

"In the last analysis it means simply this; that men and women of all degrees in their relations with each other must be governed by these principles which were promulgated (by being lived) by Him, who came into this world, taught the principles of right living, suffered, died and rose again; and while He spake as no other man ever did, was Himself a working man.

"In other words we have, all of us, simply got to align our lives with these principles and give the spirit of Christianity a real chance in this world, or the world cannot be saved industrially, economically, morally, spiritually or in any other way."

Nothing new in the above, just the same old truths; but after 50 years' experience in the railroad work, seeing and in more or less close touch with the great changes in that work during this time, it is my intense conviction that the only solution of the present troubles lies along these lines.

AN OLD RAILROADER.

### The Use of Boiler Compounds

CHICAGO.

TO THE EDITOR:

The article entitled "The Interior Treatment of Boiler Waters," by C. R. Knowles, superintendent of water service of the Illinois Central, which was published in the *Railway Age* of November 12, should be read by every railway officer who has to do with operating or mechanical maintenance problems. Mr. Knowles has shown considerable courage in placing before your readers facts which are not generally taken into consideration, during a discussion of the subject of water treatment. The remarkable lack of uniformity of opinion, on the part of those responsible for trunk line locomotive operation, would not be so evident if every officer concerned would read this article thoroughly.

It may be a shock to some who have authorized expenditures of hundreds of thousands of dollars for treating plants, to learn that these treating plants do not produce pure water. However, it should be of some comfort to these gentlemen to be informed that absolutely pure water, even if it were obtainable, would not be, in all respects, a good boiler water.

If it were, it would probably be unnecessary for the United States Navy, for instance, to purchase large quantities of boiler compound, as it does, to be used in water which is almost 100 per cent distilled.

So far as compounds are concerned, it is frequently pointed out that practically all of them are based on soda ash, and several large railroads take the position that since this is true, they may as well use the raw soda ash. It would be just as logical for them to assume that since the major ingredient used in the making of bread is flour, we may as well do away with the bread, and eat the raw flour.

Within the past few days, the writer was a passenger on a railroad which operates throughout with raw soda ash as a water treatment. In a distance of 90 miles, the blow-off cocks of the locomotive of this train were opened 22 times, for periods averaging 10 seconds each. This blowing was necessitated by the foaming tendency of the water, due to the use of soda ash, and for the purpose of changing out as much of the concentrated solids in the boiler as possible. Multiplying this amount of blowing by at least four times, to obtain the corresponding figure for freight locomotive operation, and reducing it to pounds of fuel, we have a fuel wastage, through blow-off cocks, which is startling.

If, by this means, we are getting rid of the solids which had been precipitated out of the water by the treatment, the situation would not be so bad, but we do not get rid of any considerable quantity of solids by blowing locomotives which are working. Solids are expelled through the blow-off cocks when they are open, after settlement of the water, either after a long wait on the siding, or after the fires are knocked in the locomotive terminal. In the case of one railway, which had been using raw soda ash for years, this situation was brought to the attention of higher executive officers on an inspection tour by the error of an engineer in opening the blow-off cock on the windward side, by which means he succeeded in painting the varnished equipment of the train a beautiful white from one end to the other.

A properly designed boiler compound was put into service on this trunk line, with the result that the boilers are being maintained in a cleaner condition and the blowing is all done in the terminal, under supervision of those responsible for the maintenance of the boilers. The saving in fuel was far more interesting to those responsible than was the appearance of the train. A ten-second blow, after the water is settled, is more than equivalent to the blowing which had previously been done while the locomotive was working.

If, as Mr. Knowles points out, only six per cent of the water used in locomotive boilers is at present the production of treating plants, the importance of the proposition of interior treatment by means of compounds cannot be otherwise than tremendous. Yet we find a tendency among water engineers to bend all of their efforts towards obtaining treating plants, and then towards obtaining the best service therefrom, while only haphazard consideration is given to the treatment of the vastly greater quantity of water used which cannot be the product of treating plants.

Those who consider the use of internally-applied compounds a haphazard method, in that this class of treatment cannot be properly adapted to the water sources used in the boilers, forget the fact that while this is true, scale already formed can be attacked by a given compound, even though the waters which formed this scale are made up from many sources greatly varying in their characteristics. In the use of boiler compounds we have more a boiler treatment than a water treatment, since their use results in attacking and throwing down scale already precipitated by the high temperature.

Let us put it this way. Proper treatment of water in the wayside plants throws out of the water certain impurities which would form scale before the water enters the boiler. Boiler compounds, used internally, attack scale after it has been thrown out of solution by heat. In the end the boilers

themselves tell the story, which should guide us, and it should make little difference to those responsible for these boilers which method is theoretically or chemically correct provided they are kept clean by the most economical means.

L. F. WILSON,  
Vice-President, The Bird-Archer Co.

## Why Railroad Officers Go to Washington

OMAHA, Nebraska.

TO THE EDITOR:

I have read carefully George N. Brown's article on "How to Better Bad Railroad Conditions," in the *Railway Age* of November 5, page 905. One must consider that it applies almost wholly to rates, and does not cover the operating problems or expenses that are so closely interwoven with earnings. Granted that many railroad officers spend considerable time in Washington, let us consider why.

The period of "regulation" dates back to 1907, as stated by Mr. Brown, and the regulation has increased in volume steadily during the 14 years since that time. This regulation by governmental authority for several years had to do mostly with the earnings of railroads. In an effort to secure an understanding of the justice (or injustice) of rates, it was quite necessary for railroad officers to put in much time in securing information and data bearing on questions that were brought out by applications for reductions or increases and to make arguments before the tribunal having authority to make final decisions.

Mr. Brown says: "About that time complaints by shippers began to increase rapidly and the commission was continually engaged in adjusting rates and rules and rate relationships."

Quite true; and why? Because industries through their associations and organizations began immediately to apply to the authority created by law for changes in rates that would benefit their particular business or extend and enlarge the territory in which they could operate with profit in competition with other industries. They felt that they could secure the relief or benefit by argument before the commission with less effort than to discuss or argue their applications with officers or individual railroads where (in a great number of cases) the rates asked for were sectional and general of application and affected several railroads. It was easier to make argument before an examiner for the commission, or the commission, than to the railroad rate-making bodies, since they would immediately have their case before the proper authority established to pass finally on the matter. This required the railroad officers to attend hearings, give testimony, make explanations, file information and data and to likewise make application to the commission for changes in rates, a natural consequence of having the authority to decide vested in a centralized tribunal.

There is much that the writer does not know or understand about rates or rate making, as I am, and have always been, in the operating department. Perhaps I can best explain my thought by making a comparison.

The Railroad Labor Board, authorized by law to consider wages, working rules and conditions, and "disputes" between the managements and employees, is having the same experience as did the Interstate Commerce Commission as to the "increase in complaints" and is "continually engaged in adjusting rates and rules," except that their decisions have to do with the expenditures of the railroads rather than earnings. The board recently called attention to the large number of "disputes" that had been filed for consideration and stated as its opinion that many of them could have been avoided by co-operation between officers and employees. Quite true. However, when Decision 119 was rendered by the board there was a painstaking, earnest effort made by

the railroad managers to meet with the recognized representatives of the employees for each craft or class and discuss proposed modifications of rules and working conditions as instructed by the board, applying the principles laid down by it as a basis for discussion. What was the result? Days of preparation of data, drafting of rules, correspondence with the authorized representatives of employees, conferences, argument, discussions, explanations as to the meaning of rules proposed and their application, comparisons with the national agreements, modification of proposals, further discussion and finally, after much delay, the "dispute." Then in a good many cases the representatives of employees declined to join in a submission to the board, saying "we have nothing to refer, the national agreement suits us." Then came the ex-parte submission to the board by the railroad officers to comply with their instructions or the joint submission where the representatives of employees would join.

I wonder if any member of the board would say to the railroad officer, as did the commission to the traffic manager, "I say to you that wherever your rules and regulations are unjust and unfair, you have the undoubted right to change the same. Make the proper change and advise the (board) why you did it."?

Hardly. They said just the contrary, "No changes in rules or working conditions are to be made without the approval of this board."

Truly it may be said, "It has become the settled habit of many railroad officers to spend most of their time in Chicago or riding to and from Chicago." Why? Just so long as there is any authority by law to regulate wages, working rules and conditions it is (and I fear will be) impossible to secure by agreement with the representatives of employees any change in wages or rules, unless the change increases compensation, or at least does not reduce it.

I make no criticism of the position they take. Human nature is the same the world over. Argument must be made before the tribunal having authority to decide, and this requires the railroad officers to spend much time in Chicago. Is it necessary? Was it necessary for them to spend time in Washington? Why do we have commercial associations? Why farmers organizations? Why manufacturers associations? Apply the same restrictions to business concerns that the railroads are now subjected to and create a commission to regulate the prices they shall receive for their products. How soon would the officers of these business interests apply for increases? How soon would the public apply for reductions? Go further and create a board to regulate wages and working conditions. How long would it be before the employees would ask for increases or changes, or the officers of the businesses interested ask for reductions? Would the officers "get back to their jobs and stay there?"

The railroads manufacture only one commodity—transportation. Under present regulation, if all the "railroad managers should get back to their jobs and stay there," would we not find very soon that we were manufacturing an article that could be marketed only at a loss—a considerable loss? It is only by carefully watching the cost of manufacture and being aggressive and efficient in selling the product that any business can succeed, so what more necessary than consistent effort to keep the cost of production down, or the sale price up to a point where reasonable profit can be taken, or at least one balance the other to avoid failure and bankruptcy. So long as the greater part of the cost of manufacture or production, and all the selling price, is controlled by tribunals established by the government, what more natural than a consistent effort to have the one reduced, or the other increased, by these tribunals in order that the railroads can show reasonable profits?

Under these conditions, should railroad officers stay away from Chicago, or Washington?

W. F. THIEHOFF,

General Manager, Chicago, Burlington & Quincy.

# The Preservative Treatment of Car Lumber

Practical Results So Far Obtained Suggest the Desirability of an  
Extension of the Practice

By H. S. Sackett

Assistant Purchasing Agent, Chicago, Milwaukee & St. Paul

**A** SIGNAL VIRTUE of wood which alone makes it more suitable for general car construction than steel is the readiness with which it may be protected against natural deterioration or decay by chemical treatment. This is accomplished before placing in the structure with positive assurance that it will be serviceable for the full mechanical life of the part. Steel must be continually painted with rust- and acid-resisting paints to protect it against early failure because of corrosion.

Prior to the last few years very little attention has been given to the influence on car maintenance of decay in wood

section of the country where wood equipment still predominates it may be significant.

It was shown that of a total of 265,666 individual parts or pieces replaced, 82.3 per cent failed directly because of decay, and 17.7 per cent represented mechanical failure. The repairs were distributed approximately as shown in the accompanying table.

DISTRIBUTION OF REPAIRS OR RENEWALS IN WOOD CAR PARTS BY CAUSES

Description of part	Causes of failure	
	Decay, per cent	All other causes, per cent
Draft timbers.....	0.0	100.0
End sills.....	34.4	65.6
Deadwood.....	7.4	92.6
Long sills.....	68.0	32.0
Sub-sills.....	26.2	73.8
End posts.....	32.4	67.6
Coal car sides.....	80.1	19.9
Running boards.....	97.3	2.7
Roofing.....	100.0	0.0
Stilting.....	89.5	10.5
Lining.....	89.1	10.9
Decking.....	95.4	4.6
Grain strips.....	96.5	3.5

The types of cars included in this investigation, which constituted the regular run of bad order cars turned in at this shop, were distributed as follows: box, 223; coal, 87; ballast, 23; flat, 20; refrigerator, 19; stock, 17; tank, 10.

These data when submitted to car builders, have caused

Small Tank for Creosoting No. 1 Common Yellow Pine Decking and Roofing; 250 to 400 Pieces Per Charge Immersed 30 Min.; Repairs Caused by Decay Already Reduced More Than 50 Per Cent

members of freight cars. Car builders were prone to charge a great majority of failures to mechanical causes. It developed during an exhaustive investigation conducted for a period of two years by a special committee of the American Wood Preservers Association, that the contrary was more to the point.

Analysis of a questionnaire distributed through the Master Car Builders' Association indicated that at least 30 per cent of all repairs to freight cars of all-wood or composite construction were directly due to decay.

This information was, of course, generally based on the experience of the car foremen who supplied it, and it may be assumed that but little care had been given to gathering data that would be conclusive. An effort was made, therefore, to check the estimated figures as provided in the committee report\* for which purpose a special clerk was placed by one of the committee members in a western car repair shop, whose experience could give accurate judgment as to whether decay or mechanical failure was the primary cause for the respective repair or replacement.

An interesting fact developed incidentally in this investigation was that during the month that this special inspection was in force 1,100 steel cars and 399 wood cars were repaired at the shop in question. As the shop is located in a

Open Tank Creosoting Plant for Treating No. 1 Common Yellow Pine Car Sills; Treated Sills Show No Decay After Four to Six Years' Service

much astonishment and, perhaps, some doubt. There may be circumstances which would not allow of their application, in toto, to all other shops in the country. However, there is no record of a similarly thorough investigation at any other point, and it is prudent to give very careful consideration to the facts here disclosed.

The main fact that is gleaned from these data is that the preservative treatment of car lumber is necessary as a matter of straight economy and essential as a conservation measure. This is merely another instance where reasonable precaution—maximum efficiency in utilization—would materially increase the durability of cars as a whole and reduce the cost of maintenance, thus in many cases making unnecessary the substitution of more costly steel equipment. In

\*See the proceedings of the American Wood Preservers' Association for 1919.

other words, in the past we have not obtained the maximum service from wood because of our negligence in applying comparatively inexpensive remedial measures and have, therefore, not really learned the ultimate value of wood for the several purposes under consideration.

It is true that certain changes in present shop practices must precede the introduction of treated timber in car construction; but that is a comparatively unimportant detail when the more costly changes which the adoption of all steel equipment would necessitate are considered. The latter would not only entail new shop practices but complete reorganization and almost entirely new tools and equipment or rather, duplication of machinery because the composite cars built during the last five years or so would require maintaining the present shops for their repair. Consequently, by following lines of least resistance and choosing the lesser of two evils, if they are to be considered such, immediate adoption of treated car material is a good policy and fits in well with the present desire and need for economy, wherever that may be practicably applied.

Treated material can be used in practically every type of car. Whenever creosoted timber is not suitable because of the fear of contaminating lading, the lumber may be treated with zinc chloride, sodium fluoride, etc. Methods of treatment are standardized and each standard treatment has its

Condition of Stenciling Applied to Creosoted Surface After Eighteen Months' Service; Surface Prepared by Applying One Coat of Pure Shellac

own record of achievement under suitable circumstances. There exists no insurmountable obstacle to the practice of wood preservation in car construction.

Refrigerator cars have been in service for between 7 and 10 years with treated sills. At first they were brush treated with creosote and when this had proved worth while the sills were creosoted by the open tank process. To the treated sills were added creosoted sub-flooring and roofing for the undercourse. More important still, never have the owners received a complaint that lading has been contaminated, although some cars of the latter type have been in meat service for over a year.

When speaking of treated timber for freight cars one naturally thinks first of stock cars, and these surely provide the greatest opportunity for saving in this direction. Stock cars with creosoted sills and decking have been in service for about 12 years without a single repair due to decay, where untreated stock car decking fails in from 4 to 6 years and sills in from 5 to 8 years. However, this is not the limit to which treated materials can be used in this type of car. Practically the entire car should be treated, from sub-sills (on steel underframe cars) to the roof. Where stenciling is necessary that can be applied to special boards, or it can be taken

care of by the use of metal numerals and signs, the cost of which would be a small item in comparison to the saving derived from the use of treated lumber.

Coal cars, flat cars, logging cars, caboose and housing cars all offer the same opportunity for economy by protecting the wooden parts against decay. Of box cars the sub-sills and nailing strips may be creosoted and the decking treated with sodium fluoride or zinc chloride where proper facilities are available. It may also be that other parts of box cars could be treated with these latter preservatives, but on that point there exists too little information at this time to allow a definite recommendation.

The particular advantage in addition to obtaining increased service is that preservative treatment allows the use of lower grades of wood, especially the presence of a goodly percentage of sapwood. In fact, sapwood is a partial advantage as it is more absorbent, takes treatment more readily and, therefore, gives greater protection to the stick.

Some shops are applying creosote oil to points of contact of sills, posts, etc., and the specification for the box cars developed during the war required treatment at such points with either paint or creosote. This is a step in the right direction, although paint cannot be considered a preservative in that it does not possess the necessary toxic qualities to inhibit the development of wood destroying fungi, or to kill the spores thereof that may be present on the surface and in the checks of the timber. However, it must be remembered that the value of any preservative treatment is in proportion to its thoroughness. Practically all car shops could equip themselves at little expense to employ the open tank process, and some roads operating pressure treating plants could arrange for the treatment of car material at these plants. The means for the practice of wood preservation, either by the use of surface treatments, the open tank process, or by employment of material treated at commercial or railroad plants with the standard pressure processes, are available in such varied form that no reasonable excuse can be advanced for continuing the abuse and waste of wood due to preventable decay. No repair yard, carpenter shop, or construction point along the railroad but can secure a barrel of creosote and a brush and at least partially protect such wood as it used against decay. As to the technical information involved, that likewise is readily obtainable and can be assembled by every engineering department and reduced to practical instructions to the workmen to bring about the desired results. Consequently, no extended discussion of these details need occupy us at this time. Suffice it to repeat that this is one means by which railroads can save enormous sums now expended for repairs that could be postponed or prevented were the lumber given the proper opportunity to serve its full period of mechanical usefulness by the simple expedient of reasonable protection against decay, applied before placing in the structure.

JAPANESE OWNED RAILWAYS in China have recently given manufacturers in Japan orders for cast iron pipe totaling 3,000 tons.

THE FREIGHT CLAIM DIVISION, A. R. A., has issued a circular for the benefit of receiving clerks containing the following: *Don't Accept Shipments for Transportation in barrels overloaded; in packages without marks; in packages insecure or weak; in packages with loose boards; in packages with improper tags; in packages requiring recoopering; in packages with contents rattling; in packages with insufficient nails; in packages with old consignment marks; in fibre boxes where edge seams are torn; in packages illegibly or not properly marked; in packages without rope, contents protruding; in fibre boxes with flaps not glued or sealed; in second-hand fibre boxes, unless in perfect condition; in packages with the name of consignee or the destination abbreviated; and in fibre boxes which are tied with rope, the flaps not glued or sealed.*

# Avoiding Waste in the Operation of Locomotives\*

## Determining the Most Economical Tonnage for a Given Division— Avoiding Excessive Delays at Terminals

By William Elmer

Superintendent Middle Division, Pennsylvania Railroad

LOCOMOTIVES are classified into major groups as freight, passenger, shifting and work locomotives. There are 65,000 locomotives on the railroads of the United States and half of them are in freight-train service. Thirty-two thousand and eighty locomotives earned a freight revenue of \$4,325,078,866 in 1920, or an average of \$135,000, per locomotive per year. Each engine made an average of 59.3 miles per day or 1,800 miles per month. The average freight engine earned for its owners \$370 per day or \$6.25 per mile run. This is at the rate of \$15.40 per hour or about 26 cents per minute. The striking thing in the group of facts above presented is the figure of 59.3 miles per day made by the average freight locomotive. How can we excuse an average mileage for all the freight locomotives in this country of less than 60 miles per day? We can picture the average freight locomotive rolling along the rails at 15 miles per hour and that means less than four

data a true profile may be plotted, showing the elevations above sea level and the actual grades; but this profile will not be fully representative of the resistances encountered by moving trains until it has been transformed into an equivalent compensated profile by superimposing the curve resistance on top of the grade resistances for each direction of traffic. We can imagine a railroad so full of sharp curves that a very considerable resistance would be experienced by a moving train. Many experiments have been tried in an effort to find how much resistance various curves offer to a moving car, and we will take 1 lb. per ton of 2,000 lb. per degree of curve. The resistance due to grade is fortunately an exact mathematical quantity—20 lb. per ton for each 1 per cent of grade. Therefore each degree of curve offers the same resistance as a 0.05 per cent grade. A 6-deg. curve has the same resistance as a 0.3 per cent ascending grade. A grade which is climbing upward at the

Fig. 1—Actual Profile of a Division and Equivalent Profiles, Eastbound and Westbound

hours out of each twenty-four actually moving trains. The locomotive spends its entire time either in the hands of the transportation department moving trains or ready to move trains, or in the hands of the motive power department being repaired and prepared. Roughly we may say that the engine is in the hands of each of these departments about half the time. Of course there is avoidable waste in each.

Taking up first the transportation department, there are two broad inquiries which may be made:—(a) Are the engines properly loaded? (b) Are they properly used? Assuming that suitable engines have been furnished the transportation department, or taking the engines on any division as we find them, how are we to know when they are properly loaded? If a dynamometer car is available, road tests may be run to determine the drawbar pull of the engines and to measure the resistance of trains of various make-ups on the ruling grades at the desired speeds. In the absence of this facility it may be desirable to outline the procedure.

### Are the Engines Properly Loaded?

A track chart of the road is necessary, giving the distances from the starting point to the beginning and ending of each curve and tangent, with the degree of curve, and elevations of points where the grade changes. With these

rate of 26 4 ft. per mile or 0.5 per cent and has in it a 6-deg. curve, or 955 ft. radius, will therefore have superimposed on the true grade of 0.5 per cent the equivalent resistance of a 0.3 per cent grade due to the 6-deg. curve, or a total equivalent grade of 0.8 per cent. Of course, to a train coming down this hill, the equivalent grade would be the difference between these values, or 0.2 per cent.

A typical equivalent profile is shown in Fig. 1, in which the solid line is the actual profile, the dotted line above it the equivalent west-bound grade and the dot and dash line below it the equivalent east-bound grade.

Having determined the equivalent grade, it will be necessary to decide whether it can be operated as a momentum grade or not. If the length of the grade or other physical conditions on the approach prevent attaining any considerable speed, the dead pull of the locomotive will have to be depended on to get the train over. The tractive power of a locomotive is readily calculated from a very simple formula where  $p$  is the boiler pressure in pounds per square inch by gage,  $d$  the diameter of cylinders,  $l$  the length of stroke and  $D$  the diameter of the driving wheels, all in inches. For a simple two-cylinder engine, tractive power  $= 0.85pd^2l/D$ . When a locomotive is moving, some of its tractive power is used to overcome friction of the engine and tender, and on a grade some more is needed to lift its weight against gravity, and at speeds of more than six or eight miles per hour the boiler becomes a factor in

\* Abstracted from a paper entitled "Avoidable Waste in the Operation of Locomotives and Cars," to be presented before the Railroad Division of the American Society of Mechanical Engineers, New York, December 6.

its inability to furnish enough steam to follow the pistons with full pressure under long cut-off conditions, so that some more complicated formula becomes necessary in the calculation of the tractive power required for moving trains. Besides the resistances due to curves and grades, trains are affected by journal and flange friction, wind, rolling resistance, temperature, etc.

It is a well-known fact that trains cannot be loaded on tonnage alone. One hundred empty cars weighing 20 tons each would be a 2,000-ton train, and might overload an engine to the stalling point, whereas the same engine on the same grade would handle twenty-five 80-ton cars with no trouble. The number of axles is the important factor, and in order that a long empty train may have the same resistance as a short loaded train, it is necessary to use a factor for each car, known as the adjustment factor. This factor will vary with the different physical conditions met with on different divisions.

Having discovered the adjustment factor for any given division, and knowing the principal types of freight engines in use on that division, it is well to construct tractive power-speed curves for the various engines, and plot on the same sheet adjusted-tonnage train-resistance curves on various level and compensated-grade tracks, so that the intersection

Fig. 2—Tractive Power and Train Resistance Plotted to Show Limit of Speed on Various Grades

of the tractive power curve with any given grade will show the speed that could be maintained with a full-tonnage train on that grade. A sample curve is shown in Fig. 2.

It will be noted that the curve showing train resistance on a level track intersects the tractive power curve a 35 miles per hour, consequently this is the maximum speed the locomotive in question can maintain on straight level track with a train of 3,500 adjusted tons. On a grade of 0.8 per cent, the maximum speed is 10 miles per hour.

After having completed the above described investigations and having before us the equivalent profiles and the speed curves on various grades, we can lay out a schedule of the

running time between the various towers, adding the necessary time to cover the initial and final terminal delay, water stops, coal and fire-cleaning stations, interference from passenger trains, etc., and bearing in mind the overtime limit based on a speed of  $12\frac{1}{2}$  miles per hour for the distance between terminals and the time the crew is on duty.

Now comes the crux of the whole matter. After the tonnage has been established, what are the results on the road? Do the trains lose so much time sponging or setting off cars with hot boxes, or draw heads out or brake rigging down, or due to interference from other trains that they cannot get over the road without excessive overtime? If the dispatching and terminal and road supervision are all that they should be and a record has been made for a sufficient period from which may be drawn reliable conclusions, we can de-

Fig. 3—Chart Showing Elapsed Time of Trains and Terminal Delays

termine whether the overtime is excessive;—in which event the tonnage should be decreased, or if the majority of the trains get over the road within the overtime limit, that the tonnage should be increased.

Fig. 3 is a graphical report showing each morning the performance of each of the previous day's trains, both slow and fast freight, plotting the time on duty from called to relieved against the percentage of the full tonnage loading of the engine utilized. This gives the train master, road foreman of engines and superintendent a review of the preceding day's operations, and any falling away from the standards set up on the part of the subordinate officials whose duty it is to properly load the trains is quickly brought to light.

Each dot or circle represents a train, its position vertically indicating on the scale at the left the percentage of the full capacity of the engine utilized, and its position across the sheet, read from the scale of hours at the bottom, shows the time the train crew was on duty. The small circles represent east-bound trains and the dots west-bound trains. The extreme left-hand dot shows a west-bound train which was 99 per cent of the full adjusted-tonnage rating of the engine, and made the run over the division in 8 hrs. 12 min. from the time the crew were called to report for duty until they were relieved from duty at the opposite terminal. It includes initial and final terminal delay.

The average of all the circles is shown by the cross at A, and its position shows that the average of all the east-bound trains that day were loaded to 100 per cent and the average time was  $10\frac{1}{2}$  hours. The cross at B shows that the average loading of west-bound trains was also 100 per cent and the time just under  $11\frac{1}{2}$  hours. The characters near the left-hand margin indicate the class of engine hauling the west-bound trains, the number of cars being shown on the scale at the right, and the time from called to passing

out of the yard being read on the scale of hours at the bottom.

After keeping these daily sheets for several months, the location of all the crosses may be recorded on a sheet of tracing cloth, or a composite of all the small circles may be made on one tracing, and through the center of gravity of all the dots a curve may be drawn. This will show for any point on the curve the average time for the trains corresponding to that tonnage loading. These curves are shown in Fig. 4.

The Most Economical Train Loading

The curves in Fig. 4 having been prepared, the data shown in Table I may be calculated. Column 1 gives the percentage of engine loading, from 120 per cent down to

Fig. 4—Effect of Tonnage on Time Crew Is on Duty

80 per cent. The average flat tons in the east-bound and west-bound trains having been recorded each day on the sheets shown in Fig. 3 and the percentage of the engine loading being also available for each day, a summary may be run up at the end of the month and a comparison drawn as to the number of flat tons per train which would corre-

spond to a 100 per cent tonnage train. This has been shown for the west-bound trains at the head of column 2. This amount multiplied by the percentages in column 1 gives the tons per train in column 2. From the load-time curves in Fig. 4 may be read the average time for a west-bound train loaded to 120 per cent of the engine rating, etc., and these times recorded in column 3. The summary mentioned above will also show, by extension, the total gross tons moved each day, and the average of this figure is at the top of column 4. The number of trains which it would be necessary to run to move the average day's business may be found by dividing this number of tons by the proposed tons per train in column 2 and the result recorded in column 4. The same process is followed to obtain the figure at the top of column 5 as explained for column 4 and as there will usually be the same number of east-bound and west-bound trains in order to avoid running power and crews light, the tonnage per east-bound train will be found by dividing the total tons to be moved per day by the trains per day shown in column 4 and the results recorded in column 5. The total time on duty for the crews in making a round trip is shown in column 8. It has been determined that on the division under consideration, engines are off the road and in the hands of the motive power department about 24 hours for every round trip they make. Consequently, 24 hours should be added to the times shown in column 8 to give the total time of an engine for a round trip as in column 9. The number of round trips made in column 4, multiplied by the number of hours per round trip in column 9 will give the total number of engine hours shown in column 10, and these figures, divided by 24 hours in the day, will give the number of engines assigned to the service as recorded in column 11.

As the average distance run by these trains is 128.2 miles and the overtime speed basis is now 12½ miles per hour, the time per trip is 10¼ hours and for the round trip 20½ hours. Consequently, the overtime per round trip is found by subtracting 20½ from the times shown in column 8, and the result entered in column 12. We now pay time and a half time for overtime in freight-train service, therefore the number of hours shown in column 12 multiplied by 1½ gives the overtime hours for which we have to pay at the regular hourly rates, and these figures are entered in column 13. Multiplying by the number of trains per day in column 4, we have the total number of punitive overtime hours per day shown in column 14. The total wages paid to the engine and train crews in slow freight service and with the class of engine under discussion now amounts to \$3.975 per hour, and the figures in column 14 multiplied by this sum gives the total overtime cost per day as shown in column 15. The straight-time hours per day is the product of the 20½ hours for one round trip times the number of trips in column 4

TABLE I—METHOD OF CALCULATING COST WITH VARIATIONS IN TRAIN LOADING

<sup>1</sup>2400 × (1) = 2400 multiplied by value in Column (1).

spond to a 100 per cent tonnage train. This has been shown for the west-bound trains at the head of column 2. This amount multiplied by the percentages in column 1 gives the tons per train in column 2. From the load-time curves in Fig. 4 may be read the average time for a west-bound train loaded to 120 per cent of the engine rating, etc., and these times recorded in column 3. The summary mentioned above will also show, by extension, the total gross tons moved each day, and the average of this figure is at the top of column 4. The number of trains which it would be necessary to run to move the average day's business may be found by dividing this number of tons by the proposed

and is shown in column 16. This at the rate of \$8.975 per hour gives the total straight time cost per day shown in column 17, and adding the overtime cost in column 15 gives the total wages cost per day in column 18.

Modern Mikado locomotives of the size under consideration are worth \$47,750 apiece, and taking interest at 6 per cent, depreciation at 4 per cent and insurance and taxes together at 1 per cent, we have fixed charges of \$5,256 per locomotive per year, or \$14.40 per day or 60 cents per hour. Column 19 shows the value of the engine hours in column 10 and the sum of the wages cost in column 18 gives the total engine and wage cost shown in column 20. It will be

noted that this cost is a minimum at 100 per cent loading. The limits are rather narrow and an error of 10 per cent in overloading or underloading would cause a loss of \$100 per day or \$3,000 per month on the amount of business handled on the division under consideration.

This method of working out the most economical tonnage for loading the freight engines of any division is based on actual practicable performance in everyday operation. The treatment considers the value of the locomotive, taking account of interest, depreciation and taxes; the relationship between straight-time and overtime rates for road crews; the quickening up of the time of the trains by a reduction of tonnage and the increase of the time the crews are on duty by an increase in tonnage. When these matters have been studied in the light of the recorded facts, we are in a position to answer the question, Are the engines properly loaded?

### Are the Engines Properly Used?

So far as the motive power department is concerned it is important to have reliable reports which present promptly to the responsible operating officers, on the succeeding day if possible, all the pertinent facts concerning the performance of the locomotives available. These reports should cover not only the utilization made of the serviceable locomotives but also of all those laid off for repairs, both in the roundhouses and the back shops. The more promptly the work is done the more engines will be available for service and the smaller will be the number required to be purchased and to bear interest and depreciation charges. To this end the facilities at the engine terminals should be ample to inspect the incoming locomotives and send the reports to the dispatcher, who can at once call a crew in case the engine has only light work which can be completed by the time the crew reports.

The fire-cleaning pits and facilities for handling ashes, coal, sand and water should be in duplicate at important points. At one well-known freight-engine terminal it is possible to clean the fires and prepare for service 400 locomotives per day. Hot-water systems for washing and filling boilers save time, and drop tables or unwheeling hoists should be provided for handling driving wheels, spring rigging and driving-box repairs. Ample jib or overhead cranes should be installed in all important enginehouses, as the rods, pumps, pistons, smokebox fronts, etc., of modern locomotives are now so heavy that mechanical appliances must be used to reduce the cost of handling and save time in running repairs. The enginehouse referred to above at times furnishes the power for ten eastbound trains in two hours and at the same time ten to fifteen engines an hour for westbound trains. An operation of this magnitude requires close supervision in order to avoid waste of power and loss in efficiency.

(The remainder of Mr. Elmer's paper, which deals with the utilization of cars, will appear in a later issue.—EDITOR.)

## A Recent Development in Mail Cranes

UNDER THE NAME of the "White Heron" mail crane, there has recently been developed a type of crane for use on railroads which embodies a number of unusual features in the construction and operation of equipment of this character. A particularly prominent feature of this device is the absence of the familiar ladder as a part of the construction. The crane consists simply of a length of scrap rail which extends vertically from the ground beside the track and carries two pouch arms so arranged as to collapse against the vertical standard when the pouch is released and so attached to the rail and connected with a cable as to permit of their being projected from the vertical standard for the receipt or delivery of the sack.

For the latter purpose, each of the two sack arms is attached to a collar which fits the rail section, the two col-

lars in turn being fastened together by a plate which fits over the head of the rail and maintains them, one below the other, at the proper distance apart for the mail pouch. Each of these collars is also provided with a lug to prevent the lower pouch arm from being raised above the horizontal position and to prevent the upper arm from falling below this position. Each arm is made of a strip of metal bent U-shaped with the open end pin-connected to the collars. The arrangement of these arms and the collars is such that, aside from holding the pouch securely in position by reason of the tendency of the upper arm, on the one hand, to raise to the vertical position because of the weight of the lower arm, transmitted as it is through the metal plate connecting the collars, and the tendency, on the other hand, of the lower arm to drop from gravity, these arms assume a

Raising the Mail Pouch to Delivery Position

Position of Crane Arms After Delivery

position against the vertical standard immediately upon the release of the sack.

As shown in the illustration, the arms are lowered to permit of attaching the mail pouch from the ground level, in the one case, and raised to the proper position for the delivery of the mail pouch to the mail train, in the other case, by means of a cable passing over a pulley fixed to the top of the vertical standard and extending down to a point where it may be slipped over a bolt in the rail and pad-locked. Each arm has a delivery hook which is attached in such a way that, in the case of the top arm, the hook shifts slightly downward as well as horizontally and in the case of the lower arm, the hook shifts slightly upward, thus providing for such a converging movement of the two hooks as will facilitate the removal of the sack and reduce the strain to a minimum.

This crane has been approved by the government railway mail service and one is said to be giving satisfactory service at Bovina, Miss., on the Alabama & Vicksburg, where the mail is picked up at speeds ranging from 30 to 50 miles an hour. Among the points mentioned in its favor, aside from the absence of any ladder or platform and the facility with which the mail pouch may be removed, are the inexpensive but dependable nature of the construction, the clearance it affords to traffic and its independence of vibration from trains from the fact that it is erected on the ground rather than on the ties. T. A. White, Oklahoma City, Okla., and T. M. Heron, Vicksburg, Miss., are the inventors, jointly, of the device.

# Wage Statistics for July on New Basis

Number of Classes Increased from 68 to 148—Number of Employees in July 22 Per Cent Less Than Year Before

THE INTERSTATE COMMERCE COMMISSION has issued its summary of monthly reports of employees, service and compensation for Class I steam roads, including 13 switching and terminal companies, for the month of July, which gives the first official figures on the earnings and service of railroad employees under the wage reduction order of the Railroad Labor Board which became effective on July 1. It also represents the first summary compiled by the commission under the new rules governing the classification of steam railway employees, which were designed to meet the needs of both the Labor Board and the commission and under which the number of reporting divisions or classes has been increased from 68 to 148 and an analysis of the hours of service and compensation has been introduced. The quarterly statement on this subject, heretofore published, is discontinued and comparison of the old and new statistics is necessarily impaired. The increased number of classes does not result from a mere subdivision of the classes used in the old form, but is the outgrowth of an exhaustive classification study conducted by the Labor Board.

The total number of employees in service at the middle of the month was 1,634,872, as compared with 2,111,280 in July, 1920, a reduction of 476,408, or 22 per cent. In June, 1921, the number was 1,586,872. The falling off in traffic this year as compared with last year is also reflected in a reduction in the number of hours and days worked, although the statistics on this point are not comparable. The total compensation for the month was \$214,339,385, which gives an average of \$131 for the month, for the employees in service at the middle of the month, although all did not work full time.

## Average Earnings by Classes

The average earnings and time worked per employee are given by classes as follows:

Reporting division	Time worked per employee (days or hours)		Total earnings per employee
	Straight time	Over-time	
1. Executives, general officers, and assistants.....D	25	*	\$523
2. Division officers, assistants, and staff assistants.....D	27	*	322
3. Architectural, chemical, and engineering assistants (A).....D	23	*	236
4. Architectural, chemical, and engineering assistants (B).....D	25	*	185
5. Subprofessional engineering and laboratory assistants.....D	24	*	144
6. Professional and subprofessional legal assistants.....D	23	*	166
7. Supervisory or chief clerks (major departments).....D	25	*	225
8. Chief clerks (minor departments) and assistant chief clerks and supervising cashiers.....D	25	*	177
9. Clerks and clerical specialists (A).....D	185	3	151
10. Clerks (B).....D	189	4	125
11. Clerks (C).....D	187	6	104

\*Less than one day or hour.

In an explanatory note the commission says:

This July statement has been delayed owing to the necessity of investigating many inconsistencies in the carriers' reports, but

such delay with the initial report was to be expected in view of the detailed nature of the schedules.

It will be noted that the number of employees in each class is given in two columns. The number at middle of month represents the count of the employees in service on a particular day, including those on vacation or sick leave, and all subject to call for duty whether actually at work on the day of the count or not. The number of full-time positions, in classes other than those in train and engine service, represents the number of employees required to man the service if each employee worked the full number of days or hours of the regular assignment and in addition such an average amount of overtime as is shown by the summary for each occupation. In the case of train and engine service, the number of men required to perform the work, if there were no sick leave, vacations, or "extra" men, is more nearly represented by an average of the four counts of men actually on duty during the month.

The term *straight time* refers to the time of the regular assignment as distinguished from overtime. Overtime is in some cases paid for at the same rate per hour as for straight time, and in other cases, a higher, or so-called *punitive rate*, is paid. It may be noted that in some reporting divisions the statistics show a lower rate per hour for overtime than for straight time. In the cases of passenger engineers and passenger firemen this is explained principally by the fact that for such employees 5 hours represent a basic day while overtime is computed at one-eighth of the daily rate.

It will be observed that the forms do not distinguish the overtime hours actually worked from the overtime hours paid for, although straight time actually worked is shown separately. This is explained by the desirability of reducing the number of columns to a minimum. In the classes relating to train and engine service, there is a separate column for straight time paid for, the reporting of which, however, to save clerical expenses, is not required for road freight employees.

This information can be approximated for these employees by dividing the total miles paid for by 12.5, since under the dual system of miles and hours, the pay for eight hours is equal to the pay for 100 miles.

Column 7, in reporting divisions not relating to train service, represents *time paid for and not worked* and includes such items as payment for holidays, absence on definite leave and vacations. In train service, column 7 relates to the *constructive hours* paid for which do not represent actual train service and for which mileage is not allowed. Such "constructive hours" should not be taken as equivalent to time paid for and not worked, as they frequently represent some additional service.

The columns relating to overtime and time paid for and not worked are not regarded as applicable to general and division officers. The straight time reported in such cases generally represents the regular number of working days in the month.

For a fuller explanation of the terms used, reference should be made to the printed rules and classification.

Preceding the summary of the number of employees, their service, and compensation as reported, there are presented certain averages based on the summary. These show the average straight time, average overtime, and average total compensation per employee per month. These averages are based on the number of employees shown in column 2 of the summary. If the number of full time positions were used as a divisor, the time as well as the earnings per man would be in most cases considerably increased.

The report also gives a recapitulation by groups of employees and a detailed statement showing for each reporting

#### RECAPITULATION BY GROUPS OF EMPLOYEES

D—Daily basis. II—Irregular basis.

\*Average of four counts made per month of men actually working.

division the number of employees, straight time actually worked, overtime paid for at pro rata rates and at punitive rates, time paid for but not worked, and the compensation paid for straight time, pro rate overtime and punitive overtime and for time not worked. The recapitulation is given at the bottom of the opposite page.

For the group of transportation employees there is a separate table showing some additional information. The number of employees varied from 249,002 on the 7th of the month to 252,158 on the 28th, while the number in service at the middle of the month was 289,383. The

straight time actually worked was 53,005,499 hours and the straight time paid for (not including road freight employees) was 33,101,312 hours. The overtime paid for was 5,589,533 hours and the constructive allowances 1,449,918 hours, making a total of 63,709,133 service hours. The grand total compensation was \$50,339,739, which included \$38,849,058 for straight time actually worked, \$5,439,168 for overtime and \$1,031,168 for constructive allowances. The miles actually run were 503,807,261 and the miles paid for but not run were 80,831,300. The trips for which not less than a minimum day was paid were 6,248,163.

## Labor Board Completes New Rules for Shop Crafts

Revised Provisions "More Elastic," According to Tribunal—  
Effective December 1

THE remainder of the disputes between the carriers and their shop employees as to the working rules which are to supersede the provisions of the Shop Crafts' National Agreement have been disposed of by the Railroad Labor Board with the promulgation of numerous additional rules which are to be included in the agreements formed between the individual carriers and their shop employees. The new rules are effective December 1.

Some difficulty was experienced by the Board in preparing its decision. However, the following summary, including an abstract of the new provisions, was announced by the Board on November 29:

Decision effective December 1.

Number of men affected—about 400,000 employed at present—about 450,000 under normal traffic conditions.

Estimated saving to railroads—only actual operation can tell, but may reach \$50,000,000 per year.

Nature of decision—Revision of National Agreement.

(1) Rules are made more elastic to secure greater efficiency and economy.

(2) Many criticisms of the national agreement are met by the decision, but all the demands of the managements are not granted. Older rules sanctioned by experience are retained.

(3) The principle of collective bargaining and union recognition embodied in the Transportation Act is retained in the new rules, but representation of minorities in grievance cases is provided for, thus doing away with that part of national agreement criticized as forcing the "closed shop" on the railroads. This is more theoretically than actually important, as practically all shops are unionized and unions are recognized and represented by the men in the negotiations leading up to present decision.

The Board members believe the present decision the most important work of the Board to date. It is designed to provide a permanent code of shop rules to stabilize that part of railroad industry.

### The Changes Ordered

A complete new set of rules and working conditions to supersede the provisions of the shop crafts National Agreement was announced by the Labor Board on December 1. These new rules are to be applied on all carriers and so constitute the restoration of the principle against which the carriers have been fighting for over a year, namely, the universal application of rules and working conditions regardless of varying local conditions. In general the new rules are those of the National Agreement revised in places to eliminate some of the more flagrant injustices pointed out by representatives of the carriers in the hearings which extended from January to April of this year.

The new overtime rules announced in the *Railway Age* of August 27 (page 419) and the seventeen rules promulgated by the board last October and announced in the *Railway Age* of October 22 (page 789) embody the most radical revisions

contained in this new "National Agreement." Of the 186 rules of the shop crafts agreement 99 are to be continued indefinitely, according to this decision.

Fourteen rules are eliminated, minor changes—principally in the wording—have been made in fourteen others, no mention is made of three of the old rules, one rule is promulgated and but 48 rules changed so as to eliminate specific injustices pointed out in the hearings or to make the rules more elastic. All of the qualification rules for the various classes of shop men, with the exception of a slight change in the case of electrical workers, have been retained in the new code. Similarly, the National Agreement rules relating to the classification and services of apprentices, the eligibility of helpers for promotion to helper apprentices and the differential rules for autogenous welders have been perpetuated. The rules relating to the duties of helpers and to the consist of wrecking crews have been modified but slightly.

Of the rules eliminated the most important is National Agreement Rule 24 relating to court duties of employees and expense therefor. Many of the changes made to meet the specific objections of the carriers are in the form of a slight alteration of the wording which will leave the rule open to even more interpretations than were the more specific rules of the old agreement. For instance, Rule 122 of the National Agreement reads "blacksmiths sent out on the road to do blacksmiths' work will be accompanied by helpers." The new rules simply add to the existing rule the words "when necessary."

On the other hand, several changes have been made which undoubtedly will result in better conditions. Rule 27, for instance, has been changed so that shop forces may be reduced to 40 hours per week before reductions in the force are made, a 48-hour notice being required. In the restoration of forces the regular hours must be restored before additional men are taken on.

Several of the rules have been changed to permit minority groups of employees or individuals the same rights as the employees or employee represented by an organization. Rules 37 and 38, which the carriers claimed made any system of discipline impossible, have been altered so as to give the railroads suspension privileges pending hearings, provided that if it is found that suspension was unwarranted the employee will be reinstated with unimpaired seniority and pay for time lost.

Another important change included in the new code is contained in Rule 40 which creates three classes of apprentices—regular, helper and special. Provisions are made for three-year special apprenticeships for young men with technical school training. These apprentices, however, must be in-

cluded in the total number of apprentices in computing the ratio of apprentices to mechanics. Still another important change made in answer to the objections of the carriers is illustrated in Rules 32 and 33 which have been changed so that men at outlying points may be permitted to perform repair work or work other than that listed for their craft instead of necessitating the temporary transfer of an employee at heavy expense. Likewise the necessity for having six men do a simple piece of work which was formerly performed by one man is partly obviated by certain changes in the rules which state, for example, that a machinist can do any connecting or disconnecting of wires, couplings or pipes necessary to complete his task instead of waiting for another worker of another craft.

### Some Changes for Economy

In general, the changes of this character in the rules are such as to make for more economical and efficient operation when compared with conditions as pictured by representatives of the carriers during the hearings, but the actual results which these changes will produce cannot be estimated until they have been in operation for some time. In its general instructions accompanying this new code the Board orders that its provisions shall apply on all carrier parties to the dispute except where an agreement has already been reached with the employees, in which case the rule agreed upon shall prevail.

Similarly the rules eliminated by the Board will terminate except where the carrier and the employees have already reached an agreement upon these points. The formulation of a preamble or caption to the new code is remanded to the carriers and their employees.

In the cases where the Board has failed either to eliminate the old rule or formulate a new rule the point is referred to the individual carriers and their own employees for further negotiation on the grounds that "the Labor Board believes that certain subject matters now regulated by the rules of the National Agreements may not be covered in all localities by rules of general application and require further consideration by the parties directly concerned." This constitutes the only recognition in the decision of the justice of the carriers' plea for consideration of the widely varying local conditions which cause uneconomical and inefficient situations when working rules are applied universally. The decision closes with the statement that those rules which are reproductions of similar rules in the National Agreement "are not to be understood as carrying with them the interpretations placed upon them by the Railroad Administration, by the Adjustment Boards or by other agencies acting under said administration."

### Shopmen Ask for Increased Wages

While the carriers throughout the country are announcing proposed reductions in the wages of their employees and calling conferences with representatives of the various classes of workers in accord with the terms of the Transportation Act, the officers of the six shop crafts affiliated with the American Federation of Labor are preparing demands for wage increase of five cents an hour above the rates established by the Board in July, 1920, and 13 cents an hour above the existing rates of pay for shop employees. It is reported that these demands are to be presented to the executives of the individual carriers by the general chairmen of the organizations on each road when conferences are held on the proposal of the executives for a further wage reduction. The only explanation of this move, which appears to be solely strategical, is credited to B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, who stated that this increase was requested because "we feel that the Transportation Act allows us a living wage and rates equal to those paid in similar industries outside of the railroad shops."

## Commission Asks Views on Common Officers and Directors

WASHINGTON, D. C.

**A** HEARING FOR the purpose of receiving views as to the interpretation of Paragraph 12 of Section 20-a of the interstate commerce act, which provides that no person shall hold the position of officer or director of more than one carrier, unless such holding shall have been authorized by the commission upon showing that neither public nor private interests shall be adversely affected thereby, was held at Washington before Commissioners Meyer, Eastman and Potter of the Interstate Commerce Commission on November 30. W. A. Colston, director of the commission's Bureau of Finance, said that the commission had formed no opinions on the subject, but as the law apparently gave the commission no standard, it desired to have a discussion of every phase of the subject. The bureau has made a study of the literature on the subject for the purpose of considering the various views that have been advanced as to the propriety of interlocking directors and officers.

Alfred P. Thom, counsel for the Association of Railway Executives, said that apparently the bureau had considered everything but the law, and he proposed to discuss that. He said the purpose of Congress was that men should not be exposed to improper temptations resulting from a duality of fiduciary relations, but that the commission is not charged with responsibility except where there is a conflict in such fiduciary relations. He did not think it was intended that the commission should inquire into the fitness of a man to hold the positions to which he had been elected or his ability to perform his duties as those things were the responsibility of the stockholders.

Commissioner Meyer asked whether in a case of a man who had been connected with various railroads and had caused trouble everywhere he went, the commission should not consider his personal character in passing on his application to hold more than one position. Mr. Thom said he thought that it was most important that the principle should be recognized that the commission's only responsibility was to ascertain whether the relationship between the carriers was such that a man holding positions with more than one road would be confronted with a hurtful conflict of fiduciary duty. Commissioner Potter asked whether in a doubtful case the commission should not be influenced by the well known integrity of a man to allow him to serve where it might not do so in another case. Mr. Thom insisted that the jurisdiction must be based on the relation between the carriers, and it follows, he said, that the commission has nothing to do under this section of the law with the relation of the individual to other financial institutions that are not carriers, particularly as that question is taken care of in another section of the law. In the case of a large railroad system, he said, whose common management is recognized as desirable, there is a presumption that common management ought to be allowed. In some cases, he said, the presumption is in favor of allowing common officers or directors, while in others the presumption is the other way, as, for example, where there is substantial competition between the carriers. But if the presumption is against common directors there may be other conditions which the commission may consider to justify authorization for the continuance of the practice.

The question was also discussed by R. S. Lovett, S. T. Bledsoe, Newman Erb and M. L. Bell.

DOUBTLESS if we are to remain a creditor nation we must some day reverse our merchandise trade balance, for we cannot go on indefinitely selling abroad merchandise in so much greater amounts than can be offset by our purchases of foreign goods and services.—*Guaranty Survey*.

# Prices Still Much Higher Than Railway Rates

Detailed Statistics for Over Thirty Years Show Freight Charges  
Are Now Relatively Much Lower Than Commodity Prices

**A**RE RAILWAY freight rates too high? Practically everybody, including railway officers, will answer this question in the affirmative. But no rational conclusion can be drawn as to whether the rates charged for any service, or the prices charged for any commodity, are too high or too low unless they are measured by standards of recognized validity. The universally accepted standards for measuring the reasonableness of rail-

it will soon begin a general investigation to determine whether, and to what extent, if any, further reductions in railway rates are justified. It is very doubtful if any witness who appears before the commission will claim that the present operating costs of the railways are so low as to justify substantial reductions in the rates on any commodity or class of commodities. Several important proceedings for reductions of rates have been begun before the commission. It has rendered decisions in some of these cases. In every instance the most important data and arguments presented by those asking reductions have been intended to show that the rates should be reduced because they impose an undue burden on business.

But why do they impose an undue burden? Because, as is claimed, the rates are so high in proportion to the prices that producers can get for their commodities that the shippers cannot afford to pay them. In other words, the contention really is that the great reductions in the prices of most commodities which have occurred since 1920 have made it impossible for most commodities to "bear" the present rates.

What evidence is there that most commodities, at the prices at which they are now selling, cannot "bear" the

RELATION OF FREIGHT RATES TO WHOLESALE PRICES,  
1890-1921

	AVERAGE 1890-1899										100	
	Average rate per ton per mile											

lowing the commencement of the war in Europe. Because there has been a heavy decline of railway business since 1920 it is constantly charged that the present rates have "killed" the traffic. But the best measure of what rate any commodity can bear is the price for which it sells. Therefore, the question whether the rates have become higher than the traffic can bear is, in substance, equivalent to the question whether rates have been advanced too much in proportion to the market prices of commodities.

As already indicated, most persons in discussing this question compare the differences between the present railway rates and the rates charged in the years from 1913 to 1917 with the differences between the present prices of commodities and the prices that commodities commanded in the years 1913 to 1917. If these comparisons are fair and reasonable, the present railway rates are too high in proportion to the present prices of commodities. The average railway rate per ton per mile is now only about 75 per cent higher than it was in the years from 1913 to 1917. On the other hand, the average wholesale price of all commodities is now only about 50 per cent higher than in 1913, although somewhat lower than in 1917.

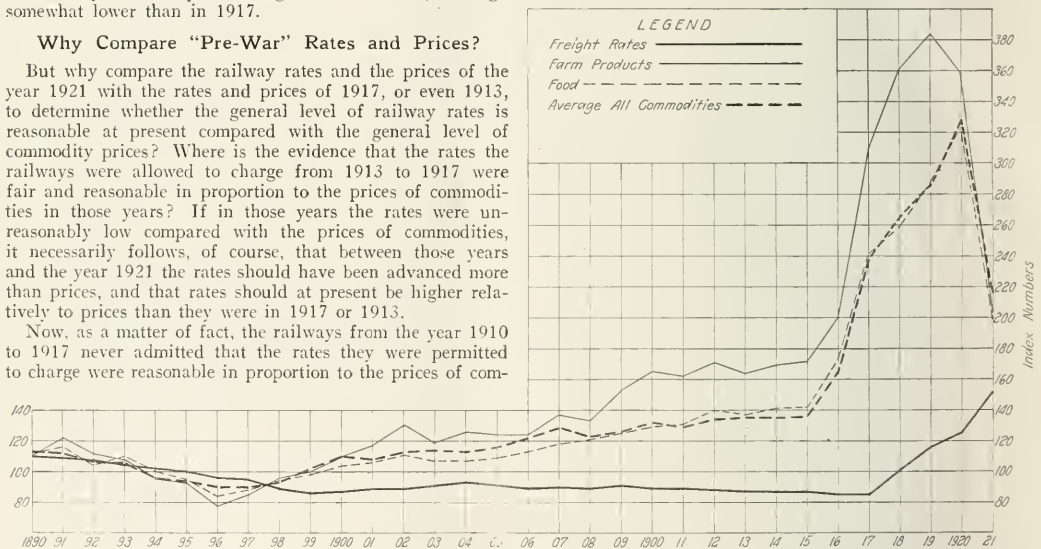

### Why Compare "Pre-War" Rates and Prices?

But why compare the railway rates and the prices of the year 1921 with the rates and prices of 1917, or even 1913, to determine whether the general level of railway rates is reasonable at present compared with the general level of commodity prices? Where is the evidence that the rates the railways were allowed to charge from 1913 to 1917 were fair and reasonable in proportion to the prices of commodities in those years? If in those years the rates were unreasonably low compared with the prices of commodities, it necessarily follows, of course, that between those years and the year 1921 the rates should have been advanced more than prices, and that rates should at present be higher relatively to prices than they were in 1917 or 1913.

Now, as a matter of fact, the railways from the year 1910 to 1917 never admitted that the rates they were permitted to charge were reasonable in proportion to the prices of com-

modities and should be taken as a basis for determining whether the advances in rates made since then have been relatively too great as compared with the advances in commodity prices.

Why did the railways from 1910 to 1917 constantly contend that their rates were too low? They did so on the ground, first, that the wages they had to pay for labor and the prices they had to pay for fuel and materials had been increasing so much for some years, while railway rates had been declining, that the rates had become unreasonably low in proportion to railway expenses; and, secondly, on the ground that the increases in prices and profits in industry and commerce in general had made it practicable for producers and shippers of most commodities to afford to pay higher rates. Both the contentions made by the railways and the findings made by the Interstate Commerce Commission in 1914 and in 1917 render it imperative, if any fair judgment is to be formed regarding the relative reasonableness of the rates now charged by the railways and the present prices of commodities in general, to consider not merely the

Relation of Average Freight Rate to Average Wholesale Prices of Farm Products, Food and All Commodities. Average 1890-1899=100

modities, the wages of labor, etc., during that period. On the contrary, the railways constantly contended during that period that their rates were relatively too low. They tried to secure a general advance in 1910. They tried again to secure a general advance in 1914. They tried again to secure a general advance in 1917.

Furthermore, in 1914 the Interstate Commerce Commission in the 5 per cent rate case specifically held that the rates of the railways in eastern territory were too low. Again in 1917 it held that the rates of the railways in eastern territory were too low. The railways in eastern territory handle practically half the traffic of the country. Therefore in 1914, and again in 1917, the Interstate Commerce Commission specifically held that the rates charged on half the traffic of the country were too low.

Both the contentions made by the railways at that time and the decisions of the commission show the unfairness of any assumption that the relationship between railway rates and commodity prices in any year from 1910 to 1917 was

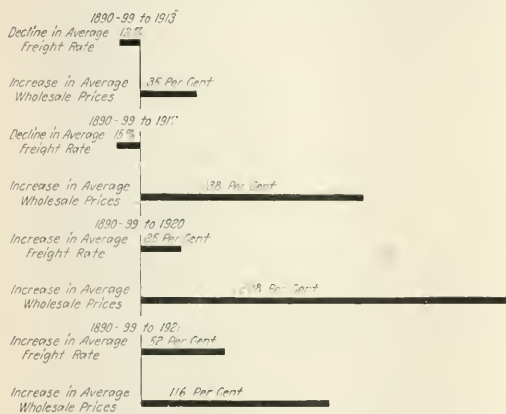

changes in rates and prices which have occurred since 1917, or even since 1913, just before the war in Europe began, but to consider the changes in rates and in commodity prices which began long prior to 1913 and have continued up to the present time.

### Rates Declined, Prices Advanced, Before 1913

Fortunately, official data for making these comparisons are available. A measure of the changes in railway rates as a whole which have occurred is afforded by the changes which have occurred in the average receipts per ton per mile. The average receipts per ton per mile are a "weighted average" of all the rates charged, and we have statistics of the Interstate Commerce Commission showing average receipts per ton per mile since 1888. Furthermore, the Bureau of Labor Statistics has compiled average wholesale prices of nine large groups of commodities for all years from 1890 down to the present time. The statistics of the Bureau of Labor regarding changes in wholesale prices formerly were

based upon average prices in the ten-year period 1890 to 1899, inclusive. The average prices of those ten years were taken as 100 per cent. Subsequently, the Bureau of Labor took the average prices of the year 1913, the year before the Great War began in Europe, as a basis, and its statistics regarding prices since then have been based upon the prices of 1913. It is a comparatively simple matter to put its figures for the years since 1913 on the same basis as those for the preceding years.

This has been done in the accompanying table, entitled "Relation of Freight Rates to Wholesale Prices." This table shows the changes in average wholesale prices which have occurred in the years from 1890 to 1921, the average prices of the ten years 1890-1899 being taken as 100 per cent. The table also shows in Column 1 the changes which have occurred in average railway rates, the average receipts per ton per mile in the ten years 1890-1899 being also taken as 100 per cent. The graphs showing the changes in average rates and in average prices which are presented herewith are based upon this table, and they show even more strikingly

**Increases and Decreases in Average Freight Rates Compared with Increases in Average Wholesale Prices All Commodities from Average for Period 1890-1899 to 1913, 1917, 1920 and First Six Months of 1921**

than the table the comparative changes in average railway rates and average prices which have taken place in a period of over 30 years.

The table and the graphs both show that the average railway rate per ton per mile declined in every year from 1890 to 1899. The wholesale prices of most commodities also declined from 1890 to about 1897. From that time on the average railway rate per ton per mile showed a generally downward tendency, although there were occasional fluctuations upward. From 1898 onward the general tendency of wholesale prices of commodities was always upward.

It was in 1910 that the railways first sought to make a general advance in rates. At that time the average rate per ton per mile was 11 per cent less than it had averaged in the years 1890-1899. On the other hand, the average wholesale price of all commodities had increased 32 per cent. The cost of fuel and lighting had increased 25 per cent, that of lumber and building materials 53 per cent, and that of metals and implements 29 per cent. The railways being large purchasers of fuel, lumber and metals, the advances in the prices of these things had appreciably affected their operating expenses. But this was not the main thing that affected their expenses. The prices of foodstuffs had increased 29 per cent, those of cloths and clothing 24 per cent,

and those of house furnishings 12 per cent. These advances in prices, as well as some others, had increased the cost of living of railway employees and brought about great movements for advances in wages which had been successful. It was these advances in wages, which were indirectly forced upon the railways by the increases in commodity prices in general, that most unfavorably affected their operating expenses.

The railways were unsuccessful in their efforts to secure the advances in rates asked for in 1910. On the contrary, their average rates per ton per mile continued to decline. In 1913 their average rate was 13 per cent less than in 1890-1899, while average prices of all commodities had advanced 35 per cent higher. These facts show clearly why it is utterly unfair to take the average rates and the average prices of 1913 as a starting point in discussing the average rates and the average prices of the year 1921. The average wholesale price of farm products had increased 64 per cent since 1890-1899, while the average railway rate had declined 13 per cent. Did the farmer have any moral right permanently to benefit from a relationship between railway rates and prices of farm products which resulted from a 13 per cent decline in the former and a 64 per cent advance in the latter? The average price of lumber and building materials had advanced 52 per cent. Where did the producers and shippers of lumber and building materials get any right, moral or economic, after railway rates had declined 13 per cent and their prices had advanced 52 per cent, to claim that the relationship between railway rates and prices established by these changes was a fair and normal relationship and should be perpetuated? And yet all arguments and deductions which are based on comparisons of the railway rates and prices which prevailed immediately before the beginning of the war in Europe are predicated on the indefensible assumption that the relations which then existed between railway rates and prices were fair and normal relations.

### Prices Up 165 Per Cent Before

#### All Rates Were Advanced

It was subsequent to the year 1913, however, as the table and the illustrations show, that the most extraordinary divergences of railway rates and commodity prices occurred. In the year 1917, the last before government control of railways was adopted, the average railway rate was 15 per cent less than in the period 1890-1899. On the other hand, the average wholesale price of all commodities showed an increase of 138 per cent, farm products had increased 210 per cent, metals and implements 166 per cent, and fuel and lighting 149 per cent. It was not until 1918, when the total increase in average wholesale prices had been 165 per cent, that a general advance in rates applying to all the railways of the country finally was made. The next and final general advance in rates was made in 1920. In that year average prices reached the highest point ever attained, being 228 per cent higher than the average for 1890-1899. The prices of farm products had increased 258 per cent, and the prices of lumber and building materials 368 per cent.

What is the final result at the present time in the year 1920 of all the changes, both increases and decreases, which have occurred in average rates and average prices? The curves in the graphs end with figures showing the comparative position of railway rates and prices in the first six months of 1921. The bottom row of figures in the table show where average rates and prices had arrived in July, 1921, the latest time for which the various statistics are available. The average railway freight rate was then 49 per cent more than the average for the years 1890-1899. At the same time, in spite of the great decline in prices within the last year, the average wholesale price of all commodities was still 100 per cent higher than in 1890-1899. The aver-

age price of farm products was still up 89 per cent, of fuel and lighting 161 per cent, and of lumber and building materials 204 per cent. At the present time the average railway rate is lower, compared with the average railway rate of 1890-1899, than is the average price of any large group of commodities compared with the average price of the same period. To state the matter in another way, at the present prices of commodities the producer or owner of almost any commodity can buy far more railway freight transportation with any given amount of that commodity than he could have bought with it at the average prices of 1890-1899.

### Prices 76 Per Cent Higher Than in

1910—Rates Only 65 Per Cent

Perhaps objection will be made to going back to 1890-1899 to get a starting point for comparing increases in railway rates and commodity prices. Let us, then, compare the relationship between average rates and prices in a later period of ten years with the present relationship between them. Never in any decade in history did the traffic of the railways increase relatively faster than in the ten years from 1900 to 1910. The total increase in freight traffic between those years was over 80 per cent. This shows conclusively not only that the relationship between rates and prices during that period was such that the traffic could easily bear the rates charged, but that it was highly conducive to the development of the industry of the country and the traffic of the railways. How much higher, then, are average railway rates and average wholesale prices at the present time than they were on the average in this ten years from 1900 to 1910? The average railway freight rate in July was 65½ per cent higher than it was then, while the average wholesale price of commodities was 76 per cent higher. In other words, relatively to wholesale prices the average railway freight rate is today substantially lower than it was when the industry of the country was developing and the traffic

percentage higher than it was then while the railway rate is a certain other and larger percentage higher. But all reasoning of this kind is unfair and fallacious, and of all the conclusions to which it leads the most fallacious is the conclusion that commodities at present prices cannot bear the present rates. Unquestionably, as a result of the horizontal percentage advances in rates which have been made within recent years, there are rates which are higher than the traffic easily can bear. Unquestionably, also, there ought to be some general reductions of rates if first the operating costs of the railways can be correspondingly reduced. But, taken as a whole, the present scale of freight rates is relatively low compared with the present general scale of commodity prices, and, taking rates as a whole, there is abso-

Relation of the Average Freight Rate to Average Wholesale Prices of Drugs and Chemicals, House Furnishings, Miscellaneous Commodities and All Commodities. Average 1890-1899=100.

of the railways was growing as rapidly as was ever known.

The data given demonstrate beyond all question that, on the whole, the railway rates of this country are now relatively lower as compared with the prices of commodities than they were until there began a few years before the commencement of the Great War in Europe the general advance in prices which had attained considerable momentum speed even before the war began, and which, before the present railway rates were fixed, had carried average prices 228 per cent higher than they were in the years from 1890-1899.

Why, then, is there so much complaint that rates are now too high in proportion to prices, and that the traffic cannot bear them? This complaint is entirely due to the fact that prior to a little over a year ago prices for years had been increasing more than railway rates, and that, in consequence, in a long period of years producers and shippers became accustomed to doing business on rates which had become extremely low compared with prices. When producers and shippers now complain about the relations between rates and prices they usually say that in 1913 or 1916, or some year prior to 1918, the price they received for their commodity was a certain amount and the railway rate on it was a certain amount, and that now the price is only a certain

lately no justification for contending that they are too high in proportion to prices in general.

### Why the Farmer Is Suffering

The greatest complaints about the present railway rates come from the farmers. The statistics and graphic charts presented herewith reveal some very interesting facts regarding the situation in which the farmer finds himself. They show that for years he benefited by very great increases in his prices, which were accompanied by actual reductions in rates, and that his present prices are relatively much higher than the present average railway rate. On the other hand, the average prices of all other classes of commodities, except foodstuffs of which the farmer himself is the principal producer, and of metals and implements, are relatively higher, and in the cases of fuel and lighting and of lumber and building materials, relatively much higher, than the prices of farm products. In other words, while the farmer is making the loudest complaints about the railway rates he has to pay, every other class of producers in the country is charging him relatively higher prices for the commodities they sell him than the railways are charging him for the transportation service that they render him.

# Commission Orders General Rate Inquiry

## Railroads Propose Present Relief for Agriculture, Followed by Further Reductions When Wages Are Cut

Washington, D. C.

THE Interstate Commerce Commission on November 23 ordered an investigation "to determine whether and to what extent, if any, further general reductions in the rates, fares and charges of carriers by railroad applicable in interstate or foreign commerce can lawfully be required by order or orders of the commission under Section 1 or other provisions of the interstate commerce act, upon any commodities or descriptions of traffic." And on November 29 the commission amended its order by adding at the end the following: "and also to determine what will constitute a fair return from and after March 1, 1922, under Section 15-a (3) of the interstate commerce act." The provision in the law providing for a 5½ per cent return expires on that date and the commission is directed to state the percentage to apply from that time.

All carriers by railroad subject to the interstate commerce act were made respondents to this proceeding, the state authorities were notified and the proceeding was assigned for hearing at Washington on December 14.

The order of the commission was issued on its own motion, but it was in accordance with a request made in a petition filed on the same day by the Association of Railway Executives asking also for a reopening of the case in which the commission ordered reductions in the rates on grain, grain products and hay in the Western and Mountain-Pacific districts and for permission to put into effect as a substitute a general 10 per cent reduction in rates on agricultural products, as proposed in the resolution adopted by the roads at the meeting in New York on November 16. The only explanation given by the commission was the following statement:

The commission has acted recently in two litigated proceedings looking to general reductions in rates.

The first was based on complaint by producers of live-stock and confined to rates in the western district. The reductions recommended became effective in September. Various applications for modification or extension of the findings were argued on November 8.

The second was an investigation instituted in July into the rates on hay and grain in the western district. Many state commissions intervened. The findings are reported in 64 I. C. C., 85. An order thereunder, effective December 27, on five days' notice, was served on November 21. Meantime, petitions have been filed by representatives of various interests asking the institution of investigations, more or less general in scope, with a view to effecting reductions in rates on various descriptions of traffic, and the carriers have indicated their intention to effect immediate reduction of 10 per cent in the rates in all districts on designated products of the farm and the ranch.

All petitions have received careful consideration, but it has seemed to the commission that its investigation should not be confined to any particular descriptions of traffic and should be distinct from and without prejudice to proceedings on complaint already filed or hereafter to be filed. The order now issued is intended to elicit whatever information may be lacking as a guide for the commission in its further action, and is along lines under consideration by the commission for some time past.

The proposal of the railroads is to give some assistance at this time to the agricultural industry as most deserving of relief and to make further reductions on other commodities as soon as further reductions are made possible by the proposed wage reduction in such manner as the commission may determine. This is in accordance with the resolution adopted by the executives when the wage cut was proposed.

The hearing is expected to give the railroads an opportunity to contend that the commission under the law cannot under present conditions order general reductions in rates except on the theory that the reductions would so stimulate traffic as to increase earnings instead of reduce them, but

that if and when further reductions are to be made they should be made on those commodities which the commission may select as entitled to precedence. It is also likely to afford a field day to the representatives of shippers who are demanding rate reductions. It is believed also that some general pronouncement of policy by the commission may result which will remove much of the uncertainty which now exists and which in many cases is causing the withholding of orders in the hope that rates will soon be reduced.

The railroad petition in the grain case asked:

1. For approval of a program for the relief of agriculture in all sections of the United States through the medium of a reduction in carload rates on the following products of agriculture and products of animals, namely: wheat, corn, oats, other grain, flour and meal, hay, straw and alfalfa, unmanufactured tobacco, cotton, cotton seed and products, except cotton seed oil and cotton seed meal, citrus fruits, other fresh fruits, potatoes, other fresh vegetables, dried fruits and vegetables, horses and mules, cattle and calves, sheep and goats, hogs, poultry, eggs, and butter and cheese, and wool, as set forth and more specifically described in the resolution of the Association of Railway Executives, adopted on November 16, 1921.

2. For special permission to make effective said reduction in freight rates on the commodities named as soon as may be and upon one day's notice.

3. For an order re-opening this proceeding and the order herein entered on the 21st day of November, 1921, and for a reconsideration thereof to determine whether the findings therein affecting the Western District, insofar as they are inconsistent with the general program for the relief of agriculture in all sections of the United States above mentioned, should be modified and for a modification thereof.

4. For an order instituting an investigation to determine whether, until a substantial reduction can be secured in the labor and other costs of operation of these petitioners, any further reduction in rates can be lawfully required or, with due regard to the transportation industry, is possible.

The statements made in support of the petition were:

### A Plan for the Relief of Agriculture

That the delay in putting into effect the reduction suggested by this Honorable Commission in its report in this case has been due to a diligent effort on the part of these petitioners to mature a plan for the relief of agriculture in all sections of the United States, more comprehensive than that embraced in this single proceeding.

In view of the difficulty and magnitude of the problem, of the many and diverse interests involved, and of the necessity for agreement and co-ordination among carriers differently situated in relation to the problem, the delay which has occurred will, the carriers trust, be fully appreciated and understood by this Honorable Commission.

There was and is an insistent demand from many sources for a reduction in rates. The demand is for a general reduction and embraces not only the rates on the commodities above mentioned but on practically all other commodities. In considering this demand and desiring to deal with it in a sympathetic and helpful manner, it was necessary for the carriers to consider the conditions which bear a substantial, and in many respects a controlling, relation to the subject. It was necessary to consider carefully the revenue conditions of the carriers themselves, because, entirely aside from the interest and rights of the owners of the properties, the carriers sustain so important a relationship to the public welfare and are so essential to the service of the public that it was necessary for them to consider how far anything that might be proposed would impair their capacity to perform their public service, and it was accordingly necessary for them to give careful consideration to the effect of any proposal upon their operating revenues.

### Railway Income Still Inadequate

The result of operations of the Class I roads for the calendar year 1920 was a net railway operating income of about 62 million

lions of dollars as against a normal in other years of more than 900 millions, and even this amount of 62 millions included back mail pay received from the government for prior years of approximately 64 millions, thus showing, when the operations of that year alone are considered, an actual deficit before making any allowance for either interest or dividends.

The interest requirements of these roads amounted for that year to approximately 475 millions of dollars.

The corresponding result of operations of the carriers showed, for the calendar year 1920, in the Western, Eastern and Southern districts respectively, the following net railway operating income:

Western	\$118,970,768
Eastern (including Pocahontas Region)	77,475,261 (deficit)
Southern	20,768,914

For the first nine months of the calendar year 1921, the net railway operating income of the Class 1 roads, taken as a whole, amounted to \$391,384,719, being only 2.9 per cent of the value of their properties as determined by this Honorable Commission, in July, 1920, for the purposes of rate-making, in a proceeding entitled "Ex Parte 74."

The corresponding results of operation of the carriers in the several districts, Western, Eastern and Southern, showed for said period of nine months the following net railway operating income, namely:

		Rate earned (annual basis) per cent
Western	\$195,118,646	3.4
Eastern (including Pocahontas Region)	167,146,720	2.7
Southern	29,119,353	1.9

The foregoing were the operating results notwithstanding the fact that the carriers as a whole were compelled to reduce their expenditures for maintenance of way and equipment for the said nine months' period \$426,793,121 below what was expended for these purposes during the corresponding period of nine months of the previous year; the reduction in such expenditures in the several districts being as follows:

Western	\$178,357,201
Eastern	208,349,365
Southern	40,086,555

The policy of rigid economy made necessary by these results, and the consequent cutting to the bone of the upkeep and maintenance of the properties, was at the price of neglecting, and for the time deferring, work which must hereafter and in the near future be done and paid for.

The condition of postponed maintenance is illustrated by the fact that, as of September, 1921, over 16 per cent, or 374,431 in number, of freight cars were in bad order needing repairs, as against a normal of bad order cars of 160,000.

From the foregoing it is apparent that the figures of operating results as shown by the reports, are unduly large to the extent that they take no note of the enormous bills charged up against the future, and which must soon be paid, for deferred maintenance.

It is obvious that, even under these circumstances of omitted and deferred maintenance, the rate of return of 5½ or 6 per cent, fixed by the Transportation Act for the first two years after March first, 1920, has not been even approximated—much less reached, the actual result being less than one-half of the prescribed return.

This unhappy and discouraging result has been largely brought about by the expenses of operation, and in analyzing these it will be found that by far the largest contributing cause is the labor cost.

### Labor Cost

Labor costs constitute three-fifths or more of the expenses of operation.

On the first day of January, 1917, when the government took charge of wages in the Adamson Act, the labor cost of Class 1 carriers had not in any year exceeded the sum of about 1,463 millions of dollars. In 1920, when governmental authority made the last wage increase, the labor cost of these carriers was about 3,698 millions for the year, or, if continued throughout the year instead of for only eight months during which the wage increases were in effect, the labor cost, on the annual basis, would have been largely in excess of 3,900 millions of dollars.

In the light of these figures, it is manifest that the recent

reduction by the Labor Board of wages, estimated at from 10 to 12 per cent, in no sense meets or solves the problem of labor costs, and in no way makes it possible for the carriers to afford a reduction in their revenues.

Notwithstanding this, however, the carriers have, since the rate increase in Ex Parte 74, made many hundreds of thousands of reductions in freight rates, these reductions having resulted, according to the best estimates which can be made from available data to a reduction in the revenue of the carriers amounting to from 175 millions to 200 millions of dollars a year on the basis of normal business.

It is obvious, from the opposition of shippers to a level of rates which is not now sufficiently high to provide for the labor and other costs of operation and to afford even a moderate support to the transportation industry, that these costs impose upon transportation a burden substantially greater than it can bear.

The only practical method of obtaining relief from these excessive labor costs is through an order of the Labor Board which can be rendered only after a hearing of the parties.

In a wise administration of the responsibilities of management, it was necessary for the facts herein enumerated to be borne in mind and carefully weighed in forming a judgment as to the duty of the carriers in respect to the demand for a reduction in rates.

### Rate Reductions Unwarranted

### Until Costs Are Lowered

From the foregoing general outline of the circumstances of the carriers it is clearly apparent that, without a substantial reduction in costs, the transportation industry is in no condition to afford any reduction whatever in its revenues.

It is urged, however, that a reduction in rates will stimulate traffic and that increased traffic will protect the carriers from loss growing out of the reduction in rates. It was the duty of the carriers to give respectful and earnest consideration to this suggestion. It is, of course, manifest that it has no basis except a basis of conjecture, and that an adverse result of the experiment would be disastrous not only to the railroads but to the public whose supreme need is adequate transportation. There can be no escape from the conclusion that it is a serious question, whether the railroad managements should venture voluntarily to place these instrumentalities of commerce, so essential to the public welfare, at the hazard of such an experiment.

It is, however, represented to them that the wheels of industrial activity in all branches of business have been slowed down to a point which brings depression and distress to the entire public and that something must in the public interest be done to start them again in motion. It is urged that some interest must take the risk of the first step to relieve the industrial congestion which is holding business back and down, and the railroads are urged to take this first step, and to rely upon public opinion to bring about promptly the necessary reduction in operating costs, including a just reduction in the abnormally high cost of labor.

It is represented to the carriers that the only just method is to apply horizontally any reduction that is made so that all users of transportation may share equitably and alike in the advantage incident to a reduction of rates, and the precedent of the horizontal increase in rates made in Ex Parte 74 is cited to justify this demand.

### An Economic Problem

It seems, however, to your petitioners that the situations then and now are substantially different. Then the problem was a revenue problem—a problem of producing revenue sufficient to support transportation up to the standard of efficiency deemed necessary in the public interest, and, manifestly, it was equitable and proper to distribute ratably the incidental burden.

Now the problem is to find a means of aiding in a vast economic readjustment, and to relieve serious economic distress—not as a right, but as a matter of high and wise expediency and in a way that will best promote the public welfare.

Inasmuch as there is no opportunity or possibility of giving relief to all, there should, in the judgment of your petitioners, and it is believed in the disinterested judgment of the public, be a resort to wise selection, and whatever is done should be

applied where it will bring the greatest relief and do the most good, considering the question from the broad standpoint of the advantage and interest of the general public.

In considering the economic needs of the various classes of industry, it is represented to your petitioners, and they believe it to be true, that the deflation since the war in the prices of agricultural products to the producers has been greater by far than in any other industry. This decline has not been confined to any particular agricultural products or to any particular section of the country, but is general, resulting primarily from two major causes—the condition of foreign credit and the condition of domestic markets. These conditions constitute a serious obstacle to the resumption of normal activities and it is not believed by your petitioners that the present agricultural depression is caused to any appreciable degree by the existing level of freight rates, or would be relieved to any substantial extent by any reduction in such rates that can be made.

But the demand for a reduction in freight rates on the products of the farm is most insistent and it seems to be a matter of general concession that no industry is as much in need of a reduction in its expenses as agriculture.

This Honorable Commission, in its recent report in this cause, at page 99, although dealing with only a portion of the country, and with reductions on only a part of the agricultural products, thus stated the situation: (Here is quoted an extract from the commission's opinion in the grain case.)

The carriers do not feel justified in remaining rigid and uncooperative in the face of this suggestion and of a public demand which is so insistent and so extensive as to amount, for all practical purposes, to a fixed public opinion.

## Present Reduction Should Not Be

### Concentrated on Western Grain

Your petitioners, however, submit that, if there is to be a reduction in rates for the benefit of agriculture, there seems little justification for confining such reductions to rates on grain, grain products and hay, nor to any particular section of the country. The economic reasons in favor of reductions apply with equal force to other products of the farm and to other territorial sections. The demand on the part of the agricultural public for a reduction in freight rates is not confined to the commodities covered by this proceeding and is not confined to the Western District. The commission and the carriers have been, or will be, confronted by the necessity of meeting the demand for a wider application among agricultural products of proposed reductions and for a more extensive territorial application of them. It is not apparent how this demand can be successfully distinguished from the action taken by the commission in this cause, and yet a general application of the scale of reductions ordered in this case to other agricultural products and to other territories of production, would involve a loss of revenue to the carriers which would seriously impair their capacity to perform their public obligations.

Actuated by these considerations, the railroads represented by the Association of Railway Executives, which include the respondents in this cause, being desirous of manifesting a sympathetic attitude toward the public demand for a reduction in rates and of making a substantial contribution to the relief of existing industrial congestion and depression, and to the economic readjustment essential in the public interest, and at the same time realizing the serious and disastrous consequences of a failure of the experiment they are about to make, not only to the railroads themselves but to the public dependent upon them for the means of transportation and for the facilities of doing business, have determined to ask this Honorable Commission for leave to put into effect as promptly as may be, the following program:

"1. A reduction, for an experimental period of six months, of 10 per cent in car load rates on wheat, corn, oats, other grain, flour and meal, hay, straw and alfalfa, unmanufactured tobacco, cotton, cottonseed and products except cottonseed oil and cottonseed meal, citrus fruits, other fresh fruits, potatoes, other fresh vegetables, dried fruits and vegetables, horses and mules, cattle and calves, sheep and goats, hogs, poultry, eggs, butter and cheese, and wool, any reduction in such rates made since September 1, 1920, to constitute a part of this 10 per cent; it being understood that the proposed reduction of 10 per cent shall not apply to the movement of such traffic wholly within New England, and that if the reduction of

wages, referred to in the next succeeding paragraph hereof, is put into effect prior to the expiration of the said experimental period, this limitation of six months shall not apply to the said reduction in rates. It should be noted that the loss of revenue resulting from this reduction would all come out of the net revenue of the carriers.

"2. The necessary steps under the law, including, in case of failure to agree in conference, an application to the United States Railroad Labor Board, to be filed as promptly as possible, for a reduction in wages of employees, with the understanding that, concurrently with such reduction in wages, the benefit of the reduction thus obtained shall, in a manner approved by this Honorable Commission, be passed on to the public in the reduction of existing railroad rates, except in so far as such reductions in rates shall have been made in the meantime."

The reason for the exclusion of traffic moving wholly within New England, from the benefit of the immediate reduction proposed in rates, is due to the special distress of the New England carriers.

## Further Reductions to Be Determined by Commission

It will be noted that the effect of this proposal will be an immediate reduction in car load rates on the products of agriculture and the products of animals which are mentioned, but, as soon as and to the extent that a reduction in wages is obtained from the Labor Board on the proposed application, a further reduction in rates (except as meanwhile put into effect), to be distributed among the users of transportation in such manner as this Honorable Commission may determine.

The proposal thus deals immediately, and without waiting for a reduction in operating costs, in the manner stated, with the needs of agriculture and undertakes to make further reductions not confined to agriculture as soon as further reductions are made possible by the proposed reduction in wages.

Your petitioners, in view of the condition and of the special needs of the transportation industry do not believe that any further reductions in rates than those herein mentioned, should be made until there is a reduction in operating costs. They further submit that there is no justification for treating grain, grain products and hay preferentially or for giving special and preferred advantage to the territory covered by the order in this cause, and that the measure of reduction recently ordered by this Honorable Commission can not be extended to the other products of agriculture or throughout the country without serious injury and hardship to the transportation industry.

Your petitioners, therefore, respectfully ask for an inquiry by this Honorable Commission to ascertain whether, until a substantial reduction can be secured in the labor and other costs of operation, any further reduction in rates than that herein proposed can lawfully be required, or with due regard to the transportation industry, is possible, and that meanwhile a rehearing be ordered in this cause, that meanwhile the order in this cause be suspended and, that meanwhile permission may be given to your petitioners to make effective on one day's notice the proposed 10 per cent reduction in freight rates on the commodities and under the conditions set out in this petition.

The petition was filed by J. N. Davis, Fred H. Wood, Kenneth F. Burgess and Alfred P. Thom.

## Program for Rate Hearing

The commission on November 28 gave out the following outline of the plan of procedure and the subjects to be considered at the hearings beginning on December 14:

The purpose of this hearing is to elicit facts. Therefore the submission of evidence is not to be preceded by an argument or debate on questions of law or of policy. Of course, at the close of the hearing opportunity will be afforded for argument, at which time questions of law as applied to the facts of record may be discussed.

During the period December 14 to 21, inclusive, it is expected that the respondents will put in their case. Hearing will be resumed on January 9 and past experience has shown that full development of the facts will be facilitated if cross-examination of respondents' witnesses is deferred until then. Before the close of the hearings on December

21 a schedule for the hearing on and after January 9, 1922, will be announced. This will be arranged according to commodities, etc., etc. Interested parties should advise the Secretary of the amount of time desired to present their case.

The hearing will be continued until adequate opportunity has been afforded for the presentation of such matters as in the opinion of the commission may aid it in determining the questions before it, but every effort will be made to expedite the proceeding and to confine the evidence within reasonable time limits. Relationships between particular points under existing rates are not in issue.

It is suggested that the matters to be presented should include the following:

1. Are the present rates\* reasonable in the aggregate under section 1 or other provisions of the act either in the country as a whole, or in the several territorial rate groups\*\* defined in Ex Parte 74. Are the rates on specified commodities or descriptions of traffic reasonable? If not, to what extent are they unreasonable? This of course includes passenger traffic.

2. To what extent are the respondents realizing return contemplated by section 15a and what are the prospects for the future? This should be shown by individual lines, by territorial rate groups, and by classification territories.

3. To what extent have operating expenses been reduced since August 31, 1920:

(a) By furlough or discharge of employees?

(b) By reduction in wages?

(c) By changes in working conditions?

Same questions as to operating expenses since June 30, 1921. State as in 2.

What part, if any, of this decrease has not been included in the monthly reports of operating expenses made to the commission since June 30, 1921?

4. (a) How do fuel contracts and costs now current compare with those in effect on August 31, 1920 (give the figures)? When do such contracts expire? To what extent are contract prices conditioned on wage scales? What part of the cost of fuel is for transportation?

(b) The same questions as to locomotives, cars, rails, ties and other materials and supplies.

5. To what extent have rates been (a) further increased and (b) reduced since general increase of 1920? This should be shown by individual lines, by territorial rate groups and by classification territories.

6. (a) What increase in gross and net operating revenues,

\*For brevity the term "rates" is used throughout, as including fares and other transportation charges.

\*\*References hereinafter to territorial rate groups are to those defined in Ex Parte 74.

absolutely and on a percentage basis, resulted from the increases authorized in Ex Parte 74?

(b) What decrease in gross and net operating revenues (1) has resulted and (2) may be expected to result from reduced rates which have become effective since August 25, 1920? State separately.

(c) What changes have there been in the volume of traffic since August 31, 1920, and what are the prospects for the future? What has been the effect of rate changes upon the volume of traffic since that date?

7. What readjustments, if any, following *Increased Rates*, 1920, have not been but should be effected? The commission there said:

"It is impracticable at this time to adjust all of the rates on individual commodities. The rates to be established on the basis hereinbefore approved must necessarily be subject to such readjustments as the facts may warrant. It is conceded by the carriers that readjustments will be necessary. It is expected that the shippers will take these matters up in the first instance with the carriers, and the latter will be expected to deal promptly and effectively therewith to the end that necessary readjustments may be made in as many instances as practicable without appeal to us."

These matters should be gone into thoroughly.

8. To what extent, if any, has maintenance of road and equipment been curtailed since August 31, 1920? What is the present condition of road and equipment?

9. What amounts have been expended since August 31, 1920, for additions and betterments, including equipment, which, under the prescribed accounting system, are chargeable to capital account? What amounts are needed or will be needed in the immediate future for such expenditures, in the public interest, based (a) on present volume of traffic, and (b) on volume of traffic under normal conditions?

10. What are the relative degrees of profitability of the freight and passenger services, respectively?

11. To what extent can net income be increased by enhanced economy and efficiency in management?

12. If rates are found to be unreasonable in the aggregate in the country as a whole, or in one or more territorial rate groups, (a) should a general reduction in all rates be required or, (b) should readjustment be required in the rates on specified commodities or descriptions of traffic?

If rates are found to be reasonable in the aggregate, but unreasonable on specified commodities or descriptions of traffic, what readjustment should be required?

13. What should be the rate of return after March 1, 1922?

# Lackawanna Success the Result of Supervision

Details of the Handling of Coal and Manifest Freight—  
Train 51—Full Use Made of Signals

By Charles W. Foss and James G. Lyne

## Part II

**T**ECHNICALLY SPEAKING, the Lackawanna serves the Northern or Wyoming anthracite field. The mines or breakers are in a small area in the neighborhood of Scranton, Pa., and extend in a narrow strip southwesterly from Scranton along the Bloomsburg branch, the mine farthest from Scranton being at West Nanticoke, about 25 miles from Scranton. Various of the older mines are within the city limits of Scranton itself; in fact, the mine cave-ins, and the resulting damages to buildings and streets overhead, represent a continuous source of trouble to the coal mining company. The Scranton mines, on the whole, are now being worked out, the Kingston district from Luzerne to West Nanticoke having superseded them in importance. Normally one-half the total coal mined by the Glen Alden Coal Company is secured in the Kingston district.

The Lackawanna normally handles about 900 to 1,000 cars of coal a day. In summer, the lake season, about 50 per cent of the coal tonnage moves west to Buffalo, about 30

per cent east and the remaining 20 per cent to Lackawanna local points or to connections other than at Buffalo, such as for Canada through Utica, etc. In winter about 35 per cent of the coal movement is to Buffalo, whence it moves by rail over the various connections from Buffalo and Black Rock.

### Hampton Yard

Probably the most important facilities for handling coal in the coal district are the assembling yard at Kingston and the hump yard at Hampton on what is known as the Keyser Valley branch. The empty cars for the Kingston district are distributed from Kingston and the loads assembled there. They are then moved in drags to Hampton yard, at which point also are assembled the cars loaded in the Scranton district. At Hampton the coal and other freight is classified over the hump by destination. The classifications number 22, including among others: Coal for Buffalo; coal for

Anthracite Mines Served by the Lackawanna

Michigan Central; coal for Grand Trunk; New York freight; Hoboken coal; Syracuse freight and empties, etc.

The west classification yard has 15 tracks ranging from 2,060 to 3,700 ft. in length, or holding from 50 to 97 cars and with a total capacity of 973 cars. The east classification yard also has 15 tracks, ranging from 21 to 76 cars, and with a total capacity of 765 cars. The three largest tracks in the westbound yard, in addition to being used for classification, are used largely for the handling of trains that do not require being put over the hump. There is also a receiving yard of 6 tracks with a capacity of 70 cars each. This yard, incidentally, is on a descending grade of 1.3 per cent. The classification yard, except for the hump itself and its approaches, is on a descending grade of 0.5 per cent.

For westbound movement trains are made up to 3,500 tons, or as it is termed in Lackawanna parlance, to 7,000 M's. Their movement to Clark's Summit requires a Mikado, usually assisted by a helper and two or three pusher locomotives, the helper and pushers being dropped at Clark's Summit, which is the end of the 1½ per cent grade. The west end of the Keyser Valley branch is at Cayuga, some four miles east of Clark's Summit. An interesting feature is the left-hand movement from Cayuga to Clark's Summit over a slow speed track which crosses under the other tracks to the right-hand side just east of the summit.

Coal moving eastward is made up to 2,500 or 3,500 tons, the trains requiring four or five locomotives eastbound up the 1½ per cent grade to Gouldsboro. If they are made up to the smaller figure only, they are filled out to 3,500 tons by the addition of cars assembled at Gouldsboro from mines on the Winton Branch which leaves the main line at Nay Aug.

In the foregoing we have spoken of the classification of the coal by destination. This term possibly needs some explanation. The loaded cars are assembled from the mines, but in the case of the Glen Alden cars they are not billed

with the other roads in trunk line territory. Prior to the war the road furnished a service rather better than that which the competing lines were able to maintain—it being able to offer this service because of its having the short line from New York to Buffalo, because of its facilities and because of the special care which the fast freight service was accorded. Up to the present its pre-war schedules have not been restored. The road now is offering the same manifest deliveries as the other lines. It seems, however, to be able to maintain its schedules somewhat better; its record for making connections is especially an enviable one.

The Lackawanna, like the other trunk lines, is now solicit-

Train 51 in the Poconos

Pushers for No. 51 at the Foot of the Pocono Grade

from the mines, but from the assembling yard—and then on the authority of a representative of the coal company whose office is at the yard. This, of course, means that in classification by destination the cars are in some measure also classified by sizes. Further classification by sizes must be carried out for the car dumpers at Buffalo and Hoboken. Included among the extensive facilities at Secaucus, N. J., for example, is a hump yard in which is classified the coal for Hoboken or for movement to the Lackawanna's territory adjacent to Newark, N. J.

#### The Movement of Manifest Freight

The Lackawanna's success in operating fast manifest freight schedules and its ability to make connections almost without fail has for many years been the road's chief stock in trade in the keen competition for fast freight business

ing merchandise or manifest freight out of New York on the basis of second morning delivery at Buffalo; third morning at Cleveland, Pittsburgh, Toronto, etc.; fourth morning at Chicago, St. Louis, Indianapolis, Cincinnati, etc.; fifth morning at Milwaukee and Nashville, and sixth morning at Kansas City, Memphis, etc. It is making the same deliveries on less-than-carload freight as it makes on carload freight, despite the fact that l.c.l. transfer freight must be delayed for some 12 or 15 hours for transfer into through cars at New York Transfer, Secaucus, N. J. Prior to the war the Lackawanna made a third-morning delivery at Chicago and a fourth-morning at Kansas City, and this summer put on a schedule offering these deliveries eastbound on perishables.

The Lackawanna's manifest trains are designated by sym-

bol numbers. A tentative schedule showing arriving and leaving times at division and terminal points is issued in mimeograph form to officers and employees concerned. That is to say, the schedules do not appear in the operating timetable, nor is a symbol book used. The schedules are given in the table. With reference to the eastbound schedules, mention should be made that frequently three sections are run of No. 54 and two of No. 56.

The spectacular feature of these schedules is Train 51—the train handling package freight from New York Transfer. This train is due to leave Secaucus at 10.30 a. m., about 15 hours later than First 55 or about 10 hours later than Fourth 55. Its movement to Buffalo in 20 hours, covering about 385 miles, is made at an average speed, including terminal time, of about 20 miles an hour. First 55 is allowed 26 hours and Fourth 55 about 28 and they are not required to make as close connections with the lines beyond Buffalo as No. 51.

Train 51 is limited to 70 cars, about 4,200 Ms (2,100 tons), from Secaucus. It was put on about January 1, 1921, and for a short period the road found difficulty in giving it 50 cars of freight from the transfer. Business has gradually become heavier and heavier as the schedule and the manner in which it is maintained have become better known to shippers. As a result the train is now run frequently in two sections. Since the train was put on it has not missed connections at Buffalo, although if the train is late connections are protected by the Buffalo lines. The operation of this train may be taken as the leading example of what Lackawanna service means. It is, therefore, worth examining into the manner of its operation.

A considerable portion of the Lackawanna's manifest freight is received at its piers in New York City. For

Indianapolis, Peoria, St. Louis, Denver, Detroit and even for Seattle and San Francisco.

An interesting feature of the operation of the transfer is the manner in which the record is kept of the freight and way-bills. As soon as one of the incoming or "feeder" cars, is unloaded, the way-bills are sent to the transfer office and

Pier 1, Hoboken

sorted. The way-bills for a particular westbound car are then abstracted, the way-bills being forwarded early in the afternoon by train mail. Copies are made of the abstract, one of which is filed and another sent to the commercial agent at the destination point to which the car is routed. The commercial agents find these reports of special value in permitting them to keep in touch with consignees and to advise them of the arrival of their freight when it reaches its destination.

Naturally, in view of the small amount of time available for loading the train, many short cuts must be utilized. For example,

freight which can during the day be made up into through cars at the New York pier freight stations the problem is relatively simple. These cars are floated across the Hudson river and dispatched in the various sections of No. 55 from Hoboken.

#### New York Transfer

New York Transfer is situated adjacent to the Secaucus classification yards, about 4 miles out from Hoboken. The facilities at the transfer include three platforms, two 1,050 ft. in length and one 1,200 ft. in length. The forces are utilized in the forenoon, from about 6.00 to 10.30, for transferring the freight for No. 51. In the afternoon, or rather from about 11.00 to 3.00 o'clock, the eastbound cars are made up. About 17 gangs are used in the morning and about 10 in the afternoon shift. On a typical day 72 westbound cars were loaded with 591 tons and 48 eastbound with 288 tons. Through cars are loaded westbound for such points as Pittsburgh, Memphis, Nashville, St. Paul, Chicago,

The Lower End of the Yards at Hoboken—Above, Float Bridges at Hoboken

while the freight is being transferred, car inspectors examine all the cars carefully. The cars are provided with long air hoses to connect the air lines of cars not coupled, so that it is possible for the inspectors to test the brakes before the train is actually made up. The cars into which the freight is loaded are on three tracks. When the transfer forces have done with their work, two switch engines are used to put the train together. The road engine is waiting

and the conductor has his bills. An hour's time is a liberal allowance from the time the last truck-load of freight is loaded until the train is on its way.

The schedule for No. 51 allows it about 30 minutes at Scranton and 35 at Elmira, which means that any necessary switching, inspection of the train and changing engines must be done as rapidly as possible. As soon as the train enters the yard at Scranton, for example, the incoming caboose is removed by a switch engine and the new caboose attached. By this time the incoming locomotive is off of the train with about 20 cars from the head-end which it has to leave on an adjacent track, the tracks in the yard not being long enough to hold a train of 70 cars. Eight car inspectors are assigned to this train. As soon as the engines are detached the inspectors connect up the train-lines with the yard air-line and go over the train under the protection of blue flags. A switch

A Model Freight House for Small Station—at Orange, N. J.

engine is stationed at both the head and rear ends of the train to set out any bad orders that may be found.

In the meantime, the conductor has his way-bills, the road engine is ready to back onto the train and two or three helpers are at the rear ready to couple on as soon as the carmen take down their blue flags. As soon as this is done the helper engines (used on all trains out of Scranton) couple on the rear and pump up the air (little of it has leaked out because the yard air-line has kept it up as long as the carmen were working). The road engine has in the meantime coupled onto the head cars, which have been doubled over, and has backed onto the train. All that remains to be done is to pull out of town. The handling of this train is always under the direct supervision of at least one yardmaster.

#### Advantage Taken of Complete Automatic Signaling

The Lackawanna has taken full advantage of a main line which is double-tracked and provided throughout with automatic block signals, in using modern methods of train dispatching. Trains move almost entirely by signal indication, with the result that unnecessary delays to trains have been thereby greatly decreased.

All through freight trains run as extras, but they do so without train orders ordering their movement and without displaying white signals. Clearance cards are issued and train registers kept at certain points. Beyond this no authority is necessary for the movement of extra trains. Third class trains when overtaken allow through extras to pass them. When drag extras moving ahead of manifest trains are likely to delay them, "19" orders or messages are issued by the dispatcher directing the slower trains to clear the

main line for the faster ones. Third class trains and extras, of course, clear the time of first class trains.

Train orders are used but infrequently in the ordinary course. If a first class train is late and the dispatcher desires to give inferior trains the benefit of the time, he may, if convenient, issue a "31" order to the first class train and "19's" to the inferior trains interested. If he does not wish to restrict the first class train, however, he can still give the inferior trains the benefit of the extra time by giving them a message to "use . . . minutes on No. . . . (the late first class train)" between certain points. When this message is used, no restriction is placed on the passenger train. It can make up all the time physically possible under the speed regulations. Automatic block signals and flagging rules are depended upon to prevent collisions. The dispatcher, of course, knows about how much time the passenger train will make up between certain stations, and this factor is reckoned with in authorizing inferior trains to "use" so much time on the first class train. A message to an extra freight train which was sent from the dispatcher's office at Scranton on August 11 giving time on first class trains, where no restricting order had been issued to the superior trains, reads as follows:

"C & E x 1152

Use 45 mins. on No. 44 and No. 46 to Lehigh."

Extra passenger trains may be run without train orders but, as distinguished from freight extras, they must display white signals. The following illustration shows a "19" order issued to inferior trains directing them to clear the time of a passenger extra.

Form 19	Form 19
THE DELAWARE, LACKAWANNA & WESTERN RAILROAD CO.	
TRAIN ORDER NO. 100	
Superintendent's Office, Hoboken, Aug. 9, 1921

Do not Delay them, and call on Telephone where you clear for this Extra.	
R. M. H.	
CONDUCTOR AND ENGINEMAN MUST EACH HAVE A COPY OF THIS ORDER	
Made Complete	Time 1:13 a. M. Scoalar Opr.

Time table rules require trainmen to be in a position to receive messages from the operator's hoop at every telegraph station, and conductors are required to report to the dispatcher by telegraph or telephone whenever their trains have come to a stop on a passing track, telephones being conveniently located for that purpose.

In addition to the two main tracks and sidings which are provided for the movement of trains there are, especially on the two eastern divisions of the road, numerous short stretches of third and fourth tracks. These additional tracks are in reality nothing more than elongated passing tracks

and are designated in the official parlance as "slow" tracks. The current of traffic moves over them in one direction only (i. e., that of the main track nearer to them, with the exception of the line from Cayuga to Clark's Summit, where the slow track is to the left) and they are in the ordinary course used only by inferior trains in clearing the through tracks for superior trains.

When a train enters the slow track it has fulfilled all requirements of clearing the main track. It will continue on

Train on Slow Speed Track Between Cayuga and Clark's Summit

the slow track until the superior train has passed and will then take the main track once more, except where the auxiliary track continues for some distance or when another superior train is expected soon. As a rule, slow freight and coal trains make a practice of using slow tracks east and west out of Scranton. Where these additional tracks are located at frequent intervals practically no time is lost by slow trains in allowing faster trains to pass them. Interlocking plants are located at the beginning and end of slow tracks, so that no stops are necessary on account of throwing switches.

Efficient operation of the whole railroad as a unit has been greatly facilitated by the installation, in addition to telephone dispatching, of a telephone system covering the entire railroad. Through it every office and every station of the company is in easy communication with all other offices. Delays and enforced brevity which characterize the handling

of office-to-office business by telegraph have thus been obviated. There can be no question but that the personal contact which is possible with the telephone system has been a great help in avoiding misunderstandings which often arise when messages and correspondence have to be relied upon for communication.

### Lackawanna Supervision—33 Report

Operating department officers are able to keep in close touch with the performance from day to day by a complete situation report for the day previous, which is laid on the desk of every interested officer each morning. The report is known as the "33" report and embodies the following information:

- 1—Engine failures, time lost thereby and cause.
- 2—Delays to trains in arriving and leaving all registering points, engine number on each train, showing where more than one engine is used, tonnage of each train with the number of loaded and empty cars.
- 3—Bad order cars at each point on each division, storage cars at each point and loaded cars not moving at each point.
- 4—Accumulations of loaded and empty cars at Hampton Yard, Gouldsboro and Taylor Tank (the assembly yards for coal), number of loaded cars in transit and how many of these are foreign open, how many are foreign box and how many are Lackawanna cars and number of cars loaded which inspector has ordered back to mine because of unsatisfactory contents.
- 5—Movements of extra passenger trains and the state of the weather.
- 6—Cars at the various mines and mining districts.
- 7—Time of departure at initial point and arriving time at destination of all manifest trains and the number of loaded and empty cars and tonnage of each train.
- 8—Leaving and arriving time of all local freight trains and the number of loads and empties handled between various points.
- 9—Turn-around runs ("pick-ups" in Lackawanna parlance), between what points run, number of loaded and empty cars and leaving and arriving time.
- 10—Ice trains run and where cars handled to (Note: The company gets most of its ice in the Pocono mountains and it is stored at Gouldsboro, whence ice trains run to various points on the system.)
- 11—Work trains run, by whom ordered, what material moved and what work performed and number of workmen.

The following details from the situation report will show in what manner the movements of Train 51—the train described above—were carried out and reported for the trip leaving Secaucus on the morning of October 11:

Morris & Essex division  
 No. 51. Engines 1170 and 1169.  
 70 loads 4069 M's.  
 Secaucus 10:35 a. m.  
 Stamford Jet 1:31 p. m.

Freight House at Buffalo

## Scranton Division—

No. 51—Engines 1170 and 1169.  
 Slatford Jct. 1:31 p. m.  
 70 loads 4009 M's.  
 Arrived Scranton 4:16 p. m.  
 Left Scranton 5:07 p. m.  
 Engine 1163—70 cars—4102 M's.  
 Arrived Binghamton 7:30 p. m.  
 Left Binghamton 8:05 p. m.  
 71 cars—4408 M's.  
 Arrived Elmira 10:05 p. m.

## Buffalo Division—

No. 51—Arrived Elmira 10:05 p. m.  
 Left Elmira 10:50 p. m.  
 Engine 1165—72 loads 4627 M's.  
 East Buffalo 5:00 a. m.

The advantages of such a report as this are obvious. Officers are given an opportunity to check up accurately the work of their subordinates. Mechanical and engineering departments are able to see what the operating department is doing and what its problem amounts to while, conversely, operating officers can tell at a glance what kind of performance they are getting from the mechanical and engineering departments in moving trains over the road. The report, too, being kept in the same manner each day, is susceptible of comparison with that of other days so that the officers may know whether conditions are improving, whether they are stationary or retrogressing. With complete information available and with an extensive use of the phone system, officers are able to detect errors and to call their subordinates and secure proper explanations within a few minutes, when ordinarily these errors might not be run down for days and perhaps weeks.

## Careful Checking of Operating Details

It is, of course, rather trite to observe that as important as the information received by the operating officers may be, the manner in which this information is used by them is considerably more important. It is far from trite to say, how-

dinates and so on down the line, with the result that every man in the operating department is fully cognizant of the fact that he is expected to give 100 per cent efficiency or be called to account by some one higher up for not doing so.

The foregoing sounds to some extent, perhaps, like an elementary lesson in the subject of supervision, for what has been said is that the Lackawanna succeeds in securing the results for which every operating officer strives. How, therefore, does the Lackawanna secure these desirable results?

The operating officers of the road, for one thing, make it a point to use the telephone extensively, not only when they are in the office, as previously brought out, but at home. A further assistance to adequate supervision is the idea of frequent conferences, attended by general officers, the division superintendents and representatives of the marine and traffic departments, etc. Conditions are carefully discussed, remedies suggested if needed, and decisions made to correct or improve any conditions necessitating such action. The value of a daily or frequent conferences of this kind is too evident to need emphasis.

The movement of manifest freight is watched primarily from the 33 report. Supervision by the officers of the road, however, extends further than this through the attention paid to eliminating unavoidable delays to cars that may be set out from manifest trains. When a car is set out, the office of the superintendent of car service at Scranton is informed by wire, as is usual on most roads. The superintendent of car service is then required to keep tabs on the car to see that it is repaired promptly and forwarded. The work of his office is checked by a report of such cars rendered daily to the general officers. A similar report is required from the mechanical department relative to cars set out at division points.

The co-operation between the traffic and operating departments on the Lackawanna is a notable feature. As a result, the operating department is advised promptly of complaints by shippers and prompt steps are taken by way of remedy. Suggestions for improved service are talked over and decision, favorable or adverse, is made promptly. Through frequent conferences, such action is expedited and such delays as might occur through the matter being lost in voluminous correspondence are eliminated. Another feature is the encouragement given operating department men to solicit freight. In a recent period of about four months' duration, one yardmaster was credited with having secured over 500 routing orders.

Considerable attention is naturally given to tonnage ratings and train loading. This is reported to the general officers by the car accountant on form C. A. 201, daily tonnage report. The sheets of this report cover each ruling grade.

Elsewhere in this article appears a copy of the report for September 29 for the seven-mile 1½ per cent grade from Scranton west to Clark's Summit. It is interesting to observe that the report shows on that day that the trains as a whole were loaded to 104.8 per cent of the engine ratings.

The Lackawanna in 1920 had a credit per diem balance of \$804,157. This is primarily the result of the extra effort given to move foreign cars to connections as rapidly as possible, a factor which is noticed most carefully at all times.

A Daily Report of This Kind Is Made for Every Ruling Grade

ever, that the care with which the details of operation are checked on the Lackawanna is the outstanding feature of the work of that road's operating department. The Lackawanna is a comparatively small and compact system. It is not so large but that the general officers are in a position to know fully what is happening along the line at all times. The knowledge by other officials that their work is being constantly watched by the general officers has a strong moral influence on them similarly to check the work of their subor-

# Hearings Before Senate Committee Continued

Testimony of Bird S. Robinson, Forney Johnston and F. A.

Molitor—F. J. Warne Attacks Carriers' Statistics

WASHINGTON, D. C.

BIRD M. ROBINSON, president of the American Short Line Railroad Association, testified before the Senate committee on interstate commerce on the Capper bill and proposed repeal of the rate-making provisions of the Transportation Act on November 28. He defended particularly the group plan of making rates provided in Section 15-a of the act. This plan, he said, is sound and is the only one under which the Interstate Commerce Commission can meet the present situation confronting the railroads because it is the only one that takes care of the problem of the strong and weak roads. Mr. Robinson said there are four essentials to a proper solution of the transportation problem, the mandatory rule of rate-making, a rule of divisions which will give to the lines which are of service to the public a self-sustaining revenue basis, authority in the Interstate Commerce Commission to permit the abandonment of lines that cannot be made self-sustaining, and the consolidation of railroads so that the stronger lines may absorb lines which may be weak in themselves, but by serving as feeders would tend to increase the profits of the main lines.

Mr. Robinson said that a large part of the traffic of the country is originated by short lines and branch lines, but that railroads cannot prosper on that kind of traffic alone. To be prosperous they must share in the more profitable through traffic. He said he knew of comparatively few roads that properly can be called worthless and cited several examples of roads which at various times have been so called, but which later have become important or even prosperous. He said that the Detroit, Toledo & Ironton was an example of a so-called "worthless" road which suddenly, after it had been acquired by Mr. Ford, became not only self-sustaining, but was widely advertised as a model road, without any improvement in its physical condition, but because Mr. Ford was able to divert his traffic to that road and thereby give it a traffic which paid a higher average rate.

Very few of the short lines, Mr. Robinson said, fail to render a real public service, but they cannot continue to serve the public unless they are fairly paid and that can be done only under the group system of making rates, by which the Interstate Commerce Commission may increase their divisions to cover the cost of service on a road which has light traffic. If a railroad does not fill a public need, he said, it should be abandoned, but there is less duplication of service by railroads than there is of duplication of railroad service by unregulated motor truck lines allowed to be operated under most unfair conditions. In answer to the argument made on behalf of the state commissions that the valuation of so-called worthless roads has been used to swell the total value of the roads on which the commission attempted to calculate a 6 per cent return, Mr. Robinson said that the value of the roads included which do not perform a public service is very small.

If the rule of rate-making in Section 15-a is taken away, Mr. Robinson said, the Interstate Commerce Commission will have no standard by which to fix the divisions. In the past the divisions have been arbitrarily fixed by the trunk lines, who have not accorded the short lines a fair proportion. The Interstate Commerce Commission has not yet made divisions under the new law, but now has that matter under consideration and he was confident it would establish a rule of divisions that can be used by the short lines in negotiations with the trunk lines and that will give each part of the transportation system an adequate revenue based on its cost of service and a fair return on its investment suffi-

cient to maintain it. Mr. Robinson said that the process of consolidation would be facilitated if the earning power of the short lines can be brought up to a fair standard.

Mr. Robinson said that Congress ought to consider soon an amendment to the labor provisions of the Transportation Act. He said he had no criticism for the Labor Board, but that it is not possible for it successfully to do what Congress contemplated for it unless it and the Interstate Commerce Commission are enabled to work more closely together.

## Forney Johnston for Security Owners

Forney Johnston, of counsel for the National Association of Owners of Railroad Securities, on November 23, completed the testimony of the witnesses appearing for the association.

Mr. Johnston asserted that the association was compelled to oppose the proposed measures because they were fundamentally wrong and destructive, and not merely because of the psychological or moral effect on railway credit and securities. He insisted that those proposing the mutilation of the Transportation Act were unconsciously trying to force the railroads into a status of absolute federal ownership and control to escape what they erroneously considered a partial interference with the state commissions. The obligation on the part of the state commissions, asserted Mr. Johnston, to readjust their rate structures after a general advance in interstate rates in order that both rate structures may contribute a fair proportion to the revenue necessary to sustain transportation involved no tangible and substantial loss in control. The state commissions were free to proceed in the normal way to deal with particular rates after any general advances consistent with the action of the Interstate Commerce Commission were put into effect.

Mr. Johnston pointed out that before the Transportation Act the railroads had no affirmative status before the commission to protect their revenue and the commission had no original jurisdiction over unreasonably low rates, its function being only to prevent excessive rates and avoid discrimination by the railroads themselves. The theory of the old act, he said, was that carriers would protect their own revenue by initiating higher rates when necessary, but that rate advances had never proven practicable before the Transportation Act for a number of controlling reasons.

"The first of these," Mr. Johnston continued, "is, that as rates are largely competitive, no increases could be accomplished without concert of action, and concerted action in fixing rates had been repeatedly held by the courts to be in violation of the Sherman act. In all of the advance rate cases full relief to the carriers was made difficult by the inability of the commission to adjust the rate structure to the circumstances of the different carriers, and to give adequate relief where needed without conferring excessive revenue upon carriers which did not require it, and also by the fact that the burden of proof on the carriers was held to be of the most exacting character. These facts, repeatedly recognized by the commission, established practical handicaps before the Transportation Act, although, in theory, revenue considerations were always before the commission.

Those proposing the repeal of the rate making provision of the Transportation Act, Mr. Johnston asserted were attempting to destroy the general public interest in transportation in order to secure a temporary advantage to individual litigants before the commissions. He said that if revenue considerations were practically excluded from rate hearings,

as proposed by those advocating the Capper bill, the government would be exercising the privileges of public ownership with none of its responsibilities.

Mr. Johnston pointed out that if effective revenue considerations were withdrawn from the commerce act, Congress was under obligations to yield the provisions in the act which confer jurisdiction upon the commission over approximately 90 per cent of the expenditures of the carriers and to abandon control over extensions, car service, wages and other important functions of the carriers, and also to repeal the Sherman act as applied to rate making.

Pointing out that in America it was impossible for Congress to force directly a consolidation of existing railway systems, Mr. Johnston asserted that the association of security owners had repeatedly urged upon Congress the necessity of a program of co-ordination and economies which could be made effective under our Constitution and without awaiting the slow process of consolidations.

### Col. Molitor Testifies

Col. F. A. Molitor, chairman of the Board of Economics and Engineering of the National Association of Owners of Railroad Securities, testified before the committee on November 22. He showed that without the recent reductions in rates the net operating income of the railroads for the year ended August 31, 1921, had been only 2.85 per cent of the tentative value; and that this return would have been approximately 1.63 per cent if maintenance expenditures had been up to normal. Assuming an increase of 5 per cent in the volume of traffic, and allowing for the July reductions in wages, but not for the recent decrease in rates on farm products, he asserted that the net railway operating income for the year ending August 31, 1922, would be only 3.4 per cent.

Senator Poindexter inquired whether this estimate was based on a normal maintenance expenditure, to which Col. Molitor replied that it was not. "With normal maintenance," he said, "the net operating income would be \$408,000,000, or equal to but 2.2 per cent on the property valuation. If the recent decreases prescribed by the Interstate Commerce Commission on farm products were to be taken into account, the net operating income for the next year would be reduced to approximately \$350,000,000, or materially less than two per cent on the property valuation."

### Testimony of F. J. Warne

The hearing before the committee in its general investigation of railroad conditions was resumed on November 25 to allow Frank J. Warne, representing the labor organizations of the train employees, to continue his testimony. Mr. Warne read from a prepared statement, which he said would take 48 hours. Chairman Cummins of the committee and Senator La Follette were the only members present most of the time. The latter appeared greatly interested in the statement, which was a general attack on the statistics presented by the railroad witnesses, while Senator Cummins frequently took issue with the witness. Although few of the members of the committee heard the testimony, from two to four stories a day based on it were sent to the newspapers. The statement included most of the charges against the railroads that have been made during the past 10 or 15 years.

Mr. Warne claimed to have proved that during the federal control period the railroads had received on the average the largest net operating income in their history, apparently by including with the net operating income the amount of the government guaranty, and he criticised the roads for not making this inclusion when they referred to the net operating income actually earned to show the relation that existed between revenues and expenses. He charged that the railroads had affected adversely or favorably their net operating income by increasing or decreasing their maintenance accounts

and that during the six months' period following the termination of federal control they had allowed their expenses to "simply run riot." To prove this he referred to the large expenditures for maintenance shown in the months of 1920 when the accounts were swollen by retroactive wage increases as compared with the first month after the guaranty expired. The roads, he said, "began extraordinary expenditures in order to put their way and structures and their equipment in the very highest state of efficiency at the expense, if possible, of the United States government."

Testimony on behalf of the railroads as to wage statistics were criticised because they in some cases included the amounts paid to general and other officers, although a separate exhibit had been filed to show how little their inclusion affected the general result. Mr. Warne gave the impression that average wage figures were very greatly increased by the inclusion of \$100,000 salaries, but he did not specify how many of such salaries were paid. In this connection he referred to the Interstate Commerce Commission's report in the Rock Island investigation which showed that officials of that road had been given bonuses in addition to their salaries. Among other things he said the railroad witnesses had used figures showing the increase in the payroll in recent years without referring in the same breath to the increase resulting from the increases in traffic and he then proceeded to correct some of the "statistical fallacies" by making various exclusions. One of these was the overtime payments and increases in overtime which, he said, "economically are not wage increases but represent the purchase at a higher rate of more man-hours." He also had some combination of figures to prove that the increases in wages made in 1920 were more than met by increases in revenues. This should be sufficient answer, he said, "to the unjustified contention of the railroads that increased wages are responsible for their discreditable showing in the year 1920." To account for the other increases in expenses Mr. Warne quoted some of the testimony regarding the expenditures by the Pennsylvania for locomotive repairs in outside shops and from a letter by John Skelton Williams regarding the profits of the steel corporation. He also read the names of railroad officials interested in companies that sold supplies to the railroads as shown in reports to the Interstate Commerce Commission in connection with an investigation of such relations for the year 1913, and he quoted from various other reports of the commission made several years ago. A Congressional investigation or one by the commission, he said, "will undoubtedly disclose the significant fact that in recent years all the railway supply companies have reported huge surplus earnings to be added to their already accumulated surplus secured through high prices to the railroads."

Mr. Warne also devoted some attention to the history of rebates and "that equally common and widespread practice of present-day railroad management of granting free transportation and the free use of private cars to passengers and representatives of favored shippers." This contribution to the information of the Senate committee as to the causes for the extraordinary increase in railroad expenses in 1920 which is the subject of the hearing was reinforced by quotations from the Interstate Commerce Commission's decision in the five per cent rate case, but he brought his story of unwarranted concessions to shippers down to date by referring to the \$122,000,000 paid in 1920 for loss and damage claims. Just how far this represented the payment of false claims amounting in effect to a rebate, he said, "is, of course, not known."

During part of the time Senator La Follette was the only member of the committee present. He gave every appearance of enjoying the proceedings hugely.

The committee proposed to hear testimony from W. G. McAdoo and Walker D. Hines before concluding the hearings.

*The Bridge Destroyed in 1918 and the New One Which Replaces It*

## Baltimore & Ohio Completes Large Bridge Project

The Structure at Lawrenceburg, Ind., Replaces a Crossing Destroyed by a Large Ice Gorge in 1918

By Philip G. Lang, Jr.

Engineer of Bridges, Baltimore & Ohio, Baltimore, Md.

ON OCTOBER 1 the Baltimore & Ohio turned traffic over a new bridge crossing the Great Miami river, between North Bend, Ohio, and Lawrenceburg, Ind., on the main line to St. Louis. The project involved an expenditure of about \$2,200,000. This structure consists of six double-track, through truss spans, each 206 ft. 2 in. center to center of end pins, and two 45-ft. deck plate girder approach spans at each end. The new bridge is designed for E-60 loading, 14-ft. track centers, 8-ft. side clearance, and 25-ft. overhead clearance. The most formidable feature of the project was the substructure work which entailed the sinking of seven pier foundations by the pneumatic process.

The section of road on which this crossing occurs was originally known as the Ohio & Mississippi Railroad, created by an act of the General Assembly of Indiana, approved February 14, 1848, and confirmed by subsequent acts of the states of Ohio and Illinois, dated March 15, 1849, and February 12, 1851, respectively. The construction of the line between Cincinnati and Illinois Town, now East St. Louis, was commenced in 1852, and the road was opened to traffic in 1857. Its completion permitted through rail con-

nection between the Atlantic coast and the Mississippi river, and was the occasion of the "Great Railway Celebration of 1857."

The original crossing of the Great Miami river at Lawrenceburg consisted of a series of timber truss spans, which were replaced in a few years by an iron structure consisting of three spans of Fink trusses. This bridge was rebuilt in 1894, using three 210-ft. through truss spans, supported on two abutments and two piers with a 48-bent pile trestle at the west end. The metal in the superstructure weighed 1,013,000 lb. and the bridge had a total length, including the trestle approach at the west end, of 1,350 ft.

The great floods which occurred in portions of the states of Ohio, Indiana and Illinois during March and April, 1913, are matters of common recollection. On March 25, 1913, the water at the Lawrenceburg bridge rose to an elevation two feet above top of rail; the westerly pier was destroyed and carried with it the two westerly truss spans, as well as 350 ft. of the approach trestle. Work was immediately commenced on a temporary timber trestle and traffic was restored on April 27, 1913. Contracts were placed at once

General Elevation of the New Baltimore & Ohio Bridge

for the construction of a new pier at the site of the one which was destroyed and the fabrication and erection of a new superstructure. The new spans were designed for E-50 loading, riveted throughout, and were of the same length as the old spans. These steel spans were completed on January 31, 1914, and continued in service from that date until they were wrecked by an ice gorge in February, 1918.

The early part of 1918 was characterized by weather conditions of exceptional rigor. The ice broke up and was released by a thaw which occurred during February. A large ice gorge was formed in the Ohio river, adjacent to the mouth of Sugar creek, a small stream which joins the Ohio river at the Kentucky side, about 40 miles below the mouth of the Great Miami. A smaller gorge occurred about six miles below Lawrenceburg, extending across the Ohio, between Rising Sun, Ind., and Rabbit Hash, Ky. At the Baltimore & Ohio bridge crossing the Great Miami river immediately above the confluence of that stream with the Ohio river, the water reached an elevation of approximately five feet below base of rail; the top of the accumulated ice floes, however, rose to an elevation approximately ten feet higher, or about five feet above the existing base of rail. When the ice gorge in the Ohio river at Rising Sun went out, the natural effect was to lower the water in the Ohio very rapidly and this pulled the water and ice out of the Great Miami. At 2:30 p. m., February 12, 1918, the ice turned over the three 210-ft. truss spans of the Lawrenceburg bridge and destroyed the approach trestle at the west end of the structure. The masonry, however, remained in place.

Baltimore & Ohio traffic was detoured over the adjacent upstream bridge of the Cleveland, Cincinnati, Chicago & St. Louis, and in view of the existing war conditions, as well as high prices of material, scarcity of labor and other factors, the reconstruction of the bridge was deferred, pending the advent of more favorable conditions. Consequently, the detour movement over the Big Four was continued until October, 1921. An exhaustive study was made of all local conditions, with a view to the adoption of such measures as would prevent a recurrence of the preceding disasters. The type of crossing finally adopted consisted of six through truss spans, each 209 ft. 10 in. center to center of piers, in place of the three spans previously used.

Comparative estimates indicated that the most economical

new base of rail to underclearance line is 6 ft. 7 $\frac{5}{8}$  in. and that from base of rail to the high water line of March, 1913, is 7 ft. 6 in. and the new bridge provides more than double the clear waterway which had existed under the previous structures. It is believed, therefore, that it removes the danger from future ice and flood conditions. In this connection, flood conservancy work, completed, underway and contemplated, was considered.

The substructure work involved the construction of six

View Through the New Bridge

new piers for the support of the truss spans, the extension of an existing pier from single to double track and increasing its height approximately 10 ft., and the construction of two bank piers and two bank abutments on concrete piles. The bottom at the site of this crossing consists of sand and gravel and it was found necessary to carry the foundation to a depth varying from 93 ft. to 99 ft. below the new base of rail. This

Location, Map and Profile, New Baltimore & Ohio Bridge

type of crossing provided for the utilization of the single-track pier which was built in 1913, founded on piles, and the use of span lengths identical with those which existed previously. This had the further effect of making an unusually attractive proposition from a structural steel standpoint, as with six square spans identical in every respect much duplication occurred. In lieu of building high and expensive abutments, two 45-ft. deck plate girder spans were used at each end, the cost of these spans with their substructures being materially less than the cost of high abutments. The base of rail was also raised 10 ft., thus giving 8 ft. 2 in. additional clearance. The distance from the

was done under compressed air. For six of the new main piers, reinforced concrete caissons were built in place at the sites of the piers. For the extension of the pier built in 1913, a timber caisson was constructed. This was carried down 105 ft. below the new base of rail. The two bank piers and two bank abutments were placed on concrete piles and approximately 4,300 lin. ft. of concrete piling was used. A total of 18,300 cu. yds. of concrete was required.

The superstructure contains 7,900,000 lb. of steel. Shop rivets, one inch in diameter, were used throughout, except for lateral and sway bracing, where rivets  $\frac{7}{8}$  in. in diameter were used. The field rivets for stringer and floorbeam con-

nections and for all main truss connections are 1 1/4 in. in diameter. A continuous footwalk was provided on the bridge south of the tracks and between them, and a refuge bay was installed on the north side of the tracks at the center of each main channel span.

The erection of the steelwork was started at the west end. All spans were erected on falsework consisting of frame bents placed on mud sills. Following the completion of the falsework, the floor system was placed complete for one span after which the truss members were erected. In one case, all the members in two trusses, that is 44 pieces, were erected by one 50-ton locomotive crane in 12 hours. Immediately after the erection of the trusses, each span was swung clear of the falsework. In order that the erection equipment could operate readily, no top laterals were placed until after all spans had been erected and swung. The west deck plate girder span was erected on May 27 and the east through truss span was swung on August 22, 1921. The entire bridge was opened to traffic on October 1.

In addition to providing double track on the bridge, the approaches were double tracked for a distance of 5,841 ft. and 4,648 ft. to the east and west, respectively. On the west end provision for the raise of grade and second track was made entirely by raising and widening the existing embankment, but on the east end the change necessitated a relocation of the approach so as to afford support for the new grade against the hillside. This is indicated on the map. This change eliminates reverse curves of 5 deg., having a total angle of approximately 76 deg., whereas the new alignment contains only a relatively short 1 deg. curve. The line revision at the east and the grading of the approach on the west end involved about 210,000 cu. yd. of earthwork.

For the substructure and grading work, the contractor's camp, plant and equipment were assembled at the east end of the bridge. All concrete was mixed at a central mixing plant, located at the east abutment, where a steel tower 225 ft. in height, its top 275 ft. above low water, was erected, and the concrete chuted across the river. For the superstructure, the contractor's yard for the storage of steel, framing of the timber deck and falsework was located approximately one mile west of the west abutment. The yard in this case was an ideal one since it afforded a strip of land 100 ft. wide and 1,000 ft. long, that was practically level. This was served by two tracks, 18 ft. center to center.

The substructure, grading and incidental work was done by the Vang Construction Company of Cumberland, Md. The superstructure was fabricated at the Ambridge plant of the American Bridge Company, and erected by that company. The entire work was handled by the engineering department of the Baltimore & Ohio, under the direction of H. A. Lane, chief engineer, and the writer. A. H. Griffith, district engineer, was in charge of the work in the field.

## The Form Nineteen Train Order

By Edgar W. Weston

Inspector of Train Dispatching, Northern Pacific

**"LET WELL ENOUGH ALONE"** is a slogan for the lazy-minded. From Columbus down to Thomas A. Edison, history records our debt of gratitude to the men who adopted as their motto "Make well enough better, and better best."

But for many of us it is difficult to adopt new methods. One stumbling block I have found in getting the A. R. A. to approve, or railway managing officers to adopt anything new in train rules, is that the A. R. A. will ask if it has been tried out on any railroad, and the railway officer will ask whether the A. R. A. has approved. Each seems to "side-step," or "pass the buck."

In view of this, it is a strange fact that the A. R. A., in

the Standard Code, approves the use of Form 19 for restricting the rights of a train, and without having the operator clear with the dispatcher before delivery of the orders. Few railway managements have adopted the 19, and those who have, aside from the Northern Pacific and possibly one other, have surrounded it with so many restrictions and safeguards that its use is limited to a point where the 31 might just as well be used.

After reading in the *Railway Age* the letters from a Cleveland dispatcher and from Mr. Forman, and the editorial comment on the use of Form 19 train order, I feel there is no better time than the present to express my own ideas as to its exclusive use. Like that of Mr. Forman, my experience with train orders covers 40 years; and during the past 25 years I have given careful study to train rules and train orders. In my opinion, there should be but one form, and that Form 19. I will concede that signatures should be required when necessary to restrict a train at a non-telegraph office, or if it has already passed the train order signal; but let the signatures be on Form 19.

In 1912 the Northern Pacific began using Form 19 on one division to restrict the trains in automatic block territory. In a few weeks it was used also in non-block territory. In a few months it was extended over the entire system.

Your Cleveland correspondent says the safeguard of the middle order is not well enough appreciated. I cannot agree with him, for I believe it is appreciated; but in using the 19 order exclusively we cannot depend on the middle order for safety, as most roads west of Chicago have many sidings where there is no operator on duty, and many stations where there is telegraph service for only a portion of each 24 hours.

The middle order is used to protect the 31 as well as the 19 order.

The important thing is to insure the delivery of the restricting order. This assured, we want the form and procedure that will cause the least delay, with equal or greater safety. Nine years' experience with the exclusive use of Form 19 warrants me in saying that it is safer, and far ahead of Form 31 in every way. As your correspondent has well said, we must enforce rigidly the rules requiring clearance cards, and prevent the careless handling of the cards.

The profane language of train men and engine men when stopped to sign a 31 order is a moral argument against the use of that Form! The lurid language is, of course, directed against the dispatcher for his "—— thick-headedness" in stopping that particular train. I have asked a number of dispatchers and chief dispatchers what they would say if they were instructed to return to the use of the 31 order, and I get replies like this: "I will quit rather than use the 31," and "The person who suggests it ought to be hung, and I am willing to pull the rope."

My friend Bill Nichols of the Southern Pacific will say that Form 31 is preferred because it makes the work easier for the dispatcher. I do not think so; for no dispatcher worthy of the name will sacrifice safety in order to lessen his responsibility.

Mr. Forman, in his letter in your issue of September 24, outlines circumstances under which the 19 may, with safety, be used exclusively. Regarding the four points of his outline, I will say:

1. He is correct as to the clearance cards. This is the keynote of safety for the 19 order.

2. It may be a good thing to deliver additional copies to the fireman and flagman may have copies; but as such extra copies are no more essential with the 19 than they are with the 31, we cannot use that as an argument for the safety of the 19.

4. I have already commented on the middle order, and cannot see where it has any bearing on safety, as between 31 and 19.

Further, under "4" of Mr. Forman's letter, he says: "This

cannot be regarded as safe practice if (a) the superior train is directed to take siding, or (b) if it must pass the switch where the inferior train takes siding before it reaches the telegraph office where the middle order is to be delivered.

Is the Form 31 any more safe than Form 19 under these conditions? I cannot see that it is. However, I think Northern Pacific Rule 208-A is important, and tends to greater safety, no matter what form order is used. Let me quote this rule:

"208-A. Meeting orders, or orders conferring rights to the point where placed, must not be addressed to the trains of superior right, at the point of execution, if it can be avoided.

"When it cannot be avoided, special precaution must be taken by the train dispatchers and operators to insure safety, and the following notice will be incorporated in the order: '\_\_\_\_\_ gets this order at \_\_\_\_\_.'

"When a train is advanced by the use of a meeting order put out at meeting point as per Rule 208-A, it must be understood by conductors and engineers on the train advanced that they must approach the station named under control and take siding at the first passing siding switch unless otherwise directed, running through the siding expecting to find it occupied. The conductor and engineer of the train advanced must bear in mind that the opposing train has no notice of this meeting point until they reach the station, and must govern themselves accordingly; and must protect as per Rule 99 if necessary to reach the switch used by them in taking siding."

In my opinion there are no reasons of safety, economy, or efficiency to justify a return to the 31 on roads already using the 19, or to oppose the adoption of the 19 exclusively on all roads.

Since writing the above I have received the *Railway Age* for October 15 and have read with interest William Nichols' "Questions About Unsigned Train Orders." These questions are very much to the point and should be considered carefully. I should like the privilege a little later on of attempting to answer some of these questions; for very likely many will say that what I have written in favor of the exclusive use of Form 19 is "old stuff" and mostly theory. I will give as examples bearing out my conclusions some of the actual results that we have obtained by using Form 19 for restricting the rights of trains.

## Freight Car Loading

WASHINGTON, D. C.

THE REPORT compiled by the Car Service Division of the American Railway Association on freight car loading for the week ended November 12 is shown in the table which is given below.

The report for the week ending November 19 was delayed and is not available for publication in this week's issue. The car surplus report for the period November 15 to 23 shows another large increase in the number of surplus freight cars to 213,523. This is an increase of 73,334 as compared with the previous week.

Tons and Ton Miles Per Car

# Chilean Railroad Electrification Program

## Initial Contract of \$7,000,000 Provides for Complete Electric Operation of First Zone

THE FIRST PART of the Chilean State Railway to be electrified will include 116 miles of main line and 144 miles of track. The contract for equipment, as announced in the October 1, 1921, issue of the *Railway Age*, was awarded to the Westinghouse Electric International Company through its South American representatives, Errazuriz Simpson & Company, and amounts to a total of \$7,000,000. This is the most important railroad electrification undertaken in 1921 and is the largest single order for electric traction equipment ever received in this country. The equipment will be designed according to American standards.

Chile is a long, narrow country located between the Andes mountains and the Pacific Ocean, on the west coast of South America. It is 2,629 miles long north and south, and varies from 100 to 250 miles in width. The extreme length of the country results in a variety of climatic condi-

posit, between 4 and 5 per cent of the world's supply coming from Chile. Iron, sulphur and gold are also mined.

Other industries in Chile are farming and some fishing. The variety of climate permits the growth of a great diversity of food plants among which are tropical fruits, vegetables, and cereals, including wheat, barley, oats, rye, corn, beans, and peas.

The United States exports a great variety of materials to Chile, and our imports from Chile are also extremely varied in character. These include such items as chemicals, dyewoods, fertilizers, minerals, glue, india rubber, meat, tobacco leaf, wax and vegetables. In import trade to Chile the United States now ranks first and Great Britain second. Published statistics of Chilean foreign trade for 1920 show imports of about \$166,100,000 and exports of about \$284,300,000, a total of about \$450,400,000. The total wealth of Chile is estimated at \$3,200,000,000, or almost \$800 per capita.

### The Railroads of Chile

The total railroad mileage of Chile is 5,200, of which about 30 per cent is privately owned mainly for mining and industrial enterprises. The remainder of the mileage is divided into two general classes, the broad gage lines and the narrow gage lines. The former extend south from Valparaiso by way of Santiago to Puerto Montt, with numerous branches, while the latter comprise most of the northern roads with a few branch lines in the south.

The conditions that arose during the recent world war brought very forcefully to the attention of the railroad management the necessity for electrifying the broad gage lines, especially the Valparaiso-Santiago line with the Los Andes branch, where traffic was rapidly approaching the track capacity. In addition, fuel costs were excessive while the almost limitless water power was going to waste.

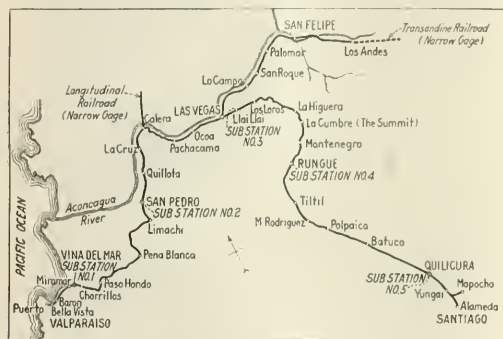

In 1918 a commission was appointed to study the problem of electrifying the broad gage lines. This commission, consisting of Rafael S. Edwards and Ricardo P. Solar, made a careful analysis of electrifications all over the world. As a result of the possible economies shown in the report of this commission, it was decided immediately to electrify the broad gage lines beginning with the Valparaiso-Santiago and Los Andes branches, or the first zone. A loan of \$10,500,000 for this purpose was authorized and was heavily over-subscribed a few hours after offering.

The specifications called not only for locomotives to fit the traffic conditions but also for all substation, distribution and overhead equipment, and for all construction work.

### Initial Electrification Will Include 144 Miles

The initial electrification will include 116 miles from Valparaiso to Santiago, and 28 miles from Las Vegas to Los Andes. Los Andes is the terminus of the Transandine Railroad, a narrow gage line, while the narrow gage Longitudinal Railroad runs north from Calera, an important station on the line to be electrified. The maximum grade in this zone is 2.25 per cent, encountered in approaching La Cumbre (the summit) from the west. The line contains a relatively large number of curves, the maximum being 10 deg. The track gage is 5 ft. 6 in. There are six tunnels on the main line, the longest, the San Pedro, being 1,600 ft. in length. Three of the tunnels are located on the most severe grade approaching the summit.

The 3,000-volt direct-current system was decided upon

Map of the First Zone to be Electrified on the Chilean State Railways Showing Location of Substations

tions. However, in the section to be electrified at present, the variation between maximum and minimum temperatures conforms to normal conditions existing in the temperate zones, the maximum temperature in the shade in the summer being from 100 to 110 deg. F. and in the sun as high as 130 to 140 deg. F., while in the winter the temperature goes as low as 20 to 25 deg. F. The rainfall in this district is relatively small. In the central and southern sections the Andes receive a heavy snowfall, making extensive water power available.

### Chilean Foreign Trade Over \$450,000,000

The chief products of Chile are minerals, agricultural products, live stock and lumber. Many of these products are exported and move north over the railroads. In return coal, merchandise, machinery and food products are imported and form the bulk of the southward railroad movement. In Chile the nitrate deposits in the North rank first among the mineral deposits, and supply 75 per cent of the exports. In 1913, 3,000,000 tons were exported. Coal deposits ranked second to those of nitrates, but in spite of this fact, there is not enough coal to supply the country, and considerable coal is imported. The present output of coal in Chile is 1,800,000 tons annually while the consumption is about 2,700,000 tons, the railroads using 550,000 tons. Copper is also an important mineral de-

as best suited to the conditions. Hydro-electric power will be generated at the Maitines station of the Chilean Electric Tramway & Light Co., Ltd. This station is already under construction and will utilize the waters of the Rio Colorado. The station will contain three 8,125 kilovolt-ampere generators and will have an ultimate capacity of 30,000 kilowatts. This power will be transmitted 37 miles to Santiago by twin circuit 110,000-volt transmission lines and will be generated at 50 cycles, 3-phase. These transmission lines will be connected at Santiago with the system fed by the Florida hydro-electric station and the Mapocho steam station, both of which were constructed some years ago by the Germans and were designed for 50-cycle 3-phase power. The total capacity of the three generating stations at present proposed will be, when completed, approximately 120,000 kw.

### Substations Provide for Large Increase of Traffic

The power supply will be distributed by five substations designed to handle a train movement that is approximately 50 per cent greater than that existing in 1917, with a further provision for tripling the 1917 traffic demands, if necessary. Each station will initially contain two 2,000 kw. motor generator sets, each set consisting of a 2,800-hp. driving motor, and two 1,000-kw. 1,500 volt generators connected in series. These sets will be designed to withstand a 200 per cent overload for five minutes without injury, and as an additional safeguard a flash suppressor will be included.

Substations 1 and 5 will receive power at 12,000 volts while 2, 3 and 4 will receive power at 44,000 volts and power indicating and limiting equipment will be installed.

### Motive Power

Thirty-nine electric locomotives are required for the initial electrification, including 6 express passenger, 11 local passenger, 15 road freight and 7 switching locomotives. The main points of interest about these locomotives are given in the following table:

Type locomotive	Weight, tons	Length, ft. in.	Wheel arrangement	Number of motors	Total h. p.	Max. speed, miles per hr.
Express passenger	127	58 ft. 6 in.	2-6-0-0-6-2	6	2,250	62½
Local passenger	80	40 ft. 6 in.	0-4-0-0-4-0	4	1,500	56
Road freight	113	49 ft. 10 in.	0-6-0-0-6-0	6	1,680	40
Switching	65	40 ft.	0-4-0-0-4-0	4	480	34

The express passenger and road freight locomotives will be equipped for regenerative braking. The service in which the local passenger locomotives will operate will not require or justify the regenerative braking feature.

According to a statement issued by the Westinghouse International Company this contract includes only the first railroad zone of the electrification project which Chile has undertaken.

## Electrification of English Railroads

THE PRELIMINARY REPORT of the Electrification of Railways Advisory Committee in England was published in the November 5, 1920, issue of the *Railway Age*. The final report has now been published in pamphlet form. The committee was appointed by the Ministry of Transport in March, 1920, to consider and advise:

1. Whether any regulations should be made for the purpose of ensuring that the future electrification in this country is carried out to the best advantage in regard to interchange of electric locomotives and rolling stock, uniformity of equipment or other matters.
2. If any such regulations are desirable, what matters should be dealt with, and what regulations should be made.
3. How far it is desirable, if at all, that railways or sections of railways already electrified should be altered so that they may form parts of a unified system.

Subsequently in October, 1920, the terms of reference were extended as follows: To consider and advise—

1. Whether any regulations should be made to limit the drop of potential in an uninsulated return conductor on electrically operated railways.
2. If any such regulations are desirable, what limits these should impose, and under what conditions.

The committee in its final report now desires to confirm the recommendations contained in its preliminary report. The final report is remarkable for its brevity and the following excerpts from the report are worthy of especial attention:

The committee desires to add to the preliminary report that from the evidence which has been put before them, as well as their own experience, they have come to the conclusion that alternating current supplied to the substations at a frequency of 50 cycles can be used for railway purposes without any detriment to railway working.

In respect to contact rail collection, it is essential for the interchange of electrically operated trains, that the contact rails should be so placed as to enable current to be collected by the same trains both on railways employing 1,500 volts and on those employing 600-750 volts. The top-contact type of rail is that now generally in use for the present low voltages; the under-contact type of rail has also been largely used, and, in the opinion of the committee, possesses advantages in regard to interference by the accumulation of ice and snow, and also in regard to the arrangement of protection for men working on the track with higher voltages. Suitably designed shoes can be run interchangeably with either the top or under-contact type of rail. Under these circumstances, the committee is of the opinion that the contact rails employed may have either a top-contact or an under-contact surface, and it does not consider it desirable to recommend the exclusive use of either type, some varieties of which may be the subject of patents, but thinks that the choice in this respect should be left open, subject to the regulations below, so as not to interfere with such future improvements as are likely to be developed in either or both types.

With regard to the practicability of further standardization of equipment by regulations, the committee desires to confirm the views expressed in Clause 10 of the Interim Report to the effect "that such regulations should put no avoidable difficulties in the way of the adoption in future, with the approval of the Minister, of any improvements in methods or appliances which may from time to time become available with increasing knowledge and experience," and to add that the committee does not consider it desirable, in the interests of railway electrification, that further regulations (other than those recommended in this report) should be issued for the time being.

With regard to the extended references 1 and 2, the committee, after careful consideration, finds that—

(1) The evidence given by the railway companies operating electric railways indicates that the cases of harmful effects due to a drop in potential substantially in excess of that allowed by Tramway Acts in earthed railway conductors have been few and unimportant, and readily corrected by the railway companies themselves on their own initiative.

(2) The clauses for the protection of observatories inserted in the Acts of Railway Companies applying for powers to operate their railways electrically have had, and continue to have, a retarding effect on railway electrification. The committee having heard in evidence officers concerned with the observatory instruments likely to be affected by the operation of electric railways, is of the opinion that the interests of observatories would in any case be sufficiently protected if the scope of the clauses referred to were limited to the portions of electric railways within the vicinity of the observatories.

Having regard to these considerations and to the views expressed in Clause 10 of the Interim Report, as well as to the difficulties in imposing any definite limit to the voltage drop owing to the variety of conditions which present themselves along different portions of any railways, the committee therefore recommends that—

(1) It is not desirable that regulations should be issued to limit the drop of potential in an uninsulated return conductor on electrically-operated railways.

The recommendations are briefly summarized in the following:

Standard system of power generation—Three-phase alternating current.

Standard system of power distribution—Direct current.

Standard Pressure—1,500 volts at substation busbars; in special cases a multiple or sub-multiple of 1,500 volts, if approved by the Minister.

Standard collection—Contact rail or overhead contact wire.

Contact rail standards—Top-contact or under-contact rail, with the contact surface in a horizontal plane installed at a gage of 1 ft. 4 in. from the gage line of the nearest track rail.

Overhead contact wire standards—Installed normally over the centre of the track at a height of 3 ft. above the maximum load gage likely to be used on the line, and at a maximum height of 20 ft. above track rail level.

Limitation of drop in earthed return conductors—No regulations to be issued.

## Edgar Steel Car Seals

SINCE THE DAYS of the lead and wire car seals requiring the use of sealing irons or special construction for their application, numerous types of self locking, self contained seals have been developed not all of which, however, have been proof against skillful tampering. The seal here described has recently been developed by the Edgar Steel Seal Manufacturing Company, Lawrence, Kan., to prevent the possibility of tampering with the fastening of the car door without destroying the seal beyond the semblance of repair.

The seal is cut from strips of No. 21 B. W. G. steel, 5/16 in. in width and each seal as furnished to the user, is self-

Details of the Seal and Method of Locking

contained. The seals are formed by punching suitable openings through the strips, nicking them at certain locations and trimming one end to form a perforated tee projection. Each seal is stamped with the name or initials of the user and a serial number.

The seal, which is triangular in form when locked, is applied and locked in one piece. In addition to the perforations required for locking, the seal is weakened at two points by nicking, thus locating the angles of the triangle when the seal is closed and locked. In applying the seal it is held with the number right side up toward the operator and is passed through the opening in the hasp lock until the nicks on the body of the seal are located one on either side of the opening through which the seal has been passed. The tee head end of the seal is then bent forward until it forms an angle of not more than 45 deg. with the body and the other end is bent forward until the two come together, allowing the tee head to be sprung firmly down over the post in the tee slot *D*. The seal is locked by bending the number end directly backward

until it is closed against the side of the triangle of which it originally was an extension. The weakness created at the tee slot causes the bend to take place at this point and the opening *C* closes directly over the protruding end of the tee head. This opening is not wide enough to permit the removal of the tee head from the post *D* which supplements the projection of the tee head against the sides of the narrower portion of the tee slot *D* in securely locking the seal.

To protect the numbered end of the seal from being accidentally raised away from the side of the triangle a slender projection formed in the type illustrated by the L-shaped slot in the body, is bent back before the seal is locked, and then bent forward over the numbered end to hold it in place. A later modification of the seal at this point, consisting of a change in the location and direction of the L-shaped slot, brings the projection directly into position for bending over the numbered end without bending it back. This form saves one operation required in locking the form illustrated. On seals of this form a projection, made by indenting the back side of the seal, has been provided to keep the numbered end from being bent down tight against the body of the seal. This lessens the probability of the lock being gummed in position after an attempt to tamper with the seal.

When locked the seal possesses considerable strength against the effect of a direct pull and to break it in this way involves considerable difficulty. To remove it by unlocking, however, involves the straightening out of the numbered end and of the angles formed at the nicks in the body of the seal, and this operation results in the complete failure of the metal at the sides of the tee slot in the case of the numbered end, and in the nicks at the angles in the body of the seal. Any attempt to remove and reapply the seal, therefore, results in its complete destruction into four short pieces of metal. The complete absence of a seal following any attempt to tamper with it facilitates prompt detection and this is said to have become a deterrent against attempts to enter cars bearing seals of this type.

The compactness with which these seals may be packed, because of their uniform section, makes it possible to store them in comparatively large quantities in an office safe or cash drawer, where they may be kept under lock and key with less opportunity for theft than is likely to exist with seals of more bulky form.

## Semi-Automatic Arc Welding Lead

A SEMI-AUTOMATIC arc welding lead has just been developed by the General Electric Company, Schenectady, N. Y., for use in conjunction with its automatic arc welding head, which retains the continuous features of the automatic apparatus, yet allows the operator to direct the arc as required by the conditions of the work.

The apparatus consists of a welding tool to be held by the operator, which acts as a guide for the electrode wire. In the handle of the tool, which greatly resembles an automatic pistol, is a switch for operating the control on the panel of the automatic welder to start and stop the movement of the electrode wire. Attached to the tool is a 10-ft. length of flexible steel tubing, called the "flexible wire guide," with an adapter on the other end for attaching it to the automatic welding head. The wire passes from the feed rolls of the head into the flexible tubing, and thence to the arc through a "guide nozzle" in the welding tool. The automatic welder functions in its accustomed manner, tending to hold the arc length constant, and the operator merely directs the arc as required by the particular job in hand.

The field of application of the semi-automatic lead is the welding of products where the seams to be welded are of very irregular contour, or on very large work where the

travel mechanism and clamping necessary for the full automatic welder would be complicated and costly. In many cases the edges of the seams are not accurately prepared, making gaps in some places and tight fits in others. The automatic welder with mechanical travel cannot compensate for these conditions by varying the speed, or by manipulation of the electrode, but with the semi-automatic, they are taken care of.

The semi-automatic welder may also be used for building up metal rapidly, as in the case of the filling up of blow holes in castings, or the building up of worn spots, etc. The speed of deposition of the metal varies widely, being somewhere between the ordinary hand speed and that of the automatic, according to the conditions of the particular job. In general it is about twice as fast as hand welding.

The advantages claimed for the automatic welding equipment may be summed up as follows: (1) Saving in time which in ordinarily lost in changing electrodes; (2) Saving

General Electric Semi-Automatic Arc Welder

of from 10 to 20 per cent in electrode material ordinarily thrown away as waste ends; (3) Operators can become proficient in the use of the tool very quickly, as they do not require the muscular training necessary for hand work; (4) Continuous operation results in few interruptions in the welding, each of which is a potential source of defective welds.

## Apron Attachment Facilitates Use of Air Dump Cars

THE USE OF DUMP CARS in ditching or other service sometimes leads into difficulties because the material is dumped too close to the rail, resulting in the fouling of the ballast and in the expenditure of considerable hand labor to keep the track clear. Engineers who have encountered this difficulty will be interested in an apron attachment which the Kilbourn & Jacobs Company, Columbus, Ohio, has devised for its all-steel automatic air dump cars to overcome this difficulty. Particular interest is derived from the fact that this attachment is not alone an improvement in new equipment manufactured by that company, but may be added to any cars of that make now in service.

This apron attachment is in effect a 28-in. extension of the car floor on both sides, pivotally connected in such a manner as to take a position in a plane practically parallel to the floor when the car is in the dumping position. As the car is dumped the apron on the low side is moved outward auto-

matically and when the car is again righted the apron is restored to the vertical position. The aprons on the two sides of the car are absolutely independent of each other.

The operation of these aprons is coincident with and a part of the operation of the car itself which is actuated by compressed air drawn from a reservoir embodied in the car. In service it is operated by air drawn from the regular air

Side View of the Car in the Dumping Position

brake train line, this passing through a check valve into the reservoir situated in the girder of the car. Its entire operation is controlled by a hand lever for each side. A vertical cylinder 20 in. in diameter is situated on each side of the car and the dumping is effected by the travel of a piston on the side opposite that to which the load is to be dumped. The car is righted by the operation of the cylinder on the dumping side. By connecting the auxiliary valves on each car

The Apron Keeps the Ballast and Rail Clear

through the medium of an air line, any number of connected cars may be operated as a unit from a position at the operating levers of any car in the connected unit. Use of the K. & J. car fitted with the apron attachment demonstrates that the material in the car is cast well away from the track.

FRAUDULENT USE of monthly commutation tickets was detected on the Long Island Railroad, in five months ending with October, in 247 cases. The conductors took up the tickets and the railroad company's last Bulletin gives the names of these conductors. One of them, W. Muir, took up 40 tickets. A large number took up from two to seven each, and a still larger number are credited with getting one each.

# General News Department

Five thousand poles, telegraph, telephone and trolley wire, were reported destroyed or disabled in New England—mainly within 50 miles of Boston—after a severe rain and sleet storm on November 27, 28 and 29. The suspension of telephone and electric lighting service was the most extensive on record for many years.

## Annual Meeting of Federated Societies

The Federated American Engineering Societies will hold their annual meeting at Washington, D. C., on January 5 and 6 at which reports will be submitted showing the progress of the federation since its formation in 1920 when Herbert Hoover was elected president.

## Mr. Elliott's Holdings of Stocks

In applying to the Interstate Commerce Commission for authority to hold the office of chairman and director of the Northern Pacific while also serving as director of affiliated companies and assistant to president and director of the New York, New Haven & Hartford and director of affiliated companies, Howard Elliott has filed a statement with the commission giving the status of his holdings of stocks and bonds of the companies. This shows him as the owner of 100 shares of Northern Pacific but only of from one to ten shares of the other companies to qualify as a director, and no bonds.

## Informal Instruction of Reading Employees

"Safety first," saving fuel, solicitation of freight and prevention of fires are among the subjects that are to be presented at noon meetings of employees of the Philadelphia & Reading which are to be held at the Y. M. C. A., Spring-Garden street station, Philadelphia, on December 7, December 14, December 21 and weekly thereafter. These meetings are intended to promote more intimate relations and more thorough cooperation between employer and employee. Department heads will discuss their work and its relation to that of other departments. Among the scheduled speakers are: J. T. Pratt, supervisor of safety; E. D. Osterhout, assistant general passenger agent; Charles P. Dampman, supervisor of fuel conservation; Harry E. Paisley, treasurer (on thrift), and F. M. Falek, general manager.

## 5,000-Volt Direct Current Locomotives

A potential of 3,000 volts direct current is now used successfully for the electric operation of heavy trams and, if necessary, 5,000-volt equipment will be developed, according to a statement made by Charles P. Steinmetz, chief consulting engineer for the General Electric Company, in a talk to the New York Electrical Society in New York on November 25. At the same time Mr. Steinmetz stated flatly and emphatically that two-thirds of the coal burned by steam locomotives was wasted and that this two-thirds could be saved by electric operation of trains with power derived from coal burned in steam-electric stations. When asked to verify this last statement, however, Mr. Steinmetz spoke only in generalities and produced no figures or tangible argument to substantiate his claim.

## Senate Calls for Railroad Administration Accounts

On motion of Senator La Follette, the Senate, shortly before its adjournment, adopted a resolution directing the director general of the Railroad Administration to furnish to the Senate on or before December 10 detailed information with reference to the settlement of claims growing out of federal control of the railroads and the administration of the affairs committed to him by the transportation act. This called specifically for a statement of account between the government and the carriers from the be-

ginning of federal control down to December 1, 1921, a statement showing in detail the claims which have been settled, showing the amounts claimed by the railroads and the basis of settlement finally arrived at, the purpose being to show in concise form the character of the settlement which has been made with each individual road.

## Standard Contract Forms Planned

In an endeavor to promote uniformity of contract forms, the Associated General Contractors of America has called a meeting of interested engineering organizations at Washington on December 15 to organize a joint committee on standard contract forms. Among the organizations which have been invited to participate in this conference are the American Railway Engineering Association, the American Society of Civil Engineers, the American Institute of Architects, the American Engineering Council and others interested in private and public construction work.

## Baggage Agents Meet

The American Association of General Baggage Agents held its annual convention at San Antonio, Tex., on November 16, 17, and 18, with an attendance of more than 100 members and associate members. The association's membership is largely composed of baggage officers from 78 major lines in the United States, Canada and Mexico and associate members, representing express companies and other interests relating to baggage transportation.

The convention devoted its attention to the promotion of uniformity of baggage tariff rules, more efficient handling of railroad business mail in interline baggage service, uniformity of color, general makeup, etc., of baggage checks; uniform methods of tracing lost or unclaimed baggage, and the vigorous prosecution of claim prevention work. The association has inaugurated a campaign to protect the traveling public against damage to baggage. It was stated that a large amount of the baggage claims are the direct result of inferior and unsafe baggage receptacles commonly in use. Fragile and insecure containers are particularly susceptible to damage, and this campaign, which will be nationwide and accompanied by a large amount of publicity, is for the purpose of educating the public in the exercise of better care and judgment in purchasing and selecting baggage receptacles. Steps were also taken to improve the service and the handling of baggage by the employee.

The following officers were elected for the coming year: President, E. B. Carson, general baggage agent, Southern Pacific, Pacific System, San Francisco, Cal.; W. J. McPhail, general baggage agent, Pennsylvania System, Eastern region, Philadelphia, Pa.; secretary and treasurer, F. L. Duncan, general baggage agent, Chicago & Eastern Illinois, Chicago. The next meeting will be held at Minneapolis, Minn., on June 28 and 29, 1922.

## Historical Handbook of the A. R. A.

The Directors of the American Railway Association have issued, for members, a handsome book of 134 pages, 6 1/4 in. by 6 in., containing in concise form a history of the activities of the association from its first meeting in 1872; and especially the history of the last two years, during which the scope of the association has been greatly enlarged.

The history up to 1919 fills only about 10 pages; but the rest of the book is packed with useful information about the present activities of the parent organization and of the numerous divisions.

The number of railroads holding membership in the association is now 712, operating 315,340 miles of road, including companies in Canada, Cuba, Japan, Mexico, Philippine Islands, Porto Rico and Yucatan.

The book contains the substance of most of the conclusions reached at recent annual meetings, of the association and of divisions and sections, together with lists of officers and com-

mittees, with condensed statements of standards of practice which have been adopted or approved by the association.

For railroad officers who have participated in (or who have followed) these activities, the book serves as a valuable compendium of details of things which, in a general way, they already know, or ought to know; while for other readers it will prove a luminous and informing work concerning a great variety of useful scientific investigations and economic discussions relative to railroad operation, the value of which ought to be more widely known.

"A. R. A." has come to be almost as familiar a phrase on railroad men's lips as "I. C. C."; and, like the latter, it is by many people used, in connection with standards, sanctions or ways of working, with only a dim understanding of its full significance. This handbook should be a welcome aid to such people.

Railroad officers can, doubtless, get copies from General Secretary J. E. Fairbanks, 30 Vesey street, New York.

### Advocates of Public Ownership Hold Convention

With the avowed object of "bringing together the leading advocates and representatives of municipal and public ownership in the United States and Canada for the consideration and study of the problems of public ownership; to get the ideas of the most careful and competent utility experts in America, to hear the methods and plans of those who have made a success of public ownership, and to consider ways and means for advancing the public ownership, efficient management and democratic control of public utilities and natural resources," a convention was held on Saturday, Sunday and Monday, November 19, 20 and 21, in the Congress Hotel, Chicago, under the auspices of the "Public Ownership League of America, the Plumb Plan League, the National Non-Partisan League and 65 other labor, farm, civic and commercial bodies". About 100 out-of-town representatives attended the convention and the attendance at different sessions varied from a figure approaching 400 on Sunday evening to 50 Monday morning.

While preparations had been made for an elaborate discussion of the railroad question, J. H. Hopkins, "of a committee of 48 assigned to the study of the railroad problems"; J. F. Comings, lieutenant-governor of Wisconsin; W. H. Johnston, international president, Association of Machinists; Laurence B. Finn, former chairman of the Kentucky Railway Commission; Timothy Shea, vice-president, Brotherhood of Locomotive Firemen and Engineers; E. F. Grable, grand-president, United Brotherhood of Maintenance of Way Employees; Warren S. Stone, grand-chief of the Brotherhood of Locomotive Engineers and Glenn E. Plumb, special attorney for the railway brotherhoods, it developed that L. B. Finn, Timothy Shea, E. S. Grable and W. S. Stone were unable to attend.

The address of Glenn Plumb was in the nature of a reiteration of the ideas which he has advanced on previous occasions concerning the railroad situation under private ownership. That the roads are physically bankrupt was the conclusion which Mr. Plumb drew from his statement that "tracks and roadbeds are disintegrating for lack of care, and cars are piling up on sidetracks for lack of repairs. Under the employees plan," said Mr. Plumb, "the government would own the railroads. They would be operated by a corporation, guided by a board of directors—one-third to be chosen by the employees, one-third by the managing officials and the remainder by the President." He then stated that one-half the saving which would result from this plan would go to increase wages of the employees and the other half would be used to build new roads and to effect improvements in existing equipments and facilities.

### Meetings and Conventions

*The following list gives names of secretaries, dates of next or regular meetings and places of meetings*

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next meeting, May 2-5, 1922. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION.—Fred W. Venon, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Peticus, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—L. A. Stone, C. & E. I. Ry., Chicago.
- AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 63 E. Adams St., Chicago.

- AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—E. L. Duncan, 332 So. Michigan Ave., Chicago.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400, Union Station, St. Louis, Mo. Next convention, August 23-25, 1922, Kansas City, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—J. W. Welsh, 8 W. 40th St., New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—G. Borchardt, 262 North Hamilton Avenue, Chicago, Ill.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Annual meeting, November, 1922.
- Division I—Operating.
- Freight Station Section (including former activities of American Association of Freight Agents). K. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.
- Medical and Surgical Section. J. C. Caviston, 75 Church Street, New York.
- Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association). J. C. Caviston, 75 Church St., New York, N. Y.
- Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y. Next meeting, March 21-23, Richmond, Va. Annual meeting, September 20-22, 1922, Colorado Springs, Colo.
- Safety Section. J. C. Caviston, 75 Church St., New York.
- Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Cover, 431 South Dearborn St., Chicago, Ill.
- Division III—Traffic. J. Gottschalk, 143 Liberty St., New York.
- Division IV—Engineering, E. H. Fritch, 431 South Dearborn St., Chicago, Ill. Next convention, March 14-16, Chicago. Exhibit of National Railway Appliances Association, March 13-16.
- Construction and Maintenance Section. E. H. Fritch.
- Electrical Section. E. H. Fritch.
- Signal Section (including former activities of the Railway Signal Association). J. C. Caviston, 75 Church St., New York, N. Y. Annual meeting, June 14-16, 1922, Monmouth Hotel, Springfield, N. J.
- Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. Next convention, June 14-16, 1922, Atlantic City, N. J. Exhibit by Railway Supply Manufacturers' Association.
- Equipment Painting Section (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.
- Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association). J. P. Murphy, General Store Keeper, New York Central, C. & N. W. Ry., Chicago, Ill.
- Division VII—Freight Claims (including former activities of the Freight Claim Association). Lewis Filcher, 431 South Dearborn St., Chicago, Ill.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Chicago. Next convention, October 17-19, 1922, Cincinnati, Ohio. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—J. F. Jackson, Central of Georgia, Savannah, Ga. Annual meeting, May 10-12, 1921, Denver, Colo.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 14-16, Chicago. Exhibit by National Railway Appliances Association, March 13-16.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Market St., Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.
- AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eisman, 4600 Prospect Ave., Cleveland, Ohio. Annual convention, September 23-30, 1922, Detroit, Mich.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June, 1922, Atlantic City, N. J.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- Railroad Division, James Partington, American Locomotive Co., 30 Church St., New York. Next meeting, December 9, 1921, 29 W. 39th St., New York.
- AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, Northern Pacific Ry., Spokane, Wash.
- AMERICAN WOOD PRESERVATION ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis. Next meeting, January 24-26, Hotel Sherman, Chicago.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morris, Northern Pacific R. R., St. Paul, Minn. Next meeting, May 17-19, 1922, Montreal, Canada.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—J. A. Andreucci, C. & N. W. Ry., Room 411, C. & N. W. Sta., Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.
- ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division I.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division II.)
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—D. J. Higgins, American Valve & Meter Company, 332 S. Michigan Ave., Chicago. Meeting with convention of American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—W. A. Booth, 53 Rushbrooke St., Montreal, Que. CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, Mo.—Thomas R. Koencke, 604 Federal Reserve Bank Bldg., St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

CENTRAL RAILWAY CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Thursday in January, March, May, September and November, Hotel Iroquois, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

CINCINNATI RAILWAY CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio. Meetings, 2d Tuesday in February, May, September and November.

EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N.W., Washington, D. C. Annual meeting May 11, 1922, Railroad Club of New York.

FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division VII.)

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO, C. H. Treichel, Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 1414, Manhattan Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—George P. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1922, Chicago. Exhibit by International Railway Fuel Supply Men's Association.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabasha Ave., Winona, Minn.

INTERNATIONAL RAILWAY STEELMEN'S ASSOCIATION.—C. W. Sullivan, Garlick Packing Co., 322 W. Madison St., Chicago. Meeting with International Railway Fuel Association.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R. Room No. 19, Union Pacific Bldg., Kansas City, Mo. Annual convention, January 20 and 27, Hotel Sherman, Chicago.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 26 Cortlandt St., New York. Next convention, May 23-26, 1922, Hotel Sherman, Chicago.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division V.)

MASTER CAR BUILDERS' ASSOCIATION.—(See A. R. A., Division V.)

NATIONAL ASSOCIATION OF RAILWAY TIE PRODUCERS.—Warren C. Nixon, Western Tie & Timber Co., 505 Syndicate Trust Bldg., St. Louis, Mo. Annual convention, January 20 and 27, Hotel Sherman, Chicago.

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York.

NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition, March 13-16, Chicago, at convention of American Railway Engineering Association.

NEW ENGLAND RAILROAD CLUB.—W. L. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 3d Friday in month, except June, July and August, at 29 W. 29th St., New York.

PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meetings, 2d Thursday in month, alternately in San Francisco and Oakland.

RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Naxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.

RAILWAY CLUB OF PITTSBURGH.—J. D. Coker, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, Fort Pitt Hotel, Pittsburgh, Pa.

RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—Chicago, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrish, C. & O. Ry., Richmond, Va.

RAILWAY SIGNAL ASSOCIATION.—(See A. R. A., Division IV, Signal Section.)

RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R. A., Division VI.)

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., New York. Meeting with A. R. A., Division V.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 30 Church St., New York.

RAILWAY TREASURY OFFICERS ASSOCIATION.—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Annual convention, September 12-14, 1922, Cleveland, Ohio. Exhibit by Track Supply Association.

ST. LOUIS RAILWAY CLUB.—B. W. Froehlich, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. B. 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—H. S. White, 9 N. Jefferson St., Chicago.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, Marine Trust Building, Buffalo, N. Y. Exhibit by Railway Equipment Manufacturers' Association.

WESTERN RAILWAY CLUB.—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Regular meetings, 3d Monday each month except June, July and August.

## Traffic News

The Union Pacific and connecting lines have reduced freight train schedules from Chicago to Denver, and other Colorado points 24 hours.

On the recommendation of Governor Maine of the state of Wisconsin the State Railroad Commission will make a detailed survey of utility and railroad rates with a view to possible reduction.

The Atlantic Coast Line has opened a freight office in Memphis, Tenn., with Walter M. Wharton in charge, as commercial agent. Mr. Wharton was formerly commercial agent of the Mobile & Ohio at Memphis.

Vigorous opposition to the granting of the petition of the transcontinental roads for lower through rates was voiced by manufacturers and jobbers at Denver, Col., on November 28, at a hearing before Attorney-Examiner William A. Disque of the Interstate Commerce Commission.

A report from Saskatoon says that a party of 1,000 Mennonites is about to leave Saskatchewan for Northern Mexico. The holdings of the Mennonites, amounting to 85,000 acres, are being purchased by a land company, which proposes to settle a colony of Poles there, to be brought from the United States.

The Interstate Commerce Commission has authorized the railroads in Southern classification territory to reduce rates on iron ore, throughout the territory by the amount of the increase which was made on August 26, 1921. The southern roads asked for the permission so as to place them on equality with the carriers, in the north and east, that have recently made reductions in these rates.

The House committee on interstate and foreign commerce has voted to report favorably Senate bill 621 extending the time for the filing of straight overcharge claims against the Railroad Administration with the Interstate Commerce Commission. The bill was passed by the Senate on June 11. The House committee amended it to add six months time in order that claims may be filed up to September, 1922.

The Southern Traffic League, composed of the traffic bureaus of prominent Southern cities—Chattanooga, Atlanta, Birmingham, New Orleans, Charlotte, Jacksonville, Tampa, Savannah, Charleston and other places met at Atlanta this week to discuss plans to go before the Interstate Commerce Commission in Washington to show the commission that it is necessary to have a general percentage reduction in freight rates throughout the South.

The Chicago, Milwaukee & St. Paul will immediately reduce railroad rates from all points on its lines in Wisconsin, Illinois, and Indiana, to Seattle and Tacoma, Wash., on classified commodities when destined to the Hawaiian Islands, to meet so far as possible the rates in effect via the Panama Canal. It is understood that the same rates will also be applied to the territory east of Chicago as quickly as arrangements can be made with eastern lines.

A special freight rate committee has been appointed by the Prepared Road Association, Chicago, with the following membership—Chairman, R. S. Crawford, Certain-teed Products Corporation, New York; J. P. Brown, Barber Asphalt Paving Company, Philadelphia, Pa.; J. L. Roberts, Barrett Company, New York; Osborn Van Brunt, Certain-teed Products Corporation, St. Louis, Missouri; William A. Harris, Flintkote Company, Boston, Massachusetts; H. S. Loving, Ford Roofing Products Company, Chicago; and Arthur T. Cavey, Richardson Company, Cincinnati, Ohio.

The Interstate Commerce Commission has authorized the transcontinental railroads to put into effect on short notice a tariff of transcontinental joint rates on lumber and other forest products applicable from California, North Pacific and "Inland

Empire" mills to destinations east of the Indiana-Illinois line, which will be 10 cents higher than the rates in effect on August 25, 1920, before the general advance made in Ex Parte 74. The filing of the new schedule represents an agreement on which the carriers in Central Freight, Eastern Trunk Line and New England rate territories have been having a controversy with the transcontinental lines for several months.

### Reduced Rate for Marshal Foch

The Pennsylvania on November 22 filed with the Interstate Commerce Commission a special tariff providing for a reduced rate of fare for the transportation of Marshal Foch and members of his party on a tour through the United States and Canada ending at New York on December 12. The total charge for the trip will be \$35, which in general provides \$1 for each road participating in the movement.

### A Satisfied Traveler

A man who has been a severe critic of the American railroads is just back from an 8,000-mile trip in which he visited about forty cities and journeyed from the Atlantic to the Pacific and from British Columbia to Southern Texas. Knowing the strain to which the railroads had been subjected in the war period, he expected to have his full complement of troubles. He had no troubles, practically no delays. He says: "In all the 8,000-mile trip the trains arrived on time in every instance but two. Once we were thirty minutes late. At another time nine minutes. Never did we know discomfort. The trainmen were helpful, kindly and courteous. And this was in the period when it seemed as if the whole Nation was to be tied up by a railroad strike. Nobody can make me believe that the railroad workers, from executives down to the tie tamper and the engine wiper, are not on the job as faithfully and conscientiously as ever."—Philadelphia Public Ledger.

### General Rate Reduction in Canada

A general reduction of ten per cent in freight rates on all steam railroads in Canada went into effect on December 1, according to an announcement made by Chief Commissioner, F. B. Carvell. The order of the Railway Board followed a conference between the president and representatives of the Canadian National Grand Trunk and the Canadian Pacific, and the commissioners.

Chief Commissioner Carvell explained that the reduction was not a straight ten per cent off the present freight rates but was to be deducted from the increases in rates made effective by the order of the Board in December, 1920, when the increases of forty per cent in the East and thirty-five per cent in the West, made effective September 13, 1920, were reduced to 35 per cent in the East and 30 per cent in the West. The present order will further decrease freight rates to a basis of 25 per cent in the East and 20 per cent in the West above the rates effective prior to the first increase in September, 1920. Also there is a decrease in sleeping car and parlor car rates of one half of the increase granted in 1920.

### New England Case Re-argued

Oral arguments on the application of the New England railroads to the Interstate Commerce Commission for an order requiring the lines west of the Hudson river to allow the New England lines increased divisions of through rates were heard before the commission on November 29, the case having been reopened for this purpose. The commission in deciding the case has declined to fix the divisions, but it directed the interested roads to appoint committees to try to work out the problem themselves. Representatives of the New England roads reported that very little progress was being made by these committees and are seeking to have the commission issue an order. Charles F. Choate, representing the New England lines, said that in enacting the transportation act Congress intended that without important exception, the railroads in existence and serving the public at that time should be allowed rates that would enable them to live and that the commission was authorized to adjust the increased revenues resulting from increases in the rates by groups. Until the commission issues a certificate au-

thorizing the abandonment of a road, he said, the intention is that it shall be allowed rates which will enable it to pay operating expenses and interest on the investment, at least. To increase the divisions of the New England lines in this case, he said, would not represent a taking away from the other lines of something that belonged to them before because when the commission was authorized to increase rates it was also given power to administer the use of the increased income and the rate divisions represent a vehicle for doing this. The traffic which produced the revenue, he said, is the joint product of the joint effort of the several lines and the sum of money to be realized by the increases in rates was calculated on the basis of the value and earning power of all the roads. Therefore, the amount of the increase constitutes a common fund to be equitably distributed among the roads.

### Joint Congressional Committee to Report on Marketing and Transportation

The labor of more than 1,500 people, for a period of three months, is represented by the data now being compiled by the transportation division of the Joint Commission on Agricultural Inquiry, which will shortly present a report of its investigation on the marketing and transportation facilities of the country. Representative Sydney Anderson, chairman of the joint congressional commission, says that splendid co-operation is being given by railroads and shippers. Approximately 800 representatives of the railroads and 600 representatives of the shippers, in all sections of the country, are gathering information through various sub-committees. Compilation of operating costs and labor costs is included in the work, and a thorough study has been made of each medium of distribution. The committee aims to determine the basic facts of the relation of the railroads on the one hand and shippers and receivers on the other. The general committees have organized sub-committees, located in the producing and consuming regions, with reference to the movement of the particular products which they are studying. For instance, the general committee organized on fruits and vegetables has in turn appointed sub-committees in nearly every state and these sub-committees are studying the particular products in their section of the country. The railroads are organized in two groups, namely, traffic and organization, and the personnel of the executive traffic committee follows: H. M. Adams, Union Pacific, chairman; J. G. Woodworth, Northern Pacific; Edward Chambers, Atchison, Topeka & Santa Fe; T. C. Powell, Erie; Gerrit Fort, Boston & Maine; Archibald Fries, Baltimore & Ohio; Robert C. Wright, Pennsylvania; Lincoln Green, Southern; F. B. Bowes, Illinois Central; and J. L. Edwards, Atlanta, Birmingham & Atlantic.

Forty-four committees of shippers have been appointed to work in conjunction with the executive traffic committee of the railroads in securing data on the marketing and transportation facilities of the country under the direction of the transportation division of the commission. Included in their membership are: C. B. Hutchins, traffic manager of the American Farm Bureau Federation; F. E. Todd, vice-president of Deere & Co.; S. J. Lowell, master of the National Grange; R. D. Phillips, of the International Apple Shippers' Association; R. Cumming, of Chicago, representing fruits and vegetables, who is working in conjunction with E. G. Dezell, assistant manager of the California Fruit Growers' Exchange; and J. A. Campbell, of Youngstown, Ohio, president of the Youngstown Sheet & Tube Co. These committees, together with the representatives of the railroads, have been asked to complete their work by January 1, whereupon all data will be carefully reviewed and analyzed by an advisory committee, whose personnel will be announced shortly. There will be 12 members of this advisory committee, representing transportation, industry and agriculture.

HENRY W. GAINES, of Huntington, L. I., has traveled between that place and New York City, as a "commuter," every month since April 1, 1877, or about 44 years, six months. Mr. Gaines estimates that he has averaged 275 days a year, 70 miles a day, making his total mileage equal to more than 34 times around the earth at the equator. From his home to his office he spends two hours and the same on the return, so that he calculates that he has been traveling 48,950 hours during this time, or the equal of about five years, seven months.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until March 31, 1922, the operation of certain schedules which propose reductions in the carload rates on sugar from eastern cities to destinations in Central Freight Association Territory.

The commission has further suspended until January 12, the operation of schedules which propose to eliminate the application of the rates on lumber from points in southeastern territory to certain stations on the Norfolk & Western.

The commission has further suspended until January 7, the operation of all schedules published in a supplement to an Alabama & North Western tariff which provides for the cancellation of the existing commodity rate of 11½ cents per 100 lb. on lumber from points on the Alabama & North Western to Selma, Ala.

The Secretary of War, on behalf of the Mississippi-Warrior river waterways, now operated by the Division of Inland Transportation of the War Department, has filed an application with the Interstate Commerce Commission for joint through rates in connection with the railroads in practically every part of the United States.

The commission has further suspended until January 12 the operation of schedules published in a supplement to Agent R. H. Countiss' tariff which propose to increase from 6½ to 7 cents the charge for storage-in-transit on apples and pears at points in Official Classification territory, applicable on east-bound Trans-Continental traffic.

The commission has suspended from November 30 until March 30, 1922, the operation of schedules published by the Chicago & North Western which propose to increase from 10½ to 14 cents per 100 lb. the rates on grain and grain products carloads, between St. Louis, Mo., and stations on the Chicago & North Western in Illinois south of Peoria, Ill.

The commission has further suspended until January 31, 1922, the operation of proposed reductions in the existing rates on coal, carloads, from mines on the Detroit, Toledo & Ironton in Jackson County and Ironton (Ohio) districts, to Detroit, Mich., and other destinations on the same line in Ohio and Michigan, the operation of which was suspended until January 1, 1922, by orders previously entered.

By a supplemental order in Investigation and Suspension Docket No. 1431, the commission has suspended until April 30, the operation of schedules published in a Missouri, Kansas & Texas tariff, which propose increased rates on cotton and cotton linters from Ft. Smith, Greenwood, Shreveport and other places; and from stations on the Midland Valley Railroad in Arkansas to St. Louis, Kansas City, New Orleans, Galveston and various other places.

The commission has further suspended until January 22 the operation of schedules published in Agent E. B. Boyd's tariff which propose increased and reduced rates on potatoes, carloads, from producing points in Minnesota, Wisconsin and the upper peninsula of Michigan to destinations in Central Freight Association and Trunk Line territories, the operation of which was suspended until December 23, 1921, by an order previously entered.

The commission has further suspended until January 7 the operation of certain schedules published in Agent W. J. Kelly's Exceptions to the Official Classification which provide that the estimated weight on crude petroleum from points in C. F. A. territory originating at points in Texas and destined to points in Official Classification territory (except to points in Canada) will be 7.4 pounds per gallon, in lieu of the existing estimated weight of 6.6 pounds per gallon, the operation of which was suspended until December 8, by an order previously entered.

### Rates on Wool and Mohair to Boston

The commission has issued its decision in the case of the Boston Wool Trade Association vs. Abilene & Southern, et al., in which the commission prescribes reasonable classification ratings on wool, mohair, camel's wool and hair, angora hair and alpaca. The proportional commodity rates to Boston on wool in the grease in carloads from Mississippi river crossings were not shown to be unreasonable, but proportional commodity rates to Boston from Duluth, Minn., lake and rail, on wool and mohair in the grease were found unreasonable and a reasonable basis of maximum rates was prescribed. The commodity rates to Boston from Texas points, all rail, on wool and mohair in the grease in carloads were found unreasonable and a reasonable basis of maximum rates was prescribed. Consideration of fourth section applications was postponed. The failure of the railroads to accord transit at Boston on wool and mohair originating west of the Hudson river and to publish consolidated wool tariffs was found to be not unreasonable or otherwise unlawful.

### Commission Reopens Rate Division Cases

The Interstate Commerce Commission has ordered the reopening of two cases involving the application of "short line" railroads for orders by the commission increasing the divisions of through rates accorded them by their connections. These are cases initiated by the Wichita Northwestern and the Federal Valley. They are reopened for further hearing, particularly for the submission of additional evidence to show: (a) the value of the complainant's railroad property used in the service of transportation; (b) revenues and expenses from January 1, 1921, to date of hearing, by months; (c) total tonnage transported from January 1, 1921, to date of hearing, by months; (d) tonnage of grain, lumber, coal and miscellaneous freight transported from January 1, 1921, to date of hearing, by months; (e) financial state as of date of hearing.

The cases will be heard before Examiner Carter at Washington on December 12. Hearing in the Federal Valley case vs. the Toledo & Ohio Central and others was held by the commission on September 30 and officers of the American Short Line Railroad Association presented arguments urging a decision by the commission which would establish a general rule to carry out what they conceive to be the purpose of the transportation act by forcing trunk line connections to accord to originating short lines divisions sufficient to represent the cost of handling traffic taking into consideration the low density of an originating line, and also a fair return on the value of the property. It was stated that as the trunk lines have not been receiving 6 per cent, it would not be contended that under all circumstances the short lines should receive that rate of return. The general idea was held forth that the commission should order established divisions sufficiently high to more nearly equalize conditions between railroads.

It was stated that the short lines had tried to persuade the trunk lines to agree on a general rule for calculating divisions, but that they had thus far been rather unsuccessful in the negotiations with the trunk lines and hoped the decision of the commission would establish a precedent that could be used in other cases.

### State Commissions

Hearings on a petition filed by the Michigan Manufacturers' Association asking for a general reduction in freight rates will be heard on December 6, by the Michigan Public Utilities Commission at Lansing, Mich.

### Court News

#### Loss of Freight Intended for

##### Nonadjacent Foreign Country

Eight carloads of grain were destroyed in accidents while in course of transportation to Baltimore from points in Nebraska, Michigan, Indiana and Ohio. The railroad on whose line the losses occurred paid the owners, the purchasers of the grain, its value at the time and place of shipment. This was the measure of damages under the bills of lading, but it did not fully

compensate the owners for the actual loss. The railroad's liability could not be restricted unless the grain was intended for export to a foreign country not adjacent to the United States. In an action by the owners against the railroad, it was conceded that the grain was to be unloaded at Baltimore into the railroad's elevators and loaded therefrom into vessels for export to Europe. The bills of lading themselves disclosed that the shipments were for export. The plaintiffs' purpose, as shown by their testimony, was to ship it to Europe. The Maryland Court of Appeals holds that the shipments were in course of transportation to a nonadjacent foreign country at the time of their destruction, and that the measure of damages stipulated in the bills of lading was not contrary to the provisions of the Federal Act to Regulate Commerce and its amendments, prohibiting stipulations against recovery of less than the full amount of the actual loss or damage to property in transit from one state to another, or for export to an adjacent foreign country. The purchase of the bills of lading while the grain was in transit merely affected the title to the shipments, and made no change whatever in its movement or destination or in any of its commercial characteristics.

The railroad company was not estopped from relying on the limitation of liability provision in the bills of lading because the consignees were not given notice of the loss until long after the shipment was due to arrive, although the replacement value of the goods was higher when notice of loss was finally received. If the shipments had been lost after a delay, however prolonged, in transportation, the limitation of liability would have applied; therefore delay in giving notice of the loss could not enlarge the measure of damages.—*Farley v. Baltimore & Ohio* (Md. App.) 114, Atl. 905.

### Decisions Under Federal Employers' Liability Act

Where an employee was injured while the railroad was engaged in interstate commerce, and while the employee was also so engaged, the Circuit Court of Appeals, Third Circuit, holds that it is immaterial to his right of recovery under the act whether or not another employee, who committed the act of negligence which was the cause of the injury, was then employed in interstate commerce. The act of negligence of the other employee was the careless placing of another car on the switch, with which that on which the plaintiff was employed came in collision. The court, treating this as "a novel proposition," holds that "the test of an employer's engagement in interstate commerce within the meaning of the statute is not the character of its engagement at the time of the commission of a negligent act, when not contemporaneous with the injury, but it is the character of its engagement at the time of the consequent injury to its employee." The employer's negligence here consisted not only in negligently placing the car, but in operating a train of cars in interstate traffic toward and against it.—*Hines v. Keyser*, 268 Fed. 772.

Where an employee, engaged in interstate commerce employment, on leaving his work, selects a dangerous way to leave the yard where the employer has provided a safe way out, he loses the status of an employee in interstate commerce, and when he is subsequently killed by a train while crossing the main track, there can be no recovery for his death under the Employers' Liability Act.—*Krysiak v. Pennsylvania*, C. C. A., 8th Cir., 270 Fed. 758.

The Supreme Court of the State of Washington holds that a trackman on the main line of a company engaged in interstate commerce, who left the section, under the direction of the foreman, to accompany the foreman on a motor car to another town to get supplies, could not recover, under the act, for injuries caused by the derailment of the motor car, it being contrary to the company's rules to leave the section during working hours.—*Adams v. Hines* (Wash.) 196 Pac. 19.

The Pennsylvania Supreme Court holds that an employee in charge of an oil tank from which oil, etc., for engines and cabooses of both interstate and intrastate trains were supplied with oil, but who did not distribute the oil, injured when opening a valve on a tank car to permit the oil to run into the tank, was not engaged in interstate commerce.—*Lindway v. Pennsylvania Co.* (Pa.) 112 Atl. 40.

The New Jersey Court of Errors and Appeals holds that a car repairer working on a car which was entirely out of commission and was not being used for any purpose whatever, was not engaged in interstate commerce within the act.—*Herzog v. Hines* (N. J.) 112 Atl. 315.

## Foreign Railway News

### Eight-Hour Day Abolished in South Africa

The Southern African Railways have abandoned the eight-hour day for certain classes of employees, effective September 5, according to the *Railway Gazette* (London). The railways have accumulated a deficit of some \$15,543,791 since the fiscal year 1917-1918. The eight-hour day is estimated to cost some \$4,860,000 annually. In lengthening the work-day the management endeavored to take into consideration the intensity and continuity of the work done. The employees affected and the length of the new work-day for them are enginemen and firemen, nine hours; ticket examiners and trainmen, ten hours. Overtime will be paid for at  $1\frac{1}{4}$  rate. The duties of other employees will be considered and further adjustments made, but no hours will be increased beyond twelve, including times for meals, and where the work is exacting the present 48-hour week will be maintained.

### New General Manager of North Eastern (England)

R. L. Wedgwood, C. B., C. M. G., has been appointed general manager of the North Eastern Railway (England), effective January 1, 1922, according to the *Railway Gazette* (London). Mr. Wedgwood was born in 1874, and was educated at Cambridge University. He entered the service of the North Eastern in 1896. In 1902 he was appointed district superintendent, and in 1904 he served for a short time as secretary of the company. In 1905 he was appointed to an official position in the goods (freight) department, and by various promotions to chief goods manager in 1911. Mr. Wedgwood served in various important military transport positions in the British army during the war, attaining the rank of brigadier-general, and in 1919 returned to the North Eastern in his former capacity as well as passenger manager and deputy general manager, which position he held at the time of his recent promotion.

### Proposed Reorganization of French Railways

A plan has been elaborated which aims at raising the general efficiency of all the railroads in France as regards national service, by bringing about the closest co-operation possible among the different lines, a standardization of rates all over the country, and financial solidarity for the French railway system as a whole.

According to advices received by the Bankers Trust Company of New York from its French information service the main features of this proposed new regime are: 1—The creation of a common central organization destined to co-ordinate the methods of operation on the different roads in the best interests of the nation as a whole; 2—The creation of a board of management which will study questions interesting the general railroad system, and act as "liaison" between the central administrative organization and the individual lines.

This central organization, which is to be called the Superior Council of Railways, will be composed of 30 representatives chosen by the Minister of Public Works from the nation's most important interests (shipping, industry, etc.), 12 representatives elected by the railroad employees and 18 representatives of the railway administration (2 directors and the general manager from each of the 5 existing private companies, and the president, vice-president and manager of the state railway).

The "board of management" will consist simply of the 18 representatives of the railway administration who are members of the Superior Council, and both the board of management and the Superior Council of Railways will be under the authority of the Ministry of Public Works.

The basic principle of an "association of interests" between the state and the railway companies which has been characteristic of the French system since its very earliest days, will be maintained and still further developed in the new regime, whose most salient feature is that through a unification of administrative policy the railways are to be put at the service

of the nation in the shape of a single system of transportation.

Another clause in the financial provisions of the proposed new regime specifies that out of the gross receipts of each line will be deducted the necessary amount for payment of: 1—The operating expenses; 2—The charges accruing from interest on capital and loans of all kinds; 3—A sum representing the total amount of the fixed dividends which are now called "guaranteed"; 4—The premium, if any, which may be compared to the extra dividend now called "reserved."

It is also proposed by the terms of this new regime that all war liabilities be cancelled and that the state restore the railroads to pre-war conditions, it being understood that the companies abandon any outstanding claims they may have against the state.

### Improvement in French Cab Signals

Jean Aumont, a French engineer, in a brief article in the Bulletin of the International Railway Association for October, page 1684, says that the roadway member, for use with audible cab signals (known as the "crocodile") has been greatly improved by the adoption of a new design. It is made hollow, and, in cold weather, is kept covered, on its upper surface, with oil, thereby forestalling failures, which have been troublesome, due to the presence of frost on the metal. The new design is called the "J. Colas anti-frost system."

This "crocodile" is a flattened tube, about 6 ft. long, resting on insulated supports between the rails. It is pierced on its upper surface with numerous holes. In each hole is a tube and a piece of felt through which the oil rises by capillary attraction. A gallon of oil lasts more than a year. When the engine contact-piece touches the "crocodile," the film of oil, which is on the surface of the oil, is scraped off and it is said that perfect electrical contact is secured under all circumstances.

In this system the engine contact piece is a brush made of steel threads, said to last more than a year, where copper brushes have been worn out in three months. The system has been tried, it is said, on the Paris & Orleans Railway, not alone for distant signals but also arranged to warn postal clerks, on trains, when they are approaching a station; and also to warn the station attendant of the approach of the train.

Mr. Aumont says that, with modifications, the "crocodile" system has been adopted on the majority of the railways of France. On the Northern Railway it has been in use 45 years.

HARD COAL has been discovered at Latchwood, Ontario, about 25 miles northwest of Sudbury; and a Toronto syndicate has leased 20,000 acres surrounding the discovery. Miners are on the ground stripping and sinking test pits to determine the exact extent of the find.

## Equipment and Supplies

### Locomotives

THE CARNEGIE STEEL COMPANY is inquiring for 1 locomotive.

THE NEW YORK, ONTARIO & WESTERN is inquiring for from 3 to 6 Mountain type locomotives.

THE ATLANTIC COAST LINE has ordered 1, 4-6-0 type locomotive from the Baldwin Locomotive Works.

THE VICKSBURG ROUTE will have repairs made to 3 Santa Fe type locomotives at the shops of the Baldwin Locomotive Works.

THE DOLBEER & CARSON LUMBER COMPANY, Eureka, Cal., has ordered 1 Prairie type locomotive from the Baldwin Locomotive Works.

MITSUI & COMPANY, New York, is inquiring for 5 Mogul locomotives for export to China, also for 4, 6-wheel tank locomotives for export to Japan.

THE HAVANA CENTRAL has ordered from the Baldwin Locomotive Works 10 locomotive boilers and fire boxes for Mogul and Consolidation type locomotives.

THE SEABOARD AIR LINE, reported in the *Railway Age* of August 20, as inquiring for 28 locomotives has ordered from the American Locomotive Company 10 Mountain type locomotives to have 27 by 28 in. cylinders and a total weight in working order of 315,000 lbs. and 15 Mikado type locomotives to have 27 by 30 in. cylinders and a total weight in working order of 284,000 lbs. All these locomotives will be equipped with superheaters.

### Freight Cars

THE BUFFALO, ROCHESTER & PITTSBURGH is inquiring for from 20 to 30 caloose cars.

THE FRUIT GROWERS' EXPRESS is inquiring for 100 steel underframes for refrigerator cars.

THE NEW YORK CENTRAL contemplates asking for prices on 1,000 box cars, of 50-ton capacity.

THE NORTHERN PACIFIC is inquiring for 1,200 center frame constructions for gondola and box cars.

THE BUFFALO, ROCHESTER & PITTSBURGH has given a contract to the Buffalo Steel Car Company for the repair of 500, 50-ton hopper cars.

THE CHESAPEAKE & OHIO is asking for bids until 12 o'clock noon, December 15, at Richmond, Va., for repairing 500 more or less steel coal cars.

THE MISSOURI PACIFIC has awarded a contract for the repair of 500, 30-ton box cars to the Sheffield Car & Equipment Company, Kansas City, Mo.

THE UNION PACIFIC is inquiring for 500, 40-ft double sheathed box cars of 50-ton capacity and expects to be in the market soon for 46-ft. automobile cars and 50-ft. all steel automobile cars, also for refrigerator cars.

THE VIRGINIAN RAILWAY, reported in the *Railway Age* of October 29, as inquiring for prices on the repair of 4,000 freight cars, has given a contract to the Virginia Bridge & Iron Company, Roanoke, Va., for the repair of 1,500, 50 to 55 ton all steel coal cars.

THE BALTIMORE & OHIO, reported in the *Railway Age* of September 10, as inquiring for prices on car bodies, has ordered 500 hopper car bodies from the Pressed Steel Car Company, and 500 from the Standard Steel Car Company, all to be of 55-ton capacity.

## Passenger Cars

The NEW YORK CENTRAL is asking for prices on the repair of 1,000 passenger cars.

## Iron and Steel

The TEXAS & PACIFIC has ordered 15,000 tons of rail from the United States Steel Corporation.

The ATLANTIC COAST LINE has ordered 15,000 tons of rail from the United States Steel Corporation.

THE CHICAGO UNION STATION will accept bids until December 1, for 3,600 tons of steel to be used in the widening of Canal street, from Jackson boulevard to Washington street, and the Monroe street viaduct, Chicago.

## Machinery and Tools

THE UNION RAILROAD OF PITTSBURGH has ordered a radial drill, a lathe and a planer from the Niles-Bement-Pond Company, New York.

THE NEW YORK CENTRAL has bought from the government stock at Hog Island, two lathes for use at the enginehouse at Solvay, N. Y.; one Reed-Prentice 24 in. lathe, and one Le Blond lathe, 16 in.

## Miscellaneous

THE NORFOLK & WESTERN is asking for bids until 12 o'clock noon, December 15, at Roanoke, Va., for electrical material; 400 rods wire fencing; 300,000 tie dating nails, and 25,000 lb. steel shapes.

ALL THE 50 Santa Fe type locomotives being built by the Baldwin Locomotive Works for the Southern Pacific are to be equipped with the locomotive booster, made by the Franklin Railway Supply Company, New York.

THE SOUTHERN PACIFIC is having the 50 Santa Fe type locomotives now being built by the Baldwin Locomotive Works equipped with open type combined feed water heaters and pumps made by the Worthington Pump & Machinery Corp., New York.

## Signaling

THE ATCHISON, TOPEKA & SANTA FE contemplates the installation of automatic block signals between Olathe, Kan., and Le Loup, 25 miles; Neva, Kan., and Cedar Point, — miles; New Boston, Iowa, and Dumas, Mo., 9 miles; Nersko, Ill. and Willow Springs, 10 miles; Las Vegas, N. M., and Sands, 34 miles; Shirley, Cal., and Calwa, 20 miles; Corona, Cal., and Atwood, 15 miles, and Caldwell and Temple, Tex. 61 miles.

## Supply Trade News

The Rich Tool Company, Chicago, has appointed the Busch Corporation, St. Louis, Mo., its representative in the St. Louis territory.

Arthur P. Bowen, formerly director of purchases of the Pullman Company, has been elected vice-president of the Ryan Car Company, Chicago.

R. W. Levenhagen, vice-president of the Glidden Company, Cleveland, Ohio, has recently assumed direct charge of the sales policies and sales activities of the Glidden organization.

The Arcola hot water apparatus is to be used to heat the 23 passenger cars of the Piedmont & Northern, an electric road 127 miles long, in North Carolina and South Carolina. Anthracite coal will be used. Hitherto the cars of this line have been heated by electricity.

J. F. Kelly, Jr., has been appointed export sales manager of the Electric Storage Battery Company, Philadelphia, Pa. Mr. Kelly will have his headquarters at 23 West Forty-second street, New York City.

J. F. Kelly, Jr.

He joined the Electric Storage Battery Company in 1909 and has been in the service of this company continuously except during the period of time he spent in military service. He was commissioned a captain in the United States army in November, 1917, at the Plattsburg Training Camp and was assigned for duty as officer in charge at the army supply base, at Port Newark, N. J., serving until his release in January, 1919. Mr. Kelly has spent considerable time with officers of the railroads

in Australia, Argentina and Brazil, having recently returned from a two years' trip around the world in the interests of the Electric Storage Battery Company.

Fred Atwater, vice-president and treasurer of the Columbia Nut & Bolt Company, Inc., Bridgeport, Conn., was on November 8, elected mayor of the city of Bridgeport by the largest majority ever given any candidate. Mayor Atwater will still retain his connection with the Columbia Bolt & Nut Company, Inc., with which company he has been associated since 1902.

John L. Artmaier, eastern sales manager of the Buda Company, in charge of the New York office, has been appointed sales manager of the railroad department of the company, with headquarters in the Railway Exchange building, Chicago. J. E. Murray, formerly assistant to Mr. Artmaier, has been appointed eastern sales manager and J. H. Maher, formerly representing the company at Buenos Aires, Argentine, has been appointed eastern export manager.

F. N. Bard, vice-president and treasurer of the Barco Manufacturing Company, Chicago, has been elected president, succeeding George M. Bard, who has been elected chairman of the board of directors. C. L. Mellor, sales manager, succeeds F. N. Bard as vice-president and will also act as secretary, F. N. Bard retaining his duties as treasurer. Frank H. Stiles, formerly mechanical representative at Boston, Mass., has been appointed district sales manager with the same headquarters. Mr. Stiles, previous to entering the service of the

Union Station, St. Paul, in Course of Construction

Barco company, was with the New York, New Haven & Hartford. **Arthur S. Lewis**, mechanical representative at New York, has been appointed district sales manager with the same headquarters.

**Wm. Bosworth** has resigned as assistant engineer in charge of contracts and production of the Underfeed Stoker Company of America, Detroit, Mich., to become mechanical engineer of the **Wine Railway Appliance Company**, Toledo, Ohio. Mr. Bosworth's experience has been almost entirely railway mechanical engineering, he having served as mechanical engineer on several steam railroads until he went to the Underfeed Stoker Company about three and a half years ago.

### Superheater Company Forms French Connection

Geo. L. Bourne and Fred A. Schaff, president and vice-president, respectively, of the Superheater Company, New York, have just returned from Paris where they have formed as a French connection the *Compagnie des Surchauffeurs*, which has been given full rights for the sale and manufacture of the "Elesco" superheaters and forged return bends controlled by the Superheater Company.

This new French company brings together interests prominently associated with superheating in France, the board of directors being Ad. Seghers, A. Fiedler, S. Magis, Capt. F. R. Fitzpatrick and Geo. L. Bourne. Capt. Fitzpatrick will represent the American interests in the company, and will reside in Paris as a resident director. Ad. Seghers, has, for 20 years, been identified with superheating in France. A. Fiedler represents the *Basse Loire* group, comprising the *Usines Métallurgiques de la Basse-Loire*, *Société des Forges et Aciéries du Nord et de l'Est*, *Ateliers et Chantiers de Bretagne*, etc., and is, himself, managing director of the *L'Auxiliaire des Chemins de Fer et de l'Industries*, manufacturers of the *Caille Potonie* feed-water heater, high temperature pumps, etc. A. Magis is a member of the firm of *Magis et Dumortier* of Brussels, dealers in railway supplies.

The *Compagnie des Surchauffeurs* is located at 11 Rue Scribe, Paris, France. A plant has been established in the outskirts of Paris for the manufacture of all types of superheaters where the forged return bends will be made, a battery of the special machines used for manufacturing these return bends having been already ordered from the Superheater Company's plant in Chicago.

### Obituary

**W. P. Hawkins**, formerly fuel agent of the Missouri Pacific and for four years president of the Western Coal & Mining Company, died on November 23, at St. Louis, Mo.

**B. C. D. Stafford**, of the Flannery Bolt Company, Pittsburgh, Pa., died on November 30 at Atlantic City, N. J., after a long illness.

### Trade Publications

**VALVES.**—The Pratt & Cady Co., Inc., Reading, Pa., has issued catalogue No. 6, 161 pages illustrated and bound in cloth describing of the brass and iron body valves and asbestos packed cocks manufactured by this company. The text includes full information relative to the different types and tables of sizes, prices and fittings.

**OIL ENGINES.**—An illustrated booklet of 22 pages has recently been issued by the Vacuum Oil Company, New York, which treats of the construction, operation and lubrication of oil engines of the surface ignition type. The text covers all of the important points in connection with this class of engines and covers in detail such problems as classification of types, the fields of service, principles of construction and operation, cooling, fuel, methods of lubrication, lubricating oils and deposits. The illustrations show various types and parts of engines, as well as the various steps in the cycles of operation.

**REFRIGERATOR CARS** are now being placed on the railroads in Latvia, out of Riga, the capital, running to various important points.

## Railway Construction

**ATCHISON, TOPERA & SANTA FE.**—This company which was noted in the *Railway Age* of November 19, as contemplating the construction of three oil storage tanks at Argentine, Kansas, will accept bids for this work until December 3.

**CENTRAL OF GEORGIA.**—This company closed bids on December 1, for the construction of a 500-ton concrete coaling station to be erected at Columbus, Ga.

**CHICAGO & NORTH WESTERN.**—This company contemplates the extension and improvement of its car and locomotive shops at Winona, Minn., at an estimated cost of approximately \$500,000. While preliminary plans have been drawn, no definite time has been set for the commencing of this work.

**CHICAGO, BURLINGTON & QUINCY.**—This company will construct a line of railroad extending from Hardin, Mont., on its main line, into the Soap Creek oil field area, a distance of about 30 miles. Surveys for this work have recently been started. This company contemplates ultimately extending this line further north into the Soap Creek Valley, a distance of 14 miles to open an area where the Holly Sugar Corporation has a large acreage of sugar beet land.

**CHICAGO, PEORIA & ST. LOUIS.**—This company will reconstruct its freight station at Havana, Illinois, which was destroyed by fire on November 18.

**CHICAGO UNION STATION.**—This company, which was noted in the *Railway Age* of November 19 (page 1016), as accepting bids for 2,600 sq. yds. of concrete track slabs, has awarded the contract for that work to W. J. Newman & Company, Chicago.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of October 8 (page 695) as applying to the war department for permission to double track its bridge across the Ohio river at Cairo, Ill., at an estimated cost of \$8,482,000, has received the government's approval for this work, and contemplates commencing construction on the project soon.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of November 26 (page 1069), as receiving bids for the construction of a new freight house and the enlarging of its passenger depot at West Frankfort, Ill., has awarded a contract for this work to the Zitterell Construction Company, Webster City, Iowa. The same company has awarded a contract to M. L. Windham, Centralia, Ill., for the construction of a track 1 3/4 miles long to extend from a point on the main line to the Shamrock coal mine, near Providence, Ky.

**MISSOURI PACIFIC.**—This company contemplates the improvement and enlargement of its station at Newport, Ark., at an estimated cost of \$10,000.

**OSAGE RAILWAY COMPANY.**—This company has applied to the Interstate Commerce Commission for permission to construct about 11 miles of railroad extending from Foraker, Okla., to the Osage County oil field in that state.

**RED LAKE NORTHERN CONSTRUCTION COMPANY.**—This company, which is located at Bemidji, Minn., contemplates the construction of a 130-mile logging railroad to run northwest from Reddy, Minn., through the Red Lake Indian reservation, and through Grygla to Roseau, and South Junction, on the Canadian border. It has been estimated that the construction and grading of this line will cost about \$2,000,000. Plans are now under way to commence 13 miles of this work during December.

**SOUTHERN PACIFIC.**—This company contemplates the construction of a levee fronting its yard trackage at Algiers (New Orleans), La., estimated to cost \$185,000. It is expected that the Orleans Parish Levee Board will pay the Southern Pacific \$25,000 in consideration of the public interest in the levee. A proposal substantiating this viewpoint has been submitted to the attorneys of the two organizations for preparation of a formal agreement.

## Railway Financial News

**ALABAMA GREAT SOUTHERN.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to nominally issue \$1,232,000 of first consolidated mortgage 5 per cent gold bonds, payable December 1, 1943, to be held in the treasury.

**CHICAGO, INDIANAPOLIS & LOUISVILLE.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$955,000,000 of first and general mortgage 5 per cent gold bonds to reimburse the treasury for money expended from income. It is not proposed to sell the bonds at this time but authority is asked to pledge them from time to time as collateral for short term notes.

**COWLITZ, CHEHALIS & CASCADE.—Granted Loan from Revolving Fund.**—The Interstate Commerce Commission has granted in part an application of this company for a loan from the revolving fund to assist it in meeting maturing indebtedness and for some additions and betterments. The amount of the loan is \$45,000 for five years.

**DELTA SOUTHERN.—Sale Ordered.**—Judge Edwin Holmes, of the United States District Court at Jackson, Miss., has ordered the sale of this road at Greenville, Miss., on December 5. The Interstate Commerce Commission recently authorized the Delta Southern to abandon its line of 52 miles in Mississippi.

**DULUTH, MISSABE & NORTHERN.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$1,174,000 of general mortgage 5 per cent gold bonds for the purpose of refunding a like amount of its first division bonds due January 1, 1922. It is expected that most of the bonds will be exchanged.

**LEAVENWORTH & TOPEKA.—Authorized to Issue Stock.**—This company has been authorized by the Interstate Commerce Commission to issue \$52,175 of common stock to the Leavenworth & Topeka Railroad Aid Benefit Districts of Leavenworth and Jefferson counties, Kansas, in exchange for a like amount of aid bonds.

**LOUISIANA & PACIFIC.—Authorized to Abandon Line.**—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon a branch line from Longville to Vandercook, La., 5.5 miles.

**NEW YORK, CHICAGO & ST. LOUIS.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$1,008,000 second and improvement mortgage 6 per cent gold bonds, series A, and \$3,027,000 of similar bonds, series B, and to pledge any part as collateral security for short term notes and as security for a note for \$1,000,000 to be given the director general of railroads on account of additions and betterments made to the company's property during federal control.

**PENNSYLVANIA.—Application to Control P. C. C. & St. L.**—The Interstate Commerce Commission has issued an order in connection with the application of this company for authority to acquire control of the Pittsburgh, Cincinnati, Chicago & St. Louis, giving leave to L. Kenn Duval to intervene, and a hearing on the petition filed by Mr. Duval has been ordered to be held at Washington on December 13 before an examiner.

**PORT READING.—New Directors.**—Robert L. Russell and Charles W. Ewing have been elected directors to succeed W. I. Brocklehurst and W. G. Brown, deceased.

**SARATOGA & ENCAMPMENT.—Control by Union Pacific.**—See Union Pacific.

**UNION PACIFIC.—Asks Authority to Acquire Road.**—This company has applied to the Interstate Commerce Commission for authority to acquire control of the Saratoga & Encampment, which runs with a connection of the Union Pacific at Walcott, Wyo., to Encampment, a distance of 44.77 miles.

**WESTERN PACIFIC.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$3,000,000 of first mortgage bonds, to be sold at not less than 94, the proceeds to be applied mainly to the redemption of equipment notes.

### Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts: Los Angeles & Salt Lake, \$800,000; Akron Union Passenger Depot Company, \$14,000. Short Line railroads, Lorama Railroad, \$2,350.

### More Equipment Certificates Sold

The director general of railroads has, with the consent of the president, confirmed additional sales, at par plus accrued interest, of railroad equipment trust certificates now held by the government as follows:

Alabama Great Southern, 1922 to 1935, inclusive.....	\$154,000
Atlantic Coast Line, 1922 to 1921, inclusive.....	1,275,900
Chicago, Northwestern, 1922 to 1924, inclusive.....	1,994,700
Pittsburgh, McKeesport & Youghi gheny, 1922 to 1927, inclusive.....	1,129,800
Richmond, Fredericksburg & Potomac, 1922 to 1927, inclusive.....	393,600
Virginian Railway, 1928 to 1935, inclusive.....	869,600
Total amount of these sales is.....	\$5,817,600

The sales were arranged by Eugene Meyer, Jr., managing director of the War Finance Corporation. The total amount of equipment trust certificates sold by the government to date, at par plus accrued interest, is \$120,068,300.

### Dividends Declared

Atlantic Coast Line.—\$1.50 quarterly, payable December 10, to holders of record December 1.

Chicago, Rock Island & Pacific.—Six per cent preferred, 3 per cent, semi-annually, seven per cent preferred, 3½ per cent, semi-annually; both payable December 31 to holders of record December 9.

Erie & Pittsburgh.—\$0.87½, quarterly, payable December 10 to holders of record November 30.

Fonda, Johnstown & Gloversville.—Preferred, 1½ per cent, quarterly, payable December 15 to holders of record December 10.

New York, Philadelphia & Norfolk.—\$3, payable November 30 to holders of record November 15.

Pittsburgh, Ft. Wayne & Chicago.—Common, 1¼ per cent, quarterly, payable January 2 to holders of record December 10; preferred, 1¼ per cent, quarterly, payable January 23 to holders of record December 10.

**FIVE MEN** were arrested at Indianapolis, Ind., on November 25, charged with the hold-up of the Illinois Central train near Paxton, Ill., on the night of November 7. Three of the suspects are negroes.

THE CANADIAN ROBERT DOLLAR COMPANY plans next year to add two large freighters to its present fleet. One will be added to the round-the-world service and one to the Vancouver-Orient line. This will permit Oriental trips at 30-day intervals.

## Railway Officers

### Financial, Legal and Accounting

**J. C. Ellington** has been appointed to the newly created position of real estate agent of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago.

### Operating

**A. T. Mercier**, whose election as general manager of the San Diego & Arizona, with headquarters at San Diego, Cal., was announced in the *Railway Age* of November 26 (page 1071),

was born at New Orleans, La., on December 11, 1881, and was educated at Rugby Academy and Tulane University where he completed a course in civil engineering in 1903. He entered railroad service in January, 1904, as transit man and clerk to a roadmaster of the Southern Pacific, with headquarters at Los Angeles, Cal. He was soon promoted to assistant gang foreman with the same headquarters, which position he held until February, 1906. From February, 1906, to

A. T. Mercier

March, 1907, he was assistant engineer in charge of reconstruction work on the Colorado River territory, with headquarters at Los Angeles; from March, 1907, to June, 1907, he was general foreman and engineer of bridges and buildings in charge of steel bridge construction, with the same headquarters; from June, 1907, to November, 1908, he was engineer and general foreman in charge of terminal construction work, with headquarters first at San Pedro, Cal., and later at Los Angeles; from November, 1908, to November, 1911, he was assistant division engineer of the Los Angeles division, with headquarters at Los Angeles; from November, 1911, to November, 1912, he was assistant district engineer of the Southern district with the same headquarters; from November, 1912, to August, 1913, he was division engineer of the San Joaquin division, with headquarters at Bakersfield, Cal.; from August, 1913, to February, 1917, he was division engineer of the Los Angeles division, with headquarters at Los Angeles; from February, 1917, to September, 1918, he was assistant superintendent of the Shasta division, with headquarters at Dunsmuir, Cal.; and in September, 1918, he was promoted to superintendent of the Portland division with headquarters at Portland, Ore., which position he was holding at the time of his recent change.

**J. D. McCully**, trainmaster of the Atchison, Topeka & Santa Fe, with headquarters at San Bernardino, Cal., has been promoted to division superintendent with headquarters at Winslow, Ariz., succeeding W. Mathie, who was killed in an accident as noted in the *Railway Age* of November 26 (page 1061).

**W. F. Farrier**, trainmaster of the Los Angeles & Salt Lake, with headquarters at Salt Lake City, Utah, has been promoted to safety agent, with headquarters at Los Angeles, Cal., succeeding G. H. Wright, who has been assigned to other duties. **J. T. Wardenburg**, trainmaster, with headquarters at Milford, Utah, will succeed Mr. Farrier, who will be succeeded by **W. R. Spettigue**, chief clerk to the superintendent of the Salt Lake division.

### Executive

**J. M. Rapelje**, general manager of the Northern Pacific with headquarters at St. Paul, Minn., has been promoted to vice-president in charge of operation and maintenance, succeeding W. T. Tyler,

who has resigned to enter business. Mr. Rapelje was born at Chippewa, Ontario, on January 22, 1857. He began railway work in August, 1879, as a brakeman on the Grand Trunk and shortly thereafter became a fireman on the Atchison, Topeka & Santa Fe. From May, 1882, to November, 1887, he was a conductor on the Canadian Pacific and then, until 1898, was a conductor on the Yellowstone division of the Northern Pacific. He was then appointed trainmaster and subsequently served as a conductor until June, 1902, when he was reappointed trainmaster of that division. From April, 1905, to July, 1908, he was superintendent of the same division and, from the latter date to May, 1910, was superintendent of the Rocky Mountain division. He was then transferred to the Idaho division, where he remained until 1912, when he was appointed general superintendent of the lines from Mandan, N. D., to Paradise, Mont. In May, 1914, he was promoted to assistant general manager with headquarters at St. Paul and, in October of the same year, to general manager of the lines east of Paradise, which position he was holding at the time of his recent promotion. For a time in 1918 he served as acting vice-president.

J. M. Rapelje

### Traffic

**W. E. Coman** has been appointed western traffic manager of the Northern Pacific.

**H. S. Garvey** has been appointed general agent of the Boston & Maine with headquarters at Detroit, Mich.

**J. M. Strupper** has been appointed assistant general freight agent of the Fort Worth & Rio Grande and its subsidiary companies, with headquarters at Fort Worth, Tex.

**P. M. Fagan** has been appointed division freight and passenger agent of the Chicago, Milwaukee & St. Paul, with headquarters at Terre Haute, Ind. Mr. Fagan will have charge of the Terre Haute division, including Chicago Heights, Ill.

**J. V. Lanigan**, assistant general passenger agent of the Illinois Central with headquarters at Chicago, has been promoted to general passenger agent with the same headquarters, succeeding H. J. Phelps, deceased. **J. W. Stevenson**, chief clerk to the vice-president in charge of traffic with headquarters at Chicago, will succeed Mr. Lanigan. **William Haywood**, assistant to the traffic manager with headquarters at Chicago, has been promoted to general freight agent in charge of solicitation with the same headquarters.

**Fred L. Hanna**, whose appointment as assistant general freight and passenger agent of the Atchison, Topeka & Santa Fe, with headquarters at Phoenix, Ariz., was announced in the *Railway Age* of November 5 (page 914), was born at Steubenville, Ohio, on May 1, 1869. He attended Wooster University in that state from 1888 to 1889. Mr. Hanna entered railroad service on September 1, 1891, as a clerk for the Atchison, Topeka & Santa Fe, and was promoted successively to rate clerk and chief clerk to the general agent, with headquarters at Los Angeles, Cal. On January 1, 1901, he was

promoted to traveling freight agent, in charge of the southern California territory, which position he held until January 1, 1909, when he left to become traveling freight and passenger agent of the Arizona & New Mexico. He left railroad service on January 1, 1914, to take a position as general agent for a commercial company. On August 1, 1918, he entered the service of the Inland traffic division of the war department and was given charge of this work in the States of California and Nevada. He re-entered railroad service on March 1, 1920, as division freight and passenger agent of the Atchison, Topeka & Santa Fe, with headquarters at Fresno, Cal., which position he was holding at the time of his recent promotion.

**W. T. Wright**, freight agent of the Illinois Central, with headquarters at Benton, Ill., has been promoted to supervisor of coal traffic, with headquarters at Carbondale, Ill. Mr. Wright was born at Scheller, Ill., on February 9, 1874. He entered railroad service in 1893 as a station helper and student of telegraphy on the Illinois Central, with headquarters at Tamaroa, Ill., and his entire railroad career has been with that company. From 1894 to 1921, he has worked mainly in the capacity of an agent at various stations on the St. Louis division. The office to which he has been promoted is a newly created one. Mr. Wright will have general supervision over all coal traffic matters on the entire system, and will act as the field man under the direction of the manager of the coal traffic department, enabling that department to maintain closer supervision of that class of traffic at its source in the coal fields of Southern and Central Illinois, Indiana, West Kentucky and Alabama.

### Mechanical

**Ora S. Jackson**, whose appointment as assistant superintendent of motive power and machinery of the Union Pacific, with headquarters at Omaha, Neb., was announced in the *Railway Age* of November 12 (page 964), was born at Huntington, Ind., on August 11, 1875. He entered railroad service as an apprentice machinist on the Erie, at Huntington, Ind., after which he worked as a round-house foreman and general foreman on the Cleveland, Cincinnati, Chicago & St. Louis for eight years. He then left that road to become general foreman and master mechanic of the Chicago, Indianapolis & Louisville, which position he held for five years, when he became superintendent of motive power of the Chicago, Terre Haute & Southeastern. After three years he was promoted to general superintendent in charge of the mechanical and operating departments, which position he held for five years up to the time of his recent appointment.

W. T. Wright

O. S. Jackson

**S. G. Kennedy**, general foreman of the Atlantic Coast Line at Lakeland, Fla., has been appointed master mechanic of the Tampa district with the same headquarters.

**W. H. Dempsey** has been appointed assistant division master mechanic of the Chicago and Milwaukee division and the Milwaukee terminal of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., succeeding G. E. Passage, promoted.

### Engineering, Maintenance of Way and Signaling

**W. W. Kelly**, division engineer of the Atchison, Topeka & Santa Fe, with headquarters at San Bernardino, Cal., has been promoted to engineer of the Grand division, with headquarters at Los Angeles, Cal., succeeding W. H. Oliver, who was killed in an accident as noted in the *Railway Age* of November 26 (page 1061).

**T. Martin**, division engineer of the Revelstoke division of the Canadian Pacific, with headquarters at Revelstoke, B. C., has been transferred to the Nelson division, with headquarters at Nelson, B. C., succeeding J. H. Sloans, who has been building master there, and who will now replace Mr. Martin at Revelstoke, effective December 1.

### Obituary

**H. J. Phelps**, general passenger agent of the Illinois Central, Northern and Western lines, with headquarters at Chicago, whose death was mentioned in the *Railway Age* of November 26 (page 1072), was born at Elmira, New York, on September 3, 1861. He entered railroad service in 1882 as a telegraph operator on the Illinois Central and remained with that company until his death. He was promoted to station agent at Onawa, Iowa in 1887, and later was successively ticket agent at Sioux Falls, S. D., and freight and passenger agent at Baton Rouge, La. In November, 1894, he was promoted to city passenger agent with headquarters at Chicago and was soon after appointed city passenger and ticket agent, with the same headquarters. In August, 1905, he was promoted to division passenger agent with headquarters at Dubuque, Iowa, which position he held until March, 1911, when he was promoted to general passenger agent, with headquarters at Chicago. Mr. Phelps died from meningitis on November 20, after an illness of four weeks in the Illinois Central hospital in Chicago.

H. J. Phelps

**Lord Mount Stephen** (George Stephen), the first president of the Canadian Pacific, died at Hatfield, Herts, England, on November 29 at the age of 92. George Stephen was born in Scotland, was educated in the parish schools and was apprenticed to a draper. In 1850 he went to Canada, entered business and, after a time, became a manufacturer of woolen goods. In 1876 he became president of the Bank of Montreal. Shortly thereafter he became associated with Donald Smith, later Lord Strathcona, and others in the development of the Northwest. In 1880 they organized the Canadian Pacific and George Stephen became its first president. He retired from this position in 1888 and has since made his home in England. It was in recognition of his activities in connection with the Canadian Pacific that George Stephen was made a baron.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free, United States, Mexico and Canada, \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue 8,700 copies were mailed to that of the 8,700 copies, 7,893 were mailed to regular paid subscribers, 57 were provided for counter and news-vending sales, were mailed to advertisers, 65 were mailed to employees and correspondents, and 354 were provided for new subscriptions, sample copies lost in the mail and office use that the total copies from this year to date were 461,700, an average of 1,422 copies a week.

Usual Drive of Standard Radials.  
(Note great complexity. Eleven gear transformations.)

Fig. 1

Ryerson-Conradson Spindle Drive.  
(Note extreme simplicity. Three gear transformations.)

Fig. 2

# Speeding Locomotive Repairs

Do you realize how far machine tool design has advanced and how modern machine tools speed locomotive repairs?

Take the Radial drill—

Figure 1 shows the inefficiency of power consuming bevel gears and "round the corner drive" found in the usual radial drill.

Figure 2 shows the simplified spindle drive of the Ryerson-Conradson Railroad Radial that reduces the number of gears by more than one-half and cuts power consumption 40%.

Do you know how the Ryerson-Conradson Radial cuts the time of tapping? Write for bulletin 4,001.

Ryerson-Conradson Railroad Radial.

The Table of Contents Will Be Found on Page 5 of the Advertising Section

Designers of cars and locomotives should more consistently follow the equipment when it goes into service. Unless there are bad failures they do not often hear from the equipment. It is important, however, from the standpoint of cost of maintenance and also of operation that they know of the minor failures and of cases where the wear of parts is excessive; and they should know that the equipment is giving complete satisfaction so far as convenience of handling and operation is concerned. This will require organized effort outside of the drafting room, but the cost of this will be repaid many times over in the improvements that will follow.

### The Equipment Designers' Responsibility

The railroads of this country are vitally concerned with the industrial prosperity of the country as a whole. Improved business conditions in this country are dependent in a large measure upon trade with foreign countries. Most of the European countries cannot do much business with us because of their unbalanced budgets and mounting deficits. Indeed our financiers and business men will not extend credit to them as long as they tend toward a condition of bankruptcy. The deficits for these countries in many cases just about equal the cost of maintaining their armaments. The conference at Washington seems to be in a fair way to succeed in its efforts to reduce the large navies and settle the Far Eastern question. The countries which are running up deficits and with whom we want to do business are more or less helpless because of the burden of supporting large land armaments. Is it not vital therefore that American business men get behind a program looking toward another conference in the near future to study land disarmament and other economic problems and that financiers and business men be well represented in the conference?

### The Railroads and World Prosperity

In view of the formidable amount of agitation that is going on in favor of reductions in freight rates and passenger fares, it is somewhat surprising that more attention has not been given to the elimination of the taxes on transportation charges. Mr. Average Man has been paying high freight rates and passenger fares, but he has somehow failed to realize that 3 per cent of his freight charges and 8 or 10 per cent of his passenger fares and sleeping car rates have represented taxes. Possibly the fact that he has failed to realize it is the reason he has failed to realize that the elimination of the taxes will amount in effect to a reduction of the charges which he has paid. On the other hand, Mr. Average Man has found himself rather busy of late, keeping up with the news. Between the conference on the limitation of armaments, the pending solution of the Irish question and a multitude of lesser things, the reduction in taxes in transportation has taken second place. The average business man further has also at last found himself in a happy frame of mind where he can worry again about his business—that is, conditions are gradually improving sufficiently so that worrying about his business is really worth while again.

### The Taxes on Transportation

Up to within a comparatively recent period one of the leading questions in connection with the railways of Japan was that of widening the lines to standard gage. Japan's government owned railways total over 6,000 miles. They are of 3 ft. 6 in. gage. It was proposed to widen this gage to 4 ft. 8½ in., although it was understood that this would have meant the expenditure of enormous sums of money both as relates to the widening of the right of way and to the necessary changes in equipment. The strength behind the proposal presented itself in a rather strong fashion. Bills were prepared for presentation by the government, although the program never went far enough to be brought to a vote. We are now advised that the proposal for widening the railway gage has been relegated to the background. Railway Japan is now thinking and talking electrification. The reason is partly the difficulty of getting sufficient quantities of coal at a reasonable cost and, on the other hand, the availability of large sources of water power. Japan at present has some electrified lines—the development of her electric tramways also is noteworthy. The country, as it happens, is in a position to build its own steam locomotives and has been building them for some time. It is not without significance to American trade, therefore, that orders should recently have been placed with two of our largest electrical concerns for some \$5,000,000 worth of electrical apparatus for hydro-electric developments.

### Electrification in Japan

As a general rule it is probably safe to say that the rewards of supervision vary with the size of a business. In other words, the need and results of supervision are of greater importance in a business of many ramifications than in one that is more or less self-contained. Because of the character of its organization a railroad presents numerous opportunities for the creeping in of wasteful practices and the efforts of supervisory officers to prevent and eliminate them are practically continuous. Nevertheless, in too many instances the corrective measures undertaken are, so to speak, retrospective in character rather than introspective. That is to say, there is often an inclination to approach the matter of effecting improvements in a negative manner by pointing out the ill results of existing practices rather than from the positive attitude of applying the remedy before the fact. For instance, the matter of prevention of freight loss and damage claims is often approached in a negative way by presenting to those concerned figures showing the total loss and supporting the figures by pictures, charts or other means. There is no question but that such action creates a desire on the part of the men to see the matter remedied. In such a plan, however, the personal equation is missing and it is not hard to believe that the desired end could more nearly be approximated if the plan of approach were made positive by giving each employee something to do in the matter in addition to bringing home to him the results of present practices. It is probably safe to say that in the great majority of supervisory problems the transition from a negative attitude to the positive is a very simple matter. However, the importance of effecting the change in front can hardly be overestimated.

### Why Not

Assume a Positive  
Attitude?

## The New "National Agreement"

THE DECISION of the United States Railroad Labor Board finally disposing of the so-called "national agreement" between the shop crafts and the United States Railroad Administration is a much needed step toward the attainment of stable relations between the railroads and their shop employees. With whatever feeling the result may be regarded by the two parties to the controversy, the mere fact of a settlement of reasonable permanency is likely to have a marked influence in restoring some measure of co-operation between the members of the shop crafts and the railway supervisory forces.

Like any decision essentially a compromise, there are not lacking numerous features with which each party to the controversy will be disappointed. The employees, however, cannot legitimately claim they have been unjustly dealt with and the railroads have been relieved of by far the greater part of the vicious and restrictive regulations of the former national rules. It is true that the main contention of the railroads in the presentation of their case before the board was the establishment of the right of the railroads to negotiate local agreements with their own employees and the abrogation of national agreements which of necessity cannot fit the widely varying conditions existing on different roads. The re-establishment of a set of national rules was a defeat for the roads on this point. This defeat, however, is only partial, since the right of negotiations between the individual roads and their own employees has been established in principle, and where local agreements have been negotiated they are undisturbed by the new national rules.

The original decision in the national agreement case was handed down by the board on April 14, 1921. This decision called upon the officers and organizations of employees on each road to negotiate their own local agreements as far as possible, in accordance with the terms of the Transportation Act. Because of the power of the Railway Employees Department of the American Federation of Labor to control these negotiations, the entire controversy was forced back to the Labor Board for final settlement. As a practical matter it would have been impossible for the board to have established other than national rules. Therefore, under the terms of the Transportation Act, the perpetuation of the equivalent of a national agreement was inevitable in the circumstances. Had the employees entered the local negotiations in a spirit of co-operation, other results might have been obtained, but they were prevented by the power of the American Federation of Labor, attained through the closed shop conditions established by the Railroad Administration.

In this connection it is worthy of note that while this power enforced the continuation of national rules, the provisions of the former agreement practically establishing the closed shop are materially modified in new rule 35, which protects unorganized or minority employees in the right of representation of their own choosing in the handling of grievances.

Specifically, however, the new rules have been made much more flexible than those of the former national agreement and will be much easier to adapt to varying local conditions. They have restored the right to the establishment of piece work by local agreement; the arrangement of shifts is left to local agreement; the features of the overtime rules have been revised substantially in accordance with the railroads' objections; the craft classifications have been modified in several important respects to permit the use of helpers where mechanics were formerly required and they have been made more flexible of application on running repairs in small shops and terminals. The right to the establishment of special apprenticeship is restored; more flexible and satisfactory provisions have been made for reducing expenses and the worst features of the running repair and dead work rules have been eliminated.

It is true that not all objectionable features of the rules have been removed. The classification rules still prevent the use of handymen and specialists not rated as mechanics; the class qualification rules, particularly the carmen's rule, place undue limitations on the supply of labor, and the seniority rule perpetuates the lack of discrimination between the various classes of carmen established by the rule of the former national agreement. The spirit of the rules, however, is greatly improved and the fact that in promulgating them the Labor Board has abrogated all interpretations handed down by the adjustment boards of the United States Railroad Administration, a large part of which were punitive in spirit, justifies the expectation that future interpretations may be formulated on a far more hopeful basis. This fact alone will be of tremendous value in re-establishing a better morale throughout the departments affected.

However unsatisfactory some of the provisions of the new rules may be, the roads should take full and immediate advantage of the opportunity which they offer for the re-establishment of piece work and the building up of better discipline and a spirit of co-operation between the employees and supervisory forces. With such a spirit fully established the way is open for future modifications of objectionable features of the rules through local negotiations and agreements.

## Railway Rates and Revival of Business

WOULD A GENERAL REDUCTION of railway freight rates help business? Almost everybody, including railway officers, believes it would. The railroads are taking steps to bring a case before the Railroad Labor Board for a reduction of wages. They have said they will give to the public in reduced rates the full benefit of any reduction of wages they get. As an earnest of their good intentions, they have granted for six months a reduction of 10 per cent in all rates on farm products, which will be permanent if a reasonable reduction of wages is secured.

There are two points regarding railway rates which should, however, be forcibly emphasized at this time. One is that no more baseless statement could be made than the oft-repeated assertion that the present railway rates have "killed" the business of the country and the traffic of the railways, and are preventing a revival of business and traffic. The other is that many other changes besides any such reduction of railway wages as seems now to be in immediate prospect must be made before any really large reduction of railway rates can be expected.

The *Railway Age*, in its issue for December 3, page 1089, published an article showing that in spite of all that has been said about the present "excessive" rates, the average railway freight rate is today actually lower, compared with the present prices of most commodities, than has been the case most of the time during the past 32 years. If we take the average freight rate and the average wholesale prices of the years 1890 to 1899 as a basis, we find that in July, 1921, the average railway rate per ton per mile and the average wholesale prices of commodities were the following percentages higher than in the years 1890-1899:

	Per Cent
Railway rate per ton per mile.....	49
Farm Products .....	89
Foods .....	84
Cloths and Clothing.....	122
Fuel and Lighting.....	161
Metals and Implements.....	60
Lumber and Building Materials.....	244
Drugs and Chemicals.....	102
House Furnishings .....	177
Miscellaneous .....	104
All Commodities .....	100

If we take the average railway rate and average wholesale prices of the years 1900-1910 as a basis, we find that in July, 1921, the average railway rate and average commodity

prices were the following percentages higher than in 1900-1910:

	Per Cent
Railway rate per ton per mile.....	65.50
Farm Products .....	42
Foods .....	64.50
Cloths and Clothing.....	93
Fuel and Lighting.....	98
Metals and Implements.....	29
Lumber and Building Materials.....	130
Drugs and Chemicals.....	82
House Furnishings .....	147
Miscellaneous .....	71.50
All Commodities .....	66.66

(This last figure was erroneously given as 76 per cent in an article in last week's *Railway Age*.)

The average railway rate is not at present quite as high compared with where it stood in 1900-1910 as the average wholesale price of all commodities. It is higher relatively than the average prices of farm products, foods, and metals and implements, but lower relatively than the average price of any other group of commodities, and much lower relatively than the average prices of fuel and lighting, lumber and building materials, and house furnishings.

It has been and is still being widely charged that the present freight rates are preventing the movement of large amounts of traffic. It is well known, however, that the volume of farm products shipped in the year 1921 has thus far been larger than in any previous year. This proves that the rates have not seriously hindered the movement of farm products. The prices charged for any class of commodities must have a much greater influence upon the amount of them that can be marketed, and which therefore can be shipped, than is exerted by the railway rates on them, which in most cases are only relatively small percentages of the total prices. The figures regarding the present average railway rate and average prices show that the prices which are still being charged for many commodities are exerting a great deal more influence on the volume of them shipped than are the freight rates being charged on them. Are not some groups of producers who are still charging prices from 100 to 150 per cent more than in the ten years prior to 1910 getting on rather thin ice when, upon the ground that the traffic cannot bear them, they demand reductions in railway rates which are relatively much lower than the prices they are charging?

Another most important point to be considered is the influence exerted by the present level of prices upon the ability of the railways to reduce their rates. The prices being charged for some important classes of commodities, such as coal, directly affect the operating expenses of the railways. The prices of all commodities also affect the operating expenses of the railways by determining the cost of living of their employees and, therefore, indirectly, the wages the railways must pay. The wages of most classes of railway employees are too high, and some much too high, in proportion to present rates, the prices of most commodities, the cost of living and the wages paid in other industries. It is made evident, however, by careful study of the present relations between railway rates, commodity prices and wages in the railroad and other industries that if both railway wages and railway rates are to be largely reduced the reduction in them must be accompanied by further reductions in the wholesale and retail prices of many kinds of commodities.

There are some important classes of commodities the prices of which at the present time are relatively lower than the average railway rate. The average price of metals and implements, for example, is only 29 per cent higher than in 1900 to 1910, and the average price of farm products only 42 per cent higher. Certainly, however, shippers of the many commodities whose prices are still much higher relatively than the railway rates on their commodities, have no right to complain about the present rates as long as they maintain the present prices. One of the principal reasons for the long continuance of the industrial depression is that the prices of some commodities are still relatively much too high compared with railway rates and with prices of other commodities.

No conceivable reduction of railway rates would materially stimulate general business until these maladjustments between the prices of different commodities were corrected, and, furthermore, no really large reduction of rates can possibly be justified as long as the prices of most commodities are relatively as high, and some much higher, than the general level of railway rates.

## Should the Low Bidder Get the Work?

IN THE EARLY YEARS of the last decade, which marked the beginning of state supervision in road construction and the first real impetus to the use of concrete in highway bridges, the state authorities were confronted with an awkward situation. Concrete bridges, unlike steel structures, may be built without the aid of a manufacturing plant. Consequently, advertisements of bridge lettings brought bids from all the concerns in the vicinity that had ever turned a shovelful of concrete. Statutory restrictions and political expediency made it necessary to award the work to the lowest bidder so long as he complied with the stipulations as to form of bid, certified check and surety bond, notwithstanding the fact that the amount of his bid established beyond question that he was bound to do the work at a loss. This actually occurred in the majority of cases because the experienced contractor who knew what the work would cost would not make tenders as low as the bidder who did not know the requirements. After a sufficient number of the contractors had learned an expensive lesson in the school of experience and after surety companies for similar reasons became more exacting in the choice of their clients, this condition was gradually corrected. In the meantime, it worked hardship on the engineering staffs of the state highway commissions, caused unending delays in the completion of structures and resulted in the construction of many inferior bridges.

This chapter from the history of highway engineering would be of no interest to railway officers if it were not for the fact that they are now confronted with an almost parallel situation. The present stagnation in building operations, following, as it does, a period of most extended construction activity, has enormously increased the competition among bidders for the limited amount of work now being advertised. Railroads that normally solicited bids from a half-dozen contractors are now being asked to supply plans and specifications to as many as 40 or 50 concerns. The impression gained is that every builder who ever erected a small dwelling or business building anywhere near the proposed work is now striving to get the contract at any price. The roads are receiving a flood of exceedingly low bids from firms that have never done work under any but the most casual supervision and are, therefore, entirely unfamiliar with the strict requirements for material and workmanship that prevail under the supervision of the railway chief engineer. Under the circumstances, the established railroad building contractors, who have constructed most of the railway structures in the past and must be depended upon to take such work during coming periods of normal building activity, are now frequently not among the low bidders.

This situation places the chief engineer in a serious predicament. He knows that the management is under a burden to conduct the capital expenditures with scrupulous economy, and that these are times of falling wages and falling material prices and he desires to take advantage of every opportunity to save money. At the same time he is under a burden to get the work completed within the allotted time, and to have it done on a grade of workmanship that is well up to the standards established by the road he represents. He also knows how difficult it is to secure these results with a firm of limited credit and mediocre organization.

By following the line of least resistance, as in the case of the highway bridges, this situation would gradually correct

itself through the eventual elimination of the irresponsible bidders. But in the meantime serious damage would be done which could not readily be righted. Fortunately, the railroads are not bound by precedent, politics or statutes to accept the lowest bid and this freedom of action, together with a thorough investigation of firms submitting tenders, the imposing of strict requirements as to surety bonds and advertisements calling particular attention to the established rule for the strict interpretation of specifications, should serve in large measure to keep the roads out of the difficulties encountered in public work.

## Unfair Motor Vehicle Competition

THE RAPID EXTENSION of paved highways throughout all parts of the country and the introduction of the motor truck and the motor bus comprise the outstanding developments in transportation today. From the standpoint of the steam and electric railways it offers a new form of competition which must be recognized. It is also creating new and serious problems for the public, most important of which is the necessity for the formulation of a means of taxation of the trucks which use these highways for hire, that will return sufficient funds to make good the damage they do.

As a general average these highways are today costing \$30,000 per mile or more. Their construction is in general paid for largely by the owners of motor vehicles. Only a small percentage of the owners of motor vehicles use the highways for commercial purposes, but this small percentage is wearing out the highways more than all the other users of them. Not only are the commercial vehicles using these highways more continuously but, traveling as they are at high speeds and heavily loaded, they do more damage to the roadways in one trip than the average automobile will in many.

These motor trucks and motor buses are competing with the railways for the transportation of freight and passengers. The highways afford them right-of-way and roadway at only nominal cost. The railways have to build and maintain their own lines. They are also taxed heavily for the support of the public activities including highway construction.

The way in which this works out is illustrated in a striking manner in Minnesota, where the railroads are taxed at the rate of six per cent on their gross earnings. A new highway was recently completed between St. Paul-Minneapolis and St. Cloud, 65 miles at a cost of approximately \$30,000 per mile. Motor vehicles are taxed two per cent on their cost. On a motor bus costing \$5,000 the owner pays \$100 tax for a year's use of the highways. For every passenger hauled from St. Cloud to Minneapolis the railways pay the state approximately 14 cents. If the two railways which connect these cities hauled only 30 people a day from St. Cloud to Minneapolis and return, the tax collected by the state in two weeks would exceed the year's license paid by the average truck, or in 24 days they would pay the state over \$200, which is more than the highest priced truck pays for a year's use of the highways. There are many days in which the gross earnings tax on the St. Cloud-Twin City business of the railways amounts to more than a year's license for a passenger bus.

Such facts as these indicate the necessity for the enactment of legislation which will tax commercial motor vehicles on the same basis as other transportation agencies with which they compete. From the standpoint of the public these trucks should be classed as common carriers and be subjected to the same regulations as to rates, continuity of service, etc., as the railways. It is also only fair that commercial vehicles make good the destruction of the highways which they cause. With these provisions in effect and the public given the protection to which it is entitled, the activities of the commercial vehicle will be restricted to those fields in which it

can be operated with real economic benefit to the public. Within such limits the railways cannot object to competition, but until such regulations are enforced the railways and the public will suffer from the mushroom-like competition which resembles the jitney competition of a few years ago that did so much to injure the street railway systems.

## New Books

*Motor Truck Transportation.* By F. Van Z. Lane, C.E., lecturer on Motor Truck Transportation, New York University. 6 in. by 9 in., 153 pages, 44 illustrations. Bound in cloth. Published by Van Nostrand Company, New York.

This volume is exclusively a discussion of motor trucks from an operating point of view. In it are discussed, in an exhaustive manner, the principles necessary to the economical and efficient use of such trucks. The book is divided into 15 chapters and the information presented is arranged in logical order and in such a way that information relative to a particular phase of the problem is readily accessible. The chapters devoted to motor truck transportation laws, cost records, motor trucks and the railroads, bodies, and loading and unloading devices, are well thought out expositions of these subjects and, moreover, are of particular interest to the railway officer concerned with the possibilities of the motor truck as used to supplement rail transportation. In other chapters the future of motor trucks is discussed, motor trucks are contrasted with horse-drawn trucks and the value of highway transport surveys is brought out.

Purely technical information relative to truck design and construction, etc., purposely has been omitted from this work and the volume better serves its purpose—the presentation of practical information on motor truck operation in usable form—because of this manner of treatment.

*Freight Traffic Red Book for 1922.* By Henry G. Williams and Charles J. Fagg. 494 pages. 8 in. by 11 in. Cloth. Published by The Traffic Publishing Company, 150 Lafayette street, New York City.

This book is well described, in its subtitle, as a practical reference book for either railroad men or shippers who are actively engaged in traffic work; and, for shippers especially, "an everyday guide; a condensed but comprehensive text book for the student of freight transportation."

The first thing in the book, following the list of abbreviations, is a traffic glossary. A glossary should serve, mainly, for the instruction of the primary class; but this one assumes a good deal of information on the part of the reader.

The next chapter is one for the post-graduate student, "rate factors." Thenceforward the authors dip into the practical side of the subject as looked at by the freight agent and the shipping clerk: classifications, rates, territories, rate bases and routing. Each detail is treated with great care and evidently with scrupulous attention to accuracy; demurrage, lighterage, reconsignment and so on. The chapter on rate bases fills 30 pages, and is an elaborate geographical essay. Rules and rulings of the Interstate Commerce Commission fill 82 pages and governmental regulation, its necessity and philosophy fills 10 pages. Following this, the Interstate Commerce Act, the Transportation Act, 1920, and other statutes are given in full, followed by the rules of practice before the Interstate Commerce Commission, chapters on express service and on export and import traffic, with 50 pages of other interesting details. Forms of bills of lading and other documents fill 50 pages more and, finally, 36 pages are taken up with five complete indexes.

It is the intention of the publisher to issue supplements, when necessary, to be sent free to subscribers, so as to keep the book up to date until October, 1922.

## Letters to the Editor

*[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]*

### Limitations of the "Middle Order"

OGDEN, Utah.

#### TO THE EDITOR:

Every dispatcher, every operating officer, must have read with interest Mr. Whinton's article entitled "Eliminating the 31 Train Order," and Mr. Forman's advocating the use of the so-called "middle order" to catch 'em if they get away under the much discussed use of the 19 Form. I hope that the managements of all single-track railroads anticipating the elimination of Form 31 will, before adopting or depending upon the obsolete "middle order," take into consideration the percentage of communicating points as against those where there is no operator.

Consider, also, the staggering of points of communication by working an operator 12 hours—one-half of the 24-hour period—at one station and an operator at the next station working the other half. When the middle order is in effect at an open office and such office must be closed, under the federal law, before the trains meet, it must be annulled. Then the protection that is supposed to make the 19 order safe has been removed. It takes time to put out the middle order, even though the operator responds promptly; and that means much to the busy dispatcher. Many times it handicaps him in placing his orders and delays the trains; thus the use of the middle order to make friends for Form 19 defeats its own purpose.

If the 19 is not safe without the middle order, then it is not safe to make meets at non-communicating points.

We should not, in my opinion, advocate the use of the middle order. It is seldom used and will not be used unless dispatchers are continually watched; this for the reason that it is not practicable, and is a train delay. It weakens our conductors and engineers, for the reason that they depend upon it. If we cannot make the use of the 19 order safe without bolstering it up with the middle order and a block signal system, we should not use it for restricting trains.

WM. NICHOLS.

### Twenty Years' Observation

MIAMI, Fla.

#### TO THE EDITOR:

I have read in the *Railway Age* of September 10 and October 15 and since, the various letters and articles on the abolishment of the "31" train order, particularly what Mr. Whinton has to say in reference to this matter. I have also advocated for a number of years the abolishment of the 31 order. I have been a train dispatcher on single track railroads for 20 years and have watched this particular feature since I first started in the business; and I have never been convinced that the signature of the conductor, or of the conductor and engineer, added materially to the safety of the transaction. If the operator enters the numbers of the orders on the clearance card, with the safeguards that have been described, the dispatcher can check them just as easily as if the operator had given him the signature of the conductor.

When an engineer finds a red signal he must either see it turned to clear or procure an order or a clearance card. If

neither, he is then required to stop. Suppose the conductor and the engineer should both overlook the red signal; the fact that it is a 31 order has no bearing on the case. To require the signature of the conductor causes, with a long train, at least 20 minutes' delay.

The middle order is all right so far as it goes, but on the majority of single-track railroads open telegraph offices are few and far between, and it is impracticable to put orders out at the meeting points. Some rule could be easily worked out to take care of the order when sent to the superior train at the meeting point; say, restrict its delivery until the train has come to a stop.

I know there is quite a lot of opposition to the abolishment of the 31 train order, but I am satisfied in my own mind from practical experience that the 19 order, even without automatic block signals and the middle order, is just as safe.

E. P. McLAIN,

Superintendent of Transportation, Florida East Coast Railway.

### Concerning "Official Goats"

CLEVELAND, Ohio.

#### TO THE EDITOR:

I have noted with some amusement, and considerable disgust, the letter entitled "The Official Goat," signed by "One of Them," in your issue of September 24. I wish to take exception to "the exception, and not the rule," as described therein. I put in about seven years as secretary to a chief operating officer. In all my travels in the business cars of various officers, from vice-presidents down the line, I never came in contact with one who treated his secretary in any but a businesslike and gentlemanly manner; and this not only applies to the man for whom I was working but to all of the officials I came in contact with; therefore I do not recognize the "typical day's bawling out" as outlined.

It is very evident that "One of Them" is either working for a man whose treatment of a secretary is not the rule, or he has a grudge against all bosses. It would seem that "One of Them" should look more to the mote in his own eye rather than to the beam in the eye of the boss. After nine years of such treatment, if "One of Them" had any backbone or pep he would get out and get another job. Evidently he is lacking in something.

While, no doubt, all secretaries sometime or other receive a "bawling out" from the boss, it has been my experience that after cooling off and giving the matter thought the secretary usually finds he had it "coming to him."

If the officer did not realize that his secretary had "sensibilities" and "intelligence," he would not be the secretary. Therefore, my suggestion to "One of Them" is that he try being "human" with the boss, stop criticising him, and get in the class with the well-treated secretaries of the country (fortunately in the majority).

EX-SECRETARY.

### The Railroads and Public Opinion

EAST ORANGE, N. J.

#### TO THE EDITOR:

For the present the railroad strike specter has vanished from the public eye, but no one knows when it will return. It is the duty, if not a necessity, for the railroad managers to keep the public posted as to the railroad situation. It was public opinion which broke the last strike threat, and it will be the public which will play the lead-role in the next railroad crisis.

The railroads must see that the public knows all the facts and fully understands the particular problems, for if the public does not know the truth the professional labor agi-

tator and government ownership propagandist will so mislead and befog the public that it will not be able to perceive clearly the justice of the controversy and wrong will triumph over right.

What the railroads must do this winter is to adopt a campaign of educating the public to the real railroad situation. Let the railroad executives explain in the newspapers the questions which the public want answered, let the railroads send speakers into the different communities, and finally let the railroads insert advertisements in the daily press which will state conditions just as they are in language and in figures which everyone can understand.

Such a campaign would without doubt bring about a clearer perception of the railroad problem by the public. Where ignorance is, there suspicion is sure to lurk. The cost would be nothing compared with the results. The railroads belong to all the public and it is only fair that the public should be kept informed of all the policies and problems of the business in which it has the most at stake. Now is the time to adopt some such plan—not tomorrow, or the next week, but now.

A RAILROAD STUDENT.

## Why College Men Fail on the Railroads

CHICAGO.

TO THE EDITOR:

The question of encouraging college men to enter railway service is attracting much interest with your readers. I entered railway service in 1882 with a granger road, owned in New England, and I was given a position because I was a college man. A relative who was interested in my future solicited the interest of a wealthy Bostonian of her acquaintance who was a director of a prosperous western railroad which operated in a developing country and whose board of directors had established a policy of recruiting its staff with young college men who could be trained in railroad work. Through him I was introduced to the president of the road who looked me over and asked me what I wanted to do. I replied, "Anything—I'll brake a freight train if you want me to." His answer, which will stay with me all my life was, "*Take hold* is all right, but *Hold on* is better." I was told to report to his office in a western city as soon as possible and after working there for about a month was transferred to an active department and put right in the thick of the fight, where I have remained ever since.

In casting up in my memory the names of other college men who started with this railroad, either before or after I did (the policy was continued well into the 90's), I can recollect 68 men. There were others, I know, but I cannot recall their names after the lapse of years. Of these 68, one has risen to the chairmanship of the board of a large railroad company, one recently retired as a general manager, one is a passenger traffic manager, one a secretary and treasurer. One rose to be a vice-president in charge of the operating department, quarreled with his president, resigned in a huff, took up other business and soon after died. Another rose to be the president of a railroad but suddenly resigned and has dropped out of railroad work.

Of the remaining 62 I am the only one, so far as I know, who has remained in railroad service. None of them to my knowledge has been very successful in any other business.

One had been appointed an assistant trainmaster and had resigned because the only place he could get board in the town where his headquarters were was a hotel patronized by coal miners and they were allowed to come to table in their shirt sleeves. This man has since risen to the position of mayor of a good-sized city, and I do not think any of the rest have gone even that far. Now these were selected college men, mostly from Harvard, Yale and Princeton (39 years ago the western colleges had not reached their present

standing), and it would appear that they "*took hold*" but did not "*hold on*."

The requirements of railroad service are probably more exacting than those of any other business or profession. Railroad companies expect to receive, and do get from their officers unwavering loyalty to the company's interest for 24 hours a day to the exclusion of social pleasures, family ties and everything else of a personal nature. Unless a man has the will to sacrifice every personal desire that will in any way interfere with the performance of the work he is employed on, he might as well give up the ambition to rise high in the railroad service. A year ago I spent a day on the car of a general manager. While we were at dinner he remarked that he had made his plans to have his Thanksgiving day dinner with his parents in a neighboring state. He had not been able to see them for four years and there was to be a general family reunion this year, which he was looking forward to, as it was quite an event. Soon after dinner we stopped for water and a handful of telegrams were brought in the car. As he read them a momentary flush of disappointment passed over his face and with the remark, "That's railroading," he handed me one of the messages which read:

"Sorry to spoil your plans for Thanksgiving, but must see you in Chicago Thursday morning. Important." It was signed by the vice-president. To this man discipline had become such a second nature that this, which was certainly a bitter disappointment, was simply passed over as all in a day's work. Would any lawyer, doctor, banker or manufacturer suppress his personal feelings in this way?

Again, the mathematical chances of securing a high position on a railroad are not bright. On a railroad with 40,000 employees the positions paying \$10,000 a year or more may be counted on one's fingers and toes. Until recently, too, the permanency of employment on a railroad, especially in the higher positions, was uncertain. Sudden changes of management brought with them sweeping changes in personnel. This occurs less frequently than formerly. In spite of all this, there is to certain types of character a fascination in railroad work, just as there is in seafaring, which keeps men who have once started at it in the service even in spite of the lack of personal freedom, the poor pay in the lower grades and the slim chance of reaching one of the higher positions.

There is no doubt that railroad managements appreciate the value of *educated* men and are constantly on the lookout for such, but here's where I pay my compliments to the modern college. The word "*education*" is derived from the Latin "*educare*," meaning to draw out, to expand, to enlarge. In the sense of our word this application is applied to the mental faculties. Now is it the practice of the modern American university or college to draw out, to expand, to enlarge the mental faculties of the student. I say, no. The system of elective courses by which an 18-yr. old boy, who knows about as much about his own capacity as he does about the planet Jupiter, picks out just what studies he proposes to pursue with a view to taking up some particular line of work in which he hopes to make money as soon as he graduates, is not getting an education, *it is learning a trade*. There is nothing mentally expanding or widening out in this. On the contrary it is narrowing. An Englishman once said to me, "You know, I don't understand your college men at all. They take up some specialty and are bully good men at that but when it comes to anything else, why they couldn't spell 'cat.'"

When a boy goes to college and simply studies civil engineering and on graduation accepts employment with a railroad he has in the first place narrowed his chances of promotion to one department only. The chances are that he will never rise higher than an instrument man, while if he has studied many subjects, thereby enlarging his range of vision and broadening his views generally, somebody is going to find it out and he will get opportunities of promotion in

other departments possibly better suited to him temperamentally. Our modern system of education is wrong as far as fitting men to rise in the world is concerned. It is all right to make specialists, hewers of wood and drawers of water all their lives because they have never learned to do but one thing; who will set grade stakes accurately, calculate strengths of material, make water softening tests, and do laboratory work generally.

After all is said and done the qualities which help men to succeed in life are born in them and not taught them. Self-control and self-discipline are two qualities most necessary to success in railroad work. The "Call Boy" has these driven into him from his start at 16 years of age, while the college man does not begin to learn them until he starts to make his living after graduation. Really educated men, whether self-educated or college-bred, barring the acquisition of bad habits, are pretty certain to succeed. They are indeed *rari avi*, but the possession of a college diploma is no guarantee of the possession of an education.

What with the adoration of the American girl for the college boy, newspaper head lines, the lack of real discipline (something that makes a man do things he does not want to do because it is his duty) in the colleges and in the police department of college towns where brutal rowdiness is winked at on the plea of being merely college prankishness, the average college graduate is the most egotistic, conceited person imaginable. This is an awful handicap to start life with and more often than not counterbalances the advantage of the education which even a good student may have received. If many of our colleges were as successful in filling as they are in swelling the heads of their students more college men would succeed, not only on railroads but in other walks of life. I do not believe there is any prejudice on railroads against college men except the prejudice they make individually through their conceit and lack of discipline.

Only a few days ago I had a letter from a large insurance company. In it was the statement that 85 per cent of the men in this country were dependent at 65 years of age; that they were failures. I think this holds good with college men as with others. Only a small proportion of each generation succeeds, as success is measured in this world. The others fall by the wayside whether college men or call boys.

I will add that I have been passed in my climb up the ladder more than once by "call boys," and some of them have trod on my fingers as they stepped on the rung ahead of me; but in looking the facts and my conscience squarely in the face, in every instance I recall, measured by the standards required by railroad service, I can only say, "You're a better man than I am, Gunga Din." ONE WHO HAS SEEN.

## A Plea for Changes in Time-Worn Methods

BREWSTER, OHIO.

### TO THE EDITOR:

No doubt every railroad manager has in mind plans for future development or improvement that would permit of resultant economies, but at the moment there appears the necessity for the reduction in expenses without further investment or increase of payroll, and it is thought the following suggestions may be helpful to that end. (1) The establishing and use of material standards for all departments. (2) The elimination of time-worn practice and form in the handling of correspondence, requisitions and vouchers. (3) Insistence upon the officers assigned to the various departments carrying full responsibility and liability for the duties assigned.

Possibly there are no departments at present that offer equal or greater opportunities for economies than the main-

tenance of way and of equipment. Furthermore, the universal establishing of standards of materials used in railway construction and maintenance to the same extent as are in force in the rules of train dispatching or car interchange, would permit the extensive reduction in store stock maintained and permit of economies, the magnitude of which is most overwhelming.

Standardization of practice and of materials is a lucrative field for those who are sincere in their efforts for economy. The standard practice of train operation is universal. We also see, to a degree, the advantages of standards of design exemplified in our car construction. No doubt the future will see still further application of universal standards for all departments of the railroads.

It is not beyond a possibility for the executives of the various regions to select men and give them the authority to establish standards of materials to be used in both maintenance of way and equipment. Such a plan, if followed, would eliminate many of the designs of track supplies that are various and wonderful, and result in a reduction of material stock as well as the cost of handling.

Many of the standards applied to car construction are the results of demands of business interchange; that is, the practice established the standards. However, in maintenance of way and other departments this incentive was not present and our railroads are now built and maintained largely with designs of materials that evidence the individuality of the officer in charge of the particular department, not to mention oftentimes material of various designs purchased to meet a rather limited authorized expenditure.

It is difficult to understand the necessity for the many different designs of rail section for rails of the same weight, used under like service and axle loading. Again, why should there be the many designs of angle bars, all for the same weight of rail? This also applies to the tie plates, frogs, crossings, signs and almost everything that enters into track and bridge construction. Equally so, do we find this variation in standards applying to our stationery, telephone and mechanical equipment. Conceive, if you can, the saving possible in materials, their use and supply, not to mention the advantage gained by the reduction in store stock, if it were possible to establish a limited number of standards for use in the various departments for the railroads as a whole.

We must necessarily maintain our present properties with like materials therein, until they have given us the expected life, or we are required to change them by the demands of service. But, for the future, is it not possible for the executives to agree to accept standards of maintenance of way and other departments, that should be established by the best thought possible to assign to this duty? Some of our larger railroads have created the position of engineer of standards, realizing its importance. Sooner or later, forced necessity for economy will drive us to uniform standards of materials as has been evidenced in the demands of business enforcing the car standards so necessary for interchange.

The more intensive personal application to detail by the respective officers in the various departments will be imperative, if the railroads are to show a balance on the right side of the ledger in the future. The establishment of practices as to form and method of handling much of our correspondence, has developed a condition that has been properly termed "red tape." This must be eliminated by more up-to-date methods in the handling of business, together with short cuts so as to avoid delay and complaint. Possibly next to the government the railroads are bound by form in the handling of their business from one office to another, to such an extent that promptness is an exception to the rule.

How many have given thought to the authority of the stamped signature of the superior officer, its far-reaching effect and the opportunity it gives for waste? It is not out of the ordinary to find in almost any storehouse, requisitions

for materials running into large sums of money that are covered with three or four stamped signatures of the officers superior to the one ordering and responsible for the use of the material. When one sees a requisition, voucher, pay check or the like literally covered with stamped signatures, it bespeaks an evidence of lack of confidence in the fellow handling the job for whom the material was ordered, and indicates a form of practice that does not check the expense incurred, but quite the contrary, results in delay in the passing of requisitions, together with relieving the man responsible for the request of the responsibility for its being supplied. Surely the more intensive application of personal attention to these details should result in economy and eliminate waste.

Let the respective officers carry in full the responsibility of the office assigned. If they are competent, give them the reins and eliminate the checking and rechecking of reports, requisitions and accounts, all of which, small in detail, are costly in the aggregate. Results are what should tell the story. Men like to be trusted, and generally speaking, when their interest and honor are appealed to, will respond. The attention to details, eliminating the unnecessary, is a field for endeavor that will result in a correction within ourselves of multitudinous small expenses, which, in the aggregate, will place the management among the successful.

JOHN C. SESSER,

Engineer Maintenance of Way, Wheeling & Lake Erie.

## Boiler Compounds and Anti-Foam Compounds

DANVILLE, Ill.

TO THE EDITOR:

I have read with much interest the article by C. R. Knowles on The Interior Treatment of Boiler Waters in your issue of Nov. 12, and also the editorial comment on the same subject. It appears to me that there is a possibility of confusion between those compounds which remove scale and those which prevent foaming, which confusion may work a great and unintentional hardship to the cause of treated water. This confusion is enhanced by the editorial interpretation of the article as a comparison between boiler compounds and treated water, a viewpoint which hardly seems to be justified.

In his article the author touched on four separate and distinct methods of improving water, viz., softening plants, hit-and-miss internal treatments for scale, technical internal treatments for scale, and technical internal treatments for foaming or anti-foaming compounds. The reader may be in doubt whether the author is considering primarily internal scale treatments or internal anti-foam treatments although in the use of the term "boiler compound" in the editorial, there can be no such doubt since common usage has designated the term boiler compound as one which is applied for the treatment of scale only.

Foaming is caused primarily by the character of the natural water supply. If properly handled, a water having a small percentage of sulphate salts will not foam unduly, whether treated or not. Likewise, even though properly handled, a water having a large amount of sulphate will foam, whether treated in a softener or with a scale-removing compound. In either case it will not foam so badly if an anti-foam compound is used. Indeed, it is probable that the anti-foam compound will need to be used just about as often, if not more often, with the internal scale treatment than with a properly conducted softener, since in the first case there is a great excess of mud, and in the second case a moderate excess of foaming salts. It is hardly fair to compare the cost of an anti-foam compound with the cost of softening on the basis of foaming alone, since the softener

removes scale and prevents flue leaks and the accumulation of excessive mud deposits, while if the anti-foam compound does any of these it is only by accident.

Internal treatments which are designed to prevent foaming are entirely different chemically from those which are designed to check the accumulation of scale. Anti-foaming materials are all based on the action of castor oil and its ability to increase the surface tension of the water. Theoretically it never gets below the surface of the water and therefore never comes in contact with the scale or scale-forming salts. Internal scale removers are composed of soda ash, sodium silicate, tannin, tri-sodium phosphate, barium salts, etc., none of which has any effect in increasing the surface tension and some of which act to lower it decidedly. Mixtures of the two into one compound have not proven very satisfactory and neither one can be substituted for the other.

Mr. Knowles quotes eight examples showing the benefits of internal treatment. The first four of these refer to the benefits of using anti-foaming compounds although it is not stated whether the basis of comparison was raw water, treated water, or water treated with anti-scale compounds. The use of anti-foam compounds is admitted to be good practice where water persists in foaming in spite of all that can be done and any experienced person will agree with the author in his contention that an anti-foam compound is more economical than foaming, but it is not clear just what bearing this agreement will have on the subject of boiler compounds and treating plants. It can hardly be claimed that a castor oil, anti-foam compound unsupported by any anti-scale method of treatment, is more economical than a softener when scale, leaks and foaming are all considered.

The fifth and sixth examples deal with the use of the "proper interior treatment" as against soda ash when used alone. If the soda ash under consideration was used as a boiler treatment, the argument comes under the author's heading of hit-and-miss treatment vs. technical applications, but if used in a softener it is more of an indictment of the operator since the mixing of a little lime with it would have probably improved the water. It is fairly safe to say that soda ash alone should never be used in a softener because of the unnecessary expense involved, considering the small amount of improvement to be obtained. The last two examples appear to be comparisons of the anti-scale compound with raw water since if a softener had been in service, and had been operated properly it would, of course, have removed all scale. It is doubtful if an anti-scale compound will be much, if any, superior to a softener in the prevention of foaming when neither one is backed up by an anti-foaming mixture.

The confusion of the article, it seems to me, lies in the fact that the first half deals with scale-removing treatments and most of the last half with anti-foaming treatments, without the change of subject being clearly marked. Looked at in this light, I am inclined to agree with many of Mr. Knowles' statements, but it seems to me that there is some danger of the reader obtaining the impression that the saving in the various examples was obtained by the abandonment of a softener and the substitution of an anti-foam mixture. This is so widely at variance with the general experience of those handling water softeners that it hardly appears to be tenable. It is admitted that a strict interpretation of the term boiler compound might be all-inclusive, but common usage has limited it to the action of scale removal only and the term should be used in the sense in which it will be interpreted. If there is any possibility of an impression, therefore, either in the article or its editorial interpretation, that the use of a softener entailed the expenses shown in the examples, it is well to correct such an idea in the minds of any who are hesitating between a choice of the two methods of water treatment.

W. H. HOBBS,

Water Chemist, Chicago & Eastern Illinois.

# The Care and Protection of Lumber in Storage

## Sanitary Precautions to Prevent Decay

### The Building of Piles and Protection Against Fire

By H. A. Sackett

Assistant Purchasing Agent, Chicago, Milwaukee & St. Paul

MUCH OF THE DISSATISFACTION with timber, particularly car lumber, is wrongly charged to assumed inherent weaknesses of wood in general, or certain species, where in fact carelessness in handling is responsible. The cause quite frequently is poor storage facilities, which lead to checking, warping, decay, caschardening, etc. Finished metal products and even raw material is given adequate protection against the elements and natural deteriorating influences. If similar precautions were taken with lumber, which often is a very highly finished product, not only would its use give better results but considerable waste could be stopped.

Failures that are mostly traceable to incipient or advanced decay before use are generally attributed to inferior quality of lumber. It is true that the constantly widening use of wood has resulted in the cutting of smaller timber than was the practice a generation ago, and that many mills now utilize practically every stick of timber available which naturally results in a larger volume of inferior grades. If greater care had been exercised in wood utilization in the past, which includes handling from the mill to ultimate consumption, the actual loss would probably have been reduced 30 per cent. It behooves everyone responsible for lumber stocks to practice such diligence as will minimize the deterioration and loss occasioned by careless handling in storage.

#### Storage Yard Improvements

Most roads have established concentration and storage yards for lumber and wood products. Some are admirably laid out and maintained; others resemble more a typical junk yard, selected not because of their suitability for the purpose but apparently because they happened to be in the way. The suggestions that follow are conservation measures designed to protect the very considerable investment represented by the average stock of timber and lumber carried day in and day out by the average road.

The first step is to rid the yard of all refuse, particularly odds and ends of old rotten wood, to remove all grass, weeds and vegetation of every sort. Then the site should be graded as nearly level as possible with at least six inches of cinders, gravel or slag to insure prompt seepage of such moisture as may collect from heavy rains, rapid thaws or overflow. In some localities drainage ditches, at required intervals, would greatly aid maintaining a reasonably dry yard.

#### Fungi Infections

Several years ago the United States Department of Agriculture investigated timber storage conditions throughout the country for the purpose of making available data that would assist in controlling the enormous waste due to deterioration of lumber in storage, which it found chiefly to be caused by decay, communicated from infected material to originally sound stock. To quote from the report, "There are two general methods by which wood destroying fungi spread from infected to sound lumber: (1) by a direct outgrowth of mycelium from an infected stick to adjoining or nearby timber, and (2) by the blowing about of spores produced by the

fruiting bodies or by the mycelium.

"In wholly or partially enclosed moist spaces, such as are often found in poorly ventilated lumber piles, the mycelium finds sufficient moisture in the air to allow it to develop on the surface of timbers and in this way may progress along the timber for considerable distances. Such may be the case, also, where timber is closely piled; the writer has records where severe infections have thus passed during rainy weather from the bottom upward through piles 12 to 15 ft. high. In lumber storage sheds, or in the base of close piles the mycelium of several species of fungi has frequently been observed developing in great abundance, not alone on the moist foundations and lower layers of lumber, but also spreading profusely on the soil.

"The chief purpose of spore formation in fungi just as

A Horrible Example: Pines Permitted to Grow Over Lumber Piles—Courtesy U. S. Department of Agriculture

Courtesy of U. S. Department of Agriculture

Partially Rotted Hardwood Will Infect the Adjoining Stock by Contact

in seed formation in ordinary green plants, is a perpetuation of the species through reproduction. Spores serve the two-fold purpose of tiding the fungus over unfavorable periods and allowing their rapid spread under favorable growth conditions. Nature is lavish in her methods and the number of spores produced is often enormous. For instance, Buller computed from partial counts that each pore of the underside of *Polyporus squamosus* produced in the course of a few hours an average of 1,700,000 spores, or a total of over eleven billion for the entire under surface of a fruit body having an area of 250 square centimeters (38.75 sq. in.)."

A lumber yard should be systemized, and arranged as carefully as a store house, where castings of various types

\*See Bulletin 510 United States Department of Agriculture.

and sizes, nails, screws, bolts, nuts, etc., are placed each in its designated bin, drawer or shelf. Lumber should be piled according to size, first by cross-section and then by length. Each species should be separated, and each class of material be assigned a section of the yard. Maintenance of way material should be in one group, including bridge timbers, switch ties, bridge ties, piling, rough lumber, etc., car lumber in another group, and so on. Finished and kiln-dried stock should always be stored under cover in sheds with at least three sides as protection against driving rains and snow as well as intense heat. Proper ventilation is also important. Every pile of lumber should be plainly marked to indicate contents and purpose for which it is to be used. Such identification cards can be arranged to act as a stock record upon which withdrawals and additions can be noted, thus giving a clear record of stock on hand at all times. This suggests that a special lumber storekeeper may be required. And when the value represented by an average railroad lumber yard is considered, what objection can be offered to this suggestion? If the issuance of lumber and its maintenance in proper condition during storage were given as much attention as is devoted to practically all other materials used on a railroad, many thousands of dollars now dwindling away in small leaks of waste and deterioration could be saved.

The site for a lumber storage yard should be carefully chosen. Low ground or "made land" should be avoided. It is practically impossible to keep such a yard reasonably dry and free from collecting bogs and pools of water, and in localities where overflow is to be expected standing water may reach to the pile bottoms, or even beyond, for weeks at a time.

Another desirable feature is reduction of the communicable

and automatically unloaded onto the pile. In addition there should be narrow gage tracks for small lumber trucks on which the stock when issued is moved from the pile to the shop. When transhipped to some other point on the system it can again be loaded directly on the work cars which, without rehandling the lumber, are switched to the work train. In the alleys and at required intervals between piles, at right angles to the main tracks narrow gage tracks should be laid for the lumber trucks. Wherever possible the grade of the yard should be in one direction so that the loaded lumber trucks, which are usually moved by manual labor, will have the aid of gravity when being moved with loads toward the shop.

An arrangement as outlined would permit the use of locomotive cranes for handling timbers, and gasoline or electric motors for hauling the lumber trucks. In fact, careful plan-

*Courtesy of U. S. Department of Agriculture*

#### Badly Infected Pile of Three-Inch Hard Pine

ning of a new lumber yard will so reduce the amount of manual labor required that the cost of handling can be more than cut in two, which will not only pay for the extra mechanical equipment needed, but will solve the problem presented by a scarcity or poor quality of labor.

Spacing of stock piles and proper clearance for tracks are details that must be adapted to the conditions that are individual to the yard. In every case care should be taken that ample space is provided to allow for the use of either gravity, or automatic loading and unloading devices, as well as the handling of lumber and timber by manual labor.

#### Foundations for Lumber Piles

Whether the yard is old or new there can be but one suggestion for bearings; they must conform to modern sanitary requirements. The ideal foundation for lumber piles consists of concrete piers and creosoted timber sills. The tops of the piers should be at least 18 in. above the ground and the treated bearing sills about 6 in. by 8 in. in sections. Another less permanent type of bearing is shown in one of the illustrations. This may be built of salvaged timber providing it is absolutely sound, and after framing should be treated with at least two coats of heated creosote oil. Where better methods of treatment are available these should be used but in any event some such protection must be given all lumber used in pile foundations. This bearing consists of ground pieces *A* which may be plank 2 in. to 3 in. thick, from 6 in. to 12 in. wide and about 2 ft. in length; risers *B* which should be at least 6 in. in height, or more as required, and may be of one piece or several as is most convenient; bearing *C* which may be made of almost any available ma-

#### Fruiting Body of Fungus Growing on Hardwood Lumber in Position to Spread Infection to Sound Stock Above

fire hazard by isolating the yard as much as practicable from other industries or localities where such a condition may be expected to develop within the immediate future.

High ground is unquestionably an ideal location, not only because this provides the best drainage, but also because a better circulation of air is obtained which aids seasoning and will keep lumber in better condition.

#### Trackage

The service tracks should be so laid out that handling is reduced to a minimum. The yard should be platted in blocks, each block facing standard gage tracks on which lumber is delivered in the original cars direct from the mills

terial but should not be less than 4 in. by 6 in. in section, and should rest on at least three foundations. Almost any sound lumber may be used, but it must be preserved with creosote.

Numerous types of bearings can be made suitable. The important point with each, however, is that it must itself be proof against infection by decay if it is to prevent the communication of such infection to the lumber piled upon it. It

*Courtesy of U. S. Department of Agriculture*

**Method of Piling Timbers. Showing Stripping and Overlapping of Ends**

must, of course, also be of sufficient strength and rigidity to carry the required load without sagging, and to provide the proper pitch to the pile so that it will freely shed water, and resist wind pressures. The slope of all lumber piles should be in one direction, preferably towards the "face" side of the alley.

The piling strips should be sound lumber and such as

*Courtesy of U. S. Department of Agriculture*

**Concrete Foundation Piers and Timber Sills**

are used for timber and rough lumber should be creosoted. Piling strips should never be allowed to accumulate between lumber piles or in the alleys. Likewise, damaged sticks or waste lumber should be removed immediately and disposed of; otherwise the best planned yard will fail to meet the chief requirement, i. e., maximum sanitation.

Properly built sheds with ample room to allow for the necessary working space should always be provided for kiln-

dried stock such as car siding, car lining, car roofing, car flooring, building siding, ceiling and flooring, dry poplar, ash, mahogany and quartered oak. The shed foundation should be either of concrete or creosoted timber, substantial and so constructed as to keep the lumber well off the ground. The roof must be tight and the siding should not run down below the bottom of the foundation sills or bearing pieces so that a free circulation of air is permitted from all sides beneath the enclosure. If fungus outbreaks occur in the shed the soil and timber immediately adjoining the infected area should be sprayed or painted with an antiseptic solution of a water soluble salt like sodium fluoride, mercuric chloride, zinc chloride or copper sulphate.

### Method of Piling

In the piling of all lumber, care must be used to have the piles substantially constructed to prevent them from falling apart or being blown over by wind storms. The sides or edges of the piles should be straight and parallel, both horizontally and vertically. Piles of boards and 2 in. plank should not be built wider than the length of the lumber in the pile, and in no case should the width of the pile exceed

*Courtesy of U. S. Department of Agriculture*

**Ideal Storage Shed. Built on Concrete Piers and Set High Off the Ground for Ventilation**

16 ft. Plank over 2 in. in thickness and all timbers should be piled in narrow piles from 6 ft. to 10 ft. wide, although piles of the same kind of material may be placed upon the same bearings closely adjoining each other. This arrangement permits the complete removal of a pile without waiting to exhaust the entire stock of one size and provides space for piling receipts of new stock without piling it on older or seasoned lumber.

In piling dressed boards and kiln-dried 2-in. plank in sheds it is permissible to strip only between each five layers. In piling out of doors similar material which has not been kiln-dried, as well as all heavier lumber, strips must be used under each layer in all cases.

In piling 1-in. and 2-in. lumber, pieces of the stock itself should be used for piling strips, but in larger sizes strips 1 in. thick and not over 1 in. wide should be used over each bearing, except the one strip on the face of the pile, which should be 1 in. thick and 2 in. wide.

The piling strips should be no longer than the width of the pile. No strips should be allowed to run through from one pile to another. One piling strip should be used over each bearing piece upon which the lumber rests and should be placed directly over the bearing piece or the strip previously applied. The edge of the strips used on the front

of the pile should be allowed to project over the ends of the lumber upon which it rests at least  $\frac{1}{8}$  in. This will act as a drip cap and assist in preventing the ends of the lumber from checking or splitting. The ends of each course of lumber applied to the pile should be brought flush with the edge of the piling strip at the front of the pile. By following this method the pile will have a forward pitch of about  $1\frac{1}{2}$  in. per ft., which together with the slope of the pile, will prevent the accumulation of moisture from rains or snows.

Except where piled in a shed all lumber should be separated in the layers so that a space of approximately  $\frac{3}{4}$  in. is left between pieces to allow of free circulation of air on all four sides of the pieces. This permits of rapid and thorough drying of the lumber and prevents sap staining and rot. Lumber so piled may be allowed to remain in stock for a long period without damage. This space may be easily regulated by instructing the workmen to allow the width of a finger between the edges of pieces.

All boards and planks dressed on one side which are stored out of doors, should be piled with the dressed side down. When similar lumber is rough on all sides the side of the piece nearest the heart of the log should be down. This will retard checking of the lumber and opening of shakes in the course of seasoning.

In piling lumber 2 in. and under and of miscellaneous lengths the entire pile should be of the length from front to rear of the longest piece of material in the pile. Thus, if 1-in. lumber 8 ft. to 16 ft. in length is being included in the same pile that pile should be 16 ft. long and should

All piles of 1-in. boards, poplar and hardwoods of all thicknesses, dressed car flooring and 2-in. plank not under roof should be protected from sun and rain by a covering of rough boards laid in two courses with the cracks in the lower courses lapped by the boards in the upper course. This cover should be laid on strips so that it will be about 6 in. above the top of the pile at the front and 2 in. at the rear. Care should be used to have this cover always in place when the pile is not being worked.

In removing lumber from piles in the yard, that which has been on hand for the greatest length of time should invariably be taken first. Lumber should always be taken

Lumber Bearing Built of Sound Salvaged Material

from the top of the pile and in no case should workmen be allowed to break into the side of the pile to avoid the effort of going to the top and removing and replacing the cover.

### Fire Protection

Adequate protection against fire is merely common sense. In addition to keeping the yard clean of accumulation of debris, which provides the greatest fire hazard, water should be always and everywhere available. New yards should always be equipped with high pressure water mains, hydrants and sufficient hose so that practically every foot of the yard can be immediately flooded. In addition to keeping this equipment in perfect working order the workmen in the yard should receive thorough training in its use by fire drills which are ordered by the regular fire alarm, previously unannounced.

Where such apparatus is not available water barrels should be distributed throughout the yard at convenient points and strategically disposed so as to be most effective in an emergency. A fire pail should be kept at each barrel and additional pails, ready for instant use, at suitable points. It is obvious that the barrels must be kept full of water, and that they must be inspected frequently. The water in the barrels can be kept from becoming stagnant or from freezing by dissolving in each barrel from 100 lb. to 150 lb. of calcium chloride (common salt). Barrels should be kept covered with well fitting but readily removable covers to prevent excessive evaporation of the water. The most suitable barrels for this purpose are those in which creosote oil is shipped. Tarring the tops will keep the salt from creeping. Barrels should be painted a bright red as identification.

All of these precautionary measures are summed up in the old and well worn but, alas, only too little applied adage, "a stitch in time saves nine." Not alone does the proper handling and protection of lumber before utilization provide real, tangible economy; it is likewise effective conservation which from the standpoint of the greatest good to the largest number is far more important than individual profit. The workmen who must carry out these details is as much profited as the employer who may derive the immediate benefit, because every stick wasted decreases the available supply just that much, which means greater scarcity and higher prices; and high priced lumber always touches every pocket.

Courtesy of U. S. Department of Agriculture

### Conditions Caused by Failure of Decayed Foundations, Creating Fire Hazard and Waste

be even at both ends. This is accomplished by bringing the ends of the shorter lengths alternately to the front and the rear of the pile.

By this method a ragged appearance of the rear of the pile is avoided and there is no waste due to warping and checking of the ends of the longer pieces projecting unprotected from the rear of the pile.

If the quantity of such stock will warrant having two or more piles it would be desirable to pile the 14-ft. and 16-ft. lengths together and the 8-ft., 10-ft. and 12-ft. lengths together.

All rectangular sizes 5 in. in thickness or over, whether rough or dressed, should be piled on edge. This includes car sills, car framing, guard rails, caps, stringers, bridge and switch ties, heavy joints, etc.

# More About Ford's Railroad Operating Methods

## Difficult to Check Flivver King's Claims Because of His Not Filing Statistics

By Harold F. Lane

WASHINGTON, D. C.

HENRY FORD is still revolutionizing the railroads, on paper, but as he is much more fond of reporting his achievements and his rosy predictions for the future to the reporters of the Hearst and other papers of that type than of filing his own reports with the Interstate Commerce Commission, it is becoming somewhat difficult to check up his statements by which he demonstrates the inefficiency of the other roads. In his latest exposition of the virtues of the Ford principles, in an interview distributed by the International News Service on December 3, Mr. Ford says that freight is now moving over the Detroit, Toledo & Ironton at the rate of 45 miles per day and that when he has finished doing things that are now under way freight will be moving over his road at the rate of at least 200 miles a day. His latest report to the Interstate Commerce Commission, that for the month of August, showed an average movement per freight car per day on the Detroit, Toledo & Ironton of only 20.7 miles, as compared with an average for the railroads of the country of 22.7, so we are left in some doubt as to whether he has effected this great improvement in such a short time or whether he is as careless in using his own figures as he is regarding those of the roads generally. To emphasize his point he gives the railroads generally credit for only 20 miles per car per day, whereas the average for the first nine months of this year, which, because of the light traffic was low, was 21.9 miles and for September it was 23.8 miles.

### The Matter of Car Miles Per Day

Mr. Ford says that when he bought the D., T. & I. its cars were making only 19 miles a day, but he omits to say that for the month of March, in which he took over the actual management of the road, the average was 27.8 and that there was a steady decrease up to and including August, the latest month for which the D., T. & I. has reported, to 20.7 miles. This was slightly less than its average for the corresponding month of 1920. Of course, as was pointed out by Walker D. Hines in his article in *The Nation's Business*, the average of miles per car per day is by no means conclusive of the speed obtained in the movement of cars actually handling traffic, because the average is based on all the cars which happen to be on the railroad at the time, whether they are moving in trains or waiting to be loaded, unloaded or switched, and include also the surplus cars. The average freight train speed for the railroads as a whole for the first nine months of 1921, according to the Interstate Commerce Commission reports, was 11.6 miles per hour. If the D., T. & I. has made such a large increase in its average car mileage as Mr. Ford says, it is very likely due to an increased demand for automobile parts which gave more cars something to move for, but here again we find that, in his efforts to reduce book-keeping, Mr. Ford is omitting to make the usual reports of car surpluses, shortages, loading, etc., to the American Railway Association, and thereby declining to place his figures in comparison with those of other roads.

To the extent to which increases in the car mileage per day do reflect increased efficiency, it would be very interesting if Mr. Ford would tell some of the reporters who trail him about some of the operating methods which result from what is vaguely described as the "Ford principles" or the application of "common-sense" methods. Unfortunately the only method we have heard of that he has actually applied

for the purpose of speeding up cars and avoiding delays has been his plan of requiring, as a shipper of freight in train-loads, that the connections of the D., T. & I. take the traffic off its tracks within 20 minutes or let some other road have it. What happens after that, as Mr. Hines says, is not his problem but theirs, and it is obvious that the same special service cannot be given for every car of freight.

Mr. Ford says that red tape is responsible for a good deal of "this slowness," by which term he describes the difference between an average car movement of 23 miles per day and a train speed of 11.6 miles per hour, but he refrains from telling us how he has avoided or untangled the red tape.

### Alloy Steel Cars

"The excessive weight of the train," he says, "is responsible for some more," and he much prefers to enlarge upon that factor, possibly because it offers greater opportunity for his expansive imagination. However, he is becoming more conservative on this point as he goes along. A while ago Mr. Ford told the world that a freight train is "several times the weight of the load it carries." He has now toned this down to what is more in accordance with the facts, that the weight of the average freight car is almost equal to the load it carries. That this is so is generally the fault of the load which the shipper puts in the car, but in predicting an average car movement of 200 miles a day, Mr. Ford says he is preparing to build cars in which two-thirds of the weight will be sacrificed without sacrificing any of the car capacity by using alloy steel. This car, he says, can be built as cheaply as present cars because although the steel costs more, only one-third as much will be used.

While awaiting with great interest the advent of the flivver freight car, which by the way has not made its appearance, except in print, in the nine months since Mr. Ford became a railroad president, we have also had time to wonder how, when it does arrive, it will revolutionize railroading unless Mr. Ford will also solve the problem of keeping the new cars fully loaded and in movement all day. The present freight car is quite capable of more than 200 miles a day at the present average rate of speed, but even "multiplying the carrying capacity of the railroads by 10 without increasing the equipment and without additional cost" will hardly solve the problem. The average freight car does not move 200 miles every day without hitting a terminal of some kind where more or less delay is encountered before it can again be started in the right direction and most of the time the roads have excessive car capacity which does not move at all. Railroad officers are constantly working to try to minimize the inevitable delays and if Mr. Ford would offer some constructive suggestions as to how this problem could be met, or even as to how he claims to have solved it for himself, beyond such broad statements as "keep the cars moving," they would listen to him with more respect when he attempts to make newspaper readers "realize how inefficiently our railroads are run" by inaccurately comparing what they do with what he could do if he tried or what he says he is going to do.

Mr. Ford also expects to reduce by 75 per cent the amount of coal burned by locomotives and says he has made such changes on one of the old D., T. & I. engines as to reduce the fuel used by 50 per cent. He also is making experiments

to see if he can't burn the coal in the mines and thereby obtain benzol with which to do away entirely with the coal-burning locomotive, claiming that he has already made an engine run 70 miles an hour on that fuel on his railroad. Various devices are advertised for which it is claimed that they will effect nearly as great an improvement in the performance of a brand-new Ford engine but we do not understand that they have yet revolutionized Mr. Ford's business.

### We Must Not Take Mr. Ford Too Seriously

It is well not to take Mr. Ford too seriously, although his habit of spilling his loose thoughts for the benefit of the reporters on every possible occasion undoubtedly spreads much misinformation on important subjects among people who do take it seriously. Even when his lighter freight car is brought out and a trial run is given with great publicity to demonstrate that it can travel faster than 20 miles a day or carry a given load with complete success, it will still take several years to ascertain its possibilities under the strain of actual service, such as its cost of maintenance and its life. It may take as long as it took Mr. Ford to equip his car with such newfangled contraptions as self-starters and electric lighting. It may be noted that almost as many people have what they consider practical suggestions for the improvement of the Ford car as have ideas as to how the railroads ought to be run, yet Mr. Ford does not allow himself to be seriously disturbed by them even when others put them into practice.

Ford says he does not believe the railroads of America "can be properly run except under government ownership," and the reporter says he expressed pain when requested to boast to the extent of saying whether he could run all the railroads, but he finally overcame his modesty sufficiently to say that if all the railroads of the United States were under his control, "I could run them all as easily as my own." He would "send word to the D., T. & I. gang to extend their principles to all other lines," but he also expressed the belief that even under private ownership American railroads will soon follow his example and cut down the weight of their cars two-thirds.

### Railroad Millennium Possibly Not So Far Off

Perhaps the railroad millennium which Mr. Ford pictures is not so far off as it appears. One of his reasons for desiring government ownership is that "nobody should get a cent of railroad income except those who work on the roads and earn it." Our experiment in government operation during the war was restricted in some ways but it came very near to realizing this ideal. If our present hopes of an improvement are not realized (and government regulation is not meanwhile extended to the prices and profits of the flivver industry) it may yet become possible for Mr. Ford to buy the roads at a bargain, as he did the D., T. & I. and thereby have an opportunity to work out the Ford principles on a broader scale without the necessity for government ownership.

### Opposes Repeal of Rate Law

WASHINGTON, D. C.

THE CHAMBER OF COMMERCE of the United States is preparing to oppose vigorously any movement that may be made in the present session of Congress to repeal provisions of the Transportation Act which authorize the Interstate Commerce Commission to make rates to provide adequate revenue for the railroads and to regulate intrastate rates where necessary to prevent discrimination. The position of the national chamber is that these provisions of the act should not be repealed until they have had a fair test. In a communication sent to the constituents of the chamber, Joseph H. Defrees, president, said that the pass-

age of such legislation as the Capper or Nicholson bills would be "a long step backward." According to Mr. Defrees, "enactment of the proposed legislation would repeal those sections of the Transportation Act by which the Interstate Commerce Commission is directed to establish rates that are reasonably adequate to the railways and just to the public. The railroad committee and the officers of the national chamber are firm and fixed in the opinion that these proposed laws would be extremely injurious to the railways and detrimental to the public good."

President Defrees points out that the rate-making provisions of the act give no guaranty whatever to the railroads. "Statements to the contrary are misrepresentation," he says. "If rates even under the most honest, efficient and economical management do not yield the return specified in the act, the amount of the shortage is lost to the railroads. Not a cent is payable to the carriers from the federal treasury, and the deficit cannot be made up from rates subsequently established."

"If the Interstate Commerce Commission is deprived of all authority to regulate intrastate rates as proposed in the Capper bill, rate regulation will return to the chaotic condition which existed for many years because of the conflict of authority between the Interstate Commerce Commission and the 48 state commissions."

"To repeal the two vital provisions of the Transportation Act which are now attacked is to overthrow the system of rate-making which the Interstate Commerce Commission has developed after long study and out of wide experience. It is the opinion of some able lawyers who testified at the hearings that the proposed bills would take from the Interstate Commerce Commission any power to prevent discrimination by the states against interstate traffic. Experience and wisdom have shown the necessity of the interstate rate being paramount and of a yielding of the state rate when it discriminates against the interstate rate. The letter of the proposed statute and the spirit of it seem to make the state right paramount and to force the adjustment of interstate rates to the rates which may be made by the state commissions of all the states, and it is at least highly probable that this result will be accomplished if the pending bills are enacted into law."

"The Constitution of the United States has always recognized the paramount importance of national control of commerce between the states. The repeal of those provisions of the Transportation Act which assert federal authority over state rates would in effect limit national control over interstate commerce in every instance where state regulations conflict with interstate regulations."

President Defrees' communication calls attention to the fact that "the railways are now in a depleted condition and that there is need for the expenditure of millions of dollars for proper maintenance and equipment. The country is growing in population; and there is need and there will be constantly growing need for an expansion of the railways. This need for expansion can be met only if they can market their securities. If the railways can receive no adequate return it is at once obvious that they cannot market their securities. The corollary follows that they will fall into a dilapidated condition and their facilities will be insufficient to supply the public needs. Not only would this be a disaster to the railroads as business enterprises, it would be a calamity affecting in a most serious way every shipper and every consumer. This condition would beyond doubt tend inevitably in the direction of government ownership."

THE PROVINCE OF QUEBEC grants for agricultural purposes about \$1,000,000 yearly, and has spent \$5,000,000 in colonization to open up the northern districts of the province.

# Texas Attack on Transportation Act Argued

Constitutionality an Issue—Asks That I. C. C. and Labor Board Be Enjoined

WASHINGTON, D. C.

ARGUMENTS were heard by the United States Supreme Court this week on the original bill filed by the State of Texas attacking the constitutionality of the Transportation Act and asking that the Interstate Commerce Commission and the Railroad Labor Board be enjoined from enforcing it in a way to interfere with the jurisdiction of the state authorities.

## A. P. Thom Files Brief

Declaring that the only power denied the states by the Transportation Act is the power to fix interstate rates that discriminate against interstate commerce, Alfred P. Thom, general counsel of the Association of Railway Executives, in a brief filed as *amicus curiae* asks the court to sustain the constitutionality of the statute.

The Texas authorities attack the constitutionality of the sections of the act relating to the regulation of state rates, the so-called rate-making section, the sections relating to the establishment of the Railroad Labor Board; to the extension and abandonment of lines of railroad and the sections relating to pooling of freights or earnings and consolidations.

In his brief, Mr. Thom asserts that the case is not justiciable because the order issued by the Interstate Commerce Commission under the act and attacked in the proceedings "inflicts no injury," adding that it is "not fair to jurisprudence to attempt to settle great constitutional questions, like those presented here, on abstract considerations not involving definite complaints of wrongs to persons or property."

"Aside from the objections on the grounds mentioned, the bill is without equity and is based on what, we respectfully submit, is a misconception of the constitutional justification of the Transportation Act and of the lawful rights and authority of the parties," the brief says.

## A Supervisory Power Over Intrastate Rates

"The Interstate Commerce Commission was given by the act," the brief continues, "direct and primary jurisdiction to fix interstate rates, but only a supervisory power over intrastate rates to be exercised only if the states failed to establish intrastate rates which would not give preference to their own traffic over interstate traffic and would not unjustly discriminate against interstate commerce."

"The only power over state rates denied to the states by Congress was the power to establish an unjust discrimination in favor of their own traffic over interstate traffic and to require the use of the instrumentalities of interstate commerce 'in their intrastate transactions in such manner as to affect injuriously traffic which is interstate.'"

"Manifestly, interstate commerce would be injuriously affected and unjustly discriminated against if it could not use the instrumentalities used by both on terms as favorable as intrastate commerce could—if interstate commerce had to pay the bill for maintaining, up to the national standard of adequacy and efficiency, the agency which was used interchangeably by both, while the state refused to make an equitable contribution. If the standard of adequacy expressly fixed by Congress in the act must be supported out of the rates derived from both classes of traffic and the states could decline to bear their equitable proportion, either the Congressional standard must be abandoned, or the deficit caused by the refusal of the state must be made up

out of increased interstate rates—and thus, in either case, the states would effectually regulate interstate commerce. No interpretation of the act which would accomplish this result can be accepted.

"The interstate commerce act confers upon the Interstate Commerce Commission the power to judge as to this discrimination, and to remove it, if the action of the states results in such unjust discrimination."

## Removal of Unjust Discrimination

"It is equally obvious, from another standpoint, that the act must be interpreted as authorizing the removal by the Interstate Commerce Commission of any unjust discrimination, created by a state, against interstate commerce, or any portion of it, in favor of intrastate commerce, or any portion of it."

"Unjust discrimination may exist, and does exist, whenever interstate commerce is injuriously affected by the more favorable terms on which intrastate commerce is permitted to move. The more favorable terms on which intrastate commerce may move, as compared with interstate commerce, may exclude the latter from markets which each is seeking, or from producing fields on which each is depending."

"It is accordingly submitted that, from whatever standpoint the subject be viewed, the act must be interpreted, in its provisions as to state rates, as conferring upon the Interstate Commerce Commission a power, and a power only, to see that all unjust and unreasonable advantages of state over interstate commerce, and all unjust discrimination of state against interstate commerce, are removed, and that there be no substantial inequality of commercial opportunity to the prejudice of interstate commerce in the use of the instrumentalities of interstate commerce."

"It cannot be successfully asserted that the powers conferred by the act, as to interstate rates and as to unjust discrimination against interstate commerce, are not within the constitutional grant of power made to the national government by the states to regulate interstate and foreign commerce."

## The Method of Rate Making

"Nor can valid criticism be made of the method of rate-making, by groups, prescribed in the act. It is the method which was adopted and followed by the commission before the act was passed. It is the only method possible."

"It is difficult to understand why the contention should now be insistently and gravely made that if Congress undertakes to regulate or fix the intrastate rates of an interstate carrier, it is invading the reserved rights of the states and violating the tenth amendment of the Constitution."

"It cannot be denied that the power to provide for, foster and protect—all of which are involved in the power to regulate—includes the power to fix the standard of efficiency and adequacy of the means or instrumentalities for carrying on interstate commerce. That standard—the national standard—must be supported out of all the traffic, state and interstate, of the carriers. If a state disapproves of the national standard and may, by fixing state rates so low as to make an inequitable and inadequate contribution to the support of the interstate agency, it has the power to impose its standard on Congress, or to throw on interstate commerce and the commerce of other states, or on both, the burden of sustaining the national standard of efficiency and

adequacy. In either event, Congress would be denied the exercise of its constitutional authority, and the state, not the nation, would be supreme in the national field.

### Brief Filed By Texas Authorities

The bill filed by the Texas authorities says in part:

Complainant avers that the Railroad Labor Board and the Interstate Commerce Commission, without power or authority, constitutional or otherwise, are each exercising functions, powers and authority attempted to be given to each of them respectively by act of Congress in the "Transportation Act of 1920" and are making findings, entering orders, and attempting to enforce its provisions in accordance with said act and several sections herein referred to, and are claiming and intend to exercise power and authority under said act and said several sections thereof.

#### Labor Board

That the acts of the Railroad Labor Board in fixing wages, salaries, establishing working conditions, practices and regulations of the various employees of the railroads of the United States and of the state of Texas have caused an enormous increase in the amount of railroad operating expense; and that its orders in force and effect at the present time have resulted in unnecessary, unreasonable and unjust wage to many of the employees of the said railroads within the state of Texas; that such salaries and wages are out of proportion to wages paid for like services in other and similar positions and employment, paid and received by the people of the state of Texas, and is an unjust and unreasonable demand upon the railroads of the state of Texas resulting in the necessity for and an increased operating income; and complainant further avers that by reason of such unjust, unreasonable wages, salaries, working conditions, practices and regulations, the Interstate Commerce Commission acting under the pretended authority of the Transportation Act in order to create and obtain for the railroads of the state of Texas an operating income pursuant to the Act of Congress of 1920 above alleged, and sufficient to pay the wage scale and carry out the practices and regulations so fixed and maintained by said Labor Board, has fixed fares and charges for the transportation of passengers and freight which are unjust and unreasonable. All of which causes and has caused a great loss to the producers and shippers of the state of Texas, a great diminution of freight and passenger traffic to the railroads of the state of Texas and has caused and is causing a great financial loss to the people of the state of Texas, producers, shippers and carriers alike in violation of the constitutional right particularly guaranteed to them by the fifth and fourteenth amendments of the Constitution of the United States.

#### Certificates of Convenience and Necessity

That the Interstate Commerce Commission has granted certificates of convenience and necessity to railroads within the state of Texas authorizing and directing them to cease operation of trains and to dismantle their railroads and dispose of their physical property contrary to the Constitution and laws of the state of Texas, and in disregard of their contract obligations with the people of the state of Texas, and particularly of the vicinities through which such railroads pass. That the Interstate Commerce Commission has refused to grant certificates of convenience and necessity and to permit railroads within the state of Texas to advertise and charge fares and freight rates and to receive passengers and freight from connecting carriers and transport same in accordance with the laws of the state of Texas, and has refused to permit the construction of railways within the state of Texas by persons and corporations who have complied with the Constitution and laws of the state regulating the chartering, organization, construction and maintenance of railways wholly within the state of Texas. That the Interstate Commerce Commission is exercising the powers attempted to be granted in the Transportation Act to supervise and regulate the issuance of bonds, certificates and other securities by the railroads of the state of Texas when so issued in accordance with the Constitution and laws of the state of Texas regulating the issuance of bonds, certificates and securities; that thereby the railroads of Texas and the people of Texas are compelled to submit to the demands and conform to the rules and regulations of the Interstate Commerce Commission at an unnecessary expense and great inconvenience resulting in the loss of property and in the taking of their property without due process of law contrary to their right guaranteed under the Constitution of the United States.

And that the Interstate Commerce Commission is making rates, charges, fares, issuing orders, regulations and schedules

and establishing practices requiring and compelling the railroads of the state of Texas to comply and conform thereto; and that the said Interstate Commerce Commission has issued an order placing the state of Texas in what is designated as the "Western Freight Group" and has and will continue to require the railroad companies of the state of Texas to charge and control fares, rates and charges contrary to the statutes of the state of Texas and its Constitution and valid contracts of said railroad companies, all of which acts, orders, rules and regulations are contrary to the statutes and Constitution of the state of Texas and the United States, and as heretofore alleged, the railroads of Texas are now and will be called upon to pay more than their just share upon property within the state to supply the operating income demanded by the railroads of the United States; that said Interstate Commerce Commission intends and will whenever it deems it necessary and desirable, authorize the creation and operation of trusts, combinations and monopolies among railroads in Texas without regard for the Constitution and statutes of Texas relative thereto, and thereby the people of the state will be deprived of their right to have competing carriers and freight competition; that the state of Texas in its sovereign capacity is being sued and has been and will be sued and made a party to suits involving the rights, powers, privileges, sovereignty and property of said state before the Interstate Commerce Commission of the United States contrary to the Constitution as herein alleged.

#### State Sovereignty

Complainant further alleges that great and grievous injury and damage is resulting to it and its citizens by reason of the enactment of the act of Congress known as "The Transportation Act of 1920"; that it is shorn of large powers of sovereignty, viz.: legislative, executive and judicial powers reserved to it by the Constitution of the United States, and it is deprived of privileges and immunities guaranteed to it as a sovereign under the Constitution of the United States, and that citizens situated in the boundaries of Texas and that its citizens and railroads are unauthorized to do and prohibited from doing acts and things otherwise legal and lawful except for the provisions of said act and the acts of the defendant herein.

Forasmuch, therefore, as complainant is without adequate remedy at law and its only protection in the premises must arise from the powers of this Honorable Court, in the exercise of its original jurisdiction, the state of Texas respectfully prays that there be granted a writ of subpoena issuing out of this Honorable Court to be directed to the Interstate Commerce Commission by service upon its chairman, Edgar E. Clark, to the Railroad Labor Board by service upon its chairman, R. M. Barton, the defendants herein named, demanding them and requiring them and each of them to appear and answer thereto, but not under oath, answer under oath being expressly waived; and that the so-called Transportation Act of 1920, and particularly Sections 300 to 316, inclusive, 402 to 407, 416 and 418, 402, sub-divisions 18 to 22, 407, subdivisions 1 to 8, 422, subdivisions 1 to 18, 439, subdivisions 1 to 11, be declared invalid, unconstitutional and void; and that the defendants named herein and constituted bodies corporate be declared and adjudged illegal and without statutory or constitutional authority; and that any and all laws or parts of laws, directing, empowering, regulating the creation, appointment, qualification and terms of service and granting authority to defendants named and the several members thereof be declared invalid, unconstitutional and void and the acts, orders and all things authorized to be done or performed by defendants be declared void, invalid and of no force and effect and without force of law, or if any part of said Transportation Act of 1920 be held to be constitutional, the remaining sections and portions thereof and all other laws in aid thereof be declared invalid, unconstitutional and void; and that the defendants and each of them be enjoined and restrained from enforcing all or such invalid and unconstitutional portions of the laws herein complained of in the state of Texas in such a manner as to interfere with the regulation of internal affairs of the complainant and the enforcement of its Constitution and its constitutional and valid laws, regulations and contracts, and the constitutional rights of its citizens, and that complainant may have such other and further relief as to this court may seem just and equitable in the premises.

#### The Wisconsin Case

The Wisconsin case was also reargued in the Supreme Court this week. The case was originally heard last spring but the court called for a reargument after the inauguration of Chief Justice Taft.

General View of the Plant and Yards During Construction

## Norfolk & Western Goes to Treated Cross Ties

New Wood Preserving Plant Built by This Road at East Radford, Va., Contains Many Advanced Features

EACH YEAR sees an increase in the use of treated timber and, in particular, of treated ties. The Norfolk & Western is one of the large railroads that has recently made a study of wood preservation and the result of its investigation is evidenced most clearly by the construction of a thoroughly modern treating plant and facilities at East Radford, Va. Heretofore this road had used no treated ties and for the present it will continue to use untreated white oak ties in its heavy traffic tracks, although about 70 per cent of its tie requirements will be met with treated ties. Outstanding among the many interesting features of the plant are its capacity of 1,500,000 ties annually; its

line. It is about centrally located on the system. The area selected lies between the present railroad tracks and the bank of the New river and comprises about 50 acres of sloping land that required considerable grading after which it was covered with a six-inch layer of cinders. The plant facilities consist of a power plant, retort house with treating and storage tanks, etc., a laboratory and office building, an adzing and boring house, a pumping station, a large storage yard and a full layout of standard and narrow gage tracks, living quarters for employees and other miscellaneous buildings and equipment.

It is the intention of the Norfolk & Western to season all

General Layout of the Treating Plant and Yard

adaptability for utilizing four different methods of treatment, if necessary; the method of handling all preservatives by air; and the duplication of all units to give flexibility and independence.

The chief tie wood which the Norfolk & Western will use is red oak, easily procurable in quantities in the territory served by that road but principally on its Bristol line. This formed one of the main reasons for locating the plant at East Radford, the others being the advantages of a central location and the acquisition of a tract of land suitable for the purpose. East Radford is on the Bristol line about two miles south of Walton, the junction of that branch with the main

ties for a period of approximately one year, after which they will be treated and shipped out immediately, no storage for treated timber having been provided except in a very small degree. The plant as a unit has been laid out to correspond with this method of handling, the area upon which it is located being divided roughly into two longitudinal sections as is shown in the plan. The buildings, the 36-in. narrow gage tracks, the loading tracks and the loading docks have been located in the section nearest to the railway tracks. Another factor which influenced the design of the layout was the desire to separate the standard and narrow gage tracks so as to avoid any conflicting movements and to provide a meas-

ure of independence in operating over the two trackage systems.

In following out this plan, the tracks were laid alternately standard and narrow gage at intervals of 60 ft., with four lines of each serving the storage yard proper. In other words there is a standard gage track every 120 ft. across the yard. A ladder at one end connects all standard gage yard tracks while a narrow gage track running diagonally across at about the center of the yard provides for the moving of the trams to the adzing and boring house. In addition to this trackage, there is a complete system of narrow gage tracks leading to the various buildings mentioned as well as to the loading tracks and the loading docks, the latter being served also by standard gage tracks.

The tie piles have been arranged not only to give accessibility, both in stacking and in the loading of the trams, but likewise to provide adequate ventilation for seasoning and fire protection. Each pile is five ties long, perpendicular to the center line of the tracks with an alleyway  $3\frac{1}{2}$  ft. to 4 ft. wide separating it from the one adjoining. Every sixth pile has been omitted, thus forming a roadway across the yard approximately 17 ft. wide. As one of the measures for protection against fire a 100-ft. opening was left at about the center of the yard across its full width. The ties are generally delivered in box cars from which they are unloaded by hand, although the piling is handled by locomotive cranes equipped with 40-ft. booms.

The tie yard equipment at present consists of 128 extra heavy tram cars, a 20-ton steam dinky, one locomotive crane and two Angier tie loaders for use with the treated ties. All main track ties are adzed and bored before treatment. In connection with and in view of the increase in the amount of heavy rail on the Norfolk & Western, that road has adopted a larger tie plate with a 1 to 20 cant and measuring 7 in. by 11 in. in area by  $\frac{3}{4}$  in. thick in place of the old flat 6 in. by  $9\frac{1}{2}$  in. plate. The equipment for adzing and boring is housed in a well-lighted structure, is electrically driven and has a capacity of about 300 ties per hour.

Ties are brought in on trams operating on a high level track and are unloaded onto a conveyor leading to the machine, which, after the work is completed, discharges them onto trams on the opposite side. The outbound track is at a lower level than the inbound and is connected to it by a loop line running around the rear of the building. The movement of the empty trams is by gravity. The trams containing the adzed and bored ties are then made up in strings of 16, each containing from 40 to 45 ties, and moved to the retorts.

One of the most important features of the plant is that it

is possible to use any one of four preservative treatments and to switch over to any one of them with practically no disturbance to the regular routine, these treatments being the straight creosote, the Rueping or empty cell process, the Card or the zinc chloride and creosote process and the straight zinc chloride treatment.

The plant and facilities for treating are housed practically in one building having concrete foundations and floor with a steel superstructure covered with corrugated sheet iron. The treating retorts, of which there are two, measuring 7 ft. in diameter and 140 ft. long, are situated along one side of the building and have superimposed on them a third tank of lesser dimensions and 35,000 gal. capacity for use with the

The Interior of the Retort House Is Clean and Well Lighted

Rueping process. Centrally located in the retort house and closely adjacent to the treating cylinders are two vertical pressure tanks equipped with various measuring gages to determine the rate of absorption and other factors. At one end two working tanks, each of 55,000 gal. capacity, are located in an elevated position and feed the retorts by gravity. These tanks are equipped with heating coils and measuring and temperature gages. They are also piped for use with the Card process and are equipped with a perforated air line to agitate the solution.

At right angles to the line of the retorts and on the opposite side of the building is an underground tank of 30,000 gal. capacity in a covered concrete pit partly within and partly without the building. This tank is utilized for un-

Showing the Full Complement of Equipment in the Retort House

loading oil direct from cars, after which it is blown up into two storage tanks outside; and also for receiving the oil dropped from the retorts when the treatment is completed. In the latter case the oil is blown back up into the two working tanks mentioned. Additional facilities for the storage of oil or zinc chloride solution consist of two 200,000 gal. covered tanks fitted with steam coils and water seal protection and a 20,000-gal. concrete tank for zinc chloride.

The space provided for the installation of the three air

Constructing the Concrete Cribbing Along the Loading Dock

compressors and two vacuum pumps is large and affords plenty of room in and around all parts of the machinery. The piping arrangement is equally openly laid out and is further simplified by giving each line a distinctive color. The air, water and oil pipes are respectively white, brown and black in color while the steam lines are asbestos covered. The air equipment consists of one compressor delivering 1,000 cu. ft. per min. at 100 lb. pressure and two delivering 300 cu. ft. per min. each at 200 lb. pressure, corresponding to the requirements of the various processes. The vacuum pumps maintain a vacuum of from 24 in. to 25 in. which, at the elevation of 1,800 ft. at East Radford, corresponds to about 26 in. at other and more nearly sea level installations. These units work independently of each other and may be used in connection with either treating cylinder, thus rendering the handling of the processes in each of the retorts a separate and independent proceeding. The same pressure that is

tunnel. The building is of brick and concrete fire-proof construction and is divided into two sections. At the present time the boiler room contains three 300 h.p. horizontal return tubular boilers equipped with automatic underfeed stokers, while provision has been made for a fourth or reserve unit which will be installed when needed. Coal is delivered over a hopper track from which it is elevated and conveyed by a conveyor system to a large, overhead, parabolic, steel hopper with chutes leading to the stokers. Ashes are dropped into concrete pits beneath the boilers and from there they are picked up and elevated by the same conveyor mentioned, to an ash storage bin over the hopper track.

The engine room is equipped with two 750-kw. steam turbines direct-connected to 3-phase 60-cycle generators delivering 2,300 volts at 3,600 r.p.m. Directly under the engine room is a basement containing the condensers, and the pumping equipment for delivering water to various parts of the plant. The water system is complete and flexible in ar-

Drawing a Charge. Laboratory and Office at the Right, Storage Tanks in the Background

range. The source of supply is the New river from which the water is drawn and pumped to the power house.

The pumping plant at East Radford contains two electrically-driven centrifugal pumps, each with a capacity of 1,200 gal. per min. The requirements of the condensers are about 1,200 gal. per min., leaving an ample margin to take care of other needs. Much of the water used in the con-

Some of the Cottages Furnished the Employees of the Treating Plant

built up during treatment is used for blowing the oil through the various parts of the system.

Power is furnished by a plant built as a part of this tie-treating layout although intended to serve other and outside purposes. Steam, and electric power as well, will be delivered to the engine terminal and shops at East Radford and current alone to the block signal system and to a nearby

densers is pumped out for other purposes, the entire water system including lines to a 200,000-gal. concrete tank at the engine terminal and a 50,000-gal. tank at the treating plant. When these storage facilities are filled the excess water from the condensers is returned to the river.

The fire pumps, which are located in the basement of the power house, draw water direct from the main water line

from the river and deliver it to the yard through two 6-in. mains. Two-way hydrants are located every 300 ft. along each of these mains in covered structures or hose houses, each containing three 50-ft. reels. Additional fire protection is secured by water barrels placed at each intersection of the standard gage track and the 17 ft. roadways. A layout of fire alarms, telephones, gongs and watchmen is contemplated to round out the system of yard protection.

A modern fire-proof office building has been constructed near the retort house which contains offices for the superintendent and his staff as well as a chemical laboratory and office for the resident or plant chemist. The equipment in the laboratory includes various pieces of apparatus of the latest design and is unique in that all ovens, hot plates and other similar devices are operated electrically. In addition to this layout, a small experimental cylinder with full accompanying equipment is installed in the retort house.

A lavatory provided with separate rooms for white and colored employees adjoins the treating plant and a bunk house located at one edge of the yard provides living accommodations for the laborers. At the extreme end of the yard

The Installation of the Coal and Ash Conveyor Is Clearly Evident Here

the railroad has constructed a two-story house for the plant superintendent and a series of one-story or bungalow-type houses for his staff. All houses are electric lighted, have running water and are connected with the yard sewer system.

The plant was designed by and constructed under the direction of J. E. Crawford, chief engineer, and his assistant, W. P. Wiltsee, who made the necessary studies and was in general charge of the work. The power plant and other buildings were designed by F. P. Turner, bridge engineer, O. V. Parsons, assistant engineer, being in direct charge in the field. All questions of a chemical nature were under the direction of J. H. Gibboney, chief chemist. The retort house and its equipment, together with other accessories, were designed and constructed by the Allis-Chalmers Manufacturing Company, Milwaukee, Wis. White & Wood, contractors, Roanoke, Va., did all the concrete work, track-laying and other miscellaneous work in connection with the construction of the plant, while John P. Pettyjohn & Co., contractors, Lynchburg, Va., built the power house and office building. H. C. Bell, who has also been connected with the construction of the plant, will be the superintendent in charge of operation.

SIX PASSENGER TRAINS were snow-bound in the Columbia river gorge on the night of November 21, on the lines of the Oregon-Washington Railroad & Navigation and the Spokane, Portland & Seattle roads. The storm was characterized as the worst in the history of railroad operation through the gorge.

## A Heavy Day's Work on the C. P. R.

THE HEAVY movement of grain eastbound from Winnipeg over the Canadian Pacific on one day in October (the 25th), which was noted in issue of November 12 (41 trains—1,579 cars), was about 70 per cent greater than the average daily movement in October. An officer of the road has sent us the following particulars of the movement:

"Owing to the different classes of power used, it was necessary to break and make up trains to suit the different classes of engines supplied to handle this traffic east from Kenora and Ignace, which are the two intermediate divisional points between Winnipeg and Fort William. This section is called the Kenora division; it is 419 miles, divided into three subdivisions: the Keewatin subdivision from Winnipeg to Kenora, 126 miles; Ignace subdivision from Kenora to Ignace, 146 miles, and the Kaministiquia subdivision from Ignace to Fort William, 147 miles. Trains are operated by train orders over train dispatchers' telephone circuit, and without block signals. The Kenora division is practically all double track. On a 40-mile section, viz.: between Winnipeg and Molson, although operated as double track, the lines diverge to such an extent that in order to give a return service, it is necessary to run a daily passenger train against the current of traffic. The figures given represent the number of loaded freight cars moved out of the initial terminal on the date in question.

"No mishap of any kind occurred, notwithstanding that there was a train on each 5.6 miles of line between Winnipeg and Kenora. The record is remarkable in that it was a natural one; there was no holding back to accumulate cars with which to make a record; and when the 1,579th car had left Winnipeg at 11:50 p.m. there still remained 1,419 east-bound loads to be moved.

It was not necessary to borrow any power from any other division, as when traffic conditions fluctuate, it is the practice to assign the necessary power. In this instance, the peak of the heavy grain movement eastward reached Winnipeg on October 24 and 25, and to take care of this wave, which had been increasing in volume daily, it was necessary to assign additional power to keep traffic moving currently east from Winnipeg. On this particular day there were in operation on the Kenora division, in freight service, 112 engines. In addition to the trains mentioned, the regular passenger and mixed trains were operated on time. These latter consist of four transcontinental passenger trains, two local passenger trains against the current of traffic between Winnipeg and Molson, and one mixed train on each of the three subdivisions. The westbound traffic on this day west from Fort William amounted to 174 loads and 1,125 empties, or 1,299 cars in all. A total of 169 trains were dispatched and on the road during the 24 hours under review, exclusive of passenger trains. To man our trains there were in the service at that time 327 engineers and firemen and 386 conductors and trainmen, exclusive of the passenger crews.

"The success of this movement was entirely due to the hearty and loyal co-operation of the employees."

RAILROAD ACCIDENT RECORDS (and similar data for city streets) might perhaps be relieved of some of their odium if occasionally they were compared with country-life conditions. In the State of Maine 13 deer hunters lost their lives in the woods during the season that closed on November 30. Four hunters were killed when mistaken for deer, three accidentally shot themselves, and one was accidentally killed by a companion. Two were drowned and three died from exhaustion and exposure. These accidents and incidents were accompaniments of the killing of 2,200 deer.

## Accident Investigations— July, August and September

THE Interstate Commerce Commission has issued its ninth quarterly summary of accident investigations made by the Bureau of Safety, covering the reports completed in the three months ending with September, 1921. This pamphlet, 32 pages, covers 17 accidents—seven collisions and 10 derailments—as follows:

Deraiment	.....	Pennsylvania	.....	Huston Run, Pa.	.....	July 13
Collision	.....	Denver & Rio Grande	.....	Grizzly, Colo.	.....	July 19
Deraiment	.....	Delaware, Lackawanna & W.	.....	Glenburn, Pa.	.....	July 22
Deraiment	.....	New York, New Haven & H.	.....	Chatham, Mass.	.....	July 27
Collision	.....	Central of New Jersey	.....	Chatsworth, N. J.	.....	July 27
Collision	.....	Chic., Rock Island & Pacific	.....	Clear Lake Jct., Ia.	.....	July 29
Collision	.....	.....	.....	Minneapolis & St. Louis	.....	July 30
.....	.....	Chicago, Mil. & St. Paul	.....	Perry, Iowa	.....	July 30
Deraiment	.....	New Orleans, Tex. & Mex.	.....	Gordon, La.	.....	Aug. 5
Deraiment	.....	.....	.....	Clear Creek, La.	.....	Aug. 8
Collision	.....	.....	.....	Toledo, St. L. & W.	.....	Aug. 13
.....	.....	Illinois Central	.....	Lerna, Ill.	.....	Aug. 13
Deraiment	.....	Baltimore & Ohio C. T.	.....	Blue Island, Ill.	.....	Aug. 20
Collision	.....	Wash'n., Balt. & Annapolis	.....	Revell, Md.	.....	Aug. 23
Deraiment	.....	Denver & Rio Grande W.	.....	Gale, Colo.	.....	Aug. 24
Deraiment	.....	Delaware, Lackawanna & W.	.....	Apalachin, N. Y.	.....	Sept. 3
Deraiment	.....	Atlanta, Birmingham & Ga.	.....	.....	.....	Sept. 3
Deraiment	.....	Chicago and North Western	.....	Belle Plaine, Ia.	.....	Sept. 16
Collision	.....	Pennsylvania	.....	Gould, Ohio	.....	Sept. 25

Following are abstracts of these reports:

On the Pennsylvania Railroad, near Huston Run, Pa. (Monongahela division) on July 13, a southbound freight was derailed by the emergency application of the air brakes when the train broke in two between the tender and the first car; and one car fouled the northbound track. It was run into by northbound passenger train No. 7731, and the passenger locomotive was derailed and overturned. The engineman of this train was killed and one other employee was injured. The inspector gave the cause as the pulling out of the coupler of the leading car because of the coupler key having worked out. The cotter key was missing. The conclusion says that if the cars had been inspected at Shire Oaks it is probable that if the cotter key had been missing at that time its absence would have been discovered and the accident probably prevented.

The trains in collision on the Denver & Rio Grande at Grizzly, Colo., on July 19, about 9:07 a. m., were westbound freight No. 65 and eastbound passenger No. 2. The trains met on a curve of eight degrees. They were moving at low speed, but the fireman of the freight was killed. Six other employees and two passengers were injured. The collision occurred between the switches of the passing track. The freight locomotive had been cut off from its train to be run forward and backed into the siding. It had right of track to do this as, by train-order No. 10, the passenger train would be two hours 40 minutes late; but train-order No. 15, which had not been delivered to the freight, allowed the passenger to run 20 minutes earlier; and the passenger had right of track to the east switch until 9:17 a. m. The inspector finds that the dispatcher who omitted to send a copy of order No. 15 to the freight had ample time to do so; and if this had been done the freight would have had no right to the main track west of the east switch without flag protection. The dispatcher was employed as agent and operator in 1905, promoted to dispatcher in 1907 and to chief dispatcher in 1917.

The train derailed on the Delaware, Lackawanna & Western at Glenburn, Pa., on July 22, was westbound passenger No. 3, consisting of locomotive No. 1120 and nine cars, all of steel. The train was moving at about 50 miles an hour on a descending grade when it was thrown off the track by a nut,  $\frac{3}{4}$  in. square, which had been placed on the track by some unknown person. The engineman and fireman were killed, and 79 passengers, three mail clerks and two employees were injured. The leading wheels of the engine truck were first derailed and they ran on the ties more than 2,600 ft. to a trailing switch, where the rest of the train ran off; and the locomotive was overturned. It appears that neither the engineman nor the fireman, nor any person on the train, knew

that the leading wheels were off the rails until the train had traversed the half-mile from the obstruction to the switch. Throughout the half-mile it was noted that the marks on the ties were not sufficiently severe to necessitate any repairs to the track. The wheels on the right hand side, in some cases, skipped over a tie without touching it.

On the New York, New Haven & Hartford, near Chatham, Mass., on the seven-mile branch from Harwich to Chatham, on July 27, southbound passenger train No. 5553, consisting of three cars and a locomotive, the locomotive moving backwards, was derailed on a curve of five degrees while moving at about 25 miles an hour; and the engine was overturned. The engineman and fireman were killed. The engine was being run backwards because of some difficulty in using the turn table; but it had been run backwards many times and there was no evidence that the derailment was due to any fault in the tender or the track. The report gave the cause of the accident as not definitely ascertained.

The trains in collision on the Central of New Jersey near Chatsworth, N. J., on July 27, were eastbound passenger No. 324 and westbound freight extra No. 182, the latter consisting of 10 cars and a caboose drawn by engine 182. The freight, running at high speed, passed the train order signal at Chatsworth, set against it, and collided with the passenger train 200 ft. west of the station. The passenger train had stopped, the engineman having seen the freight; but there had not been time to move it backward. The passenger train was driven backward about 65 ft. by the impact. The engine remained upright, although all its wheels were off the rails. The freight engine was overturned. Eleven passengers and seven employees were injured.

The trains had had orders to meet at a station west of Chatsworth, but this order was superseded by another, to meet at Chatsworth. This second order had not been delivered to the freight, but was placed at Chatsworth for it. The signal was properly displayed, and the train approached on a straight line of about three miles, in clear weather; but the signal was disregarded. The station agent saw that the freight was coming too fast and he gave a stop signal by hand (on the fireman's side) but no attention was paid to this signal. Engineman Wilson of the freight said that approaching Chatsworth brakeman Lundell said the train order signal was clear, and Wilson said it was difficult to see, but this excuse appears to have had no foundation. The fireman of the freight was making his first trip over this division, and had not seen the signal at all.

The report attributes the collision to the failure of Engineman Wilson to observe the signal. Wilson admitted approaching the station at 40 miles an hour, or faster, although knowing that he was approaching a train order signal. The brakeman is censured for misinforming the engineman, but it is observed that his action was not responsible for the engineman's failure to keep his speed under control.

The trains in collision on the Chicago, Rock Island & Pacific near Clear Lake Junction, Iowa, on July 29, were eastbound second-class freight No. 912 and westbound third-class freight No. 83. The trains met within yard limits at about 12 to 20 miles an hour and the engineman, fireman and one brakeman of train No. 83 were killed. The inspector finds that the conductor and the engineman of train No. 83 had departed from Clear Lake Junction without examining the train register; and they were encroaching on the right of an opposing superior train. It appears that an engine without train, No. 1523, had been run ahead of No. 912 as an extra, as far as Clear Lake Junction; and then from Clear Lake Junction eastward it was run as No. 912. Thus, the men of train 83 had met No. 912, but after passing Clear Lake Junction had to meet another train of the same number.

The inspector also finds that if any one of the men on the engine of No. 83 had been maintaining a proper lookout, on

the inside of the curve; the approach of No. 912 would have been observed in time to admit of stopping the westbound train. The eastbound engineman was deceived, for a short time, by assuming that the westbound train was on the track of the Chicago Great Western, which lies alongside the Rock Island track. Other irregularities contributed to the collision; and one flagman had made only two trips over this part of the road.

The trains in collision at Perry, Iowa, on July 30, about 6:10 a. m., were eastbound passenger No. 4 of the Minneapolis & St. Louis, and westbound freight extra 8653 of the Chicago, Milwaukee & St. Paul, the passenger running into the side of the freight at the crossing of the two roads. The 22nd, 23rd and 24th cars of the freight were knocked off the track and damaged, and the passenger locomotive fell down a bank. An employee, off duty, was killed by being struck by one of the freight cars. There is no interlocking at the crossing and trains are required to stop at a stop board. The passenger train approached on a straight line, but the engineman, although he had reduced his speed at a point one mile back of the crossing, did not keep a good lookout, and reached the crossing sooner than he expected to. He said that he struck the freight at about 10 miles an hour, but the inspector thinks he was running faster. The engineman was acquainted with the road and there were landmarks, including a bridge about one-fourth mile from the crossing, which should have enabled him to determine his location with sufficient accuracy.

The inspector finds that about 30 trains a day pass over this crossing on the St. Paul road and 14 trains a day on the M. & St. L.; and therefore recommends the installation of interlocking signals.

The train derailed on the New Orleans, Texas & Mexico near Gordon, La., on August 5, was a westbound freight, extra 113—locomotive and 46 cars. Moving at about 40 miles an hour, or faster, where the regulations required a much lower speed, the four rear cars and the caboose were derailed, and the conductor and one brakeman were killed. The inspector believes the derailment was due to excessive speed on uneven track, combined with excessive side-bearing clearance on the forward end of a tank car. Inspection of this car, the first to run off, showed that this clearance on one end of this car was  $\frac{7}{8}$  in., while it should not have been over  $\frac{3}{4}$  in. This was a car of 100,000 lb. capacity.

The train derailed on the New Orleans, Texas & Mexico, near Clear Creek, La., on August 8, was eastbound freight extra No. 88, consisting of a locomotive and 42 cars. Two trespassers were killed and one employee and four trespassers were injured. The inspector finds the cause of the collision to have been excessive speed on irregular track, together with excessive side bearing clearance on the front truck of a tank car. The wreckage of 17 cars was piled up in a distance of 300 ft. and the leading portion of the train ran about 1,000 ft. after derailment, indicating that the speed had been high. The rule limits the speed at this point to 25 miles an hour.

Trains in collision at Lerna, Ill., on August 13, were eastbound freight No. 46, second section, of the Toledo, St. Louis & Western, and northbound passenger No. 222 of the Illinois Central, the freight running into the side of the passenger at the crossing of the two roads; the crossing is at right angles. Both trains were moving very slowly. This collision occurred at about 9:50 p. m., and the passenger train had made a stop for the crossing, there being no interlocking signals. A conductor, off duty, was killed, and four passengers and two mail clerks were injured. The engineman of the freight had not attempted to stop, although he had been a runner since 1913. The inspector found that of the air brakes on the freight train only 77 per cent were operative.

The train derailed on the Baltimore & Ohio Chicago Terminal near Blue Island, Ill., on August 20, was a southbound extra freight. The locomotive was overturned and the

engineman was killed. Moving at 20 miles an hour, or faster, the tender rocked, on uneven track, so as to jump the track and cause the derailment. The engine was running tender first.

The trains in collision on the Baltimore & Annapolis Electric Railroad at Revell, Md., on August 23, were northbound passenger No. 332 and a southbound work train, the latter consisting of a motor car with one platform car, the motor pushing the flat. The conductor and the motorman of the work train were killed. These men had encroached on the time of the passenger train several minutes. How they came to do so is not known, but the brakeman, who was riding on the rear of the motor, thought that they were depending on the rights of a following superior train, No. 329. They thought that 332 would have to wait at Revell for 329; but an order had been issued fixing the meeting point at a station north of Revell.

The train derailed on the Denver & Rio Grande Western at Gale, Colo., on August 24, about 3:20 a. m., was westbound passenger No. 1, first section, consisting of a locomotive and 11 cars, all of steel construction. Moving at about 20 miles an hour, the train broke through a trestle bridge, the foundations of which were weakened by a sudden flood. One passenger and Engineman Armstrong were killed and 63 passengers and six employees were injured. The foundations of the bridge, 16 ft. apart, were 20 ft. long and 3 ft. wide with a depth of 5 ft. These were surmounted by bents of yellow pine, 12 in. x 12 in., properly braced and tied. The water course usually is dry, but on the night of the derailment there had been a heavy storm several miles upstream, and water had been flowing under the bridge to a depth of from 6 feet to 9 feet. This train had orders calling attention to 13 places where speed was to be reduced; but none of them applied at this particular point, no danger having been apprehended.

The train derailed on the Delaware, Lackawanna & Western near Apalachin, N. Y., on September 3, was westbound passenger No. 3, second section, consisting of a locomotive and nine cars, seven of the cars being all-steel. Moving at about 45 miles an hour, or faster, the train was derailed at or near the end of a curve of less than four degrees; and the locomotive and first car were overturned. One passenger was killed and 69 passengers and eight employees were injured. The inspector finds that the track, which was being raised and ballasted, was not strong enough to carry a train of this weight at this speed. "The indications are that the ballast did not hold, and that the track slid underneath the train." The trackmen had stopped work at this particular point and there was a heavy shower shortly before the derailment which may have tended to loosen some of the ties.

The derailment on the Atlanta, Birmingham & Atlantic at Cascade Crossing, Ga., on September 7, was caused by an explosion, the explosive having been placed under the track maliciously. The report on this case was noticed in the *Railway Age* of October 3, page 665.

The train derailed on the Chicago & North Western near Belle Plaine, Iowa, on September 16, about 3 a. m., was westbound passenger No. 7, consisting of a locomotive and eight cars. Moving at about 35 miles an hour, the train was derailed at a washout and the locomotive was overturned. The engineman and fireman were killed and one passenger, three employees and three trespassers were injured, one of the trespassers fatally. The report of the inspector says that the washout was due to an unusually heavy rainfall and that it was at a point where no previous difficulty had been experienced.

The collision on the Pennsylvania Railroad at Gould, Ohio, September 25, was caused by a false clear semi-automatic block signal, which was out of order by reason of grounds on controlling electric wires. This case was reported in the *Railway Age* of November 26, page 1052.

# Meeting of Railroad Division of A. S. M. E.

## Papers on Elimination of Waste in Design of Motive Power and in Operation of Locomotives and Cars

THE ELIMINATION of waste in industry was the general topic discussed at the annual meeting of the American Society of Mechanical Engineers held in New York this week. In conformity with the central theme, the Railroad Division of the society, at its meeting on December 6, presented three papers on avoidable waste in locomotives and cars. The first of these papers, by James Partington, on

Avoidable Waste in Locomotives as Affected by Design, was published in the *Railway Age* of November 5, page 899. The first part of the paper by William Elmer on Avoidable Waste in the Operation of Locomotives and Cars was abstracted in the issue of December 3, page 1081. The concluding section of Mr. Elmer's paper and the paper by W. C. Sanders appear below.

### Avoidable Waste in Car Operation—The Container Car

By Walter C. Sanders

The container car was an outcome of the railroad congestion during the war and was first put in operation last year by A. H. Smith, president of the New York Central Lines, to reduce the transportation losses due to congestion which tied up industry. It is hoped that mail, express and freight robberies, breakage, checking and rehandling, delays to ship-

pers and station overseers, as well as switchmen to shunt cars to fixed locations where loading and unloading are possible.

The container system provides that the portable container shall be loaded and locked at the shipper's own store door, conveyed by motor truck to the railroad yard, and lifted by crane aboard the container car, where steel bulkheads and sides form absolute protection against opening the container in transit. At the destination the locked container is unloaded by a crane and carried by motor truck directly to the warehouse or consignee's door, to be unloaded at his convenience. This simple system of handling goods will make it possible to greatly reduce the force of employees now necessary.

Another advantage of the container-car system expected

A Carload of Mail Containers Ready for Delivery to the Post Office

pers, and many other railroad evils may also be materially reduced by the container-car system.

Loss of and damage to freight has grown in recent years into one of the heaviest leaks in the transportation industry and strenuous campaigns which included maintenance of extensive police and supervisory forces, together with educational campaigns among shippers and railroad employees to secure stronger packing, careful handling and suppression of theft, have failed to stop this economic waste.

The proportions of this transportation problem may be judged from the fact that in the year 1914 American railroads paid out \$33,000,000 in claims for loss of and damage to freight, and for the year 1920 this mounted to a total of \$125,000,000, the incidental injury to business affected being considerably greater. Under the ordinary system of handling less-than-carload lots or shipments the goods are checked and handled item by item from shipper to truck or dray, from truck to depot platform or warehouse, and from the platform to the car. They are subject to handling and checking at each stage of the journey, and when finally they reach their destination this handling and checking is all done over again. It is therefore necessary to maintain armies of employees to act as freight handlers, clerks, check-

Freight Type Container Loaded on a Motor Truck. The Larger Containers Which Originally Formed Part of the Equipment Are No Longer Used, the Size Shown Being Standard

to prove most valuable is the greatly increased use of container rolling stock in moving service, which is particularly important when traffic expands to its peak and when the prime need is to shorten layovers of cars in yards and stations for loading and unloading, and to limit their idleness and obstruction through misuse for storage purposes. In busy times the need is to keep every wheel turning as continuously as possible to secure maximum transportation. With ample supplies of the removable containers, which in

their several classes are of uniform size and interchangeable, one carload of containers may be removed and sent with their loads to consignees, and another set immediately hoisted into place and the car be ready to proceed within a matter of minutes in most instances. The locked containers may remain on station platforms or at the stores of shippers for loading or unloading at convenience without tying up costly rolling stock at points where track capacity is limited and congestion quickly obstructs the flow of traffic unless the cars are kept moving. With this rapid handling of the containers on and off the car the mileage per year made by the ordinary piece of rolling stock may be doubled, and it is predicted that the tremendous expense of maintaining box cars and other rolling stock equal to all emergencies will be materially cut down.

The container car may make costly packing and crating unnecessary because goods packed in flimsy pastboard boxes or even bound with heavy paper are protected against breakage, theft, and water or weather damage.

There are at present in service on the New York Central Lines three container cars, one of the mail or express type, and two that are being used for valuable freight, such as silks and woolsens. Three new mail cars of improved design which are now being constructed will be equipped with an improved type of all-steel container. A new freight-type container car is being designed, and refrigerator and tank container cars are contemplated.

### General Description of the Container Car

The container car is nothing more than a long car with a steel side or fence, similar to a low-side gondola, loaded with large steel safes or containers, made as light as possible, in which commodities of all kinds travel from consignor to consignee, inviolate against thieves, fire, weather and breakage. The safes or containers are lifted on and off the car by cranes or hoisting devices, permitting the "parent" rolling stock to continue in immediate transportation circulation.

[Mr. Sanders' paper included a detailed description of the express container cars as illustrated and described in the *Railway Age* for February 4, 1921, page 315, and the freight container cars described and illustrated in the issue of April 8, page 905.—Editor.]

### Containers and Container Cars

#### Now Under Construction

The three new mail-type container cars now being built will carry eight containers of a new, improved design, the outside measurements being, length 7 ft. 2½ in., width 9 ft. 3½ in., clear height 8 ft. 2 in., with 5 ft. 9 in. by 3 ft. 6 in. door on the length side of the container. The cubic capacity will be 438 cu. ft., light weight 3,000 lb. and capacity 7,000 lb.

Tests conducted in the last few months on the New York Central Lines have demonstrated that the express type of container car can be emptied of the nine containers by an ordinary crane in 21 min. and reloaded with other containers and the car put back in circulation in about the same time. This test was made with an ordinary moving track crane, since no special cranes or handling devices have as yet been constructed for use in handling the containers. With the special handling devices contemplated it will be possible to unload the containers with greater speed directly to waiting motor trucks, platforms, or on the ground.

During May, 1921, at the request of the Postmaster General, a mail test was run from New York City to Chicago, Ill., and return with the express type of container car. Upon arrival at Chicago the nine containers, containing 37,000 lb. of mail, were unloaded onto waiting Post Office motor trucks in 21 min., which is one-fifth of the time used in unloading an ordinary mail storage car. At Chicago connections were

made with western mail trains that have never been made before. Upon the arrival of the car at New York on the return trip the containers were removed from the car in 18 min.

It is believed that the use of containers in mail service (1) will prevent the loss in transit of valuable registered mail, parcels post and other mail; (2) will mean a saving to the government in handling mail, both in trucking and checking as well as a material saving to the railroads in the use of equipment; (3) will make possible a quick transfer at important gateway points and the maintaining of close railway connections otherwise impossible; and (4) will afford an increased weight and capacity as compared with the average load now handled in mail storage or baggage cars, the average weight of mail now carried in mail storage cars being approximately 30,000 lb.; 37,000 lb. of mail were carried on the run to Chicago.

### Summary

A summary of prime advantages of the container car system is as follows:

- (a) It will furnish a means of expediting delivery of less-than-carload lots of commodities by eliminating the time and expense of rehandling, checking and trucking.
- (b) It will eliminate costly crating and packing.
- (c) The immediate unloading and loading of containers at terminal points eliminates the item of demurrage, at the same time promptly releasing rolling stock, clearing the yards of cars and reducing congestion.
- (d) It will eliminate the piecemeal loading of cars at railway sidings in exposure to all kinds of weather.
- (e) It will tend to keep the car moving at all times, making possible double the mileage as made now by an ordinary piece of rolling stock.
- (f) Containers are fire- and weather-proof, and also burglar-proof in that they cannot be opened while on the car or while being transferred by handling device to and from the car.

The increased service capacity of each unit by the development of the container-car system is thought to hold far-reaching economic possibilities in railroad operations of the future, as well as in the co-ordinated use of the motor truck and the electric railway.

### Discussion

R. H. Newcomb (Boston & Maine), told of experiments with container cars manufactured by the River and Rail Transportation Company on the Boston and Maine. This design differs from the container car described by Mr. Sanders in that the containers can be transferred from the car to motor trucks without the use of cranes or other lifting devices. The container method of transportation seems particularly well adapted for use on the railroads in New England and it was thought that by this system less than carload freight could be handled with one-third the number of cars now used. Replying to questions, Mr. Newcomb stated that no trouble was encountered due to containers freezing to the car underframe in winter and no difficulty was experienced in meeting the requirements of the Safety Appliance Act.

A. E. Ostrander (American Car & Foundry Company), brought out the fact that high-grade commodities, such as furniture, were frequently shipped in the bodies of vans which were removed from the running gear and loaded onto freight cars. The container car affords a much better method of handling such traffic which should be advantageous to the railroads and also to the shippers. The container method of transportation should open up to the railroads a profitable traffic field in the handling of raw and finished silks which are now shipped principally by auto truck.

Representatives of the railway mail service emphasized the

value of the container car in expediting the delivery of mail and in handling parcel post matter.

F. S. Gallagher (New York Central) stated that the appli-

cation of the container system to the transportation of milk was now being considered. By using suitable insulation around the tanks, no icing in transit would be required.

## Avoidable Waste in the Operation of Cars\*

By William Elmer

The avoidable waste in the operation of cars may be considered under three heads: *a*, The utilization of cars in the hands of agents, shippers and consignees; *b*, The handling and dispatching of cars in yards and on the road; *c*, The inspection and repair of cars by the maintenance of equipment department.

### Utilization of Cars in the Hands of

#### Agents, Shippers and Consignees

So far as the railroads are concerned, one great means of improving utilization that suggests itself is the increased use of cars in the hands of agents and shippers, which necessarily involves the promptness with which they are loaded and unloaded and the extent to which they are loaded, i. e., that the maximum loading be secured for the car in the minimum time, etc.

Maximum car loading is a matter of dire necessity during periods of car shortage. It is also very essential to the economic conduct of transportation. During recent months the necessity for conserving cars has been decreased by the small volume of tonnage handled by the railroads. With the slump in traffic there is a tendency on the part of the shippers and railroad men alike to let down in their effort to secure maximum loading. This "line of least resistance" method is resulting in considerable less than capacity loading.

It is a fact, not generally recognized, that car loading affects the cost of railroad operation very seriously, not only because the paying load may be a small percentage of the gross train load, but also because lightly loaded cars require more tractive effort per ton than heavily loaded cars, e. g., the average weight of a car is from 15 to 20 tons while the average weight of all commodities is averaging approximately 27 tons. The load of the car itself must be hauled with every movement of the contents and requires as much tractive effort on the part of the locomotive per ton to move this weight as it does for the contents, therefore the importance of keeping the percentage of lading to total weight as high as possible is self-evident. This question has assumed a very different aspect to the shipper since the passage of the Transportation Act, which stipulates that the rates must be sufficient to earn a fixed return on the value of the properties. Any waste due to the light loading of cars adds to the operating cost and thereby to the rates necessary to earn the specified return. The shipper therefore has a new interest in effecting economics of transportation and can contribute to that end most effectively by co-operating in the heavier loading of cars.

General practice permits the loading of cars 10 per cent in excess of the marked capacity. There are great possibilities in the utilization of this margin for with many classes of loading great advantage may be taken of it to gain one car in every ten and to increase the average carload correspondingly.

There are many commodities moving which will permit of making trade units to correspond to the capacity of the car; this has been done with cement, and other like commodities. If this were done with flour and all similar commodities great assistance might be rendered to the railroads.

The agent through close association with shippers is in the best position to encourage maximum loading. It is often decidedly hard to convince shippers that they are not loading their cars to cubical capacity. This is particularly true of the coal operators. The best means of producing convincing evidence of the empty space in the car is to show the shipper a photograph of the car which will speak for itself, and we have found a kodak to be a most helpful instrument in increasing the tons per car. The cars may be intercepted and photographed at scales or in classification yards.

The prompt release of cars under load is a large factor in the efficiency of the car. Most shippers and consignees are reasonable in this respect and will give us their best efforts if the matter is handled with them in a diplomatic way. After urging the shippers and consignees, the railroad then has a very important part to play by the prompt movement of cars, whether loaded or empty; it being purely psychological that, after urging the shipper or consignee, failing on our own part would necessarily breed antagonism.

### The Handling and Dispatching of

#### Cars in Yards and on the Road

After cars have been loaded and waybills furnished by the agent to transport freight from point of origin to destination, it becomes the duty of the trainmaster to arrange for movement and delivery with the least possible delay consistent with economical operation. This necessarily involves good organization and effective supervision to accomplish proper movement through yards and over the road. Trains arriving in the receiving yard are subjected to inspection and minor repairs to insure safe movement over the road between terminals, sending to the repair yard any bad-order cars that must be "shopped" for this purpose. After inspection and repairs have been completed, the train is prepared for switching from receiving yard to classification yard, which process requires car markers to chalk-mark cars for their respective classification tracks, according to destination and routing, also furnishing corresponding switching lists for the conductor in charge of switching crew, and switchmen who operate switches leading into the classification yard. Yard locomotives and a force of trainmen are required to switch trains into the classification yard at proper speed for accurate weighing at points where cars pass over a track scale; also requiring brakemen to ride cars into the classification yard and control them by use of hand brakes to bring them to a stop at the proper point and to avoid damage by impact with preceding cars standing on the track.

The train from the receiving yard has now been distributed on various tracks in the classification yard, usually from ten to thirty tracks, depending on the size and importance of the yard operation. The original train having thus lost its identity, following trains, classified in like manner to the same tracks, are required to assemble cars that will comprise new trains to be dispatched when the required tonnage is accumulated. A variety of conditions arise at this stage of the operation that seriously influence the time consumed by cars en route to their destination, which may necessarily be repeated from one to many times between the originating point and destination of cars, depending on the distance and the territory over which they are moving. The time required to assemble sufficient tonnage for a train in

\*An abstract of the section of Mr. Elmer's paper dealing with locomotives was published in the issue of December 3, page 1081.

the classification yard is very largely dependent on the steady or intermittent arrival of trains in the receiving yard; also on the hauling capacity of road locomotives used on trains dispatched in the same direction, which may be 35 or 50 cars from one yard and 100 to 115 cars from another yard for the same class of locomotive, depending on the ruling grade of the division over which trains are being hauled.

In this connection another primary cause of delay in assembling trains in the classification yard is to be found in the usual number of classifications imposed upon certain yards for the convenience of connecting divisions to meet their requirements for various reasons, but primarily due to inadequate track and switching facilities. So-called "prior classifications" are also a source of yard delay at the point where they are assembled, but the time thus consumed is presumably offset by saving in time at the next yard or terminal point where such trains are kept intact and delivered to the division in advance thereof without reclassifying, which means an actual saving in the aggregate time consumed from shipping point to destination, also in operating expenses. Therefore a considerable portion of yard delay is beyond control, owing to prevailing conditions that cannot be eliminated. However, there is ample opportunity for minimizing yard and road delays to train movement by employing the best operating methods, maintaining sound organization and efficient supervision.

Time consumed assembling tonnage for heavy trains to be hauled by large types of locomotives over comparatively level grades may be viewed by some as a contributory cause of "avoidable waste in cars," but it should be recognized that doing so reduces the number of engine and train crews and locomotives required to haul a large volume of freight, which means economical operation.

#### The Inspection and Repair of Cars by the

##### Maintenance of Equipment Department

When trains are hauled over the road, certain defects develop and by the time they reach the terminal of a run, a certain portion of the cars, say 3 to 5 per cent, must go to the shop for repairs.

In order to keep a check on cars undergoing repairs, a report is prepared and sent to the different operating officials. The report indicates the time the car is shopped, the time it is moved to the shop, the time repairs are completed and the time car is moved out of shop. By checking over this report each morning the master mechanic, superintendent or general officers can determine in a few seconds if there are any cars that are being held an unreasonable length of time.

It is the aim of the operating officials to not only see that all cars are repaired, but to have the cars repaired promptly and returned to service in the most expeditious manner.

##### Conclusions

The great secret of the entire operation, therefore, is co-operation and teamwork, and these can be checked by suitable reports.

The statistics which reach the superintendent's desk giving hourly, daily, weekly and monthly information are many and varied, and originate from numerous sources, but the reports scanned by the author with most interest each day are those which tell where each of the heavy road freight and passenger engines were the day before and what they were doing. There is a maxim, "Take care of the shillings and the pounds will take care of themselves." It seems to apply particularly to the railroads. Take care of the engines and the dividends will take care of themselves. Of course this could not be literally true, but there is so much involved in this "taking care of the engines," embracing as it does the time and inferentially the money spent in locomotive repairs, the quality of back-shop and enginehouse work performed,

the proper tonnage rating, and suitable loading of engines in order to obtain the most economical road speed, the reduction of delays getting into and out of yards, the inspection and repair of car equipment, the efficiency of water stations, coal, sand and ash-handling plants, the organization and operation of wreck forces, the handling of local freight and work trains, in fact, almost each and every one of the thousand and one matters that go to make up a successful operation of a division.

If any one of the features named above is not functioning properly, as well as others too numerous to mention, the effect will be seen in the slowing down of the road speed or a lowering of the average mileage per serviceable locomotive or a falling off in the loading efficiency. All these must be at their highest possible levels of practical performance, and when they are, a glance of the eye at the daily barometer ought to tell it, and when they are not, a few minutes' inspection of the data ought to tell why and point the remedy. The supervisors must have tracks fit for speed and service; the signal engineer must have communicating systems and signal apparatus in good working order; the road foremen must have engines properly rated and sufficient crews and supervision; the train master must have his yard and road forces properly instructed and disciplined; the division operator must have his train dispatchers and signalmen alert and intelligent; and the master mechanic must produce the power in ample quantity and fit for service.

If the division superintendent can be assured that everything is being done that can be done to have every available engine in service that can be put in service, and every engine dispatched is being loaded to the maximum number of cars it can economically haul, then he is assured of an economical performance and an avoidance of waste in the operation of locomotives and cars.

##### Discussion

In presenting his paper, Mr. Elmer amplified some of the more important sections and presented a series of charts which he used to keep a record of the performance of individual locomotives and of the motive power on the division taken as a whole. He referred to the omission of figures regarding the cost of fuel from the tabulation of expenses from which the most economical train loading was determined and explained that this was done because of the difficulty of determining accurately the variation in the unit costs of fuel with the relatively small change in the tonnage which was included in the table.

W. L. Bean (New York, New Haven & Hartford) commented Mr. Elmer's paper as a splendid exposition of the methods to be used for overcoming poor utilization of equipment. Referring to the subject of fuel consumption he stated that the condition of engines has a great effect on the amount of coal burned. Locomotives may perform satisfactorily to the operating officers to the extent of keeping off the delay sheet and yet burn 25 per cent more coal than necessary. It has been demonstrated that a great improvement could often be made by properly adjusting the valve motion.

Mr. Bean called attention to the variations in operating results brought about by changes in the amount of traffic. During periods of light traffic the time over the road decreases and fuel consumption also goes down. He expressed the opinion that more harm is done by overloading locomotives than by underloading them.

In discussing equated tonnage rating Mr. Bean stated that on some roads a constant adjustment factor is used on all divisions irrespective of local conditions. The adjustment factor applies only to the frictional resistance and therefore should vary with the grade, being high on level divisions and low on divisions with steep grades. The same applies also to the temperature adjustment factor used for regulating tonnage rating in cold weather.

## Discussion of Paper by James Partington

The discussion of the paper on Avoidable Waste in Locomotives as Affected by Their Design, by James Partington, which was published in the *Railway Age* of November 5, 1921, page 899, brought out some striking suggestions for modifications in the design and types of motive power as the following extracts from the discussion will show:

Among the newly developed locomotive attachments that make for increased efficiency and economy the thermic syphon may be mentioned, by reason of its already ascertained influence over the avoidable waste in locomotive design and operation. On all tests made thus far the thermic syphon has never failed to reduce the amount of fuel consumed per drawbar horsepower. In some cases the installation of these syphons has resulted in a 25 per cent fuel saving. An average saving of 15 to 19 per cent, according to class, is now well established.

The second efficiency requirement proposed by Mr. Partington is that a drawbar horsepower be produced for the minimum amount of weight of locomotive and tender.

Locomotive 50000 was built back in 1910; and Mr. Partington therefore refers to a number of newly developed attachments which make for increased efficiency and economy. Along with these the thermic syphon, also of fairly recent development, should be considered. Indeed, consideration of thermic syphons, as if applied to locomotive 50000, will at once demonstrate the fundamental character of the improvement which the thermic syphon has accomplished in locomotive design. I will assume that the boiler horsepower of this locomotive is 2250 as stated in the paper. I have also assumed that all of Mr. Partington's figures relating to boiler horsepower are based upon the formulas devised by F. J. Cole of the American Locomotive Company and have used this method in estimating the capacity increasing ability of the thermic syphon; although, over and beyond the increase brought about by the addition of radiant heat absorbing surface in the firebox, consideration must be given the very rapid circulation which the syphons impart to all the water in the boiler, and the effect which this circulation has in further increasing the capacity of the boiler.

The thermic syphon is an inverted triangular water leg that is positioned vertically above the fire in the firebox, and which by thermal action draws water from the throat and barrel of the boiler, and discharges it through and above the crown sheet of the firebox. Thereby the firebox heating surface is much increased and a vigorous fore-and-aft circulation of boiler water is set up. Both factors contribute to a marked increase of capacity, as well as economy. Incidentally the syphons support the brick arch.

If two syphons were applied to locomotive 50000 they would add approximately 62 sq. ft. to the radiant heat absorbing surface of the firebox. The effect of this installation would be to add 164 boiler horsepower to the capacity of the locomotive, although I again desire to emphasize the point that this is, at best, a theoretical approximation which in actual practice is far exceeded due to the improved circulation effected throughout the entire boiler.

Allowing for the net additional weight of the syphons, the result of such installation in locomotive 50000 would be to reduce the weight of this locomotive to 113 lb. per boiler horsepower as compared with 119.6 pounds without syphons.

Further in the case of locomotive 50000, the application of thermic syphons as described would increase the boiler horsepower to 100 per cent of the cylinder horsepower. This increase in boiler capacity is alone sufficient to insure a substantial improvement in fuel economy, but assuming that a 92 per cent boiler, as originally provided is ample, what further contribution can the syphons make toward eliminating the avoidable weight in the design of this locomotive?

The original weight of this locomotive was 269,000 lb. If 2,350 boiler horsepower is sufficient and the application of syphons enables us to reduce the locomotive weight to 113 lb. per boiler horsepower, then it should be possible to build a syphon equipped locomotive of this capacity weighing approximately 254,000 lb., which is 15,000 lb. less, or to increase the cylinder horsepower of locomotive 50000 from 2,427 to approximately 2,600 horsepower by means of thermic syphons, without increasing the weight per axle.

Let us see what thermic syphons have actually contributed toward the elimination of avoidable waste in recent locomotive construction. For an example, consider the Mountain type locomotives which were constructed by the American Locomotive Company for the Chicago, Rock Island and Pacific last year. These locomotives are each equipped with three syphons and have a calculated boiler horsepower of 2,855. Without syphons the capacity of these boilers would be reduced to 2,550 horsepower. As these locomotives weigh 369,000 lb., their weight with syphons is 129.3 lb. per boiler horsepower, while without syphons, their weight would be increased to 144.7 lb. per boiler horsepower. The cylinder horsepower of these locomotives is 2,824 and to have provided a 100 per cent boiler without syphons on the basis of 144.7 lb. per boiler horsepower, would have increased the total weight of the locomotive to approximately 408,000 lb.

From a statement issued by the Interstate Commerce Commission, it is noted that the cost of these locomotives was approximately \$70,000, or at the rate of 19 cents per pound. At this rate it is apparent that if the railroad had purchased a Mountain type locomotive having a 100 per cent boiler without syphons, the first cost due to increased weight would not only have been \$7,410 greater, but the design of this locomotive would have included 39,000 lb. of added weight. Clearly, this is an instance of a most practical avoidance of waste in locomotive design. Moreover, it is obvious that by employing syphons in these locomotives, the railroads also eliminated avoidable waste in first cost, besides securing a more efficient locomotive that will continue to eliminate waste of fuel and upkeep every day that it is operated. The only conclusion that can be drawn from the foregoing is that locomotives built or operated without syphons must now be taken as representing avoidable wastes, from the standpoints of both fuel economy and unnecessary weight. An examination of the actual facts will convince anyone that syphon maintenance is a negligible factor; and further, that the syphon affords a potential safeguard against disastrous boiler explosions. Already 26 railroads have ordered and purchased thermic syphons. There are now more than 300 thermic syphons in actual use and it is a notable fact that to date, syphons have never caused an engine failure.

C. C. Trump (Stumpf Una-Flow Engine Co.): Perhaps many have wondered why the una-flow engine has not been as much used in locomotive as in stationary work where there are now nearly a million horsepower in service here and abroad. The difficulty has been to find room on the present locomotive for cylinders of a proper size on account of tunnel and bridge clearances. From the latest information from Prof. Stumpf, it appears that he has overcome this and other difficulties.

By using the energy in the exhaust steam with an ejector action, he is able to lower the back pressure in the una-flow cylinder by as much as 4 or 5 lb. per sq. inch, especially at heavier loads. He is thereby able to reduce both the length and diameter of his una-flow cylinder for a given draw-bar pull. This also applies to booster engines. He also obtains a better and steadier draft on his fire with less losses. He requires a smaller boiler, but a larger super-

heater because of the reduced temperature of the flue gases.

With a three or four cylinder locomotive he expects still better vacuum and better drawbar horsepower for weight of locomotive and amount of fuel. Tests are now being conducted on locomotives of this type abroad.

With respect to higher pressure steam, it seems to me that the una-flow engine offers promise of remarkable economies. It is probably no use to go above 400 lb. gage with a simple engine. But data we have from Europe recently indicates that 700 to 800 lb. pressure with a compound una-flow engine and well designed condenser, economizer, etc., might well compete in fuel economy and even in simplicity with a Diesel locomotive engine. It would have great advantages over the Diesel in starting torque and traction and in being able to burn any kind of fuel in solid, liquid or powdered form.

W. F. Kiesel, Jr. (Pennsylvania System): The paper is of particular interest, due to its presentation of locomotives designed on basic values adopted by different designers, but compared on American Locomotive Company's formulae. Such formulae, being empirical, must be changed from time to time to keep pace with new theories introduced in locomotive design. Even then, they are useful only as a preliminary approximation of desired values.

Mr. Partington refers to 100 per cent maximum steam requirements of the cylinders. On referring to American Locomotive Company's Bulletin 1017, this, for superheater locomotives, is found to be based on a horsepower  $H. P. = .0229PA$ , in which  $P$  = boiler pressure and  $A$  = cylinder area. That formula is reasonably satisfactory, for locomotives having equal cut-off in full gear, but falls short of forming a basis on which to compare a locomotive with 90 per cent cut-off with one having 50 per cent maximum cut-off.

The test of the Decapod locomotive, Class 11S, showed that in full gear, at low speed, the steam per indicated horsepower was 38 per cent less than the steam rate for a locomotive with 90 per cent cut-off. Under average service conditions the saving in steam is at least 15 per cent.

If the empirical formulae are changed to meet cut-off effect, such as obtains in the Pennsylvania System 11S locomotive, some of the values in the second table would be affected. With a saving of steam of 15 per cent, the steam rate, calculated, pound-per-horsepower-hours, which is given as 20.8 would be 17.68 which compares favorably with test results. The best actual test for steam rate per indicated horsepower was 14.9 pounds.

The empirical formulae also fall short for comparison due to relative freedom of draft, especially in the smoke-box which seriously affects size of nozzle and cylinder back pressure. Furthermore, the beneficial effect of large combustion chamber volume has not been clearly demonstrated. The freedom of the draft and large combustion chamber volume greatly affect the maximum boiler horsepower.

The locomotives listed in the first and second columns of table 1 are, respectively, the American Locomotive Company No. 50000, and the Pennsylvania System Class K4S. The test results for these locomotives are as follows:

	No. 50000	K4S
Low rate, one test, coal lb. per 1. H. P. ....	2.12	1.52
Low rate, one test, steam lb. per 1. H. P. ....	16.5	14.96
Maximum 1. H. P. ....	2,216	3,184
Weight of locomotive per maximum 1. H. P. ....	121.4	97

This shows that the K4S is actually far ahead of No. 50000 on every count, instead of being inferior as the comparison based on the antiquated empirical formulae would indicate.

Although these figures show the fallacy of empirical formulae in serving as a basis for comparative tabulation, they do not detract from the substance of the matter presented by Mr. Partington, which shows the method of procedure and the strides made in design and construction

during the past few years to make the locomotive a truly economical power plant.

C. J. Mellin (American Locomotive Company) commenting on the discussion by W. F. Kiesel, Jr., pointed out that the formulae used by Mr. Partington are intended for purposes of design and therefore all values have been taken on a very conservative basis. Furthermore, a careful study of locomotive proportions has resulted in an improved design since the formulae were originated and therefore in practice better results are always obtained than are indicated by the formula.

F. H. C. Coppus (Coppus Engineering and Equipment Company): In my opinion the steam locomotive can be developed to such a high degree of efficiency that its drawbar horsepower would be so cheap and its capacity increased to such an extent that the electrification of railroads for the sake of economy would be out of the question, at least on a large scale, for some time to come.

The logical order of locomotive development as far as combustion is concerned should be the following: 1. Mechanically induced draft in the front end. 2. Condensing the exhaust steam and carrying the condensate to the tender. 3. Pumping the hot water from the tender through a waste steam and waste gas heater into the boiler. 4. Under-grate forced draft in the ash pan.

Mechanically induced draft in the front end would eliminate the exhaust nozzle and reduce the back pressure to a maximum of four pounds. Exhaustive tests made on the Santa Fe showed that an average *added* indicator horsepower of 24 per cent could be obtained by reducing back pressure to four pounds. This means among other things a saving in fuel of 20 per cent.

The hot water from the tender pumped through a waste steam heater would enter the waste gas heater at 220 deg. F. This temperature can easily be raised to 300 deg. in the waste gas heater. Raising the temperature from an average of 60 deg. the year round as it now is to 300 deg. is an undisputed saving of 20 per cent.

Under-grate forced draft in the ash pan in conjunction with induced draft in the front end would create a balanced draft condition which would largely eliminate the loss of unburned coal in sparks and cinders through the stack—estimated to be between 5 and 20 per cent.—would stop the inrush of cold air every time the fire door is opened, enable the burning of cheaper grades of coal and, giving unlimited control, automatic action, and absolute flexibility, would increase the furnace efficiency. All of which will easily result in an average saving of 20 per cent.

From these savings should be deducted the steam used for the operation of the pump and blowers which will reduce them to a net overall saving in fuel of a little over 45 per cent.

It is difficult even to estimate the indirect savings which would result from drafting locomotives mechanically. The increase in the power of compound engines would be enormous. I have figures to show that the *added* indicated horsepower to the low pressure cylinder would be 53 per cent. Taking it altogether I look forward with confidence to the reduction of the operating expense of the locomotive to an equivalent of 50 per cent of the present coal consumption. The suggested improvements can be added to all locomotives now in use and at a cost that they will pay for themselves inside of a year.

Elmer A. Sperry discussed the application of the Diesel engine to locomotive service, stating that this is one of the principal problems confronting designers and builders of Diesel engines. The fuel efficiency obtained with the Diesel type of engine is so striking that, in Mr. Sperry's opinion, it is bound to come to the fore. He felt that there was an encouraging outlook for the application of the compound Diesel engine which has recently been developed.

# Asked to Abrogate Foreign Ship Line Contracts

Eastern Roads Willing; Transcontinental Lines Reluctant as to Agreements with Japanese Lines

WASHINGTON, D. C.

REPRESENTATIVES of the railroads having traffic contracts with foreign steamship companies were called to a hearing before a committee of the United States Shipping Board on December 1, scolded for their alleged assistance to competitors of the ships operated by the government and asked to promise at once that they would abrogate the contracts on the ground that the board considers them a "menace" to the success of ships operating under the flag of the United States. The officers of the roads serving Atlantic and Gulf ports said they attached little importance to the contracts, that they did not discriminate against lines with which they had no contracts and expressed a willingness to abrogate them, although in some cases they desired time to take the matter up with the steamship companies. The Great Northern and the Chicago, Milwaukee & St. Paul, however, having traffic contracts or agreements with Japanese lines, expressed a willingness to co-operate with the Shipping Board for the upbuilding of an American merchant marine but declined to agree offhand to give up the agreements by which they receive many millions of revenue from import traffic which, they said, would otherwise probably go to Canadian lines, without being offered some satisfactory substitute. Commissioner Thompson, who with Commissioners Lissner and Plummer conducted the hearing, referred to this as a "discordant note" in the proceedings and several times tried to get the railroad officers to promise unqualifiedly to abrogate the contracts. He admitted that the Shipping Board could not make an exclusive contract with a railroad as a substitute for a foreign contract. R. M. Calkins, vice-president of the Chicago, Milwaukee & St. Paul, and W. P. Kenney, vice-president of the Great Northern, both urged that the present arrangements ought not to be disturbed unless it is required by law, on the ground that they have created a great deal of foreign trade for the Pacific coast ports of the United States and markets for the products of American industry, that they bring a large tonnage of import traffic to the American railroads who are able to control the routing of but little of the export traffic in return and that the breaking off of the contracts would have little effect on the routing of the traffic on the Pacific until the American lines build up a service superior to that of the Japanese and Canadian lines. Commissioner Thompson said the board was just as much concerned with retaining traffic for American railroads as with obtaining freight for American shipping and that some agency of the government ought to be able to protect the roads, but he did not suggest how it could be done. Both Mr. Calkins and Mr. Kenney agreed to take the matter up and give the board an answer as soon as possible but both said they would not recommend giving up the agreements voluntarily without something to replace them.

## Position of the Shipping Board

In opening the hearing Frederick I. Thompson, chairman of the committee on interstate commerce conferences, made the following statement:

Any exclusive or preferential contract or agreement between any American railroad and any foreign flag shipping company is a menace to the success of ships operating under the flag of the United States. The resulting effect is the diversion of American commerce to the ships of other nations operating in competition with our own. Section 28 of the merchant marine act, 1920, clearly defines the intent of Congress that American railroads

be preferential feeders of tonnage for American ships. Yet it is of record before the United States Shipping Board that a number of railroads in the United States have such exclusive or preferential contracts with foreign flag shipping companies in direct conflict with the spirit of the American Congress.

It is also of record that more than 2,500,000 tons of cargo were interchanged last year between these railroads and ships operating under the flag of nations other than the United States. This is a condition admittedly requiring correction, recognizing the full force and effect of the enactment clause of the merchant marine act which clearly provides that "a greater portion" of the commerce of the United States be carried in American vessels.

This committee first approaches the question of these contracts in a spirit of desire for those corrective and co-operative measures as will insure that the influence and organizations of the rail carriers, at present agencies of promotion for the extension of American commerce in vessels of other nations, be utilized for the extension of American commerce in vessels operating under the registry of the United States. The United States Shipping Board is assured that the rail transportation interests represented here, parties to these adverse agreements, recognize that any losses arising through the initial upbuilding of an American merchant marine necessarily falls upon the American public. The board believes that any American enterprise, particularly those the beneficiaries of government support, should make every effort to co-operate in full and unmeasured degree with any division of the government, whose duty it is to build, foster and promote American enterprise.

To bring about such corrective condition this meeting between representatives of the railroads possessed of these agreements and this committee of the United States Shipping Board is held. The railroads and the contracts of record with foreign shipping interests are as follows:

Baltimore & Ohio.....	Donaldson Lines; Scandimavian Lines, North German Lloyd; Furness, Withy & Co. and International Mercantile Marine Company.
Great Northern.....	Nippon Yusen Kabushiki Kaisha.
Pennsylvania Railroad.....	International Mercantile Marine Company.
Northern Central.....	International Mercantile Marine Company and Furness, Withy & Co.
Southern Railway.....	Mobile Lines, Inc.
Mobile & Ohio.....	Mobile Lines, Inc.
Boston & Albany.....	Lehigh Steamship Lines and Cunard Steamship Company.
Chicago, Milwaukee & St. Paul.....	Osaka Shosen Kabushiki Kaisha.
Atlanta, Birmingham & Atlantic.....	Sydney Shipping Company.
Grand Trunk System.....	White Star Dominion Line.

## Eastern and Southern Roads Acquiesce

Archibald Fries, vice-president of the Baltimore & Ohio, said its contracts with three foreign companies were entered into long before the American merchant marine was brought into existence but that there is no discrimination in their favor and the service given them is the same as that given to any of the 27 steamship lines that dock at its piers, so far as the facilities of the Baltimore & Ohio will permit. Mr. Thompson pointed out that the contract with the Donaldson lines provides for the free use of terminals and that the Baltimore & Ohio shall use its best endeavors to promote the business of that company. That is the objectionable feature as viewed by the board, he said, because there is no record of any pledge to promote the best interests of any American line. Mr. Fries replied that his road gave its best efforts to promote the interests of all lines docking at its piers and has tried to secure for the port of Baltimore as many lines as possible, assuring them in every case equal treatment. When Mr. Thompson asked if he had any objection to the cancellation of the contracts, he replied, "None whatever," and said he had consulted with the local agents of two of the companies, who expressed themselves as willing to recommend the cancellation on the ground that they assured no service that would not be accorded without the contracts. Mr. Thompson tried to get Mr. Fries to say at once that the contracts would be cancelled but he said it

would be necessary for him to consult his legal department, which had advised that the contracts are not in violation of any law. He assumed there would be no question.

Commissioner Thompson said that since 1918 the American lines have had adequate tonnage and asked if the Baltimore & Ohio had ever made an effort to make a contract with a Shipping Board line. Mr. Fries said it had considered the contract entirely inoperative and that it would not consider an exclusive contract with any line, believing it to be the best policy to take care of all to the best of its ability. Mr. Thompson said he had seen cases where the contract had operated to give preference to a foreign line and where proper facilities had been denied a line not under contract. When he repeated his request for assurance to the committee that the contracts would be cancelled, Mr. Fries said he would use his best efforts to have them cancelled, but that if the foreign lines decline he thought they should be allowed to lapse. The dates of expiration are 1922, 1926 and 1927.

### Pennsylvania Has No Agreement

R. C. Wright, general traffic manager of the Pennsylvania, said that the Northern Central contracts were no longer in force and that the Pennsylvania had no traffic agreement with the International Merchant Marine, merely an arrangement for the allocation of certain piers made for the purpose of inducing lines to the port of Philadelphia and for the improvement of the service. Recently half of one of the piers used by the International Mercantile Marine had been turned over to an American line. Mr. Wright said that during the past three years 648 American vessels had used his company's piers as against 279 foreign ships. In reply to a question, he said his company would be willing to cancel the contract at once if the board desires it.

H. M. Biscoe, vice-president of the Boston & Albany, said the contracts with the Leland Line and the Cunard Line were practically a dead letter and both would be canceled in his opinion.

Lincoln Green, vice-president of the Southern, said his company intended to cancel the contracts with the Mobile Lines anyway and would do so at once.

D. O. Wood, foreign freight agent of the Grand Trunk, said that his contract was a reciprocal traffic agreement and that 80 per cent of the cargo was Canadian grain delivered at Portland, Me., during the winter. He said it would be necessary to confer with the principals on the abrogation of the contract.

J. L. Edwards, assistant to the receiver of the Atlanta, Birmingham & Atlantic, said the contract with the Strachen Line was not now in existence because of the physical condition of the docks and also because it was not assumed by the receiver. He promised to confer with the board before executing any new contract.

### Great Northern and St. Paul Reluctant

#### to Give Up Agreements

W. P. Kenney, vice-president of the Great Northern, said that his company's contract with the Nippon Yusen Kaisha was dated November 1, 1911, and had expired but had been renewed with slight changes on October 18. The original contract was negotiated 25 or 30 years ago by James J. Hill and was exclusive, the purpose being to promote the movement of cotton to Japan and to get cargo from Japan for the Great Northern rails. This was the first Japanese line to give a regular service across the Pacific. Later the law was passed giving the shipper the right to control the routing and the Nippon Yusen Klen built up a large soliciting organization of its own in the United States which has far more to do with influencing the routing than the railroad has. It also has an extensive organization and connections in the Orient which give it the control of the

inbound tonnage to the United States and it acts as the agent of the road in the Orient, thereby giving the road practically all its inbound tonnage, while the road gives a very little in return because it has so little control over the routing.

In reply to questions by Mr. Thompson he admitted that the Shipping Board equipment in the Pacific Orient service is of the highest type and that he appreciated that the United States Government is operating its ships at a loss. Mr. Thompson asked then why he had neglected to confer with the board before making a new contract with a direct competitor.

"I didn't think there was any possibility of any Shipping Board line across the Pacific making an exclusive contract with any American railroad," said Mr. Kenney, "while we had a preferential contract which was very advantageous to us. The shippers have their preferences and we couldn't get 1,000 tons a year for any other line, if we had no contract, because the business is so closely tied up."

Mr. Thompson said: "The Great Northern on October 18 went into direct competition with the United States government in its efforts to build up an American merchant marine" and asked Mr. Kenney what his feeling was about abrogating the contract. "I don't want to let your statement go unchallenged," retorted Mr. Kenney. "This is only an extension of a contract that has been in existence for 25 or 30 years. Up to the present time there has been no other service available to the Great Northern. In proportion to our resources we have lost more money carrying the American flag on the Pacific than the United States government has. We are not opposing any measures of the Shipping Board to promote American commerce but we should not be condemned for carrying out our contract. When you talk about patriotism you might also talk to the shipper in this country who is shipping by the Canadian Pacific because he prefers its service on the Pacific. That agreement with the Nippon Yusen Kaisha is very valuable to the Great Northern and we want to hold it as long as we can until some substitute is given us that is as good. Why should we work with a line that cannot make a contract and is as likely to turn its inbound freight over to the Canadian Pacific as to us?"

Mr. Thompson said he had not said anything about patriotism nor attempted to "wave the flag," but that he was talking business and that the Great Northern had given the board no opportunity to offer its service.

"I know enough about the law to know the board couldn't make any exclusive contract," said Mr. Kenney.

"It could take care of all of your business," said Mr. Thompson.

"But the N. Y. K. gives us business in return," said Mr. Kenney.

### Business Might Go to Canadian Roads

With the preferential clause in it, Mr. Kenney said, he supposed the Shipping Board could object to the contract. Asked if he would abrogate the contract, he said he had no authority to do that and he would have to put the question up to his president. Mr. Thompson asked if he would not do so by wire. Mr. Kenney said he would want an opportunity to confer on the subject and asked if he could not submit a contract that might be approved by the Shipping Board that would not make it necessary for the road to throw the business to the Canadian Pacific. Mr. Thompson persisted in asking whether, assuming the Shipping Board would not approve any contract, Mr. Kenney would give assurance that any contract considered by the board to be adverse to American interests would be cancelled. Mr. Kenney said that his disposition was to be helpful but he would want time to consult on this. Commissioner Lissner asked if the railroad officers were not aware of the agitation against these foreign contracts when the contract with the

Japanese line was renewed. Mr. Kenney replied affirmatively, but said that if his company had refused to renew it, the contract would probably go to a Canadian road, which would give the Japanese line dock facilities at Victoria or Vancouver and this would be of no benefit to the American merchant marine. Mr. Lissner said that the law provides that such a contract is lawful only so long as approved by the Shipping Board and that the company had failed to file it with the board or consult with the board about it. Mr. Kenney said he had not understood it was necessary to get the approval of the board, although the board had been advised that the company intended to make a new contract. Much American freight, he said, is now going to the Canadian Pacific because of its superior service on the Pacific. When the Shipping Board has a superior service it will get the business. He promised to take up the matter with the president of the road and to advise the board promptly.

#### **Insists C. M. & St. P. Contract**

##### **Beneficial to U. S. Trade**

R. M. Calkins, vice-president of the Chicago, Milwaukee & St. Paul, insisted that his company's relations with the Osaka Shosen Kaisha have been beneficial to the trade of the United States. The contract is no longer in existence, he said, but there is a tacit understanding for the interchange of tonnage on about the same basis as provided in the contract during the latter years of its life. The St. Paul has done, and will continue, he said, to do all it can to foster American shipping and it has taken a deep interest in the efforts of the Shipping Board to build up a service on the Pacific coast. It is grateful for the beautiful ships that were recently put into the North Pacific coast service and it has spent a good deal of money to advertise that service, but as to the freight business the routing is largely controlled by the shippers and the railroad has very little to say about it.

The Japanese have their own ships and the shippers in the Orient naturally prefer to patronize their own lines. If a bar is put up against this traffic, it would be easy for it to be handled through the canal and by water to Atlantic ports where there is a comparatively slight rail haul to be considered, because a large part of the Oriental business originates or is destined to ports east of Chicago. A bar against this traffic through the North Pacific coast would simply deprive the American lines of the opportunity to participate except for the short haul inland from the Atlantic seaboard. The Osaka Shosen Kaisha is firmly entrenched in the Orient, he said, and if American lines want to control the business, they must fortify themselves in the same way, because to operate ships successfully they must be loaded in both directions. The railroad has never been advised that there was a dependable American service on the Pacific coast and in order to solicit business it is necessary that regular sailing schedules be maintained so that space can be reserved in advance. He also pointed out that whereas Canada prevents most of her exports from being handled through other than Canadian ports, enough American goods are sent out via Canadian ports to fill up a good many American ships. Mr. Thompson said the board is just as much concerned with fostering business for American railroads against Canadian railroads as it is with getting business for American ships and he had discussed with the Interstate Commerce Commission the question of protecting the American lines. Mr. Calkins said that the Interstate Commerce Commission is vested with authority to deal with the situation if it will do so.

Mr. Calkins said that the agreement provides that each party shall give preference to the other as against competing lines. When Mr. Thompson said that means that the

St. Paul will give preference to the Osaka Shosen Kaisha as against the government service from Puget Sound to the Orient, Mr. Calkins said that language was put in the contract in 1908 and conditions have been altered since then. The road would be willing to cancel the preferential clause, but as to the abrogation of the contract entirely, it would depend on what substitute could be made for it. The present traffic is balanced and gives many millions of revenue to the railroads. "I am sure," he said, "this committee would not ask me to recommend that we give up that business unless I have something tangible with which to replace it."

#### **Rate Question Also Involved**

The rate question is also involved, Mr. Calkins said, citing a case where a Shipping Board vessel had recently quoted a rate of 65 cents to New York on crockery from China as against a rail rate of \$1.50. Commissioner Thompson said that the railroad is apparently unwilling to take a chance in order to do business with American ships. He recognized the problem involved in the inbound traffic and said that it may be true that some of it might be lost to the St. Paul, but he thought some assurance could be given that it would be confined to American lines. Mr. Calkins said that he was sure the board did not expect to secure tonnage at the expense of the Great Northern or St. Paul treasuries, to which Mr. Thompson replied that there would be no loss on the outward cargo. Mr. Calkins said he could not admit that, because 80 per cent of it originates east of Chicago and he doubted whether the railroads and the Shipping Board together could control it if the foreign steamship companies prefer to handle it by way of Canada or through the Panama Canal to the Atlantic seaboard. Mr. Thompson said the board would like to have the same kind of co-operation from the St. Paul that it now gives to the Japanese line and while there may be some loss of inbound traffic there is some agency of the government that can give some protection. Mr. Thompson again asked if the railroad would abrogate the contract, saying that he had preferred to discuss the question on a friendly basis rather than on a legal basis. Mr. Calkins said he would want to discuss further the question of what can be done to replace the contract. His company has made no money for its stockholders for five years and he would not be justified in sacrificing the revenue without any assurance.

#### **Board Issues Statement**

Commissioner Thompson issued a statement, saying that the attitude of the railroads with respect to those contracts had been reported to a full meeting of the board, and that the members were gratified at the willingness of the railroad companies to follow the views of the government. The statement also indicated his belief that the Great Northern had committed itself to abrogate the contract.

"The conclusion of the Shipping Board that the agreements were harmful to the development of American vessels," said Commissioner Thompson, "was clearly defined to the railroad executives present, and it was considered a good augury to have evidenced the disposition of the rail carriers to form a closer working contact with the organization of the Shipping Board, looking toward an extension of American commerce in American vessels. "It was particularly gratifying to the board to hear the expression of the two trans-continental carriers, handling the major portion of the Pacific-Orient commerce, that the establishment of an American flag service from the Pacific Coast to the Orient had resulted in a record-breaking service as to time and accommodations. The Shipping Board felt confident that upon reflection the Chicago, Milwaukee & St. Paul, the only company whose representative would not guarantee to recommend to his associates the cancellation of its agreements

with the Osaka Shosen Kaisha, would recognize the necessity of meeting not only the views of the board, with respect to its contract with this foreign company, but would fall in line with the spirit evidenced by all of the rail lines who were represented at the meeting and who possess similar agreements."

Commissioner Thompson has asked the roads to give him written confirmation of their statements regarding the abrogation of the contracts.

### Possibility of Ship Subsidy

President Harding has let it be known that he intends to go before Congress early in January with a special message advocating some form of a ship subsidy to assist in the development of the American merchant marine. The form of subsidy to be proposed has not yet been decided upon but will be based on recommendations to be made in a report from the Shipping Board which is making a study of the whole situation, under the direction of Commissioner Meyer Lissner, assisted by a committee of economic experts. It is hoped to substitute this plan for that contemplated in the Jones merchant marine act of assisting American shipping by preferential rail rates and other discriminations against freight shipped in foreign bottoms. It is also hoped by this plan to hasten the day when the Shipping Board will be able to sell its ships to private companies and get the government out of the business of ship operation.

## Calm Again Marks Railroad Labor Situation

ONCE MORE comparative calm prevails in the railroad labor situation. The recent rules regarding the working conditions of shop employees promulgated by the Railroad Labor Board, and announced in last week's *Railway Age*, have been received with widely varying attitudes, ranging from severe condemnation to tacit approval. From B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, who is largely responsible for the attitude which the employees will take toward these new rules, came only the brief statement that no definite action would be taken by the Federated Shop Crafts until after the first of the year. Other labor leaders connected with the Federated Shop Crafts, however, have expressed approval of various sections of the new rules and it is considered unlikely that any radical action will be taken on this issue alone. At the same time, it is recognized, because of the past policy of these organizations, that it is not improbable that the changes which have been made in the working conditions of the shomen will be used as a strong argument against any further reductions in the wages of these employees.

Samuel M. Felton, president of the Chicago Great Western, in commenting upon the new rules, said:

The ruling of the Railroad Labor Board, promulgating new rules to govern the working conditions of railway shop employees, contains provisions which should tend to remedy, to some extent, the waste and inefficiency caused by application of various rules of the National Agreements adopted during federal control. However, the decision does not give relief from the bad effects produced by the application of most of the working rules throughout the country regardless of widely varying local conditions. To this extent the decision represents a denial of the railroads' plea. The effects produced by these new rules can be properly appraised only after they have been in effect for some time. It is not improbable, however, that a large part of the objections made by the railroads to the rules in the National Agreement will apply with equal force to these new rules, unless, as in some cases authorized by the Board, they are modified by agreements between the individual lines and their employees. It is quite evident from an examination of the rules as promulgated by the Board that

the savings to the railways in money which will be effected by the changes it has made will not relieve the railways of a really substantial part of the burden imposed by the National Agreements.

### Labor Board Takes Up Maintenance

#### Of Way National Agreement

On December 8 the Railroad Labor Board began consideration of the disputes in regard to the rules and working conditions of maintenance of way employees. The Board's action on these disputes will probably result in the modification of the National Agreement between the Railroad Administration and the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers which became effective December 16, 1919. This National Agreement has been superseded on some 35 or 40 railroads by subsequent agreements between the carriers and the men involved and these agreements will not be affected by the Board's action. Where rules have been agreed to in part by the carriers and the men the agreed rules will stand.

Approximately 95 railroads are directly involved in the present disputes, but the decisions as to them will affect others which may afterward come before the Board. Of the 83 rules in this National Agreement all are in dispute before the Board. However, an agreement has been reached on most of these rules on a majority of the lines. The six rules over which a majority of the roads and their maintenance of way employees have disagreed relate to overtime and similar subjects and to pay for time of men traveling to and from work.

### Clerks Request Wage Increase

Following the lead of the Federated Shop Crafts, in requesting increases in wages as a strategic move to offset the requests of the carriers for further wage reductions, the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Station and Express Employees, through E. H. Fitzgerald, its president, has issued instructions to its general chairmen on the various carriers to demand the restoration of the rates of pay in effect prior to the 12 per cent wage cut of last July.

### New England Roads Win Case

A minor decision, significant, however, to five New England carriers—the Boston & Maine, the Maine Central, the New York, New Haven & Hartford, the Central New England and the Portland Terminal—was recently handed down by the board. This decision rules that the differential now existing between the daily rate of pay of employees working on a six and seven-day per week basis (caused by the application of Rule 66 of the clerks' National Agreement to daily and hourly rated employees) should be abolished by reducing the daily rate of the seven-day per week employees to the same daily rate paid the six-days per week employees. The change is effective on December 16.

### B. W. Hooper Tells of Labor Board's Work

Reports to the United States Railroad Labor Board show steadily improving conditions among the railroads of the country, Ben W. Hooper, vice-chairman of the Board, said in a statement on December 5. Mr. Hooper pointed out that the Board's decision not to consider wage reductions for any class of employees until working rules for the class had been disposed of had not delayed consideration of wage disputes on any railroad or for any class of employees. His statement follows:

The railroad situation is more conducive to optimism than it has been for many months. The absence of any serious general labor disturbance, combined with the disposition of the carriers to make voluntary reductions in freight rates, will both contribute to the restoration of sound business conditions.

The Labor Board receives evidence every day of the more cordial co-operation of the carriers and the employees in carrying out the provisions of the Transportation Act. Another gratifying feature of the situation is that the public is manifesting an awakened interest in the work of the Board.

If it be a fact that the Labor Board is solely dependent on public opinion for the enforcement of its decisions, then it is highly important to the public that it be furnished correct and impartial information relative to the work of the Board.

The misleading statements that have been fed to the public in regard to the alleged methods employed to avert the recently threatened strike have been completely refuted by the subsequent work of the Board.

It has been amazingly reiterated that the Board or some of its members promised that there should be no consideration of the question of wages for a year, or until next July as it was frequently put. As a matter of fact, the Board merely said that it would not take up any readjustment of wages, upward or downward, for any class of employees, until the rules and working conditions for that particular class of employees had been decided.

This was a sensible and just exercise of the Board's discretion in arranging its own docket. It did not involve the promise of a delay of one year, one month, or one minute in the consideration of the wage question.

As a vindication of the Board's course in this matter, it now transpires that the shop craft rules have been finished and handed down, effective December 1, and neither the

carriers nor the crafts can get before the Board with a wage dispute for weeks.

In an address before the Chicago Association of Commerce several days previous Mr. Hooper, in commenting on the railroad labor problem, said:

There are grounds for optimism in the railroad situation. Under ordinary conditions there is an esprit de corps among the railroad workers that is highly conducive to the welfare both of the carrier and the public. This spirit should be encouraged and enlarged until railway employees feel as deep a sense of responsibility to the people and the government as though they were in the postal or other public service.

From this will come efficient and uninterrupted transportation, and the employees need have no fear that a grateful people will fail to reward this service with just and reasonable wages and working conditions. Gradually railway labor will come to entertain the belief that they must fight for what is justly due them or to be subject to the temptation to contend for more than their due.

In this connection it is it but just to state a fact based upon the records of our Board, and that is that up to the present time the carriers have been guilty of far more violations of the decision of the Labor Board than have the employees. There are evidences, however, of a growing purpose both on the part of the roads and their employees to co-operate hereafter more closely and cordially with the Labor Board.

# Interstate Commerce Commission Annual Report

## Rate Readjustments and Relations with Merchant Marine Leading Topics Discussed

WASHINGTON, D. C.

THE ANNUAL REPORT of the Interstate Commerce Commission, covering the year ended October 31, 1921, submitted to Congress this week, says that perhaps the most difficult task now confronting the commission, and certainly the one of greatest importance to the public, is the readjustment of freight rates which is necessitated by the changing conditions attendant upon the recovery of this country and others from the effects of the World War. The commission is "hopeful that with an improvement in the volume of traffic and with a further adjustment of operating costs in harmony with prevailing tendencies, a substantially lower level of rates and fares will be compatible with the rule of rate-making which has been prescribed by the Congress and at the same time permit an adequate maintenance of the properties." The report was compiled prior to the issuance of the order for a general rate inquiry on which hearings are to begin on December 14, but the discussion of rate readjustments and of the action of the commission with relation to intrastate rates is given first place in the report.

### Summary of Recommendations

For the reasons stated in this report and in former reports, the commission recommends:

1. That section 1 of the interstate commerce act be amended to provide for the punishment of any person offering or giving to an employee of a carrier subject to the act any money or thing of value with intent to influence his action or decision with respect to car service, and to provide also for the punishment of the guilty employee.

2. That the boiler-inspection act, as amended, be further amended to provide for increases in the number and salaries of inspectors.

3. That the use of steel cars in passenger-train service be required, and that the use in passenger trains of wooden cars between or in front of steel cars be prohibited.

4. That the hours of service act of March 4, 1907 (34 Stat., 1415; 8 Comp. Stat. 1916, p. 9448), be so amended that it will require all service of employees subject to the act

to be construed as continuous service, except that if an employee is given a release from duty for a definite period of not less than three hours, and under such circumstances that the employee has proper facilities and opportunities for securing rest during such relief period, such relief period can be used to break the continuity of the service and the service ceases to be continuous service and becomes aggregate service.

5. That the power to award reparation be placed wholly in the courts; that a condition precedent to an award of reparation by a court for unreasonable rates or charges be that we have found such rates or charges unreasonable as of a particular time; that the law affirmatively recognize that private damages do not necessarily follow a violation of the act; that provision be made that sections 8, 9, and 10 of the interstate commerce act shall be construed to mean that no person is entitled to reparation except to the extent that he shows he has suffered damage; and that the law should provide that if a rate is found to be unreasonable the rule of damages laid down in the *International Coal Case*, 250 U. S., 184, should control.

6. That section 20a of the Interstate Commerce Act be so amended as to indicate definitely the classes of electric railway companies subject to that section.

7. That paragraphs (4) to (8), inclusive, of section 5 of the Interstate Commerce Act be so amended or supplemented as clearly to provide whether and, if so, how voluntary consolidations of carriers may be effected pending ultimate adoption by us of a complete plan of consolidation.

8. That section 19 of the merchant marine act, 1920, be amended so that its provisions will clearly not be applicable to the Interstate Commerce Commission.

9. That section 28 of the merchant marine act, 1920, be reconsidered by the Congress in the light of the circumstances set forth in the chapter on the effect of this statute appearing at pages 13 and 14 of this report.

An abstract of the more general parts of the report is as follows:

## Abstract of Report

During the war, and for some time after the signing of the Armistice, the constantly rising operating expenses of the railroads made necessary very material increases in rates. It is unnecessary to refer particularly to what may be called minor readjustments, affecting only one or a few commodities in a restricted territory, although many of these resulted in substantial increases.

The Congress is familiar with the situation of the railroads at the termination of federal control, and with the various provisions in the transportation act, 1920, designed to remedy that situation. Among other things, the Interstate Commerce Act was amended by adding a new section, designated section 15a.

Following this enactment we instituted a proceeding to determine what rates would be necessary to give effect to the intent of Congress. Since that decision was promulgated on July 29, 1920, conditions throughout the country have changed to a marked degree. The general trend of commodity prices and of labor costs has been downward.

We have been confronted with the demands of shippers, on the one hand, for reductions in rates which they allege are excessive and out of all proportion to the fall values of commodities, and which interfere with, or prevent, commodity movement; and, on the other hand, with the fact that the carriers have not been receiving the fair return contemplated by Congress.

Many rate readjustments have been made since the increases authorized in *Increased Rates*, 1920, *supra*, became effective on August 26, 1920. Some were made by the carriers voluntarily, others at our suggestion, and still others under our requirement after formal hearing. In some adjustments there were both increases and decreases, and in many others only decreases. It is safe to say that at least a million changes in individual rates have been filed with us. The increases were made to remove discrepancies in rate adjustments and classifications. The reductions have been material, entailing reductions in carrier revenue of millions of dollars. The reductions embrace rates on lumber, grain, hay, raw sugar, canned goods, coal, smelter products, iron ore, iron and steel; on range cattle and other live stock; on potatoes and other vegetables; on sand, gravel and other road-building material; and on other articles of commerce that move in large volume.

The value of the service and the cost of transportation are among the important elements to be considered in determining the reasonableness of freight rates. These elements are, and for some time have been, in a state of flux. As a result, freight rates have not yet reached a condition of equilibrium.

### Interstate and Intrastate Rates

As previously stated herein, we instituted a proceeding designated Ex Parte 74, in which hearings were held in Washington in May, June and July, 1920. In accordance with the provisions of paragraph (3) of section 13 of the act we invited the state commissions to cooperate with us in this proceeding, whereupon three state commissioners were selected by the National Association of Railway and Utilities Commissioners and sat with us throughout the hearings and oral argument and deliberated with us in conferences antecedent to our determination of the matters in issue.

As a result of the information obtained, we concluded that for the purposes set forth in section 15a, the country should be divided into four groups, designated eastern, southern, western and mountain-Pacific; that, with certain exceptions, passenger fares should be increased 20 per cent, with a 50 per cent surcharge on sleeping and parlor car fares to accrue to the rail carriers; and that, generally, freight rates should be increased 40 per cent in the eastern group, 25 per cent in the southern group, 35 per cent in the western group, 25 per cent in the mountain-Pacific group, and 33 1/3 per cent between groups, subject to the readjustments there recommended.

Corresponding increases were authorized by state commissions in about one-half of the states. In the other states the state commissions denied, either wholly or in part, the carriers' applications for similar increases, whereupon the latter filed petitions with us, in accordance with the provisions of paragraph (3) of section 13, alleging that such refusals caused advantages, prejudices, and discriminations prohibited and declared to be unlawful by paragraph (4) of section 13.

In these cases it appeared that the commissions in 3 states declined to authorize any increases in intrastate rates, fares, or charges; in 17 they denied increases in passenger fares, but granted full or partial increases in freight rates; in 4 they granted increases in passenger fares, but not the full increases in freight rates; in one the state commission granted all increases except the Pullman surcharge. Thirteen out of the 17 commissions which denied increases in passenger fares did so on the ground of lack of jurisdiction, because the intrastate fare was fixed by state statute.

Pursuant to said petitions we instituted additional proceedings, and after hearings, we found that certain of the intrastate rates or fares or charges complained of caused undue and unreasonable advantages, preferences and prejudices as between persons and localities in intrastate commerce on the one hand, and interstate commerce on the other hand, and undue, unreasonable and unjust discrimination against interstate commerce; whereupon, for the purpose of removing such advantages, preferences, prejudices and discriminations, we issued orders requiring the carriers involved to make certain increases in intrastate rates or fares and charges. To meet complications which early arose, we stipulated that the authority to increase rates, fares and charges should not be construed as authorizing any common carrier to establish, put in force or maintain any rate, fare or charge intrastate which is greater than its corresponding rate, fare or charge interstate commerce from, or at the same points, or greater than its corresponding rate, fare or charge contemporaneously in effect and applicable to the transportation of passengers or property in interstate commerce.

Court proceedings have been instituted by the authorities of certain states to set aside the orders affecting their respective states on the grounds, generally, that the orders were invalid, first, because not based upon substantial evidence of unlawful discrimination; second, because we had misinterpreted the authority conferred upon us by the interstate commerce act; and third, because the provisions of law under which we acted constitute an unauthorized interference with state authority and are unconstitutional. Certain carriers have also sought injunctions in the United States district courts to restrain state authorities from interfering with their carrying out of our orders. Hearings have been had in a number of these cases, and so far as we are advised, the federal courts have held our orders to be valid.

Two cases involving such orders have been argued before the Supreme Court. One of them, known as the *Illinois v. Passenger Fares Case*, has been set for further argument. In addition to the two cases mentioned, two original proceedings have been instituted in the Supreme Court, one by the state of North Dakota, and the other by the state of Texas. The Texas case, apparently, raises every conceivable issue.

The provisions of section 15a of the act do not apply to express companies, but we have before us proceedings as to 13 states wherein it is contended that certain rates and charges, which the American Railway Express Company is required by these states to apply to transportation of express matter in intrastate commerce, cause the advantages, preferences, prejudices and discriminations prohibited and declared to be unlawful by paragraph (4) of section 13 of the act.

### Consolidation of Railroads

On May 11, 1920, we instituted an investigation for the purpose of preparing and adopting a plan for the consolidation of the railway properties of the continental United States into a limited number of systems. We contemplated in paragraphs (4) and (5) of section 5 of the interstate commerce act, Prof. W. Z. Ripley, of Harvard University, was employed to make a preliminary study of the problem. Under our direction he spent several months assembling and analyzing data and conferring with interested parties. The results, together with his recommendations, were embodied in a report to us. On August 3, 1921, we agreed upon a tentative plan confined, in the main, to class I roads, and published Prof. Ripley's report as an appendix thereto. In some respects our tentative plan presents alternatives for systems recommended by Prof. Ripley.

Due publicity has been given to this tentative plan. After a reasonable time for preparation by parties interested, hearings will be held at convenient times and places upon notice, given to all carriers by railroad, so that a full record can be developed upon which can rest the plan to be ultimately adopted.

### Railroad Earnings

Railroad earnings and expenses during the past year reflect the unsettled industrial conditions resulting from the economic adjustments following the war. In 1920, the rising cost of labor and materials led us to sanction a sharp increase in the charges for transportation. These increases became effective near the close of August, 1920, which was the last month of the guaranty period. The increased rates, combined with a volume of traffic that tested the capacity of the railways, resulted, in spite of the high costs of operation, in substantial increase of net earnings in September and October, 1920, but these did not attain a level equivalent to a rate of 6 per cent per annum upon the aggregate value of the railway property of the carriers held for and used in the service of transportation as determined by us in July, 1920, under section 15a. Net earnings fell rapidly after October, 1920, reaching almost a vanishing point in January, 1921. The inability of railroads at once to adjust expenses, proportionately to a marked reduction in traffic, accounts for the change. With a reduction of nearly half a million employees in service, and also as a result of some recession in the cost of materials, the net railway operating income showed an improvement in succeeding months. The reduction in expenses involved some retrenchments with respect to maintenance. With the reduction in the level of wages effective as of July 1, 1921, the net earnings in July, August and September, 1921, again showed substantial increase, although not reaching a rate of 6 per cent on the value so determined for the United States as a whole. This more favorable showing came in spite of the continued depression in traffic.

### Relations with the

#### Railroad Labor Board

Under the provisions of the transportation act, 1920, the Railroad Labor Board is given certain jurisdiction over the wages which shall be paid by carriers to their employees, and over working conditions. While the law makes no provision for co-ordination between the labor board and the commission, the desirability of contact between the two bodies is appreciated. Since the creation of the labor board, informal conferences have been held from time to time, and will, without doubt, be continued in the future. We have been solicited to procure and have at hand such statistical information as may aid the labor board in its work.

### Relations with the

#### United States Shipping Board

Section 19 of the merchant marine act, 1920, provides in part as follows: "Sec. 19. (1) The (United States Shipping) Board is authorized and directed in aid of the accomplishment of the purposes of this Act \* \* \*

"(c) To request the head of any department, board, bureau or agency of the government to suspend, modify or annul rules or regulations which have been established by such department, board, bureau or agency, or to make new rules or regulations affecting shipping in the foreign trade other than such rules or regulations relating to the Public Health Service, the Consular Service and the Steamboat Inspection Service."

The United States Shipping Board has taken the position that the provisions of section 19 are applicable to the Interstate Commerce Commission. With this view we are not in accord. However, recognizing the desirability of co-operation between different branches of the government, and the benefits to be derived from joint consultation, we have appointed a committee

to confer with a like committee from the Shipping Board upon matters of common interest and concern. But we feel that decision in such matters as have been placed within our jurisdiction by the interstate commerce and related acts must lie with us just as determination of matters placed primarily within the jurisdiction of the Shipping Board by the acts under which it functions must lie with that tribunal. It is desirable that section 19 of the merchant marine act be amended specifically to exclude this commission from its operation.

Section 8 of the merchant marine act, 1920, requires the United States Shipping Board, in cooperation with the Secretary of War, to investigate territorial regions and zones tributary to ports; the causes of congestion of commerce at ports; the subject of water terminals, and other matters which would tend to promote and encourage the use of vessels of ports adequate to care for the freight that would naturally pass through such ports, and in case changes are deemed necessary in the rates, charges, rules or regulations of rail carriers subject to our jurisdiction to submit its findings to us for such action as we may consider proper under existing law. Pursuant to section 8, the Board of Engineers for Rivers and Harbors made a survey of port facilities at south Atlantic and gulf ports, and on March 25, 1921, the Secretary of War and the United States Shipping Board placed the results of this survey before us. In substance it was represented to us that the charges, regulations and practices of rail carriers at these ports were preventing the erection of needed terminal facilities; the natural development of the ports; the proper building up of our merchant marine, and the economical carrying on of foreign commerce. On April 9, 1921, we entered an order instituting a general investigation into the situation. Hearings in this investigation have been held. Necessity may be developed for extending the scope of the investigation to include north Atlantic and Pacific coast ports.

#### Section 28 of the Merchant Marine Act, 1920

Section 28 of the merchant marine act, 1920, provides that no lower rate, fare or charge shall be charged, collected or received for the transportation within the United States of persons or property in foreign commerce than is charged for like transportation in domestic commerce, unless the water transportation from or to the port of export or import shall have been or is to be in a vessel documented under the laws of the United States. It also authorizes us, upon the certification of the Shipping Board that adequate shipping facilities are not afforded by vessels documented under the laws of the United States, to suspend the operation of the provisions of this section, and to terminate the suspension upon further certification of the Shipping Board that adequate facilities are so afforded. Upon appropriate certifications received from the board, we have suspended the operation of the provisions of this section indefinitely.

The effect which the operation of section 28 may have upon the flow of commerce through different ports, and the possible resultant injury to some ports, merit the serious consideration of the Congress. Rail carriers, in making export or import rates, frequently group the ports in a given region, such for instance, as the gulf region, and the lowest domestic rate to or from any port in the group upon the particular description of traffic under consideration is published as the export or import rate on

that traffic to or from all ports within the group. The grouping is of benefit to shippers as well as to the ports affected, each one of which is nearer to some points of origin, and more distant from others, than any of the other ports. It follows that between certain origins and certain ports export or import and domestic rates are on a substantial parity. Even in the absence of such grouping, the difference between the export or import and domestic rates to or from various ports is materially greater in some instances than in others. When section 28 becomes operative, it is probable that export and import shipments moving in foreign vessels will seek the ports having the lowest domestic rates, and at these ports the foreign vessels will be able to compete upon practically equal terms with the United States vessels. The ultimate effect of section 28 may be merely to divert traffic from certain ports to others with little or no gain in tonnage for United States vessels.

The adequacy or inadequacy of shipping facilities afforded by vessels documented under the laws of the United States may vary from time to time dependent upon market conditions and the hazards of operation. It may become desirable, when adequate shipping facilities at particular ports are afforded by vessels so documented, to terminate the suspension of the operation of section 28 with respect to those ports, but not as to others. Subsequent developments may make renewed suspension necessary. The construction and maintenance of port facilities are costly, and if the use of ports is to be made variable and shifting under the operation of this section, that cost will be reflected in varying proportions in the charges to be borne by the shipping public.

Another aspect also merits careful consideration. A large part of the exports of grain, for example, move by rail under transit arrangements which permit of elevation, storing, grading or other treatment within a limited period, as for instance 12 months, at the transit point, and forwarding on the balance of the through rate in effect at the time and from the place of original movement. If section 28, now suspended, should become operative, shipments of grain could thereafter be carried in the same train from the same elevator to the same port for the same foreign vessel, on some of which the balance of the through export rate, which was in effect perhaps a year before, will be collected, and on other of which the higher domestic rate must be collected. If for some cause the suspension should be renewed, grain which had left the country elevator while section 28 was operative, would still take the domestic rate from the transit point, and grain originally shipped during the new suspension would take the export rate, although moving together from the same market to the same port for the same foreign vessel. The difficulty of policing such situations will be great. Moreover, grain dealers at primary markets name prices to foreign purchasers on grain delivered at the port. The purchasers arrange for the vessel, and the dealer can not tell, in naming his price, whether or not a foreign vessel will be selected by the purchaser. Obviously the dealers' risk of loss will be great, and the effect upon commerce most prejudicial.

In our judgment, the Congress should take such action with respect to this section as may be necessary to obviate unnecessary conflict with the needs and usages of inland transportation.

#### Export Bill of Lading

The transportation act, 1920, added to the interstate commerce act, a new section, designat-

ed section 25, which requires water carriers engaged in foreign commerce whose vessels are registered under the laws of the United States, to file with us schedules of sailing dates, routes and destinations, which schedules shall be published by us and distributed to railway agents, at points designated by us, for the information of shippers; provides a method of procedure for reserving space at specified rates in the vessels of such water carriers; and, where such space for an export shipment has been reserved, directs the rail carrier to which the shipment is delivered for transportation to issue a through export bill of lading to destination.

Paragraph (4) of section 25 provides, in part: "The Commission shall, in such manner as will preserve for the carrier by water the protection of limited liability provided by law, make such rules and regulations not inconsistent herewith as will prescribe the form of such through bill of lading."

On April 14, 1919, we made a report and order in *Bills of Lading*, 52, 1. C. C., 671, wherein we prescribed a uniform domestic bill of lading and a uniform export bill of lading. Our order was enjoined by a divided court in *Flag v. S. S. Co. v. United States*, 259 Fed., 713.

The Supreme Court held, on appeal, that the case was made moot by the passage of the transportation act, 1920, and reversed the order of the district court, remanding the case to that court with directions to dismiss the petition with out prejudice to the right of the complainants to assail in the future any order we might make prescribing bills of lading pursuant to the new legislation.

On August 7, 1920, we entered an order reopening *Bills of Lading*, *supra*, for further hearing with respect to the form and substance of through export bills of lading. Pursuant to the directions of Congress quoted above, we made a report and order, *Export Bill of Lading*, 64, 1. C. C., 347, making rules and regulations prescribing the form of through export bill of lading to be issued by carriers subject to the interstate commerce act for application to the transportation of property from points in the United States designated under the provisions of section 25 to points in nonadjacent foreign countries in connection with ocean carriers whose vessels are registered under the laws of the United States.

The inland carriers, and more particularly the eastern carriers, challenged our jurisdiction to do more than prescribe the "form" as distinguished from the substance of the bill of lading, their illustrations of form being size of type and color of paper. For the reasons stated in our report, we found that:

"... our power to prescribe rules and regulations, not inconsistent with the act, which shall constitute and determine the form of the bill of lading, covers the terms or tenor of that instrument, and is, as to the transportation and delivery to the ocean carrier, adequate and complete."

The ocean carriers beyond the port of export, however, are not subject to the act except to the extent stated in section 25. A additional legislation may become necessary to carry out the purpose of the Congress.

All parties to the proceeding emphasized the importance of securing a bill of lading that would be placed in general use at once. We have taken such action, consistent with the record before us, as in our view seems calculated to effect this object. Before adopting the report and order, we conferred with a committee of the Shipping Board representing that body

The commission's expenditures for the fiscal year ended June 30, 1921, were \$6,193,714, including \$2,728,656 on account of the valuation work.

THE GOVERNMENT RAILWAY in Alaska was opened through to Fairbanks on November 26. A total of 545 miles of railroad is now in operation with train service twice a week in each direction. At two river crossings temporary arrangements are still used. At Mile 347 a steel viaduct is to be constructed, contract for which is held by the Phoenix Bridge Company, Phoenixville, Pa. The steel for this viaduct has been shipped and it is expected to have the bridge erected by the first of February. This will complete the

Abstracts of the reports of the various bureaus of the commission, which are included in its report, are given separately.

line with the exception of a permanent crossing of the Tanana river at Nenana, about 35 miles from Fairbanks, the northern terminus. The appropriation recently granted by Congress for work of the Alaskan Engineering Commission for the next fiscal year is principally to take care of this bridge. The crossing is now made by means of a ferry in the summer time, and by extending a narrow-gage track over the ice in the winter time. When the bridge is built, the gage of the track from North Nenana to Fairbanks will be standardized.

## Freight Car Loading

WASHINGTON, D. C.

**L**OADING OF REVENUE FREIGHT totaled 673,827 cars during the week which ended on November 26, according to reports compiled by the Car Service Division of the American Railway Association. This was 112,844 cars less than were loaded during the previous week, the decrease being due principally to the observance of Thanksgiving Day. The total, however, was 129,874 cars less than were loaded during the corresponding week in 1920 which also included the same holiday and 65,370 cars below the total for the corresponding week in 1919.

Because of the observance of the holiday, reductions were reported in the loading of all commodities, compared with the week before. Loading of coal amounted to 137,432 cars, the lowest for any week since that of July 9, which included the Fourth of July. This also was a reduction of 29,354 cars compared with the week before. Merchandise and miscellaneous freight, which includes manufactured products, totaled 419,757 cars, 63,424 less than the previous full week.

Loading of live stock totaled 25,866 cars, the lowest number since the week of September 10 and a drop of 8,672 compared with the week before. Grain and grain products amounted to 35,081 cars, 2,374 less than the week before, but 1,773 more than the corresponding week last year. Tabulations showed 43,843 cars loaded with forest products during the week, 6,457 less than the previous week, while coke totaled 6,307 cars, or 180 cars less than the week before.

Ore loadings also were 2,383 below the week before, the total being 5,541 cars.

Except for grain and grain products, the loading of each commodity during the week of November 26 was less than during the corresponding week last year. Total loadings of all commodities by districts were also less compared with the previous week as well as compared with the corresponding week last year.

The loading during the week which ended on November 19 totaled 786,671 cars. This was an increase of 33,625 cars over the week before when loadings were reduced by the observance of armistice and election days. The reports show, however, that while the total for the week of November 19 was greater than that for the week before, the average per day was less. Compared with the corresponding week last year, the total for the week of November 19 was a reduction of 102,467 cars, while it was 67,930 cars less than for the corresponding week in 1919.

Loading of merchandise and miscellaneous freight totaled 483,181 cars, which was an increase over the short week before of 16,884 cars. This was, however, 8,070 cars less than were loaded during the corresponding week in 1920. Coal shipments amounted to 166,786 cars, an increase of 14,477 over the previous week, but 49,536 cars less than were loaded during the corresponding week last year.

Loading of grain and grain products totaled 37,455 cars, 3,053 more than during the week before, and 1,702 cars more than during the same week last year. Livestock also showed an increase over the previous week of 269 cars, the

Revenue Freight Car Loadings for the Past Four Years

total being 34,538 cars, while coke totaled 6,487 cars, a gain of 37 over the week before.

Shipments of forest products amounted to 50,300 cars or 361 less than the week before, and ore totaled 7,924 cars, a decrease of 734 cars within a week. Except for grain and grain products, shipments of all commodities were less during the week of November 19 than during the corresponding week last year.

Compared by districts, increases over the week before were reported from all regions in the loading of all commodities, except the Pocahontas and Southern districts, but all showed decreases, compared with the corresponding week last year.

The summary for the week of November 19 is given in the table on the opposite page.

An item of interest in the comparison of the week of November 19, with the same week a year ago, is the fact that the decrease in the loading of coal, coke and ore, which commodities are particularly vital to the iron and steel trade, accounts for more than 80 per cent of the total decline.

Complete reports for quarter-monthly period ended November 23 indicate a continued increase in the surplus of all classes of cars, the total being 213,523. This is an increase of 73,000 cars as compared with period ended November 15. The bulk of this increase is evenly divided between box and coal cars, there being approximately 35,000 increase in each type with scattering increases in flat, stock and refrigerators.

Shortages reported the past few periods no longer exist, the total for the period ended November 23 being 393 cars.

The Car Service Division has published a chart showing graphically the record of surplus equipment maintained by the railroads during the past 15 years to meet the demands of commerce. While during the periods of maximum demand there was a low average car shortage, the car surplus which the roads have been obliged to maintain during periods of inactivity averages much greater. This represents a sustained unproductive investment of considerable proportions. Certain periods show a surplus, as represented by the solid portion above the base line, and at the same time a shortage, as represented by the shaded portion below the base line. This always occurs at a time of transition between a car surplus and a car shortage period; it is also prevalent to some extent at all times of moderate demand, but disappears when conditions become acute on either side of the line. The cause is the varying requirements for different types of equipment, such as a shortage of coal cars when box cars are not in demand; and varying conditions in different parts of the country, such as a box car shortage in New England and a surplus of box cars in California which, in the nature of things, cannot at once be remedied by the movement of cars from one section to another.

The reports showed 333,616 freight cars in need of repairs on November 15, or 14.4 per cent of the cars on line, as compared with 345,801, or 15 per cent on November 1. This represents a reduction of 11,585 cars.

## President Touches on Freight Rates in Message

Suggests Also the Setting Up of Tribunals for Peaceable Settlement of Labor Disputes

WASHINGTON, D. C.

THE President, in his address before a joint session of Congress on December 6, upon the occasion of the opening of the regular session, made no definite recommendations for railroad legislation but he suggested two ideas, which, if followed up, might lead to far-reaching consequences. Following a discussion of the need for an improvement in the condition of the agricultural industry, in which he said the farmer "is justified in rebelling against the transportation cost." President Harding urged attention to the question of a readjustment of freight rates in connection with the general policy of restoring the balance between city and country, saying that the present adjustment has been favoring the basing points. He also urged a further effort toward a solution of the problem of capital and labor, suggesting some plan for the setting up of judicial or quasi-judicial tribunals for the settlement of disputes in order to do away with strikes, lockouts and boycotts. While he outlined no definite plan, the principle which ran through his entire discussion of the subject was the necessity for the regulation and supervision of labor organizations and he said that it may be well to frankly set forth the superior interest of the community as a whole to either the labor group or the capital group. On these two points the President said in part:

"The base of the pyramid of civilization which rests upon the soil is shrinking through the drift of population from farm to city. For a generation we have been expressing more or less concern about this tendency. Economists have warned and statesmen have deplored. We thought for a time that modern conveniences and the more intimate contact would halt the movement, but it has gone steadily on. Perhaps only grim necessity will correct it, but we ought to find a less drastic remedy.

"The existing scheme of adjusting freight rates has been

favoring the basing points, until industries are attracted to some centers and repelled from others. A great volume of uneconomic and wasteful transportation has attended, and the cost increased accordingly. The grain-milling and meat-packing industries afford ample illustration, and the attending concentration is readily apparent. The menaces in concentration are not limited to the retarding influences on agriculture. Manifestly the conditions and terms of railway transportation ought not to be permitted to increase this undesirable tendency. We have a just pride in our great cities, but we shall find a greater pride in the Nation, which has a larger distribution of its population into the country, where comparatively self-sufficient smaller communities may blend agricultural and manufacturing interests in harmonious helpfulness and enhanced good fortune. Such a movement contemplates no destruction of things wrought, of investments made, or wealth involved. It only looks to a general policy of transportation, of distributed industry, and of highway construction, to encourage the spread of our population and restore the proper balance between city and country. The problem may well have your earnest attention.

"It has been perhaps the proudest claim of our American civilization that in dealing with human relationships it has constantly moved toward such justice in distributing the product of human energy that it has improved continuously the economic status of the mass of people. Ours has been a highly productive social organization. On the way up from the elemental stages of society we have eliminated slavery and serfdom and are now far on the way to the elimination of poverty.

"Through the eradication of illiteracy and the diffusion of education mankind has reached a stage where we may fairly say that in the United States equality of opportunity has been attained, though all are not prepared to embrace it.

There is, indeed, a too great divergence between the economic conditions of the most and the least favored classes in the community. But even that divergence has now come to the point where we bracket the very poor and the very rich together as the least fortunate classes. Our efforts may well be directed to improving the status of both.

"While this set of problems is commonly comprehended under the general phrase 'Capital and labor,' it is really vastly broader. It is a question of social and economic organization. Labor has become a large contributor, through its savings, to the stock of capital; while the people who own the largest individual aggregates of capital are themselves often hard and earnest laborers. Very often it is extremely difficult to draw the line of demarcation between the two groups; to determine whether a particular individual is entitled to be set down as laborer or as capitalist. In a very large proportion of cases he is both, and when he is both he is the most useful citizen.

"The right of labor to organize is just as fundamental and necessary as is the right of capital to organize. The right of labor to negotiate, to deal with and solve its particular problems in an organized way, through its chosen agents, is just as essential as is the right of capital to organize, to maintain corporations, to limit the liabilities of stockholders. Indeed, we have come to recognize that the limited liability of the citizen as a member of a labor organization closely parallels the limitation of liability of the citizen as a stockholder in a corporation for profit. Along this line of reasoning we shall make the greatest progress toward solution of our problem of capital and labor.

"In the case of the corporation which enjoys the privilege of limited liability of stockholders, particularly when engaged in the public service, it is recognized that the outside public has a large concern which must be protected; and so we provide regulations, restrictions, and in some cases detailed supervision. Likewise in the case of labor organizations, we might well apply similar and equally well-defined principles of regulation and supervision in order to conserve the public's interests as affected by their operations.

"Just as it is not desirable that a corporation shall be allowed to impose undue exactions upon the public, so it is not desirable that a labor organization shall be permitted to exact unfair terms of employment or subject the public to actual distresses in order to enforce its terms. Finally, just as we are earnestly seeking for procedures whereby to adjust and settle political differences between nations without resort to war, so we may well look about for means to settle the differences between organized capital and organized labor without resort to those forms of warfare which we recognize under the name of strikes, lockouts, boycotts, and the like.

"As we have great bodies of law carefully regulating the organization and operations of industrial and financial corporations, as we have treaties and compacts among nations which look to the settlement of differences without the necessity of conflict in arms, so we might well have plans of conference, of common counsel, of mediation, arbitration, and judicial determination in controversies between labor and capital. To accomplish this would involve the necessity to develop a thoroughgoing code of practice in dealing with such affairs. It might be well to frankly set forth the superior interest of the community as a whole to either the labor group or the capital group. With rights, privileges, immunities, and modes of organization thus carefully defined, it should be possible to set up judicial or quasi judicial tribunals for the consideration and determination of all disputes which menace the public welfare.

"In an industrial society such as ours the strike, the lockout, the boycott are as much out of place and as disastrous in their results as is war or armed revolution in the domain of politics. The same disposition to reasonableness, to conciliation, to recognition of the other side's point of

view, the same provision of fair and recognized tribunals and processes, ought to make it possible to solve the one set of questions as easily as the other. I believe the solution is possible.

"The consideration of such a policy would necessitate the exercise of care and deliberation in the construction of a code and a charter of elemental rights, dealing with the relations of employer and employee. This foundation in the law, dealing with the modern conditions of social and economic life would hasten the building of the temple of peace in industry which a rejoicing nation would acclaim.

No mention whatever was made of the railroad securities bill which he had asked Congress to pass in a message sent to it in July and which was passed by the House in August but was delayed in the Senate and only taken up for discussion on the floor during the latter part of the extra session.

The failure to mention the railroad bill was not particularly surprising since the President had let it be known before the close of the last session that he had rather lost interest in it because market conditions had improved sufficiently to make it possible to sell more of the equipment trust certificates held by the Railroad Administration in order to provide funds with which to make settlements with the railroads for some time to come. It has also been apparent that the railroads themselves were not sufficiently interested in the passage of the bill with the various conditions that have been put into it, to make any great efforts toward its passage, particularly in view of the danger of having it used as a vehicle for ill-considered amendments to the transportation act. As market conditions improve it may soon become possible for the railroads to finance themselves their indebtedness to the government for additions and betterments made during Federal control and their efforts now are being directed toward effecting settlements with the Railroad Administration.

Senator Cummins had allowed the bill to be displaced as the unfinished business of the Senate before the close of the extra session and the bill for the funding of the foreign loans was made the unfinished business on December 5.

On December 5 the President sent to Congress a special message on the budget, which included a report from the director of the budget estimating the expenditures of the various branches of the government for 1922 and 1923. This estimated the expenditures on account of the Railroad Administration and the transportation act for the fiscal year 1922 at \$337,679,235 as compared with actual expenditures for 1921 of \$730,711,669. No estimate was made for 1923.

Turning a Narrow-Gauge Locomotive at Lake Maggiore, Italy

Caused by Failure of Train Crew to Obey "31" Order and to Heed  
Signal Indication

A BUTTING COLLISION of passenger trains on single track on the Newton branch of the Philadelphia & Reading, 16 miles north of Philadelphia, on the morning of December 5, resulted in the death of 25 persons and the injury of 20 or more. The only explanation of the accident which investigation thus far has brought out is, in the language of C. H. Ewing, vice-president of the company, the "failure of the human agency." Specifically—it appears that the train crew of one of the trains disregarded a meet

conjunction with the crew of No. 154, which was waiting on the main line just far enough north of the north end of the siding to allow No. 151 to back into the clear.

The operator had placed the manual block semaphore at stop for No. 151 and in addition had displayed a red flag, which is the practice when there are orders for a train. The conductor of No. 151 accordingly reported to the telegraph office and received an order, a fac-simile of which is shown in an accompanying illustration, directing his train to meet No. 156 at Bryn Athyn and to take the siding. This order was made "complete" at 7:46 a. m. The conductor delivered a copy of the order to the engineman.

As soon as No. 151 had cleared the main line, No. 154

[illegible]

## The Order Which Was Disobeyed

order which they had received and, furthermore, the train entered a manual block section the signal for which was set against them.

The two trains involved were No. 151 and No. 156—the former northbound and the latter southbound. No. 151 arrived at Bryn Athyn at 7:42 a. m., 11 minutes behind schedule, and found waiting No. 154, a southbound train

*Photo by International*

### Removing Victims from the Wreckage in the Cut

proceeded southward. The operator at Bryn Athyn at this time was called by Churchville, about 5½ miles north and the first station at which an operator was on duty, asking for the block between the two stations for No. 156, which had received the order to meet No. 151 at Bryn Athyn and was ready to proceed southward. With No. 154 out of the block and No. 151 in the siding, the block was clear and accordingly the operator at Bryn Athyn allowed No. 156 to depart from Churchville, which it did at 7:45.

A minute or so later the operator at Bryn Athyn saw that

Section of the Newtown Branch in Vicinity of Accident

which it ordinarily meets at Huntingdon Valley, the first station south of Bryn Athyn. The siding at Bryn Athyn, as is shown in the accompanying sketch, can be entered from the north end only. Consequently No. 151 had to proceed past the manual block signal (also shown on the map) under protection of a flag. This protection was provided in

No. 151 was leaving and he ran up the track shouting to attract the attention of some of the train crew—but to no avail. No. 151 had left Bryn Athyn disregarding its meet order and also the manual block signal, without the clearing of which no train is, under the rules, permitted to proceed northward. The operator informed the dispatcher of what

had happened and calls for doctors and nurses were immediately sent out.

The trains met head-on about four minutes after No. 151 had left Bryn Athyn. The collision took place on a curve in a rather narrow rock cut which caused the wreckage to pile up instead of scattering over the right-of-way. To this fact the heavy loss of life may be laid. Many victims were imprisoned beneath the mass of wreckage and so perished, who might have been saved if the debris had been scattered.

The cars of both trains were of wood and they soon caught fire. Volunteer rescuers from houses in the neighborhood were not able to do effective work because of the fire and it was with difficulty that fire apparatus was brought from surrounding towns to the scene of the disaster because there are no highways in the immediate vicinity. Before any effective work could be done toward quenching the flames both trains had been practically consumed and with them the unfortunates imprisoned by the wreckage.

A relief train was sent from Philadelphia soon after the accident occurred and the injured were removed to neighboring hospitals as rapidly as possible.

It is understood that the conductor of No. 151 is inclined to admit some degree of responsibility for the accident. The engineman of this train is in the hospital and cannot be questioned. His fireman is among the dead. It appears, however, that the conductor, and possibly also the engineman, failed to give their orders to their subordinates to read as is required by the rules. The engineman and conductor, it is supposed, had in mind train No. 154 which they had met and by some peculiar psychological phenomenon assumed that the meet order referred to No. 154 and

for any unprotected movement into the block. No. 151 had never been admitted to the block and the fact that the signal was, when the train was in the siding, at the rear of the train, offers no excuse whatever to any of the train crew for proceeding without the assurance that it had been cleared by the operator.

Bryn Athyn is at the northern end of automatic block signal territory. On the accompanying sketch an automatic banjo signal, located just north of the north end of the siding to govern southbound movements, marks the northern extremity of automatic signals on this line. North from Bryn Athyn train movements are protected by manual block signals.

The Newtown branch is 19 miles long and is primarily

Wreckage Piled in the Narrow Cut Which Made Rescuers' Work Difficult

not to No. 156—in spite of the fact that No. 156 was quite plainly written on the orders delivered to them.

But even with the general misunderstanding or neglect of the order, if any one of the five men composing the crew of No. 151 had paid any attention to the semaphore signal which was kept constantly in the stop position, the collision could have been averted.

This signal, as the map shows, is at the station and No. 151 had to pass the station to back into the siding. This movement was, however, protected by a flag, as was before noted, and no authority was given at any time by the operator for the train to enter the block. Such authority, indicated by clearing the signal, is necessary under the rules

a suburban passenger line. About ten passenger trains in either direction are operated daily over its rails between Newtown and Philadelphia. Most of the suburban communities it serves are relatively small and travel on the line is not remarkably heavy. As a result the equipment used is rather light and the trains are not as a rule long. For example, No. 156, an express train due to reach Philadelphia at a convenient hour, 8:30, in the morning and which may be presumed, therefore, to be a popular train—had on the day of the accident but five cars, a combination and four coaches. No. 151 had but three cars. All of these eight cars were of wood and the locomotives, No. 161 on Train 151 and No. 278 on Train 156, were relatively light "Mother Hubbards" of the American type and with Wooten fireboxes.

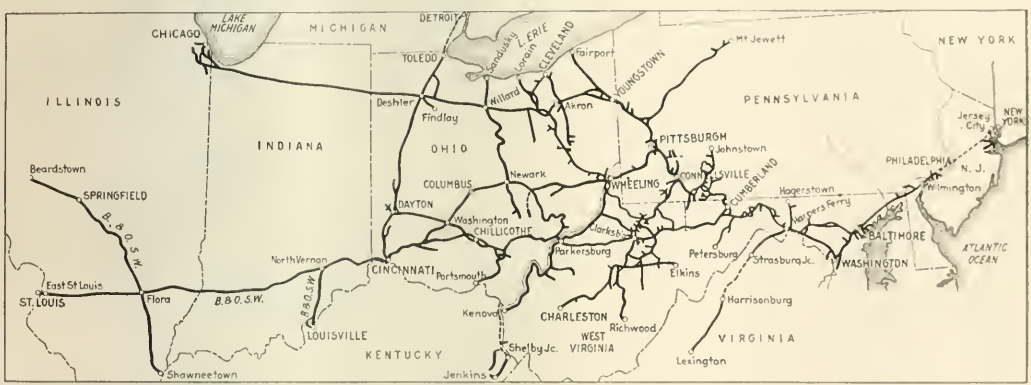

On December 6—the day following the accident—an investigation into the causes of the disaster was begun by the following: C. H. Ewing, vice-president of the company; F. M. Falk, general manager; V. B. Fisher, general superintendent; W. L. Kinter, general solicitor; W. F. Eckert, superintendent, New York division; A. H. Yocum, signal engineer; L. D. Shearer, superintendent of telegraph; B. H. Baker, chief dispatcher; J. T. Pratt, supervisor of safety; J. J. Sellers, train rules examiner; R. J. Steele, supervisor of signals; J. C. Wrenshall, division engineer; N. W. Jones, assistant superintendent; H. A. Rose, of the Pennsylvania Public Service Commission; and Messrs. Temple, Patterson and Hawley, representing the Interstate Commerce Commission. No official report of the results of the investigation have been made public and the details herewith set forth must be taken as preliminary to the official report of the investigators which is not yet complete.

# Baltimore & Ohio Shows Much Improvement in 1921

## An Analysis of What the Road Is Doing in Operation and Earnings—The 1920 Results

THE MONTHLY REPORT of revenues and expenses of the Baltimore & Ohio for October and the first 10 months of 1921 furnishes a striking contrast with the figures for the preceding year, and particularly with the data given in the recently issued annual report. The net railway operating income for October, \$3,422,497, is considerably in excess of that of any previous month of 1921 and more than \$500,000 greater than the figure for October, 1920. For the first 10 months of 1921 the road had a net railway operating income of \$18,693,694. In the first 10 months of 1920 the property experienced a deficit of \$5,661,523. The figure, therefore, represents an improvement of \$24,355,217. This improvement is in part due to the adjustment

that we did not already know about the operations of the property during that eventful year. There are some things in the report, however, that are shown in such a striking way as to demand special attention. For one thing, the report brings out the fact that in the 12 months of 1920, the road handled 101,924,520 tons of revenue freight. This compared with 88,862,248 tons in 1919 and represented an increase of 14.7 per cent over that year. The ton-miles of revenue freight totaled 20,932,667,112, which broke all previous records for the Baltimore & Ohio. It was 15.3 per cent greater than the best previous year in the company's history. This seems to justify amply the statements made by the officers that the road regained more rapidly than

The Baltimore & Ohio

that was made in rates and charges in August, 1920, in part to economizing in maintenance, and in part to improved operating conditions generally. The Baltimore & Ohio in 1920 handled the largest business in its history. At the present time its net ton-miles are averaging but two-thirds those of last year. The latest figures available at this writing are those for September. Up to the end of that month,

was anticipated much of the traffic which, under federal control and as a necessary war measure, was diverted to keep the strategically located eastern lines open for the movement of fuel, steel and munitions to the seaboard. This last accounted in large part for the relatively poor showing in net income during federal control.

Although 1920 was a record year from the standpoint of

BALTIMORE & OHIO OPERATING RESULTS, 1914 TO 1920									
Year ended June 30	Mileage	Freight revenue	Gross revenue	Operating expenses	Operating ratio	Net operating revenue	Revenue tons	Revenue tons per mile	Average haul
1914	4,515	\$76,398,717	\$99,164,010	\$74,403,389	75.03	\$24,760,621	72,267,060	14,054,421,501	194
1915	4,535	70,780,809	91,815,797	63,925,508	69.62	27,890,290	64,175,595	12,970,894,074	201
1916	4,539	88,476,032	111,668,680	79,319,804	71.03	32,348,876	80,785,993	15,793,944,856	195
Year ended Dec. 31									
1916	4,712	95,596,677	121,793,842	87,780,154	72.07	34,013,688	87,785,876	17,004,703,831	194
1917	4,989	107,174,612	139,851,910	108,093,666	77.29	31,758,244	93,516,882	18,144,817,428	194
1918	5,152	129,877,038	175,259,575	161,933,591	92.40	13,325,984	95,346,220	17,032,281,066	179
1919	5,154	136,802,852	182,620,016	170,348,032	93.28	12,271,984	88,862,248	17,203,592,303	194
1920	5,155	182,710,629	211,944,443	226,399,308	97.61	5,545,135	101,924,520	20,932,667,112	205

the road had handled since January 1, 11,062,904,000 net ton-miles. In the first nine months of 1920, the net ton-miles aggregated 16,095,181,000. The increase in net, therefore, is the more remarkable because it has taken place in spite of this falling off in traffic and in spite of the resulting sharp decrease in gross income.

Record-Breaking Business in 1920. The annual report of the Baltimore & Ohio which was given to the annual meeting at Baltimore on November 21, does not tell us much

the traffic carried, increased costs of operation without corresponding increase in rates and charges prevented the Baltimore & Ohio from realizing on its record breaking business. Its operating ratio was 97.61. For the year the road had a net railway operating deficit of \$4,427,019. The corporate income account, however, which takes into consideration the standard return for the first two months and the guarantee for the following six months and the earned income for the remaining four months, showed a

gross corporate income of \$31,834,154. The interest on funded debt and other deductions amounted to \$24,588,480. Dividends of 4 per cent on the preferred stock amounted to \$2,354,531 and the surplus after allowance for dividends was \$4,890,950. No dividends on the common stock were paid in 1920.

*Interesting Comparative Figures of Equipment Maintenance Costs.* A noteworthy feature of the Baltimore & Ohio's annual report is the comparative figures which are given for the years 1911 to 1920. A perusal of the several tables showing these figures brings out details which explain strikingly the reason for the net railway operating deficit which the road experienced in 1920. The tables develop the interesting fact that the wages of engine crews in 1913 averaged \$10.88 per 100 locomotive-miles. In 1919 they averaged \$18.70 and in 1920, \$24.43. Fuel per 100 locomotive-miles in 1913 was \$9.58; in 1919 it was \$22.96 and in 1920, \$36.81. The total cost per 100 locomotive-miles in 1913 was \$36.66; in 1919 it was \$100.78 and in 1920, \$122.98.

Another table shows the costs of repairs to cars, the statement including the repairs, retirements and depreciation charged to operating expenses. The average cost per freight car in 1913 was \$87.97; in 1919 it was \$212.97 and in 1920, \$287.55. The same figures for passenger cars

in a safe condition and is in adequate shape to handle properly all the business it has been called upon to carry; nevertheless, all has not been done that the officers of the road would like to have seen done.

### Some Maintenance of Way Statistics

It may be of interest to put some of these details in the form of statistics. The road will probably lay this year new rail amounting to about 28,000 tons. In 1920 it put in track 53,638 tons; in 1919, 28,262 tons; in 1916 and 1917, about 75,000 tons. New ties put in track in 1921 will total about 2,350,000. In 1920 the total was slightly in excess of this, the actual figure for 1920 being 2,576,398. The amount of rock ballast put in track this year is counted on reaching 275,000 yards. In 1920 the figure was 216,000. The average for the years 1908 to 1917 was 490,000. Gravel ballast used this year will total approximately 340,000 yards; in 1920 it was 425,000. Slag and cinder ballast this year is figured at 190,000; in 1920 it was 438,000.

*Orders for 3,000 New Car Bodies.* The best index of maintenance, insofar as cars are concerned, is the percentage of bad order freight cars. The Baltimore & Ohio on November 15 had 13.3 per cent of its freight cars in bad order. The percentage for all roads on that date was 14.4

		LOCOMOTIVES			CARS Repairs, retirements and depreciation charged to operating expenses

1920	67,371,623	47.41	24.43	36.81	122.98	95,867	27,566,870	287.55	2,504.56	

\*Includes also enginehouse expenses, cost of operating fuel stations, water for locomotives and lubricants and other supplies for locomotives.

show an increase from \$797.32 per car in 1913 to \$2,504.56 in 1920. A selection from these figures has been made up in the form of a table. The striking increases in costs reflect the changes which have come about through the inflation of labor and material during and incident to the war.

*Maintenance Savings in 1921.* As between 1920 and that part of 1921 for which the returns are available, the Baltimore & Ohio has seen a striking change. While influenced somewhat by the lesser amount of traffic handled and also by the reductions in wages, improvement in morale and changes in working conditions, there can be no question but that a large portion of the savings in expenses in 1921, as compared with 1920, has been due to reduced maintenance. The situation has been aptly described by a Baltimore & Ohio officer who explained that the condition was a great deal like that of the owner of a house whose bank balance had been seriously reduced but who desired nevertheless to repaper his living room and was confronted at the same time with the necessity of repairing a leak in the roof. Naturally, under the conditions, he would repair the roof and presumably postpone the repapering of the living room. This, the officer said, is what has happened with the Baltimore & Ohio. The road-bed has been maintained to a high standard, but customary painting, etc., has been omitted. A trip over its main line evidences that it looks good and rides well. It is certainly

per cent. Bad order box cars on the B. & O. on the date mentioned totaled 12 per cent and coal cars 13.9 per cent. There are at present stored along the lines of the road large numbers of cars requiring heavy repairs, although this perhaps is not on the whole exceptional as compared with other roads. However, the road is taking heroic measures to remedy the situation. Early in October, as reported in the Equipment and Supplies column of the *Railway Age* of October 8, it placed orders for 1,000 box and 1,000 hopper car bodies; it was reported in the issue of December 2 as having placed orders for 1,000 additional hopper car bodies. The intention is to use rebuilt trucks and the running gear and replace the bodies; at any rate, the steps taken will permit the elimination of 3,000 heavy bad orders from the bad order total.

### B. & O. Primarily a Coal Road

*Coal Traffic Falls Off.* In the editorial review of the Baltimore & Ohio's annual report for 1919 which appeared in the *Railway Age* of January 21, 1921, page 224, considerable attention was paid to the manner in which the road handled its coal traffic, to the fields from which the coal is obtained, and the way in which it is moved. Similarly, comments were made concerning the growing traffic in other commodities. It was noted, however, that, "Nevertheless, despite the increase in general business, the Baltimore &

Ohio is still primarily a coal road." This statement applies with equal force to the 1920 annual report. In 1918 the Baltimore & Ohio carried 45,259,560 tons of bituminous coal, this constituting 47 per cent of the total tonnage; in 1919 the tonnage of bituminous coal was 40,752,924 or 45.86 per cent; in 1920 the bituminous coal moved reached 48,933,438 tons or 48 per cent. The increase in total tons of all commodities handled in 1920 over 1919 was 13,062,272; of bituminous coal 8,180,514.

The Baltimore & Ohio, as was noted in the editorial review above mentioned, moves its coal to tidewater at Baltimore. With one exception—the Pennsylvania System—it moves more coal to the lakes than any other carrier. There is also a heavy movement to central Pennsylvania, New York and New England over the Philadelphia & Reading through Shippensburg, Pa., which coal is delivered to that carrier by the Western Maryland and the Cumberland Valley. The movement to the coal piers at Baltimore this year has fallen off in a rather unusual degree, due largely to the difficulties which have beset the country's export trade in coal. In 1920 the B. & O. broke all records for dumpings at its Baltimore piers—Curtis Bay and Locust Point. Whereas in 1918 it dumped at these piers 2,400,000 tons, and in 1919 about 2,000,000 tons, in 1920 it reached a figure of 5,500,000 tons. For purposes of comparison it may be noted that in 1920 the Chesapeake & Ohio dumped at Newport News, Va., about 7,000,000 tons; the Virginian at Sewalls Point (Norfolk), about 5,500,000 tons and the Norfolk & Western at Lamberts Point (Norfolk), about 8,800,000 tons. This year, however, the B. & O. will dump at Baltimore but 2,200,000 tons. As has been the case at many other piers the pooling arrangements at Curtis Bay have been abandoned.

The Baltimore & Ohio dumps coal at the lakes at Toledo and Lorain, and will resume the handling of coal at Fairport, where it formerly handled considerable quantities also at Fairport. In the first 10 months of 1921 it has loaded bituminous coal into vessels at Toledo amounting to about 2,400,000 tons as compared with 1,400,000 tons in the same period of 1920 or 2,100,000 in 1919. For Lorain the figures for the first 10 months of 1921 show 2,500,000 tons as against 2,900,000 in the first 10 months of 1920, or 2,800,000 in the same period of 1919. The lake movement seems to have held up considerably better than the movement to tidewater at Baltimore.

**Back Haul on Iron Ore.** The Baltimore & Ohio has the advantage of a sizeable back haul on iron ore from its lake ports. It ranks fourth in this traffic, its business being exceeded by that of the Bessemer & Lake Erie, the Pennsylvania and the New York Central. Naturally, in view of the state of the steel industry, this business has been considerably less than it was in 1920. In the first nine months of 1921 the road handled from the lake ports about 1,500,000 tons as compared with 2,800,000 tons in the same period of 1920. Ore is received at Lorain, Toledo, Fairport and Cleveland. Last year the tonnage shipped from the first three was practically equal—about 900,000 tons. This year about two-thirds of the business has been handled from Fairport.

#### Attitude of Officers and Men Seems Excellent

**Conclusions.** It is fairly well understood that the Baltimore & Ohio has experienced rather rough going during the past three or four years. It has been handicapped by the manner in which its lines were divided during federal control under the jurisdiction of six federal managers reporting to four regional directors and by the diversion of much of its traffic, particularly its high grade freight traffic and passenger business, to other roads. While the officers of the road, themselves, do not believe that the system has

regained all the ground lost during federal control, the 1920 annual report states: "In the ten months of the year (1920) during which the road was operated under the jurisdiction of the company, the pre-war basis for maintenance of way and structures was re-established, and some improvement made in track and equipment conditions"; that the through passenger train service was re-established, and the general ability of the road reflected in the fact that the Baltimore & Ohio "during the year 1920 moved a larger volume of traffic \* \* \* than ever before in its history."

The general attitude of officers and men seems excellent. The substantial increase in net railway operating income, notwithstanding the falling off in business which has characterized the present year, seems to indicate that the Baltimore & Ohio has turned the corner and should continue the improvement which has already been developed.

## Senate Committee Hearings

WASHINGTON, D. C.

**T**ESTIMONY on behalf of the railroad train service brotherhoods by Frank J. Warne was concluded on December 3, after Mr. Warne had been on the stand for 10 days. This testimony was given in connection with the committee's general investigation of railroad conditions in accordance with a Senate resolution. In the same proceeding the committee expected to hear testimony of Walker D. Hines, former director general of railroads, on Friday of this week. Mr. McAdoo is to be called later. Commissioner Campbell of the Interstate Commerce Commission is also to be heard by the committee at the request of Senator Poindexter, and Chairman Cummins asked the Interstate Commerce Commission whether it cared to introduce testimony. It is understood that Commissioner Hall will appear for the commission some day next week.

Hearings on the Capper bill and other proposed amendments to the transportation act have not yet been concluded and it is expected that additional witnesses will be heard on behalf of the railroads. After hearing the testimony of the state railroad commissions and of Clifford Thorne and S. H. Cowan, the committee appeared anxious to conclude the hearings and act on a bill, but the testimony presented on behalf of the railroads and Security Owners' Association has apparently counteracted to some extent the effect of the previous testimony and indicated to the committee that it had heard a one-sided story. Representatives for the railroads insisted on having an adequate time to present their case in spite of the efforts of Senator Cummins to conclude the hearings and this made it necessary to postpone action until the new session.

Warne claimed that the case of the public interest in the country's transportation highways has not been properly presented before most tribunals in valuation and other cases. "One can even go further, with due regard to the facts in the case," he said, "and state without fear of successful contradiction that much of the public interest in the railroads has been automatically and arbitrarily capitalized by the financial interests in control of the roads for the benefit of private groups and individuals. These now exercise 'squatter' sovereignty over vast amounts of value belonging to the people and which were never surrendered by them. In brief, the greater part of the interest of the public in the railroads, which was retained by it even in the charter grants to the roads, has been taken from it by various methods and devices of economic exploitation and is today 'legalized' as private property. And a considerable part of this public interest is represented in the present-day land values in road and equipment of the railway property investment account."

The witness discussed the important part investments in

the roads made out of earnings and surplus play in the property investment account at the present time. He argued that the public had an interest in such sums and that it should not be required to pay an additional return on these invested surplus earnings. In this connection he claimed that the total cost of the Pennsylvania terminal and tunnel in New York City of \$114,000,000 contained \$57,000,000 of such surplus earnings. Illustrations were also given from the practices of the Chicago & Alton, the Burlington, the Delaware, Lackawanna & Western, and numerous other carriers.

Replying to testimony presented before the committee by witnesses for the railroads as to the proportion of operating revenues that goes to labor in the form of wages to employees. Warne said that the total amount of the government rental under the guarantee, amounting to as much as \$906,500,000, was omitted from the calculation for the years 1918, 1919, and 1920. He also said that as much as \$92,000,000, representing salaries to general and division officers, was included as wages to employees, so that the ratio to labor was made very much larger by each one of these two "statistical fallacies." He said:

"The amount received by the American railroads as representing return on investment was \$788,633,049 in 1920 and not \$61,928,626 as reported by Mr. Elliott and other representatives of the railroads. It was \$906,524,492 in each of the years 1919 and 1918 and not \$454,984,953 and \$638,568,603, respectively, as stated by Mr. Elliott.

"Mr. Elliott's figures give the proportion going to investment in 1920 as 1.0 cent out of each dollar. The inclusion of the amount of the standard return increases this more than eleven-fold—to 11.4 cents. For 1919 investment received 16.2 cents out of every dollar instead of Mr. Elliott's 8.8 cents, and in 1918 the amount going to investment out of each dollar was 17.6 and not 13.1 cents.

"The 11.4 cents out of every dollar that in 1920 went to investment, a relatively low return compared with 1919 and 1918 because of much greater maintenance expenditures in 1920 out of revenue, is equal to 105,528,216 more dollars than the 23.8 cents out of every dollar in 1915; it is \$127,614,902 more than the 21.8 cents going to investment in 1914; it is even greater in total amount by \$80,148,666 than the 25.2 cents received by investment in 1912.

"The 16.2 cents in 1919 and 17.6 in 1918 received by investment out of every dollar are \$223,419,659 more than the 23.8 cents in 1915. They are \$245,506,345 more than the 21.8 cents in 1914; \$198,040,109 more than the 25.2 cents in 1912. They are only \$78,348,467 less than the 29.1 cents in 1916, this latter standing for the largest proportion out of each dollar received by investment in any one of these years from 1912 to 1920.

"With labor receiving 53.6 cents out of every dollar in 1920, the largest proportion in any one of these nine years, there went to investment a much larger sum, not taking into consideration the large income to capital through excessive maintenance, than in either 1915, when labor received only 41.5 cents, or in 1914, when it was paid 44.1 cents, or in 1912, when the proportion of each dollar was 43.1 cents.

"It should be plain from all this that an increase in the proportion that goes to labor out of each dollar earned is not inconsistent with even large revenue to investment. It is also clear that the proportion that goes to capital out of each dollar earned may decrease in any one year in relation to another year and at the same time investment receive a much larger return. This usually comes about through the smaller proportion being received on a great many more dollars."

Mr. Warne said that railroad corporations today own as much as \$2,760,000,000, face value, of the stocks of other railroad and affiliated companies and \$2,453,000,000, face value, of their bonds, the total investment of railway corporations in the securities of other rail transportation and affil-

ated companies exceeding \$5,213,000,000, or approximately one-fourth—25 per cent—of total railway securities.

"This ownership of stock should not be regarded from the purely investment standpoint," he said, "that is, as the investment of capital upon which a stated or specified rate of return should be secured. This is true because of the fact that such ownership has no relation to and is not based upon the principle of investment that prevails in ordinary circumstances. The conclusion is indisputable that railway corporations do not purchase railway stock widely for purpose of investment, but that the holdings in the stock of other railways are rather for the purpose of controlling or influencing the management of corporations whose operations are of real concern to the holding company. Such holdings are either majority holdings, which ensure control, or minority holdings of sufficient amount to guarantee an effective influence in management."

Among the conclusions which the witness drew from his presentation of a large number of specific illustrations of different railroads as to this intercorporate ownership are the following:

- Inflation of the property investment account.
- Over-capitalization, involving the excessive issue of securities.
- Over-expansion of credit.
- Corporate speculation and speculation with corporate funds.
- Centralization or concentration of financial power.
- "Reckless and profligate" financing.
- Complex, complicated, intricate, secret, and confusing intercorporate relations and bookkeeping.
- Manipulation of accounts and falsification of records.
- "Circuitous and subterranean" transactions between corporations within the same system.
- Control of a company or of companies by a single corporation stockholder over against the interest possibly of thousands of individual stockholders.
- Minority stock control of transportation companies.
- Removal of control from close relations to the subsidiary's public.
- Creation of holding companies that deny the authority of the Interstate Commerce Commission.
- Diversion from investment in equipment and other property of holding corporations of vast sums tied up in stock purchases.
- Diversion of funds for needed improvements in the subsidiary to channels serving more the interest of the holding company.
- Neglect of necessary improvements to the subsidiary road in order to pay dividends to the holding corporation.
- Impairment of credit of the subsidiary.
- Destruction or deterioration of stock value to minority stockholders.
- Reduction or passing of dividends to the subsidiary stockholders.
- Replacement of a conservative by a speculative management; of one practicing rigid economy by one engaging in extravagance.
- Cash dividends, bonuses, gifts of securities in subsidiary companies, syndicate profits and commissions, stock dividends, and the like.
- Unfair and unjust division of through rates.
- Unfair and unjust distribution of traffic.
- Limitation of necessary new construction.
- Encouragement to dummy directors and dummy officials and even dummy stockholders and dummy corporations.
- Contracts presumably between two or more subsidiary companies made in fact by one and the same holding company.
- The relation of holding and subsidiary companies and their officials to construction and supply companies.

# General News Department

The Illinois Central is experimenting with peat as a substitute for coal as fuel on its Chicago suburban trains.

Demurrage on freight cars, in Canada, according to a ruling recently handed down by the Railway Commission, is hereafter to be one dollar a day on each car, after the first 48 hours, and five dollars a day thereafter.

The division terminal of the Nashville, Chattanooga & St. Louis, now located at Lexington, Tenn., will be moved to Hollow Rock Junction, Tenn., on January 1, where new yards have been constructed at a cost of approximately \$500,000.

George J. Ray, chief engineer of the Delaware, Lackawanna & Western, will address the Western Society of Engineers, Chicago, on the evening of December 15, on "Economic Considerations of Line Revisions on the D. L. & W."

The Interstate Commerce Commission has announced a series of hearings in valuation cases to be held at Washington during January, including the Elgin, Joliet & Eastern and the Atlanta, Birmingham & Atlantic on January 9; Evansville & Indianapolis on January 16, Central of Georgia and Florida East Coast on January 23.

A million dollars a month, approximately, is the amount of the war taxes which the New York Central during the past four years has been collecting on passenger tickets and freight bills, and a circular has been issued telling the company's patrons how they are now going to save twelve millions a year. When the tax is taken off, January 1, the fare from New York to San Francisco will drop from \$120.59 to \$111.70.

## New England Railroad Club

C. B. Smith, mechanical engineer of the Boston & Maine, will speak on the subject of Rebuilding Old Locomotives at the next meeting of the New England Railroad Club, to be held on Tuesday, December 13. A dinner will precede the regular business meeting, which will be held at the American House, Boston, Mass., at 8 p. m.

## North Dakota Campaign Against Crossing Accidents

The Board of Railroad Commissioners of the state of North Dakota proposes to launch immediately a state-wide campaign for the reduction of grade crossing accidents. This is believed to be the first instance of a state department undertaking on its own account an extensive campaign against such accidents.

## Recommends Another Claim Prevention Congress

The Freight Claim Division of the American Railway Association has issued a circular to all roads recommending that another "Freight Claim Prevention Congress," be held in Chicago during the month of January, 1922, and to be somewhat similar to the one held in Chicago in November, 1920.

## "Labor" Contributes Some Additional Strike News

Labor, the newspaper published by the Plumb Plan League, reproduces in its latest issue a copy of an order said to have been sent by the Navy Department to all heads of departments and barracks petty officers under date of October 21, directing them to interview all men who come under their jurisdiction, with a view of finding out if any had previous experience in railroading; and to prepare lists showing the previous experience, such as fireman, engineer, trackman, switchman, round house and repair man, or in any duties in connection with railroad operation of all men assigned to each barracks or head of department.

The order also asked for a list of those who had had experience in machine gun crews and were good pistol or rifle shots. The lists were to be submitted to the executive officers on October 24.

The paper draws from this the inference that the government had made extensive plans for resisting the strike of railroad employees which was called for October 30.

## Chicago Engineers to Study Railroad Economics

The Chicago chapter of the American Association of Engineers has established courses of instruction in railroad management and in railroad economics. These courses are open to the members of this association without charge. They are not designed to make operating officers or accountants of the students, but are intended to give them an insight into the methods employed in these departments. It is the intention to direct the work of these courses by reference as far as possible to the methods in vogue on the roads on which the students are employed.

## Board Summons Carriers in Contract Controversy

Representatives of nine railroads—the Erie, the Pittsburg & Lake Erie, the Indiana Harbor Belt, the St. Louis-San Francisco, the Gulf Coast Lines, the Chicago Great Western, the Colorado & Southern, the Chicago, Milwaukee & St. Paul and the Great Northern have been summoned to appear before the Labor Board on December 19 in controversies arising over the action of these carriers in leasing their shops or maintenance of way work to outside companies. The disputes in each case have been brought by the employees involved as constituting a violation of the labor provisions of the Transportation Act. It has long been an open question as to the attitude of the Labor Board on this subject and its action will therefore be given careful attention not only by those roads which have already engaged in this practice but by representatives of other carriers which have been contemplating such action but have hesitated because of the unknown attitude of the Board.

All of the cases now before the Board, 70 in number, involving the American Express Company, are to be disposed of by hearings which will begin on December 12 and continue until testimony in all of the cases has been completed. This is part of the Board's attempt to clear its docket of a large number of minor cases which were submitted to it because of the lack of adjustment boards.

## Coal in Store November 1

The Bureau of the Census and the Geological Survey have made a joint investigation of the stocks of anthracite and bituminous coal in the country as of November 1, which shows total consumers' stocks on that date amounting to approximately 47,000,000 tons. This quantity was about 25 per cent below the maximum reached during the war. Because of the business depression, the report says, the stocks on hand appear larger than they are and at the present low rate of consumption if evenly divided among all users they would last about 43 days. With business active they would last 35 days. The present stocks are about the same as those on January 1, 1921. During the spring and summer stocks declined to 39,000,000 tons, but they increased rapidly in October because consumers feared a possible railroad strike. Now that the strike has been averted, production has fallen sharply to a point below consumption and coal is being withdrawn from storage.

The report estimates that the railroads had on hand as of November 1 29 days' supply of bituminous coal, which is a larger amount than they have had since January 1, 1919, when there was a 32 days' supply. This estimate is based on preliminary returns from 255 roads furnished by the American Railway Association.

### I. C. C. Questions Interlocking Directors

The Interstate Commerce Commission has sent out a questionnaire to directors and officers of railroads that occupy such positions on more than one road, calling for information which the commission desires to have in passing upon their applications for authority to retain such positions after December 31. A large number of such applications under Paragraph 12 of Section 20-a of the law are being filed with the commission daily. So far the commission has passed on a number of simple cases in which the dual positions are held with purely subsidiary or affiliate companies. The questionnaire asks for information as to the following:

- 1.—Personal ability of person;
- 2.—Extent of financial interest in road;
- 3.—Affiliation if any with banks or banking institutions, railroad equipment concerns; supply houses, coal companies, real estate concerns or others doing business with railroads generally;
- 4.—Interest in commodities transported by railroad carriers;
- 5.—Number and importance of boards of which a member;
- 6.—Extent of actual or potential competition between carriers involved.

### Net Operating Income for October 5.4 Per Cent

Reports of the earnings of the Class I railroads for the month of October just filed with the Interstate Commerce Commission show a net operating income of \$105,186,283, which is at the rate of 5.4 per cent for a year on their tentative valuation. This is the largest net operating income the roads have had for a month since the rates were increased and is 21.8 per cent greater than that for October, 1920, which was the best month they have had heretofore since the rate decision. The compilation is based on reports from 199 roads. The Detroit, Toledo & Ironton and the Kansas City Terminal have not yet filed their reports. October is normally the heaviest traffic month of the year and, due to the

per cent and the Western roads 5.8 per cent, in each case showing an improvement as compared with last year.

For the 10 months of 1921 ended October 31, the net operating income of the Class I roads has been \$494,606,000, which is at an annual rate of return of 3.2 per cent. Operating revenues for the 10 months show a decrease of 8.1 per cent and operated expenses show a decrease of 17.1 per cent. That this was accomplished to a considerable extent at the expense of maintenance is shown by the fact that the maintenance expenses decreased 21.7 per cent. Thirty railroads had operating deficits in October as compared with 36 in September, 13 being in the Eastern, 7 in the Southern and 10 in the Western district. The table below giving a preliminary report for October and the 10 months has been compiled by the Bureau of Railway Economics.

### A. R. E. A. Nominees

The Nominating Committee of the American Railway Engineering Association has submitted its report to the Board of Direction as follows: For president, J. L. Campbell, chief engineer, El Paso & Southwestern, El Paso, Texas; for second vice-president, G. J. Ray, chief engineer, Delaware, Lackawanna & Western, Hoboken, N. J.; for directors (three to be elected), D. J. Brumley, chief engineer, Chicago Terminal Improvements, Illinois Central Railroad, Chicago; Maurice Coburn, engineer maintenance of way, Pennsylvania System, Indianapolis, Ind.; H. T. Douglas, Jr., chief engineer, Chicago & Alton, Chicago; F. W. Green, vice-president, St. Louis Southwestern, St. Louis, Mo.; C. E. Lindsay, special engineer, New York Central Lines, Albany, N. Y.; J. C. Mock, signal-electrical engineer, Michigan Central, Detroit, Mich.; H. L. Ripley, valuation engineer, New York, New Haven & Hartford, Boston, Mass.; O. E. Selby, principal assistant engineer, Cleveland, Cincinnati, Chicago & St. Louis, Cincinnati, Ohio, and W. P. Wiltsee, principal assistant engineer, Nor-

### PRELIMINARY REPORT OF REVENUES AND EXPENSES, CLASS I ROADS AND LARGE SWITCHING AND TERMINAL COMPANIES

Item	Month of October			Ten months' period ended October 31		
	1921	1920	Per cent of increase	1921	1920	Per cent of increase
Total Operating Revenues:

threat of a railroad strike, the volume of freight for the latter part of the month was beyond normal. Immediately after the strike threat was removed, carloadings fell off more than 122,000 in a single week and have since been declining at a rate which would indicate that the traffic for November will probably approximate only about 80 per cent of that for October. The ton miles of freight handled in October were approximately 36,000,000,000, a decrease of 14 per cent as compared with October, 1920. This was lower than the ton mileage for any October since 1916. The total operating revenues for the month were \$553,135,126, a decrease of 16.6 per cent as compared with October, 1920, while the operating expenses were \$397,114,777, a decrease of 24.6 per cent. The maintenance expenses were \$184,480,060, a decrease of only 20.1 per cent as compared with last year. The operating ratio this year was 74.2 per cent as compared with 82 per cent last year. Railroads of the Eastern district showed a net return at the rate of 5 per cent, the Southern roads 5.3

per cent and the Western roads 5.8 per cent, in each case showing an improvement as compared with last year. For members of nominating committee (five to be elected), W. J. Backes, engineer maintenance of way, New York, New Haven & Hartford, New Haven, Conn.; A. M. Burt, assistant to vice-president in charge of operation, Northern Pacific, St. Paul, Minn.; J. V. Hanna, chief engineer, Kansas City Terminal, Kansas City, Mo.; Maro Johnson, assistant engineer, Illinois Central, Chicago, Ill.; H. K. Lowry, signal engineer, Chicago, Rock Island & Pacific, Chicago; J. de N. Macomb, office engineer, Atchison, Topeka & Santa Fe, Chicago; A. Montzheimer, chief engineer, Elgin, Joliet & Eastern, Joliet, Ill.; W. L. Morse, special assistant engineer, New York Central, New York; P. B. Motley, engineer of bridges, Canadian Pacific, Montreal, Can., and A. O. Ridgway, assistant chief engineer, Denver & Rio Grande Western, Denver, Colo. Ballots will be distributed to the members shortly after January 1, and the result of the election will be announced in March.

### Mississippi River Barge Line

The operations of the government freight barges on the Mississippi river during the 22 months ending with August last, are the subject of a brief review, prepared by the Transportation Division of the United States Department of Commerce, and published in Commerce Reports for November 28.

For the whole period of 22 months the quantity of freight carried southbound was 256,875 tons, and northbound 159,476 tons. The total movement for August was 266,578 tons, by far the heaviest month's traffic in the record.

Sailings are now made weekly from each terminal, New Orleans and St. Louis; and landings are made at Cairo, Memphis and Vicksburg. The boats have the benefit of municipal docks at St. Louis, at Memphis and at New Orleans, and at Cairo the barge line owns a floating terminal. With funds lent by the Secretary of War, additional terminals are being prepared at Memphis, Vicksburg and New Orleans.

The line now has in service 50 cargo barges and 10 tow boats; and other craft. Forty of the steel cargo barges are 230 ft. long with a capacity of 2,000 tons each; and 10 of the barges are adapted to carry oil in bulk, 118,400 gal. each. The freight rates by the barge line are about 20 per cent lower than those by parallel railroad lines.

### Commission Authorizes Temporary

#### Reduction in Rates on Farm Products

The Interstate Commerce Commission on December 2 issued a special order granting the request of the railroads for permission to make a reduction for six months of 10 per cent in the freight rates on agricultural products on short notice and in as inexpensive a manner as possible, by the publication of master tariffs and special supplements to freight tariffs in abbreviated form. The commission has issued the necessary modifications of its rules to permit the abbreviated tariffs to be filed on short notice on or before December 31.

The railroads proposed this temporary reduction as a substitute for the order of the commission which has been made effective on December 27, reducing the rates on grain and hay in the western districts by half of the amount of the increases made in Ex Parte 74; and the request was made in the same petition in which the commission was asked to reopen the Western grain case for further hearing. The present order is effective in all parts of the country except in New England; and it was granted without any statement of the commission's intentions as to the enforcement of its order in the grain case.

The commission also issued separate orders authorizing the establishment of the reduced rates on agricultural products without observing the long-and-short-haul rule, and providing that outstanding orders may be modified to the extent necessary to permit the proposed reduction to be applied to the rates covered by them. An "inexpensive form" of notice is shown with the order. This form has been worked out after conferences with the tariff publishing agents.

Representatives of the western states that would benefit particularly by the reduction on grain, hay and grain products provided for in the commission's order are making a fight to prevent the commission from withdrawing this order and substituting the 10 per cent reduction on agricultural products generally. Clyde M. Reed, chairman of the Kansas Public Utilities Commission and of the management committee of the state commissions which filed the original complaint in this case, which led to the investigation on the commission's own motion in which the order was entered, filed a protest with the commission on Monday against the granting of the railroads' petition. This, the protest said, "is in substance a request, that the Interstate Commerce Commission stultify itself by receding from its original position." It says that the railroads have failed to show any change in conditions or changed facts which were not put before the commission during the original investigation and the commission is asked to maintain its order and put the reductions into effect.

## Commission and Court News

### Court News

#### Live Stock Shipper Falling From Top of Car

The Circuit Court of Appeals, Eighth Circuit, holds that a shipper of live stock, who himself undertook to move a car to the chute and went on the top of the car in the dark without a lantern, and walked off the end, was guilty of gross negligence as a matter of law, barring recovery from the railroad for his injuries.—*Birkestrand v. Chicago, M. & St. P.*, 275 Fed. 194.

#### Abandonment of Telegraph Company's Easement

Where an easement for telegraph lines along a railroad right of way was not used for 40 years, during which time the telegraph company had accepted an exclusive lease of rights for its lines, and had subsequently started condemnation proceedings to take part of the right of way, the Alabama Supreme Court holds that the non-user, together with the acceptance of the lease and the condemnation proceedings, sufficiently showed an abandonment of the easement.—*Western Union v. L. & N. (Ala.)*, 89 So. 518.

#### Neither Railroad Nor Director General

#### Responsible for Defective Track in Military Camp

The Circuit Court of Appeals, Fourth Circuit, holds that neither the Atlantic Coast Line, which built a branch into Camp Jackson, nor the Director General, who took over the operation of the road, was liable for the death of soldiers caused by derailment of a car in the camp from a defective track, the military authorities having taken over control of the track and substituted lighter rails, insecurely fastened, at the place of the accident.—*Heise v. Davis*, 275 Fed. 326.

#### Sufficient Clearance Between Tracks in Yards

The Rock Island constructed its switching yards at Council Bluffs 20 years ago with the clearance between tracks usual at that time, 6 ft. 6 in., in yards constructed recently the usual clearance being 7 ft. 6 in. In an action for death of an employee, alleged to be due to insufficient clearance, the Minnesota Supreme Court holds that if the yard was reasonably safe, continuing to use it without rearranging the tracks so as to provide a greater clearance is not negligence, unless it appears that such yards are no longer in common use or that changed conditions require a greater clearance. Judgment for the defendant notwithstanding verdict for the plaintiff was affirmed.—*McNamee v. Hines (Minn.)*, 1184 N. W. 675.

#### Industrial Track Must Be Justified

#### By Amount of Business

The Oklahoma Supreme Court holds that under section 33 of article 9 of the state Constitution, the Corporation Commission is not justified in issuing an order to require a railroad to maintain a "switch" for the benefit of any "coal mine, saw-mill \* \* \* or other industry, unless it appears that the amount of business is sufficient to justify the same."

It is also held that when a person seeking to have a switch put in by a railroad for his benefit accepts the terms of a letter that he is to pay a certain amount of the expense of installation, the letter clearly stating that the switch is temporary and shall be removed in six months, no equity arises in his favor to compel the railroad to continue to maintain the switch after the expiration of the time for which it was installed, because of the expenditure of money made by him.—*Rock Island v. State (Okla.)*, 201 Pac. 260.

## Foreign Railway News

### Raven's Automatic Train Stop

Raven's automatic train stop, the invention of Sir Vincent Raven, chief mechanical engineer of the Northeastern Railway of England, is now fitted to 1,500 locomotives of that road, according to a recent statement in the *Railway Gazette* (London).

The stop is a simple mechanical trip, similar to that in use on the Interborough subways, New York City, and is a development of the well-known cab signal of the same inventor, which has been used on the Northeastern for many years. It is stated that on lines where his apparatus is in use no provision is made for stationing fogmen at distant signals. As the use of power-brakes is, in England, confined mainly to passenger trains, this statement would seem to indicate that the audible signal, sounded in the cab, is a main feature of the system.

The passenger trains of the Northeastern use the Westinghouse brake, but the apparatus works also on trains using the vacuum brake, many of which traverse parts of the Northeastern lines.

### Spanish Northern Railway Electrification Project

A contract for the electrification of 40 miles of the Spanish Northern Railway is announced by the Sociedad Iberica de Construcciones Electricas, of Madrid, Spain, one of the associated companies of the International General Electric Company, Inc., of New York. This initial order constitutes the most recent and one of the largest European railway electrification projects now under development. The high voltage direct current system will be used.

The equipment to be supplied by the Sociedad Iberica de

be used similar to those on the St. Paul locomotives, having a double contact shoe.

### A New Bill for Reorganizing Spain's Railways

At the last session of the Spanish congress a bill was brought forth for the reorganization of the railways of the kingdom, according to the *Railway Gazette* (London). This bill, the principal provisions of which were noted in the *Railway Age* of July 16 (page 133), evoked so much protest that it was shelved. Now a new bill has been prepared. This legislation would make the state a partner in railway enterprise by having it advance to all the properties enough financial aid to put them on a sound basis. The railways, under the bill, would be managed by a council of 15 members—6 representing the government, 6 the companies, and 3 the Spanish business interests. The council would fix rates sufficiently high to provide adequate returns and net profits would be divided by the stockholders and the government.

### German Railways Have a Bad Year

At the close of the war railway rolling stock showed increases in locomotives of 22 per cent and in freight and passengers cars of 10 per cent over numbers on hand at the beginning of 1914, due primarily to confiscation from invaded territory, according to Commerce Reports. As the terms of the armistice forced the return of 5,000 locomotives and 150,000 cars to France and Belgium, the rolling stock now available is considerably less than that of 1914. A difference of 31 per cent is given for locomotives in 1920, and 36 per cent and 25 per cent, respectively, for passenger and freight cars.

A great number of the locomotives and cars now in use are in need of repairs, as well as the roadbeds of most of the German railways.

The railway deficit for the present year (operation and replacement) will amount to about 7,000,000,000 marks (about

End View and Side Elevation of One of the Locomotives to Be Used in Spain

Construcciones Electricas will consist of six 78-metric ton, six motor locomotives, two complete sub-stations, each comprising two 1,500 kilowatt, three unit motor generator sets, transformers and switchgear and the material necessary for line construction.

The first electrification project of the Spanish Northern comprises about 40 miles of the Leon-Gijon line running through the mountains between Ujo and Busdongo. Although this is a single-track line, traffic is extremely heavy, as it is a link between the mining district and the northern seaboard through a mountainous region with many tunnels, considerable grades and severe climatic conditions.

The electric locomotives on order will be of the freight type, with the following dimensions:

Length over bucklers.....	46 feet
Height.....	13 feet, 11 inches
Width of cab.....	9 feet, 8 inches
Rigid wheel base.....	11 feet, 6 inches
Maximum wheel base.....	35 feet

The locomotives will be arranged for regenerative braking, and will operate at 3,000 volts. The locomotive speed at continuous rating is 13.5 miles an hour. Pantograph collectors will

\$35,000,000 at the present rate of exchange) as compared with 15,000,000,000 marks (about \$75,000,000) in 1920. The extraordinary large figure last year was due to an unusual expansion in the number of employees.

An increase of 30 per cent in freight rates is scheduled to take place some time this month. This condition is based on existing rates, which are the result of an 80 per cent raise during 1920, and which in turn had been based on rates greatly advanced the year before. Freight-rate increases were not effected between 1913 and 1917, but during the latter year an advance of 7 per cent was made, followed by further advances, each time over existing rates, of 15 per cent in 1918 and 60 per cent in April and 100 per cent in October, 1919.

Passenger rates are also to be raised very shortly, according to the latest plans, by 25 to 30 per cent. Previous increases in these rates, extending over the period 1913-1920 have amounted to 671 per cent for first-class fares, 433 per cent for second, 380 per cent for third, and 405 per cent for fourth class fares.

## Equipment and Supplies

### Locomotives

THE LEHIGH & HUDSON RIVER is inquiring for 1 Consolidation locomotive.

THE AKRON, CANTON & YOUNGSTOWN contemplates inquiring for prices soon on 5 locomotives.

THE CUMBERLAND & MANCHESTER has ordered from the Baldwin Locomotive Works, 1 locomotive for passenger service.

THE DELAWARE, LACKAWANNA & WESTERN in the near future expects to ask for prices on about 5 Pacific type locomotives.

### Freight Cars

THE ERIE is building 70 caboose cars in its own shops at Buffalo, N. Y.

THE NORFOLK & WESTERN contemplates making repairs to about 2,000 coal cars.

THE SEABOARD AIR LINE is inquiring for prices on the repair of 1,000 or more 40-ton gondola cars.

THE BENGAL & NORTH WESTERN (India) is inquiring through the car builders for 300 four-wheel wagons.

THE CENTRAL OF GEORGIA may be in the market soon for about 800 cars to include box, stock and gondola cars.
