railroad operation would justify consideration of the application of radio and wired wireless; (3) Information on the application of wireless telephone for short haul transmission, as for example—between important division points; and (4) Information on the application of wireless telephone for operation in conjunction with physical lines, to take care of transmission by wireless through certain sections, to be continued over physical lines to regular telephone stations.

### Report on Message Traffic

This committee of which G. D. Hood, superintendent of telegraph, C. R. I. & P., is chairman, recommended the use of an automatic telephone system for intercommunication between various departments of a railroad, leaving the ordinary switchboard free to handle public requirements, whenever and wherever the business on the ordinary switchboard reached the point where release is necessary. Such an automatic system should have the greatest possible flexibility and should be practically unlimited as to growth and length of circuits. For intercommunication between offices located in the main building where such stations will not be subject to any material changes of location, if it can be foreseen that the ultimate requirements will not exceed 20 stations, an intercommunicating telephone system of the push button or cam-key type should be considered.

In considering the desirability of tie lines between the switchboards of the different railroads in cities where there are headquarters of several railroads, it was felt that their use would eliminate the necessity of communication going through the different telephone exchanges and would expedite service. In cities having a number of railroad private telephone exchanges it was recommended that circuits connecting such private exchanges are desirable whenever and wherever a traffic study justifies their installation, as the use of such circuits will facilitate communication between railroads by expediting telephone service and improving transmission.

In addition to the subjects above mentioned this committee presented information on the use of rotary repeaters; standardization of operators' employment records; necessity for transmitting initials of railroads after signatures; use of printer telegraph apparatus; use of carrier system for distribution of messages; uniform rules governing employees; recommendations in connection with the organization of a proper method of educating wire chiefs, repeater attendants and operators and the desirability of a standard code covering the routine matters exchanged on a railroad and more particularly in connection with such matters exchanged between different railroads transmitted over commercial wires, such as reservation messages.

### Report of Committee on Technical Training

This committee, of which I. C. Forshee, electrical engineer, telegraph department, Pennsylvania System, is chairman, stated in its report that it was the consensus of opinion of this committee that the courses of instruction to be recommended or developed by the committee should be available for all employees under the superintendent of telegraph from the messengers, groundmen, linemen or laborers who first enter the employ of the company to the highest employee in the department. The methods of instruction which are applicable to the work of this department are: In a class room, under a competent instructor; by an instructor or foreman who can assemble the employees on the job; by lectures; and by correspondence.

For each road to attempt properly to equip school or class rooms for the instruction of employees would result in a needless duplication of facilities and expense in a large number of important railroad centers. In such cities better and more complete facilities and more competent instructors could be obtained by pooling the interests. With this ar-

range ment the employees of each road and each class of employees could be given regular class room assignments; instructors who are specialists in each particular class of work could be employed; more complete and adequate equipment and material could be furnished, and all at a smaller expense to each road than to attempt to equip and man even the most elementary layout by each company. The expense of equipping and running such a school could be pro-rated upon some equitable basis.

In order to ascertain to what extent the different railroads have developed educational work for the telegraph and telephone department, a questionnaire was prepared by this committee and sent out to the superintendents of telegraph of all railroads holding full membership in the A. R. A. Sixteen companies with a mileage of 41,802 at present have courses of instruction, while 78 roads are in favor of a course in technical training and four are not in favor of such a course. Sixty-three favored an apprenticeship course, while 11 roads were opposed to this practice.

### Construction and Maintenance—Outside Plant

Committee No. 1—G. A. Cellar, general superintendent of telegraph, Pennsylvania system, chairman, has perfected its rules for the construction of pole lines, the tables indicating classes and spaces of poles, and specified its methods of calculations, assumed stresses to which the line shall be opposed and the strength recommended to approve these stresses. The appendices submitted with its report covered: (1) method of calculating the class and number of wood poles required for railroad telegraph and telephone pole lines; (2) tables of minimum dimensions and classes of poles; (3) modulus of rupture of various species of wood used for telegraph and telephone poles; (4) method of calculating strength of side guys and (5) method of calculating the replacement tables.

It also presented specifications for telegraph, telephone and other signal wires, and cables, crossing the tracks of steam and electrified railroads. It has given attention to crossing legislation and commission orders passed or issued in various states where progress is being made in the establishment of proposed standards covering this class of work. The committee resubmitted practically the same specifications for transpositions as were given at the last meeting at Winnipeg to which very slight additions have since been made.

### Construction and Maintenance—Inside Plants

R. F. Finley, superintendent of telegraph, New York Central, Lines West, chairman of this committee, stated that the specifications for the installation of telegraph and telephone equipment in railroad offices, as recommended by the committee at the Winnipeg meeting in 1920 for submission to letter ballot for inclusion in the manual, covered quite generally fundamental principles only and that the work of the committee from now on will be devoted largely to the preparation of separate specifications for the manufacture, installation and operation, etc., of telegraph and telephone inside plants.

A specification for lead sheath insulated and enameled, non-quodded office cable for No. 18 A. W. G. conductors and a specification for braid sheath rubber insulated non-quodded office cable for No. 16 A. W. G. conductors were presented. A report was also made on the preparation of typical floor and wall plans showing the space necessary for and the most desirable arrangement of telegraph and telephone equipment in railroad station towers, booths and office buildings. These plans include sizes and locations of operating tables at smaller offices where only single Morse and train order telephone instruments are used, together with layouts of instruments and signal apparatus in such offices. Drawings for all circuits required in railroad telegraph and telephone inside plant and specifications for the installation and maintenance of gravity batteries; of caustic

soda batteries and for cross connection records were also presented.

### Other Committee Reports

Committee No. 3—Protection Against Electrolysis, B. J. Schwendt, superintendent of telegraph and signals, Toledo & Ohio Central, chairman, reported on the extent to which it has been found that ordinary maintenance forces are able to detect and record electrolytic action intelligently. The committee also submitted a brief outline of the work done by other bodies on the subject of protection against electrolysis.

Committee No. 4—Protection against Lightning for Electric Light and Power Circuits, J. F. Caskey, superintendent of telegraph, Lehigh Valley, chairman, presented reports on the comments and suggestions received from representatives of members; carried to a conclusion manufacturing specifications previously submitted; submitted specifications for telegraph and telephone protector mounting, and for telegraph and telephone protectors assembled and also instructions for the installation and maintenance of telegraph and telephone protectors.

The officers of the section chosen for the ensuing year are as follows: Chairman, W. H. Hall (M. K. & T.); first vice-chairman, R. F. Finley (N. Y. C.); second vice-chairman, I. C. Forshee (P. R. R.).

## Increasing the Efficiency of Employees

By Paul H. Pearson

SINCE THE RETURN of the railroads to private management, every possible effort has been directed toward increasing their capacity through rehabilitation of equipment, increasing loads per car and miles per car per day, and last but not least, increasing the efficiency of the employees. Of these several methods, the increased efficiency of labor has been developed to the smallest degree, notwithstanding the fact that it possesses the greatest of possibilities with the smallest expenditure of capital of any of the factors mentioned; and this at a time when capital is hard to get, expensive because of the high rate of interest, and in some instances actually impossible to obtain at all.

It must be admitted that in the now quite distant past, capital had the upper hand, and used it without a great deal of regard for the rights of labor; in the last few years the tables have been turned and labor now has the balance of power; it, too, has used it in many cases without regard to either the rights of the carriers or the public. It is not my intention to enter into a discussion of the merits or demerits of either capital or labor's use of their respective advantages, but it is unthinkable that this condition should ever again be allowed to exist. On the other hand, both labor and capital should get down to a business-like basis and work together for the best interests of each other.

My position is not sufficiently official to remove me from the confidences of those employees with whom I have summered and wintered—been cold and wet, as well as dry and warm—and with whom I have often shared food and "smokes" while we were all growing up together in the business of transportation. At the same time my relation to my superiors has come to be sufficiently close to give me an insight into the problems and perplexities surrounding those responsible for the efficient operation of the transportation machine of which I am a part.

Owing to the very nature of their work, the various classes of train service employees must of necessity constitute the chief problem, because no method of supervision has yet been devised which gives more than a superficial check on the work performed by these men. They are out at all hours of the day and night many miles from the nearest superior officer, with problems arising at a moment's notice the suc-

cessful solving of which is dependent upon their own individual experience, judgment and faithfulness, as well as the degree of co-operation existing between the individuals.

From the constant daily contact with the various train service classes, I am firmly convinced that fully 80 per cent of the normal number of such employees possess both the will and the ability, intelligently directed, to give the very best work they have in them; that the efforts of executive officers responsible for the efficient operation of the transportation machine should be directed toward a better understanding of the problems confronting both the officers and the men. Instead of a very unwise attempt to break down labor organizations, which have come to stay, every effort should be made to have the better class of men, numbering, as before stated, about 80 per cent, become the predominating influence in such organizations.

As a first step towards this end, I believe that much information now in the possession of supervisory officers, and heretofore considered as confidential, could be disseminated among the men with good results. It would give them an insight into the reasons underlying certain policies of the management, and contribute toward the more intelligent performance of their duties.

As a second step, some method should be followed of keeping an accurate record of the many good performances recorded weekly or monthly, and suitable publicity given them by the publishing and distribution of a bulletin or news letter at stated periods. This bulletin should cover only such territory as may come under the jurisdiction of one superintendent in order to keep up the local interest of the men who are working side by side daily. It would, of course, be advisable also to record the poorer performances, being careful to omit the names of the offenders.

A great deal of unrest and dissatisfaction is often caused by employees being acquainted with facts pertaining to the operation of their own division, without knowing the underlying reasons therefor. Much of this could be corrected by the inclusion in the bulletin of such of these facts as can be disseminated without injury to the management.

What is true of the train service men is also true of all the other branches of the service, as all have a great interest in the operation of the road, and only need to have this interest stimulated to begin to show good results. I know that a great many executive officers will doubtless discount this statement by about 50 per cent; if so it will be because the facts are hidden under the mass of troubles caused by the other 20 per cent of the employees, thus leaving little time for attention to those faithful employees who by the very nature of their good work go unnoticed.

There can be no question, in the mind of any thinking person, but that the national agreements lead to great inefficiency and unnecessary expense. Each road should deal directly with its own employees, whose problems they are familiar with, and the conditions surrounding which are so dissimilar even on adjacent roads. On the other hand, there is still present in the minds of even the more conservative of the labor men a very considerable doubt as to the real intentions of the officers of the different carriers, and it is the big job of such officers to so establish their own sense of justice and integrity, that they will have the absolute confidence of such employees. This cannot be done without some means of bringing both sides together into a knowledge of the problems of each and how it is proposed to meet them; or, in other words, bringing each other's troubles out into the sunlight; this can also be partly accomplished by some such publication as I have suggested.

Finally, it is my opinion that the desired results can only be obtained by much careful thought and hard work on the part of the best brains our railroad executives can produce. There will be many discouragements, but I have an abiding faith that the problem is possible of a solution.

# General News Department

The Railroad Administration will settle immediately the claims for damages sustained by 278 residents of Cloquet, Minn., in the forest fire of October 12, 1918, at 50 cents on the dollar.

A new organization known as the Rock Island Ampere Club has been organized recently, the membership including managers, wire chiefs, operators and linemen at all of the clay telegraph offices.

A lone masked bandit, who held up a Chicago, Burlington & Quincy train at Parkville, Mo., about 15 miles from Kansas City, Mo., on the night of September 10, was overpowered and captured by passengers and members of the train crew while in the smoking car.

A party of officers of the St. Louis-San Francisco, including T. A. Hamilton, vice-president, and F. G. Jonah, chief engineer, last week went over the line of the Missouri & North Arkansas, which has discontinued operation. The Frisco crosses the abandoned line at Seligman, Mo.

The official opening of the Cairo, Ill., floating dock connection of the Mississippi River barge service with the Illinois Central took place on September 16, when a special train carrying members of the Chicago Association of Commerce arrived. The canal fleet now consists of 40 steel barges and four towboats, each with a carrying capacity of 2,000 tons.

Torpedoes which appeal to three senses, hearing, seeing and smelling, are now in use on all of the lines of the Canadian Pacific. The new torpedo, according to an announcement by the company, has spring steel or brass clips by which it is fastened to the head of the rail. Each detonation is accompanied by a brilliant flash and a pungent smell. This torpedo is called the "Meteor Track Signal," Wanklyn patent. It is made by the Dominion Cartridge Company.

A Statistical Analyst, at a salary of \$3,600 to \$5,000, is wanted by the Interstate Commerce Commission, according to the last announcement of the United States Civil Service Commission. Applications may be filed up to November 1. Appointees will be required to assist in the analysis of railroad reports and must be capable of conducting independent research and analysis of statistical data pertaining to the economics of transportation and of making reliable and readable reports thereof. Other requisites can be learned by applying for Form 2118, giving the title of the examination desired.

Veteran Employees' Associations are being organized on all divisions of the Pennsylvania Railroad, which have not already organized, and campaigns are going on to increase the membership of those associations already in existence. As soon as the divisional organizations are perfected it is planned to hold a Pennsylvania System convention. Approximately 38,778 employees are eligible for membership in these associations by virtue of 20 years of service; that is, one employee in five. Many of the 6,185 former employees now on the pension roll are members of the division veterans' associations. These associations were first started in 1897, and they have been among the active factors in perpetuating those traditions and ideals of public service and mutual co-operation between officers and men which have been handed down through 75 years of Pennsylvania Railroad history.

## Traveling Passenger Agents

The American Association of Traveling Passenger Agents held its annual convention at Salt Lake City, Utah, on September 15. F. R. Perry, general agent of the passenger department of the Canadian Pacific, New York City, was elected president.

## Signal Section

F. B. Wiegand, chairman, and H. S. Balliet, secretary, announce that the meeting of the Signal Section of the American Railway Association, which was to have been held in New York City on November 3 and 4, has been cancelled. The majority of the committees have not progressed to the point where they can report conclusively on the subjects assigned to them.

## Inconvenience of Eight Hour Day

Claiming that inconvenience and hardships are caused to patrons of the railroads in Louisiana, under a strict application of the Public Service Commission's rule prescribing an eight-hour day at stations, the railroads in that state have asked the commission to amend the rule in order to permit a split of the time a ticket agent works. Under the rule at present the agent works eight hours straight regardless of the time of the arrival of trains. Under the ruling asked for, the railroad may arrange for a ticket agent to divide his time so as to be on duty at the time of all passenger trains.

## Transmission of Electric Power at 1,000,000 Volts

Experiments in the transmission of electrical energy at a potential of 1,000,000 volts were made recently in a laboratory of the General Electric Company at Pittsfield, Mass. The result of the tests indicated that a line in which the conductors are 4 in. in diameter, or larger, would be necessary for the transmission of 1,000,000 volts, but also confirmed the belief of the engineers that it will be commercially feasible to employ higher voltages than any now in use. A power line is now under construction on the Pacific Coast, over which energy will be transmitted at 220,000 volts.

## Reduction in Employees and Their Compensation

A further reduction in the number of employees and the total payroll of the railroads for the second quarter of 1921, as compared with the first quarter, is shown in the Interstate Commerce Commission's quarterly summary of statistics on employees' service and compensation for Class I roads for the three months ending June 30. The average number of employees for the quarter was 1,568,143 as compared with 1,691,471 in the first quarter of 1921. In the third quarter of 1920, when the number of employees was at the maximum, the total was 2,157,989. The number in service at the middle of the month was 1,542,716 for April, but increased to 1,575,599 for May and 1,568,143 for June. The number in service in April was 655,108 less than it was last August.

The total compensation for the second quarter of 1921 was \$699,684,795 as compared with \$757,325,356 in the first quarter of 1921 and \$1,052,109,451 in the third quarter of 1920. The total payroll for the 12 months ending June 30, 1921, was \$3,491,000,000.

## Steel Treaters Convene at Indianapolis

The third annual convention of the American Society for Steel Treating was held in the Manufacturers' and Women's Buildings, State Fair Grounds, Indianapolis, Ind., September 19 to 24 inclusive. Prominent metallurgists and steel experts, both of this country and Europe were present. Eighty-seven papers relating to steel treating in its various phases were read and presented by title, simultaneous sessions being held on several afternoons to allow time for reading and discussing the large number of papers. The exhibition was of exceptional size, interest and value, approximately 80 manufacturers exhibiting products ranging from immense electric and gas furnaces to small scleroscopes and high-speed drills. The entertainment program was featured by a 100-mile match

race Wednesday morning on the Motor Speedway between Duesenberg and Frontenac motor cars. Other interesting features were a smoker and vaudeville entertainment Tuesday night and the annual banquet Thursday night at the Claypool hotel.

### C. M. & St. P. Officers to Test Election Laws

Test of the law which requires that employees be allowed two hours with pay in which to cast their votes at primaries and elections in Chicago will be made by the officers of the Chicago, Milwaukee & St. Paul, for whom warrants charging violation of election laws were issued on September 19. These warrants were issued on complaint of an assistant states attorney and named H. E. Byram, president of the St. Paul, Burton Hanson, general counsel, L. K. Silcox, general superintendent of motive power, and George T. Martin, assistant to Mr. Silcox. It is charged that at the time of the judicial election last June a machinist employed by the St. Paul asked for two hours off in which to vote. His request was not answered. Nevertheless he was absent for two hours and found the following day that two hours' pay had been deducted from his wages. The warrants were issued as a result and attorneys for the railroad announced that they intended to test the constitutionality of the law, carrying the case to the highest court if necessary.

Mr. Byram, in statements made to the press, takes the stand that under the eight-hour day, the men have opportunity to vote outside of working hours and the carrier should not be forced to pay for two hours lay-off every election day.

### Large Loss from Claims on Household Goods

The Freight Claim division of the American Railway Association has found that the railroads pay \$1,500,000 yearly on household goods, of which amount 83 per cent is for damages and 17 per cent for shortages. Recent statistics show that the railroads pay about 85 cents in claims for every ton of household goods shipped, while claims do not exceed 5 cents a ton on all other classes of freight.

The Freight Claim division has issued a circular to division superintendents requesting them to bring the matter before their district freight claim prevention meetings for discussion. Among the suggestions proposed are those that freight agents be required to see that all household goods are properly marked, securely packed and stowed to ride safely; that the shipper declares the valuation in a signed statement; that the shipper number each piece consecutively and place a slip of identification in each box. Agents should weigh damaged pieces in order to help the claim department determine the value under the tariff. One railroad has issued a pamphlet for the benefit of storage companies, individual shippers and others, stating its requirements when accepting responsibility for shipments.

### Federated Shop Crafts Announce Strike Vote

Railroad shop employees, members of the Federated Shop Crafts, have decided, by a "constitutional majority," to strike in protest against the recent wage reduction authorized by the Railroad Labor Board, according to the announcement made by B. M. Jewell, president of the Railway Employees' Department of the American Federation of Labor, at a mass meeting of shop employees at Chicago on September 18. Mr. Jewell stated that no strike had been called because the organization leaders believed that their cause will be considerably strengthened if the contemplated strike is called in protest against changes both in the wage scale and in the rules and working conditions.

General charges that the railroads were opposing the demands of the organizations as part of the movement which Mr. Jewell said was backed by "nine billion dollars or more" were made. The object, he said, was "to crush organized labor." In support of this charge he cited the "unfair action of the railroads in offering to negotiate working rules on each road and then failing to agree."

N. P. Good, chairman of the Pennsylvania System Federation No. 90, expressed his opinion that the Pennsylvania had been selected by the railroads to conduct a fight for the "open shop" as the first step in a campaign which would eventually involve all the railroads. Practically all of the speakers at the meeting condemned the Railroad Labor Board and its decisions, Mr. Jewell charging that the railroads were attempting to use the board to take unfair advantage of the present industrial situation.

### Iowa Increases Railroad Taxes

Railroad companies operating in the state of Iowa have been taxed, they believe, too high and not according to the basis set down for other properties. The roads have, therefore, brought injunction suits against the State Executive Council and 99 county auditors to restrain the spreading of the tax assessment on the valuation as laid down. The suits began in the federal court of the state on September 12 with H. L. Adams, counsel for the Chicago & North Western, J. L. Parish, for the Chicago, Burlington & Quincy, and J. E. Gamble, for the Chicago, Rock Island & Pacific, presenting the railroad side of the case. During the opening day of the hearing the railroads charged that they are being assessed for taxation in Iowa at 79 to 84 per cent of their actual value, while Iowa farms are only taxed upon the basis of 38 per cent.

The assessed tax valuation of the railroads operating in the state for 1921 has been materially increased over that for 1920. Thus the Chicago, Burlington & Quincy, which was taxed on an assessed valuation of \$11,607,617, or \$8,500 per mile of road, in 1920, has been given an assessed valuation of \$10,500 per mile, or \$14,333,160, for 1921. The Burlington claims that its assessed valuation should be \$3,220 per mile and at that figure the road's taxes for this year would be \$777,000 less. The Chicago & North Western has 1,615.71 miles of tracks in the state and was assessed in 1920 at \$9,700 per mile, which figure has been increased in 1921 to \$10,500 per mile, or a total of \$16,964,955.

The Chicago, Rock Island & Pacific, with 2,202.35 miles of track in the state, was assessed at \$7,750 per mile in 1920 and \$8,000 per mile in 1921, or a total of \$17,618,680 for the latter year.

### Unemployment Conference at Washington

Secretary Hoover, of the Department of Commerce, has announced the names of those invited by the President to attend a conference at Washington, beginning on September 26, called by the President to inquire into the volume and distribution of unemployment, and to consider measures that would tend to recovery of business. Men of experience in those industries where there is the largest degree of unemployment have been called upon in larger proportion than from trades where there is less difficulty. It was impossible to include representation of the whole of some 50 trade groups in the conference and hold its size within workable limits.

An Economic Advisory Committee has been appointed in advance of the conference by enlarging the economic advisory committee of the Department of Commerce. This committee will prepare an agenda for the conference. Mr. Hoover has been appointed chairman of the conference and it is expected that it will at once dissolve into special committees which will, no doubt, seek co-operation from further representatives of labor, employers, and civic bodies. Secretary of Labor Davis has made a renewed survey of unemployment in preparation for the conference.

The members invited include

C. H. Markham, president of the Illinois Central; W. S. Carter, president of the Brotherhood of Locomotive Firemen and Engineers; Edgar F. Clark, ex-president of the Railway Conductors; member Roosevelt Anthracite Organization in 1902; formerly chairman Interstate Commerce Commission; and Charles P. Neill, former U. S. Commissioner of Labor Statistics; empire Anthracite Organization; former president of the Southeastern Railway Association.

## Operating Statistics of Large Steam Roads—Selected Items for the Month of July, 1921.

Region, road and year		Average miles of road operated	Trains-miles	Freight Service				Car-miles		Ton-miles (thousands)		Locomotives on line daily			
				Locomotive-miles		Loaded (thousands)	Per cent loaded	Gross, Excluding locomotive and tender	Net, Revenue and non-revenue	Serviceable	Unserviceable	Per cent unserviceable	Stored

### A Regional Adjustment Board

Two roads, the Baltimore & Ohio and the New York Central, have agreed with their train-service employees on what is called a regional board, for arbitrating disputes growing out of personal grievances or from the interpretation of the application of existing working schedules. It is named the "Train Service Board of Adjustment." This board will consist of eight members, four to represent the two railroads and four chosen by the chief executive officers of the four train service organizations, engineers, firemen, conductors and brakemen. A tentative course of action has been outlined. The agreement provides that when disputes arise the settlement of which by the usual method of direct conference has failed, they shall be passed upon by the new regional board whose decisions will be final and binding on both the railroads' management and the train service employees. It will not come within the province of this board, however, to hear any disputes arising from proposed changes in rules, working conditions or rates of pay; such matters will go before the Railroad Labor Board.

### University of Illinois

Edward Charles Schmidt has been appointed professor of railway engineering at the University of Illinois, and head of that department. Professor Schmidt was associate professor and professor of railway engineering at the University for 11 years up to November, 1917, when he resigned to enter military service as Major of Ordnance. He was graduated from Stevens Institute of Technology in 1895 with the degree of mechanical engineer. He was connected with the Kahlfleisch Chemical Company, New York and Buffalo; with the Edison Electric Illuminating Company of Brooklyn, N. Y., and with the American Stoker Company. He first went to Urbana in 1898 as instructor of machine design. After five years there he went into the employ of the American Hoist & Derrick Company of St. Paul, and in 1904-06 he was engineer of tests with the Kerr Turbine Company.

After a comparatively short time in the Ordnance Corps, Professor Schmidt was requisitioned by the Fuel Administration, and later was transferred to the Railway Administration in charge of the campaign for fuel economy in locomotive service. From August, 1919, until the present time, he has been mechanical engineer for the North American Company.

### Vandalism on the A. B. & A.

B. L. Bugg, receiver in charge of the Atlanta, Birmingham & Atlantic, has called upon the state authorities to protect the road, its trains, employees and passengers, from train wreckers, who use dynamite; and has offered a reward of \$5,000 for the conviction of the guilty person or persons of murder, a locomotive engineman having been killed when a freight train was derailed by dynamite on the night of September 7. This wreck was near Cascade, eight miles from Atlanta; and a similar outrage had been committed several days before this at a place near Cordele. Colonel Bugg gave to the governor of the state a statement of 33 wrecks or attempts at wrecks which had been committed on the lines of the road since the beginning of the strike, on March 5, which led to the employment of non-union men to run the company's trains. The governor, following a conference with the receiver, offered a reward of \$500 for the detection of the miscreants.

At Fitzgerald, Ga., on September 5th, 19 men, including the mayor of Fitzgerald, were indicted by a special grand jury on a charge of interfering with the employees of the road. Of the 19 men, two were classed as enginemen, two trainmen, ten shopmen, two conductors and one clerk, all, evidently, men who had been among the strikers.

The Governor of Georgia has appointed a special commission to investigate the wrecks on this road, consisting of C. M. Candler, chairman of the State Railroad Commission; William P. Turner, master mechanic of the Georgia Railroad and Woods Hudson, general superintendent of the Georgia Car & Locomotive Company. The Bureau of Safety of the

Interstate Commerce Commission is also making an investigation. The governor was requested to appoint the commission in a letter from three machinists—a "committee," who complained that organized labor had been unjustly accused in connection with the wrecks.

### Welding Equipment Investment Nets 300 Per Cent

Practical application of the electric arc welding process was the subject of a paper read by E. Wanamaker, electrical engineer of the Rock Island, at a meeting of the Metropolitan Section of the American Welding Society, on September 20, at the Engineering Societies' Building, New York, N. Y. The paper dealt principally with the equipment, materials and skill required for successful welding. Mr. Wanamaker spoke particularly of the manner in which results are obtained on the Rock Island. A book of loose-leaf specifications is sent to welders and welding foremen, which explains what can be welded, how the work can best be done, how to test the quality of a weld, etc., giving the welder sufficient information to work intelligently, provided he understands the fundamental principles, and keeping him up to date on all new practices. New sheets, superseding those in the book, are sent out as new methods are developed. Cleanliness and impressing the welder with his responsibility, said Mr. Wanamaker, are big factors in getting and maintaining good results.

It has been shown that an investment of \$150,000 in welding equipment on the Rock Island has in a few years saved three times its cost.

After the practice of welding locomotive tires was established, no new tires were purchased for a period of three years, and the number now bought is only about one-third of the former average.

### Railway Returns for July

The Interstate Commerce Commission's summary of revenues and expenses for July for 201 Class I roads is as follows:

Item No.	Item	July		Seven Months	
		1921	1920	1921	1920

## Traffic News

The Public Service Commission of Oregon has ordered extensive reductions in freight rates on sand, gravel and crushed stone.

The passenger trains of the Atlantic Coast Line, in the month of August, made a record of 97.8 per cent maintenance of schedules. In July, 96.9 per cent of the trains maintained their schedules.

Sunday excursion trains on the Pennsylvania Railroad System, in three months, May, June and July, carried 291,669 passengers. In July, including Monday, July 4, the number of such trains run was 209. Of the total number of passengers above noted, about 85 per cent (248,566 passengers occupying 4139 cars) were reported by the Eastern Region.

Proposals to reduce transportation taxes, as agreed upon by the House committee, have been modified by the Senate committee. This committee has decided to restore all transportation taxes (which the House committee would repeal as of January 1) so that those on freight and passenger and Pullman accommodations would continue throughout 1922, but at only half the present rates.

The Railway Commissioners of Canada, by a vote of three to five, have agreed to make no reduction in freight rates at the present time. Commissioners Corvell and Nantel were in favor of a general reduction of ten per cent, with certain exceptions. The majority held that no action could reasonably be taken until the special investigation of railroad wages, now going on, has been concluded.

### Portrait Tickets on the New York Central

The use of photographs on commutation tickets has proved so successful on the New York Central since September 1, when the requirement was extended to a large number of stations, that announcement is made that, beginning October 1, the portraits will be required on these tickets at all stations in the New York City suburban territory. Sales of monthly tickets have fallen off about 25 per cent, indicating that the railroad has been losing \$500,000 yearly by the use of these tickets by passengers who ought to have paid the full single-trip fare. For tickets to be used, beginning with October 1, passengers may have photographs taken and the purchase may be made at any time after September 21. They may have their photographs taken at the Grand Central Terminal, New York, for 35 cents each.

### Rates on Western Vegetables to Be Reduced

After a conference between representatives of the transcontinental carriers, western vegetable shippers and the Interstate Commerce Commission, a decision has been reached to make reductions desired by shippers in the rates on vegetables from California and other Pacific Coast territory to the territory east of the Rocky Mountains as far as Chicago and the Mississippi river.

The basis to be employed is to substitute for the increase of 33 1/3 per cent made on August 26, 1920, an increase of 15 per cent over the rates in effect August 25, 1920, thus removing more than half of the increase made at that time.

A large volume of movement takes place annually under the rates to be reduced and it is hoped that the reductions will materially assist growers and shippers of western vegetables.

### Freight Rate Revisions in Canada

The Canadian Railway Association, since January 1, last, has reduced 1,450 rates, voluntarily, to meet varying traffic and commercial conditions. This work has been supplementary to the blanket reduction of five per cent, ordered by the Government, which went into effect in January. These reductions cover about

400 commodities. Among these are those on lumber from British Columbia to eastern Canada; livestock between all Canadian points—a reduction of about 25 per cent; on grain and grain products for export from Bay ports and Fort William via Montreal and other Atlantic ports, from nine to 26 per cent.

Transcontinental rates on 48 different staple commodities show reductions of from six to 32 per cent; and 78 commodities to United States consuming points show reductions varying from four per cent to 64 per cent.

### Freight Traffic Officers Meet at Chicago

The American Association of Freight Traffic Officers held its annual meeting at the Drake hotel, Chicago, on September 19, and its annual dinner at the same place that evening. The principal speakers were J. F. T. O'Connor of North Dakota, who was the candidate for governor of that state on an independent ticket a year ago, and Henry A. Palmer, editor of the Traffic World. Mr. O'Connor spoke upon the business man in government affairs and urged he should take a more lively interest in the conduct of the government. He also told of the work of the non-partisan league in his home state. Mr. Palmer opened his remarks with a statement of the fundamental railroad problem and then called attention to the needed co-operation and understanding between carrier and shipper if the problem is to be solved. He said, "I know that talk of co-operation between carrier and shipper sounds stale. We all believe in it—or say we do. But we do not all practice it." Mr. Palmer then referred to what might be called the proper business attitude on the part of the railroads. He said a lack of it exhibited itself in several ways. "There are for instance," he continued, "the railroad rate committees. Their purpose is good and the carriers are entitled to and have received great credit for their actions but the plan has been permitted to degenerate into a time-killing scheme that is becoming the bane of shippers. There is perhaps no one thing in which the traffic department of the railroads could better help themselves to a higher place in the esteem of their customers than by revising this rate committee plan so that it will work with something like business method. If it cannot be revised then it had better be cast aside altogether. It not only annoys the shipper but it is suppressive of initiative in the carrier." Speaking of the fundamental railroad problem and the matter of railroad initiative and enterprise in the broader aspect, Mr. Palmer said, "we have a perplexing phase of the railroad problem before us. But do we see railroad initiative, railroad leadership in an attempt to solve it? The attitude of the railroads seems to be that the law is what it is and times are what they are and neither is their fault. They are victims and their hands are tied. It is true that they are shackled by over-regulation, but it is also true that they have the benefit of a degree of protection not afforded to other business. But even if the hardships outweigh the benefits there is still opportunity for the exercising of talent in an attempt to make the scale turn the other way." In referring to the present rate situation, he said that it had been successfully shown that high rates have not throttled or even hampered business generally in the sense that they have prevented tonnage from moving. After referring to the 4 1/2 per cent earned last July on the valuation of all the roads as fixed by the Interstate Commerce Commission, Mr. Palmer said that while 4 1/2 per cent was not enough it was considerably more than most businesses were now earning. Is there not here then, he queried, an opportunity for constructive action on the part of the railroads that will not only aid some business that is in even worse condition than the railroads, and thus contribute to the return to normal conditions, but that will also be a master stroke in winning for the carriers a place in public esteem which rightly or wrongly they are losing?

In conclusion, Mr. Palmer said that there should be at this time a meeting of transportation minds in the forming of a wise and definite policy. That policy should aim immediately at a reduction of operating costs through the reduction of the Labor Board and by all other possible means; a readjustment of rates so as to give the shipping public the benefit of any possible saving that may be achieved by this means; the establishment of some degree of certainty as to the rate for some time to come, and the elimination of losses incurred in the dealings of railroads with shippers and with carriers, to the operation especially of individual carriers and enterprises.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until January 18, 1922, the operation of an item in a Kansas City Southern tariff which proposes the cancellation of the commodity rates on live poultry and eggs from stations on the Kansas City Southern in Missouri, Arkansas and Oklahoma to New Orleans, La.

### State Commissions

The State Railroad Commission of California has protested to the Interstate Commerce Commission against the application of the Santa Fe to acquire control of the California Southern, an intrastate line serving the cotton growers between Rice Junction and Ripley. The State Commission bases its protest on a claim of complete jurisdiction over an intrastate carrier.

The Railroad Commission of Texas has denied permission to James A. Baker, receiver of the International & Great Northern, to incur a debt of \$193,400, which he had recently applied for to the Interstate Commerce Commission. The Texas state law prohibits receivers of railroads from issuing securities exceeding \$100,000 in value, without permission from the state railroad commission.

The State of Alabama has asked the United States District Court for an order enjoining the Interstate Commerce Commission from placing a surcharge of 50 per cent on Pullman and parlor car transportation within the boundaries of Alabama. The point is stressed that the federal rate-making body has no right to interfere with the Alabama Public Service Commission in prescribing rates for intra-state traffic. Twice the railroads doing business in Alabama requested the Alabama Public Service Commission to authorize the imposition of the 50 per cent Pullman and parlor car surcharge and twice this request was denied by the state commission. An appeal was then taken by the railroads to the Interstate Commerce Commission, which authorized the collection of the surcharge on intrastate passenger transportation, and later declined to modify this order.

The Public Utilities Commission of Rhode Island has refused to suspend a tariff filed by the New York, New Haven & Hartford, making advances in passenger fares on the line between Providence and Bristol. This line is operated partly by electric trains and commutation rates are very low. Remonstrances against the advances have been filed also with the Interstate Commerce Commission and with the Massachusetts Commission. The Rhode Island Commission in its decision says that this section of the New Haven railroad was operated during the first six months of this year at a loss of \$106,525; that the monthly tickets are left at the old rate and that if there is any discrimination as between passengers on different sections of the New Haven road it is in favor of this section. To suspend the rates would continue a burden of loss upon the company, whose existence appears to be very seriously endangered by the condition of its finances.

### Personnel of Commissions

Charles R. Vanneman, heretofore at the head of the Steam Railroad division and connected with the New York State Public Service Commission in various capacities for the past 11 years, has been appointed chief engineer of the new commission at a salary of \$8,000 a year. Under the reorganized commission, which, unlike the former commission for the second district, has authority throughout the whole state, the chief engineer will be in charge of engineering and inspection work in connection with all steam railroads, street railroads, including grade crossing elimination; and also all electric light, gas, telephone and telegraph companies.

## Foreign Railway News

### Belgium Gets Contract for Big Chinese Bridge

The Peking-Hankow Railway has, according to press dispatches, awarded a contract to a Belgian firm for the construction of a bridge over the Yellow river. This firm's bid was stated at \$10,500,000. It was reported that four American concerns entered bids for the structure, which will be in excess of 1½ miles in length.

### Ohio Man Appointed American

#### Purchasing Agent for Chinese Government

Charles H. Kettenring, president of the Defiance Machine Works, Defiance, Ohio, has been appointed purchasing agent in America for the republic of China. Mr. Kettenring will have charge of purchases in this country of practically all classes of equipment and supplies of a mechanical or engineering nature.

### Australian Railway Officers to Visit America

The railway commissioners of Victoria and New South Wales, Australia, recently announced their decisions to send delegations of railway officers to the United States to study railway operations, according to a report from Trade Commissioner A. W. Ferrin, announced in Commerce Reports. The delegations from each state consist of four members, who, remaining in America for three or four months, will concentrate their attention on an intensive study of the most modern and efficient railway facilities of the country.

### Passport Visas Cost More Than Railway Fares

While a welcome beginning has been made in the removal of passport difficulties, the prices charged for visas by several countries remain exorbitant, says the Railway Gazette (London). The price of a first class railway ticket from Paris to Constantinople by the shortest route is \$215 (at par exchange) and of a second class ticket about \$100. The passenger passes through six countries, and the total price of the six different passport visas required amounts to \$106 or about \$6 more than the cost of a second-class ticket. The French visa costs 28 cents, the Swiss 30 cents, the Italian \$27, the Czecho-Slovakian \$27.20, the Greek \$26, and the Serbian \$25.

### Electrification of Japanese Railways

The official plan for the electrification of the railways of Japan has recently been revised and a new electric bureau established, according to information published in Commerce Reports. According to the plan now being worked out by the Department of Railways, the first steps will be to electrify the entire Tokaido line, the traffic of which has been increasing enormously each year, from Tokyo to Kobe, and a part of the Central line between Iidamachi station in Tokyo and Kofu, in the rear of Mount Fuji, where many tunnels make transportation slow. Electric trains will be used exclusively for passengers, freight trains being operated by steam as at present.

### Relative Value of Railway Supply Exports

According to a pamphlet recently issued by the Chamber of Commerce of the United States, railway cars and locomotives ranked respectively twenty-fifth and twenty-sixth in value of all of our exports for the first six months of the current year. Steel rails ranked thirty-fifth. If, however, the value of these exports had been added together, viz. cars and parts, \$21,205,000; locomotives \$20,745,000; and steel rails, \$14,806,000—the result \$56,756,000, representing exports of railway supplies, would have been the eighth in the list. The order would have been as follows: wheat, raw cotton, tobacco, coal and coke, flour, lard, illuminating oil and railway supplies.

### July Exports of Locomotives

Exports of locomotives in July fell to 30, valued at \$876,840, compared with 136, valued at \$4,254,474, during the previous month. The July total is the lowest of any month during the current year. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Number	Dollars
Canada .....	2	20,900
Mexico .....	10	245,000
Other British West Indies .....	1	2,250
Colombia .....	8	274,110
Peru .....	1	12,000
Japan .....	1	23,100
Australia .....	1	12,550
Philippine Islands .....	6	286,940
Total .....	30	876,840

### Germans Seek to Develop Italian Lignite Fields

LONDON.

German capitalists have offered to the Italian government their co-operation for the exploitation of the mines of lignite in Italy to be used as fuel for the railways, in exchange for the facilities the Italian government would grant to Germany in connection with their confiscated properties in Italy. According to reports published by the Italian papers, Germany estimates that there are in Italy about 300,000,000 tons of lignite, of which only 3,000,000 tons are produced yearly. They propose to form a German-Italian company which should undertake the exploitation of the whole lignite wealth of Italy and to build special plants in which the lignite should be distilled, and, through a process discovered by them during the war, obtain oil to be used as fuel. It is estimated that the lignite produced and the oil obtained would cover the whole demand for fuel of Italy including the railways.

### July Exports of Car Wheels and Axles

Exports of car wheels and axles totaled only \$78,237 in July, as compared with \$236,719 during the previous month. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Dollars
Canada .....	5,050
Costa Rica .....	384
Guatemala .....	839
Honduras .....	120
Nicaragua .....	356
Panama .....	43
Salvador .....	245

Brazil .....	665
Chile .....	1,329
Colombia .....	436
British India .....	1,995
Japan .....	20,656
Belgian Congo .....	35
Portuguese Africa .....	1,800
Total .....	78,237

### Tampico-Mexico City Short Line to Be Completed

Information has been received from the City of Mexico to the effect that the National Railways of Mexico have awarded the contract for the completion of the short line of that system to extend from Tamos, on the Tampico-San Luis Potosi division, to a connection with the Hidalgo and Northwestern division, near Honey. It is stated that the work of building the new line will be resumed by October 1. The construction of this Tampico-City of Mexico short line, as it is called, was started about 12 years ago and about 50 miles of grade and track were finished before the revolutionary period caused a cessation of the work. From a traffic standpoint it is regarded as one of the most important railroad projects ever undertaken in Mexico. It will mean the reducing of the distance between the port of Tampico and the capital by about two hundred miles and the line will traverse a region that is very rich in agricultural and mineral resources. It also will penetrate a coastal territory that is believed to contain vast oil potentialities. With the resumption of construction of this line the rumor has been revived that the contract will be let soon for building the long proposed road that is to run between Tampico and Matamoros, near the mouth of the Rio Grande. B. F. Yoakum, of New York, while at the

head of the Frisco system, obtained a concession from the Diaz government for the construction of a railroad down the Gulf coast of Mexico from Matamoros, but difficulties arose that prevented him from undertaking the actual building of the line at that time.

### Portuguese Railway Results

The Portuguese Railway Company, which owns and works the principal lines running out of Lisbon and Oporto and the Spanish frontier, has just held its annual general meeting, according to the Railway Gazette (London). The receipts for 1920 were \$29,889,561, or \$15,053,098 more than in 1919, this considerable increase being due to the general increase in rates. Notwithstanding this, the company is no better off, operating expenses having continued to rise in even greater ratio, with the result that the year's operation shows a deficit of \$7,512,156. Failing an early and radical reduction in the cost of fuel it is difficult to foresee the company's future; rates have already been raised 200 per cent, and further relief can therefore hardly be looked for on the receipts side.

### July Exports of Cars

Freight cars totaling 464, valued at \$705,281, were exported in July, compared with 536, valued at \$1,066,256, during the previous month. Exports of parts of cars were valued at \$653,683, compared with \$887,241 in June. Three passenger cars, valued at \$20,036, were exported, as against 21, valued at \$96,100 during the previous month. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Passenger		Freight and Other		Parts of cars
	Number	Dollars	Number	Dollars	
France .....					1,647
England .....					1,050
Canada .....	2	12,536	8	9,700	16,351

Total .....	1	20,036	464	705,281	25,682

### Extent and Importance of Australian Railways

The mileage of all the railways open for traffic throughout Australia aggregates some 25,652 miles of various gages, according to Weekly Bulletin of the Canadian Department of Trade and Commerce. Their recapitulation is as follows:

	Miles
New South Wales Government Railways .....	4,824
Victoria Government Railways .....	4,189
Queensland Government Railways .....	5,469
South Australia Government Railways .....	2,289
Western Australia Government Railways .....	3,538
Tasmania Government Railways .....	601
Commonwealth Government Railways .....	1,233
Private companies' railways .....	3,009
Total Australian railways .....	25,652

The New South Wales State Railways are practically all of the standard gage, 4 ft. 8½ in. The Victorian State Railways are nearly all of the 5 ft. 3 in. gage. The Queensland State Railways are of the 3 ft. 6 in. gage. The South Australia State Railways comprise 1,080 miles of 5 ft 3 in and 1,029 miles of 3 ft. 6 in. gage. The Western Australia State Railways' entire track of 3,535 miles is of 3 ft. 6 in. gage. The Tasmania State Railways are of 3 ft. 6 in. gage. The Commonwealth Government Railways (chiefly in the states of South Australia and Western Australia) comprise 1,051 miles of 4 ft. 6 in., 478 miles of 3 ft. 6 in. and in the Northern Territory 200 miles of 3 ft. 6 in. gage. The private company lines comprise 1,600 miles

of 3 ft. 6 in. gage and 1,070 miles of 2 ft. 6 in. gage. The unaccounted gages are of comparatively unimportant feeder lines varying from 1 ft. 8 in. to 3 ft.

"It is obvious that these government railways require considerable quantities of imported materials of a most comprehensive variety," the Weekly Bulletin comments in conclusion.

### French Railways Before the War and Now

Operating expenses of the French railways mounted some 440 per cent during the period 1913-1920, according to information compiled by the Bankers Trust Company, New York. In 1920 the operating expenses of the railways were approximately \$1,380,600,000 (par exchange) as compared with \$225,000,000 in 1913. The enormous increase was due to higher cost of fuel and supplies, increased forces due to shorter hours and to higher wages.

The following table shows the number of railroad employees on the different roads in 1913 and 1920, and the amounts paid in wages:

	Number Employees		Wages (millions of dollars)	
	1913	1920	1913	1920
Northern .....	53,053	76,632	24.2	105.0
Eastern .....	54,259	75,326	22.8	94.0
P. L. M. ....	81,000	118,577	41.8	160.0
Midi .....	27,489	40,586	8.6	47.8
Orleans .....	50,338	72,179	19.0	98.0
State .....	78,805	106,586	32.6	120.2
Totals .....	344,944	489,886	159.0	625.0

Under the term "wages" are included indemnities growing out of the war which were in 1920 incorporated in the sums paid as wages. There was an increase in wages in 1919 and again in 1920.

The cost of fuel on all roads increased from \$35,000,000 in 1913 to \$38,200,000 in 1920. Total cost of operation of individual roads compares as follows (millions of dollars):

	1913	1920
State .....	55.4	275.2
Northern .....	41.2	232.0
Eastern .....	37.8	174.0
P. L. M. ....	67.8	366.0
Orleans .....	36.2	238.0
Midi .....	16.6	95.4
Totals .....	255.0	1,380.6

### Car Exports in June

June exports of freight cars totaled 536, valued at \$1,096,256, as compared with 465, valued at \$639,454, during the previous month. A total of 21 passenger cars, valued at \$96,100, were also exported, and also parts of cars valued at \$887,241. The detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Passenger		Freight and Other		Parts of cars

## Equipment and Supplies

### Freight Cars

THE PAULISTA RAILWAY (Brazil) is inquiring through the car builders for 180 freight cars.

### Passenger Cars

THE NEW YORK, NEW HAVEN & HARTFORD has bought from the International Motor Company three gasoline motor cars, supported by special trucks, with seating capacity of 35, also compartment for baggage. Delivery of these cars is expected early in December and they will be used in short haul passenger service on branch lines.

## Railway Construction

AMERICAN RAILWAY EXPRESS.—This company contemplates the erection of a building at Sweetwater, Tex., to cost about \$10,000.

ATLANTIC COAST LINE.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the construction of a 250-ton, automatic electric coaling plant to be erected at Dothan, Ala.

CADDO RIVER LUMBER COMPANY.—This company, located at Rosboro, Arkansas, will begin the construction on October 1 of a short line railroad connecting with the Missouri Pacific at Womble, Arkansas, and extending northward towards Oden, a distance of 16 miles. The work will cost approximately \$10,000 per mile.

CHICAGO & ALTON.—This company has awarded a contract for the construction of a second track, between Wann, Ill., and Brighton, about 12 miles, to Mulvill Bros., Alton, Ill.

CHICAGO & NORTH WESTERN.—This company is accepting bids for the rebuilding of a 1,900 ft. viaduct across its yards at Proviso, Ill.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract to the Railway Water & Coal Handling Company, Chicago, for the installation of a pipe line in connection with a reservoir being built by company forces at Valier, Ill.

CHICAGO, BURLINGTON & QUINCY.—This company will construct a 30-ft. by 50-ft. brick machine shop at Herrin Junction, Ill., with company forces.

CHICAGO GREAT WESTERN.—This company contemplates the construction of a passenger station at Afton Junction, Iowa.

FLORIDA EAST COAST.—This company will open bids about November 1 for the construction of a general office building at St. Augustine, Fla., to cost approximately \$175,000. The proposed structure will be 50 ft. by 105 ft. and 4 stories in height and will be of terra cotta, marble and brick construction on a concrete frame.

GREAT NORTHERN.—This company has awarded a contract to the F. W. Miller Heating Company, Chicago, for the installation of a boiler washout and refill system at Superior, Wis. The same company has awarded a contract to the National Boiler Washing Company, Chicago, for the installation of a boiler washout and refill system at Great Falls, Mont., and one at Hillyard, Wash.

ILLINOIS CENTRAL.—This company has awarded a contract to the A. Lund Construction Company, Chicago, for the enlarging of the waiting room at the Randolph street suburban station, Chicago, to cost about \$20,000.

INTERSTATE.—This company has awarded a contract to the Brooks-Callaway Company, Atlanta, Ga., for the construction of three tunnels on its Guest river extension. These tunnels will be, respectively, 600 ft., 550 ft. and 350 ft. in length through hard sandstone, slate and shale. It is anticipated that two of the tunnels will require lining, to be done with concrete.

## Supply Trade News

**Henry S. Lebarge**, formerly Chicago representative of the Handlan Buck Manufacturing Company, has been appointed manager of the railroad department of the **H. Channon Company** for Chicago territory, effective October 1.

**Theodore Rogatchoff** has been elected president of the **Rogatchoff Company**, Baltimore, Md., succeeding A. E. Davis. The company has moved its offices in Baltimore from 205 Water street to 1512 Latrobe terrace.

**R. H. Blackall** has been appointed railway sales representative for the New York territory of The Lowe Brothers Company, Dayton, Ohio, with offices at 7 East Forty-second street, New York City and Farmers Bank building, Pittsburgh, Pa.

**T. N. Gilmore**, who for the past sixteen years has been associated with Westinghouse, Church, Kerr and Company, engineers and contractors, has opened offices as a consulting

engineer at 136 Liberty street, New York. Mr. Gilmore was in charge of railroad shop and engine terminal work for Westinghouse, Church, Kerr and Company and was for several years a director and vice-president and chief engineer of the company in charge of all engineering and construction. Mr. Gilmore received his early training in steam railroad work. Prior to the World's Fair at St. Louis in 1904, he went with the St. Louis Terminal where he was in charge of the mechanical and car departments and in addition planned the power houses, locomotive shops and engine terminal facilities constructed to handle the traffic for the fair. Mr. Gilmore is a member of the American Society of Civil Engineers, the American Society of Mechanical Engineers and the Structural Engineers Association of Illinois.

**J. H. McMullen** has been appointed railroad representative in the Boston, Mass., territory, for the **Western Electric Company**, succeeding E. R. Morgan and E. B. Denison, formerly in charge of the Minneapolis, Minn., territory, has been appointed Detroit, Mich., railroad representative, succeeding R. S. Cowan.

The **English Electric Company of Canada, Ltd.**, a newly-formed company associated with the English Electric Company of Great Britain, has acquired control of the **Canadian Crocker-Wheeler Company, Ltd.** R. A. Stinson, vice-president and general manager of the latter company, has been elected president and general manager of the new company.

The **Conewango Car Company**, incorporated in Delaware, has leased the site at Warren, Pa., formerly occupied by the Allegheny Tank Car Company, which plant was partly destroyed by fire on April 6 last. The new company will specialize in repairs to tank cars. In addition to three buildings on the site which were not destroyed by fire, the new company has built a car shop, a machine shop and a sand-blast shop. Shop and yard space is provided for repairing 20 cars at a time, as is storage space for 50 additional cars. The plant is now being equipped with modern machinery and is

expected to be ready for operation by October 1. N. C. Stiteler is president and treasurer of the new company and J. C. Sullivan is vice-president and general manager.

## Obituary

**Kenneth Rushton**, vice-president in charge of engineering of the Baldwin Locomotive Works, who died on September 2, as was noted in the *Railway Age* of September 10, was born

K. Rushton

60 years ago in Philadelphia, Pa., and was educated in the city schools and Episcopal Academy. He served an apprenticeship, as machinist, under Hugo Bilgram, Philadelphia, and afterward entered the employ of the Baldwin Locomotive Works in April, 1881. Mr. Rushton's association with the Baldwin Locomotive Works continued uninterrupted until the time of his death. He served first as a draftsman, and then as designer, chief of the mechanical engineer and later as vice-president. He was

the inventor of many appliances used in the construction of locomotives, and was closely associated with S. M. Vauclain in the development of the four-cylinder compound that bears the name of the latter. While Mr. Rushton did not travel extensively in the prosecution of his business, he represented Baldwin's abroad in some important missions. In 1913, he was sent to Chile, visiting various points of railroad interest on the west coast of South America, and in 1918 went to France, in connection with the design of railway transport for artillery.

"WE ARE JUST AS RESPONSIBLE as the South Americans for the lull in trade between the two continents," said W. E. Leigh, export manager of the International Western Electric Company upon his return from a five months' trip to Brazil, Uruguay and Argentina. "As long as we refuse to accept the animal and agricultural products which form their main stock in trade, just so long will they find it impossible to buy from us the output of our factories."

Atlantic Type Compound on the Northern Railway (France)

## Railway Financial News

**BALTIMORE & OHIO.—Asks Authority to Acquire Stock.**—Application has been filed with the Interstate Commerce Commission for authority to acquire the entire capital stock of the Indian Creek & Northern from the New England Fuel & Transportation Company at an estimated cost of \$850,000.

**COLORADO & SOUTHERN.—Annual Report.**—A review of this come account for the year ended December 31, 1920, compares this issue.

**GEORGIA RAILROAD & BANKING COMPANY.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue and sell at not less than 95 per cent of par and accrued interest \$1,500,000 of debenture bonds, the proceeds to be used in connection with other funds to pay off and retire a like amount of plain debentures now outstanding.

**GRAND TRUNK RAILWAY OF CANADA.—Bonds Sold.**—Dillon, Read & Co. and other bankers have sold \$25,000,000, 15-year, 6 per cent sinking fund gold debenture bonds at 95½ and interest to yield about 6.50 per cent. The issue is dated September 1, 1921, and the Dominion of Canada guarantees principal and interest by endorsement. A sinking fund of \$500,000 annually, accruing from September 1, 1921, is to be available in equal semi-annual amounts for the purchase of the bonds in the market at not exceeding par and interest. If the bonds are not so obtainable any unexpended balance reverts to the railway company. These bonds are the direct obligation of the Grand Trunk Railway Company of Canada, which is controlled by the Government of the Dominion of Canada and forms part of the Canadian National Railways System.

**INTERNATIONAL & GREAT NORTHERN.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year, as follows:

	1920	1919
Net revenue from operations (September 1 to December 31).....	\$2,129,697	.....
Federal rental and Transportation Act guaranty (February).....	1,416,854	\$1,394,946
Hire of equipment-credit (September 1 to December 31).....	349,916	.....
Other corporate income.....	200,801	Def. 51,380
Gross corporate income.....	\$4,097,268	\$1,343,566
Corporate operating expenses (January and February).....	110,166	\$60,058
Tax Accruals (September 1 to December 31).....	119,831	.....
Hire of equipment-debit (September 1 to December 31).....	779,155	.....
Other corporate deductions.....	80,737	108,234
Total deductions.....	\$989,890	\$168,292
Net corporate income.....	\$3,107,379	\$1,175,274
Interest on funded debt.....	\$902,043	\$818,793
Interest on unfunded debt.....	874,149	695,905
Total.....	\$1,776,192	\$1,514,698
Surplus, carried to profit and loss.....	\$1,331,187	Def. \$339,424

**INDIAN CREEK & NORTHERN.—B. & O. Asks Authority to Acquire Stock.**—See Baltimore & Ohio.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—Authorized to Issue Bonds.**—The Interstate Commerce Commission has authorized the sale at not less than 97½ and accrued interest of \$10,000,000, 10-year, 6½ per cent collateral trust gold bonds. The company has also been authorized to issue and pledge as collateral security for these bonds \$12,500,000 of first refunding mortgage bonds and to procure the authentication and delivery to its treasury of \$2,500,000 of first refunding mortgage bonds to be held in the treasury until the further order of the commission.

**NORTHERN PACIFIC.—Asks Authority to Abandon Line.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of the Washburn Branch extending from Iron River to Washburn, Wis., 33.78 miles.

**TEXAS & NEW ORLEANS.**—A hearing was held before an examiner of the Interstate Commerce Commission at Washington

on September 21 on this company's application for approval of a lease of the Texas State Railroad.

**WHEELING & LAKE ERIE.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year, as follows:

	1920	1919
Railway operating revenues (Mar. 1 to Dec. 31).....	\$15,747,525	.....
Railway operating expenses (Mar. 1 to Dec. 31).....	13,906,828	.....
Net revenue from railway operations.....	1,846,697	.....
Taxes and uncollectible railway revenue.....	797,125	.....
Operating income.....	1,049,572	.....
Non-operating income.....	7,457	.....
Gross income.....	1,057,029	\$1,687,327
*Compensation (Jan. and Feb., 1920; year 1919).....	264,340	1,592,037
*Guaranty (Mar. 1 to Aug. 31).....	1,438,622	.....
Interest on funded debt.....	1,217,161	979,224
Total deductions from gross income.....	2,703,265	1,380,691
Net income.....	56,725	306,636
Total appropriations.....	117,187	146,276
Surplus transferred to profit and loss.....	Def. 60,462	160,360
*Tentative, pending decision as to "just compensation" and other matters in dispute arising out of federal control and guaranty period operations.		

The report of the Wheeling & Lake Erie will be reviewed editorially in an early issue.

### More Car Trust Certificates Sold

Additional funds have been put at the disposal of the Railroad Administration for use in making settlements with the railroads by the sale of \$20,204,000 of equipment trust certificates, in addition to the \$7,500,000, the sale of which was announced last week. The sale was made by the War Finance Corporation acting as the agent of the Railroad Administration. The certificates were those issued by the Atlantic Coast Line; Atchison, Topeka & Santa Fe; Central of New Jersey; Chicago, Burlington & Quincy; Great Northern; Louisville & Nashville; Norfolk & Western; Pittsburgh & Lake Erie, and Southern Pacific. Of these, \$13,778,000 were sold to White Weld & Co.; Brown Brothers & Co., and Lee, Higginson & Co., and \$6,426,000 to the Prudential Insurance Company. The price was par and accrued interest. The legislation which would authorize the War Finance Corporation to purchase these securities itself is expected to be taken up in the Senate very shortly.

On September 20 announcement was made of an additional sale of \$5,479,500 of these certificates, making a total of \$33,283,500.

### Railroad Administration Settlements

The Railroad Administration has made final settlements for the period of federal control and has paid to the following carriers the amounts named: Chicago & North Western, \$6,500,000; Chicago, St. Paul, Minneapolis & Omaha, \$1,200,000; Old Dominion Steamship Company, \$900,000; Wrightsville & Tennille, \$22,500; Louisville & Wadley, \$3,175.

### Guaranty Payments

The Treasury Department has announced the following payments to railroads on account of the six months guaranty for 1920: St. Louis-San Francisco, \$200,000; Chicago Junction, \$50,000; Gulf, Texas & Western, \$20,000; Cooperstown & Charlotte Valley, \$15,000; White Sulphur & Huntersville, \$14,000; Sandy River & Rangeley Lakes, \$10,000; Mohassuck Valley, \$10,000; Delaware & Hudson, \$7,500; Greenwick & Johnsonville, \$6,000; Frankfort & Cincinnati, \$5,600.

### Dividends Declared

Minneapolis, St. Paul & Sault Ste. Marie.—Common, 3¼ per cent, semi-annually; preferred 3¼ per cent, semi-annually; both payable October 15 to holders of record September 30.

Northern Pacific.—1¼ per cent, quarterly, payable November 1 to holders of record October 3.

Reading Company.—Common, 2 per cent, quarterly, payable November 10 to holders of record October 18; second preferred, 1 per cent, quarterly, payable October 13 to holders of record September 27.

**COUNTRY SAVED—CONSTITUTION VINDICATED.**—"Oklahoma City, Sept. 15.—An order forbidding alleged discrimination by the Fred Harvey Corporation and the Atchison, Topeka & Santa Fe Railway was issued today by the State Corporation Commission. It was on a complaint made by Campbell Russell, chairman of this commission, who had been denied the privilege of eating in a Harvey dining room at Purcell, Okla., without wearing his coat."

# Annual Report

## Colorado & Southern Railway Company—Twenty-Second Annual Report

CHICAGO, January 1, 1921.

To the Stockholders of The Colorado Southern Railway Company:  
Herewith is submitted the Twenty-second Annual Report of your Board of Directors for the year ended December 31, 1920, setting forth comparative statements for the fiscal period of The Colorado & Southern Railway Company, Fort Worth & Denver City Railway Company and The Wichita Valley Railway Company.

### THE COLORADO & SOUTHERN RAILWAY COMPANY.

## Railway Officers

### Executive

**H. B. Titcomb**, vice-president of the Pacific Electric, with headquarters at Los Angeles, Cal., has been elected president of the Southern Pacific of Mexico and the Arizona Eastern, to succeed Epes Randolph, deceased. Mr. Titcomb was born at Indianapolis, Ind., in December, 1871. He graduated from the Cogswell Polytechnical College in 1891, and in July of the same year entered the service of the Southern Pacific as a draftsman. He was promoted to assistant engineer in the construction division in 1898; was appointed roadmaster on the Western division in 1899, and was successively roadmaster on the Shasta and Sacramento divisions from 1900 to 1904. He was assistant resident engineer from 1904 to 1905, resident engineer at San Joaquin, Cal., from 1905 to 1906, and at Los Angeles from 1906 to 1909. He was district engineer, with headquarters at Los Angeles, from 1909 to 1914, and maintenance of way assistant to the assistant chief engineer, with headquarters at San Francisco from 1914 to 1917. In October, 1917, he was promoted to superintendent of the Stockton division, with headquarters at Stockton, Cal., which position he held until September, 1918, when he resigned to become vice-president of the Pacific Electric.

H. B. Titcomb

### Financial, Legal and Accounting

**W. E. Fitzgerald** has been appointed auditor of the San Antonio & Aransas Pass, with headquarters at San Antonio, Texas, succeeding J. W. Terry, deceased.

**G. E. Bramon**, auditor of freight accounts of the Chicago, Burlington & Quincy, with headquarters at Chicago, has been appointed auditor of expenditures, succeeding **S. L. Porter**, who will assume the duties formerly performed by Mr. Bramon, effective September 1.

### Traffic

**W. M. Long** has been appointed commercial agent of the Illinois Terminal, with headquarters at Wood River, Ill.

**F. F. Seymour, Jr.**, has been appointed general agent of the Kansas City Southern, with headquarters at Kansas City, Mo., succeeding T. A. Dudley, deceased.

**A. S. Edmonds**, traffic manager of the Los Angeles & Salt Lake, has been appointed traffic manager of the Oregon-Washington Railroad & Navigation, effective September 1.

### Operating

**Eugene H. Daniel**, assistant to the general superintendent of the Central of Georgia, has been appointed superintendent of transportation with headquarters at Savannah, Ga., effective September 1, and the position of assistant to the general superintendent has been abolished.

**Eugene H. Daniel**, assistant to the general superintendent of the Central of Georgia, has been appointed superintendent

of transportation with headquarters at Savannah, Ga., effective September 1, and the position of assistant to the general superintendent has been abolished.

**E. J. Devans**, general superintendent of the Buffalo, Rochester & Pittsburgh with headquarters at Du Bois, Pa., has been appointed superintendent with jurisdiction over the entire system. The positions of general superintendent, division superintendent and superintendent of stations and transfers have been abolished. **M. G. McInerney**, superintendent with headquarters at Rochester, N. Y., has been appointed assistant superintendent with the same headquarters, succeeding **T. C. McCarthy**, who has been appointed chief dispatcher of the Buffalo division. **A. B. White**, superintendent with headquarters at Du Bois, Pa., has been appointed assistant superintendent with headquarters at Punxsutawney, Pa., succeeding **A. H. Stokes**, who has been appointed acting assistant superintendent during the illness of R. L. Moore, assistant superintendent. **H. E. Patterson**, assistant superintendent with headquarters at Rochester, N. Y., has been transferred to a similar position with headquarters at East Salamanca, N. Y. These changes were effective on September 1.

**W. H. Newell, Jr.**, whose appointment as superintendent of the Atlantic Coast Line with headquarters at Wilmington, N. C., was announced in the *Railway Age* of September 17 (page 556), was born at Wilmington on February 27, 1884, and was educated in the grammar schools of that city and Portsmouth, Va., and the Portsmouth Academy. He entered railroad service on September 1, 1898, as a messenger and operator in the superintendent's office of the Atlantic Coast Line. From September, 1899, to January, 1903, he served in the office of the general agent at Norfolk and Pinner Point, Va., consecutively as receiving clerk, billing clerk, loading clerk, baggage agent, ticket agent and assistant cashier. In January, 1903, he became a flagman on the Norfolk & Carolina (a branch of the Atlantic Coast Line). In April of the same year he was transferred to the Wilmington district and served consecutively as flagman, baggageman, freight and passenger conductor and station master of Wilmington Union Station, until May 1, 1918, when he was appointed trainmaster of the Norfolk district with headquarters at Tarboro, N. C. In September of the same year he was transferred in the same capacity to Pinner Point, Va., in charge of the Southern and Atlantic Coast Line terminals which were under unification. In April, 1919, he was transferred as trainmaster of the Atlantic Coast Line and Seaboard Air Line terminals (also under unification) at Wilmington (N. C.), which position he was holding at the time of his recent promotion.

W. H. Newell, Jr.

### Engineering, Maintenance of Way and Signaling

**J. H. Moore**, signal supervisor of the Rochester division of the Buffalo, Rochester & Pittsburgh, has had his jurisdiction extended to include the Buffalo division with headquarters at East Salamanca, N. Y., succeeding **A. J. Darrow**, who has been assigned to other duties, effective September 1.

### Obituary

**S. B. Howard**, general agent of the homeseekers bureau of the Chicago, Burlington & Quincy, died at Omaha, Neb., on September 17. He was 64 years of age and had been with the Burlington since 1907.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free: United States, Mexico and Canada, \$6.00. Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE, that of this issue 9,000 copies were printed, that of these 9,000 copies, 8,032 were mailed in regular mail subscribers, 52 were provided for counter and news company sales, 348 were mailed to advertisers, 65 were mailed to employees and correspondents and 512 were provided for new subscribers, 512 copies lost in the mail and office use, that the total cost of this year to date were 374,100, an average of 9,582 copies per issue.

With Ryerson Standardized Flue Shop Machinery, erecting shop work never waits for flues.

## Do the Flue Job Right

Flue work is sometimes considered as a necessary evil. It really is conservation and offers means for saving that is continuous.

In one flue shop four men replaced seven men when Ryerson Standardized Flue Shop Equipment put the flue job on a production basis.

The saving in wages alone will pay for the equipment in less than two years.

We would like to make a layout for your shop without obligation. Write us to-day.

## Railway Age

The Table of Contents Will Be Found on Page 5 of the Advertising Section

In a letter appearing elsewhere in this issue, A. C. Irwin discusses the two motives which are responsible for the use of

### Placing the Burden on the Bridge Engineer

low unit stresses in designing concrete railway structures. One of these relates to the variation in the strength obtained in concretes and the writer very properly points to the need of refinement in practices so that a much more effective control of results will be secured. The other condition concerns the provision of sufficient allowance for further increases in train loading so that a structure designed and built to be permanent may be expected to function adequately many years hence. In the absence of authority to use higher design loadings, lower unit stresses are often resorted to with the idea that when the greater loadings are applied the stresses will remain within conservative limits. A more consistent practice would be to use maximum conceivable loads with maximum allowable working stresses. This has been done in the cases of a few large steel bridges and would seem to have equal applicability to concrete structures.

With labor leaders and labor lobbyists by the score working night and day to defeat the passage of Senate Bill 2337,

### Good Sense From a Labor Leader

which, in the words of the director general of railroads, provides that "the government refrain from collecting certain amounts that the roads owe and do the same for the transportation system of the United States that the government is doing for France, England, Italy and Germany in extending obligations growing out of the war," it is refreshing to see that at least one man who has been prominent in railway labor organization work has recognized the fallacy of this opposition. The letter to the editor published elsewhere in this issue and headed "The War Finance Corporation Bill," sets forth very clearly certain facts which might well be seriously studied by railway labor organization leaders. It is unquestionably true that the prosperity of the railway employee is solely dependent upon the prosperity of the railroads. It is probable that labor leaders will not recognize this fundamental fact so long as the moves which they advocate or oppose are steps toward eventual government ownership and operation. Nevertheless, it is indeed unfortunate that the rank and file, who are after all, most vitally affected, cannot have the full benefit of the saner logic which is expressed in this letter to the editor.

A part of England's contribution to the International Railway Association, the next meeting of which is scheduled to be held at Rome, Italy, in 1922, will

### A Contrast in Maintenance Problems

be a paper on the maintenance and supervision of railway track. A short review of this, appearing in the Railway Gazette of London, England, is particularly interesting because of the conclusions arrived at in the summary, through a study of data furnished by 44 roads located in Great Britain and Ireland, India, Australia and South Africa. While the report is intended to

cover only the conditions existing on the roads of the countries named, the statements made are to some extent applicable to railway maintenance work the world over. In effect, the summary states that present organizations and methods on the roads in question have changed but little since 1900; that they are adapted only to conditions where labor is plentiful and cheap; that the present system does not lend itself readily to the adoption of labor-saving appliances; that a reduction of wages alone does not appear likely to reduce the cost to a reasonable figure; and that a profitable means for effecting economies lies in the reorganization of the present system to utilize labor-saving devices to advantage. These statements are worthy of consideration by railway officers on this continent. In all fairness, it must be said that the organizations of a large number of American railways lend themselves readily to the adoption of labor-saving devices, as some of our more progressive roads have already demonstrated. In contrast to the situation in Great Britain, there is nothing inherent in American railway organizations, which in itself retards the adoption of labor-saving equipment; but it is safe to say that the officers of practically every American road could spend some time profitably in studying the progress actually made in development of modern maintenance equipment and the extent to which other roads have put it to practical use.

The unemployment conference convened at Washington this week at the call of the President should find some interesting

### Railways' Contribution to Unemployment

material for consideration in the quarterly report just issued by the Interstate Commerce Commission on statistics of railway employees' service and compensation for the three months ending June 30, 1921. This report shows that the average number of railway employees in service during the quarter was 1,568,143, or 436,617 less than during the corresponding quarter of 1920, and 123,328 less than during the first quarter of 1921. An even more striking reduction in railroad employment is shown by the comparison between August, 1920, when the railroads were carrying a record-breaking traffic, and April, 1921. The reduction for this period was 655,108, or nearly 30 per cent. In August, 1920, the number of employees in service on the railroads of the United States was 2,197,824. In April this had been reduced to 1,542,716. For the first quarter of 1921 the average was 1,691,471 and for March it had fallen to 1,593,068. In April the situation was still worse, but there was a slight increase in May to 1,575,599 and in June to 1,586,143. Later reports will undoubtedly show further increases for the ensuing months, for which the reports are not yet available, as traffic has increased and the railroads have been able gradually to increase their maintenance forces, particularly since the slight reduction in wages allowed by the Railroad Labor Board on July 1. but every one knows that the improvement since last spring has been relatively very slight. An analysis of the report indicates that while the decrease in the amount of freight offered to the carriers has naturally led to a reduction in the number of train crews, even heavier reductions were made

in the track and car repair forces and heavy reductions were also made in the clerical forces. The total compensation paid to the employees of Class I roads for the second quarter of 1921 was \$699,684,795 as compared with \$757,325,356 for the first quarter of 1921 and \$1,052,109,451 in the third quarter of 1920. Since in all these three quarters the employees were on the same basis of wages, the reduction in the payroll was entirely due to reduction in the number of employees. While the commission's statistics indicate the extent of the unemployment in the railway industry which has resulted from the general business depression of the past year and the necessity for the railroads to curtail their expenditures in every way possible, it does not show the very large amount of unemployment in industries which are dependent upon the prosperity of the railways. Directly and indirectly the drastic retrenchments the railways have had to make undoubtedly have caused the unemployment of more than a million men.

The railway facilities of India are notoriously inadequate. In October last year a committee, of which Sir W. M.

#### Plans for India's Railway

Acworth is chairman, was appointed by the government to examine the situation and recommend changes which would ameliorate conditions. The Indian railways are now for the most

part owned by the government, but are leased for operation to private English companies. The committee was unanimous in recommending that this system of management be done away with at the termination of existing contracts. On the solution of the problem, however, the committee divided. Five members, including the chairman, recommend out-and-out government operation. The other five members favor operation by private companies, as at present, but they insist that these companies should be domiciled in India and not in Britain. Some action must be taken at once to bring about the additions to railway plant and equipment which India sorely needs. Capital must be secured and it would seem that the recommendation of the committee members advocating operation by Indian companies would give the necessary incentive to efficient operation and would be of assistance in interesting Indian capitalists in investing in the railways of the country. With the rather conspicuous failure of government operation in Great Britain and many of its dominions it seems strange that so large a number of the committee members are favoring such a plan for India.

### The Coal Situation

RAILWAY OFFICERS and coal mine operators will watch developments in the production and transportation of coal with much interest during the weeks immediately ahead of us. The production and transportation of bituminous coal thus far in the year 1921 are believed to have set a new low record for the last quarter century in proportion to the population and consuming capacity of the country. Up to September 17 the total production in 1921 had been only 279,881,000 tons. This was 111,185,000 tons less than in the corresponding part of 1917, 140,663,000 tons less than in 1918, 47,000,000 tons less than in 1919 and 97,000,000 tons less than in 1920. The Geological Survey estimates that at the rate of production since January 1 the total for the year would be only 393,000,000 tons. Never since 1909 has the total production fallen below 400,000,000 tons, and in the record year 1918 it was 530,000,000 tons.

There will soon be a seasonal increase in the demand for coal for domestic consumption. If general business activity revives in any substantial measure there will also be an in-

crease in the demand on this account. How large will this increase in demand be? Will it be so large that it will be difficult for the railways to meet it? For many months now the railways have been setting many thousands more cars at the mines than the operators have been loading and there has been continuously a very large surplus of coal cars. On August 31 the number of surplus coal cars which were in serviceable condition was 130,596. There was in addition a large number of coal cars which were in bad order but could soon be put in serviceable condition if they were needed.

It is hard to believe that one year ago the country was filled with outcries about the danger of a great coal shortage, that the railways were making the utmost efforts to move enough coal to supply the demands, and that they were being widely criticised for alleged inefficiency in not moving more coal. For many months they have had hundreds of thousands of coal cars standing on side tracks and rusting their wheels off because there was no demand. After all these months of huge car surpluses, will the public arise and smite the railways hip and thigh as soon as they are again unable to transport all the coal the mines can produce and the public consume when they are producing and consuming to capacity?

Coal shipments are beginning to show an upward trend. They amounted to 7,606,000 tons in the week ended September 3; 7,069,000 tons in the week ended September 10, and 8,139,000 tons in the week ended September 17. This was the first week since early in June when they passed the 8,000,000 mark. While, however, total shipments in these three weeks were 22,814,000 tons, they were in the same weeks of the year 1920, 33,506,000 tons, or about 50 per cent more. We now rejoice when the shipments exceed 8,000,000 tons a week. Perhaps in a few months we shall hear the railroads again being denounced because they do not transport more than 13,000,000 tons a week. Nobody thinks of denouncing the coal operators, the coal dealers and the consuming public when they don't furnish the railways coal with which to load their coal cars, but the coal operators, the coal dealers and the dear public all join in one wild howl when the railways cannot furnish cars in which to load all the coal. It's a great little world and many of the people in it are so fair and consistent—not!

### The "Government Guarantee" to the Railways

THERE IS NO FEATURE of the railway situation regarding which there is more misunderstanding on the part of the public than regarding the so-called "government guarantee of 6 per cent." Selfish and industrious misrepresentation by persons who desire to destroy the rate-making provisions of the Transportation Act, or even private ownership of railways, has caused literally millions of people to believe that the Transportation Act actually guarantees to the railways a net return of 6 per cent. Many people, and even many newspapers, believe and say that the railways are guaranteed 6 per cent, while other industries of the country are making little or no net return, or actually are losing money. Whether the railways under present conditions should be guaranteed or enabled to earn an average return of 6 per cent may be a debatable question, but one fact which is beyond all reasonable question is that they never have been guaranteed 6 per cent, that they are not guaranteed 6 per cent now, and that they have not been and are not earning or getting 6 per cent.

Since there is such general misrepresentation and misunderstanding regarding the facts bearing upon this matter, it is desirable that they should be stated clearly and in detail.

Nowhere does the Transportation Act in any form, directly or indirectly, temporarily or permanently, guarantee to the railways an annual net return of 6 per cent or any other

amount. The law first requires the Interstate Commerce Commission to fix rates which will "under honest, efficient and economical management and reasonable expenditures for maintenance of way, structures and equipment, earn an aggregate annual net railway operating income equal, as nearly as may be, to a fair return upon the aggregate value of the railway property of such carriers held for and used in the service of transportation."

It will be noted that this provision, which is here quoted in the exact language of the law, requires the rates to be so fixed as to yield a "fair return" *only if the railways are efficiently and economically managed.* The law then continues: "The Commission shall from time to time determine and make public what percentage of such aggregate property value constitutes a fair return thereon, and such percentage shall be uniform for all rate groups or territories which may be designated by the Commission." Are these provisions a guarantee of 6 per cent? They require the Commission to let the railways earn a "fair return," but they do not say that this return must be 6 per cent.

But this is not all. The law adds: "Provided, that during the two years beginning March 1, 1920, the Commission shall take as such fair return a sum equal to 5½ per cent of such aggregate value, but may, in its discretion, add thereto a sum not exceeding one-half of one per cent of such aggregate value to make provision in whole or in part for improvements, betterments or equipment, which, according to the accounting system prescribed by the Commission, are chargeable to capital account."

Now, what does all the foregoing mean? It means, first, that Congress has directed the Interstate Commerce Commission to so fix rates that for a period of two years beginning March 1, 1920, the railways shall be allowed to earn not less than 5½ or more than 6 per cent, and, second, that after March 1, 1922, the Commission itself shall determine what is a "fair return" for the railways to be allowed to earn, and, having so determined, shall allow them to earn this return. *The provision that not less than 5½ nor more than 6 per cent shall be taken by the Commission as the measure of a fair return covers only the period from March 1, 1920, to March 1, 1922, and then expires by limitation.* After that the Transportation Act will place no limitation whatever on the exercise by the Interstate Commerce Commission of its best judgment in determining what is a "fair return" for the railways to be allowed to earn.

How has this particular provision covering the two years from March 1, 1920, to March 1, 1922, been carried out thus far? The Commission, in the rate advance case of last year, decided that the "fair value" of the railways as a whole was \$18,900,000,000, and that under the conditions then existing 6 per cent would be a "fair return" for them to earn upon this valuation. On a 6 per cent basis the net operating income of the Class I railways—that is, of the railways earning more than \$1,000,000 gross each annually—should have been, in the eleven months ending with July, 1921, \$978,340,000. Did they earn this much? The net operating income actually earned by them was only \$437,600,000. Instead of the net earned by them being a "fair return" of 6 per cent, it was only 2.7 per cent. The difference between what they should have earned to get 6 per cent, and what they did earn, was \$541,000,000. If the government had "guaranteed" them 6 per cent it would have to pay them this \$541,000,000. But the government is not obligated under the law to pay this, and it won't pay it, or any part of it. The railways simply earned a net return of 2.7 per cent, and this being all they earned this is all they will ever get for that particular period. A "guarantee of 6 per cent" that produces only 2.7 per cent is about as valuable as the present paper currencies of some European countries.

A lot of people are advocating repeal of these so-called "guarantee" provisions upon the ground that they tend to make railway rates higher. *But never in any year since rail-*

*way statistics were kept have the railways of the United States earned as small a percentage of return on the book cost of their road and equipment as they earned in the first twelve months that the rates fixed under these so-called "guarantee" provisions were in effect.* In the twelve months ended September 1, 1921, they earned less than 3 per cent on the book cost of their road and equipment. The smallest percentage of return ever earned by them in any previous year of which there is a record was 3.2 per cent in 1894. Furthermore, since the provision specifying a minimum return of not less than 5½ or more than 6 per cent will automatically go out of existence in five months, why repeal it? It would take that long to get a bill to repeal it through Congress.

Those who have been active in carrying on propaganda regarding the so-called "guarantee" to the railways know all the facts regarding this so-called "guarantee" which have been stated in this editorial. They have carried on their propaganda solely to misrepresent the Transportation Act and the railroads to the public as a part of their unscrupulous campaign to discredit and destroy private ownership and management, and erect the Plumb Plan or some other socialistic or Bolshevistic system of railroad ownership and management in its place. It is astounding how the press will lend itself to the dissemination of the grossest misrepresentations regarding railway matters, and how easily the public is misled by them. It is no wonder that we have a very serious railroad problem when the railways are subjected to drastic and comprehensive regulation the wisdom or unwisdom of the administration of which depends on public opinion, and when a large part of the press and the public will accept almost any misrepresentation or canard regarding railway matters that any interested prevaricator may put into circulation.

Cleveland, Cincinnati,

Chicago & St. Louis

THE NET railway operating income of the Big Four in 1920 was not as great as in 1919 but, because of the manner in which the earnings held up during the latter part of the year when the property was being operated on its own account, the net accruing to the corporation showed a considerable increase over 1919. The corporate income account for 1920 showed total earnings from railroad operations of \$11,829,376, including the government compensation for January and February, the amount accrued under the guaranty provisions of Section 209 for March to August and the net railway operating income for the remaining four months of the year. This compared with the government compensation for 1919 totaling \$10,427,351, the increase over 1919 being \$1,402,025.

The net corporate income for 1920 was \$5,888,779 as compared with \$577,780 in 1919, but the 1919 figure was after the deduction of \$3,580,184, representing revenues and expenses applying to the period prior to January 1, 1918, settled for the account of the corporation by the Railroad Administration. The dividends declared by the Big Four totaled \$499,925—5 per cent on the preferred stock. The surplus carried to profit and loss in 1920 was \$5,323,339, in 1919 but \$35,005.

The Big Four's standard return for operation by the Railroad Administration was \$9,938,597, although in 1919, for instance, the accrued compensation was \$10,427,351. The Big Four earned considerably over its governmental rental during the period of federal control. In 1918 its net railway operating income was \$14,688,939; in 1919 it was \$12,746,171 and in January and February, 1920, as compared with a rental for the two months of about \$1,700,000 there was a net railway operating income of over \$5,000,000.

This level of earnings, however, was not maintained during the guaranty period.

At the present time the road is carrying about 80 per cent of the business it was carrying at this time last year. Its net railway operating income for the first seven months of 1921 was \$3,453,217 as compared with \$4,014,445 in the same period of last year.

The total revenue tonnage moved by the Big Four in 1920 was 38,513,685 tons, of which slightly over one-half was bituminous coal. This tonnage was an increase of 5,249,352 over 1919, the increase being made up principally by increases in the tonnage of coal. The revenue ton mileage in 1920 was 6,874,262,476, as compared with 6,042,170,957 in 1919. The average haul in 1920 was 179; in 1919, 182 miles. The total freight revenue in 1920 was \$60,825,455, as compared with \$50,700,076 in 1919. The total operating revenues of \$88,862,078 compared with \$73,856,456 in 1919, an increase of \$15,005,622. The operating expenses were \$76,326,466, as compared with \$57,427,452 in 1919, an increase of \$18,899,014 over 1919. Because of the greater increase in expenses than in revenues the net operating revenue of \$12,535,612 in 1920 represented a decrease of \$3,893,393 from the 1919 figure. The Big Four secured in 1920 an average revenue train load of 799 tons, an increase of 31 tons over 1919. The average load per loaded car was 30.9 tons, as compared with 27.3 tons in 1919. Miles per car per day was 28.3 and the net ton-miles per car per day were 540, as compared with 530 in 1919. It is only fair to say that at present, with the falling off of traffic, none of these figures are being maintained at their 1920 average.

One of the distinguishing features of the operations of the New York Central Lines in the past few years has been the broad policy the lines of the system have followed in the matter of acquiring new equipment and of making expenditures for additions and betterments to the property. The Big Four has been no exception. That road received from the Railroad Administration 2,000 of the standard freight cars and 35 of the standard locomotives. The total cost of this equipment was \$6,842,500, 75 per cent of which is covered by equipment trust certificates given to the director general of railroads and amounting to \$5,130,000. The company has also acquired or will acquire 75 locomotives, 55 passenger train cars and 3,100 freight cars under sublease from the New York Central. The estimated cost of this equipment is \$15,227,995.

Under the arrangement with the parent company the Big Four will assume its pro-rata share of the equipment trust certificates covering 75 per cent of the total cost, or \$11,416,671. The remaining 25 per cent was secured in the form of a loan from the New York Central covered by fifteen 6 per cent notes maturing December 23, 1921 to 1935. This loan totaled \$3,944,000, including \$3,415,000 for the new equipment and also \$529,000 for additions and betterments to existing equipment. In the same manner \$4,560,000 was borrowed from the New York Central for additions and betterments to way and structures, this loan being covered by a 10-year promissory note dated December 23, 1920. The Big Four also borrowed from the New York Central \$113,000, giving therefor its 10-year, 6 per cent note secured by the pledge of a like note given by the Cincinnati Northern to provide the latter company with money for additions and betterments.

The manner in which the New York Central was assisted in making loans such as these to its subsidiary companies through the medium of the revolving fund administered by the Interstate Commerce Commission has already been detailed in these columns. The equipment trusts and promissory notes issued by the Big Four in 1920, as above detailed, totaled \$25,163,671. During the year the company retired \$722,000 in bonds and equipment trusts totaling \$1,447,940. This means that the 1921 income account will

show a considerably increased charge for interest on funded debt. This is the kind of charge which in the last analysis must be paid by a railroad desiring to keep up with the march of progress in its territory.

The total expenditures made for additions and betterments by the Big Four in 1920 totaled \$10,777,210, including \$7,778,293 for equipment (less equipment retired or transferred). Projects which the company had or now has under way include second track and grade revision work on the Indianapolis division, grade separation work at Indianapolis now under way for several years, relocation of line in the Miami Conservancy District, etc. An important step taken during the year was the assumption of operation of the Evansville, Indianapolis & Terre Haute for the benefit of the owning company for a period of three years with the option of purchase. In 1921 this last step was taken through the purchase of the entire capital stock. The line, 134 miles in length, will prove of value to the Big Four primarily because of its access to important coal deposits.

The operating results in 1920 as compared with 1919 were as follows:

	1920	1919
Mileage operated	2,421	2,409
Freight revenue	\$60,825,455	\$50,700,076
Passenger revenue	19,550,414	17,267,397
Total operating revenue	88,862,078	73,856,456
Maintenance of way expenses	12,003,633	9,235,773
Maintenance of equipment	20,666,894	14,685,269
Traffic expenses	1,279,461	921,481
Transportation expenses	39,861,700	30,735,156
General expenses	1,859,961	1,474,546
Total operating expenses	76,326,466	57,617,418
Net railway operating revenue	12,535,612	16,239,038

The corporate income account is as follows:

Compensation (January and February)	\$1,705,535	
Guaranty, March 1 to August 31	5,059,713	
Net railway operating income, September 1 to December 31	5,064,107	
Total (compared with compensation accrued in 1919)	11,829,376	\$10,427,351
Total other income	1,621,425	757,762
Gross income	13,450,801	11,190,574
Interest on funded debt	5,957,003	4,919,060
Total deductions from gross income	7,464,654	7,032,604
Less revenues and expenses applicable prior to January 1, 1918, settled by U. S. R. A.	100,606	3,580,184
Net corporate income	5,885,779	577,786
Dividends; preferred, 5 per cent.	499,925	499,925
Surplus for the year	5,323,339	35,005

## Great Northern

THE RECENT DECLARATION by the directors of the Great Northern of the regular  $1\frac{3}{4}$  per cent quarterly dividend will serve to call attention to the fact that owing to adverse business conditions in the extended territory which it serves, the property has been able thus far to make but small progress towards recovery from the unfortunate circumstances which have characterized railway operation since the advent of federal control. The continuance of the regular dividend has been made possible by performances in former years; it is in spite of a very adverse earning record to date this year. The Great Northern in the first seven months of the present year carried but 3,167,524,000 net ton-miles of freight. The contrast with the figures for the first seven months of 1920—namely, 5,255,637,000—shows only too well why it is that the road has been unable, even with drastic economies in all directions, to show sufficiently improved results.

In the first seven months of 1921 the gross earnings of the property were \$50,046,749 as compared with \$65,747,635 in the same period last year. The drastic economies and the reductions naturally contingent upon reduced traffic have produced total operating expenses of \$45,654,483 as against \$60,025,245 last year. The net from railway operations this year to July 31 was \$4,392,266; in the same period of last year the figure was \$5,722,390. The operations for the seven months showed, after the deduction of taxes, equipment rentals, etc., a net railway operating deficit of \$538,012. In the first seven months of 1920 there was a net railway operating income of \$1,791,728.

To refer to the figures by months, it will be noted that for the first four months of 1921 the Great Northern suffered deficits. In May it broke a little bit better than even. The net railway operating income of over a million dollars for June and July respectively has not been sufficient to overcome the deficits made earlier in the year. The operating ratio for the road—which in the old days used to range between 55 and 60 per cent—was in the first seven months of 1921, 91.20, and in July, 79.20. The Great Northern is

suffered the typical experience that practically all the roads of the country have gone through in the last three years except perhaps that in the Great Northern's case the factors stand out in somewhat greater relief. There is no indication that when business picks up in the road's territory improvement will not be of marked degree.

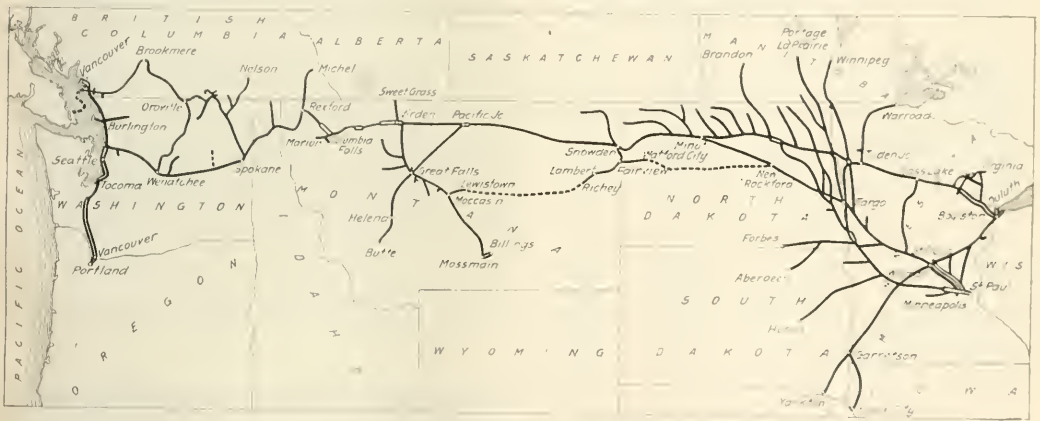

In 1920 the Great Northern carried 32,948,292 revenue tons of freight, a figure exceeded in but one previous year, 1914, in which year, however, the revenue ton-mileage was

Year ended	Freight revenue	Total operating revenue	Operating expenses	Net operating revenue	Operating ratio	Revenue tons	Revenue ton-miles	Average haul	Revenue train load	Revenue car load
June 30										
1912.....	\$44,877,369	\$66,197,819	\$37,662,548	\$28,535,271	56.89	27,543,172	6,277,142,27	226	661	27.3
1913.....	58,426,236	78,692,767	45,859,255	32,833,512	58.27	33,626,638	7,634,056,449	227	635	26.0

1918.....	76,937,445	100,698,520	84,429,245	16,269,275	83.84	30,948,659	8,844,747,071	286	683	25.88
1919.....	77,351,472	106,562,145	87,148,403	19,413,742	81.78	27,390,432	7,973,568,958	291	663	24.66
1920.....	89,760,845	122,616,776	113,999,659	8,617,117	92.97	32,948,292	8,518,840,991	259	684	25.33

gradually improving as the months go by, but the point to be made is that this improvement has not been sufficient to be satisfactory.

The Great Northern suffered adversely from federal control. It was far from proving a good money-maker for the Railroad Administration. The standard return for operation by the government was \$28,686,973. In 1918, the first year of federal control, despite the fact that the revenue ton-miles carried were the greatest in the company's history, the net railway operating income was \$11,978,791; in 1919, it was

less than in 1920. The revenue ton-miles in 1920 totaled 8,518,840,991, which figure was exceeded in 1918. The average haul in 1920 was 259 miles; in 1919, 291, and in 1918, 286. Of the Great Northern's total tonnage about 42 per cent consists of iron ore. The ore carried in 1920 increased approximately 3,570,000 tons over that carried in 1919, but the 1919 tonnage was reduced because of labor trouble. The grain carried in 1920 was not up to ordinary amounts. Some 97,000,000 bushels were carried in 1920 as against 112,400,000 bushels in 1919. This reduction was

The Great Northern

\$12,459,618. In 1920, including operation for two months by the government and for six months under the guaranty, the net railway operating income was but \$6,283,494.

The Great Northern did a large business during federal control and continued this business into 1920. It was unable, nevertheless, even with this heavy traffic to overcome the influences of higher wage scales, increased fuel costs, decreased efficiency of labor, etc., to which the transportation lines have been subjected. As far as 1921 is concerned the road is gradually overcoming these several handicaps to satisfactory earnings, but the sharp falling off in business and in gross earnings has prevented the results from showing in net earnings. The Great Northern has always been recognized as one of the country's most efficiently operated roads. The figures that have been given merely show that it has

the result of the farmers holding their grain in the hope of better prices.

The total freight revenues in 1920 were \$89,760,845, an increase of 16.04 per cent over 1919. The gross operating revenues of \$122,616,776 represented an increase of \$16,054,631 or 15.07 per cent over the previous year. The total operating expenses were \$113,999,659, an increase of \$26,851,255 or 30.81 per cent. The result of this greater increase in expenses than in revenues was a decrease of \$10,796,624, or 55.61 per cent, in net operating revenues. The operating ratio in 1920 was 92.97; in 1919, 81.78. Attention has already been drawn to the fact that prior to federal control the operating ratio of the Great Northern varied between 55 and 60 per cent; in fact, in 1915 it was but 54.04 per cent. With reference to the increase in operating ex-

penses in 1919, it is worth noting that the Great Northern estimates that the wage order in the Labor Board's Decision No. 2, issued July 20 and retroactive to May 1, 1920, increased operating expenses during the last eight months of the year to the amount of \$7,600,000. There was also an increase in taxes of \$2,070,386 or 25 per cent.

The Great Northern during 1920 placed orders for and received 50 Mikado locomotives, 1,000 75-ton ore cars and 163 other cars. It spent for new equipment and for additions and betterments to equipment, \$17,440,968, of which, however, \$7,080,922 was paid to the Great Northern Equipment Company for expenditures in prior years. Because of increased cost of oil, 70 locomotives were converted for coal. Expenditures for additions and betterments for other than equipment totaled \$5,204,841. The road made use of the revolving fund administered by the Interstate Commerce Commission to the extent of \$17,910,000; including \$2,010,000 to assist in the purchase of cars and locomotives, \$100,000 for strengthening existing equipment, \$800,000 to assist in paying for additions and betterments to way and structures and \$15,000,000 to aid in meeting maturing obligations.

The corporate income account of the Great Northern in 1920 showed a net corporate income of \$19,304,097 of which \$17,462,916 was applied to the payment of the 7 per cent dividends. The balance for the year after the payment of these dividends and \$25,685 applied to sinking and other reserve funds was \$1,815,497. In 1919, the net corporate income was \$22,139,586. Of this \$17,462,890 was applied to dividends, and \$76,230 to sinking and other reserve funds and \$2,500,000 was appropriated for investment in physical property, leaving a balance for the year 1919 of \$2,100,466.

The operating results in 1920 as compared with 1919 were as follows:

	1920	1919
Mileage operated .....	8,175	8,230
Freight revenue .....	\$89,766,845	\$77,351,472
Passenger revenue .....	20,551,025	19,623,859
Total operating revenue .....	122,616,776	105,562,145
Maintenance of way expenses .....	25,739,672	18,176,655
Maintenance of equipment .....	26,742,469	20,200,065
Traffic expenses .....	1,232,215	678,088
Transportation expenses .....	55,712,338	44,482,867
General .....	2,938,478	2,208,981
Total operating expenses .....	113,999,659	87,148,403
Net operating revenue .....	8,617,117	18,413,742

The corporate income account is as follows:

	1920	1919
Standard return (January and February, 1920; net 1919) .....	\$4,781,162	\$28,686,973
Miscellaneous income .....	14,498,381	513,943
Gross corporate income .....	27,801,719	32,082,267
Interest on funded debt .....	7,375,984	7,431,387
Total deductions from gross corporate income .....	8,497,622	9,942,687
Net corporate income .....	19,304,097	22,139,586
Dividends (7 per cent) .....	17,462,916	17,462,890
Income appropriated for investment in physical property .....		2,500,000
Balance transferred to profit and loss .....	1,815,497	2,100,466

IN AMERICA for many years the passenger cars have been made of steel; ours are for the most part still of wood—no doubt that they may burn faster. In America they have automatic couplers, which prevent accidents and save time; in France there are still unhappy human beings who have to lock the cars together one after the other by hand. In America there is not a coach which does not have its two wash rooms, one for women, the other for men; in France a third of the cars have no wash rooms and in those that have them they are kept by ineradicable tradition filthy. In America, in the Pullman cars, which correspond to our first class, each passenger has at his shoulder a small electric light which enables him to read, and a tiny table on which he can work; in France, even in the de luxe cars, it is impossible most of the time to see clearly after dark. In America each coach is furnished with a reservoir of cold water and with paper cups from which to drink; in France, in point of water, there is only that which drops on your head when you go to the wash room.

—Stephane Lauzanne in *Le Matin* (Paris).

## Letters to the Editor

### The Stop-and-Proceed Rule

CHICAGO, ILL.

TO THE EDITOR:

Mr. Rudd has some interesting views on the question of automatic signals on grades (*Railway Age*, August 6, 1921, Page 247), and the importance of avoiding unnecessary stops; and I am in full sympathy with his suggestion for doing everything possible in the way of accomplishing this desired economy; but if this rule to proceed without stopping should be made general I think that we should not find the extensive improvements which he hopes for.

Take the case of two freight trains, both moving eastward, one of which we will call Train A and the other Train B. The leading train is B. When Train A is stopped by an automatic block signal it is because it is closing in on Train B. If it makes a full stop and then proceeds it has lost enough time to give Train B a chance to get ahead of it far enough to permit the next signal to clear for Train A. If it does not stop the chances are multiplied that it will overtake Train B in the block; and if Train B is stopped Train A will have to stop also; and if Train B is barely moving then Train A will have to slacken speed to the same slow rate.

Block signals should always be located in the best starting ground that can be found. Neglect of this requirement has been the cause of much waste of power. On steep grades it is assumed that all of the starting ground is poor; but when we come to make this non-stop rule universal then we shall find that in a good many cases the omission to stop at the signal would result simply in forcing upon the train the necessity of stopping, between signals, at some point less favorable for starting.

Those who advocate the usual stop and proceed practice and who would relax this rule only in extreme cases do not always state their reasons as clearly as they might. A Chicago railroad officer put the idea aptly the other day; he said that the stopping was necessary "in order that the engineer's mind may emphatically be impressed with the thought that in moving through the section governed by the signal he is doing so without the protection afforded by the automatic block signal system."

Where is Mr. Anthony these days? What would he say to these 1921 novelties?

B. Q. R.

### One Swallow Does Not Make a Summer

CHICAGO.

TO THE EDITOR:

In an editorial appearing in the issue of September 17, 1921, under the title "Securing Good Results with Concrete" the following statement occurs: "A recent investigation of a concrete building failure disclosed the remarkable fact that it is apparently impossible to produce a concrete of a greater strength than 1,000 lb. per sq. in. at 28 days, with the materials used because of wide variation in the results secured with the concrete materials available in railroad work."

After reading this several times, I am led to believe that you did not mean what you say. You have properly referred to the low strength of the concrete in this particular building as a remarkable and hence unusual fact. The conclusion, therefore, that this remarkable and unusual fact may be taken to represent a general truth is obviously poor logic. I assume, therefore, that something slipped between the writer and the printer. The failure referred to in this editorial

refers to *one* building which failed out of *thousands* which have not failed. The only conclusion, therefore, that can be drawn from this failure is that in this particular case all specifications and rules formulated to secure a satisfactory building had been violated or else the specifications and rules themselves were grievously at fault. In no other way would such low strength concrete be produced.

The obvious intent of the editorial is to show the necessity of securing proper materials, controlling the amount of water used, proper proportioning, thoroughness of mixing and protection of the concrete after it has been placed in the forms. All these are important and when they are secured the concrete will have a strength at least double that to which you refer as being the practical limit of 28 days.

Railway bridge engineers know about these things. Their apparent conservatism in the unit stresses used in the design of railway structures is due both to difficulty in securing the observance of best construction methods and in the sort of live loads which the structure must carry, rather than in any inability to accept economical design.

Only when designers realize fully the paramount importance of the quantity of mixing water, the design of concrete mixtures, and the effect of proper curing conditions, and when the methods of construction are reduced to positive assurance that all these factors will be controlled, can we hope to obtain the maximum strength and economy in the use of reinforced concrete. It is equally possible to obtain concrete of a predetermined strength within limits of 10 or 15 per cent, as to obtain structural steel of specified quality. It is time that designers and builders should understand that there is a limit to which concrete may be abused, and it is a poor argument for such abuse that field operations cannot be so controlled as to prevent it.

A. C. IRWIN,

Engineer, Structural Bureau, Portland Cement Association.

(Mr. Irwin's conclusion is correct. The editorial in question was improperly punctuated as published. The first two sentences should have read as follows: "Recent investigation of a concrete building failure disclosed the remarkable fact that it is apparently impossible to produce a concrete having a greater strength than 1,000 lb. per sq. in. at 28 days with the materials used. Because of wide variation in the results secured with the concrete material available in railroad work the railroad bridge engineers are inclined to be conservative \* \* \*."—Editor.)

## The War Finance Corporation Bill

SMITHSBURG, Md.

TO THE EDITOR:

On August 22 the House of Representatives passed H. R. 8331, a bill to amend the Transportation Act by authorizing the President, through the War Finance Corporation, to purchase from the Railroad Administration securities now held by it, or to be acquired by it, to an aggregate purchase price not exceeding \$500,000,000, of which amount about 159,000,000 were in the hands of the director general of railroads on August 1 of this year. They were acquired under authority granted by Section 207 of the Transportation Act.

On July 22 President Harding made the following statement: "With this end in view you are asked to extend the authority of the War Finance Corporation so that it may purchase these railway funding securities accepted by the director general of railroads. No added expense, no added investment is required on the part of the government; there is no added liability, no added tax burden. It is merely the grant of authority necessary to enable a most useful and efficient government agency to use its available funds to purchase securities for which Congress already has author-

ized the issue and turn them into the channels of finance ready to float them."

This is clear and understandable. It is advice given for the benefit of the nation in a period of stress and uncertainty, when the whole nation is struggling in its efforts to return to that prosperous normal condition which obtained before the war.

This week in Washington there will be a labor conference called by the President and made up of representatives of capital and labor to consider ways and means to combat unemployment throughout the country. The 600,000 railroad employees who were laid off between August 20, 1920, and March 21, 1921, are among the number who will be affected by the findings. The conference could take no more important action than the adoption of a resolution urging the early passage of Senate Bill 2337, which is similar to the bill already passed by the House of Representatives. If the railroad brotherhoods would take similar action and devote their energy to assist in passing this important bill, they would be doing their members the greatest possible service.

This measure is not giving the railroads one dollar. It means only that the government guarantees a loan for a period of 10 years, supplemented by securities furnished to the director general of railroads and the War Finance Corporation by the railroads. In other words, it gives a moral guarantee, not a banking endorsement. The director general has said: "It seems to me that this is an expediency that is the result of the war, and what the government is asked to do in this case is to refrain from collecting certain amounts that the roads owe, and do the same for the transportation system of the United States that the government is doing for France, England, Italy and Germany in extending of liabilities growing out of the war."

Congressman Layton ably said: "If the roads need help, and instant help, which is admitted on every hand, they should have it, no matter what the credit and debit account between them and the government may show as the result of government control during the war."

The railroads must function; not to function is inconceivable. Unless they function there is immediate and universal disaster; they must function even if the government assumes entire financial liability. The farmers are asking financial aid in order that their crops may be moved. What good is it to finance them for such a purpose if the railroads cannot function?

The condition of railroad credit is being impaired more and more until loans are almost impossible to obtain from private sources except when a railroad can place a bond issue which will take precedence over its regular stock. To do this they must first obtain the consent of the Interstate Commerce Commission. The commission might be reluctant to consent for the reason that if this were continued it means that the common stock of the railroads would soon become absolutely worthless.

The general public believes that under the Transportation Act the railroads have been turned back to their owners in the same condition they were in prior to January 1, 1918. This is a great mistake. Under the provisions of the Transportation Act the railroads are unavoidably running into debt every month. This is due primarily to the fact that all their powers have been taken away from them. They have no authority; no power to borrow money; no independent power to spend it when borrowed. The price of all they have to sell—freight and passenger service—are fixed by a government body. The wages of their employees are determined by the Railroad Labor Board. The employees have already received a big cut in wages estimated at about \$400,000,000 annually. Unless this bill is passed by the United States Senate and the railroads are given this financial assistance, another cut will be necessary, not only in the number of men employed but in the wages paid those still

in service. This condition would be deplorable in the face of approaching winter with several million men already out of work.

This bill is the greatest piece of legislation that could be enacted at this time to restore a full degree of employment to labor. Increased railroad purchases of supplies and equipment would mean increased employment in maintenance and repair work. It would also increase production, and incidentally employment, in iron and steel industries and in the moving of lumber, coal and other raw materials.

The welfare of the whole nation is at stake. If the arteries of transportation are disrupted, there will be a malnutrition that will eventually cause economic starvation. The entire business world demands a practical adjustment of the railroad situation; a reduction of freight and passenger rates with adequate service and equipment and avoidance of car shortage.

Some are trying to make the exigencies of war force the railroads into bankruptcy and thereby bring on government ownership. This is not only unjust but absolutely dishonest.

Summing up—the compelling question at this time is the importance of financing the transportation system, whose continued function is vitally necessary to the welfare of the nation. The passage of this bill will restore confidence, increase stability of railroad management and be one more move toward that national condition of certainty and prosperity which existed before the war. EARL H. MORTON.

## Non-Spectacular Safety First

ST. JOSEPH, Mo.

TO THE EDITOR:

The Marshall County News, published at Marysville, Kan., the headquarters of the Central division of the Union Pacific, printed in a recent issue a notice of the triennial re-examination of employees on train rules which had been conducted on that division during the past few weeks, and commenting on this work, says that it is "safety-first." This is a point which railroad men would do well to bear in mind.

To educate men to perfect themselves on the train rules is real safety-first; more so than most of the activities that go by that name. This for the reason that the prevention of collisions and derailments is more important than to keep men from falling off ladders or from burning their fingers in the fire; for the same reason that the preservation of 100 lives, on a fast-moving train, is paramount to saving a single life.

In this work on the Union Pacific, Superintendent C. E. Hedrix, and examiner O. W. Brandt held numerous rallies, conducting question-meetings at different centers where the men could be gathered, attracting 40 to 75 men on each occasion. These meetings were held on three evenings a week at Marysville and on successive Sundays at other places. Meetings of this kind are safety-first rallies of the right sort. The local newspaper is published for the general public and, of course, it cannot be expected to be well acquainted with the details of railroad management, but that editor certainly guessed right when he adopted this hackneyed title. It surely is an interesting and important truth, suitable to be laid before the general public, that Superintendent Hedrix is awake to his duty of keeping his engineers, conductors, station agents and operators keyed up to a high standard of efficiency.

By all means let us keep up our safety rallies, at shops and elsewhere, and get as many men enthused over them as possible; but at the same time bear in mind that the safety of fast-moving trains is the title of the first chapter of the railroad gospel.

There is nothing spectacular about train-rule education; success depends, not on big meetings, but on securing patient fidelity in the locomotive cab, and in jobs at other places which are comparatively lovely. The work of examining men, such as Mr. Brandt is conducting, is sometimes a tedious and exhausting work; but it is work that counts.

OBSERVER.

## Freight Rate Allowances to Plant Facilities

WARREN, Ark.

TO THE EDITOR:

In the very interesting review of Mr. Ford's doings on the Detroit, Toledo & Ironton, which you print in your issue of September 10, you say, very truly, that that road is now practically nothing but a plant facility of the Ford Motor Works. This is an important point to be kept in mind. It places this Ohio railroad in exactly the same position as the "tap lines" of the southwest, whose freight rate dealings with their trunk line connections were such a prominent subject of discussion in freight circles some 10 years ago.

It will be recalled that the Interstate Commerce Commission conducted an elaborate investigation, covering three or four years. [The principal Tap Line decision was reported in the *Railway Age Gazette* of May 3, 1912.] The Commission instituted proceedings against a large number of lines in the lumber-producing territory and orders were issued to trunk lines restricting the amounts of divisions which could rightfully be allowed to the industrial lines (called tap lines). In many instances this reduced the earnings of some short railroads so that they could not pay expenses. The same principles were later applied to industrial railroads in the north and east. The southern lines most affected were, of course, short, few exceeding 40 miles in length. At the same time many of them were actually needed more by the public as common carriers than is the D. T. & I.

The D. T. & I. is in reality more of an industrial road than many lines so-called, even though it be 400 miles long. If the principle is right as applied to short lines: if justice is to be done, then the same should also be applied to any line where conditions are similar, regardless of mileage. With the application of the principles laid down by the Interstate Commerce Commission, and with Mr. Ford's road treated as were the tap and industrial lines, his excess earnings are liable to go glimmering.

W. S. HOBBS,

General Manager Warren & Ouachita Valley.

[Prior to the decision above referred to, the Interstate Commerce Commission, in its annual report for 1911, page 12, expressed itself on this subject as follows: "The evils most difficult to detect and to prove today are those arising out of the community of interest of certain carriers and industrial corporations. The ownership of industrial corporations by carriers and of carrier corporations by industrials is frequently taken advantage of to defeat that equality between shippers which the Act contemplates. This is accomplished by unreasonable divisions of joint rates, forced upon carrier by powerful shippers who control industrial railroads. Such arrangements may be legal in form, although certainly illegal in effect. We find that a certain number of large industrial concerns control tracks and terminal facilities nominally owned by small railroad corporations which do not rise to the dignity of common carriers, but which are treated as such by the connecting carriers. As a result, the connecting carriers make a switching allowance or a division of the joint rate to such terminal lines, which practice unquestionably results in discrimination and places the industrial at an advantage in the market. Another form of discrimination is found in the leasing of property by carriers to shippers for a nominal consideration with a further agreement that all shipments made by the lessee shall be routed over the lines of the lessor. It becomes increasingly evident that entire freedom from discrimination can be secured only by a complete separation of the business of transportation from every form of commercial or industrial enterprise."—EDITOR.]

# Commission Presents Tentative Consolidation Plan

## Preliminary Report Proposes Nineteen Competing Systems— Based on Report of Prof. W. Z. Ripley with Alternatives

WASHINGTON, D. C.

A TENTATIVE PLAN for the consolidation of the railway properties of the continental United States into 19 systems with one alternative plan for the New England lines, was made public by the Interstate Commerce Commission on Wednesday, September 28, and served upon the railroads and state authorities as the basis for a plan to be ultimately adopted by the commission, in accordance with the provisions of paragraphs 4 and 5 of Section 5 of the interstate commerce act, after public hearings, the dates for which have not yet been announced. Under the commission's direction, Professor William Z. Ripley of Harvard University has prepared a report which is printed as the appendix to the commission's report. In some respects the commission's tentative plan does not follow his recommendations, which propose 21 systems, but presents alternatives thereto for like consideration, the main differences being indicated. The commission says it has sought to minimize dismemberment of existing lines or systems and that this tentative plan is put forward in order to elicit a full record upon which the plan to be ultimately adopted can rest, and without a pre-judgment of any matters which may be presented upon that record. Whenever a property is referred to in the tentative plan, the properties controlled thereby under lease, stock ownership or otherwise should be understood as included unless otherwise indicated.

### Proposed Systems

The commission finds for the purposes of this tentative plan that the railway properties of the continental United States may be consolidated under the statute into the following systems:

#### SYSTEM NO. 1.—NEW YORK CENTRAL

New York Central.  
Pittsburgh & Lake Erie.  
Rutland.  
Michigan Central.  
Chicago, Kalamazoo & Saginaw.  
Cleveland, Cincinnati, Chicago & St. Louis.  
Cincinnati Northern.

Western Maryland.  
Fonda, Johnstown & Gloversville.  
Lake Erie & Pittsburgh.  
Central Indiana.  
Pittsburgh, Chartiers & Youghiogheny.  
Monongahela.  
Boston & Maine.  
Maine Central.  
Bangor & Aroostook.

And all railway properties controlled by the above carriers through lease, stock ownership, or otherwise, except:

Lake Erie & Western and Toledo & Ohio Central.  
Both now controlled by New York Central.  
Zanesville & Western and Kanawha & Michigan. Both now controlled by Toledo & Ohio Central.  
Indiana Harbor Belt, now controlled by New York Central, 30 per cent; Michigan Central, 30 per cent; Chicago & North Western, 20 per cent; Chicago, Milwaukee & St. Paul, 20 per cent.

NOTE.—Prof. Ripley recommends the inclusion of the Western Maryland in system No. 5, Nickel Plate-Lehigh Valley.

Prof. Ripley makes no specific assignment of the Fonda, Johnstown & Gloversville.

The Lake Erie & Pittsburgh; Central Indiana; Pittsburgh,

Chartiers & Youghiogheny; and Monongahela may be incorporated in either system No. 1 or No. 2. Prof. Ripley makes no specific assignment of these four roads, which are controlled jointly in the interest of the New York Central and the Pennsylvania.

The Boston & Maine, Maine Central, and Bangor & Aroostook may be included in system No. 7, New England, or system No. 7a, New England-Great Lakes. Prof. Ripley rejects the trunk line treatment of the New England roads, but we present this alternative with a view to developing the situation upon hearing.

The Lake Erie & Western may be included in system No. 5, Nickel Plate-Lehigh Valley.

The Toledo & Ohio Central, Zanesville & Western, and Kanawha & Michigan may be included in system No. 9, Norfolk & Western.

The Indiana Harbor Belt is reserved for consideration in connection with terminal situations.

#### SYSTEM NO. 2.—PENNSYLVANIA.

Pennsylvania.  
West Jersey & Seashore.  
Long Island.  
Baltimore, Chesapeake & Atlantic.  
Cumberland Valley.  
Maryland, Delaware & Virginia.  
New York, Philadelphia & Norfolk.  
Pittsburgh, Cincinnati, Chicago & St. Louis.  
Waynesburg & Washington.

Grand Rapids & Indiana.  
Cincinnati, Lebanon & Northern.  
Ohio River & Western.  
Louisville Bridge & Terminal.  
Wheeling Terminal.  
Toledo, Peoria & Western.  
Lorain, Ashland & Southern.  
Lake Erie & Pittsburgh.  
Central Indiana.  
Pittsburgh, Chartiers & Youghiogheny.  
Monongahela.

And all other railway properties controlled by any of the above carriers under lease, stock ownership, or otherwise, except the Norfolk & Western and railway properties controlled by it, which may be included in system No. 9, Norfolk & Western.

NOTES.—The Lorain, Ashland & Southern may be included in system No. 4, Erie, which owns one-half the stock, the Pennsylvania owning the other half.

The Lake Erie & Pittsburgh; Central Indiana; Pittsburgh, Chartiers & Youghiogheny; and Monongahela may be included in system No. 1, New York Central, which controls one-half the stock, the Pennsylvania controlling the other half.

#### SYSTEM NO. 3.—BALTIMORE & OHIO.

Baltimore & Ohio.  
Sandy Valley & Elkhorn.  
Staten Island Rapid Transit.  
Reading system, comprising the Philadelphia & Reading, Central Railroad of New Jersey, and various others.  
Cincinnati, Indianapolis & Western.  
Chicago, Indianapolis & Louisville.  
New York, New Haven & Hartford.  
Central New England.  
Lehigh & New England.  
Lehigh & Hudson.

NOTES.—The Baltimore & Ohio Chicago Terminal is reserved for consideration in connection with terminal situations.

The New York, New Haven & Hartford; Central New

England; Lehigh & New England; and Lehigh & Hudson may be included in system No. 7, New England, or system No. 7a, New England-Great Lakes.

#### SYSTEM NO. 4.—ERIE.

Erie.

Chicago & Erie.

New Jersey & New York.

New York, Susquehanna & Western.

Delaware & Hudson.

Delaware, Lackawanna & Western.

Ulster & Delaware.

Bessemer & Lake Erie.

Buffalo & Susquehanna.

Pittsburg & Shawmut.

Pittsburg, Shawmut & Northern.

Lorain, Ashland & Southern.

Wabash lines east of the Missouri River.

NOTES.—Prof. Ripley recommends including the Lehigh Valley in this system; but in this tentative plan that carrier is proposed as a main stem for system No. 5, Nickel Plate-Lehigh Valley.

The Delaware & Hudson, Delaware, Lackawanna & Western, Ulster & Delaware, Pittsburg & Shawmut, and Pittsburg, Shawmut & Northern may be included in system No. 7a, New England-Great Lakes.

The Bessemer & Lake Erie may be included in system No. 5, Nickel Plate-Lehigh Valley.

The Lorain, Ashland & Southern may be included in system No. 2, Pennsylvania.

#### SYSTEM NO. 5.—NICKEL PLATE-LEHIGH VALLEY.

Lehigh Valley.

New York, Chicago & St. Louis.

Toledo, St. Louis & Western.

Detroit & Toledo Shore Line.

Lake Erie & Western.

Wheeling & Lake Erie.

Pittsburgh & West Virginia.

Bessemer & Lake Erie.

NOTES.—Prof. Ripley recommends the Lackawanna as main stem in this system. In this tentative plan it is replaced for that purpose by the Lehigh Valley, and made available for either system No. 7a, New England-Great Lakes, or system No. 4, Erie. He also includes the Buffalo, Rochester & Pittsburgh and Wheeling & Lake Erie in this system.

The Bessemer & Lake Erie may be included in system No. 4, Erie.

#### SYSTEM NO. 6.—PERE MARQUETTE.

Pere Marquette.

Detroit & Mackinac.

Ann Arbor.

Detroit, Toledo & Ironton.

Boyer City, Gaylord & Alpena.

NOTE.—The last-named road is a class-II road not specifically covered by Prof. Ripley's report.

#### SYSTEM NO. 7.—NEW ENGLAND.

New York, New Haven & Hartford.

New York, Ontario & Western.

Central New England.

Boston & Maine.

Maine Central.

Bangor & Aroostook.

Lehigh & Hudson River.

Lehigh & New England.

NOTES.—Prof. Ripley recommends inclusion of the New York, Ontario & Western in system No. 4, Erie.

The Lehigh & Hudson River is not included in any system under Prof. Ripley's report, but is left as a "bridge line."

#### SYSTEM NO. 7A.—NEW ENGLAND-GREAT LAKES.

Same as system No. 7 with addition of the following, which otherwise with, the exception of the Buffalo, Rochester &

Pittsburgh may be included in system No. 4, Erie. That carrier may be included in system No. 5, Nickel Plate-Lehigh Valley.

Delaware & Hudson.

Ulster & Delaware.

Delaware, Lackawanna & Western.

Buffalo, Rochester & Pittsburgh.

Pittsburg & Shawmut.

Pittsburg, Shawmut & Northern.

NOTE.—The addition of these lines has not been recommended by Prof. Ripley.

#### SYSTEM NO. 8.—CHESAPEAKE & OHIO

Chesapeake & Ohio.

Hocking Valley.

Virginian.

NOTE.—Prof. Ripley recommends consolidation of the Virginian with the Norfolk & Western, Toledo & Ohio Central, and Kanawha & Michigan, in order to afford a western outlet for coal originating on the Virginian. This apparently would involve upgrade eastbound haul of westbound coal to the vicinity of Roanoke, unless there be new construction near Gauley Bridge, W. Va. The Virginian's present outlet to the west is via Deepwater, W. Va., and the Chesapeake & Ohio.

#### SYSTEM NO. 9.—NORFOLK & WESTERN

Norfolk & Western.

Toledo & Ohio Central.

Zanesville & Western.

Kanawha & Michigan.

Kanawha & West Virginia.

NOTE.—From the Norfolk & Western is excepted the branch from Roanoke to Winston-Salem, which may be included in system No. 11, Atlantic Coast Line-Louisville & Nashville and the branch from Lynchburg to Durham which may be included in system No. 12, Illinois Central-Seaboard.

#### SYSTEM NO. 10.—SOUTHERN.

Southern.

Alabama Great Southern.

Georgia, Southern & Florida.

Mobile & Ohio.

Southern Railway in Mississippi.

Northern Alabama.

Cincinnati, New Orleans & Texas Pacific.

New Orleans Great Northern.

Alabama & Vicksburg.

NOTE.—Prof. Ripley recommends inclusion of the Georgia Southern & Florida branch from Valdosta, Ga., to Palatka, Fla., in the Seaboard system.

#### SYSTEM NO. 11.—ATLANTIC COAST LINE-LOUISVILLE & NASHVILLE.

Atlantic Coast Line.

Atlanta & West Point.

Charleston & Western Carolina.

Louisville & Nashville.

Nashville, Chattanooga & St. Louis.

Louisville, Henderson & St. Louis.

Western Railway of Alabama.

Richmond, Fredericksburg & Potomac.

Norfolk Southern.

Atlanta, Birmingham & Atlantic.

Winston-Salem Southbound.

Roanoke to Winston-Salem branch of Norfolk & Western.

Florida East Coast.

Carolina, Clinchfield & Ohio.

Georgia & Florida.

Gulf, Mobile & Northern.

Mississippi Central.

NOTES.—Prof. Ripley recommends that the Richmond, Fredericksburg & Potomac and Florida East Coast retain their present status without inclusion in any system.

The Carolina, Clinchfield & Ohio may be included in system No. 12, Illinois Central-Seaboard. Prof. Ripley recommends inclusion in system No. 10, Southern.

The Gulf, Mobile & Northern and Mississippi Central are not specifically included in any system under Prof. Ripley's report.

#### SYSTEM NO. 12.—ILLINOIS CENTRAL-SEABOARD.

Illinois Central.

Yazoo & Mississippi Valley.

Central of Georgia.

Seaboard Air Line.

Lynchburg, Va., to Durham, N. C., branch of Norfolk & Western.

Gulf & Ship Island.

Tennessee Central.

Carolina, Clinchfield & Ohio.

NOTES.—Prof. Ripley recommends that a separate system be built around the Seaboard Air Line.

The Gulf & Ship Island is not included in any system by Prof. Ripley.

The Carolina, Clinchfield & Ohio may be included in system No. 11, Atlantic Coast Line-Louisville & Nashville.

#### SYSTEM NO. 13.—UNION PACIFIC-NORTH WESTERN

Union Pacific.

St. Joseph & Grand Island.

Oregon Short Line.

Oregon-Washington Railroad & Navigation Company.

Los Angeles & Salt Lake.

Chicago & North Western.

Chicago, St. Paul, Minneapolis & Omaha.

Lake Superior & Ishpeming.

Wabash lines west of the Missouri River.

NOTES.—Prof. Ripley recommends inclusion of the Central Pacific in this system.

The Lake Superior & Ishpeming is not specifically included in any system by Prof. Ripley.

#### SYSTEM NO. 14.—BURLINGTON-NORTHERN PACIFIC.

Chicago, Burlington & Quincy.

Northern Pacific.

Chicago Great Western.

Minneapolis & St. Louis.

Spokane, Portland & Seattle.

NOTES.—From the Chicago, Burlington & Quincy are expected the Colorado & Southern and Fort Worth & Denver City, which may be included in system No. 16, Santa Fe. Prof. Ripley recommends that they be included in system No. 19, Chicago-Missouri Pacific.

Prof. Ripley recommends extension of this system to the Pacific coast by including the Denver & Rio Grande and the Western Pacific. He also recommends redistribution of portions of the Minneapolis & St. Louis and Chicago Great Western.

The Spokane, Portland & Seattle may be included in system No. 15, Milwaukee-Great Northern.

#### SYSTEM NO. 15.—MILWAUKEE-GREAT NORTHERN

Chicago, Milwaukee & St. Paul.

Great Northern.

Chicago, Terre Haute & Southeastern.

Duluth & Iron Range.

Duluth, Missabe & Northern.

Green Bay & Western.

Spokane, Portland & Seattle.

Butte, Anaconda & Pacific.

NOTES.—The Green Bay & Western and Butte, Anaconda & Pacific are not included in any system under Prof. Ripley's report.

The Spokane, Portland & Seattle may be included in system No. 14, Burlington-Northern Pacific.

Prof. Ripley recommends that the eastern half of the Chicago & Eastern Illinois be included in this system.

#### SYSTEM NO. 16.—SANTA FE.

Atchison, Topeka & Santa Fe.

Gulf, Colorado & Santa Fe.

Colorado & Southern.

Fort Worth & Denver City.

Denver & Rio Grande.

Western Pacific.

Utah Railway.

Northwestern Pacific.

Nevada Northern.

NOTES.—Prof. Ripley recommends inclusion of the Colorado & Southern and the Fort Worth & Denver City in the Missouri Pacific system. He also recommends inclusion of a part of the Gulf Coast Lines in the above system.

Prof. Ripley recommends that the Northwestern Pacific retain its present status.

The Nevada Northern is not specifically included in any system by Prof. Ripley. It may be included in system No. 17, Southern Pacific-Rock Island.

#### SYSTEM NO. 17.—SOUTHERN PACIFIC-ROCK ISLAND

Southern Pacific Company.

Nevada Northern.

Chicago, Rock Island & Pacific.

Chicago, Rock Island & Gulf.

Arizona & New Mexico.

El Paso & Southwestern.

San Antonio & Aransas Pass.

Trinity & Brazos Valley.

Midland Valley.

Vicksburg, Shreveport & Pacific.

Chicago, Peoria & St. Louis.

NOTES.—The Nevada Northern may be included in system No. 16, Santa Fe.

The Arizona & New Mexico and Chicago, Peoria & St. Louis are not specifically included in any system by Prof. Ripley.

The Trinity & Brazos Valley may be included in system No. 18, Frisco-Katy-Cotton Belt. So recommended by Prof. Ripley.

Prof. Ripley recommends redistribution of portions of the carriers included in this system.

#### SYSTEM NO. 18.—FRISCO-KATY-COTTON BELT.

St. Louis-San Francisco.

St. Louis Southwestern.

Louisiana Railway & Navigation Company.

Chicago & Alton.

Missouri, Kansas & Texas.

Trinity & Brazos Valley.

San Antonio, Uvalde & Gulf.

NOTES.—The Trinity & Brazos Valley may be included in system No. 17, Southern Pacific-Rock Island.

Prof. Ripley recommends inclusion of the San Antonio, Uvalde & Gulf in either system No. 17, Southern Pacific-Rock Island, or in a Southwestern-Gulf system.

Prof. Ripley recommends redistribution of portions of the carriers included in this system.

#### SYSTEM NO. 19.—CHICAGO-MISSOURI PACIFIC.

Chicago & Eastern Illinois.

Missouri Pacific.

Kansas City Southern.

Kansas City, Mexico & Orient.

Kansas, Oklahoma & Gulf.

Texas & Pacific.

Fort Smith & Western.

Louisiana & Arkansas.

Gulf Coast Lines.

International & Great Northern.

NOTE.—Prof. Ripley recommends redistribution of portions of the carriers included in this system.

Certain lines such as the Minneapolis, St. Paul & Sault Ste. Marie and the Central Vermont, which are controlled by

Canadian carriers, have not been specifically included in this tentative plan because these lines form parts of through transcontinental Canadian systems in active competition with systems above set forth.

The carriers included in this tentative plan comprise most of the class-I steam railroads but very few of those in class II and class III. Those not so included, whether industrial common carriers, terminal carriers, interurban electric railways operated as a part of general steam railroad systems of transportation or engaged in the general transportation of freight, "short lines," or others, will be considered at the hearings to be hereafter assigned so that in the plan to be ultimately adopted provision can be made for their inclusion in the systems.

The report does not specifically mention water carriers. Where these carriers are now controlled by carriers by rail they will be considered as being tentatively in the systems in which the controlling rail carrier has been included.

Paragraphs 4 and 5 of Section 5 of the Interstate Commerce Act, under which this plan is prepared, read as follows:

(4) The commission shall as soon as practicable prepare and adopt a plan for the consolidation of the railway properties of the continental United States into a limited number of systems. In the division of such railways into such systems under such plan, competition shall be preserved as fully as possible, and wherever practicable the existing routes and channels of trade and commerce shall be maintained. Subject to the foregoing requirements, the several systems shall be so arranged that the cost of transportation as between competitive systems and as related to the values of the

properties through which the service is rendered shall be the same, so far as practicable, so that these systems can employ uniform rates in the movement of competitive traffic and under efficient management earn substantially the same rate of return upon the value of their respective railway properties.

(5) When the commission has agreed upon a tentative plan, it shall give the same due publicity and upon reasonable notice, including notice to the governor of each state, shall hear all persons who may file or present objections thereto. The commission is authorized to prescribe a procedure for such hearings and to fix a time for bringing them to a close. After the hearings are at an end, the commission shall adopt a plan for such consolidation and publish the same; but it may at any time thereafter, upon its own motion or upon application, reopen the subject for such changes or modifications as in its judgment will promote the public interest. The consolidation herein provided for shall be in harmony with such plan.

The commission's tentative plan is not discussed in detail. The balance of the report as served by the commission is made up of Prof. Ripley's report, which covers 192 printed pages and contains some 30 maps and charts. Prof. Ripley proposes 21 systems, 5 within the trunk line region, 2 lake to tide soft coal systems in the Chesapeake Bay region, in the southeast 4 systems, 5 transcontinental systems west of the Mississippi, and 2 running southwest toward the Gulf ports, and 3 outlying regional groups, in New England, in the Southern Michigan peninsula, and down the east coast of Florida toward Cuba. His report contains chapters giving a detailed discussion of trunk line territory, the New England region, the Chesapeake region, the Southeastern region, the Western transcontinental region, and the Southwestern Gulf region. An abstract of some of the more general portions of his report, contained in the introduction and the recapitulation, follows:

### Abstract of Professor Ripley's Report

It is the theory of this legislation that the railways must be considered as a whole, group by group, fixing by means of the new statutory rule of rate making, a general level of return adequate to maintain them all at a proper pitch of efficiency. To this end, the Senate bill sought to reduce the carrier corporations to a common denominator of earning power in terms of valuation by compulsory consolidation. But the measure ultimately emerged from conference committee with the procedure as above described, in place of compulsion. It was evidently expected that the new statutory rule of rate making would afford an incentive sufficiently powerful to induce the strong companies to merge with weaker ones, rather than to be compelled to pay over their surplus earnings above the rate of return fixed as reasonable, into a revolving fund for the general benefit of their respective groups. An incentive to the weaker roads might also conceivably obtain. The aid extended by the act from the surplus earnings of the strong roads consists merely of advances or loans, except in so far as a better balanced opportunity yields larger earnings. Or else possibly a fairer administration of the division of through rates may help. But the weaker roads are encouraged to seek shelter through affiliation. They are not taken care of by any definite guaranty of earnings. But the motive for consolidation, it was held, should not be permitted to bring about indiscriminate mergers, regardless of natural relationships of the carriers either to one another, or to the needs of their respective territories. It was in order that there might be consonance between such mergers as took place and the public welfare, rather than that mere immediate profit to those concerned might result, that the formal procedure as above described was enacted into law. And it is because of this causal relationship that the act further prescribes that no mergers which are not in accordance with this plan, as thus adopted, may lawfully take place.

#### General Purpose of Consolidations

The leading paragraph of the statute, dealing with consolidation, contains three requirements. The first is that competition, presumably in service, shall be preserved; the second is that existing routes and channels of commerce shall not be disturbed; and the third, subject it will be noted, to the foregoing requirements, is that the financial aspects of such mergers shall be kept in view. Without having regard to the fundamental principle involved, it might appear that these several requirements were stated in the order of their importance; in other words, that the element of financial strength was less significant than the preservation of competition and of the existing traffic routes. But having

due regard to the matter in its larger practical aspects, it is evident that any plan adopted will not only be a mere paper plan, ineffectual and futile, but that it will fail to conform to the spirit of the act, unless the financial requirements be given equal weight with those of operation and traffic. For the plan will never be put into effect unless a financial motive for consolidation be afforded; and unless it is put into effect, a positive bar to the attainment of uniform reasonable rates, under which all the carriers alike may thrive, will continue to exist, if the underlying principle of the legislation is in reality sound.

One might, presumably, first ascertain the relative financial standing of the corporations; and thereafter check up the alliances thus indicated, by applying the test of operating efficiency and satisfaction of the traffic needs of the territories concerned. Or, contrariwise, one might first seek the natural alignment of these properties as operating and traffic units, before inquiry as to whether such alignment contained an effective invitation to merger, based upon considerations of earning power and financial stability. The former method appeals particularly to financial students of the subject. The latter calls for a somewhat wider range of information, dealing not alone, as it does, with the operating and traffic characteristics of the carrier companies, but also looking to the broader considerations of the traffic needs of the entire communities served. For, unless the location of its railways conforms to the commercial requirements of the country, there can be no permanent prosperity for either.

As to procedure, also, it has been represented stoutly that this plan should confine itself strictly to broad outlines; and even, perhaps, merely propose but a statement of principles. It is contended that useless complications and prejudice to future negotiations, as well as a dangerous effect upon market values, may result from descent into detail. Fully conceding the force of this reasoning, experience demonstrates that general principles and broad outlines may only be tested, as to their feasibility, by tentative elaboration of the finer points.

Certain statistical data have been compiled in order to check up the plan, as proposed, by territories and by systems. The calendar year 1917 has been chosen for the purpose, largely because the results for that period most closely approximate the standard requirement established by the statute of an operating income amounting to 5.5 per cent of the investment in road and equipment. For 1917, the actual rate of return was in fact 5.45 per cent. It should be noted that the net operating income, however, is not that of the calendar year 1917, but is based upon the standard return—the average annual net railway operating income

for the three years ended June 30, 1917. This standard return for some roads is considerably less than the actual income of the calendar year 1917. But for other roads the standard return will be found to exceed the 1917 income. The net result is that for class-I roads as a whole, the 1917 income exceeds the standard return by about 7.5 per cent. Thus it appears that for a few roads, perhaps undergoing rapid development, the standard return understates the case; but for all of the rest, the three-year average affords a safer basis than the results of any single year.

The foregoing data as segregated by systems set up under this plan, afford a rough indication of the competitive strength, geographical scope, and inherent financial stability of the relationships proposed. Statistics, as well as maps, under these given circumstances must be regarded and treated as imperfect criteria. The realignment of properties, with the consequent disturbance of all traffic, is bound to be instantly reflected in earning power. The putting together or dismemberment of individual properties may bring about results which are quite unpredictable by the arbitrary means of statistical investigation. Elaborate calculations by experts concerning the development of business under the new conditions are really necessary in order to afford a reliable forecast.

### Plan Includes Only Class I Roads

This consolidation plan, it should be noted, has thus far been concerned only with class-I roads. There remains the not inconsiderable aggregate of 39,000 miles of line, consisting of the so-called short lines, the remaining class-I roads, and those within classes II and III. A comprehensive plan of railroad consolidation would include their allocation in due course; but the data are not at present available.

As for the troublesome problem of allocation or abandonment of certain properties not serviceable to their respective communities, the matter is discussed in chapter VI. For it is in the southwestern states that the question presents itself in the most acute form.

It has been urged with some cogency that this plan does not call for wide-spread disturbance of existing relationships except to take care of the properties that are either well above par or substantially below it. In other words, it has been urged on behalf of several properties of moderate size that they are already doing fairly well under the statute, conforming to the requirements and enjoying the reasonable return fixed by the commission without further alliance with other companies. Deciding roughly, as one must under existing conditions, it is held to be more important to create self-sustaining systems as to earnings derived from as large a proportion as possible of the area of the several great subdivisions of the country, rather than to attempt to put these properties together in such an exact way that they shall all have approximately equal mileage or equal gross or net earnings within each group. Neither mileage nor volume of business is the real test of ability to exist under the statute. In brief, as illustrated by trunk line territory, it is held that a Baltimore & Ohio system adequate to satisfy the requirements of the statute may be created by giving it a mileage or a gross volume of traffic by no means commensurate with either the New York Central or the Pennsylvania. Its ability to serve may perhaps be dependent upon quite other considerations than those of size.

The purpose being to promote a more evenly balanced competition, especially by means of equalization of opportunity in originating traffic as well as in its interchange and delivery, it is conceivable that congestion may be in a measure relieved by this plan. The growth of business in future years must accrue largely to the existing stems. Sound public policy demands that this growth should be so distributed as to avoid blockades and embargoes on the strong roads, while the weak ones are coincidentally drifting toward starvation. To insure a larger proportion of the increment to the weaker roads, by rendering them more capable of efficient service, is the idea. The purpose of the legislation being not to guarantee an income but to afford an equality of opportunity to earn it, was intended to be promoted by this means.

### Size and Scope of Proposed Mergers

Fundamental differences between various plans proposed for consolidation arise concerning the size and scope of the mergers. Shall they be continental in range, or shall they conform to territorial divisions of the country? Considerations of operating

efficiency and of conformity to the traffic needs of the country, as well as preservation of competition and of the established channels of trade and commerce, are not sufficient. It is essential also that administrative organization both within the company and in its relations to the government should be likewise comprehended. Particularly is it important that correspondence be maintained between the scope of these railroad systems and the long-standing rate-making areas and statistical divisions which have commended themselves upon the basis of long experience to the parties concerned. All of these considerations join in commending a division of the country for purposes of consolidation primarily into the great sub-divisions of trunk line territory, south-eastern territory and western territory. Furthermore, local peculiarities and the marked individuality of certain areas seem to make it desirable to set off certain subdistricts within these great primary divisions. Such a general division of the territory of the United States conforms practically to the widest range thus far covered by any existing railroads or systems. Ambitious plans, notably that of the Gould system after 1901, and of the Farquhar syndicate, somewhat later, have sought in vain to constitute tenuous systems covering a wider territory than these historic areas. Any substantial system must have breadth as well as length, an amplitude of feeders as well as main stems; and there seems withal to be a pretty clearly defined upper limit of the aggregate mileage which may be efficiently operated. The experience of the federal Railroad Administration in dividing up the area of the country seems to confirm this view, that for operating and traffic purposes each system should be comprehended within the certain great territories above named.

### Territorial Divisions Condensed

The new statutory rule of rate making and the first decision rendered thereunder by the Interstate Commerce Commission—Ex Parte 74—also render it imperative in planning for comprehensive consolidation not to transgress the boundaries of these traditional territorial subdivisions. The purpose of the law being to fix reasonable rates, not for individual railroads but for entire groups, renders it essential that the grouping adopted for this purpose conform to that which is adopted in effecting the consolidations.

The preparation of a comprehensive consolidation plan necessarily upon occasion involves a disruption as well as a putting together of relationships for other purposes also than the one above mentioned. Obviously, such dismemberment should be rigidly minimized; and no proposal for so doing is made unless the evidence in its favor is most convincing. Were the plan in effect a final one involving large financial considerations, one might hesitate even under these circumstances. But having in mind that these proposals are purely tentative, that they are the preparation of a sketch or an ideal layout, the plan assumes the right to tear apart as well as to consolidate; in other words, to effect where necessary a comprehensive readjustment.

This tentative plan for consolidation proceeds upon the assumption that the distinction between so-called weak and strong roads, financially, is at present highly uncertain; and that it will require a period of experience under the new rates and under the new division of through rates as well as under the slowly readjusted commercial and industrial conditions after the war, in order to establish the relative earning power and credit of each. Yet in the meanwhile, tentative plans must be set up, in preparation for the application of the final test of relative financial strength as soon as the available data make this possible. Not infrequently it will be found that in these plans it has been necessary to put together what appears to be a disproportionate number of weak roads, or at all events, of roads which have yet to establish their claim to entire stability. Particularly has this been the case in the so-called Gulf region, where practically all of the properties seem to be below par. No strong roads exist with which these may be consolidated, without extension of the scope of consolidation far beyond the bounds which are apparently laid down by traffic and operating experience. The same condition would obtain under the so-called New England plan for that particular territory, as well as for the peninsula of Michigan. Necessarily the first step must be to provide for proper grouping in order to promote the best operating and traffic results. The responsibility for the subsequent financial success of the undertakings must then rest upon the exercise of the new rate-making powers, conferred upon the Interstate Commerce Commission by the act.

A peculiar difficulty in effecting consolidation of strong with weak roads and of reconciling such merger with existing operating and traffic relationships, arises from the tendency of the weak roads to link up in series and to form thereby through routes extending sometimes clear across the country. Under such conditions, the mandate of the statute, to preserve "as fully as possible and wherever practicable" such traffic associations, impels one of necessity toward consolidation of a number of equally substandard roads. Conformity with the other mandate of the statute by seeking to ally strong and weak properties to a like degree, thus threatens to overset the traffic relationships which have become customarily established by very force of circumstances. It is because of the clash between these at times discordant requirements, that the emergent result is so often a piebald compromise.

Several assumptions akin to the foregoing one are made in the following plan. The first is that for a number of roads a substantial readjustment of capitalization must occur as a prerequisite for consolidation. It is clear that this must be so by virtue of the authority vested in the commission under section 5, paragraph 6b. The purpose, obviously, is to bring about the re-establishment of a due relationship between the total volume of securities outstanding and the valuation assignable to the property for rate-making purposes, as well as the assurance of a sound relationship between indebtedness and capital stock. The experience of a number of recently reorganized properties is significant as indicating the recuperative effect of a drastic reorganization of capitalization.

It is likewise presupposed throughout this report that all of the new powers conferred upon the Interstate Commerce Commission by the transportation act, 1920, will be upheld constitutionally. Sporadic control by the courts, as evidenced in the pending dissolution proceedings, it is assumed, now yield place to a continuing supervision and control by the Interstate Commerce Commission, acting as a branch of the executive authority. Such a complete reversal of public policy must lead to protracted litigation; but regardless of the final outcome no course in connection with this report is possible save to hold that the will of Congress as expressed in the transportation act is governing and supreme.

### Terminals

Another far-reaching assumption is vital to the success of this plan. This has to do with the operation of terminals at great centers. Some roads are peculiarly fortified as to terminals, while possessing weak lines from an operating standpoint across the open country. For others, the reverse is true. But whatever the cause for the existing situation, a practically universal demand of shippers is that they be able freely to exercise their routing rights by the provision of open terminals, both at the point of shipment and at destination. To put together railway lines on the map without having a constant regard to the possibility of free delivery or receipt at either end would indeed be futile. Conceivably, joint ownership and operation, as at St. Louis, may succeed in that environment, while reciprocal switching may satisfactorily answer the purpose as at Chicago. But, whatever the means adopted to this end, it is submitted that a proper adjustment of the various terminal situations, always of course for due compensation, is an important adjunct to any comprehensive consolidation plan. Consolidation can never be effectively brought about without the adoption of a comprehensive policy as to terminal ownership, operation, or both. It is herein assumed that free access will be somehow provided, either under the present emergency powers as contained in section 1, paragraph 15c, or by the adoption under a consolidation plan of permanent arrangements in all of the important centers.

Another general principle constantly kept in mind in connection with consolidation and having substantial effect upon it is the encouragement of alternate routes and gateways, in order to relieve present or prospective congestion at the great railway meeting points. A tendency has been strikingly manifest for many years for all the great systems to expend funds unstintingly upon their main stems, and all of these main stems tend to run together at certain nodal points, notably New York, St. Louis, and Chicago. Such concentration upon great cities is a natural response to the commercial forces which tend with increasing power to attract traffic, even although it may not be destined for that place but may be passing through en route to points beyond. The shippers' routing often dictates such shipments in order to take advantage of a change in market conditions. The result has

been an undue congestion in times of emergency, which paralyzes the commerce of the country. There is always a certain proportion of business, however, which by careful attention to the matter might be consolidated and shipped by an alternate route which should avoid the great center. An attempt has been made wherever possible to coordinate such direct relationships between the different systems proposed by the establishment of definite and common gateways of this sort.

### Recapitulation of Ripley Plan

The objects sought in the foregoing plan are as follows: An inherently natural geographic scope for each system, a sound operating adaptation of each unit to its surroundings, due consideration being given to the nature of its traffic administrative practicability, that is to say, a size under each particular set of circumstances, commensurate with human capacity in management; an ever-present competition between rival roads, in order to insure the continuance of an alert and accelerated service to the public, assuming that the foregoing physical arrangements have already provided economical carriage by each competitor; and such an equalization of earning capacity between these competitors, as to perpetuate such rivalry in service on an even-handed and wholesome basis. All of these requisites for a sound consolidation plan, it should be understood, must of necessity be combined with the least possible disturbance of existing corporate integrity. The formation of a better sort of competitive system than we now enjoy, must in the nature of things probably be voluntary. The existing physical instrumentalities have been closely coordinated with the present corporate structure. Both of these circumstances therefore commend, as the most feasible governmental policy, a process of induced although necessarily voluntary trading between the existing railroad companies through interchange of their corporate securities.

Should the policy of voluntary consolidation not prevail, after due encouragement by governmental authority, it seems clear that an added incentive to government ownership will be afforded. In other words, a failure to seek earnestly the economies of large-scale and systematic operation must necessarily strengthen the arms of those who are contending for the entire supersession of private ownership through a government taking. The issue of governmental versus private ownership and operation of railroads is constantly pressing itself upon the attention of the Congress and the people. The principal argument in its favor is that it conduces to economy and efficiency because of unified operation. All the wastes of competitive management, it is alleged, may thus be avoided. Nor can it be denied that in considerable measure such economies were brought about in the United States during the period of federal control. But it is equally incontrovertible that the cessation of competition under a system of complete regional monopoly such, for example, as seems to be contemplated under the pending British plans, is destructive of one of the great incentives to efficiency. That was perhaps one reason why the cost of operation mounted so phenomenally during the war. The instrumentalities may be present; but the vigor and initiative which are commonly set on foot through rivalry are bound to be lessened. One of the larger aspects, then, of this proposed consolidation plan is that it offers a third choice, in place either of completely unified regional ownership and operation with its lack of incentive, on the one hand; or of the economic wastes which are incident to helter-skelter competition between a heterogeneous congeries of more or less imperfectly developed properties, on the other. One alternative threatens stagnation; the other has driven our railroads to the verge of bankruptcy. May not a well-ordered consolidation program offer a way out, without resorting to the ultimate expedient of government ownership from which, once adopted, there can be no withdrawal?

### Outline of 21 Systems

A total of 21 systems has resulted from the foregoing proposals made serially in detail. These are as follows: Five systems within the trunk line region; two lake-to-tide soft-coal systems in the Chesapeake Bay region; in the southeast, four systems, five transcontinental systems west of the Mississippi; and two running southwest toward the Gulf ports. In addition to these, and completing the list, there are three outlying regional groups; in New England, in the southern Michigan peninsula and down the east coast of Florida toward Cuba, respectively. For these 21 systems the main stems are portrayed on map 27. The map throws into

the foreground certain primary bases. Some of these, like New York, Jacksonville, New Orleans, Galveston, San Francisco, and Seattle, are located along the seacoast at nodal points, generally at the corners of the great territorial divisions, trunk line, south-eastern, western, etc. In the heart of the country there are actually only two primary strategic bases, Chicago and St. Louis, although for the southern territory the Ohio River gateways are in a sense secondary bases. And Toledo, Ohio, and Norfolk, Va., are secondary bases for the group of Chesapeake Bay coal roads. But in the main everything is based, centrally, upon Chicago and St. Louis as far as the main stems are concerned. Wherever possible the systems are brought in through their main stems to these points. But it is proposed also to create detours or alternative belt lines by which congestion may be avoided at these great centers.

The general practice of basing on Chicago and St. Louis, in the heart of the country, is exemplified in detail within each great region upon the map. The five trunk lines from the Atlantic seaboard split somewhere in their westerly courses, with branches to each great central base. Similarly the five transcontinental stems which spread out on the Pacific coast, from north to south, are drawn together to the same dual base on Chicago and St. Louis; and from the southwest, likewise, the two systems, only secondarily based on Kansas City and St. Louis, each run also into Chicago. And of course there is always, at the junction points where these main stems from every direction cross one another, the opportunity of free interchange, avoiding the congested centers entirely. Only from the southeast, for the reasons fully set forth in the chapter thereon, has it been deemed wise to stop the systems at the Ohio River and to have them carried into Chicago and St. Louis over trunk line connections.

The objective of conformity to the statute as respects competition is sought wherever possible by having each considerable city all over the United States tapped by at least two railways; and all of the great competitive routes, hither and thither, are so arranged that there is a matching for competitive purposes everywhere. Thus it will be noted that the Santa Fe and the Southern Pacific-Rock Island each split in western Texas, with one branch running to the Gulf and another to the dual base on Chicago and St. Louis. For two of the remaining three western transcontinental lines the same thing happens in an inverse direction. Both the Union Pacific and the Burlington-Northern Pacific start out from Chicago (and St. Louis) and split in order to send arms to Seattle and San Francisco, respectively. The St. Paul-Great Northern system is the only transcontinental one which is localized in the north. And the possibility of its future entrance into San Francisco is clearly foreshadowed. But each and every line has another road of approximately equal competing strength set up to match it. Take the southeast as another illustration. Starting from Richmond one notes, going southwest, parallel to the seacoast, that each of the three systems splits somewhere in the Carolinas, with a southerly arm to Savannah and a northerly one to Atlanta. Or, from the Ohio River gateways, three roads enter from the north, the Southern Railway at Cincinnati, the Louisville & Nashville at Evansville, and the Illinois Central at Cairo. All three alike split into two arms, one of which goes to New Orleans and the other easterly to Savannah or Jacksonville, via either Atlanta or Birmingham. Or, turning to the Southwestern-Gulf region, one finds two systems which really spring from Kansas City and St. Louis as bases matched against each other. They each, to be sure, run up to Lake Michigan, but their Chicago operating divisions are mere bridges. The real originating stems lie southwest of the Missouri River gateways; and each of the two systems reaches San Antonio, Galveston, and New Orleans, albeit by routes which for each particular city are more or less indirect.

The foregoing description of competitive routes, matched in pairs, does not, of course, preclude the possibility of competition between a larger number of roads than two. At most nodal points, for example, it will be found that from three to five are as likely to compete as two. Thus at Seattle, San Francisco, Savannah, Atlanta, or the twin cities, one discovers three systems in competition. At Galveston four systems enter. New Orleans has three systems from the southeast and four from west of the Mississippi. Kansas City will be touched by at least four of the transcontinental lines, with the two Southwestern-Gulf systems in addition. In short, as a city rises in the scale from third to second or first place, as a strategic center, the number of systems which independently seek to provide competition increases.

The principle that earning capacity in terms of valuation con-

stituted the ultimate test of the feasibility of any proposed grouping of railroads, in contradistinction to any attempt to bring about an absolute equalization in size among these projective competitive units, was avowedly adopted at the outset. Yet the relative magnitude of the different systems proposed is not entirely immaterial. An attempt has been made in the grand summary (exhibit 8) to bring out the facts in this regard. Size, relatively, is shown in two respects. One measures the volume of business by the revenue ton-miles. The other finds expression in the mileage operated. In other words, the revenue ton-miles exhibit the density of traffic rather than the extent of the systems on the map. Each of these two tests of magnitude is significant for its own particular purpose. The range of mileage is considerable. Excluding the Florida East Coast, which of course is not a system, the smallest of the proposed groups is the Chesapeake & Ohio, with a mileage of 2,761. This is not much exceeded by either the Norfolk & Western-Virginian, the Michigan peninsula system, or the Seaboard Air Line. These four constitute a group apart in size from the rest. For all of the others run above 5,000 miles of operating length; and nine of them exceed 10,000 miles of line. The contrast between the western transcontinental systems in this respect and most of the others is notable. Four at least of these western roads are approximately 20,000 or more miles long, as operated. The only approach to this geographical scope is found in the Atlantic Coast Line-Louisville & Nashville system with 14,170 miles of lines, and in the two Southwestern-Gulf systems with 12,000 and 13,000 miles, respectively.

### Earning Capacity the Basis

Turning now to the second index of size, namely, revenue ton-miles, the same wide variation appears as in the matter of miles of line. But here, with the emergence of the density factor, the differences regionally contrast sharply in another way. Thus the proposed Pennsylvania system with 47,871,000 revenue ton-miles is nearly twice as large as either the proposed Burlington or Union Pacific systems, judging by the returns for 1917. The Lackawanna-Nickel Plate is as much smaller than its great neighbors, measured by revenue ton-miles, as the Santa Fe system is smaller than the other western transcontinental roads. Likewise, in the southeastern region the volume of business, in view of the mileage operated, is surprisingly light. It is clear that the proposed systems are as diverse in this respect of revenue ton-miles as they have appeared to be in miles of line operated.

The really significant feature of the exhibits respecting size, however, and one which has been kept in mind throughout the evolution of this plan, is the fact that the load thrown upon any single system for administrative purposes is kept well below the existing standards. The attainment of the Pennsylvania in 1917 to 47,871,000 revenue ton-miles, followed next in order by the New York Central standing at 38,477,000 revenue ton-miles, is not elsewhere approached by any of the other proposed systems. And these two great groups, above named, represent in this plan not additions to the existing corporate business handled, but at least in the case of the New York Central, a substantial subtraction therefrom. The only proposed systems which approach within hailing distance of either the New York Central or the Pennsylvania in volume of business are the Baltimore & Ohio-Reading, the Erie-Lehigh Valley-Wabash, the Burlington, and the Union Pacific systems. In fine, if it lie within the bounds of human capacity to operate the Pennsylvania and the New York Central systems as at present constituted, there is no reason to suppose that these newly suggested systems are too big to be properly managed. This consideration is indeed a very vital one.

Another reason for limitation upon the size and scope of these proposed systems operates in the interest of the local stations along the line. It is submitted that more and more do the little local communities along the lines of these primary railroads need encouragement and support in face of the commercial and industrial rivalry of the great centers of population. The cities of the intermediate class, Des Moines, Iowa, for example, can not expect all of the rivalry which would arise between carriers at a primary center like Kansas City or St. Louis. But the chances for development attendant upon first-class main-line service will be considerably increased if there are, for example, three or four competing trunk lines of large systems across the state of Iowa, rather than a smaller number. It is also true that each main

# Missouri Pacific Rebuilds Station in Record Time

Passenger Terminal at Little Rock, Ark., Completed  
Within Short Period After Being Burned

By E. A. Hadley  
Chief Engineer, Missouri Pacific

On the night of April 6, 1920, the passenger station of the Missouri Pacific at Little Rock, Ark., was almost totally destroyed by fire. The building which was burned was constructed in 1908 and 1909 and placed in operation in the latter year. It was a brick structure erected on substantial concrete foundations and concrete piers which were carried to a depth of some 20 ft. below the level of the tracks to rock and consequently were not seriously damaged by the fire. The waiting room and office floors of the building, which was a two-story structure with an attic, were carried on cast-iron columns with a frame-work of steel I-beams with timber floor joists and wooden floor construction on top of which, for the waiting room floor, was laid a tile surface.

The fire, which started in the closed attic, apparently had been smoldering for some time before it was discovered and as soon as outside air was admitted to this attic by the opening of a door, the hot air mixture caused an explosion which blew out the windows in the attic and created a draft which caused the fire to spread rapidly throughout the wooden roof frame-work supporting the clay tile roofing. It was impossible for the fire department, upon its arrival, to get water onto the flames effectively with the result that practically the entire superstructure of the building was consumed or collapsed into the basement in a tangled mass of twisted I-beams, bricks, plaster and other incombustible materials, leaving only a small part of the exterior walls, including the tower, standing after the fire was under control.

Little Rock is one of the most important points on the Missouri Pacific system and a large passenger, express and mail business is handled through this point. It is also the location of the district offices of the Southern district of the system so that it was imperative that immediate steps be taken to establish facilities for the continuous handling of business. It so happened that, at the time the fire broke out, the president, accompanied by the vice-president in charge of operation, the general manager, the chief engineer and other officers were on an inspection trip of the Southern district within 90 miles of Little Rock, and their train was run special to Little Rock, arriving there while the fire was at its height.

Sufficient authority was available on the ground to authorize temporary as well as permanent facilities to replace those being destroyed. While the fire was still burning, extra labor gangs and bridge gangs from four operating divisions were

being brought into Little Rock by special trains and material was being hauled from the company's store yards across the Arkansas river at North Little Rock. Plans were perfected immediately for temporary arrangements for sheltering baggage, express and mail and for taking care of passengers on the "midway" over the tracks, which was not burned; with the construction of a ticket office and temporary settees these facilities were in use continuously without change or addition, from the day following the fire until the various parts of the new passenger station were made ready to accommodate portions of the business. Temporary quarters in adjacent hotel buildings and stores were secured for various offices and on the morning after the fire all of the passengers were cared for by temporary arrangements without a single accident or loss or damage to the property of any passenger and with no train delayed more than five minutes.

The growth of express and mail business at Little Rock had reached a point where the facilities in the station which was burned were inadequate and consideration was being given to the construction of an additional building to be located south of the passenger station for the handling of this business and which would have a second-story for additional office space required for handling the railroad company's business. It was therefore decided immediately that in reconstructing the building it should be extended to a sufficient length to accommodate the increasing business and also would be constructed three stories in height, eliminating the attic and having the third floor available for additional office space; also to extend the waiting room portion of the building to provide larger waiting rooms and a more commodious dining room and kitchen to accommodate the increasing passenger traffic.

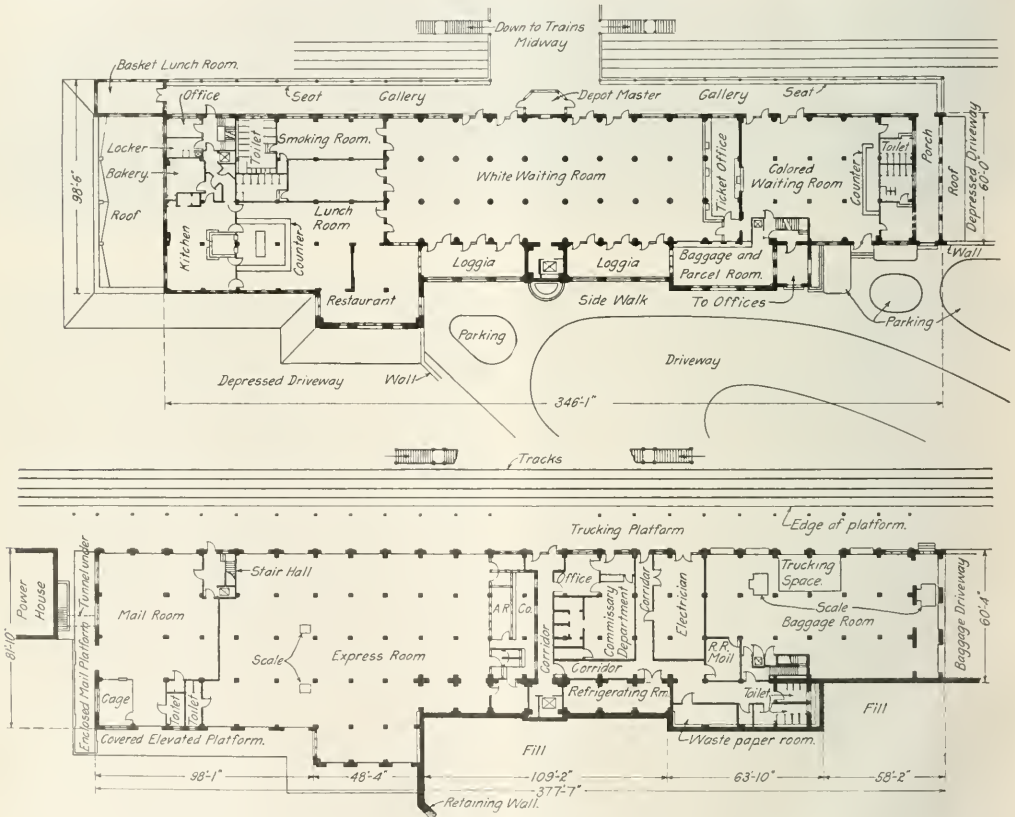

With these objects in view and before the ruins had cooled and the debris was cleared away, which work was being performed by company forces, arrangements were made with Link & Trueblood, architects, St. Louis, Mo., who had designed the structure which was burned and had in their possession plans showing the spacing of foundations for columns, etc., as previously constructed, to proceed at once with the design for a reinforced concrete frame-work to be erected inside of the original walls of the building and also to prepare an exterior design for the building, retaining such portions of the existing walls as were in safe condition and such

portions of the tower as remained in place. This tower had become a landmark in the city. Other than the design of the interior reinforced concrete frame-work and the design for the exterior of the building, all other features in connection with the architectural work of the designing and construction of the building have been handled in the engineering department of the railroad under the direct supervision of E. M. Tucker, architect.

On April 12, 1920, or within five days after the fire, contract was awarded to James Stewart & Co., Inc., on a cost plus basis for the erection of the new building which is of fire-proof construction, finished with the same kind of light-faced brick and Bedford stone which was used in the old building for the purpose of harmonizing with those parts of

uary 1 of this year, it has seemed advisable to complete the interior work before turning the waiting rooms over to the public, which was done on August 1, at which time the dining room facilities were also placed in operation.

In making the rapid progress which has characterized this work under adverse market conditions, advantage had to be taken of every opportunity for securing material and labor and to co-ordinate the operations of the several departments of the railroad and the contractor's organization. This was all the more necessary because complete plans and specifications for the work could not be prepared in advance of starting construction but were, of necessity, prepared as the work progressed, and kept just ahead of the contractors' construction. The final plans were completed just ahead of the com-

The Waiting Room and Track Level Floor Plans of Station as Rebuilt

the structure which remained standing. On March 1, 1921, eleven months after the date of the fire, the mail room in the new station was turned over to the post office department and on March 15, the entire express room was turned over to the express company for its use. On April 1, one of the offices in the third-story of the new structure was occupied by the land commissioner as the lease on his former quarters in an uptown office building expired on that date. All of the district and division officers located at Little Rock occupied their permanent offices on the second floor on June 1.

The temporary quarters in which passengers were handled subsequent to the fire proved so satisfactory that while it was possible to have occupied the new waiting room on Jan-

pletion of the entire structure. The cost of the construction, including additions to the building and all equipment was about \$1,000,000.

The work of construction has been in charge of J. A. Lahmer, principal assistant engineer, reporting direct to the office of the chief engineer.

A SPECIAL TRAIN carrying 250 men en route to the oil fields in California, where a strike has been in progress, was surrounded near Pendleton Junction, Cal., by several thousand men, who caused the train crew to return to Bakersfield, Cal., where the train was re-routed by way of San Francisco.

# Pennsylvania Declines to Appear Before Labor Board

## Carrier's Refusal to Attend Hearings Result of Restrictions on Evidence to Be Presented

THE PENNSYLVANIA RAILROAD notified the Railroad Labor Board on September 26 of its refusal to participate in further oral hearings which the Board had granted in compliance with that carrier's request. The carrier's refusal was based on the Board's action in restricting the testimony which the carrier might present "to matters over which the company maintains the Board has no jurisdiction." Instead, a statement of the carrier's position signed by Samuel Rea, president, was submitted to the Board on that date. This statement contends:

(1) That the Board has refused to grant a hearing at which which the company proposed to give concrete evidence of the fact that the great majority of its employees are satisfied with the manner of selecting employee representatives and with the rules and working conditions now in effect.

(2) That the Board, on the contrary, has restricted tomorrow's hearing to matters over which the company maintains the Board has no jurisdiction and has declined to hear any other evidence.

(3) That the real issue in this case is the fundamental right of employer and employees to deal directly with each other.

(4) That the company does not question the jurisdiction of the Board to hear and decide such disputes as fall within the purview of the Transportation Act. It does, however, deny the right of the Board to invade the domain of management.

The progress of the controversy between the Pennsylvania and the Railway Employees' Department of the American Federation of Labor, and the Brotherhood of Steamship Clerks, Freight Handlers and Station Employees, has been described in the *Railway Age* of July 16 (page 115), August 6 (page 257), August 13 (page 297), August 20 (page 352), August 27 (page 399), September 10 (page 493), and September 24 (page 579).

After quoting Sections 5 and 6 of the Pennsylvania's application (described in full in the *Railway Age* of August 27, page 399) to set aside the Board's first ruling in this controversy; sections in which are outlined the number of employees with whom new agreements have been negotiated and the satisfaction with which these agreements and the method of negotiation have been hailed by the employees involved, the carrier says in part:

"In its application (to set aside the decision of the Board) it was the earnest hope of the carrier that the Board would take cognizance of the new and changed conditions set forth in the application, and by its co-operation, counsel and advice would assist the carrier in its announced policy of endeavoring to re-establish with its employees a contented and harmonious relationship, based upon honest, efficient and economical railroad operation, which can be secured only by close and unrestricted co-operation by and between the management and its own employees."

Mr. Rea's statement then calls attention to that portion of the Board's order which restricts the testimony which the Pennsylvania could present to:

(1) The question as to what employees, if any, not in the actual and active service of the carrier, such as men laid off, furloughed or absent upon leave, shall be permitted to vote in the election of representatives to negotiate agreements on rules and working conditions.

(2) The question of how the representative capacity of

the spokesmen of unorganized employees shall be ascertained.

(3) The carrier will be permitted to offer such evidence, as it may see fit, of the adoption or ratification of its shop craft rules by the representatives of said crafts fairly selected by a majority of the employees of that class.

The statement, which is couched in legal phraseology, continues in substance:

"It is clear that Paragraphs 1 and 2 pre-suppose that the election prescribed by the Board in Decision No. 218, with all of its objectionable forms and conditions, will be held. The carrier in Section 4 of its application to vacate this decision denied the power of the Board to prescribe an election, or any other method, by which the carrier may desire to ascertain who are the authorized representatives of its employees; and the carrier hereby reaffirms its denial of any such power or authority in the Board. Therefore, it can not acknowledge the jurisdiction of the Board by the submission of any testimony relative to the subject matter of Paragraphs 1 and 2."

As to Paragraph 3, the carrier calls the attention of the Board to Section 5 of its application to vacate Decision No. 218, and particularly to the averment that contracts respecting working rules and conditions have been entered into between the carrier and the representatives of approximately 150,000 of its employees. The carrier again denies the right or the power of the Board to set aside these contracts without a hearing upon the justness and reasonableness thereof.

It is apparent that in this paragraph also the Board has in mind the election prescribed by it with a ballot having printed thereon the appellations "System Federation No. 90, Railway Employees' Department of the A. F. of L." and "American Federation of Railroad Workers," a ballot avowedly in accordance with the established method of taking a ballot among the railway labor organizations.

Therefore, the carrier does not desire to offer any evidence on the subject matter of Paragraph 3, which relates to mere procedure and which is not within the jurisdiction of the Board.

The carrier reminds the Board that in its application it asked the Board to find, in pursuance of the Transportation Act, (a) that the carrier has the lawful right to establish rules and working conditions in the first instance, either with or without first holding conferences with its employees; and (b) that the contracts respecting rules and working conditions heretofore entered into by the carrier and its shop craft employees are now in full force and effect without any further action on the part of the carrier and its employees. The Board has refused to grant a hearing and to make such a finding, and has in all respects declined to hear the carrier upon the issue of law and fact presented in its application. It follows, therefore, that there is nothing for the carrier to present in the way of oral evidence.

The carrier notes that it is referred by the Board to its Decision 224 in which the Board arrogates to itself the right to ignore the decisions of the Supreme Court of the United States determining the respective rights of employers and employees, and decides that "hitherto unquestioned legal rights" must give way to the Board's views of what is just, fair and reasonable as between the parties and the public.

The carrier cannot accept these views of the Board, novel and even startling though they may be, and if followed to their logical conclusion revolutionary in effect. It does not believe that the Transportation Act has deprived, or was

intended by Congress to deprive, either employers or employees of their constitutional and legal rights as established by the Supreme Court and other courts of the United States.

The carrier states finally that it has not denied and is now not denying the jurisdiction of the Labor Board to hear and decide such disputes as fall within the purview of the Transportation Act, but it denies the right of the Board to invade the domain of management and to assert jurisdiction over grievances of whatsoever kind and character in connection with the employment, the discipline and the discharge of its employees.

The carrier also asserts and will exercise its right to deal with its own employees without the intervention of individuals or organizations whose manifest object is the denial of the fundamental right of employer and employees to deal in the first instance directly with each other respecting wages and working conditions in which they alone are directly interested.

### General Atterbury Suggests Further Wage Reductions

Another development of significance during the past week was indicated in remarks of General W. W. Atterbury, vice-president in charge of operation of the Pennsylvania, who, in addressing the Mutual Benefit Association of the road at Philadelphia, predicted a reduction in wages for the company's employees, with the alternative of either government control or a receivership.

"Railroad rates must come down, but wages also must be cut in order to do this," Mr. Atterbury said.

He declared earnings of the Pennsylvania today do not meet expenses. "There faces us either a reduction in wages or a receivership or government ownership," he said. "It is not possible that you want to put yourselves on a par with letter carriers, clerks and other government employees, or army men, all of whom are notoriously underpaid, judged by your standards.

"There is only one solution to present problems in the United States and that is liquidation. The farmers and industries say they have liquidated. The outstanding features, coal and transportation, have not been materially touched. But both, curiously enough, have been touched with the damning effect of government control.

"The farmers are united and the industries are united. They say to us: 'Rates must come down, and if you don't bring them down we'll bring them down for you.' One of the ideas in their minds is group control in Congress.

"What does reduction in rates mean to us? What are earning today is insufficient to meet fixed expenses, and improvements are made at the sacrifice of property.

"It is true there is not much left but a further reduction in wages, and it isn't pleasant to hear or to contemplate; but there faces us either the reduction or government ownership or receivership."

### Brotherhoods Count Strike Ballots

General chairmen and offices of the Brotherhood of Railway Trainmen are assembled in Chicago to count that organization's strike ballots. The first of these ballots opened were in favor of a strike. That the final result will show the trainmen solidly supporting a walkout is the opinion of the union leaders.

General chairmen representing the members of the Brotherhood of Locomotive Engineers, Order of Railway Conductors, Brotherhood of Locomotive Firemen and Enginemen and the Switchmen's Union of North America are scheduled to meet in Chicago on October 3. Counting of the strike votes of these organizations will start at that time.

WHEN ONE TRAVELS in America and follows with a voyage in France he has somewhat the impression that after tasting the refinements of civilization he has returned to life among the Kaffirs.—*Stephane Lauzanne in Le Matin (Paris).*

## Committee of Security Owners' Association Discusses Consolidations

THE COMMITTEE on Public Relations of the National Association of Owners of Railroad Securities has addressed to the members of the association the following letter regarding the Interstate Commerce Commission's tentative plan for railroad consolidations:

"A plan for the consolidation of the railroads of the country into 20 large railroad systems, prepared at the instance of the Interstate Commerce Commission, has recently been made public. The commission has not as yet endorsed this or any particular plan, but has announced that public hearings will be held thereon.

"The Transportation Act of 1920 (Esch-Cummins Act) directs the commission to formulate a plan for the consolidation of the railroads of the country into no less than 20 or more than 35 large systems. While the plan finally adopted by the commission cannot, under present laws, become effective without the assent of the security owners of the railroads, nevertheless all future consolidations of any railroads by whomsoever suggested or desired are required by the act to conform to whatever countrywide plan the commission now decides upon. It will be seen how vitally important it is that the basis for consolidations established by the commission shall be fundamentally sound, from the physical, traffic, operating and financial standpoints. The commission is directed to hold public hearings in respect to the plans proposed.

"One of the requirements of the act is that all consolidations shall be based on the valuation of the properties of the respective carriers, as determined by the commission, in that the amount of the securities to be issued by each new consolidated company shall not be greater than the aggregate ascertained value of the properties of the constituent railroads.

"This association, in recognition of the importance—both as to the valuation to be placed on the properties and the conditions under which consolidations coming within the meaning of the act are to be attempted—appointed a board of economics and engineering, of which you have been previously advised, to make an exhaustive study of this among other problems.

"The proposed large consolidations will have far-reaching effect upon all railroad securities, as well as on the ability of the carriers when consolidated to render an adequate and efficient public service. If there is a time when those who own the securities of railroads should prepare to meet the questions now presented, it is when their assent is essential to effect so complete a change as is contemplated in the relation of their securities to the properties that issued them, and which may adversely affect their value.

"It is self-evident that an impartial analysis of any plan of consolidation or of the questions to be considered in reaching conclusions in respect to consolidations, under the terms of the act, can best be attained through an agency representing, in its broadest aspect, all classes of securities issued by all carriers rather than by any particular railroad. Such an agency is presented in the board of economics and engineering appointed by this association. To further extend the effectiveness of its work the board has been clothed with full power of independent action. Its members, in addition to their recognized qualifications for this work, were impressed with the fact that the first consideration should be the public interest, as no plan of consolidation can be effective that is not founded principally on an efficient transportation public service economically administered.

"The board is engaged in an exhaustive study of the subject, with a view to analyzing the plan of consolidation now

before the commission, above referred to; such other plans as may be proposed either to or by the commission, and to endeavor to work out or see if there can be worked out, in the public interest, a plan from which may be obtained the results expected to be secured under the requirements of the Transportation Act.

"This association, before the committees of Congress and elsewhere, has given expression to the many difficulties, practical and legal, surrounding the questions involved in these consolidations. During the progress of the legislation leading to the Transportation Act, the association contended that consolidations should be made permissive and not compulsory. The act does not attempt to enforce them.

"In pursuance of this work by the board, the cooperation of the executives of the railroads of the country has been asked, both in the supplying of data necessary to a comprehensive study of the subject and in the way of any suggestions in respect thereto. It has been made plain that such study and suggestions as the board may make will be available to any railroad they affect, and that before action is taken by the board, its conclusions or suggestions will first be submitted to the railroads concerned.

"It is not proposed to unduly hasten so important a work. Public hearings before the commission on plans of consolidations that are not based on the intensive study that is essential to insure their practicability and effectiveness will prove disturbing in an already disturbed railroad situation. The undersigned committee therefore hopes that the Interstate Commerce Commission before acting in the premises will afford full opportunity for the careful and extensive investigation which the board of economics and engineering has undertaken."

## Additional Sales of Equipment Trust Certificates

WASHINGTON, D. C.

THE DIRECTOR GENERAL of railroads announced on September 22 that he had, with the consent of the President, confirmed additional sales of railroad equipment trust certificates in the aggregate amount of \$30,298,500. These sales, as well as those previously announced, were made through Eugene Meyer, Jr., managing director of the War Finance Corporation. Total sales of railroad equipment securities announced by the director general to that date aggregated \$63,482,600, but additional sales have since been made without announcement.

As in previous sales, these securities, which bear interest at the rate of 6 per cent per annum, were sold at par and accrued interest. Subject to minor adjustment, the detail of the sales is as follows:

To Messrs. White, Weld & Co., and Blair & Co., the last eight maturities of the following issues and in the following amounts:

Atlantic Coast Line and Louisville & Nashville as lessees of Georgia Railroad.....	\$631,200
New York Central.....	7,292,800
Michigan Central.....	2,229,600
Chicago & Northwestern.....	5,319,200
Delaware & Hudson.....	2,123,200
Illinois Central.....	5,176,800
Cincinnati, New Orleans & Texas Pacific.....	510,400
Total.....	\$23,783,200

To Hornblower & Weeks the last eight maturities of the following issue:

Richmond, Fredericksburg & Potomac.....	\$524,800
---	-----------

To L. F. Rothschild & Co., the last eight maturities of the following issue:

Buffalo, Rochester & Pittsburgh.....	\$534,400
--------------------------------------	-----------

To Freeman & Co., the last eight maturities of the following issues and in the following amounts:

Buffalo, Rochester & Pittsburgh.....	\$534,400
Kansas City Terminal.....	100,000
Terminal Railroad Association of St. Louis.....	182,400
Total.....	\$816,800

To White, Weld & Co., the 1928 and 1929 maturities of the following:

Pittsburgh & Lake Erie.....	\$77,600
-----------------------------	----------

To White, Weld & Co., the last eight maturities of the following issue:

Nashville, Chattanooga & St. Louis.....	\$692,000
---	-----------

To Salomon Brothers & Hutzler, the first six maturities, that is, January 15, 1922, to January 15, 1927, both inclusive, of the following issues:

Central Railroad of New Jersey.....	\$1,186,500
Atchison, Topeka & Santa Fe.....	1,471,200
Chicago, Burlington & Quincy.....	1,211,700
Total.....	\$3,869,500

The sale of \$5,479,500, announced September 20, including issues of Atchison, Topeka & Santa Fe, Norfolk & Western, Chicago, Burlington & Quincy, Central of New Jersey and Pittsburgh & Lake Erie, represents parts of the first six maturities—that is, January 15, 1922, to January 15, 1927, both inclusive—and was made to White, Weld & Co.

Including these sales and the one to Salomon Brothers & Hutzler announced above, the director general has sold the entire amounts held by him of the equipment trust issues of the Central of New Jersey, Atchison, Topeka & Santa Fe, Chicago, Burlington & Quincy, and Pittsburgh & Lake Erie.

In addition a banking syndicate has offered publicly \$31,154,000 of Pennsylvania equipment trusts, the sale of which was not announced in Washington.

The unexpected degree of success experienced by the War Finance Corporation in disposing of equipment trust certificates held by the Railroad Administration, of which over \$94,000,000 have now been sold, is not influencing the administration to relax its efforts to put through Congress the so-called railroad "funding" bill, which would authorize the War Finance Corporation to purchase itself railroad securities held by or to be acquired by the Railroad Administration. The bill has already been delayed by the Congressional recess since its passage by the House, and the Senate, on reconvening last week, showed a disposition to give its attention first to the taxation bill and the treaties before considering the railroad bill.

The President, however, has made it known that he intends to urge speedy action on the bill, and while there is a considerable element of opposition to the bill in the Senate, the influence of the administration is counted on to insure its passage. The opposition is not confined to Democratic senators, but includes some Republicans, who are inclined to be afraid of the bill either because they consider it in the nature of some kind of charity to the railroads or because of fear that it will be so regarded by a large proportion of the public that does not understand it.

Chairman Cummins of the Senate Committee on Interstate Commerce has announced his intention of pressing the bill as soon as the Senate has disposed of the pending tax bill and treaties. The Senator objects very strenuously to the popular characterization of the bill as a "funding" bill, saying that the funding of the railroad indebtedness to the Railroad Administration was provided for in the Transportation Act and that the funding question is no longer at issue. The sole purpose of the bill is to enable the government to realize cash on the railroad securities which have been and are to be given as evidence of the railroad indebtedness so that the funds with which to pay the admitted indebtedness of the government to the railroads may be placed at the disposal of the Railroad Administration without an appropriation. The Senator believes that a great deal of unnecessary prejudice against the legislation has been aroused

by the use of a term which seems to bring the funding question into issue at this time.

If the War Finance Corporation were authorized, as the bill proposes, to purchase these securities from the Railroad Administration at par, it would provide the Railroad Administration with cash at once and it would merely carry the securities itself until it could market them in the way it is now marketing the equipment trust certificates as the agent of the Railroad Administration. Senator Cummins expressed the opinion that if the War Finance Corporation continues to be successful in its sale of the equipment securities it probably would not be necessary for it to use the full authority proposed to be conferred by the bill, which would allow it to purchase not exceeding \$500,000,000 of the railroad securities. If the entire \$300,000,000 of equipment trusts should be sold only approximately \$100,000,000 might be needed by the Railroad Administration, which still has some funds on hand.

Following Senator Cummins' return, conferences were held among the Republican senators for the purpose of making plans for the consideration of the railroad bill and there was some discussion as to the advisability of reducing the amount of the authorization to the War Finance Corporation in view of the sale of the certificates. Senator Cummins planned to confer with Director General Davis of the Railroad Administration for the purpose of getting the latest figures of the situation.

## Unemployment Conference

WASHINGTON, D. C.

THE UNEMPLOYMENT conference called by President Harding to inquire into the volume and distribution of unemployment and to consider measures that would tend to recovery of business convened at Washington on September 26. After listening to addresses by the President and by Secretary Hoover of the Department of Commerce, the conference organized by appointing nine sub-committees on various phases of the subject: Unemployment statistics; employment agencies and registration; emergency state and municipal measures and public works; emergency measures by manufacturers; emergency measures in transportation; emergency measures in construction; emergency measures in mining; emergency measures in shipping, and public hearings. Following the appointment of the committees, the conference itself adjourned to October 5, by which time the specialized committees are expected to report.

The committee on emergency measures in transportation consists of W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen; Edgar E. Clark, formerly chairman of the Interstate Commerce Commission; C. H. Markham, president of the Illinois Central; Charles P. Neill, manager of the Bureau of Information of the Southeastern Railways; Julius H. Parmelee, director of the Bureau of Railway Economics; Raymond A. Pearson, president, Iowa State College of Agriculture; D. R. Dewey, professor of economics at the Massachusetts Institute of Technology, and Clyde L. King, professor of political science at the University of Pennsylvania. Mr. Neill was appointed executive secretary and Mr. Clark was elected chairman of the committee.

The conference consists of 51 members, principally men of experience in the industries where there is the largest degree of unemployment. In addition to the list as made public last week, some additional names of those whose acceptances were received later have been added, including A. L. Humphrey, president of the Westinghouse Air Brake Company. Other industries which are involved in the railroad problem because the railroads are ordinarily large purchasers of their products are represented by several execu-

tives of steel, lumber and coal companies. Mr. Humphrey was appointed a member of the committee on emergency measures by manufacturers, which also includes James A. Campbell, president of the Youngstown Sheet & Tube Company, and Charles M. Schwab, chairman of the Bethlehem Steel Company. C. H. Markham, president of the Illinois Central, was also appointed a member of the committee on unemployment statistics.

The various committees at once went into executive sessions and were also expected to take part later in a series of public hearings. The initial efforts of the conference are being directed to meeting the emergency needs of the unemployment situation. Simultaneously with this an exhaustive study will be made to bring out the exact facts concerning unemployment. Estimates of the number of unemployed vary from 3,000,000 to 5,500,000 and it is felt that reliable data as to the extent of the agricultural distribution and industrial distribution is imperative before relief measures can be put into effect. Each committee is particularly equipped to handle the subject assigned to it and is small enough to operate with speed. Each of the committees will originate, study and recommend practical measures for meeting the emergency. After the emergency measures and the collection of statistics are completed, the conference will be re-grouped into committees whose function will be to recommend permanent measures by which unemployment can be held at a minimum.

Public hearings were to be held every day for the first week, while the work of the specialized committees is progressing. The first public hearing was held on Tuesday morning on the statistics of unemployment. This was to be followed by hearings on Wednesday on public employment service, on Thursday on public works, and on Friday on civic relief agencies. The hearing on transportation was expected to be held early next week. Secretary Hoover of the Department of Commerce and Secretary Davis of the Department of Labor are ex-officio members of all the committees.

In his address to the conference, President Harding called attention to the fact that the conference was called to consider a condition which is in no wise peculiar to the United States and that the industrial depression is a war inheritance throughout the world. He said he would have little enthusiasm for any proposed relief which seeks either palliation or tonic from the public treasury; that the excess of stimulation from that source is to be reckoned a source of trouble rather than a source of cure.

Secretary Hoover, in his opening address, said there can be no question that we are on the upgrade, but economic progress cannot under any expectation come with sufficient rapidity to prevent much unemployment during the forthcoming winter. It is the duty of the conference to find definite and organized remedy for this emergency and he hoped also that it might be able to outline for public consideration such plans as will in the long view tend to mitigate its recurrence. The remedies for these matters, he said, must in the largest degree lie outside of the range of legislation and the administration has felt that a large degree of solution could be expected through the mobilization of the co-operative action of manufacturers and employees of public bodies and local authorities.

While none of the committees has reported as yet, it is understood that the transportation committee, among other things, has given consideration to the improvement that might result from the expedition of the settlement of the accounts between the railroads and the Railroad Administration, which would give the railroads additional credit and funds with which to prosecute maintenance work and that the same subject was also discussed by the committee of manufacturers. This committee also has discussed the question of reductions of railroad rates and wages.

# Expressing Railway Grading Costs by Trend Curves

Texas and Louisiana Engineers Favor Practice Similar to That of New England Roads

By Leslie A. von Rosenberg  
Fort Worth, Tex.

IN THE *Railway Age* of January 14, there appeared an article under the title "Analysis of Railroad Grading Develops Trend Curves," describing the method developed by the New England carriers for fixing the cost of grading when establishing a basis for government valuation. This article showed eight railroads to have adopted a system of weighed

averages and graphical analyses of unit costs as the solution of a somewhat intricate problem. This system of valuation was also employed by the Texas, also Oklahoma and Arkansas and Louisiana engineers, and in the belief that the description of such a system may well be supplemented by an account of its application in a different type of country, the following information is furnished regarding the work in Texas.

The method of arriving at these costs was as follows: It was primarily assumed that all material in the work was distributed uniformly within the limits of haul prescribed in the contract. If then the limit of haul for a certain job was 1,000 ft., it was assumed that the material hauled beyond the established 500 ft. limit would constitute one-half the total yardage in the job. Furthermore, being equally distributed over a distance of 500 ft., the average distance over which all the material in this section was hauled beyond

Chart of Trend Curves for Western Texas

averages and graphical analyses of unit costs as the solution of a somewhat intricate problem. This system of valuation was also employed by the Texas, also Oklahoma and Arkansas and Louisiana engineers, and in the belief that the description of such a system may well be supplemented by an account of its application in a different type of country, the following information is furnished regarding the work in Texas.

In analyzing the Texas situation studies were made of the grading done from a date as early as 1872 to 1918. In this period, as might be expected, many separate jobs, well distributed over the state, were undertaken. The sketch map, showing as it does the exact location of each project included in the computations, gives an idea of the extent of this work and its distribution, both for the entire period and for any one year, each job shown on the map being numbered to correspond with the numbers in the table and having its extent represented by a line.

A table was made in which the several jobs entering into the work were grouped according to the year in which they were undertaken. In this table, a portion of which constitutes one of the illustrations, were recorded among other things, the name of the road, the location of the work and the index number of each individual job. In preparing the data for the various trend curves, the total amount of earth, loose rock and solid rock work was determined for each job and, for the purposes of uniformity, the costs of these items

Chart of Trend Curves for Eastern Texas

the standard 500 ft. would be 250 ft. This 250 ft. is considered as overhaul and by referring to the following table, it is found that the contract price of the work done on a free haul basis of 1,000 ft. should be reduced by 14 cents per yard to give the probable cost of the work on the basis of 500 ft. The table is that used by the Western Valuation Group Cost Data committee.

1,000 ft.	add to base price	\$0.25
500 ft.		\$0.15
300 ft.		\$0.10
200 ft.		\$0.05
100 ft.		\$0.05
0 ft.	subtract from base price	\$0.00
1,000 ft.		\$0.25

Having adjusted all the costs to a uniform basis of 500 ft. average unit price for each year's work may then be determined

A typical calculation will show how this work is done. Referring to the larger table shown it will be seen that three jobs are listed for the year 1905, the work in all three cases being earth excavation. The weighed average of the unit price on this work is determined as follows:

Job	Quantity Cu. Yd.	Price	Amount
33 .....	45,647	\$0.180	\$8,160.56
34 .....	66,069	0.201	13,279.87
125 .....	1,115,969	0.140	156,235.66
	1,227,685		\$178,126.09

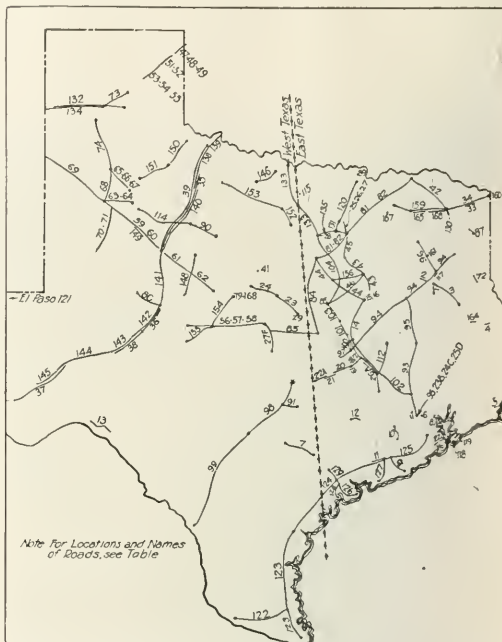

Dividing \$178,126.09 by 1,227,685 gives \$0.145 which is the weighed average price for the year 1905. The relation of this average price to the several unit prices may be seen readily by comparing it with the recorded prices for each job. In the example in question, it will be seen that the weighed average price for 1905 is but slightly different than the contract price for job No. 125, owing to the fact that this work was much larger than the other two undertaken that year. For the same reason, the value is much different than the average contract price for the year, the latter value being \$0.1736.

These weighed average values for the several years when plotted in a graph form give curves represented by the light dotted lines in the charts in which the black dots represent the years in which a weighed average value could be determined. Owing to the fact that prices for grading in west Texas were somewhat lower than for east Texas (probably due to the price of labor), a separate analysis was made for each part, hence the two sets of charts.

The second broken line on the graphs shows weighed average prices determined for a five-year period. These values were obtained by finding the weighed average price for each successive five years in a manner similar to that of determining the weighed average price for any one year, the price found being recorded as the price for the third year of the five years in question. For example, the five-year period price for 1905 is obtained by finding the weighed average price of the work done in 1903, 1904, 1905, 1906 and 1907, as follows:

Year	Quantity Cu. Yd.	Price	Amount
1903 .....	560,210	\$0.181	\$101,657.01
1904 .....	2,447,697	0.150	367,154.55
1905 .....	1,227,685	0.145	177,676.09
1906 .....	50,597	0.185	9,382.99
1907 .....	218,941	0.181	40,249.38
	4,505,130		\$696,120.02

Dividing \$696,120.02 by 4,505,130 gives \$0.1545 or \$0.155 as the average price per cubic yard for these years. The next five-year period obviously will be 1904, 1905, 1906, 1907 and 1908, and by the same method the average price

Map of Texas Showing Jobs Represented in Trend Curves

is obtained and recorded for the year 1906. Plotting these prices in graph form gives a curve which shows a more gradual trend of prices than that of weighted average prices determined for each year. Obviously, this is due to the fact that large jobs have less effect in influencing the final

#### WEIGHED AVERAGE OF CONTRACT GRADING COSTS IN TEXAS

Classification	One-way			Two-way		
	Cu. Yd.	Total Cost	Weighted Av. Unit Cost	Cu. Yd.	Total Cost	Weighted Av. Unit Cost

166	1909	S. L. & S. W.	Hubbard.	6,338	170	1,077.46						
1	1909	T. & N. O.	Gallatin-Rusk.	407,395	195	79,441.03	3,337	456	1,521.67	955	756	721.98
126	1909	S. L. B. & M.	Bloomington-Pt. Conner.	175,515	160	28,082.40						
127	1910	S. L. B. & M.	Buckeye-College Port.	101,095	160	16,175.20						
45	1911	S. T. Co.	Dallas-Waxahachie.	223,205	130	39,577.92						
89	1911	M. K. & T.	Denison.	89,443	320	28,621.76				6,210	850	5,278.50
19	1912	H. & T. C.	Caldwell.	86,388	480	41,562.24						
81	1912	M. K. & T.	Vaco-Hewitt.	67,010	350	23,453.50	876	500	438.00	4,972	950	4,723.40
128	1912	S. L. B. & M.	Hwyer-Austwell.	185,727	170	21,573.59						
129	1912	S. L. B. & M.	Bloomington-Victoria.	206,965	170	35,184.05						

results. With these two graphs or curves plotted on the same graph a line may then be drawn to represent the general trend of prices over the several years. The unbroken line on each chart represents this curve.

This work forms the basis of study of present interest to valuation engineers. From the curves themselves one could study and reason out why they develop a trend as they do and how such factors as labor, war, introduction of machinery, topography, geology, etc., affect grading prices. Furthermore, the system provides a basis for letting all contract

work. In the latter respect, the accompanying table on the weighed average prices for contract grading in Texas may be of interest, this table being based upon grading work all over the state and giving the weighed averages for both the one and two-way bases of pay for the several kinds of material. This table, together with the other data presented, was compiled from information prepared by the valuation engineers of Texas and Louisiana, the Cost Data Committee of the Western Valuation section and the Texas & Pacific railway.

## European Railroad Problems Similar to Ours

Samuel M. Felton Tells of Transportation Conditions Abroad and the Remedies Being Tried

**S**AMUEL M. FELTON, president of the Chicago Great Western, who recently returned from a two-months' trip through Europe, states that "the railway situation abroad is very much the same as in this country and the same remedies in a way are being applied for the relief of the roads."

Some interesting observations are made by Mr. Felton in the following statement regarding conditions in the various European countries which he visited:

In Great Britain the lines have just been returned to their owners, under an act of Parliament which provides that the railways shall be divided into four groups for the purpose of securing more efficient operation and greater economy. In this connection, Parliament has provided the sum of 60,000,000 pounds to be paid the railways in full satisfaction of all the claims which arise out of their operation during the war by the government. Of this amount, 25,000,000 pounds are to be distributed generally in proportion to the net receipts of the companies during the year 1913 and 25,000,000 pounds are to be distributed among the companies who, on December 31, 1920, were behind in their maintenance. This amount is to be ascertained according to an agreement to be made between the government and the carriers. The remaining 10,000,000 pounds are to be distributed to those roads which suffered abnormally from government operation.

A tribunal consisting of three members, a railroad man, a business man and a lawyer, is provided for handling rates. Their duties are somewhat similar to the duties of our Interstate Commerce Commission. It is interesting to note that Great Britain is giving its 23,691 miles of railway 60,000,000 pounds, which, at the normal rate of exchange is the equivalent of \$291,000,000 or at the rate of \$12,283 per mile. With our 239,009 miles of railways we are struggling hard to collect claims during federal control and so far 50,500 miles have been allowed but \$1,350 per mile. The only help we may get from the government is a loan, now proposed, of \$500,000,000 on account of the additions and betterments put on the properties during the war by the government, very largely to take care of war conditions—work that certainly would never have been undertaken by the railroads unless they were well able to finance it, which of course was not the case during the war and has not been since.

### French Railroads Try New Plan

In France a contract has been entered into between the minister of public works and the railroads, wherein it is agreed that the operation of each of the lines will be subject to a common organization destined to insure the co-ordination of operation of the various railroads in accordance with the general interests of the nation. This organization is to consist of a high commissioner of railways and a board of

directors. Aside from this, each line maintains its interior organization and its own methods of operation. The board is obliged to assume questions of interest representing each line in matters relating to technique, commerce, administration and financing; also such other questions of importance as may come up. It passes on questions concerning working rules, rates of pay and pensions; it is supposed to stabilize the financial condition of the railroads. A provision is made in the contract for payment of premiums to the carriers which show improved results both in traffic and operation. England's plan seems to be the best and the most liberal. That of the French is very complicated but they have the same object in view.

Taking the countries separately. The French railways apparently are in about the condition they were at the end of the war, excepting the lines that were damaged and had to be reconstructed. In that case the work of reconstruction has been very thoroughly done and in a most permanent manner and to that extent those roads in the north are in better condition. The equipment evidently requires extensive repairs but with the present business depression there seems to be sufficient equipment and facilities to take care of the business offered.

It was quite interesting to find that the locomotives and cars built by the United States for the American Expeditionary Force and sent to France are giving excellent satisfaction and are being used freely; also that the largest railroad in France has decided to adopt the American system of train dispatching.

### German Railroads In Good Condition

As to the railways in Germany. They are in better condition than those of France or Belgium and apparently in as good condition as those of England. Their rolling stock has been thoroughly overhauled and their tracks have been put in good condition. The wear and tear of the war has been taken care of and the roads are in shape to handle any amount of traffic that may be offered. Their freight business is reported to be only 15 per cent less than in pre-war times and passenger business but 35 per cent less. The deficit of the German railways in the last fiscal year was approximately 15,000,000,000 paper marks but 11,000,000,000 of this amount covered expenditures for deferred maintenance which of course is the result of war conditions, so that the actual deficit, based on normal conditions, would be about 4,000,000,000 paper marks.

The railroads of France, England and Belgium are all suffering under very high wage scales and very high costs of material, especially coal. In Germany the wages, while high in marks, are low in their equivalent in dollars, the result

being that as far as their wage scale contributes to the output of their industries they have a very decided advantage over France, England and the United States.

### Motor Transport Presents Problem In England

In England the railroads are in excellent condition but like all other roads on the Continent are suffering from a lack of business and in addition, they have a permanent interference with their traffic that will be hard to regulate. I refer to the motor truck and motor bus business. As an illustration, I understand that the cotton which formerly moved from Liverpool to the mills at Manchester by rail is now all going by motor trucks and the finished product is being handled back in the same manner. I saw a great deal of motor truck transportation on the highways and even in London, where steam trailers move over the most crowded streets with two and three trailers behind them, hauling freight through the city. The diversion of short-haul traffic from the railways to the highways is much more serious to them than it would be in this country, where our profitable traffic is long-haul business.

### Rate Problem Common to All Countries

One hardly picks up a paper in this country without finding a reference to the high freight rates. Everybody is clamoring for a reduction in freight rates when the railroads are not earning anything like the amount they are entitled to earn under the provisions of the Transportation Act. People think that a reduction in freight rates will stimulate business very much but do not seem to realize that we are confronting a condition that is world-wide; that we cannot hope for any permanent revival until the European situation is adjusted. Freight rates, in some cases, are out of line, owing to the horizontal advances during the war and since and these inequalities, where they affect the movement of traffic, are being adjusted but beyond that the railroads in this country cannot go without bankruptcy.

Before the war freight rates in Europe were very much higher than in this country. The present freight rates in England show an advance of 112 per cent over those of the pre-war period; in France 140 per cent; in Germany 600 per cent; in Belgium 100 per cent; in Switzerland 111 per cent; in Norway 186 per cent and in Sweden 170 per cent while, with all the advances made in this country by the Railroad Administration and the Interstate Commerce Commission, since the Transportation Act was passed, our rates have only increased from 80 per cent to 85 per cent. France, England, Germany, Belgium and all the other European countries are struggling with the same problem and are unable to make any substantial reduction in their rates on account of their very high wage scales and material costs.

If we could get our costs of labor and material down to pre-war times there would be no trouble about reducing rates but first the cost of living must come down so that the employees will be able to live as well as they do now on a lower wage scale. This means a readjustment of everything to pre-war times and that is not possible of accomplishment in this country until the foreign situation is cleared up and world conditions are restored, so that it is fair to presume no immediate general reduction in rates will be practicable or possible without bankrupting a large number of our railroads.

---

THE COLOSSAL IGNORANCE of the British public with regard to the Latin American republics is astonishing. In spite of the amount of British investments there—well over one thousand million sterling—and the attention given to these countries during the past three years by almost the entire press of this country, one hears daily of facts proving a general want of knowledge of what the Latin American countries really are.—*British and Latin American Trade Gazette.*

## Freight Car Loading

WASHINGTON, D. C.

**D**URING THE WEEK ended September 17, 853,762 cars were loaded with revenue freight on the railroads of the United States, according to the reports received from the carriers by the Car Service Division of the American Railway Association. This is the largest number loaded during any one week since the week of December 4, 1920. The total for the week was 105,644 cars greater than that for the previous week when, however, the observance of Labor Day resulted in a falling off in traffic. It was, however, 137,404 cars less than were loaded during the corresponding period last year and 141,229 less than during the corresponding period in 1919.

Increases in the loading of all commodities over the week before were reported but in making comparisons, consideration must be given to the fact that the week of September 17 contained six full working days while there was a holiday during the preceding week. Grain and grain products was the only commodity which showed an increase over the corresponding week last year.

Loading of merchandise and miscellaneous freight, which includes manufactured products, amounted to 522,434 cars, while there was an increase, compared with the previous short week, of 24,009 cars for coal, bringing the total for that commodity to 166,058 cars. This was, however, 30,045 cars below the total for the corresponding week last year and 37,400 under that for the corresponding week in 1919.

A total of 30,399 cars were loaded with live stock during the week, an increase of 5,291 over the five-day week before; and forest products totaled 46,472 cars, or an increase of 4,327 cars over the preceding week. Grain and grain products amounted to 55,331 cars, an increase of 874 cars compared with the week of September 10 but an increase of 9,051 cars over the corresponding week in 1920 and 5,861 cars more than were loaded during the same week in 1919.

Coke loadings increased 254 cars to a total of 4,853 cars while an increase of 583 cars or a total of 28,215 was reported for ore.

Compared by districts, increases compared with the week before were reported in all regions but decreases, compared with the corresponding week in 1920.

The reports to the Car Service Division also show a decrease, compared with the week before, in the number of idle freight cars. The total on September 15 was 433,536 or 17,267 cars less than were reported the week before. Of the total, 213,545 were freight cars idle because of the need of repairs while the remaining 219,991 were surplus freight cars which could be placed in immediate service if transportation demands warranted.

There was a decrease in approximately a week of 17,981 in the number of freight cars in good order but an increase in 15 days of 714 in the number of unserviceable cars.

Surplus box cars in good repair on September 15 totaled 62,372 or 3,486 less than were reported the week before, while surplus coal cars totaled 118,514, or a decrease within a week of 11,317 cars. There was also a decrease within the same period of 822 in the number of idle stock cars.

Of the 2,298,383 freight cars on line reports received by the Car Service Division showed 374,431 or 16.3 per cent in need of repairs on September 15, compared with 374,087 or 16.2 per cent at the beginning of the month. In computing the number of cars needing repairs but idle due to business conditions an allowance of 7 per cent is made to represent the number regarded as normally out of service because of their condition.

---

THE HOTELS of the Canadian Pacific have reduced the prices on their bills of fare 16 per cent, and on some items as much as 20 per cent, according to the statement of an officer of the road, at Vancouver, last week.

# The Field for Gasoline Railway Motor Cars

## Lessons to Be Learned from Earlier Cars—Practical Limitations for Successful Designs

By L. C. Josephs, Jr.

International Motor Company, Allentown, Pa.

WITH THE GENERAL POLICY of retrenchment in all railroad managements, the branch line and short line have been receiving lately a large amount of attention. These lines usually show a deficit at the end of the year's operation and it has even been recommended that in many cases the tracks be torn up and improved motor truck highways provided in their place.\*

The branch lines of many railroads, however, while showing a deficit for actual operation, have considerable value to the parent system as business collectors, and stations and other facilities now in existence might be made to show a profit if a cheaper means could be furnished to handle the traffic, which is of small density. A 60 or 70-ft. passenger coach or a standard box car are too large units to handle the available traffic on many of these lines. In many cases, also, the branch line service, because it did not pay, has been allowed to run down and for this reason the motor bus and motor truck have been able to step in and take away almost the entire business.

A motor bus or a motor truck adapted to operation on rails is in a preferred position as compared to similar vehicles operating on the highway, from the point of view of reduced friction and therefore a greater tonnage haul with the same horsepower as well as from the point of view of reduced maintenance because of the smoother riding on the steel rails.

The question of self-propelled motor cars for branch line service is by no means new. Many types of cars have been tried such as steam, compressed air, storage battery, gasoline and oil engine, driven both with mechanical and electrical transmission. The earliest car developed was a steam car in 1847 in England. Compressed air cars were tried in 1879 and storage battery cars in 1891. The idea of a gasoline engine driven car came simultaneously with the earliest development of the automobile. In developing the gasoline railroad car there has been a large amount of work done both in the United States and in Europe. European development has been generally successful, while the development in the United States has led to many failures.

### Causes of Past Failures

It is proposed to go over some of the causes of past failures of self-propelled motor cars in this country so that we may not fall into the same mistakes in considering the possibilities of these cars today. Briefly, steam motor cars have never succeeded in the past because they had nothing to offer in the way of advantages, over an ordinary steam locomotive. Two men were required for the head end and there were all the objectionable features, preparation time, round house care, etc., which makes the branch line operation so expensive. Compressed air and storage battery cars both failed on railroads for identical reasons, namely, limited radius of operation and inefficient transmission of power.

The gasoline cars produced in this country were of two types, mechanical drive and electrical drive and their failure to come into general use was due to two reasons: first—a failure on the part of manufacturers to size up the economics of the situation correctly; and second—inherent weaknesses in design.

The failure to take account of the economics of the situa-

tion were responsible for the rejection of most of the cars produced between 1910 and 1913 when a number of manufacturers were going into this field.

At this time it costs 60 or 70 cents a train mile to operate the ordinary steam two-car branch line train, which now costs from \$1.50 to \$2.50 a train mile. Many of these branch lines only operate a two-car train because it is necessary to provide baggage and mail space as well as passenger space and the locomotive is able to handle two cars as easily as one, and by law a full crew had to be provided anyway. The business offered, however, in many cases could be packed away in one-half of one car. Some of the motor car manufacturers, however, did not see the true situation and tried to put out a unit which could handle as much as the standard two-car train. This was the first economic mistake, because if there is enough business to fill a standard two-car train, steam operation can be made to pay. The second economic mistake was in misjudging the gasoline engine as a prime mover. The gasoline engine has been distinctly the ideal prime mover of small applications of power but has never succeeded in breaking into the field above say 100 horsepower when economic operation has been the important consideration. The only cases where gasoline motors of larger than 100 horsepower are operating in general use are for airplanes and private yachts in both of which cases the cost of operation is not a prime consideration. Four of the manufacturers of motor cars in this country in the period referred to started out with engines of around 200 horsepower. Engines of this size were expensive, very heavy and ran into many problems in operation and maintenance that do not occur in gasoline engines of small size. Moreover, the size of these engines made the transmission of power a difficult problem which, if handled mechanically, was a continuous source of trouble, or, if handled electrically, added tremendously to the cost and weight of the outfit, thus producing a vicious circle of weight, power and cost.

Manufacturers of motor cars at this period were not alone responsible for these mistakes, as the railroad officers themselves urged them to build motor cars of this type. The idea of furnishing Pullman service on a branch line was very alluring and was the chief cause of specifications calling for cars which would be 60 or 70 ft. long, weighing 50 or 60 tons, of all steel construction and capable of making 60 miles an hour, as well as having every modern convenience in the car body.

There were at this time many manufacturers of smaller motor cars who had probably the right idea as to the economics of the situation but who through faulty design or lack of capital failed to get started. Every now and then in traveling around the country one comes across one of these small cars. In fact, last fall one of them figured in the newspaper dispatches in connection with President-elect Harding's isolation at Point Isabel, Texas.

### Limitations of a Successful Motor Car

The proposition today is to go ahead with the simple idea of taking the motor truck and motor bus which are now successfully operating on the highway and transferring these bodily to the railroad tracks and securing the economies attendant to such a transfer. Of course in making this trans-

\*C. A. Morse, Chief Engineer, C. R. I. & P., A. S. M. E. Annual Meeting, 1920.

fer it is necessary to make certain changes in design but these should be kept down to absolute essentials and the equipment must not be loaded up with features which may be required in standard railroad operation, but which have nothing to do with the operation of the motor car equipment.

In making a successful transfer of the motor truck from the highway to the railroad, the first essential is that the truck must have been a successful performer when used on the highway. Highway service as a rule is more severe than railroad service so far as shocks to parts and general wear and tear on the chassis, but the differences are not great between the two services and for this reason the truck which has not been successful on the highway is pretty certain to be unsuccessful as a railroad vehicle. The second essential to be considered in making the change is the matter of weight. A motor truck or a bus operating on the highway has a rolling friction of from 50 to 75 lb. per ton. It is known from tests that the friction of small vehicles on rails may run from 20 to 30 lb. per ton. This reduction in car friction means that the load can be somewhat increased over the load carried on the highway, but this amount of increase cannot be great. The steam locomotive because of storage of energy in its boiler is able to produce a short-time output much greater than its continuous rating. The same is true of the electric motor on a trolley car with the powerhouse back of it. This means that in these two cases the entire power can be drawn upon for a short time in acceleration or in climbing grades and that, therefore, the continuous rating is no measure of the tonnage that can be handled. The gasoline motor, however, is a strictly limited power proposition and if more tons are loaded on the equipment the speed will be correspondingly reduced.

The writer went into this matter in some detail in a paper before the Association of Railway Electrical Engineers in 1913, at which time it was brought out that in self-propelled cars about 2.3 h.p. should be provided for each ton of weight on the basis of ordinary gas engine rating, or if the gas engine were rated on its maximum output about 3.3 h.p. should be provided for each ton to be handled.

Consider for a moment what this means in a particular instance. The Mack Model AC motor truck engine, which is the largest truck engine on the market, rates at 40 h.p. (N. A. C. C. rating) and has shown from 50 to 60 h.p. on brake test. From the figures in the foregoing paragraph a motor of this size is capable of handling from 15 to 17 tons load.

A rail car of 15 tons weight equipped with such an engine and running in service which requires a stop every  $\frac{1}{2}$  mile of 20 seconds' duration would make a schedule speed of 21 miles an hour. Without changing any other conditions if the weight were increased to 45 tons the schedule speed would be reduced to 8 miles an hour. If, on the other hand, the 15-ton car were operated on a 2 per cent grade its schedule speed would be 11 miles an hour and if increased to 45 tons the speed would be 3 miles an hour.

The foregoing illustrates clearly the limitations of the railway motor car. In the first place no economical gasoline engine has been built in quantities in sizes larger than 100 h.p. In the second place it would not be advisable to develop a railway motor car of larger power than the largest commercial highway truck, for the reason that the design of the successful commercial highway truck incorporated years of experience, which is the reason for its success. This much would be lacking if a specially built railway vehicle were developed. If, therefore, the railway motor car is to be a success it should be limited to the 15 or 20 tons that can be handled with the existing truck motors and transmissions. The question that the railway man will then ask is "What can be done with 15 tons total weight of vehicle in meeting branch line conditions?"

It has been found possible in motor construction by the

use of the best practice, design and materials to make a freight carrying vehicle in which the weight of the chassis and body is about equal to the load carried. This would mean a railway motor car for freight service could probably be built that would carry a total load of 15,000 to 20,000 lb. For passenger carrying vehicles the weight of chassis and body would not be quite so low and it would probably be necessary to figure on somewhere in the neighborhood of 200 lb. per seat, or say a vehicle carrying a total of 85 passengers.

It is hoped that the foregoing thoughts on this subject, which is very much alive at the present time, will prevent some of us from falling into the same mistakes which have been made in the past in expecting to do too much with the gasoline engine, when applied to railway motor cars.

## Railroad Inquiry to Be Resumed

WASHINGTON, D. C.

CHAIRMAN CUMMINS of the Senate Committee on Interstate Commerce returned to Washington from Iowa this week and announced his intention of resuming hearings at an early date in the general railroad inquiry, which was suspended early in July because of the Senator's ill-health, the hot weather and because a number of the witnesses expected were not ready to proceed. There have been some rumors that the hearings would not be resumed, but they have probably emanated from some of those whose attitude toward the entire proceeding has been critical and who have liked to have it appear that the committee would drop the subject after hearing only the representatives of the railroads and the railroad security-holders. This class of critics prefers to couple the railroad executives and the Warfield organization as if they represented identical interests, overlooking the fact that Mr. Warfield's presentation before the committee was exceedingly critical of the executives.

The witnesses to be heard when the hearings are resumed will include the railroad labor leaders, who had asked that their hearing be postponed because they were engaged in conferences and in hearings before the Labor Board in Chicago, and also representatives of the shippers.

Senator Cummins expressed the opinion that the railroad situation had considerably improved as compared with the condition which existed when the hearings were adjourned but said that there is a tremendous demand throughout the country for a reduction in freight rates. He said he realized that the roads had already made many reductions in rates and also that they cannot live without adequate revenues, but he thought there should be a more general reduction. He said he had advised both the railroad officers and the Interstate Commerce Commission that a general reduction in rates would have an important psychological effect and that it ought to be tried for the purpose of finding out what the effect on revenues would be. He doubted whether further reductions in wages could be relied upon to assist the roads in reducing rates until there has been a more manifest reduction in the cost of living.

Discussing the suggestions that have been made both in and out of Congress that the Railroad Labor Board ought to be abolished Senator Cummins said that the creation of the board had been an experiment and that if the experiment does not result successfully it may be necessary to repeal that part of the law, but that possibly the object can be accomplished by providing some means for enforcing the board's decisions. He added, however, that the opinion is strongly held in some quarters that there is a way to enforce the board's orders by the injunction process. If both the railroads and the labor organizations refuse to abide by the decisions of the board, he said, either the board will be abolished or some means will be found to strengthen it. He

expressed no opinion as to the merits of the controversies before the board but said he thought it exceedingly unfortunate that the Pennsylvania management should have decided not to obey it and he recalled that in the Senate railroad bill the provisions intended to prevent strikes carried penalties that might be imposed against either side.

Senator Cummins said that the Transportation Act had two main purposes, one to improve the credit of the railroads and the other to prevent interruption of transportation service resulting from labor controversies. While the first part of the act had not worked out entirely as expected, he said, no law could have accomplished the purpose during such times as we have experienced recently, and without the law many railroads would have been thrown into bankruptcy.

In view of the special consideration given the railroads, he said, they could hardly expect to have the same freedom to manage their own affairs in their relations with labor that is enjoyed by other industries.

## Safety Section of A. R. A.

### Holds First Meeting

By William S. Wollner

**A**S HERETOFORE announced, the American Railway Association now has a Safety Section in the Operating Division, with a temporary Committee of Direction. The temporary officers were: Chairman, E. M. Switzer (C., B. & Q.); first vice-chairman, J. T. Broderick (B. & O.); second vice-chairman, Isaiah Hale (A., T. & S. F.); secretary, J. C. Caviston, 30 Vesey street, New York. The section held its first meeting on Monday of this week, at the Hotel Copley-Plaza, Boston. Ninety-five representatives of 85 roads registered attendance. Chairman Switzer explained the reason for the organization of the Section and the plans for its future. President R. H. Aishton of the American Railway Association also addressed the meeting. It is not intended to make the recommendations of the Section mandatory upon the members of the association but rather to provide a means for exchanging information. The Safety Section is to co-operate with the Interstate Commerce Commission's Bureau of Safety in the compilation of accident statistics so as to afford a better basis for comparing the records of different roads than is possible at present. Reduction of accidents at grade crossings and to trespassers through correlation of the educational efforts of individual roads, and a national campaign with this end in view are proposed. Mr. Aishton urged co-operation with the National Safety Council, local councils, and all organizations working toward greater safety to the public and those engaged in industry.

Professor W. J. Cunningham, of Harvard University, addressed the meeting, calling attention to the danger of placing too much stress on emotional appeals. These do not convert men. Gradual and continuous efforts for the correction of specific faults offer the greatest promise of success. Satisfactory results can only be secured when "safety" has become a state of mind.

In many cases there is too great an effort upon the part of safety officers to exalt organization and to lose sight of the fact that individual co-operation is the real test of success; that as in all scientifically directed effort ideas should be promulgated by indirection rather than as orders or instructions. The importance of safety devices should not be over emphasized. An appliance which eliminates one-half the risk may eliminate all of the care.

The report of the temporary Committee of Direction, in addition to presenting tentative regulations for the conduct

of business, suggested the following matters for consideration:

1. The question of providing for more or less summary discipline for violation of rules which prohibit the adjustment of draw-bars, couplers, steam or air hose, while cars are moving or coming together.

2. A recommendation, as standard practice, of proper end guards (rail and metal netting) on front of track motor cars.

3. A recommendation, as standard practice, of the use of auxiliary glass guards as adjuncts to metal housing of emery wheels.

4. A proposed rule making compulsory the wearing of goggles by shopmen doing work involving danger to the eyes.

5. Proposed use of whistles by track foremen for warning their men to clear all tracks when trains are approaching; the question whether the adoption of such a rule would have a tendency to increase the danger where the foreman is temporarily absent.

Subject 1 was discussed at length, many strong points being made both for and against the assessment of discipline for infractions of safety orders. It was decided to discuss the subject further at a future meeting.

On subject 2 the committee's view was approved, and was referred to the association's executive committee. The adoption of glass guards for emery wheels was referred back to the Committee of Direction.

On subject 4 a roll call was taken, resulting in 84 for, and 122 against the promulgation of a rule making wearing of goggles compulsory. It was the opinion of all who discussed the matter that while the wearing of goggles should certainly be insisted upon, that the means of accomplishing this should be left to individual roads. No action was taken on subject 5.

The report of the Committee on Publicity and Education was read by its chairman, Isaiah Hale (A. T. & S. F.). The committee proposes to establish a library of safety films, to compile publicity matter, and to prepare a standard form for the uniform reporting of accidents. It has in view the publication of bulletins, and of a plan for calling attention of school pupils to practical safety matters.

The report of the committee on prevention of grade crossing accidents of which J. T. Broderick (B. & O.) is chairman, took the form of a paper on "A National Stop, Look and Listen Campaign," by M. A. Dow (N. Y. C.), who is a member of the committee. Mr. Dow called attention to the difficulties encountered in endeavoring to reach the persons who ultimately become involved in automobile accidents at grade crossings. He sketched a plan showing how many of these difficulties might be overcome through co-operation of the A. R. A. Safety Section with automobile clubs, chambers of commerce, etc., together with the distribution of educational literature and the displaying of posters by all roads.

In the discussion Chairman Broderick proposed a national campaign such as had been outlined, and it was the unanimous opinion of those who spoke that not only could such a campaign be successfully conducted, but that its conduct should by all means be undertaken. The discussion of the subject was closed by the Section instructing the Grade Crossing Accident Committee to perfect its plans for a campaign and to place them in the hands of the Board of Direction for execution. The temporary officers and Committee of Direction were continued in office until the annual election in June, 1922, and G. G. Watkins, of the Boston & Maine, was elected an additional member of the Committee of Direction. C. L. La Fontaine (G. N.), R. Scott (A. C. L.), F. W. Mitchell (N. Y., N. H. & H.), L. F. Shedd (C. & R. I. & P.), and L. G. Bentley (C. & O.), were elected as the 1922 Nominating Committee.

## National Safety Council at Boston

By William S. Wollner

THE National Safety Council held its tenth annual congress at Boston, Mass., this week, beginning on Monday. The general business meeting was held on Monday morning, C. P. Colman, president of the National Safety Council, presiding.

The steam railroad section, T. H. Carrow (Penn.), chairman, held its first session on Tuesday morning, with over 100 officers and safety committee members in attendance from about 50 roads. Mr. Carrow in his annual report as chairman of the steam railroad section told of the difficulties that had to be overcome in managing the section's affairs during the past year, due to the economic situation from which all railroad activities have suffered. He complimented the officers of the section and the committee chairmen on the efficient discharge of their duties in the face of these difficulties.

Addresses were made by John F. Moore, associate general secretary of the Railroad Y. M. C. A., on "Safety First from a Moral Viewpoint," and by the Rev. Walt Holcomb, an evangelist, of Cartersville, Ga., on "The Safety of Man."

The principal paper of the morning session was by C. W. Galloway, vice-president of the Baltimore & Ohio, on "The Importance of Safety in Railroad Operation." Following a general discussion of the history and ethics of various safety activities, Mr. Galloway gave interesting data from the records of what has been done on his own road. In 1920 the casualties among employees on that road, 6,941, were 28 per cent less than in 1915, while the train mileage increased 13 per cent. Special tests for 60 days, last spring, at a number of terminals and shops, resulted in reductions of casualties among employees ranging from 79 to 83 per cent, as compared with the same period the preceding year. [These "drives" were noted in the *Railway Age*.] Foremen and other supervising officers were held responsible for any avoidable accidents occurring among their men during that time. During the past year expenditures have been severely limited on the B. & O. as on all other roads, but the safety work was not allowed to suffer; its importance was recognized by all of the officers.

The four million warning cards sent out by the Baltimore & Ohio to automobile drivers who had been found careless at highway grade crossings are believed to have done much good. Some of the recipients wrote back expressing thanks for the admonition given them. Observations at crossings to make up a record of careless conduct have, after two years, resulted in some apparent reduction in recklessness. Reviewing six months of this year it is found that of 248,988 observations, only  $3\frac{1}{2}$  per cent showed failures to observe due care. Recklessness is still plentiful, however; on one division of the road 89 per cent of the persons observed were checked as negligent.

In connection with the circulation of the warning leaflets, 10,000 large posters, printed in colors were put up at garages, gasoline stations and other places. Many newspapers took editorial notice of the warnings sent out by the railroad.

Mr. Galloway exhorted the safety men to do their best to inaugurate a vigorous educational campaign, believing that genuine co-operation ought to reduce very greatly the number of automobile accidents at crossings. Automobile trucks are now becoming very common, and week-days are as bad as Sundays for crossing accidents; perhaps worse. A recent check showed that accidents happened mostly in clear weather and where there was a good view, indicating that undiluted recklessness is a main cause of these distressing tragedies.

The speaker urged greater care in granting drivers' licenses to motorists, stating that at present any person over sixteen can secure one although most automobiles are capable of

equalling the speed of an average passenger train. Investigation of the records of 50 locomotive engineers had disclosed that they had not been permitted to run a passenger train until they had averaged 17 years' experience in road service.

In closing Mr. Galloway expressed the opinion that railroad officers and employees now have the safety idea "pretty nearly right," and that the principal work of the safety officer in the future must be with the public, as the reduction of grade crossing accidents is one of the gravest problems now confronting the carriers for solution.

On Tuesday afternoon F. M. Metcalfe, assistant to general manager of the Northern Pacific, read a paper on "The Substitution of Superintendents' Staff Meetings for the Customary Safety Committee Meetings as a Medium for Promoting Accident Prevention." This paper was formally discussed by D. G. Phillips (Wabash) and informally by practically every other safety officer and safety committee-man in attendance; and although Mr. Metcalfe had emphatically stated that he believed that the Northern Pacific's substitution of staff meetings for safety committee meetings had met with success, the idea of such substitution was emphatically opposed by most of the speakers.

A paper by Harry A. Adams, assistant to general manager of the Union Pacific, on "The Position, Authority and Responsibility of the Safety Officer" was spiritedly discussed and brought out the practically unanimous opinion that the safety officer's title and the amount of authority with which he is clothed have very little to do with the effectiveness of his efforts.

E. L. Blair, vice-president of the Benefit Association of Railway Employees, spoke on the interest of the railway brotherhoods in safety. When a man indulges in a dangerous practice and jeopardizes his own life or that of a fellow employee or a passenger he violates his pledge to his brotherhood. Safety should be taught and practiced by every brotherhood man. Mr. Blair also called attention to the financial burden that is placed upon the men's organizations when an employee is maimed. Although the man may receive \$5,000 or \$10,000 in compensation for his injury, his lack of business judgment nearly always results in his losing this money, and he then becomes a charge upon his organization.

A CLERK OF THE PENNSYLVANIA RAILROAD at New York City has been arrested on a charge of changing the consignee and destination of a carload of rubber, valued at \$8,000 and, with a confederate, securing possession of the rubber and selling it for \$4,200.

Six Hundred Tons of Export Rails Going Through the New York State Barge Canal

# The Railroad Shop vs. the Contract Shop

## Obscure Elements of Cost of Freight Car Repairs Developed by Analysis of Railway Accounts

By J. W. Roberts

President, The Roberts-Pettijohn-Wood Corporation, Chicago

THE RELATIVE COST of making heavy repairs to railroad equipment in railroad shops and in outside contract shops has long been a matter of speculation, because, since the methods of accounting are radically different, a fair comparison cannot readily be made. A comparison is possible only after railroad accounts have been reconstructed, segregating shop operating costs and bringing them together from the widely divergent sources through which they are disposed of in the ordinary process of railroad accounting. Some elements of actual cost must be developed, since lack of thoroughness in accounting causes them to be ignored as current factors of operating expense.

An effort to restate railroad accounts and obtain a refinement beyond their original purpose encounters many difficulties. Finding a reasonably accurate and complete railroad shop cost is practically impossible, for reasons which are apparent when the situation is understood.

### Railroad Accounting Methods

The Interstate Commerce Commission's system of accounting as prescribed for the use of steam railroads, has characteristics peculiar to itself. It has no analogy with cost accounting as practiced by industrials, or for that matter by other public utilities whose product is marketed under strictly competitive conditions which necessitates a knowledge of departmental and unit costs. The first cost found in railroading is the ultimate cost and the system being designed accordingly, it is to be expected that accounting record would not be kept of many details essential to a redistribution of expenses to departments and thence to a job, or unit cost. Railroad operating cost has many ramifications. The preponderant element of equipment repair cost is represented by expense which is common with some other phase of operations, or with some other productive unit. The proper division of common expense is difficult under all circumstances, but particularly so when the necessity for distribution is not recognized or anticipated when record is made of the experience which should furnish the factors for making the division.

Railroad accounts are designed to show, to the extent to which it is currently accounted for, the cost of furnishing transportation. Primary accounts relating to classes of expense which are constant and of significant importance when compared with the total, are grouped to form general accounts. These general accounts represent the main sub-divisions of operating outgo, i. e., Maintenance of Way and Structures; Maintenance of Equipment; Traffic; Transportation-Rail Line; Transportation-Water Line; Miscellaneous Operations; General; and Transportation for Investment-Credit.

The line of demarcation between the maintenance of way and structures and maintenance of equipment accounts, however, is in many places indistinct; likewise between these two general accounts and the transportation-rail line account. Considering that the maintenance of the roadway and its appurtenances, the maintenance of rolling stock, and the conduct of transportation through the use of the roadway and equipment, constitute departments of expense, the traffic and

general accounts represent administrative and selling expenses common to all—then there is no completeness in the charges against either department. For instance, the expense incident to hauling materials over the carrier's own rails for use in maintaining the roadway and structures and for repairing and rebuilding equipment, etc., unless performed as special service, is not adjusted as between departments and the bulk of the expense lodges in the Transportation-Rail Line account; the maintenance of shops and engine houses, the former being used almost if not exclusively in the maintenance of equipment, is charged against the Maintenance of Way and Structures account; the expense of maintaining pile-drivers, steam shovels, and similar devices used exclusively in roadway maintenance is classified as Maintenance of Equipment. The expense entailed in hauling the fuel used to furnish power for a shop plant, as well as the materials used by it, is a very considerable item in shop operating expense when the haul is a long one, but it is not charged against the shop. Depreciation is not accrued on fixed property, although it exists as a demonstrable fact. Expense of the character referred to is not inter-departmentally accounted for; it lodges where it falls and but little is known of its extent.

The overhead burden of general expense is common to all of the activities of the railroad. Certain departments of the business are doubtless responsible for a greater proportion of it than are other departments. If the truth were known, the maintenance of equipment, being not only important in itself but likewise having effect upon the maintenance of way and the conduct of transportation, would doubtless prove to be the beneficiary or the responsible cause for a greater proportion of this expense than is commonly acknowledged. A fair proportion of general expense is of course attributable to the maintenance and operation of general shops and should be considered in reckoning the cost of the production in such shops.

The investment in railroad shops and shop equipment, in power plant service and in storehouses and service tracks is an appreciable one, and frequently subject to rapid dissipation because of the expansion of the property and the fluctuating needs of operating expediency. The amortization in losses on investment, the gross cost of providing money for railroad improvements, and the taxes involved, are all items of cost chargeable against railroad shop output but in the majority of cases most difficult of ascertainment. Even the direct money outlay made in establishing railroad shop facilities is seldom known and this fact alone is significant. The unobtrusive elements of railroad shop operating cost are var-

great. Many of them are considered intangible so far as current accounting is concerned, but are found to be most substantial when maturity forces their recognition. The consideration of such elements of expense as of casual importance may easily lead to deception having most serious consequences.

From the foregoing it may appear that in the case of a railroad, the settlement for the expense incurred in repairing cars in owned shops, other than the direct charges for productive labor and applied materials, may be confused with other issues, or so long delayed as to be disassociated with the cause of the expense. The repair of equipment being a mere incident, as it were, in operating a vast railroad system, there is opportunity for other activities to carry and absorb, perhaps without noticeable distortion, expenses pertaining thereto which would be prohibitive to the commercial success of the equipment repair department if it were an entity engaged in competitive business.

### Thoroughness in Commercial Accounting a Necessity

A commercial car plant must recover through the charges made for its product or for services performed by it not only the direct outlay upon its undertakings, such as productive labor, applied materials and the expenses incurred by the activities enclosed by the shop-yard fence, but likewise every other expense, however indirectly or even remotely it may be involved. It must also recover something to provide against contingencies, such as sub-normal production and casualty expenses. If the business is to be a firmly established and prosperous one, the outlay must be wholly recovered, which includes not only expenses which have matured, but likewise expense which is in the process of accrual but is not yet matured. There must also be included in its charges a margin above the outlay sufficient to pay taxes, and to provide a reasonable return upon the investment in fixed assets and working capital which makes activity possible. Unlike a railroad, such an enterprise has but one general source of revenue and a single outlet for expense; it is capable of self-service to a limited extent only, being obliged to pay profits upon its raw materials and their delivery which must be absorbed in the selling price. The necessity for careful management and economical performance is manifest, and their effectiveness may be measured by the prices charged for service.

In attempting the comparison of the cost to a railroad of doing general repair work in its own shops with the costs of having such work done in outside shops, we have one factor—the outside shop cost—established, after adding to it the expense to the carrier which may be incident to having its work done in a contract shop. The amount paid the contractor by the railroad may be safely assumed, under normal conditions at any rate, to comprehend every element of the contractor's cost, including the use of property and working capital and a margin for contingencies, which is commonly called profit.

It only remains then to assemble the cost factors experienced by the railroad shop and apply them to the same volume of identical work.

### A Case for Comparison of Railroad and Contract Shop Costs

An effort was recently made to ascertain the facts in the matter by selecting a typical case and making a thorough examination of it. It was desired that conditions in the test case should be normal with respect to the circumstances under which the cost of the outside work was fixed, and as to the character of the railroad shop in which the comparable work was done. It was, of course, important that a case be found where work done in a railroad shop was entirely similar, and susceptible to measurement as to volume with the work done under contract, without necessitating arbitrary adjust-

ments of various kinds which would in any manner jeopardize the integrity of the comparison. The normality of the railroad shop's production during the test period and the facility with which the railroad accounts would lend themselves to analysis and redistribution were also matters of prime importance.

An instance was eventually found which met these requirements as satisfactorily as could be expected, although because of conditions inherent to the situation, the full facts of railroad shop costs could not be assembled. To the extent that omissions exist, because of inaccessibility of information or the prohibitive expense of developing it, and likewise because of the newness and superiority in style of construction of the railroad shops as compared with the average railroad shop in this respect, the comparison is somewhat unfair to the outside work.

In the early summer of 1920 the carrier let a contract to a prominent car company, whose plant was situated on the carrier's line some 300 miles distant from its own general shops, to repair a large number of 60,000-lb. capacity box cars. The body and underframe of these cars were wood, and they were equipped with the old style couplers and double spring draft gear. The cars were to be repaired to the extent of practically rebuilding them. They received from three to six new sills, one or both new side plates and end plates, practically all new siding, decking, lining and roof sheathing; new door, corner, and end posts; Z-bar or Economy ends; "XLA" or Murphy roofs; Economy draft arms; two new side doors equipped with National door fixtures; Cardwell friction draft gear; heavier oak subsills, heavier needle beams and heavier end lining; U. S. Standard safety appliances, and two coats of good paint. The trucks were overhauled, wheels, springs and truck castings being renewed as found necessary; braces were placed on the arch bars to strengthen the truck in general, and all brake attachments were repaired or renewed as required. When turned out of the shop the rebuilt cars were in first class condition and to all intents and purposes as good as new cars of the same construction.

For several months prior to letting this contract, the carrier had been repairing the same class and series of cars in substantially the same manner in its own general car repair shops. This work was continued even after the outside contract was let, cars of the type in question being sandwiched in with other classes of cars which were receiving general overhauling. It was, therefore, possible to select for test a number of cars repaired by the carrier in the same fashion and to the same extent as by the outside contractor, during a period current to the time when the outside contract was let.

The cars rebuilt by the carrier did not receive, generally speaking, quite such thorough renewal as those repaired in the outside shops. The work done by the contractor was thorough, providing for the restoration of all deterioration or damage which had accrued in the car, so that insofar as utility and life expectancy was concerned, it was in perfect condition when released. In the carrier's shops, however, the officials exercised their judgment, and observed a certain latitude as to the extent to which renewal and replacements would be made, with the result that the work done in the carrier's shops on some cars was less in volume than the work done on any of the cars repaired under contract. For this reason, there was selected from among the cars repaired by the carrier a number sufficient to stabilize an average cost, which had received as nearly as possible the identical treatment given the cars rebuilt in the outside shop. A selection of 50 such cars was made by the carrier's officials and the investigator jointly. The repairs on these 50 cars and a very large number of other cars were completed during June, July, August and September, 1920. A greater number of cars might have been selected for the test by extending the period of time, which would have necessitated analyzing the accounts.

of other months. This would have greatly increased the work without adding any value to it. For the purpose of were chosen at random from the list of cars for which final comparison, another 50 cars repaired in the outside shop bills had been rendered.

A minute comparison was made of the volume of work performed on the test cars in each shop. It was found not to be exactly the same. As measured by the quantity of materials applied, the work done in the carrier's shop was 1.1 per cent less than that done in the outside shop. This being sufficiently close for practical purposes, the difference is ignored in the comparison of the costs which follows.

### Character of the Railroad Shop

The railroad plant in question is superior, with respect to physical condition and equipment, to the average railroad plant. The facilities are all comparatively new, the plant having been established only about five years ago. The buildings and appurtenances are of substantial construction; the service tracks are new and well built; the equipment is modern and highly efficient, and none of the facilities have reached the age where maintenance expense is normal. But very little repair expense was traceable to the plant. The records for several months of the preceding year, which was taken as the basis for maintenance experience, were missing and whether or not they contained additional charges for upkeep is not known. The charges found appear to be subnormal. This may be accounted for by the scarcity of labor and materials which existed during the preceding twelve months, which would tend to minimize expenditures for maintenance. An attempt to compare the structure and track maintenance costs as found with system averages for previous years proved to be impracticable.

The carrier shop in question is devoted exclusively to heavy repairs. Light and running repairs are made at other shops, and therefore offer no interference with the orderly procedure of shop operations on heavy repair work.

During the period when the test costs were ascertained, the shop was operated at something more than normal capacity. The monthly man-hours worked from May, 1918, to October, 1920, inclusive, averaged 24,171; during the period of the test, the monthly average was 29,727, or 123 per cent. To the extent, therefore, that abnormal production operates to reduce productive costs, the situation favors the railroad's case.

### Basis of the Contract for Outside Repairs

Under the terms of the contract, the work done in the outside shop was to be charged for on the following basis:

- Direct labor to be based on the carrier's piece work schedules which were in effect July 1, 1917, plus 10 per cent, plus 30 per cent (the equivalent of 43 per cent) to equate such rates to the basis of the current wage schedule.
- For handling materials, a charge of \$6 per car.
- For milling lumber, a charge of \$8 per thousand board feet.
- For blacksmith work, agreed prices per operation.
- The aggregate of the foregoing items to be surcharged 100 per cent for overhead expense.
- Materials to be furnished in part by the carrier and to that extent exempted from the surcharge for profit; in part to be furnished at reciprocal prices (i. e., furnished by the carrier and billed at agreed prices and rebilled by the contractor at the same prices) and subject to the surcharge for profit, and in part to be furnished by the contractor at agreed prices, subject to the surcharge for profit.

(g) To the sum of the foregoing items to which applicable, profit to be added on a graduated scale, regulated by the amount of charge per car, the average rate of profit surcharged being between 10 per cent and 11 per cent.

The amounts billed the carrier under the terms of the contract do not, of course, represent the sole cost to it of the work done by the contractor. Among the possible incidental expenses may be mentioned:

(a) The cost to it of free materials furnished the contractor, and not included in his bill.

(b) The cost of delivering such materials, and attendant store expenses, etc.

(c) Moving the cars to be repaired to the contract shop, and returning them, to the extent that such movement represent otherwise useless haulage.

(d) Concentrating recovered scrap.

(e) Inspection of work, and reviewing accounts at the contract shop.

(f) Unoccupied space in its own shops and attendant expense, idle investment, etc.

(g) Administrative, purchasing, and accounting expense.

These, and other kindred items have received careful attention, and to the extent that such expenses were experienced, have been added to the amounts billed by the contractor in arriving at the total cost of the outside shop work.

### Development of the Total Cost

#### of Work in Carrier's Shop

To avoid encumbering this article with voluminous detail, it will doubtless suffice to review in a brief way the particulars of the carrier's costs as found, to comment upon their reliability or the deficiencies known to exist in them, and to explain the bases used for their apportionment where it was necessary to resort to apportionments.

[The author next discusses in detail the various elements of cost assignable to the repairs of the 50 cars selected from those going through the carrier's own shop. This will be taken up in next week's issue.—Editor.]

## Commission Presents Tentative

### Consideration Plan

\*Corrected.

surely promotes that high grade of transportation which is the aim of this legislation to promote.

Quite irrespective of size, the ultimate financial test of the feasibility of the 21 systems herein proposed is applied in the subjoined table. The significant feature is the right-hand column bringing out the net operating income in percentage of investment. Further details concerning this relationship are, of course, to be

found in the grand summary (exhibit 8), from which these particular figures are compiled. This table merely assembles the data dealing with the various regions one after another; and the relativity within each region, that is to say, the earning capacity of each system as compared with its immediate neighbors, has been already discussed. In the background there is always retained the theoretical standard for the country as a whole of a 5 per cent return on valuation.

The last step in financial analysis is theoretically necessary and in a measure practicable. The systems herein proposed are intended to be matched one against another to the end that the net operating income in percentage of investment shall be the same for all. For each region this test has been applied by taking the net operating income for the year 1917 as a percentage of the property account. But this so-called investment account is purely a book statement as to capital. The supreme test must be applied by checking everything in terms of financial valuation.

### Valuation

Returns as yet available from the valuation division are of course mainly working papers. The returns may be regarded rather as straws showing the direction of the wind; that is to say, affording an indication as to whether the investment account is understated, normal, or inflated. The following table comprises the returns as of the dates indicated, for all those roads for which the engineering report, the land valuation, and the account-

by the last column of this exhibit, is very uneven for the New England group. It varies from 125 per cent—a heavy excess of valuation over capital account—for the New Haven, to 108 per cent for the Boston & Maine, falling to practical equivalence for the Maine Central and the Central Vermont, and to a deficit of 18 per cent for the Bangor & Aroostook. But the valuation dates, it should be noted, cover a range of three years, characterized by fast mounting prices. The only trunk lines cited are the Chicago & Eastern Illinois, with present value at 78 per cent of recorded investment; the Big Four, at 85 per cent; the New York, Ontario & Western, at 43 per cent; and the Pere Marquette, at 64 per cent. For the Virginian Railway the corresponding figure is only 54 per cent. None of these roads is in the most thickly settled and highly developed region, and several of them are distinctly subnormal financially. The somewhat disquieting returns for these roads, therefore, need not necessarily shake one's confidence in a full valuation or even an excess for the first-class roads like the Pennsylvania and the New York Central. The returns for trunk line territory, however, are on the whole not as reassuring as the testimony in Ex Parte 74 makes it appear.

For the southeastern region, wherein, according to Ex Parte 74, the capital account stands strongly reinforced by valuation data, the same variability is apparent. There is nothing especially to shake the testimony of Mr. Hulme, yet it is quite apparent that the conditions are most uneven as between one property and an-

ing report have been rendered. At the same time the recorded investment in road and equipment for the corresponding date is afforded.

The accompanying table, then, exhibits the results thus far available concerning physical valuation. No reports as yet from the accounting division are available.

But total present value, as the recorded data show in periods like the last five years characterized by rapidly mounting prices, may be quite misleading. Certainly a total present value as of 1914 for the Boston & Maine is quite incomparable with a corresponding figure for the Central Vermont taken three years later. A superficial examination of the phenomenal price changes during that period suffices to discredit all such comparisons.

Turning now from means and methods of valuation to results, the carriers may best be treated in the great regional groups utilized for consolidation purposes. Considerable testimony along the same line was adduced in Ex Parte 74 by Mr. T. W. Hulme. Most of his statistical data concerned the same properties as are comprehended in this exhibit. His conclusion was that valuation was substantially more than capital account for New England, and for the eastern and southern regions as a whole. Only for the roads west of the Mississippi did he acknowledge that reproduction cost of road and equipment showed a slight deficiency under the capital account; and even for these western roads he excluded the so-called standard properties, such as the Burlington, the North Western, the Rock Island, etc. He contended, furthermore, that appreciation would probably more than counterbalance the depreciation during the years intervening since the date of examination.

The ratio of present value to recorded investment, as shown

other. Some will be grossly overvalued and others perhaps undercapitalized. The Rock Island is surprisingly sound with a practical correspondence of present value and recorded investment. At the other extreme stands the Western Pacific, now undergoing reorganization, with present value constituting only 39 per cent of investment account. Probably, and this confirms the general impression, conditions will be found more uniform in the Southwestern-Gulf region than almost anywhere else in the country. This valuation table includes the two most prosperous properties in that territory. For the St. Louis Southwestern the present value is only 52 per cent of recorded investment; for the Kansas City Southern it is only 38 per cent. In view of the long record of bankruptcies and reorganization for most of the roads hereabouts, the conclusion is inescapable that an excessive property valuation will have to be dealt with. Applying this conclusion to the matter in hand, namely, the percentages of return figurative under this plan for the proposed Frisco and Missouri Pacific systems of less than 3.5 per cent, it is evident that the actual rate of return is substantially higher than this figure. Whether it is enough higher, in the light of due correction of the investment account, to bring the results for these properties to a parity with those for the trunk lines, the southeastern states and the transcontinental roads, must be only a matter of surmise. But incontrovertibly the effect of any and all corrections must be in the direction of a regional uniformity for the country as a whole.

### Advantages of Consolidation

Examination of transportation conditions in the preparation of this report has disclosed a number of substantial advantages which might be attained through the larger-scale operation which such

consolidation permits. One or two of these may be mentioned in passing as indicative of the trend of events. One in particular is the greater proportion of solid train movement from points of origin through to destination, especially with the creation of shipping days between the less important places, which thus permits of solid train movement from the primary yard at least to the neighborhood of destination. The improvements recently put into effect on the Pennsylvania Railroad for coal and coke traffic and also in the carriage of steel, illustrate the point.

It is somewhat difficult to predict accurately the effect of a larger-scale operation under consolidation upon the several individual properties. The earning power of some of them which have already attained some of the foregoing efficiencies through a high degree of specialization of function will perhaps be lessened.

Another operating economy, conducive it is believed to efficiency through a better utilization of the fixed investment, is a considerable elaboration of the device of trackage. The principle, embodied for the first time in the transportation act of 1920, that it is economically sound and socially expedient to avoid useless duplication of facilities, is clearly illustrated in this connection. Already and for many years trackage has been taken by existing railroads either because a carrier was too weak financially to duplicate a line already in operation, or because the road in question was not for most purposes a competitor and therefore could afford to strengthen the lessee carrier. There is a surprising frequency of downright gaps in the very heart of some of the great systems. Whole divisions, even on the main line, will be found not owned, reliance being had upon long-time traffic agreements. The Rock Island, for example, is honeycombed with such trackage, in many cases

the contracts being very much more favorable as to maintenance than could have been expected under downright ownership. Everywhere, where trackage may be had, even as between direct competitors, the device has been resorted to freely. When the traffic develops to a point where the single line is outgrown, it may then be double tracked or a new link be constructed.

The defects and shortcomings of this comprehensive scheme are manifold and in many cases self-evident. The outcome is avowedly almost everywhere a compromise, a choice between evils. All of the warring and conflicting interests; all of the hopes, aspirations, fears and prejudices have come home to roost in the course of its preparation. An extraordinary amount of friendliness and co-operation has been encountered. But, as is inherent and natural under the circumstances, much of this assistance has necessarily been circumscribed by the particular interest of the participants; and a governmental plan, in contradistinction to one projected for private profit or interest, may not content itself with caring even for most of the properties. It must of necessity recognize the right and the interest of every last one of them. It is this requirement of universality which so often compels the halfway expedient, the compromise, the solution which falls so far short of the ideal. Administrative influences impel one in certain directions; the bankers would have some matters otherwise; the representatives of the employees entertain quite positive views, it may be; and all of the shippers' organizations have to be satisfied. But despite these divergent interests, the desirability, nay more, the downright necessity for the furtherance of consolidation on a large scale as a remedy for the existing situation is almost universally conceded.

## A Shipper's Views of Railway Needs\*

### Relation of Motor Transport to Steam Railways; Central Ownership of Freight Cars Advocated

By Geo. C. Conn

Director of Traffic, Buick Motor Company, Flint, Mich.

**P**ASSENGER AND FREIGHT service by motor is now rapidly encroaching on both steam and electric lines—not only for short distances, but for general service up to 100 or more miles, and in some cases regular freight service is operated over longer distances. A recent advertisement of the Standard Oil Company (Indiana) contained the statement that during the past year more than six million head of cattle, sheep and hogs were moved by motor trucks directly to stockyard markets, and that farmers had found this method of transportation dependable, economical and profitable.

There seems to be the same attitude on the part of some steam railway officials toward the motor truck as they took toward the electric lines, and the same tide of progress will undoubtedly swamp those whose vision is so limited as to fail to work with the motor instead of against it. There are, of course, some who see the signs of the times. One railway in the northwest is promoting rural trucking routes in connection with its own service, and with beneficial results. W. G. Besler, president of the Central Railroad of New Jersey, says railways have nothing to fear from automobiles and should recognize them as an ally, augmenting and extending the service rendered by the railways.

Each class or method has its legitimate field, and that when the traffic is separated to meet what each has to offer, the greatest efficiency will be reached. There can be no question but what the electric line and motor truck are able to do some things more quickly than steam railways, and so

long as they can give superior service they will attract business; and with railways in their present physical condition, every known means of transportation will be required to move the commerce of the country when the tide of business turns.

It cannot be overlooked that the steam railways have unintentionally done much to encourage electric and truck service by their attitude toward less than carload traffic. They have educated everyone to the idea that there was no money for the railways in less than carload business, and by declining to accept such freight except on certain specific days, they have forced shippers to find and use other methods of transportation. If steam railway executives do not want the short-haul merchandise traffic there now seems an opportunity to get away from it—possibly with profit to all concerned.

### Railway Efficiency Improving

For reasons which it is useless to review here, and which are generally understood, government supervision and intervention have surrounded our steam railways until the officials in charge are no longer free agents, and as one prominent railroad president recently said: "It is a very grave question whether regulation has not been overdone, encroaching on the field of management, dividing responsibility and checking initiative." One of the prominent papers in New York state, in referring to government regulation of railways, says: "It would be foolish in the extreme to expect anything satisfactory results from this kind of legislation," and ventures the suggestion that the country at large would be as well off if all present restrictions of the government were

\*From a paper read before the Western Railway Club, Chicago, September 19, 1921.

removed. The present system of having one commission fix the rates and another the expenses is certainly ridiculous. If the railways are to have governmental supervision, there should be but one commission in control.

It is common practice to criticize the efficiency of our railways. What we really criticize is the efficiency of the employees either individually or collectively. If the spirit of a railway organization is gone, or is at a low ebb, it is immediately reflected in the individual acts of the employees. Representing a large shipping concern and coming in close touch with local men, I can see a marked change for the better in the attitude of many railroad men since the roads "came back home," but it must be remembered that efficiency in an organization extending over hundreds of miles and embracing many departments widely divergent in their activities is a very different proposition from efficiency in a manufacturing plant employing an equal number of men but all within a mile of each other. There is no business where good-will and individual responsibility are greater assets than in the steam railway as it stands today. It is a great industry making but one product, and that is service.

### Service More Desirable Than Low Rates

While freight rates should be adjusted to protect shippers and consignees against unfair competition, and while in some instances a very slight variation may make a lot of trouble, I venture the opinion that prompt and ample transportation is the thing most needed and most desired by the great shipping public. I do not believe there is any good reason for constantly asking for reduced rates. Much of this demand originates with semi-professionals who feel that they must "start something" against the railroads. It must, however, be remembered that the present high basis of rates is more or less of a war tax imposed to meet war expenses. The various increases were accepted by rich and poor, large and small, without protest, and the readjustments, as they are made, should benefit all classes of business alike.

It should be the duty of executive and traffic officers to foster their industries, know what they need, and endeavor to keep them on a relatively proper rate basis. Uncertainty as to freight rates is the most serious thing with which a shipper has to contend.

Nothing does more to keep a railroad in good standing with the communities it serves than regularity of local service. A railway which fails to give such service not only fails in its duty, but creates adverse public sentiment which later on shows itself in state legislatures and city councils. The time has passed when railways can ignore the towns and cities along the line and take their chances in the state senate with adverse legislation.

The joint use of terminal facilities should be seriously considered, and where they can be brought under one control, a large saving can be effected. If this subject is not given early and serious voluntary consideration, railroad people will invite merited criticism and government interference.

### Railway Corporation Directors

While it may be true that directors of any corporation should dictate its policy only and keep away from details, I think there is a great opportunity on our railways to select directors who will familiarize themselves with their properties and get away from boards of directors who merely attend the board meetings, and who many times do not see their roads for months at a time, and then only for a superficial inspection.

I know of one railroad controlled by a banking house which could, if it chose to do so, select eight of the eleven directors. Instead of doing this it selects three and allows the president to select eight who live on the property and represent the business interests of the community. These men are not dummy directors. It is a rare thing when they

fail to attend the monthly board meetings, which usually last several hours, and at which they give the president reports from their cities and their own viewpoint of current affairs. One of these men was chosen because he had previously been quite antagonistic, and he is now thoroughly converted and a great help. This railroad is on the right way to success through the upbuilding of public sentiment along with its traffic. Other roads would do well to study this plan.

### Kind of Cars a Shipper Wants

In the evolution of transportation one of the problems is that of equipment. Speaking specifically of freight equipment, there has been developed on many railways types of cars which theoretically served that particular road to greatest advantage, but which in reality were nothing more or less than the personal idea of some executive.

Recently one of the largest railway systems in the country has put in use box cars with an inside length of 40 ft. 7 in., when all the rates and classifications are based on 40 ft. 6 in. Not long ago one of the transcontinental lines built some box cars with an inside length of 41 ft. when the ratings were based on 40 ft. 6 in. A glance at the cars in any freight yard will prove the assertion that there is no uniformity in equipment.

From my education as a traffic man I am, of course, thinking of that phase of the car question. What seems desirable is a large standard car. There are so many factors which cost no more on a large car than on a smaller one that it looks wrong to build the smaller type, and I cannot figure out why the smaller and obsolete types of cars are allowed to exist. It must be true that the repair bills on these old cars are very much above the average. I do not believe there is any great demand for a car longer than 40 ft. 6 in. inside and 10 ft. high, and I think that attention should be directed to a standard of this size, and that the freight rates and classifications should be adjusted to fit the standard equipment.

The end-door box car is not in great demand. If side doors are wide enough, 90 per cent of the demand for end doors will cease. There are very few shipments which cannot now be loaded through wide side doors, and these few can go on gondolas or flat cars.

### Central Ownership of Freight Cars

If cars are to be standardized, why should they not be controlled by a central ownership, made common route cars, and leased to the using roads on a fair basis? No ordinary railroad can afford to own enough refrigerator or other special cars to care for its seasonal and perishable freight, and I am much inclined to the belief that the same principle will apply to standard box cars.

Is it not time that someone should analyze this equipment problem carefully both as to its ownership and character? The subject is very far-reaching both as to the cost of the equipment itself and as to operating expenses in the way of repairs, empty haulage, and per diem rentals. If you will go back to the years 1902 or 1903, when freight cars were interchanged on a mileage basis, you will recall the misuses of and the dissatisfaction with the system. It was about this time that the per diem system became operative, and no one seems satisfied with that because it is being constantly changed. The well-to-do roads complain that they are buying cars for the poorer roads, and the poorer lines are struggling under the heavy car rental in their operating expenses. Increasing the rental or per diem will not deter the smaller lines from using the cars. They will take what they need or can get for the movement of traffic and pay the penalty.

For the past five years I have taken every possible opportunity to advocate a central ownership of freight cars—a holding company which would build and maintain cars and

rent them to railroads for general use, on a fair basis, such cars to be known as general or open route cars to run anywhere on any railroad.

Such a company could build and maintain cars cheaper than individual lines and move them from one section to another as crops or other conditions require, thus getting the maximum of loaded miles and minimum of empty miles. This would do away with the moving of cars empty merely to send them back home, especially when the home road has no use for them.

With central ownership and a few standard types of cars, selected so as to give greatest utility, the original cost of construction could be kept very low. Naturally such central ownership would establish its own repair shops at strategic points, and this would greatly reduce, if not eliminate, individual railway car shops.

The overhead in most shops is very high and hard to determine. Much of the machinery in railway shops is old and not economical. Most of these shops operate to capacity but a very small part of the year. Very few roads today are well equipped to repair steel cars; and if all roads are to be so equipped, it will mean a tremendous expenditure for machinery and facilities, and the wisdom of such an expenditure is questionable. The centralized control can avert this duplication of equipment.

Under central control a better opportunity would be afforded for records of the actual performance of each car—a thing practically out of the question under present conditions. There were on December 31, 1920, 2,382,212 cars in existence, and the *Railway Age* gives \$626,746,636 as the amount expended in 1920 for maintenance, or about \$265 per car per year. This looks like a great field for economy, both in the cost of repairs and in the quicker return of the car to service.

In constructing cars the weight capacity is not the only factor to consider. It may be necessary to build heavy capacity box cars, but in doing so a tremendous increase in deadweight or non-revenue weight is added to every train. A few years ago I checked up the loaded movement of several Pennsylvania System cars of 100,000 lb. capacity. The heaviest load in any of them was about 80,000 lb., and most of them carried less than 30,000 lb.

Consideration should be given to the increasing number of light and bulky articles and the necessity for a large car.

During the year 1920 there were driven away from factories 470,867 automobiles, equal to about 110,000 carloads, simply because of car shortage, and the railways lost earnings on this high-class traffic simply because equipment was not available. Our own company and our agents own over 500 flat cars used for automobile shipments, purchased solely to protect ourselves. We also made an investment of \$118,000 for steel decking to deck these cars and make them move a double load.

We have met every kind of objections from railway men to our advocacy of large cars with wide doors, but they are coming to it and are discovering that what some roads are doing others will sooner or later be obliged to do. It is not for the shippers to tell the railroads how to build cars, but it is their privilege to tell what they need, and the railroads should find the method of meeting the situation. I believe this lies in a central ownership and control of equipment.

### Organize a Department of Public Relations

Every railway should have an executive official reporting to the chief executive whose first duty should be to keep in touch with the public along the line and endeavor to create more harmonious relations between the railway and its patrons. The present organization of most railway staffs does not provide for such an official. Just what duties now handled by others should come under his supervision might depend on the size of the railroad, but regardless of the size

of the road, this official should report to the president or chief executive officer and have a title plainly indicating his position.

### Railroad Labor

Regardless of the present political labor situation, the underlying principles surrounding railroad labor are not very different from those in other lines except that the men are better organized; and because of this fact and the practice recently created, under government control, of increasing the freight and passenger rates to meet the increase in expenses, there may have developed, in some quarters, a lack of resistance by the supervisory forces.

While it is often stated that railway employees were generally underpaid, it is a fact that many of the men have been in service a long time and of their own accord, and this must speak for itself as to the desirability of their employment. Most men are willing to do an honest day's work if they are properly directed and treated fairly as to conditions as well as pay. The conditions surrounding railroad labor have been anything but good. I refer to offices, rest rooms, hours of labor, sleeping accommodations, and other things with which yard and train men are obliged to contend. These conditions would not be tolerated in an industrial plant.

Possibly one reason railways fail to control the efficiency of their employees is because the supervisory or inspection forces are too closely allied to those whom they supervise. Possibly the system or method of measuring a day's work is wrong in that the only measure is the hours of service and not the number of units of work done. In this I do not refer particularly to shop work. The laws of nature and traits of individuals do not differ much, regardless of occupation, and the principles cannot be very different in any line of commercial activity.

Very reliable figures of labor conditions in Akron, Ohio, are available, and I summarize the situation merely to illustrate the point. One concern in Akron with a capacity of about 1,000 tires per day had this experience: In May, 1920, its pay roll totaled \$108,000, and the daily average production of tires was 978. In May, 1921, the pay roll amounted to \$40,000 and the daily production averaged 1,018 tires. In 1920 it employed 950 men, and in 1921 the larger output was done by 387 men.

In a paper published by the Goodyear Tire & Rubber Company called the "Wingfoot Clan," they say that in their tube department in 1920 the average number of tubes per man per day was 20, while in 1921 the production per man is 60 tubes. The hours of labor have increased from eight to ten, and the rates of pay per hour have greatly decreased. Taken as a whole, and as an average in the various Akron plants, the efficiency per man measured by the output has increased about 75 per cent. If this increase in efficiency can take place in Akron, Ohio, it can also take place in railroad service if properly directed.

Shippers are entitled to the most efficient operation possible. Men in railway service should be paid properly and in line with what is paid for similar work elsewhere. The conditions surrounding the work should be as good as possible. The results are what really fix the cost of operation, and the better the results, the lower the cost. If the costs are reduced, the rates will also be reduced, and business will be quickened to the advantage of all concerned.

### Discussion

N. D. Ballantine, superintendent transportation, Union Pacific, agreed with the author of the paper that the private ownership of freight cars would cause more empty car miles than would result under a scheme of central ownership. Under private ownership the cost of repairing freight cars is much cheaper at home than on foreign lines. Other factors, however, must be taken into consideration in deciding the

advisability of sending foreign cars home when in need of extensive repairs. In explaining this situation Mr. Ballantine called attention to the fact that it would cost \$75, for instance, to move an empty Pennsylvania car home from Ogden, Utah. In view of the fact that the balance of traffic on the Union Pacific is east-bound, to send this car home would require the empty movement of another car west for loading which would place a total burden of \$150 on the transaction and might make it advisable to repair the car away from home.

G. E. Patterson, general superintendent, Illinois Central, expressed a doubt as to whether there would be any advantage in building cars of light capacity since so many bulky commodities must be moved under modern industrial conditions. To go to cars of lighter capacity would increase the number of cars moved, which would add to the burden on railroad facilities, particularly in terminals and transportation yards.

In answer to a question as to why a car with an inside length of 40 ft. 7 in. was any less desirable than one measuring 40 ft. 6 in., Mr. Conn explained that the carload minimum classifications are based on a length of 40 ft. 6 in. and 42 ft., and for a car that exceeds 40 ft. 6 in. the road should apply the 42 ft. minimum if traffic regulations are observed. This works an injustice on the shipper; as it costs him as much to use a 40 ft. 7 in. car as to use a 42 ft. car.

In answer to a question as to the width of side doors which would make possible the elimination of end doors for automobile loading, Mr. Conn suggested that the doors be 10 ft. wide and staggered so that about 6 ft. of the width of the two doors would be directly in line across the car. He called attention to the fact that the fastenings on the inside of the end doors form a projection which has been the source of a large part of the damage in transit to automobiles shipped from the Buick plant.

## Freight Traffic Statistics

WASHINGTON, D. C.

THE number of tons of revenue freight carried by the Class I railroads of the United States in the first six months of 1921 was 800,067,738, as compared with 1,031,969,587 in the first six months of 1920, a reduction of 22 per cent. The tonnage of revenue freight originated for the six months period of 1921 was 440,543,243, as compared with 575,670,571 in 1920, a reduction of 23 per cent. These figures are indicated by the quarterly summary of freight commodity statistics just issued by the Interstate Commerce Commission for the second quarter of 1921, taken in connection with the reports for previous quarters.

For the quarter ending June 30, 1921, decreases as compared with the corresponding quarter of 1920, are shown in the totals for animals and products, products of mines, products of forests, manufactures and miscellaneous, and l. c. l. merchandise traffic, both freight originating and total revenue freight carried, but the tonnage of products of agriculture carried shows an increase from 43,445,220 in 1920 to 44,639,283 in 1921. The tonnage of wheat carried was 9,632,585 for the quarter, as compared with 6,088,429 in the corresponding quarter of 1920; corn, 5,935,075, as compared with 4,834,640; citrus fruits, 2,061,791, as compared with 1,766,587; other fresh fruits, 2,119,730, as compared with 1,807,186; potatoes 2,221,396 as compared with 2,068,278. Other items under the head of products of agriculture show decreases.

The total tonnage carried of animals and products was 10,146,292, as compared with 10,743,059, but there were increases in hogs, fresh meats, other packing house products, poultry, eggs, butter and cheese, and wool. Of products of mines the tonnage was 208,779,616, as compared with

272,179,656. Anthracite coal shows an increase from 31,129,687 to 32,924,400, but bituminous coal decreased from 144,470,058 to 121,374,695 and all other items in this class show a decrease.

Of forest products the tonnage was 36,858,931, as compared with 49,631,766. Ties show an increase from 1,876,993 to 2,124,505.

Total manufactures and miscellaneous freight carried amounted to 81,054,733, as compared with 121,664,689, increases being shown only in vegetable oils, cement and ice. L. c. l. merchandise decreased from 22,605,696 to 16,770,520. The grand total of carload and l. c. l. traffic for the quarter was 398,249,375, as compared with 520,270,086.

## Dual Control of Railroads Criticized

WASHINGTON, D. C.

DUAL CONTROL of our transportation systems by two separate and distinct governmental agencies, the Interstate Commerce Commission and the United States Labor Board, is declared to be the outstanding obstacle in the path of efficient and economical operation of the railroads in a statement to the press by Representative Sydney Anderson, chairman of the Congressional Joint Commission of Agricultural Inquiry.

"The Interstate Commerce Commission regulates the prices of transportation and the United States Labor Board regulates its costs," Mr. Anderson said. "This division of authority and responsibility violates the fundamentals of efficient business management. While the railroads are semi-public corporations and exercise a semi-governmental function, there is no fundamental difference between the economic laws which apply to the operation of railroads and those which apply to the operation of any other business. There are certain well-defined restrictions which can properly surround railroad operations and which are necessarily public requirements, but when these regulations or restrictions result in divided authority and responsibility for operation, and attempt to substitute arbitrary and fixed rules for economic laws, they result in imposing burdens upon the railroads which must eventually become burdens upon the public in general.

"Centralized authority and responsibility are just as essential to the management of railroads as to the management of any other business, and the existing dual control of railroad, which divides responsibility and authority, is a compromise on the fundamentals of sound business organization and efficient management, which results in excessive burdens upon the shipping public.

"Prices for transportation and costs of transportation are mutually inter-related and interdependent factors and supervisory control over them should be exercised under a single authority. The policies involved in the determination of the expenses to be assumed by the railroads are essentially policies of management rather than of supervisory governmental control, and a careful analysis of functions of management and regulation should be made, with a view to so modifying existing laws that the functions of private management and responsibility for their exercise may be left with the management of the railroads, and the control of the government limited to supervisory, regulatory functions, if private management of railroads is to continue. Any other relation will inevitably result in imposing excessive burdens upon the public.

"While the commission has come to no conclusion with respect to the recommendations which it will make with regard to railroad operations and regulations, it is undertaking an analysis of the functions of the railroads with a view to making definite recommendations for improvements, both in regulation and operation."

# General News Department

London to Birmingham in two hours is the time advertised for the best trains in the latest time-tables of both the London & North Western and the Great Western Railways. This is the first restoration of these fast schedules, which were discontinued during the war. The distance between the two cities, by the North Western, is 113 miles, and by the Great Western, 110 miles.

Two bandits were shot and killed on the night of September 14, by federal agents and railroad detectives, when they attempted to hold up Texas & Pacific passenger train No. 11, fifteen miles west of Ft. Worth, Tex. The train had been heavily guarded following information received by federal agents that bandits had planned to rob the mail car.

The production of Portland cement in 1920 was 100,023,245 barrels, exceeding that in 1917, the next highest year in production, by 7,209,043 barrels. This amount was an increase of 24 per cent over the production in 1919, which was 80,777,935 barrels. The stocks at the mills increased from 5,256,900 barrels at the end of 1919 to 8,941,046 barrels at the end of 1920.

The executive and advisory committee of the American Association of Railroad Superintendents, at a meeting held in Chicago on September 10, decided to hold the next convention in Kansas City, Mo., on August 23 to 25, 1922, inclusive. Kansas City was selected as the location of the convention in view of the fact that it had been originally planned to hold the 1921 meeting at that city, which meeting was canceled.

The engineman of passenger train No. 327 on the Pennsylvania, en-route from Louisville, Ky., to Indianapolis, Ind., was killed and four persons were severely injured and several less seriously injured, when the train went through a bridge into the Blue river, one mile north of Edinburg, Ind., on September 17. The train was derailed on the approach to the bridge and struck an end post, knocking part of the bridge into the river. The engine and baggage car plunged into the stream while a day coach and three Pullman cars remained on the track.

Chief engineers' night was the name given to a meeting held by the Western Society of Engineers at Chicago on Monday evening, September 26. Brief addresses were given by C. A. Morse, chief engineer, Chicago, Rock Island & Pacific; H. R. Safford, assistant to the president, Chicago, Burlington & Quincy; C. F. Lowth, chief engineer, Chicago, Milwaukee & St. Paul, and E. H. Lee, vice-president and general manager, Chicago & Western Indiana. The addresses were directed primarily at the young engineers and concerned the elements necessary for success, the speakers drawing largely on their own experiences.

C. M. Candler, chairman of the special commission appointed by the governor of Georgia to investigate the causes of a freight train derailment on the Atlanta, Birmingham & Atlantic on September 7, has made a report, signed by himself and W. H. Hudson, holding that the wreck was caused by an explosive placed on the track with criminal intent. William T. Turner, president of the Georgia Car & Locomotive Works, who is the third member of the commission, handed in a minority report holding that the derailment was due to a loose wheel of the front truck of the locomotive.

## Pennsylvania Pensions

During the first six months of 1921 the Pennsylvania Railroad paid out \$1,354,692 in pension allowances to retired employees; and 696 new names were placed on the pension list in that time. During the same period, 287 retired employees died. The total number now receiving pensions is 6,406. It is estimated that the

average term of service of these men is 40 years. The average age of all employees on the roll is 73 years and 1 month.

All officers and employees who attain the age of 70 years are automatically retired, and those from 65 to 69, inclusive, who after thirty or more years in the service become disqualified for active duty, are also eligible for pensions.

## Coal Production Increasing

Production of soft coal showed a decided improvement during the week ended September 17, according to the weekly bulletin of the Geological Survey, and for the first time since early in June passed 8,000,000 tons. The total output is estimated at 8,139,000 net tons. Production of soft coal during the first 219 working days of the year has amounted to 279,881,000 tons, which is 99,000,000 tons behind the average of the previous four years. The cumulative movement to the lakes for the season, however, stands at 17,669,670 net tons, nearly three and three-quarter million tons ahead of 1920 and 186,580 tons ahead of 1919.

## Chicago River Straightening

Four of the railroads owning tracts of land on the South branch of the Chicago river have appointed officers to negotiate with the city of Chicago on the proposed straightening of the river, as follows: E. T. Glennon, assistant vice-president, New York Central; L. C. Fritch, vice-president, Chicago, Rock Island & Pacific; W. J. Towne, chief engineer, Chicago & North Western, and G. P. Palmer, engineer of maintenance and construction, Baltimore & Ohio Terminal. These officers will serve on a joint committee of city and railroad officers to be headed by E. T. Noonan, chief engineer of the city's Railroad Terminal Commission.

## Telegraph and Telephone Appliance Association

Officers for the Railway Telegraph & Telephone Appliance Association, which met in conjunction with the Telegraph and Telephone Section of the American Railway Association at Cleveland, Ohio, last week, were elected for the ensuing year as follows: Chairman, J. Warren Young, Kerite Insulated Wire & Cable Co., New York; vice-chairman, F. W. Bayles, New York Telephone Company, New York; secretary and treasurer, G. A. Nelson, Waterbury Battery Company, New York. The members elected to the executive committee are: B. A. Kaiser, American Telegraph and Telephone Company, New York; W. T. Kyle, Page Wire & Steel Company, New York; J. W. Hackett, Okonite Company, New York; Wallace L. Cook, Reliable Electric Company, Chicago; E. V. Adams, Western Electric Company, New York, and D. H. Morris, Ohio Bell Telephone Company, Columbus, O.

## The French Exhibit in Canada

The eight-car exhibit of the life and commerce of France (heretofore noticed in the *Railway Age*) which is now traveling through Canada has drawn large crowds of visitors. The car devoted to literature, science and the arts contains the sword presented by the people of Liege to Marshal Foch. Other treasures are Rodin's "A Dancer," a painting valued at 75,000 francs, loaned by the Louvre, Caron's statue "Spring Smile," loaned by ex-President Poincaré, and busts of Clemenceau and Puvion de Chavannes. Car number two, devoted to setting forth the beauties of France as a touring ground, contains illuminated views of old chateaux and forests, state maps, and models of trains and ships. The jewelry car contains a large collection of the best examples of French jewelry; diamond pendants, jewel-encrusted bracelets and unique rings; also fine cutlery, bronzes and statuary. The

French government has invited the Canadian government to send an exhibit of Canadian wares to France next year, and offers free transportation of Canadian sample goods both ways across the ocean, free housing of goods, free railway transportation and many other privileges.

### Roadmasters Elect Officers

At the closing session of the convention of the Roadmasters and Maintenance of Way Association at Chicago on September 22, the following officers were elected for the ensuing year: President, L. M. Demey, supervisor Cleveland, Cincinnati, Chicago & St. Louis, Indianapolis, Ind.; first vice-president, J. P. Corcoran, roadmaster, Chicago & Alton, Bloomington, Ill.; second vice-president, J. B. Martin, supervisor New York Central, Elkhart, Ind.; secretary, P. J. McAndrews, roadmaster Chicago & North Western, Sterling, Ill.; treasurer, T. F. Donahoe, general supervisor Baltimore & Ohio, Pittsburgh, Pa.; roadmaster W. F. Muff, Atchison, Topeka & Santa Fe, Newton, Kan., was elected to fill the unexpired term of Mr. Martin as a member of the executive committee. George W. Koontz, supervisor Delaware & Hudson, Carbondale, Pa., and C. A. Joyce, supervisor Erie, Paterson, N. J., were elected as four year members of the executive committee. Cleveland was chosen as the place for the next convention.

At the annual meeting of the Track Supply Association, held on Wednesday morning, September 21, the following officers were elected: President, Herbert Potter, Wyoming Shovel Works, Wyoming, Pa.; vice-president, F. M. Condit, Fairbanks, Morse & Co., Chicago; secretary-treasurer, W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y.; directors, J. J. Cozens, Union Switch & Signal Company, Swissvale, Pa.; K. J. Eklund, Mudge & Co., Chicago; Alex. Chapman, Rail Joint Company, Chicago, and A. H. Told, Positive Rail Anchor Company, Marion, Ind.

### Constitutionality of Election Laws to

#### Be Tested by C. M. & St. P. Officers

H. E. Byram, president of the Chicago, Milwaukee & St. Paul, Burton Hanson, general counsel, L. K. Silcox, general superintendent of motive power, and George T. Martin, assistant to Mr. Silcox, were placed under arrest on September 26 before Judge F. S. Righimer of the Cook County Court, Chicago, on warrants charging violation of the election laws by refusing to pay employees for two hours during which they were absent from their work to cast ballots on election days. Mr. Byram and the other officers appeared before the court voluntarily with the object of making this a test case. The officers furnished bonds of \$1,000 each and their case was set for hearing on October 17.

A brief notice of the earlier developments of this case was included in the *Railway Age* of September 24 (page 589).

Subsequently attorneys representing the four officers of the St. Paul filed a brief containing 17 reasons why that section of the election law giving employees two hours with pay in which to vote is unconstitutional. Among other points, the attorneys contend that the act is invalid because "it is contrary to the policy of law that any person should be paid for performing that duty of citizenship which consists in attending the polls and voting at elections." Another contention is that the act "seeks to take the property of one citizen for the private use of another citizen."

### Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.
- AIR BRAKE APPLIANCE ASSOCIATION.—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.
- AMERICAN ASSOCIATION OF DEMURGAGE OFFICERS.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa.
- AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 29 S. La Salle St., 332 South Michigan Ave., Chicago.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meetings, November 21 and 22, Carolina Hotel, Pinchurst, N. C.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400, Union Station, St. Louis, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 3-6, Atlantic City. Exhibits this year will be omitted.

AMERICAN RAILROAD MASTER TINNERS' CO-PERSMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Borchardt, 202 North Hamlin Avenue, Chicago, Ill.

AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.

#### Division I—Operating

Freight Station Section (including former activities of American Association of Freight Agents). R. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.

Medical and Surgical Section. J. C. Caviston, 75 Church Street, New York.

Protective Section (including former activities of the American Railway Chief Special Agents and Chiefs of Police Association). J. C. Caviston, 75 Church St., New York, N. Y.

Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents). W. A. Fairbanks, 75 Church St., New York, N. Y.

Safety Section. J. C. Caviston, 75 Church St., New York. First annual meeting, Boston, Mass., September 26.

Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.

Division III—Traffic, J. Gottschalk, 143 Liberty St., New York.

Division IV—Engineering, E. H. Fritch, 431 South Dearborn St., Chicago, Ill.

Construction and Maintenance Section. E. H. Fritch.

Electrical Section. E. H. Fritch.

Signal Section (including former activities of the Railway Signal Association). H. S. Balliet, 75 Church St., New York, N. Y.

Division V—Mechanical (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.

Equipment Painting Section (including former activities of the Master Car and Locomotive Painters' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.

Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association). J. P. Murphy, General Storekeeper, New York Central, Collinwood, Ohio.

Division VII—Freight Claims (including former activities of the Freight Claim Association), Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 Waller Ave., Austin Station, Chicago. Next convention, October 18-20, 1921, Hotel McAlpin, New York City. Exhibit by Bridge and Building Supply Men's Association.

AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—J. F. Jackson, Central of Georgia, Savannah, Ga. Next meeting, November, 1921, Chicago.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 14-16, Chicago. Exhibit by National Railway Appliances Association, March 13-16.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.

AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.

AMERICAN SOCIETY OF STEEL TREATING.—W. H. Eismann, 4600 Prospect Ave., Cleveland, Ohio.

AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings 1st and 3d Wednesdays in month, except July and August, 33 W. 39th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, Northern Pacific Ry., Spokane, Wash.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. E. Morris, Northern Pacific R. R., St. Paul. Next annual meeting, May 19, 1922, Montreal.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreuccetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Convention this year has been postponed indefinitely. Exhibit by Railway Electrical Supply Manufacturers' Association.

ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.

ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clokey, 1558 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division 1.)

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division 2.)

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—A. J. Filkins, 3346 So. Artesian Ave., Chicago. Meeting with convention of American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—W. A. Booth, 131 Chaffon St., Montreal, Que.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, Mo.—Thomas B. Koneke, St. Louis, Mo. Meetings, first Tuesday in month at the American Hotel Annex, St. Louis.

CENTRAL RAILWAY CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y. Annual dinner, Thursday evening, November 10.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.**—W. F. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill.

**CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.**—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.

**CINCINNATI RAILWAY CLUB.**—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio.

**EASTERN RAILROAD ASSOCIATION.**—E. N. Bessling, 614 F St., N. W., Washington, D. C.

**FREIGHT CLAIM ASSOCIATION.**—(See American Railway Association, Division 7.)

**GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856. Insurance Exchange Bldg., Chicago.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—W. J. Mayer, Michigan Central R. R. Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.

**INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.**—George P. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.

**INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—J. G. Crawford, 702 E. 51st St., Chicago.

**INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Win. Hall, 1061 W. Wabasha Ave., Winona, Minn.

**MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.**—E. E. Matlin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, which was to have been held October 4-6, 1921, at Buffalo, N. Y., has been canceled.

**MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 26 Cortlandt St., New York. Next convention, May, 1922.

**MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.**—(See A. R. A., Division 5.)

**MASTER CAR BUILDERS' ASSOCIATION.**—(See A. R. A., Division 5.)

**NATIONAL ASSOCIATION OF RAILWAY TIE PRODUCERS.**—Warren C. Nixon, Western P. & Timber Co., 905 Syndicate Trust Bldg., St. Louis, Mo.

**NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.**—James B. Walker, 49 Lafayette St., New York. Next convention, October 11, Atlanta, Ga.

**NATIONAL FOREIGN TRADE COUNCIL.**—O. K. Davis, 1 Hanover Square, New York.

**NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition, March 13-16, Chicago, at convention of American Railway Engineering Association.

**NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.

**NEW YORK RAILROAD CLUB.**—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 4th Friday in month, except June, July and August, at 29 W. 39th St., New York.

**PACIFIC RAILWAY CLUB.**—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting, 2d Thursday in month, alternately in San Francisco and Oakland.

**RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.**—E. R. Woodson, 1116 Woodward Building, Washington, D. C.

**RAILWAY BUSINESS ASSOCIATION.**—Frank W. Nixson, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.

**RAILWAY CLUB OF PITTSBURGH.**—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, American Club House, Pittsburgh, Pa.

**RAILWAY DEVELOPMENT ASSOCIATION.**—(See Am. Ry. Development Assn.)

**RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

**RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.**—R. J. Himmelricht, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.

**RAILWAY FIRE PROTECTION ASSOCIATION.**—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md. Annual meeting, October 18-20, Hotel Sherman, Chicago.

**RAILWAY REAL ESTATE ASSOCIATION.**—R. H. Morrison, C. & O. Ry., Richmond, Va.

**RAILWAY SIGNAL ASSOCIATION.**—(See A. R. A., Division 4, Signal Section.)

**RAILWAY STOREKEEPERS' ASSOCIATION.**—(See A. R. A., Division 6.)

**RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa. Meeting with A. R. A., Division 5.

**RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, 30 Church St., New York.

**ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Exhibit by Track Supply Association.

**ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meeting, 2d Friday in month, except June, July and August.

**SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.

**SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.

**SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, F. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

**SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, Western Ry. of Alabama, Ga.

**SUPPLY ASSOCIATION OF AMERICAN RAILWAY TROLLEY FOREMEN'S ASSOCIATION.**—C. N. Thulin, 935 Peoples' Gas Bldg., Chicago.

**TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hilburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.

**TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, 117 East 98th St., Cleveland, Ohio. Exhibit by Railway Equipment Manufacturers' Association.

**WESTERN RAILWAY CLUB.**—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Meeting third Monday each month except June, July and August.

## Traffic News

Apples, in carloads are now moving in large quantities from the Annapolis Valley, Nova Scotia, to Pittsburgh, Cincinnati, Indianapolis, Dayton, Detroit, Buffalo, Cleveland, Toledo and Philadelphia.

The Detroit, Toledo & Ironton failed to appear before the examiners of the Interstate Commerce Commission at Columbus, Ohio, on September 15, to show cause why it should be permitted to reduce interstate freight rates.

More than 19,000,000 bushels of this year's grain from the three prairie provinces of Canada, the bulk of it destined for Fort William, have been moved by the Canadian Pacific, according to a report of that company. Of this amount 17,132,372 bushels was wheat.

Fifty-eight hours from Seattle to St. Paul is the time of the latest reported run of a trainload of silk over the Northern Pacific. The train consisted of eight cars and the silk was brought from Yokohama to Seattle by the steamship "Ixion" in 13 days. The distance from Seattle to St. Paul by the Northern Pacific is 1,904 miles, which makes the rate of speed 32.8 miles an hour.

Ferry boat fares across the Hudson river, between New York and New Jersey, have been advanced by the Delaware, Lackawanna & Western, and the West Shore railroads, following similar action recently by the Pennsylvania. The rate on the West Shore boats between Cortlandt street and Weehawken is advanced from five cents to six cents, and the Lackawanna advance, single fares, is one cent.

The "Neosho plan" of advertising and cooperative sales days is to be introduced at a number of prominent places on the Central of Georgia, by cooperation of G. R. Lowe and the industrial department of the railway company. The Neosho Community Development plan, by which the merchants of a town stimulate their business with the farmers in the country tributary, was described before the Railway Development Association at its meeting in New York City last May, which was noticed in the *Railway Age* of May 20, page 1172.

The Illinois Central in its latest newspaper advertisements sets forth the reasons why freight and passenger rates can not be reduced at the present time. Labor, material, locomotives, refrigerator and other cars, and passenger coaches have all increased considerably in price over 100 per cent since 1914. Interest on borrowed capital has advanced from five per cent to seven per cent and taxes have grown 183 per cent. It states that the abolition of the transportation tax might benefit the public. The advertisements invite constructive criticism and suggestions.

The Philadelphia & Reading is not often thought of as an important trunk-line grain-carrier; but it is one to be taken into account. In the week beginning on Monday, September 12, it moved a single shipment of 321 cars, loaded at Buffalo, N. Y., and destined to Baltimore, Md. The total quantity of grain (corn) was over 500,000 bushels. It was shipped to Baltimore for export and had to be on board boat by midnight on Thursday, the 15th. It started moving from Buffalo on Monday and continued through four days, seven solid trains. The route was over the New York Central from Buffalo to Newberry Junction, Pa., over the Reading from Newberry Junction to Gettysburg, Pa., and over the Western Maryland from Gettysburg to Port Covington Elevators, Baltimore.

Frank H. Alfred, president of the Pere Marquette, in an article in the September Service, predicts a country-wide retrenchment of local passenger train service because of bus line competition. Between Howell, Mich., and Lansing, 33 miles, there is a bus line operating daily, although the Pere Marquette has five trains each way stopping at each station. The ticket agent at Howell estimates that the traffic that properly should go from Howell to Lansing by the Pere

Marquette but is now handled by the bus line, amounts to \$15 a day, from this one point alone. The patrons of the bus line put up with the greater discomfort because of the slight saving in fare. On the entire Pere Marquette system the losses of this character amount to a large sum.

The fast passenger service between New York City and Havana, Cuba, over the Pennsylvania, the Richmond, Fredericksburg & Potomac, the Atlantic Coast Line, the Florida East Coast, and the Peninsula & Occidental Steamship Line, which was in vogue prior to the war, has been restored. The Atlantic Coast Line announces that southbound train No. 85, leaving New York at 9:15 a. m., will arrive in Jacksonville at 2:40 p. m. the next day, Key West the third day at 9:10 a. m., and Havana at 5 p. m., or 55 hrs. 45 min. from New York to Havana. This is 14 hours less than the time of the best train over this route in the last preceding time table. The northbound train will be run three hrs. and 25 min. quicker than heretofore. The condensed schedule appears in the Official Guide for September, page 487.

Traffic officers of the eastern and southern railroads held a conference at Washington on September 27 with Commissioner Cox, director of Traffic Hardie and Chief Examiner Quirk of the Interstate Commerce Commission, for the purpose of discussing the possibility of an agreement to make reductions in the rates on southern hardwood lumber from the southeast as requested by the Southern Hardwood Lumber Association in a formal complaint now pending before the commission. The conference came to no result, however, because of the unwillingness of the eastern and northern lines to shrink their revenues for the purpose of stimulating the movement over the southern lines and it is understood that the case will proceed to a conclusion in the usual way on formal complaint. A hearing in the case had been set for October 4, but was postponed.

The Southwestern Industrial Traffic League, Dallas, Tex., has sent out copies of recommendations adopted by the association, urging drastic changes in the Transportation Act of 1920. Congress is asked to repeal section 15A, which provides for standardization of returns and pooling of excess earnings. It is proposed that the act be amended so as to give the Interstate Commerce Commission as much authority as it had under the act prior to the amendment as construed by the Supreme Court in the Shreveport case, and no more. The Railroad Labor Board is declared to have a tendency toward nationalization of railroads, and the League is opposed to such nationalization. Congress is also asked to amend section 11 so that members of the Interstate Commerce Commission shall be required to have at least five years' experience in traffic and transportation matters before being eligible to appointment. The Winslow railroad refunding bill was endorsed.

### Traffic Club of Chicago

The Traffic Club of Chicago passed the following resolution at a special meeting on September 16: Whereas, President Harding, by the first day of January next, will have appointed not less than seven members—a majority—of the Interstate Commerce Commission; and Whereas, it would seem that the appointing power does not always appreciate the functions that his appointees to this body must discharge, therefore, the training and knowledge they must have along special lines. Therefore, be it resolved: by the Traffic Club of Chicago, composed of over one thousand members, representing both the transportation lines and the shippers who use them, and, from the very nature of their employment, being especially competent to pass on the question here involved, That the President of the United States be petitioned, not in the interest of this or that individual or locality, but to the end that he give consideration, in making future appointments to the Interstate Commerce Commission, to the importance of a place on this body, which, to a large extent, holds in its hands the destinies of our railroads, and the prosperity of the country, in order that men, not only of good character and ability, but of special knowledge and training that adapt them for this particular work, be chosen to serve.

### Reduction in Rates on Grain in Eastern Territory

The Interstate Commerce Commission has authorized eastern trunk line and New England roads (including the states of Virginia, Maryland, Delaware, New Jersey, Pennsylvania, New York and the New England states) to reduce, on ten days' notice, freight rates on grain and grain products (domestic) from, to and between points in the states in question. It is understood that the reduced rates will range from 2 to 4 cents per 100 lb., or about 12½ per cent.

### N. I. T. League Committee Denounces Labor Board

The executive committee of the National Industrial Traffic League, at Chicago on September 23, adopted resolutions calling upon the railroads for an immediate readjustment of wages and freight rates, based upon wages and working conditions more nearly on a parity with those paid in other industrial lines. The resolutions adopted read in part as follows: "Manifestly there can be no return to normal business conditions until the price of transportation bears a proper relation to commodity value. The business of this country has been developed, and the wide distribution of commodities encouraged under freight rates that bear a proper relation to the price of each commodity, and until rates are readjusted so as to approximate such a level, it is obvious that business confidence cannot be restored. . . . The failure of the railroads to reduce their operating costs is one of the principal factors in the present economic situation. The carriers are hampered by the policy and slowness of the United States Railroad Labor Board. Any condition which prevents the employer and employee from dealing directly with each other is bad and is a fertile field for dissensions. . . . It is not fair to the carriers and to the public that the railroad employees should be given preference over other employees performing work of a similar nature in private industry and until the railway employees are placed upon a corresponding basis with those of private industries it cannot be said that the railroads are efficiently or economically operated."

TWENTY THOUSAND DOLLARS, according to report, is the sum which the Philadelphia & Reading has had to spend for printing time-tables in connection with the changes necessitated by the use of Summer Time in important cities on its lines, since last June. The New England roads could tell a similar story.

THE LONDON & NORTHWESTERN and the Great Western have, according to the Railway Gazette (London), restored their pre-war two-hour schedules for express passenger trains from London to Birmingham. The distance covered is 113 miles by the former road and 110½ by the latter, which will necessitate an average speed of 56½ and 55½ miles per hour, respectively.

Passenger Train from Mexico Entering the United States—the First Since 1913

## Commission and Court News

### Interstate Commerce Commission

The Interstate Commerce Commission has issued a decision finding the proposed increased express rates on interstate traffic from, to and between points in the state of Maine on the Bangor & Aroostook not justified. The suspended schedules were ordered cancelled and the proceeding discontinued.

The commission has suspended until January 24, the operation of a Boston & Maine tariff, in so far as it indicates an advance on existing commodity rates on iron and steel articles from Boston, Chelsea, Davenport, Gloucester, Cambridge, Clinton, Fitchburg and Worcester, Mass., to destinations on the Maine Central.

The commission has further suspended until November 27, the operation of an item in a Southern Pacific tariff which proposes to increase the rates on fresh vegetables, c. 1, from Hoover and other points in Oregon to El Paso, Tex., the operation of which was suspended until October 28, by an order previously entered.

The commission has further suspended until November 28, the operation of certain schedules published in a supplement to Agent J. E. Fairbanks' tariff which provide for the elimination of heater service for the protection of perishable traffic originating outside of the present cold weather zone when destined to points to Utah, Wyoming, Colorado, Kansas, Nebraska, Missouri, Iowa and Illinois, or on traffic originating outside of the present cold weather zone routed through these states when destined to points beyond, the operation of which was suspended until October 29, by an order previously entered.

### Conference on Rates on Fish

The commission has called a conference relative to charges for the transportation of fish and sea foods by freight and express throughout the United States, to be held at Washington, on October 10. It has been reported to the commission that the present rates on fish and other sea foods have resulted in curtailment of production. The proceeding will be of an informal character.

### State Commissions

The Georgia State Railroad Commission has adjourned until September 26, its hearing on the general question of revising discriminatory freight rates throughout the state.

### Court News

#### Intermediate Rate Taken in Computing Through Rate

In an action by the Missouri Pacific for a difference in freight charges on a shipment of flour, from Coffeyville, Kan., to Smithland, Tex., the parties agreed that, there being no through rate, the proper charge was to be made up by a combination of the lowest intermediate rates applicable to the shipment, but they disputed as to what rates should form the combination. The flour went to destination over the Missouri Pacific, the Kansas City Southern, and the Black Bayou railroads. The Kansas City Southern publishes a rate of eight cents from Texarkana to Smithland for shipments originating in Texarkana, and one of 18 cents for those coming from other points, including Coffeyville. The Circuit Court of Appeals, Eighth Circuit, holds that the 18 cent rate must be taken for shipments such as this. The question of the reasonableness of the 18-cent rate was not considered by the Court; basing its opinion on certain de-

cisions of the Supreme Court, it was held that a duly published freight rate is conclusive upon the courts, in the absence of any finding by the Interstate Commerce Commission that it is unreasonable. *Missouri Pacific v. Rea-Patterson Milling Company*, 273, Fed. 518.

#### Caretakers' Duty Under 28-Hour Live Stock Law

The Circuit Court of Appeals, Eighth Circuit, holds that under section 2 of the 28-hour law, where the railroad furnishes free transportation to caretakers, it is the duty of these caretakers to assist in unloading, feeding, watering, resting and reloading animals at rest stations; and their refusal to do so is a matter of defense to an action for loss alleged to have been due to improper handling by the railroad's employees; the bills of lading also expressly providing that the carrier should not be liable for any loss due to the act or default of the shipper or his agents.—*Atchison, T. & S. F. v. Merchants' Live Stock Co.*, 273 Fed., 130.

#### Sufficient Bridge With Curve, Grade and Railing

In an action for personal injuries sustained when the plaintiff's automobile skidded and went through the rail on the approach to a highway bridge over a railroad, the Circuit Court of Appeals, Eighth Circuit, holds that the fact that such a bridge was constructed with a curve approximately a 60-ft. arc of a circle, with a circumference of 290 ft., and having a grade downward from the center of about 3 per cent, does not authorize the inference that the bridge was negligently constructed. As to the railing on the approach, the court was of opinion that the law did not require that the railroad construct and maintain a railing that would resist and hold back the pressing power and force of an automobile.—*Medcina v. Hines*, 273 Fed., 52.

#### Railroad Not Liable for Negligence of Hospital Association

The employees of a railroad company having formed a beneficial association, each employee, on entering the company's service, agreed to become a member and that a small percentage of his salary should be turned over each month by the company to the association to build and equip hospitals; and surgeons were employed by the association. The railroad contributes \$50,000 yearly toward the hospitals, but does not control their management and makes no profit out of them. The Circuit Court of Appeals, Ninth Circuit, holds that the association is not the agent of the railroad company in furnishing medical treatment to the members, and the company was not liable to an employee for negligence in such treatment.—*Carr v. N. P.*, 273 Pac., 511.

#### Dunnage of Automobiles

##### Chargeable at Automobile Rates

The Circuit Court of Appeals, Eighth Circuit, holds that a railroad was entitled to charge at the automobile rate and not at the lumber rate for dunnage on shipments of automobiles in closed cars, consisting of the wooden braces and blocking used to keep the automobiles steady in the cars, the weight of which was separately specified in the bill of lading, both the official and western classification (covering the territory in which the shipments moved) containing a general provision that unless otherwise provided "charges shall be computed on gross weights."—*Butler Motor Co. v. Atchison, T. & S. Fe.*, 272 Fed., 683.

#### Value of Goods at Place of Delivery

##### Approved as Measure of Damages

The Massachusetts Supreme Judicial Court holds that, under the first and second Cummins Amendments, a provision in a bill of lading that loss or damage shall be computed on the basis of the value at the place and time of shipment does not apply where the value at the place and time at which the goods should have been delivered is less than the value at the place and time of shipment. The court says: "Evidently the effect of the second amendment is to limit the maximum recovery to the value stated in the bill of lading and does not affect cases where the value is less than the value stated in the bill of lading."—*Crutchfield & Woolfolk v. Hines* (Mass.), 131 N. E., 340.

## Foreign Railway News

### Nitrate Railways' Concession Held Up

The Nitrate Railways, a British company serving the nitrate oficinas in northern Chile, was on June 30 granted a concession for 50 more years of operation together with a 35 per cent increase in rates, according to Commerce Reports. This concession, which was granted by ministerial decrees, has been suspended pending the determination of its legality.

### New Trunk Line in Norway

A new trunk line railway from Christiania north to Trondhjem was recently completed, according to the Times (London). This line was commenced in 1909 and is built almost entirely through mountainous country. A number of tunnels and some 41,000 yards of snow sheds were involved in the work. The highest point reached by the new line is 3,160 ft., which is 900 ft. lower than the highest point on the narrow gauge line which the new road displaces.

### Direct Current Recommended for

#### Electrification in Netherlands

The commission appointed in January, 1920, to study the desirability of electrification of all railways in Holland has prepared a report which, it is understood, not only favors such a scheme but recommends the use of 1,500 volts direct current, according to the Electrical World. It is also recommended that the electrification be made in connection with the proposed unification of electric light and power service throughout the country. There is no indication, however, that this work will be undertaken in the near future.

### Electrification of Railroads in Madagascar

The governor general of Madagascar has decided to electrify the railroads of that colony from Tananarive to Tamatave, according to Commerce Reports. A hydro-electric power station will be built on the Vohitra river to furnish a maximum power of 30,000 horsepower. The length of the line is 93 miles and the total cost of the installations will reach \$4,620,000. Assistant Trade Commissioner F. G. Singer, who furnished this information, states that the governor general is also considering the electrification of the future railroad from Diego-Saurez to Joffre Ville, a road about 22 miles in length.

### High Cost of Motor Transportation in Africa

"Motor roads we have in plenty," says the governor of Britain's Gold Coast Colony in the African World. "In fact we have in the whole of the Gold Coast about 3,000 miles of motorable roads open to traffic. That is to say, 700 miles are open all the year round, but the remainder are necessarily closed for a couple of months during the height of the rains. The motor roads, although they have served very well in the past, form an up-to-date system of transport for nothing but short distances. The cost of construction and maintenance is very high; the cost of running lorries (motor trucks) on them is also high.

"As an example, the following are the comparative costs of conveying one ton (2,240 lb.) one mile on the Gold Coast:

By CARRIERS—3s. 6d. (approximately 87 cents) a Ton Mile.  
By FORD LORRY Carrying 15 cwt. (1,680 lb.)—3s. (approximately 75 cents) a Ton Mile.  
By FORD LORRY Carrying 15 cwt. and Pulling a Trailer Carrying 10 cwt. (25 cwt. equals 2,800 lb.)—2s. (approximately 50 cents) a Ton Mile.  
By MAXIMUM LORRY Carrying Altogether About 2 Tons (4,480 lb.)—1s. 6d. (approximately 37 cents) a Ton Mile.  
By RAILWAY—3¼d. (approximately 9.5 cents) a Ton Mile.

"A study of the above figures will convince anyone that the railways are the only means of transportation. Railways in the Gold Coast cost about £17,000 (somewhat under \$85,000) a

mile to build and equip with the present cost of materials; a motor road strong enough to take 2-ton lorries will cost £3,000 (approximately \$15,000) a mile to build and between £400 and £500 (i. e. \$2,000 and \$2,500) for upkeep. With railways direct revenue comes in; with roads expenditure goes out.

"The routes of all the new railways which the Gold Coast requires have been approximately laid out with a view to tapping those districts which are most in need of transportation, and the topographical survey of the country to determine the best routes is in hand."

### Americans to Build Railway in Bolivia

The American International Corporation, together with a group consisting of Stone and Webster, Marshall Field, Glore, Ward and Company and the Ulen Contracting Corporation, have entered into a contract with the Bolivian government for the construction of a railway 128 miles in length, connecting the railways of Bolivia with those of Argentina, according to the Wall Street Journal. As has been noted in these columns, the Ulen Contracting Corporation already had the contract for this construction, but details of finance had not been worked out. With the entrance of the other American companies into the agreement, this part of the work is taken care of. The new line will extend from Atocha, Bolivia, to Villazon, on the Argentine frontier, and will provide, with existing railways, a transcontinental route from the Pacific to Buenos Aires. The American companies will purchase \$7,000,000 of Bolivian 8 per cent bonds, the proceeds of which will be used to cover construction costs. These bonds will be payable as to principal and interest in the United States and are secured by a first lien on export duties on rubber and minerals and an absolute mortgage on the railway.

### Brazilian Market for Railway Equipment

Commercial Attaché W. L. Schurz, at Rio de Janeiro, calls attention in Commerce Reports to the difficulties being experienced in connection with the railways of Brazil. Since 1914 new construction has been limited and only restricted quantities of rolling stock purchased, with the result that the present mileage and somewhat deteriorated equipment are entirely inadequate for the growing needs of the country. A crisis has developed in the Rio Grande railway system where the farms of the interior have produced more than the carrying capacity of the railways. Similar troubles are experienced in other districts. More or less additional equipment is needed for all the lines, of which there is a total of 17,477 miles—a little less than was in the United States in 1855, and also slightly more than is now in Texas.

Both the government and private railways are unable to purchase the rolling stock or make the extensions so urgently needed, although some new purchases are under consideration and a small amount of new construction in progress. This inability is due to the following conditions: (1) Reduced receipts, resulting from reduced foreign trade, and the fact that public sentiment opposes any increase in the rates; (2) reduced value of the currency as compared with the pound or dollar, the currencies of the countries that would probably supply the materials required.

Although the present market for rolling stock is obviously far below the actual needs of the country, it is still important. Approximately 50 steam and electric locomotives have recently been shipped from factories in the United States or are in course of construction here. Further electrification and more business are expected.

The market for rolling stock is at present largely limited to the Rio Grande system (government owned); the three lines of the state of Sao Paulo, viz., the Paulista, the Mogiana, and the Sorocabana; the Central of Brazil (government owned); and the Inspectoria Federal das Obras Contra as Secacas. The last-mentioned is the administrative bureau in charge of the reclamation projects being carried out in Cearé and the adjoining states. The Noroeste, the Oeste de Minas, the Viacao Bahiana, and the Ferrocarril de Goyaz have all had certain sums placed at their disposal from the Federal budget for the purchase of limited quantities of materials. Other business would develop rapidly if the financial and legal obstacles could be overcome.

## Railway Project to Connect Brazil and Paraguay

The long-standing project for a railway to connect Paraguay and Brazil has lately been revived and is being actively prosecuted in both countries, according to information from Commercial Attaché W. L. Schurz, published in Commerce Reports. The projected line would give Paraguay an alternative outlet to the Atlantic, thereby freeing it from its present dependence on Argentina and generally improving its international position. On the other hand, the railway would open the Paraguayan market to the Paulista manufacturing interests and create a stronger current of trade between Brazil and the northeastern provinces of Argentina.

Recently the project took concrete form in the Brazilian Congress in a bill granting to the state government of either Sao Paulo or Parana a concession to build a line from Santa Cruz do Rio Pardo, the terminus of one of the lines of the Sorocabana railway system, to some point on the Rio Parana between the Guayra Falls and the mouth of the Iguassu, and also to build another connection from Guarapuva to some point on the main line to be constructed, thus offering another outlet by way of Curitiba to the Atlantic at Paranaguá. This concession would carry with it a subsidy of \$44,000 a mile. In case neither state should show a disposition to utilize the proposed concession within three months from the date of the passage of the law, the concession would be offered to the highest bidder. Should no offers be made by private interests, the government would construct the line.

It is claimed that as a connection between Sao Paulo and Corrientes the proposed route would offer an economy of 684 miles over the present roundabout route by Buenos Aires, and would soon correct the unfavorable trade balance suffered by Brazil in its commerce with Argentina. There are several different schemes being advanced by the various promoters, however, so that it is possible that the bill will be altered before it is finally enacted.

## Westinghouse Reported to Have

### Received Large Chilean Contract

The Westinghouse Electric International Company has announced that it has received final confirmation of the contract to supply the equipment for electrifying the Chilean State Railway between Valparaiso and Santiago and to Los Andes, according to the Wall Street Journal.

The contract received from the Chilean government through the company's Chilean agents, Errazuriz, Simpson & Co., associated with Spruille Braden, of New York, continues the Wall Street Journal, covers the most important railway electrification since the beginning of the war and the largest ever undertaken by an American firm outside of the United States. The main line, which is 116 miles long and is now under steam operation, is the most important in Chile. It connects the leading seaport, Valparaiso, with the capital, while the line to Los Andes is 28 miles long and forms the Chilean end of the transcontinental route to Buenos Aires.

The contract, which has a total value of \$7,000,000, was secured in spite of keen competition from German and other European concerns. The award was given to the American firm because of its more complete and accurate engineering analysis of the proposition as well as its lower price.

The equipment to be furnished consists of 11 passenger locomotives, 15 road freight locomotives and 7 switching locomotives, together with five sub-stations of 4,000 k. w. each. The 3,000-volt direct current system will be used and all standards will be strictly American in character. Capacity of this equipment will be 50 per cent greater than the present traffic demands, and the plans have been so drawn that an increase of traffic capacity to three times the present amount can be readily obtained. Owing to the abundance of water power in Chile and the high price of fuel, practically all of the Chilean railways will probably eventually be electrified and the present project is the first step in this process.

Other American concerns that will participate in additional awards for the requirements of the Chilean railways, according to the Wall Street Journal, are the American Locomotive Company, the Pressed Steel Car Company and the Anaconda Copper Mining Company.

## Equipment and Supplies

### Freight Cars

THE CHICAGO, ROCK ISLAND & PACIFIC has awarded a contract for the repair of 125 steel gondola cars to the Bettendorf Company, Bettendorf, Ia.

THE PITTSBURGH & LAKE ERIE has awarded a contract for the repair of 1,000 freight cars to the Standard Steel Car Company, Pittsburgh, Pa.

THE CHICAGO, MILWAUKEE & ST. PAUL has awarded a contract for the repair of 300, 50-ton composite gondola cars to the Bettendorf Company, Bettendorf, Ia.

THE CHICAGO, MILWAUKEE & ST. PAUL has awarded a contract for the repair of 100 composite gondola cars to the Western Steel Car & Foundry Company, Chicago.

### Iron and Steel

THE WESTERN MARYLAND TERMINAL has awarded a contract for 274 tons of steel for an elevator at Baltimore, Md., to the Pittsburgh Bridge & Iron Company, Pittsburgh, Pa.

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon October 12, for its present requirements of frogs, new metal hopper beams for hoppers of locomotive coaling plants, steel required for repairs to the Hudson River freight bridge and miscellaneous materials for repairs to turntables.

### Miscellaneous

THE NEW YORK CENTRAL, Lines East of Buffalo, will receive bids up to 12 noon, October 7, for its requirements up to January 1, 1922, of the following: Fuel oil, kerosene, long burning semaphore oil, turpentine substitute, coach candles, mineral seal oil, common black oil, West Virginia black oil and gas oil.

THE U. S. LIGHT & HEAT CORPORATION, Niagara Falls, N. Y., recently received several orders from the railroads including the following: Atchison, Topeka & Santa Fe, 50 2 kw. car lighting devices and 50 batteries; Car Brothers, New York, agent for the Mexican Railway six, 4 kw. devices with 6 batteries, and the Norfolk & Southern, five, 1½ kw. devices.

### Railway Construction

ATLANTIC COAST LINE.—This company has awarded a contract to R. N. McEachern, Moultrie, Ga., for the construction of a one-story brick freight warehouse, 36 ft. by 188 ft., and a cotton shed, 36 ft. by 378 ft., at Bishopville, S. C.

CHICAGO UNION STATION.—This company, which was noted in the *Railway Age* of September 10 (page 510), as accepting bids for the substructure for a viaduct at Madison street, Chicago, has awarded a contract for this work to the Underground Construction Company, Chicago. The company has also awarded a contract to George P. Cullen, construction contractor, Chicago, for the structural work in widening Canal street, between Jackson Boulevard and Van Buren street, Chicago.

GRAND TRUNK.—This company has undertaken the construction of a subway with concrete abutments and steel span at Yonge street, Aurora, Ontario, and has awarded a contract to the Hamilton Bridge Works, Hamilton, Ontario, for the steel superstructure, erection of which will be handled by company forces.

ILLINOIS CENTRAL.—This company will receive bids until October 3 for the construction of a pipe line, well, and pumping station at Flossmore, Ill.

**ILLINOIS CENTRAL.**—This company contemplates the erection of permanent car repair sheds at McComb, Miss., to replace those destroyed by fire.

**JACKSONVILLE TERMINAL COMPANY.**—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the erection of an electric cinder conveyor at Jacksonville, Fla.

**KANSAS CITY, MEXICO & ORIENT.**—This company in conjunction with the National Railways of Mexico, contemplates the construction of an international bridge spanning the Rio Grande between Del Rio, Tex., and Las Varas, Mex.

**LOS ANGELES & SALT LAKE.**—This company has applied to the Interstate Commerce Commission for certificates authorizing an extension of its Santa Ana branch in California for a distance of fourteen miles, and also for a new line extending from its branch from La Habra east and south to Tustin, Orange County, 21.8 miles.

**MISSOURI PACIFIC.**—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for five pumping stations and water treating plants to be erected at Alexandria, La., Annapolis, Mo., Hoxie, Ark., McGehee, Ark., and Van Buren, Ark., to cost approximately \$135,000.

**OKLAHOMA & ARKANSAS.**—The Interstate Commerce Commission has issued a certificate authorizing this company to construct a line from an intersection with the Kansas, Oklahoma & Gulf near Salina, Okla., in a generally easterly direction for approximately 20 miles.

**OKLAHOMA & ARKANSAS.**—This company has awarded a contract for the construction of a 40-mile line from Salina, Okla., to Kansas, Okla., to J. W. Hoffman, Kansas City, Mo. The right-of-way is now being acquired and construction work will begin about October 1.

**PITTSBURGH & WEST VIRGINIA.**—This company has awarded a contract for a 150-ton, two-track, concrete coaling station with sand storage drying, elevating and delivery equipment at Avella, Pa., to the Ogle Construction Company, Chicago.

**QUEBEC EXTENSION.**—This company, of which A. R. Gould, Presque Isle, Me., is president, is contemplating the construction of a line from Washburn, Me., to Frontier Lake, Quebec. This company has 12 miles of road in operation at the present time and will probably begin active work on the new line next season. The work will involve the construction of two steel bridges, 500 ft. and 600 ft. in length, and a number of trestles.

**SAN ANTONIO & ARANSAS PASS.**—This company contemplates the construction of a hollow tile passenger depot at Taft, Tex., to cost about \$11,000, and a hollow tile combination freight and passenger depot at Poth, Tex., to cost about \$8,300.

**SEWELL VALLEY.**—This company is contemplating the erection of a shop building at Rainelle, W. Va., to have an erecting aisle approximately 60 ft. by 120 ft., and a machinery aisle 30 ft. by 120 ft., to be equipped with an electric crane of 25 or 30 tons' capacity covering the entire main erecting aisle.

**SOUTHERN PACIFIC.**—This company has started the construction of a 420-ft. extension to the grain elevator gallery of its Sunset elevator on Pier "A" at Galveston, Tex., equipping this gallery with a 36-in. belt. The work will be done by company forces, and the entire cost of the work is estimated at \$41,000.

**ST. LOUIS-SAN FRANCISCO.**—This company will receive bids until October 1, for the erection of a machine shop at St. Louis, Mo.

**TEXAS & PACIFIC.**—This company, which was noted in the *Railway Age* of September 3 (page 469), as receiving bids for the construction of a new passenger station at Ranger, Tex., has awarded the contract for this work to Henger & Chambers Company, Dallas, Tex.

A NEW DRY DOCK, now being built by the Government at Esquimalt, British Columbia, will be able to accommodate the largest vessels afloat. It will have a total length of 1,150 ft., a width of 120 ft. on sill and of 135 ft. on the coping level. The depth of the sill will be 40 ft. The dock will be built of concrete and granite.

## Supply Trade News

William C. Wolfe has been appointed manager of sales of the Highland Iron & Steel Company, Terre Haute, Ind., a subsidiary of the American Chain Company. Mr. Wolfe's headquarters will be at 208 South La Salle street, Chicago.

G. H. Redding has been elected secretary of the Massey Concrete Products Corporation, succeeding F. C. Shannon, formerly vice president and secretary, and the position of vice-president will remain unfilled for the time being. David A. Hultgren, has been appointed resident manager at Chicago, for the company.

Henry J. Kimman who, since 1902, has been manager of the Cleveland plant of the Chicago Pneumatic Tool Company, died in Cleveland, Ohio, on September 7. Mr. Kimman was born in Harlem, Holland, in 1863 and came to America with his parents in 1870, settling in Chicago. He served an apprenticeship with the Adams & Westlake Company and other manufacturing concerns in Chicago and in the far west. In collaboration with his brother, T. P. Kimman, he developed and manufactured the first practical portable piston air drill. He became associated with E. N. Hurley in 1898, in the formation of the Standard Pneumatic Tool Company, and with the Chicago Pneumatic Tool Company in the consolidation of pneumatic tool interests in 1901, at which time he became manager of the Cleveland plant of the Chicago company. He remained in active charge of the plant until his death.

## Obituary

Henry Eliot, Jr., president of the Eliot Frog & Switch Company, East St. Louis, Ill., died at his home at St. Louis, Mo., on September 9, from the effects of a cerebral hemorrhage.

## Trade Publications

**LIGHTING DATA.**—The Lighting Service Department of the Edison Lamp Works of the General Electric Company has issued a new series of bulletins on the general subject of electric lighting with titles as follows: Reflectors for Incandescent Lamps, The Lighting of Printing Plants, Lighting for Outdoor Sports, Ship Lighting, Railway System Lighting, Buildings and Yards and Lighting for Indoor Recreations. The numbers of these bulletins are respectively, LD123, LD125, LD126, LD127, LD128 and LD129. They are profusely illustrated, contain from 16 to 34 pages each and the information given on each subject is quite complete.

## Railway Financial News

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**Authorized to Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$811,000 series A, and \$2,689,000 series B, 6 per cent refunding and improvement mortgage bonds to be pledged as collateral security for a 6 per cent promissory demand note for \$3,500,000 issued to the director general of railroads in payment of indebtedness to the United States for additions and betterments made during the period of federal control.

**CUBA RAILROAD.—Annual Report.**—The income statement for the year ended June 30, 1921, compares with the previous year as follows:

	1921	1920
Gross earnings	\$15,853,959	\$14,149,108
Operating expenses	14,210,562	10,601,476
Net earnings	1,643,397	3,547,632
Other income	145,272	157,240
Gross income	1,788,669	3,704,872
Interest on funded debt	1,475,711	1,264,705
Net income	312,958	2,440,167

**GAINESVILLE & NORTHWESTERN.—Asks Loan From Revolving Fund.**—This company has applied to the Interstate Commerce Commission for a loan of \$75,000 for five years from the revolving fund to enable it to retire outstanding indebtedness.

**GREAT NORTHERN.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**GRAND TRUNK.—Shareholders to Appeal.**—The shareholders of this company have decided to appeal to the Privy Council against the recent finding of the board of arbitration declaring the common and preferred stocks of the railway valueless. (See *Railway Age* of September 10, 1921, page 511.)

**MILLEDGEVILLE.—Authorized to Issue Stock.**—This company has been authorized by the Interstate Commerce Commission to issue \$30,000 of common stock and to exchange it for a like amount of the company's outstanding first mortgage bonds.

**NEW YORK CENTRAL.—Operating Contract Approved.**—The Interstate Commerce Commission has issued an order approving and authorizing the execution of a new contract whereby the Boston & Albany, through its lessee, the New York Central, operates the line of the Providence, Webster & Springfield.

**SOUTHERN.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue and sell \$5,655,000 of first consolidated mortgage 5 per cent gold bonds payable July 1, 1994, for the purpose of providing funds for the retirement of a like amount of first mortgage 6 per cent gold bonds of the Georgia Pacific maturing January 1, 1922. The application states that negotiations for the sale of the bonds have been postponed until action has been taken by the commission, but that it is proposed to sell the bonds at not less than 81 and accrued interest.

**SOUTHERN PACIFIC.—Subsidiary Leases Texas State Railroad.**—(See Texas & New Orleans.)

**SUGAR PINE.—Authorized to Abandon Line.**—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon its line from Ralph to Lyons Dam, Calif., a distance of 14.15 miles.

**TEXAS & NEW ORLEANS.—Authorized to Lease Texas State Railroad.**—The Interstate Commerce Commission has authorized this company to lease the Texas State Railroad. (See *Railway Age*, September 10, 1921, page 512.)

The Texas & New Orleans agrees that in determining operating revenue there shall be credited to the State no division lower than the present basis of division to the Texas State Railroad, and on traffic not now covered by division sheets, that may hereafter arise, the relative proportion of divisions shall not be lower than the divisions which now obtain. The company is not to charge any portion of overhead or general expenses of any officers above the grade of division superintendent; such expenses

as are charged shall be prorated on train mileage basis. Suitable reserve may be created currently by the T. & N. O., and set up in the accounts to cover liabilities of operation. At the termination of this contract any reserve funds so accumulated will, after settlement of all liabilities for which the reserve was created, be divided equally between the State and the company.

**TEXAS STATE RAILROAD.—Leased to Texas & New Orleans.**—(See Texas & New Orleans.)

**WESTERN MARYLAND.—Authorized to Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to procure the authentication and delivery to its treasurer of \$1,500,000 of first and refunding mortgage 5 per cent gold bonds and to pledge \$1,527,000 of such bonds with the Secretary of the Treasury as security for a loan from the United States.

**WHEELING & LAKE ERIE.—Asks Authority to Pledge Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue and pledge \$125,000 of 6 per cent refunding mortgage bonds to be pledged as collateral for a loan from the United States government and also for authority to repledge \$924,000 of refunding mortgage 5 per cent bonds as collateral for the renewal of short term notes.

**WYOMING & MISSOURI RIVER.—Sold.**—This road, which operates between Aladdin, Wyo., and Belle Fourche, S. Dak., 18 miles, has been sold to Mahlon S. Kemmerer of Mauch Chunk, Pa., for \$51,200. The sale was ordered to satisfy a federal court judgment of \$348,000 held by Mr. Kemmerer.

### Railroad Administration Settlements

The U. S. Railroad Administration reports the following final settlements and has paid out to the several companies the following amounts: Merchants & Miners' Transportation Company, \$600,000; New York, Ontario & Western, \$500,000; Sharpsville, \$14,403; New Mexico Central, \$31,394; Gulf, Florida & Alabama, \$29,100.

### Offering of Equipment Trusts

The equipment trust certificates sold by the Railroad Administration to various bankers are being offered to the public at prices to yield 5.75 to 5.80. The sale of these certificates was noted in the *Railway Age*, issues of September 17 and 24, 1921, pages 530 and 558, respectively. See also an article on another page of this issue entitled "Additional Sales of Equipment Trust Certificates."

### Treasury Payments to Railroads

Since last announcement, dated September 19, 1921, payments under Sections 204, 209, 210 and 212 of the Transportation Act, 1920, as amended, have been made by the Treasury as follows:

Alabama & Mississippi	\$60,295
Georgia Coast & Piedmont	40,000
Fernwood, Columbia & Gulf	6,000
Norfolk Southern	50,000

Total.....\$156,295

Total payments to September 24, 1921, follow:

(a) Under Section 204, for reimbursement of deficits during federal control	\$1,354,340
(b) Under Section 209:	
(1) To carriers to which final payment of the guaranty has been made under paragraph (c) including previous advances under paragraphs (b) and (i)	1,690,115
(2) For advances under paragraphs (b) and (i) to carriers as to which a certificate for final payment has not been received by the Treasury from the Interstate Commerce Commission	262,950,874
(c) Under Section 212:	
(1) For partial payments in respect to the guaranty provided in Section 209	165,817,775
(2) For partial payments in respect to the reimbursement for deficits during the period of federal control provided in Section 204	1,751,941
(d) Under Section 210, for loans from the revolving fund of \$300,000,000 therein provided	246,411,467
Total	\$3,070,766,412

### Dividends Declared

Kansas City Southern.—Preferred, 1 per cent, quarterly, payable November 15 to holders of record September 30.  
New York, Ontario & Western.—Common, 2 per cent, payable November 17 to holders of record October 8.  
Norfolk & Western.—Adjustment preferred, 1 per cent, quarterly, payable November 19 to holders of record October 31.  
Western Pacific.—Preferred, 1½ per cent, quarterly, payable October 17 to holders of record October 8.

# Annual Report

## Cleveland, Cincinnati, Chicago & St. Louis Railway Company—Thirty-Second Annual Report

To the Stockholders of

THE CLEVELAND, CINCINNATI, CHICAGO AND ST. LOUIS RAILWAY COMPANY:

The Board of Directors herewith submits its report for the year ended December 31, 1920, with statements showing the income account for the year and the financial condition of the company.

The operation and maintenance of the company's road were continued under federal control until 12:01 o'clock a. m. of the first day of March, 1920, at which time the company resumed the operation of its railroad property. The Board of Directors at its meeting of March 10, 1920, authorized the acceptance on behalf of the company of the guaranty provisions of Section 209 of the Transportation Act, approved February 28, 1920, and such acceptance was filed with the Interstate Commerce Commission before March 15, 1920, as provided by the Act. The effect of this was that for the six months to September 1, 1920, the company was guaranteed in its contract with the Government as annual compensation.

The Interstate Commerce Commission by its order of July 29, 1920, granted an increase, effective August 26, 1920, in freight rates in eastern group territory of 40 per cent and of 33 1/3 per cent between points in group territory of 40 per cent and of 33 1/3 per cent between points in western group territory and other territories. It also granted an increase in passenger rates of 20 per cent, with a surcharge on Pullman fares of 50 per cent accruing to the carriers. These increases were not immediately allowed by several of the States as to interstate rates, so that the full effect of the advance was not measured by the percentages for interstate traffic, although, in most instances they were subsequently allowed under further orders of the Commission.

For the full year 1920, the freight and passenger revenues showed marked advance over the previous year. The return, however, was not as great as it would have been under normal business conditions, due to the fact that the greater part of the tonnage increase was carried in relatively low rates. The principal source of additional tonnage was in shipments of coal and other products of mines, these constituting an increase of 4,500,000 tons out of a total increase of 5,249,000 tons.

The number of passengers carried during the year increased 1,007,609, the increase being practically all in local and commuter passengers. This is reflected in the decrease of 3.6 miles in the average distance each passenger was carried. The advance in passenger rates, however, under order of the Interstate Commerce Commission, increased the average receipts per passenger per mile from 2.705 cents to 2.870 cents.

New industries located along the line of the company in 1920 wld, it is estimated, increase its traffic by over 100,000 carloads, yielding several million dollars in revenue.

In the matter of payment for transportation of mail, which had been before the Interstate Commerce Commission for some time, an order was entered by the Commission in January, 1920, establishing increased rates from November 1, 1916, which, under the same order were increased 25 per cent on January 1, 1918. Under this order the company received as additional compensation for the period November 1, 1916, to December 31, 1917, approximately \$655,000, while the Railroad Administration received, as its share for the period of federal control, \$992,000.

The substantial increases in pay and the changes in working conditions during and since federal control have created a situation which is giving the company great concern. Besides the actual increases in wages granted by the Director General or ordered by the Labor Board, there have been reclassifications of employees and special allowances which entail additional expense without compensating return in labor performance which provides that employees who are required to check in and out on their own time will be paid one hour extra at the close of each week, and under rule 3 in the same agreement which provides 20 minutes without loss of pay for lunch, the company incurs a substantial additional annual expense. The abolition of piece work in the shops of the company has also been the cause of heavy additional expense.

The condition of the company's equipment at the end of federal control has caused an unusual outlay for repairs, which are still under way. There was a substantial increase in the cost of fuel.

Final settlement of accounts with the Railroad Administration for the period of federal control has not been effected, but the company is actively engaged in the preparation of the data necessary for use in connection with the making of such a settlement.

The settlement with the United States Government for the guaranty provision of the Transportation Act, is progressing.

—six months, March to August, 1920—in connection with the guaranty provision of the Transportation Act, is progressing.

The following is a comparative table of the mileage operated:

	1920	1919	Increase or decrease Miles
Main line and branches owned.....	1,693.03	1,693.03	—
Proprietary line .....	.78	126.09	—125.31
Leased lines .....	205.10	204.43	—0.67
Lines operated under contract.....	326.68	301.37	125.31
Lines operated under trackage rights.....	195.56	183.61	12.23
Total road operated.....	2,421.45	2,408.53	12.92

In view of the status of foreign exchange, the Board of Directors authorized the purchase in France of this company's 4 per cent European Loan Bonds due in 1936, of which \$50,000 francs net value were sold in 1920, the company realizing net proceeds of \$5,583,286.12. During 1920 there were acquired 32,346,000 francs par value of these bonds, equivalent at the normal exchange rate (\$1.813 francs to the dollar) to \$6,242,834.81, at a total cost of \$2,149,253.

Provision was made for financing the cost of 2,000 freight cars and 35 locomotives allotted to the company, during federal control, by the Director General of Railroads, all of which have been delivered, through an equipment trust (known as Equipment Trust No. 44) established by an equipment trust agreement dated January 15, 1920, providing for the payment of 75 per cent of the cost of the equipment in the company's 6 per cent equipment notes, dated January 15, 1920, maturing in equal annual installments over a period of 15 years, the balance to be paid by the company, to be deducted from the equipment depreciation and retirement credits arising in the company's favor under the standard contract with the Director General. The total cost of the equipment will amount to approximately \$6,843,500. The amount of the notes issued is \$5,130,000. In addition to the equipment allocated to it by and acquired from the Director General of Railroads, the company is to receive from the New

York Central Railroad Company, under sublease, 70 locomotives, 55 passenger-train cars and 3,100 freight-train cars, covered by that company's equipment trust of April 15, 1920. The sublease to this company provides that the sub-lessee shall assume its pro rata share of the equipment trust certificates, principal and interest, and expenses of the trust, and shall pay that part of the cost of the sublet equipment which is not financed through the trust, and that it shall, upon the fulfillment of the trust, become the owner of the equipment sublet to it. The estimated cost of this equipment is \$15,227,995.43 and this company's share of the certificates to cover approximately 75 per cent of the cost is \$11,416,671. Of the remainder of the cost, \$3,415,000 was obtained from the New York Central Railroad Company as a loan. For this and for \$529,000 obtained from the same source for additions and betterments to equipment, the company gave its fifteen 6 per cent notes maturing in equal installments December 23, 1921-35, aggregating \$3,944,000.

On its ten-year promissory note dated December 23, 1920, given to the New York Central Railroad Company, this company borrowed for additions and betterments to way and structures \$4,560,000.

The company also borrowed from the New York Central Railroad Company \$113,000, giving therefor its ten-year 6 per cent note secured by the pledge of a like note given to this company by the Cincinnati Northern Railroad Company to provide it with money for additions and betterments.

During the year the company's notes of a maturity of more than two years and equipment trust obligations were increased as follows:

Equipment Trust No. 44 of January 15, 1920 notes.....	\$5,130,000.00
C. C. & St. L. Ry. Co. proportion of N. Y. C. R. R. Co. Equipment Trust of April 15, 1920, certificates .....	11,416,671.00
Fifteen promissory notes of the C. C. & St. L. Ry. Co., dated December 23, 1920, given, given to the N. Y. C. R. Co., due serially at intervals of one year.....	3,944,000.00
Ten-year promissory notes of the C. C. & St. L. Ry. Co., dated December 23, 1920, given to the N. Y. C. R. R. Co.....	4,673,000.00
	\$25,163,671.00

The following bonds were retired during the year:

C. I., St. L. & C. Ry. Co. general first mortgage bonds retired .....	\$81,000.00
C. I., St. L. & C. Ry. Co. first consolidated mortgage bonds retired .....	562,000.00
C. C. & St. L. Ry. Co. (St. Louis Division) first collateral trust mortgage bonds purchased for sinking fund .....	53,000.00
Central Grain Elevator Co. bonds retired....	26,000.00
	722,000.00

Payments falling due during the year and on January 1, 1921, were made on the company's liability for certificates issued under equipment trust agreements as follows:

N. Y. C. Lines Trust of 1907, installment due November, 1920.....	\$246,689.81
N. Y. C. Lines Trust of 1910, installment due January, 1921.....	199,625.82
N. Y. C. Lines Trust of 1912, installment due January, 1921.....	159,890.20
N. Y. C. Lines Trust of 1913, installment due January, 1921.....	116,733.71
Big Four Railway Trust of 1914, installment due June, 1920.....	373,000.00
Big Four Railway Trust of 1915, installment due July, 1920.....	115,000.00
Big Four Railway Trust of 1917, installment due June, 1920.....	237,000.00
	1,447,939.54

There were nominally issued during the year and pledged as collateral for the ten-year note for \$3,560,000 given to the New York Central Railroad Company, \$4,560,000 of this company's refunding and improvement 6 per cent mortgage bonds, series B.

In addition to the notes mentioned above, the following notes of a maturity of two years or less appear on the balance sheet:

The New York Central Railroad Company.....	\$4,000,000.00
Banks and trust companies.....	3,425,000.00
Total .....	\$7,425,000.00

### SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

	Year ended Dec. 31, 1920	Year ended Dec. 31, 1919	Increase or decrease
Compensation accrued for the possession, use and control of the property of this company and its leased lines, as stated in contract with the Director General of Railroads—January 1 to February 29, inclusive.....	\$1,656,432.88		
Additional compensation accrued account completed additions and betterments—January 1 to February 29, inclusive .....	49,122.10		
Guaranteed net railway operating income under section 209 of Transportation Act of 1920—March 1 to August 31, inclusive.....	\$5,153,038.52		
Less operating income items audited March 1 to August 31, inclusive, applicable to the period prior to January 1, 1918 .....	93,325.40		
	\$5,059,713.12		

Net railway operating income— —corporate account—Sep- tember 1 to December 31, inclusive .....	\$,064,107.44		
Total (compared with com- pensation accrued in 1919 under contract with Director General of Railroads) .....	\$11,829,375.54	\$10,427,350.68	\$1,402,024.86
Miscellaneous non-operating Revenues .....	\$27,480.19	\$25,913.01	\$1,567.18
Expenses and taxes .....	24,241.34	20,451.30	3,790.04
Net income .....	\$3,238.85	\$5,461.71	—\$2,222.86
Other Income— Miscellaneous rent inc. me. Miscellaneous non-operating physical property .....	\$257,544.45 157,995.48 70,705.90 318,492.54	\$204,241.48 99,574.65 70,705.92 72,762.63	\$53,302.97 \$8,420.83 —\$2,002.02 246,229.89
Income from funded securities Income from unfunded securi- ties and accounts .....	810,281.07 4,925.57	304,768.87 1,545.89 4,662.51	505,512.20 —66.04 263.06
Released premiums on funded debt .....	1,479.85	1,545.89	—66.04
Miscellaneous income .....	4,925.57	4,662.51	263.06
Total other income .....	\$1,621,424.86	\$757,761.97	\$863,662.89
Gross income .....	\$13,454,039.25	\$11,190,574.36	\$2,263,464.89
Deductions from Gross Income— Rent for leased roads .....	\$235,267.08	\$516,740.45	—\$281,473.37
Miscellaneous rents .....	146,613.00	150,836.37	3,973.37
War taxes accrued .....	164,200.00	185,678.78	—21,478.78
Miscellaneous tax accruals ..	25,580.00	10,123.45	15,456.55
Separately operated properties —loss .....	56,566.93	1,707.22	54,859.71
Interest on funded debt .....	5,957,003.16	4,919,060.03	1,037,943.13
Interest on unfunded debt ..	680,838.22	961,709.43	—280,871.21
Amortization of discount on funded debt .....	128,693.67	49,569.01	79,124.66
Maintenance of investment organization .....	254.01	514.47	—260.46
Miscellaneous income charges	33,278.08	32,806.77	471.31
Corporate general expenses ..	36,359.88	204,108.42	—167,748.54
Total deductions from gross income .....	\$7,464,654.03	\$7,032,604.40	\$432,049.63
Less revenues and expenses applicable to the period prior to January 1, 1918, settled for account of the corporation by the United States Railroad Adminis- tration .....	100,606.07	3,580,183.52	—3,479,577.45
Net corporate income .....	\$5,888,779.15	\$577,786.44	\$5,310,992.71
Disposition of Net Income— Dividends declared (5 per cent each year on pre- ferred capital stock) .....	\$499,925.00	\$499,925.00	
Sinking funds .....	35,174.00	33,135.66	\$2,038.34
Investment in physical prop- erty .....	30,341.41	9,720.38	20,621.03
Total appropriations of in- come .....	\$565,440.41	\$542,781.04	\$22,659.37
Surplus for the year .....	\$5,323,338.74	\$35,005.40	\$5,288,333.34
Profit and Loss Account— Balance to credit of profit and loss, December 31, 1919 .....			\$10,724,270.81
Additions: Surplus for the year 1920 .....		\$5,323,338.74	
From United States Government in adjust- ment of mail pay for years 1916-1917 ..		253,175.21	
Accumulated unrelending overcharges ..		83,836.96	
Reacquisition of securities below par .....		33,780.20	
Sales of land .....		5,544.32	
Unclaimed wages and pensions, 1914 .....		5,386.42	
			\$16,432,632.66
Deductions: Unaccrued depreciation prior to July 1, 1907, on equipment retired during 1920 ..		\$153,749.01	
Road property abandoned .....		34,547.23	
Adjustments of sundry accounts (net) .....		9,084.26	
			197,380.50
Balance to credit of profit and loss, De- cember 31, 1920 .....			\$16,235,252.16

Pursuant to an agreement, dated February 19, 1920, between the company and the bondholders' Committee of the Evansville & Indianapolis Railroad Company, formerly owning the railroad, 134 miles in length, extending from Terre Haute, Indiana, to Straight Line Junction, 3½ miles north of Evansville, Indiana, this company at midnight June 15-16, 1920, assumed operation of the railroad, which had then been acquired in the interest of the bondholders' Committee and conveyed to Evansville, Indianapolis & Terre Haute Railway Company, an Indiana corporation organized June 12, 1920. The agreement provided that the company should operate the line as the agent—at the risk and for the benefit of the owning company for a period of three years, with an option to the company to acquire the entire capital stock of such owner, at any time within the three-year period, for \$1,000,000.

Appreciative acknowledgment is made to all officers and employees of their loyal and efficient co-operation and service.

For the Board of Directors,

ALFRED H. SMITH, President.

## Railway Officers

### Executive

H. L. Traber has been elected president of the Oklahoma & Arkansas with headquarters at Muskogee, Okla., and E. H. Foster has been elected vice-president.

John T. Torian, whose appointment as assistant to the vice-president and general manager of Morgan's Louisiana & Texas, with headquarters at Houston, Tex., was announced in the *Railway Age* of September 10 (page 515), was born on June 21, 1866, at Lafayette, La. He began railroad work in November, 1898, with Morgan's Louisiana & Texas, with which road he has served successively as call boy, car checker, roadmaster's clerk, timekeeper on an extra gang, clerk in a local freight office and in an assistant superintendent's office, brakeman, switchman, train and engineman's timekeeper, chief clerk to assistant superintendent, and head clerk in the office of the superintendent of the timekeeping bureau, chief clerk to the superintendent, assistant yardmaster, yardmaster and transportation inspector and train rule examiner. On April 19, 1916, was appointed trainmaster of the Gulf & Ship Island, and on June 14 of the same year was promoted to superintendent, continuing in this position until March 1, 1917, when he returned to the Morgan's Louisiana & Texas. On November 1, 1917, he was appointed supervisor of wages and inspector of transportation, which position he held until the time of his recent promotion.

### Financial, Legal and Accounting

W. H. Whitehead has been appointed auditor of the Lehigh & New England with headquarters at Bethlehem, Pa., succeeding E. M. Kuntz, resigned, effective September 22.

D. N. Fink has been appointed treasurer of the Oklahoma & Arkansas, L. W. Randolph has been appointed secretary and E. R. Jones general counsel, all with headquarters at Muskogee, Okla.

George H. Parker has resigned as comptroller of the Philadelphia & Reading to become commerce counsel of the American Short Line Railroad Association with office at Washington, D. C. Mr. Parker was formerly financial assistant to the director general of railroads and later comptroller of the United States Railroad Administration. In addition to his work for the short line association, Mr. Parker will also be engaged in private practice on general railroad accounting problems.

### Operating

D. W. Steeper has been appointed acting superintendent of the Edson division of the Canadian National, with headquarters at Edson, Alberta, succeeding A. D. Carey, effective September 15.

G. H. Linney has been appointed acting assistant superintendent of the Canadian National, Western Lines, with headquarters at Humbolt, Sask., succeeding E. W. Cameron, transferred, effective September 16.

Eugene H. Daniel, whose appointment as superintendent of transportation of the Central of Georgia was announced in the *Railway Age* of September 24 (page 600), was born on March 13, 1874, at Talbotton, Ga. He was educated at LeVert College, Talbotton, Ga., and entered railway service in 1892 as a telegraph operator for the Central of Georgia. Since that date he has served consecutively as train dispatcher, chief dispatcher, trainmaster, transportation inspector, division superintendent and assistant to the general superintendent, which position he was holding at the time of his recent promotion.

## Traffic

J. P. Baker has been appointed general agent of the Kansas City Southern, with headquarters at Houston, Tex., effective September 16, succeeding G. M. Riley, deceased.

J. F. Fox, live stock agent of the Chicago, Rock Island & Pacific, with headquarters at Kansas City, Mo., has been promoted to general live stock agent, with the same headquarters.

O. J. English has been appointed commercial agent of the Atlantic Coast Line, with headquarters at Atlanta, Ga., effective September 26, succeeding W. W. Johnston, resigned.

Joseph D. Saunders, whose appointment as general freight agent of the Southern Pacific, with headquarters at Los Angeles, Cal., was noted in the *Railway Age* of September 17 (page 556), was born on May 25, 1885. He entered railroad service as a stenographer to the chief clerk in the passenger department of the Southern Pacific at Los Angeles in 1903, since which time he has been contracting freight agent, correspondence clerk to the assistant general freight and passenger agent, chief clerk in the general freight office, and industrial agent. He was appointed assistant general freight agent, with headquarters at San Francisco, on June 1, 1916, which position he held at the time of his recent promotion.

Herman W. Klein, whose appointment as assistant general freight agent of the Southern Pacific, with headquarters at San Francisco, Cal., was noted in the *Railway Age* of September 17 (page 556), was born at Lathrop, Cal., on September 4, 1888. He began railroad work in the traffic department of the St. Louis-San Francisco in June, 1906, leaving that road in 1910 to enter the traffic department of the Southern Pacific. On September 1, 1916, he was appointed chief tariff clerk, which position he held until August 1, 1917, when he was promoted to chief clerk in the general freight department. One year later, he became acting assistant general freight agent at San Francisco, and on March 1, 1920, he was appointed foreign freight agent, which position he held until the time of his recent promotion.

B. Levy, whose appointment as assistant general freight agent of the Atchison, Topeka & Santa Fe, with headquarters at San Francisco, Cal., was noted in the *Railway Age* of September 10 (page 515), was born at Los Angeles, Cal., on October 29, 1885. He began railroad work in the auditor's office of the Santa Fe on June 24, 1902, and after holding various minor positions, was promoted to chief clerk in the interline department. On January 1, 1910, he was appointed tariff clerk in the traffic department at Los Angeles, and on August 1 of the same year, he was promoted to chief tariff clerk. In July, 1913, he became chief local rate clerk at San Francisco, which position he held until December, 1916, when he was appointed chief rate clerk with the same headquarters. During government control, Mr. Levy was associated with the San Francisco district freight traffic committee. Upon the return of the railroads to private ownership, he became chief clerk to the assistant freight traffic manager of the Santa Fe, with headquarters at San Francisco, which position he held until the time of his recent promotion.

## Special

Dr. Wayland Morrison has been appointed chief surgeon of the Santa Fe Coast Lines Hospital Association, succeeding Dr. N. H. Morrison, deceased.

H. W. Klein

F. P. Cruice has been appointed manager of the agricultural and industrial development department of the Atchison, Topeka & Santa Fe, with jurisdiction over the lines east of Albuquerque, N. M., with headquarters at Topeka, Kans.

## Mechanical

A. W. Kirkland has been appointed acting superintendent of motive power of the Atlanta, Birmingham & Atlantic, with headquarters at Atlanta, Ga., during the temporary absence of J. F. Sheahan, effective September 25.

## Engineering, Maintenance of Way and Signaling

Walt Dennis, division engineer of the Wabash, with headquarters at Moberly, Mo., has been appointed superintendent of the New Jersey, Indiana & Illinois, with headquarters at South Bend, Ind.

F. A. Benz, division engineer of the Buffalo, Rochester & Pittsburgh with headquarters at East Salamanca, N. Y., has been transferred in a similar capacity to Du Bois, Pa., succeeding J. B. Oatman, who has been appointed roadmaster with the same headquarters, and the position of division engineer at East Salamanca has been abolished. The position of engineer of construction has been abolished and D. S. Watkins, who held that position, has been assigned to other duties. These changes were effective September 1.

H. O. Kelly, engineer of deferred maintenance of the Wabash, with headquarters at St. Louis, Mo., has been appointed division engineer, with headquarters at Moberly, Mo., succeeding Walt Dennis, resigned, to accept service with another company. J. T. Vitt, assistant engineer, with headquarters at St. Louis, has been promoted to division engineer of the St. Louis Terminal division, succeeding H. N. Huntsman, who has been appointed assistant engineer of the Detroit division, with headquarters at Montpelier, Ohio, succeeding S. N. Crowe.

## Obituary

W. B. Lindsay, who for the past 16 years has been eastern passenger agent of the Lehigh Valley with headquarters at New York, died on September 17 at New York.

James E. Crosland, chairman of the Southern Classification Committee, died at his home at Atlanta, Ga., on September 17, after an illness of several weeks. Prior to going with this committee Mr. Crosland was assistant general freight agent of the Louisville & Nashville.

David H. Wilson, Jr., consulting engineer of the Erie, died in New York on September 15. Mr. Wilson was born at Paterson, N. J., in 1879, and was educated in the grade schools of Paterson, at the Bliss Electrical School, Washington, D. C., whence he was graduated in 1899, and Purdue University, from which institution he was graduated in 1902. Following his graduation, he was in charge of transmission line and electric railway construction in Porto Rico and subsequently was engaged in a similar connection in Canada. He went with the Erie in 1906 as electrical engineer, which position he held until 1911, when at his own request he was granted a leave of absence to work out a storage battery and an electric welding machine. When the Wilson Welder and Metals Company was organized he was elected vice-president. He re-entered the service of the Erie on June 1, 1921, as consulting engineer, which position he held at the time of his death.

PERHAPS the one most immediately effective measure, however, which the government could take to ameliorate the (unemployment) situation would be the funding of the existing indebtedness of the railroad companies on account of capital expenditures while the roads were under its control. That would place at the disposal of the roads \$500,000,000 and would materially improve their financial position and hasten the time when they could make needed expenditures for maintenance, improvement and expansion.—*The Guaranty Survey.*

Our foreign trade in railway equipment and supplies, insofar as the government is interested in it, has been entrusted to the Industrial Machinery Division of the Bureau of Foreign and Domestic Commerce. American consuls and representatives of the Department of Commerce are scattered the world over.

### Government Service to Trade

It is their business to assist our foreign trade in every legitimate way. Information regarding opportunities for the sale of American goods, reports on business conditions in the various countries, peculiar local customs and laws which may influence business relations—all this and much more is transmitted by these representatives to the Bureau of Foreign and Domestic Commerce at Washington, where the data are distributed among the several divisions specializing in various industries. It is the division's duty to assemble the information and interpret it to its industry. The chief of the Industrial Machinery Division announces the earnest desire "to co-operate in every possible way with manufacturers and exporters of railway equipment and supplies in the markets of the entire world." The value of such a service as this is obvious, but by close co-operation with the division it can be extended and increased. At a time when our exports are dwindling, a service such as this, which is designed to promote foreign trade, should be utilized to the utmost.

A year ago the Committee on Heavy Electric Traction of the American Electric Railway Association pointed out the fact that the work of the heavy electric traction committees of several associations overlapped, and much of their work was duplicated. Railroads have been called upon to answer questionnaires sent out by a number of associations, all asking for information on a single subject. A clearing house was suggested to remedy this situation. This year, apparently in an effort to correct the situation, the same A. E. R. A. committee included in its report a statement of the activities of each of the other associations which had committees at work on this subject. This is without question a step in the right direction, but in the same report the committee presents a considerable amount of data and information which is largely a duplication of what has been presented previously by the Association of Railway Electrical Engineers. The electric locomotive data table published in this year's report, except for some additions, is largely a duplication of part of a table prepared last year by the A. R. E. E. committee. Data are also presented on multiple-unit equipment in this report, and the same report states that the A. R. E. E. committee is working on this subject. The bulk of the report consists of a bibliography, based largely on data issued two years ago by the A. R. E. E. committee, enlarged, reclassified and brought up to date. This rearrangement is spoken of as co-operation, but it undoubtedly involves a duplication of effort as a new group of men have rehandled and reprinted the bibliography. An invitation will probably be sent out by the American Electric Railway Association to the executive bodies of the American Railway Engineering Association, the American Rail-

way Association, Mechanical Division, the National Electric Light Association, the American Institute of Electrical Engineers, the Association of Railway Electrical Engineers, and such other organizations as the executive committee of the A. E. R. A. may deem expedient, asking each association to appoint two representatives to serve on an American committee on electrification. This will probably meet with some opposition as the steam railroads are those most vitally interested, and it would seem logical that their representation should be in proportion to the magnitude of their interest. This opposition is probably justifiable, and it may not be entirely feasible for one committee to handle all matters pertaining to electrification. The fact remains, however, that all of the associations named should confer on the subject, and either form an American committee on electrification, or a steering committee which could assign appropriate parts of the work to each of the interested associations and thus unite and direct their efforts and do away with much unnecessary duplication and lost motion.

The financial condition of the railroads during the past four or five years has been such that the appropriations for machine tools, signaling, passing tracks, yards and similar improvements have of necessity been held in abeyance in spite of the fact that the savings that these expenditures would have produced would represent a high rate of return on the proposed investment. In order to stimulate the investigations and calculations that are now required to revise these old estimates it would seem advisable to consider the increasingly favorable conditions that will undoubtedly influence the expenditures for improvements during the coming year. In brief, the steady increase in the net income of the roads should point to the probability that the railroads will soon be in a position to finance a considerable part of the extensive maintenance and improvement program that has been delayed so long. Considering these facts it would appear self-evident that the officers in charge of the various departments should now investigate with added zeal the details of the equipment and materials listed on their proposed budget estimates in order to ascertain whether they are still in accordance with the best practice.

### Revise the Old Estimates

The New York Central on October 1, in a letter addressed by President A. H. Smith to the company's 75,000 employees, announced the adoption of a plan intended to assist them in the purchase on the installment plan of stock in the company. The accession of this important system to the ranks of those who believe in the value of this idea is a matter of congratulation. The *Railway Age* has advocated the encouragement of investment by employees in the stock of the company by which they are employed. On the one hand the employees are led to take a greater interest in their company and on the other the assistance given the employees to lay aside their funds is always praiseworthy. The value of the idea is

### Helping Employees Buy Stock

further pointed out by the success that has accompanied the plan on the Lehigh Valley which was the first large railroad to adopt it or by the favor with which similar plans are regarded and utilized by the official personnel and employees of such industrial companies as the American Telephone & Telegraph Company, the United States Steel Corporation, etc. While it is true that the stocks of certain railroads, such as the Pennsylvania, Lackawanna, etc., are held in sizable proportion by officers and employees, it is unfortunate that the railways have been as slow as they have been in adopting and pushing the idea. With three important roads—the Lehigh Valley, the Union Pacific and the New York Central—now favoring assisting their employees to purchase stock, considerably better progress may be expected in the future.

The Safety Section of the American Railway Association has made a successful start. The preparations for the Boston convention were made on rather short

#### The Safety Section of the A. R. A.

notice and it was not intended to do much talking at this first meeting; but the talking that was done was very much to the point. Not the least significant feature of the meeting was the careful attention paid to the brief address by Professor W. J. Cunningham, which was a logical appeal to avoid the error (which has been quite common) of trying to make circulars, pictures, meetings and emotional speeches accomplish the good which can be accomplished successfully only by long-continued and intimate intercourse with individual employees. The important action of the meeting was the resolution to start a national campaign to educate automobilists not to kill themselves (and other people) at grade crossings. The reader who thinks that this subject is already too hackneyed should examine with care Mr. Dow's outline of what ought to be done. The convention has practically decided that this is what *shall* be done. This means that the hopeful results already realized on a few roads are to be aimed at on every road throughout the country. The field for possible enlightenment of the public is unlimited. Last year the people killed at grade crossings numbered seventeen times as many as the passengers killed in train accidents.

## The Talk of a Railroad Strike

THE EFFECTS of government control and the Plumb plan propaganda carried on by labor leaders on the relations between the railways and the public, on the one side, and railway employees, on the other, have seldom been more strikingly illustrated than by the widespread talk recently of a general railway strike.

On July 1 a reduction averaging 12½ per cent was made in railway wages. Some changes also recently were made by the Railroad Labor Board in the rules regarding compensation for overtime work. On the whole, however, railway employees who have not been laid off are better off relatively than almost any other class of people in this country. Even since the recent reduction of wages the average hourly railway wage is about 134 per cent more than in 1914. In August, according to the statistics of the National Industrial Conference Board, the average cost of living in all parts of the United States was only about 65 per cent more than in 1914. Therefore, in spite of the recent reduction in wages, the average railway employee can buy with an hour's wage 42 per cent more of the necessities and comforts of life that he could before the war.

The average hourly wage of union labor employed in all industries increased between 1914 and 1920 only a little over one-half as much as that of railway labor, and within the

last year has been reduced much more in proportion. The average prices of farm products are now only about 15 per cent more than in 1914, while the prices of the things the farmer has to buy are still relatively much higher. The result is that he cannot buy with a given amount of his products nearly as much of other things as he could in 1914.

While, however, railway employees as a class, in spite of the recent reduction in their wages, are relatively so much better off than the farmers and most other working men, the leaders of the railway labor unions are busily engaged in taking and counting strike votes. Of course, the votes are announced as practically unanimous for a strike. They always are. The percentage of members of a railway labor union usually announced as voting for a strike is 98. Sometimes it is only 97, and sometimes it is 99. The skill the leaders have acquired in always getting practically the same percentage of their members to vote for a strike is quite remarkable. If they should submit to the unions the question whether they should strike because the science of astronomy denies to them control over the movements of the planetary system the vote in favor of striking would be announced as just about 98 per cent. The question of a railway strike is one of great public importance. Some day the public may insist on having the ballots prepared and counted by some governmental agency. We suspect the official count would then show a vote for a strike surprisingly different from the 98 per cent now usually announced.

There is one important feature of the strike votes now being taken which makes them different from any ever taken before. The Transportation Act empowers and directs the Railroad Labor Board to fix reasonable wages and working conditions for railway employees. If the Labor Board performs its duty in accordance with the provisions of the Act, a strike by railway employees in violation of its decision would be a plain violation of a federal law. Therefore, the strike votes now being taken are votes to determine whether railway employees shall commit wholesale violations of a federal law. The labor leaders have loudly denounced certain railway companies on the ground that they have violated this same law. Nobody ever has charged, however, and there never has been any ground for charging, that the railway companies as a whole ever have violated, or considered violating, the law. It is a remarkable spectacle, the significance of which the American public can hardly overlook, when the labor leaders submit to a vote of all their members the question whether they shall deliberately and openly violate a federal law, and this in spite of the fact that the changes in wages and working conditions to which they object are so small as to leave railway employees as a class better off than almost any other large class of people in the country.

The managements of the railways certainly do not want a general strike. They can now, however, listen to the talk of it with less disturbance and apprehension than they usually have felt on the numerous occasions when there has been such talk within recent years. It has cost the railway companies and the public a vast amount of money to comply with the orders regarding wages and national agreements which the Railroad Labor Board has made within the last year and a half. A strike would put railway employees belonging to labor unions entirely outside the law and leave the managements legally free to deal as they thought proper with wages and working conditions without themselves violating the law.

The traffic being handled by the railways is the smallest for some years. Therefore it would be easier for the railways to handle it, in spite of a strike, than it would have been at any time within recent years. Besides, it is estimated that there are now about 4,000,000 men out of employment in this country. About 600,000 of these are men who were employees of the railways a year ago. The difficulty of

getting men to replace the strikers would therefore be much less than it would have been at any time within at least six years.

The facts that have been mentioned are not unknown to the labor leaders and most members of the unions. Therefore, unless there are special considerations of labor union politics which are influencing the leaders, all the current talk about a railway strike will end in talk. For some years, however, there has been strong reason for believing that sooner or later there would be a general railway strike. The propaganda persistently carried on by labor leaders and the Plumb Plan League have produced sentiments and feelings among railway employees, especially the element that are disposed to be radical, which have greatly increased the possibility of a general strike at some time or other. The innumerable concessions, beginning with the passage of the Adamson Act, which the unions have obtained by constant threats of strikes, and by not infrequent sporadic actual strikes, apparently have encouraged them to believe that whatever they cannot get by reason they can get by force. If a strike there must be, the present would be, from the standpoint of the railways and the public, as good a time as any to have it. If the railway labor leaders must be taught sooner or later that they cannot dictate their own terms to the railways and the public by constant threats of force, the sooner they are taught it the better it will be for all concerned.

## Train Speeds Affect Maintenance Costs

ARE HIGH TRAIN SPEEDS a necessity or a luxury? Under the obligation imposed on the railroads to operate their properties with prudence and economy, this question is of sufficient importance to demand careful scrutiny. The relations of speed to fuel consumption and engine rating are generally recognized, but the effect of speed on the cost of track maintenance has received minor consideration. With increases in speed as with added wheel loading, the maintenance of way department is not usually consulted but must strive to meet the larger burden as it is imposed. This question has received some study in connection with analyses of the relative costs of passenger and freight service, but it has been given little consideration as a factor in the determination of the justification for increased speed, particularly of passenger trains.

Whatever the facts may be with regard to what may be termed legitimate or regularly imposed speeds, the real waste as concerns the maintenance of way department arises in the lack of regulation or control of train velocity as a consequence of which trains occasionally run at much higher speeds than those specifically authorized. In the case of wheel loading the problem of the maintenance of way officer is to insure adequacy for a definite and regularly applied burden. With speed it is one of insuring safety for an occasional velocity far in excess of that required for the needs of the traffic.

Taken as a whole the average passenger train speeds have not increased materially in the last quarter century. It is also certain that the lengthening of train schedules to permit of lower average speeds would meet with severe public objection. The answer, therefore, is not to decrease the average velocity but to exercise that degree of control which will eliminate the unnecessary, excessive speed—speed to compensate for needless delays at station, time killing, etc. In short, the need is for regulation that will prevent speeds in excess of those reasonably required for the movement of trains according to properly prepared schedules, proper measures being instituted to expedite the handling of trains at stations, terminals, etc.

Such regulation of locomotive operation is entirely within

reason and has the justification of precedent. With the maximum velocity of trains established and properly supervised, standards of track maintenance on lines of varying character may be established with a far greater degree of accuracy than is now generally possible and in consequence economies may be introduced with no sacrifice of the earning power of the lines in question.

## A New Form of "Jitney" Competition

ALTHOUGH many railway officers have taken a keen interest in the extensive highway construction programs now under way, railway managements as a whole have not taken this development as seriously as its possibilities warrant. Co-operating in the promotion of good roads in the early stages of the propaganda because of the aid which such highways would render to the farmer in bringing his products to their tracks, the railways now find that this movement has developed primarily into a system of trunk line construction having as one of its objects the connection of important cities. These highways, which have been built at public expense, are being used largely and in many cases primarily by motor trucks which have sprung up, mushroom-like, to engage in the transportation of both passengers and freight in competition with the railways. Where these trucks open routes not existing previously they are rendering an added service to the public, but in the vast majority of cases their routes parallel existing steam lines and the service offered duplicates that already existing. The public is therefore receiving little or no additional service and the only result is to divide the traffic between the two agencies to the detriment of the railways.

These motor trucks are, in general, not subject to regulation of rates, character or regularity of service or any of the other restrictions imposed on the steam roads for the protection of the public. They are free to abandon service, temporarily or permanently, at any time that it becomes unremunerative, while the steam roads must be prepared to serve the public at all times, in good weather or bad. The trucks are thus free to pick the cream of the business, leaving the less remunerative traffic to the steam roads.

The trucks are able to make inroads on the traffic of the steam roads primarily because of the fact that the highways are open to them without expense whereas the railways are required to build and maintain their tracks, structures and other fixed properties over which they operate. If the railways were able to pass on to the public their corresponding expenses they could likewise reduce their costs greatly. When the public wakes up to the fact that the highways which it has provided at tremendous public expense, are being destroyed by these motor trucks and will soon require extensive maintenance, towards which the trucks are contributing almost nothing, it will demand that the owners of the trucks pay their proportion of the added investment in the highways and in the maintenance expenses which have been incurred largely on their account. When the owners of the trucks are thus required to contribute their full share to the cost of their roadways, their operations will be restricted primarily to the transportation of short haul less-than-car-load freight, a traffic which the railways can well afford to let them have. Until that time comes the railways will continue to suffer sporadic inroads upon their traffic at one point after another, which inroads are of serious proportions in the aggregate.

This unregulated mushroom competition which the railways are now meeting is similar to that which the street railways have encountered with the jitneys in many cities in recent years. It is to be hoped that the public will see the natural results of this more recent competition in sufficient time to prevent a repetition of the experiences of Des Moines, Ia., Bay City, Mich., and other cities where the

street railways have been forced to suspend service with the result that the jitneys have then been unable to cope with the traffic and the public has suffered greatly. Railway managements can do much to educate the public to the unfairness of the competition to which they are now subjected and stem the "Ship by Truck" and other propaganda of the motor interests. By presenting these facts they will not only be protecting their own future, but will be rendering a distinct service to the public.

## The Illinois Central's Public Relations Work

EVERY RAILWAY EXECUTIVE is painfully aware that government regulation has become such that it exerts a dominant influence in determining whether the railways as a whole and individual railways can be developed and operated successfully from the standpoint of either the public or their owners. The governments represent the public, and in the long run public sentiment determines how the various governments, municipal, state and federal, regulate the railroads. It necessarily follows that if the railways are to be successfully developed and operated public sentiment must be made and kept so intelligent and fair regarding railway matters that it will cause regulation to be intelligent and fair.

On whom devolves the plain duty of causing presentation to the public of the information and arguments which will cause it to understand railway matters and to favor fair and constructive regulation? It devolves upon the railway executives themselves. It is under present conditions as much their duty constantly to present the facts about the railroad business to the public so as to bring about intelligent and fair regulation as it is to present facts to their officers and employees which will bring about intelligent and energetic operation of the properties. There are many thousands of people in this country who find, or believe they find, it is to their selfish interest to attack and misrepresent the railways. If these attacks and misrepresentations are not constantly met with presentations of the facts and of counter arguments public opinion will be constantly misled and regulation of railways will be unfair and harmful.

Of course we do not mean the executives of the railways should personally be constantly engaged in presenting to the public facts and arguments regarding the railway situation. There is no more reason why they should personally do all of this kind of work than why they should personally perform the duties of the superintendent of motive power, the general manager, or the general counsel. But they should see that the relations of the railway with the public are properly handled just as they should see that the equipment is properly maintained, that freight and passenger service are properly rendered and that the legal interests of the company are properly protected.

It is a remarkable fact that although public sentiment, acting through government regulation, has become within recent years such an important, and even dominant, influence in the development and management of the railways, only a comparatively small number of railway executives have created and maintain on their railways special departments adequately equipped to present constantly and effectively to the public the facts about the railroad situation and to make replies to the innumerable misrepresentations of the railways which constantly are being given dissemination. The worst troubles of the railways for 15 years have been mainly due to unfair regulation, and unfair regulation undoubtedly has been mainly due to failure of the railways persistently and adequately to present the facts about their business to the public.

The education of public opinion concerning the railroad

situation demands not only organized action by the railways as a whole regarding problems of national scope, but also persistent and intelligent public relations work by each individual railway in its own territory. This is a vast country with a population of over 100,000,000. The railways ramify into every part of it, and they must carry on their public relations work in every part of it if they are to make the public understand their problems and through fair and reasonable regulation help to solve them.

Among the comparatively small number of large railways on which the problem of educating the public regarding the railway situation recently has been boldly, persistently and skilfully attacked is the Illinois Central. President Markham is an ardent believer, first, that the public will deal fairly with the railways if it is given an opportunity to understand the conditions under which they are operated and the problems their managements have to solve; and, secondly, that a railway management can and should so present the facts and principles of railway economics and administration to the public as to create a friendly and intelligent public sentiment regarding the railways. Therefore, within the last year he has carried on a very unusual campaign to improve the relations of the Illinois Central with its public. An account of what has been done under his direction and of some of the results that have been obtained is given elsewhere in this issue.

Some minor details of the work Mr. Markham has done and of the way it has been done may be open to criticism, and, indeed, have been criticised. One thing, however, is certain. This is that the work which has been done has had, from a railway standpoint, a very favorable effect upon the attitude of the press and of the public in the territory that the Illinois Central serves. The facts regarding the railway situation which have been presented in the Illinois Central's advertising and the public statements made by its president and other officers have caused the press and public in its territory to understand the railway situation far better than they otherwise would have understood it. Under present conditions a better understanding by the press and public of the railway situation is bound to redound to the advantage of the railways. Therefore, the work Mr. Markham has done and caused to be done has been beneficial not only to the Illinois Central but to the railways of the country as a whole. It may or may not be significant in this connection that during the last year the Illinois Central has shown as good operating and financial results relatively as any other railway in the country.

There are certain important things about railway public relations work which many railway officers seem surprisingly slow to learn. One of these is that this is work which always will have to be done as long as the railways are privately owned or they will never be intelligently and fairly regulated. Another is that it is important work. The most able and energetic management of the railways in other respects will never make and keep them prosperous unless their public relations work is so done as to secure intelligent and fair regulation. Another fact often overlooked is that effective public relations work requires the employment of able men with special qualifications and the giving to them of opportunity to devote their whole time to it. Recognition of these facts must carry with it recognition of the further important fact that effective public relations work cannot be done without the expenditure of substantial amounts of money in perfectly legitimate ways.

Mr. Markham has recognized and accepted all these facts and acted accordingly. His example, his methods and the results obtained merit just as serious and careful consideration by other executives as a plan that his or some other railroad might adopt and carry out to increase train loads or promote safety in operation; for the intelligent and adequate handling of public relations has become just as impor-

tant and integral a part of railroad administration as the adoption of methods of increasing economy of operation or of reducing accidents.

## Central Ownership of Freight Cars

THE CENTRAL OWNERSHIP of freight cars and central control of their disposition has frequently been suggested as a way out of a situation which is far from ideal either from the viewpoint of the shipper or of the railroad. The most recent advocacy of this plan was voiced by George C. Conn, traffic director of the Buick Motor Company, in a paper before the Western Railway Club, an abstract of which appeared on page 635 of last week's issue. The advantages claimed for this plan may be summed up as follows: First, a more flexible car supply to meet seasonal demands, with a smaller investment; second, a reduction of empty mileage; third, the development of cars of standard detail design, and of standardized sizes most suitable for the shippers' requirements; fourth, the placing of rentals and repairs on a business basis, including the establishment of centrally owned heavy repair shops.

The question immediately arises, why can these advantages not be obtained with the railroads owning their own rolling stock? It may be accepted as true that the ownership of freight cars is generally regarded by railroad managements as incidental to the more direct problems of getting and moving traffic. The history of the development of interchange regulations both as to maintenance and rentals gives ample justification for this statement. Apparently the theory is held that a scale of nominal charges for repairs made in interchange and for per diem rentals is all that need be made in settling accounts between the railroads, as these settlements are merely clearing house operations with approximately equal debits and credits in each case. But the debits and credits are not equal and there is no reason to expect them to be equal.

As long as the nominal charges do not exceed the actual cost of the service rendered there is no incentive, for instance, for a weak road to tax its credit to provide itself with an adequate supply of equipment reasonably to care for its own needs. If the nominal charge is less than the cost of the service there is a good business reason why such roads should own the least possible amount of equipment that traffic conditions will permit. An analogous situation holds with respect to the maintenance of cars in interchange. As a result, neither the owning nor the using line has a real business incentive to meet its full responsibility for maintaining an adequate supply of highly serviceable equipment. These conditions are fundamentally unsound and are at the root of the generally unsatisfactory equipment situation. Improvement has been made both in per diem rates and in car repair billing prices during the past few years. But it is significant that these improvements came slowly and painfully only through agreement among the railroads.

The question of standardization has received attention for many years and progress has slowly been made toward a degree of standardization of details which, when completely carried into effect, will go far toward reducing the need for empty mileage in connection with freight car maintenance. The standardization of car sizes to satisfy completely the varying requirements of the shippers and the railroads' pocketbook is even more difficult of settlement than the standardization of details. Here again the difficulty lies in finding common ground for agreement among the railroads.

Central ownership is suggested as a solution of these difficulties. But before a plan of central ownership can be put into effect the railroads must agree on it among themselves. They must agree to accept a rental charge which will be fixed on a business basis, since a central owning corporation

will be required to charge a rental high enough, while the cars are in service, to carry its capital investment, unimpaired through depreciation, during the time the equipment is idle as well as during the time it is in service, to pay for the cost of maintenance and to provide a profit large enough to justify the owning corporation continuing in the business.

When the railroads become sufficiently alive to the business side of car ownership to agree to such a plan will not the greatest need for the plan have ceased to exist? It will be no more difficult to secure agreement to adequate per diem rates and a businesslike schedule of billing prices for labor and material used in interchange repairs than it will be to agree to these same requirements of a scheme of central ownership. Similarly, when this state of agreement has been reached, the same harmony of action could be secured in the adoption of a standard car or cars to be owned by the railroads individually. And the way now lies open to the railroads to break away from uneconomical shop conditions through the contract repair shop as effectively as though the establishment of shops under the ownership and operation of a central equipment corporation.

There might be some saving in car capacity through a scheme of central ownership which would be able to control freight car distribution to meet the requirements of varying seasonable demands. The great seasonal variation in car loadings, however, is largely coincident throughout the country, amounting to from 200,000 to 300,000 car loads a week. If the equipment is provided to meet the maximum demands of the country through the late summer and fall months, there must be a large surplus to be carried during the winter and spring months even under central ownership. Furthermore, it is doubtful whether a central owning corporation could exercise the function of distribution in times of maximum demand to better advantage than it is now exercised by the Car Service Division of the American Railway Association and it would still remain under the regulation of the Interstate Commerce Commission, just as at present.

The conclusion, therefore, seems justified that a state of mind which would make possible a general agreement among the roads to the central ownership of freight cars, with all it entails in adequate charges for services now rendered at nominal prices, and the sacrifice of individual opinions as to the best type of equipment for local needs, would automatically accomplish much the same ends with no change in equipment ownership. Whether or not this in the end should prove to be the case, the sooner a general knowledge of the business fundamentals essential to the success of such a scheme is acquired by all the railroads, the sooner a situation unsatisfactory alike to the railroads and the shipping public is likely to be effectively improved.

## Philadelphia & Reading

THE PHILADELPHIA & READING's history is, in the main, a story of the manner in which that system engaged in the anthracite coal business—the purchase of coal lands and the mining and sale of coal—to the end that by owning its own mines the carrier would be guaranteed a steady and growing business in the transportation of anthracite coal. The Reading for many years has been the largest carrier of anthracite coal. It is not generally known, however, that its business of carrying bituminous coal is also large. The tonnage of bituminous moved in recent years has been about one-and-one-half times the tonnage of anthracite. It will no doubt surprise many to learn that the Reading—known as the country's largest carrier of anthracite—in 1920 actually carried twice as much bituminous as the Hocking Valley, or three times as much as the Virginian.

Interest in the Reading is especially active at this time

because of the pending decision of the United States Supreme Court as to the relative rights of the preferred and common share-holders of the parent Reading Company to share in the segregation of the railroad properties from the coal properties. It is especially interesting, therefore, to see what kind of a railway system the Philadelphia & Reading is and what it does.

The Reading system has a total mileage of 2,223, of which 880 is double track. This includes: Miles owned by the Philadelphia & Reading, 387; miles leased by the P. & R., 702; miles owned and leased by other companies in which the Reading Company owns the controlling interest, 1,130; the Allentown Terminal Company leased jointly by the P. & R. and Jersey Central, 3. All of the stock of the Philadelphia & Reading is owned by the parent Reading Company, which also owns the equipment and leases it to the P. & R. The owned and leased lines of the Philadelphia & Reading total 1,127, including trackage rights.

The P. & R. also operates, but reports figures separately for, the other lines in the system such as the Perkiomen, the Catawauqua & Foglesville, the Catawissa, etc., but excepting the Central of New Jersey. The latter company is controlled by the parent Reading Company through majority stock ownership. As noted, it is operated separately, but traffic and operating arrangements are in force to facilitate co-operation of the two lines to the best advantage. It is well-known that the Philadelphia & Reading Coal & Iron Company—owner of the Reading coal mines—supplies a large proportion of the railroad's total anthracite tonnage.

The Reading secures its anthracite from a large area lying generally north and west of Pottsville and Tamaqua and also from the Lykens district to the southwest. The area served is known technically as the southern or Schuylkill field and the western middle or Mahanoy and Shamokin field. Some of the coal moves west via Newberry Junction or Williamsport and the New York Central. The predominant movement is eastbound to Philadelphia and the Read-

from there east with loads frequently as high as 5,000 or 5,500 tons gross handled with an M1 or Mikado locomotive, the grade being about 0.5 per cent descending.

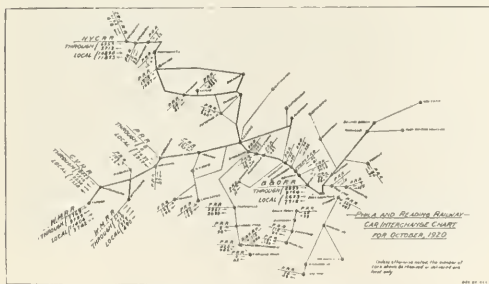

TONNAGE OF FREIGHT CARRIED BY THE PHILADELPHIA & READING—  
Tons of 2,000 Lb.

Year	Anthracite	Bituminous	Md.se.	Total
1917	16,339,859	22,549,852	32,548,033	71,337,745
1918	16,277,781	24,078,596	30,918,224	71,274,602
1919	13,815,371	23,329,574	26,074,519	63,219,464
1920	15,121,124	24,875,761	29,716,679	69,713,564

Professor Ripley in his report on railroad consolidations—reproduced in part in last week's issue of the *Railway Age*—has considerable to say concerning the manner in which the Reading serves as a connecting link and terminal facility for various other roads, notably the Baltimore & Ohio. In his plan he proposes the inclusion of the Reading and its associated lines with the Baltimore & Ohio system, his reasons being the larger traffic interest in the Reading of the Balti-

The Philadelphia & Reading and Its Controlled Lines

From Professor Ripley's Report on Railroad Consolidations

P. & R. Car Interchange Chart

ing's territory generally, to New York via Port Reading and to New England. From Port Reading the movement to New York is on lighters. To New England the movement is all-rail via Allentown over the Jersey Central to Phillipsburg, thence over the Lehigh & Hudson, the Poughkeepsie bridge route and the New Haven, or by rail and water in the form of a barge movement from Port Richmond or Port Reading.

The coal is assembled, speaking rather generally, at various points in the coal district, moved over the mountains in some cases on planes with a barney and cable and brought to points such as St. Clair (just north of Pottsville), Tamaqua, etc. At St. Clair there is a gravity yard with a capacity of some 4,400 cars; at Tamaqua, a yard with a capacity of 2,100. The St. Clair yard is in reality the main assembling yard for the anthracite coal district. Trains move

more & Ohio as compared with the New York Central or Pennsylvania and the desirability of furnishing the Baltimore & Ohio with better arrangements of access to its various New York terminals. The Baltimore & Ohio in effect reaches the Reading at Philadelphia and at Shippensburg and it is through these two gateways that the Reading receives the larger portion of its bituminous coal business.

Some coal is received at Williamsport from the New York Central, largely coal originating on the Buffalo, Rochester & Pittsburgh. Such coal, as well as the merchandise freight, which is received from the Baltimore & Ohio at Philadelphia moves north over the Reading and Jersey Central in through freight runs from Willsmere, near Wilmington. The coal handled in this way leaves the Jersey Central at Cranford Junction, where connection is made with the B. & O.'s Staten Island lines. The merchandise freight for New York is moved to Jersey City.

The coal from the Baltimore & Ohio which is received at Shippensburg is the most important part of the bituminous coal movement. The B. & O. does not connect directly with the Reading at Shippensburg. The coal movement is over the Western Maryland from Cherry Run and over the Cumberland Valley from Martinsburg. This coal may move over the Reading's lines in various ways. A typical movement is through Harrisburg—or Rutherford yard which has a capacity of 4,900 cars—thence to Allentown, where the coal is turned over to the Jersey Central for movement to points on that road and to New England as in the case of anthra-

cite coal. Other coal moves to Port Reading for delivery to points adjacent to New York City or to New England. The more important movement, however, is to the Reading's industrial territory and to Port Richmond, in the latter case for New England delivery by water or for export. This export movement is sizeable; the scheme of a tidewater coal exchange and pools is in use as at the coal piers at Baltimore and Hampton Roads.

The Reading's terminal at Port Richmond has a capacity of some 8,600 cars. There is also a grain elevator with a capacity of 1,000,000 bushels. The capacity of the yards at Port Reading approximates 4,500 cars. The coal movement over the Reading rails is its most important business. The Reading, however, also handles a merchandise business of large proportions. It stands high with shippers for the service it renders with its symbol or manifest trains and for its favorable connections.

The Reading's passenger business is noted for its high speeds. During the war this service was considerably upset. No less than 21 of the "Every hour on the hour" New York-Philadelphia trains were withdrawn. The schedule has not yet been restored and the Reading's passenger business has suffered accordingly. The Camden-Atlantic City business has done better. The road went through August, 1921, with a record of 95 per cent of its Jersey seashore trains on time. The Atlantic City schedule calls for 56 miles in 55 minutes.

Because of the conditions contingent upon federal control, in the way of increased expenses and changes in traffic arrangements, the Reading did not show favorable operating results while it was being operated by the government and it is only in recent months that it has been able to begin to show improvement. The standard return was about \$16,000,000. In 1918, the net railway operating income was but \$8,847,390; in 1919, only \$3,083,280. In 1920 there was a net railway operating deficit of \$655,107. In the first seven months of 1921 the net has been \$3,901,337 as against a deficit of \$1,139,868 in the same period of last year. The improvement in recent months is indicated by a net of about \$800,000 in April, May and June respectively, and of \$1,200,000 in July.

The Reading is not at present doing anywhere near as much business as it was doing at this time last year, its net ton-miles in the first six months of 1921 being 2,664,786,000 as compared with 3,386,271,000 in the same period of last year. The road, however, is in rather good shape from the standpoint of maintenance. Its bad order cars on September 15, to take one factor, were but 5.3 per cent as against an average for the country of 16.3 per cent. The impression one would derive, therefore, is that the Reading is showing steady recovery and should be in good shape to handle the increasing traffic that will accompany any revival in business conditions.

The Reading's corporate income account for 1920 showed a net of \$9,010,790 as compared with \$8,460,763 in 1919. The dividends paid in 1920 totaled \$6,372,255, all accruing to the Reading Company, which owns all of the Philadelphia & Reading Railway Company stock.

The operating results for 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated.....	1,127	1,127
Freight revenue.....	\$78,043,029	\$57,850,183
Passenger revenue.....	11,532,277	10,854,210
Total operating revenue.....	94,819,755	72,871,823
Maintenance of way expenses.....	10,746,542	7,490,427
Maintenance of equipment.....	26,984,497	19,296,340
Traffic expenses.....	700,292	482,181
Transportation expenses.....	48,578,617	35,476,881
General expenses.....	2,167,870	1,646,549
Total operating expenses.....	80,486,240	64,608,174
Net revenue from railway operations.....	5,333,515	8,263,649
Railway tax accruals.....	2,512,846	1,659,029
Railway operating income.....	2,796,664	6,602,723
Net railway operating income.....	Def 655,107	3,083,280

The corporate income account is as follows:

	1920	1919
Compensation (January and February, 1920; year 1919).....	\$2,656,513	\$16,009,826
Guaranty, March 1 to August 31.....	7,969,539	
Gross income.....	15,514,922	16,351,892
Interest on funded debt.....	1,956,195	1,961,583
Total deductions from gross income.....	6,504,132	7,891,129
Net income.....	9,010,790	8,460,763
Appropriated for investment in physical property.....	2,538,571	4,500,100
Dividends.....	6,372,255	4,348,170

## Central of New Jersey

THE CENTRAL of New Jersey is controlled by the Reading Company through majority stock ownership. The Central owns 169,788 shares of the total 184,200 outstanding shares of the Lehigh & Wilkes-Barre Coal Company. By the order of the court in the Reading dissolution case, the Central has been ordered to divest itself of its shares in the coal company. The government attorneys also wanted the court decree to order the sale by the Reading of its Jersey Central shares. Upon protest by the Reading Company that such an order would be unfair at this time, the court required the Jersey Central shares to be transferred to trustees appointed by the court and held until action had been taken by the Interstate Commerce Commission looking to the formulation of a plan of railroad consolidation as required by the Transportation Act. The commission has now made public the tentative plan of railroad grouping.

Bearing in mind that this tentative plan is meant merely as a starting point for discussion of the proposed consolidations, it is nevertheless patent that Professor Ripley suggests, which suggestion the commission follows, that the Central of New Jersey should be included with the Philadelphia & Reading in System No. 3 built around the Baltimore & Ohio as a nucleus. A study of the relationships between the Reading and its controlled line would make it difficult to see any other solution than to include them together in the same system, whichever it might be.

The Central of New Jersey operates 686 miles of line, including lines owned, lines controlled and mileage operated under trackage rights. It is the only railway controlled by the Reading Company which is operated separately from the Philadelphia & Reading Railway. The Central of New Jersey in 1920 carried 9,634,411 tons of anthracite coal. In the same year it carried 9,550,006 tons of bituminous; in other words, the tonnage of hard and soft coal is now approximately equal. The anthracite coal is derived from mines in its own territory or is received from the Reading. It moves to Jersey Central territory, to New England via Phillipsburg, the Lehigh & Hudson to Maybrook and thence over the New Haven. Delivery in the case of the large movement to tide-

CENTRAL OF NEW JERSEY—NET TONS HANDLED

Year	Bituminous coal	Anthracite coal
1916.....	6,616,604	9,638,951
1917.....	7,542,625	11,040,273
1918.....	7,791,545	11,078,182
1919.....	8,060,793	9,496,781
1920.....	9,550,006	9,634,411

water is made at Jersey City, Elizabethport and in periods of heavy business at Port Johnson. The Jersey Central operates no barge lines, but the Lehigh & Wilkes-Barre Coal Company has such lines.

The bituminous coal tonnage handled by the Jersey Central is secured from the Philadelphia & Reading at three important connecting points: Allentown, Pa.; Haucks, Pa., and Bound Brook, N. J. The movement through Haucks is largely B. R. & P. coal, received from the New York Central at Williamsport. Inasmuch as this bituminous coal movement is described in the review of the Philadelphia & Read-

ing which appears also in this issue, it is hardly necessary to repeat it here.

The Jersey Central has an interesting problem in connection with the operation of the route constituted in the B. & O., Reading and Jersey Central lines between Wilmington, Del., and Jersey City. Freight is moved over this line on an engine-haul basis—there being one freight district from Philadelphia to Jersey City on Reading business, and from Williams near Wilmington on the B. & O. to Cranford Junction, N. J., or Jersey City.

The Central of New Jersey is like the Reading in many particulars. It is built to high standards and well maintained. Its suburban service out of New York, handling some 15,000,000 passengers annually, is characterized by the use of a large proportion of vestibuled steel equipment moved in heavy trains at high speed.

The Jersey Central is not in a position to secure as heavy freight train loading as the Reading. In 1920, its average revenue train-load was 710. This was an increase of 39 tons over 1919, but it compared with the Reading's 1920 figure of 906. The Reading was characterized as a terminal road; the Central of New Jersey is even more of a terminal than the parent company. The effect of the methods of operation necessitated has prevented a high daily car mileage. The miles per car per day in 1920 were but 13.9. The tons per loaded car were 34.2 and the net ton-miles per car per day were only 299. The average distance each ton was carried in 1920 was but 71 miles.

The Jersey Central, like the Reading, did not do well during federal control. Its standard return was \$9,352,301. In 1918 it earned a net railway operating income of \$6,268,096. In 1919 its net earned for the government was but \$1,384,554. In 1920 the property was operated at a deficit of \$5,852,417. The road is now carrying a fairly heavy traffic, presumably on account of the heavier anthracite coal movement. In the first six months of 1921, the net ton-mileage, revenue and non-revenue, was 1,099,943,000 as compared with a figure for the first six months of 1920 of 1,193,021,000. With increased rates and substantial reductions in expenses, the result has been a considerable improvement in net earnings. The net railway operating income for the first seven months of 1921 was \$4,171,917 as compared with a deficit for the first seven months of 1920 of \$1,411,910. The net railway operating income in July was \$1,098,407.

The road has made substantial additions to its equipment during the last year or two. It was allocated by the Railroad Administration 21 heavy Mikado and 10 switching locomotives and 500, 50-ton box and 1,000, 55-ton coal cars. In 1919 there were also received 500 box and 500 coal cars. In 1920 there were purchased and received 11 Mikado locomotives and 950 coal cars. Equipment trusts issued in 1920 increased the total funded indebtedness of the company at the end of 1920 by \$5,895,000 over the amount at the end of 1919.

The corporate income account for 1920 showed a deficit of \$2,528,481. Dividends were paid of 10 per cent and amounted to \$2,743,680, making a net deficit of \$5,272,161. In 1919 the corporation earned a net income of \$5,095,625. Dividends in 1919 totaled 12 per cent, or \$3,292,416, and the surplus for the year was \$1,803,209. The result of the deficit for 1920 was a reduction in the surplus account from \$8,942,343 at the end of 1919 to but \$3,327,079 at the end of 1920. This, however, is not quite as serious as it looks on its face to be. The corporate income account for 1920 includes under non-operating income, an item of \$5,146,411 representing receipts from the government on account of the guaranty period. This amount is equivalent only to slightly over half the standard return; it does not include the deficit in operation for the six months of the guaranty period which was of sizable proportions. It is very likely that were this

amount to be included that the year's deficit might be eliminated.

Referring to the dividends mentioned above, it is noteworthy that of the 10 per cent dividends paid in 1920, \$548,736, or at the rate of 2 per cent, were paid out of dividends received on stock of the Lehigh & Wilkes-Barre Coal Company and in 1919, \$1,097,472, or at the rate of 4 per cent. The income account for 1920 was not credited with an amount of \$551,811 representing the coal company dividend due December 27, 1920, because of a ruling of the district court. The court later assented to the payment of the dividend and it was paid by the coal company and included in the income account in February, 1921. This explains the 10 per cent dividends in 1920 as against the usual rate of 12.

The operating results for 1920 compared with 1919 are as follows:

	1920	1919
Mileage operated.....	686	686
Operating revenues:		
Merchandise.....	\$21,324,604	\$19,063,439
Bituminous coal.....	4,999,826	3,255,700
Anthracite.....	11,874,513	10,389,975
Passenger.....	6,090,107	8,164,830
Total operating revenues.....	51,669,750	44,837,302
Maintenance of way expenses.....	7,064,229	5,510,957
Maintenance of equipment.....	20,279,617	11,869,423
Traffic.....	449,982	322,112
Transportation—rail line.....	27,845,048	21,226,447
General.....	1,315,451	1,014,676
Total operating expenses.....	57,493,096	40,273,951
Net operating revenues.....	Def. 5,811,297	4,563,352
Railway tax accruals.....	2,933,251	3,096,466
Operating income.....	Def. 8,744,769	1,466,706

The corporate income account is as follows:

Standard return (January and February, 1920; year 1919).....	1,675,019	9,352,301
Net operating deficit (March to December 31).....	2,029,763	.....
Receipts from U. S. Government account guaranty period (March 1 to August 31).....	5,146,411	.....
Taxes.....	2,997,392	453,646

Net income.....	2,528,481	5,095,625
Dividends (10 per cent in 1920; 12 per cent in 1919).....	2,743,680	3,292,416
Balance of income account for year.....	Def. 5,272,160	1,803,209

## New Books

*Economics of Bridge Work* by Dr. J. G. L. Waddell. 6 in. by 9 in. 512 pages, illustrated. Bound in cloth. Published by John Wiley & Sons, Inc., New York.

The purpose of the author has been to cover the entire realm of bridge engineering from the mixing of concrete and the driving of rivets to the designing of the world's greatest bridges. There is reason to believe that the author's treatment of the more profound projects will meet with disagreement from some of the other leading authorities in bridge engineering and that they also will question the propriety of carrying comparative economic analyses to as definite conclusions as the author proposes, without recourse to the local conditions obtaining at the particular structure. However, this text contains a great fund of information of value to the engineer concerned with the design, construction or maintenance of bridges. In general the treatment is one of logic rather than mathematics. In few books does the author inject his own personality into the text as is done in the case of this work, so much so in fact that it gives the reader an impression of perhaps an undue reliance on the author's personal opinion. By the same token the prominence given to some of the more unusual problems encountered in the author's personal practice seems greater than is warranted by the frequency with which the problem would be encountered by the ordinary reader.

Following a general introduction of the subject, various chapters take up the promotion of bridge projects, market prices and alloy steels. Then follow separate chapters taking up the various types of construction used in bridge engineering, in some cases using direct comparisons between two

such types. Of these the chapter on the economics of cantilever and suspension bridges is written in a controversial tone which seems ill-suited to a text book. This chapter and the one on the economics of steel arch bridges were originally presented before technical societies, while the chapter on the economics of movable bridges appeared in an abstract in the *Railway Age* of June 17, page 1391.

Chapters on the economics of designing and other office routine and, in the latter portion of the book, on contract letting, inspection, shop work, erection, etc., may be said to comprise a detailed statement of the principles of good practice or sound management which of course in a sense implies economics. Chapter 41 covers maintenance and repair and includes an outline of the practice on the Chicago, Milwaukee & St. Paul with respect to the "classification" of old structures. Waterproofing is also treated in a separate chapter as is the economics of military bridging by Major-General L. H. Beach and Colonel P. F. Bond. In general, the text is matter that comes well within the ken of the engineer who is not a bridge specialist.

*Book of Standards—American Society for Testing Materials, 1921 edition, 890 pages, illustrated, 6 in. x 9 in. Bound in cloth. Published by American Society for Testing Materials, 1315 Spruce street, Philadelphia, Pa.*

In view of the large number of standards which are considered by this society at its annual meetings and the heavy expense involved in the printing of them each year, it was decided three years ago to publish these standards triennially. The present edition is the second issued under this plan and contains 160 standards. Among those of principal interest to railway officers are the specifications for steel rails, splice bars, track bolts and spikes; structural steel for bridges, for locomotives and for cars; carbon-steel bars for railway springs; billet-steel and rail-steel concrete reinforcement bars; axles, shafts and other forgings for locomotives and cars; wrought solid carbon-steel wheels; lap-welded and seamless steel boiler tubes for locomotives and boilers and firebox steel for locomotives.

*Proceedings of the American Railway Engineering Association. Bound in cloth or paper, 6 in by 9 in. 1092 pages, illustrated. Published by the American Railway Engineering Association, Manhattan Building, Chicago.*

This is the twenty-second volume to be published by this organization. This year's edition is somewhat smaller than those of previous years with the exception of 1919, and whether or not this is the result of a policy towards greater condensation or refinement of the material, the more compact form will unquestionably be welcome by most of those who have reason to consult this valuable engineering work. This volume contains the reports of 23 regular committees, which collectively covers practically every conceivable branch of maintenance of way. Two of the newer committees, namely, those on shops and locomotive terminals and economics of railway operation, present extended reports in this issue for the first time. The contents of this volume, covering the work of the 23 committees, is unusually diversified and contains a great fund of information on many different subjects. The reports of the committees on water service and track probably contain more varied subjects than the others. The volume includes two monographs, one on rail inclination and the standardization of track appliances on railways in France by W. C. Cushing, and one on rail laying with locomotive cranes on the Lehigh Valley by W. G. Barrett.

At WHITE PLAINS, N. Y., ten employees of the New York Central, with certain outsiders, have been arrested on charges of stealing merchandise from freight cars. A night yardmaster is said to have been the leader of the robbers.

## Letters to the Editor

"[The RAILWAY AGE welcomes letters from its readers, and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]"

### No Disgrace to Be Poor

MOBILE, AL

TO THE EDITOR:

I have read the article entitled "Will the Mechanical Department Make Good?" in your issue of August 20, 1921. I resent the title of the article, from which the public may infer that the mechanical department of the railroads in the past has not made good.

Of course the mechanical department is going to make good, just the same as it has in the past. The mechanical departments of many roads are handicapped by the limited means available for making improvements that they know should be made. It must not be inferred, however, that the mechanical departments are in any peculiar manner lacking in ability to make good. It only resolves itself down to the old saying that while it is "No disgrace to be poor, it is very inconvenient at times."

A SUBSCRIBER.

### Stop the Leaks

SPRING VALLEY, N. J.

TO THE EDITOR:

In a noteworthy article in the New York Evening Post of August 16 W. J. Cunningham, J. J. Hill Professor of Transportation at Harvard University, lifts a corner of the blanket which covers the operations of the average railroad in respect to the handling of its material and supplies and gives us a peep at some of the concealed losses which are being incurred on nine-tenths of the railroads of this country.

Prof. Cunningham's life-long practical experience and intelligent study of the problems of railroad economics and operation constitute him an authority on such subjects, but while he touches on some of the less obvious of these concealed losses he does not, by any means, disclose all of them. There can be no question but what the railroads collectively are losing between one hundred and one hundred and fifty millions of dollars every year through their neglect of this branch of the service and their failure to grasp the underlying causes of these concealed losses and correct them. There is today no single phase of the railroad business where such large economies are possible as in the Service of Supply, and none to which so little intelligent attention and study is directed.

Prof. Cunningham points out clearly some of the losses incident to an accumulation of surplus, or unnecessary materials in the stock, which he estimates at about \$1,500,000 per annum on a typical railroad of 3,300 miles. He includes in his figures interest on the investment at 6 per cent and the losses due to depreciation and obsolescence, which he estimates at 10 per cent. He says nothing, however, about the original cost of the surplus material which, being unnecessary, represents an unnecessary expenditure at least for the time being. Nor does he mention the cost of handling and accounting for this unnecessary material, which would not have been incurred if it had not been bought, nor the cost of transporting it over the line to the storage points, nor the value of the storage space unnecessarily occupied or the facilities used in handling it, which might have been profit-

ably employed in some other direction, nor of the added taxes and insurance charges due to its presence.

His estimate of losses due to depreciation and obsolescence is very conservative. It is probably safe to say that one-half of the unnecessary material is kept on hand for an unusual length of time—often for several years—and being handled over more or less frequently and left lying around in out-of-the-way places, becomes bent, broken, rusty, partially decayed or otherwise damaged by exposure, or is lost, misappropriated or wasted by being finally adapted to uses for which it was not intended, to the extent of 15 per cent of its original value. Applied to the whole quantity of surplus material this is equivalent to a loss of  $7\frac{1}{2}$  per cent. on account of damage and depreciation.

Obsolescence introduces a different element of loss. After standing around and occupying valuable storage space for years, being repeatedly handled to get it out of the way of the necessary material and at inventory periods, perhaps 15 per cent of this surplus material becomes useless through changes in standards and the adoption of more modern devices. It is finally consigned to the scrap pile and disposed of for 40 per cent, or less, of its original cost. This is equivalent to a loss of 9 per cent on the original value of the whole.

All of this surplus material has to be handled and accounted for in the same manner as if its purchase had been necessary. Under present conditions no railroad can handle, distribute and account for its material for less than 4 per cent of its cost if the work is properly done. As a matter of fact the cost of handling surplus material is always above the average.

The cost of transporting unnecessary material over the line is the same as any other and is, of course, a variable quantity depending on the distance it is moved to the storage points and the value of the material itself. Like the handling cost this charge is likely to be enhanced by the movement of the material from point to point in the effort to find a place where it can be used. It might be fair to estimate this cost at  $\frac{1}{2}$  per cent.

Taxes, insurance, the value of storage space occupied and facilities employed, additional labor at storage points in consequence of shifting the material repeatedly out of the way, all involve expense which it is impossible to allocate accurately, but it seems reasonable to place an estimate of 1 per cent on the combined costs arising from these sources.

We have then, as direct losses due to an accumulation of surplus material in the stocks:

	Per Cent.
1. Interest on the investment.....	6.0
2. Damage and depreciation.....	7.5
3. Obsolescence .....	9.0
4. Handling and accounting.....	4.0
5. Transportation .....	5
6. Taxes, insurance, etc.....	1.0
Total .....	28.0

To be conservative the cost of carrying surplus material in stock at present may be stated as 25 per cent per annum.

During the year 1919, while the railroads were under federal control, it was definitely shown, by a comparison of the performance of the different lines, that the surplus stocks of miscellaneous materials, exclusive of fuel, rail and ties, amounted in the aggregate to \$135,000,000, which was over 28 per cent of the total investment in that class of material. The annual carrying charge on this unnecessary material, therefore, amounted to \$33,750,000, to say nothing of the money needlessly expended in procuring it.

One hundred and sixty-eight million dollars would buy a good many new locomotives, improve a great many defective engine terminals or pay dividends on a good many shares of stock. It might even occur to some one to use a small part of this wasted money, as Prof. Cunningham suggests, in offering some inducement to men of the requisite ability and experience to organize an efficient Service of

Supply and intelligently manage this large investment in material, which swallows up 36 per cent of the gross earnings, in a manner calculated to stop some of these leaks, which are apparent to every one except the average railroad executive.

The only sure remedy is a properly organized Service of Supply in the hands of a competent and adequately paid staff, entirely independent of the jurisdiction of the users of the material.

A few railroads have done this! Why not all?

GEORGE G. YEOMANS.

## College Men Not Wanted

OUT WEST

TO THE EDITOR:

I have been following with much interest your discussion of the attitude of the railways toward college men. I am a college man and have been working for a large railway system for four years.

The great obstacle in the way of the college man entering railway service is prejudice. The railways are prejudiced against college men, their ways and their knowledge. The personnel all come from the "bottom." They were "call boys." When the college graduate is out of school he is mature and cannot earn his salt as a "call boy." But the exponent of the inefficient system of "do-as-you've-always-done" thinks that is where he should begin. He thinks even the college man cannot grasp a conception of the specialized knowledge except by long experience.

Railways have persistently spurned the advice of college men. They have repeatedly refused to make a place in their ranks for the graduate. As a result, the railways find themselves several years behind the pace set by most other progressive enterprises. It gives me no pleasure to contrast the wheezing locomotives, out-of-date methods of handling material, miles of belting in the shops, inefficient rows of line-shafting, cast-off locomotive boilers doing duty as heating systems with uncovered pipes, etc., with a modern plant with a motor at each machine, plenty of light, plenty of heat and systems of conveying material without waste of time or space.

The railways have made no place for the college graduate, and the university has no place in its curriculum for the railroad man. Until both have made concessions, I see no hope for a college graduate in the railway service. I do not blame the college man for entering more inviting fields of enterprise where he is better cared for.

A. R. A. CLERK.

## Unnecessary Transferring

### of Loaded Cars

NORTH PLEASANTON, TEXAS.

TO THE EDITOR:

It is truly refreshing to read the letter of R. R. Farmer in your issue of September 17 on the unnecessary transferring of loaded cars. At least one superintendent is awakening to the uncalled-for expense for switching, per diem and labor, caused frequently by an ignorant or a vindictive car inspector, to say nothing of the loss and damage due to transfer and the delay and inconvenience to the consignee. Consider our loss and damage freight claim payments—over \$100,000,000 a year. What does it cost to switch a car from the interchange track to the yard, from the yard to some convenient point for the transfer of the lading (another car switched opposite to, or by it), thence to the rip-track and back again? And how about empty cars set back for some technical application of a rule?

My experience with the Interstate Commerce Commission

and their inspectors is that they are broad-minded and intelligent, exerting themselves to keep business moving and to eliminate unnecessary expenses, but impressing upon us "safety first." I am afraid the real trouble is that the managers of the roads are so occupied themselves that they do not realize what is actually transpiring along these lines in their large terminals, and the mechanical departments for some unknown reason feel they must stand behind their inspectors.

This evil can be corrected if vigorous steps are taken, and I would suggest a check at some large terminal of the preceding three months to ascertain the ratio of setbacks and transfers as compared with the total number of cars handled. A disinterested commission should then be appointed to pass on every car set back or ordered transferred for a month. Probably the commission would have but little to do, but I feel sure there would be a considerable reduction in the ratio. In view of the many features and expenses involved it would be worth while to ascertain what the actual conditions are.

F. L. LEWIS,

General Superintendent San Antonio, Uvalde & Gulf Railroad.

## Give the Chief Clerk Free Rein

TO THE EDITOR:

I see by the paper we're at it again!

Officer vs. Chief Clerk!

Unfortunately instead of mutual admiration and recognition of each other's ability we find a feeling of antagonism. The boss and his chief clerk co-operate; if they did not one would get discharged and it's an easy answer as to who it would be. It is an ambiguous situation; cooperation with mutual antagonism.

The chief clerk could write reams of criticism about the boss, and vice versa. But the question of "why" still remains and an analysis of the situation on the part of both would probably do a great deal of good.

One can readily recognize the fact that the writer of the original "Chief Clerk" letter was a man in the operating department. That is, transportation, mechanical or maintenance of way. These are the fellows who plod along in railroad service for years, finally reach the apex of their particular line, the position of chief clerk, and what do they find? They are up against a stone wall that is insurmountable; a blind alley from which there is no avenue of escape unless they resign.

Why? Simply because the chief clerk to the superintendent of motive power has not passed through one of the mechanical trades; the chief clerk to the chief engineer of the maintenance of way has never had actual road service; the chief clerk to the general manager has never been a conductor or train master, etc.

It took fifteen years for the writer to reach his apex in railroad clerical work, two and one-half years to wake up to his "blind alley" situation and six months to secure a position away from railroad work. Eighteen years given to railroad work and absolutely at a stand-still. Couldn't possibly become a superintendent of motive power!

### Again, Why?

Perhaps the railroad official who answered the "Chief Clerk's" letter can answer. Perhaps he can say what a chief clerk can do to better his situation. It would be interesting to read his comments.

However, let's get back to the "mutual admiration society of officials and chief clerks." Each, without the other, would be hopeless. The chief clerk needs the guiding hand of the official and the official needs the detail of the chief clerk.

Of what avail would it be to a superintendent of motive power to make a killing on his "cost per mile for main-

tenance," if the chief clerk were not able to compile this statistical information and pass it on to the general manager? How could the superintendent of motive power handle the big things in his department if he were burdened with working out the infinitesimal details that his chief clerk handles? Who would handle the mass of correspondence that daily comes in and goes out? If the official would analyze the thousand and one trifling duties his chief clerk performs and add to that the hundreds of important duties the chief clerk must attend to, the society before mentioned would have a solid foundation to begin with.

I believe the antipathy (and there is no doubt but what it exists) has its origin in the shops or on the road. On the one hand we find the apprentice machinist who must work nine or ten hours a day, inside and outside, rain or shine, usually encased in oily clothes and generally mussed up in appearance. He is probably down in a greasy pit, sweating (not perspiring) and along comes a sleek-looking timekeeper with his white collar, clean hands and face. The clerk, afraid of getting soiled, is the very essence of "snubbery." The apprentice feels like the underdog and the clerk does nothing to disillusion him.

Again we have the track laborer toiling in all kinds of weather, and the chief clerk who approaches him.

The feeling engendered in that apprentice and that track laborer is with him subconsciously when he reaches the position where he has a chief clerk and it is this feeling that is responsible for the existing difficulties between the operating official and his clerk. If the official would recognize his chief clerk as a necessity instead of a necessary evil the first step would therefore be accomplished.

In my category of railroad officials (based on actual contact) I have three classes:

1. The "iron man."
2. The "don't give a d—n."
3. The "Big Boss" with the first and second eliminated.

The "iron man" was absolutely the dictator of his department down to the last man. A man of vigorous mental and physical power, an absolute wonder. But—he had one weakness and that was the fear that an officer higher than himself would propound a question pertaining to some problem that had been handled in his department and with which he was not familiar. The result was that he was "snowed under" all the time and while he was familiar with every detail under his management, nevertheless he was continually criticised for his delay in handling important matters.

The "don't give a d—n" man didn't last long. Golf, plus the desire to be out on the line the majority of the time, resulted in his chief clerk having to assume almost the total responsibility for his division. This man was a procrastinator and the least said of this type the better.

The third man was the "Big Boss" in every sense of the word. He did not rule with an iron fist, and still every one in the department knew who was boss. He would temper his criticism with advice and frequently would bring from his personal library data that would assist his chief clerk in understanding certain problems. He had time for everything and everyone. Why? Because he handled his work systematically. His chief clerk was no figurehead; he was an official in the department the same as the assistants. The morning mail would come in, files attached thereto, and the chief clerk would carefully go over it. At a certain hour each morning the chief clerk took all the correspondence in for conference. The boss would go over the papers with the clerk and instruct him how to answer certain letters, would keep some for his personal attention and in that way dispose of all the mail.

His ability was readily recognized and today this Big Boss is bigger; he is in charge of the mechanical department of one of the largest railroads in the country. And that is

get, his several chief clerks while he was climbing the ladder of success helped him along.

Who answers the official higher up when a phone call comes in while the boss is away? Who looks after the comfort of the boss during his working hours? Who reminds the boss of his engagements and important business matters that must be attended to? Who gets rid of "callers" the boss has not time to see? Who assists the most in keeping the boss posted as to general conditions on the railroad and in his department?

And who is held responsible for the handling of the department in the absence of the boss?

The chief clerk does all this and much more. I am speaking of a type which is in every sense of the word a chief clerk. It is agreed that many incumbents in that position are incapable, but it is the dyed-in-the-wool chief clerk that I refer to. The man who can do great things in the department, if given sufficient latitude. Possibly "Operating Official" has been unfortunate (?) in his men.

Were I an operating official my greatest concern upon being promoted would have to do with my chief clerk. I would study my man and if necessary make changes until I found the right one. Then, instead of restricting him, I would give him the greatest latitude as I know my interests would be his and his attitude towards me (engendered by my apparent faith in his ability) would be of such a calibre that he would seldom go wrong.

Through this co-operative plan, I would be giving him his birthright; the opportunity of using his initiative.

Try it, "Operating Official!" GRANT GIBSON.

## Forman and Ford

SAN FRANCISCO, CAL.

TO THE EDITOR:

What I wrote in your issue of September 24 relating to the 19 order was predicated upon just how far the average officer would be likely to go in the light of present knowledge or customs. No officer, I take it, would care to deviate from the Standard Code to such extent that his road could be held up as a horrible example should a collision result from some experiment which had not at the very beginning been fully worked out.

As surely as the next decade is going to see a searching investigation as to the components of concrete, with the view of overcoming its present unstable qualities, just so surely will there be made known the imperfections of our present cumbersome train dispatching system and more simple methods adopted. This may possibly result in the abolition of all written train orders. Delaying freight trains twenty minutes and passenger trains five minutes to secure signatures to train orders is so clearly wrong in principle as well as expensive and burdensome in results that relief therefrom is imperative and must eventually come about in some way.

If I were a Henry Ford and owned a railroad I should reason about as follows and would handle the train dispatching accordingly:

With the protection that the clearance card affords, made out as outlined in my letter of September 24, there should be no risk in using the unsigned order for any movement, provided it be further safeguarded by having the train order signal against the ruling train. Therefore the proposition is reduced to three general principles:

(a) There must be an order-signal which will stop the train to get the instructions.

(b) There must be a clearance card to insure that all orders issued by the dispatcher are delivered to the train.

(c) The instructions must be so clearly worded that they cannot possibly be misunderstood; and if firemen and flagmen are to be in any way held responsible for the proper

observance of train orders they must be given copies of them to retain.

When the order-signal, or its equivalent, cannot be depended upon, then, of course, acknowledgment from the conductor and engineman of the superior train must be obtained before authorizing the inferior train to move against it.

Provisions for the "X response" should not be eliminated from the new form, for the reason that it is needed at times. Neither should we omit the line on which to show when an order is "Repeated."

In religious circles one sometimes hears the expression, "If it is in the Bible, it is so." In railroad circles it is equally common to hear, "If it is in the Standard Code, it goes." Unlike the Bible, however, the Standard Code is not a finished book. A comparison of the original and present Standard Code rules will show that there have been changes—changes of a progressive nature. Devotees of this much-respected and feared document should bear in mind that even the Standard Code does not place any restrictions upon the use of the 19 form of order. And it makes no provision for the safeguard of a clearance card, to be given with all orders.

Just why every restrictive feature of the Standard Code makes such a strong appeal to everybody, while at the same time they do not endorse some of its more liberal provisions, is a problem too deep for the ordinary mind to solve.

For absolute safety the middle order is the greatest single safeguard so far devised, for the following two important reasons: (a) There are two order-signals against opposing trains. (b) It is a reminder at the most important place of all—the point where the trains are to meet. Use of the middle order is attended with unqualified success when dispatchers are permitted to instruct operators (holding such orders) to change the order-signal from "stop" to "proceed" to permit disinterested trains to pass the station without slowing them to secure a clearance card. The principal objection to the middle order, so far as I know, has been that having so many order-signals at "stop" causes delay to trains not concerned. I have made it a practice to instruct operators to change the signal as described and I know of no collision chargeable to this method of handling. It is to be frankly admitted, however, that to do so is, to say the least, a strained interpretation of Standard Code Rule 221 B.

When practicable to use it the middle order is the all-important thing; when its use is impracticable orders should be placed as near the point where they must be executed as is possible. Again, when practicable, dispatchers should refrain from issuing orders six or eight hours before operators are required to make delivery.

Telephonic dispatching is a great help which is not yet sufficiently appreciated. A telephone should be installed at every siding, without regard to the number of order offices open. Another improvement often unappreciated is to shorten the territory of train dispatchers, especially on heavy single track lines, so that they may have ample time to think and to do what is required of them without undue haste.

But where, after the adoption of the foregoing recommendations, dispatchers are permitted to become careless in the duty of underscoring each word and figure of a train order the instant it is being repeated by each operator; or habitually to read newspapers or books when on duty, there need be no hope of any such thing as safe handling of trains by the use of train orders.

H. W. FORMAN.

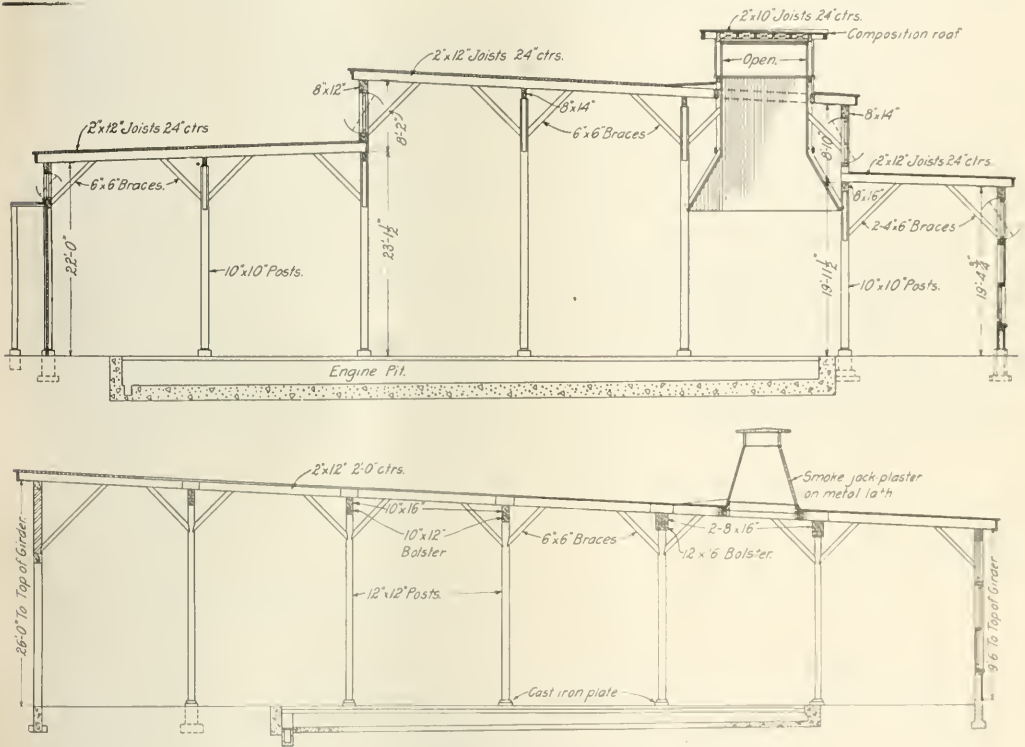

PENNSYLVANIA TRAINS departing from the Union Station, Chicago, will be held whenever the Adams street or Monroe street bridges leading to the station are open. If these bridges open within five minutes before the departure of any train, the train will be held in the station until five minutes after street traffic again begins to move over the bridge.

# Frisko Secures Maximum Benefit for Modest Outlay

## Series of Minor Projects for Second Track and Locomotive Facilities Expedite Operation

THE CAPITAL expenditures made by the St. Louis-San Francisco during 1920 and the early part of the present year for additional main tracks, grade revision and locomotive facilities, comprise a striking illustration of a minimum outlay for the maximum benefit. They serve as an object lesson in the character of improvements which may be undertaken during periods of restricted financing. In the case of second track this problem was approached by selecting those portions of the line where the greatest relief would be afforded by the construction of short sections of

and Kansas respectively. The main trunk traverses a rough country and was built with maximum grades of 1.25 per cent in both directions. The preponderance of traffic is eastbound, consisting of oil and products of agriculture, while the westbound traffic comprises manufactured goods together with an empty return movement of box and tank cars to compensate for the excess of eastbound traffic. The general program for the improvement of this line contemplates continuous double track from St. Louis to Monett with a revision grade whereby the ruling grade will be 0.8

Stall Sections Through Two Types of Roundhouse Construction Used by the Frisko

second track which would conform to a general plan for the ultimate second tracking of certain operating divisions. In the case of the locomotive facilities, the success of the program undertaken must be ascribed to the fact that the existing terminals provided ample opportunity for additions and extensions.

### Second Track Work in Four Units

Three of the sections of double track work prosecuted during the past 18 months are on the main stem of the St. Louis-San Francisco, extending from St. Louis southwesterly to Monett, Mo., near which point it divides into three important lines extending into eastern Arkansas, Oklahoma,

per cent in both directions. However, the schedule for the completion of this work has been drawn along conservative lines with the idea of providing initially only as much of the second track as will be designed to relieve those portions of the line subject to the greatest congestion. Consideration is also taken of the revision of grades in connection with the second track work which will prove of greatest immediate benefit.

The first step in double tracking the St. Louis-Monett line comprises that portion of the line between St. Louis and Pacific, a distance of 34 miles. This embraces the territory over which the Frisko maintains a suburban service into St. Louis and also comprises a region of frequent meeting

points between inbound and outbound passenger trains during the early morning and evening hours. Previous to 1920 second track in this section had been completed as far as Windsor Springs, a distance of 13 miles. Last year an additional section of 7 miles was undertaken between Eureka and Pacific, this portion being selected because it involved light work. Its completion leaves a gap of 14 miles still to be completed and the next section to be undertaken will be the five miles from Windsor Springs to Vailey Park which will eliminate the Meramec tunnel for eastbound up-grade traffic. No work is, however, being done on this section at present.

The next section of double track line is at the center of the engine district between Newburg, Mo., and Springfield and covers a distance of seven miles between Sleeper and Lebanon. There were two reasons for selecting this stretch of line for the first second track work in the district. Its location at the midpoint of the district is a natural meeting point for trains, a condition which is further complicated by the character of the railroad right-of-way through the town of Lebanon which is built up close to the tracks. The other feature was the fact that five miles east of Lebanon there was a 1.5 per cent grade  $1\frac{1}{2}$  miles long opposing eastbound movements, the elimination of which would afford a ruling grade of 0.8 per cent for eastbound trains over the entire engine district. Surveys demonstrated that the new east-bound line could be obtained on a location about one mile south of the operated line with grades not to exceed this maximum and not over one per cent against westbound movement.

The third section authorized extends four miles eastward from Monett to Globe. This stretch of line includes a 1.1 per cent grade against eastbound traffic, beginning at the east end of the Monett yard and has been operated as a helper grade in starting eastbound tonnage trains out of the yard. Here it was found advisable to revise the grade on the old line to 0.8 per cent by cutting down the summit of the hill at Globe and to construct a new line for westbound movement alongside on the same grade.

The fourth section of second track work is on the Kansas

25, 1921. The plans of the St. Louis-San Francisco contemplate the completion of second track into Paola within the next few years.

### Grading Work of a Varied Nature

The second track work east of Pacific, Mo., was carried on under contract by the List & Gifford Construction Company of Kansas City, Mo., the contractor doing all work, including track laying and ballasting. The grading consisted principally of side earth borrow handled with teams and scrapers and one sand-stone cut that was taken out with

Map of a Part of the St. Louis-San Francisco

a revolving shovel, the material being hauled into the embankment in narrow-gage, four-yard dump cars, without interference with traffic.

The second track between Sleeper, Mo., and Lebanon, as shown in the map, consists very largely of a new independent single-track line. This was handled by contract with Scott & White of St. Louis, Mo., who did all work including track laying and ballasting. The excavation consisted of about 20 per cent of solid limestone rock excava-

Map and Profile of the New Line, Second-Track Work Between Lebanon, Mo., and Sleeper

City line extending southward in eastern Kansas for the distance of 42 miles between Kansas City and Paola, Kan., where the St. Louis-San Francisco track is also used by the Kansas City trains of the Missouri, Kansas & Texas. During times of heavy business the combined traffic of the two roads is more than can be handled satisfactorily and economically on a single track. Because of this, double-tracking of this line has been in progress for some time. In 1920, it had been completed as far as Olathe, about 20 miles. During the past year another section of 10 miles from Olathe to Spring Hill was constructed and put into service on April

tion, about 50 per cent of loose rock and cemented gravel, and about 30 per cent of earth. The excavation practically balanced the material needed for embankment, and the larger portion of the work was handled with steam shovels. The new track is now practically complete.

Between Globe, Mo., and Monett the large summit cut was handled by the railroad company's steam shovels, the material being taken care of in 16-yd. dump cars and unloaded for widening embankments as it was not needed for second-track fills. Some of the lighter grading and the masonry, bridge and culvert work was contracted to All-

loose and had been the cause of the derailment, was taken to the shop and was forced back on to the axle and then forced off again; and the opposite wheel was also forced off; and from these and other experiments it was shown that the wheel, which had run only about 1,400 miles, could not have been loose on the axle.

The conclusion of the report says that the evidence is strong that an explosive was placed between the head and the base of the left-hand rail; that this lifted the left forward engine truck wheel and forced it outward and upward. The chiller marks on the wheel made an impression on the head of the rail. The axle from which the wheel was blown off was slightly bent.

James E. Howard, engineer-physicist of the commission, made an investigation and a report supplementing the foregoing. He calls attention to the fact that 40,000 lb. per square inch is not an unusually high pressure to be exerted by a high explosive. A pressure of 200 lb. per square inch on the inner base of the wheel would have been adequate to remove it from the axle.

## Proposed National Stop-Look-and-Listen Campaign\*

By Marcus A. Dow

General Safety Agent of the New York Central Lines

UNDOUBTEDLY, grade crossing accident prevention presents one of the most difficult problems in railroad safety work. The public cannot be reached effectively by any individual railroad. The avenues of approach are difficult. The people who might be reached today are supplanted by others who cross your tracks tomorrow. These people do not confine their traveling to a limited area and they are not familiar with your crossings. The growing record of deaths and injuries; the steadily increasing expense to railroads and the lamentable loss to the nation each year of hundreds of its highest type of citizens should awaken both the railroads and the public to the need of a concentrated effort to curb the carelessness that is largely responsible. If a campaign is to be made effective at all, it would seem to be absolutely necessary for every railroad in the country to join.

1. Such a campaign should officially cover a period of say three months and be conducted at the time of the year when extensive touring is done.

2. Notify the general public through the press and ask their co-operation. An article for the press should be prepared by a special committee and distributed to all railroads to be sent to the local papers on each road; to be submitted to the papers in person by the local agent in the smaller cities and towns and by the most influential officer in the larger cities. Follow up articles could be used.

3. In a similar manner advise automobile clubs, rotary clubs, chambers of commerce, etc.

4. The secretary of the Safety Section should obtain a monthly report from each railroad, at the end of each month, of the number of persons killed and injured in crossing accidents; such information to be used in advising the public through the press, automobile clubs and otherwise of just what the monthly toll of human life amounts to because the rule of Stop, Look and Listen is disregarded.

5. Inexpensive but effective posters should be designed by a special committee and posted in every passenger and freight station on every railroad in the country. Also posters to be distributed for posting to automobile clubs, etc. Local agents should personally handle such distribution.

6. Distribution to automobile drivers of a warning notice,

printed on a small slip of paper . . .

This warning slip should be personally handed to the automobile driver by a railroad representative. Crossing flagmen, station agents, freight agents, safety committee members and others should be furnished with a supply, a record kept of the number furnished the employee and report made to some officer or to the safety committee on the division of the use each employee made of his supply. Hundreds of thousands of automobiles could be personally reached in this manner.

7. (a) Pastors to be used on stationery. (b) Stickers to paste on windshields.

8. (a) Endeavor to get the International News or similar agency to include in one or more of its illustrated news posters, appropriate photographs and descriptive matter. (b) Make an effort to interest the motion picture news weeklies. Smash up an old automobile in a fake crossing accident; photograph such a scene and run it in the theatres.

9. Seek the co-operation of the secretary of state or state automobile license bureau, or similar public office, in the distribution of a special warning notice printed on a card to accompany the license plate when delivered. This should be attended to in time to have the distribution made with the next license plate. I have tried this and believe considerable attention is paid to it. I have found the secretaries of state in the states on our lines are glad to co-operate.

10. The co-operation of churches and schools should be solicited. A special form of letter should be prepared to be sent to proper officers of schools and churches.

11. For publicity purposes, early in the campaign, on a certain day to be specified, every railroad should assign observers at one or more grade crossings for a period of five or six hours. The information thus gathered when used in connection with a nation-wide campaign would be most enlightening, and would be given wide publicity. It should be sent by wire to the general headquarters of the A. R. A. for prompt distribution to the press of the country.

12. The B. & O. plan of checking automobilists is worth considering in connection with a national campaign.

So much for the traveler-on-the-highway; but railroad officers and employees have responsibilities no less important and the campaign should include a careful check of all those employees and departments of the railroad who can in any way contribute to the success of the campaign. (a) Locomotive engineer should receive a personal letter from the superintendent. (b) Station agents should receive special instructions to co-operate. (c) Crossing flagmen must be personally interviewed and instructed by the official to whom they report; make them feel a personal responsibility so that each one will resolve not to have an accident on his crossing during the campaign. (d) All trainmen and conductors to be notified of the campaign and be instructed to protect crossings while switching over them. (e) Maintenance employees to correct defective planking, or other conditions that might stall an automobile. (f) An inspection of crossings by proper officers to observe obstructions to view, such as trees, that should be trimmed or removed.

The foregoing suggestions for a national campaign do not involve any great expense. The printing of circulars, posters, etc., would be nominal for each road. The main thing is to have the full backing and enthusiastic support of the officers of each road and I believe the safety men of the roads could put such a campaign over. We, who are in the railroad safety work have found that continuous and systematic efforts have reduced the number of deaths and injuries to railroad employees. Our most effective weapon has been an appeal to the human heart. Surely human beings are alike everywhere and if, by a great united effort, we railroad men of the country can inject some of the spirit of safety into the hearts and minds of the motorist we shall render a great service to the railroads we represent, to the citizens of our communities and to the country we love to call our own.

\*A paper read before the Safety Section of the American Railway Association at Boston, September 26; abridged.—The Boston meeting was reported in the *Railway Age* of October 1, page 629.

# Can Railroads Compete With Contract Shops?

## Costs of Repairing 50 Cars in a Railway Shop for Comparison with Contract Cost of Similar Work

By J. W. Roberts

President, Roberts-Pettijohn-Wood Corporation, Chicago

*[In a preceding article the author outlined the bases under which the cost of repairing 50 box cars in a contract shop was compared with the cost of similar repairs to 50 cars of the same series carried out in the shops of the owning railroad. The present article discusses in detail the elements of cost of the work done in the railroad shop.—EDITOR.]*

THE CARRIER does not accumulate in its records the costs pertaining to individual repair jobs, and it was therefore necessary to examine the details and build up the costs from the beginning. The carrier's local officers and employees who were intimately familiar with the particular work the cost of which was sought, as well as the records relating thereto, rendered enthusiastic co-operation throughout, to the end that the findings might be consistent with the facts.

### Shop Labor—Direct

Direct labor on the 50 test cars, by crafts, was found as follows:

Carpenters .....	\$11,636.00
Steel workers .....	426.00
Blacksmiths .....	365.50
Air brake men .....	280.00
Painters .....	240.00
Door makers .....	140.00
Total .....	\$13,087.50

Carpenter labor was taken directly from the daily service cards turned in by the workmen, which fortunately had been continued in use as a relic of the former piece work system, which showed the individual cars worked each day and the time devoted to each operation on each car. Total time reported was checked against the payrolls. Service cards were not required of the other craftsmen, however, and it was necessary to use an average cost per car for these respective classes of labor. All cars repaired at the shop during the period when the test cars were under way received substantially the same kind of repairs. The test cars, however, were among those receiving the most extensive repairs. The total hours worked during the period by each class of direct labor other than carpenter labor, was divided by the total number of cars repaired, and an average cost per car found. This average cost in each instance was multiplied by 50 and the result assumed to be the cost of labor. This is conservative, and undoubtedly understates the actual cost since the box cars required the maximum amount of labor. Open top cars required less painting, many cars did not have draft arms applied, some cars did not require two new side-doors as did the test cars, and some cars were not completely re-rigged for air as were the box cars. The labor thus arbitrarily determined is only 11 per cent of the total direct labor.

In addition to the foregoing, certain work was done in other departments which did not record the time devoted thereto, to wit: steel men riveting coupler yokes, steel men rectifying body bolsters, reclamation shop recovering 16 journal box and 4 column bolts. The cost of each of these operations was determined from a performance time study and the application of the standard rate of pay, resulting in a total charge of \$3.71 per car, or for 50 cars, \$185.50.

### Shop Labor—Indirect

Indirect labor in each department each month has been apportioned on the basis of the departmental direct labor. For instance, mill foremen and mill men have been distributed on the basis of carpenter labor; rip track foremen, laborers, material and supply men, drill press and bolt threaders, and box packers, on the basis of repair track labor exclusive of carpenters; and assistant general foremen, clerks and watchmen on the total labor to which such expense was common.

The total indirect labor charge assigned to the 50 cars amounts to \$4,395.31.

### Shop Expense

The total shop expense charged against the shop for the four months during which work was under way on the test cars was as follows:

Labor .....	\$53,896.36
Operating materials and supplies, .....	11,852.68
Fuel .....	29,421.15
Electric current consumed.....	5,664.60
Ice .....	959.65
Total .....	\$101,734.64

These charges include nothing for haulage of the fuel used over the rails of the company. The tonnage of fuel used was ascertained, likewise the distance hauled over the carrier's line from the normal source of supply, and haulage cost was computed at the rate of seven mills per net ton mile, resulting in a surcharge of \$4,099.53 as the cost of transportation. This increased the shop expense for the period to \$105,834.17. The cost of transporting materials and supplies is necessarily omitted because of inaccessibility of the data as to weight and point of origin.

Shop expense was apportioned to the test cars and other work on the basis of assigned shop labor, \$2,383.31, being assigned to the test cars.

### Insurance Expense

The premium paid on commercial policies for fire insurance and the accruals to the carrier's own insurance fund to protect the margin between the insurance carried and the amount of hazard on the insured facilities comprising the shop layout, was reduced to a monthly basis and distributed on the basis of assigned shop labor. The apportionment to the test cars amounted to \$13.23.

### Maintenance of Shop, Power House, Machinery, etc.

The total expense for four months charged to accounts, 302—Shop Machinery; 304—Power House Machinery; and 335—other expenses, representing the actual expenditures during the test period at the shop in question, was apportioned on the basis of assigned shop labor, resulting in \$1,317.07 being assigned against the test cars. The records did not lend themselves to analysis in such a way as to permit of averaging the machinery maintenance expense for a longer period, which apparently would have increased the charge somewhat.

### Maintenance of Buildings and Tracks

The labor and material charged during the calendar year 1920 against the maintenance of the buildings and tracks

comprising the shop facilities was taken as the basis for ascertaining cost of maintenance of these facilities. The total charges were reduced to a four months' average and this amount apportioned on the basis of assigned shop labor, which assigned \$235.89 against the test cars.

In the charges thus distributed nothing was included for transporting the materials used over the carrier's rails, which could not be computed for lack of detail as to material quantities. The records were not always kept in such detail as to show the facilities to which repairs were made, and repair expense not described may have applied to the facilities in question. Cognizance is taken only of the charges identified to the facilities involved.

#### Maintenance Expenses Common to all Local Shops

Other shops than the one in which the test cars were repaired are located at the same point, and during the year 1920 account 235—Shops and Enginehouses, received charges common to all such shops. The charge for the period was reduced to a four months' average, and then distributed on the basis of assigned shop labor (less superintendence) in all shops, resulting in a charge of \$57.91 against the test cars.

#### Divisional Overhead—Maintenance

##### of Way and Structures Expense

During the calendar year 1920 the divisional overhead charges applicable to maintenance of way and structures expense (exclusive of accounts not benefitted thereby, as for instance, Account 275—Insurance) were as follows:

Account 269—Roadway machines .....	\$17,346.48
Account 271—Small tools and supplies.....	26,413.11
Account 274—Injuries to persons.....(Cr.)	253.97
Account 276—Stationery and printing.....	1,916.20
Account 277—Other expenses .....	157.25
Total .....	\$45,579.07

This annual overhead expense was apportioned on the basis of its relation to the total maintenance of way and structures expense supervised and \$6.27 assigned to the cost pertaining to the test cars.

#### Entire Line Overhead—

##### Maintenance of Equipment Expense

Superintendence and other overhead expense applicable to maintenance of equipment during the calendar year 1920 was as follows:

Account 301—Superintendence .....	\$458,267.75
Account 332—Injuries to persons.....	55,206.26
Account 334—Stationery and printing.....	41,392.11
Total .....	\$554,866.12

A relationship between total overhead expense and the total expense supervised was found and on the basis of this relationship the supervised expense assigned against the test cars was applied, resulting in a charge of \$1,720.22 against the test cars.

It should be mentioned that divisional overhead expense relating to maintenance of equipment is consolidated with system charges by the carrier and could not be segregated and separately accounted for without a prohibitive amount of work. The consolidation of the expense before apportionment reduces the proportion which would otherwise be assignable to the work in question.

#### Entire Line Overhead—Maintenance

##### of Way and Structure Expense

The charge against the test cars for system overhead applicable to all maintenance of way and structures accounts, as represented by the charges to Account 201—Superintendence, was predicated upon the equitable distribution of the total charges to this account on the basis of the total ex-

penses supervised, using the experience of the calendar year 1920. The relation of superintendence to total expense supervised was 4.838 per cent and the amount assigned to the test cars was \$14.79.

#### Entire Line Overhead—Repairs of General

##### Office Buildings and General Storehouse

The identifiable expenditures for repairs to system general office and general storehouse buildings and appurtenances during the year 1920 were collected, and their relation to total operating expenses (less common to system repairs) and expenditures for additions and betterments was found, and on the basis of this relationship the costs assigned to the test cars were surcharged pro rata, the amount assigned for expense of this character being \$2.36.

#### Entire Line Overhead—System General Expense

System general expenses for the year 1920, comprising the items included in the various primary accounts under the sub-division "General," above referred to, were found to be equivalent to 3.4733 per cent of the total expenditures for other operating expenses plus the expenditures for additions and betterments to road and equipment, excluding the adjusting credits for property retired and the amount of liability for certain equipment allocated by a governmental order which involved no general expense during this period on the part of the carrier's organization.

The charges assigned to the test cars were burdened with this per cent for system general expense, amounting to \$2,436.20.

#### Mounting Car Wheels

In connection with the work in question thirty-one sets of 33-in. car wheels were mounted on axles. This work was done in a department which merely allocated the time worked upon different operations to each operation. During the four months' period in which the test work was done the average cost of mounting car wheels was found to be \$2.61 per set, which for 31 pairs amounted to \$80.91, which has been included.

#### Depreciation on Fixed Properties

The carrier does not exercise the option of accruing currently depreciation on its fixed properties. In view of the demonstrable fact that the maintenance policy of the company does not perpetuate the life of such property, but that deterioration not offset by current repairs does accrue, and that obsolescence and inadequacy cause a gradual consumption of the value of the assets, depreciation, as commonly regarded for accounting purposes, is considered to be an element of actual cost. It is believed to be fair to include an allowance for it in this case particularly, because of the apparent subnormality in the amount of repairs made to the property, due to its comparative newness and the influence which tended to retard maintenance expenditure during the test period.

Depreciation was therefore computed upon buildings (not tracks) and depreciable machinery (excluding all items usually replaced at the expense of repairs) used in the repair of cars. The base used for computing depreciation on each item of property was the original cost, computed by the carrier's valuation engineers if not of record. A rate was used in each case which took cognizance of the character of each item of property, and was based on experience as to the life expectancy of such property. The rates used were taken from a table promulgated by the United States Railroad Administration for use of car builders in computing cost of work performed under cost-plus contracts and which were subsequently adopted for use by many builders.

While the rates of depreciation used are considered fair and equitable for the car-building industry, they are prob-

ably too conservative for railroad use, inasmuch as they do not recognize to the full extent the effects of obsolescence and inadequacy upon the railroad properties, which is more marked than in outside plants. The need for relocating railroad shops to correct defects in original location, to make room for the expansion of other facilities and to meet the shifting requirements of operating conditions is wholly ignored in measuring life expectancy as represented by the percentages used.

The depreciation accrued for the four month period, for the freight car shop and machinery, the storehouse and appurtenances, and the powerhouse, machinery and appurtenances, respectively, was distributed on the basis of the assigned labor to which applicable, resulting in a total charge of \$332.33 being assigned to the cost of the test cars.

### Applied Materials

The quantity of applied materials was carefully developed in minute detail with respect to each of the test cars. The piece work record form on which carpenters' time was reported also noted the quantity and kind of material used by them on each car; a record was also kept of the character of repairs made to each car. The material reported as used was checked against the work record showing operations, and from the latter record a list of minor items not reported, which of necessity were used in the repairs as made, was compiled in conjunction with the local officers and car foremen of the carrier. The different items of material were totaled and priced out from the storekeeper's and purchasing department's records at prices f. o. b. the carrier's rails at points of delivery. The net weight of each item was computed, the distance hauled over carrier's line from point of delivery thereto to the shop where applied was ascertained and net ton miles figured, and the cost of haulage calculated at the rate of 7 mills per net ton mile.

The prime cost of the materials applied was found to be \$45,158.96; the cost of haulage by the carrier \$1,481.43, the aggregate sum of \$46,640.39 being used as the cost of applied materials delivered for application.

It will be observed that any losses resulting from materials spoiled in fabrication have been omitted; likewise losses due to shortages in shipments, breakages in handling and like causes. Neither has anything been included for inventory adjustments, which are usually disposed of on the basis of material issues during the period between inventories.

### Proportion of Fixed Charges

It was not possible to ascertain the taxable value of or the actual investment in the units of property devoted to shop purposes. It was likewise impossible, as may be expected, to secure the same information with respect to units of property used incidentally in connection therewith. Without such facts, moreover, it was impracticable to make direct application for the fixed charges related to the shop properties and the properties used in furnishing incidental service thereto.

During the year 1920, for each dollar disbursed as operating expense, as designated by the Interstate Commerce Commission's classification, the carrier had a further outlay of 20.0809 cents for fixed charges, consisting of taxes, interest on capital obligations, operating losses (uncollectable revenues) and rentals paid for the use of property owned by others (which is tantamount to interest on investment). This is a part of overhead expense. The outside contractor recovers his outlay on account of these items through charging a profit. In the railroad's case it must be provided for out of earnings and must therefore be reckoned with the more primary costs of services. This overhead burden being inherent to railroad operation, it must be considered at all times as a part of the cost of every operation performed in-

volving the use of property and inter-departmental service.\* For lack of a more equitable basis for disposing of this element of cost of doing business, it has been assigned to the test cars on a pro rata basis, with the belief that, notwithstanding the rough-and-ready method employed, it nevertheless does substantial justice to the situation in arriving at a comparable cost.

It is well to recall, in this connection, the previous statement that the productivity of the carrier's shops was not lessened within the period fixed by the necessity, real or apparent, of sending work to an outside shop in order to have its equipment repaired and in usable condition. Investment in its own facilities was not therefore made non-productive to any extent, nor were operating or administrative overhead expenses made unduly burdensome to activities to which they were incident.

The fixed charges include taxes, uncollectible revenues, which are operating losses, the net debits for hire of equipment and for joint facility rents, interest on fixed charge obligations and interest on certain cumulative adjustment bonds. There is not included in the sum dealt with the rentals on properties other than joint facilities, the sinking and other funds which pertain to disposition of surplus rather than accruals of contingent or unmatured expenses, losses on separately operated properties or interest on income bonds.

Application of the factor of 20.0809 to the accumulated cost of repairing the test cars results in a surcharge of \$14,640.82 for fixed charges.

### Salvage Credit for Materials and Scrap Recovered

The recoverable material salvaged from the repaired cars was carefully accounted for, its weight ascertained, credit calculated at 75 per cent of the current cost new of usable material and at current prices for scrap, and the account credited with \$4,399.50 for the 50 cars. The cost of handling is not deducted in this connection, as the expense was included in overhead accounts and was distributed as such.

### Total Costs In Carrier's Shop

The total costs assigned to the 50 cars repaired in the carrier shops are briefly recapitulated here, but are later given comparatively and in more detail.

Total rebuilding costs.....	\$72,909.19
Proportion of fixed charges, as assigned..	14,640.82
Less salvage credit.....	—4,399.50
<b>Total .....</b>	<b>\$83,150.51*</b>
Average cost per car.....	\$1,663.01

[The next and concluding article will set forth the items of cost to the railroad of the repairs to 50 cars made in the contract shop, and will compare them with the costs of the work done in the road's own shop.—Editor.]

A PASSENGER COACH on the Corsicana-Mexia Oil Special of the Houston & Texas Central line of the Southern Pacific, broke its coupling as the train was leaving Mexia on September 22 and ran wild for 8 miles. The runaway coach was finally stopped on an up-grade and was later recoupled to the train. A number of men who jumped from the coach were badly bruised.

TRAIN NUMBER FIVE of the Atchison, Topeka, & Santa Fe was stopped by six robbers near Edmond, Okla., on the night of September 28, and the mail clerks were forced to deliver to them four pouches of mail. Following the robbery a reward of \$30,000 was announced for the capture of the robbers. \$5,000 for each of the six men. A motor car, which was waiting nearby, was used by the robbers to escape.

\*Expenditures chargeable to capital account are excludable from depreciation in connection with this burden, because the accounting rules provide for interest and taxes being included in the construction cost of new work.

## One Senator's View of Strike Threats

THAT NOTHING so retards industrial revival in this country today as the attitude of organized labor in refusing to come down to reasonable wages and a reasonable basis of employment, was the opinion expressed by Senator Nelson of Minnesota in debate in the Senate, October 1. "All over the United States we are suffering because of that situation," he said. "In the case of transportation, the railroads are unable to reduce the rates because of the high cost of operation arising from excessive wages which their operatives demand, and which they were accustomed to receive during the war under the administration of Mr. McAdoo as director general of the railroads. Until there is a reduction in that high scale of wages and a change in the demand as to limited hours and other peculiar conditions, including the bonuses which were provided in the days of the war, the outlook for the people of this country securing cheaper transportation rates and better facilities is hopeless, and without cheaper transportation rates there will not only be a failure of industry to revive as it ought to revive, but, more than that, the farmers of this country will labor under a severe handicap.

"Aside from the railroads, I cannot conceive of any industry where there is a greater opportunity for revival, for an increase of activity in all directions, than in the building trades. We all admit that there is a scarcity of buildings throughout the country, but the high cost of labor and the high cost of material—labor is a factor in that high cost, in fact, labor is what makes building material high—deters building operations.

"We are now threatened with a railroad strike. The men have taken a vote, and they are posing as ready to take the whole country by the throat again, as they were at the time the Adamson law was passed. Let me tell you a little incident.

"You all know that I was born in the little mountain country of Norway. It is a poor country, and practically all the railroads in the country are owned and operated by the government. Last winter the men who work on the railroads concluded to have a strike there. They laid their heads together, and undertook to tie up all the railroads in that country. What happened?

"The business men in the cities and the high officials of the railroads managed to operate enough trains in the country to carry the mails and bring supplies and provisions to the cities, so that there was no suffering, and then they let the strike go on. The strikers were all the time desiring to negotiate with the government. The government said, 'We will not negotiate with you until you quit striking;' and at the end of 14 days they were glad to lay down their arms and glad to come back to work and glad to resume their duties, as they did. I venture to say that that experience of 14 days was such a lesson to them that they will never again call a strike.

"I am getting tired of these strike threats. With that matter in view that came under my observation, I do not know but that it would be a good thing for the country if these railroad men should start on a strike. Let the people of this country once for all understand what these men mean by their striking. Let the people realize that they will be deprived of their food supply, their fuel, and everything else. If these men ever embark on a strike that leads to such results, I venture the prediction that the American people will rise in their might and wipe them from the face of the earth.

"We cannot tolerate in this country a government or a rule stronger than the people of the United States. We cannot tolerate a government within a government. We cannot afford to have any people take our country by the throat and say, 'You must do as we want or we will destroy everything in this country. We will hold up the entire transportation system of the country and deprive the cities and the towns of their fuel, their food supply, and everything else, unless you

do as we want.' It is time that we taught these men the lesson that they are not bigger than the government of the United States."

## Brotherhood Leaders

### Count Strike Ballots

LEADERS of the Brotherhood of Railroad Trainmen have undergone a decided change of heart as to their threatened strike during the past week if the interviews which have been published in the press properly express their views. But a few days ago, during the first days of the official count of the strike vote of that organization at Chicago, officers of the union openly declared that if the result of the vote indicated that a constitutional majority of the men signified a desire to strike the walkout would be called immediately. Later statements indicated that the officers of the trainmen's organization lost their belligerency and despite the fact that the announced result of the vote showed that about 90 per cent of the men had signified their willingness to strike in protest against wage cuts, it was quietly announced that the actual calling of a strike would be left to the grievance committees of the various railroads.

On September 12 Mr. Lee sent a circular letter to the men, who were then in the midst of the balloting, in which he pointed out five reasons why he thought a strike would be unwise and why the men might expect to accept some wage reduction.

"The executive of the labor organization that fears to tell the truth or point out dangerous places ahead to the membership of his organization is not worthy of the title of leader," Mr. Lee said. He then asked the men to consider the fact that wages and working conditions of all classes established since 1918 were "the result of a world war such as never before known"; that 5,000,000 men are now unemployed; that "nearly all classes of labor have been forced by mediation, arbitration, strikes or lockouts to accept reduced rates of pay during the past year; that the increased wages granted railroad men last year were based on increased cost of living and that government reports indicate a 16 per cent cut in living costs since July 1, 1920."

Mr. Lee's letter, however, apparently has failed to influence the voting, approximately 90 per cent of the men voting to walk out.

Several days later Mr. Lee announced that if the strike vote cast by the members is upheld by the grievance committees, a tentative strike order would be issued, effective only when and only if the other organizations should walk out at the same time. Thus Mr. Lee has shifted the responsibility for whatever might happen first to the members of his organization, then to the grievance committees and lastly to the other train service organizations.

On October 3 the other three train service brotherhoods and the Switchmen's Union of North America began the count of their ballots at Chicago. The result of these counts, according to union officers, indicate that a large vote in favor of a strike will be registered. However, in the case of these organizations the actual calling of a strike is in the hands of the executive officers.

The 400,000 members of the federated shop crafts voted for a strike several weeks ago, but their officers, apparently awaiting a move on the part of the brotherhoods, have taken no action.

A fire in the car shops of the Missouri, Kansas & Texas at Wichita Falls, Texas, on September 20, damaged the woodwork mill, several freight cars, a crude oil tank and the entire machine shop equipment—estimated loss, \$75,000; cause, unknown.

# The Division of Interline Passenger Fares

Explaining the Uniform and Simplified Basis Proposed  
by the R. A. O. A. Passenger Committee

By L. C. Esschen  
Auditor Passenger Receipts, Illinois Central

**D**URING THE PERIOD of federal control there was in effect a simplified plan for apportioning inter-road passenger revenue that was devised by committees of passenger accounting officers and observed by all carriers under federal control from June 1, 1918 to November 30, 1919. Under this plan the total monthly interline ticket sales of each carrier were apportioned on a basis of the passengers carried one mile accruing to the initial and all other interested carriers and yielded the same average revenue per passenger per mile to all the carriers concerned in such sales. With

method that was a very radical departure from past practices led the passenger committee of the Railway Accounting Officers' Association to believe that it might be possible to devise some other simplified plan that would be acceptable to carriers throughout the country and get away from the intricate bases that are now in vogue. The committee accordingly turned its efforts in this direction and after very careful consideration of various methods that might be employed, finally reached the conclusion that the best for universal adoption would be the Zone Rate Prorate Plan, which was

Map Showing the Zones Used in the Proposed Simplified Basis for Dividing Interline Passenger Fares

this simplification it was possible to perform the major portion of the interline work with inexperienced clerks and the plan unquestionably proved advantageous in many ways during this time when the division forces of practically all the carriers were depleted and the inter-road traffic, including a volume of military transportation orders, was exceedingly heavy. It would have been utterly impossible for carriers to have rendered their reports of interline passenger traffic in anything like the prescribed time if they had been obliged to continue to make their divisions by the application of former bases during the period of the war.

While the simplified basis that was in effect during federal control produced equitable results and accomplished the purpose intended, the plan was abolished by the railroad administration shortly before the roads were turned back as part of the program to restore conditions to their pre-war status. There is some question whether the basis could have been consistently continued under private control. However, the experience that was gained by the employment of a

submitted at the annual meeting of that association held at Atlantic City, June 8 to 10, 1921.

The success of this undertaking will depend a great deal on the interest and activity that is displayed by the carriers at large, as it naturally follows that it is only through the combined efforts of the carriers that the adoption of a uniform plan can be brought about.

## The Plan Proposed

To the layman and in fact even to the passenger accountant who is not so well versed in the interline division work, the plan might seem somewhat involved, but briefly summing up the situation it simply means this:

The plan proposes a uniform rate prorate basis for dividing interline fares such as is now in effect in certain parts of the country, except that as a means to simplify certain zone prorating gateways are established, the same basis as locals is ignored except when contracted from such gateways, and from points of interchange, and the same basis

made via the route traveled instead of observing the so-called short-line principle of division.

If measured by existing methods and practices and the conclusions are to be reached by a comparison of proportions received on individual items, the foundation of the zone plan is necessarily weakened, as it must be dealt with in its entirety and receive broad and liberal consideration. Unless the carriers are willing so to consider the proposition it is rather doubtful whether any progress can be made towards simplification that would help them get away from the existing intricate and technical methods.

Test figures as published in the 37th report of the Railway Accounting Officers' Association were prepared to show that the results produced under the proposed plan compare favorably with results produced under the so-called pre-war bases, now in effect, which in themselves are not accepted by all carriers as being entirely consistent in many of their phases, and the committee suggested that the members of the association, before passing judgment on the merits of the proposed plan, make a further test by comparing the amount of revenue accruing in the aggregate on a considerable volume of their traffic under the existing bases of division with the amount that would be produced under the proposed zone rate prorate plan.

Experience has proven that inter-road passenger traffic, when dealt with collectively yields an average revenue per passenger per mile somewhat lower than what is derived from local traffic, due very largely to the fact that the longer route carriers participate in more short line interline fares than short line local fares. There are other contributing factors, but the ultimate result is substantially the same regardless of the basis of division employed just so long as this is consistent, even to the extent of applying the passengers-carried-one-mile basis which was in effect during federal control. This fact should lead the carriers to weigh the matter very carefully as to whether there is need for the high-class refinement that now takes place in the division of interline passenger revenue, requiring the services of highly trained experts who sometimes consume as much as two hours in figuring a single division, only to have one of the interested carriers, whose division man no doubt consumed as much or more time in the refiguring, come back with a claim on account of erroneous proportion, necessitating a further refiguring by the initial carrier and in all probability resulting in long drawn-out correspondence as to who is correct. Questions of this kind arise with more or less frequency but they usually concern isolated movements of traffic, the amounts of revenue involved are of no great consequence, and are exceeded many times by the cost of the labor.

After the plan was drafted the passenger committee of the Accounting Officers' Association met in conference with a sub-committee of the American Association of Passenger Traffic Officers and that committee expressed itself as being heartily in accord with the idea of devising a plan which would have the effect of simplifying the bases of division of passenger fares throughout the United States and Canada. It is also expected that the individual passenger accountants will do their utmost in securing the co-operation of their respective traffic departments on whom so much depends in bringing about the desired simplification. When conclusions are reached the members of the Accounting Officers' Association are requested to file their concurrence with the secretary or advise him of their views and any communications offering suggestions or criticisms will be handled to a conclusion by the accounting committee.

### Present Bases Nothing More Than Tradition

To make it clearer to those who are not so well informed as to the needs for all of this it might be pointed out that the division of interline fares is acknowledged to be the most intricate part of passenger accounting work. The general

principles, bases applicable in different parts of the country, agreements, arbitrary requirements, etc., are nevertheless nothing more or less than tradition today. In New England, Trunk Line, Central, and Southeastern Passenger Association territories a mileage prorate basis of division prevails; in Western, Southwestern, and Trans-Continental Passenger Association territories a rate prorate basis is in effect. On trans-continental traffic the fares are divided by applying a rate prorate over the Missouri river with a re-division west on published percentages, derived from the rates or arbitrarily established, and the basis to be employed in the re-division east depends on the territory in which the point of origin or destination is located. In addition to this there is the re-division that is always necessary incident to the observance of the short line principle, and the analysis of the rates for the purpose of picking out small pieces of local contributed, all of which consume a great deal of time. It requires years of experience to make a competent division clerk, so there appears to be every good reason why a simplified basis of division should be adopted if it is possible to devise a plan which will be acceptable to all carriers.

It is not claimed that the proposed plan is perfect in all of its details, but it is felt that the general principles of the simplified basis as submitted will produce an equitable division of revenue for all carriers, overcome practically all of the division controversies that were heretofore met with, permit of educating clerks in this branch of the work to a high degree of proficiency in considerable less time than required under present methods, and eventually accomplish a saving of 25 per cent in clerk hire for this work.

An outline of the plan was given in the 1921 R. A. O. A. Agenda. It follows in part:

SUGGESTED UNIFORM METHOD OF DIVISION TO BE EMPLOYED IN APPOINTMENT OF REVENUE DERIVED FROM THE SALE OF INTERLINE TICKETS AND EXCESS BAGGAGE COLLECTIONS ON PASSENGER TRAFFIC INTERCHANGED BETWEEN ALL CARRIERS IN THE UNITED STATES, CANADA AND MEXICO, EFFECTIVE WITH THE ACCOUNTS FOR THE MONTH OF.....19.....

#### ZONES

The territory in the United States, Canada and Mexico will be divided into zones to be designated Atlantic, Eastern, Central, Western, Pacific, Canada and Mexico.

#### BOUNDARIES OF ZONES

ATLANTIC ZONE. Territory east of a line drawn from Buffalo, N. Y., to Mobile, Ala., via Pennsylvania Railroad. Buffalo, N. Y., to Pittsburgh, Pa., Ohio River to Cincinnati, O., C. N. O. & T. P., to Chattanooga, Tenn. A. G. S. to Birmingham, L. & N. to Mobile, Ala.

EASTERN ZONE. Territory west of the Atlantic zone to a line drawn from Chicago, to St. Louis, Mo., via C. & E. L., thence via the Mississippi river to the Gulf of Mexico.

CENTRAL ZONE. Territory west of the Eastern zone to a line drawn from Duluth, Minn., to Houston, Texas, via Great Northern; Duluth, Minn., to St. Paul, Minn., C. St. P. M. & O. to Sioux City, Ia., Missouri River to Kansas City, Mo., M. K. & T., M. K. & T. of Texas to Ft. Worth, Texas, thence H. & T. C. to Houston, Texas.

WESTERN ZONE. Territory west of the Central zone to a line drawn from the Canadian boundary line to El Paso, Texas, via Great Northern from Sweet Grass, Mont., to Billings, Mont., Nor. Pac. to Butte, Mont. Union Pacific System to Ogden, Utah, D. & R. G. to Colorado-Utah state line, Colorado-Utah state line and A. T. & S. F. to El Paso, Texas, through Albuquerque, N. Mex., thence Rio Grande river to Gulf of Mexico.

PACIFIC ZONE. All territory west of the Western Zone.

CANADA ZONE. All territory in Canada.

MEXICO ZONE. All territory in Mexico.

#### PRORATING ZONE GATEWAYS

BETWEEN ATLANTIC AND EASTERN ZONES. Buffalo, N. Y.; Pittsburgh, Pa.; Cincinnati, Ohio; Chattanooga, Tenn.; Birmingham, Ala.; Montgomery, Ala., and Mobile, Ala.

BETWEEN EASTERN AND CENTRAL ZONES. Chicago, Ill.; St. Louis, Mo.; Memphis, Tenn.; Vicksburg, Miss., and New Orleans, La.

BETWEEN CENTRAL AND WESTERN ZONES. Duluth, Minn.; St. Paul, Minn.; Sioux City, Ia.; Omaha, Neb.; Kansas City, Mo.; Ft. Worth, Tex., and Houston, Tex.

BETWEEN WESTERN AND PACIFIC ZONES. Billings, Mont.; Ogden, Utah; Salt Lake City, Utah; Albuquerque, N. Mex., and El Paso, Tex.

BETWEEN ALL UNITED STATES ZONES AND CANADA ZONES. All points of interchange.

BETWEEN ALL UNITED STATES ZONES AND MEXICO ZONE. All points of interchange.

#### SECTION I. GENERAL PRINCIPLES TO BE OBSERVED

(A) Rate prorate.

(B) Locals or joint fares contributed to or from points that are not zone

prorating gateways or interchange points shall be ignored except as specifically provided for in Section 3, Paragraph A.

The fact that more than selling fare may accrue to or from a zone prorating gateway or point of interchange in the division shall also be ignored.

(C) Arbitraries on account of bridge tolls, water transfers, also omnibus and baggage transfers when incurred, shall be allowed interested carriers. (See Section 6, Paragraph A.)

#### SECTION 2. RECOGNITION OF ZONE GATEWAYS

(A) On inter-zone traffic moving via two or more zone gateways within the same zone the first zone gateway en route shall be the initial prorating gateway.

(B) On inter-zone traffic moving through three zones without passing through initial authorized zone prorating gateway, the first prorate shall be made on zone prorating gateway through which traffic moves and redivision made as though traffic had originated at or was destined to such gateway.

(C) On inter-zone traffic moving through four zones without passing through Duluth, Minn.; St. Paul, Minn.; Sioux City, Ia.; Omaha, Neb.; Kansas City, Mo.; Ft. Worth, Texas, or Houston, Texas, the initial prorating gateway shall be in Chicago, Ill.; St. Louis, Mo.; Memphis, Tenn.; Vicksburg, Miss., or New Orleans, La., according to gateway used and redivision made as though traffic originated at or was destined to these gateways. In the event traffic does not move through any of the above named zone gateways the initial prorate shall be over the first zone gateway en route and redivision made as though traffic originated at or was destined to such gateway.

#### SECTION 3. ALLOWANCE OF AMOUNTS CONTRIBUTED TO THROUGH FARES

(A) Fare made by use of current selling or basing fares to or from the actual point of interchange via route of traffic, or to or from zone prorating gateway, such current selling or basing fares shall be allowed line or lines contributing and the remainder divided on basis applicable from or to such point or points proper.

(B) When current selling or basing fares are deducted it is understood that the remainder shall be prorated regardless of whether or not it is applicable as a selling or basing fare via route traveled.

#### SECTION 4. DEFINITION OF TERM "PRORATE VIA ROUTE TRAVELED"

The term "Prorate via Route Traveled" means a prorate using current one-way selling or basing fares for each line used via route of traffic.

#### SECTION 5. FARES TO BE USED AS PRORATING FACTORS

(A) ONE WAY.—Where the through short line fare applies via route of ticket the short line current selling or basing fares shall be used as prorating factors throughout. When through fare is constructed by use of fares higher than via direct route, prorating factors shall be the fares applicable via route of traffic.

(B) ROUND TRIP.—Round trip fares made by use of double current one-way fares, the current one-way fares shall be used as prorating factors. Round trip fares that are made in part less than double locals to or from points of interchange shall be divided by using the same relative fares as prorating factors to or from prorating gateways as were used in construction of the through fare to be divided.

Note: Intrastate fares should be used in the division of intrastate sales and interstate fares on interstate sales.

#### SECTION 6. ARBITRARIES

(A) Bridge tolls, water transfers and omnibus and baggage transfers heretofore considered in the division of interline fares and when incurred via route of ticket shall be allowed interested carriers and deducted as follows:

1. Intra-zone.—From through fare.

2. Inter-zone.—From joint proportions accruing to zone or zones in which arbitrary is incurred.

Amounts contributed on account of the same arbitraries in construction of the fares that are used as prorating factors shall be deducted from such prorating factors in establishing proportions accruing to interested carriers.

(B) Side trips and stage lines' fares.—Extra charges collected for side trips and stage lines shall be allowed carriers performing the service or working with the stage line.

#### SECTION 7. BASIS FOR DETERMINING PROPORTIONS ACCRUING TO BOAT LINES

The amounts accruing to boat lines will be determined on a prorate per rate basis using fares of like class over the port through which routed and the remainder redivided between rail lines, observing zone gateways.

#### SECTION 7-A. SPECIAL CAR AND TRAIN MOVEMENTS

Lump sum collections shall be divided using proportions accruing in division of one-way fares between points of movement.

#### SECTION 8. INTERLINE BAGGAGE CHARGES

Proportions for interested carriers shall be established by applying to the ticket proportions the per cent that the baggage rate per cwt bears to the one-way passenger fare, extending the amounts so obtained by the excess weight of the shipment.

#### SECTION 9. GOVERNMENT NET FARES

(A) Through fares made on point of interchange or made via route of traffic shall be divided as made.

(B) Through fares for traffic moving via other than net fare making route shall be divided on basis outlined herein, using commercial fares as factors.

(C) No line or lines to receive more than net local or joint net fare received for same haul on local or joint business.

(D) In case a line or lines are restricted to net local or joint fare as provided in preceding paragraph, the remainder to be apportioned on same basis as is used in the division of same class of commercial fares, eliminating factors of the line or lines receiving net locals or joint fares.

#### SECTION 10. ESTABLISHING PROPORTIONS FOR SYSTEM LINES

Where separate proportions are required for system lines same will be established under the rate prorate basis of division as herein provided. If

such carriers prefer, arrangements may be made to have the combined proportions for the system lines reported to the initial carrier and the matter of subdividing the revenue left to the carriers directly interested.

#### SECTION 11. DIVISION OF ROUND TRIP FARES

Round trip fares to be divided as constructed as between going and return trip, recognizing such amounts as are added to the through fares for side trips, diverse or circuitous routes, etc., each part to be redivided rate prorate, using same basis as applicable for one-way sales via the direction traveled, recognizing factors as provided for in Section 3, Paragraph B. Report amounts added for side trips to line performing the service and for diverse or circuitous routes of the line or lines involved.

#### SECTION 12. INTRA-ZONE (TRAFFIC LOCAL TO ZONES)

(A) Fares made on all gateways to point at which traffic is routed by use of current selling or basing fares will divide as made.

(B) Fares not made on any gateway through which traffic is routed by use of current selling or basing fares shall be prorated via route traveled.

(C) Fares made by use of current selling or basing fares to or from actual point of interchange, deduct same current selling or basing fares and prorate remainder via route traveled.

(D) Where deductions of selling or basing fares are provided for it is understood that the remainder shall be prorated regardless of whether or not it is applicable as a selling or basing fare via route traveled.

(E) In the event originating point and destination are within the same zone but traffic for a portion of the journey passes through another zone prorate on same basis as though traffic moved entirely within one zone.

NOTE: Sections 13 to 27 inclusive are devoted to specific and detail illustrations as to how the rate prorate is to be applied in the observance of gateways, re-division within zones, etc., on traffic interchanged between zones.

#### SECTION 28. TRAFFIC WITH POINT OF ORIGIN AND DESTINATION IN THE UNITED STATES BUT PASSING THROUGH CANADA

Traffic with point of origin and destination within same United States zone but passing through Canada, prorate via route traveled. (See Section 12, Par E.)

Traffic originating in one United States zone and destined to a point in another United States zone but passing through Canada.

(a) If via any United States zone gateway, prorate recognizing same zone gateways and basis as outlined herein in Sections 1 to 22 inclusive, for traffic passing through such gateways, the total amount to and from the United States zone prorating gateways which involves a joint haul between United States and Canadian lines shall be prorated via route traveled, amounts accruing within zones to be redivided via route traveled.

(b) If no United States zone gateway is involved prorate via route traveled.

#### SECTION 29. TRAFFIC WITH POINT OF ORIGIN AND DESTINATION IN CANADA BUT PASSING THROUGH THE UNITED STATES

Traffic with point of origin and destination within Canada but passing through only one United States zone, prorate via route traveled.

If traffic passes through more than one United States zone, prorate recognizing same basis and United States zone gateways passed through as for traffic originating in Canada and destined to points within United States and via such gateways, the total amount to and from the first and last United States zone prorating gateway shall be prorated via route traveled.

If no United States zone gateway is involved prorate via route traveled, amounts accruing within zones to be redivided via route traveled.

#### BETWEEN UNITED STATES AND MEXICO

#### SECTION 30. VIA AUTHORIZED POINTS OF INTERCHANGE AND NOT PASSING THROUGH ANY UNITED STATES ZONE GATEWAY

Prorate over point of interchange with Mexican line and amounts accruing within United States zone or zones to be prorated via route traveled.

#### VIA AUTHORIZED POINTS OF INTERCHANGE AND PASSING THROUGH UNITED STATES ZONE GATEWAYS

Prorate recognizing same United States zone gateways and basis as outlined herein in Sections 1 to 22 inclusive for traffic passing through such gateways, the total amount thus established to or from the first or last United States prorating gateway, as the case may be, passed through, which involves a joint haul between United States and Mexican Lines, shall be prorated via route traveled.

#### SECTION 31

Bridge arbitraries which are to be considered, as outlined in this section are as follows:

(To be inserted)

Map

The accompanying map outlines route territories and connecting zone gateways as prescribed herein

Index

Appropriate index to be prepared.

IT IS INTERESTING to note that in many of the larger countries abroad the heavy trunk-line electrification projects in the United States have been very carefully studied and are very fruitfully referred to by foreign consulting engineers in their reports, and that in several instances standard American plans have been adopted practically complete by engineers advising foreign governments on steam railway electrification. It is believed that the experience of American manufacturers in developing reliable heavy railroad equipment in this country will be of considerable help in negotiating a foreign contract.—Commerce Reporter

## Unemployment Conference Makes Emergency Report

WASHINGTON, D. C.

THE UNEMPLOYMENT conference begun at Washington on September 26, on September 29 adopted a series of recommendations, formulated by the organization committee and based on the reports of sub-committees, constituting an emergency program for immediate adoption and prosecution. The conference then adjourned until October 10 to allow an opportunity for further work by its sub-committees; the views of the conference in amplification of the emergency recommendations and as to permanent measures which would contribute to the restoration of industry will be given following the receipt of further reports by the committees.

The only debate at the session of the full conference was on the question of the wording of a report by the committee on unemployment statistics, which had reported that the number of unemployed in the country is approximately 4,000,000. Secretary of Labor Davis objected to this because it ignored the estimate of 5,700,000 made by the Bureau of Labor Statistics, and Secretary Hoover suggested that to avoid controversy the report confine itself to stating that there were many millions of unemployed. After a discussion as to whether the wording should be "many millions," "several millions," or merely "millions," the report was adopted temporarily in a form stating that the conference finds that there are variously estimated from  $3\frac{1}{2}$  to  $5\frac{1}{2}$  millions unemployed and referred the report to the committee for further study.

The report as adopted stated that there has been an improvement, but pending general trade revival this crisis in unemployment cannot be met without definite and positive organization of the country. There was no reference in the report of emergency recommendations adopted to the railroad situation, although it had been given serious consideration both by the committee on emergency measures in transportation and the committee on emergency measures by manufacturers. It is understood that the former had prepared a report urging the importance of the passage by Congress of the bill to authorize the War Finance Corporation to purchase railroad securities held by or to be acquired by the Railroad Administration to provide cash for an early settlement with the railroads of their accounts for the period of federal control, but it was announced at the conference that the trans-

portation committee desired further time for the preparation of its report. Possibly the subject was omitted from the emergency program to avoid controversial subjects. The transportation committee, with several others, will report at the session of the conference on October 10.

The emergency recommendations adopted stated that the problem of meeting the emergency of unemployment is primarily a community program and recommendations were made for the organization of community emergency committees to carry through a community plan for meeting the unemployment emergency. Other recommendations include public construction by way of the expansion of municipal, state and federal building programs, and Congressional action to expedite roadbuilding work.

The report states that the greatest area for the immediate relief for unemployment is in the construction industry, which has been artificially restricted during and since the war. It was estimated that more than two million people might be employed if construction were resumed. It was recommended that the governors of the various states summon representative committees, with the co-operation of the mayors or otherwise, to determine facts, to organize community action and secure adjustments in cost, including removal of freight discriminations, and clean out campaigns against combinations, restrictions of effort, and unsound practices where they exist, that building may be fully resumed.

Another recommendation stated that the manufacturers can contribute to relieve the present acute unemployment situation by part time work, manufacturing for stock, taking advantage of the opportunity to do plant construction, repairs, etc. One of the important obstacles to a resumption of normal business activity will be removed, the report said, as prices reach replacement values, and all manufacturers and wholesalers who may not yet have adopted this policy were urged to do so. It was declared essential to the success of these measures that retail prices shall promptly and fairly reflect the price adjustment of the producer, manufacturer and the wholesaler.

An appeal to governors and mayors to co-operate in carrying out the recommendations made by the conference was sent out by President Harding on October 3. The President's statement said that in order that there may be unity of action by all of the forces which may be brought to bear, the unemployment conference is establishing an agency in Washington through which appropriate co-ordination can be promoted and through which reports on progress and suggestions may be given general circulation and co-operation.

# Manufacturers Discuss the Railroad Problem

## National Conference at Chicago Favors Repeal of Adamson Law and Abolition of Labor Board

THE RAILROAD PROBLEM and the close relation between freight rates and the high cost of labor, fuel and taxes comprised the most important subject of discussion at the National Conference of State Manufacturers' Associations which was held at the Congress Hotel, Chicago, on September 29-30. William Butterworth (Deere & Co., Moline, Ill.), president, presided at the sessions.

R. M. Barton, chairman of the Railroad Labor Board, Chicago, discussed the work of the Labor Board and the problems with which it is confronted. Clarence E. Bement, president of the Novo Engine Company, Lansing, Mich., presented a paper, "The Railroad Problem," which laid particular stress on the problems confronting the manufacturers of railway supplies because of the present freight rates. W. L. Allen, Laclede Steel Company, St. Louis, Mo., spoke on the relation of the public to the Railroad Labor Board. Samuel O. Dunn, editor of the *Railway Age*, addressed the Friday afternoon session on the problem, "How Can the Railroads Reduce Freight Rates?" Three papers, those of Samuel M. Felton, president, Chicago Great Western, Chicago; E. B. Leigh, president, Chicago Railway Equipment Company, Chicago, and A. C. Davis, Gurney Ball Bearing Company, Jamestown, N. Y., are summarized below. Mr. Davis' paper in particular was received with great enthusiasm.

The following resolution was offered by the Transportation Committee at the close of the session on Friday and adopted by the Conference:

"Resolved, That it is the sense of this meeting that the industrial, commercial and agricultural interests of this country require a decided reduction in freight rates as a necessary step towards the revival of business, and we also recognize that it is necessary in order to bring about these reductions in freight rates that the railroads be relieved of the necessity of paying a higher wage rate than prevails generally in the communities through which they pass and are paid by private corporations doing similar work. We also go on record as favoring the repeal of the Adamson law and the modification of the Transportation Act of 1920, to do away with the United States Railroad Labor Board and the power of the government to fix wages and labor conditions, such as the so-called national agreements, in connection with the railroads of the United States."

### The Principles Underlying the Present Railway Situation

By A. C. Davis

Gurney Ball Bearing Company, Jamestown, N. Y.

I am going to discuss the railway situation as an observer from two points of view, first, from experience as an engineer in railway service which began as apprentice in the machine shop; second, from the experience in following years as a manager of an independent industrial organization such as comprises the center of most of our smaller cities in this country.

The most serious menace to American business and industry is the concerted action of small but powerful groups of men who, without regard for natural economic laws, throw public welfare into the discard and proceed to exploit the people of this country for their own selfish group benefit.

It would be idle to say that this has occurred in the transportation industry alone or that this advantage has never

before been seized by any other than this labor group. The student of railway history cannot forget the financial group-exploitation of the investing public, nor the attempt of certain shippers to stifle competition by forcing secret rebates and preferential rates from the transportation companies, contrary to the best public interest. These were the problems of the last decade and were solved or placed under regulation by the Sherman Act and the Interstate Commerce Commission.

The greatest economic problem before this country today is the regulation of the activities of the labor unions—how to control them effectively in the best interests of the nation.

There can be no question in the mind of any fair-minded student that the brotherhoods have been of great usefulness not only in assisting the families of their own members in cases of distress and the securing of new positions for their members if discharged for responsibility in accidents, but they also have in thousands of cases secured substantial justice for their men in the administration of discipline and have called attention of the railway officers to conditions jeopardizing the safety of travelers and welfare of the men.

### Labor Leaders Become Active

The labor leaders, quick to perceive the trend of public opinion and the sentiment of legislators, have found eager listeners among the younger element of railway employees and from an organization originally intended for mutual benefit insurance and for fraternal assistance in sickness and accident, the railway brotherhoods became dominated by grievance committees. The right of appeal from decisions of the division officers was established and meetings arranged with the higher executives. In many cases the matters taken up in appeal were so insignificant as to be regarded as unimportant by the general officers and frequent compromises were made and the decisions and rulings of the local division officer were reversed. This rule of expediency was sometimes adopted only after threat of strike or strike votes, but regardless of the reason why, the fact remains that these compromises weakened the authority of the local foremen and officers over their men, who now looked to their union representative to get them what they wanted.

To understand certain fundamentals of the wage situation one must know that it has always been necessary in the development and growth of this country to pay higher wages in the west than those paid to eastern labor to induce it to move out to the "wild and woolly west." For this reason the Central West gave higher rates than the New England states, the Rocky mountains higher than the Mississippi valley, and the Pacific coast highest of all. These wage rates were offset by the increased cost of living or the hardships of the new localities.

Now comes forward the grievance committee of the eastern railway groups saying that their work in running of shifting engines, for example in Boston, is just as hard work and requires just as much skill as a similar crew in Seattle or San Francisco, and after much contention and appealing and taking of secret strike ballots they succeeded in having the rates of pay in the east "equalized up" to the far western scale.

Within a short time, the western brotherhoods having data on the difference in economic conditions and rates paid to common labor, demanded an increase based upon the differences in the cost of living over the east. Then the east took up the "equalization game" again. This see-sawing at

"equalization upward" is characteristic of the period 1897 to 1914, and constitutes one of the reasons for the distortion of wage rates existing before the war, as between the railway brotherhood members and other railway employees. Wage advance upon wage advance was secured in this manner.

In the face of these rapidly increasing expenses and unbalanced conditions, the managers were confronted by the dilatory policy of the Interstate Commerce Commission, which with an ear to the ground for public opinion, heard rate case after rate case and granted appeals for delay and stays in execution of advanced rates, upon the representation of every group of interested shippers. Into this remarkable state of inaction and slow strangulation we allowed our main arteries of transportation to drift, even after two years of the World War were upon us.

Not content with the fact that they were already better paid than any class of railway workers and in some cases better than the staff officers themselves, the brotherhoods had effected a substantial alliance with the American Federation of Labor and seized upon the threatened war with Germany and the critical international situation of 1916 as their opportunity to force further wage advances. They forced the Adamson bill through an abject Congress at the behest of a political leader anxious to secure organized labor's pledge of support in the presidential campaign.

### Labor in the Saddle

After the declaration of war in April, 1917, the railway presidents formed an operating board to co-ordinate the handling of traffic over the trunk lines, but the hampering effects of previous legislation both state and national prevented their being given a free hand, so that the administration deemed it necessary to take over the transportation systems as a war emergency measure in December, 1917. It becomes evident what was the real power behind this move when we see these very A. F. of L. leaders immediately placed in the seat of the administration's national adjustment boards clothed with the full authority of the government over all transportation systems of the country in regard to appeal from discipline, wage classifications, and rules of working. Their absurd decisions stand as a record of how not to do the job.

Having at last forced federal control and having their hands in the national treasury, the A. F. of L. and the brotherhoods proceeded to have Director-General McAdoo issue general order No. 27, establishing still further increases in wages retroactive to January 1, 1918. This was followed by Supplement No. 4, which added to it again with retroactive wage increases, making about 80 per cent increase over 1916, besides abolishing piecework in the shops and starting a "leveling downward" of shop craft efficiency. These were followed by the so-called "national agreements" in September, 1919, in which our representative, the director-general, had no hand at all, except the hand which held the pen to sign on the dotted line. They never were *agreements* at all—they were American Federation of Labor ultimatums—the price they demanded in times of our nation's emergency for continuing their plain duty or tie us up in a strike.

A further wage increase was made in 1919 which brought the total to 100 per cent increase over 1916. And as a parting gift from the new director-general in July, 1920, a still further increase retroactive to May 1 was allowed by the Railway Labor Board, just following the so-called "out-law strike," which finally brought the figures to 150 per cent increase over 1916.

It is a tempting bait to the workers—this getting a wage increase at the public expense by threat of strike. The labor leaders know that if they are to hold their jobs they must continue to get results. These jobs are getting into the desirable class of recent years. A recent press notice stated that one of the leaders was actually voted a salary of

\$100,000 per year. The total wage bill of the railways in 1916 was \$1,468,000,000—in 1920 it was \$3,698,000,000, an increase in four years of about \$2,230,000,000, and we must acknowledge that \$100,000 would be small commission to pay for such results!

### A Real Agreement

Flatly refusing to consider the Plum Plan Government Ownership bill, Congress enacted the Esch-Cummins bill now known as the "Transportation Act," which returned the railways to their owners on March 1, 1920, under terms intended to insure substantial justice to shippers, owners and employees alike. One most important provision is the establishment of local adjustment boards and of a railway labor board of nine members, representing equally the public, the managers and the employees, clothed with authority to decide "any dispute in regard to grievances rules, or working conditions, which cannot be agreed upon in direct conference between any carrier and its employees, if the dispute is likely to interrupt commerce."

The rulings of this labor board are the important news of today. Yet it is questionable whether many of the gentlemen present can tell who are your three representatives on the board, much less have they heard with personal emphasis and explanation your views and experiences. How can you then expect them to represent you?

The program and ambitions of the A. F. of L. and the brotherhoods are pretty well understood by this time, but the failure of the Plumb Plan propaganda has not caused them to give up their plan to get hold of the transportation systems of this country in some effective way, if possible, through the rulings of the Labor Board. If they can perpetuate the union-made agreements and thus indirectly attain their end, then they believe they can force all railway employees to deal with the managers through the committees dominated by the union, and this being accomplished, why should the union leaders trouble about who owns the railways, so long as they can make the working rules and wage schedules to suit themselves. That is all they ever wanted government ownership for!

This is the crux of the question brought up by the Pennsylvania Railroad's working agreement negotiated with its own employees under Section 301 of the Transportation Act. The railway managers demand the right to deal directly with their own men regardless of membership or non-membership in any union. They insist that the men who do not desire to pay tribute in union dues be permitted to have a voice in the working agreements with their own employers as the Transportation Act contemplates they should do.

### Some Things Are Worse Than a Strike

The railway managers have taken the firm stand that Congress did not delegate authority or jurisdiction to the Labor Board in cases of this kind in which a mutual satisfactory agreement has been reached between employer and employees and where no dispute has arisen and there is no threatened disruption of traffic.

Perhaps we are being treated to an "educational" strike ballot again. We expect it to be the usual 98 per cent announced through the press in favor of a strike. It is time for our public representatives to call this "strike bluff" and have a show-down. There are some things worse than a strike—one of them is a continuation of compromising with wrong when we know what principles are right—when we acquiesce for expediency's sake in continuing an unjust system.

We are not among those who would criticise the Labor Board or the provisions of the Transportation Act until it has been fairly tried out, but we cannot believe that Congress in the Transportation Act intended that the Labor Board should assume the functions of railway managers.

The transportation companies and their employees must be subject to federal supervision, but there should be closed coordination between the Labor Board and the Interstate Commerce Commission.

A plan of working rules and wage rates must necessarily vary to meet local conditions and must be readjusted from time to time to meet the changes of economic conditions. If the Labor Board will adopt the rule so fundamental in the government of our states—"the maximum of power to local authority, the minimum of federal supervision"—then we have some chance of making the Transportation Act a working success. In conclusion we can doubtless agree on some important principles: (1) That the ordinary economic laws which govern all business should apply without artificial restraint of law to the conduct of the railway's business. (2) That the operation of the railways should be in the hands of the trained body of responsible managers to whom shall be delegated sufficient authority to maintain discipline and efficiency of operation. (3) That direct working and wage agreements be established between the railway managers and their own employees, free from outside dictation. And finally, that we will never tolerate the seizure of our transportation systems for the benefit of any group of men, be they shippers, financiers or employees.

## Railway Operating Costs and Railway Rates

By Samuel M. Felton

President, the Chicago, Great Western

At almost every meeting of bodies of business men nowadays the railway situation is a subject of discussion. One feature of the railway situation which is discussed on almost every such occasion is that of freight rates. There is pretty general agreement that many of the present freight rates should be adjusted downward.

The Interstate Commerce Commission had the support and approval of most of the business interests of the country in fixing the present rates. Without most people realizing it, however, there had begun shortly before these rates were fixed a general decline of business and of prices, which continued with accelerating rapidity for some months. The result is that the rates do not bear anything like the same relationship to the prices of most commodities that they did when they were fixed.

The declines in prices which have occurred in most industries have been accompanied by reductions of most costs of production and operation. There is a natural sentiment that all the costs of production and operation of our various industries should be correspondingly reduced. Freight rates enter more or less into the costs of all industries. There have been numerous readjustments of freight rates, most of them downward, since the present rates were fixed, but there has been no general reduction. It is but natural that business men and farmers should believe that some substantial reductions in rates should under existing conditions be made, and should ask why they have not been made.

One of the subjects to be considered at your conference is that of railway operating costs and rates. The present rates were fixed solely because of enormous increases in railway operating costs. The only way conditions can be produced which will make it practicable to substantially reduce the present rates in fairness to all concerned is by reducing the present operating costs.

The managements of the railways have made enormous retrenchments within the last year. For example, in July, 1920, the operating expenses of the Class I roads were \$514,254,000, while in July, 1921, they were only \$362,800,000, a reduction of 29 per cent. A very large part of this reduction in expenses was made both possible and necessary by the heavy decline in the amount of traffic that had to be handled, and another large part consisted of deferred

maintenance. The total expenditures of the railways for the maintenance of their properties in July, 1920, were almost \$240,000,000, while in July, 1921, they were only \$160,000,000, a reduction of 33 per cent. This large reduction in maintenance was made at the cost of the physical properties. On August 15 the railways had 552,440 freight cars in bad order. This is but one of the effects of the drastic but necessary policy of retrenchment which has been followed.

In spite of all the retrenchments made the railways in the first 12 months the present rates were in effect earned a net operating income of only about \$500,000,000. Considering them as a whole, this was but little more than the amount required to pay the interest on their bonds. The rigorous retrenchment policy which has been followed to save the companies from general bankruptcy could not be long continued without an impairment of the condition of the physical properties which would render them unfit to give anything approaching satisfactory service to the public. The only real remedy for the present situation is a reduction of their unit costs which will enable the railways to make reductions in their operating expenses which will be real and permanent, and which will help them to rehabilitate their properties instead of causing them further to deteriorate.

The principal unit costs of the railways are of three kinds—cost of materials and supplies, cost of fuel, and cost of labor. There already have been considerable reductions in the costs of materials and supplies, but the costs of fuel and labor constitute about 80 per cent of operating expenses, and there have as yet been no substantial reductions of these items.

In the year 1916 the total fuel bill of the railways was \$250,000,000, and the average price they paid for coal was \$1.76 per ton. In 1920 their total fuel bill was \$673,000,000, and the average price they paid for coal was \$4.20 per ton. In the first six months of the present year the average cost of coal to the railways was \$4.43, and while it has been coming down, in June—the last month for which we have official statistics—it was still \$4.07 a ton. The railways normally consume about 150,000,000 tons of coal in a year. At the average price they were paying at the time of the last reports this much coal would cost them about \$350,000,000 more than at the average price of 1916.

The largest item of railway expenses is the cost of labor. The total wages paid in 1916 were \$1,470,000,000. In 1920, after the wage advance granted by the Labor Board, and while the railways were still handling a large traffic, the wages paid were running at the rate of \$3,900,000,000 a year, or about \$2,400,000,000 more than in 1916. This enormous increase in wages was due, first, to changes in rules and working conditions made under government control, which necessitated the employment of a largely increased number of men; and, secondly, to large advances in basic wages.

The railways made great efforts to secure abrogation of the national agreements through which the revolutionary changes in the rules and working conditions of employees were made. The Railroad Labor Board at one time ordered abrogation of the national agreements and reminded the making of new rules and working conditions to negotiation between the individual railways and their employees. These negotiations in most cases proved futile because the labor unions insisted on acceptance by the individual railways of exactly the same rules and working conditions which were incorporated in the national agreements. The Labor Board then rescinded its order for the abrogation of the national agreements, and they are still in effect except for certain changes in the rules regarding overtime. The labor unions thus far have not accepted even the overtime rules adopted by the Labor Board.

Because of the heavy decline in traffic and the drastic

retrenchment policy adopted by the railways there has been a large reduction in the number of employees. As long, however, as the present rules and working conditions remain in effect the reduction in employees must be regarded as, in the main, only temporary. Sooner or later the railways will again be called upon to handle a large traffic and to do a normal amount of maintenance work. Unless reasonable changes can be secured in the rules and working conditions they will again necessitate the employment of an excessive number of men, as was the case last year, and a corresponding increase in expenditures for labor.

The railways also asked the Railroad Labor Board to wipe out the advance in wages granted by it on July 20, 1920, which averaged 22 per cent. The board granted a reduction of wages which it estimated averaged only about 12½ per cent. About 90 per cent of railway employees are paid by the hour, and this award by the Labor Board leaves the average wage per hour of railway employees about 124 per cent higher than it was in 1916. If the railways were now employing as many men as last year, the wages being paid would be about \$2,000,000,000 a year more than in 1916.

Another large increase in outgo to which the railways have been subjected is in taxes. Their taxes in 1916 were \$157,000,000. They are now running at the rate of almost \$300,000,000 a year, or almost twice as much as five years ago.

The following is then, in brief, the situation with which the railways now find themselves confronted. Their average passenger rate is about 53 per cent more than in 1916, and their average freight rate about 74 per cent more. On the other hand, the prices of materials and supplies average about 65 per cent more than in 1916, the average hourly wage of labor is 124 per cent more, the average price of coal over 130 per cent more, and taxes almost 100 per cent more. Thus far this year, with a somewhat smaller traffic than in 1916, their total earnings have been about 60 per cent more than in the same months of 1916, and their operating expenses, in spite of all the retrenchments that have been made, have been about 110 per cent more. These figures afford a full explanation of the fact that in 1916 they earned a net operating income of 6 per cent, while thus far this year they have earned at the rate of only about 2¼ per cent.

It is undoubtedly true that the rates of our railways must be readjusted, and in many cases reduced, if they are to be made fair to the business interests of the country and such as to contribute to a revival of prosperity, but we must not forget that the high rates of the railways are not holding back a revival of business generally. There is no doubt, however, that the present operating costs of our railroads are so high that we cannot make a substantial reduction in rates until we get those costs down where they will not unduly reduce net earnings and imperil the railways, financially, and render them unable to provide the facilities and service that the welfare of the country requires.

How, then, are reasonable reductions in the operating costs to be secured? The railway managers are doing, and will do, all they can to increase the efficiency and economy of operation. The solution of the problem of reasonably and permanently reducing railway operating costs is, however, mainly in the hands of the public and of public authorities. The main cause of the present high prices of coal are the wages for miners fixed by a government commission, and the prices the railways must pay for coal will remain excessive until these wages have been reduced. The taxes the railways must pay are entirely in the hands of government authorities. The present rules and working conditions and wages of railway employees are entirely due to the action of government authorities. They were made entirely by the Railroad Administration and the Railroad Labor Board.

One-third of the members of the Labor Board are appointed to represent the public. They hold the balance of power on the board, and therefore whether reasonable rules and working conditions and reasonable wages shall be made, and the payroll correspondingly reduced, depends upon the attitude of these public members. To them, therefore, the public may, and in fairness, must look, for most of the reductions in railway expenses which are prerequisite to any reasonable reduction of rates.

The railways are in a situation unlike that of almost any other large industry in the country. The farmer and the manufacturer enjoy a degree of freedom in the conduct of their businesses that the railway manager does not possess. You manage your business without much government interference. On the other hand, while the railways are privately owned and managed, they are subjected to various kinds of government regulation, and their situation as a whole is determined by the way in which they are regulated. The railway managers will do their part in improving the railway situation with respect to operation and rates, but they cannot effect the improvements which ought to be made unless the public does its part by regulating the railways intelligently, wisely and fairly. Those attending this meeting are a part of the general public. Therefore my suggestion to you and all other business men is that while you do demand, and should demand, that the managers of the railways spare no effort to improve the present situation, you should on your own part spare no effort to bring about regulation of the railways which will make it possible for the managers to operate the properties with the efficiency and economy, and provide the service and make rates, that the business interests and, indeed, all the people of the country so greatly need.

## What Will Effectively Restore Business?

By E. B. Leigh

President Chicago Railway Equipment Company

In lieu of an address I ask leave to present a letter mailed to Herbert Hoover, Secretary of Commerce, in his capacity as chairman of the Unemployment Conference now in session at Washington:

Restoration of national prosperity can be started on its way by just one factor—purchasing power. All substitutes are bootstraps or phantoms.

Among the sources of purchasing power the largest and most definitely available is the power of the railroads to buy material and labor for maintenance, additions and betterments. In normal years the railways directly or indirectly have consumed from 40 to 50 per cent of the iron and steel production, admittedly the "barometer of business." It is the history of depressions that recovery is always accompanied by resumption of large railroad buying, and never comes without it—the only exception being the war period. The business so initiated flushes the channels of all industry and trade, including agriculture, and favorably affects every inhabitant of every community.

At present the railroads lack the money and the credit to finance proper maintenance, not to say additions and improvements. Their net income is neither sufficient nor certain. It is insufficient because railway labor is too high. It is uncertain because special groups of shippers are exerting pressure upon the roads and upon the Interstate Commerce Commission for privileged concessions which, if made general without wage reduction, would dissipate all hope of net income either adequate or stable.

In my judgment the Unemployment Conference could devise no remedy for current depression more effective than to persuade every shipper who favors lower freight rates to:

1. Participate in an organized effort to convince the Rail-

road Labor Board that railway labor cost must be immediately and substantially reduced.

2. Refrain from enlistment of executive and legislative officers of the government for exertion of pressure upon the railroads or upon the commission in connection with rates; and to employ exclusively in the discussion of proposed rate revisions negotiation with the carriers or, failing agreement with them, orderly procedure by testimony and argument before the Interstate Commerce Commission.

Purposely the so-called railroad refunding bill is not bracketed with the factors next above specified. The reason for so treating it is that its great importance would be in direct relief to the railway supply industry, and in what I shall say I am discussing not the special needs of that industry but the needs of the whole nation. Somewhere near \$500,000,000 may be made available for settlement of balances due the railroads by the government on current account if the sum due the government by the railroads on capital account can be funded. Somewhere between \$200,000,000 and \$300,000,000 may be due supply concerns from the railroads—remittances awaiting settlement of government balances. Therefore probably not much in excess of \$300,000,000 would remain for new orders, which at best would be temporary and not large compared with amount permanently involved in the rate and wage problem. Not even the whole of this sum will be paid over immediately. Settlements are the result of negotiation, and take time. The director general has predicted that the last will be completed by the end of 1922.

In discussing this topic I have exchanged ideas with many persons, and among those who have given it sustained thought there seem to be two classes. The first class are persuaded that in the upward climb from a depression the first stage is resumption of merchandise movement in such

necessary for all concerned to harmonize exactly their views as to the stage of recovery, if any, which business has reached. We ought to be unanimous in this—that if merchandise buying is now on the upward trend, large railroad buying will help mightily to give it permanence. The novel aspect in the present situation is this—that whereas during about 20 years past recoveries have found the railways able to come into the market with some vigor, though steadily less in each recurring instance, the present occasion finds them almost utterly without the means to resume purchasing. Never in the history of our railways has their physical condition been at a lower ebb, or their need of rehabilitation greater. It is respectfully suggested that the Unemployment Conference picture railroad buying and the requisites for its resumption to the public in such colors as will evoke an irresistible movement for railroad wage reduction and, that accomplished, and railway operating cost brought down, for reconsideration of railway rates by the Interstate Commerce Commission in orderly procedure as befits a quasi-judicial arm of the government charged by Congress with the responsibility of sanctioning tariffs under which the traffic can move and the railroads can grow.

## Freight Car Loading

WASHINGTON, D. C.

**F**REIGHT CAR LOADING showed another considerable increase during the week ended on September 24. According to the weekly report of the Car Service Division of the American Railway Association, the number of cars loaded with revenue freight was 873,305, an increase of 19,543 over the previous week, and the largest loading for any week since November 20, 1920. This was, however,

commodities as textiles, boots and shoes, and other necessities of the individual consumer, and that the consequent improvement in railroad earnings is reflected in railroad purchases, which broaden and accelerate commercial and industrial resurrection. The other class, to which I belong, hold that as a matter of history it is railroad buying which itself initiates the whole movement, and that any recovery in general business before the roads come into the market is negligible. There is no present occasion for arguing which of the two classes is correct on the point where they differ, because the important point is that on which they agree; namely, that however it starts, a resumption of general business is strengthened and hastened by railroad buying and cannot be permanent without it.

Applying this doctrine to the present juncture, it is un-

134,804 cars below the total for the corresponding week of 1920 when the loading was 1,008,109. For the corresponding week of 1919 it was 995,901.

Increases as compared with the previous week were reported in the loading of all classes of commodities except grain and grain products and the total for those showed increases as compared with the corresponding weeks of 1920 and 1919. The largest gain over the previous week was in merchandise and miscellaneous freight, which totaled 550,069 cars, or 10,635 more than for the previous week. Coal loading amounted to 171,474 cars, an increase of over 5,000 in a week. Livestock loading was 32,933 cars, a gain of 2,534, and forest products totaled 48,702 cars, or 2,330 cars more than the week before. The loading of grain and grain products amounted to 51,848, or 3,483 cars less than the week

before. A decline is to be expected, in view of the fact that this year's crop has largely been moved. The loading of ore was 30,333 cars, an increase of 2,118. Increases as compared with the week before were reported in all districts, but all were below the figures for the corresponding week last year except the Southwestern.

A further reduction in the number of surplus freight cars is also shown by the report for the period ending September 23. The average was 201,153, of which 55,849 were box cars and 110,376 were coal cars. This was a reduction of 6,253 in the number of surplus box cars and of 8,138 in the number of surplus coal cars.

Heavier loading of refrigerator cars in order to prevent a car shortage and enable the railroads to move during the next three months the big increase in perishable freight was urged in a statement issued by the Car Service Division of the American Railway Association.

For the 12 months ended on June 30, 1921, the railroads moved 848,425 cars of citrus and other fresh fruits and vegetables, packing house products, eggs, butter and cheese. Each car carried an average load of 14.4 tons while the average maximum load was 15.7 tons per car. The average capacity of refrigerator cars is 32.1 tons. Had the cars been loaded to the average maximum amount, 15.7 tons, 74,300 refrigerator cars would have been made available for the transportation of other freight during the year or 336 cars daily. In view of the increased amount of perishable freight now anticipated to be shipped this fall it is estimated that approximately 44,450 refrigerator cars can be made available for other uses if shippers will load their cars to the average maximum amount. This means that if this heavier loading is obtained to the extent specified—an average of 15.7 tons per car—it will be possible for the railroads to provide transportation for 700,000 tons of perishable freight during the next three months that probably cannot otherwise be moved by the railways.

## Annual Convention of the National Safety Council

By William S. Wollner

THE TENTH ANNUAL CONVENTION of the National Safety Council, held at Boston, on September 27, 28 and 29, was reported in part in last week's issue. The second day of the convention was devoted to discussion of the causes of train accidents in 1920, based on the totals shown in the Interstate Commerce Commission's accident bulletin No. 74; and the nomination and election of officers.

A paper on "Negligence of Employees" was read by F. W. Mitchell (N. Y., N. H. & H.), and was spiritedly discussed. There was an increase of 10,717 train accidents during 1920 as compared with 1919, with an increase of over \$11,000,000 in expense of operation due to this cause. The number of casualties to persons did not, however, increase proportionately with the number of accidents. "Failure to control or secure hand brakes" was the most prolific single cause of train accidents, having totaled 1,122, or 15.7 per cent. Mr. Mitchell said that in his opinion "Safety First" must be more than a slogan if the number of train accidents is to be reduced. Safety must be a controlling instinct, that will mingle in proper proportion the impulses from which action springs.

S. G. Watkins (B. & M.), spoke on "Train Accidents Due to Defects or Failure of Equipment" and T. Q. McCampbell (C. C. & St. L.), spoke on those resulting from improper maintenance of way and structures.

As a result of the annual election, Isaiah Hale of the Santa Fe was elected chairman and Arthur Ridgeway (D. & R. G.

W.), vice-chairman; and A. W. Rohweder (D. M. & N.), was re-elected secretary; all without opposition.

A joint meeting of the Steam and the Electric Railway sections was held on the morning of the third day, the topic of discussion being "Highway Grade Crossing Accidents," John T. Broderick (B. & O.) presiding. The topic was discussed from many angles and members brought out much data to be used in the national campaign to be conducted by the Safety Section of the A. R. A.

I. C. C. Bulletin No. 74 was further discussed at this session and during the afternoon, train service and non-train accidents being given particular attention.

At the afternoon session, D. L. Cease, editor of the Railway Trainman, spoke on "What Is On My Mind," and was responded to by L. F. Shedd of the Rock Island. Mr. Cease had circularized men on various important roads and had found that many were suspicious of Safety-First campaigns. Most of them believed that the roads were only willing to carry out this principle when the cost was not great. A majority of those who responded to Mr. Cease's circular agreed that the men were in part to blame for the apparent failure of the safety department to properly function, as they had failed to show the proper interest in its activities.

A unanimity in agreeing that "safety work has suffered since the end of federal control" gave Mr. Cease the impression that the writers of the letters were trying to draw a contrast between organized safety effort under the government and what has been done since. Mr. Cease's paper gave interesting data from his experience in dealing with life and accident insurance of trainmen. Railroad employees have for years been incredulous when told that the railroad companies had no selfish or wrong motives in establishing safety-first committees. He thinks that the men found justification in their critical attitude, in the publications of the railroads telling the employees and the public of the benevolent motives behind their safety-first operations, while at the same time yardmasters and foremen were allowed to hurry the men in their work so that they did not feel warranted in taking precautions when, to do so, would use up time. Moreover, the ambitious and energetic trainman or yardman, however desirous he may be of following safety rules, finds his ambition to make a good record the stronger motive; in other words, he takes risks because he thinks it necessary to do so in order to maintain his standing with his fellow employees. Many men still stick to the old opinion that the only way to "railroad" is to continue the old habit of taking risks when to do so will save them a little time. It is the task of the safety department to root out this manner of feeling.

### Need of Standardizing Highway Crossing Signs

This was the main topic of an interesting paper scheduled for one of the meetings of the Electric Railway Section. It was by R. S. Messenger, claim agent of the Rochester & Syracuse (electric) Railroad. He called attention to the fact that the usual warning sign (a disk 24 in. in diameter), set 300 ft. or more back from the railroad, is too small; a larger one would be more effective. Other signs, confusing to motorists, ought to be forbidden. Mr. Messenger would have a sign at least 4 ft. square and the color would be orange, which has been found to be more conspicuous than red or white. He would prohibit all other signs on the highway within 1,500 ft. of grade crossings. On his road there has been considerable difficulty in improving the view at crossings (both from the cars and from the highway) because many landowners object to having trees and shrubbery trimmed. Their primary motive is to have a hedge to cut off the view of the railroad from their dwellings. Drivers of automobiles should always go over railroad crossings in intermediate gear so as to guard against failure of their engines while on the crossing.

## Charles C. McChord

COMMISSIONER CHARLES CALDWELL MCCHORD was unanimously elected chairman of the Interstate Commerce Commission on October 3, succeeding Edgar E. Clark, who recently resigned as a member of the commission to engage in private practice. He has been serving as acting chairman. The commission's announcement said the election was pursuant to the policy adopted January 13, 1911, for rotating the office of chairman annually in the order of seniority of the members of the commission. His term was made to run until December 31, 1922, to make the term of chairman coterminous with the calendar year. For many years it was the practice of the commission to elect its chairman in March each year. Commissioner McChord was appointed a member of the commission by President Taft in December, 1910, at the same time that B. H. Meyer was appointed. He served as chairman for the year beginning in March, 1915, whereas Commissioner Meyer was chairman for the year 1916. Chairman Clark was elected in March, 1920, for the year ending June 30, 1921, but when that term expired he was re-elected, upon the motion of Commissioner McChord.

The plan of electing the chairman each year in rotation was adopted by the commission after the resignation of Martin A. Knapp, who had served as chairman for several years, had raised a question as to whether any of the commissioners should be made permanent chairman. At that time President Taft suggested the selection of Mr. Clark, but Commissioner Clements was elected as the senior member and the rotation rule has since been followed. Last year Commissioners Woolley and Eastman were elected successively and declined to accept the office. Formerly the chairmanship of the commission involved comparatively little responsibility not shared by other members of the commission. The chairman presided over the commission's conferences and at hearings and acted as spokesman for the commission in a public way. As the commission's organization has increased and as its administrative functions have been developed the office of chairman has become of greater importance and has assumed more of an executive character, although in arriving at decisions the chairman's vote counts for no more than that of any commissioner.

Under the plan of reorganization of the commission authorized by the law of April 9, 1917, under which many of its functions are assigned to divisions, Commissioner McChord has been a member of Division 1, which is charged with the conduct of the bureau of valuation, and generally with the conduct and determination of matters arising under the valuation act, also matters arising under the safety appliance acts, the accident report act, the hours of service act, the ashpan act, the block-signal resolution and the section of the act which has to do with the requirement for the installation

of automatic train stops and train control or other safety devices.

Mr. McChord had had experience in railroad regulation as a member of the Kentucky Railroad Commission for several years before becoming a member of the Interstate Commerce Commission and he also interested himself in railroad regulation matters while a member of the Kentucky legislature, but, although a lawyer, while a member of the Interstate Commerce Commission his particular work has to a large extent been identified with matters pertaining to railroad operation. He had charge of the long investigation of car service matters made by the commission in 1916. In his long experience on the commission, however, he has naturally had an active part in its work of all kinds and has written many of its important decisions. He has also been a frequent dissenter and often while agreeing with a majority decision in the main, writes a separate opinion to express his individual views wherein they differ from those of the majority. He was one of the two

commissioners who were in the minority in the 1914 eastern rate advance case as originally decided by the commission, when he and Commissioner Daniels expressed the opinion that the railroads should have been granted the increase in rates asked for. The majority of the commission finally came around to this view upon a rehearing of the case. When the commission decided the general rate case in 1920, Ex Parte 74, Commissioner McChord wrote a separate opinion as a reply to the objections made in separate opinions by Commissioners Woolley and Eastman. He took the position that the commission had attempted to deal with this case under the law in a broad, comprehensive, common-sense way, realizing that the primary responsibility for the future of the railroads rested upon its shoulders. Had the decision been left to his individual judgment, he said, he would have arrived at the same general conclusion but

perhaps by a somewhat different route, because there was no difference of opinion as to the necessity for increased revenues for the carriers. He also wrote a strong opinion in the Illinois intrastate passenger fare case last November, expressing the attitude of the commission, that the commission's power to remedy state discrimination against interstate commerce had been broadened by the transportation act. He also wrote the commission's opinion in the long contested railway mail pay case, issued in 1920, in which the commission ordered large increases in the rates for the transportation of the mails and provided for retroactive payments to the carriers by the Post Office Department for the period during which the case had been pending.

Mr. McChord was born December 3, 1859, at Springfield, Ky. He was educated at Center College at Danville, Ky. After leaving college he became a member of the bar of Kentucky and engaged in the general practice of law. He was prosecuting attorney at Springfield from 1886 to 1892. He was appointed a member of the Kentucky Railroad Commis-

© HARRIS & EWING

Hon. C. C. McChord

sion in May, 1892, and elected chairman. He resigned in 1895 and was elected a member of the Kentucky state senate, serving four years. During this time he was the author of the bill which became popularly known as the McChord railroad law, empowering the railroad commission to prescribe freight and passenger rates for railroads in Kentucky. He was again elected a member of the railroad commission in 1899 and was again made chairman. He was re-elected commissioner and chairman in 1903 and in December, 1910, was appointed member of the Interstate Commerce Commission. He was re-appointed by President Wilson for the term expiring at the end of 1922.

## The Train Service Board of Adjustment

THE TRAIN SERVICE Board of Adjustment, the board which will adjudicate points of difference between train and engine service employees and the managements of the New York Central and the Baltimore & Ohio (*Railway Age*, September 24, page 592) will be composed of eight members, four to be selected by the railroads and one by the chief executive officer of each of the four unions signatory to the agreement. These organizations are the Order of Railway Conductors, the Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen and Enginemen and the Brotherhood of Railroad Trainmen.

The agreement provides that when disputes arise from personal grievances or from the interpretation of schedules, the settlement of which by the usual method of direct conference has failed, they shall be passed upon by the Train Service Board. The decisions of this board will be final and binding on both the management of the roads and the train service employees. It will not come within the province of the board, however, to hear any disputes arising from proposed changes in rules, working conditions or rates of pay, since such matters are to be left to the Railroad Labor Board. Disputes arising prior to the termination of federal control likewise may not be considered by the board.

As soon as all the members of the board have been appointed, they will meet in New York and select from their number a chairman and a vice-chairman, who will not thereby lose their vote on questions before the board. Thereafter the board will meet regularly at stated times each month and will continue in session until all matters before it are considered. The meeting place will be New York unless otherwise agreed upon, but the board will have authority to empower two or more of its members to conduct hearings and pass upon disputes at any place the board may designate. Such a sub-division, however, may not make a final decision—the board as a whole alone has that right.

When a disagreement arises between a train or engine service employee and the management, it will be handled in the usual manner as at present, by the general committee of employees and the various officers of the roads. If, however, after the matter has been taken to the chief operating officer of the road (or some one designated by him) and no agreement has been reached, then the employees may refer the matter to the chief executive of their organization and if he approves the contention of the committee, he and the chief operating officer of the road will refer the matter with all supporting papers to the Train Service Board. If either the chief executive of the employees' organization or the chief operating officer of the railroad declines to join with the other in submitting a dispute, then either may refer the matter to the board under such regulations as it may make to govern such a contingency.

One hundred or more unorganized employees (who are engineers, conductors, firemen or trainmen) who are directly interested in a dispute may place it before the board by a

petition. No interpretation of an existing rule, agreement or practice which has been agreed to or accepted by the management of the railroads and the authorized employees' committees can be considered by the board as a dispute.

The board is authorized to act only in matters duly submitted to it as described above. In hearings before the board the railroads and employees will designate their own spokesmen.

The railroads and the employees will pay the compensation of their representatives on the board and the general expenses of the board will be borne one-half by the carriers and one-half by the employees' organizations. The board may require evidence in addition to that submitted when a dispute is referred to it. A majority vote of the full membership is required for a decision, which will be binding. If a majority cannot be obtained, the board will, on the request of either party to the dispute, submit the matter to the Railroad Labor Board.

Complete copies of all matters submitted and decisions made will be kept by the board and copies of decisions will be furnished to the representative of the railroads involved in the dispute, to the representative of each class of employees covered in the agreement and to the Bureau of Information of Eastern Railways.

The board will have no jurisdiction over discipline administered in the case of personal grievances. Its province in such cases will be solely the determination of innocence or guilt.

The agreement affecting the organization of the board will be effective for one year from the date of the organization of the board and thereafter for periods of one year. Any party may withdraw at the end of any year upon a 90-day notice.

AN AMENDMENT to the pending tax revision bill in the Senate has been offered by Senator McNary to repeal on January 1 all taxes on the transportation of freight, passengers and express.

# Public Relations Work on Illinois Central

## Unusual Campaign Carried on by President Markham to Enlighten Public Regarding Railway Matters and Some of Its Results

ONE OF THE TRADITIONS which has come down from the early history of the railway service is the idea that railway executives should hold themselves aloof from the public, responding, to be sure, to demands from the public for information about the transportation industry, but making no initial effort to give such information or to build up a public understanding of railway affairs. Railway executives should not have all the blame, if the policy is to be criticised. When the railroads were growing out of their swaddling clothes a worshipful public invested with an air of mystery the men whose genius conceived and built and operated them, and the barrier thus erected from the outside came to represent a more or less well defined policy. The executive who violated it was not approved by his fellows for so doing. But, regardless of where the idea originated, it is true that only within recent years has there been any real attempt to find a policy to substitute for it.

Railway transportation has undergone a radical transformation in the course of the last generation. Private operation of the railroads has given way to a system whereby the real rulers of the agencies of transportation are not the titular heads of the industry, but the mass of the people, whose wishes are reflected in the proceedings of legislatures and governmental regulating bodies. New problems have made new policies necessary.

A method of dealing with the public on the Illinois Central system during the last year may be expected to play a part in the development of transportation policies in the future. The Illinois Central's attitude is summed up in a statement recently made by President Charles H. Markham:

"We are the trustees of a vast investment. We realize that railway property will be dealt with accordingly as public sentiment develops and crystallizes. We feel, therefore, that we must present our case before the court of public opinion, and we are glad to do that, having an abiding faith in the fairness and justice of the people when they have the facts before them."

For more than a year the Illinois Central has been endeavoring to strengthen the spirit of confidence and support on the part of its patrons for the management by laying its problems before the public and inviting constructive criticism and suggestions. Public statements discussing current phases of railway problems in non-technical language have been published in a uniform style as advertisements in about 500 newspapers in the cities and towns on the Illinois Central lines, and this has formed the basis of the public relations effort.

The program began September 1, 1920. A few days prior to that the management made public a statement to the patrons of the system acknowledging that the road had not been able to serve them as satisfactorily as was desired, but asking that they realize the problems which it faced and be patient until such time as equipment and facilities could be built up to the point where adequate service would be possible. Patrons were urged to take up directly with the management any constructive criticism of the service which they had in mind and to make suggestions for the improvement of service. They were also asked to let the management know of any phase of service which was being rendered to their complete satisfaction.

It was something new for a railway president to make a public statement to the effect that the system of which he was the head had failed to give adequate service. Patrons

liked the frank tone and they did not hesitate to express their approval. The double invitation which was given in the letter brought forth thousands of replies, some critical, but the majority commendatory.

### Advertisements Bring Public Response

The public statements forming the basis of the public relations work have appeared in the newspapers the first of each month. They have departed from the usual style of advertising designed to sell goods or service, and have been more in the nature of editorials discussing railway affairs. Each statement has been published over President Markham's name.

"It didn't take us long to discover that these statements were being watched for eagerly, not only by the people who would ordinarily read what a railway executive says, but by every class of men and women," Mr. Markham said. "Each statement was concluded with an invitation to patrons to submit constructive criticism and suggestions, and this invitation has led to a correspondence which has brought the personality of the Illinois Central into the homes and business places of many thousands of people who depend upon the railway system for freight and passenger service."

Every suggestion brought forth by the public relations work addressed to Mr. Markham has been given careful attention by him and promptly replied to, and he believes the value of the personal touch of this correspondence cannot be over-estimated.

That a busy railway president feels the importance of considering the wishes of the least of his patrons cannot fail to make an impression. The correspondence also opened up a channel through which he might obtain, in a way otherwise impossible, a bird's-eye view of the reaction of patrons to the service rendered by employees.

"This also deeply impressed our officers and employees," Mr. Markham continued. "It meant that complaints about unsatisfactory service could no longer be prevented from reaching the highest authority on the railroad. It meant that I as president would be brought closer in touch with the patrons than ever before. The officers and employees immediately began vying with each other to render a service of satisfaction—a service that would not result in complaints reaching me. Perhaps no innovation ever accomplished more for a railway system in stimulating the personnel and also in pleasing patrons than the invitation which we repeat every month for constructive criticism and suggestions in regard to the conduct of the Illinois Central system."

The placing of advertising in the newspapers also has served to emphasize, especially to the people of the smaller communities, that the Illinois Central system is a vital part of their community.

The plan which the Illinois Central system has followed in dealing with the newspapers is one to which Mr. Markham attaches great importance. The advertising has been placed directly from the offices of the Illinois Central at Chicago, and the correspondence with the newspapers which this has entailed has served to bring the newspaper men into touch with the Illinois Central's executive offices.

Editorials and articles appearing in the newspapers bearing upon railway questions have been carefully watched. In the few instances where articles or editorials have been published giving misinformation or false conclusions, Mr. Markham has written the editors, correcting their misinformation

or giving such comment upon the problems which they discussed as might help them to form correct judgment.

The newspapers received the innovation warmly at its inception, but as the work has progressed and as they have had opportunities to observe that the road is not trying to "put something over," but on the other hand is devoting its space in the newspapers to telling simple stories based upon truth in regard to the railroads, the newspapers have become even more friendly to the plan.

The public relations movement has by no means been confined to Mr. Markham. When the program was begun, local or division officers were given an outline of the plan to be followed and were instructed to call in person or have members of their staff call upon the newspaper men in their territory and keep in touch with them.

"This served to form still another valuable point of contact between the railway organization and its patrons," Mr. Markham said. "The officers and principal employees of the system have been advised from time to time as to the progress of the public relations work and have displayed great interest in keeping up their part of it."

#### Material for Officers on "What to Talk About"

One phase in particular of the plan for making the division officers and principal employees a part of the public relations campaign should be of special interest. The traditional reticence which has come down from the early days of railroading left its mark upon the under-officials, as well as the heads of the railway systems. Well-informed officers and employees have been reluctant to discuss railway problems, and it has developed that some of the comment upon railway affairs which has reached the public as coming from railway men has come from those who have not been well informed upon the subjects they chose to discuss. The Illinois Central has attempted to correct this by urging officials of all grades and employees to talk about railway questions with the public; not only that, but it has furnished them with the material upon which to base those discussions. A monthly bulletin entitled "Things to Talk About" is published under the direction of Mr. Markham and sent to all officers and the principal employees of the system. They are instructed to take this material and use it as the basis of talks at public gatherings, newspaper interviews and the like.

In order to give the officers and employees a working knowledge of the Illinois Central system's history, a pamphlet entitled "What Every Employee Ought to Know About the Illinois Central System" was prepared by the management and placed in their hands.

Another feature of the public relations program has been the cultivation of the farmers. One of the counties in each agricultural state served by the Illinois Central was selected, and a representative of President Markham was sent to interview a number of the leading farmers of the county about the railway problems with which the farmers have to deal.

The plan of the Illinois Central in seeking constructive criticism and suggestions was explained to the farmers and the comments which they made upon the service they had received were reported in the Illinois Central Magazine for the information of the officers and employees of the system. Such feasible suggestions as were brought out were put into practice. News stories about the interviews were released in advance to the newspapers in the Illinois Central's territory. These were printed and freely commented upon.

#### Conferences Between Farmers and Railways

One of the tangible results of the interviews with farmers was the formation of a railway committee by the Champaign County (Ill.) Farm Bureau. The railway committee holds meetings with railway men from time to time, the first meet-

ing being called shortly after the interviewer's visit, when an Illinois Central superintendent was invited to meet with the farmers.

The idea of giving patrons of the railway system a voice in the direction of the affairs of the system has made a particular appeal to the men who publish the newspapers in the cities and towns on the lines of the Illinois Central system. Scores of editorials have been written commending the management for its policy, and the newspaper editors have commented freely from time to time upon the problems which have been discussed in the public statements. It has not been unusual for literally hundreds of favorable newspaper clippings to be received by the Illinois Central during the course of a month.

The way in which the newspaper men look upon the Illinois Central's plan is expressed in a letter which an Illinois Central officer received recently from a Mississippi newspaper man. He said:

"We feel that the class of advertising which you have been using during the past year has been educational and has done a great deal toward a clearer understanding of the railroad company's point of view by the general public. It has certainly clarified some subjects in reference to the railroad's relation to the public for this writer."

An Illinois newspaper man had the following to say of the Illinois Central's policy when he was discussing another subject:

"For many months the Illinois Central has been conducting a campaign for 'service.' The idea that 'service' is the first essential in the conduct of its business is being drilled into the mind of every employee of that railroad. Recently the writer had occasion to ride over the Illinois Central and a number of other railroads, and the work that has been accomplished by this campaign of 'service' was clearly noticeable."

#### Comments of the Newspapers

A Mississippi newspaper man told editorially of President Markham's action in correcting a misstatement made by the correspondent of another paper, and said in his editorial:

"The incident is cited as an illustration of President Markham's free, open and straightforward method of dealing with the patrons of the Illinois Central . . . .

"The head of the Illinois Central believes in publicity. He has no secrets from the general public. He is ready and willing at all times to show his hand, to give patient and courteous hearing to any complaint or criticism that may be offered, and do everything that is reasonable and within his power to satisfy the critic or complainant.

"Mr. Markham goes even further than this. For the past several months he has had a well-trained newspaper interviewer touring the various lines of the system for the purpose of actually soliciting complaints and grievances from patrons. This interviewer also solicits suggestions as to ways and means of bettering the service, and President Markham frankly acknowledges that some first-class ideas have been obtained through this method, and will be put into practical operation."

The following view was said in an editorial which appeared in a Chicago newspaper when the Illinois Central announced that the public relations work would be continued another year:

"Transportation is as vital to trade and prosperity as sound money and honesty. It is to business what blood is to human life and health. The Illinois Central system's policy has quieted many animosities as a constructive and harmonizing influence in business education. People are realizing that railroads are prodigious assets which add enormously to their prosperity and comfort, and not a menace or a liability or a civic burden."

A New Orleans newspaper made the following comment

the same day from the other end of the Illinois Central system:

"Co-operation brought about by mutual understanding works steadily and surely to mutual advantage. In the matter of preventable loss and damage, millions may be saved by that sort of teamwork, which is no less profitable, directly or indirectly, in other lines. Mr. Markham's experiment interested all students of railway problems. Its success under twelve months' test constitutes fresh evidence that the railway managements who give attention to the cultivation of their 'public relations' in sound and proper ways are rendering constructive and practically helpful service."

An Indianapolis newspaper, commenting editorially on President Markham's published statement relative to the direct taxes paid by the railroads in 1920, and the transportation tax on freight and passenger traffic collected by the railroads for the government during 1920, totaling \$511,678,631, says:

"It all came out of the railway receipts from the public.

The railways merely acted as the agency through which more than \$500,000,000 was turned into the public treasuries, and there was no way in which the war tax on freight and passenger receipts, which would relieve the public of paying about \$250,000,000, could affect the finances of the railways. They still would have to pay 18 1/2 per cent more taxes than they did back in pre-war days, and that money must come from freight and passenger revenues. The thought or hope of getting back to anything approximating the prices we formerly paid for transportation is out of the question while taxes and other expenses remain at post-war levels. The raises in rates granted to the railways have to cover much more than increases in wages, and there is small prospect for material reduction in some of those items, including that of direct taxes."

The newspapers in the territory of the Illinois Central system are full of such constructive comment as has been quoted, all of which results from President Markham's work in the field of railway public relations.

## Report of A. E. R. A. on Heavy Electric Traction

### Effort Made to Coordinate with Other Organizations—Locomotives and Multiple-Unit Cars Compared

THE report of the Committee on Heavy Electric Traction of the American Electric Railway Association was presented at the annual convention, held this week at Atlantic City, N. J. The committee outlined the work in progress by the A. E. R. A. and other societies in America interested in heavy electric traction, and suggested that much of the present duplication of work should be done away with. The term heavy electric traction was defined as it applies to locomotives and multiple-unit equipment, a progress report on electric switching locomotives was made, comparative advantages of locomotives and multiple-unit cars were outlined and much data presented in the form of charts, tables, and a bibliography. An abstract of the report follows:

It is evident that considerable valuable work is being accomplished by other technical organizations which would be of interest to the members of the American Electric Railway Association; and it is possible that the work of this association would be of interest to the membership of other organizations. It is recommended, therefore, that an effort be made to coordinate the activities of various organizations with the view of eliminating so far as possible overlapping and duplication and of making more valuable to the profession the work of the technical committees, much of which represents considerable sacrifice of time and energy on the part of the members of the several committees.

#### Electric Switching

The use of electric switchers in heavy railroad operation has been relatively slight as compared with that of electric road engines. Two railroads only, the New York, New Haven & Hartford, and the Chicago, Milwaukee & St. Paul have developed electric locomotives in connection with their operation especially for switching service. The New York Central, the Norfolk & Western, the Butte, Anaconda & Pacific, and the Pennsylvania at New York City do considerable switching with their electric road locomotives, but naturally these are not especially adapted to switching requirements. Inasmuch as satisfactory records are not available in regard to electric switching it is impossible at the present time to present data either as to relative costs or as

to the number of cars switched by electric as compared with steam locomotives under same conditions.

The Butte, Anaconda & Pacific has developed a tractor truck in connection with its electric switching at Butte. These tractors consist of a truck, weighing about 40 tons, with motors, which may be coupled to a road locomotive unit. The current collection and other functions are taken care of by the locomotive, the auxiliary equipment being connected by jumpers. The use of the auxiliary tractor is said to give 50 per cent more tractive effort, at about two-thirds the normal speed, when connected in series with a single locomotive. The device also accomplishes considerable saving in wear and tear on the resistance grids.

A very large number of light electric locomotives weighing from 20 to 60 tons are in operation at the present time which are doing valuable work in industrial switching, interurban freight service, etc. This type of engine is now practically standardized just as street railway and interurban equipment has become standardized. The locomotives operate usually at either 600 volts or 1,200 volts direct current.

Light storage battery locomotives have been employed to some extent for switching. A storage battery unit for yard switching is proposed and designs are under way. Certain advantages might be obtained by the use of a storage battery locomotive for switching, notably in territory where the passage over any individual track is infrequent.

#### Locomotives or Multiple-Unit Trains?

In suburban electrification of railroads the application of multiple-unit equipment provides a solution for many important problems. This has been especially noteworthy in the case of the Pennsylvania at Philadelphia, and the New York Central, New York, New Haven & Hartford, Long Island and New York, Westchester & Boston in the vicinity of New York. Where both local and through service are operated electrically, however, the problem as to the relative amount of traffic to be handled by electric locomotives and by multiple-unit equipment is somewhat complex, and a decision is necessarily based on local conditions.

In general the advantages of multiple-unit equipment are

compared to electric locomotives may be summarized as follows:

The long heavy multiple-unit train accelerates more quickly than a train of the same weight hauled by a locomotive. Where stops are frequent a material increase in scheduled speed is thus possible.

In a multiple-unit train the motor equipment is varied to correspond to length of the train, and thus is often more efficiently used than is the case with the electric locomotive, which being of a fixed and definite size cannot be so easily adapted to varying requirements.

The reliability of operation of multiple-unit equipment (several motive power units being employed in a train) is somewhat greater than that of electric locomotive equipment. In the event of a failure on the road, one of the motor cars may often be cut out of service electrically and the train thus enabled to reach the terminal with little or no delay by means of the remaining motors.

The multiple-unit cars, being heated electrically in winter, are free from all difficulty connected with oil-burning steam boilers, and although the cost of power thus used in heating may be considerable, this convenience of operation is valuable. One of the chief sources of expense in maintenance of electric locomotives is the steam heating boiler.

Perhaps the most important advantage of multiple-unit equipment as compared with electric locomotives is in switching, especially in crowded stub-end terminals. Locomotive-drawn trains, after arrival at the terminal, must be backed out to free the locomotive. This extra double move is often necessary when the terminal tracks are most congested. The multiple-unit train, on the other hand, practically as soon as it has reached the terminal is ready for the return trip.

There are some limitations, however, to multiple-unit operation as compared with electric locomotives. Multiple-unit cars in general can be operated economically only over tracks equipped with an energized third rail or trolley (although occasionally this type of equipment is hauled outside the electric zone by steam locomotives for short distances). The result is that the cars are not available for duty outside the electrified territory in the event of a local heavy traffic demand elsewhere.

The mileage of multiple-unit motor equipment is often less than that of an equivalent electric locomotive, on account of traffic limitations. The multiple-unit motive power cannot be interchanged between local and through trains. This means that owing to the limitations of traffic, especially in the case of the so-called "fleet movement" of commuter's trains (heavy traffic in the morning and evening with little mid-day travel) much of the multiple-unit equipment can make but one round trip a day. The electric locomotive, on the other hand, which is available for hauling either local or through trains may be more intensively and thus more economically operated in this respect.

The maintenance, reduced to a seat-mile basis, is usually higher with multiple-unit equipment than in the case of electric locomotives and standard trailer coaches.

The decision between multiple-unit and locomotive equipment in each individual case is governed by local considerations. The excess cost of multiple-unit car maintenance is often offset by the saving made possible in terminal tracks, on account of elimination of switching requirements. In general, it may be said that each type of equipment has its definite place in the heavy traction field.

In designing multiple-unit equipment there is some question as to the relative advantages of trains made up of all motor cars as compared with motor cars and trailers. This question involves careful study and equipment as well as terminal characteristics. One railroad which started electric

operation with mixed motor car and trailer trains has since equipped all cars with motors, while another railroad which started operations with all motor cars has revised the initial policy by acquiring trailers.

### Charts, Tables and Bibliography

The chart showing the growth of steam railroad mileage electrified and electric locomotive tonnage in heavy traction service in the United States and Canada indicated that track mileage and locomotive tonnage has increased at approximately a constant rate from 1905 to the present time, and that now there is something more than 2,600 miles of track electrified and over 52,000 tons of locomotives in service in the United States and Canada.

### Discussion

The greater part of the discussion was offered in the form of a short paper, presented by H. H. Norris, managing editor, *Electric Railway Journal*, suggesting how an American committee on electrification might be formed, and expressing the need of such a body as follows:

"In opening the report this year with a synopsis of the electrification activities of the committees of the several national societies concerned with heavy traction, the committee has taken one step towards the formation of an American Committee on Electrification. The compilation shows that there is much duplication of effort among the committees, which could be avoided through the functioning of such a joint committee. Such a national committee could act as a clearing house for all information on this subject. On one hand it could suggest topics appropriate for consideration by the several special committees, and on the other hand could collect on its own account the data which would be of general interest. The value of a central, co-operative and unbiased agency of this kind would be very great.

"As an example of the kind of thing such a co-operative committee could do nothing would serve better than the elaborate bibliography which the committee has been able to present this year in collaboration with the Association of Railway Electrical Engineers. Here is illustrated co-operation on a limited scale. A joint committee could maintain such a bibliography continuously. This bibliography furnishes an excellent start. It will stand some editing and condensation. Having printed this year the complete list, the association might later provide a condensed list of the most important articles, including a brief summary of the salient features of each. This could be made to include articles published up to the date of the completion of the list. The danger of unconscious padding in a list of this sort lies in the fact that an important electrification is reported by the leading domestic and foreign papers in all degrees of completeness and balance. The best one or two of these would suffice, although mention could be made in small type of a few other articles on the same subject for the benefit of those who might not have access to the papers mentioned first.

"It is to be hoped that this bibliography will be used in such a way as to justify the considerable expense and effort involved in compiling and publishing it. It might be well to reprint it in pamphlet form for miscellaneous distribution. A nominal price could be put upon the pamphlet and the association could advertise it along with other reprints, so that its existence would not be forgotten.

"The compilation of the locomotive and multiple-unit car data, which the committee was able to get up with the co-operation of the two large manufacturers of heavy traction equipment, is one of the outstanding features of the committee's report and of the year's work. Particularly noteworthy is the table of multiple-unit car data. The admixture therein of data regarding heavy multiple-unit car prac-

tion on steam roads, interurban lines and rapid-transit urban lines, together with the general similarity of these data, indicates the substantial similarity of short-haul, high-speed passenger service under these different auspices. This is, we hope, a prophecy of the time when there will be a greater community of interest between the steam and electric roads in relation to suburban passenger traffic.

"It is unfortunate that the chart presented by the committee shows a zero rate of increase in electrification in 1920, after a steady, although small, rate from 1905 on. This slump merely reflects the financial condition of the steam roads. It will cease when conditions improve. There are electrification projects now developing which will at least restore the normal rate of increase; for example, the Lackawanna Railroad has been making definite plans for a considerable undertaking. The Illinois Central is, of course, on the eve of an important terminal electrification at Chicago. One of the most heartening announcements was recently made of a \$7,000,000 contract for railroad electrification in Chile.

"There has been some question as to the appropriateness of the electrification activity on the part of the American Electric Railway Engineering Association. The basis of this criticism is that the matter is properly one for the steam railroads to consider and push. It is true that no electrification project is possible unless the railroads are convinced of the savings that can thus be effected. At the same time we can well look at this matter from the other side. Electric traction, having demonstrated its success under steam road conditions, is looking for new fields to develop. It is to be expected, therefore, that initiative will be exerted by the electrical manufacturing and operating interests who are looking for new worlds to conquer. The steam railroads will necessarily be somewhat conservative in regard to this matter, partly from financial consideration, partly because they have so much money and talent tied up with their steam equipment. The electrical interests have a 'selling proposition' of enormous magnitude."

J. H. Davis, electrical engineer, Baltimore & Ohio, called attention to the fact that the diagram accompanying the report indicates that the first electrification work in the United States was started in 1903, while actually it was done in 1895.

W. B. Potter, General Electric Company, spoke of the activities in railway electrifications in foreign countries and said that many steam railroads in this country were waiting only for more favorable circumstances. Comparative operating expenses of steam and electric traction, he said, have been fairly well established, and he closed his remarks by prophesying that with better financial conditions and the development of super-power zones, electrification will progress rapidly.

## A Novel Cinder Disposal Plant

AT THE ENGINE TERMINAL of the Akron, Canton & Youngstown at Brittain, Ohio, is an ash handling system which presents a number of interesting features in ash disposal at cinder pits. Essentially, the system at this point consists of a depressed pit below a track where the engines may be "spotted" and dumped before entering the roundhouse, and a steam discharging arrangement by means of which the ashes may be removed from the pit and discharged into a cinder car. The cinder pit, which is constructed of concrete, extends 12 ft. (inside dimension) along the track and about 10 ft. to one side and is divided into two compartments by a concrete wall which extends entirely across the pit parallel to the track except for a vertical opening of  $2\frac{1}{2}$  ft. at the center; the cross-section in the drawing is taken through this opening.

The compartment thus formed, which is below the track, is so constructed that the three outside walls of the pit slope from their tops to the bottom of the opening in the cross partition, while the other compartment has a level bottom which makes it possible for a man to rake the ashes from below the track, through the opening in the partition and over the trap of the ash-handling arrangement; the latter is similar to the equipment installed in power plants, etc., whereby ashes and cinders are removed by the force of steam injected

Cross-Section Through the Cinder Pit

into that end of the pipe line below the floor. The steam for operating this system is obtained from the engines on the cinder track, each locomotive being equipped with a quick-acting screw connection in the steam dome.

This plant was put in operation in January, 1921, and is reported to be giving satisfactory service. Originally, it was intended that the cinders should be discharged from

A View of the Cinder Plant at Brittain

the pit immediately upon being dumped, but it was found that the pit afforded a sufficient capacity to permit the dumping of about three locomotives before cleaning of the pit was required. With respect to the operation of the installation, it was found that the complete cycle of dumping ashes and removing them from the pit required from 15 to

20 min., distributed as follows: 10 minutes for "pulling" the fire, five minutes for blowing the cinders and from two to three minutes for connecting and disconnecting the steam connection to the engine. The operation of blowing the cinders out of the pit and into a cinder car, requires considerable steam, but the amount of steam remaining in the locomotive has always been sufficient to move the engine into the roundhouse. In operating the system it has been found best not to wet down the cinders while in the pit, the established practice being to spray the water into the pipe conveyor near the upper end, thus killing any fire remaining in the ashes and coals.

The ash conveyor system is a product of the Conveyor's Corporation of America, Chicago, Ill. We are indebted for the information and illustrations of this equipment to S. S. Senter, chief engineer of the Akron, Canton & Youngstown.

## Safety First Must Be a State of Mind

By Prof. William J. Cunningham

**D**URING THE YEAR 1920 the aggregate of the payments made by the railroads of the United States on account of personal injury to employees, passengers, and others was over \$53,000,000; and a large proportion of the accidents resulted also in damage to property. Every injury to an employee had the effect of disturbing the organization when his work was temporarily assigned to another with less experience. Every case of personal injury to a passenger had a harmful effect on morale and upon public good will.

These factors cannot be measured in dollars and cents, but including all factors the railroad expenditures on account of accidents which caused personal injury in 1920 were certainly far in excess of \$100,000,000.

Some 12 years ago R. C. Richards, of the Chicago & North Western, launched the first organized drive against carelessness in this field. It was he who conceived and inaugurated the first systematic and comprehensive plan for stopping railroad accidents at the source. The North Western quickly began to show gratifying improvements in its accident record, and the idea was widely copied. Many extensions have been made to Mr. Richards' original plan and many innovations introduced. \* \* \* Interest and co-operation

on the part of the workers is absolutely essential to success. Many skillful specialists have emerged and the technique of safety-first practice covers a wide range of activity. \* \* \* But it may not be amiss to offer three suggestions, which in a small measure imply criticism of current methods. There is an inclination on the part of the specialists to overdo in administering stimulants. At times the propaganda has bordered upon the sensational and the appeals have been too emotional. Safety first, to be really effective, must become a state of mind—not an element in organization. That state of mind cannot be attained by sporadic or sensational appeal. It must be developed gradually, naturally, continuously.

Unlike the problem of floating an issue of Liberty bonds we are selling an ideal. When we sell the ideal of safety first the transaction has just begun. The real task is to keep it sold. There are no return privileges with the sale of the bond. With safety-first the purchaser may backslide if his interest is allowed to wane. The spectacular methods adopted by the Liberty loan committee during the war period cannot be equally effective in promoting the general adoption and continuance of safety first principles. A flaring placard in which a skull and crossbones are the most prominent feature in giving point to an admonition against carelessness may compel attention, but the mental reaction in many cases is that of amusement or ridicule.

The second suggestion is that in some quarters there is a tendency to exalt the organization. An organization should, as far as practicable, be held in the background. The appeal must be to the individual. The most successful leader is one who by indirection rather than by fiat can induce his men to adopt his ideas as their own.

When a mechanic is told that he must wear goggles to protect his eyes against flying particles of metal and is reminded that no one but a fool would work without them, the natural reaction is one of resentment against interference with personal liberty. But if by indirect suggestion the mechanic can be made by his own process of reasoning to come to the conclusion that the use of goggles is desirable the chances are that he will demand that goggles shall be furnished.

The third suggestion is that the importance of safety appliances should not be overemphasized. Paradoxically, it often happens that the most dangerous operation is the safest. Its very danger begets respect and inspires care. An appliance which eliminates one-half of the risk may eliminate all of the care. The chief field for cultivation is the state of mind and the habits of the individual worker.

## Short Lines Begin Series of Regional Meetings

THE FIRST of a series of regional meetings of the American Short Line Railroad Association was held at Chicago on October 4, approximately 50 representatives of members of the association participating in the discussion of various phases of the present railroad situation and its relations to the short lines. The object of the meetings being primarily to disseminate information, no fixed program was arranged. Instead a list of subjects of interest to all short lines was issued with the call to the meeting and the discussion closely followed this topical outline.

The effect of the present freight and passenger rates on the movement of traffic and upon the revenues of the short lines; the present divisions on interline roads and the work that is being done to obtain more equitable divisions; the work of the Railroad Labor Board and its effect upon the short lines; settlements with the government; the requirements of the Interstate Commerce Commission; federal valuation; consolidations; the railway mail pay question; motor truck competition; the consolidation of purchases for the short lines and the prospect for new railroad legislation in both Congress and the states were topics taken up at the meeting.

Two resolutions were adopted at the meeting, one of which urges the short lines to defend the transportation act under the terms of which these carriers have been greatly benefited. This resolution declares the transportation act to be most constructive piece of railroad legislation ever passed, and that if it is given a fair trial it will ultimately save the railroads, whereas if it is not given a fair trial, government ownership will be unavoidable. The second resolution recommends the continuance of the consolidated purchasing agency which was recently established by the association, and which has, according to the resolution, already demonstrated its success in obtaining materials and supplies for the short lines at the same rates quoted to large trunk lines.

A great deal of time was given to the discussion of railroad legislation both that which has already become law and that which is contemplated. Several of the officers of the Association stated that the short lines have gained much by the terms of the Transportation Act and other recent legislation and that it was essential that every means be taken to insure that this legislation is not so changed as to take away the advantages which the short lines have gained.

The call to the meeting, discussing the need for information regarding present conditions, said:

"The transportation companies of the country are now surrounded by more and greater adverse conditions than ever before, and this is especially true of short lines. These present bad conditions are apparently growing worse, and they not only justify but demand that every owner and officer of such lines carefully and deeply study the situation, which is now so complex that nothing less than full information will enable them to protect their properties; and after having obtained necessary information, to aid in the work of re-establishing the railroads in a healthy and serviceable condition."

In all of the discussion, the officers of the association endeavored to impart this necessary information.

Similar meetings were held at St. Louis, Mo., on October 5, and at Kansas City, Mo., on October 6. Additional meetings have been arranged as follows: Denver, Colo., October 8; Salt Lake, Utah, October 10; Portland, Ore., October 12; Seattle, Wash., October 13; San Francisco, Cal., October 17; Los Angeles, October 18; Houston, Texas, October 24; New Orleans, La., October 25, and Atlanta, Ga., October 27. Meetings have also been arranged for New York and Harrisburg, Pa., but the dates have not been fixed as yet.

## Cutting Down the Labor Cost

A PRACTICAL ILLUSTRATION of what may be accomplished through the use of material handling equipment is illustrated by the following account of the use of a locomotive crane in the handling of ties at the treating plant of the Atchison, Topeka & Santa Fe at Albuquerque, N. M. The crane was a 15-ton Standard crane manufactured by the Industrial Works, Bay City, Mich. The information was supplied by W. E. Jackson, superintendent of the treating plant.

The daily capacity of the plant, with the zinc chloride treatment, is six charges or 96 tram-car loads of 7 in. by 8 in., 8-ft. sawed pine ties. The trams average 45 ties, making the daily output 4,328 ties.

A single load of freshly treated ties weighs approximately 7,955 lb.

Thirty trams at a time are drawn by the locomotive crane

Piling Ties 20 ft. High

from the cylinder to the unloading piles, a distance at more than half a mile. The use of a double-chain hoist enables the complete load of 45 ties to be picked up at one time and placed on the pile, the crane working at a 52 ft. radius when piling on the outside tier. An advantage of this method of piling ties is the ease with which they can again be loaded by the crane.

If manual labor was employed to handle these ties by hand, it would cost at least \$2 per 100 ties, whereas the work is accomplished by the crane at the rate of 57 cents for the same number. Loading freshly treated ties by hand requires two men to tie and these men could not do more than shoulder high, while the locomotive crane lifts them at a height of 20 ft.

# General News Department

By a fire on an old pier of the Erie Railroad at Twelfth street, Jersey City, N. J., on October 1, eight carloads of hides, with a part of the pier, and other property, were destroyed; estimated loss \$100,000.

Railway agricultural department representatives will hold a convention in connection with the National Dairy Show to be held at the Minnesota state fair grounds at St. Paul, Minn., beginning on October 8.

A fire in the car shops of the Missouri, Kansas & Texas at Wichita Falls, Tex., on September 20, damaged the woodwork mill, several freight cars, a crude oil tank and the entire machine shop equipment. Estimated loss, \$75,000; cause, unknown.

The Pajaro Valley Consolidated Railroad Company, operating between Salinas and Spreckels, California, a distance of 41 miles, having been authorized by the state railroad commission, will discontinue certain trains and run automobile stages in place of them. The stage line will parallel the railway and will carry passengers, baggage and express at the same rates as are charged on the trains.

Damages amounting to \$180,000 were paid to the Pennsylvania Railroad by the city of Chicago on September 28, the payment closing a legal contest which had started in 1894. The railroad had obtained in 1905 a verdict of \$105,000 against the city for damages caused by the trainmen's strike of 1894 and the accompanying riots. The case was appealed and lost again by the city, and the interest on the original judgment continued to mount until \$180,000 was required to settle the case.

Employees of the Lehigh Valley in the last 14 months have bought stock of the road to the extent of 6,482 shares. An officer of the company says that 1,348 employees have become stockholders. The per capita subscription in October, 1920, was 4.36 shares; in October, this year, it was 4.80 shares. The company buys the stock for the employee in the open market, and it is paid for at a rate of \$5 a month a share. Interest is allowed on the part payments at the dividend rate carried by the common stock, which is 7 per cent annually.

The Southern Railway Company has filed a suit in a state court in North Carolina asking an injunction to suspend the collection of taxes assessed against the company in that state, protesting against changes in valuation which have disturbed the relation between the taxes on railroad property and those on other property. A few days later the Atlantic Coast Line entered a similar suit in the Federal Court. According to an account in the Raleigh News and Observer, the Atlantic Coast Line, in taking action in the Federal Court, has violated an agreement by which it agreed to regard itself as a North Carolina corporation, as regards its property in that state.

The Pennsylvania Railroad, since May 15, has taken on about 14,000 men, the total number of employees now being 199,000, as compared with 184,625 on May 15. President Samuel Rea, in giving out these figures, said: "It is the purpose of the Pennsylvania to co-operate as far as possible with President Harding's efforts to reduce unemployment. It is our hope that still more men will be needed. We intend to utilize the additional men chiefly in putting our idle cars in order prior to the coming of winter. We have at present on the Pennsylvania system 82,149 idle cars, of which 46,691 have been stored without being repaired. None of the latter are required for current use, or, as far as can be foreseen, are likely to be needed this fall. In all probability it might be perfectly safe to defer their repair until next spring, but

we feel that if we put them in order we shall not only be prepared for a revival in business but shall also be assisting in President Harding's endeavor to improve the general employment situation."

## New England Railroad Club

The regular meeting at the New American House, Boston, on Tuesday evening, October 11, will be "Canadian Night," with an address by F. L. Wanklyn, general executive assistant of the Canadian Pacific, on the Organization, Mobilization and Activities of the Canadian Overseas Railway Construction Corps. He will show a number of lantern slides. There will also be an address by Grant Hall, vice-president of the Canadian Pacific.

## New York Signal Engineers

Fred W. Bender, chairman of the New York sectional committee of the Signal Section of the American Railway Association, announces that a meeting of the committee will be held at Hotel McAlpin, 34th street, New York City, on Thursday evening, October 20. Progress of Railroad Signaling in America will be the subject of an illustrated address by H. S. Balliet, secretary of the Signal Section; and W. H. Arkenburgh, of the National Carbon Company, will speak on dry batteries and carbon brushes. All men interested in signaling are invited to attend.

## American Engineering Council's New President

Mortimer Elwyn Cooley, dean of the College of Engineering and Architecture of the University of Michigan, was elected president of the American Engineering Council of the Federated American Engineering Societies at a meeting of the executive board of the council held at the Cosmos Club in Washington, D. C., on September 30. Dean Cooley assumes office at once and will carry out an extensive program in the interest of the public and the profession of engineering.

## Rains Cause Heavy Damage in Northern Mexico

Railroad property in northern Mexico has been greatly damaged by heavy rains during the past three months and operation of the lines has been correspondingly hampered. The present rainy season in the northwestern section of the state of Chihuahua has been the heaviest since 1907, the only rainy season approaching the severity of the present year being that of 1914. The rains have caused a considerable number of washouts and slides, sections of track have been washed away and many bridges, small buildings and structures have been moved from their foundations.

## Cause of the C. & N. W. Elevator Explosion

A report on the cause of the grain explosion in the Chicago & North Western elevator at Chicago, which resulted in the death of six persons and the loss of \$3,000,000 in property, was presented before the Western Society of Engineers on October 3, by David J. Price, engineer in charge of development work, U. S. Department of Agriculture, Washington, D. C. Mr. Price attributed the cause of this explosion, which occurred on March 19, to the ignition of dust clouds from an incipient fire in the driers. According to the speaker, the recurrence of such explosions can only be prevented by the elimination of dust, which is an exceedingly difficult problem, owing to the grain handling rules and statutes prohibiting the removal of the dust before the grain is taken into the elevator for weighing.

## Accounting Rules Amended to Provide for Stock of No Par Value

The Interstate Commerce Commission has amended the text of its uniform system of accounts for steam railroads to provide for accounting and reporting in connection with capital stock having no par value, which the commission has recently authorized in the case of several roads. The amended rules provide that when certificates or receipts issued to represent permanent interests in the accounting company, and such certificates or receipts have no par value, they shall be included in the accounts at the amount corresponding to the cash received or the cash equivalent if the consideration is other than cash.

## Hearing on Short-Lines' Claims

The Interstate Commerce Commission has announced that argument will be heard before the commission at Washington on November 4, on the question of the proper construction of the word "deficit" as used in paragraph a of section 204 of the transportation act, which provides for the reimbursement of deficits of short line railroads for that portion of the period of federal control during which they operated their own lines. The American Short Line Railroad Association has taken the position that this guaranty provision provides for the reimbursement of losses during that period and the commission has thus far held that carriers are not entitled to the guaranty unless they actually sustained a deficit. Notice of the hearing was served upon officers of the Short Line Railroad Association.

## Railroad Hearings to be Resumed

The Senate Committee on Interstate Commerce has decided to resume hearings in its general investigation of the railroad situation at Washington on October 13, the first witnesses to be representatives of the railroad brotherhoods. Frank J. Warne, their statistician, is to be one of the witnesses. The committee has called a meeting for Friday of this week to consider other matters pertaining to railroad legislation, including the valuation bill, on which some hearings have been held, to strike out the requirement that the Interstate Commerce Commission report the excess cost of acquisition of land, also the bill to authorize the War Finance Corporation to purchase railroad securities from the Railroad Administration, and possibly some of the bills designed to restore the power of the state railroad commissions to reduce rates.

## The Railroad Service as a Career

The Illinois Central, in its latest newspaper advertisement, says: "Right now, when optimism in all branches of industry is needed more than ever before, we begin to note an unorganized but none the less effective effort to make railway work appear unattractive to our young men. Non-railway men have expressed discouraging views and even some railway officers have lent their opinions to this unprogressive effort. For the most part, fortunately, these views are merely opinions without a statistic in support."

"We of the Illinois Central do not subscribe to these pessimistic opinions in any single particular. We believe—indeed, we know—that the present-day complexity of railway organization demands men better trained and more resourceful than ever before, and that opportunities for advancement, to the right men, are as good as they ever were."

After discussing the attractiveness of railroading as a business from the young man's viewpoint, and the three factors of opportunity, compensation and adventure, the article presents a brief statement of the ages of the men occupying executive positions on the Illinois Central, thus: 85 of these positions are held by men less than 30 years of age, 122 are held by men between 30 and 35 years of age, and 213 are held by men between 35 and 40 years of age.

"This," the article concludes, "proves that opportunities still exist in the railway business. The same effort wins in railway work as in other lines and the final reward compares favorably with those in most competing industries."

## New York Central Employees May Become Stockholders

The New York Central announces that, by a vote of the board of directors, the company will buy shares of its capital stock for employees and allow them to make payment in monthly instalments. The announcement says that stocks may be paid for in 24 instalments, to be deducted from the employee's pay in the first half of each month. An individual may buy from one to 15 shares. On money lent to him by the company, interest will be charged at the rate of 6 per cent. The company has no stock for sale and purchases must be made in the open market.

The company explicitly states that whether or not an employee chooses to become a stockholder, his status as an employee will not be affected in any manner. Provision is made in the plan for proper adjustment in the event of the resignation, permanent disability or death of any employee—subscribing for stock.

Employees are not to be urged to purchase stock. Employing officers are called upon to thoroughly familiarize themselves with the plan, so as to be prepared to explain fully any of its features to employees interested and to be careful not to approve an application except when reasonably assured of the ability of the employee to carry out his contract without unduly taxing his resources. In special cases where unforeseen circumstances may arise which would make it impossible for the employee to meet his obligations, exceptional consideration may be given.

## National Association of Railway and Utilities Commissioners

The thirty-third annual convention of this association will be held at Georgian Terrace Hotel, Atlanta, Ga., beginning on Tuesday, October 11, and continuing probably four days. The call for the meeting sets forth that the rights of the states in the regulation of railroads is still challenged by the great railroad corporations and that it is the duty of this association to expose unfounded assumptions and claims. The officers of the association appeal to every state to send as many representatives as possible.

A partial program shows the following speakers. On Tuesday afternoon, Hon John E. Benton, general solicitor of the association. On Wednesday afternoon, Hon. Joseph B. Eastman, member of the Interstate Commerce Commission. On Friday, Hon. M. H. Aylesworth, of the National Electric Light Association.

Reports of committees will be presented on the second day, Wednesday, in the forenoon, and presentation of reports will be continued thereafter, as opportunity offers, subject to regulation by the executive committee. On Wednesday, at 12 o'clock, the annual election of officers will take place.

On Wednesday afternoon there will be a round table discussion on "After-the-war-phases of regulation," to be led by Hon. E. I. Lewis, member of the Interstate Commerce Commission, and on Thursday afternoon, one on automobile transportation, omnibuses and jitneys, led by Hon. George McNamery, of New York City.

The president of the association is James A. Perry, of Georgia, and the secretary, James B. Walker, 49 Lafayette street, New York City.

## Conference on Public Ownership

The Public Ownership League of America, the National Non-Farmer League, the Plumb Plan League and other radical labor, farmer, civic and commercial organizations have issued a call to a public ownership conference which is to be held in Chicago on November 19-21. The invitation states that the purpose of the meeting is "to bring together the representatives of all progressive groups in America—organized labor, organized farmers, civic, educational, business and religious bodies and individuals of all classes who are interested in and earnestly seeking a better and more efficient organization, operation and democratic control of our basic public utilities, to bring into counsel the leading advocates and representatives of municipal and public ownership in the United States and Canada, for the consideration and study of the problems involved, to get the ideas of the most careful and competent utility experts in America, to hear the methods and plans of those who have

made a success of public ownership; and to consider ways and means for advancing the public ownership, efficient operation and democratic control of public utilities and natural resources!"

Among the men who have been invited to speak before this conference are William G. McAdoo, former director-general of railways, on "Will Public Ownership Solve the Railroad Problem?"; Senator Robert M. LaFollette, on "The Repeal of the Esch-Cummins Bill as the First Step Toward Public Ownership of Railroads"; Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers; Timothy Shea, vice-president of the Brotherhood of Locomotive Enginemen and Firemen; Frank Hodges, secretary of the Miners' Federation of Great Britain; John Lewis, president of the Illinois State Federation of Labor; Alexander Howatt, president of District 14, United Mine Workers of America, and Glenn E. Plumb.

### Improved "Ferry-Car" Service on the Pennsylvania

The Pennsylvania Railroad, in its central region, by getting shippers who load freight at their stores and factories into "ferry" or "trap" cars to load in geographical order, has made a marked improvement in that branch of the service and has received commendatory letters from numerous patrons.

Shippers have been furnished with loading guides, which show in a simplified manner the correct loading to be followed; and after six months' trial the majority of shippers have permanently adopted them. Efforts are now being made to secure the co-operation of all others using the ferry car service. Both railroad men and shippers feel assured of a great improvement in expeditious handling of l. c. l. freight. Heretofore this freight was loaded indiscriminately, that destined to Eastern points being loaded in the same car with miscellaneous shipments destined to Western or Southern points; and every car had to be moved to adjacent freight stations or transfers, where the shipments were sorted and reloaded. With the new loading guide the shippers are able to assemble their shipments and so regulate their loading that the car can be forwarded to the proper transfer, the same as would be done with a car loaded at the freight house. Moreover, shippers find that it is advantageous to them to hold their shipments several days, and thus assemble a load for a proper transfer; and as compared with the old plan of indiscriminate loading the shipments reach destination more promptly. The plan is so flexible that the individual shipper can set up a ferry car program to meet his own peculiar needs. Important economies are made possible because of reduced handling of freight at intermediate transfers, the car supply is improved, and congestion is relieved at many local stations.

A report for the first six months shows that approximately 16,500 "ferry" cars were loaded in accordance with the loading guide and forwarded from industrial plants without the intermediate handling that formerly was necessary.

### Roads Earned 5 Per Cent in August

A preliminary compilation of the reports of revenues and expenses of 200 Class I railroads to the Interstate Commerce Commission for the month of August shows a net railway operating income for the month of \$90,221,000, which is the largest that has been reported for any month since the increased rates became effective last year. Reports of only two Class I roads, the Duluth, South Shore & Atlantic and the Duluth, Winnipeg & Pacific, are missing from this compilation. To earn a 6 per cent return on the valuation tentatively adopted by the Interstate Commerce Commission for rate-making purposes, the Class I roads should have earned \$108,000,000 in August, but a net of \$90,000,000 is at the rate of 5 per cent for a year and represents a closer approximation to a 6 per cent return than has been reported since the transportation act became effective.

The total operating revenues for the month were \$504,957,000, a decrease of 8.9 per cent as compared with August, 1920, while the total operating expenses were \$381,787,000, a decrease of 44 per cent. The net operating income compares with a deficit for August, 1920, of \$158,000,000, but in this connection it should be recalled that the operating expenses for last August included approximately \$79,000,000 of retroactive wage payments under

the order of the Railroad Labor Board. The actual reduction in operating expenses is, therefore, less than that indicated.

August completes a full year under the increased rates. On the basis of the preliminary returns the net operating income for the year was approximately \$530,000,000, or \$86,000,000 less than a 6 per cent return, which for the Class I roads would be \$1,116,000,000 for the year. The actual return, therefore, for the year was about 2.8 per cent.

The summary for 200 roads is as follows:

District	1921	1920	Per cent of increase 1921 over 1920
Total operating revenues:			
Eastern District .....	\$222,449,000	\$252,024,000	d 11.7
Southern District .....	71,699,000	83,445,000	d 14.1
Western District .....	210,809,000	218,965,000	d 3.7
United States .....	504,957,000	554,434,000	d 8.9
Total operating expenses:			
Eastern District .....	176,484,000	315,824,000	d 44.1
Southern District .....	66,673,000	94,213,000	d 35.6
Western District .....	144,630,000	271,163,000	d 46.7
United States .....	381,787,000	681,205,000	d 44.0
Net railway operating income:			
Eastern District .....	32,244,000	Def. 78,398,000	....
Southern District .....	7,461,000	Def. 13,175,000	....
Western District .....	50,516,000	Def. 66,945,000	....
United States .....	90,221,000	Def. 158,518,000	....

### Pennsylvania Athletic Meet

More than 1,000 contestants (winners in a series of elimination games in which 25,000 employees participated) took part in the second annual Pennsylvania System athletic championship meet held at Dennison, Ohio, on Saturday, September 24. Seven thousand employees and their families went to Dennison in 17 special trains from Philadelphia, Pittsburgh, Columbus, Cleveland, Chicago and St. Louis, and with townspeople of Dennison and Urichsville, the crowd in Panhandle Athletic park was swelled to about 25,000 people.

The athletes from the Eastern Region won the meet with a total score of 102 points. Next came the Central Region with 45, the General Office in Philadelphia with 33, the Northwestern Region with 26, the Southwestern Region with 13 and Altoona Works with 3. The special features of the program this year were tennis and a 50-yard dash for women employees, and also dashes for the sons of employees. The program began at 9 a. m. with tennis and trap shooting followed by swimming events and trials in track and field events. The finals in all events were run off after lunch.

In the first of a three-game series for possession of the Atterbury Cup awarded annually to the championship baseball team on the Pennsylvania System, the Columbus Division defeated the Philadelphia Terminal Division by a score of 8 to 4.

Vice-president James A. McCrea presented medals to the individual and team winners of first, second and third place in each event.

Among the honorary referees who were present on the field were Benjamin McKeen, vice-president in charge of the Southwestern Region; Elisha Lee, vice-president in charge of the Eastern Region; J. G. Rodgers, vice-president in charge of the Northwestern Region; R. E. McCarty, general manager of the Central Region; I. W. Geer, general manager of the Southwestern Region; T. B. Hamilton, general manager of the Northwestern Region; C. S. Krick, general manager of the Eastern Region, and P. F. Smith, Jr., manager of the Altoona Works.

Otto Schroll, P. P. Neff and H. B. Chaffin acted as referees.

The local committee in charge of all arrangements included F. A. Kerner, chairman; H. B. Chaffin, J. S. Albright, J. H. Baker, H. L. White, C. P. Davidson and C. M. Speed. For the Pennsylvania System the committee consisted of John T. Coleman, chairman; C. E. Clay, M. Y. Shuster, V. C. Ernest, E. F. Ewing and C. S. McIntyre.

The Chamber of Commerce in Dennison and Urichsville, the local post of the American Legion, the local churches and other organizations united to make excellent arrangements for feeding the large crowd. Playgrounds were provided for the small children, a field hospital tent was set up near the entrance to the park, and convenient information booths were located about the grounds. The visitors came away with the highest impression of Dennison and Urichsville hospitality.

## Traffic News

A reduction of 20 per cent on all rates over 50 cents per 100 lb., on live stock shipments from the prairie provinces of Canada to St. Paul and Chicago, has been made by the Canadian Pacific.

C. E. Carson, general agent at Chicago for the Fort Dodge, Des Moines & Southern, has been appointed manager of the Traffic Club of Chicago, effective September 15.

### Coal Production Increases

Continued improvement marked the production of bituminous coal in the week ended September 24, according to the weekly bulletin of the Geological Survey, and the resulting increase carried the output to the highest mark attained since the last week in January. The output is estimated at 8,506,000 net tons, an increase over the preceding week of 3.8 per cent and preliminary reports indicate that loadings on Monday and Tuesday of the following week will show a further increase of over 1500 cars a day.

### Panama Canal Tolls

The bill to provide free tolls for American coastwise vessels through the Panama Canal, S. 665, was briefly considered in the Senate on October 4. A unanimous consent agreement had previously been made for a vote on the bill not later than Monday, October 10. There has been very little discussion of the bill because the pending treaties and the revenue bill are absorbing the attention of the Senate and there is a report that President Harding is opposed to Congress acting at this time on the bill, for diplomatic reasons, although he has previously expressed his approval of the policy. Senator Fletcher of Florida made a long speech opposing the bill and estimated that to waive the tolls would mean a gratuity to the shipowners of at least \$1,500,000 a year, which would have to be made up by taxation.

### Preparation Urged for Heavy Refrigerator Car Traffic

Because of an expected big increase, estimated at nearly 40 percent over last year, in the amount of perishable freight to be moved during the next three months, the Car Service Division of the American Railway Association is calling for expedited movement. In a circular letter all carriers are urged to encourage the prompt loading and unloading of refrigerator cars, prompt handling in transit and preference in repairing. The circular says, in part:

"There must be very energetic action on the part of everyone. \* \* \*"

"Do not load refrigerators with other than perishable traffic.

"Do not furnish refrigerators for potatoes while they can be safely transported in other cars.

"Do not hold refrigerators for other prospective loading which can be provided for without delay by refrigerators being made empty daily on your lines.

"Speed up unloading, do not use for storage purposes.

"Give the same prompt handling to the empty as the loaded cars. \* \* \*"

The situation is so serious and important that where it has not been done, it is suggested that "someone in your principal transportation office be assigned the special task of checking the refrigerator situation in detail day by day."

The task of moving this year's crop is a stupendous one, but, says the circular, "we believe it can be accomplished with reasonable success by the united support of the railroads, the shippers and their associations, with all others interested."

A check of 38 of the largest terminals last week showed 3851 refrigerator cars awaiting unloading of which 1203 had been delayed three days or more.

## Commission and Court News

### Interstate Commerce Commission

The conference relative to rates for the transportation of fish which was to be held in Washington on October 10, has been postponed to November 1.

The commission has announced that oral arguments will be heard at Washington on November 1, 2 and 3 in the valuation cases of the Los Angeles & Salt Lake and the Kansas City Southern.

The commission has suspended from November 15 until March 15, 1922, the operation of proposed increased rates on marble, jasper, onyx and slate, building and monumental, from eastern shipping points located in Groups D to J to California terminal and intermediate points.

The commission has suspended until January 31, the proposed cancellation of the existing through commodity rates on cast iron pipe from Attalla, Birmingham and other points in Alabama and Chattanooga, Tenn., to destinations in Montana, indicating the application of combination rates in lieu thereof.

The commission has suspended until January 31, the operation of an item of Trans-Continental West Bound Joint Tariff, which propose increased rates on marble, jasper, onyx and slate, building and monumental, from eastern shipping points located in Groups D to J to California terminal and intermediate points.

The commission has suspended until January 29, the operation of certain schedules published in a supplement to Agent E. B. Boyd's tariff proposing to eliminate from the list of articles taking corn rates, the commodities alfalfa feed, cane seed, cottonseed cake, cottonseed meal, copra cake, and other kindred articles, and place the same in the list of articles taking wheat rates.

The commission has suspended until January 28, the operation of certain schedules published in a Chicago, Rock Island & Pacific tariff which proposes to eliminate the existing provisions for the absorption of switching charges at St. Louis, Mo., and East St. Louis, Ill., on non-competitive traffic resulting in increases in charges to the extent of the existing switching charges on such traffic.

The commission has suspended until January 31, the operation of schedules which provide for the non-application of Group J rates from and to points on the Denver & Rio Grande Western east and south of Grand Junction, Colo., leaving applicable instead combination rates, which results in increases to the extent of the local rates to the boundary of the restricted territory.

### Hearings on Transcontinental Rates

The commission has announced a series of hearings before Attorney Examiner W. A. Disque in various western states on the application filed by R. H. Countiss, agent for the transcontinental roads, for authority to charge rates for the transportation of sugar, c. I. from Pacific Coast terminals and other western point to Chicago which are lower than the rates contemporaneously in effect to Omaha and other intermediate points.

Hearings will also be held on other similar applications filed by Agent Countiss, on ground coffee from New Orleans and Galveston to Pacific Coast terminals; on sisal and hule from New Orleans and Westwego, La., Galveston, Tex., and other Texas ports and Mexican gateways to Pacific Coast terminals; on asphalt, beans, canned goods, dried fruit, etc. from Pacific Coast terminals to New York via the shortest Gulf route through Galveston; and on various commodities from eastern defined territories to Pacific Coast terminals which are lower than the rates contemporaneously maintained on like traffic to and from intermediate points.

## Foreign Railway News

### Siam Seeks American Bridge Materials

The commissioner general of the Siamese State Railways is advertising in this country for superstructures for steel railway bridges. Bids will be received up to December 31 at Bangkok, Siam. Specifications and drawings are obtainable from C. P. Sandberg, 143 Liberty street, New York.

### Thirty-Three Passengers Killed in Paris

In a rear collision of outgoing suburban passenger trains in a tunnel in Paris, France, on the evening of October 5, thirty-three passengers were killed and a large number injured, many being injured or killed by flames.

The trains had just left the St. Lazare station, about four minutes apart; and according to reports the leading train had been stopped by the rupture of an air brake pipe. Firemen could not get within 500 ft. of the burning cars; and at the time of going to press, complete reports had not been received.

A train for Marly-le-Roi ran into one destined for Versailles. The precise cause of the fire is not known, but the flames were intensified by the explosion of a gas tank.

### Motor Trucks More Careful of Shipments Than Railways, Says English Shipper

An English architect who handles large amounts of building materials and household furniture has written to the Times (London) praising the motor trucks for careful handling of shipments and decrying the carelessness of the railways of his country, in this respect, saying that since the war he has noticed a decided tendency on the part of contractors to ship by truck rather than by rail. It would seem from his statement that increasing carelessness on the part of railway employees is largely to blame for the damage which involves the railway companies in heavy claims and diverts the traffic to the highways.

"Quite lately," he continues, "I ordered 35 kitchen ranges from Falkirk, of which 11 arrived broken. The loss falls on the railway shareholders, the inconvenience on my contractor. I have seen a truck of large and expensive baths unloaded by tipping them over the edge of the track on the platform; several were broken, amidst the laughter of the men. The loss to the companies by these methods must be very great. Surely some method of supervision of loading and unloading could be found that would prevent wilful damage, and even penalize carelessness. When I wish to make sure of a thing that I particularly want to arrive whole I do not send it by rail."

### The Railways of Spain

Commerce Reports presents the following statistics of the Spanish railways:

Four ft. 8½ in. (1.435 meter) gage railway:	
Single track .....	miles 6,773
Double track .....	miles 243
Locomotives .....	2,122
Passenger cars .....	4,803
Freight cars .....	40,304
Five ft. 6 in. (1.674 meter) gage railway:	
Single track .....	miles 2,110
Double track .....	miles 16
Locomotives .....	626
Passenger cars .....	1,250
Freight cars .....	10,230
Meter (39.37 inch) gage railway:	
Single track .....	miles 8,886
Double track .....	miles 260
Locomotives .....	2,748
Passenger cars .....	6,053
Freight cars .....	50,574

Spain is still dependent on foreign manufacture for its locomotives. When the Spanish government asked for bids on 300 locomotives and 10,000 cars in 1920, Germany offered to supply 150 of the locomotives and 5,000 of the cars within one year at prices which almost excluded competition. When the Spanish Government gave contracts early in 1921 for 119 locomotives Germany got them all.

At present nearly all the locomotives in Spain are of German, Belgian, French, Italian and English make. The American type of engine has not yet gained popularity in Spain, and American bids, being so far above those of European competitors, are not, as a rule, seriously considered. Of the Madrid, Cáceres & Portugal Railway's 88 locomotives, 57 were built by the Chemnitz Works and 10 by the Cockerill. Of the Madrid, Zaragoza & Alicante Railway's 872 locomotives, 485 were built by five firms—Henschel, Maffei, Creusot, Chemnitz and Hannover.

The commonest type of locomotive in use in Spain is the English, equipped with English vacuum brakes. The dimensions and weight are governed by the gage and curve of track. The minimum curve radius for the broad gage is 250 to 300 meters (1 meter=39.37 in.); for the narrow gage, 80 to 100 meters. Wide-gage rails are 30 to 35 kilos (1 kilo=2.2 lb.) per meter on old roads and 40 to 45 kilos on modern lines; narrow-gage rails, 20 to 22 kilos per meter on the old roads and 30 kilos on the new. Each company adopts the locomotive which is judged to be best suited for its lines and work. In recent years several compound engines have been built, but they are not popular, and at present those fitted with steam superheaters predominate, mostly of the Schmitt system.

### Private Operation Being Considered in Switzerland

After 25 years' experience with railway nationalization, the Swiss public is now debating a return to private operation, according to the Bureau of Railway Economics. Shortly after 1847, when the first Swiss railway was constructed and operated by private means, the feeling was so strong against nationalization that the Swiss Confederation voted that the railways should be built by private enterprise and vested sole authority in the cantons to grant concessions to the companies.

Some of the concessions expired between 1880 and 1890, but the government did not exercise its right to purchase any of the lines until 1897. The general desire at the time was not so much to secure an increase in government revenue as to free the railways from the control of foreign interests, and to operate them on behalf of the public as a whole. The last large road (the St. Gothard) was purchased in 1909, and today the railway mileage owned and operated by the government amounts to 1,769 miles, representing 54 per cent of the total railway mileage of the country.

According to the Railway Gazette (London), the present movement for denationalization is not the work of any particular party or faction, but has adherents among persons of all shades of political opinion. Before the war the government lines were operated fairly well; during the war, however, the roads were militarized. Naturally military requirements came first and civilian needs second. Public annoyance over this fact led to inquiries into railway management generally, with the following results:

It was found that in 1913 the net operating revenue of the government lines provided a margin of profit (after deducting interest and amortization charges), of nearly \$4,500,000. Since 1914 the net revenue in no year has been sufficient to meet the fixed charges, and there was a steadily increasing deficit down to 1918, when it was nearly twice as large as the deficit for 1914. Some improvement was shown in 1919, although the deficit for that year was \$5,952,904. The total operating deficit on the government lines during the six years ending December 31, 1919, was \$66,604,583, equivalent to a deficit per mile of line of \$21,789.

The chief cause of these deficits is the great increase in wages and the cost of fuel. In 1919 nearly 71 per cent of the operating expenses was absorbed by compensation to employees, while the cost of coal and other materials made up an additional 24 per cent. The operating expenses in 1920 increased at a greater rate than the receipts, so that the operating ratio was even greater than that shown for 1919.

The Swiss public seem to have concluded that railway nationalization does not pay. A petition for denationalization of the railways is being circulated, and if it is signed by 50,000 duly qualified Swiss voters, the matter is to come before Parliament and be submitted to referendum. It is expected that this movement for denationalization will obtain the necessary 50,000 signatures, since the supporters of the movement include representative persons of all political parties.

## Equipment and Supplies

### Locomotives

THE BAHIA RAILWAYS of Brazil have ordered 17 locomotives from the Baldwin Locomotive Works.

### Freight Cars

THE MONONGAHELA CONNECTING is inquiring for 50 gondola cars, of 100-ton capacity.

THE CHICAGO, MILWAUKEE & ST. PAUL is inquiring for 2,500 composite gondola cars of 50-ton capacity.

THE ALABAMA, TENNESSEE & NORTHERN is inquiring for 140 flat cars and 75 composite gondola cars, all of 50-ton capacity.

THE KATANGA RAILWAY (Africa), is inquiring through the car builders for 25 general service cars, of 35 metric tons capacity.

THE LAKE CHAMPLAIN & MORIAH is inquiring for 12 ore car bodies, of 50-ton capacity and for 10 hopper ore cars, of 60-ton capacity.

THE ASSOCIATED OIL COMPANY, San Francisco, Cal., has ordered 8, three-compartment tank cars of 8,050 gallons capacity, from the Pennsylvania Tank Car Company.

THE MICHIGAN CAR has awarded a contract for the repair of 500, 40-ton underframe box cars and 250, 50-ton steel twin hopper cars to the Illinois Car & Equipment Company, Hammond, Ind.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS has awarded a contract for the repair of 500, 50-ton all-steel box cars to the American Car & Foundry Company, the work to be done at the Madison, Ill., plant.

THE DELAWARE, LACKAWANNA & WESTERN reported in the *Railway Age* of September 10, as inquiring for 1,000 steel hopper cars of 50-ton capacity has ordered 500 from the Cambria Steel Company; 500 from the American Car & Foundry Company and 500 from the Standard Steel Car Company.

THE BALTIMORE & OHIO, reported in the *Railway Age* of September 10, as inquiring for 2,000 new car bodies, has ordered 500 steel hopper car bodies from the Cambria Steel Company, 500 box car bodies from the American Car & Foundry Company, 500 box and 500 steel hopper car bodies from the Standard Steel Car Company. The company is also asking for prices on 1,000 70-ton steel coke car bodies and 1,000 50-ton steel hopper car bodies.

THE NEW YORK CENTRAL has awarded contracts for the repair of 500, 40-ton steel underframe box cars to the Streeter Car Company, Kankakee, Ill., to the Standard Steel Car Company, Pittsburgh, Pa., and to the Ryan Car Company, Chicago. It has also awarded contracts for the repair of 500, 50-ton steel hopper cars to the Buffalo Steel Car Company, Buffalo, N. Y., to the Detroit, Mich., plant of the American Car & Foundry Company, and to the Ryan Car Company; and for 250 cars of this type to the Steel Car Company, Euclid, Ohio; also for 500 box cars to the Koppel Industrial Car & Equipment Company, Koppel, Pa.

### Passenger Cars

THE GREAT NORTHERN is inquiring for 30 complete steel underframes for first-class dining cars.

### Iron and Steel

THE COLORADO & SOUTHERN has ordered 312 tons of steel from the Chicago Bridge & Iron Company, for two oil storage tanks at Wichita Falls, Tex.

## Machinery and Tools

THE SEWELL VALLEY is in the market for shop machinery as follows: 1—1,200 lb. steam hammer; 1—36 in. by 36 in. by 10 ft. or 36 in. by 40 in. by 10 ft. planer, 3 heads, power feed, reversing motor drive; 1 No. 2 or No. 3 universal milling machine, belt drive, geared; 1—24 in. high speed, upright drilling machine, back geared belt drive with speed box; 1—58 in. or 68 in. 250-ton wheel press, inclined type, belt driven; 1—60 in. driving wheel lathe to turn straight connected and shay type drivers, variable speed motor driven. The company ordered recently 1 Greaves-Klusman 18 in. geared head engine lathe.

### Miscellaneous

THE PENNSYLVANIA ENGINEERING WORKS, Pittsburgh, Pa., are inquiring for 30, 4-wheel trucks.

THE LONG ISLAND will receive bids until 12 o'clock noon, October 10, for frogs, switches, guard rails, intermediate guard rail, and twin tie plates, track bolts and spikes.

THE NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock noon, October 19, for 2,500 pr. angle bars; 400 steel spring plates; parts for electrical apparatus; approximately 100,000 lb. welding and threading steel; approximately 4,300 lb. spring steel; 5,000 copper signal rail bonds and 500 lb. flux rods.

### Signaling

THE GRAND TRUNK has ordered from the General Railway Signal Company 22 signals, and other apparatus, to be installed on its line between Oxford, Me., and Danville Junction.

THE WESTERN PACIFIC has ordered from the General Railway Signal Company a mechanical interlocking, to be installed by the signal company, at the crossing of the Southern Pacific at Fourth street, San Jose, Calif. The machine will have 17 working levers. The home signals on the Southern Pacific will be electric motor, Model 2A.

## Railway Construction

CHESAPEAKE & OHIO.—This company has under construction at Logan, W. Va., a new brick and concrete freight station 33-ft. by 200-ft. with an adjoining 220-ft. transfer platform upon which work has just been started. It is also planning a new station layout at the same place to include a 35-ft. by 100-ft. passenger station and a 35-ft. by 100-ft. baggage and express building, both of brick and concrete construction. These facilities will be served by an extensive system of covered concrete platforms. It is also contemplating the extension of the present engine house at Peach Creek, W. Va., to include five additional stalls, the installation of a new 100-ft. turntable and the revision of the supporting yard to include 10 additional tracks, five of which are now under construction, new machine, forge and pipe shops, a coaling station, inspection pits, cloder conveyors and other miscellaneous facilities.

CHICAGO, BURLINGTON & QUINCY.—This company contemplates the erection of a 9-stall roundhouse at Centralia, Ill.

CHICAGO & NORTHWESTERN.—This company has awarded a contract to John Marsch, Chicago, for the construction of a spur track 1½ miles in length at Consol, Iowa.

CHICAGO, ROCK ISLAND & PACIFIC.—This company contemplates the erection of a storehouse and oil house at Amarillo, Tex., to cost about \$10,000.

CHIPPewa IRON MINING COMPANY.—This company has awarded a contract to C. M. Magnuson for the grading of a 4½-mile spur track extending from the McComber mine, Vermillion Range, to the Armstrong Bay mine. The work is estimated to cost approximately \$40,000.

ILLINOIS CENTRAL.—This company has applied to the war department for permission to double-track its bridge across the Ohio river at Cairo, Ill. The cost of this work is estimated at \$8,500,000.

## Supply Trade News

The Canadian Austin Machinery, Ltd., Woodstock, Ont., has been incorporated to manufacture and distribute in Canada the equipment of the Austin Machinery Corporation.

E. E. Aldous has been appointed representative of the American Steel & Wire Company, in the St. Paul, Minneapolis and Duluth territory, with headquarters at St. Paul, Minn. Mr. Aldous has been connected with the company for 20 years.

The Central Steel Company, the National Pressed Steel Company and the Massillon Rolling Mill Company, all of Massillon, Ohio, have been brought together in a merger just completed. The new corporation takes the name of the Central Steel Company and the following officers have been elected: R. E. Bebb, chairman of the board of directors and president; F. J. Griffiths, first vice-president; C. C. Chase, second vice-president; H. M. Naugle, third vice-president; C. E. Stuart, secretary and treasurer. The reorganized company has complete modern equipment and facilities for producing all kinds of commercial alloy steels, hot and cold rolled sheets, hot rolled strip steel and light structural steel sections.

Sidney G. Down has been appointed to the newly created office of general sales manager of the Westinghouse Air Brake Company, with headquarters at Wilmerding, Pa. He was formerly Pacific District Manager of the Westinghouse Air Brake interests and president of the Westinghouse Pacific Coast Brake Company. Mr. Down served as general air brake inspector and instructor on the Michigan Central until 1901, and then joined the Westinghouse Air Brake organization. He was for several years instructor on the company's instruction car and later was appointed mechanical expert with headquarters in Chicago. In 1910 he was appointed district engineer and transferred to San Francisco and shortly afterward he was appointed Pacific district manager. He was largely responsible for the organization of the Westinghouse Pacific Coast Brake Company in California, and when it was formed, became vice-president and later president of that company. Two years ago he made an extensive tour of the Far East and established various commercial activities which have resulted in an increased business for the Air Brake Company from the Orient.

S. G. Down

The firm of Stovel & Brinkerhoff, engineers and constructors, with offices at 136 Liberty street, New York City, was organized recently by R. W. Stovel and H. A. Brinkerhoff. Mr. Stovel was graduated as an electrical engineer from McGill University in 1897 and three years later was given the degree of master of science by the same university. From 1898 to 1903 he was with the Pittsburgh & Lake Erie, where he served on the design and construction of terminals and shops. He was then to 1914 with Westinghouse, Church, Kerr & Co., serving in various positions, including those of mechanical engineer and managing engineer, directing a large variety of work involving reports, designs and construction. From 1914 to 1917 he was with Gibbs & Hill in charge of

construction on the Pennsylvania electrification and also the Elkhorn grade of the Norfolk & Western. He was with the American Expeditionary Forces as lieutenant-colonel in charge of the mechanical and electrical equipment at ports used by the American army in France from 1917 to 1919, and in the latter year he re-entered the employ of Westinghouse, Church, Kerr & Co., as consulting engineer in mechanical and electrical work and since the merger of that firm with Dwight P. Robinson & Co., has been engaged on reports and power problems with the latter firm. Mr. Brinkerhoff served with the C. & C. Electrical Company as mechanical draftsman from 1893 to 1897, and then to 1920, was consecutively draftsman, chief draftsman, superintendent, general superintendent, engineer-in-charge and managing engineer, with Westinghouse, Church, Kerr & Co. He was general superintendent of construction in charge of the installation of all mechanical and electrical equipment in the Pennsylvania Station, New York, and also in charge of many other large engineering and construction projects including manufacturing plants and power plants for railroad and industrial use. Since 1920 he has served as industrial engineer in charge of the Industrial Engineering division with Dwight P. Robinson & Co., Inc.

### Pullman Company

The Pullman Company earned a net income of \$6,120,984 or 5.10 per cent on its capital stock in the fiscal year ending July 31, 1921, which compares with \$12,913,509 or 10.76 per cent in the previous 12 months. In order to maintain its dividend rate the company drew on surplus with the result there was a deficit in the fiscal year of \$3,478,836 as against a surplus of \$3,313,709 in the preceding year. The income account with comparison, follows:

	1921	1920
Federal Compensation.....	\$979,166	\$11,750,000
Earnings of cars.....	60,315,717	60,315,717
Manufacturing profit, etc.....	5,947,181	2,769,777
Total income.....	67,242,066	14,519,777
Operating expenses, taxes, etc.....	54,853,523	1,606,268
Depreciation on cars in general.....	6,267,558	6,267,558
Net income.....	6,120,984	12,913,509
Dividends.....	9,599,820	9,599,800
Deficit for year.....	3,478,836	*3,313,709

The balance sheet compares as follows:

	July 31, 1921	July 31, 1920
<b>ASSETS</b>		
Plants, etc.....	\$20,136,408	\$20,136,408
Cars and equipment.....	84,157,041	76,666,128
Repair shops.....	4,169,360	4,121,187
Pullman building, less depreciation.....	997,279	1,010,312
Other real estate.....	6,650	6,651
U. S. Government accounts.....	35,519,098	35,519,098
Operation supplies, linens, etc.....	10,673,342	7,979,678
Securities.....	8,373,190	8,330,528
Cash.....	20,086,452	25,596,362
Car leases.....	4,700,218	5,606,566
Bills and accounts receivable.....	9,849,221	10,019,629
Unexpired insurance.....	99,825	123,220

Total current assets.....	\$53,782,250	\$57,856,183
Total assets.....	\$163,248,989	\$195,311,967

	July 31, 1921	July 31, 1920
<b>LIABILITIES</b>		
Capital stock.....	\$120,000,000	\$120,000,000
Inc. and other res.....	2,433,296	2,370,969
U. S. Government.....	20,199,255	29,711,792
Profit and loss surplus.....	18,216,477	17,151,165
Accounts payable.....	2,399,960	2,399,950

Total liabilities.....	\$163,248,989	\$195,311,967

\*Surplus.

## Obituary

H. E. Billau, a field representative of the Sherwin-Williams Company for the past 35 years, died at Fremont, Ohio, on September 19, 1921.

Andrew G. Young, traffic manager of the American Sheet & Tin Plate Company, died at Cleveland, Ohio, on September 29. Prior to his appointment, 20 years ago, to the position which he held at the time of his death, Mr. Young was serving as general freight agent on the Lake Erie & Western.

## Railway Financial News

**AHUKINI TERMINAL & RAILWAY.—Asks Authority to Issue Stock.**—This company has applied to the Interstate Commerce Commission for authority to issue \$620,000 of capital stock, the proceeds to be used for the construction of a railway from Kapaa to Ahukini, Hawaiian Islands, 16 miles.

**CAMBRIA & INDIANA.—Asks Authority to Issue Stock.**—This company has applied to the Interstate Commerce Commission for authority to issue \$500,000 additional capital stock to represent an amount transferred from surplus to capital account, which it is proposed to distribute as a stock dividend.

**CENTRAL OF NEW JERSEY.—Sale of Stock of the Lehigh & Wilkes-Barre Coal Company.**—At a meeting of the board of directors on September 29, 1921, Robert W. de Forest, Daniel Willard and Edward T. Stotesbury were appointed a committee to receive and consider any proposals that may be presented to it by persons wishing to purchase 169,788 shares of the capital stock of the Lehigh & Wilkes-Barre Coal Company, which the railroad company is directed to sell under order of court in the so-called Reading trust suit, and to report to the board any such proposals previous to October 27, 1921.

The total issued capital stock of the Lehigh & Wilkes-Barre Coal Company is 184,200 shares.

**Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**DELAWARE, LACKAWANNA & WESTERN.—Declares Quarterly Dividend of 3 Per Cent.**—The directors on September 29 declared a quarterly dividend of 3 per cent, payable October 20, to stockholders of record October 8. This is the first dividend action taken by the company since the 100 per cent stock dividend distribution made last July, increasing the total stock outstanding to \$97,277,000. The par value of the stock is \$50 a share, so that the road has now been placed on a 12 per cent annual dividend basis. Under the old capitalization this would amount to 24 per cent, as compared with the 20 per cent which the road paid from 1910 to 1920, including extra dividends of 10 per cent each year.

**ETTRICK & NORTHERN.—Claim for Guaranty Denied.**—The Interstate Commerce Commission has denied the claim of this company for \$15,816 on account of the guaranty for the six months period following March 1, 1920, on the ground that the carrier's property was not operated prior to January 20, 1919, and therefore had no contract for compensation from the government. Under these circumstances, the commission finds there is under the law no basis for any guaranty to the carrier.

**FRANKLIN & PITTSYLVANIA.—Asks Authority to Abandon Line.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of its line from Rocky Mount to Pittsville, Va., 29.9 miles, which, the application states, cannot be operated except at a heavy loss.

**GREAT NORTHERN.—Asks Authority to Abandon Road.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the abandonment of its line from Portland to Portland Junction, N. Dak., 3½ miles.

**KNOXVILLE, SEVIERVILLE & EASTERN.—To Be Sold.**—This road will be sold at auction at Knoxville, Tenn., on November 10. Samuel E. Cleage was appointed receiver on January 27, 1921. The road operates between Knoxville and Sevierville, Tenn., 30 miles.

**NORFOLK & WESTERN.—New Director.**—F. S. Royster, of Norfolk, Va., has been elected a director to succeed Victor Morawetz, of New York, who has resigned.

**PHILADELPHIA & READING.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**UNION PACIFIC.—Asks Permission to Be Director of Three Roads.**—W. Averell Harriman is the first railroad director to

apply to the Interstate Commerce Commission in accordance with paragraph 12, Section 20-a, of the interstate commerce act for authority to hold the position of director or officer of more than one railroad. The law provides that after December 31, 1921, it shall be unlawful for any person to hold the position of officer or director of more than one railroad unless such holding shall have been authorized by order of the commission upon due showing, in form and manner prescribed by the commission, that neither public nor private interests will be adversely affected thereby. Mr. Harriman asked authority to hold the position of director of the Baltimore & Ohio, the Illinois Central and their subsidiaries, while being at the same time a director or officer of companies of the Union Pacific System. An application dated August 19 for authority for directors and officers in common among all or any carriers comprising the Union Pacific System has been heretofore filed.

### Railroad Administration Settlements

Announcement was made at the White House on October 4, following a conference between the President and Director General Davis, that up to October 1, an aggregate of \$856,033,589 in claims had been filed by carriers on final settlement with the United States Railroad Administration. The total mileage recognized as under federal control was 241,000 miles. Claims filed represent a total mileage of 189,394 miles, or 78.705 per cent of the total mileage under federal control. If the remaining percentage of mileage files claims on the same basis as those already filed, the total claims that will be filed against the Railroad Administration will aggregate \$1,087,633,476.

The amount of claims on final settlement adjusted up to October 1, aggregates \$387,017,099. The mileage for which claims have been settled is 90,944 miles, or 47.907 per cent of the mileage of all roads that have filed claims, and 37.705 per cent of the total mileage of all roads under federal control. The amount paid in settlement of these claims is \$117,715,840, or 30.416 per cent of the amount claimed.

This indicates that the Railroad Administration has up to this time settled nearly 50 per cent of the claims which have been filed. Substantially all of these settlements have been made since the first of January.

### Treasury Payments to Railroads

The Treasury Department has announced the following payments on account of loans under Section 10 of the Transportation Act: Aransas Harbor Terminal, \$50,000; Boston & Maine, \$3,049,000; Erie, \$1,733,750; and also payment on account of the six months guaranty to the New York Dock Railway of \$64,000. The Treasury has now paid a total of \$430,000,000 on account of the guaranty for the six months' period following the termination of federal control, and \$251,000,000 on account of loans from the \$300,000,000 revolving fund.

### Dividends Declared

Delaware, Lackawanna & Western.—3 per cent, quarterly, payable October 20 to holders of record October 8.

Lackawanna Railroad of New Jersey.—1 per cent, quarterly, payable October 1 to holders of record September 3.

Northern Railroad (N. H.).—1½ per cent, quarterly, payable October 1 to holders of record September 12.

Pittsburgh & West Virginia.—Preferred, 1½ per cent, quarterly, payable November 30 to holders of record November 11.

THE PHILADELPHIA & READING announces that, beginning with November 1, passengers paying fare on trains, when they have had suitable opportunity to buy a ticket, will be charged five cents more than the regular fare. This action is similar to that taken about six months ago by the Pennsylvania. The Reading circular says: "Conductors and trainmen, by long practice, can lift, examine and cancel a ticket, all in one operation, and a trainload of ticket passengers can be quickly covered. But when (particularly in the suburban district, where the train speed averages about three minutes between stations) the conductor is confronted with a cash paying passenger he must stop, ask destination, ascertain fare and war tax, punch cash fare receipt, collect fare, and usually make change (frequently in large bills) and finally tear off and hand receipt to passenger before proceeding, all of which represents an unwarranted consumption of time

## Railway Officers

### Financial, Legal and Accounting

**G. H. Parker**, formerly controller of the Railroad Administration, has been appointed commerce counsel for the American Short Line Association.

**C. M. Sheafe, Jr.** has been appointed general solicitor of the New York, New Haven & Hartford with headquarters at New Haven, Conn., succeeding **J. C. Sweeney**, resigned to enter private practice, effective October 1.

### Operating

**M. H. Gold** has been appointed trainmaster of the Florida division of the Seaboard Air Line with headquarters at Tampa, Fla., effective October 1.

**Walter Dennis**, whose appointment as superintendent of the New Jersey, Indiana & Illinois, with headquarters at South Bend, Ind., was announced in the *Railway Age* of October 1 (page 650), was born at Alliance, Ohio, in 1879.

He graduated from the State University of Kansas in 1900, and entered railroad service in the same year as an axeman in the maintenance of way department of the Kansas City Southern. During 1902 he was in the employ of Waddell & Hedrick, Kansas City, Mo., as a bridge draftsman, and in 1903 he was employed by the Kansas City, Mexico & Orient on location and construction work. In 1904 he was appointed chief delineator on double track and new construction work of the Union Pacific, which position he held until 1906, when he became associated with Horace G. Burt, consulting engineer on special reports in connection with grade reduction and economics. In 1907 he returned to the Kansas City Southern as office engineer. He left this road in 1912 to enter the engineering department of the Chicago, Rock Island & Pacific, where he served successively as construction engineer, special engineer and assistant engineer on special investigations. In 1917 he left the Rock Island to become principal assistant engineer of the Wabash, with headquarters at St. Louis. During the war he served as major in the construction division of the American army. He returned to the service of the Wabash in November, 1918, and was appointed division engineer of that road with headquarters at Moberly, Mo., which position he was holding at the time of his recent appointment.

**B. W. Wilson** has been appointed general agent in the passenger department of the Chicago, Burlington & Quincy, with headquarters at St. Paul, Minn., succeeding **C. I. Twyman**, who has been transferred, effective October 1.

**A. B. Raine**, assistant general manager of the Tennessee, Alabama & Georgia, has been granted leave of absence on account of illness, and **H. F. Bohr**, traffic manager, has been appointed assistant general manager in the interim, effective September 1.

### Traffic

**W. T. Lyman** has been appointed general agent of the Wabash with headquarters at Boston, Mass.

**P. M. Browning** has been appointed commercial agent of the Seaboard Air Line with headquarters at Cordele, Ga.

**E. F. Austin**, formerly division freight agent of the Pennsylvania, has been appointed a member of the auxiliary committee of the Central Freight Association, succeeding **W. C. Laughlin**, deceased.

**J. F. Dyas**, traveling passenger agent of the New York Central, with headquarters at Memphis, Tenn., has been promoted to general agent in the passenger traffic department with headquarters at Omaha, Neb. **C. A. Brawner**, traveling passenger agent with headquarters at St. Louis, Mo., has been promoted to general agent in the passenger traffic department, with headquarters at Dallas, Tex. **R. J. Ross**, traveling freight agent, with headquarters at Niagara Falls, New York, has been promoted to general agent in the freight traffic department, with headquarters at Omaha, Neb. **A. C. Huggins** has been appointed general agent in the freight traffic department with headquarters at New Orleans, La., and **M. A. Greeding** has been appointed general agent in the freight traffic department with headquarters at Dallas, Tex. These changes are effective October 1.

### Purchasing and Stores

**A. Singleton** has been appointed purchasing agent and general storekeeper of the Hocking Valley with headquarters at Columbus, Ohio, succeeding **J. R. Mueller**, purchasing agent, and **Leon Stiers**, general storekeeper, assigned to other duties.

### Obituary

**Lewis E. Foster**, claim accountant of the American Railway Express, with headquarters at Chicago, died in Chicago on September 16.

**J. D. Hawks**, formerly president and general manager of the Detroit & Mackinac, died on September 20 at Gloucester, Mass. Mr. Hawks was born at Buffalo, N. Y., on October 13, 1847. He was graduated from Buffalo High School and the University of Michigan and entered railway service in 1870 as an assistant engineer on the Lake Shore & Michigan Southern. In 1875 he went to the Erie division of the same road as assistant engineer and in 1878 to the Lake Shore division. In 1881 he became superintendent of construction of the New York, West Shore & Buffalo (now a part of the New York Central) and, in 1883, engineer of maintenance of way. In 1884 he was appointed chief engineer of the Michigan Central and left that position in 1892 to become general manager of the Detroit Citizens' Street Railway. The following year he was appointed manager of the Detroit Bay City & Alpena (now the Detroit & Mackinac). In 1895 he was elected vice-president and general manager of the Detroit & Mackinac and assumed the presidency of the same road in 1896. He served continuously in that position until his retirement in May, 1920.

**J. D. Brennan**, superintendent of the Sacramento division of the Southern Pacific, died at his home in Sacramento, Cal., on September 20, after a long illness. Mr. Brennan was born in 1864 and entered railroad service in 1881. He served in various positions on different roads until 1909 when he entered the employ of the Southern Pacific, where he was successively superintendent of the Stockton, Western and Sacramento divisions of that road.

Ryerson Standardized Flue Shop Layout for a large Railroad

## Two Flues Every Minute

On their way through the Ryerson Standardized Flue Shop, from the time they leave the Rattler till they reach the engine, the flues never touch the ground.

They are cut off—safe ended—swedged—cut to length—expanded in continuous operations at the rate of two flues every minute or faster.

Ryerson Standardized Flue Shops increase engine repair output by turning out flue work on schedule with the erecting work.

All installations have shown great savings—one railway has cut its labor costs in half.

*Bulletin No. 19,400 describes  
this cost reducing flue shop  
machinery in detail.*

The Labor Board conducted a hearing last week on a controversy between the big four train service brotherhoods and the Order of Railroad Telegraphers with the Buffalo, Rochester & Pittsburgh, which while apparently of little importance, will have far reaching effect on train operation if decided in favor of the brotherhoods. A strike has been threatened unless a rule is incorporated in the working conditions to the effect that the trainmen will not have to receive train orders by telephone direct from the dispatcher (without the intervention of a station operator). This will mean that one of the important advantages of the telephone for the operation of trains will be nullified and train dispatching in many places will again be dependent on the Morse code. Also, additional employees will be required at certain blind sidings and other locations to transmit instructions or the orders of the dispatcher to the train crews. In handling orders and getting instructions at such locations the train crew is not taking over work which belongs to operators any more than the operators are taking over work of the train crews when they line up switches for them in order to keep trains moving. This hearing raises a question in which the public is vitally interested for this rule, if placed in force, will make train operation more expensive as it will require additional employees for work which has been handled satisfactorily in the past, trains will be unable to get over the road as rapidly and poorer service will result, the cost of all of which will have to be passed on to the public. The present is no time to add to operating costs in any branch of the railroad service.

### Train Crews Handling Train Orders

The unsatisfactory performance of the coiled springs on car trucks, especially on 50-ton cars, has given trouble for some time. As a result, the Committee on Car Trucks of the Mechanical Division of the American Railway Association has recommended an alternate design of springs made of chrome molybdenum steel instead of high carbon steel. The committee contemplates the substitution of these springs for the present standard if the anticipated advantages of the new material are borne out in practice. The individual railroads have been slow in adopting alloy steel, one of the principal objections raised being the difficulty of properly treating the material. The committee's action in advocating the introduction of alloy steel in general interchange service is therefore significant. It seems to indicate that the committee does not consider the handling of this material as a serious obstacle. Furthermore, the simple heat treatment recommended in the specification shows that it would not be difficult for the roads to treat these springs in their own shops. It is interesting to see engineers again turn to alloy steel as the solution of a difficult problem. A few years ago several roads tried various alloys in an attempt to overcome the unsatisfactory counterbalancing condition caused by heavy reciprocating and revolving parts of locomotives. The adaptation of the material to this use was found difficult. Some of the roads could not secure the steel promptly during the war and the experiment was given up. The problem is still waiting for a solution.

### Alloy Steel for Cars and Locomotives

tion. It will be solved when the roads attack it with energy and courage and with a determination not to be turned aside by the discouragements that are inevitable in the development of new methods.

The economic plight in which this country would find itself if each state became a separate nation can be only vaguely imagined. If, however, we could picture such a situation and should add to it an intense nationalistic feeling on the part of each of the new nations, we should have with us just such a situation as prevails in Central Europe today. The old Austro-Hungarian empire has been dismembered into several independent states, all intensely jealous of each other. If a traveler wants to go from one country to another, he must have a passport and submit to a customs examination. Similarly, freight has to be examined by the customs authorities and because of the impediments to free passage, some important railway lines have been abandoned altogether for through traffic. If such conditions should prevail in this country it would naturally follow that little business would be done because the greater part of our commerce is interstate. America would quit producing and the whole world would suffer. Such an inexcusable barrier to the free movement of freight and passengers, together with a railway system sorely in need of physical rehabilitation, is the key to the chaotic conditions in Central Europe. Central Europe, moreover, is the chief cause of economic troubles in Europe generally and, indeed, in the entire world. Colonel W. B. Causey, American Technical Adviser to Austria, in an article appearing elsewhere in this issue, gives a first-hand analysis of transportation problems in Central Europe. His observations will be of interest to those who realize the importance to this country of world-wide economic revival as well as to those who are seeking conclusive proof of the value to a nation of an efficient system of railways.

### Transportation and Central Europe

"In output and grade of work employees receive from labor almost exactly what they are willing to take." This remark recently was made by a railroad officer in discussing the importance of intelligent supervision in all branches of railway work. In the old days of railroading the ability to drive men often was one of the chief requisites to be desired in men employed in a supervisory capacity. The day of the driver, however, is past and under present conditions the successful supervisor is the one who finds means, other than by word of mouth, of influencing his men towards increased activities. This can only be done when the men are thoroughly convinced that the boss is doing all in his power to make it easy for them to get the desired results. Comparatively inexpensive opportunities for the higher officers to co-operate, such as providing improved working conditions or a more convenient rearrangement of materials or tools and so on, often present themselves. The desire of labor to be relieved of useless drudgery suggests the important relation labor saving devices bear to the entire question of super-

### Mechanical Devices and Supervision

vision, whether the problem under consideration concerns the mechanical department, the engineering department or the handling of package goods at freight stations or transfers. Under the present state of development of material handling devices, machines for carrying on almost all classes of laborious railway work are available and their possibilities in securing higher efficiency from the labor are worthy of careful consideration.

## Equipment Repairs in Contract Shops

WHAT constitutes the actual cost of operations performed in railroad shops is a question which has seldom been given the attention it deserves. In most cases, after obtaining the direct labor and material charges, a percentage is added to cover shop expense and the result is considered to be the complete cost of the operation. In the series of articles by J. W. Roberts, comparing the cost of repairing 50 box cars in a railroad shop with the cost to the railroad of 50 cars of the same series repaired in a contract shop, concluded in this issue, a painstaking effort has been made to include every item of operating expense which logically should be charged against the work done in the railroad shop. While a lack of adequate information in the railroad accounts has compelled the selection of bases of apportionment of some of the items of overhead expense and affixed charges which may be open to question, there can be no doubt of the logic of including some part of each of these items.

When questions as to such items arise the familiar answer is that these expenses would be incurred whether the particular operation in question were to be performed or not. No doubt in many specific instances this argument is correct, but if used often enough such operations will accumulate in sufficient volume so that in the aggregate there can be no question but that they are responsible for a portion of every item of expense which a strict analysis such as that made by the author of these articles would charge against them. This applies particularly to the various manufacturing operations carried on more or less extensively in all railroad shops.

But there is a broader phase of this matter in its bearing on the primary operations of equipment maintenance. The volume of maintenance is subject to more or less fluctuation, the railroads never having succeeded in accumulating sufficient reserves to discontinue a hand-to-mouth policy largely dependent on the volume of revenues. The periods during which shop facilities are crowded beyond the limit of efficient operation are followed in cycles by periods during which considerable portions of these facilities are idle. The past year has presented a most marked example of this condition. A year ago not only were railway shops working to capacity, but a large volume of equipment repairs was being cared for in contract shops. Since the decline in traffic last fall all maintenance work has been subjected to a most drastic curtailment and railroad shops have been operating far below normal capacity.

If such cycles are to continue, and there is little reason to doubt that they will, it becomes a serious question whether, as a matter of general policy, the railroads can afford to provide the capital and the organization necessary effectively to care for these congested periods, whether they should provide for average conditions or whether they should provide only for a volume of maintenance which may reasonably be expected to continue during periods of depression. The correct formulation of policy in this matter must rest on a complete and accurate determination of the elements of railway shop costs. This, of course, applies only to heavy repairs, since light and running repairs are probably too closely related to the actual operation of the railroad to permit

them to be separated readily from the control of its own organization.

Admitting the correctness in detail of each item of operating expense charged against the railroad shop repairs by Mr. Roberts it would be unsafe to draw general conclusions on the basis of the results obtained in this specific case, and the author has made no such attempt. It is worthy of note, however, that in this case the assignment of equipment repairs to the contract shops did not result in idleness of the facilities provided by the railroad to do the same work. Had such idleness resulted, thus making a portion of the railroad's fixed charges a legitimate item in the determination of the complete cost of the contract work, the margin of saving favorable to the contract shop would be narrowed. It would then become a serious question whether the investment of capital in contract shops should be encouraged to an extent which could only be justified on the assumption that the railroads were materially to curtail operations in their existing shop facilities.

When the question becomes one of expanding existing shop facilities, however, the possibilities are much more favorable for the contract shop. It is true that a change from the present unsatisfactory and inefficient labor conditions with which the railroads are confronted might materially decrease the attractiveness of contract repairs. But one of the most effective ways to control this condition is to prevent the establishment of a railway labor monopoly in the maintenance of equipment field. This consideration alone is sufficient to justify careful consideration of whether contract shops should not be used more in future than they have been in the past.

## Net Return of the Railways Smallest in Twenty Years

THE PRESENT FREIGHT and passenger rates of the railways had been in effect twelve months at the end of August, 1921. A perfect hurricane of agitation for their reduction is raging. Many people seem to believe that on these rates the railways have earned a large net return, while others believe that they are guaranteed 6 per cent by the government.

How astoundingly different from these widespread popular impressions are the cruel facts. The facts are that the total net operating income earned by the railways in the first twelve months the present rates were in effect was smaller than they had earned in any fiscal year for twenty years, except when, as a result of government control, their returns were guaranteed. We have to go back to 1902 to find a full fiscal year when they were operating without guarantees; when their operating income was as little as \$555,666,000. Their gross earnings in that year were only \$1,726,400,000, so that they were able to keep for themselves almost one-third of what they earned. In the twelve months ended with August, 1921, the total net operating income of the Class I roads was only \$530,000,000. This figure is not strictly comparable with that already given for 1902, but it is nearly enough comparable to show that the net operating income in the first twelve months the present rates were in effect was, as already stated, the least in any year for twenty years, except when the net returns were guaranteed. The gross earnings in these twelve months were over \$6,000,000,000. In other words, while twenty years ago almost one-third of the gross earnings of the railways were net returns which they could keep, since the present rates have been in effect only one-twelfth of what the public has paid them has been net return which they could keep.

But this is not the worst of the story. Twenty years ago the investment in their properties was only a little more than half what it is now, and the net return earned then amounted

to over 5 per cent on their property investment. On the valuation of the Class I roads made by the Interstate Commerce Commission, which is somewhat less than their property investment as shown by their books, the net operating income of the Class I roads in the twelve months ending with August yielded a return of only 2.9 per cent. In its annual report for 1916 the Commission gave figures showing the percentages of return earned in every year beginning with 1892. The smallest percentage of return then shown by its figures was for 1894, the year after the great panic of 1893, and was 3.2 per cent. Therefore the percentage of return earned in the first twelve months the present rates were in effect was the smallest ever shown in any year for which statistics are available, except, as stated, when the net returns were guaranteed.

As a result of the recent relatively small reduction of wages, and of the most drastic economies ever made by the managements of the railways, the net operating income recently has been increasing. It was \$70,000,000 in July, which was at the annual rate of about 4.50 per cent on the valuation. It was over \$90,000,000 in August, which was at the annual rate of about 5 per cent on the valuation. It was assumed, however, when the present rates were fixed that on them the railways would earn an annual net return of 6 per cent, which, for the Class I roads, would have been \$1,101,998,000 in a year. The net return actually earned in twelve months under the present rates was \$571,911,000 less than the amount required to yield a 6 per cent return.

The railways are just convalescing from the most serious financial illness from which they have ever suffered. It would require not only months, but even years, of substantial net earnings to enable them to recover from the effects of what they have recently gone through. On the whole, the present rates are too high. Clearly, however, no steps should be taken toward reducing them which are not accompanied by measures to reduce present railway labor and other costs. The railways have no right to ask for any better treatment than other industries, but as one of the basic industries of the country they should be treated as well as other industries, not only in fairness to themselves, but also in the interest of the public welfare.

## Railroad Consolidations

FOR THIRTY YEARS the people and government of the United States sought to prevent any consolidation or agreement by railways which would interfere with unrestricted competition in construction, service or rate-making. A remarkable change in sentiment occurred about the time government operation was adopted which resulted in the consolidation provisions of the Transportation Act. This act directed the Interstate Commerce Commission to formulate a plan for the consolidation of all the railways into a limited number of systems. The Commission delegated to Professor William Z. Ripley of Harvard University the task of formulating the first plan, and his report to the Commission which recently was made public shows that he did his work with remarkable thoroughness, intelligence and skill. He recommended the creation of 21 systems. The Commission, in making its tentative plan, adopted that of Professor Ripley in the main, but so changed the combinations as to reduce the number of proposed systems to 19.

All discussions of the plans made by Professor Ripley and the Interstate Commerce Commission should be predicated on recognition of the fact that they worked under certain definite directions given by the Transportation Act. The act requires that "competition shall be preserved as fully as possible, and wherever practicable the existing routes and channels of trade and commerce shall be maintained." "The several systems," says the law, "shall be so arranged that

the cost of transportation as between competitive systems and as related to the value of the properties through which the service is rendered shall be the same as far as practicable so that these systems can employ uniform rates in the movement of competitive traffic, and under efficient management earn substantially the same rate of return upon the value of their respective railway properties."

Probably the most important difference between Professor Ripley's plan and that tentatively adopted by the Commission is that under the former the principal distinctively New England railways would be consolidated into a single system, while under the Commission's plan they might be consolidated into a single system or different ones of them be united with railways in Trunk Line territory. One of the Commission's suggestions is that the Boston & Maine, Maine Central and Bangor & Aroostook might go with the New York Central, while the New York, New Haven & Hartford might go with the Baltimore & Ohio. Professor Ripley suggested that the Florida East Coast Railway should be left independent, while the Commission favors putting it into the Atlantic Coast Line-Louisville & Nashville system.

Either plan apparently would carry out the provisions of the act as well as any that could be made. Before, however, any scheme of consolidation can finally be adopted by the Commission public hearings must be held, and these hearings are pretty sure to disclose a wide diversity of opinion among public men, business men, farmers and railway officers regarding the desirability of such wholesale consolidations as are contemplated and regarding each of the particular consolidations that have been suggested. It should be clearly understood that so long as the railways are privately owned, whether all or any of the consolidations proposed shall be made will depend on the voluntary decision and action of the railways themselves. The government could buy the railways, and having bought them put them together in any way it pleased, but it has no constitutional power to compel two or more privately-owned railways to unite if they do not want to. While it cannot compel any two railways to consolidate, it can, of course, prohibit any combination it may regard as contrary to the public interest.

There is one provision of the Transportation Act that is likely to prove a far more serious obstacle to effecting its purposes than its authors anticipated. This is the provision which, in substance, requires any two or more railways which may desire to consolidate but whose outstanding securities exceed their valuations to reduce their capitalizations so that they will not exceed their valuations. It has been found in the past comparatively easy for railways to consolidate by buying one another's stock, or by having a holding company buy their stock, because this did not necessitate retiring securities actually outstanding. On the other hand, it always has been found practically impossible to retire large amounts of securities except through receivership.

There can be no doubt that many consolidations, including many or most of those proposed by Professor Ripley and the Commission, would be beneficial to the railways and to the public. Many consolidations made in the past would still be in existence and many more would have been effected if the government under the anti-trust law had not broken up or prevented them. The consolidations now proposed would preserve a large amount of competition and enable it to be carried on in most parts of the country on much more equal terms; and they would thus simplify the problems of rate regulation arising from the existence in every territory of some so-called "strong" lines and some so-called "weak" lines.

It is doubtless pardonable to be somewhat skeptical as to the extent to which the consolidation program actually proposed will be carried out. It should, however, receive open-minded, fair and thorough consideration and discussion. There is no question that the prolonged efforts of the government to prevent reasonable consolidations or even agreements

did more harm than good. The policy enunciated by the Transportation Act is incomparably more sane and sound than that enunciated by and followed under the Sherman anti-trust law. The *Railway Age* believes and always has believed, that legislation should simply authorize the railroads to effect voluntarily such consolidations or make such agreements as the Interstate Commerce Commission might hold would not be prejudicial to the public interest. The Transportation Act goes farther than this, but possibly when an actual trial of them is made its provisions may be found more workable than some of them now appear to be.

## Are American Locomotives Harder on Bridges?

OCCASIONALLY technical problems that primarily concern the engineer become of vital importance to the businessman. This is the case with the questions raised by Dr. P. H. Chen in a paper before the Association of Chinese and American Engineers at Peking, China. The seeming inconsistency between American and European bridge designing practice, to which he draws attention, would seem, at first thought, to be of interest only to the bridge designer, but, as pointed out by Dr. J. A. L. Waddell in a letter to the editor, the inquiry implies an indictment of the American locomotive. Dr. Chen shows that American bridge designers use lower unit stresses, make greater provision for the effect of impact and also brace their bridges against lateral motion or vibration to a much fuller extent than do the designers of European bridges. The inference is that the American locomotives impose a much greater burden on bridges (for the same weight) than do European engines. American bridge designers are thoroughly conversant with the merits of this controversy, but Dr. Chen's paper, with the comments of an American bridge engineer now in China which appears elsewhere in this issue, presents the subject in a new light.

American railroad bridges carry much heavier loads than do those of Europe and in consequence, our bridges appear heavier even to the layman, but Dr. Chen states specifically that the inconsistency to which he refers arises in a comparison of structures intended to carry the same loads. This difference may be explained in part by a conservatism on the part of American bridge engineers born of their experience with earlier structures designed without sufficient regard for future increases in loading and which, in consequence, became obsolete long before they had suffered any appreciable depreciation. Therefore, American bridges now designed for E50 or E60 loading are expected to be safe for loads at least 25 per cent heavier.

Experience with obsolescent structures is also largely responsible for the heavy details referred to by Dr. Chen. Every engineer who has ever investigated any number of old bridges knows that weak details rather than inadequate main sections have been primarily responsible for the inadequacy of the old structures. Moreover, the vibration that commonly attends the passing of the train across an overloaded bridge has had no little influence in creating a demand for heavier sway and lateral bracing. The commercial factor must also be considered. American railroad bridges are contracted for on a pound price basis on general drawings prepared by the purchaser and are fabricated according to detail plans made by the bridge company, an arrangement which obviously tends toward heavy rather than light detailing.

The most important point made by Dr. Chen concerns the allowance for impact, but as brought out in the discussion of his paper, there is no opportunity for an accurate comparison owing to the fact that there is no extended equivalent in Europe of the elaborate impact tests made upon American railway bridges carrying American rolling stock. One exception to this is a series of tests carried out on English

bridges to which reference was made recently in these columns. These tests, while not sufficiently comprehensive to be conclusive, give every indication that the impact effects of English locomotives are fully as high as those encountered in American practice and English bridge engineers are now considering the adoption of an impact factor fully as large as that now employed in this country.

There is no denying that the dynamic augment has a marked effect and that there may be pronounced differences in the extent to which this has been ameliorated in different designs of locomotives. American engineers are keenly alive to this and are endeavoring to decrease the effect of the over-balance to the greatest possible extent. It should be clear, however, to anyone who is familiar with bridge designing practice that the difference in the riding qualities of European and American locomotives is not to be measured by the difference between American and European bridge designing practice.

## Speed and Fuel Consumption

IN CONSIDERING the freight locomotive as a machine for the production of ton-miles its internal characteristics are of less interest than the character relationship between the fuel placed in the firebox and the ton-miles produced by the work done at the drawbar. Much of the data concerning locomotive performance developed by engineering tests do not convey a clear impression of these over-all characteristics, since the purpose of such tests is largely to determine correct proportions and relationships within the locomotive itself. Hence, such data as that developed by the fuel conservation committee of the Southern Pacific, referred to on the floor of the recent meeting of the Traveling Engineers' Association, are of special interest and value.

The test was made with a 2-10-2 type oil-burning locomotive with a 1,000-ton train. The fuel consumption for 1,000 gross ton-miles was measured at speeds varying by increments of five miles an hour from five miles an hour to 50 miles an hour, other conditions remaining constant. The unit fuel consumption varied from .3 gallons at the lower speed to 28 gallons at the higher speed, and throughout the range the rate of fuel consumption varied remarkably closely as the square of the speed. Such an increase was to be expected through the higher ranges of speed but it is especially worthy of note that in this test the same law held for the lower speeds.

This rate of increase in unit fuel consumption is the result of several factors, such as the increase in train resistance with the increase in speed and the internal characteristics of the locomotive itself, both thermal and mechanical. While the law of variation apparently established in these tests may not hold strictly for all locomotives or for trains of all weights, the results illustrate in a striking manner that fuel consumption is likely to increase much more rapidly than the speed is increased. Since with present average freight train speeds the cost of fuel under average conditions is approximately equal to the wages of engine and train crews, the prospect of economy from increasing the running speeds of freight trains does not look promising.

There is a real opportunity, however, for fuel economy as well as for decreasing the unit cost of crew wages, by the elimination of delays at terminals and on the road. Data obtained in these same tests indicate that for every hour of delay there is a fuel stand-by consumption to keep the locomotive hot and maintain brake pipe pressure on the train great enough to produce 10,000 gross ton-miles at 20 miles an hour under the conditions obtaining in the previously mentioned speed tests. It must be remembered that the same relationship would not hold where the fuel is coal, but even though the stand-by losses in the case of coal might be less the fact remains that whatever their extent they are complete losses so far as the production of ton-miles is concerned.

## Letters to the Editor

[*"The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated."*]

### Eliminating the "31" Train Order

DAVID L.

TO THE EDITOR:

I have read with much interest in the *Railway Age* of September 10 the letter to the editor on signatures to train orders with reference to extending the use of the 19 train order; also your editorial. I have been advocating the abolishment of the 31 train order for a good many years, for I believe it has passed into antiquity.

The Missouri, Kansas & Texas is now making a study of the subject and we hope within the near future to formulate a plan whereby we can, with safety, eliminate entirely the use of the 31 train order. I see no reason why train operation cannot be safely conducted through the use of the middle order and the clearance card, and I feel positive, insofar as our road is concerned, that we shall have something tangible and effective to put forward in the near future.

W. M. WHITENTON,  
Assistant Chief Operating Officer

### A Good Stepping Stone

VERNON S. D.

TO THE EDITOR:

I have read with interest the letter from "One of Them," entitled "The Official Goats," which alludes to the position of secretary to a railroad official, and which appeared in your issue of September 24.

After almost five years' experience as a secretary, and during a period which has been trying for all railroad officials, I must say that my experience has been both pleasant and profitable. I may have been blessed with exceptionally pleasant bosses, but I have come in contact with a great many railroad officials and their secretaries during that period and have found that the majority are congenial and considerate.

Men, to be really big and to successfully operate their properties, must command the confidence and respect of the great numbers of employees who come under their jurisdiction and in this advanced age it cannot be done by "raw-hiding." In this majority, whose respect and confidence an official must command, is included his secretary, in whom he must confide, and who is closer to him than any other employee, not excluding his chief clerk.

To my mind there is no better avenue of progress in the transportation department of any railroad than through a division and general office, and through this avenue a secretary has a decided advantage because of the officials with whom he comes in contact and to whom he becomes known. This does not imply that a man must have pull, but it must be admitted that to be known is an advantage.

It is generally considered that office men have a very limited opportunity for advancement in railroad business, but that is a fault of the office men in that the majority of them prefer to remain in a swivel chair instead of eventually getting out on the road and taking the hard knocks which are part of the road experience and which help to make them hard-skinned.

Read the biography of almost any railroad official who has

come up through the ranks without office experience and it will be found that most of them were just a little above the men with whom they were associated with the result that they stood out. It is equally necessary for an office man to push himself ahead and stand out to secure recognition.

We all sympathize with "One of Them" for being the "goat," but the fact that he was a secretary for nine years indicates that perhaps he has not taken advantage of his opportunity, and it is only natural that he should be sore at officials in general.

WILLIAM WHITE

### Are American Locomotives

### "Rough Riders"?

PEKING, CHINA

TO THE EDITOR:

The Journal of the Association of Chinese and American Engineers for May, 1921, contains a paper comparing American and European bridge standards\* and a report of the discussion which followed. The matter at issue is an important one for the United States, because a claim is being made here by Chinese engineers to the effect that the impact from American locomotives is far greater than that from European ones. If this notion is not driven out of their heads, they will continue to buy Belgian and French locomotives. They have been buying both European and American ones of late years, and I should hate to see the business get away from the United States.

The question is one for our locomotive manufacturers and engineers to solve. I cannot deny the claim of a large difference in impact from the two different types, because I have never experimented with European locomotives, but I state that I am of opinion that the difference—if any—is small.

I have lately had occasion to reply to a claim made in writing by an Austrian engineer to the Railway department concerning the greater expense of American bridges as compared with European ones on account of this matter of impact. They seem to doubt the correctness of our impact experiments.

Consulting Engineer

### The Railroads and the College Man

CHICAGO, ILL.

TO THE EDITOR:

As a college bred man and a railroad employee, I have read with much interest the current discussion in your columns with reference to the employment of college men by the transportation and operating departments of our railroads. The problem of employment is today a complicated one, and requires more serious consideration and more mature study than ever before. The herculean effort which is being put forth by the railroad managements to develop an organization which will effect the highest degree of economy in the manufacture of transportation, and which will render the equivalent service to the public, must be supported by the very best human intelligence to be had.

I do not believe that it is a question as to whether the railroads want college men. Rather it is whether the college man wants to work for the railroads, and whether the railroads need the college man. The average college man does not want to work for the railroads, for two reasons. First, because employment in the ranks of railroad workers is not presented attractively or thoroughly to the college student and graduate. Second, the remuneration for the railroad beginner is not sufficient to attract him, especially in the face of his lack of knowledge of the handsome rewards ahead for the man who works hard and diligently.

The engineering, mechanical, electrical and valuation de-

\* Abstracted elsewhere in this issue under the title "Why Are American Bridges Heavier Than European?"

partments of our railroads require college graduates and want them, and offer reasonably good wages for the initiate. It is a question whether the college or university can provide a course on transportation and operation which will be complete enough to develop a man to such an extent as to warrant the railroads employing him for service which will command a substantial remuneration and place him alongside of the man of years of practical experience in transportation and operation. If they can, so much the better. But from my personal experience the actual daily association with the many problems practical is necessary to effect the required grounding. However, merely to instruct the college student in the fundamentals would be an invaluable aid, and serve to direct him towards the railroad field.

To influence the railroads to offer financial inducements to the college man is an up-hill grind, especially in the face of the present mandatory methods of establishing the daily wage set by the Labor Board. This cannot be overcome at present, and we must leave that issue to time and education.

Does a college man want to work for a railroad? Suppose he does. Is he willing to put in the hardest kind of mental study and physical application to the duties demanded of him? Is he willing to plod along day after day, apparently unnoticed, disregarding the advancement of men he may believe to be less worthy than he, ever keeping his eyes on the goal ahead? Is he determined to hang on? If he is all this and has natural ability he will be rewarded.

I know of no field that offers a wider scope or a more fascinating study than the railroad field, and I see no reason why any young man who leans towards railroading should not follow the path. We cannot all be rich in material effects, but we all have it in us to earn a moderate success and attain a position of trust and confidence.

Do the railroads need college bred men? I believe they do, and furthermore I believe the railroads want them. By virtue of his four years' application to concentrated study, the college man has sharpened his intellect, and is more capable of getting down to bed rock, of seeing a situation quicker. His ability to study prepares him to assimilate facts easier, and apply what he learns. The potential ability to analyze and grasp a situation, the ability to think accurately, and the ability to stick to facts and to follow instructions, all these attributes are ingrained in the college bred man, and are necessary factors in producing a constructive, well-rounded and responsible executive. It is intelligence any business house or railroad wants, and I believe the college man offers a quality of intelligence which the railroads can well afford to take advantage of.

Some constructive means must be established by the railroad and the college to induce the college man to look favorably on the railroad field. When once employed the railroad must give him the opportunity and the necessary encouragement so that he will enjoy his work and stick to it.

JOHN DEWAR,

Assistant Car Accountant, C. M. & St. P. Ry.

## Questions About Unsigned Train Orders

PORTLAND, Oregon.

TO THE EDITOR:

I have read, with interest, your editorial of September 10, on "Why Require Signatures to Train Orders?" The unrestricted use of the 19 form of train order means that the train dispatcher may issue all his orders, both restrictive and those that confer right, on the 19 form and issue as many as may be necessary for a train to receive at one point, and then dismiss them from his mind. If one of the orders is lost in making delivery, or the operator misplaces or overlooks one or more of them, the dispatcher may be immune from responsibility. That fact, no doubt, enters to quite an extent into the desire on the part of the average train dis-

patcher to use the form without restriction. This should be taken into account by each management when its train dispatchers so strongly advocate the practice.

When a dispatcher sends a number of orders to a certain train at one point, using Form 31, and the operator fails to transmit the signatures to all of them, then it is clearly his duty to require the operator to obtain and transmit the signatures to those that have been overlooked before he completes any of them. This is the one great protective feature of the 31. Form 31 cannot with reason be entirely abandoned; but we can increase the use of the 19 form to probably 95 per cent of all orders issued.

With clearance cards indicating the number of train orders and checked by the dispatcher, and the rules and practice properly stiffened up, we may provide for a large percentage of cases; but before changing any rules let us carefully enumerate the typical situations in which signatures must be required. Consider Rule 217. For an order sent through third parties to a conductor at a non-telegraph station, the dispatcher must get signatures. Why? Because the dispatcher must know that the order has been received by the superior train.

Take Rule 219, covering the case where the engine has passed a train order signal. Unless you require the signature, the train may pull out while the operator is trying to deliver the order. This has happened a good many times.

If you have a work extra between B and D, and you desire that it shall protect against an extra after a specified time, what assurance has the dispatcher that the work extra has received its order which places it under flag, if he does not obtain the signatures? If the dispatcher desires to annul the right of a work extra before its time limit expires, how may he positively know the annulling order is in the hands of the work extra without obtaining signatures?

Should the dispatcher desire to reduce a time order, how may he know all who are using the time have received the annulment of it before permitting the train to run a less amount late if he does not obtain signatures?

If a dispatcher desires to give an extra right over all trains, A to Z, the order must be placed ahead of all trains on the section of road so restricted and the signatures obtained before the extra can be authorized to run. Why? Because he must know that each restricted train has reached the point where the order has been placed for it and has actually received it. Otherwise, it is a lap order and the extra so created and given right beyond the point where the order is placed could collide with the train against which it holds right, if such restricted train had not the order in its possession.

Other conditions arise occasionally where the dispatcher must know positively that the restricting order is in the possession of the restricted train before he can authorize the use of the order by the train upon which it confers right.

The 19 form should never be used to restrict a train at a meeting point, for the reason that the operator may become confused, especially where he has many duties to perform, and hand the restricting order to the engineman without stopping him. When an operator standing in front of his office holds up a 19 order to an engineer, nearly all engineers assume that the order does not affect them at that station; and so, in many cases, they run at such a high rate of speed that it would be impossible for them to stop before they side-wiped an opposing train, entering the siding beyond the office.

The middle order and block signals should not be considered in this problem. If considered, then we admit our system is faulty and that we are distrustful of it:

Mr. General Manager, when your over-zealous train dispatchers come to you with a proposition to use the 19 Form without restriction, ask them what they would do under the conditions as herein outlined. I will guarantee that they will immediately begin to hedge or attempt to cloud the issue.

WM. NICHOLS.

# Railway Revival Central Europe's Greatest Need

## Railway Chaos and Endless Custom-House Formalities an Effectual Barrier to Any Progress

By Colonel W. B. Causey  
Technical Adviser to Austria

**W**HEN THE UNSETTLED economic conditions prevailing in Central Europe, which are the subject of the deliberations of various councils and high-councils, commissions and high commissions, are brought to a final analysis they resolve themselves into one problem—transportation.

The nations of Central Europe will never become self-sup-

give consideration to every other phase of human life from ethnology to military contingencies.

Some slight conception of the unnatural barriers which are placed in the way of transportation under the present absence of co-ordination may be gleaned from the following. Before the war a traveler could take a train at Trieste (see map) and go through Vienna, Cracow, Lemberg and to the eastern extremity of Galicia without a passport or other custom-house formalities. Now in making the same journey the passenger must submit to passport and customs examinations at five international boundaries, viz., Italy-Yugoslavia, Yugoslavia-Austria, Austria, Czechoslovakia, Czechoslovakia-Poland, Poland-Roumania—in a total distance of only 968 miles—or practically the same as that from New York to Chicago.

The inconvenience and discomfort to passengers, aggravated as it is, is a mere incident compared with the hindrance which such customs formalities place in the way of the free movement of freight. It is now three years since the dissolution of the old Austro-Hungarian monarchy and commercial treaties between the new states are still in the making. Travel between the countries is almost as difficult as ever and many railroad lines, some of which before the war carried a heavy traffic, have not even been re-opened to international commerce. The result of this separation of states can only be appreciated by a study of the map. The Austrian State Railways are, of course, less extensive than before the war. Furthermore, some of the succession states, notable Czechoslovakia, have their rail lines radiating from Vienna, a foreign city. In order for Czechoslovakia to have adequate transportation service, free movement of freight and passengers over the Austrian border line is essential. It is as if, in America, all of the principal east and west rail routes passed through the province of Ontario, Canada. Under such conditions artificial and unnecessarily stringent customs regu-

**Hollenburger Bridge, Karawanken Railway**

porting unless reasonable international trade relations and reasonable co-ordination of lines of transportation are re-established and apparently without some strong hand this co-ordination will not take place. When the treaty makers dismembered the old Austro-Hungarian empire they took no account of existing railway systems, although they undertook to

lations would greatly impede commerce even between two points in the United States.

Before the war, with the exception of the Southern Railway, 1,385 miles in length (333 miles of which were in Hungary); the Bustiehrader Railway, 262 miles; the Aussig-Tepelitz Railway, 157 miles; and some other private railways of lesser importance, the railways of Austria were owned and operated by the government and constituted the Austrian State Railways. Similarly the principal railways of Hungary were owned and operated by the government as the Hungarian State Railways. The Austrian State Railways and the Hungarian State Railways were as entirely independent of each other as any two systems in the United States, but these two systems had interchange agreements with each other and with the other railways of Central Europe very similar to such agreements between the railways of the United States.

It will be remembered that the Austro-Hungarian empire before the war included, besides Austria and Hungary, what are now Yugoslavia and Czechoslovakia and portions of Italy and Poland. The former through route from the English channel to Constantinople followed the valley of the Rhine, crossed Germany to the Austrian border, followed the valley of the Danube to Vienna, Budapest and Belgrade, and led thence to Sofia and Constantinople. From Budapest there was another main line of travel to Bucharest and the Black Sea. Vienna and Budapest are connected by a double-track line north of the Danube and a single-track line south of the Danube. The double-track road was formerly the main line of travel. It runs through what is now Czechoslovakia and because of the friction between the Czechs and the Hungarians there has been no through traffic on this double-track line since the revolution in November, 1918. Therefore, all of the traffic from Vienna to Budapest and other parts of Hungary has since the revolution been moved over the direct single-track line on the south side of the river and over a roundabout line of the Southern Railway.

The Southern Railway is double-tracked between Trieste and Vienna and on account of this, as well as of its more favorable grades, it is the principal line of travel from Vienna

to the Adriatic and to the East. From Pragerhof, about halfway between Trieste and Vienna, a single-track line runs to Budapest, thus placing Budapest in direct connection with Trieste. This single-track line runs through a flat country

Doessenbach Bridge, Tauern Railway

and was built for heavy traffic, but for nearly two years there has been no movement on this line across the Yugoslav-Hungarian border at the Mur river—with the exception of three trains of American foodstuffs which were forced through by

Principal Railways of the Former Austro-Hungarian Empire

the Allied Railway Mission in the fall of 1919. In spite of all the pressure brought to bear on the Yugoslavs they have steadily refused to open this line to traffic, alleging political and military objections. This attitude of the Yugoslavs forced the movement of 50,000 tons of American flour to Budapest in the summer of 1920 over the long and mountainous route via Graz, Fehring and Steinamanger.

Recently a partial resumption of through schedules from Budapest to Belgrade has been secured. Passenger trains from Paris to Constantinople are now running through the Simplon tunnel, Milan, Venice, Trieste, Laibach, Steinbruck and Zagreb, thence to Belgrade, Sofia and Constantinople—instead of Paris, Vienna, Budapest, Belgrade, which is the direct line and which, as before stated, was the pre-war route.

As a result of the new frontiers the Southern Railway, although a private corporation, instead of being operated under one administration, is cut up into practically four systems: Italian, Yugoslav, Austrian and Hungarian. However, the Austrian and Hungarian lines work very closely together and the Hungarian lines recognize the authority of the central administration of the Southern Railway Company in Vienna. To a certain extent the Yugoslavs also recognize this central administration. The Italians do not recognize it.

Instead of a system of 10,893 miles the Austrian State Railways now total only 2,581 miles, and instead of one central administration in Vienna the lines in Bukovina are operated, when they work at all, from Bucharest; the lines in Galicia from Warsaw; the lines in Czechoslovakia from Prague; the lines in Jugoslavia from Belgrade; and the lines in the South Tyrol and in Goerz, now Italian territory, from Rome. Apparently no consideration was given to the economic and transportation consequences entailed by the fixing of new frontiers, as in fixing these frontiers no effort

crews, and on local passenger trains of equipment, is the present practice at all these borders.

In another case on the northern border of new Austria the boundary line was manipulated so as to leave an important junction, railway station and repair shop in Czechoslovakia, while the town which the station served was left on the Aus-

On the Mittenwald Railway in the Tyrol

trian side of the boundary, thereby making it necessary for the people to go through passport formalities in order to reach the railway station. This railway station was also the terminus of two narrow-gage lines running into Austria and passengers have been compelled to leave the trains at highway crossings before reaching the station unless properly supplied with passports. Anyone who is familiar with present conditions in the succession states can testify as to the difficulties surrounding the passport problem.

The double-track line from Vienna to Lemberg and to the Galician oil fields south of Lemberg is one of the most important transportation routes in Central Europe. Before the war the heavy traffic in grain and oil from Eastern Galicia and coal from Upper Silesia and the district around Teschen (see map) made this one of the busiest and the most profitable lines in Central Europe. There was also a heavy traffic in manufactured articles from West Galicia, Moravia and Vienna, as well as from the great manufacturing districts in the coal fields. In addition to the traffic mentioned there was a heavy passenger traffic over this line from Vienna to Germany and Russian Poland and to Galicia and other Austrian territory.

Now, instead of being operated under one administration, this line is divided up into Austrian, Czechoslovak and Polish sections, and for weeks at a time during the past twelve months there has been an absolute interruption of through traffic due to the political differences of the new states. Although both the Czechs and the Poles are Slav peoples there has been much more friction between them and the difficulties of railroad operation have been much greater

Typical Country Through Which Austrian Railways Pass

whatever was made to maintain the integrity of certain transportation routes, although no strategic or political advantages were involved. For instance, the Southern Railway line from Marburg in Jugoslavia to Innsbruck in Austria runs for a short distance through Jugoslavia, thence through Austria to Imichen, thence through Italian territory to the Brenner Pass, then again into Austria. Changes of engines and

than between the Czechs and the Austrians. These little pleasantries of life are things that can only be fully appreciated by residents in this part of the world. Chauvinism and ultra-nationalism are two great obstacles to the resumption of normal life in the territory comprising the succession states.

## Railroad Executives Confer on Rate Reductions

WASHINGTON, D. C.

**I**MPORTANT QUESTIONS of policy with particular reference to rate and wage reductions are to be considered at a meeting of the member roads of the Association of Railway Executives at Chicago on Friday of this week, following a report of the executive committee of the association which has spent three days in Washington going over the entire railroad situation with the President and other governmental authorities. As a result of the conferences the railroad executives found brought to bear upon them a tremendous pressure for more definite action on the part of the railroads themselves in the direction of rate reductions, on the basis of which the committee has prepared recommendations for action by the member roads.

The executives met in Washington on Friday, Saturday and Sunday. They conferred with Chairman McChord of the Interstate Commerce Commission and Secretary Hoover of the Department of Commerce on Friday. On Saturday morning they called on President Harding and later they talked with Chairman Cummins of the Senate Committee on Interstate Commerce, Chairman Winslow of the House Committee on Interstate and Foreign Commerce and Chairman Anderson of the Congressional Joint Commission of Agricultural Inquiry. Among other subjects discussed with the President and particularly Secretary Hoover was the topic of unemployment. It is understood that the railroad men told that the roads were now increasing their forces to some extent as the volume of traffic and their earnings have increased, and a statement issued by the Department of Commerce referred to conferences held by Mr. Hoover with the heads of great national industries, including railways, "from which have resulted definite steps undertaking to meet the emergency in many practical directions." In this connection the early passage of the War Finance Corporation bill now before the Senate was urged as an important means of enabling the railroads to take steps to increase their forces and their expenditures.

The railroad bill was also discussed with others with whom the railroad executives conferred; and while it appears that the bill will be passed, as soon as the Senate disposes of other measures which have been allowed to take precedence, it was pointed out to the railroad executives that the so-called "agricultural bloc" in the Senate, consisting largely of western senators and some of the radicals, is preparing a most vigorous fight against this bill, and in favor of Senator Capper's bill to repeal Section 15-a, unless something can be done to insure a reduction in freight rates. If the railroads could see their way clear to do something in the direction of silencing some of the clamor from the west the prospects for early action on the bill might be improved. While the railroad executives were in Washington there was a meeting of the "agricultural bloc" senators at the home of Senator Capper, where plans for a strong effort to reduce rates were discussed but deferred for another meeting to be held this week.

It is understood that the railroad executives went away from Washington strongly impressed with the view that some sacrifice on the part of the railroads in response to the general demand is practically forced upon them by the situation

if they are to escape the consequences of public resentment and a loss of sympathy in high circles in Washington. A number of predictions that the conference would result in rate reductions, to be followed by further efforts toward wage reductions, have appeared in the Washington newspaper correspondence, evidently inspired by some of those with whom the railroad presidents talked. Senator Cummins was quoted as saying he believed the executives would vote at the Chicago conference to reduce freight rates and that the carriers would then probably ask the Labor Board for a further reduction in wages or appeal to Congress for legislation to meet the situation.

Chairman McChord of the commission had been carrying on an interchange of views with the railroad executives previous to the conference last Friday, in which he has urged that they would improve their standing with the public by taking earnest steps toward a more general downward revision of rates and the suggestion was made to the railroads in several quarters that they would receive public support in an effort to bring about further wage reductions if they would first take action themselves to reduce rates. While the executives pointed out that to reduce rates before there is a further reduction in expenses would mean that many roads would have to give up their entire net income under present conditions, while some would merely have their deficits increased; and while they did not talk for publication, it is believed that the recommendation of the committee is in the direction of some reduction now in the rates as to which there has been the most complaint and the promise of further reductions to come at a later date and to the amount of any further wage cut.

The members of the Interstate Commerce Commission called on President Harding in a body on October 6. It was officially stated that the call was merely for the purpose of paying respects to the President, who had not met all of the commissioners, somewhat in the manner that the Supreme Court justices call on the President at the opening of the fall term each year, but there is a belief in many quarters that the present administration is seeking to make the commission a more responsive part of its organization than it has been heretofore and the conference gave rise to rumors that something more than official courtesy was involved. However, the commissioners were with the President but 15 minutes.

The Senate Committee on Interstate Commerce held a meeting on October 7 to discuss the railroad securities bill and adjourned to hold another meeting on Wednesday of this week. The committee has already reported favorably the Townsend bill, which differs somewhat from the Winslow bill to the same purpose, which was passed in the House. The House bill as passed contained an amendment providing that no claims on account of the so-called inefficiency of labor during the period of federal control should be paid from any of the funds provided for in the bill and this was worded in such a way that a railroad which failed to settle with the Railroad Administration might be barred from obtaining a court decision on this point. The Senate committee considered a possible modification of this amendment providing that except for the payment of a final judgment, order, or decree of a court no money in the Treasury shall be used to make, in connection with the claim of any carrier, any payment or allowance on account of the so-called inefficiency of labor, and also that a final settlement with such carrier shall forever bar the carrier from prosecuting any further claim against the United States arising out of or incident to federal control. It is distinctly understood that the railroads will secure no allowance for inefficiency of labor in any settlement which is effected with the Railroad Administration, but it is believed that some roads will desire to make a further test of their claims on this account in the courts.

# The Railroads' Appeal to the Intelligent Public\*

Pressing Need for a Sound Transportation Policy—Statesmen  
Standing Helpless—Clear the Decks for Action!

By Samuel Rea

President of the Pennsylvania Railroad

A SEVERE business depression exists, and notwithstanding the high wages, shorter hours and easier working conditions that have existed for several years, a program of discontent is being disseminated. However, I take it that we are prepared to take our share of the burden to preserve law and order and regular employment. The railroads have much to lose by a policy of pessimism, delay or silence. Dividends have been reduced and loss of traffic has brought many of the eastern railroads down to the figures of 1912, and which combined with heavy wages and taxes shows a return of about 3 per cent. per annum earned in the last 12 months. The mandate of the Transportation Act entitled the railroads to rates that would produce a return of up to 6 per cent. on their property investment taken in groups, but the mandate failed of its purpose; it was not a guarantee in any sense of the word; and attempts to enforce it would cause a more serious restriction in business.

The President of the United States called a conference on unemployment. That conference is to deal solely with the practical proposition of securing steady employment, but the first proposition for its consideration that appeared in the newspapers was the reduction in railroad rates and the reduction of railroad wages. There is always a feeling that nothing should stand in the way of reducing railroad rates no matter how low they are, but unprofitable rates prevent railroad expansion and improvement and in the end the shipper reaches his limit of profit because of lack of cars or facilities, or bad service. Our splendid new highways, many of them paralleling the railroads, with the heavy cost for their repairs and the corresponding increase in taxation will in very large part fall upon the railroads. In the State of Pennsylvania, however, the Public Service Commission has made an equitable attempt to deal with situations of this character by declining to authorize common carrier motor service where the railroads or the trolleys were already giving a reasonable public service, and the public could not support both; but this foresight is by no means a common experience.

The taxation that has been placed on the backs of the railroads is now so heavy that it is a serious menace to their ability to pay their fixed charges. Further, the railroads need relief through the Government Labor Board from the National Agreements on wages and working conditions. It is a gratification to say that our sensible employees on the Pennsylvania have materially improved their working efficiency and shown the greatest interest and loyalty in restoring prosperity to the railroads; and if encouraged and not terrorized they will do much more.

## Measures to Improve Conditions

Now this brief summary of conditions which place an embargo on prosperity need not frighten us. No real remedy can be provided for the railroad situation until the steel, coal and building industries revive at prices that will encourage the public to buy. The first positive step that could be taken is the passage of the funding bill by Congress. This of itself would do little to help the railroads, but it will enable the Railroad Administration to use its holdings of railroad securities

to obtain cash and pay over to the railroads amounts due them. With this four or five hundred million dollars the railroads could pay off their current obligations and resume the upkeep of their equipment, roadway and stations and so give additional employment. After this funding will come the maintenance claims which are still undisposed of by the Government. And settlements have not yet been effected for the guaranty period by the Interstate Commerce Commission. If our estimate of the amounts due is correct, fully \$1,000,000,000 actually held by the Government might enable railroads to carry on a fair volume of maintenance and replacement work. This is not a fanciful sketch nor a bid for generosity to the railroads. The President of the United States is anxious for a final settlement, but Congress has not yet shared the same convictions—although the House passed the funding bill and many able minds in the Senate see its great benefits. It will require speeding up by the Railroad Administration, the Congress and the Interstate Commerce Commission if the funds are to be available to help out in the present depression. Meanwhile the railroads are grateful for what the President has done and are anxious to help him in reducing unemployment.

## Freight Rates

A further help to business would unquestionably be lower rates, but would we ask any manufacturer today to buy raw material and manufacture and sell new goods, with the knowledge that they will not realize their actual production cost? That is what the railroads are requested to do. They have had glowing promises of increased business if lower rates were made effective, but most of these glowing promises have not materialized; the public is not displaying any purchasing power and waits for lower commodity prices.

## Wages

The law of supply and demand should ultimately settle railroad wages and working conditions, but meanwhile a realization of the conditions by the Federal Labor Board and the labor leaders would do much to promptly adjust that situation. Railroad managements do not desire to have under-paid or discontented working men. We have no quarrel with the Labor Board or with labor unions, and desire none. On the contrary, I have long waited for the time when the labor leaders, and the labor journals, instead of believing that their position was more secure by hostility to railroad managements and railroad owners, would realize that co-operation was much better for both and was the only way to induce the public to pay for their railroad service an amount which would mean fair wages to the employees, a fair return to the owners and a constantly improving and reliable service to the public. The Transportation Act should be amended so that subordinate railroad officers are not thrown under the same regulations as to wages and working conditions as the men. This is breaking down discipline and encouraging laxity. It can all be adjusted without loss or suffering if the labor leaders will do their duty. They are in stronger position if they rely upon the public support for fair wages and working conditions than to talk about strikes which would settle nothing and

\*Address before the Pennsylvania State Chamber of Commerce at Harrisburg, Pa., October 10.—Abridged.

policy which leaves railroads no alternative but to maintain high rates for transportation service so as to continue war-time pay and working privileges. The labor leaders must, therefore, answer the public demand as to what they are willing to do to help decrease unemployment and promote prosperity throughout the country. So far they have conceded nothing.

The Pennsylvania Railroad is reported to be in conflict with the labor unions, and especially with the Labor Board. That is not true. \* \* \* None of us is infallible. The Labor Board made some slips and also rectified some. We shall never question the Board's actions and powers so long as they enable us to establish and keep harmonious relations with our employees, maintain the credit of the Company and continue an efficient and economical transportation service. Congress intended by the Transportation Act to encourage direct negotiations with employees, for the act makes it the duty of a carrier and its employees to exert every reasonable effort, through conferences, to bring about settlement of disputes. But Congress did not undertake to regulate the manner in which these conferences should be carried on or the method of selection of representatives. The Pennsylvania inaugurated, with the co-operation of the employees, a method of employee representation which adhered to that vitally important principle, "employee representation," and which has deservedly earned commendation of both employers and employees. The Labor Board has, in effect, directed us to annul and disregard these agreements. Compliance with this order would necessarily involve an abandonment of the method of conducting negotiations with its own employees which has been approved by a large majority thereof. The Company is desirous of avoiding conflict with the Labor Board, but when compliance with the order involves disregard of public duties and the principles of sound management, and such order in its opinion deals with a subject matter over which the Board has not been given jurisdiction by Congress, the Company believes that non-compliance is a duty.

### Lower Taxes

The Governments, Federal, State and Municipal, could do much to help railroad conditions and the industries by relieving the heavy burden of taxation. In addition the Government might relieve the public by the abolition of the Federal tax of 8 per cent on passenger fares and 3 per cent on freight shipments. A suggestion has been made to cut these in half, and that is a step in the right direction. Taxation, however, cannot be finally reduced without wiping out a great number of unnecessary Governmental expenditures, Federal, State and Municipal, together with the numerous bureaus for so-called regulation and investigation, which are the result of unnecessary restrictive laws no longer beneficial to the public.

### Freedom From Excessive Regulation

The Federal Transportation Act and the legislation of all the states and municipalities should now be revised and an attempt made to give the railroads the greatest freedom from Government interference and regulation, with the ability to carry on their own business with their employees and the public in a way that will restore initiative. Under present conditions Federal and State expenditures for railroad regulation and taxation are particularly costly, and their advantage to the public, aside from avoiding discrimination in rates, which is a very great advantage, has become questionable. I refer to amending or wiping out laws such as the Adamson act, the full crew laws, various provisions of the Hepburn act and some provisions of the Clayton act. They would relieve and correspondingly strengthen the Interstate Commerce Commission and the state commissions in the discharge of their widespread duties.

### A Sound Transportation Policy Needed

The whole transportation question must be faced in a businesslike way. The country must decide whether it wants strong or weak railroads. A cabinet officer like a Secretary of Transportation would be helpful to enforce a continued constructive policy and prevent waste or duplication of government appropriations for transportation purposes. If we do not want strong railroads, and do not want them operated under commercial conditions, let the country so decide. The whole tendency of the time is that from lack of requisite courage to enforce a real policy affecting the railroads, we have tied their hands by unnecessary restriction and regulation and increased their expenses so that we are getting close to a condition where either the Government, with the consent of the citizens, must purchase the railroads and assume through taxation the costs that are not covered by rates, or else give a fixed guaranteed return sufficient for that purpose and put it all on the backs of the citizens in the shape of taxes. I need not tell you how greatly I deplore what appears to be a world-wide idea that in some miraculous way these great public enterprises, which are owned by our citizens and provide the cheapest transportation service in the world and the most efficient service, shall not be given the freedom to work out their own problem and be made self-sustaining out of their own revenues, but that in some way if we can only put them on the backs of the Government, Federal, State and Municipal, and hide their cost and expense, and subject them to a changing policy every few years, we shall have cheaper and more efficient transportation. Further, that we can take the so-called strong and weak railroads and irrespective of cost or necessity so route the traffic and put them into some kind of system omelets that will prove less costly than the present systems.

### Government Competition in Transportation

Motor trucks on the highways are much more expensive and less reliable than rail transportation, although in some places they are a great convenience in developing the country. I do not condemn them, for I regard good modern highways as a necessity. I only ask that they pay a fair share of the cost and taxation.

There is not a large railroad system today that has not been supporting and operating for public use hundreds of miles of unproductive railroads. We have in the Pennsylvania System a couple of roads on the Maryland, Delaware and Virginia peninsula, and these lines also operate steamers as feeders, that connect them with Baltimore and develop a part of the country where transportation facilities are scarce. No money has been made out of these railroads, but on the contrary several millions of dollars have been spent for their construction and to pay their operating losses and fixed charges, and keep them operating for public use. Since the roads were built much of the business which formerly went to Baltimore now has a North and South movement, or a direct motor movement. This is due to changed commercial conditions resulting from the use of storage warehouses, and the method of competitive purchasing of crops on the ground by the commission houses in various cities, and to the use of motors on the adjacent state and local concrete highways. In addition to the new highways the State of Maryland has subsidized ferries across the Chesapeake, which are and will be competitive with the boat lines of these weak companies, but it seems unwilling to subsidize the boats of the companies that have been endeavoring to provide facilities across Chesapeake Bay for so many years in connection with these rail lines. I am not criticising the State for what it conceives to be its best highway policy for the benefit of its own citizens, but I am pointing out that when these new highways and subsidized ferries are provided

by the States these railroads and steamer lines will have lost the traffic, and the cost of these competing routes is laid largely on these railroads as taxpayers. These lines, with such a loss of business, with high taxes and wages cannot, therefore, be much longer maintained. We can also ask what is the encouragement for railroad expansion and improvement under such conditions. The public pays the cost of having no definite policy to adopt.

We are gradually, by extreme regulation, putting the railroads deeper into politics, and the deeper they get the less satisfactory they will be to the people and the more costly

they will be. But the statesmen and fair-minded representatives in the State and National legislatures who realize the situation and are deeply concerned in the transportation service of the country as a whole, stand almost helpless. While, therefore, I am convinced that prosperity will return and the country will again prove its ability to exceed all past records for productivity and business, yet to clear the decks for action some of these questions must be tackled in an earnest way; and the sooner it is done the sooner shall we as a nation enter upon the high road to national contentment and prosperity.

## Unemployment Conference Urges Rate Revision

Other Steps Agreed Upon by President's Conference—Urge Speed in Passing Financial Legislation

WASHINGTON, D. C.

**R**EADJUSTMENT of railway rates to a fairer basis of the relative value of commodities, with special consideration of the rates upon primary commodities, at the same time safeguarding the financial stability of the railways, was the first of a series of recommendations for measures for the permanent recovery of employment and business generally adopted by the President's Conference on Unemployment at its meeting on Tuesday, October 11. The conference also recommended "settlement of the financial relationships between the government and the railways, having in mind the immediate necessity for increased maintenance and betterments, making effective increased railway employment and stimulation of general employment, in order that the railways may be prepared for enlarged business as it comes."

The recommendations were reported to the conference by the organization committee on the basis of such parts of reports submitted by the various subcommittees of the conference as to which there was complete agreement among the committee members. Recommendations proposed within the committees which involve controversial points were reserved for further discussion at a session of the conference on Thursday, the purpose being to present to the country a program on which the whole conference could unite and thus to avoid many points on which sharp conflicts between the representatives of business and of labor have developed in conference. For example, the reference to the financial relationships between the railways and the government was the result of recommendations favored by a majority of the members of the committees on transportation and on manufactures urging the passage of the railroad bill now pending in the Senate designed to provide the funds for a settlement. W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, had, however, insisted upon a qualification of the recommendation to provide that the funds received by the railroads should be used exclusively for the purpose of employing additional forces and should not be used for work performed in outside contract shops. The labor element in the manufactures committee, which included Samuel Gompers, also took the same position with reference to a similar recommendation made by a sub-committee of the manufactures committee. The latter had prepared a report which also proposed wage reductions, the reduction of freight rates, the repeal of the Adamson law and the transfer of the functions of the Railroad Labor Board to the Interstate Commerce Commission. This was approved by a majority of 11 to 3 in the committee. The transportation committee report had also expressed the opinion that business would be improved if people stopped waiting for price and rate reductions.

The recommendations in the form presented by the organization committee were adopted by the conference practically without discussion. When the reference to the financial settlement was adopted Matthew Woll, vice-president of the American Federation of Labor, stated that no objection was made on the ground that it was merely a declaration of principle and that some special considerations with reference to it would be presented by the labor representatives on Thursday.

In addition to the two recommendations referred to the report as adopted included the following:

"Recovery of our industry and employment must necessarily be a process of gradual healing of the great economic wounds of the world war. This healing is making distinct progress. Without attempting the impossible task of assessing the relative weight of different forces, the conference presents the following summary of the more important matters that require constructive and immediate settlement if recovery in business and permanent employment are to be more expeditiously accomplished:

"Speedy completion of the tax bill with its contemplated reduction of taxes, in order that business now held back pending definite determination may proceed.

"Definite settlement of tariff legislation in order that business may determine its future conduct and policies.

"Limitation of world armament and consequent increase of tranquillity and further decrease of the tax burden not only of the United States but of other countries.

"Steps looking to the minimizing of fluctuations in exchange, because recovery from the great slump in exports (due to the economic situation in Europe) cannot make substantial progress so long as extravagant daily fluctuations continue in foreign exchange, for no merchant can determine the delivery cost of any international shipment.

"Definite programs of action that will lead to elimination of waste and more regular employment in seasonal and intermittent industries, notably in the coal industry, in order that the drain upon capital may be lessened and the annual income of workers may be increased.

"In the field of all the different industries and occupations the rapidity of recovery will depend greatly upon the speed of proportionate adjustment of the inequalities in deflation. A table is attached hereto, drawn from various sources, showing the percentage of present levels above the levels of the same commodities and services of the pre-war period. It will be observed that agriculture has reached an unduly low plane, while transportation, coal and some branches of the construction industries are of the highest. It will also be observed that there is an entire disproportion between the

price of the primary commodities and the ultimate retail price. These disproportionate increases in the progressive stages of distribution are due to increased costs of transportation, enlarged profits, interest, taxes, labor and other charges.

"If the buying power of the different elements of the community is to be restored, then these levels must reach nearer a relative plane. For example, the farmer cannot resume his full consuming power and thus give increased employment to the other industries until either his prices increase or until more of the other products and services come into fair balance with his commodities, and therefore the reach of his income."

### Conference Opened by Hoover

In opening the conference Secretary Hoover said that the major purpose of the conference had been to provide suggestions and means for emergency organization to meet the situation of the coming winter, and that this object had to a large extent been accomplished by the adoption of the emergency program which had met an extraordinary response from many communities. The second purpose was to suggest permanent measures for the recuperation of industry and employment and as to these the organization committee had prepared the recommendations previously quoted based on the committee reports.

He pointed out that the conference is not a legislative body whose decisions are binding, apparently for the purpose of suggesting that one of the primary objects to be accomplished is the enlistment of public interest in the problem, and he said that the most important object is to afford some relief locally for the 10 to 20 per cent of the unemployed that will be in an actually destitute condition.

At the meeting of the conference on October 12 the committee on construction industries presented a report urging a reduction in freight rates, as follows:

"This group, recognizing that transportation problems are not within its peculiar province desires, nevertheless, to express the conviction that every reasonable step should be taken, necessary to enable the railroads to resume their customary activities, and to reestablish efficiency, economy, and regularity in transportation service.

"Readjustments of, and reductions in, freight rates on construction materials are essential to a sustained revival of building activity. Increases in rates on construction materials imposed during the war left the construction industry under a relatively heavier handicap of increased transportation costs than had been imposed on most other commodities.

"To this war-time increase in freight rates has since been added an increase of 25 to 40 per cent, thus perpetuating and even magnifying the effect of the war-time policy of restricting general construction activity.

"The construction industry can not effectively function under a freight rate fabric artificially distorted by the continuation of restrictive war measures. A great economic waste would be incurred if, because of failure to reduce and readjust freight rates existing plants for the production of construction materials had to be abandoned and a new alignment of producing facilities established in accordance with the present rates, a fabric originally designed, in the public interest, to discourage the very thing which, in the public interest, the government now desires to encourage; that is, the normal operation of industry. The financial burden of such a readjustment of plants would have to rest ultimately upon the public; and its necessary effect would be to curtail existing competition and to limit the radius of distribution of many of the construction materials.

"In addition to such readjustment of freight rates on construction materials as will permit construction activity, freed from unnecessary artificial restriction; it is urged that such inequalities as may after such general readjustment, exist in the rates on various construction materials be investigated and removed by the Interstate Commerce Commission. We

suggest the consideration of the practicability of encouraging during winter months the transportation of materials used in road and other construction work, thus utilizing transportation equipment which might perhaps otherwise remain idle.

"To meet the present unemployment emergency and to make renewed activities in the construction field possible does not require special concessions to the industry. But it does require a complete and prompt removal of unnecessary handicaps, restrictions and limitations, both direct and indirect, these including credit, freight rates, priorities, undue costs in relation to labor and materials, wasteful building codes, and the like."

It was recommended that Secretary Hoover appoint a committee selected from the various elements interested in construction, such as financiers, labor, engineers, architects, contractors, material manufacturers, and others to be known as the Committee on Construction Development, to be charged with the responsibility of preparing and making effective plans for co-operation with the governors and mayors in the several states in carrying on community conferences on construction.

### Critical of the I. C. C.

The report also contained a paragraph saying that "the Interstate Commerce Commission did declare without full hearing from all the parties interested an emergency which took away from the construction industry the use of open top cars." "In the interest of an equal opportunity to all industry," the report said, "the Interstate Commerce Commission should provide full hearings to all interested in matters of this kind in the future." E. E. Clark, former chairman of the Interstate Commerce Commission, said he felt he must call the attention of the conference to the paragraph on priorities as he did not think the committee wants to add to the great volume of misunderstanding throughout the country on that subject. He said that Congress had delegated to the commission emergency powers over car service in the interest of the public and the commission had required for a considerable period the use of open top equipment in the transportation of coal in preference to other commodities in response to the most urgent public demand that coal be transported. The commission had no thought or idea of preferring one industry over another and this action was obviously necessary and the only thing to prevent people from suffering from want of coal. It would be absolutely impracticable, he said, to exercise such a power if it could not be done until after hearing all who insisted that their interests are paramount above all others, because the emergency would have passed. C. P. Neill, of the Bureau of Information of the Southeastern Railways, also protested against the attempt of the committee to make the conference go on record as criticising the Interstate Commerce Commission when the conference itself was not fully acquainted with the facts. At the suggestion of Mr. Hoover the committee agreed to delete the paragraph and bring in a separate report on this subject. With this and one other slight amendment, the report of the committee was adopted.

The conference also adopted reports of the committee on employment agencies, foreign trade and shipping. At the session on Wednesday, Mr. Hoover announced that the conference had received information of from 20,000 to 25,000 additional men recently taken into employment by railroads.

THE EL PASO POST of the Travelers' Protective Association, El Paso, Tex., adopted resolutions on October 1, urging legislation providing for the reestablishment by the railroads of the mileage book system and approving the Watson bill now before Congress. Telegrams were sent to senators and representatives of the states of Texas, New Mexico and Arizona, asking for their support of the bill.

# M. K. & T. Improves Its Facilities at Oklahoma City

Engine Terminals and Yards Have Been Reconstructed to Take Care of Increased Business

**T**O OBTAIN an improved terminal operating arrangement and provide more adequate facilities for the handling of its locomotives, the Missouri, Kansas & Texas has completed a new engine terminal at Oklahoma City, Okla., together with a relocation of one of its entrances to the city, which improvements have the effect of expediting its yard operations greatly. These improvements form part of a gen-

eral plan for the rehabilitation and intensive development of the Missouri, Kansas & Texas lines which has been in progress since 1916 and are made necessary by the increasing importance of Oklahoma City as the terminal or junction of a line extending northeastward to Parsons, Kan., with one to the southeast through Shawnee to Atoka on the main line of the Katy system.

Being the center of the oil fields of the same name and increase the car capacity from 520 cars to 982 cars and three-quarters of a mile of main track was relocated. However, the principal improvements have been made at Oklahoma City and these have been carried out with the purchase of sufficient right-of-way to permit of ready future enlargement to several times the present capacity.

The junction of the Oklahoma and Shawnee divisions occurs only about 2,000 ft. east of the throat of the Oklahoma City passenger station yards (see map) and just south of a crossing with the Chicago, Rock Island & Pacific which lies parallel to the Shawnee line. Because of this it had been necessary in the past to locate the entire freight yard and engine terminal east of the junction of the two lines with the result that freight trains on the Oklahoma division could enter and leave the terminal only with a reverse movement that fouled the approach to the passenger station and also interfered with the service to various industry tracks in the business center of the city. It also resulted in frequent blocking of two important streets which crossed the railway at grade. The presence of the Rock Island tracks and the acute angle of the junction between the two M. K. & T. lines, as well as the industrial development in the neighborhood, precluded any local change in the Oklahoma division track

The Roundhouse as Seen from the Power House Side

eral plan for the rehabilitation and intensive development of the Missouri, Kansas & Texas lines which has been in progress since 1916 and are made necessary by the increasing importance of Oklahoma City as the terminal or junction of a line extending northeastward to Parsons, Kan., with one to the southeast through Shawnee to Atoka on the main line of the Katy system.

Being the center of the oil fields of the same name and

General Layout of the M. K. & T. Terminals at Oklahoma City

serving also as a receiving point for pipe line oil from the Wichita Falls field, Oklahoma City has been the source of increasing traffic for the Katy, thereby increasing the importance of the Parsons-Oklahoma City line. As a consequence, it has also been necessary to effect appreciable improvements in the physical condition of this line, including the relaying of rail with 85-lb. steel, reballasting, bank widening, etc. Improvements have also been made at Osage, Okla., the intermediate terminal between Oklahoma City and Parsons. Here the yard tracks have been extended to in-

which would overcome this difficulty. The situation as to the engine terminal was also objectionable. The layout was such that it was impossible to increase the number of stalls or to lengthen the existing stalls to accommodate larger locomotives. Moreover, the turntable was only 65 ft. long.

The situation was obviously one requiring drastic treatment and was accomplished as shown on the small map. A cut-off was constructed from a point about three miles out on the Oklahoma division to a connection with the Shawnee division about 9,000 ft. east of the junction. This enables

trains from both lines to enter and leave the freight yard over the Shawnee tracks and therefore by a direct movement. It also releases from main line service a portion of the Oklahoma division track which passes through a built up section of the city, involving a great many skew grade crossings with the city streets. This old line will now be used only for emergency or local industrial track service. The cut-off junction is located at a sufficient distance east of the existing yard to permit of the future construction of a train yard between the existing terminal and the junction and right-of-way for this purpose has been acquired by the railroad.

The old engine terminal has been replaced by a new plant built to the south of the freight yard on a site that will allow of a nearly full-circle development of the roundhouse whenever this is required, together with corresponding enlargement of the other facilities. The yard tracks and leads were modified only sufficiently to fit into the changes in the engine terminal and main track. One detail was to construct a switching tail track at the east end of the yard. Owing to the fact that the engine terminal site interfered with an existing wye track, a new wye was built just east of the passenger station so that it could be used as well for the turning of the passenger trains, so that all trains, whether outbound or inbound, may be backed into the passenger station.

A three-track car repair yard and a four-track coach yard were also provided just south of the freight yard. The coach yard is served with steam, water and compressed air.

The locomotive facilities in the new terminal embrace a 10-stall roundhouse with 5 additional radial tracks in the open, served by a 100-ft. turntable, with a machine shop, boiler house and engine room in a wing at one corner. The auxiliary facilities include a 300-ton reinforced concrete coaling station built by the Roberts & Schaefer Company, Chicago, a water softening plant with a 100,000 gal. capacity steel water tank for softened water built by the Graver Corporation, Chicago, a storehouse, a car repair shed and a fore-

Flood lights are provided at four points between each pair of stalls so that the interior of the house is truly "flooded" with light. White washing of the walls, timbers and ceiling adds greatly to the effect of the illumination in either the natural or the artificial light. This is brought out emphatically in the photograph showing the house illuminated by the flood lights. Considerable of the illumination is obtained through

Typical Section Through an Engine Pit

the monitor lights which are pivoted so that they can be washed from the roof and therefore require no washing scaffold on the inside. Improved ventilation is insured by the use of Johns-Manville asbestos smoke jacks of large area with stacks 36-in. in diameter extending through the roof.

The floor is paved with brick on a cinder base. One fea-

Typical Section Through a Roundhouse Stall

man's office (both moved from the old site and rebuilt), two Robertson cinder conveyors, a lavatory and locker building and a National boiler washing system.

The roundhouse follows the general lines of the more common type of roundhouse construction with a timber frame and roof and brick walls, but with the modern tendency towards large window areas in steel frames carried out to the fullest extent. In this connection the proportion of glass in the track doors is unusually large, as may be noted in one of the photographs.

Artificial lighting has also been given particular attention.

One of the features of the engine pit that is of interest is the provision of the rounded coping as a protection for the radiators which are mounted on the wide walls. The rails rest on steel plates placed directly on the concrete walls to which they are bolted.

The power plant, machine shop and engine room wing is of construction similar to the roundhouse with the roof carried on wooden roof trusses. The boiler house contains two 250-hp. Heine boilers with furnaces designed for burning coal but modified to permit the use of oil as a fuel. The power plant is designed mainly for a supply of steam heat, hot water for the boiler washing, compressed air, etc., as the electric

light and power is purchased from a local public utility. The floors in the wing are of three types. Mastic floors are used in the engine room and a portion of the machine shop which also is provided in part with a cinder floor, while the boiler room has a concrete floor.

The 100-ft. turntable is operated by a Nichols tractor and is equipped with an essentially original type of end bearing,

his time is occupied each day in the work at the treating plant. A matter of incidental interest is presented in the fact that a test of the treated water by the state health authorities resulted in the water being approved as satisfactory for drinking purposes, whereas the untreated water had been declared unfit for drinking.

#### Combined Storehouse and Oil Building

The storehouse is a brick and concrete building 105 ft. by 50 ft. in area with a platform at one end 55 ft. 10 in. long, which also extends along one entire side of the building.

The Track Doors Contain Unusually Large Glass Areas

This storehouse also houses the oil storage which is equipped with pumps supplied by the St. Louis Pump and Equipment Company. The portion of the building used for this purpose has a basement containing oil tanks ranging from 120 gal. to 1,000 gal. capacity each.

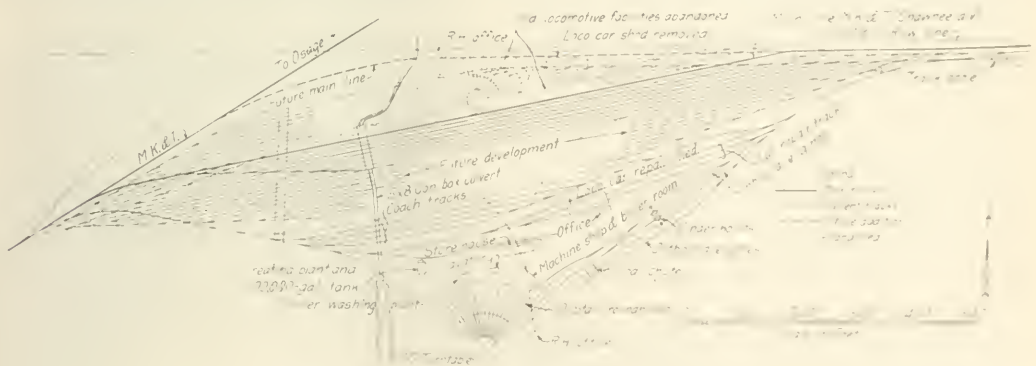

The site chosen for the new engine terminal is in the flats of the Canadian river occupied by some portions of an abandoned channel of that stream and was available for terminal purposes only after 175,000 cu. yd. of filling had been placed. Some of this material was obtained from borrow pits nearby and from the excavation for a creek channel with the use of a dragline excavator. However, a large portion of

An Example of Modern Roundhouse Illumination

comprising the use of four M.C.B. car springs to act as shock absorbers when the locomotive runs onto the table. The design of these end trucks was worked out by the engineering department of the railway in co-operation with the American Bridge Company, the contractor for the table.

The water softening plant was provided to treat water from the city supply, this being water from the Canadian river,

The Yard and Engine Terminal Reconstruction

which contains about 24 grains of incrusting solids per gallon. The plant has a capacity of 20,000 gal. of treated water per hour, and reduces the hardness to less than 3.5 grains per gallon. In addition to the use of soda ash and hydrated lime, the plant provides for the use of ferrous sulphate as a coagulant to the extent of one grain per gallon during times when the river water is turbulent. The arrangement of the plant is such as to secure very economical operation, one man dividing his time between the treating plant, boiler washing plant, coal station, ash pit and the stationary boilers in the powerhouse. Only about one hour of

the material was obtained with steam shovels and trains in a cut west of the yard on the site of the future train yard. The presence of a creek extending through the site of the yard not only entailed the excavation for its new channel but required the construction of 200 ft. of a 5-ft. by 8-ft. concrete box culvert under seven of the yard tracks.

The low land at the site of the terminal also added to the cost of the building foundations owing to the need of carrying the footings down to solid material. To avoid the use of excessive amounts of material in the foundation construction the building wall foundations were constructed for the

part according to the beam and pedestal design with natural spread footings. A different plan was followed for the engine pits which were built with the two walls extending down to a footing slab with the engine pit floor suspended between the walls at a suitable elevation. In order to save material, the continuity of the side walls of the pit was broken at intervals by openings 6 ft. 8 in. long between the footing slabs and the floor slabs. The foundation conditions were such that natural foundations were permissible for all of the structures except the turntable and the coaling station which required pile foundations. The turntable center was heavily reinforced with a grillage of old rails and the entire turntable pit was paved with a concrete floor.

The building of the cut-off, which has a length of about 10,000 ft., involved the construction of two grade separation structures, an overhead highway viaduct to carry Twenty-third street, Oklahoma City, over the tracks, and a three-span subway to carry the cut-off over Alice avenue. Both of these are reinforced concrete structures which were built in place complete before traffic was turned over the line.

The entire project has been developed under the direction of F. Ringer, chief engineer of the Missouri, Kansas & Texas, assisted by J. M. Metcalf, principal assistant engineer, and A. L. Sparks, architect. D. I. Stevens, assistant engineer, was in direct charge of the construction. The roundhouse and other buildings were built under contract by H. D. McCoy of Cleburne, Texas. The List and Gifford Construction Company, Kansas City, had the contract for the grading.

## Freight Car Loading

WASHINGTON, D. C.

THE volume of freight being handled by the railroads continues to show large increases from week to week, as indicated by the weekly car loading reports of the American Railway Association, Car Service Division. While the increase is, of course, seasonal, the car loading figures are now showing a closer approach to the record figures for last year than they have at any previous time during the year. For the week ending on October 1 the total car loading was 901,078 cars, an increase of 27,773 cars as compared with the week before. It was, however, 91,205 cars less than were loaded during the corresponding week of 1919.

Except for livestock, which showed a slight decrease, and ore, gains were reported in the loading of all classes of commodities as compared with the previous week, while, for the first time this year, loading of merchandise and miscellaneous freight, which includes manufactured products, eclipsed the total for the corresponding week of last year. Grain and grain products also exceeded both the corresponding weeks of the past two years but other commodities fell below last year.

Compared with the week before, the largest gain was made in the loading of merchandise and miscellaneous freight, which totaled 551,656 cars or a gain of 18,587 cars. This was also a gain of 1,619 cars over the total for the corresponding week in 1920. Loading of coal amounted to 178,005 cars which was an increase over the previous week of 6,531 cars. Grain and grain products totaled 57,075 cars, a gain of 5,227 cars in a week and 13,443 cars more than were loaded during the corresponding week last year. This also was 13,286 cars in excess of the total for the same week in 1919.

Forest products increased 764 cars to a total of 49,466 compared with 48,702 the week before while coke loadings were 5,615 cars, an increase of 669 cars compared with the previous week. Livestock loading fell off 65 cars, compared with the preceding week, the total being 32,868 cars, while ore

dropped to 26,393 cars, a decrease of 3,940 cars within a week.

Increases as compared with the week before were shown in the loading of all commodities by districts but the central western and southwestern were the only districts to show increases over the corresponding week in 1920.

The following table prepared by the Car Service Division compares the car loading with the peak weeks of 1920 and 1919, showing that the loading for the week of October 1 was within 10 per cent of the highest loading during the last two years, while the grain loading was considerably higher. During the first six months of 1921 railroad freight traffic was about 23 per cent less than during the corresponding period of 1920.

	October 1, 1921, peak, 1921	As compared with				September 25, 1919, The peak, 1919	Per cent
		October 1, 1920	Per cent	October 23, 1920, The peak, 1920	Per cent		
Grain and grain products .....	57,075	43,632	130.8	30,886	184.8	45,140	126.4
Live stock .....	32,868	33,383	98.5	34,971	94.0	35,555	92.4
Coal .....	178,005	209,595	84.8	229,043	77.7	213,746	81.4
Coke .....	5,615	14,790	38.0	16,898	33.2	9,628	58.3
Forest products ..	49,466	62,085	79.7	58,820	84.1	65,360	75.7
Ore .....	26,393	78,458	33.6	73,182	36.1	69,853	37.8
Merchandise, L.C.L. and mis- cellaneous .....	551,656	550,037	100.3	559,161	98.7	551,619	100.0
Total .....	901,078	992,283	90.8	1,010,961	89.1	995,901	90.5

A large further decrease in the number of surplus freight cars and in the number of cars in bad order was also reported by the Car Service Division. For the period from September 23 to October 1 the number of surplus cars was 172,420, a decrease of 28,733 in approximately a week. This included 42,093 surplus box cars, a reduction of 13,756 and 98,040 surplus coal cars, a reduction of 12,328. The number of freight cars in need of repairs on October 1 was 364,372, or 15.8 per cent, as compared with 16.3 per cent on September 15.

## "Perfect Package Month"

THIS is the name of the country-wide campaign to promote good packing of freight which is to be conducted during November jointly by the American Railway Association, through its committee, and the American Railway Express Company; and elaborate preparations are being made.

In previous campaigns, the railroads have succeeded in getting large shippers to give better attention to their shipping methods, and the losses formerly entailed in the transportation business, due, in part, to poor packing, have been much reduced. By the "Perfect Package" drive, the carriers hope to reach the smaller shippers. This is the first campaign in which all of the carriers of the country have taken part. It will reach practically every shipper in the United States. At the larger places committees of employes of the transportation companies will handle the campaign and keep in touch with local shippers' associations.

Throughout the month of November, all shipments, freight and express, will be more carefully examined than usual, and suitable notations will be made on special "Exception Reports." These forms are issued separately for express and freight, the latter being on white paper and the express on pink.

The "exception reports" are made up so that the most common errors in packing or marking can be quickly checked up, with a minimum of handwriting. If, for example, the shipper's name is missing or old and confusing marks are found, an "exception" will be made and an "exception report" filled out by the employee making the examination.

These exception reports will be used only in connection with the outbound business from each point; incoming shipments will not undergo this special examination. The issuance of these reports will not delay the shipment.

The exception reports will be sent daily by each of the carriers, to shippers of the packages on which exceptions are made, and they can thus immediately take steps to correct the errors. At regular intervals the carriers will inform the local Chamber of Commerce or other traffic bodies, who act for shippers in the movement, regarding the number of exceptions made on the outbound business of that city, giving the names of the shippers. Exception reports will be regarded as confidential information, only for the shipper affected.

In each city the agents of the railroads and of the express company have been requested to get together and form a local Joint Perfect Package Campaign Committee. These will distribute printed matter, give notices to local newspapers and present the matter to the leading shippers' organization.

The carriers do not intend to throw any unnecessary burden on these local organizations or to ask them to make any expenditures, unless they wish to do so on their own volition.

The shippers' associations will be asked to put up notices on their bulletin boards, publish articles about the campaign, and make announcements of it at their meetings. At the conclusion of the campaign, the carriers will notify the associations what the total number of outbound shipments by all carriers was during November. By comparing the total number of "exceptions" with the total outbound business during that month, the shipping "score" of local industries may be determined. The percentage attained will be publicly announced and information sent to the central joint campaign committee of the railroads and express companies. That committee will prepare a list that will show, for the whole country, the cities which make the best records. This list will be made public after the campaign is over and the cities heading the list will achieve such reputation as they deserve.

The "Perfect Package Month" activities are to be directed by a Joint Campaign Committee of the American Railway Association and the American Railway Express Company; and the representatives are: Lewis Pilcher, Secretary, Committee on Freight Claim Prevention, A. R. A., Chicago, and J. H. Butler, Manager, Loss and Damage Department, American Railway Express, New York.

## Strike Talk Dies As Labor Leaders Count Ballots

### Pennsylvania Cited for Failure to Obey Board's Order—New Adjustment Board for Western Roads

THE THREATS of a general railroad strike which were so indiscriminately thrown about several weeks ago have been abandoned by leaders of the railroad labor organizations who have been in Chicago for the past week, the consensus of opinion now being that the only difficulty which is even possible might be between the Pennsylvania shopmen, and members of the Federated Shop Crafts, employed by that road. One well known labor leader was recently quoted in the press as saying: "If a walkout should be ordered, half the workers affected would become 'scabs' and the other half would become tramps. There will be no strike because both the men and their leaders know it would be a foolhardy move. If the men vote to quit work it is merely to strengthen the hands of their officers in seeking concessions from the carriers. They trust their officers not to lead them into this winter's bread line." The name of the union leader quoted was withheld at his request. This leader was also quoted as stating that the strike votes already polled by the brotherhoods mean nothing and that, since W. G. Lee, president of the Brotherhood of Railway Trainmen, has announced that his organization will not strike unless the other brotherhoods join the movement, there will be no general walkout because the officers of these other organizations have the power to veto a strike vote.

L. E. Sheppard, president of the Order of Railway Conductors, later made the statement that there will be no extensive tie-up of the country's transportation facilities.

"I made this promise to President Harding," Mr. Sheppard was quoted as saying, "and I know of no reason why I should not give the same assurances to the public. If we have to break with the railroad officials we will do it with just as slight inconvenience to the public as possible."

#### Labor Board Favors Pennsylvania in Five Decisions

Five recent decisions of the Labor Board, although rendered in minor disputes involving in each case the claim of an individual employee, are significant in that the decision in each case is in favor of the Pennsylvania. Coming, as these decisions do, immediately after the publication of a great

deal of information regarding the Pennsylvania's attitude toward the Labor Board and the Labor Board's attitude toward the Pennsylvania, the rulings may, according to the views of members of the Board, serve to establish the fact that, despite the discussion which has taken place in the last month, the Labor Board will continue to decide disputes which are properly certified to it free from prejudice because of developments in other controversies. It was pointed out at the same time that the Pennsylvania has likewise signified its approval of the Board's jurisdiction over and judgment in, controversies in which there is no question of jurisdiction or authority by recently certifying to the Board a case involving a wage reduction for dining car stewards in the eastern region of Pennsylvania.

A hearing to determine whether the Pennsylvania has violated the Transportation Act by its refusal to accept the decision of the Board ordering a new election of employees' representatives will be held within the next ten days, according to a recent announcement of the Board. The Board will proceed under Section 313 of the Transportation Act.

#### B. R. & P. Dispute Before Board

Threat of the train service brotherhoods and the Order of Railroad Telegraphers to call a strike on the Buffalo, Rochester & Pittsburgh unless that road incorporates in its working conditions a rule against trainmen having to receive train orders by telephone, was basis of a rather significant dispute heard by the Board on October 7.

The carriers' executives are unwilling to concede that "employees other than those covered by the telegraphers' agreement shall not be required to or permitted to handle train orders or messages pertaining to the movement of trains except in cases of wrecks, washouts, snow blockades, or personal injury."

T. F. Brennan, vice-president of the road claimed that adoption of the rule would "nullify the advantage of the telephone over the telegraph from the standpoint of convenience, safety and the prompt movement of trains." He declares it would seriously interfere with train

operation, create misunderstandings and enforce the employment of operators where they are not needed now and never have been employed.

The unions claim that train service men have been required to receive and write out train orders while regular telegraphers were laid off, at the same time placing upon the train service men more responsibility without additional compensation and introducing another element of danger. They declare the operation of the rule would not prevent trainmen "getting block" or reporting "in clear" at points where operators are not maintained regularly for this particular purpose and where no other telegraph service is necessary or required.

#### Arrangements for New Board of

#### Adjustment Completed

The new Board of Adjustment, created recently to handle disputes between certain western carriers and the train service brotherhoods and their members, is now fully organized and is making preparations to take up and dispose of the large number of grievances which have arisen since the end of Federal control.

W. E. Morse, formerly assistant general manager of the Chicago & North Western and more recently vice-president of the Denver & Salt Lake, was named a permanent member and chairman of the new body, which is composed of four representatives of the railroads and four representatives of the train service brotherhoods.

Other members of the board are: J. T. Gillick, general manager of the Chicago, Milwaukee & St. Paul, (Lines East); F. G. Pettibone, vice-president and general manager of the Gulf, Colorado & Santa Fe; Frank Bell, general manager of the Great Northern (Lines East); Harry Dougherty, vice-president of the Brotherhood of Locomotive Engineers; E. P. Curtis, vice-president of the Order of Railway Conductors; C. F. McLaughlin, vice-president of the Brotherhood of Locomotive Firemen and Enginemen, and A. F. Whitney, vice-president of the Brotherhood of Railroad Trainmen.

As soon as suitable office space can be found a permanent office will be opened in Chicago and the new board will go into continuous session until the accumulation of grievances of the "big four" against the member roads since Federal control has been disposed of. After that, meetings will be held at stated intervals.

The railroads which signed the agreement for one year are the Union Pacific, the Atchison, Topeka & Santa Fe, the Chicago, Burlington & Quincy, the Colorado & Southern, the Northern Pacific, the Illinois Central, the Chicago, Milwaukee & St. Paul and the Minneapolis, St. Paul & Sault Ste. Marie.

The board will confine its jurisdiction to the adjustment of "disputes growing out of personal grievances or out of the interpretation or application of the schedules, agreements or practices now or hereafter established on the railroads signatory hereto which cannot be adjusted by direct conference between the representatives of the individual railroad and its respective employees."

The agreement continues:

All disputes arising out of proposed changes in rules, working conditions or rates of pay are specifically excluded from the jurisdiction of the board.

The board shall not assess punishment or change the discipline administered. In the determination of disputes involving personal grievances the decision of the board shall be limited to the guilt or innocence of employees as charged.

All decisions of the board shall be approved by a majority vote of the full membership of the board and shall be final and binding upon the parties to the dispute.

If a dispute had been considered by the board, but a majority vote cannot be obtained, then upon the request of either party to the dispute, the board shall certify such dispute to the United States Railroad Labor Board for final decision, accompanied by all supporting papers.

On October 11 the Railroad Labor Board cited the Pennsylvania for failure to obey its order directing a new election of employees' representatives and ordered that further hearings be held beginning October 20.

### Lehigh Valley Files Segregation Plan

THE LEHIGH VALLEY on October 6 filed with the United States District Court of New York a plan to segregate its coal properties in accordance with the decree of the United States Supreme Court, noted in the *Railway Age* of December 10, 1920, page 1030. The plan calls for no assessment from the stockholders and results in no sacrifice of their equity in the coal company investment. The government filed objections to the plan.

E. E. Loomis, president of the Lehigh Valley, outlined the segregation plan in the following statement:

"The stockholders of the Lehigh Valley Railroad Company are the owners not only of the railroad company itself but also, through the railroad company, of the entire capital stock of the Lehigh Valley Coal Company and of Cox Brothers & Co., Inc.

"The Supreme Court of the United States, however, on December 6, 1920, declared that the railroad company must sever its control of the Lehigh Valley Coal Company and Cox Bros. & Co., Inc., and the management of the company has devoted its best thoughts to finding a way to do this, and at the same time insuring full protection to the rights of all having an interest in the matter.

"On January 10, 1921, the boards of directors and officers of the railway company and the two coal mining companies were changed, eliminating all interlocking directors and officers. Each company now has a separate and distinct set of officers and board of directors, in accordance with the requirements of the decision of the Supreme Court.

"In considering its stockholders, the management recognizes a particular responsibility because of the fact that they are 19,122 in number, representing an average holding of 63 shares. Of its stockholders, also, 7,028 are women, and 615 are corporations of one character or another—banks, insurance companies, fiduciary concerns, charitable institutions, etc., with the funds or interests of thousands of persons partially invested in its stock. Also, 1,350 employees of the Lehigh Valley have placed their savings in the shares of the company, and are looking to the management to protect them.

"The management, in seeking a solution of this problem, has kept constantly in mind the necessity of complying fully with the letter and spirit of the decision of the Supreme Court and at the same time protecting the interests of its many small stockholders as well as those of the owners of bonds issued under the general consolidated mortgage. In other words, the management conceives it as its duty to see that the stockholders of the company shall receive full consideration and that the bondholders and their trustee are assured that the values subject to the mortgage lien are not impaired.

"To accomplish these results the management has offered the following plan:

"First: The Lehigh Valley Coal Company will issue \$30,000,000 non-cumulative preferred stock (with no voting rights) of \$100 par value per share, yielding dividends at the rate of 7 per cent. per annum, which will be turned over to the Lehigh Valley Railroad Company in the form of a stock dividend declared out of surplus. The \$2,100,000 annual income from this preferred stock will be payable to the railroad company.

"Then, in order that the railroad company may completely dissociate itself from control of the coal company, in accordance with the court's order, it will convey all of its interests in the common stock to a trustee, which will then issue, at the

direction of the railroad, to the holders of the railroad company stock, 242,432 certificates of interest in the common stock of the coal company in the ratio of one certificate for every five shares of common or preferred railroad stock.

"These certificates of interest will be dividend-bearing, based on the dividends earned by the coal company on its common stock, and in addition will give their holders the same voting rights as if they actually held the coal company stock. The trustee, under the general consolidated mortgage, will give the new trustee a proxy, such as it has given the railroad in the past, enabling the new trustee to vote the stock as directed or authorized by the holders of the certificates of interest.

"These certificates of interest are evidences that, upon the maturity of the general consolidated mortgage and the release of the coal company stock pledged thereunder, the holders will be entitled to a pro rata distribution of the shares of the coal company stock.

"So far as the trustee under the general consolidated mortgage is concerned, the segregation makes no change in the value of the property subject to the mortgage lien.

"Second: The stock of Cox Bros. & Co., Inc., will remain as at present until the maturity, in less than five years (February 1, 1926) of the collateral trust agreement under which it is pledged, except that the voting power in the meanwhile will be assigned to a trustee to be appointed by the United States District Court. After that time the stock is to

be sold, the proceeds to go into the treasury of the Lehigh Valley Railroad Company.

"Third: The stock of the Delaware, Susquehanna & Schuylkill Railroad Company, owning a small branch line in the coal regions, which is also pledged under the collateral trust agreement, to be held until February 1, 1926, the maturity date of the agreement, and in the meanwhile application to be made to the Interstate Commerce Commission for authority to consolidate this line with the Lehigh Valley Railroad Company under the provision of the Interstate Commerce Act which permits the commission to allow consolidation of railroads notwithstanding the anti-trust laws. In the meanwhile, the voting power of this stock will be assigned to a trustee, as in the case of Cox Bros. & Co., Inc.

"This plan leaves the Lehigh Valley Coal Sales Company in position to negotiate a new contract with the mining companies."

The government filed objection to the plan on the ground that the segregation plan does not contemplate the disposition of the stock of the coal company, or the railroad company's equity therein, to persons not connected with or interested in the railroad company. The doctrine laid down in the case of the Union Pacific and Southern Pacific segregation, to the effect that in dissolving combinations in violation of the Anti-Trust Act the parts into which the combination is divided shall be placed under independent ownership, management and control, has been followed in subsequent cases.

## Bad Order Car Situation Presents Serious Problem

Essential That Railway Equipment Should Be Sufficient to Take Care of Maximum Traffic

By M. J. Gormley

Chairman Car Service Division, American Railway Association

TODAY THERE IS NO actual shortage of transportation with the possible exception of perishable traffic, and no complaint about the movement of traffic of any kind. That this is the condition in the face of the fact that there were loaded on the railroads during the week ending September 24, 1921, 873,305 cars, which is 86.6 per cent of the cars loaded during the corresponding period of last year, is the very best indication that there has been a very remarkable improvement in the efficiency of the transportation machine. The maximum business of last year was during the week ending October 23, when 1,010,961 cars were loaded, and this exceeded any previous records of the railroads. The record of September 24 this year is only 13.6 per cent less than the peak week of last year when considered only from standpoint of cars loaded and not tonnage. During this week there was a heavy increase in the movement of grain and grain products over the same week of the previous year, but this unfortunately was offset by a greater decrease in coal, forest products, coke and ore. If we stop with the presentation of these facts it would appear that the freight service does not need a general building up, but this is only part of the story. We must face the following facts. There are in the country today 374,431 cars in bad order, divided into 183,480 box, 153,275 coal and 37,670 miscellaneous types. There are also 201,153 surplus cars; that is, cars for which there is no demand. This means that there is a total of 575,584 cars out of commission today, classed as surplus and bad order, or 24.6 per cent of the total ownership. In considering this, however, we must

keep in mind that the bad order situation is always with us but to a less extent than it is at the present time. Considered from the standpoint of a liberal allowance, under present conditions there should not be an excess of 7 per cent of the freight cars of the country in bad order. There should be only about 160,886 cars in bad order, which means if that were the condition, the number of cars now reported as surplus, or available in excess of the demand, would be 414,698.

The problem now before the railroads is to repair or rebuild the bad order cars that can be so treated, and to replace with new cars those that cannot be economically repaired or rebuilt and make other necessary additions to the equipment. These facts, with the further fact that there were in existence 27,048 less cars under date of July 1, 1921, than on July 1, 1920, gives you what might properly be termed a "bird's-eye view" of the car situation today.

The heavily decreased earnings, with the extremely high operating costs, have made it necessary for the railroads to curtail their maintenance expenditures to the lowest possible limit that would enable them to furnish good service. With an immediate prospect of a business increase, the carrying out of the proposed plan for funding of the indebtedness of the railroads to the government for capital expenditures will have the effect of providing funds for the rebuilding program of the railroads which are not available from any other source.

With this accomplished we believe the railroads could put in condition all cars that are awaiting repairs in excess of 7 per cent and thereby make available sufficient equipment

\*Address before the Traffic Group, National Retail Dry Goods Association, Washington, D. C., on October 7, 1921.

to handle up to at least the past records of performance; but what concerns the railroads and the shippers today is the providing of facilities that will not only take care of business up to the maximum of the past but the possible maximum of the future, and unless the revenues of the railroads are sufficient to attract capital to that channel it follows to a certainty that commercial expansion of the country will be impossible.

I do not want to tire you with post mortems as I believe that now is the time to look forward and not backward, but post mortems are often performed to find out what caused the death of the patient in order that the knowledge gained thereby may be used in finding a cure for future cases. Our memories are very short in this country, but if you will recall, the railroad officers were for several years pointing to the people that unless there was an increase in their revenues they would be unable to expand to meet the growing transportation needs of the country. It is regrettable that they were able to convince only themselves of this fact. This is the real reason why a building up program of the railroads is now necessary and in progress.

By not obtaining sufficient net earnings the railroads will be unable to enlarge their facilities to provide for the movement of the possible maximum traffic of the future with a service equal to that rendered today. We maintain that the people of this country are always entitled to as good service as they are getting today and, if they will keep this in mind and not let the mistakes of the past be their guide post in the future, and insist on a constructive program for commercial expansion, we believe this service can be furnished and maintained. This brings to our minds the wholesale demand today for a decrease in the freight rates. A great many people apparently can only see this situation from the standpoint of rate reductions and they have the mistaken idea that the only way traffic can be stimulated is by reduction in the freight rates. I do not qualify as competent to discuss the freight rates but I do not think that any one needs to be an expert in that direction today to realize if he takes the time and the trouble to study the situation from every angle that the rate situation has but a very small bearing on the question of the traffic movement today. Without a doubt there are rates that are out of line but a great many modifications have been made in these rates and are being made daily. A glance at the freight loadings today I think will convince anyone who has an open mind that these are the facts. It has been shown that a decrease in the selling prices of commodities very many times in excess of any possible reduction in the freight rates has failed to move the traffic. In my opinion, and I would like it understood that this is my opinion only, the fact that there has been so great a clamor for freight rate reduction has had more to do with holding back the movement of traffic than any excessive freight rates.

I know there are some very well defined opinions that the railroads are unnecessarily losing short haul traffic to trucks, barges, etc., by reason of these high freight rates, but I maintain that if transportation can be provided by trucks or barges for short haul traffic more economically than can be provided by the steam lines then most certainly it should go to the cheaper lines of transportation provided they, like the railroads, are required to pay their proper part of the country's taxation expenses; and right at this point I call your attention to what I doubt if many of you know, and that is that the taxes paid by the transportation companies of this country amounted in the year 1920 to \$278,868,668, an increase of \$180,241,820 over 1911 or 183 per cent.

I think you all agree that the only time there is a general public clamor for a reduction in freight rates is at a time when business is moving in small volume and the service on the railroads the best. Without a doubt every one here will recall that at some time in the past three years you have

said that what we need is service; the most expensive thing for us is low rates and poor service. This country has gone through in the past four years periods when the service was anything but satisfactory, due of course in a large measure to the war conditions but to other causes too numerous to mention today, but I would ask of any of you to answer your own question as to whether you would prefer seeing that the railroads obtain sufficient net earnings to provide the same service you are getting today, or would you prefer a lowering of the freight rates and what would consequently follow a blocking of the expansion of the transportation machine of this country?

I have been fortunate enough to have spent nearly all of the last two years on the industrial side and I know there were times during that period when the answer to that question would have been—"The cheapest thing for the industry is that the railroads be maintained at a level that would attract capital to railroad investment and thereby expand the transportation machine so that it would be able at all times to move the maximum business with entire satisfaction."

We should never lose sight of the fact that to provide first class service at times of peak movement of traffic means that for certain seasons of the year there must be maintained a very great surplus capacity. Right at the present moment the energies of the railroads are being directed to moving the largest perishable traffic in their history, estimated to be 40 per cent in excess of last year, when it was considered that there was a very heavy movement; this must be made with no more refrigerator cars in service and, in fact I think a detailed check would show less cars in service than in previous years. In looking over these estimated figures I could not help recalling that the refrigerators now being used for that movement have been standing on the side tracks of the railroads of this country awaiting business for as long as five or six months. This surplus capacity can only be maintained at a very considerable expense.

I wonder how many of us today really realize that transportation is the right hand of industry. The lack of transportation today has more to do with famine in China and Russia than anything else. I assume you all know that in this country there are about 270,000 miles of main line tracks and if we include all of the sidings this mileage would reach 400,000. Transportation is the biggest industry in the United States and for a great many years the railroad development was very much ahead of the industrial development. The foresight of the railroad officers that made that possible in the past is just as great today as it was then and they will meet the situation and again bring railroad development to the point where it leads the industrial development if they are given a reasonably free hand where their incentive and initiative can be used to its fullest extent. Take away the initiative of an organization and you have undermined its foundation.

If your organization and other similar organizations and individual shippers will study this and view it from the standpoint of your own future interests, I am sure you will see that the transportation industry is given an opportunity to again resume its proper place in the commercial development of this country.

THE CHICAGO, BURLINGTON & QUINCY has presented to conductor William H. McGee, of the St. Joseph division, a gold watch and chain, in recognition of his capture of a robber on the night of September 10. Conductor McGee was in charge of southbound passenger train No. 16, near Parkville, Mo., 12 miles north of Kansas City, when the robber forced him down and bound him. McGee later cut the bonds from his hands and feet, secured a revolver from the mail car, disarmed the robber and finally turned him over to the proper authorities.

Two Baldwin-Westinghouse Electric Freight Locomotives for the Paulista Railway

## Electric Motive Power for Paulista Railway

### Two Freight and Two Passenger Locomotives Built for Brazilian Road by Westinghouse Company

A TOTAL of 16 electric locomotives, six for passenger and ten for freight service, were purchased in the United States for the Paulista Railway, Brazil. Two passenger and two freight locomotives were supplied by the Westinghouse Electric International Company and are described in this article. The remainder of the locomotives, consisting of two types manufactured by the General Electric Company,

2-4-0 + 0-4-2 wheel arrangement and each driving axle is equipped with a 580 h.p., 3,000-volt twin motor and quill drive.

The passenger and freight train weights and schedule speeds are such as to require locomotive horsepower ratings in almost exact ratio of four to three, so that by using eight armatures on the passenger locomotive and six on the freight locomotive, it was possible to use the same identical motors in both services, except for the external frames. The passenger motors are in twin frames, while the freight motors are in axle and nose suspension frames, but the motors are identical electrically and all replacement parts, coils, complete armatures, field poles, brushes, armature bearings, etc., are interchangeable throughout. This is, of course, a tremendous operating advantage and is obtained without the sacrifice of fitness of type of each engine for its service. The freight locomotives operating at speeds up to 40 m.p.h. with comparatively light axle loads, have the mechanical simplicity inherent in axle-mounted motors and direct geared drive, while the passenger locomotives for speeds up to 65 m.p.h. have the advantages of high center of gravity and large proportion of spring-borne weight given by the quill drive.

Electric Passenger Locomotive

were described in the *Railway Age* of July 9, 1921, page 80, together with an outline of general conditions on the railroad and a description of other electrical apparatus.

#### Freight and Passenger Motor Parts Interchangeable\*

The freight locomotives are of the six-axle type, with two six-wheel articulated trucks. There are six axle-mounted motors rating 280 h.p. each at the one-hour rating. The motors are wound for 1,500 volts for operation two in series on 3,000 volts and are arranged for field control. Each motor drives its axle by a single flexible gear.

The passenger locomotives included in this order have a

\*Abstract of an article on the Paulista Railway electrification by S. B. Cooper, general engineering department, Westinghouse Electric and Manufacturing Company.

#### Mechanical Construction

The frames are of solid slab steel with the openings drilled and burned out by torch. The brake rigging and equalizer parts are fitted with case-hardened pins and bushings throughout, minimizing wear and facilitating replacement. The pedestal shoes are of bronze and the journal boxes are arranged for grease lubrication of the hub liners.

The control equipment has been worked out to give the greatest possible degree of simplicity consistent with good engineering and the proper degree of operating flexibility. All switches required to break heavy current are of the unit type mounted in two rows just below the main grid resistors. Motor combination circuits for motoring and regenerating are set up by cam switch groups and stabilizing resistor

nections for regeneration are made by smaller unit switches without blowout coils.

Continental type couplers with take-up screws are used on passenger cars, but only open links on freight equipment. For this reason it is particularly desirable to have a high degree of flexibility and smoothness in the control. This is accomplished by having three motor combinations of six, three and two armatures in a series on the freight locomotives, giving, with field control notches, six running speeds. The main handle on the master controller has 18 positions, giving a total of 54 notches. On the passenger locomotives, the armatures are connected eight, four and two in series, giving six running speeds and 54 notches.

### Regeneration Provided For

Regeneration is provided for in all three combinations, with 13 notches in each combination, giving a particularly wide range of regenerating speeds, a most desirable feature with the various classes of trains and varying grade conditions existing on the Paulista.

The brake equipment consists of a combination of air and vacuum brakes. The space requirements for the cylinders made it impossible to use vacuum brakes on the locomotives, so they are equipped with air brakes. The control of the brakes is so arranged that air on the locomotive and vacuum brakes on the train is handled from a single valve with uniform rates of application and release. An independent straight air valve is provided for the separate control of the locomotive brakes as desired, thus making it possible to shut down the exhauster during light engine or switching movements.

### Provision For Future Conditions

The auxiliary equipment is simply arranged; a single high voltage auxiliary motor-generator set furnishes power for control, lights, motor excitation during regeneration, and for the blowers, compressor and vacuum exhauster. The motors driving the exhauster and blowers are practically identical. The control and auxiliary equipment throughout is the same on the freight and passenger locomotives, excepting for such detailed differences as are required for the control of six and eight armatures respectively.

The traffic on the Paulista system is growing at a very

healthy rate and even with double track it will not be many years before track capacity becomes a serious consideration. It seems probable that by that time both the Sao Paulo Railway and the Paulista Company will change over to M. C. B. type couplers and therefore be able to handle much larger trains. With this end in view, these locomotives have been equipped for multiple operation so that they can be double-headed with a single crew and handle 1,400-ton trains instead of 700. The bumper castings have been so designed that M. C. B. couplers can be very easily applied to replace the Continental type.

One hour rating, per motor.....	280 h.p.	560 h.p.
Locomotive ratings—short field:		
Horse power (one hour).....	1,680	2,240
Fractive effort.....	29,400 lb.	19,400 lb.
Speed, m. p. h.....	21.4	43.2
Horse power (continuous).....	1,350	1,800
Fractive effort.....	21,600	14,300
Speed, m. p. h.....	23.4	47.2
Fractive effort at 25% adhesion, lb.....	58,500	51,000
Maximum safe speed, m. p. h.....	40	65

The more important ratings and dimensions are shown in the table. Ratings are on the basis of the A. I. E. E. rules throughout, the continuous rating being based on 85 deg. C. rise by thermometer, or 105 deg. C. rise by resistance, thus giving conservative total temperatures with the high air temperatures encountered at certain seasons in Brazil.

The freight locomotives are now in Brazil ready for service, and the passenger locomotives have been completed and shipped from the works of the Westinghouse Electric and Manufacturing Company at East Pittsburgh, Pennsylvania.

# Debate Federal versus State Regulatory Powers

## State Utility Commissioners Question Extent of I. C. C. Authority Under Transportation Act

THE National Association of Railway and Utilities Commissioners was accustomed to formulate a theme for its annual meetings, it would probably have chosen for the convention held this week at the Georgian Terrace Hotel, Atlanta, something like the following: "The Attempt to Construe the Transportation Act to Mean the Transfer of State Jurisdiction Over Railroads to the Federal Government." This was the keynote of the meeting. One of the most important reports was that of the Committee on Litigation formed in September, 1920, to take action in the various cases before the Interstate Commerce Commission relative to the increase in intrastate to agree with interstate rates.

The convention, which began on the morning of October

11, was welcomed to Atlanta by Thomas W. Hardwick, governor of Georgia. In addition to the presentation and discussion of the committee reports, there were two round-table discussions, one on "After-the-War Phases of Regulation" and the other on the subject of "Automobile Transportation—Omnibus and jitney." The convention was also addressed by James A. Perry of the Georgia Railroad Commission, president of the association, by John E. Burton, general solicitor of the association, who presented a report on the work of his office, and by Joseph B. Eastman, member of the Interstate Commerce Commission. The meeting opened with President Perry in the chair with 72 commissioners representing 31 states in attendance.

### President's Address

Opposition in the strongest terms to a centralization in Washington, in the Interstate Commerce Commission, of control over all railroad rates, thereby destroying the power of the states to regulate their domestic commerce, was a distinguishing feature in the address of James A. Perry, of the Georgia Railroad Commission, President of the association.

The Transportation Act is being construed by the Interstate Commerce Commission in such a manner as practically to destroy the right of the states to regulate railroad rates and fares within their own borders, declared Mr. Perry, and a continuance of this interpretation of the act will amount to nothing less than complete abrogation of the fundamental principle of the sovereignty of the states as embodied in the federal constitution.

The Interstate Commerce Commission, Mr. Perry, contended, has construed the Transportation Act too much in the light of a revenue producing measure for the railroads, instead of in the light of an act to further regulate commerce. He called attention to the fact that the National Association of Railway and Utilities Commissioners some months ago appointed a committee to confer with the I. C. C. in an effort to work out a policy of harmonious co-operation, whereby the right of the states to prescribe intrastate rates would be preserved, but the conferences, he declared, "amounted to nothing, and nothing can be accomplished along this line so long as the Interstate Commerce Commission holds its present views."

The issue of states' rights, he pointed out, is now before the United States Supreme Court in the Wisconsin case and other cases, but he did not believe a satisfactory final solution of the issue could be obtained in that direction. Only by legislative action, in the form of amendments to the Transportation Act so as to re-establish clearly and indisputably the right of the states, can the issue be settled in his opinion, as expressed at the meeting. "If the present views of the Interstate Commerce Commission remain the law of the land," said Mr. Perry, "then we have suffered a

most serious blow at our dual system of government."

Local self-government, he declared, is essential to the success of our political institutions in this country. One central body can never deal intelligently or satisfactorily with local conditions, he continued, and remarked that "the people had a taste under Secretary McAdoo of the nationalization of the railroads, and quickly grew sick of it."

He pointed out that the Interstate Commerce Commission's rule of procedure, where advances in rates are sought by the carriers, is to allow the carriers to file schedules of the proposed advances, and if the same are not objected to within 30 days they become effective; whereas, the practice of a majority of the state commissions is to require the carriers, when applying for rate advances, to justify them before they are authorized. "To require the carriers to go to Washington and justify every advance, whether interstate or intrastate," said Mr. Perry, "would speedily bankrupt the weak railroad lines, would stifle completely the expression of protest by affected communities, and would mean that communities seeking relief from unreasonably high rates would spend great sums of money and months of traveling back and forth to Washington."

Mr. Perry further contended that the "utter futility," as he called it of federal regulation was clearly demonstrated in *Ex Parte 74*, The I. C. C.; in that case he said, "applied a horizontal increase to all roads alike, rich, poor, bankrupt short and long—all were given the same increase. And notwithstanding that increase, giving the roads the highest rates in 35 years, they have lost money at a shocking rate. They are back before Congress at this time, appealing for financial help. Every known principle of rate-making was violated in *Ex Parte 74*. Without knowledge or inquiry as to whether the traffic would stand these undreamed of increases, the Commission granted them. The inevitable happened when the movement of various commodities to a large degree stopped. Millions of dollars worth of perishable farm products rotted in the fields with staggering losses to carriers and producers alike."

### Commissioner Eastman's Address

Commissioner Joseph B. Eastman of the Interstate Commerce Commission in an address before the convention on Wednesday discussed the relations between the federal government and the state commissioners in the matter of interstate and intrastate rates.

"I feel confident," he said, "that you will all agree that

a sound national policy calls for harmony between state and interstate rates.

"We know from experience, and would know even without experience, that the absence of such harmony can only be a source of complaint and confusion."

Continuing, he said:

In some parts of the country the state and the interstate rates are now on a reasonably consistent basis; in other parts they differ. In my judgment harmony will eventually be established all over the country. I am also convinced that if it is not attained with the aid of the states, it will in due time be brought about by the exercise of national authority. This may seem to you a rash prophecy and I hope there may never be occasion for proving its truth. I make it merely because harmony in rates is so clearly a matter of vital national interest that I believe its attainment sooner or later to be inevitable. I am just as thoroughly persuaded, however, that it will be most unfortunate if it cannot be accomplished with your assistance and co-operation.

Whether or not co-operation is possible does not depend upon the law, it seems to me, for the law already authorizes and definitely contemplates such a getting together. It really depends, like many other things in life, upon the good will and good sense of the individuals who are called upon to do the co-operating. If we in Washington are arbitrary or inconsistent, for example, or if you are sensitive or short-sighted in your views of what you deem to be local interests, the difficulty will be very great. Now I assume that you will discuss our own errors and infirmities in this respect and keep us informed as to how we may mend our ways to advantage.

I realize that you may think this idle talk in view of our decisions during the past year in the various state cases. But the court has not spoken in those cases as yet, and they dealt with an issue which is not at all the same as the issue which I am now discussing. There it was a question of accomplishing uniformity of increase rather than harmony in rates and the two, as you know, may be very different things.

Coming back to the suggestions: First of all I suggest that it would be well to keep in mind continually the fact that you are dealing with a national railroad system whose operations are affected with a national interest, and that national policies, so far as important matters are concerned, are bound in the long run to prevail. This means mutual concessions and a spirit of give and take. No state can fairly expect to mould the national policy in complete accordance with its views, or to win 100 per cent of its contentions.

I suggest that you be long-suffering and patient in your dealings with us, because the inconsistency of state and interstate rates is only one of our troubles. Nor ought you to entertain the fear, which I understand exists in some quarters, that where inconsistency is present we always reach the conclusion that it is the state rate which is wrong. To use one of the favorite phrases in our reports, such fear is not justified by the record.

I suggest that it is well not to allow your energies to be wasted by exasperation with the carriers, and I make this suggestion because their attitude toward the state commissions in recent months has in some cases furnished cause for irritation.

I suggest that it may be possible for you to adjust differences among yourselves and take the initiative in bringing about harmony in state and interstate rates instead of waiting until the issue is thrust upon you. In this way you will gain the advantage of being positive rather than negative factors in the controversy. I realize that there may be many obstacles to such procedure of which I am not aware, but let me illustrate what I mean by the situation right here in the south. Probably there is no part of the country where there is more lack of consistency between the state and the interstate rates, and it seems to be very generally agreed that sooner or later this situation must be adjusted—at least, that is my impression of the general sentiment. Broadly speaking, the desirable thing is that the adjustment should be made with as little change as possible in the average level of rates, and such an adjustment is not easy of accomplishment. It occurs to me that if the state commissions of the south could get together and become the active proponents of a plan for bringing about harmony in rates within their territory they would stand on stronger ground than if the issue is brought to the front upon complaint of the carriers or upon our own initiative in Washington. And why should agreement between the states be impracticable? Surely no state wishes advantages at the expense of another. I feel confident, also, that the shippers of the south are not opposed to harmony in rates,

but are only concerned that it shall not be made the excuse for a further increase in the general rate level.

The opportunities for co-operation between the federal commission and the state commissions are wellnigh unlimited. Many of the matters over which we now have jurisdiction often appear to have more of local than of national interest. It may be that we shall not always retain jurisdiction in all these cases, but so long as we do we need your help. Consider, for example, the jurisdiction over the construction of new lines and the abandonment of old lines. \* \* \*

The field of regulation is so huge, in short, that whether our jurisdiction is enlarged, curtailed, or remains as it is, I cannot conceive of the time arriving when there will not be plenty of opportunity in railroad affairs for usefulness on the part of state commissions responsible to local authority and thoroughly in touch with local conditions. It is impossible, as I see it, to administer all these matters from Washington with any degree of satisfaction. But I caution you again to bear in mind that you are dealing with a national transportation system which must be guided in many respects by a national policy. And I further suggest that our duties are so numerous and our jurisdiction so wide that we may neglect at times the initiative in co-operation which you may think we ought to take, and that the burden of this initiative may appropriately be borne by you as well as by us. \* \* \*

I think I can foresee tremendous possibilities in the development of our national transportation system. For example, there are the possibilities in the reconstruction and joint use of the terminal facilities of our great cities, a matter to which far too little constructive thought has been devoted; the possibilities in electrification and the economical production and use of power; the possibilities in the development of waterways and motor transport and their relation to and co-ordination with the rail systems; and the possibilities which go with the phrase economy and efficiency in management and concentration upon the details of operation which have so much importance in the mass. And aside from these possibilities, the country is continually growing and if the experts are to be believed, our national transportation system has not for some years kept pace with this growth and now falls far short of its proper capacity.

Now it is not difficult to list the essentials, if growth is to be normal and if the country is to reap the full measure of the possibilities which I have described. Clearly there must, first of all, be adequate inducement for the investment of capital. Billions of dollars will be needed. There must be harmony and co-operation between the managements of the great railroad companies. Manifestly, it will deadlock any well-rounded development of our national transportation system if each has thought only for its selfish advantage, however such a course may profit a few industries or a few localities. There must be opportunity for the executives, particularly the operating executives, to manage their properties without the strain of continual financial worry or of too frequent public attack and investigation. Initiative does not show to advantage in fetters. Finally, and above all, there must be co-operation between the managements and the employees, for no railroad can operate efficiently with labor which is disloyal or disheartened. But to list these essentials and to say how they shall be attained are different matters.

It occurs to me that railroad discussion in recent years has been on a painfully low level. I am not thinking of the ignorance and demagoguery which always enter into any public controversy, but of discussion from sources which are presumptively intelligent. Rather than being an earnest and constructive effort to seek the truth, it has too often, if my impression be correct, been largely an endeavor to shift the blame, in other words to find a "goat," an endeavor productive of nothing but rancor and bad blood. For a long time, in the minds of railroad operators and investors, the Interstate Commerce Commission was apparently the sole obstacle to progress and increases in railroad rates the sole panacea. We have heard less of this since Ex Parte 74, but no doubt our turn will come again and so will yours. More recently the vials of wrath have been emptied upon the Railroad Administration, upon labor, and more recently still upon the Railroad Labor Board. \* \* \*

## Safety of Railroad Operation

Following are abstracts of some of the committee reports presented at the meeting. Other reports and additional details concerning the other business of the convention will be given in next week's issue of the *Railway Age*.

The report of this committee, of which C. C. McChord of the Interstate Commerce Commission is chairman, dealt primarily with safety on interurban lines. The report said that "while much has been accomplished in the direction of safety,

there has been a tendency to focus attention upon the larger steam lines, with a result that improvement on the smaller roads, particularly the interurban lines, has not kept pace with the larger steam systems."

"In nearly all instances," the report continued, "the interurban electric lines originated in street railways, doing an ordinary city street railway business. With the growth of cities and the rapid development of the surrounding country

they have gradually branched out and extended their lines into suburban territory, forming connecting links between towns and cities, until they have become important factors of the transportation system of the country and carry no small part of the nation's commerce. In their inception the interurban electric systems were comparatively small, their traffic was light, operating conditions were simple, and few, if any, operating rules were required. But with the development and extension of these systems there has been introduced more complex operating conditions and requirements, until they have approximated, if not equalled, those on the average steam railroad. In the meantime, however, there has not been adequate advancement or improvement in operating methods or practices. The result is that many such systems, practically trunk lines railroads, are today operating under primitive street railway rules and regulations, which constitute a serious menace to life and property."

The report instanced one road, a single track line, approximately 50 miles in length, over which there were operated

during a daily period of 20 hours, 56 trains, but on which road none of the employees were furnished with time-tables. Train crews were required to secure such information as they might need from a time-table made with pen and ink and posted on the walls of the terminal station. Complaint was made of other roads that failed to have proper train dispatching. Some roads, it was maintained, lack adequate and safe operating rules and arrangements, while still others which may have elaborate codes are constantly menacing the lives of their patrons through failure to require the enforcement of such rules. Laxity of time regulations and the absence on many interurban lines of signal systems and other safety devices also came in for severe condemnation, as did the lack of care in the selection, training, etc., of train service employees.

The report is signed by C. C. McChord, I. C. C., chairman; G. E. Halderman (Colo.), E. C. Kash (Ky.), W. A. Dutton (Ut.), Geo. R. Edwards (Miss.), B. H. Cooper (Ala.), D. F. Johnson (Ariz.).

## Grade Crossings and Trespassing on Railroads

The committee in its report said in part:

Of all careless travelers the automobilists are the worst offenders. The reckless things they will do are almost unbelievable. Their favorite pastime seems to be to race with a train in order to pass over the crossing just ahead of it. After frightening the engineer half out of his wits, causing him to blow the whistle and put on the emergency brakes, the automobilist, with a grin and wave of his hand, disappears in a cloud of dust. Of course, these cases are unusual but not so exceptional as they should be.

### Reckless and Careless Automobilist Worst Offender

But beside the daredevil reckless driver we have the careless driver, who is either too lazy or indifferent to danger to slow down, and, not having his car under proper control, he stalls his engine upon the tracks of the railroad, or discovers the approaching train too late to stop before the train hits him. If it were not for the automobilist it might be said that grade crossings under the modern methods of protection are reasonably safe. Notice the word safe is qualified. It is recognized that no grade crossing is or can be made absolutely safe.

But to return to the automobilist, some means must be devised to make him slow down, or, still better, stop his car before passing over the railroad tracks. If this can be brought about the greatest danger at grade crossings will be eliminated. Various states have endeavored to do this by passing a law requiring all motorists when approaching a railroad crossing and at a certain distance therefrom to reduce the speed of his car to 5 or 10 miles an hour. The difficulty with this law is that it is difficult to enforce and is not observed. In a few states the operator is

required to bring his car to a full stop before proceeding over the crossing. In other states a hummock or other defect is made in the roadway near the crossing so that automobiles for the comfort of the occupants and safety of its springs must slow down. This last method would seem objectionable in that it is creating a defect in the highway to the annoyance and inconvenience of everyone. It has not been adopted generally.

### Severe Punishment Needed to Stop Reckless Driving

The law prescribing the speed of vehicles over railroad crossings and the precautions to be exercised by travelers should be enforced as far as possible in order to make them effective. A few stiff fines, short imprisonments and loss of licenses to operate a motor car will go a long way towards putting a stop to reckless automobile driving over railroad crossings.

While doubtless the last word has not been spoken upon protection at grade crossings, apparently the means and devices now in use if judiciously employed by installing at each crossing the type best adapted to protect that particular crossing seems to be about all that can be desired for the purpose for which they are intended.

But it has been demonstrated that, regardless of the kind or degree of protection, accidents will happen at grade crossings. This is well known and needs no argument to prove it. Some one may say that no one is under an obligation to protect a man from death or injury due to his own carelessness. Human life, however, is so precious that it is desirable to protect a man from death due to his own negligence and vastly more desirable to protect the lives of those who would be killed by his negligence.

## State and Federal Legislation

The Committee on State and Federal Legislation reported that there had been no material change in the situation since the last meeting of the association. The report continued:

The last convention by resolution endorsed the bills then pending in both houses of Congress, to amend the Valuation Act, so as to relieve the Interstate Commerce Commission of the obligation in its valuation of railroad properties the estimated "present cost of condemnation and damages or of purchase of lands in excess of original cost or present value." Strenuous efforts were made to secure this amendment, but without results.

At this session new bills have been introduced in the House by Congressman Sweet, and in the Senate by Senator Cummins, and a favorable report has been made by the sub-committee of the Senate to the full committee.

At least a dozen state legislatures have passed resolutions demanding that congress amend the Esch-Cummins Act, so as to preserve to the states the regulation of their internal affairs. The American Farm Bureau Federation together with a number of other farm organizations and dozens of business associations have passed resolutions of the same nature. There is a popular feeling that this be done quickly in order to eliminate all litigation and prevent misunderstandings between the state and federal governments.

The Interstate Commerce Commission has held that its jurisdiction extends to every rate charged by an interstate carrier,

which after hearing it may find adversely affects interstate commerce, using the term "commerce" in a sense which covers "the entire field of transportation, the traffic itself and all the instrumentalities and means of carrying it on."

If these decisions are valid, then the Esch-Cummins Act, contrary to the declared intent of its authors, has extended federal control of intrastate rates to the point of destruction of state power of regulation, and has placed such control exclusively in the hands of a single overworked bureau in Washington, ill-informed as to local conditions, far from shippers, and available for relief only at such expense of time and money as practically to place it beyond the reach of complainants of ordinary means.

Bills have been introduced in the House by Congressman Sweet, of Iowa, H. R. 6801, and in the Senate by Senator Capper, of Kansas, S. 1150, which will clarify the situation.

We have had several meetings and conferences and have done everything possible to secure this amendment. The previous legislative committee was not satisfied with the provisions as to the power of the states in this act but was unable to secure any further concessions, and was told repeatedly, and has been assured since the enactment of the Esch-Cummins Act, that it was not the intention of congress to deprive the states of any of their prerogatives. Notwithstanding all this, we are obliged to establish our rights by the slow process of litigation, placing on the authorities of the state the burden of great expense in order to preserve to themselves the right of state regulation.

Congress should immediately pass an amendment that will rectify the condition and will read so plainly that there will be no necessity for continued litigation and misunderstanding between state and federal authorities.

The report is signed by CHAS. WEBSTER, (Iowa), Chairman; J. W. RAISH, (S. D.); T. A. BROWNE, (Neb.); ALEXANDER FORWARD, (Va.); ERNEST D. LEWIS, (W. Va.); FRED W. PUTNAM, (Minn.); OLIVER C. SEMPLE, (N. Y. P. S. C.).

## Litigation

The report of the Committee on Litigation included a detailed analysis of the several intrastate rate cases. It gave an outline of the efforts the committee and the association's general solicitor, John E. Burton, had made and were making in opposition to the Interstate Commerce Commission's decisions bringing intrastate rates up to the level of the interstate rates. "The year has been prolific," the report said, "of litigation begun to set aside intrastate rates. . . . To the extent that they have acted in such cases, the lower federal courts have without exception sustained the federal commission's orders. In most states the carriers have procured from such courts temporary injunctions restraining the state commissions and other state officials from taking any action to interfere with the putting into effect of advanced rates ordered by the federal commission. In every state the rates so ordered have taken effect. In no state, however, so far as we have knowledge, has a final order of a court sustaining the federal commission been entered."

The report follows in part:

The Committee on Litigation was created by a vote passed at a special meeting of commissioners held in Chicago on September 11, 1920, to consider what collective action the state commissions would take in the proceedings which had just before been instituted under the Transportation Act before the Interstate Commerce Commission to procure orders advancing intrastate rates in New York, Illinois, Wisconsin, and other states. The committee was authorized, by the vote creating it, to follow all litigation in which carriers might attempt to secure an interpretation of the Transportation Act diminishing the powers of the states to control intrastate rates and regulation of carriers, and to represent state commissions, granting authority therefor, in such proceedings.

The convention continued the existence of the committee by a vote as follows:

"That the president of this association be directed to appoint a committee of seven, to be known as the Committee on Litigation, said committee to act in all matters for the association wherein are involved the powers and rights of the several states to control the rates and regulations applicable to intrastate commerce; this committee to work with our general solicitor in representing the states in all such cases arising in the courts or before the Interstate Commerce Commission."

### Effect of Federal Commission's Orders

The effect of the decisions of the Interstate Commerce Commission in the several intrastate rate cases, may be summarily stated as follows:

"The prohibition against 'undue, unreasonable, or unjust discrimination against interstate or foreign commerce' is not limited to particular persons or facilities, but is applicable to such discrimination against interstate or foreign commerce in their broad definitions. (Illinois Passenger Fare Case, 59 I. C. C., 363.)

"The term 'commerce' covers the entire field of transportation—the traffic itself and all the instrumentalities and means of carrying it on. The language used is certainly broad enough to cover every discrimination growing out of the relation between intrastate and interstate commerce which unjustly affects the latter." (Illinois Passenger Fare Case, 59 I. C. C., 361.)

"If, without good reason, the fares within a state are lower than those authorized and established for interstate application, intrastate passenger traffic will not contribute its just share to the passenger revenues of the carriers, and the carriers may not earn the statutory return without further increases in the transportation charges on other traffic, including interstate commerce, thus unjustly discriminating against such commerce." (In the Matter of Intrastate Rates within the State of Illinois, 59 I. C. C., 365.)

"Whenever a carrier believes that an intrastate rate is too low, from a revenue standpoint, it may apply in the first instance to the Federal Commission for an order advancing the same, disregarding any state agency having jurisdiction over the rate under state laws. (Arkansas Rates and Fares, 59 I. C. C., 473; Nevada Rates, Fares and Charges, 60 I. C. C., 637; Arizona Rates, Fares and Charges, 61 I. C. C., 573.)

"It is no defense in such a proceeding that the intrastate rates yield a fair return on the value of property devoted to intrastate transportation. The law does not contemplate any segregation of such property and consideration of earnings thereon. (In the Matter of Intrastate Rates within the State of Illinois, 59 I. C. C., 364.)

"It is no defense that the interstate and intrastate business taken together, in the state involved, yield the aggregate return contemplated by the Trans-

portation Act upon the aggregate value of railroad property within such State. Section 15a, in its provision for group rates and aggregate returns, contemplates the disregard of state lines. (Nebraska Rates, Fares and Charges, 60 I. C. C., 312; and in the Matter of Intrastate Rates Within the State of Texas, 60 I. C. C., 426.)

"In order that the commission may act quickly, when it deems carriers' need of increased revenue urgent, it may increase specified classes of rates by straight percentage increases, without examination of particular rates, leaving persons aggrieved to secure modification of the commission's order after it has become effective. (In the Matter of Rates, Fares and Charges of the New York Central Railroad Company and other Railroad Companies in the State of New York, 59 I. C. C., 294.)

"In order that the Federal Commission may exercise jurisdiction to advance intrastate rates on any commodity, as discriminatory against interstate commerce, it is not necessary that there be any interstate commerce in such commodity. In such case the Federal jurisdiction rests upon the loss in revenue suffered by the interstate carrier. (Louisiana decision on sugar cane rates, 60 I. C. C., 476.)

"The question whether a rate or practice sought to be changed is 'unjustly discriminatory against interstate commerce' does not depend upon the amount of revenue involved, and the commission may accordingly advance intrastate rates prescribed by state authority, even when it is found that the advance will have 'no very substantial effect upon the revenues of any one carrier,' as in the case of the increase of minimum passenger fares in South Carolina. (60 I. C. C., 298.)

"Furthermore, the commission has jurisdiction to impose charges with respect to intrastate traffic, in contravention of state law, which charges are not designed for direct revenue purposes, such as the conductor's cash penalty charge imposed in South Carolina. (60 I. C. C., 298.)

Paragraph (4) of section 13 of the Interstate Commerce Act, as amended by the Transportation Act, provides that any rate or practice ordered by the commission "shall be observed while in effect by the carriers parties to such proceedings affected thereby, the law of any state or the order of any state authority to the contrary notwithstanding." All orders of the commission thus far made, prescribing state rates, have provided that the same shall "remain in force until the further order of the commission."

### Proceedings Have Related to Large Bodies of Rates

From the first the commission has proceeded under the Transportation Act, not upon investigation of particular rates, but with respect to large bodies of rates. In several instances the commission has advanced all of the freight rates within a state, and in other instances all of the passenger fares (with inconspicuous exceptions, such as commutation rates, too unimportant to mention) and that in some instances all rates within a state, both passenger and freight, have been advanced. This it has done, without examination of the rates increased, by the application of the same percentages of increase which were applied to interstate rates under the authority of the commission's decision in *Ex Parte* 74. The result has been that many situations were created where intrastate rates were so glaringly in excess of interstate rates that the carriers themselves desired to make adjustments. This they could not do without first securing a modification of the applicable order of the federal commission.

To remedy these situations, the federal commission designed a provision which, by amendment, or by original inclusion, has been a part of each order of the commission advancing intrastate rates, the same being as follows:

"It is further ordered that nothing in this order shall be construed as requiring any common carrier to establish, put in force or maintain any rate, fare or charge for the transportation of passengers or property in intrastate commerce, which is greater than its corresponding rate, fare or charge applicable to the transportation of passengers or property in interstate commerce from to or at the same points in effect on (the date of the order) or greater than its corresponding rate, fare or charge contemporaneously in effect and applicable to the transportation of passengers or property in interstate commerce."

"Whatever may be the meaning of the peculiar language 'from, to or at the same points in effect \* \* \* or greater than its corresponding rate, fare or charge contemporaneously in effect and applicable to the transportation of passengers or property in interstate commerce,' it is treated as permitting carriers to reduce the percentage of their intrastate advances when they desire to do so, to avoid or remove maladjustments which would otherwise result from an order.

Reference has been made to this device as a necessary preliminary to a statement of the extreme length to which the federal commission has gone in its orders aimed to exempt carriers from the obligation to conform to state rates prescribed by state laws.

### The Kansas Case

In the Kansas case it was shown affirmatively, upon the hearing before the federal commission, that without increases the Kansas freight rates were already, in large part, as high as interstate rates. Nevertheless, the *Ex Parte* 74 percentage advance was ordered, with the proviso in the order just quoted, under which it was said "difficulties of the kind referred to can be avoided." (Kansas Rates, Fares and Charges, 62 I. C. C., 448, 450.)

The effect of this order is that the federal commission, as to the entire body of Kansas intrastate freight rates, said to the carrier: "We find that these rates are in part lower than corresponding interstate rates. You may accordingly determine what rates are in fact lower than corresponding interstate rates, and may advance those rates such percentage as you may determine to be necessary to bring them to a parity with corresponding interstate rates, not, however, exceeding the percentage advances authorized as to interstate rates in *Ex Parte* 74."

In other words, the commission in effect authorized the Kansas carriers to determine what intrastate rates in Kansas were discriminatory, and to advance the same by such a percentage as such carriers determined to be necessary to remove the discrimination.

It is difficult to conceive of the more complete destruction of state power of regulation than is represented by these several orders of the commission to which we have referred, if those orders are valid.

It should be noted that from these orders (with the exception of the Chicago, North Shore & Milwaukee case) Commissioner Eastman has dissented. In the Kansas case the newly appointed commissioners, Campbell and Lewis, also dissented, the first upon the ground that the federal commission has no jurisdiction under the Transportation Act to review the reasonableness of State rates, and the latter upon the ground that the fact of discrimination must be found by the commission itself before it can properly make an order advancing an intrastate rate.

### Appearances Before Federal Commission

Acting under the authority of the vote of the last convention, heretofore set out in this report, this committee directed the appearance of the general solicitor in cases pending before the federal commission "involving the power and rights of the several states to control the rates and regulations applicable to intrastate commerce." He accordingly appeared in the several cases mentioned, and from time to time made arguments, as new questions, not before passed upon by the commission, were presented in any case.

The validity of the several orders mentioned is being contested in most if not in all of the States affected. In New York, Ohio, Nebraska, Michigan, Montana and Utah attempts were made in the State courts to enjoin the carriers from putting into effect rates in excess of those authorized by State laws, but the State courts appealed to refused to exercise jurisdiction. In some cases temporary injunctions were obtained, but these were without exception later dissolved. The States were accordingly left to protect their rights in the federal courts.

The State of North Dakota instituted an original action in the United States Supreme Court. The Wisconsin, New York, Minnesota and Illinois cases have already reached that court. All other cases are still pending in the lower federal courts.

### Appearances in Court

It obviously was impracticable for your committee to attempt to provide intervention on behalf of the state commissions in these several suits in the lower federal courts. In the first and only case thus far argued in the United States Supreme Court the committee did instruct the general solicitor to appear on behalf of all state commissions desiring appearance to be made on their behalf. A brief was filed, which has been distributed to all the commissions.

This brief was a revision and extension of the brief which was filed before the Interstate Commerce Commission in the New York and Illinois cases, involving the same questions as are involved in the Wisconsin case, covering which report was made by this committee at the last convention.

In the brief in the Wisconsin case in the United States Supreme Court the general solicitor joined 42 state commissions. In filing the same he was also joined by the attorneys general, or rate counsel, of all the states but one affected by the advanced rate orders of the federal commission made prior to the date of the filing of said brief. In all 43 states were thus represented on the brief.

The states that thus appeared necessarily did so *amici curiae*. Under an established practice of the United States Supreme Court, *amici curiae* are not permitted to be heard in oral argument. In only a very few instances in the history of the court has the rule been relaxed. Upon a motion filed by the general

solicitor, however, setting forth the interest of the forty-three states represented, leave was granted for the appearance of a single counsel to represent said States upon the argument. Two hours' time was allowed for the purpose. The argument was made by the general solicitor.

This case was argued on March 11, resumed on the 14th and concluded on the 15th, and is yet undecided.

A very important and interesting case now pending in the United States Supreme Court is that of the State of Texas against the Interstate Commerce Commission and the Labor Board, which is an original action brought to test the validity of various provisions of the Transportation Act. The New York, Illinois and Minnesota cases, as has been stated, are also pending in the same court, and it is probable that several other cases of like nature will reach that court and be argued during the coming year.

It is not to be expected that the decision in the Wisconsin case will determine all questions involving the rights of states as to regulation of intrastate commerce under the Transportation Act. While it will not be practicable, and probably will not be desirable, that appearance be made on behalf of state commissions generally in all such cases, it doubtless will be desirable to have such appearance made in some of them. New cases involving state power of regulation will also undoubtedly arise before the federal commission, in which the state commissions should be represented.

### Conclusion

It is accordingly the recommendation of this committee that the same be continued for another year, the membership to be appointed by the president, with the same responsibility and authority as was provided in the vote passed at the last convention.

The principal assistance given to our general solicitor has been through commerce counsels of the various commissions and attorney generals of the various states. The real work of this committee has been carried on by our general solicitor. The committee believes that this work should be continued and that a committee should be appointed by the president for the ensuing year to give such assistance to our general solicitor as is possible.

The report is signed by FRED W. PUTNAM, (Minn.) chairman; DWIGHT N. LEWIS, (Iowa); W. D. B. AINEY, (Pa.); ALLISON MAYFIELD, (Tex.); JOHN F. O'RYAN, (N. Y.); JNO. A. KURTY, (Mo.); R. HUDSON BURR, (Fla.).

The following officers were elected by the association for the ensuing year: President, Carl D. Jackson, of the Wisconsin; first vice-president, Dwight N. Lewis, of Iowa; second vice-president, Alexander Forward, of Virginia; secretary, Leroy S. Boyd, of New York.

## Why Are American Bridges Heavier Than European?\*

By Dr. P. H. Chen

Engineer of Construction, Tientsin-Pukow Line, Chinese Government Railways, Tientsin, China

I HAVE BEEN GREATLY interested in studying the specifications and standards of different countries. The more I study the worse becomes the puzzle. The principal points of perplexity are those which affect the strength and rigidity of railroad structures.

The allowable unit stress in continental Europe seems to be high. Many people think that Europeans do not take impact into consideration while others believe that impact is already covered by the allowable unit stresses. I take live load, dead load and impact into consideration in analyzing the European allowable unit stresses and find the difference in short spans about 40 per cent to 60 per cent higher than in American practice. The low unit stress used by Europeans, therefore, is not enough to cover American impact formula, especially in short spans.

Some people think Europeans use steels of better quality

\*Abstract of paper and subsequent discussion presented before the annual meeting of the Association of Chinese and American Engineers, Peking, China, April 6, 1921.

They specify higher minimum ultimate stress for structural steel. It appears to me that it largely depends upon the value of impact. If the American impact formula is right, naturally softer steel is preferable. Otherwise, high carbon steel may be used to advantage. Americans also use high carbon steel for long span bridges where impact is small.

I am greatly surprised at the difference in top chord bracings. For comparison I have chosen two bridges, actually in service, with the same span length and designed for almost the same live loads. The European bridge seems to be weak and to lack rigidity. It is braced on top with only one 3-in. by 3-in. by  $\frac{3}{8}$ -in. angle without cross struts, while the American bridge is braced with two heavy struts, web system and corner brackets. The American bridge has greater truss depth, and both on top and at the bottom there are rigid connections. The European bridge seems weak and slender while the American bridge looks stiff and rigid. Undoubtedly Americans use a great deal more metal for bridges of the same span length with identical live loads.

The reasons for such a wide difference in standards and specifications should be thoroughly investigated. The American impact formula is certainly correct, as it is obtained by stress measurements and the result has been carefully checked by a great number of well known engineers. The allowable unit stresses in European practice must also be correct, because Europeans also have measured the actual stresses in bridge members. I wish to bring out three questions for discussion:

(1) If American practice is correct, how can European bridges stand long service without signs of failure?

(2) If European practice is correct, why should Americans waste so much money in building heavy structures?

(3) If different conditions require different standards and specifications, what should ours be in order to secure economical and reliable structures?

#### Comments by Dr. J. A. L. Waddell

Whether "the allowable unit stress in Continental Europe" is high or low, it is impossible to cover the effects of impact "by the said allowable unit stress." Impact is a real stress, varying mainly with the span-length but also somewhat with other conditions, such as character of superstructure, type of substructure, kind of rolling stock, and velocity of train; and its greatest probable amounts must be provided for in scientific bridge designing. This cannot be done by changing the intensities of the working stresses for various span-lengths and different bridge-members, but the matter must be treated by considering impact stresses as increments to the live-load stresses, as is now the custom in America.

Dr. Chen has shown that, when impact is duly considered, the intensities of working stresses employed in Europe are higher than those used in America. In the old days, "the boot was on the other leg," American bridges being much lighter than those designed by European (especially English) engineers. While the science of bridge design has been developing in America, the bridges there have been increasing in weight even more rapidly than the moving loads have augmented; for it has required a liberal use of metal to correct the old faulty details and to provide adequate rigidity for the checking of all unnecessary and avoidable vibration.

Dr. Chen may well be surprised at "the difference in top-chord bracings," for the European bracing he describes is almost unbelievable in its crudeness and inefficiency. The function of such bracing is to hold the top chords to place and line and to permit the legitimate assumption of the panel length as  $l$  in the ratio of  $l$  over  $r$  in strut formulae. The lateral bracing serves an exceedingly important function in bridge designing; and any attempt to reduce its effectiveness by cutting down its weight is reprehensible.

Dr. Chen admits that the American impact formula is correct—it certainly is; for some of the best brains in the

engineering profession have been devoted to its establishment, and the methods employed thereon have been practical—not theoretical. Dr. Chen says "The allowable unit stresses in European practice must also be correct, because Europeans also have measured the actual stresses in bridge members."

To this I cannot agree, for when results differ so materially, one side only can be right—and it is acknowledged that the European impact—experiments have been quite meagre as compared with those made in America.

Dr. Chen asks three pertinent questions; and I shall answer them to the best of my ability.

(1) "If American practice is correct, how can European bridges stand long service without signs of failure?" Do they so stand it? Take, for instance, the bridges of European design on the Chinese railroads, built not so very long ago. I am told that they are nearly all so fundamentally weak that their immediate removal and replacement are a necessity. It is true that, the world over, bridges of inferior design can often be used without disaster for long periods. This is because of the so-called "factor of safety" employed in their designing; but that is no reason for building any more structures like them. There have been many badly designed bridges built and operated in America, but they are rapidly being removed, and either discarded *in toto* or employed on branch lines where the rolling stock is light.

(2) "If European practice is correct, why should Americans waste so much money in building heavy structures?" Without stating whether European practice is right or wrong, I beg to maintain most positively that American bridge designers rarely waste money by making their structures unnecessarily heavy. Experience has taught them what the traffic truly requires; and they provide enough metal to meet the demand—but no more.

(3) "If different conditions require different standards and different specifications, what should ours be in order to secure economical and reliable structures?" I would suggest that the true science of bridge design has been developed mainly in America; that there the old practice of building light, flimsy, and vibratory structures has slowly and gradually been changed to constructing stiffer and still stiffer ones; and that the modern American bridge if properly cared for, will last for centuries, unless excessively overloaded. Such being the case, what better can Chinese engineers do than to study American bridge practice, adopt standard American bridge specifications, and employ live loads so large that, in all probability, they will not be exceeded for at least a quarter of a century?

Unloading American Supplies at Riga, Russia

## The Cost of Contract vs. Railway Shop Repairs

Total Cost to the Railroad Was 28 Per Cent Greater in Its Own Shop Than in a Contract Shop

By J. W. Roberts

President, Roberts-Pettijohn-Wood Corporation, Chicago

*[Following the computation of the total cost of repairing 50 box cars in a railroad shop arrived at in the preceding article, the author in this, the concluding article, develops the cost to the roads of similar repairs made in a contract shop, and compares the cost under the two sets of conditions.—Editor.]*

**T**HE TOTAL COST of the work performed in the outside shop is in four subdivisions:

1—Direct costs as billed by the contractor, covering materials supplied by him, or purchased from the railroad at agreed prices and rebilled at the same prices, including labor, overhead, and profit, in accordance with the terms of the contract.

2—So-called "free" materials, supplied by the railroad at its own expense, and not covered by the contractor's bill.

3—Expenses incident to having the work done in an outside shop, which were borne by the carrier.

4—The credit for the salvage value of usable materials and scrap recovered from the cars repaired by the contractor, inclusive of the expense incident to concentrating the same for reclamation, or disposal, according to the practice with regard to the scrap recovered in the carrier's own shop.

These items are considered in the order named.

### Direct Costs as Billed by the Contractor

The contractor was required to render a detailed bill of charges for each car repaired. The gross amount of the bills rendered on the fifty cars selected at random, which were audited and paid by the carrier, was \$47,885.69.

As a matter of interest, and not because it has any direct bearing on the matter of cost to the carrier of outside work as herein developed, it might be said that the carrier operates a line of railway which is so situated as to compete, and doubtless with marked success, for tonnage moving from raw material markets to the contractor's plant. To the extent, therefore, that materials furnished by the contractor and billed against the carrier may have moved over

its own rails, there was presumably an element of profit in the rates charged for transporting such materials.

### Free Materials Supplied by the Carrier

Under the terms of the contract certain materials to be used by the contractor in the car repairs were to be furnished without charge by the carrier, delivered at the contractor's works. This material consisted of car roofs, draft arms, door fixtures, draft gear and steel car ends. The cost of such materials applied to the 50 cars, delivered to the carrier's own rails, was ascertained from the purchase records as \$18,017.00. The cost of hauling it over the carrier's own line to delivery at the car plant, computed at 7 mills per net ton mile, amounted to \$387.00, making the total cost to the carrier for "free" materials \$18,404.00.

Except for isolated cases where car-load lots of these materials were moved via the general storehouse to accommodate the immediate needs of the carrier shops, and of other contractors repairing the same class of cars elsewhere, the free material moved direct in car-load lots, and was not subject to storehouse handling. The cost of purchasing and accounting for it is included in general expense apportioned to the contract cars the same as company repaired cars.

### Incidental Expenses Borne by the Carrier

The charges absorbed by the carrier for switching cars to and from the plant of the contractor amount to \$7.00 a car, or a total of \$350.00.

The cars repaired at the contractor's plant, which is located at an intermediate point on the carrier's system of railroad, were not apparently given any special movement to make them available for repairs. It was said that the cars were selected from those moving through or made empty at the terminal at which the repair plant is located, and the only expense involved was the switching to and from the

plant. The cars repaired in the carrier's shops were made available in the same way and no extra haulage to bring the cars to the shop seems to have been incurred in either instance. In both cases, also, the points at which the cars were repaired are tonnage-producing stations, and it is claimed that when the cars were repaired and released they were simply contributed to the local supply of cars ready for loading and that special movements to loading points were unnecessary.

In this connection it is proper to remark that the contract costs have apparently been burdened with all the switching expense incident thereto. The railroad shop costs have been burdened with switching expense only to the extent that switching was performed by the shop yard engine. In addition to this, however, it appears that shop fuel was switched to the railroad shop by regular yard engines, as were also the materials used in repairs, which were drawn from the general storehouse stock. It was not practicable to identify such expense, of course, and rather than estimate it, it has been omitted.

The carrier stationed car inspectors and accountants at the contract shops to pass on the quality of work and to verify the charges of the contractor. This expense reached its peak during the inception of the work, when the plan of procedure had to be worked out and the preparatory work done. It tapered off as the work progressed. The work under the contract not having been wholly finished when this examination was made it was necessary to estimate the additional amount necessary to be spent in connection with the cars unfinished. The average cost per car of inspection and accounting at the contract plant was thus found to be \$16.00 per car, or equivalent to \$800.00 for the fifty test cars. This sum of \$800.00 is not properly to be considered as an addition to the other costs enumerated, however, because the expense was charged to overhead accounts, which have of necessity been apportioned in total, and the test cars are elsewhere assigned with their pro rata share of the total expense. Because similar expenses of which no record was available had been coincidentally incurred in connection with other repair contracts, and the overhead accounts carried still other elements of indirect expense which could not be specially assigned, it was necessary as a matter of equity to treat with the total of such accounts in an arbitrary way. To have assigned the \$16.00 per car to the contract cars, deducting the sum from the overhead expense and apportioning the remainder would have charged the test cars with one hundred per cent of their own expenses and a part of expense attributable to other enterprises, which would have been unfair and misleading.

To the same extent as though the expense had been incurred in the carrier's own shop, it is considered that railroad general expenses representing administrative and supervisory expense, purchasing, accounting and similar items of a general character are applicable to the costs attaching to the outside contract. To the accumulated direct and incidental costs there has been applied, therefore, the same percentage (3.473 per cent) applied to the carrier's shop costs, resulting in the sum of \$2,314.60.

#### Salvage Credit for Materials and Scrap Recovered

The contract covered the bases on which scrap and usable materials recovered were to be accounted for. Averaged to a per car basis for the 50 test cars, the current price new of recovered material was \$108.40 per car; taken at 75 per cent. of the cost new this equals \$81.30. There was recovered an average of 892 lbs. of miscellaneous scrap per car, at \$15.00 per ton, or \$6.69. From the total salvage per car of \$87.99 is deductible the cost of handling as charged under the contract, plus 10 per cent. for profit, or \$2.20 per car, leaving the net salvage credit as \$85.79 per car. The net weight of the usable material and scrap was used as the basis for computing the cost of hauling by the carrier at 7 mills per

net ton mile from the contract plant to the usual point of scrap concentration, in the sum of \$128.70. On this basis the net credit for salvage amounts to \$4,160.80 for the 50 cars.

The cost of unloading the concentrated scrap and usable materials is included in the carrier's storehouse expense, in which the materials handled for both jobs have been caused to participate on an equitable basis.

#### Relation of Carrier's Own Fixed

#### Charges to Outside Work

It has been previously shown that the ratio of fixed charges to the carrier's expenditures for operating expenses and additions and betterments for the year 1920 was slightly over 20 cents per dollar of expenditure. It has been shown, also, that insofar as it could be traced no idle investment resulted and no non-productive time was spent by reason of letting certain work to outside shops. A fair proportion of general expense has already been apportioned to the outside work, and that expense is foreign to this topic. It is not clear to what extent, if any, the costs attendant upon contract work should be increased because of interest, taxes, operating losses, etc., which are pertinent to the carrier's operations. The ratio of such outgo to operating expenses does not exclude, because of lack of information, the total sums paid for work done in outside shops. But the aggregate of such expense, if known, would doubtless be of such small moment as compared with the total expenditure as not to affect the percentage.

It seems best to leave this question to the judgment of the reader, with the statement that by using the same factor of 20.0809 per cent the amount of fixed charges assessable against the accumulated costs of the contract work would be \$13,846.64. While it might not be wholly fair to say that no portion of this amount should be reckoned as a part of the costs in question, it is quite obvious that under the circumstances it would be unfair to say that the entire amount should be considered as a part of such costs. If this were done the comparison would be on the basis, substantially, that the railroad shops were in disuse.

#### Summary and Conclusions

While it is most difficult to obtain a true comparison in an instance of this kind, it is felt that the one hereinafter made is eminently fair to the railroad costs. A greater refinement in distribution and a recognition of elements which could not be computed would doubtless have increased them appreciably.

A comparison of total cost follows:

	Contract costs	Railroad costs	Ratio of railroad to contract costs, Per cent
Applied materials, etc.....	\$41,462.58	\$42,240.89	102
Direct labor .....	7,786.19	13,353.91	171
Contract overhead and profit.....	13,230.12		98
Railroad overhead .....		12,914.89	83*
Railroad general expense on contracts	2,314.60		
Total .....	\$64,793.49	\$68,509.69	106
Interest, taxes and other fixed charges .....		14,640.82	..
Total .....	\$64,793.49	\$83,150.51	128

\*Railroad overhead is 93 per cent of the total of contract overhead and profit plus railroad general expense on contract.

The 28 per cent increase of railroad costs over the contract costs in this particular case, which is found as the result of comparing totals, partakes of none of the uncertainties which obtain when an attempt is made to compare overhead ratios to direct labor, etc., which introduces the dissimilarities found in the bases of direct labor, and of overhead, in the different cases. It has not been possible to analyze the contractor's costs and harmonize these factors in order to afford a true comparison with respect to them. Statements of the elemental costs in the two cases, however, are shown in the two accompanying tables, based on the findings in the railroad's case and classifying accordingly the information

shown upon the bills in the case of the contract. The ratio of different classes of expense to direct labor is given in each case, but in considering them comparatively it must be recognized that if the bases are different a comparison of the ratios is of no avail.

#### ANALYSIS OF THE COST OF THE CONTRACT WORK

		Relation to direct labor Per cent
<b>Applied materials:</b>		
Applied materials as billed.....	\$27,219.38	
"Free" materials, at cost to carrier.....	18,017.00	
Haulage over carrier's rails.....	387.00	
Less net value of salvage recovered....Cr.	4,160.80	
	<u>\$41,462.58</u>	
<b>Direct labor:</b>		
Piece work labor, on equated base.....	\$6,590.34	
Blacksmith labor .....	428.21	
Milling lumber .....	767.64	
	<u>\$7,786.19</u>	
<b>Overhead expense and contractor's profit:</b>		
Labor delivering materials as billed*.....	\$300.00	
Overhead surcharge as billed.....	\$8,086.19	
Contractor's profit as billed.....	\$4,493.93	
Cost of switching, borne by carrier.....	350.00	
Total .....	<u>\$13,230.12</u>	169.91
Add proportion of carrier's general expense	2,314.60	29.73
Total overhead expense .....	<u>\$15,544.72</u>	199.64
Total cost to carrier, exclusive of any proportion of its fixed charges.....	\$64,793.49	
Apportionment of fixed charges on same basis applied to carrier's costs of work done in its own shops.....	13,846.64	177.84

#### ANALYSIS OF THE COST OF WORK IN CARRIER'S OWN SHOPS

		Relation to direct labor Per cent
<b>Applied materials:</b>		
All applied materials, prime cost.....	\$45,158.96	
Haulage over the carrier's rails.....	1,481.43	
Less net value of salvage recovered....Cr.	4,399.50	
	<u>\$42,240.89</u>	
<b>Direct labor:</b>		
All classes of direct labor.....	\$13,353.91	

<b>Overhead expenses:</b>		
Indirect labor, current .....	\$4,395.31	
Shop expense, current .....	2,383.31	
Insurance on buildings and machinery.....	13.23	
Maintenance of machinery and tools, direct charges .....	1,317.07	
Maintenance of buildings and tracks, direct charges .....	235.89	
Proportion of maintenance of buildings common to this and other shops.....	57.91	
Proportion of divisional overhead expense on maintenance of way and structure..	6.27	
Proportion of "entire line" overhead expense on maintenance of way and structures .....	14.79	
Proportion of maintenance of equipment overhead expense .....	1,720.22	
Proportion of cost of maintenance of general office and storehouse buildings....	2.36	
Proportion of "system" general expense....	2,436.20	
Accrued depreciation on shop buildings and depreciable machinery and tools.....	332.33	
Total operating overhead.....	<u>\$12,914.89</u>	96.71
Proportion of fixed charges for interest, taxes, etc. ....	14,640.82	109.64
Total of all overhead expense.....	<u>\$27,555.71</u>	206.35
Total cost to the carrier.....	<u>\$83,150.51</u>	

\*This item has been included in the overhead charges in order that the total may be comparable with the total operating overhead charged against the work done in the railroad shop.

The average cost per car repaired in the carrier's shops is \$1,663.01; the aggregate cost in the outside shop is \$1,295.87, including no part of the carrier's fixed charges, and \$1,572.80 if fixed charges be included in the same proportion as in the case of the carrier's work. The carrier's work, therefore, cost, in the first instance, \$367.14 per car, and in the latter instance \$90.21 per car, more than the work done in the contract shop.

In conclusion, attention should be drawn to the fact that of the costs pertaining to the work done by the carrier's shop, only direct labor, shop expense and applied material costs to the extent of \$64,873.31 were identified in connection with the work in the carrier's accounts. The remainder, \$18,277.20, was charged to other accounts, or not accounted for at all. In other words, of the total costs to the carrier as herein developed, 78 per cent could be identified and recognized if the accounts were analyzed, while 22 per cent was either omitted from the accounts entirely or so disguised as to appear unrelated to the expense of repairing cars.

A Mixed Train Pulling into Jerusalem

# General News Department

Repeal of all transportation taxes at the end of the present calendar year has been agreed upon by Senate leaders as part of a compromise plan for tax legislation.

A fire which swept the Chicago, Rock Island & Pacific shops at Pratt, Kan., on October 7, destroyed the repair tracks, car sheds, carpenter shops and 25 box cars; estimated damage \$200,000.

The freight traffic department of the Atlantic Coast Line has in its service 72 men who have been with the road an aggregate of 1,440 years. This was brought out at a recent conference of the freight representatives at Savannah. The 72 men each stated the length of his service, and the average was 20 years.

The disastrous collision at Paris, France, reported last week, resulted in about 40 deaths, not all of the bodies being recovered. Edouard Lozahic, the signalman at the outgoing end of the tunnel, was formally charged with homicide through imprudence. It was testified that he telephoned that the track was clear, although the leading train was still in the tunnel.

S. M. Williams, chairman of the Federal Highway Council has recently resigned that office because of the press of his own personal affairs. The Washington office of the Federal Highway Council has as a result been closed and the work suspended for the present, except perhaps that which the various committees of the association have found means for continuing.

The monthly meeting of the St. Louis Railway Club will be held at the Hotel Statler, St. Louis, Mo., on October 14, and the principal address of the evening will be delivered by Edwin J. White, vice-president and general solicitor of the Missouri Pacific. Mr. White's subject will be "Something of the History of the Railroads of Missouri and Some Side-lights on the 1920 Transportation Act."

Albert Stone, who was 86 years old on October 8, has worked for the New York Central and its predecessor, the New York & Harlem, *seventy-one years*, and is still at it. He is a clerk in the office of the auditor of passenger accounts, in New York City. When the New York Central began its pension system in 1910, Mr. Stone, being 75 years old, was pensioned and retired. He played around a little while and took a trip here and there, but soon wanted his job back. He got it and has been working ever since. On his birthday he found his desk laden with gifts. He recalls the day, in 1864, when Commodore Vanderbilt became active in the affairs of the road. He was then a clerk in the office and is the sole survivor of a group of clerks who worked for Commodore Vanderbilt. Mr. Stone was born and reared on Manhattan Island. When he was 12 he was run over by one of the horse cars operated by the old Harlem Railroad. The accident, which caused the loss of his left leg, led to his employment by the railroad company. Robert Schuyler, then president of the road, arranged that he go to school two years, after which he went to work for the road.

## A Conference on Railroad Cross Ties

In accordance with requests received by the American Engineering Standards Committee, a conference has been called to discuss the subject of railroad cross ties and switch ties. The meeting will be held on Tuesday, October 25, 1921 in Room 206 of the Atlantic Building, Washington, D. C. The purpose of the conference is to decide: (1) Whether the unification of specifications for railroad cross ties and switch

ties shall be undertaken; (2) If so, what the scope of the work shall be; and (3) How the work shall be organized.

## Passenger Traffic Officers

The American Association of Passenger Traffic Officers will hold its 65th annual convention at French Lick Springs, Indiana, on November 14 and 15, instead of Pinehurst, N. C., November 21 and 22 as previously announced.

## Telegraph and Telephone Section

The committee of Direction of the Telegraph and Telephone section of the American Railway Association, has decided that the March meeting of this section shall be held at Richmond, Va., on March 21, 22 and 23. It was also decided to hold the next annual meeting at Colorado Springs, Colo., on September 20, 21 and 22, 1922.

## Settle Railroad Tax Dispute

Attorneys for the Southern Railway, the Atlantic Coast Line and the Atlantic & Yadkin, the three railroad companies resisting the assessment levied by the North Carolina State Tax Commission on their property, and attorneys representing the state have reported an agreement to the three district judges hearing the case. The railroad companies will pay taxes on the valuation that they admit, while the question of additional taxes on the state's assessment will be litigated in the courts.

## Operating Statistics for July and Seven Months

The Interstate Commerce Commission's monthly report of operating statistics of Class 1 roads for July and the first seven months of 1921 shows a reduction in the number of freight cars owned from 2,371,599 to 2,343,090. The average miles per car per day in 1921 was 21.5 as compared with 23.5 in 1920. The net ton miles per car day averaged 375 as compared with 473, and the tons per car 27.9 as compared with 28.6. The average train load was 643 as compared with 700, but the train speed in 1921 was 11.5 miles per car as compared with 10.4 in 1920. The traffic density, net ton miles per mile of road per day, for 1921 averaged 3,883 as compared with 5,072. The average locomotive miles per day was 48.6 as compared with 61.1. For the month of July the average train load was 660 tons as compared with 745 last year. The average train speed was 11.9 miles per car as compared with 10.5.

## Checking Careless Drivers

At a crossing near Fort Loudon, Pa., on the South Penn Branch of the Cumberland Valley Division of the Pennsylvania Railroad, where the view for drivers of automobiles is obstructed until they are almost on the tracks, a Safety First observer of the railroad company recently checked motor vehicles which approached the crossing at excessive speed. In about two hours (between 12:50 and 3:10 p. m.), 34 out of 99 cars were carelessly driven. The average speed of the 34 cars was 25 miles an hour and three were traveling at 30 miles. The driver of a motorcycle, when within 25 feet of the crossing, was observed to turn his head to converse with the passenger riding in the side-car. Post-cards have been mailed through the State Highway Commissioner's office to those owners of the 34 vehicles who live in Pennsylvania. A supply of "Safety First" cards has been distributed to division superintendents for use by crossing observers.

### Extension of Time on Interchange Rule Three

The mechanical division of the American Railway Association, in circular No. V-216, announces the extension of the effective date of section f of Rule 3 of the interchange rules, to January 1, 1922. As it now stands this section of the rule requires that after October 1, 1921, no cars carrying products which require the use of salt with ice, and equipped with brine tanks, shall be accepted in interchange unless provided with a suitable device for retaining the brine between icing stations. The extension of time has been made in accordance with the recommendation of the Committee on Car Construction, in view of the fact that not all refrigerator cars with brine tanks have yet been equipped to meet the requirements of the rule.

### Union Pacific Offers University Scholarships

The Union Pacific has inaugurated the plan of awarding scholarships in the University of Nebraska to the boy ranking highest in the farm clubs in each of 39 counties in that state. This plan offers to the boy between 16 and 21 years of age ranking highest in the boys' and girls' club work for 1921, in corn, potatoes or wheat projects, a \$75 scholarship in the college of agriculture, or the short winter course of the school of agriculture in the University. In addition to the scholarship, the Union Pacific will reimburse the student for the expense of railroad transportation from his home to the school and return. The winners will be chosen by a committee of three, consisting of the county superintendent, one person appointed by the director of extension in the University, and the third person to be chosen by these two members.

The railroad company has offered the same prizes for 1921 as outlined above for 1922, except that the competition is to be on activities now in effect, such as calf clubs, pig clubs, potato and corn clubs, etc.

### Wire Banding of Packages for Protection

The freight claim division of the American Railway Association recently carried on an investigation among shippers in an effort to learn what progress was being made towards the elimination of "package troubles." It was found that firms using steel and wire banding for the securing of their packages have greatly reduced the shortages which had formerly occurred. One large Chicago firm reported that its package troubles were reduced 85 per cent by banding its packages; and another firm reported that the use of steel banding straps has reduced their losses 75 per cent.

The steel tape banding with the company's name or trade mark printed along the tape, and the ends sealed, has proved the most satisfactory. In this case, if the seals are broken, or if any part of the banding straps is missing or cut, and a piece of banding tape is substituted, it is a certainty that the package has been pilfered en route, and the shipper may file his claim accordingly. Many firms have found that banding packages in this manner has tended to keep dishonest employees in railroad service from looting the contents of their shipments.

### Railway Fire Protection Association

The Railway Fire Protection Association will hold its eighth annual meeting at the Sherman Hotel, Chicago, on October 18, 19 and 20, with two sessions scheduled for Tuesday, two for Wednesday and one on Thursday.

The principal committee reports, with names of the chairmen, are as follows: Statistics, George R. Hurd; Protection of shop plants, J. R. Peters; Handbook on merchandise in transit, W. S. Topping; Coaling plants, W. E. Cathcart; Locomotive hazards, E. N. Floyd; Gasoline and electric motor trucks in freight depots and terminals, E. W. Reilly.

On Wednesday morning there will be a paper on fire protection on foreign railroads by Loring F. Wilcox, and one on fire prevention in tunnels, by Harry Pollard. On Wednesday afternoon there will be a paper on standardization of fire hose coupling, by E. R. Townsend, and a question box will be opened by J. L. Walsh.

The president of the Association is W. S. Hickey (N. Y., N. H. & H.), and the secretary is R. R. Hackett (B. & O.), Baltimore, Md. The chairman of the committee of arrangements at Chicago is G. R. Hurd (I. C.).

### Imprisonment for Falsification of Car-Repair Bills

Theodore W. Krein, general manager of the Muscatine, Burlington & Southern, pleaded guilty to an indictment charging him with falsification of car repair records and accounts in violation of the Interstate Commerce Act, in the United States District Court at Davenport, Iowa, on October 6 and was sentenced to one year and a day in the federal penitentiary, and fined \$3,000. The railroad company and Krein were charged with falsifying the company's records to show that the railroad had made repairs to cars of other railroads when no such repairs were actually made. Fraudulent bills based upon these records were rendered against other railroads and in this manner approximately \$30,000 was collected from other carriers during the year 1919 for car repairs which were not made. Nearly all of this amount was collected from railroads operating under federal control and therefore was a fraud upon the government; the Muscatine, Burlington & Southern was not under federal control during that period. The prosecution followed an investigation by the Interstate Commerce Commission.

This road is 54 miles long, extending from Muscatine, Ia., south to Burlington. It has six locomotives and 22 freight and passenger cars.

### C. S. Gaskill Joins Russian Mission of American Relief Administration

Charles S. Gaskill, formerly master mechanic of the Pennsylvania at Baltimore, sailed on October 4 to join the staff of Colonel W. N. Haskell, director of the American Relief Administration's Mission to Russia.

Mr. Gaskill will have charge of the transportation of the food-stuffs with which the Administration proposes to supply the Russians. Mr. Gaskill was born at Mount Holly, N. J., on October 11, 1877. He was graduated from Princeton in 1898 and entered the employ of the mechanical department of the Pennsylvania at its Altoona shops. In 1917 he left his position as master mechanic at Baltimore to join the Railway engineers of the A. E. F. He was commissioned major and, later, lieutenant colonel.

Following his discharge from the army, Mr. Gaskill became technical adviser to the Polish Ministry of Railways and held that position until quite recently when, having returned to this country to take up railway work again, he received his appointment to serve under Colonel Haskell.

C. S. Gaskill

### The Pennsylvania's Committees on Loss and Damage

For the prevention of loss and damage to freight on the Northwestern Region of the Pennsylvania a complete reorganization of this work has been devised by which special divisional committees, each of which will have the assistance of six sub-committees, will supervise the handling of freight in their respective territories. The divisional committee will consist of the superintendent, supervising agent, trainmaster, division engineer, master mechanic, division operator, road foreman of engines, and captain of police, and this committee will provide whatever corrective methods are necessary to prevent freight loss and damage. These committees have been created for the Chicago Terminal, Fort Wayne, Logansport, Toledo, Grand Rapids, and Mackinaw divisions. The sub-committees will be headed by the members of the divisional committee, who will check and supervise the various stages of the freight movement which fall within their own particular line of work. This is the sixth sub-committee, of which the captain of police is chairman, will look after the sealing of cars that are found unsealed.

improperly sealed and the protection of freight in transit and at stations and transfers. In addition to the detailed work assigned to each of these committees, all employees are being urged to keep a constant watch for conditions needing correction and to report them promptly to the division safety agents who will be responsible for forwarding them to the proper committee for action.

### Freight Loss and Damage Fifty-five Millions

The total of freight loss and damage expenditures for six months ending June 30, 1921, as totaled from the reports of 227 carriers, representing 90.4 per cent of the railroad mileage in this country, was \$55,707,753. Of this sum, \$33,054,508 was chargeable to full carload shipments. Clothing (dry goods), fruit, vegetables and grain, furnished 28.8 per cent of the total amount of claims.

The freight claim division of the American Railway Association has recently issued a circular to division superintendents giving a statistical summary of the five main causes responsible for the loss and damage claims, which has been prepared from the May statements. "Unlocated damage" heads the list of principal causes with 14.8 per cent of the total. "Rough handling" follows with 13.7 per cent of the total claims. "Loss of entire packages" also amounted to 13.7 per cent of the total claims. "Defective equipment," such as leaky car roofs, loose floorings, etc., caused 10.9 per cent of the claims, with 9.3 per cent of this amount due to full carload shipments. "Delay" was the cause of 10.5 per cent of all claims, and 89.1 per cent of the delay claims were on full carload shipments.

### Loss and Damage Agitation

The Pennsylvania Railroad has been having a campaign to prevent loss and damage to freight in transit, aiming to awaken employees to the seriousness of the situation and to impress the urgent necessity for their wholehearted co-operation in uncovering and correcting wasteful practices. In 1920 payments on account of loss or damage to freight cost the railroads of the country more than \$100,000,000, largely because of the general backsliding and loss of morale following upon the war period. F. W. B. Humes, superintendent of stations and transfers and chairman of the Eastern regional committee, has congratulated the employees on the enthusiasm displayed in the drive. He commends the intensive supervision of operations at stations and transfers, in yards and on the road by division officers; the frequent meetings with employees of various classes and the daily bulletins; also the publicity through local newspapers. The marked success of this campaign has convinced the committee that another drive on similar lines is desirable in the near future.

From January, 1920, to June, 1920, the number of claims presented decreased 15 per cent, while from January, 1921, to June, 1921, the decrease was 38.9 per cent. June, 1921, compared with June, 1920, shows a decrease of 48.6 per cent. The decrease in number of claims filed is greater than the decrease in traffic. There is, however, urgent necessity for further improvement. Amounts paid for theft continue to stand out prominently. Actual results of the campaign show that in the Eastern Region in one month the number of irregularities in handling I. c. l. freight was 51.8 per cent less than the same month last year.

### Eye Accidents and Faulty Vision

#### Cause Waste in Industries

Eye accidents are revealed as an important source of avoidable national waste in a special report of the Committee on Elimination of Waste in Industry of American Engineering Council, just made public. The report embodies the results of an investigation conducted in many states in connection with the assay of waste in basic industries started by Herbert Hoover.

The total number of industrial blind in the United States is given as 15,000, or 13.5 per cent of the total blind population, this type of injury being the leading causative factor of blindness, according to the report which was prepared by Earle B. Fowler. The eye, it was found, is involved in 10.6 per cent of all permanently disabling accidents.

Present protective methods as applied in large plants have effected a great reduction in injuries. The use of goggles is one of the chief protective devices. In the plants of the American Car & Foundry Company there has been a reduction of more than 75 per cent through the use of goggles and the percentage of reduction would be much higher if the men would wear goggles more conscientiously, according to the management. Not a single case of injury to the eyes from broken glass has been recorded since goggles were introduced into the shops of the New York Central. All employees of the Union Pacific are now required to wear goggles on eye-dangerous work. Striking reductions in eye accidents are also shown by the American Locomotive Company and the American Steel Foundries, eye accidents in the plant of the latter company having been reduced 85 per cent.

The report also states that industrial waste is chargeable to sub-normal vision and faulty lighting. The correction of sub-standard vision produces an increase in return that will pay for its cost in the opinion of the management in plants where several years of trial has provided a basis for judgment. The report states that it has been shown improved lighting systems increase output 2 per cent in steel plants and as much as 10 per cent in shoe factories where work is more exacting. The cost of providing adequate illumination for the entire industry of the country would amount to  $\frac{3}{8}$  per cent to 1 per cent of wages. One estimate placed the loss due to faulty conditions in this country as above the entire cost of illumination. Of the 466 plants investigated, only 8.7 per cent were found to have lighting conditions that could be rated as excellent.

### J. H. Young Discusses the Railroad Situation

Speaking at a meeting of the Denver Rotary club, on September 29, Joseph H. Young, president of the Denver & Rio Grande Western, expressed his opinion on several issues pertaining to the railroads which are of paramount interest to the public at large. Of the railroad rate situation, President Young said in part:

"Railroad rates are out of kilter and some of the rates are too high, there is no doubt. Present-day rates, and, in particular, present-day freight rates, are the result of years and years of work and study by experts up to the time the war started, and of a horizontal rise of first 5 per cent, then 30 per cent, and then 25 to 40 per cent. They were thus thrown out of adjustment. Rates must not be reduced horizontally, but must be worked out on a common-sense basis. There are many ways this can be done."

Wages, President Young declared, are not entirely out of proportion, except as they affect common laborers, such as car oilers, who, he said, are classed as skilled labor, whereas, he asserted, "any man with common sense can be taught the work in one operation." Speaking of the proposed grouping of the railroads as advocated by the Interstate Commerce Commission, President Young declared the belief that the government is without the power to force the stockholders of the stronger lines to accept stock in the weaker ones at a figure that would be satisfactory to those who own them.

"Grouping of the railroads as proposed by the Interstate Commerce Commission is part of a plan to take care of the weaker railroads," President Young said. "Development of the stronger lines has tended to weaken the less powerful, which are, in themselves, a menace to the country's finance and detrimental to the country in which they operate."

"Strong lines that work together at their terminals with other lines may, by turning their freight business over to one particular line, force other lines that compete with that line into a tight place and strangle them. We should have an arrangement whereby there would be a just distribution of freight between competing lines at terminal points, general time of hauling and method of handling being practically the same. A shipper has no right to determine the routing of the material he ships, beyond naming the receiving road and the delivering road. It is really of little consequence to the shipper who handles the goods as long as the service is as quick and as good."

"Service of an acceptable standard can only be accomplished by allowing the weaker lines to earn money for their maintenance; to earn interest on their bonded indebtedness, and to earn enough to meet the requirements of additions and expansion."

## Traffic News

The executive committee of the National Industrial Traffic League has decided to hold the annual meeting of the league at the Hotel Sherman, Chicago, on November 9 and 10, with the annual dinner coming on the evening of the ninth.

Railroads operating in Ohio have been ordered by the Public Utilities Commission of that state to reduce freight rates on sand, gravel and crushed stone, approximately 28.5 per cent. On paving brick, in addition to the percentage reduction, a reduction of 10 cents a ton is ordered.

Hearings will soon be held by the department of justice on the request of western fruit growers for the modification of the "packers' consent decree" by which it is hoped that it will be possible for the fruit growers to ship their products in the meat men's refrigerator cars. The attorney-general has asked the Department of Commerce and the Department of Agriculture to send representatives to the hearings. No definite date for the hearings has as yet been announced, and the whole question will be held in abeyance.

Hearings on five new transcontinental applications and one old application asking to disregard the long and short haul statute on traffic moving up and down the Pacific coast and a like request on traffic moving east and west will begin in Chicago on November 7, with Attorney-Examiner W. A. Disque conducting the hearing on the latter petition and Special Examiner Pitt on the first named. After concluding at Chicago, hearings will be held at: Denver, Colo., November 21; Helena, Mont., November 23; Salt Lake City, Utah, November 25; Boise, Idaho, November 28; Spokane, Wash., December 1; Portland, Ore., December 5; San Francisco, Cal., December 8; Phoenix, Ariz., December 17; Atlanta, Ga., January 9; and New Orleans, La., January 11.

### Coal Production

For four weeks in succession the production of soft coal has advanced steadily upward. The total output during the week of October 1, according to the weekly bulletin of the Geological Survey, is estimated at 8,876,000 net tons. The week's production was the largest since last January and represents an increase over the preceding week of 4 per cent.

### Little Progress in New England Divisions

The Boston & Maine on October 6 reported to the Interstate Commerce Commission that little progress had been made in the direction of readjustment of freight rate divisions between the New England lines and the lines west of the Hudson river within the 90 days which the commission in its recent decision in the New England case had allowed for a report. In conformity with the commission's recommendation, representatives were appointed to confer with the lines west of the Hudson and the first meeting was held in New York on August 18. The trunk lines and Central Freight Association roads had no suggestions to offer and said that they would expect the New England carriers to submit proposals. The Boston & Maine says that it began promptly to study its divisions for the purpose of permanently revising them, but it became evident that nothing definite could be formulated within the 90 day period.

At a second meeting, on September 21, the New England carriers called attention to their serious financial condition and the impossibility of making a revision within 90 days and each proposed to trunk line representatives that pending such a revision the carriers west of the Hudson should shrink their divisions by 15 per cent on all traffic except coal, this amount to be added to the divisions accruing to the New England lines. No reply has been received to this proposal. As soon as substantial progress has been made in developing a basis for a revision of its divisions the Boston & Maine will submit the results to the committees of the defendants,

but if favorable action is not secured in conference it is the intention to bring the matter to the attention of the commission, with a view to a prompt submission of the issues involved.

### Toll's Exemption Bill Passed

The bill introduced by Senator Borah to exempt American coastwise vessels from the payment of tolls for passage through the Panama Canal was passed by the Senate on October 10 by a vote of 47 to 37, after five hours of lively debate devoted mainly to the international aspects of the question, in view of the treaty with Great Britain, rather than to the domestic economic phases of the canal tolls controversy. Although President Harding had previously on several occasions declared himself in favor of the passage of such a bill, he has not recently been urging it and the vote on the bill was interpreted as a defeat for the administration. Thirty-five Republicans and 12 Democrats voted for the bill and 20 Democrats and 17 Republicans against it. Senator Lodge, the Republican floor leader, opposed the bill, while Senator Underwood, the Democratic leader, supported it. Without a roll call, the Senate voted down amendments proposed by Senator King to authorize the President to seek arbitration of the tolls question with Great Britain and to appropriate \$2,000,000 as a subsidy for American vessels using the canal. Some of the Senators who voted for free tolls in 1914 on this occasion voted against the bill, while others who had formerly been for the bill reversed themselves. The bill now goes to the House, and it is predicted that it is likely to remain there in committee for some time, possibly until after the disarmament conference has been held, because the differences with Great Britain with regard to the interpretation of the canal treaties are regarded as embarrassing to the administration at this time.

### Hearing on Lumber Rates

Hearings on the complaint of the Southern Hardwood Traffic Association, asking for a reduction in the rates on hardwood to those prevailing before August 26, 1920, were begun before Commissioner Cox and Chief Examiner Quirk of the Interstate Commerce Commission at Washington on October 4 and were so expedited that they were concluded on October 10, oral argument being held immediately following the taking of the testimony. Representatives of the complainants asked that the case be treated as an emergency matter on the ground that the condition of the hardwood lumber industry is now as critical as was that of the railroads when Ex Parte 74 was argued. It was declared that because of the disruption of rate relationships created by the percentage advance the southern hardwood shippers are now doing very little business and no logging operations are being carried on. This has greatly decreased the tonnage of the Southern roads although it appeared that some of the northern and eastern lines have profited by that fact to some extent by the increase in shipments of lumber from other sections.

Reductions in the rates were opposed by railroad witnesses representing the southern roads, as well as those north of the Ohio river, on the ground that the railroads could not afford the reduction in their revenues and that the shippers had exaggerated the effect that would result to them from the proposed reduction in the rates. E. P. Bates, freight traffic manager of the Pennsylvania, presented exhibits in contradiction of contentions of the shippers that existing rates have caused a reduction in shipments of lumber. Other witnesses who opposed the reduction represented the Southern, Louisville & Nashville, Nashville, Chattanooga & St. Louis, Illinois Central, Missouri Pacific and Chicago, Rock Island & Pacific. L. E. Wettling, manager of the statistical bureau of the western lines, presented general exhibits regarding the financial condition of the railroads to show that they were in no condition to stand any considerable reductions in rates. Among other things, he testified that what showing the railroads have made has been largely at the expense of maintenance, saying that during the first six months of 1921 the railroads expended for maintenance purposes \$290,000,000 less than in the corresponding period of 1920, which, if it had been spent, would have more than absorbed all of the net operating income.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended, until February 7, the operation of proposed increased rates on brick, clay and clay articles from Central Freight Association Territory to Sault Ste. Marie, Ont.

The commission has suspended, until February 7, the operation of schedules contained in a Minneapolis, St. Paul & Sault Ste. Marie tariff which proposes reductions in proportional rates on grain from Minneapolis, St. Paul and Minnesota Transfer, Minn., to Gladstone, Mich., when to go east by lake.

The commission has suspended from October 17 until February 14, 1922, the operation of schedules published in Agent F. A. Leland's tariff, which propose increased commodity rates on domestic fruits, melons and vegetables from Texas producing points to interstate points.

The commission has suspended until February 7, the operation of schedules published in a New Orleans, Texas & Mexico tariff proposing reductions in the rates on salt from Jefferson Island, La., to Chicago, St. Louis, and points on the Illinois Central and Yazoo & Mississippi Valley directly intermediate thereto, north of the Mississippi-Louisiana state line.

The commission has suspended from October 5 until February 2, 1922, the operation of an item in a Chicago Great Western tariff proposing the cancellation of through rates on corn, oats, rye and barley from stations in Iowa, Minnesota and Missouri on the Chicago Great Western Railroad to Texarkana, Ark.-Tex., leaving applicable instead combination rates based on either Des Moines, Iowa, or Kansas City, Mo.

The commission has announced a series of hearings before Examiner Barclay at New York, in the rooms of the Merchants' Association, 233 Broadway, on the charges made by the Machinists' union as to the alleged excessive cost of car and locomotive repairs at outside shops. The case of the Philadelphia & Reading will be heard on October 24, the Erie on October 26 and Central of New Jersey on October 28.

The commission has suspended from November 15 until March 15, 1922, the operation of an exception to transcontinental west bound joint tariffs which provide for the non-application of Group J rates from and to points on the D. & R. G. W. east and south of Grand Junction, Colo., leaving applicable instead combination rates, which results in increases to the extent of the local rates to the boundary of the restricted territory.

### State Commissions

The Wisconsin Railroad Commission, on October 6, denied the application of the Chicago & North Western for authority to reduce train service on its line between Madison, Wis., and Montfort.

The federal court has ruled that the Interstate Commerce Commission has power to order the discontinuance of service on the Eastern Railway of Texas, 30 miles long, between Lufkin and Crockett. The Railroad Commission of the State has refused permission for the scrapping of the line. The State has now appealed the case to the United States Supreme Court.

The Public Service Commission of Louisiana, in order No. 10, has denied the application of Morgan's Louisiana & Texas Railroad & Steamship Company for authority to advance the freight rates on sugar cane. The commissioners think that the period of depression is passing; that the sugar

business is depressed as well as the railroad business and that if the railroads make an advance in rates and thus burden the sugar planters, they will cause a general depression in business from which the carriers also will suffer.

The Railroad Commission of the State of California on September 23 gave permission to the California Southern to lease its road to the Atchison, Topeka & Santa Fe. Application for the lease of the California Southern was originally made to the Interstate Commerce Commission, but consideration of it by that body was protested by the California Commission as the California Southern lies wholly within the State. Now that the matter has been passed upon in California the state commission's objection to the Interstate Commerce Commission giving its approval to the transaction has been withdrawn.

### Court News

#### Mechanism in Constant Use Without Injury Held Safe

The New York Court of Appeals holds that, when it comes to a question of proper condition and safety under the Boiler Inspection Act, mechanism which has been in constant use for years without causing injury must be considered proper and safe until some notice or occasion indicates its danger and insufficiency.—*Ford v. McAdoo* (N. Y.) 131 N. E. 874.

#### Provision in Transportation Act as to Limitation of Actions Not Applicable to Employers' Liability

The New Jersey Court of Errors and Appeals holds that the federal act of February 28, 1920, enacting that the period of federal control shall not be computed as a part of the periods of limitation in actions against carriers, is inapplicable to actions under the Federal Employer's Liability Act.—*Jones v. Delaware, L. & W.* (N. J.) 114 Atl. 331.

#### Amount of Damages for Injuries to

##### Automobiles in Transit

The South Carolina Supreme Court holds that where an automobile company shipped cars to itself, the title not passing to the purchasers until the shipment arrived and the draft was paid, the purchaser's rights as to injuries in transit were no greater than those of the automobile company, and it could recover no more than the automobile company could have recovered if it had sued, namely, the price the purchaser had agreed to pay, less the value of the injured cars.—*M. C. Johnson Motor Co. v. Payne* (S. Car.) 107 S. E. 252.

#### Trainmen May Assume Automobilist Will See and Avoid Train on Crossing at Night

In an action for damages resulting from a collision between the plaintiff's automobile and a freight car standing on the tracks of the Philadelphia & Reading at a street intersection in Chester, the Delaware Supreme Court holds that the men in charge of a train lawfully obstructing a crossing at night have a right to assume that a reasonably careful automobilist would adopt such lights and rate of speed that he could stop his car within the distance that he could see the train and avoid running into it, and were not negligent in failing to warn by lights or otherwise of the presence of the train on the highway.—*P. & R. v. Dillon* (Del.) 114 Atl. 62.

### United States Supreme Court

The United States Supreme Court on Monday refused to grant an application of the state of North Dakota for an interlocutory injunction to restrain the collection by the railroads of intrastate rates increased by the Interstate Commerce Commission by the amount of the interstate rate increases made last year. The broad question of the right of the commission to advance state rates under the new law is pending before the court in the Wisconsin case.

## Foreign Railway News

### Westinghouse Receives Additional Order From Chile

The Chilean State Railways have ordered six express passenger electric locomotives from the Westinghouse Electric International Company. This equipment is in addition to the 33 electric locomotives and other electrical material the contract for which the Westinghouse Company received several weeks ago (*Railway Age*, October 1, page 645). This equipment will be used in electrifying the Chilean State Railways from Valparaiso to Santiago and Los Andes, a total line mileage of 144 miles.

### Denies Russian Railways Are in Bad Way

Statements to the effect that the railways of Russia are utterly disorganized are untrue, according to a press dispatch from Paris, quoting C. R. Crane, former American minister to China. "As regards the trans-Siberian Railway, the longest line in the world, I found not only that everything is in a state of complete repair, but that the Soviets have successfully electrified portions of the line, something which had never been attempted under the Czarist regime. I traveled the entire length in a private car. I never suffered at any time from hunger, and the personnel is apparently well fed."

### August Exports of Car Wheels and Axles

Exports of car wheels and axles in August were valued at \$255,752—a total greater than that of any month since April. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Dollars	Countries	Dollars
England	1,071	Colombia	5,241
Canada	29,967	Ecuador	720
Guatemala	2,442	Peru	7,214
Mexico	55,063	Venezuela	186
Jamaica	524	Dutch East Indies	74,921
Other British West Indies	232	Japan	39,176
Cuba	3,378	Australia	1,734
Dominican Republic	450	Philippine Islands	676
Argentina	12,764	British South Africa	225
Brazil	19,029		
Chile	749	Total	255,752

### Exports of Locomotives in August

Exports of steam locomotives in August rose to 66, valued at \$2,334,737, showing an increase of 33 over the July figure of 30, valued at \$876,840. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Canada	1	2,400
Ecuador	4	40,400
Mexico	21	780,200
Brazil	7	238,500
Peru	1	5,138
China	25	1,105,409
Japan	7	162,690
Total	66	2,334,737

### Proposed Wage Cut on Scottish Railways

C. T. Cramp, industrial secretary of the National Union of Railwaymen, addressing railway employees at Edinburgh, said that the Scottish railways have proposed the abolition of the increases in wages granted by the National Wages Board in June (averaging \$1.25 per week), and of the special payment for night duty; also that minors shall not receive the pay of adults until they reach the age of 21, according to the Times (London). There are also proposals to abolish the eight-hour day, and substitute 10 hours in many classes, with a "spread" in some grades of 12 hours.

The companies have agreed, he continued, on condition that the employees give up the National Board's award on wages, that they will withdraw their other proposals, and in the event of this offer being rejected, they will go, first to the Central, and afterwards, in the event of disagreement, to

the National Wages Board, with the whole of their original proposals. There could be no strike until one month after the National Wages Board has issued its award.

The meeting passed a resolution, expressing the opinion that the proposals were entirely unacceptable, and recording dissatisfaction at the financial statement made by the companies as the reason for proposed changes. The meeting asked for information regarding the allocation of the \$25,000,000 set aside by the government for the relief of companies having a deficit because of the conditions of the national settlement, and urged on the union executive the desirability of preserving the principle of national negotiations.

### New Railway in South West Africa

The administrator of Britain's South-West Africa Protectorate, G. R. Hofmeyr, has approved the construction by the South African Railways and Harbors Board of a new railway to run from Windhuk, the capital, in an easterly direction to Gobabis, a distance of about 132 miles according to the Times (London). It is to be built on the standard South African gage (3 ft. 6 in.), and the cost is estimated at \$3,600,000. Gobabis is one of the chief settlements in the eastern portion of the Protectorate, and, having numerous fresh water springs in its vicinity, it is the centre of one of the few districts where agriculture is feasible. Maize is the principal crop.

### Argentina Buys Freight Cars

According to Commerce Reports, word has been received from Commercial Attaché Edward F. Feely, of Buenos Aires, reporting that the lowest bids offered by each of the following nationalities, as covering railway cars, under tender at Buenos Aires, were as follows:

	Gold pesos per car*
Lowest German bid	3,484
Lowest American bid	4,580
Lowest Belgian bid	5,000
Lowest British bid	5,900

\*Gold peso = \$96 at par.

Further word has been received which indicates that the authorities of Buenos Aires have decided to increase the number of cars which they intend to purchase at this time. The original bids covered 70 of the above cars, but at the time of placing the order it was decided to increase the quantity to 100 cars, and the business has been awarded to a firm in Breslau, Germany, under the name of Linke Hoeman, the price being 3,200 Argentine gold pesos each.

This transaction is peculiarly interesting as showing the position of American manufacturers compared with Belgian and British makers who are obviously not in a favorable position with regard to such equipment, although the design of the cars used on the railways of Argentina resembles European practice more closely than the American designs.

This incident also raises the question as to whether the German manufacturers will be able to make prompt delivery of materials of satisfactory quality. Recent experience in other foreign markets suggests that serious difficulty in this connection may result.

### The Spanish Railway Problem

The railway problem in Spain is somewhat similar to that in this and other countries, according to Commerce Reports. Operating costs have risen to the point where freight and passenger rates must be increased or some corresponding form of relief discovered if the roads are to continue to operate and escape bankruptcy. The public is not in favor of an increase in rates.

Nor are the railways giving satisfactory service. They are built on three different gages, approximately 5 ft. 6 in., 4 ft. 8½ in., and 3 ft. 4 in., respectively, and as they all radiate from Madrid, they do not always meet the economic needs of the country.

Among other efforts the government is making to meet the present situation, they have decided to encourage the construction of locomotives and cars in Spain, and have ar-

ranged that when bids are called, the business shall be awarded to manufacturers in Spain, provided their price does not exceed foreign offers by more than 10 per cent. In addition to this preference they have increased the duty on imported locomotives and cars, and Commercial Attaché Cunningham, of Madrid, reports that further increases are to be expected. Moreover, Spanish industrial plants, on complying with certain formalities, are allowed a reduction in the import duties charged on foreign manufactured materials needed in the construction of locomotives and railway cars.

As a result of the government's activities, the production in Spain of railway equipment of the class mentioned has been stimulated, and Commercial Attaché Cunningham reports that in the first six months of this year orders have been placed for the construction of 5,000 European pattern railway, freight, passenger, and baggage cars with 16 different Spanish plants in different parts of the country.

Correspondingly, the Maquinista Terrestre y Marítima has received an order for 50 locomotives, of which five have been delivered, and as these are larger and more powerful than other engines previously in operation, the better service resulting is adding to the prestige of these builders and to the disadvantage of the German, Belgian, French, Italian and British manufacturers who have previously supplied most of the locomotives operated in Spain.

Other companies plan to build locomotives in Spain, and, in addition to the inducement mentioned, there are other ways to show them preference. The Sociedad Española de Construcciones Babcock and Wilcox has been extended an exemption from the payment of imports and stamp taxes covering an issue of 39,200 shares of 500 pesetas (1 peseta = \$.193 at par) each, and also a 60 per cent reduction during five years from the amounts that would ordinarily be due under the utilities tax. These special benefits are understood to have been accorded to assist this company in the production of locomotives and parts and similar products. Recently the Spanish government established an industrial bank with a capital of 150,000,000 pesetas, which is reserved for loans to purely Spanish enterprises.

### Exports of Track Materials in August

Exports of track spikes and steel rails fell sharply in August from the July totals. August exports of steel rails were valued at \$274,864 as against \$1,018,859 in July. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Railroad spikes, Pounds	Rails of steel, Tons	Switches, Structural frogs, splices, iron bars, etc., and steel Tons

## Equipment and Supplies

### Locomotives

THE DELAWARE & HUDSON is inquiring for from 1 to 10 Mikado type locomotives.

THE CENTRAL OF PERU is inquiring through the locomotive builders for some Mikado type locomotives.

THE MISSISSIPPI CENTRAL has ordered 1 Mikado type locomotive from the American Locomotive Company.

THE J. J. NEWMAN LUMBER COMPANY, Hattiesburg, Miss., has ordered 1 Mikado type locomotive from the American Locomotive Company.

THE EAST BRAZIL FEDERAL RAILWAYS have ordered 3 Pacific type and 4 Consolidation type locomotives, from the Baldwin Locomotive Works.

THE CHICAGO, ROCK ISLAND & PACIFIC, reported in the *Railway Age* of August 27, as inquiring for 10 Mikado type locomotives has ordered 14 Mikado type locomotives from the American Locomotive Company.

THE HUTCHINSON LUMBER COMPANY, Huntingdon, W. Va., has ordered 1 Shay type locomotive from the Lima Locomotive Works, Inc. This locomotive will have a weight of 80 tons in working order and will be equipped with superheater.

THE PEKING-SUIYUAN (China), reported in the *Railway Age* of June 24 as contemplating asking for bids through the Universal Steel Export Corporation, 26 Cortlandt street, New York City, for 7 Mallet type, 25 Mikado type and 5 Pacific type locomotives is now asking for bids on this equipment.

### Freight Cars

THE ATLANTIC COAST LINE is inquiring for 30 steel underframes for caboose cars.

THE BLAW-KNOX COMPANY, Pittsburgh, Pa., is inquiring for three 50-ton gondola cars.

THE UNION RAILWAY EQUIPMENT COMPANY, Chicago, is asking for prices on 25 30-ton refrigerator cars.

THE UNITED FRUIT COMPANY, New York, is inquiring for a number of cane cars of 60,000 lb. capacity.

THE NATIONAL RAILWAYS OF MEXICO are inquiring through the car builders for prices on 2,000 box cars.

J. B. FLETCHER & COMPANY, Fort Worth, Texas, are inquiring for 100 tank cars, of from 10,000 to 12,000 gal. capacity.

THE WATERBURY GAS LIGHT COMPANY, Waterbury, Conn., has ordered one 50-ton coal car from the General American Car Company.

THE STAUFFER CHEMICAL COMPANY, Chauncey, N. Y., has ordered 1 tank car of 8,000 gal. capacity from the General American Tank Car Corporation.

THE CHESAPEAKE & OHIO, reported in the *Railway Age* of June 17, as asking for prices for rebuilding about 2,500 cars, is now asking for prices on the repair of 500 to 1,000 composite gondola cars and 1,500 to 2,000 steel coal cars.

THE TOLEDO & OHIO CENTRAL is asking for prices on the repair of from 200 to 250 steel underframe box cars, and prices are also wanted for the repair of from 350 to 400 open top steel cars, for this road and the Kanawha & Michigan.

THE CENTRAL OF BRAZIL is asking for prices on 250 20-ton box cars, standard gage, also for 150 20-ton box cars, meter gage, 25 20-ton cattle cars, standard gage and 20 20-ton cattle cars of meter gage, all to be of wood construction. Information

may be obtained from Mr. Snowden, representing Bordeaux & Company, Rio de Janeiro, at the office of Monsen & Company, 2 Rector street, New York City.

THE PEKING-SUIYUAN (China), reported in the *Railway Age* of June 24, as contemplating asking for bids through the Universal Steel Export Corporation, 26 Cortland street, New York City, on 400 high side steel freight cars, is now asking for prices on this equipment.

## Passenger Cars

THE BALTIMORE & OHIO has ordered 2 dining cars from the Pullman Company.

THE NEW YORK CENTRAL is inquiring for prices on from 25 to 50 motor trucks.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 2 combination baggage and mail cars, from the American Car & Foundry Company.

## Iron and Steel

THE CHICAGO, MILWAUKEE & ST. PAUL has ordered 1,354 tons of steel for reinforcing underframes of coal cars from A. M. Castle & Company, Chicago.

## Machinery and Tools

THE NEW YORK CENTRAL has ordered 1—6 ft. radial drill and a 400-ton car wheel press from the Niles-Bement-Pond Company, New York. The railroad has ordered also a 48 in. planer and roundhouse equipment including some small lathes, grinders and bolt cutters.

## Railway Construction

ATLISON, TOPEKA & SANTA FE.—This company will construct a warehouse and the necessary trackage leading to it, on its water-front property at Stockton, Cal., the work to cost \$99,000. The same company will install a 55,000 gal. oil tank with necessary facilities for fueling oil burning locomotives at Clovis, N. M., to cost about \$40,000. Trackage will be constructed by the Santa Fe at a cost of \$32,000, to a large coal mine at Radley, Kan.

CANADIAN PACIFIC.—This company has awarded a contract to Angus and Taylor, North Bay, Ontario, for the construction of a 68-mile extension from Kipawa, Quebec, to Desquinze, and eight miles into Villa Marie on Lake Temiskaming, the work to cost about \$3,500,000.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract to the Link Belt Company, Chicago, for a 400-ton coaling station to be erected at Centralia, Ill.

CHICAGO UNION STATION.—A contract has been awarded to A. S. Schulman, Chicago, by the Chicago Union Station Company which includes the installation of all of the wiring and switchboard equipment for a substation which will supply power to the new Railway Mail Terminal building, Chicago.

CHICAGO, ROCK ISLAND & PACIFIC.—Authorized to Issue Bonds.—The Interstate Commerce Commission has granted the joint application of this company and the Burlington, Cedar Rapids & Northern, authorizing the latter to sell \$1,905,000 of consolidated first mortgage bonds at par and accrued interest to the Chicago, Rock Island & Pacific, and also authorizing the Chicago, Rock Island & Pacific to procure authentication and delivery to its treasurer of a like amount of first and refunding mortgage bonds to be pledged from time to time as collateral for short term notes.

LOS ANGELES & SALT LAKE.—This company plans extensions to its lines from Whittier to Santa Ana, a distance of 14 miles, and from Whittier to Tustin, a distance of 22 miles, both in Orange County, Cal. The work, as estimated, will cost between \$1,500,000 and \$2,000,000.

## Supply Trade News

The Superior Supply Company, Chicago, has been appointed the exclusive railway distributor of the Rex concrete mixers, manufactured by the Chain Belt Company, Milwaukee, Wis.

C. A. Dunn has resigned as general superintendent of the Detroit Seamless Steel Tubes Company, Detroit, Mich., to take a position in the sales department of the Prime Manufacturing Company, Milwaukee, Wis.

The Toronto, Ontario, office of the Independent Pneumatic Tool Company, Chicago, has been removed from 32 Front street West, to larger quarters at 163 Dufferin street, Toronto. This office will remain in charge of William McCrae.

C. J. Burkholder, who has been serving the Franklin Railway Supply Company, New York, as special engineer in the western territory, is now supervising service for the same company on all railroads. A sketch of Mr. Burkholder's career was published in the *Railway Age* of July 2, 1921, on page 41.

George L. Sawyer, formerly sales manager of material handling machinery for the Barber-Greene Company, Aurora, Ill., has been appointed sales representative for The Universal Crane Company, of Elyria, Ohio, in charge of the New York territory, with headquarters at the Allied Machinery Center, New York City, N. Y.

W. E. Kelly, western representative of the Central Railway Signal Company, Pittsburgh, Pa., has been appointed also representative of the Handlan-Buck Manufacturing Company, St. Louis, Mo., for Chicago and adjacent territory, with headquarters at room 624 McCormick building, 332 South Michigan avenue, Chicago.

H. O. Davidson has been appointed to take entire charge of the Prudential Sectional Building Department of the Blaw-Knox Company, with headquarters at Baltimore, Md., where he will also serve as general manager of the C. D. Pruden plant, of the Blaw-Knox Company. At the time of his appointment Mr. Davidson was general manager of the Hydraulic Steelcraft Company.

O. B. Frink, assistant principal engineer of the Hall Switch & Signal Company, Garwood, N. J., has been appointed representative of the Waterbury Battery Company, Waterbury, Conn., with office at 30 Church street, New York City, and S. J. Hough, field service engineer at New York, of the Waterbury Battery Company, has been appointed western representative with office at 1361 Peoples Gas building, Chicago, Ill.

J. H. Redhead, assistant manager of sales of the National Malleable Castings Company, has resigned to become manager of the Reliance Company, Cleveland, Ohio, which firm has recently been organized by the Reliance Trust Company in conjunction with its affiliated companies, the Reliance Savings and Loan Company and the Reliance Securities Company. These companies are engaged in various banking and investment activities. Mr. Redhead was born in Cleveland in 1880 and was graduated from Central High School of that city in 1899. He began his career as an office boy with the National Malleable Castings Company and worked through various branches of the accounting department until 15 years ago when he entered the sales department. He was lately appointed assistant manager of that department. For several years Mr. Redhead has been in charge of the advertising carried on by the American Malleable Castings Association.

THE PENNSYLVANIA reports the movement of fruits and vegetables out of Chicago on its lines as 30 per cent greater than last season. The largest increase is in apples.

# Railway Financial News

ANN ARBOR.—*Annual Report.*—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Standard return (January and February, 1920; year 1919).....	\$85,580	\$528,000
Guaranty, March 1 to August 31.....	354,343	.....

Average revenue per ton per mile (cents).....	1.253	1.205

## Railroad Administration

The Railroad Administration reports the following final settlements, and has paid out to the roads the following amounts:

Union Pacific and subsidiaries.....	\$8,000,000.00
St. Joseph & Grand Island.....	1,000,000.00
St. Louis San Francisco and subsidiaries.....	580,000.00
Saskatchewan & New York.....	42,000.00
Arkansas & Memphis Railway Bridge & Terminal.....	90,000.00
St. Paul Bridge & Terminal.....	34,000.00
Ontonagon.....	11,936.84
Short Line Railroads:	
Lufkin, Hemphill & Gulf.....	8,700.00
Dearing Southwestern.....	9,000.00
Bullfrog Goldfield.....	12,000.00

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

## Dividends Declared

Banor & Arrowstock.—Common, 2 per cent; preferred 3½ per cent, semi-annually; both payable October 1 to holders of record September 29.  
Belt Railroad and Stock Yards (Indianapolis).—Common, 2 per cent, quarterly; preferred, 1½ per cent, quarterly; both payable October 1.  
Georgia Railroad & Banking Company.—3 per cent, quarterly, payable October 15 to holders of record October 2.  
Meadville, Conneaut Lake & Linesville.—2 per cent, payable October 1 to holders of record September 15.  
Norwich & Worcester.—Preferred, 2 per cent, quarterly, payable October 1 to holders of record September 14.  
Pere Marquette.—Prior preferred, 1½ per cent, quarterly, payable November 1 to holders of record October 15.

# Annual Report

## Southern Railway Company—Twenty-Seventh Annual Report

RICHMOND, Va., October 11, 1921.

### To the Stockholders of

### SOUTHERN RAILWAY COMPANY:

The Board of Directors, submits the following report of the affairs of the Company for the year ended December 31, 1920:

The accompanying tables will tell the story of another difficult year. The gross revenue for 1920 reached the record-breaking figure of \$152,817,409.93, the revenue from freight alone exceeding one hundred millions of dollars. Unfortunately, no benefit to net income followed this remarkable expansion in gross revenue, and taxes were more than twice what they were in 1917, the year preceding the surrender of the property to the Government. An idea of the volume of business, as well as the swollen current of expenses, during this period of post-war inflation may be obtained from the following comparison of revenue and expense units:

	1920 Compared with 1917	Increase	Decrease
Gross Revenue.....	68.46%		
Expenses and Taxes.....	111.44%		
Operating income.....	15.82%		36.09%
Tons of revenue freight handled.....	15.82%		
Average distance hauled.....	9.13%		
Average receipts per ton per mile.....	35.79%		
Number of passengers carried.....	10.10%		
Average passenger journey.....	9.14%		
Average receipts per passenger per mile.....	38.34%		
Expenses and taxes per dollar of revenue.....	21.28%		
Average wage paid.....	85.76%		
Average cost of fuel coal per ton.....	94.15%		
Average cost of cross ties.....	137.29%		
Average cost of new rail per ton.....	47.17%		
Average cost of ballast per cubic yard.....	203.70%		

So long as traffic continued at high tide, as it did during the first six months after the end of Federal control, these costs could be endured, but the stimulus of traffic was withdrawn. Management, regulated in its every act except that of meeting the pay roll, was, then, deprived of the power to apply the remedies which alone can save a business in such conditions.

In November traffic began to slump, as was expected. The reduction was so precipitous that in January the gross revenue was only three-fourths that of for the preceding October. Despite, or, as some economists maintain, because of, this rapid decline, during the ensuing six months to June 30th was \$10,332,896.04, compared with the preceding six months of 1919. Every measure for retrenchment in the expense account open to management was applied when the first symptoms of this decline in revenues were arresting the loss in net, but, despite grueling effort and sacrifice, the current loss was actually large. The one comfort was that, with such allowances for seasonal fluctuations, the gross revenues month by month from January to July remained practically stationary. The worst was soon known.

As this report is written there are evidences that the long drought has been broken; that there is such renewal of business activity in the South as to justify hope that a railroad depending on that business may now, once more, look forward to profitable operations.

Meanwhile the Board of Directors, exercising its best judgment, has been compelled again to suspend the preferred stock dividend. This distressing action has been severely criticised by disappointed stockholders, but, on explanation of the facts, has usually been accepted as inevitable. It may be appropriate here to say that the first ambition of the management at this time is to accomplish an early restoration of that dividend.

Out of this experience our venturers to develop industry. The rate increases authorized by the Interstate Commerce Commission effective September 1, 1920, conspicuously failed to produce the result sought by the Government, that is, the stabilization of railroad income on a basis of a fixed percentage of the annual gross revenue of the railroads. It is difficult to escape the judgment that the remedy as applied to date, that as long as the business of the United States shall continue to be difficult in the future, as it always has been in the past, to alternate periods of prosperity and depression, no regulation of railroad rates can be successful which does not permit the accumulation and conservation of surplus earnings of boom times against the need of hard times. Such a policy would make it possible in periods of lean traffic accompanying industrial depression to suspend the preferred stock dividend, and the Government for transportation. The policy actually followed in 1920, in the face of rates at a time when every one engaged in industry was in deep depression was imminent. Whatever else it may have been, this was not good business.

### IMPROVEMENTS AND BETTERMENTS IN THE CAPITAL ACCOUNT.

No additions of importance were made to the property during the year, the policy of the management in that respect having been governed by a consideration of the inflated costs of construction and the uncertain business outlook consequent upon the readjustment period, as well as the in the balance sheet of the Company, the increase from \$75,582,322.13 on December 31, 1919, to \$86,960,333.51 on December 31, 1920, is due to taking up in the accounts the engines and cars costing upwards of ten millions of dollars received through the Government equipment trust referred to in the preceding report.

### SETTLEMENT WITH THE FEDERAL RAILROAD ADMINISTRATION.

It is gratifying to report that the effort to effect an acceptable adjustment of the account with the United States Railroad Administration arising out of Federal control has succeeded much earlier than seemed possible a year ago.

In this settlement the Railroad Administration has paid to the Company \$8,412,000, of which \$6,000,000 was paid in cash and \$2,412,000 in three-year notes of the Company which the Administration had left on its hands March, 1919. The account is closed with many entries of both debits and credits, but what this settlement amounts to briefly may be explained as follows:

The commencement of Federal operation on January 1, 1918, the Railroad Administration took over the Company's current cash and collected its outstanding accounts receivable, and in this way the Administration received..... \$22,702,216.15

of the Company's money. Against this the Administration paid all of the Company's current obligations on that date, consisting of wages, supply bills, etc. On these accounts the Administration paid out for the Company..... 25,752,914.55

As a result of these strictly cash transactions the Company owed the Administration a net balance of..... \$3,050,698.40

The "standard return" claimed by the twenty-six months amounted to \$40,416,768.49, and of this the Administration paid to or for account of the Company for fixed charges, dividends, etc., \$36,425,339.15, leaving due on this account..... 3,991,429.34

so that down to this point in the account the Administration owed the Company..... \$8,990,717.84

The double tracking of the main line was under way when Federal operation commenced. The Railroad Administration continued this work, and the cost of it and of other alterations and betterments made and paid for by the Administration amounted to..... 14,586,299.91

The account as stated down to this point practically was undisputed on both sides, except for certain improvement charges to which the Company took exception. It is seen that the Company owed the Railroad Administration..... \$13,655,568.36

We now come to the claims set up by the Company, and consisting of \$10,940,931.10, for additional compensation beyond the "standard return" of \$27,764,447.79 for undermain tenance, and \$12,801,966.58 of bookkeeping interest such as depreciation property retired, etc., a total of..... \$30,934,439.47

In settlement of which and by way of retention the Company has, in effect, received..... 22,067,568.36

In improvements..... \$ 3,655,568.36

In notes..... 2,412,000.00

In cash..... 6,000,000.00

\$22,067,568.36

Of the cash received the sum of \$5,000,000 was paid over to War Finance Corporation, in part payment of the Company's note aggregating \$7,355,279.

The Railroad Administration and applied toward the payment of fixed charges then accruing.

### EXPRESS BUSINESS.

Express traffic on the Company's lines was handled prior to Federal control by Southern Express Company under a contract providing for a division of the gross revenue. One of the results of Government operation field and the conduct of the regional express companies from that by one company, which upon the resumption of corporate operation of the railroads, proposed to the railway companies the continuation of the side activities under a uniform contract. Aside from the fact that the standpoint of our interests, the contract was substantially unsatisfactory from the viewpoint of material advantage to the management of Southern Railway System express service were desired by the people of the South and would prove new corporation. Southern Express Company, was chartered under the laws of the State of Alabama, with power to transact express business, and its capital stock of one million dollars par value offered for public subscription, resulting in a substantial over-subscription and an original stock list of 2,651 holders, principally Southern business men, scattered over the twelve States served by the lines of Southern Railway System and Mobile and Ohio Railroad, on which the Southern Railway System and Mobile commenced active operations on May 1, 1921. It is still too early to report on the operations of this Company. It will suffice to say that they are entirely satisfactory to the management of the Company, which it serves and seem amply to justify the decision which inaugurated these operations.

### AGRICULTURAL AND INDUSTRIAL DEVELOPMENT IN THE TERRITORY SERVED.

#### AGRICULTURE.

In common with other parts of the United States, the farmers of the South suffered severely from the abrupt fall in prices of farm products. This was especially true in the cotton belt. Tempted by the high prices of raw cotton prevailing during the war, the farmers had planted a large crop in 1919, the growers produced in 1920 a crop of 13,270,970 bales, exclusive of linters. In anticipation of a price of forty cents or more per pound, the effort was toward maximum production rather than to economy in the twelve cents caused a large loss, reduced the purchasing power of the farmer, and seriously affected the business of entire communities. To a somewhat less extent the same was true of tobacco, peanuts, and other field crops.

The expectation of a continued high price for cotton gave a setback to crop diversification as well as to the production of live stock. Many farmers numbers of hogs and poultry, and there was an actual decrease in the numbers of hogs and poultry in the South.

Despite this record, the agricultural outlook for the future is hopeful. While estimates of the cost of producing the cotton crop of 1920 averaged ranged from twenty-seven cents to thirty-three cents a pound, the crop of 1921 probably has been sold at the lowest per pound cost in years, but withstanding the small crop, Little fertility has been used, and the soil has been plentiful and cheap, conditions which afford good reason to expect of a fair profit at the prevailing prices.

On account of light foreign demand, which usually absorbs a large part of the poor crop, prices for these grades are very low.

This year's southern peach crop was the largest in recent years, in quality, and has brought fair prices, and there is a prospect of a large increase being devoted to this purpose. Much raising has been done, and the same is true of other kind of fruit, which track the same course served by the Southern Railway System.

Unusually late frosts in the spring have destroyed the early crop of principal apple and pear regions in the territory, except in northern Georgia, where there are prospects of a nearly normal crop.

The Development Service of Southern Railway System is continuing its efforts to correct the economic error of the one crop system in the South, working especially in the direction of growing more and better live

stock and of increasing fruit and truck production in localities where there is promise of success in those directions. Special attention is being given to dairy development, not through establishments devoted exclusively or principally to dairying so much as encouraging the keeping of a few good dairy cows on each farm and securing the establishment of creameries so located that the farmer may have a market for sour cream, retaining the skimmed milk on the farm to be fed to hogs or poultry. In addition to furnishing a constant source of revenue directly to the railway, this method, through the periodical distribution of cream checks among the farmers, contributes substantially to the general prosperity of farming communities. An illustration of this is afforded by a creamery at Selma, Alabama, started on a small scale several years ago, which is now a source of substantial revenue to the railway, as well as to the farmers for milk and cream purchased from them. When this creamery was started there were few dairy cows in the community. The number has been so increased that a second creamery has been established at Selma, and the older concern has gone into the making of cheese as well as butter, affording the farmers a market for whole milk as well as cream.

Southern sweet potatoes are coming to the front as a large scale profitable crop. Curing them in specially constructed storage houses has made possible their marketing during the entire year. We are encouraging the building of these storage houses and co-operating with growers to secure broader markets throughout the United States. The area of land devoted to strawberries was increased somewhat during the past year, especially in east Tennessee, and there are indications of a further substantial growth in that territory as well as in Alabama and other States. The growing of dewberries for market has been started on the line between Macon and Brunswick. A small quantity of such berries was marketed this year at profitable prices. There will be some increase in the acreage of Satsuma oranges in the southern part of Alabama. Encouragement is being given to the cultivation of blueberries in southern Georgia and northern Florida. Vinifera grapes are being introduced at points in the southern part of the territory.

#### INDUSTRIAL.

The slackening national demand for commodities of all kinds was severely felt in the South, and there was a consequent let up in the provision of additional manufacturing capacity. There was not, however, a total cessation of construction of new industrial plants. Far-sighted men, making ready for the return of improved business, have been preparing accordingly in the case of building entirely new plants and in others by making additions to existing plants.

There is reason to believe that within the next few months there will be under construction at points served by Southern Railway System at least two new large cement plants, an important porcelain industry, a glass plant, and a paint and pigment industry.

In at least one important industry the South has suffered relatively less than other parts of the country during the painful pilgrimage to "normalcy." The figures of the United States Census Bureau for the twelve months ending June 30, 1921, show that the consumption of cotton by mills in the cotton growing States amounted to 2,997,675 bales, compared with 3,582,919 bales in the preceding twelve months, a decrease of 585,244 bales or 16.3%. In the same period mills in all other States consumed 1,890,218 bales, compared with 1,838,315 in the preceding twelve months, a decrease of 946,597 bales or 33.4 per cent.

#### RELATIONS WITH EMPLOYEES

The thanks of the Board of Directors are tendered to the officers and employees for the faithful performance of their duties. Especially, the management records with pleasure its sense of appreciation of the loyal and self-sacrificing co-operation of those employees who, through their able representatives, have joined with the officers in harmonious conference in the effort to accomplish the disagreeable but necessary task of readjustment of wage and working conditions.

Respectfully submitted by order of the Board.

FAIRFAX HARRISON, President.

## Railway Officers

### Financial, Legal and Accounting

W. H. Whitehead has been appointed auditor of the Lehigh & New England with headquarters at Bethlehem, Pa., succeeding E. M. Kuntz, resigned.

### Operating

V. S. Burnham, trainmaster on the Los Angeles division of the Southern Pacific, with headquarters at Indio, Cal., has been transferred to Los Angeles, in a similar capacity succeeding C. M. Murphy, promoted. H. R. Hughes will succeed Mr. Burnham as trainmaster on the Los Angeles division, with headquarters at Indio.

J. S. de Echagaray has been appointed superintendent of the Monterey and Gulf division of the National Railways of Mexico with headquarters at Monterrey, succeeding J. C. Garcia, transferred. R. P. Micatiri has been appointed superintendent of the Guadalajara division with headquarters at Guadalajara, succeeding M. Acosta, transferred. V. E. Palacios, superintendent of the Isthmian division with headquarters at Tierra Blanca, has been transferred to a similar position on the Aguas Calientes division with headquarters at Aguas Calientes, succeeding P. R. Rivera, transferred. A. Fuhrken, superintendent of the Durango division with headquarters at Durango, has been transferred in a similar capacity to the Hidalgo division with headquarters at Mexico City, succeeding O. M. Palma, transferred.

C. M. Murphy has been appointed assistant superintendent of the Los Angeles division of the Southern Pacific, with headquarters at Los Angeles, Cal., succeeding C. J. Donnatin, who has been promoted to division superintendent of the San Joaquin division, with headquarters at Bakersfield, Cal. Mr. Donnatin succeeds F. M. Worthington, who has been transferred to the Coast division, with headquarters at San Francisco, Cal., succeeding T. Ahern, who has been transferred to the Sacramento division, with headquarters at Sacramento, Cal., succeeding J. O. Brennan, deceased. A. J. Hancock has been appointed supervisor of transportation, with headquarters at San Francisco, Cal., succeeding L. R. Smith, who has been appointed assistant superintendent of the Stockton division, with headquarters at Stockton, Cal. Mr. Smith succeeds W. M. Stillman, who has been transferred to the Sacramento division, with headquarters at Sacramento, Cal., succeeding W. L. Hack, who has been promoted to superintendent of the Salt Lake division, with headquarters at Ogden, Utah. Mr. Hack succeeds E. L. King, who has been transferred to the Portland division, with headquarters at Portland, Ore., succeeding A. T. Mercier, who has resigned to accept service with another company.

### Traffic

A. S. Gimble, general agent of the Gulf Coast Lines with headquarters at Monterrey, Mex., has been transferred to Brownsville, Tex.

T. L. Southwell has been appointed commercial agent of the Seaboard Air Line with headquarters at Orlando, Fla., effective October 1.

G. L. Oliver, general freight and passenger agent of the Fort Smith & Western, with headquarters at Fort Smith, Ark., has been promoted to traffic manager with the same headquarters.

J. E. Sneed has been appointed traffic agent in charge of the newly established Cleveland-Detroit freight and passenger offices of the Chicago & Eastern Illinois, with headquarters at Detroit, Mich.

J. J. Morton has been appointed foreign freight agent of the Canadian Pacific with headquarters at New York, succeeding F. G. Frieser, resigned.

L. J. Anderson, traveling passenger and freight agent of the Denver & Rio Grande Western, has been promoted to general agent, with headquarters at Fort Worth, Tex.

A. R. Mulkins, has been appointed commercial agent of the Atlantic Coast Line with headquarters at Philadelphia, and C. J. Carty has been appointed commercial agent with headquarters at New York, effective October 1.

E. W. Clapp, whose appointment as assistant freight traffic manager of the Southern Pacific, with headquarters at San Francisco, Cal., was announced in the *Railway Age* of September 17 (page 556), was born at Memphis, Tenn., on February 25, 1874, and was educated in both public and private schools in Memphis and Bell Buckle, Tenn. He entered railroad service on October 4, 1893, and served as a stenographer, and as a clerk, in the superintendent's office of the Southern Pacific at Tucson, Ariz., until 1895. From November, 1895, to July, 1896, he was employed in train service. He became ticket clerk at Lordsburg, New Mexico, in July, 1896, and remained at that position until January, 1897, when he was appointed chief clerk and cashier. From July, 1897, to November, 1905, he served as an agent and assistant trainmaster. In November, 1905, he was appointed traveling freight and passenger agent, with headquarters at San Francisco, Cal., which position he held until August, 1906, when he was promoted to district freight and passenger agent, with headquarters at Reno, Nev. In November, 1909, he was transferred to Fresno, Cal. From August to November, 1910, he was chief clerk in the general freight office at San Francisco. In November, 1910, he left the railroad to become general agent for the Atlantic Steamship Lines. In January, 1911, he was appointed assistant general freight and passenger agent, with headquarters at Tucson, Ariz., also serving at the same time as general freight and passenger agent for the Arizona Eastern, a subsidiary of the Southern Pacific, with the same headquarters. In April, 1915, he was appointed general freight agent of the Southern Pacific, with headquarters at Los Angeles, Cal., where he remained until March, 1919, when he was transferred to San Francisco, which position he was holding at the time of his recent appointment.

E. W. Clapp

L. C. Zimmerman, whose appointment as assistant general freight agent of the Southern Pacific, with headquarters at Los Angeles, Cal., was announced in the *Railway Age* of September 17 (page 556), was born at Williamsport, Pa. He entered railroad service about 26 years ago in a local freight office of the Atchison, Topeka & Santa Fe. Some time later he left this road to become chief rate clerk in the general freight office of the Colorado & Southern, with headquarters at Denver, Colo., on which road he was later promoted to contracting agent and then commercial agent. He entered the service of the Southern Pacific as general agent, with headquarters at Denver, Colo., which position he held until federal control, when the off-line offices were closed. During government control he was with the Southern Pacific in Texas, later being transferred to San Francisco. He left San Francisco to become industrial agent, with headquarters at Los Angeles, and was promoted to district freight agent, with the same headquarters which position he held at the time of his recent promotion.

## Mechanical

J. E. Carr has been appointed assistant general road foreman of engines of the United Railways of Havana with headquarters at Cruces, Cuba.

## Engineering, Maintenance of Way and Signaling

C. P. Richardson, assistant engineer of the Dakota division of the Chicago, Rock Island & Pacific, has been transferred to the general offices in Chicago, where he will be in charge of special work in the engineering department.

E. F. Kulchar has been appointed district engineer, maintenance of way, of the Illinois district of the Chicago, Burlington & Quincy, with headquarters at Galesburg, Ill. A. Craine has been appointed district engineer, maintenance of way, of the Missouri district, with headquarters at St. Louis, Mo., and D. Cameron has been appointed district engineer, maintenance of way, of the Iowa district, with headquarters at Burlington, Iowa.

## Purchasing and Stores

A. J. Mello has been appointed superintendent of commissary stores of the Southern Pacific, with headquarters at San Francisco, Cal.

J. D. McCarthy, whose appointment as purchasing agent of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., was announced in the *Railway Age* of September 17 (page 556), was born at Chicago, Ill., on August 26, 1881. He entered railroad service in 1889 with the Chicago Great Western, and served successively until 1904, as roadmaster's clerk, chief clerk to the division engineer and division storekeeper. From 1904 to 1906 he served in the accounting department of the Chicago, Rock Island & Pacific. In 1906 Mr. McCarthy entered the service of the Chicago & North Western and through various promotions became assistant purchasing agent of that company. He was serving in this capacity at the time of his recent appointment.

J. D. McCarthy

## Obituary

M. Burke, formerly roadmaster of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, Ill., and president of the Roadmasters and Maintenance of Way Association in 1917, died suddenly while at work in the Western Avenue Yard of that road on October 11.

F. F. Busted, formerly general superintendent of the Canadian Pacific, died suddenly from heart disease at his home in Vancouver, B. C., on October 2. Mr. Busted was born at Battery Point, Que., in 1858. He entered the service of the Canadian Pacific in 1879, and through various promotions became assistant chief engineer in June, 1904. In 1907 he was promoted to general superintendent of the British Columbia division and, in 1911, was transferred to the Manitoba division. He re-entered the engineering department the same year in charge of double tracking and grade revision from Calgary to the coast, which included the construction of the Connaught tunnel through the Selkirk mountains. Mr. Busted retired in 1918.

Records for perfect welds come naturally in a Ryerson-equipped flue shop

## Can You Cut Your Flue Costs?

It is not often you can cut the time on a job in half.

Particularly a job like flue repairs that goes on day after day.

But that is exactly what Ryerson Standardized flue repair machinery is doing for one railroad.

Would you like to know the name of the road and something more about this remarkable performance? We shall be pleased to give you all the facts.

### Another Crisis on the Railroads

THE HISTORY of the railways of the United States for some years has been largely a series of important crises, some due to labor conditions, some to operating conditions, and some to financial conditions.

Within the last week there has developed a crisis which probably is as important as, and may prove to be more serious than, any which the railways have passed through in the last ten years.

The executives of the railways met in Chicago on October 14 and decided to ask the Railroad Labor Board for a further reduction of wages, announcing that the benefit of any further reduction in wages would immediately be given to the public through reductions of rates. Almost at exactly the same time the heads of the five train service brotherhoods issued an order for general strikes against the reduction in wages put into effect by the railways last July. The heads of the other railway labor organizations are considering whether they shall issue orders for strikes by their members.

There has been much talk by railway labor leaders about strikes for some months. This was not taken seriously until the meeting of the railway executives last week, because apparently the labor leaders were not threatening strikes with any real expectation of getting the wage reduction of last July rescinded, but in the hope of preventing steps for any further wage reduction being taken.

#### Pressure to Which Railways Have Been Subjected

For some months the railways have been subjected to powerful pressure from two opposite directions, the continuance of which was bound to result in the very kind of crisis which has come. They have been subjected to a practically universal and daily intensifying demand for reductions of freight rates. This demand was first given expression by the agricultural and some of the industrial interests. It was taken up by members of Congress, especially the new but very potent "agricultural bloc," and a little later by President Harding, his cabinet, and members of the Interstate Commerce Commission. The railways have been told repeatedly by those who voiced this demand, including officials of very high position in Washington, that they must find a way to reduce their rates, and have even been threatened with the passage by Congress of a bill for a general reduction in rates unless it was brought about by some other means.

The railway executives, since the recent great declines of prices, especially those of agricultural products, have never contended that the present rates should be maintained beyond the time when the operating expenses of the railways made their continuance necessary. In order to rescue the railways from threatened general bankruptcy, and also prepare the way for reductions of rates, they have struggled for months

to secure substantial reductions of their operating costs, and especially of their labor costs.

In spite, however, of all the efforts the railways have made to secure the abrogation of the costly National Agreements made by the Railroad Administration, most of the rules in them, owing to the action or inaction of the Railroad Labor Board, are still in effect. In spite of all the efforts that have been made to secure substantial reductions of wages, the wages still being paid are only 12 per cent lower, as a result of the decision of the Railroad Labor Board in the last wage case, than the highest wages ever fixed. Every attempt of the railways to secure a reasonable liquidation of their labor costs has been met with the most unyielding resistance and constant threats of strikes by the labor unions.

The last general advance in passenger and freight rates went into effect on August 26, 1920. These rates and the wages awarded by the Railroad Labor Board on July 20, 1920, were together in effect during the ten months ended on June 30, 1921. Even when the railways a year ago were handling a heavy business the rates were found insufficient, with the operating costs then prevailing, to enable them to earn the 6 per cent return which had been expected. Owing to these high operating expenses and the heavy decline in traffic the net return earned by the railways during the ten months when the advanced rates and the wages awarded by the Railroad Labor Board on July 20, 1920, were both in effect was only 2½ per cent. This was not sufficient for the railways as a whole to pay the interest on their bonds, and many railways did not even earn their operating expenses.

When the railways appealed to the Railroad Labor Board last spring for a reduction of wages they emphasized the fact that it was needed to save a large part of the companies from insolvency. Since the wage reduction on July 1 there has been a substantial increase in the net return earned. But the largest monthly net returns earned have not been equal in any month to the net return which it was expected the railways would earn every month under the present rates.

It became evident, however, that the railways must heed the constantly increasing public demand for a general reduction of rates. Therefore they decided upon the plan announced on Friday, namely, of asking for a further reduction of wages, and of giving a definite pledge that the benefit of any reduction of wages obtained would be given to the public in reductions of rates.

#### Strike Would Be Defiance of Labor Board

This did not afford the labor unions any ground for ordering a strike. In fact, the strike vote of the brotherhoods already had been taken and the strike order prepared be-

cause of the reduction of wages awarded by the Railroad Labor Board and put into effect by the railways on July 1. The strike now ordered, if it comes, will be a strike against the decision of the Labor Board acting under the provisions of the Transportation Act and the action of the railways in accepting the award made in that decision.

The labor provisions of the Transportation Act were passed and the Labor Board was created to establish a permanent means and a permanent tribunal for settling railway labor controversies that might cause an interruption of transportation. The proposed strike would be in direct disregard of these provisions of law and in direct defiance of the Railroad Labor Board and of its decision. The action of the railway executives at their meeting on October 14 merely contemplates a strict compliance with the provisions of the Transportation Act in the form of an appeal to the Labor Board for authorization for a further reduction in wages. It gave no ground for any apprehension that the railways would make any reduction in wages not authorized by the Labor Board and therefore, as already indicated, afforded the labor brotherhoods no ground whatever for calling a strike.

However, it is doubtless true that it is the announcement of the railway executives that they will ask for a further reduction of wages which has made the issuance of the order for a strike a matter of serious moment. It would be worse than foolish for the railways, public officials or public to act on the assumption that there is not now any serious danger of a strike. Neither the labor leaders nor the railroads are "bluffing," whatever may have been the case a short time ago, and if a strike is averted this will be due to the mediation or pressure of others besides the railways and the labor unions.

#### **Remarkable Suggestion of Public Members of Labor Board**

The crisis already has caused some suggestions to be made regarding means which should be adopted to relieve it. One of these has come from the three public members of the Labor Board. This suggestion is that the railways shall at once make a reduction of rates equal to the reduction of wages made on July 1, that they shall postpone applying for a further reduction of wages, and that the labor brotherhoods shall withdraw their order for a strike.

This suggestion, coming from the source that it does, is greatly to be regretted. It discloses an attitude and a want of understanding of the present railroad situation on the part of the public members of the Labor Board which are difficult to comprehend. Nobody who is familiar with the facts regarding the earnings and expenses of the railways prior to July 1 can doubt that a very large part of them were then headed for ruin. The adoption of the suggestion of the public members of the Labor Board would put the railways back financially almost where they were then.

The railways during the first twelve months the present rates were in effect earned only one-half as much net return as they earned five years ago and less than one-half of the net return they are entitled to earn in a year under the provisions of the Transportation Act. They have been suffering along with the farmers and other business concerns from the terrific liquidation and business depression of the last year.

On the other hand, the wages of railway employees are still more than twice as high as they were five years ago. Upon what rational ground can it be suggested that the railways should make a reduction in rates which would cause them to continue to earn only one-half as much net return as they earned five years ago, and as the Transportation Act says they should earn, in order that they may continue to pay their employees wages more than twice as high as they paid them prior to government control?

The result of adoption of the suggestion of the public members of the Railroad Labor Board would be that the railways would be rendered unable to rehabilitate their properties, much less to prepare to render the increased service which later will be demanded of them, in order that they might continue to pay their employees an average wage per hour at least 135 per cent higher than that of 1914, when the average cost of living, according to the reports of the Industrial Conference Board, is only 65 per cent greater than it was in 1914.

#### **Would Ruin of Railways Help Business?**

The whole argument for early reductions in railway rates is based on the proposition that it is needed to relieve industry of a heavy burden and help promote a revival of general business. The railways, however, are one of the most important industries in the country. A general reduction of rates without a corresponding reduction of wages would postpone indefinitely the time when they could begin to rehabilitate their properties and increase their purchases from other industries. If the reduction in rates were substantial it would financially ruin many railway companies. Would the indefinite postponement of an increase in purchases by the railways, and the financial ruin of many companies, promote a revival of business? On the contrary, nothing could be better adapted to protracting the business depression.

Congress has under consideration the passage of legislation which would cause the railways to be paid at an early date about a half billion dollars which the government owes them. Many believe that the passage of this legislation would restore the purchasing power of the railways. If, however, the passage of this legislation were accompanied by a general reduction of rates, without a corresponding reduction of labor costs, the effect of the legislation would be much more than offset by the effect of the reduction of rates, the railways would in consequence be disabled from increasing their purchases and the whole purpose of the proposed legislation by Congress would be defeated.

The railways are sure to be severely criticised in many quarters for refusing voluntarily to reduce their rates without a corresponding reduction of wages. Their position is, however, entirely defensible, not only from the standpoint of the rights of their owners, but also from the standpoint of the welfare of the public. There are intimations given that unless, regardless of whether there is a further reduction of wages they soon make a voluntary reduction of rates, measures will be adapted to force them to reduce their rates. This means that the railways are invited to commit suicide, and told that if they do not do so they will be murdered. The presentation of such an alternative leaves the railways but one choice, and that is to refuse to commit suicide and find out whether, because of their refusal, they really will

be murdered. If they must be ruined, it is not the function of their managers to ruin them. Their managers should let others do it, and then let those who do it assume the responsibility for the consequences.

### A Singular Hallucination Regarding Railways

For years there has been prevalent in the country a very singular hallucination. This is that the railways should be subjected by the government and the public to a kind of treatment which no other large industry is given, and that then the managers of the railways, and not the government and the public, should find and apply the remedy for the results of this treatment. The public, through Congress, the Railroad Administration, the Railroad Labor Board and other bodies, has created most of the conditions which have made, and are still making, the operating costs of the railways so excessive. Having created these conditions, some government officers and a large part of the public come to the railways and say that, regardless of the consequences to the railways themselves and regardless of the effect which would be produced on the service they could render the public, they should reduce their rates relatively as much as the prices of commodities have declined, and make them even lower compared with pre-war standards than are the prices of many commodities even at the present time.

These demands are utterly unreasonable and unjust. It is the duty of the government and the public, which are chiefly responsible for the present high operating costs of the railways, to remove the causes of these high costs before they ask the railways to make general reductions of the rates which these high costs make necessary. When the government and the public have removed the conditions which necessitate the present rates, then, and only then, should general reductions of the rates be made.

This, in substance, is the position the railways have taken and they should not retreat from it. It may be said that if

they maintain it they will arouse a very hostile public sentiment. We hope this will not be the case. If, however, the railways cannot secure the support of the government and the public by taking and maintaining a position which is fair and defensible on the basis of actual facts and reason, then all hope for the solution of the railroad problem under the policy of private ownership and public regulation is futile.

Our present system of government regulation is now being subjected to the severest test to which it has ever been put. We shall soon know how it will stand the test. If it does not stand it, the owners of the railways undoubtedly will suffer severely, but, in the long run, the public will suffer most.

### The Railroad Bill as a Relief for Unemployment

THE VALUE of the series of constructive recommendations for the relief of unemployment and the recuperation of business generally which were made by the President's Conference on Unemployment will depend on the activity which is displayed by those to whom the recommendations appeal in putting them into practical effect. To comply with some of them involves the solution of problems almost as complicated as the broad subject of unemployment itself. Others are comparatively simple.

Two of the subjects which received the most attention among members of the conference pertain to the railroad situation, involving a general demand for a reduction of freight rates and nearly as general a demand for the passage of something like the railroad bill now pending in the Senate to authorize the War Finance Corporation to purchase railroad securities from the Railroad Administration in order to provide it with possibly \$500,000,000 with which to settle its indebtedness to the railroads for the period of federal control.

The rate question represents one of the most difficult of problems. The railroad officers themselves have recognized

## A LABOR MESSAGE FROM EUROPE

From Robert E. Thayer, European Editor of the Railway Age

London, October 18. (By Radio.)

American business men in Europe view with alarm the threatened railway strike as reported by press cables. It seems inconceivable that American labor is so utterly ignorant of the world's economic conditions as to even think of fighting the present wage reduction to say nothing of striking. Can it be that labor reads the world's news and cannot see the handwriting on the wall?

Does labor not realize the great life and death struggle for economic existence going on all over the world? It is a bitter struggle and not without famine and death. The nation that is the quickest to adjust itself to existing conditions is the nation to win. The nation's success is the workman's success and today the difference between success and failure is food and famine. Has labor not profited by the experience of others?

Did labor ever hear of the English coal strike which not only failed but resulted in untold unemployment and was all but a death blow to Britain's trade? English labor learned a bitter lesson and the railwaymen are judiciously accepting their wage reductions.

Have our men at home grown to believe themselves so omnipotent that they still can demand cream—which is but to fatten them for the slaughter? Let them watch their step! They are no longer citizens of Pennsylvania, Illinois or California; they are citizens of the world. Their problems are no longer home problems, but world problems.

They are not bucking the railways; they are bucking the world, the economic condition of which they seem to know but little about.

the necessity for action and are working to make it possible, and the President and the Interstate Commerce Commission are also working on it. The passage of the so-called railroad "funding" bill, while the subject is surrounded with an unusual amount of misunderstanding, misinformation and misrepresentation, represents a comparatively easy problem, although the opposition to it has been sufficient to result in much delay in its consideration.

Its importance as a means of relieving unemployment is emphasized by the fact that it was advocated in one form or another in the general program of recommendations adopted by the conference itself and in the reports of the committees on transportation, manufactures and mining, as well as in the advance suggestions made by the Economic Advisory Committee. The conference itself did not specifically recommend the passage of the Senate bill, but in accordance with its policy of adopting only general principles on which there was complete agreement it urged "settlement of the financial relationships between the government and the railways having in mind the immediate necessity for increased maintenance and betterments, making effective increased railway employment and stimulation of general employment, in order that the railways may be prepared for enlarged business when it comes." The Senate bill proposes the only plan for a settlement of the financial relationships between the government and the railways which is now actually under consideration.

A majority of the committee on manufactures recommended the "prompt passage of the measure funding the obligation of the railroads," while the committee on mining, without referring to the bill, went to the heart of the question by recommending that the conference "memorialize Congress to the effect that the railroads be paid all monies now owing them by the federal government."

The only objection to the bill that was in any way expressed at the conference was that of the labor members that it now contains no provision to insure that the money to be received by the roads will be actually expended in directions that will relieve unemployment among railroad men. The transportation committee recognized this point in recommending the immediate passage of "a bill such as Senate Bill 2337 as a very obvious and direct means for the reduction of unemployment in railroad service," by suggesting that it would not be inconsistent to make such funding conditional, in proper cases, upon the expenditure of the funds in such channels as will increase employment.

"Such a condition had also been suggested by the Economic Advisory Committee, but it was not sufficient for W. S. Carter, president of the firemen's brotherhood—which has just shown its desire to relieve unemployment by taking a strike vote—nor for the other labor members. Mr. Carter not only insisted that practically the entire sum be devoted to "the purchase of labor and material for maintenance," (if Mr. Gompers should object to the language used as treating labor as a commodity, we must remind him that the quotation is from Mr. Carter), but that the maintenance of equipment be performed in railroad shops. He apparently was not concerned with the unemployment problem in other shops.

The bill has been strongly advocated not only by the President but by Secretary Hoover, Managing Director Meyer of the War Finance Corporation, and Director General Davis, on the specific ground that it would result in the employment of thousands of men, not only on the railroads, but in the industries from which the roads buy. Yet some of the strongest opposition to the plan, which has helped to delay it since it was urged upon Congress by the President nearly four months ago, has come from the side of labor, and the misinformation that has been circulated by their publications on the subject has been so flagrant that it is difficult to see any purpose behind it other than a determination to do everything possible to embarrass the railroads in a hope that in

some way the Plumb plan or some form of government ownership may result.

Mr. Carter's argument, presented to the conference in support of his amendment to the transportation report, while containing some undeniable facts, on the whole represents one of the worst examples of perverted logic and garbled facts that has ever come to our attention. One of his principal arguments was that the money involved covers only additions and betterments chargeable to capital account and that the roads, therefore, will not use it for current expenditures.

If Mr. Carter had ever read S. 2337 instead of getting his information from Mr. Plumb's paper which persists in referring to a \$500,000,000 gift to the railroads, he would know that all of the money that it covers would go first to the Railroad Administration and that while the Railroad Administration would then take the railroads' ten-year notes for their indebtedness to it on capital account instead of demanding cash, the money which the Railroad Administration would turn over to the roads in settlement would be largely that which under their contracts was payable quarterly during 1918 and 1919, plus some allowance for the money which should have been spent for maintenance during those years and other items, including in some instances cash taken over by Mr. McAdoo in 1918. Therefore it represents current funds instead of capital and would give the roads the money for current purposes instead of requiring them to use needed current funds for permanent capital purposes.

It is undoubtedly true that some roads have used and others might use money received from the Railroad Administration to pay deferred dividends. That is one of the purposes for which the roads were allowed a guaranty. But in most instances the most pressing need of the railroads is for cash with which to pay some \$250,000,000 to \$300,000,000 of unpaid bills, for coal and other supplies, and the payment of which would give them new credit or release other cash for the purchase of more coal and supplies and more labor.

It is true, as Mr. Carter says, and as the transportation committee says in its report, that the payment of the money owed to the railroads by the government will not result directly in increased work for the classes of employees whose number depends on the volume of business being done by the railroads, such as trainmen. Possibly the only effect on this kind of employment would be the indirect stimulus to business generally resulting from increased expenditures by the railroads. However, as the committee pointed out, there is also a very large amount of deferred maintenance work which "is actually there and waiting to be done," some of which ought to have been done long ago and would have been done if the roads had had the money, and some of which, as in the case of coal car repairs, is so urgent that any further delay in it may be the cause of serious difficulty this winter. Mr. Plumb is already boasting in his paper that the railroads will not have sufficient cars in repair to haul enough coal this winter to keep the people from freezing, although he gleefully arrives at this conclusion by figuring on the basis of last year's demand for coal.

Without an understanding of some of the difficulties which the unemployment conference faced in its efforts to avoid an out-and-out break between capital and labor, it might be hard to see why the settlement between the railroads and the government should have been included among the permanent measures suggested instead of in the emergency program. The payment to the railroads of any part of \$500,000,000 in cash would doubtless be useful to them at any time in the near future, but for the purpose of relieving unemployment every day of delay detracts from the value of the plan.

The bill was originally proposed as a measure to assist the railroads in putting their equipment in shape for the crop-moving season. By staving off most of the demands for reductions in rates the roads were able to fix up enough cars to handle an unprecedented grain crop without a car shortage,

and recently, as traffic has been increasing, they have been able to provide funds with which to make some reduction in the number of bad-order coal cars. If business continues to improve rapidly enough to relieve the unemployment problem the railroads will be blamed because they have not kept their cars in shape to handle the business and the lack of funds which the bill would provide will be the responsible cause. If business continues to be so dull that the car repairs and other work are not needed until next year the importance of enabling the roads to pay to have the work begun now instead of postponing it longer will have been increased.

## Letters to the Editor

*[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]*

### Freight Traffic Increasing

A REMARKABLE increase in the volume of railroad freight traffic during recent weeks is shown by the weekly car loading reports issued by the Car Service Division of the American Railway Association. A gradual increase during the summer and fall months is of course seasonal and is of no particular significance, but the fact that the loading for the week ending October 1—a total of 901,078 cars, as compared with 992,283 in the corresponding week of 1920 and 957,596 in 1919—was 90.8 per cent of the loading during the peak week of the record year 1920 is highly gratifying when it is recalled that during the first six months of 1921 freight traffic was 23 per cent less than it was in the first half of 1920. The peak week of 1920 was that ending October 23, when the total car loading was 1,010,961 cars. Moreover, the loading during the week of October 1 was 90.5 per cent of the total for the peak week of 1919, that ending September 25, and it was a still greater percentage of the loading during the week of 1920 corresponding to that of October 1, 1921.

The percentage of difference between this year and last might be slightly larger if measured in tons instead of in cars, because the average load per car this year has been less than it was last year, but the tonnage statistics will not be available for some time and when it is considered that a large percentage of the traffic recently has been grain, which loads heavily, the difference can hardly be very great.

The movement of grain and grain products has been especially remarkable during the past two or three months. For the week of October 1 it was 130.8 per cent of that during the peak week of 1920 and 126.4 per cent of that for the peak week of 1919. It is said that the farmers in August and September marketed an unusual percentage of the year's crops and that they have been letting go of their grain much earlier than usual in order to realize some cash as quickly as possible—incidentally, it is pointed out, one of the reasons why the prices they are receiving are so low as they are—but the increases in the total car loading are not attributable solely to the grain movement. Of special significance is the fact that the loading of l.c.l. merchandise and miscellaneous freight, which includes the manufactured products, for the week was 551,656 cars, which exceeds the loading of these classes of freight for the peak weeks of either the years 1920 or 1919.

The coke and ore loading figures have been especially low as compared with previous years, but the coal loading, which has been low all year, has recently begun to pick up and for the week of October 1 was 84.8 per cent of that for the week of 1920 referred to and 81.4 per cent of that for 1919. The grain traffic is already falling off as compared with earlier weeks, but as the coal is coming to take its place it is reasonable to expect that the total car loading figures may reach still higher figures, although there was a reduction during the week of October 8 to 895,740. The number of serviceable surplus freight cars continues to shrink rapidly and for the week of October 1 was only 172,420, while for the following week it was 142,970.

### In Defence of Railway Executives

"SOMEWHERE ON THE JOB."

TO THE EDITOR:

In fairness to a great majority of our railroad executives I think some answer should be made to the article in your issue of September 24 by one of "The Official Goats." While it is true that the position of a secretary often requires long and uncertain hours, and the work is of an exacting nature, it has been my experience as a secretary to various railroad officials for the past 12 years that they are as fine a set of men as any other employers. While some officials become impatient at times, and often with good reason, I have never found one that was not agreeable if he had a man who tried to anticipate his wants and was really on the job.

The official for whom I work is not only reasonable at all times, but really goes beyond what a man of his position should in order to make my work agreeable, and I have many pleasant recollections of the kindness he has shown in my work with him. With his broad knowledge of railroading and many other subjects, his courteous manner, and with the opportunity offered to get a practical education in the railroad field, I consider it a privilege to work for him, and I feel that, generally speaking, my experience is not much different from a host of other men.

A SECRETARY.

### A Locomotive Engineer

#### On the Wage Question

CHICAGO.

TO THE EDITOR:

Pages in your publication seem to be overburdened recently with propaganda favoring most everything but death for railway employees and I am wondering if you have room for the opinion of a locomotive engineer. The *Railway Age* appears each week at nearly all R.R.Y.M.C.A.'s, and usually after a man in train or engine service reads it, he throws it across the room and starts a flow of cuss-words that would do credit to any deep-sea captain. However, I'll speak for myself only and tell you how I feel about the present situation.

Right now we have the spectacle of a group of employers and employees each calling the other a lot of robbers, thieves and crooks. Could anything possibly do more to destroy the teamwork and co-operation which is so necessary to success in any operation? The president of the road I work for recently appeared before a gathering of business men to make the stereotyped plea for their support in cutting our pay. In effect, it was as though he said to me, "I'm compelled to pay that bird a whole lot more than he is worth, and if I could I would cut his pay at once." And he would not hesitate a moment to do it either, if it was not for the protection of the much maligned brotherhoods.

The division I am on is slightly under 100 miles in length. At present, I am holding a regular "pool job" and working every day. Our tonnage is 5,300—average train from 75 to 95 loads. I cover the division on an average in seven hours—have not made an hour of overtime in 17 days. For hauling

this train I get \$7.20. I am sitting on \$60,000 worth of machinery and pulling the value of more than that. If I stay on the alert and everything goes all right I deliver the train O. K. If I have a little hard luck, or overlook a bet, I've lost a job that it took me 18 years to get. Considering the responsibility, am I overpaid? I certainly am not.

This railroad has shown a nice report of net earnings the past few months and the stock cry that it was done at the expense of maintenance cannot be made, for I can never remember a time when they had on as many section men putting in new ties or relaying steel. Also, the locomotive shop is going at a good rate. One might say, given a heavy tonnage to move, they could make all kinds of money, but there is the rub. They want to reduce our pay before heavy tonnage movement commences again, for they know they cannot get us over the road then without heaps of overtime. Last fall and winter I made 14 to 16 hours each trip and was heartily sick of those hours and hope I will never have to repeat them. We have heard a heap about the inefficiency of labor, but darn little about the inefficiency of management until the organizations mentioned it, for our American managers, both railroad and industrial, are a great little tribe of "buck-passers." I have always, as long as I have been railroading, had an obsession to "get over the road"—to complete my trip in the least possible time—but I could not make any headway last fall. If called for a certain time I would leave the dock on time with the engine and upon arrival at the yard find the train not yet made up. Was my inefficiency to blame for that? After a wait of anywhere from a half hour to four hours, I would finally get out of town. Then I would do everything possible, use every trick of the trade I know, take chances, "n everything," but before long I would drive up behind some local train and there I would lay and lay and lay, repeating this several times before I got in.

I have gone over the division times without number when we had absolutely no work to do, "not a pin to pull," not overloaded, engine in good shape and steaming well, but still we had to be relieved for the 16-hour law before we got in, simply because we were blockaded all the way. And there were hundreds of times when the poorest brakeman on the road could have cleared up the situation better and have gotten trains moving better than the dispatchers did. But of course, I was pulling the train, and as it was 16 hours getting over the division, thus having a heavy penalty cost in overtime, my "inefficiency" was to blame.

I could cite cases of this kind until I was blue in the face, but what is the use. I have no great kick to make over the recent cut we were given by the Labor Board, and have always been a quiet, reasoning, conservative man, but another cut puts me on the warpath, and I guess the present hysterical propaganda of chambers of commerce, railroad presidents and bankers will bring it, so I may as well be putting in my spare time getting the war paint ready. I never used to put much stock in the socialistic tales of how capital was organized to beat the workingman, but they appear to be mighty finely organized in this desire to reduce my pay; or at least they have temporarily buried the hatchet, believing they must all hang together or the terrible brotherhoods will hang them singly.

So what is the use of me trying to be a good loyal workman? My superior officers go around telling the country that I am inefficient, overpaid and generally a menace to the nation. Have they any real right to expect loyalty and co-operation from me when they give me that kind of a public reputation? There is one old saying: "having the name, I may as well have the game." This continual agitation against me simply because I know that I am worth all that I am being paid and decline to have my wages cut, is getting me and thousands of others to where we are disgusted with our bosses. It is darn poor business to go around shouting that your employees are no good, for after a while they will be-

lieve it themselves, and those that are some good will join the sabotage gang. And, oh boy, once a bunch of railroad men start sabotage, they can "gyp" a railroad "more ways than a farmer can come to town" and never get caught at it.

Chickens come home to roost and railway companies are now sowing something which is going to be hard to reap.

LOCOMOTIVE ENGINEER.

## Are the Railways Most Guilty of All?

INDIANAPOLIS.

TO THE EDITOR:

The editorial in your issue of October 1 entitled "The Coal Situation" was intensely interesting to me. We do not know whether it was intended to be facetious with a view to stirring up railway officials to correct their own deficiencies or not. The pitiful picture you have painted as to the shortcomings of the poor public in general certainly arouses the sympathy of the most hard-hearted.

We agree perfectly that the public should store a portion of its winter's coal in the summer for reasons innumerable. All consumers, large and small, should get ready for winter in order to relieve the strain on the mines and the railroads, principally the railroads.

If this is true of the general public, how much more is it true of the railroads themselves as coal consumers. Here we have the spectacle of an industry limited in capacity in times of stress; first by the capacity of the carriers. This same limiting factor happens to be far and away the largest consumer of coal. The railway's entire success in handling and transporting the coal supply of the United States depends upon spreading the shipments more or less equally over the entire year—in other words storing in summer for use in winter. Do you not think the very first and elementary rule of consistency would demand that they themselves set a good example to the smaller consumers by storing their own coal?

They will immediately alibi by saying they have or had no money to store coal. That need not worry them. They were not paying for current supplies for months after it was due, so why worry about a large overdue account for storage coal?

We think you will find the householders, the public utility plants and many manufacturing plants, if not all of them, have been infinitely more forehanded in preparing for winter than the railroads themselves. Many large systems of railroads have no storage coal whatever, in fact, have not even contracted for their coal for the winter, but are buying from day to day at the lowest price they can possibly extract from the urgent necessities of the operator.

While the "coal operators, the coal dealers and the dear public all join in one wild howl when the railways cannot supply cars in which to load all the coal" this winter the railway executives themselves "will join in one wild howl" to the Interstate Commerce Commission asking for their pet hobby "the assigned car" and painting the most doleful pictures of the terrible plight of the railways due to the greedy operators and the terrible strain on the railway machine brought about by the failure of the dear public to buy its coal in the summer time.

"People in glass houses should not throw stones" and there is some place else a saying to the effect that before starting out to clean up the neighborhood one's own back yard should be clean.

Inasmuch as the railways are the biggest consumers of coal and the worst offenders of all in delayed purchases one cannot find very much room to sympathize with them when they finally reap the whirlwind of their own short-sightedness. "It's a great little world and many of the people in it are so fair and consistent—not."

H. A. GLOVER,

Sales Manager, W. H. Howe Coal Company.

A View of One of the Three Lift Bridges

# New Haven Freight Transfer Facilities at Cedar Hill

Tractors and Trailers Constitute the Basis of Operation in This Modern Station

**T**WO IMPORTANT transfer stations, having a combined capacity for handling approximately 25,000 tons of merchandise freight monthly, have been closed permanently by the New York, New Haven & Hartford, and freight houses at eight originating points on its western lines have been relieved, in a large degree, of the necessity of carrying on transfer work as a result of opening for business new freight transfer facilities at Cedar Hill, New Haven, Conn.

In addition to the important economies effected in the entire freight transfer business on the west end of the

of merchandise freight a month. Because of the diversity of destinations, and the lack of sufficient tonnage to warrant direct cars to destination, a large amount of freight handled there received a secondary transfer, east. The gang and hand truck system was also followed at Maybrook. Less freight was received at that point than at Westchester and it was not practical to make up the direct-to-destination cars which good service demands.

By centralizing the cars received through both gateways at Cedar Hill, a direct-to-destination classification was made possible for approximately 75 per cent of the freight handled

Layout of Cedar Hill Transfer

New Haven, through the concentration of eastbound merchandise cars at one point, made possible by the new facilities at Cedar Hill, the new transfer is of particular interest because of the modern practices followed in its operation.

## Concentration of Cars Made Possible

Before the opening of the Cedar Hill transfer eastbound merchandise cars received by the New Haven via the Harlem river gateway were handled at the Westchester, N. Y., transfer as far as the limited facilities at that point would permit. Cars received in excess of that plant's capacity were sent further east, either to the Bridgeport, Conn., or the New Haven transfer. Similarly eastbound cars received via the Maybrook, N. Y., gateway were handled at Maybrook transfer.

Westchester transfer was operated under the gang and hand truck system and handled from 15,000 to 20,000 tons

there, thus insuring better service from the standpoint of time, and reducing the number of cars required for the service as well as the loss and damage resulting from a transfer of freight en route.

In addition to the Westchester and Maybrook plants, the road operated transfer plants at Bridgeport, Conn., and New Haven. These transfers accommodated approximately 100 cars each. Smaller transfers were operated at Danbury, Waterbury, Hartford and Putman, Conn.; Springfield, Mass., and Poughkeepsie, N. Y. Because of the small tonnage handled at these points only a limited number of classifications could be made and, in many instances, a second transfer was required before freight could be delivered at destination or to a connecting line.

All of the transfers mentioned, except Westchester and Maybrook, were in cities originating a considerable local tonnage and the local and the transfer plants were com-

bined. As a result, delays to either the local freight or freight in transit were frequent.

"Cedar Hill transfer was opened in July, 1920. One hundred and thirty-one distinct classifications are made daily and as many as 305 cars have been worked in one day, a normal daily performance being between 260 and 285 cars. The ability of the transfer to work this number of cars, with tractors and trailers, has resulted in the closing of the transfers at Westchester and Maybrook permanently. Furthermore, approximately 80 per cent of the transfers at Bridgeport and Hartford and 50 per cent of the transfers at Waterbury, Danbury and Poughkeepsie, have been eliminated through the concentration of the transfer business on the west end of the line. In addition, the Cedar Hill plant handles business diverted from all of the other transfers mentioned.

### Platforms and Supporting Tracks

Cedar Hill transfer and its supporting tracks are located approximately in the center of the Cedar Hill yard, between the humps serving the westbound and the north and eastbound classification yards, in a location convenient for the receipt of cars from the various New Haven lines converging at Cedar Hill and for the delivery of northbound cars to the various points from which trains depart. The transfer facilities are a part of the Cedar Hill yard proper which was described in the *Railway Age*, May 10, 1918, page 1166.

The layout includes 11 tracks and 3 platforms. Beginning at the east, platform No. 1, which is 20 ft. wide, separates the four outside tracks, which are numbered consecutively, A, B, 1 and 2, from tracks 3 and 4. Platform No. 2 is also 20 ft. wide and is located between tracks 3 and 4 and tracks 5, 6 and 7. Platform No. 3 is 30 ft. wide and separates tracks 8 and 9 from tracks 5, 6 and 7.

Each platform is 1,200 ft. long. Platform No. 1 is of wood construction and is covered with an umbrella shed

provides for disposing of trailers after they are made empty without interference with oncoming loads.

An extension of 40 ft., on the platform level, at the north end of platform No. 3 provides space for a charging station and a repair shop for the tractors as well as for toilets and washrooms for the laborers. Individual lockers, benches and tables for the laborers are in the basement of the extension. This space is also used for a rest-room during lunch hour.

With the exception of the outside tracks 8 and 9, where space is available for 29 cars, each track accommodates 27

A General View of the Transfer

cars. Taken together, the supporting tracks provide capacity for the total of 300 cars which constitutes the daily set-up.

### The Car Set-Up

Empty cars are placed on tracks 3, 4, 5 and 6 and all other tracks are used for loaded cars. By referring to the plan showing the transfer layout it will be seen that, by this arrangement, the center platform becomes what might be termed a loading platform with two tracks for empty cars on each side. This permits the freight to be trucked from the loaded cars over the lift bridges and the center platform to the proper destination car and allows a quick return of the empty trailers to the working platforms Nos. 1 and 2; the trailers, after the unloading is done, are pushed out of the cars onto the outside platforms by the stevedores.

Six of the tracks, 3, 4, 5, 6, 7 and 8 as well as 17 cars on track 2, are devoted to standard classification daily. The set-up on these tracks is arranged in station and train order so far as the length of the tracks permit. As previously mentioned, tracks 2, 7 and 8 are set-up daily with loaded merchandise cars. Therefore it is evident that 17 cars on track 2 and all the cars on tracks 7 and 8 must be made empty and reloaded daily in following the standard classification. In addition to the cars of the standard set-up, direct-to-destination cars and overflow cars are loaded on the working tracks A, B, 1 and 9 as conditions require; or, in other words, in taking care, each day, of merchandise from the cars which are released.

The standard classification provides for merchandise cars to be made daily for 131 different points. In several instances, however, more than one car for a destination is required. These are, of course, loaded in series on the same track, preserving the station and train order so that at the close of each day's work they can be moved forward without delay. For instance, the daily tonnage for Boston and for Providence is sufficient to warrant a regular assignment of 10 cars for each of these cities. More than 131 cars are, therefore, required daily to fulfill the car requirements of the standard classification. Actually, the number of cars required for this purpose is usually in excess of 200 cars.

Motor-Generator Sets, Compensators and Control Switchboard for Charging Tractor Batteries

roof with the posts located in the center of the platform. Platform No. 2 is also of wood construction and is covered with a hip roof with the posts placed on the edges of the platform. Platform No. 3 is of concrete and steel construction.

Three lift bridges, 20 ft. wide, are provided between the platforms; the first bridge is located 200 ft. from the north end of the platform, the second 600 ft. from the north end and the third 200 ft. from the south end. The bridges serve as the main line route between platforms for loaded trailers and trucks while the door-to-door method of spotting cars

Including the overflow cars and the direct-to-destination cars, the total number of merchandise cars forwarded daily is approximately 225.

### Rapid Handling and Low Costs

The platform equipment used at the transfer includes 13 Elwell-Parker electric storage battery tractors and one Mercury tractor; 485 four-wheel trailers of various types, a majority of which are equipped with Hyatt roller bearings or ball bearings; 132 two-wheel hand trucks and 6 dolly or machinery trucks. With the exception of short haul shipments, liquids in barrels and single package shipments too

A General View of the 30-ft. Concrete Platform

heavy to be loaded economically on flat trucks, all transferring is done with tractors and trailers. To secure the full value of the tractors, three-wheel "tip-up" trailer trucks have been ordered. When they are received the heavy packages and liquids in barrels will also be moved by the tractors and trailers.

During the month of August, 1921, based on an 8-hr. day, the transfer was operated with 306 employees per day as follows: 1 general foreman; 3 foremen; 10 office men; 3 inspectors; 43 tallymen; 93 loaders and stevedores; 146 truckmen; 1 cooper; 1 car cleaner; 1 car sealer; 1 watchman; 2 battery chargers, and 1 messenger; a total of 306 men. Twenty-eight of the truckmen work on the tractors, either as operators or helpers.

Including all money paid to all the employees listed, and excluding the "no credit" tonnage which is not considered in arriving at the cost of handling, the average cost per ton of freight handled during the month was \$0.669.

With this force a total of 5,745 merchandise cars were forwarded out of the transfer during August, a daily average of 221 cars. During the same month 6,408 loaded cars were received and unloaded, an average of 246 cars per day. The average daily tonnage handled was 1,849 tons; in addition, 1,334 tons of "no credit" tonnage moved out of the terminal in the original cars during the month.

### Operation and Organization

The merchandise cars destined for the transfer arrive at both the east and westbound hump yards continuously throughout a 24-hr. period. On arrival, the cars are switched to classification tracks where they are arranged according to the route to be followed when forwarded from the transfer, and are so placed on the transfer tracks.

The "block" numbering system for cars at the house is simple and easily understood by the men. The last figure in the number indicates the number of the track and the preceding figures the relative position of the cars on a track. For example, the northerly car on track No. 1 receives the

number 11; the corresponding car on track No. 2 receives the number 12. The second car from the north end of track No. 1 receives the block number 21 and so on up to block No. 261 indicating car 26 on track 1, numbered from the north. Block numbers are posted conspicuously on each platform.

The house organization is headed by a general foreman who reports to the agent and consists of a day and night force. The night force is limited to office help only.

Messenger service is maintained between the two hump offices and the transfer office for carrying waybill pouches. A book record of each pouch, arranged according to the last two figures of the car numbers, is kept. It includes the date of receipt of bills and the point of origin. The record is completed later with the addition of the location or block number of the cars as placed at the platform and the date of handling. This is done so that tracing work, when necessary, may be expedited.

One of the illustrations shows the suspense rack in which waybills are placed after the stamp of the transfer, showing the date of receipt, is added. The boxes in the rack are numbered to correspond with the book record in order that the pulling of pouches, as cars are received on the transfer tracks, may be expedited.

The daily layout sheet of the transfer is made up by the night force as the tracks are filled. The block numbers showing the location of cars to which the merchandise is to be transferred is noted on the waybills, by the route clerks. This number serves as a guide to the tallymen and check clerks when the actual handling of the merchandise is begun. These men are also expected to check the waybills and detect any errors made by the route clerks.

Waybill pouches are assigned to tallymen by the foreman in charge of the platform where the cars covered by the bills are located. The tallymen are required to check the original waybill as the freight is handled and to note, on the original, any exceptions as to condition or shortage. The tallymen

Tractors with Trains and One Running Light

also make a combined memorandum astray waybill and check-over slip for any freight in the car not covered by a revenue waybill.

With each direct-to-car truck or trailer load, the tallymen furnish a veri-check showing the block number to which the truck is to be run, the destination of the load, and the number of packages it contains, and the number by which the tallyman is known. In addition thereto, on trailer loads, the tallyman places with blue chalk, in a conspicuous spot on the load, the block number to which the trailer is destined.

The contents of cars are loaded on trailer trucks, the trailers being held until the entire lading of a car has been handled. When the unloading of a car has been completed the

trailers are made up into trains of six to eight placed in location order—with the longest haul next to the tractor—and hauled to destination. Trailers are dropped from the train on the platform opposite the proper car and are taken into the car and unloaded by stevedores. The stevedores then push the empty trailers out of the cars, to the platforms, where they are picked up by the tractors. The stevedores are assigned to the same car each day and become familiar with the destinations of freight that belongs in their cars. They are required to examine marking as to destination and report for correction any freight trucked to them in error.

As an additional check on destination three qualified tallymen act as inspectors. These men make the rounds of the cars and inspect veri-checks to determine if the freight is properly loaded. This can be done readily from the destination marking appearing on the veri-check.

Explosives, inflammables and acid shipments are handled specially, one man being assigned to this work. He is held responsible for the proper placarding of the cars.

As the cars are worked pouches, containing the waybills, are picked up by messengers and returned to the office where the tonnage by gangs is computed. At the end of the day the tonnage is totaled, the totals showing the tonnage actually transferred, tonnage traveling without revenue billing, tonnage left in cars, and the amount checking short according to waybills. The latter two items are called "no-credit" tonnage and are not considered in arriving at the cost of handling.

The bills then pass on to exception clerks and any exceptions made by the tallymen are recorded. The bills are then racked, by the pouching clerks, and at the close of business are examined by the rack clerks before being pouched. Each

dled at Cedar Hill than at the transfers operated under the gang and hand-truck system which it has largely superseded. The increase in tonnage handled per man has resulted in a decrease in the cost of handling.

Comparative figures between the operation of Westchester transfer—a two-wheel hand-power truck-operated transfer entirely—for the last month of its operation, June, 1920, and Cedar Hill for the month of May, 1921, disclose the fact that 7,542 tons per man per 8-hr. day were moved at Cedar Hill as compared with 4,454 tons at Westchester, an increase of 69 per cent.

### Auxiliary Facilities

Tractor maintenance, including the charging of the tractor batteries, is a comparatively simple matter, requiring the

The Waybill Rack

All Truck Repair Facilities Are Located in One Corner of the Charging Room

rack clerk is required to note the block numbers of cars he verifies thus making it easy to place the responsibility for improper pouching.

At the close of business switching requests are made on a standard form showing the track number, date, the initials and numbers of the cars as they stand on the tracks, the destinations, route, etc. Platform foremen are required to check the switching requests against their records and the rack men are required to check the pouches against the copy of the switching request which is retained in the office. The forms, after these checks are made, are passed on to the yard department.

The results of the tractor and trailer system of operation have been gratifying. Much more tonnage per man is han-

dled at Cedar Hill than at the transfers operated under the gang and hand-truck system which it has largely superseded. The increase in tonnage handled per man has resulted in a decrease in the cost of handling.

One of the maintainers goes on duty at four o'clock in the afternoon, just after work on the platforms has stopped. Eight of the tractors are run into the charging and repair room and placed on charge. Each truck is equipped with a battery consisting of 30 Edison cells and they are charged at the 8-hr. rate which insures their being fully charged before midnight. Charging is discontinued when the no-load voltage reading is 52 volts. The second maintainer relieves the first at midnight and has the remaining six tractor batteries charged before work is again started in the morning.

Two motor-generator sets supply all of the charging current. The two are identical and each set consists of a 75-volt, 240-ampere direct current generator driven by a three-phase, 440-volt, 30-hp. induction motor running at 1,800 r.p.m. There are two charging panels in the switchboard and each one is equipped with a circuit breaker having an overload trip and no-voltage release, a grid charging resistance, an ammeter switch and a voltmeter button. With this equipment the operator can control the rate of charge on each tractor separately and can determine the current and load or no-load voltage of any battery with one ammeter and one voltmeter. Occasionally some of the batteries are given a boosting charge at noon, but this is not often necessary.

The transfer is located on the New Haven division, E. E. Regan, superintendent, and is operated under the direct charge of J. B. O'Brien, agent, and under the general supervision of George Mark, assistant to the general manager.

# Labor Leaders Call Strike for October 30

While Unions and Roads Prepare for Finish Fight, President  
Considers Plans to Avert Walkout

THE past week has brought many unexpected and critical developments in the railroad labor problem. Interest has been centered in Chicago where the leaders of the railroad labor organizations were gathered to formulate plans for future policies in light of the developments which have already been described in previous issues of the *Railway Age* and where executives of all of the larger roads were gathered to discuss the present problem of wages and rates. As a result of these two meetings plans for a nation-wide strike of railroad employees to begin at 6 a. m. on October 30 have been definitely announced by the employees and a definitely announced proposal to reduce rates commensurate with whatever reductions in wages will be allowed by the Railroad Labor Board has been made by the carriers.

For some time the officers and general chairmen of the various train service brotherhoods and the Railway Employees' Department of the American Federation of Labor have been in Chicago counting the ballots of their respective membership on acceptance or rejection of the recent wage cut of approximately 12 per cent and discussing strike measures and future policies. An overwhelming majority of the men voted in favor of a strike according to the announcements of responsible officers, but at the same time it has been freely admitted by many of the labor leaders that the heavy strike vote was returned by the men merely to place more power in the hands of their officers to fight any further wage reductions. In other words, the vote was not in protest against those wage cuts which have already been made but against those which might be requested as part of the carriers' efforts to bring operating costs down to a point where rates could be reduced. It is evident now, however, that extensive plans for a general walkout were being arranged; plans to be utilized only in case of absolute necessity.

## Executives Propose Wage and Rate Reductions

This was the situation when the Association of Railway Executives met in Chicago on October 14. The action taken by the executives at this meeting is summarized in the following statement issued after the meeting by T. DeWitt Cuyler, chairman of the association.

At the meeting it was determined to seek to bring about a reduction in rates, and as a means to that end seek a reduction in present railway wages which have compelled maintenance of the present rates.

An application will be made immediately to the Railroad Labor Board for a reduction in wages of train service, employees sufficient to remove the remainder of the increase made by the Labor Board's decision of July 20, 1920, (which would involve a further reduction of approximately 10 per cent) and for a reduction in the wages of all other classes of railroad labor to the going rate for such labor in the several territories where the carriers operate.

## Proposed Reduction in Wages to Be

Followed by Reduction in Rates

The foregoing action is upon the understanding that concurrently with such reduction in wages, the benefit of the reduction thus obtained shall, with the concurrence of the Interstate Commerce Commission, be passed on to the public in the reduction of existing railroad rates, except insofar as such reductions shall have been made in the meantime.

The railroads have decided upon this course in view of their realization of the fact that the wheels of industrial activity have been slowed down to a point which brings depression and distress to the entire public and that something must be done to start them again in operation.

The situation which confronts the railroads is extremely

critical. The railroads in 1920 realized a net railway operating income of about \$62,000,000 upon a property investment of over \$19,000,000,000 and even this amount of \$62,000,000 included back mail pay for prior years received from the government of approximately \$64,000,000, thus showing when the operations of that year alone are considered an actual deficit before making any allowance for either interest or dividend.

The year ended in a serious depression in all branches of industry, and in marked reduction of the market demand for and the prices of basic commodities, resulting in a very serious falling off in the volume of traffic.

In this situation, a policy of the most rigid economy and of postponing and cutting to the bone the upkeep of the properties was adopted by the railroads.

This was at the price of neglecting and for the time deferring work which must hereafter and in the near future be done and paid for. This is illustrated by the fact that, as of September 15, 1921, over 16 per cent, or 374,431 in number of the freight cars of the carriers were in bad order and needing repairs, as against a normal of bad order cars of not more than 160,000 and is further illustrated by the deferred and inadequate maintenance of other equipment and of roadway and structures.

## Eight Months Earnings Only 2.6 Per Cent

Even under those conditions and with this large bill charged up against the future—which must soon be provided for and paid if the carriers are to perform successfully their transportation duties—the result of operations for the first eight months of this year, the latest available figures, has been at a rate of net railway operating income before providing for interest or dividends, amounting to only 2.6 per cent per annum, on the valuation of the carrier properties made by the Interstate Commerce Commission in the recent rate cast an amount not sufficient to pay the interest on their outstanding bonds.

It is manifest, from this showing, that the rate of return of 5½ or 6 per cent for the first two years after March 1, 1920, fixed by the Transportation Act as a minimum reasonable return upon railroad investment, has not been even approximated—much less reached; and that the present high rates accordingly are not due to any statutory guarantee of earnings, for there is no such guarantee.

In analyzing the expenses which have largely brought about this situation it becomes evident that by far the largest contributing cause is the labor cost.

## Labor Receives 60 Cents of Railroad Dollar

Today the railroads pay out to labor approximately 60 cents of the dollar they receive for transportation service, whereas in 1916, 40 cents of the dollar went to labor.

On the 1st day of January, 1917, when the government took charge of wages through the Adamson Act, the labor costs of the railroads had not exceeded the sum of about \$1,468,000,000 annually. In 1920, when governmental authority made the last increase, the labor costs of the railroads were about \$3,698,000,000 annually, or if continued throughout the year instead of for the eight months during which the wage increases were in effect, the labor cost, on an annual basis, would have been largely in excess of \$3,900,000,000—an increase since the government took charge of railroad wages in the Adamson Act of approximately \$2,450,000,000 annually. In the light of these figures it is manifest that the recent reduction of wages authorized by the Labor Board, estimated from 10 to 12 per cent, in no sense meets or solves the problem of labor costs and in no way makes it possible for the railroads to afford a reduction in their revenues.

## 4,000 to 5,000 Individual Rate Reductions in Year

Indeed, during the past year there have been between four and five thousand individual reductions in freight rates. On some railroads the reduction in rates have amounted to more than the reduction in wages so far made and on many other railroads the reduction in wages allowed no net return on operation, but merely provided against a further accumulation of a deficit.

The point is often made that agriculture and other industries are also suffering the same immediate difficulty as the railroads. Why, therefore, do not the railroads take their medicine like anybody else? The answer lies in several facts.

1. The railroads were not permitted as were other industries

to make charges during the years of prosperity making possible the accumulation of a surplus to tide them over the present extreme adversity. According to the reports of the I. C. C., the rate of return on property investment of the railroads of the United States for the past several years has been as follows:

RATE OF RETURN EARNED BY RAILROADS OF THE UNITED STATES ON THEIR PROPERTY INVESTMENT			
	Per cent		Per cent
1912.....	4.84	1915 calendar year.....	6.16
1913.....	5.15	1917 calendar year.....	5.26
1914.....	4.17	1918.....	3.51
1915.....	4.20	1919.....	2.46
1916 fiscal year.....	5.90	1920.....	0.32

## Railroads Not Allowed to Accumulate

### Surplus in Boom Years

It will thus be noted that during the years when other industries were making very large profits, when the prices of farm products and the wages of labor were soaring to unheard of heights, the earnings upon railroad investments of the United States were held with very narrow limits, and that they have during the past four years progressively declined.

2. The railroads are responsible to the public for providing adequate transportation. Their charges are limited by public authority and they are in very large respects (notably for labor) compelled to spend money on a basis fixed by public authority. The margin within which they are permitted to earn a return upon their investments, or to offer inducements to attract new capital for extensions and betterments is extremely limited. However much the railroads might desire, therefore, to reduce their charges in times of depression, it will be perceived that the limitations surrounding their actions do not permit them to give effect to broad and elastic policies which might very properly govern other minds of business not thus restricted.

It has been urged upon the railroads that a reduction in rates will stimulate traffic, and that increased traffic will protect the carriers from the loss incident to a reduction in rates. The railroad managements cannot disguise from themselves the fact that this suggestion is merely conjectural and that an adverse result of the experiment would be disastrous, not only to the railroads but to the public whose supreme need is adequate transportation. Consequently the railroad managements cannot feel justified in placing these instrumentalities so essential to the public welfare at the hazard of such an experiment based solely upon such a conjecture.

## Rates Disproportionate to Some Commodity Prices

It is evident, however, that existing transportation charges bear in many cases a disproportionate relationship to the prices at which some commodities can be sold in the market, and that existing labor and other costs of transportation impose upon industry and agriculture generally a burden greater than they should bear. This is especially true of agriculture which is suffering to a greater extent than any other industry in the reduced prices of its products, and for which some relief must be found to escape an entire readjustment and a serious relocation of agricultural production.

The railroad managements are keenly sensitive to and sympathetic with this distressing situation and desire to do everything to assist in relieving it that is compatible with their duty to furnish the transportation which the public must have.

At the moment, railroads in many cases are paying 40 cents an hour for unskilled labor when similar labor is working alongside the railroads and can easily be obtained by them at 20 cents an hour. The railroads of the country paid in 1920 a total of considerably over \$1,300,000,000 to unskilled labor alone. However desirable it may be to pay this or that schedule of wages it is obvious that it cannot be paid out of railroad earnings unless the industries which use the railroads are capable of meeting such charges.

## General Reduction of Rates

### Promised With Wage Reductions

The railroads, and through them the people generally, are also hampered in their efforts to economize by a schedule of working rules and conditions now in force as a heritage from the period of federal control and upheld by the Railroad Labor Board. These conditions are expense, uneconomic and unnecessary from the point of view of railroad operation and extremely burdensome upon the public which pays the bill. This schedule of wages and working conditions prevents the railroads from dealing equitably with labor costs in accordance with rapidly changing conditions and the great variety of local considerations which ought to control wages in different parts of the country. The railroads are seeking to have those rules and working conditions abrogated.

The railroads will seek the reduction in wages now proposed by first requesting the sanction of the Railroad Labor Board. The railroads will proceed with all possible dispatch and as soon as the Railroad Labor Board shall have given its assent to the reduction of wages the general reduction of rates will be put into effect.

## Representatives of Brotherhoods and Carriers Confer

During the progress of the Association's meeting a delegation representing the train service organizations requested and was granted a conference with a committee representing the carriers and composed of W. W. Atterbury, vice-president of the Pennsylvania; J. E. Gorman, president of the Chicago, Rock Island & Pacific; Carl R. Gray, president of the Union Pacific; C. H. Markham, president of the Illinois Central, and Ralph Budd, president of the Great Northern.

The employees were represented by Warren S. Stone, chief of the Brotherhood of Locomotive Engineers; W. S. Carter, president of the Brotherhood of Locomotive Engineers and Firemen; L. E. Sheppard, president of the Order of Railway Conductors; W. G. Lee, president of the Brotherhood of Railroad Trainmen, and T. C. Cashen, president of the Switchmen's Union of North America.

The union men asked the same assurances that were formally denied them in July by the railway executives—that the wage reduction of July 1 be cancelled, that no further wage decreases be asked, and that no effort be made to change time and one-half pay for overtime work.

The carriers' committee again denied these assurances requested and outlined, as representing their position at the present time, the resolutions which had just been adopted by the Association and which are outlined in Chairman Cuyler's statement.

## Train Service Organizations Announce Strike

Brotherhood leaders accepted this move on the part of the railroads as a direct challenge and immediately announced their plans for a general railroad strike to begin at 6 a. m. on October 30 and extend throughout the country by November 5. W. G. Lee, president of the Brotherhood of Railroad Trainmen, expressed the consensus of opinion of the labor leaders as expressed in interviews by saying, "We're going out on the greatest railroad strike the country has ever known; nothing in the world can now avert it."

## The Strike Call

The call for the strike of train service men said in part:

1. No man in road service involved in the strike will perform any service after hour set to strike, unless he has already begun a trip and has actually left the terminal. If the train has left the terminal, he will complete the trip and deliver the train at the end of run, or tieup point if tied up under the law, after which he will perform no further service until the close of the strike. Men in other than road service will leave the service at the appointed time.

So far as your legal right to strike is concerned, there is no difference between a mail train and freight train. You have identically the same right to refuse to perform service on a mail train as you have to refuse to perform service on a freight train.

2. All men on strike will keep away from the company's property, except such men as are designated certain duties to be performed by authority of the organizations.

3. Every man should understand that the laws of the organizations involved must be obeyed. Acts of violence of any nature will not be tolerated by the organizations.

4. The local representatives will arrange for a hall for meeting purposes at all terminals, using one of their own lodge rooms if available. Immediately after the strike becomes effective all men will assemble at the hall secured for the meeting purposes. When thus assembled, an organization will be perfected by the election of a chairman, vice chairman, and secretary.

No person will be permitted to be present in the meeting halls other than those who are on strike, except by permission of the assemblage.

5. The secretary will arrange a roll call (alphabetically), with each organization on a separate sheet. Roll will be called twice daily, morning and afternoon. The names of the non-members

will be kept separate on the roll from the names of those who are members of the organizations. All strikers will be required to answer the roll call and also to be in the halls, where halls are provided, during the day at all times, unless excused by committee action or by chairman of the meeting.

The secretary will also keep a record of the proceedings from day to day.

6. In the conduct of every strike there are numerous irresponsible persons, not members of the organizations, who take occasion to engage in acts of violence and disorderly conduct, and such actions are usually attributed to members of the organizations, and great care should be taken by every member of the organizations to avoid associating with such persons and such conduct should be discouraged so as not to cast reproach upon the cause.

7. Some railroad officials may endeavor to coerce or mislead the men by asserting that men at other points have not quit, or that they have returned to work. Such information should be discounted and all strikers should apply to their officers and committeemen for information, and be governed accordingly, and no member or nonunion man will return to work until the strike is officially declared off, when all will return at the same time, without prejudice and with all former rights.

8. The local chairmen of each organization on each division of the territory will jointly supervise the prosecution of the strike on the territory over which they have jurisdiction.

9. Local chairmen are expected to keep in close touch with the situation and will report daily, preferably by night telegram letter, to their representative general chairmen as to the condition of affairs.

### Roads Grouped for Four Successive Walkouts

The arrangements for the strike provide for walkouts on successive days by groups of roads. The groups are four in number, the employees in the first group are to quit at 6 a. m. on October 30, and those in the other groups at intervals of 48 hours. The names of the roads in the four groups were made public at Cleveland Monday night by Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers.

The four groups are as follows:

#### GROUP 1.

Strike 6 a. m., Oct. 30.  
Kansas City Southern.  
Missouri Pacific.  
St. Louis Southwestern.  
International & Great Northern, Texas & Pacific.  
Southern Pacific System.  
San Diego & Arizona.  
Chicago & Northwestern.  
Chicago, Milwaukee & St. Paul (except Chicago, Terre Haute & Southeastern).  
Northern Pacific.  
Southern Railway.  
Seaboard Air Line.  
Virginian Railroad.  
Chicago Great Western.  
Chicago, Rock Island & Pacific.

#### GROUP 2.

Strike 6 a. m., Nov. 1.  
New York, New Haven & Hartford.  
Delaware & Hudson.  
Chicago & Eastern Illinois.  
St. Louis & San Francisco (entire system).  
Louisville & Nashville.  
Nickel Plate.  
Erie System.  
Atchison, Topeka & Santa Fe (entire system).  
Atlantic Coast Line.  
Buffalo, Rochester & Pittsburgh.  
Delaware, Lackawanna & Western.  
Lehigh Valley.  
Nashville, Chattanooga & St. Louis.

#### GROUP 3.

Strike 6 a. m., Nov. 3.  
Minneapolis & St. Louis.  
Burlington System.  
Chesapeake & Ohio.  
New York Central lines (East and West).  
Boston & Albany.  
Baltimore & Ohio.  
Western Pacific.  
Denver & Rio Grande.  
Chicago & Alton.  
Illinois Central.  
Yazoo & Mississippi Valley.  
Soo Line.  
Great Northern.  
Lake Erie & Western.  
Cleveland, Cincinnati, Chicago & St. Louis.

Group 4, on which the men will walk out at 6 a. m., Nov. 5, comprises all other railroads of the country, and includes specifically the entire Pennsylvania Railroad System, the Boston & Maine and its subsidiaries and the Rutland Railroad.

The wording of the circular covering railroads in Group 4 is as follows:

The membership on all other roads to which Decision No. 147 applied, and upon which railroads two or more of the organizations have received the necessary majority for a strike vote; the organizations which did not receive the necessary vote are not included herein.

Explanation was made that some organizations on lines included in Group 4 did not register a majority in favor of the strike, consequently members of those organizations voting against the strike are not included in the strike authorization. However, the organization chiefs expect that there will be practically a general walkout of those organizations when the other organizations which voted in favor of

the strike leave the service of those lines at the designated time.

### Break Appears in Ranks of Labor Organizations

It was noticeable during the progress of these developments that representatives of the labor organizations other than the train service brotherhoods have had little to say. The reason for this was explained on October 17, when a prominent union officer charged that the leaders of the train service organizations had "double-crossed" the other railroad organizations. The break between the five train service brotherhoods and the other eleven organizations is based on the assertion that the brotherhood leaders have refused to enter into an agreement with the other organizations to carry on this strike as a concerted movement, the leaders of the brotherhoods maintaining that their strike, if called, would last no longer than necessary to gain the concessions the brotherhoods want from the railroads. This indicates the disintegration of the so-called "associated standard recognized railroad labor organizations," of which B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, has been spokesman. It is recalled in this connection that only in crises have these two factions worked in entire harmony, and therefore the break is not unexpected or unusual.

"If we go on a strike, we haven't a chance to win," said the president of one of the eleven unions it is predicted will refuse to join the train service men in a recent interview. "I am going to spend this week driving the truth home to our men. Once they realize we have been 'double-crossed' there won't be any danger of dragging them into this stampede."

The union leader quoted recited events in the history of the association between the brotherhoods and other organizations.

"There never has been a real tie binding us," he said.

"The brotherhood leaders are relying upon the belief they have worked our men to such a pitch that we can't keep them from joining in the movement.

"We're going by your stations so fast it will sweep you off the platform," they told us in shop talk.

"Maybe they will—I don't believe they will. I believe the 320,000 train service men will find themselves all alone. If the other 1,680,000 men are told what the 'game' is they will stick to their jobs. Winter is just coming on; they haven't forgotten that.

"If there was a general strike, the transportation brotherhoods would be out on one issue and we on another. All they want is assurance that the working agreements they have had with the railroads shall remain in force one more year. They won't whimper about the 12 per cent wage reduction of July 1, and they will submit to the additional cut of 10 per cent the railway executives have said they are going to ask for.

"But, with the possible exception of the shop crafts, the

other unions would be holding against another pay cut. And they would be fighting alone. The shop crafts object to the working rules prescribed by the labor board. These cut their overtime pay and affect working conditions. But the shop crafts would not declare a strike on this, or any other issue, if they had not been led into it on false assurance of support."

This development however does not materially change the aspect of the approaching crisis for the leaders of the eleven organizations freely admit that they cannot influence their men to change their position in the short time remaining before October 30.

These charges were met with counter charges by the brotherhoods that the shop crafts were committed to a policy equally independent.

The shop crafts leaders have made it known that, while they will go out with the brotherhoods they are not pledged to stay out after their own grievances have been satisfactorily adjusted.

Leaders of the "Big Four" brotherhoods and of the switchmen's organization returned to Cleveland on October 16. Their arrival there was followed by reports of secession among the eleven associated unions, leaders of some of whom, it was said, were unwilling to order their men out under existing circumstances.

Whether the opposition of these leaders will result in an open break between the two groups will not be fully settled until a meeting of the general chairman of the eleven unions at Chicago when issuance of a formal strike call will be voted on formally. Several railroad labor leaders said, however, that they believed the majority would rule, and that it would be a case of "majority strike, all strike." They professed to see little chance of a break.

Following the announcement of the break between the brotherhoods and the other organizations, leaders of the brotherhoods repaired to Cleveland, where conferences were held to complete plans for the walkout or for meeting governmental or railroad peace moves. At the same time leaders of the other organizations gathered in Chicago to formulate their plans in view of the dissension in the ranks of the "association standard recognized railroad labor organizations." The extent of the threatened strike will be determined at the latter conference. Leaders of eleven groups of railway employees not affiliated with the train service brotherhoods point out that they have as yet issued no definite strike orders, although all have voted to strike.

One of the 11 groups, the blacksmiths, has announced its intention of going with the five brotherhoods.

Chiefs and some general chairmen of each of the remaining 10 unions which have taken no strike action began meeting at Chicago on October 19. They probably will attend a joint conference October 23.

From Cleveland Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, issued a statement on October 17 stating that either the government or railway officials can avert the threatened transportation struggle.

"The government," he asserted, "can prevent a strike by taking over the railroads, which it will do some day, and the railroads can prevent by withdrawing requests for further wage reductions and elimination of working rules favorable to us."

Other than reiterations of the brotherhood's position in this controversy, nothing of great importance has so far come from the Cleveland conference.

#### Western Presidents Issue Statement

After a meeting on October 17, the presidents of the railways entering Chicago issued a statement through Samuel M. Felton, president of the Chicago Great Western, outlining their views of the situation. This statement said in part:

It is most important that the public should clearly understand

the reason for, and the significance of, the order for strikes on the railroads which has been issued by the railway labor brotherhoods. The thing it is proposed to strike against is the decision of the Railroad Labor Board authorizing the reduction of 12 per cent in wages which the railways put into effect on July 1, 1921. There is at present no other possible ground for a strike by the railway labor brotherhoods.

The wage reduction put in effect on July 1 was authorized by the Railroad Labor Board under the provisions of the Transportation Act. Therefore, the strike which has been ordered will be, if it occurs, a strike against decision made by a government body acting in accordance with a federal law.

The situation presented is, in important respects, more serious than that created by the issuance of a strike order by the same labor organizations in 1916, which precipitated the passage of the Adamson Act. At that time, while the railways had asked for arbitration, there had not been any arbitration because the labor unions had refused it. Therefore, the labor unions were then within the law. The present case is entirely different. There is now a law which requires the railways and their employees to submit to the Railroad Labor Board disputes which may interrupt transportation.

While the railways complied with the decision in 1920 for an advance in wages, the labor brotherhoods propose now to defy the law, and strike, rather than accept a much smaller reduction in wages. The course of the labor unions in ordering a strike in violation of the decision of the Railroad Labor Board, and in disregard of plain provisions of law, is clearly adapted to nullify these provisions of the law.

"The railway executives at the meeting on October 14 decided to ask the Labor Board for a further reduction in wages and to give the public in the form of reductions in rates all the benefit of any further reductions in wages that were granted. This, however, afforded the labor brotherhoods no reason for ordering a strike. As a matter of fact, the strike vote was taken on the question of accepting the wage reduction authorized by the Labor Board last July and the strike order had been prepared before the meeting of the railway executives in Chicago was held. The railway executives at their meeting did not make any reduction in wages, but merely decided, in accordance with the provisions of the Transportation Act, to ask the Labor Board to authorize them to make a further reduction in wages. The further reduction in wages contemplated by them would not be made until after full hearings before, and a decision by, the Labor Board.

In asking for a further reduction in wages in order that they may be able to grant the public reductions in rates, the railways are acting only in accordance with the law and in obedience to an insistent public demand that they shall create conditions which will enable them to reduce their rates. The suggestion has been made in a statement issued by the public members of the Labor Board that the railways to prevent a strike shall make a reduction in rates equal to the reduction in wages made on July 1 and shall postpone asking for a further reduction in wages. A general reduction of rates without a further reduction in wages would be ruinous to many railways. Thus far in the year 1921, the railways have earned a net return of only 2.6 per cent, and, although the net earnings have increased recently, owing largely to the recent reduction of wages, a general reduction of rates without a further reduction in wages would put the railways back in a very precarious position financially.

#### Labor Board Summons Brotherhood Officers

An attempt to avert the threatened strike of the train service employees was launched on October 18 by the public members of the Railroad Labor Board who had been in Washington. This attempt was announced by telegrams to the leaders of the "big four" brotherhoods and the Switchmen's Union of North America who were assembled at Cleveland, Ohio, summoning them to a conference with the Board on October 20. The executives of the train service organizations were the only ones summoned.

"We are on the job and prepared for any eventuality." This was how one New York railroad officer sized up the situation. The railroads in New York territory are advertising for men in the daily newspapers. The general managers' committee at New York, of which E. M. Rine, vice-president and general manager of the Delaware, Lackawanna & Western, is chairman, decided on Thursday to take a poll of their employees requesting them to signify whether they intend to strike or remain in their positions if the strike order is put into effect.

# I. C.C. and Public Group of Labor Board Meet

## President Summons Messrs. Barton, Hanger and Hooper to Discuss Wage and Rate Reductions

WASHINGTON, D. C.

THE NEWS from Chicago of the developments in the strike threat situation did not deter President Harding from proceeding with his plans for trying to bring about reductions in both railroad wages and freight rates, in which he has been interesting himself ever since his message to Congress last April when he said that railway rates and the cost of railway operation must come down as part of his program for a "return to normalcy." In the face of the news dispatches predicting a strike order, the President summoned the members of the public group of the Railroad Labor Board to Washington. After a conference with them on Saturday morning at the White House he went personally with them to the offices of the Interstate Commerce Commission for a continuation and expansion of the conference, the purpose of which, according to a statement issued from the White House, was "a broad consideration of the possibility of an early adjustment of railroad wages and rates, in the expectation that it would contribute to the industrial revival."

The President's plans had been somewhat crystallized, it is understood, as a result of his conference with the executive committee of the Association of Railway Executives on October 8, at which the possibility of further rate and wage reductions was discussed, although the railroad executives at the Chicago meeting did not go so far as to accept the proposals made to them by government authorities and the executive committee that the roads make a voluntary reduction in rates first.

### Labor Board Members Not Called

#### To Discuss Strike Order

The President's invitation to Messrs. R. M. Barton, G. W. W. Hanger and Ben W. Hooper to come to Washington was extended after a conference with Chairman McChord at the White House on Wednesday. They had left Chicago before either the conclusion of the railroad executives' meeting in Chicago on Friday or the definite announcement of the issuance of the strike order on Saturday. The fact that they arrived at the White House at about the time of the receipt of the definite announcement of the strike plans led to the writing of many hasty newspaper stories to the effect that the President had called the members of the Labor Board and the Interstate Commerce Commission together to discuss the strike situation. The White House statement, however, did not mention the strike, but referred entirely to the adjustment of rates and wages and the desirability of getting together "these two highly potential bodies" that are charged with responsibility for rates and wages and reaching something like a definite understanding between them. The statement was somewhat obscured in many of the newspapers by the volume of "copy" regarding the strike order, but it was taken in Washington as indicating that the strike threat had not caused the President to waver from his purpose. The statement follows:

#### Statement from White House

By invitation of the President, Messrs. R. M. Barton, Chairman, G. Wallace W. Hanger and Ben W. Hooper, constituting the public group of the United States Railroad Labor Board, came to the White House today for a conference with the President. Later, the President went personally with them to the offices of the Interstate Commerce Commission, for a continuation and expansion of the conference.

The purpose of the meeting was a broad consideration of the possibility of an early adjustment of railroad rates and wages,

in the expectation that it would contribute to the industrial revival.

The Railway Labor Board, created by the Cummins-Esch Act, comprises nine members in three groups of three each. The public group are named by the President; the labor group are named from a list nominated by the railway labor organizations; and the managing group, from a list of nominees named by the railway executives. The board is authorized generally to deal with the labor, wage and working conditions that concern the employees of the railways, and is given, in some directions, rather broad powers.

In asking the members of the public group to meet him the President was moved by the desire to accomplish what he hopes may be important results as early as possible. Recognizing that the labor group and also the managing group are in the nature of things partisans of the respective elements which they represent, the President felt that it was unnecessary to invite these two groups because their attitudes would necessarily be partisan in any consideration of wage questions. The labor group could be expected to advocate maintenance of the highest possible wages, while the managing group could equally be expected to insist that wages ought to be reduced. It was, therefore, the President's opinion that the most prompt and effective results might be secured by simply calling in the public group, which is concerned equally with the interest of labor, of management, of shippers, and of the general community.

The President has been impressed that a somewhat anomalous situation surrounds the relations of the Interstate Commerce Commission and the Railroad Labor Board. The Interstate Commerce Commission has very large powers, through its control of rates, to determine what the revenue of the railways shall be; while the Railroad Labor Board, through its authority in the matter of wage determinations, has a very large power in determining the largest item of railway expenditures. The President was, therefore, impressed with the desirability of getting these two highly potential bodies together and reaching something like a definite understanding between them. It is a fact not entirely without interest, that these two bodies have never officially met together.

For a long time the President has been giving much attention to the problem of the railroads in its broadest relations. He has been persistently assured on one side that business could not make a general and lasting improvement until railroad rates should come down; and on the other side, he has been told that it was impossible for rates to come down unless the wage charge should be lowered. He, therefore, determined to get together the two public bodies which have to deal with wages and rates, and give them every possible encouragement to take a strong lead in the effort at an adjustment.

The President remained with the Labor Board members and the commission for only a few minutes. The commissioners had been hearing argument in the Memphis-Southwestern rate case but they remained in conference for an hour or so after the President left. After luncheon the joint conference was resumed with Commissioners McChord, Esch, Eastman, Lewis and Potter present, while the other commissioners returned to the rate hearing. Nothing was given out as to the deliberations and the joint conference was resumed on Monday.

#### Statement by Public Group of Labor Board

On Sunday the public group of the Labor Board made public a statement urging that the railroads immediately reduce rates to the extent of the wage cut that was made effective on July 1. The Interstate Commerce Commission refrained from giving out in the same way its views of the wage questions under the jurisdiction of the Labor Board. The Labor Board statement, which had been shown to the President but was given out with no expression as to whether he approved it, follows:

Up until Friday there was but little, if any, danger of a railroad strike. This fact is well known to every man in close touch with the real situation. The railway workers would have brought down upon their heads universal condemnation for raising by

force a wage cut so manifestly just and reasonable as that made in July. It may likewise be said that it remains to be seen whether the issuance of a strike order merely because a petition for a wage reduction is about to be filed will be sustained by public opinion.

The Railroad Labor Board has functioned for more than 18 months, settling hundreds of controversies between carriers and their employees, and its decisions, with but few exceptions, have been respected by both sides. There would have been a strike long ago if the two parties had undertaken to settle without intervention or supervision the manifold disputes they inherited from the war period. There is absolutely nothing in existing conditions that justifies the carriers and their employees in inflicting the ruinous results of a strike on themselves and on the public. There is no amount of propaganda that can convince the people that either side is entirely blameless.

On the first day of July the Railroad Labor Board made effective a decision which reduced the wages of railway employees 12 per cent, aggregating about \$400,000,000 per annum, basing the estimate on the normal number of employees. Since then, by a revision of only a part of the working rules of only one class of employees, the carriers have received further benefits, amounting to many millions of dollars.

Friday the carriers notified the employees they would ask the Labor Board for a further wage cut of 10 per cent, at the same time assuring the public that the shippers and the people should have the benefit of this wage reduction in the form of reduced freight rates.

To this proposition the employees reply that no general reduction of freight rates followed the \$400,000,000 wage reduction of July 1, that the cost of living has not been sufficiently lowered since July 1 to justify another wage reduction, and that they will strike without even awaiting a decision of the Labor Board as to whether another wage reduction is just and reasonable.

This is the stage which the controversy has now reached.

### General Atterbury's Plan

There is at least one feasible plan by which it can be settled and a strike averted. That plan is predicated upon an excellent suggestion made by Gen. Atterbury, of the Pennsylvania railroad, in his speech before the convention of vehicle and implement manufacturers at Chicago last Friday. His suggestion is quoted as follows:

"Nevertheless it is a fact that the carriers, though they are not earning what they should earn to entitle them to be called prosperous, nor what the law intends they should earn, can not rest under such protection, while other business struggles for its life. It would be a wise policy for the carriers publicly to avow that view, and voluntarily reduce rates where they now work hardship, even though such rates may be reasonable in a transportation sense, and even though to reduce them means a loss of revenue to the carriers. The carriers can do this of their own volition, where it would be improper for the Interstate Commerce Commission to do so. The result would be a temporary check in the rising fortunes of the carriers, and that they can ill afford, but it would be a step in the restoration of sound business conditions, and the public should give to the carriers a real appreciation of their act."

If the railroads will immediately, in good faith, adopt this suggestion of Gen. Atterbury, the situation can be cleared up, freight rates reduced to shippers, the cost of living reduced to the consumers, and a stimulating effect exerted upon all business.

We would suggest that the wage cut of July 1 be translated at once into a reduction of freight rates. This would be much more tangible and satisfactory to the public than to promise that future wage reductions will be passed on to the people in the form of reduced freight rates. The public undoubtedly expected this result when the July wage reduction was made, and its consummation now, though somewhat delayed, would be highly gratifying. That direct benefits would promptly follow and that the psychological effect would be instantly beneficial can not be doubted.

Such reduction in the cost of living as might result from this and other causes would inure to the benefit of the railway employees and would constitute one of the statutory grounds for a further reduction in wages. At the same time, it would have a tendency to reduce the cost of material supplies to the carriers, and it would not then be necessary for the carriers to rely solely upon wage cuts for a reduction of their operating expenses.

Deflation should be general and, as far as possible, uniform. Up to this time the farmer is the only man that has deflated, and he came to the earth with a thud. This was because he did not possess the parachute of organization to break his fall.

Another catastrophe of that sort should be avoided if possible. Wages and freight rates should come to a just and reasonable level uniformly or by alternating stages.

Of course, nothing in these observations should be construed to indicate what the action of the Labor Board will be on any wage dispute that may be brought before it. Such disputes will

continue to be adjusted by the board in accordance with the evidence submitted and the requirements of the transportation act. When reductions are justifiable they will be given.

It must be understood that there is no intention to indicate, in any sense, the duty of the Interstate Commerce Commission in the premises.

### Wages and Rates Should Come Down

#### Uniformly or Alternately

In this connection it may be informative to the public to know what factors the Transportation Act requires the Labor Board to consider in fixing wages. They are as follows:

(1) The scale of wages paid for similar kinds of work in other industries; (2) the relation between wages and the cost of living; (3) the hazards of the employment; (4) the training and skill required; (5) the degree of responsibility; (6) the character and regularity of employment; (7) inequalities of increases in wages or of treatment, the result of previous wage orders or adjustments. "Other relevant circumstances" are also to be considered.

It is obvious that the first two factors above-named are subject to frequent change, and that, during a post-war period of readjustment, the changes may be rapid and radical, necessitating a more frequent revision of wage schedules than would ordinarily be necessary.

Condensing the foregoing suggestion into definite propositions, they stand as follows:

#### Some Definite Suggestions

1. Let the carriers immediately give a general rate reduction measured by the July wage reduction and the benefits derived from the new rules, and devised under the supervision of the Interstate Commerce Commission, to afford the greatest degree of relief to the public.

2. Let the request for further wage reductions be withdrawn, until the rate reductions have been completed.

3. At such time as the carriers deem advisable, let them present to the Railroad Labor Board their petition for a further reduction in wages, based upon conditions then existing.

4. Pending the working out of the rate reduction and the action of the Labor Board on such petition for a further wage reduction as the carriers may subsequently submit, let the strike order be withdrawn.

This method of procedure has the merit of affording "cooling time" to everybody concerned, and requires of the carrier only one thing, namely, that they give to the public, in reduced freight rates the benefit of the July wage cut, just as they are proposing to do in case of further wage reductions. It also involves the withdrawal or suspension of the strike order upon the part of the employees.

The course suggested does not involve any sacrifice of pride or prestige, either to the carriers or to the employees.

The view of the enormous destruction of property values, the deadly blow to slowly reviving business and the appalling human privation, suffering and death that will follow in the wake of a tie-up of the country's transportation system, the people should bring to bear upon both parties the pressure of an impartial public sentiment.

The joint conference was concluded late Monday afternoon and Chairmen McChord and Barton at once went to the White House to report. They were with the President nearly an hour, but no statement of the results was given out. Mr. McChord said that the members of the two bodies had had an opportunity to get better acquainted with each other, had fully discussed the situation in all its phases, and believed the conference had been most helpful. The members of the Labor Board then returned to Chicago. It was later intimated to newspaper men that there might be some news worth watching for in a few days on the subject of rate reductions, but it is believed this refers to decisions of the Commission in the grain and other formal cases.

THE COMMISSION has suspended until February 12 the operation of schedules published in Chicago, Rock Island & Pacific and St. Louis-San Francisco tariffs which propose to cancel rules providing for the absorption of switching charges assessed by the Kansas City Street Railways.

JEWELS valued at \$40,000, supposed to have been stolen from a passenger on the Missouri Pacific, near St. Louis, Mo., on October 1, were recovered the same day in a thicket near the track.

## Strike Directed Against Labor Board Say Eastern Executives

**"I**F THE employees of the carriers leave the service of their respective lines in response to a strike order, it seems to me," says Daniel Willard, president of the Baltimore & Ohio, "that it will be in violation of the decision of the Labor Board which has acted in accordance with provisions of the Transportation Act."

"The reduction in wages on which the strike vote was taken, was ordered by the Railroad Board," Mr. Willard, in a statement issued Monday, continued: "A full hearing was given and both the railroads and the employees affected by the reduction were given every opportunity to be heard. After this hearing the Labor Board ordered a reduction of 12½ per cent, effective as of July 1 last. In putting the reduction into effect the Baltimore & Ohio, as well as other carriers, was merely doing what it was ordered to do by a body created by an Act of Congress and acting in due process of law."

"I understand that the unions have endeavored in some way to link up the questions of time and half for overtime and other possible reductions in wages. I do not say that the Baltimore & Ohio may not at some time in the future consider such questions, as no doubt other roads will, but I want to make plain that any such step in this decision will be taken in accordance with the Transportation Act, that is to say, the matter will be submitted to the Labor Board and the decision of that body will determine just what is to be done. If the Railroad Labor Board rules that no further reduction in wages are justified, personally these reductions will not be made."

"I have always contended that the reduction of wages of railroad employees should follow a reduction in the cost of living. The wages of such employees were the last to be advanced and are among the last to come down. In my opinion the reduction, as ordered by the Labor Board, was justified by existing conditions at that time, and it may be that present conditions warrant a still further reduction. But this is for the Labor Board to determine."

### Statement by F. D. Underwood

"The present strike is different from any other strike," maintains F. D. Underwood, president of the Erie, "in that it is not directed against railroads but against the verdict of a body constituted by Congress who, after a hearing, fixed wages, not at the instance of the interested parties, but founded on conditions developed by evidence."

"The situation is that of striking on the 'umpire'—the United States Railroad Labor Board," Mr. Underwood said.

"The real purpose is not appreciated by some of us. It is to bring about government control—the desire of all labor bodies, some part of the public, some members of Congress."

### Employees Want Government Control

"Railroad labor has the idea that under government control they are better off; naturally they are for it. A leader of the railway conductors, when asked why his men favored Federal control, said, 'Because the conditions are better and the discipline not sharp.'"

"This is an interesting thing for the public—the users of the railroads, whose money pays the railroad employee. Their safety depends largely on the discipline, which is not a thing to be trifled with. We are back at the old junction. Are a minority to starve and inconvenience their paymasters, the public, for the reason that a board of umpires, on which they (the men) were represented, failed to suit their views?"

"It is really a government affair, inasmuch as both rates and conditions were inaugurated by a tribunal entirely apart and distinct from railroads."

## Strike Aimed Directly at People

William G. Besler, president of the Central & New Jersey, expressed the opinion that "it could not be too strongly emphasized that this threatened strike is aimed directly at the people of this country, that it is in defiance of the law of the land, and that the people, as evidenced through the columns of the papers, are thoroughly aroused and that, if the leaders attempt to carry through their alleged program, there can be but one end to the strike."

"All of the machinery," he continued, "all of the direction in connection with the so-called 'strike vote,' all of the instruction and advice and direction, even to the counting of the ballots and instruction in minute detail for the conduct of the strike, has emanated from the top. Of course, as is the case in every organization or society, there are a few radical members who sanction and, to the extent that they are able, instigate trouble, but in this instance it is a fact beyond peradventure that the great mass of employees do not desire to strike and will not, unless coerced, leave their places."

"I believe that generally the people of the country are fully aware of the situation and that this action on the part of the organization leaders places upon them individually the responsibility for what is threatened. I believe that it was Roosevelt who said that 'guilt is personal.'"

### Railroad Officers Preparing to Meet Threatened Conditions

President E. E. Loomis of the Lehigh Valley in a statement issued also on Monday said:

"First—The train service employees have been given increases of approximately 95 per cent since the Adamson Act became effective January 1, 1917. As of July 1, 1921, after full hearing, the United States Railroad Labor Board ordered a reduction in wages averaging 12 per cent. Acceptance of this reduction, ordered by a government tribunal, is the real issue on which the labor leaders have taken a strike vote and propose to paralyze the transportation industry of this country."

"Second—Although the railroads have, since July 1, given shippers the benefit of practically all of the 12 per cent wage reduction through the big reductions in freight rates already made on grain, flour, iron and steel, iron ore and many other commodities, continued pressure for further reduced rates led the railroad executives at their Chicago meeting to agree to ask the United States Railroad Labor Board to order another wage reduction of approximately 10 per cent, to be followed by a corresponding freight rate reduction. This was the only way to meet the shippers' demands. Any attempt to make further rate reductions without an additional wage cut could only result in placing the railroads in a more precarious condition than the shippers, so dependent upon them for efficient service."

"Third—As to employees other than those in train service, such as mechanics, unskilled labor, etc., the same classes of labor are employed by other industries. The fact that railroad employees have been getting a higher wage than those working for others has caused great dissatisfaction to many large employers, who are also shippers, because they have had to pay the big freight rates this differential made necessary. Certainly there is no hardship in placing such employees on a basis similar to that of men of their own trades working for others in the same locality, and at the Chicago meeting it was decided also to ask the United States Railroad Labor Board to do this, the shippers to be given the benefit of the reduction."

"Fourth—So far as the strike situation is concerned, I prefer to make no prophecies. The public is entitled to the facts and protection, and railroad officials are preparing to meet threatened conditions."

## Railroads Have Already Made Extensive Decreases in Rates

SINCE the general increase in rates put into effect under authority of the Interstate Commerce Commission, September 1, 1920, there have been, in fact, extensive reductions, most of them voluntary, in railroad rates, bringing about a large diminution of the earnings of the railroads. The reduction of wages made on July 1 was put into effect only after many freight reductions had previously been made. Since the reduction in wages of July 1, a large additional number of reductions in rates have been made.

These points were brought out in a statement issued in New York on Monday by T. DeWitt Cuyler, chairman of the Association of Railway Executives. The statement, besides giving these details, also purported to be an answer to the suggestion made by the public group members of the Labor Board.

Mr. Cuyler's statement follows in part:

### Mr. Cuyler's Statement

"The proposition of the public members of the United States Labor Board, as published in the papers of today, has not been brought formally to the attention of the Association of Railway Executives. Its only information concerning it has been derived from the newspapers, and the executives have held no meeting at which the matter could have been discussed.

"The proposition, as stated in the newspapers, is that the railroads should withdraw their plan to seek a concurrent reduction in present railroad rates and wages. The intimation of the public members of the Railroad Labor Board is that the public has had no benefit from the 12 per cent reduction in wages authorized in July, and it is suggested that the railroads make further reductions in rates without further reductions in wages.

"In order that the public may be able to judge the merits of this proposition the following is submitted:

"Since the reduction in wages of July 1 a large additional number of reductions in rates have been made. For example, there was a reduction on cargo coal from points in Ohio, Western Pennsylvania and West Virginia to Lake Erie ports, affecting, from August 1 to October 7, some 14,700,000 tons, on which the actual loss in revenue to the railroads amounted to \$4,116,000.

### Successive Reductions in Grain Rates

"Successive reductions have been made on grain and grain products, beginning during the summer and continuing until now, ranging from \$1.40 to \$2.10 per ton, and the export rates from Chicago to the Atlantic seaboard are actually lower than when the Interstate Commerce Commission approved the increases in August, 1920.

### Road-Making Materials

"Reductions have been made in rates on road-making materials—i.e., crushed stone, sand, gravel—in New England, New Jersey, Pennsylvania, West Virginia, Indiana, Maryland and Delaware. The rates on these commodities were not raised in New York State. This involves reduced revenues on many millions of tons, the benefit of which goes directly to the taxpayer.

"There was a reduction in rates on export iron and steel articles, effective September 6, 1921. In 1920 the tonnage of this business amounted to 4,701,169 tons. The reduction in rates on this traffic averaged \$1.66 per ton.

"A reduction of 58.8 cents per ton on imported iron ore is just becoming effective. In 1920 this business amounted to 1,231,094 tons. The average railroad rate from port to furnace was \$2.10.

"Rates on ex lake ore are being reduced a representative reduction amounting to 36.5 cents a ton. Last year 33,992,292

tons of ore were shipped by rail from lake ports to eastern iron furnaces.

### 3,871,286 Rate Reductions on

#### Pennsylvania, East of Pittsburgh

"A compilation by the Pennsylvania Railroad shows that on that system east of Pittsburgh there have been since September, 1920, a total of 3,871,286 rate reductions. These reductions were in part due to exempting certain articles from the higher class rates and making for them a lower rate. The exceptions on these articles apply from 1,225 stations on the Pennsylvania and 1,763 stations on lateral lines, making a total number of points of origin of 2,988. The number of destination stations to which such rates were effective was 34,561.

"By tariffs filed by the Central Freight Association Agency, freight rates have been reduced on about 662 commodities, covering approximately 4,500 origin points and 10,000 destinations.

"Similar figures could be given for the railroads throughout the country. There has been a constant tendency toward readjustment and reduction of rates ever since the general rate advance of August, 1920, was authorized.

"On some railroads the reductions in rates have amounted to more than the reductions in wages so far made, and on many other railroads the reductions in wages allowed no net return on operations, but merely provided against the further accumulation of a deficit."

## Public Prepares for Strike

THROUGHOUT THE COUNTRY, industries, industrial organizations and bodies representative of the public are taking steps to provide for the transportation of food-stuffs, coal and other necessities by truck and boat should a nation-wide strike materialize. Press reports from the larger cities indicate that no great fear is being shown over the prospect of a general cessation of work on the part of the railway employees. This calmness is engendered by the repeated statements of railway officers in close touch with the present developments, practically all of whom maintain that the threatened strike will probably not materialize and even if it does that a number of employees sufficient to man the carriers for skeleton service will remain loyal to the roads.

Officers of the National Conference of State Manufacturers' Associations are urging industrial centers of 11 states to form temporary organizations for service in the threatened railway strike. A telegram urging the 11 associations belonging to the National Conference to create temporary organizations to furnish supplies and to use their influence to see that public officials enforce the laws was sent out on October 17.

The telegram was signed by William Butterworth, president, and John M. Glenn, secretary, of the National Conference of State Manufacturers' Association, and read as follows:

"It is unfair to ask manufacturers to operate their plants on a scale of wages lower than is paid for similar service in railroad shops. Manufacturers cannot afford to pay these high wages and hope to get a manufacturing cost that will start buying. It therefore behooves the members of every industrial organization to sustain the railroads in their proposed reduction of wages. In order to do this manufacturers' associations should see to it that industrial centers are prepared to meet the emergency of a general strike on the part of railroad employees by creating temporary organizations to furnish supplies and should use their influence to urge public officials to see that laws are enforced. Please advise President Harding as to effect present high railroad wages are having on industry in your state."

# Administration Takes Strike Threat Calmly

Attitude of Skepticism Evident—Inference that Washington  
Regards Board Decisions as Binding

A MARKED SPIRIT of skepticism regarding the possibility of a general railroad strike appears to pervade the government authorities. There were no indications of either panic or hysteria among the officials at Washington and no evidence was manifested of any desire to rush in and try to effect a compromise.

For one reason, the opinion is held in many official quarters that the chief purpose of the labor leaders is to do anything possible to embarrass the railroads in a way to make government intervention necessary, and also that they are doing more or less bluffing in the hope of inducing the President to step in and save them from probable consequences of extreme action. As a first step the administration intends to ascertain definitely whether the creation of the Railroad Labor Board represented the establishment of a futile agency whose function is to express its opinions on various disputes, to be accepted or not at the pleasure of the parties involved, or whether its decisions are to be respected by both sides. The inference to be drawn from unofficial and confidential statements made to the press representatives in Washington is that the administration regards the decisions of the board as binding, and that it will proceed on that understanding until or unless it is clearly demonstrated that legislation to strengthen the power of the board or to create some tribunal whose decisions must be respected is necessary. In other words the action of the labor organizations in taking strike votes in protest against the order of the board reducing wages on July 1 and in ordering a strike in advance of even the formal presentation of new requests for further wage cuts to the board is regarded as placing them in an illegal and anomalous position of defiance of the government which cannot be tolerated. It is clearly recognized that the strike situation grows out of the efforts of the railroads to meet the public demand for rate reductions and that the strike has been inspired by the labor leaders on the ground of the railroads' announcement of their intention to ask further wage cuts, although as yet the requests have not been filed and of course it cannot be known what the decision of the board would be.

## Labor Board Represents Uncle Sam

The calling of the brotherhood leaders to Chicago by the labor board was not for the purpose of offering Mr. Stone "peace with honor" unless the labor leaders indicate a willingness to abide by the decisions of the tribunal set up by law to decide just the kind of questions that the brotherhoods are proposing to settle for themselves, nor is it intended to develop the "miracle" that W. G. Lee has said alone can prevent a strike. As indicated in Washington the purpose was rather to determine whether formal citations shall be made by the board and to disclose to the labor leaders informally the fact that the Labor Board represents Uncle Sam. No conference between the President and the brotherhood chiefs was said to be in immediate prospect.

The labor provisions of the transportation act were formulated and adopted with the idea of creating an impartial tribunal which should be able to substitute a finding based on justice and the merits of the case for the method of settling labor disputes by a trial of strength. The board was given no power to enforce its orders on the theory that its findings would be supported by public opinion and because of their appeal to a sense of justice among the contending parties. It was believed to be futile, or at least unnecessary, to endow the board with powers that would enable it to enforce a decision that could not be so accepted. Therefore any thought of

amending the law is regarded as premature until there has been a definite demonstration as to whether the present plan cannot be made to work as intended. While there were reports of numerous conferences among the heads of various government departments, particularly the Department of Justice, the Post Office Department and the War Department, to discuss ways and means for meeting any situation that might arise, the only suggestion for a settlement, other than that proposed by the public members of the Railroad Labor Board, was a statement from Secretary of Labor Davis that he had several ways of settling it to offer if he were called upon. There was little activity at the White House on the subject, and the President left Washington Tuesday evening to be away for two days.

## Confident of Ability

The regular Cabinet meeting was held on Tuesday, but it was stated at the White House on the highest authority that neither the strike nor any other phase of the railroad situation was discussed and the view was expressed that the strike had already been "over-discussed" in a speculative way in the newspapers.

President Harding held his usual conference with the press correspondents, who went away impressed with the idea that he felt confident of ability to deal with the situation and that he had as yet seen no reason to alter the plan of campaign on which he has been working for several months. No announcement was made of the character of the report made to the President Monday evening by Chairman McChord of the Interstate Commerce Commission and Chairman Barton of the Railroad Labor Board, but one of the results of the conferences held between the President and the members of the public group of the board and members of the commission was seen in the announcement that the Labor Board had summoned the brotherhood executives to a conference at Chicago on Thursday. It was learned that the President heartily approved of this action as a wise step, on the ground that the board should promptly call to account any one who has ignored the orders of the board. In this connection it was recalled that the board had already cited the Pennsylvania for declining to obey one of its orders.

## Lack of Co-ordination Between I.C.C. and Board

The most important development since the issuance of the strike order is expected to result from the President's action in bringing together the public members of the Labor Board and the Interstate Commerce Commission. There has been the most widespread dissatisfaction because of the lack of co-ordination between the two bodies and it is believed that both may have felt less free to act because of uncertainty as to what action in the premises might be taken by the other. For example, when the Labor Board last spring was considering the requests of the roads for wage reductions it had no assurance as to the extent to which payroll reductions would be translated into rate reductions, and the Interstate Commerce Commission, which is believed to have been rather anxious of late to bring about further rate reductions, has had no way of knowing whether the Labor Board would do anything to make a considerable rate reduction safe for the roads. The joint conference undoubtedly gave the two bodies an opportunity to reach a common understanding. For example, the members of the commission might have informed the board members that the railroads have already made rate reductions which would eat up a large proportion of the amount of the

WASHINGTON, D. C.

12 per cent wage cut made on July 1, as well as the fact that several important rate reduction cases are now before it for decision. Technically the public group could hardly speak for the entire board, but it holds the balance of power and if convinced by the Interstate Commerce Commission that a wage reduction either is or is not necessary as a condition precedent to a rate reduction that would be sufficient to satisfy the persistent demand of the public, it could very readily bring about the result desired by uniting with either the railroad or the labor group.

President Harding's desire for rates to come down is well known but he has never gone so far as to insist that the rates should be revised downward any more precipitately than the financial condition of the carriers would permit, and if the joint conference is to result in early rate reductions, as is strongly intimated, the inference is that a wage cut is to accompany it or follow it shortly. In the recent conferences between the President, Mr. McChord, Mr. Hoover and the railroad executives reductions in the rates on primary commodities, particularly agricultural products, have been discussed rather than a flat general reduction, on the ground that the prices of agricultural products have already been deflated more than others. It is believed that an early decision by the Interstate Commerce Commission in the grain, hay and lumber cases, based on formal complaints asking rate reductions, is contemplated, and that, after having demonstrated to the public that all of the wage reductions thus far made have been used to reduce rates, further steps will be taken toward another wage cut.

#### "The Mails Will Be Moved"

Post office officials held conferences for the purpose of preparing plans for moving the mails and for preventing any interference, and Postmaster General Hays issued a brief statement saying: "I am sure the parties to the controversy will not permit developments which will interfere with the government service. This is no time for statements from this department. A time may come for action. I sincerely trust that it will not. If it does there will be action. The mails will be moved."

The Attorney General's office was also said to be devoting some attention to the legal aspects and precedents but Mr. Daugherty said there would probably be no statement from the department unless there were further developments.

The War Department had already prepared detailed plans for such use of troops as might become necessary in an emergency.

The strike was not discussed in the open sessions of Congress on Monday or Tuesday, except that Representative Blanton of Texas asked unanimous consent on Monday to speak for five minutes on "the recent declaration of war against the people of the United States which is to begin on October 30." An objection was made but he made his speech on Tuesday and Representative Burke answered him.

#### Senate Hearings Temporarily Suspended

The hearing before the Senate committee on interstate commerce in its general railroad inquiry, at which representatives of the brotherhoods were to testify, was suspended temporarily and a meeting of the committee called for Tuesday to consider the railroad bill was not held. One reason given was that the committee did not desire to open a debate on the strike question. At the White House it was said that the strike situation would not change the policy of the administration on the funding bill. It had previously been stated that the President intended, after the pending tax bill is disposed of in the Senate, to reiterate his desire and the necessity for the passage of the funding bill by the Senate.

The members of the Railroad Labor Board called on Senator Cummins on Monday to discuss the situation. They also went to the Department of Justice, but it was stated this

was for the purpose of looking up something in connection with the suit brought by the state of Texas in the Supreme Court which attacks the jurisdiction of the board.

The President has received a telegram from Alfred Reeves, general manager of the National Automobile Chamber of Commerce, saying that the 9,200,000 automobiles and trucks in the country can protect the country in the event of a rail strike and offering the services of the automotive industry in the mobilization of motor transportation if needed. Mr. Reeves said that 990,000 trucks in 1920 hauled 1,200,000 tons of freight.

Shipping Board officials said they were in a position to put 250 small steel ships into use in the coastwise trade and on inland waterways in the event of a strike.

Sydney Anderson, chairman of the joint commission on agricultural inquiry, issued a statement saying that "One of the greatest problems before the American people today is the establishment of a more economic system of distribution, and one of the greatest factors in the cost of distribution is transportation, and it appears that the greatest factor in transportation costs is represented in wages.

"We are now passing through a period of readjustment of prices of commodities and wage levels incident to the activities of production and distribution, he said. "The unwillingness of any group which is an element in costs of production or distribution to do their full share toward effecting a proper readjustment of costs and wages, necessarily retards a return to normal. The interests of all groups and classes of people in this readjustment are so interwoven that no group or class can properly avoid the concessions necessary to a re-establishment of normal activities.

"Freight rates are today at their peak. It is recognized by every one that the transportation charges incident to the movement of essential commodities must be placed upon the level which will permit of the free movement of these essentials to consumers at a cost that can be supported on the basis of normal prices."

#### Wage Differential Important Factor, Says Cunningham

**D**IFFERENTIALS in rates between train service employees and shop employees are one important factor in the present critical railroad situation that is seldom discussed, according to Professor W. J. Cunningham of Harvard University, writing in the New York Evening Post of Tuesday. He points out that the average earnings of car repairmen, for example, were, in 1920, 145 per cent greater than in 1916, while the earnings of freight enginemen and conductors advanced but 85 per cent and of passenger enginemen and conductors but 57 per cent during the same period. The present critical railroad situation presents a three-sided problem, says Professor Cunningham; on the one side, he says, are the railway executives, on the second side the shippers and on the third the unions.

On the subject of the differential in wages, Professor Cunningham says:

"One important factor in the present situation is seldom discussed; that is, the differentials between wage rates for different classes of workers. An outstanding feature of the wage advances during federal control was the success of the shop crafts and office clerks in securing increases which relatively were much greater than those secured by the 'Big Four' brotherhoods. As a consequence the spread between the train service employees and the shopmen, car inspectors and clerks was noticeably narrowed. Comparing average earnings in 1920 with those of 1916, car repairmen enjoyed an increase of 145 per cent and the increase for car inspectors was 138 per cent. These may be contrasted with an in-

crease of 85 per cent for freight enginemen and conductors, and 57 per cent for passenger enginemen and conductors. These are the official figures for all railroads.

### Train Service Men vs. Shopmen

"On one railroad the figures indicate that while in 1916 the average earnings of all train service men were 85 per cent greater than the average for all shopmen, this excess earned by the train service men in 1920 had dwindled to 15 per cent. The train service brotherhoods have publicly said little about this change in the relation of their wages to those of the other more fortunate organizations, but they have been greatly disturbed by the narrowing of the differential. Among themselves they are much dissatisfied because the shop crafts have been able to get away with the larger share of the increases. They also feel keenly the adverse public comment on the national agreements.

"The train service men are not in any way affected by these national agreements with the shop crafts and clerks, yet the unfavorable reaction of the general public, caused in greater part by the unreasonableness of certain rules and wage rates applying only to shopmen, clerks and others included in the agreements, applies to railroad labor as a whole, including the train service men. As a matter of fact, there is substantial basis for the argument of the engineers, conductors, firemen and brakemen that, considering the degree of skill and the experience required for their work, they are not overpaid on the present wage scale. They are charged with a degree of responsibility not required of shopmen. While on the road they work with but little supervision, and in many ways the train service requires a higher order of skill and more dependable men than are needed in the shops. An evaluation of these differences comes closer to the former differential of 85 per cent than it does to the present 15 per cent.

### Roads Forced Hands of Unions

"Up to last Friday, when the railroad executives announced their determination to seek a further horizontal wage cut, applying to all employees alike, the taking of the strike vote and all of the talk of striking against the acceptance of the July 1 wage reduction may be regarded as pure bluff. The tactics of the train service organizations were probably intended to restrain the railroads from seeking further decreases, at least in train service. Now that the machinery for the additional wage cuts has been set in motion the bluff has been called and the union leaders have acted. Apparently they are serious in their strike orders, and the men will respond unless the strike call is withdrawn as a result of compromise of governmental action looking toward mediation in a form acceptable to the labor leaders.

### Unions Working Together

"The opportunity has probably passed for discrimination as between classes of employees. The entire sixteen organization are now working together as a unit to a common end. It is to be regretted, however, in the interests of all three interests in the controversy, that the proposed procedure did not contemplate differentiation between those classes of labor which were given the greatest increases and those which received the least, so that the dislocation of long established differentials might have been corrected in part. A program of that nature would have been less objectionable to the train service brotherhoods and might have kept them neutral in a controversy between the railroads and other classes of employees. Without the active support of the train service men the shopmen would have hesitated before striking.

### Life of Unions May Be at Stake

"One additional factor has had the effect of solidifying resistance without regard to class of employee. On a few

roads the men believe with more or less reason, that the management has set out deliberately to 'smash the unions.' On the very great majority of the roads there is absolutely no ground whatever for that belief, but there is just enough real basis on the very few roads to give the union leaders the opportunity to put the thought in the minds of the men, so that they will regard this as life or death struggle for the continued existence of unions. Regardless of inter-union jealousies, no one organization desires to see the destruction of another organization. They reason that if one is destroyed the destruction of the others will follow. The fear, even though groundless, that the real issue is not wage reductions but union disintegration gives the leaders a lever which they will without doubt use effectively in stiffening the resistance of the men to anything short of a favorable compromise which the leaders are prepared to accept."

## President of U. S. Chamber of Commerce Criticises Strike Call

JOSEPH H. DEFREES, president of the Chamber of Commerce of the United States, declared that commercial organizations throughout the country will, in the event of a railroad strike, take the lead in their communities in maintaining the national life. Mr. Defrees was replying to a statement by Warren S. Stone, who, in reply to an earlier statement by Mr. Defrees, declared that the national chamber is taking an unfair position in the situation. Mr. Defrees' statement follows:

Warren S. Stone, president of the Brotherhood of Locomotive Engineers, one of the organizations threatening to tie up the rail transportation system of the country, in a signed statement appearing in the press Wednesday morning attempts to beg the issue. Mr. Stone substitutes vituperation and slander for fact and logic. The propriety of such a course I leave, without comment, for the judgment of all citizens. Mr. Stone mentions the valor of the railway workers in the late war. It is not questioned. Right conduct at one time is not a sufficient basis for wrong conduct at another. No amount of valor can confer license for lawlessness upon a later occasion. No war record can justify any individual, group, or class of American citizens in taking the country by the throat and coercing it. That is lawlessness and brutality, and will be so characterized by every thoughtful and patriotic American, including the rank and file of Mr. Stone's own organization.

No justification can be found by Mr. Stone in conduct of railroads toward the Railroad Labor Board. No railroad has threatened wilfully to cease operation, and when the board advanced wages of railway workers and the Interstate Commerce Commission increased rates accordingly, the public paid and did not boycott railroad transportation. If the railroads or anyone else take any action comparable to the action of the leaders of the railroad workers in calling their strike, they will be stigmatized as unmistakably as the persons responsible for the present threat of national calamity.

It should be clearly understood that I am not voicing an individual opinion. I am expressing in effect the position which has been taken repeatedly by hundreds of organizations in the membership of this chamber. Against such a threat as has been made, and against any such strike as it contemplates, these organizations can be depended upon to assume leadership in their communities in maintaining the national life.

As I said in my previous statement, the merits of the controversy between the railways and the railway workers are comparatively of no consequence. The real issue is whether this government can sustain its institutions if one section of the community can by force impose its will upon the public and precipitate conduct which, if persisted in, will inevitably lead to public disaster.

The quicker every element of the community, whether worker or employer, comes to know and bases its action upon the proposition that if a project is not for the common good, the general public interest—it is not good for the element proposing it the quicker will we return to the type of democracy contemplated by our forefathers when they founded this government—the quicker will we return to that vigor and volume of business and industry which will give work, comfort, peace and prosperity for all.

## Implement Men Vote to Abolish Labor Board

**A**BOLITION of the United States Railroad Labor Board and all other existing national labor adjustment boards was urged in resolutions adopted by the 28th annual convention of the National Implement and Vehicle Association at the Congress Hotel, Chicago.

The resolution recommended:

That the national government facilitate settlements with the railroads of the amount due as rentals during government operation.

Passage of the present bill pending in Congress, permitting the railroads to fund their indebtedness to the federal government.

Early repeal of the Adamson act.

An immediate reduction in freight rates and to accomplish this in full measure the amendment of the Esch-Cummins law and the passage of such other legislation as is necessary to abolish the Railroad Labor Board and all other existing national labor adjustment boards, leaving the railroads free to negotiate wage and employment agreements direct with their own employees, unhampered by legislative regulations, to the end that the expense of railroad operation, particularly that involved in the labor cost of transportation can be reduced to a proper relative basis with that of other industry.

Elimination of such state legislative enactments as the full-crew bill, which have continuously added to the expense of railroading and influenced higher freight rates.

That the American Farm Bureau Federation, the National Grange and other farmers' organizations be appealed to to join in the effort to secure these legislative reforms so necessary to the re-establishment of the normal purchasing power of the American farmer's dollar.

### General Atterbury Addresses Implement Men

Railroad wages and freight rates must come down, General W. W. Atterbury, vice-president of the Pennsylvania, said in a recent address before the closing session of the National Implement and Vehicle Association's convention at Chicago.

General Atterbury said:

My judgment is that.

*First:* That the railroads of this country, in order to show their good faith, should make an adjustment in rates. This adjustment should go to the agricultural interests, inasmuch as they are by far the largest and most important element of our population, and have already themselves borne the brunt of the greatest deflation.

*Second:* That there should be an immediate application on the part of the railroads to the U. S. Railroad Labor Board for a reduction in wages commensurate with the change in wages in other industries.

*Third:* That the public should enter heartily into, and assist the carriers in the request for a reduction in railroad wages.

*Fourth:* That the railroads should immediately pass on to the public in reduced rates, whatever saving may hereafter be accomplished through reduced wages, except insofar as rate reductions already shall have been made.

*Fifth:* That the public should stand solidly behind the railroads in a program of laws and regulations which, while sound economically, shall yet not impair the initiative of railroad management.

By the reduction in rates, the reduction in wages, and the release from regulation, by co-operation between the public and the public's railroads, the railroads will have been brought into harmony with the readjustment so essential to the return of prosperity."

### Traffic Club of Chicago Urges Abolition

The Traffic Club of Chicago recently passed the following resolution urging abolition of the United States Railroad Labor Board by a vote of 340 to 3:

After careful deliberation, it is the judgment of the Traffic Club of Chicago that the return to business normalcy and prosperity is being

materially prevented by the failure of transportation lines to make such reductions in their costs of operation as would be possible if the United States Railroad Labor Board, which exercises jurisdiction over railroad wages and working agreements, had not failed to act expeditiously and with due realization of the necessity for readjustments of rates of pay and working conditions to the end that they may be comparable with those existing in private industries; therefore,

Be it resolved, That the Traffic Club of Chicago deplores the situation and recommends the repeal of that part of the transportation act providing for the United States Railroad Labor Board.

## Farm Bureau Federation

### Enters Controversy

**T**HE AMERICAN FARM BUREAU FEDERATION entered the strike controversy, Tuesday, with a statement by J. R. Howard, president. The statement reviews the activities of the Federation in regard to the requests for rate reductions as outlined by the stand taken by President Howard at the conference of representatives of the railroad, manufacturing, shipping and agricultural interests in New York, September 21. "After long discussion," Mr. Howard said, "in which the railroad executives strenuously contended that under present conditions any rate reduction would mean bankruptcy and conference appeared to be futile, a small committee was appointed to proceed further." Mr. Howard and the manufacturing representatives on this committee argued that "the least the railroads could do would be to announce an immediate reduction in rates on basic commodities which would include agricultural products, building material, coal and ores and that all subsequent economies in operating expenses should be reflected in decreased freight rates on these commodities until the 40 per cent advance of August, 1920, is eliminated."

"The railroad executives," Mr. Howard continued, "finally agreed to submit a proposition to the executive committee of the railroad executives with a recommendation for approval. The proposals made at New York were presented to the executive committee of the railroad executives October 9 and approved by them with a 10 per cent reduction to become effective immediately. At the meeting October 14 of all the executives, however, an immediate reduction was not approved, but a very strong resolution passed which stated that all decreases in operating costs from whatever source were to be given at once to the public in the form of rate reductions.

"The refusal to make immediate reductions was very disappointing to the representatives of the American Farm Bureau Federation, and it is only fair to say that many of the outstanding railroad executives regret deeply the majority action of the executives."

Directly discussing the strike, Mr. Howard said, "This strike is a problem as between employer and employee and is not an issue in which the American Farm Bureau Federation functions except as part of the American public. We are selfishly interested in labor having a wage schedule which will enable it to maintain a good standard of living. We believe that that wage schedule is best which will stimulate that degree of employment of labor which will result in the payment of the largest aggregate wage for the largest consistent production. The wage system which maintains so high a standard as to force general unemployment is not to the advantage of labor or to the general public. Such working rules as the National Agreements tend to set up standards which in the long run materially decrease production and hence should be done away with. Mr. Howard then outlined the objections of the Federation to the rate making provisions of the Transportation Act; to the lack of co-ordination between the Interstate Commerce Commission and the Labor Board and suggested either the repeal of the Transportation Act or its amendment to "correct these serious defects." Mr. Howard also stated that the Federation favored the repeal of the Adamson Law as being "economically unsound."

*Heavy Pacific Type Handles 12 Passenger Cars or More Over the Rocky Mountains*

## New Locomotives for the Northern Pacific

Pacific Type for Heavy Fast Service—Mikados, Mallets and Switchers Follow Lines of Earlier Designs

THE NORTHERN PACIFIC placed one of the largest orders for locomotives given in 1920. This consisted of 20 eight-wheel switchers (0-8-0 type), 20 Pacific (4-6-2 type), 25 Mikado (2-8-2 type) and 6 Mallets (2-8-8-2 type), all of which were built by the American Locomotive Company at the Brooks plant.

### Pacific Type

The Pacific type locomotives, railroad Class Q-5, are of a new design developed to meet the need for a heavier fast passenger engine to haul the overload trains. They have been assigned to all divisions between Dilworth, Minn., and Missoula, Mont. The profile on these divisions varies from comparatively level to grades of 2.3 per cent, which occur in the Rocky Mountains, with curves up to 16 deg. The average train consists of 12 cars, although in the summer season the number occasionally reaches as high as 17. The majority of these locomotives operate over two divisions or sub-divisions of about 110 miles each, crews being changed at the end of each sub-division. In other cases the locomotives are assigned to the heaviest runs in such a way that they double the sub-division each day, there being in such cases either two crews assigned to each engine or three crews to two engines.

These Pacific type locomotives have a rated tractive effort of 41,900 lb. with 26 in. by 28 in. cylinders, and 73 in. driving wheels and weigh 314,000 lb., of which 181,000 lb. is on the drivers. They have boilers of the conical connection type with wide firebox, combustion chamber 39 in. long, tubes 18 ft. long, brick arch and superheater. The tenders are equipped with coal pushers.

### Mikado Type

The Mikado type locomotives, railroad Class W-3, are similar in design to previous locomotives which have been found to be well suited to general traffic conditions on the Northern Pacific. They are used in main line freight service on several divisions having profiles of different characteristics. On the Pasco division they run 153 miles, 90 miles of which is a 0.4 per cent continuous grade, and handle trains of 3,200 tons. The Yellowstone division profile between Mandan, N. D., and Glendive, Mont., is a series of ascending and descending grades, with ruling grades of 1.2 per cent both eastward and westward. The rating on this division is 1,775 tons in both directions. On the Seattle division between Auburn and Lester, Wash., a fairly uniform 1.0 per cent grade occurs, and the tonnage rating for this portion of the division is 1,600 tons. From Lester to the summit helpers are used and they are also employed on several other divisions in the mountainous sections.

These Mikado type locomotives have a rated tractive effort of 57,100 lb.; 28 in. by 30 in. cylinders and 63 in. driving wheels, and weigh 337,000 lb., of which 247,000 lb. is on the drivers. The boilers are of the conical connection type, provided with brick arches, combustion chambers 36 in. long, tubes 18 ft. long and superheaters.

### Mallet Type

The Mallet type locomotives, railroad Class Z-3, are similar to previous 2-8-8-2 locomotives used on the Northern Pacific. They are employed as helpers in freight service on the Rocky Mountain and Montana divisions where grades are

*Mallet Type Locomotives Used Either as Road Engine or Helper*

### Details and Specialties

Longitudinal boiler seams are welded for a length of 18 in. at front and back except the seams over the combustion chamber which are welded at the front end only on the Pacific and Mikado locomotives and are not welded on the Mallets. The top seam in the smoke box is also welded. The fireboxes of all types have the crown and side sheets made of a single piece. The combustion chamber is also made in one piece, butt welded on the bottom center line and butt welded to the firebox crown. Two 2 in. combustion tubes are used in each side of all fireboxes. Injectors are of the Hancock non-lifting type and feed water enters the boiler through vertical check valves. All boilers are equipped with Butterfly firedoors and brick arches. Duplex type D stokers are used on the Mikado and Mallet locomotives, and coal pushers on the tenders of the switcher and Pacific locomotives.

Driving axles are of hammered open-hearth steel, oil heat treated. Front truck, trailing truck and tender axles are of open-hearth carbon steel, oil heat treated, as are also the crank pins. On the Mallet engines the main crank pins are hollow bored. Bushings in cylinders and steam chests and also packing rings for main and valve pistons are of Hunt-Spiller iron. Extended piston rods are used on the Mikado locomotives and on the low pressure cylinders of the Mallets. Walschaert valve gear is used on all types. Ragounet power reverse gear is applied to the switch engines, while the locomotives of the other types have Mellin reverse gears with oil

pistons. Other specialties used are Pyle National electric head and back-up lights, Franklin grate shakers, pneumatic cylinder cocks and Chicago flange lubricators.

The important dimensions, weights and factors of the four types of locomotives are given in tabular form herewith.

### Changes in Railway Mail Service

WASHINGTON, D. C.

THE POST OFFICE Department, through the efforts of E. H. Shaughnessy, second assistant postmaster general, has recently made a number of changes in its regulations, which are of interest to the railroads, some of which are included in three circular letters addressed to the superintendents of the railway mail service. One of the most important of these is the doing away with the system of assessing small fines against the railroad companies for delinquencies in mail handling, which for a number of years has been a source of great contention. The fines have been small, generally from \$1 to \$25, and assessed in a perfunctory way so that they have not acted as a corrective. The entire matter is now being placed in the hands of the railway mail service division superintendents, with the idea of eliminating the mass of perfunctory handling and taking action only where deliberate negligence or failure properly to co-operate is found, in which event the superintendent is to report the

incident and recommend what should be done. In the past the field forces have simply reported and action has been handled in the department.

Circular Letter No. 1499, addressed to the superintendents of the railway mail service, gives the following instructions to be observed hereafter in handling failures and delinquencies against railroad companies:

1. Where at any station there is a failure to dispatch a small quantity of mail which is the result of oversight or mishandling on the part of the railroad employee, and such failure is of infrequent occurrence (say not more often than once in a quarter) the papers should be filed; if it occurs at the same station more often a cautionary letter should be addressed to the company, but if it is of frequent occurrence the matter should be reported to this office with a full statement of the facts with proper recommendation for disciplinary action. Care should be taken to present the company's side of the case.

2. Where, as a result of investigation, there is doubt as to responsibility of the employee, the papers should be filed without action, but should be available for action in case same condition should arise again.

3. Where there is failure to handle a considerable quantity of mail (such as to promptly unload, to transfer to train of the same or another company, etc.) immediate investigation should be made by the chief clerk and such instructions given by the railroad company as will prevent a recurrence; if the circumstances indicate willful neglect of mail, the particular attention of proper officials of the company should be directed to that feature of the case, and if prompt steps are taken to remedy the conditions papers may be placed in files for the time being; but if corrective measures are not at once adopted and the same failure occurs again soon, the department should be placed in possession of all the facts, with a recommendation for disciplinary action.

4. Where an outgoing train is not held for the loading of mail that should be dispatched therein, the matter should be handled to a conclusion with the proper company officials. If prompt orders are given by the railroad company to prevent the recurrence and the same does not occur again soon, the papers may be placed in the files for the time being. If, however, the same failure occurs again soon, the papers should be included with succeeding cases and forwarded to the department with recommendations for proper disciplinary action. Care should be taken in cases of this kind that the company actually responsible is dealt with. If in doubt, the chief clerk, if possible, should make a personal investigation.

5. In all cases where mail or equipment is damaged while in the possession of the company, the papers should be forwarded to the department after the matter has been investigated, with report of all the facts and proper recommendation as to whether disciplinary action should be taken. This is in order that the department may be protected in case claim is made by senders or addressees for any loss sustained to insured or registered mails.

6. Where there is a failure to catch a pouch from a crane, where the clerk has made proper effort, the irregularity should be taken up with the company in the usual manner, and if there does not appear to have been any negligence on the part of the company, papers may be filed. If such failure occurs at the same point frequently the company shall be requested to see that the crane is in good order and proper alignment. Cases of this kind need not be reported to this office unless the company manifests indifference in the matter of placing the crane in proper condition.

7. In cases where report is made that the engineer failed to sound signal, resulting in failure to catch, papers should be filed in the office of the chief clerk after the company's attention has been called to the matter.

In circular letter No. 15 notice is given that the department has decided to change its form of lease of terminal

railway post offices, most of which are located on railroad property and generally part of a passenger station building, by eliminating the provision that a lease may be terminated upon the discretion of the postmaster general and substituting that only where the growth of the service makes it necessary to secure more commodious quarters, the lease may be terminated and cancelled upon three months' notice. This assures the railroads that there will be no arbitrary action taken; and a benefit is expected to accrue to the post office department in securing lower rentals than it could obtain with the former cancellation clause.

### Faulty Side Service

Circular Letter No. 1523 provides that hereafter no deductions will be made from pay of railroad companies for failures to perform side service unless the failures are due to some delinquency on the part of the company. Deductions will not be made for failures due to snow blockades, wash-outs and similar causes. Those failures due to causes over which the company has not control may be omitted from the quarterly certificates. For those failures which are reported on the certificates superintendents are directed to show the cause in their indorsement. They are to continue to specify the offices involved when there is a complete failure for a 24-hour period.

Col. Shaughnessy held a meeting with the Railway Mail Pay Committee at Washington on October 7, at which the question of the consolidation of routes was given further consideration. The Interstate Commerce Commission had refused to grant the petition of the railroads to re-state the routes as they had been prior to the installation of the space system, deciding that this was an administrative matter for the postmaster general to handle. Since the consolidation of routes, the department has been considering practically an entire railroad system as one route. The commission's order provides that the minimum payment on any route over any part of which mail is transported on less than six days a week shall be \$50 per mile per annum and this has since been increased to \$62.50 per annum.

Col. Shaughnessy told the committee that the department would be glad to review any claims presented to it wherein the carrier can show that under the former stating of routes they are entitled to this minimum pay and that it would adjust their claims accordingly, although no action would be made retroactive so as to require back payment. The committee agreed to advise the railroads to submit claims on this basis. There was also a discussion of the recent tests made at the request of the railroads as to the number of sacks found to be the average in a three-foot space.

The railroad committee was not entirely satisfied with the first test and it suggested another, but this was not agreed to by the department, for the test was made at the request of the committee and in accordance with conditions which the committee had proposed.

THE COMMISSION has suspended until February 12 the operation of schedules published in a Kansas, Oklahoma & Gulf tariff which propose the cancellation of the application of an emergency penalty charge of \$10 per car for detention to cars loaded with lumber at points on the Kansas, Oklahoma & Gulf, the Chicago & Alton, the Chicago & Eastern Illinois and other roads.

THE ILLINOIS CENTRAL reports an increase of 338 stockholders during a period of four months, from April to August, of this year. The number of stockholders on April 6, was 14,225 and on August 5, 14,563, an increase of 2.37 per cent. The rate of increase for the preceding seven years, from August 10, 1914, to April 6, 1921, was 30.84 per cent, when the number of stockholders increased from 10,872 to 14,225. More than 98 per cent of the stockholders of this road are said to be American citizens, residing in this country.

# President's Conference on Unemployment

## Reports of Committees Received, but Not Acted Upon Unless Unanimous—Rate Reductions Urged

WASHINGTON, D. C.

THE PRESIDENT'S Conference on Unemployment, after creating a standing committee with authority to convene the full conference at any time and to continue its work through sub-committees during the continuance of the emergency, concluded its sessions at Washington on October 13. The conference adopted a general program of emergency measures outlining means of affording temporary relief during the coming winter and more fundamental methods for reviving business and preventing seasonal unemployment and depression in the future, as well as a number of committee reports in amplification of the general principles expressed.

These two programs, which were published in the *Railway Age* of October 1 and 8, respectively, were, however, practically the only expressions of the conference itself and represented the general principles which had been unanimously recommended by various subcommittees of the conference and then accepted without dissent in open session of the conference. Recommendations which were not concurred in by all of the members of the committees in which they originated were presented to the conference but in most cases were not read. They were received as information, laid upon the table and given out to the press and the public for the weight that may attach to the opinions of those who signed them, but with the understanding that they were not to be considered as in any sense representing the findings of the conference.

### Controversial Points Avoided

By the plan of avoiding controversial points in its own recommendations, the conference was able to preserve complete harmony in its open sessions and to present an unanimous program of proposed measures or principles. The numerous controversies which arose, as to details or other principles were confined within the committees, to be made public merely as the expression of the divergent views of a gathering of men of many minds and varying interests. As a result the conference, which had at times appeared likely to be disrupted by the irreconcilable differences between the representatives of capital and labor, adjourned with promises of co-operation by the representatives of both groups.

The outcome was largely the result of the unusual tact and leadership displayed by Secretary Hoover, the presiding officer, who, with the co-operation of the organization committee, was able to find a common point of contact on which an agreement in principle at least could be reached, as to some of the most vigorously disputed topics that were discussed. The handling of questions pertaining to transportation, which were among the most important in the discussions of several of the committees, represent an excellent illustration of the method pursued by the conference. Both in its own program of recommendations and in several of the committee reports that were adopted, the conference went on record in favor of a reduction or readjustment of freight rates, but in such language that no objection was offered from any source.

On the other hand, recommendations made by majorities of the transportation committee, the committee on manufactures and the committee on mining, advocating in one form or another the passage of the so-called railroad "funding" bill, failed to obtain unanimous approval within the committees because of the opposition of the labor members, but they assented to the conference declaration in favor of "settle-

ment of the financial relationships between the government and the railways."

Neither the railroad bill nor the rate question was debated on the floor of the conference. Similarly the question of wage reductions which for a time threatened to disrupt the conference was kept in the background. Secretary Hoover, who was the guiding spirit of the entire proceedings, expressed complete satisfaction with the accomplishment of the conference, in view of the fact that it was not a legislative body and its influence is to be measured only by the extent of the general acceptance of its recommendations. President Harding also declared himself well pleased with the results.

### Report of Committee on Emergency

#### Measures in Transportation

The transportation committee reported as follows:

As to the facts of unemployment in railroad transportation service, the committee has had before it certain figures furnished to the committee on statistics by the Interstate Commerce Commission and further figures prepared by the Bureau of Railway Economics and certain other figures filed with the committee by representatives of the employees and prepared by the statistical bureau of the United States Railroad Labor Board. The Interstate Commerce Commission figures show, taking the average number of employees of Class I steam roads for the calendar years from 1916 to 1920, inclusive, that there was a steady increase in the number of employees during each of these years over the year preceding. Using only thousands and beginning with 1916, there were 1,647,000 employees; in 1917 the number increased 86,000; in 1918 there was an increase of 105,000; in 1919 an increase of 70,000; and in 1920 another increase of 105,000; making the total number of employees for the year 1920, 2,012,000. During the first six months of 1920 there was unusual steadiness in employment, there being in January 2,000,105 employees and in June, 2,056,381.

During the six months the fluctuations above and below the average for the year did not exceed 50,000 on either side or a variation of only about 2½ per cent above or below the average for the year. The number of employees increased very materially during July, August, September and October, 1920, as during these months transportation was steadily on the increase, as shown by weekly freight car loadings. In November business began to fall off and the decrease was marked in December. During November and December railroad employment began to decline. In January, 1921, there were 125,000 less men on the payroll than in January, 1920, and 250,000 less men than in June, 1920. The reduction of employees continued through February and March, 1921, and reached its peak in April, 1921, there being 128,000 less men on the payroll in February, 1921, than in January of that year; in March 83,000 less than in February; and in April 50,000 less than in March. In 1921 there were 410,000 less men on the payroll than in April, 1920. There was a slight increase in the number of men on the payroll in May and June, 1921, as compared with April, 1921, May showing an increase of 33,000 over April, and June showing an increase of 11,000 over May; but even with these slight increases over April, 1921, June showed 470,000 less men on the payroll than June, 1920.

The figures of the Interstate Commerce Commission give the number of men in totals but not classified, while the figures from the statistical bureau of the Railroad Board

showed the number out of employment by classes. The figures submitted by the Labor Board, however, compare March, 1921, with August, 1920. In considering comparison between these two dates it must be borne in mind that employment in the largest numerical group of railroad employees—that is, maintenance of way and unskilled labor forces—is probably very near the minimum in the month of March and near the maximum in the month of August.

Using these dates, the Railroad Labor Board figures show a little over 600,000 more men on the payrolls of the Class I roads in August, 1920, than in March, 1921. As the result of the months chosen, however, of the total number of men out of employment over one-half are embraced in the single group designated as maintenance of way and unskilled labor forces, there being a little over 307,000 less in March, 1921, than in August, 1920.

In group 4, shop employees, there were over 135,000 more men on the payrolls in August, 1920, than in March, 1921. These two groups alone, therefore, represent over 70 per cent of the total amount of unemployment in railroad service, if March, 1921, and August, 1920, be taken as a basis of comparison. The figures as between these two months further subdivided show that of section men alone there were over 191,000 less employed in March, 1921, than in August, 1920. As these two months would, under normal conditions, show nearly the maximum in the annual seasonal fluctuations of section forces, 600,000 less men on the payrolls on March, 1921, as compared with August, 1920, reflects cumulative effects of unemployment due to the inevitable annual seasonal fluctuation in the number of section men and other unskilled labor forces, together with the further reduction in forces due to the present acute depression. Comparing, however, the same month in 1921 with 1920, the latest figures available, those for the month of June showed very nearly 500,000 men off the payrolls in railroad service, this being nearly 25 per cent of the total number employed in June, 1920.

The figures above discussed are payroll figures and show, as stated, the number of men actually off the payrolls on the date on which the figures were gathered. This, of course, is not the full measure of unemployment. It rather reflects total unemployment with a consequent wiping out of the entire income from wages of those who have been dropped. We have to recognize frankly that there is a further degree of unemployment in railroad service as in other service, due to the fact that many employees are working only part time with a consequent diminution in income. In the railroad service this partial unemployment in the shop crafts is brought about by the entire closing down of the shop for short periods or for certain days in the week while working the full day at other times. In the direct work of transportation carried on by engine and trainmen, this partial unemployment is reflected in a different way, for while the reduction in the volume of traffic would lay off a certain number of these employees, it also spreads the opportunity for employment for those who remain more thinly among them so that all of those who remain in what is known as "pool service," which embraces a large majority of those in direct transportation service, suffer diminished earnings through diminished opportunities for actual employment.

#### CAUSES OF UNEMPLOYMENT

Two very different elements enter into the causes of this present unemployment in railroad service. On the one hand, tens of thousands of engine, train, and yard men, and clerical and station forces are without employment and off the payrolls because the railroads have no work to offer them. By reason of the general stagnation of business, the work is not there to be done; and even if the railroads were fortunate enough to have on hand available funds, this would not create employment for the class of employees just referred to. But in the case of many classes of employees in the

maintenance of way and maintenance of equipment departments, the situation is markedly different; the work is actually there and waiting to be done; and the reason that many of the employees who are now idle and earning nothing are not at work on the jobs that are there, is because of the financial inability of the railroads generally to undertake the work that is waiting.

A very considerable amount of renewal and repair work in both the maintenance of way and the maintenance of equipment departments, that would under normal circumstances have been done currently, has been steadily deferred because of lack of available funds to purchase supplies and to meet the payrolls for such work; and this deferring of work with its direct consequence of unemployment is still going on. The extent of it is indicated by figures prepared by the Bureau of Railway Economics. In June, 1920, the total number of "bad order cars"—that is, cars out of service and awaiting repair or reconstruction—was 170,493. Their number remained practically stationary until the end of 1920, it having risen only to 182,000 in December of that year. As already stated business had fallen off sharply from October to January. In January repair and construction work accordingly began to be deferred, and the number of bad order cars mounted steadily, until in June, 1921, it stood at the enormous number of 341,337. This postponement of repair work has continued until in September the number of bad order cars had mounted up to 374,087, which is nearly three times the proportion normally in bad order.

#### ADVOCATE PASSAGE OF SENATE BILL 2337

It is, therefore, perfectly obvious that there is a large amount of work in railroad service actually ready and waiting to be started; and could be started as a practical and effective unemployment measure the moment funds become available to purchase supplies and re-employ the men now waiting idle and anxious at the gate. This committee, therefore, recommends that this conference urge upon Congress the immediate passage of a bill such as Senate Bill 2337, as a very obvious and direct means for the immediate reduction of unemployment in railroad service. The discretion now vested by law in the President should not be restricted, but inasmuch as the funding provided for in the plan proposed in that bill is here recommended as insuring relief to unemployment, it is suggested that it would not be inconsistent to make such funding conditioned, in proper cases, upon the expenditure of the funds in such channels as will increase employment.

As the committee understands the bill referred to it is not a provision for a gift by the government to the carriers, as appears to be believed by many who are misinformed. Very few railway companies have been able to pay out of current earnings for additions and betterments chargeable to capital account. The compensation that the government agreed to pay for the use of the carriers' properties was measured by their respective net railway operating incomes for the test period. It was, therefore, essentially current earnings. If the expenditures made by the government for additions and betterments chargeable to capital account are deducted from the compensation due to the carriers, the effect is to force payment for such items from current earnings. That necessarily depletes in important measure the funds that should be available for maintenance, and caused deductions in working forces and undesirable deferring of needed maintenance work. This is reflected in the statistics of the bad order cars. If the government now funds the sums of money expended during the federal control for additions and betterments chargeable to capital account under proper security, it will simply do for the carriers in connection with these expenditures made by the government while it had full possession and control of the properties, that which is ordinarily done by the banker and the investor.

For that part of the unemployment amongst railroad employees due to the general business depression, a very different type of remedy must be sought. The degree of employment or unemployment in railroad service is peculiarly sensitive to general business conditions. Depression in any particular line of production or commerce immediately reflects itself in the volume of transportation derived from that source; and when a condition such as the present exists, with depression in most if not all lines of business, the resulting railroad unemployment bears a direct relation to the extent of the general depression. It is obvious, therefore, that any reduction of the unemployment in the railroad service that is due entirely to the lack of demand for transportation can only be brought about to such extent and with such promptness as there is a revival in business either in certain lines or in all lines.

Increases in activity in road building and other forms of public construction work by the nation, states, and municipalities will increase the demand for railroad transportation and to that extent decrease unemployment in railroad service, and we assume that the ways and means to bring about the stimulation of this public construction work will be discussed in the reports of the special committees dealing with these topics. This committee, however, recommends that the conference also urge that all railroads that are in a condition to do so should at once increase their maintenance, repair, construction, and other kinds of work to the very fullest extent possible in order that the railroads themselves may contribute just as far as they can to increasing the opportunity of employment.

#### BUYERS' STRIKE MUST BE BROKEN

This committee, however, fully appreciates that even if all forms of public work should be pushed to the limit, it would still only partially remedy the present unemployment in railroad service. Nothing short of a general revival of business can stimulate the demand for transportation to an extent that would furnish re-employment to the various classes of railroad employees who are now off the payroll and are waiting for the pick-up in transportation to furnish them again the opportunity to earn a livelihood. It seems, therefore, logical and proper for this committee to offer certain suggestions to the conference dealing with the reviving of industry in general. There can be no general resumption of business so long as the "buyers' strike" continues unabated.

So long as the public restricts its purchasing to the minimum in the belief that later it can purchase at lower prices, or because of a vague fear that the future is uncertain and that it must husband its purchasing power against unforeseen developments, just so long will the present distressing depression not only continue but probably grow in volume and intensity. There can be no marked resumption of business and no appreciable start toward a restored prosperity unless and until we all face the future with courage and confidence and deliberately and consciously throw aside our present policy of postponing all except essential purchasing and begin to buy freely and generously. It is inevitable that our domestic conditions will feel the effect of that aftermath of the war which has prostrated Europe and destroyed the market which we had always had there, but the natural doubt and timidity as to the future which these conditions have created in the United States, has brought about a condition of acute distress in our domestic affairs which is now beginning clearly to show itself, with the certainty that it will rapidly spread unless we resolve that by conscious effort we will bring about such resumption of prosperity as we can.

In the face of the present depressed conditions every individual should be willing to make some sacrifices for the general good in the same patriotic spirit as most of our citizens made them under the stimulus of war necessities. A patriotic and civic spirit in each individual is just as necessary for

the common good in time of peace as in time of war; and it should not be cast aside with the cessation of hostilities. We should, further, frankly recognize and assimilate the changed ideals, conditions, and attitudes of mind that were born of the war and that will persist. Our ideals of democracy and of liberty are the object of attack and assault in times of peace from enemies that are as dangerous and more insidious than an armed foe. We must meet such attacks with the same patriotic devotion and sacrifice that we would contribute to the support of our naval and military forces in time of war. It should be further frankly recognized that any long continuance of the present situation is playing directly and very effectively into the hands of these forces of demoralization.

Although, even at the best we can expect, our domestic business conditions will inevitably reflect in some degree the general world prostration, and while we cannot hope by and of ourselves to restore the fullest measure of pre-war prosperity, we could, if each of us individually would regard it as his duty and would determine without delay to "buy till it hurts," create a condition of business which compared with the present would represent a marked degree of prosperity.

The preliminary recommendations of the advisory committee point out that manufacturing for stock and rotation of employees would each tend to alleviate the growing evil of unemployment. Producing for stock, wherever at all possible, would certainly tend to lessen unemployment, but it carries with it hazards and possibilities of loss to the individual producer. Rotation of labor forces would relieve those more acute cases of distress due to entire unemployment, but it merely distributes the burden of the present situation more widely amongst wage earners, increases partial unemployment, and does not appreciably decrease the sum total of unemployment. It is unfair and would, therefore, probably be futile for the conference to appeal to the employing and wage working groups of the public to assume voluntarily the risks or make the sacrifices involved in the remedial measures above referred to, if each of those in the other groups constituting the consuming public has an eye single for his own selfish interests and deliberately postpones, as far as he can, purchases he is in position to make, in the belief, if not in the hope, that by such action he can bring on a period of "bargain days" during which he can "stock up" much to his own advantage.

The committee, therefore, recommends to the general body of the conference that it urge upon the public the policy of immediate general buying as a patriotic duty; that it formulate a program to direct such buying, as far as it may be practicable, into the lines where unemployment is most serious, and that it also formulate, or suggest, a program under which individual communities may create organizations to guard against the possibility of sellers taking advantage of the new activity of purchasers to push up prices or to make undue profits out of a movement involving much of individual sacrifice and growing out of a sense of patriotic duty.

#### FARMERS NEED RELIEF

In discussing the revival of business as it affects transportation service, we cannot lose sight of the fact that farmers represent some 40 per cent of the total population; that because of the reduction in price of what farmers have to sell, as compared with what they have to buy, there is a very large proportion of them who are financially prostrated and whose purchasing power is reduced almost to the vanishing point. The farmer has borne an undue share of the burden of deflation; and until this large and important element of the public finds itself in better financial condition and able to come into the market as buyers, there cannot be a full resumption of business or of transportation activities.

The committee, therefore, recommends and suggests that, if its recommendation for the resumption of buying be adopted

by the conference and a plan devised to direct such buying, special effort be made to direct such buying in a way that will bring relief to the fullest extent possible to the farming interests.

The report was signed by E. E. Clark, former chairman of the Interstate Commerce Commission; Charles H. Markham, president of the Illinois Central; Raymond A. Pearson, president, Iowa State College of Agriculture; Charles P. Neill, manager of the Bureau of Information of the South-eastern Railways.

#### W. S. CARTER ON SENATE BILL 2337

W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, concurred in the report with the inclusion of the following:

"Inasmuch as this conference has been called by the President for the sole purpose of relieving unemployment, we also recommend that in the disbursement of the funds advanced to the railroads, as provided in Senate Bill 2337, the railroads should be required to devote practically the entire sum so appropriated to the purchase of labor and material for maintenance of way and structures and for maintenance of equipment, and that the maintenance of equipment be performed in the shops of the railroads to their capacity, thus insuring the expenditure of the money so appropriated in the re-employment of railroad labor."

A copy of an argument and brief presented by W. S. Carter in support of his amendment to the report was also made public. Mr. Carter said he found it to be the belief of every other member of the committee that if \$500,000,000 could be immediately advanced to the railroads they would immediately expend it in undertakings that would promptly restore to their former positions a great number of railroad employees now out of employment, but he took the position that the Senate bill "covers only additions and betterments chargeable to capital account," from which he argued that as "it has never been the general policy of railroads to use any money affecting their capital to repair cars and locomotives," they would use very little of it to employ labor but "probably would follow the past practice in the disbursement of money properly chargeable to capital account and would pay deferred interest, deferred dividends and other deferred obligations."

He said that the railroads would not employ additional men except as traffic increases require it and increased earnings warrant increased expenditures for maintenance and, therefore, he doubted whether the passage of the Senate bill would relieve to any noticeable extent the present unemployment unless it was required as a condition. He quoted from a letter from the president of a railroad that had received \$3,000,000 in settlement of its accounts with the Railroad Administration to its stockholders announcing that it had enabled the directors to declare dividends out of the earnings of the years 1918 and 1919 and, Mr. Carter said, \$1,774,360 of the amount was so used. He also quoted from a summary of advance suggestions made by the Economic Advisory Committee to the conference, which said that "a condition should be attached that would make such funds immediately available in greater part only for new construction, repairs and outlays that would increase the demand of the railroads for labor and materials and thus augment general employment and revive industry."

Mr. Carter also insisted that the use of the money should be restricted to give relief to railroad workers, and not expended for work in outside shops. He assumed that if no conditions were attached a large proportion of any expenses incurred by the railroads in renewal of and repairs to track would be devoted to the purchase of rails, spikes and ties and that the proportion that would probably go to the employment of track labor would in most instances be delayed.

#### Report of Manufactures Committee

Seven members of the committee on permanent measures in manufactures presented a report declaring that "whereas transportation is a great factor affecting every community, every condition of life, and every occupation, therefore we respectfully urge immediate consideration and action respecting conditions existing in the operation of the American transportation systems which obstruct the improvement of general business conditions." The committee, therefore, strongly advocated that the conference recommend, as a means of permanently bettering the existing situation:

1. (a) The prompt passage of the measure funding the obligations of the railroads for advances of money by the government for additions and betterments made by it during the period of its operation of the roads. These expenditures were capital charges and would not have been undertaken by the roads without previous provision for the supply of funds, a provision now impossible for them to make in the present market.

- (b) The facilitation and expedition of payment of unsettled government obligations to the railroads, grown out of its rental obligations. This rental was a substitute for the income of the railroads and is the source from which they meet their current obligations. These measures are demanded by ordinary business fairness. They would strengthen the credit of the roads and place them in funds; making possible the payment of their supply bills, and their physical rehabilitation; give additional employment to labor and greatly benefit the public.

2. That the functions now performed by the Railroad Labor Board be transferred to the Interstate Commerce Commission in order that the dual control which establishes rates through one body and requires another to regulate the terms of the largest item of expenditure shall end, and opportunity be given for the reduction of operating expense to be immediately reflected in decreased cost of transportation for the public good.

3. That the Adamson act, enacted under circumstances disapproved by the American public, be repealed as an initial step in the reduction of artificial and uneconomic costs imposed upon the shipping public by law.

4. That while we recognize no business can permanently operate at a loss, we believe every employer should join with every employee in the endeavor to eliminate every discoverable waste and inefficiency from production, transportation, and distribution which is practically removable, and every element in our citizenship should frankly set its face against any group, whether in agriculture, business, labor or transportation that selfishly undertakes to resist necessary economic adjustment in any narrow endeavor to protect its personal interests at the expense of the permanent betterment of our national life.

This report was signed by J. A. Campbell, Wm. M. Butler, John E. Edgerton, A. L. Humphrey, W. H. Stackhouse, J. A. Penton, and T. P. Hinman.

#### Minority Report of Manufactures Committee

A minority of the members of the committee on permanent measures by manufacturers dissented from the conclusions and decisions reached by the majority, and submitted for consideration a brief statement of the reasons.

On the recommendation for the repeal of the Adamson law, the report said that wholly apart from, independent of and prior to the decisions of the Supreme Court declaring the Adamson law constitutional and before its provisions were put into operation by railroad managements, a voluntary agreement had been reached between the presidents of the railroad companies and the chief executive officers of the railroad brotherhoods by which the eight-hour day was established in the railroad service, and that the recommendation for the repeal of the Adamson law can only be interpreted

as an effort to break down the principle of the eight-hour workday.

The report continued in part:

The proposal of the committee majority for the abolition of the Railway Labor Board established under the Esch-Cummins law upon which labor has or is supposed to have representation of persons of their own choosing, would remove the only responsible governmental agency to which the workers may present for consideration and action their claims relating to wages and conditions of employment.

While we agree with the declaration that waste in industry and transportation (more than 50 per cent of which has, by competent engineers, been allocated to capital and management) should be eliminated and that co-operation of workers and management is necessary to accomplish this purpose, the attempt of the majority of the committee to place the wage earners of our country, human beings, in the same categorical position as "business" and "transportation" is based upon the assumption that men and women, human beings, are in the same category as commodities or articles of commerce to be weighed, measured, bought and sold in the same manner as commodities or articles of commerce.

The statement by the author of the resolution was that this conference and the citizenship of the country should condemn and denounce any resistance on the part of railroad employees—the men engaged in the railroad service—should they resist wage reductions. From this we most emphatically dissent.

The statement of the committee majority that "every element in our citizenship should frankly set its face against any group whether in agriculture, business, labor, or transportation that selfishly undertakes to resist necessary economic adjustment in any narrow endeavor to protect its personal interests at the expense of the permanent betterment of our national life" is vague and indefinite but evidently is intended to imply that the workers (mistakenly called "labor") are seeking selfishly to promote their interests by narrow endeavor.

We dissent from this point.

Every thinking person, freed from purely selfish gain, understands that reduction of the earning power of the working people is most injurious to the whole people, economically, industrially, commercially and socially.

On sections *a* and *b* of recommendation No. 1 relating to the settlement of the financial relationship between the government and the railroads, we sustain the declaration of the general conference adopted on this subject at its meeting October 11, with the distinct understanding and conditional upon the adoption of the minority report of the transportation committee signed by W. S. Carter.

We further recommend the following addition to the minority report of Mr. Carter: "That any railroad company which fails or refuses to abide by the decisions and regulations of the Railroad Labor Board and the Interstate Commerce Commission shall not participate in the funds provided for in Senate Bill 2337."

This was signed by Samuel Gompers, Sara A. Conboy and Roy Dickinson.

The manufactures committee also recommended a substantial reduction in the operating expenses of the federal government, the prompt enactment by Congress of a law free from ambiguity providing for a substantial downward revision of taxes, and the early passage of a satisfactory and adequate revenue and tariff bill.

### Other Reports

The committee on agriculture presented a report which was adopted, stating that 50 per cent of the earnings of the railroads are derived from agriculture and declaring that "railroad freight rates on commodities to and from the farms must be substantially reduced without delay." The report

also declared that all prices and wages should be so adjusted that normal relations may be re-established and the purchasing power of the farmers may be restored.

### CAR SUPPLY AND FUEL

The Committee on Emergency Measures in Mining presented the following recommendations pertaining to car supply:

1. As our bituminous coal deposits are ample and the developed mine capacity is far in excess of the country's bituminous coal requirements, therefore safeguarding the public's coal supply is mainly a question of car supply and transportation.

2. As the preferential car supply was permitted to exercise its evil influence in 1920 with most disastrous results to our people, your committee respectfully recommends that the Esch-Cummins act be hereafter rigidly enforced to the end that there shall be no preferential use or assignment of railroad cars in the coal industry. This practice has been condemned as an evil by the Fuel Administration in 1918, by the Presidential Coal Commission in 1920, and is prohibited by the Esch-Cummins law, all recognizing that it results in reducing coal costs to users of the preferential fuel cars only, and thereby unduly increases the cost of coal to the remainder of the coal consuming public who do not enjoy the use of the preferential car. It has the further baleful effect of increasing both unemployment and irregularity of employment at the mines not enjoying the use of the preferential fuel cars; all resulting in the unnecessary pyramiding of coal costs upon all coal consumers.

3. As an aid to prevent unemployment, as a substitute for the assigned car and to avert the peak load at bituminous coal mines, your committee therefore further recommends that this conference memorialize the committee of railroad executives and ask that they gradually accumulate and maintain along their lines of railway throughout this country a quantity of bituminous coal sufficient to take care of their requirements for a period of at least five months, as that quantity should provide for their requirements over any reasonable emergency that may arise, and permit the remaining fuel consumers to fully employ our transportation facilities.

4. Your committee further recommends that this conference memorialize Congress to the effect that the railroads be paid all monies now owing them by the federal government.

5. Your committee further recommends that the per diem charge made by railroads for cars used off their lines be materially increased and enough so as to insure their prompt return to the owning railroad, thereby materially increasing transportation facilities.

This was a unanimous report of the committee but was not acted upon by the conference, it was stated, because of a dissent within the organization committee on the statement regarding assigned cars. This committee did not recommend reductions in the freight rates on coal.

### UNEMPLOYMENT STATISTICS

The Committee on Unemployment Statistics recommended among other things:

That the present practice of the Bureau of Labor Statistics of collecting from manufacturing concerns as of the fifteenth of each month data concerning the number of employees on payrolls and the amount of their earnings and of publishing monthly indices of the changes therein be extended to cover transportation, trade and mining and quarrying. That in getting the data concerning the state of employment in mining and quarrying the Bureau of Labor Statistics collaborate with the U. S. Geological Survey. That in getting data concerning the state of employment in railroad transportation, the Bureau of Labor Statistics collaborate with the Interstate Commerce Commission.

The committee also recommended that an inter-departmental committee be constituted to consider means of extending and improving employment and unemployment statistics and of co-ordinating the informational service of local, state and federal agencies.

The report was adopted by the conference.

#### UNEMPLOYMENT AND BUSINESS CYCLES

The committee on public works submitted a report including a general discussion of unemployment and business cycles, stating that the work of the unemployment conference is not complete until it has provided for a thorough study of the problem as to whether we are helpless to prevent the periodical recurrence of periods of business depression, or at least to reduce their intensity and duration. This report pointed out that the business cycle is marked by peak periods of boom between valleys of depression and unemployment and that the most helpful way to check the losses and misery of depression is to check the feverish extremes of "prosperity."

If all branches of our public works and the construction work of our public utilities, including the railways, would systematically put aside financial reserves to be provided in times of prosperity for the deliberate purpose of improvement and expansion in times of depression, the report said, it would not only greatly decrease the depth of depressions, but would at the same time diminish the height of booms. A reserve of but 10 per cent of the average annual construction for this purpose would almost iron out the fluctuations in employment. The committee also reported that the leadership of the federal government in expanding its public works during periods of depression and contracting execution in periods of active industry would accomplish a great deal to stabilize conditions and would require no great change from existing procedure.

The chief remaining step, the report said, is to choose a period of intensive execution to synchronize with major periods of industrial depression. Certain works of the federal government, such as reclamation, flood prevention, river and harbor work, and roads and public buildings were declared to be peculiarly constituted for consideration as large undertakings covering a long period and capable of elasticity of execution to synchronize with cycles of business depression. The committee on public roads urged upon Congress the importance of at once making a liberal appropriation for road building and the states to carry on their share of the work.

#### AN APPEAL TO EMPLOYERS

A statement by employer members of the conference was read, appealing to employers throughout the country to support the immediate program adopted by the conference as a means of practically ameliorating the existing situation. The statement said in part:

We do not think our fellow citizens sufficiently appreciate the value of the insistence of the President and the Secretary of Commerce that neither government relief nor public doles shall be considered as a means of meeting unemployment.

The plans upon which the conference have agreed are practical forward steps. But as employers, conscious of a high social responsibility, impelled alike by considerations of intelligent self-interest and public obligation to restore the employing power of productive enterprise, we do not believe our situation can be permanently improved until some of its chief causes are frankly recognized and squarely faced. Our prime difficulty is a high and unbalanced cost of production which is keeping goods and services beyond the buying power of consumers. That condition cannot be bettered until each of us recognizes it as a fact and does his part, individually and collectively, to restore a free exchange of commodities and services upon such terms that we may reciprocally absorb each others products.

Wages rose more slowly than prices during the war. Since

then wholesale prices have declined more rapidly than wages, and in the great field of foodstuff production farm products have declined more rapidly than the things for which they are exchanged, while fuel, transportation, and some construction costs are still predicated upon wartime costs. Costs in these fields of human activity are more greatly out of line than in any other and the effect is plainly felt in all our inter-dependent social transactions. The drastic economic adjustment through which we must pass in establishing new prices and values for goods and services knows no favorites. Employers and employees, manufacturers, merchants, distributors, transporters, all must meet them. For neither commodity prices nor wage rates can be maintained above the natural economic level.

Following this President Gompers of the American Federation of Labor addressed the conference, saying that he had been gratified at the spirit manifested in the conference, although he regretted that the same spirit was not present in the committee of which he was a member. He said he was sure the work of the conference would be helpful in promoting an early emergence from the acute unemployment situation and that labor is willing to co-operate in carrying its program.

#### A SUCCESSFUL CONSUMMATION

Mr. Hoover made a brief concluding speech, saying the primary purpose had been to get a plan which "without calling on the public purse would carry the country through the next winter and into seas less rough" and expressing gratification that the plan had been so willingly accepted by a large part of the country, as indicated by the many communications already received. The problem, he said, is mainly one for voluntary organization and success depends on the co-operation of industry and civic bodies. He referred to the successful consummation of the conference as "marking a milestone in social progress" and pointed out that it was the first one held in Washington since the war in which extremes in social thought had been brought together and parted in good will after agreeing on every major issue.

The announcement of the members of the standing committee was made on Monday. It includes C. H. Markham, president of the Illinois Central, and E. E. Clark, former chairman of the Interstate Commerce Commission. It is to appoint sub-committees for further report including such committees of service to the present emergency as may be required, a committee on construction development and a committee on investigation of remedial measures for reducing intermittent and seasonal employment.

Public Utility Commissioners in Convention at Atlanta

## Meeting of Public Utility Commissioners at Atlanta

Will Ask Congress to Define and Limit Power of I. C. C. in  
Regulation of Intrastate Rates

**T**HE NATIONAL ASSOCIATION of Railway and Utilities Commissioners completed its annual meeting at Atlanta, Ga., Friday, October 14, after having passed resolutions putting the meeting on record as favoring immediate legislation by Congress to define and limit the power of the Interstate Commerce Commission as to intrastate rates. The resolutions further expressed the commissioners' opinion that the group plan of making rates as prescribed in Section 15a of the Interstate Commerce Act was "uneconomic and unsound."

These resolutions were passed after a lively discussion, in which the opinions of those present, as expressed in the resolutions, were brought out in rather unmistakable terms.

### Resolution Asks Congress to Define and Limit I.C.C. Rate Making Powers

The report of the meeting appeared in part in last week's *Railway Age* in the article on page 723 and following pages, entitled, "Debate Federal Versus State Regulatory Powers." The resolutions were formulated by the committee on state and federal legislation, the report of which was given last week. The resolutions were in part as follows:

*Whereas* the Interstate Commerce Commission, under authority claimed to have been conferred upon it by the Transportation Act of 1920, has made orders advancing railroad rates applicable to intrastate transportation in 24 states, in disregard of state laws and orders of state commissions, and has instituted investigations, upon the petition of carriers, which are now in progress, looking towards the advancing of railroad rates and express rates in several other states, and

*Whereas* Section 15-a of the Interstate Commerce Act, as amended by the Transportation Act, provides that the commission, under the group plan of rate-making, contained in said section, shall fix an aggregate value of all lines within each rate group, and shall make rates that will yield an aggregate fixed return on such aggregate value, and

*Whereas*, under such group plan, the worthless roads of the country, ill-considered ventures, duplicated lines, speculative enterprises, and roads that have served their useful purpose and outlived the industries which once justified their construction, are valued with the good, and the good roads are given the right to earn upon their own value and also upon the value attributed to such worthless roads, which cannot earn because they perform no sufficiently useful service in the actual movement of traffic to enable them to earn, and

*Whereas* the group plan, if carried out, will necessarily enable some carriers, in the exact words of said Section 15-a, "to receive a net railway operating income substantially and unreasonably in excess of a fair return upon the value of their railway property," and

*It hereas* the Interstate Commerce Commission has attempted to make rates according to said group plan, and has asserted the power, under said plan, to raise rates within one state to meet deficits in earnings incurred in other states, and

*Whereas* unjust and unreasonable rates have thereby been imposed upon the public, and

*Whereas* the people of the several states, under the Interstate Commerce Act, as amended, as interpreted and administered by the Interstate Commerce Commission, have been deprived of their accustomed powers of self-government.

*Therefore, be it resolved:* That we urge upon Congress immediate legislation, at the present session, which shall so amend the Interstate Commerce Act as clearly to define and limit the power of the Interstate Commerce Commission, so that no intrastate rate may be changed or set aside without proof by competent evidence, and upon findings of fact made, that the same is non-compensatory and injures a person or persons, or a locality or localities, engaged in interstate commerce to such an extent as seriously to diminish the business of such person or persons, or seriously to retard the growth and development of such locality or localities, and

*Resolved further:* That it is the sense of this Association that the group plan of making rates, prescribed by said Section 15-a, is uneconomic and unsound, and that the attempt, under its provisions, to produce returns upon roads that are unable to earn returns themselves, has placed an unjust burden upon the business of the nation, from which it should be relieved by the immediate repeal of said Section 15-a, and

*Resolved further:* That, as an aid in the construction of the Interstate Commerce Act by the commission and the courts, Congress is requested to incorporate in such amendments amendatory legislation, a declaration of the purpose of Congress to recognize the right of the several states to exercise full and final jurisdiction over all rates for intrastate transportation which do not injure persons or localities engaged in interstate commerce, in the manner aforesaid.

#### Resolution Relating to Amendment of Valuation Act

*Whereas* there are now pending in the House and Senate of the National Congress bills introduced by Congressman Sweet and Senator Cummins respectively, each to amend Section 19-a of the Interstate Commerce Act (which section is commonly referred to as the Valuation Act) so that the Interstate Commerce Commission shall not be required to include in its valuations of railroad properties any estimates of hypothetical damages for present cost of condemnation and damage in excess of present value, or original cost, of railroad lands,

*Therefore, be it resolved:* That this Association urges the prompt passage of the proposed amendment as an act of plain justice to the public.

#### Resolution Relating to Car Service

*Whereas* it is impracticable for the Interstate Commerce Commission to attempt to supervise the distribution of cars as between individual shippers throughout the United States, and

*Whereas* there should be some governmental authority within reasonable reach to which appeal can be made to require equitable distribution of cars without regard to whether the same are to be used for shipments interstate or intrastate,

*Therefore, be it resolved:* That Congress be respectfully urged to amend the Interstate Commerce Act in such way that the regulatory authorities of the states may make reasonable orders and regulations, not in conflict with federal law, or with lawful orders of the Interstate Commerce Commission, requiring cars within the respective borders of such states to be equitably distributed to shippers desiring same, without regard to whether they are desired for use in shipments that are interstate, or intrastate.

#### Resolution Relating to Certificates of

##### Convenience and Necessity

*Whereas* by the Transportation Act of 1920, the Interstate Commerce Commission was, in terms, given exclusive authority to grant certificates of convenience and necessity for construction and abandonment, not only of railroad lines which are interstate in character, but of railroad lines lying, or to be constructed, wholly within one state, and

*Whereas* the Federal Government ought not to undertake to authorize state railroads engaged in intrastate transportation, which have often been constructed, in part, by public aid from the State or sub-divisions thereof, to abandon intrastate operation without authority from the State.

*Therefore, be it resolved:* That Congress be respectfully urged to amend the existing law so that certificates of convenience and necessity granted by the Interstate Commerce Commission shall not purport to relieve the carriers obtaining the same from conforming to the laws of the states with respect to construction and operation within the states for intrastate transportation, or with respect to the abandonment of such transportation.

#### Committee Reports

Some of the committee reports presented at the meeting were given in abstract form in last week's *Railway Age*. Other reports of interest to *Railway Age* readers were those of the committees on railway rates, on valuation and on car service.

#### Report of Committee on Railway Rates

The report of the committee on railway rates reviewed briefly the hearings in the Western Grain Rates case, decision of the I. C. C. in which is expected shortly, and the decision in the Live Stock case. Continuing, it referred to the lack of power of the state commissioners over intrastate rates as follows:

The main subject of interest in rate making the last year has been the boundaries of the jurisdiction over intrastate rates as between the Interstate Commerce Commission proceeding under the Transportation Act and the various state commissions. The Interstate Commerce Commission has assumed jurisdiction over so many intrastate rate tariffs that not much authority has been left to the state commissions. As long as this condition continues there is not much room for functioning through the state commissions. That the result is highly unsatisfactory to the state commissions and the shippers, and presumably to the I. C. C. is recognized. Only the carriers seem to be pleased because their campaign of many years to cripple the state commissions and concentrate the authority over all rates, state and interstate, in the hands of the Interstate Commerce Commission where the machinery would be so clogged that readjustment would be practically impossible, appears to have met with some success.

Most of the state commissions are marking time. They are so fettered with orders of the Interstate Commerce Commission and injunctions of the federal courts that until the law is defined by the Supreme Court or Congress acts, their ability to serve the states in the matter of intrastate rates is very limited.

#### NEED FOR UNIFORMITY IN INTRASTATE RATES

The committee also discussed the need for uniformity of intrastate rates in states similarly situated:

One of the principal things that the states, particularly the western and southern states, ought to consider is the need for greater adjustment in the intrastate rate schedules of those states whose business is performed under substantially similar conditions. One of the most telling criticisms made against state regulation, and the hardest criticism to answer, is the disparity in many instances in the rate levels in states where transportation conditions are somewhat similar. It could be pointed out that similar disparity exists in interstate rates but as it is state regulation that is under fire your chairman calls your attention to this subject with his earnest suggestion that it be given most careful thought by the members of this association.

It is realized that in many states statutory rates affect the power of the commissions to adjust inconsistencies but nevertheless it is our judgment that the state commissions will take the longest step toward strengthening themselves if they will work together in an attempt to harmonize conflicting state levels where the transportation conditions are substantially similar. I think that this association could render no greater service than to use its best efforts in this direction and that this convention should give this phase of the subject its most careful consideration.

#### MOTOR TRUCK TRANSPORTATION.

One of the recent developments that must be given earnest consideration by the state commissions is the competition with railroads on l. c. l. short hauls by motor trucks. As the highways of the country improve and the motor truck becomes more and more a permanent part of our economic machinery the tendency is to move merchandise, household goods and other forms of traffic by truck instead of by rail. There will be much work for the state commissions to do in the future along this line. If the movement by traffic by truck is an economic advantage it has doubtless come to stay and will be extended in the future. If, on the other hand, this movement has been induced by freight rates higher than they should be, and particularly under those scales of rates where the short haul rates are abnormally high, then there is an opportunity for the state commissions to function through a readjustment of such rates. There has been a tendency in recent years to apply very high rates to short haul traffic. The application of such scales together with the percentage increases in rates has resulted in bringing about the situation discussed.

The report is signed by C. M. Reed, Kansas Public Utilities Commission, Chairman.

## Report of Valuation Committee

The committee on valuation began its report with a tribute to Charles A. Prouty, late director of Valuation of the I. C. C. With reference to the present progress of the valuation work the report quoted a letter from C. F. Staples, acting director of the Bureau of Valuation. This letter said in part:

**Engineering Section:** The field work in all branches has been completed for some time, except in the Eastern district, where we concluded field work during the month of June. This narrows the engineering work down to that of the office, where our energies are now concentrated upon the application of prices and the writing of reports. On June 30th, last, the engineers had submitted to this office reports covering 111,682 miles of main line, representing the properties of some 425 carriers. While many of these are small properties, quite a number of the larger lines of five hundred miles or more, and will continue to do so until reports are received on all the larger carriers. The work of compiling reports is well organized and good results are expected.

**Land Section:** The field work of this section is practically complete except for terminals, in all except the Eastern district. In that district, owing to the extreme density of the larger lines, the work will continue for some time. Our field forces on July 1 were reduced to 25 per cent of the former personnel. This section is slightly behind the engineers in the submission of land reports, but the work is in the main well abreast of the other.

**Accounting Sections:** The accounting field work will be concluded by December 31, 1921, and the field forces disbanded. The only work then remaining to be done will be the compilation of accounting reports.

**Tentative Valuation Reports:** The work of preparing these reports is proceeding rapidly and many additional tentative valuations have been sent out during the past 60 days. These reports include a final value as well as figures showing the excess cost of acquisition of lands.

In case of the fifty-six tentative valuation reports issued prior to the decision of the Supreme Court in the Kansas City Southern case, the Commission has issued supplemental tentative valuation reports covering a final value and the excess cost figures. Tentative valuation reports have been prepared and served upon 190 of the 1,966 corporations, which includes 151 independent carriers and 39 subsidiaries. The main line mileage for these carriers is 26,553.

The corps of analysts is preparing additional tentative valuation reports as rapidly as conditions permit.

The report of the committee followed with various references and opinions of the Valuation Committee relative to the procedure adopted by the commission in such matters as present cost of condemnation, original cost, appreciation and depreciation, etc. Reference was also made to the efforts of the utility commissioners' association to procure an amendment of the valuation act to relieve the I. C. C. from the obligation to include in its valuations its estimate of the "present cost of condemnation and damages in excess of original cost or present value" of lands.

## Committee on Car Service

C. B. Aitchison, of the Interstate Commerce Committee, and chairman of the Committee on Car Service and Demurrage, did not attend the Atlanta meeting. He, however, sent a letter in which, among others, the following points were brought out:

The enforcement of equitable rules for the distribution of inadequate supplies of equipment has become of increasing importance as periods of car shortage have succeeded each other. The margin between the volume of traffic which causes a complete surplus of equipment or an acute car shortage is always relatively small. Seasonal and periodic depressions or expansions of business activity, it is to be expected, will make recurring conditions of car surpluses and car shortages for a considerable time to come. The problems in times of car shortage are to mitigate the effects of the deficiency in equipment, and to insure equal opportunity to all users.

But by what test is equality in opportunity to be measured? The two principal proposals are: (1) past performance and potential productive capacity, and (2) immediate ability to ship. Other tests have been proposed, such as distribution primarily to growers or those who have purchased from growers, but the principal bases suggested are those indicated. Shall distribution be on the basis of the past and future, or on the basis of the present, disregarding the past and future? These questions are pressing toward a determination. In the formulation of such rules, the general good of the service, in the broadest sense of the term, is to be given great weight. This is but another way of expressing the desire for equality of treatment, and recognizes that besides the immediate claimants for cars, other shippers have rights which can be preserved only by the adoption of rules which will result in obtaining the greatest possible amount of movement in the aggregate. The shippers who are affected, aside from the

immediate claimants, may be, and often are, located at far distant points, and even upon other lines.

Car distribution rules, like other rules laid down by law, are often stretched and violated. As an incident to the formulation of any code of distribution rules, it is desirable that the tests proposed shall be such that the basic facts can be readily examined and cases of discrimination and preference may be ascertained and punished with a fair degree of certainty. The basis, therefore, should not be one which is solely or peculiarly within the knowledge or possession of the shipper, impossible of verification by the carriers, commissions or courts. Any system of ratings which is dependent upon reports of facts solely within the knowledge and control of the shippers affords the opportunity to obtain inflated ratings, and puts the honest shipper at a serious disadvantage in comparison with his dishonest competitor.

Another minor consideration of some importance, is that the rating system proposed shall be based on normal operating conditions and traffic, rather than the maximum of achievement or demand. When it is considered that the bituminous coal mine ratings have at times been based on an aggregate of 19,000,000 tons capacity per week, which is taken as 100 per cent in measuring car supply, while the maximum amount ever produced slightly exceeded 13,000,000 tons, it is apparent that the manner of statement of relative ratings may give a wholly misleading idea as to the character of the service in fact afforded.

Mr. Aitchison here referred to the bad order car situation, to the needs of the railroads in general for new equipment, new facilities, etc. Continuing, he said:

An unduly large increase in permanent improvements will mean unnecessarily high costs; so in the interest of conservation, a proper balance must be maintained in order that large sums of capital expenditure will not remain idle longer than sound policy requires. Such effective co-operation between carriers as will insure the maximum service from the available equipment is, therefore, emphatically necessary to economical management, and very properly be demanded.

## Other Business

The association voted to meet next year at Detroit, Mich., on September 26. With reference to the list of officers elected for the ensuing year, there was an error in the names as given in last week's *Railway Age*. The secretary's name should have been given as James B. Walker, who is secretary also of the New York Transit Commission. Leroy S. Boyd of Washington, D. C., was elected assistant secretary.

From the Indianapolis News

Some Fellow Can Always Use Something in Discard

## Freight Car Loading

THERE was a reduction of over 5,000 cars in the freight car loading during the week ending October 8 as compared with the previous week, which set a new high record for the year. The total was 895,740, as compared with 1,011,666 in the corresponding week of 1920 and 982,171 in 1919. The decreases were in grain and grain products, of which the loading was 53,964 cars; in forest products, 49,459; ore, 25,702, and merchandise and miscellaneous freight, while there were increases in live stock, 34,073; coal, 180,339, and coke, 6,054. The loading of grain and livestock was, however, greater than for the corresponding week of 1920.

Except for the Allegheny and Southern districts, de-

from October 1 to October 8 averaged 142,970, a decrease of 29,450. Of the total 31,020 were box cars and 82,525 were coal cars. There were also scattering shortages amounting to 5,237.

The Car Service Division of the American Railway Association reports that the loading of fruits and vegetables in September in California, Colorado and the Northwestern states was 60 per cent in excess of last year. Including Michigan and New York, the total was 45,324 cars, an increase of 10,500 cars over last year. This has necessitated special attention to the handling of refrigerator cars and ventilated box cars. The loading in the West for the first week of October averaged 150 per cent in excess of last year and the month's loading will exceed September by a wide margin. All of this must be accomplished with less cars than a year

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary—All Districts, Comparison of Totals, This Year, Last Year, Two Years Ago, for Week Ended Saturday, October 1, 1921

creases were reported compared with the previous week in the loading of all commodities by districts, while compared with the corresponding week last year, all reported decreases except the Central Western which showed an increase.

The summary for the week of October 1 is given in the table above.

The car surplus continued to decline and for the period

ago. The report says it is essential that every available car be used, that bad order cars be repaired, that the movement of empties as well as loaded be expedited, that refrigerator cars be not used for dead freight and that all terminal delays be reduced to the minimum.

The distribution of cars will be as directed by the refrigerator section.

Revenue Car Loading This Year as Compared with Preceding Years

# Bridge and Building Men Meet in New York

## Thirty-First Annual Convention Characterized by Large Attendance and Active Interest

THE American Railway Bridge and Building Association met in its thirty-first annual convention at the McAlpin Hotel, New York, on Tuesday, Wednesday and Thursday of this week. The meeting was one of the most largely attended in the history of the association, the total attendance of members exceeding 250. W. F. Strouse, chief engineer, Maryland Public Service Commission, Baltimore, Md., and president of the association presided.

The convention was called to order promptly at 10 o'clock Tuesday morning. W. G. Besler, president of the Central Railroad of New Jersey, welcomed the association to New York. After referring to his early experiences as a division officer in charge of operation and maintenance, he dwelt on the crisis the railways are now facing. After expressing the opinion that there would be no strike, he stated that railway officers would be blind if they failed to take the action necessary to meet the issue and they were taking this course. He pointed to the fact that while the labor organizations

call their members out they could not call them back. He urged the members of the association to use their influence for conservative action.

In his opening address, W. F. Strouse, president, also referred to the threatened strike. After tracing the developments since the passage of the Adamson law he said that "to the railroad labor unions must be attributed part of the responsibility for the present high freight rates and until there is a reduction in wages and bonuses, the people cannot hope to get cheaper transportation. What the railways need and are entitled to is a dollar's worth of work for every dollar expended and they must have it before normal conditions will return." He closed with an appeal for the members to support their companies loyally.

The report of C. A. Lichty (C. & N. W.), secretary-treasurer, showed over 75 applications for membership with a total of over 900 members and a balance of \$1,600 in the treasury of the association.

## Report on the Construction and Maintenance of Cinder Pits

Cinder pits may be divided into the following types: (A) Depressed track pits where ashes are loaded into cars by hand. (B) Dry pits where ashes are received in cast iron buckets and loaded into cars by means of an overhead crane. (C) Water pits, both shallow and deep, where ashes are removed by clamshells operated by a locomotive or overhead

pit about 3 ft., leaving an air space between the cinders and the concrete. This will prolong the life of the back wall.

Figure 2 shows the pit deepened and both rails supported on cast iron pedestals with a pre-cast slab between the rail and back wall; this design keeps the rail off the concrete wall and leaves the beams and pedestals exposed where they can be replaced in a few minutes if a failure should occur.

Figure 3 shows a dry pit used by the Bangor & Aroostook, and is similar in construction to Fig. 1, the difference being that the bottom of the pit slopes from the back wall to the center of the pit; the beam carrying the track is made of two 70-lb. rails placed upside down to support the track; the pedestals are spaced 6 ft.  $\frac{3}{8}$ -in. between centers and are built

Fig. 1—Standard Cinder Pit of the D. M. & N.

crane and loaded into cars. (D) Miscellaneous pits, where ashes are removed by various mechanical means.

Figure 1 shows a standard pit used by the Duluth, Missabe & Northern at Proctor, Minn., which is typical of the hand-loading pits installed by many of the railroads in this country. The pit is constructed with one rail resting on the back wall of concrete, and the other on two 10-in. channels back to back with cover plate top and bottom, the channels being supported by cast iron pedestals on 7-ft. centers. This pit has failed in one respect: the action of the hot cinders and water on the top and face of the back wall have caused it to crumble and produce an unsafe bearing for the rail. No trouble has been experienced with the cast iron pedestals, and with a reasonable amount of cleaning of the hot cinders away from the steel beams, they do not buckle. The beams require cleaning and painting every spring and fall. The back wall can be protected with old plates  $\frac{1}{4}$ -in. thick hung over the edge of the back wall on the inside of the pit and down the

Fig. 2—A Second Design of Type A Pit

of two 70-lb. rails back to back on end and encased in concrete, the concrete being protected by a  $\frac{1}{8}$ -in. steel plate; these vertical rails are supported by two 70-lb. rails running lengthwise in the foundation.

The Buffalo, Rochester & Pittsburgh has built a pit of Type B at Lincoln Park, N. Y., shown in Fig. 4, which seems to be a favorite design for a dry pit in cold climates.

This pit can be built with one track and a loading track, or if the length of the pit is fixed, several tracks can be built side by side. This style of pit is constructed of a series of cast steel buckets placed in shallow pits to receive ashes direct from locomotives. There is enough depth provided under the buckets to allow for drainage. The buckets are handled by means of an overhead crane from the pit directly to the ash cars. The pits are of an unusual shape with sloping sides in the upper part and a narrow rectangular lower portion. old rails being imbedded in the sloping surfaces with their bases projecting  $\frac{1}{8}$ -in. from the surface of the concrete; each parapet wall is capped with a 12-in. channel to which the track rail is bolted. The buckets have a capacity of 2 cu. yd. each, each seated on the projecting rails of the pit walls. When the buckets are filled the traveling crane carries them to the cinder cars where they are dumped automatically. The buckets open at the bottom like a clam shell, the two halves being carried by a pair of scissor levers at the middle.

The Lehigh Valley has two modern water ash pits of Type C, both being built within the last three years. The one at Copton, Pa., Fig. 5, is a double-track arrangement, 400 ft. long with a water pit between the two tracks. The water pit is 12 ft. wide in the clear by 14 ft. 3 in. deep, the ash tracks having 29-ft. centers. The water in the pit is generally within 1 in. of the bottom of the carrying rails, so that it is impossible to overheat or burn any part of the supporting structure. The outside rail of each ashing track is carried

Fig. 3—A Dry Pit Built by the Bangor & Aroostook

on the outside concrete wall of the pit, bearing on a  $\frac{1}{2}$ -in. iron plate. The inside rail of the ashing track is carried by three rail girders supported by heavy cast iron posts with large bases imbedded in the concrete. These carrying girders consist of two 136-lb. rails, side by side, with spacing blocks so designed that the base of the track rail, also of 136-lb. section, rest on and are gripped between these spacing blocks and the heads of the two lower carrying rails, forming, when tightly bolted together, a rigid 3-rail carrying girder.

The walks around the ashing tracks of this pit consist, on the outside, of the natural surface of a cinder fill, while on the inside the walk consists of 80-lb. rail brackets fastened to the cast iron columns. The rail brackets carry the floor of the walk, consisting of old boiler flues laid side by side and spaced by means of iron straps, so that the finer ashes fall through. A suitable railing, also of old flues, amply protects anyone from falling into the water pit.

Crushed slag was used in the concrete for the pit as a precaution against hot cinders coming in contact with the concrete while the pit is without water.

The Pere Marquette installed a mechanically-operated pit in January, 1912, which seems to be a favorite for small terminals and shows a low cost of operation. From recent reports the pit and conveyor are in good shape with very little maintenance. There are two good points in favor of the mechanically-operated pit. It requires less room, due to cinders being loaded continually into cars; and it requires

but one man to operate it, which makes for a low operating cost. The structural steel in these pits should be inspected, cleaned and painted frequently.

The report was signed by G. K. Nuss (D. M. & N.), chairman; C. L. Beeler (N. Y., N. H. & H.), Wm. Cardwell (Wash. Term.), H. A. Gerst (G. N.), W. L. Rohbock (W. & L. E.), F. E. Schall (L. V.), E. R. Wenner (L. V.), J. P. Wood (P. M.), A. E. Kemp (L. V.).

### Discussion

The discussion hinged largely on the efficient use of the ash pits in connection with the equipment and the disposal of

Fig. 4—Type B, Pit Built by the Buffalo, Rochester & Pittsburgh at Lincoln Park, N. Y.

the cinders. It was emphasized by Arthur Ridgeway (D. & R. G. W.) that no car had as yet been developed that would handle hot cinders without resulting in the destruction of the car body by burning or warping. Quenching was necessary though it gave considerable trouble in the winter with the handling of the cinders. It was stated by J. S. Robinson (C. & N. W.) that at the Chicago terminal the cinders are

Fig. 5—Type C, Water Pit Built by the Lehigh Valley at Copton, Pa.

loaded into out-bound empty coal cars, moved to West Chicago, and there unloaded by locomotive cranes and stored. Later they are loaded as needed, and distributed to branch lines for ballast and to other places where they can be used to advantage. Other members stated that their roads make a practice of storing cinders in the winter to obviate the difficulty of handling them when frozen, and that others store them both in the winter and summer. L. D. Hadwin (C. M. & St. P.) stated that one difficulty arose from the fact that the use of locomotive cranes to handle cinders has the disadvantage in that it may be taken away and used out on the line with the result that the cinders pile up in quantity, and in the winter time freeze into an unmanageable mass.

## Report on Lining Tunnels Under Traffic

The reasons for lining a tunnel depend largely on the conditions surrounding it. A timber-lined tunnel, no matter how short, located on a busy trunk line at a point where dewatering is prohibitive or badly restricted, presents a hazard which may result in enormous cost, for while the earth formation may be such as to give no trouble from compressed sides or upheavals, there is the ever-present danger from fires, derailments and loads fouling the timbers, any one of which might delay traffic enough to cut into the revenue of the road seriously. Wet tunnels have been another source of annoyance on many lines. This excessive moisture not only causes track trouble but oftentimes creates side pressure and upheavals which endanger the stability of the tunnel and interfere with traffic.

The kind of lining selected differs somewhat on the various roads. Some roads deem it advisable to line with concrete only while others use concrete back walls and brick facing such as are found in many tunnels on the Baltimore & Ohio. The concrete lining has proven the most economical to install, especially with the present day methods—the pneumatic process being the latest development in this line. By this process the work may be carried on successfully with little interruption to traffic and to the work. There are various designs of machines for this work and the methods are divided as to the application of the lining. There is now a machine by which a grout of sand and cement is applied to the rock walls of the tunnel, either with or without reinforcement as the conditions warrant, to the desired thickness. This has proved to be a satisfactory method of lining rock-faced tunnels where there is considerable seepage or where decomposition is setting in, but has not been used to any great extent in railroad tunnels otherwise.

### Lining Tunnels by Hand

Lining tunnels by the so-called hand method has been accomplished under traffic very economically under favorable circumstances. This is done in long tunnels by the use of the jumbo car with the staging high enough to permit of the concrete being shoveled into the form from this elevated platform. The difficulties encountered in this method are generally caused by the interference with the work by traffic, making the work spasmodic and creating an economical loss, which can be overcome only by the strictest supervision and the employment of a small crew of men. Where short tunnels are to be lined the hand method is probably the most practical.

On the Southern Pacific in some instances a 4-ft. by 5-ft. drift has been opened over the top of the tunnel timbers, where the earth formation was favorable, a track laid on the tunnel timbers and the concrete carried into the form in dump cars. In this case the form can be poured to the top with little shoveling. Several short pieces of lining were done by this method, the drift over the top being used only where it could be easily opened, but the work was found to cost more than with the pneumatic method.

### Lining Tunnels by the Pneumatic Method

The Southern Pacific has now practically adopted the pneumatic method for the lining of its tunnels under traffic. The first piece of work of this nature consisted of enlarging to standard size and lining with concrete the tunnels on the Tehachapi Pass and the San Fernando tunnel, all of which are located on the single track main line, between San Francisco and Los Angeles. Of the 18 tunnels on the Tehachapi section, 11 were lined throughout by the pneumatic process.

From one to five tunnel gangs were kept constantly at work repairing and retimbering these tunnels and the maintenance expense mounted to from \$2,000 to \$5,000 per month. It was therefore finally decided to enlarge and line the tunnels

to a standard size with a minimum overhead clearance of 22 ft. and a minimum width of 16 ft. on tangent track and 17 ft. on curves of over 2 deg.

The machine used for placing the concrete lining is simple and long-lived. It consists of a cone-shaped hopper with a trap door at the top and a cast iron elbow at the bottom or apex of the cone. A 6-in. discharge pipe is used for the ¼-yd. batch.

These machines have come into general use on many roads for lining tunnels under traffic and have proved to be very satisfactory, both as regards the quality of concrete produced and the economy of applying the lining, although the economy in this process is governed largely by the extent of the work to be done, for the reason that the initial cost of the plant would be prohibitive if only a small number of short tunnels were to be lined.

The concrete placed by these methods was found to be well mixed and of a good quality when crushed rock of 1 in. to 1½ in. size was used with good, clean sand, but round rock and pebbles did not do as well as they had a tendency to roll into pockets, which sometimes caused considerable trouble.

The cost of these tunnels varied somewhat owing to conditions on the ground, the fluctuation in wages and the uncertainty of delivery of material, during the 57 months that the work was in progress. Costly delays were experienced through labor shortage and lack of material delivery. The cost on a typical tunnel 684 ft. long lined by the pneumatic method was \$31 per lineal foot for labor and \$33 per lineal foot for material.

### Lining Two Tunnels on the Lehigh Valley

Two novel methods were used by the Lehigh Valley in relining short sections of two of its tunnels. One, a double track tunnel, was partly lined with brick when constructed, but as time went on the brick disintegrated and bulged to such an extent as to become dangerous and clearances were reduced. In 1890 a shaft was dug from the top of the ground above the tunnel down to the top of the brick arch and a second arch and side walls were built around the whole of the original tunnel, and then the brick arch was removed and the inner surface of the new concrete arch faced to produce clear and neat surface lines.

The other tunnel was arched completely with brick when constructed about 1886. A few years ago about 115 lineal feet of the arch showed some signs of sagging and bulging. The defective section of the tunnel was lined with cast iron segmental arch sections bolted together at the ends and along the sides through flanges. At the springing line, and for a short distance upward, part of the brick arch was cut away to make room for the cast iron lining. This lining was shaped so as to form a complete but flatter arch under the brick arch, and the space between the cast iron arch and the brick was grouted with a cement gun; this was done for each complete ring separately as it was completed. After all the cast iron lining was in position, steel-crete metal was wrapped about the flanges of the cast ribs and the whole inside surface (including the bolts), covered with a thin layer of gunite, placed with a cement gun, to prevent destruction of the metal by the gases from passing locomotives.

[The report also included detailed accounts of the methods used in lining the San Fernando tunnel on the Southern Pacific, the Connaught tunnel on the Canadian Pacific and the St. Paul Pass tunnel on the Chicago, Milwaukee & St. Paul.]

The report was signed by W. C. Harman (E. F. C.), chairman, M. M. Corrigan (B. & O.), James Gratto (S. P.), Geo. W. Rear (S. P.), A. Ridgway (D. & R. G. W.), H. B. Rivers (C. M. & St. P.).

### Discussion

In the discussion of the report, reference was made to an article entitled *Virginian Builds Double Track to Relieve Congestion*, which appeared on page 487 of the September 10 issue of the *Railway Age*. G. W. Andrews (B. & O.)

also incorporated an article appearing in the August issue of the *Railway Maintenance Engineer* in his discussion, this article describing the form of tunnel organization which the Baltimore & Ohio had developed to handle the maintenance of its tunnels under traffic.

## Report on the Construction and Maintenance of Passenger Platforms

When a new platform is to be built or an old one replaced the first problem is to determine the kind of platform to be used. There are many kinds to choose from, including concrete, brick, asphalt or mastic, asphalt blocks, wood, crushed stone, gravel, cinders, chats, etc. The selection for a particular location depends upon the kind and volume of traffic, climatic conditions, availability and cost of materials, importance of the station for passenger traffic, permanence, probability of future change of grade and whether under cover or exposed to the elements.

### Filled Platforms

For convenience the committee uses the term "filled platforms" to designate those that are made with a top surface of cinders, gravel, stone screenings, shells, chats or other suitable material which is merely compacted by tamping or rolling. These are built both with and without curb. There are some locations, especially at wayside stations, where there is no trucking, at which a filled platform without curb can be used. Something will depend upon the ground surface and the drainage, but usually a platform of this kind, if carefully built to begin with, will give very satisfactory service with very little maintenance expense for many years. Bad spots will develop from time to time, especially in wet weather, but they are easily repaired. As a rule platforms of cinders or stone screenings are objectionable when much trucking is done, especially in the spring of the year when the frost comes out, when they are also objectionable because of the dirt that is tracked into stations and coaches by passengers.

The usual method of constructing these platforms is to excavate to a level grade about a foot below the base of rail, put in a six-inch layer of broken stone or cinders and on this six or eight inches of screenings, shell, chats or other finishing material. This is thoroughly rolled or tamped, making a hard, smooth surface.

### Curbs

Most platforms of this kind are built with a curb of wood, stone or concrete. Sometimes this curb is placed only on the side opposite the track, at other times on the track side, and again on all sides. The curbs used vary considerably in design but in the main are much like those used in connection with brick and concrete platforms.

### Wooden Platforms

The usual types of wooden platforms are three in number. The first consists of plank laid on sleepers resting on the ground and is usually employed in dry localities or for temporary installations. The life of such a platform is rather short, varying from 3 to 5 years, and is usually only warranted to take care of a temporary need. The second type includes plank laid on joists that rest on sleepers embedded in the ground. This platform gives somewhat better service because there is an air space under the floor for ventilation, which keeps the floor and joists comparatively dry. The sleepers in this style of platform rot quickly and it might be worth while to make them of treated timber. The third type contemplates the flooring and joists resting on stringers which in turn are supported on blocking or posts. This form of wood platform gives the best service, lasting from eight to ten years. Instead of wood posts, more permanent supports of brick or stone can be used.

The floor of wood platforms soon shows the wear of trucks and traffic, and it is not long before it becomes uneven. It is rather difficult to keep a wood platform in good appearance. Broken or worn plank replaced by new look bad and are apt to form stumbling blocks for passengers. This is one of the main objections to this type of platform.

### Concrete Platforms

It was rather surprising to the committee that concrete is not used more generally for station platforms. In some cases it is not long before the edges and corners begin to chip and crack and small imperfections start in large surfaces. In colder climates they are liable to injury by frost. Then too platforms adjoin railroad tracks and are subject to marked vibrations from passing trains. There are many instances of concrete platform installations that are giving excellent service, although as a general rule they are more successful in warmer climates. One trouble with the concrete platform is the difficulty of making repairs. For this reason it is apt to be allowed to stay in an unsightly condition for a long time before it is considered bad enough to require renewal. In case of a change of grade a concrete platform cannot be raised or lowered, but must be broken up and a new one put down.

The C. & E. I. finds concrete to be the most satisfactory material for passenger platforms in large terminals and in larger cities where the traffic is heavy. From the standpoint of construction and maintenance this road has found platforms built to the following specifications the most economical.

"Excavate to a depth of 10 or 12 in. and put in a layer of 6 to 8 in. of cinders thoroughly tamped. (Care should be taken to see that the subgrade has proper drainage). On the cinders lay the usual two course sidewalk, the first course of 1:3:6 and the top or finish course of 1:2 concrete. Provide expansion joints of  $\frac{1}{2}$ -in. every 50 feet using an elastic saturated asphaltic felt. Platforms constructed according to the above specifications have been in service from 2 to 20 years without any maintenance expense. All concrete platforms are provided with expansion joints at the curb."

### Brick Platforms

Communications from many members of the association indicate that the brick platform is finding much favor and has many points to commend it. If a brick platform develops bad spots, part of the bricks are easily taken up, the foundation repaired and the brick replaced. If the grade is changed the brick can also be taken up and relaid with no loss of material. If bricks become broken they are easily taken out and replaced with new materials.

### Asphalt Blocks

Asphalt blocks are usually laid in or rather on a stiff half-inch mortar bed which has been struck to a smooth surface over the concrete base. The blocks are very uniform and lay up tight and smooth without buckling, no matter what the temperature may be. The blocks are made for heavy service and the wear is very slight. The blocks produce a clean, comfortable non-slip surface that is dustless and practically noiseless. They are acid, alkali and water proof and the normal dripping of oil incidental to daily usage is beneficial to the asphalt blocks and readily assimilated without making a spotty looking platform.

### Asphalt or Mastic Platforms

Passenger platforms of asphalt or mastic are largely confined to the larger cities and terminals. The asphalt coating is about two inches in thickness and is placed on a concrete foundation. Much experience is necessary in building such a platform to make sure that this top coat will not become too soft in hot weather. As the asphalt coating is hard and smooth it is apt to become slippery in freezing weather. Most asphalt or mastic platforms are built under shelter as for instance in large train sheds which protect them from excessive heat.

Repairs to this form of platform are not made easily. Bad spots develop and gradually increase in size, making it necessary to tear up a portion of the top coating and put in a patch. The best patches are made with heated materials and it is usually necessary to call in the contractor who built the platform to make the repairs. There is also a cold patch process but it does not usually result in as satisfactory a job as the hot process.

The report was signed by F. E. Weise (C. M. & St. P.), chairman; E. K. Barrett (F. E. C.), vice-chairman; E. E. Allard (M. P.), R. W. Beeson (C. & S.), A. O. Cunningham (Wabash), Geo. Dickson (S. P.), F. A. Eskridge (C. & E. I.), J. H. Markley (T. P. & W.), H. Silcox (Penna.).

F. J. Welch (C. M. & St. P.), J. J. Wishart (N. Y. N. H. & H.).

### Discussion

The discussion dealt chiefly with the comparative advantages and disadvantages of concrete and vitrified brick platforms. Some members reported installations of brick that had been very satisfactory, and their statements indicated that the tendency on many roads was toward the adoption of this type. The chief objection cited consisted of settlement and the insecure, or even dangerous, footing it presented in winter, which can be remedied by giving proper consideration to the construction of the base and to thorough cleaning in the winter. Objection was made to concrete on the basis that it chipped and shattered from the vibration of passing trains and the unloading of local freight. T. B. Turnbull (Ann Arbor) stated that this road had been using concrete platforms for about 15 years, and that it had experienced considerable difficulty from shattering. He stated that they had alleviated the trouble by pouring the platform monolithic. J. J. Wishart (N. Y., N. H. & H.) stated that the South Station, Boston, Mass., had had good success with mastic platforms, which had been in service about 29 years, and only during the last 18 months had it been necessary to make any repairs.

## Report on the Recruiting of Bridge and Building Employees

When men are invited to enter the service of the railroad they should be made to feel that it is the intention to treat them fairly, that their grievances, if they have any, will be given careful consideration, and that if it is found that their complaints are justified, remedial action will be taken promptly. The foreman should show a disposition to be fair and impartial, be ready to grant minor privileges consistent with the rules of the railroad company and should not take unfair advantage of technicalities or be guilty of what may be termed "sharp practice." Men in supervisory positions should at all times make the men under them feel that they have an interest in their personal welfare, be kind and considerate, yet fair and firm in their demands, protect the interests of the loyal men and at the same time act with equal fairness and firmness in disciplining the disloyal. The men must be made to realize that they also have obligations and that they are expected to respond to their superior officers in the same spirit of interest and fairness. The most satisfactory workmen are those who live on the division or section on which they are working and of these the most desirable are those who are married and who visit their families weekly. A married man with a family is less likely to be attracted by the seasonal and occasional occupations at higher wages, because he plans for the future and he knows by experience that he cannot afford many periods of idleness.

Replies to inquiries indicate that the shipment of men from large cities by labor agencies is seldom satisfactory for bridge and building service. The men so obtained are "floaters," and do not remain long enough to receive proper training or to become trustworthy and efficient. Fortunately it is not often necessary to hire men in very large numbers for bridge and building work and the supervisor and foreman may do many things that will keep them in touch with available men.

In going over his district a supervisor can make inquiry at the various cities and towns regarding probable recruits. He can ask station agents to be on the lookout for desirable men and urge his foremen to make inquiry at the towns where they live. In this way he will at all times have a list of available and desirable men. It will also be found that section gangs frequently contain bright young men who will develop into good bridge and building men. Their experience and training in section gangs makes them familiar with railroad conditions, a training very desirable for bridge gangs. Some

supervisors have had very good success by following this method.

Having let it become known that you are in need of additional men and that applications are desired, make it a point to acknowledge each application properly, letting the man know that it is receiving consideration, and also make a proper record. One may receive more applications than can be used on a particular occasion but a week or two later he may be in the market again. Every applicant should be investigated carefully, not only as to his qualifications as a workman but as to his habits and temperament. Is he cleanly and companionable? Can he bunk with other men without causing disturbance or friction? One grumbler in a camp can do a lot of harm. Is he honest and trustworthy? Men in camp have clothes and valuables that they must leave in camp while at work and they must feel that they are reasonably safe, especially as far as their fellow workmen are concerned.

Some supervisors make a practice of getting acquainted with applicants, even though they do not need their services at the time, by writing to them or looking them up when in their town. This has been done with good results. They then know just where to go when the need for more men comes.

Occasion may arise when it is necessary to call upon a labor agency in a large city to supply men for bridge and building work. This condition must be faced by placing orders with the most reliable labor agency available and it is better to send a man from one's own forces to interview and select the men. The selection of men in this way is of course at best a matter of personal judgment and it will be necessary, after a few days' service, to weed out the less desirable men.

When men enter a railway company's service there should be a definite understanding of what is required of them and what they will receive in return. The question of wages and occupation are settled in advance, but just as important as these are the new man's relation to his fellow workmen, his assignment of duties, his place at the table and in the bunk car. There should be definite rules of behavior, those for retiring and rising, for smoking and talking in the bunk cars, a definite time after which everything must be in sanitary arrangements and numerous other things that are necessary for the conduct of the crew. Sometimes such rules

are printed and posted in the cars or camp, but this is not always necessary. The important thing is that the men understand what the rules are and that they will be enforced. It will be found much easier to maintain discipline if the newcomer understands these matters in advance.

The report was signed by F. W. Hillman (C. & N. W.), chairman, S. C. Tanner (B. & O.), J. E. Buckley (B. & M.), J. K. Davidson (Penna.), Frank Lee (C. P. R.), E. G. Storck (P. & R.).

### Discussion

The discussion hinged largely on the necessity of giving the foreman more instruction in the handling of his men.

## Report on the Detection and Repair of Leaks in Water Mains

The several causes of leaks in underground water mains may be classified in the order of their importance, as follows: (1) Jars and shocks due to vibration, etc.; (2) Joints poorly made; (3) Water hammer; (4) Unequal settlement of pipe; (5) Deterioration through oxidation and electrolysis, and (6) Expansion and contraction of pipe.

The detection of leaks in water mains laid underground is sometimes a very serious problem as such leaks do not always show on the surface, particularly where the mains are laid in a porous formation such as sand, cinders, loose rock, etc., or in proximity to sewers and drains. Leaks in mains laid under these conditions may assume enormous proportions and continue for years before they are discovered. It is needless to say that the losses through such leaks will justify considerable effort and expense to overcome them.

As an example of the losses that may occur in underground water mains from leaks that do not appear on the surface, a survey made at Washington, D. C., showed 93 concealed leaks on underground water mains which were wasting 1,034,000 gal. of water per day. The presence of such leaks is often made apparent only through a greatly increased consumption of water. Even then they are sometimes exceedingly difficult to locate. It is obvious that the problem, so far as determining the presence of leaks is concerned, lies with those that do not show on the surface. With a straight line of pipe or a system of piping where the location of each line as well as the outlets are definitely known the procedure is comparatively simple as it consists merely of closing the various outlets, maintaining a pressure on the line and checking the losses through the decrease in pressure or by the speed of the pump. If the line is metered the meter reading will, of course, show the exact loss and if it is possible to isolate each line the survey may be confined to any particular part of the system.

On extensive and complicated systems of pipe lines such as at shops, yards and terminals the location of lines and outlets is not always known and the valves controlling the various connections may leak, with the result that it is almost impossible to make a pressure test of the pipe lines. A check of the quantity of water pumped against the actual requirements will often indicate a leakage but as a general rule only a leak of considerable proportion may be found through this method. An examination of the sewers and drains will show whether any abnormal waste exists. Other methods may suggest themselves in each case.

After it has been determined definitely that a leak exists, the matter of locating it is a still more difficult problem and no rule may be suggested that will prove infallible. The methods generally followed are the use of an aquaphone or what is generally known as a "leak finder." This instrument is similar to a common telephone transmitter connected to a small rod instead of a wire. The rod is applied to the pipe and under favorable conditions the sound of the leak will be transmitted to the ear; by following the pipe the location of

Several speakers urged that the responsibility for the hiring of men be placed on the foremen in whose gangs they work, subject to general supervision by division officers. Some supervisors refer all applications for employment to the foremen working in the territory in which the applicant lives. Some roads, notably the New York Central and the Chicago & Northwestern, have found it practical and profitable to take men from the section forces for use in bridge and building and water service gangs. Another point discussed was the question of physical examination of each applicant. In respect to this R. H. Reid (N. Y. C.) and G. W. Andrews (B. & O.) stated that their respective roads require that all applicants undergo a rigid physical examination.

The leak may often be determined. The use of the aquaphone on underground pipe lines may, however, entail almost as much excavation as would be necessary to uncover the line. The use of this instrument also requires considerable practice and experience to locate leaks quickly. Another method is to make a comparison of the pressure on the line at various points as a pressure drop will occur on the pipe line beyond the leak in the direction of flow due to the decreased friction.

An instrument known as the pitometer has been used extensively in the larger cities to determine the presence of leaks. The pitometer is a device by means of which the velocity of flow in the main may be determined. While there are, of course, points where the pitometer could be used to advantage in railway water service, its use, as a general thing, is limited.

### Repairing Leaks

No set rules may be laid down for the repair of leaks as the method of repair will depend upon the nature of the break and the materials available for repairs. This is particularly true of emergency cases. The method to be followed in making repairs will depend upon the nature of the leak. The majority of leaks will, of course, result from bad joints in bell and spigot pipe on account of the preponderance of this type of joints.

The majority of underground leaks will occur in lead joints. The advantage of a joint of this kind is that it can usually be repaired by recaulking. Lead wood can frequently be used to advantage for making repairs, especially in wet trenches or on submerged mains where it would be difficult to use hot lead.

The most persistent leaks are those occurring in pipe lines laid under tracks and caused by the vibration and shock of passing trains. This trouble may be corrected by supporting the track so that the weight does not come on the pipe. The method to be followed will depend upon local conditions and may consist of placing the service pipe within a larger pipe, or a concrete box. In extremely soft, marshy ground it may be necessary to provide a trestle similar to a standard ballast deck trestle.

The report was signed by C. R. Knowles (I. C.), chairman, J. H. Grover (A. T. & S. F.), J. Mellgren (C. & N. W.), committee.

### Discussion

The question of making good joints in pipe lines and the methods to be employed in pouring and calking such joints formed the major part of the discussion. It was stated that where joints have been poured hastily or an insufficiently high gate had been used that the gate should not be cut off with a cold chisel but should be worked with a calking tool to close up any blow holes or other results from shrinkage, in recognition of the fact that leaks occurred at the top of the joint in nearly all cases. F. A. Demars (O. S. L.)

and C. R. Knowles (I. C.) stated that any discussion should hinge on the development of leaks in properly made joints and that not all leaks by any means resulted from blow holes on top. It was emphasized that the movement of

trains where pipe is laid in the vicinity of tracks, causes a vibration that results in pounding the lead calking so thin that it fails and causes leaks. Several members stated that they had very poor success with cement joints.

## Other Papers, Reports and Closing Business

L. F. Loree, president of the Delaware & Hudson, spoke at the opening of the session on Wednesday morning. After tracing the development of the steam engine from its infancy to its present high efficiency, and its influence on our civilization, he referred to the retarding influence of trade unionism today. He advocated the secret ballot and an honest count as the relief from the present high-handed control of labor agitators, closing with an appeal for the local supervisory officers' support, as they are in direct contact with the rank and file.

The Committee on Tool Equipment for Pile Drivers presented complete lists of equipment for track and floating pile drivers. An appendix by R. C. Young (L. S. & I.) presented additional information regarding the jetting of piles. In the discussion of this report, G. W. Andrews (B. & O.) traced the development of pile driving equipment during the last 50 years, and emphasized the value of modern tools, stating that 10 blows can now be delivered in the time required for one, a half century ago. Arthur Ridgeway (D. & R. G. W.) and others described the advantages of equipping pile drivers with electric lights, particularly in times of emergency when night work is necessary.

C. M. Taylor (C. of N. J.) gave an illustrated talk Tuesday evening on the use of treated timber by bridge and building forces. He stated that if the best work is to be secured, the timbers must be completely framed in advance, then treated and shipped to the location. Where this is been done, a satisfactory and lasting construction can be secured. The advantages to be derived are numerous, and include such important factors as the lessened chances for decay, the more thorough treatment of the wood, and the general speeding up of the erection. Emphasis was placed on the fact that treated timber must be handled carefully at all times, abstaining from the use of pike poles or other devices which penetrate the treated surface. In answer to a number of questions, it was brought out by Mr. Taylor that the ordering of timber, and particularly piles, was often delayed so long that it was very difficult to secure the best treatment and still make the required delivery. He urged that more consideration be given to this point.

Other features of the convention included the annual dinner held this year at Coney Island on Wednesday evening, with approximately 400 attending, and the tour of inspection

of the Pennsylvania Terminal, the New York Connecting Railway and Hell Gate arch bridge, the electrified line of the New York, New Haven & Hartford to Stamford, Conn., and the Grand Central Terminal by special train, following the conclusion of the convention on Thursday afternoon.

### Closing Business

The following subjects were selected for consideration during the next year: (1) Pile driving records; (2) labor-saving devices in routine bridge and building works; (3) building inspection and records; (4) the relative merits of wooden, steel and concrete tanks; (5) the painting of structural steel; (6) the framing of bridge timbers before treatment; (7) handling and driving concrete piles; (8) the construction and maintenance of sewers and drains.

At the closing session on Thursday morning, the following officers were elected: President, C. R. Knowles, superintendent of water service, Illinois Central, Chicago; first vice-president, Arthur Ridgeway, assistant chief engineer, Denver & Rio Grande Western, Denver, Colo.; second vice-president, J. S. Robinson, division engineer, Chicago & North Western, Chicago; third vice-president, J. P. Wood, supervisor of bridges, Pere Marquette, Saginaw, Mich.; fourth vice-president, C. W. Wright, master carpenter, Long Island Railroad, Jamaica, N. Y.; secretary-treasurer, C. A. Lichty, general inspector, Chicago & North Western, Chicago; directors for two years, F. C. Baluss, engineer bridges and buildings, Duluth, Missabe & Northern, Duluth, Minn.; Maro Johnson, assistant engineer, Illinois Central, Chicago; and O. F. Dalstrom, bridge engineer, Chicago & North Western, Chicago. Cincinnati, Ohio, was selected as the location of the next convention.

At the close of the session on Thursday morning the following resolution was adopted:

RESOLVED: That the American Railway Bridge and Building Association in convention assembled deplores the present agitation for a strike of railroad workers, and the individual members hereof reaffirm an unbroken record of loyalty to their respective railroads and pledge anew their support to the management in their efforts to provide uninterrupted, efficient and economical transportation for the American public.

## The Bridge and Building Supply Men's Association

The exhibit of the Bridge and Building Supply Men's Association in connection with the meeting was the equal of that presented in 1920 at Atlanta, Ga., which was the largest as to the number of exhibitors in the history of the organization. The exhibits of the companies consisted in a large measure of literature, photographs and samples although a considerable number showed their devices and equipment either in models or in full size.

The officers of the association for the past year were: President, C. E. Ward, U. S. Wind Engine & Pump Company, Batavia, Ill.; vice-president, Merle J. Trees, Chicago Bridge & Iron Works, Chicago; treasurer, C. R. McVay, Barrett Company, Chicago; secretary, A. J. Filkins, Paul Dickinson Company, Chicago; honorary director, Tom Lehon, the Lehon Company, Chicago; members executive committee W. O. Washburn, American Hoist & Derrick Co.,

St. Paul, Minn.; C. W. Kelly, the Kelly Derby Company, Chicago; D. J. Higgins, American Valve & Meter Company, Chicago; F. M. Condit, Fairbanks, Morse & Co., Chicago; T. W. Snow, The T. W. Snow Construction Company, Chicago, and W. H. Lawrence, The H. W. Johns-Manville Company, New York City.

At the annual business meeting on Thursday morning, the following officers were elected: President, M. J. Trees, Chicago Bridge & Iron Works, Chicago; vice president, G. R. McVay, The Barrett Company, Chicago; treasurer, A. J. Filkins, Paul Dickinson Company, Chicago; secretary, D. J. Higgins, American Valve & Meter Co., Cincinnati, Ohio; honorary director, C. E. Wood, U. S. Wind Engine & Pump Co., Batavia, Ill.; members executive committee M. Condit, Fairbanks Morse & Co., Chicago; W. H. Lawrence, Johns-Manville Company, New York; T. W. Snow, T. W.

Snow Construction Company, Chicago; J. E. Nelson, Joseph E. Nelson & Sons, Chicago; William Volkhart, William Volkhart, Inc., New York, and B. J. Wilson, *Railway Age*, Chicago.

The companies exhibiting, with the nature of their displays and the names of their representatives, were as follows:

American Tar Products Company, Chicago; S. H. Fields and P. L. Griffiths.

American Valve & Meter Co., Cincinnati, Ohio; model of drop spout; J. T. McGarry and B. J. Higgins.

American Hoist & Derrick Company, St. Paul, Minn.; literature; F. J. Johnson and H. W. Davis.

American Radiator Company, Chicago; literature; G. J. Meyer.

Barrett Company, New York; samples of paint, roofing, shingles and literature; G. R. McVay, W. S. Babcock, G. H. Hilderbrandt and W. S. Wallace.

Carter Bloxend Flooring Company, Chicago; photographs and samples of flooring; R. G. Stowell.

Chicago Bridge & Iron Works, Chicago; photographs and literature; Merle J. Trees, H. C. Brown and Sedrick B. Smith.

Cleveland Pneumatic Tool Company, Cleveland, Ohio; H. S. Covey and Guy Gregory.

Detroit Steel Products Company, Detroit, Mich.; window sash and literature; R. S. Bishop and W. H. Maxwell.

Detroit Graphite Company, Detroit, Mich.; samples of paint and literature; L. D. Mitchell and J. R. C. Hintz.

Duff Manufacturing Company, Pittsburgh, Pa.; jacks; C. A. Methfessel, Fairbanks, Morse & Company, Chicago; literature; A. A. Taylor, F. M. Condit, B. S. Spaulding, J. L. Jones, H. E. Vogel and E. J. Coverdale.

Ferrolineum Manufacturing Company, Jersey City, N. J.; samples of paint pigments; O. C. Wakefield.

Hastings Pavement Company, New York; literature and samples of block flooring and pavement; J. B. Weed and P. L. Thompson.

Highgrade Manufacturing Company, Cleveland, Ohio; literature and samples of roofing cement; S. A. Baber and A. C. Copper.

Johns-Manville Company, Inc., New York; samples of roofing, pipe and boiler installations, packing, flooring and shingles; J. E. Mink, E. L. Colopy, B. J. Jordan, G. A. Nichols and W. H. Lawrence.

Joseph Dixon Crucible Company, Jersey City, N. J.; literature; A. A. Neally and W. W. Chase.

Kelly-Derby Company, Chicago.

Lehon Company, The, Chicago; samples of roofing and shingles; Tom Lehon and John E. Eipper.

Luitweiler Pumping Engine Company, Rochester, N. Y.; model of deep-well water pump; E. E. Alexander.

Mimwax Company, The, New York; model of bridge deck drain and literature; A. S. Harrison, R. W. Harrison and J. E. Marble.

Massey Concrete Products Corporation, Chicago.

National Lead Company, New York; literature; G. M. Hartley, Jr., and A. H. Sablin.

Norton, A. O., Inc., Boston, Mass.; jacks and jack cover; G. R. Law and Wm. R. Kelly.

Nelson, Jos. E., & Sons, Chicago; literature; J. E. Nelson and W. K. Nelson.

Nichols, Geo. P. & Bro., Chicago; literature.

Pocket List of Railroad Officials, New York; copies of paper; K. A. Brown and J. A. Brown.

Patterson, W. W., & Co., Pittsburgh, Pa.; tackle blocks; W. W. Patterson, Jr.

Patterson & Sargent Company, Cleveland, Ohio.

Paul Dickinson, Inc., Chicago; model of cast-iron camp car jack and ventilators; A. J. Filkins.

Railway Review, Chicago; copies of paper; G. L. Bates, J. E. Gougeon and W. M. Camp.

Robertson Company, H. H., Pittsburgh, Pa.; literature and samples of asbestos protected metal, skylights, ventilators and roofing; Willis F. Haddock.

Robertson & Company, Wm., Chicago; model of culvert; R. F. Repasz and T. F. Landeran.

Simmons-Iordan Publishing Company, New York; copies of papers and encyclopedias; E. T. Howson, Milburn Moore, W. S. Lacher, F. C. Koch, B. J. Wilson and H. L. D. Jackson.

Sherwin-Williams Company, Cleveland, Ohio; F. A. Elmquist and John Schintz.

Snow Construction Company, T. W., Chicago; literature; T. W. Snow and B. S. Snow.

U. S. Wind Engine & Pump Company, Batavia, Ill.; literature; C. E. Ward.

Volkhardt Company, Inc., The, New York; model of hydrants and torches; Wm. Volkhardt.

## Labor Board Lifts Piece Work Ban

THE PRESENT labor crisis has been complicated by a decision of the Labor Board handed down on October 13 and containing drafts of 17 rules considered by the Board as just and reasonable rules for inclusion in all agreements between individual roads and their shop employees. One of these rules removes the present ban on piece work, and of the total of 17 rules, 10 have been so worded as to eliminate inefficient and uneconomical results caused by the application of the counterparts of these rules in the Shop Crafts' National Agreement. Seven rules of the National Agreements, Rules 8, 31, 61, 66, 67, 68 and 78, dealing respectively with Sunday work, seniority in departments, requirements for machinists, definition of "dead work," assignment of "dead work" forces to running repair work, machinists and helpers on wreck trains, and requirements for boilermakers, have been judged as just and reasonable by the Board and are made effective on October 16.

The new rules promulgated by the Board are as follows, the rule number corresponding with the similar rule in the National Agreements and the italic portion indicating the changes made by the Board:

### Rule No. 1

Eight hours shall constitute a day's work. All employees coming under the provisions of this agreement, except as *otherwise provided in this schedule of rules, or as may hereafter be legally established between the carrier and the employees*, shall be paid on the hourly basis.

*This rule is intended to remove the inhibition against piece work contained in rule 1 of the shop crafts' national agreement and to permit the question to be taken up for negotiation on any individual railroad in the manner prescribed by the Transportation Act.*

### Rule No. 2

(Rule adopted as substitute for Rules 2, 3, 4, 5, of the national agreement.)

There may be one, two, or three shifts employed. *The starting time of any shift shall be arranged by mutual understanding between the local officers and the employees' committee based on actual service requirements.*

*The time and length of the lunch period shall be subject to mutual agreement.*

### Rule No. 18

When new jobs are created or vacancies occur in the respective crafts, the oldest employees in point of service shall, if sufficient ability is shown by trial, be given preference in filling such new jobs or any vacancies that may be desirable to them. All vacancies or new jobs created will be bulletined. Bulletins must be posted five (5) days before vacancies are filled permanently. Employees desiring to avail themselves of this rule will make application to the official in charge and a copy of the application will be given to the local chairman.

*An employee exercising his seniority rights under this rule will do so without expense to the carrier; he will lose his right to the job he left; and if after a fair trial he fails to qualify for the new position, he will have to take whatever position may be open in his craft.*

### Rule No. 46

Applicants for employment may be required to take physical examination *at the expense of the carrier to determine the fitness of the applicant to reasonably perform the service required in his craft or class. They will also be required to make a statement showing address of relatives, necessary four years' experience, and name and local address of last employer.*

### Rule No. 48

Employees injured while at work will not be required to make accident reports before they are given medical attention, but will make them as soon as practicable thereafter. Proper medical attention will be given at the earliest possible moment and, *when able*, employees shall be permitted to return to work without signing a release pending final settlement of the case.

At the option of the injured party, personal injury settlements may be handled by the duly authorized representatives of the employee with the duly authorized representatives of the carrier. Where death or permanent disability results from injury, the lawful heirs of the deceased may have the case handled as herein provided.

THE COMMISSION has suspended until February 12 the operation of schedules naming increased rates on cotton seed products from points in Missouri, to St. Louis, and East St. Louis, published in Agent F. A. Leland's tariff.

A RESOLUTION introduced in Congress on October 7 by Representative Dowell would order the Interstate Commerce Commission to reduce freight rates on agricultural products by 25 per cent. The resolution also provides that the rates thus reduced should not later be advanced without the consent of Congress.

**Rule No. 50**

Existing conditions in regard to shop trains will be continued unless changed by mutual agreement, or unless, after disagreement between the carrier and employees, the dispute is properly brought before the Labor Board and the Board finds the continuance of existing conditions unjust and unreasonable, and orders same discontinued or modified.

The company will endeavor to keep shop trains on schedule time, properly heated and lighted, and in a safe, clean, and sanitary condition. This not to apply to temporary service provided in case of emergency.

**Rule No. 55**

*Work of scrapping engines, boilers, tanks, and cars or other machinery will be done by crews under the direction of a mechanic.*

**Rule No. 60**

*At the close of each week one minute for each hour actually worked during the week will be allowed employees for checking in and out and making out service cards on their own time.*

**Rule No. 65**

Machinists assigned to running repairs shall not be required to work on dead work at points where dead-work forces are maintained except when there is not sufficient running repairs to keep them busy.

**Rule No. 77**

*At points where there are ordinarily 15 or more engines tested and inspected each month, and machinists are required to swear to federal reports covering such inspection, a machinist will be assigned to handle this work in connection with other machinist's work and will be allowed five cents per hour above the machinist's minimum rate at the point employed.*

*At points or on shifts where no inspector is assigned and machinists are required to inspect engines and swear to federal reports, they will be paid five cents per hour above the machinist's minimum rate at the point employed for the days on which such inspections are made.*

Autogenous welders shall receive five cents per hour above the minimum rate paid mechanics at the point employed.

In each case the italic portion of the new rule is intended to eliminate the objectionable features of the old rule, especially those to which the railroads objected during the hearings on National Agreements.

## Senate Committee Railroad Hearings Resumed

WASHINGTON, D. C.

HEARINGS BEFORE the Senate Committee on Interstate Commerce in connection with its general inquiry into the railroad situation, which were suspended early in July, were resumed at Washington on October 13 but were shortly adjourned on account of the death of Senator Knox and after a session on Saturday, October 15, the hearing was again adjourned.

The few members of the committee who were present were treated to a statistical medley by Frank J. Warne, statistician for the Big Four brotherhoods, the burden of whose argument was that the committee had been completely misled by the witnesses for the railroads in their presentation of statistics of railway revenues, expenses and income for the war period and inferentially by the Interstate Commerce Commission that had published the same statistics minus the emendations and commendations of them which Mr. Warne had made in a series of complicated charts. He said the commission should not have based its decision in the Ex Parte 74 rate case on the abnormal results of the war period, but on the more permanent tendencies as shown by the results prior to that time, during which, he said, the commission had repeatedly held that railway revenues were adequate. To prove it he quoted from several of its rate decisions without reading from the later reports in which the commission after further consideration found occasion to alter its conclusions. He also said that rates should not have been raised during

the period of federal control while the railroads were being guaranteed and he attempted to prove that the advances in rates during that period were made at the instance of the railroads by referring to their unsuccessful efforts later, in 1919, to persuade Director General Hines to advance rates before the roads were returned.

Mr. Warne's principal charges about the railroad witnesses who had previously testified during the hearing were based on the fact that in showing the abnormal relation between earnings and expenses that had come out of the federal control period they had constantly referred to the net railway operating income actually earned for 1918, 1919, and 1920 instead of using the corporate income of the roads including the guaranteed rental, which he placed at \$906,000,000, although a large part of it has not yet been paid.

The omission of the guarantee, Mr. Warne said, had concealed the fact that the roads had earned the largest net operating income in their history. He had some combination of figures to make it appear that \$906,000,000 exceeded the net operating income of 1916 and 1917, although the official figures are larger. In explaining his point, however, Mr. Warne read from the testimony a colloquy between L. E. Wetling and Senator Cummins which showed that it was understood that the figures under discussion were the net operating income which resulted under the earnings and expenses as they were, and that they did not in any way represent the effect of the promised guaranty. He also objected because the railroads had used the net operating income and not the guaranty in calculating a percentage of return on the "inflated" property investment account.

After having presented one series of charts using the guaranty as net operating income Mr. Warne produced another set in which he added the guaranty which the roads were supposed to have received, and some of which is still held up until the Congress passes some kind of a bill to provide the Railroad Administration with funds with which to pay it, to the total operating revenues, in order as he said, to show the proper margin between earnings and expenses. By subtracting the expenses, taxes, etc., he thus arrived at a net operating income which included the guaranty. Mr. Warne said that the fact that the railroad witnesses were able to hide behind accounting technicalities was no excuse for their not telling the truth, which gave Senator Fernald an opportunity to bring up his theory that taxes and bond interest should be added to operating expenses. In this case, however, Mr. Warne preferred to rely on the commission's system of accounting.

Another bit of information which he furnished for the enlightenment of the four senators who represented the committee was that while the railroads in most of the eight months of 1920 during which they were under guaranty showed operating deficits, during the last four months of the year, while they were not guaranteed they had a net of \$226,000,000. It was left to the knowledge or the imagination of the senators to recall that this was during the four months in which a rate advance of about 33 per cent was in effect.

WASHINGTON TO NEW YORK, in 79 minutes, or at about 170 miles an hour, is the speed reported for an airplane trip made on October 10, with one passenger, by Lieut Howard K. Ramey, piloting a De Havilland army airplane. The flight was made at an average height of 3,800 feet.

THE HOUSE COMMITTEE on interstate and foreign commerce held a meeting this week and decided not to take up for consideration at this session of Congress any of the railroad bills which have been referred to it unless some new situation develops. The committee has before it a number of bills intended to amend various parts of the transportation act, particularly with reference to the rate-making provisions

# General News Department

The National Association of Railroad Tie Producers will hold its fourth annual meeting at the Hotel Sherman, Chicago, on January 26 and 27. This meeting will follow immediately after that of the American Wood Preservers' Association which will be held at the same hotel on January 24, 25 and 26.

## "Organized Business and the Railways"

"Organized Business and the Railways" is the title of a leaflet issued to members of the Railway Business Association by President Alba B. Johnson. Its text is a letter to President Joseph H. Defrees of the Chamber of Commerce of the United States. It was authorized by the association's general executive committee at Chicago, Thursday evening, October 6, following a noon luncheon at which the situation was described to members and guests of the association by Frank W. Noxon, secretary, and S. O. Dunn, editor of the *Railway Age*.

## Sixty-Seven Trespassers Apprehended

One hundred and twenty hoboes boarded a Southern Pacific freight train bound for Los Angeles, Cal., from the north, at Mojave, Cal., on September 29, and refused to get off the train when ordered to do so by the train men. The train was met in the outskirts of Los Angeles by Los Angeles police officers and 67 of the trespassers were arrested. On the following day 51 of the men pleaded guilty and were given the alternative of paying a \$20 fine or going to jail for 20 days. Five were given suspended sentences and 11 were released.

## Fraudulent Pay Checks

Three men arrested at Pittsburgh, Pa., and brought into court on October 7, on charges of conspiracy to defraud the Baltimore & Ohio Railroad, were found to have cashed a large number of counterfeit pay checks; and to identify themselves, when making purchases, they used counterfeit railroad passes, written on blanks which they had printed. All three pleaded guilty. One was an employee and another a former employee; and two other men, including a printer, are yet to be caught. In passing checks amounting to \$1,412, the thieves had received more than \$1,000 in change.

## Railway Fire Prevention Association

The eighth annual convention of the Railway Fire Prevention Association opened at Chicago, on October 18. The meeting was opened by President W. F. Hickey in the presence of about 150 members and guests and was addressed by Alfred H. Erickson, assistant corporation counsel of the city of Chicago, who represented the mayor of the city in welcoming the convention. The meeting was also addressed by J. E. McDonald, chief of fire prevention of the city of Chicago, who gave a short account of the history of fire prevention in Chicago and congratulated the railroad association in having taken so prominent an interest in fire prevention.

## Railroad Division of A.S.M.E. to

### Discuss Elimination of Waste

The Railroad Division of the American Society of Mechanical Engineers will discuss the elimination of waste on railroads in connection with the general consideration of that topic at the annual meeting of the society. Three papers will be presented as follows: Avoidable Waste in Locomotives as Affected by Design, by James Partington, American Locomotive Company; Avoidable Waste in Operation of

Locomotives and Cars, by William Elmer, Pennsylvania Railroad; Avoiding Waste in Car Operation—The Container Car, by W. C. Sanders, New York Central. The meeting will be held in the Engineering Societies' building, 29 West Thirty-ninth street, New York, on the morning of December 9.

## Specifications for Cast Iron Car Wheels

The Delaware, Lackawanna & Western has issued a new specification for cast iron wheels (No. 261, dated September 1, 1921). It is very complete, somewhat more rigid than the A. R. A. specification, and is particularly notable in that it contains a specification for the chemical composition which is similar to, but does not allow as wide a range as the chemical specification tentatively adopted at the last convention of the American Society for Testing Materials. The composition specified is as follows:

	Minimum	Maximum
Total carbon.....	3.00	3.65
Combined carbon—not over.....		.85
Manganese.....	.50	.85
Phosphorus—not over.....		.32
Sulphur—not over.....		.16
Silicon.....	.45	.75

## Protests Against Valuation

A large number of protests against the tentative valuation report of the Interstate Commerce Commission on the Chicago, Rock Island & Pacific have been filed with the commission this week.

The Rock Island declared in its protest that the tentative valuation did not represent the value of the property owned and used by it; that the valuation, because of "the erroneous methods, rules and principles applied therein," did not comply with the valuation act, and that "the cost of reproduction now reported in the tentative valuation was determined by the application in some instances of erroneous principles and methods, by the exclusion of costs which should have been included, by the failure to list in the inventory all the owned or used property, by the use of inadequate unit prices, by improper classification, and by other errors of commission and omission, as the result of which the cost of reproduction now of the said properties as reported is much less in amount than should have been allowed."

The road's complaint made no general estimate of the total valuation it would claim, but asked the commission to withdraw its tentative valuation and to give the carrier opportunity for hearings upon it and the presentation of evidence.

In addition protests were filed by the various roads, a part of whose property is jointly used by the Rock Island and also by the Iowa, Nebraska and other state commissions, who objected to the inclusion of certain items.

## The Oldest Illinois Central Locomotive

The Mississippi, the first engine ever used on the Illinois Central system, has been exhibited during the past month at the Indiana State Fair, Indianapolis, Ind.; the Kentucky State Fair, Louisville, Ky., and the Interstate Fair at Sioux City, Iowa. It will also be shown at the National Implement & Vehicle Show at Peoria, Ill., until October 8.

This engine was built at Natchez, Miss., in 1834, the parts having been imported from England to be assembled there. Its cylinders are 9½ in. by 16 in., and it weighs 14,000 pounds. It is said that the entire cost of the engine was less than \$2,000. The newest locomotive bought by the Illinois Central this year weighs 382,000 pounds, has cylinders 30 in. by 32 in., and its cost was \$88,819.

The Mississippi was first used on a line between Natchez and Foster, Miss. (later acquired by the Illinois Central), in 1836,

1837 and 1838. There are no records between 1838 and 1873, but in 1873 and 1874 the Mississippi was in service on a line between Warrenton, Miss., and Vicksburg. In 1874, an engineer, John Rogers, put the Mississippi on a side track to rest for the night, but forgot to close the throttle, with the result that the engine ran into a deep mud bank, where it lay until 1880. From 1880 to 1890, it was used as a switching engine in a gravel pit at Brookhaven, Miss. The engine was given a general overhauling in 1892 and was exhibited in the Transportation Building of the World's Columbian Exposition at Chicago in 1893. It traveled from McComb, Miss., to Chicago under its own power. It was also on exhibition at the St. Louis World's Fair in 1904.

### Railway Returns for August

The Interstate Commerce Commission's summary of the railway income account for August is as follows:

Item No.	Item	August		Eight Months	
		1921	1920	1921	1920
1	Average number of miles operated.....	235,398.39	235,120.00	235,260.10	234,625.18
<b>Revenues:</b>					
2	Freight .....	\$353,307,011	\$369,596,250	\$2,537,466,013	\$2,583,585,913
3	Passenger .....	109,174,998	132,903,613	793,021,501	822,170,330
4	Mail .....	7,449,068	7,823,168	63,850,810	117,709,025
5	Express .....	10,331,274	15,165,514	60,098,598	146,136,724
6	All other transportation.....	14,465,961	14,580,954	106,181,410	96,081,152
7	Incidental .....	10,073,997	14,814,110	79,660,354	97,847,797
8	Joint facility—Cr.....	608,803	840,098	5,110,614	5,098,679
9	Joint facility—Dr.....	114,662	185,318	1,110,614	1,538,020
10	Railway operating revenues.....	505,508,274	555,522,389	3,644,288,883	3,825,048,200
<b>Expenses:</b>					
11	Maintenance of way and structures.....	71,940,562	144,541,602	507,837,688	693,788,085
12	Maintenance of equipment.....	105,482,549	181,370,718	843,320,826	1,030,442,877
13	Traffic .....	6,875,585	8,066,234	56,729,579	67,229,579

18	Railway operating expenses.....	382,279,070	682,315,188	3,109,990,740	3,770,449,385
19	Net revenue from railway operations.....	123,229,204	126,793,799	534,798,143	54,508,815
20	Railway tax accruals.....	26,151,760	26,263,402	183,205,302	182,407,235
21	Uncollectible railway revenues.....	138,352	141,876	809,448	755,532
22	Railway operating income.....	96,939,092	153,193,077	350,283,193	128,561,952
23	Equipment rents—Dr. balance.....	5,675,073	3,846,496	35,058,763	20,373,840
24	Joint facility rent—Dr. balance.....	1,022,916	1,537,997	10,503,677	12,187,844
25	Net of items 22, 23, and 24.....	90,241,103	158,589,570	304,320,753	161,125,856
26	Ratio of expenses to revenues (per cent).....	75.62	122.82	85.34	98.57

<sup>1</sup>Includes \$2,919,363, sleeping and parlor car surcharge.

<sup>2</sup>Includes \$21,751,193, sleeping and parlor car surcharge.

### Common Officers or Directors

The Interstate Commerce Commission has issued a set of regulations to govern the applications to be filed with the commission under that provision of the transportation act which makes it unlawful after December 31, 1921, for any person to hold the position of officer or director of more than one carrier unless such holding shall have been authorized by the commission. The commission interprets the law as covering "any person authorized by a carrier to perform, temporarily or otherwise, the duties or any of the duties ordinarily performed by a director, president, vice-president, secretary, treasurer, general counsel, general solicitor, general attorney, comptroller, general auditor, general manager, freight traffic manager, passenger traffic manager, chief engineer, general superintendent, general land and tax agent, or chief purchasing agent." The order prescribes in detail the form of application to be filed with the commission.

The Union Pacific and its subsidiaries, and the St. Louis-San Francisco and its subsidiaries have filed with the commission blanket applications for authority for their respective officers and directors to hold similar positions with the various subsidiary companies. The Union Pacific application says that its reason for such application is the identity of ownership throughout the system and the fact that all roads of the system are operated as a unified transportation system. Individual applications have also been filed by R. S. Lovett for authority to be a director of the New York Central and its subsidiaries, the Illinois Central and the Chicago & Alton because of the large investment of the Union Pacific in those companies, and by E. N. Brown to retain his offices and directorships in the St. Louis-San Francisco, the Kansas City, Fort Scott & Memphis, the Kansas City, Memphis & Birmingham and the Pere Marquette. Judge Lovett's application

states that the roads in which he asks to retain his directorship are not competitive with the Union Pacific except that there is competition to some extent between the Illinois Central and the Chicago & Alton for business between Chicago and St. Louis.

### Think of the Train Baggage man

The Buffalo, Rochester & Pittsburgh, in a circular entitled "The Human Desire to Serve," counsels with its patrons as follows:

The railroads and the American Railway Express Company are so closely allied that the problems of one are largely the problems of the other. The aims of this railroad company and the express company are identical, to sell transportation, and to promote harmony, efficiency and reduce loss and damage claims. Transportation is and must be a failure

unless closely coupled with the human desire to serve. The men in the baggage cars are jointly employed by the railroad and the express company. As a body they have given an average, per man, of over 20 years' faithful service. Six of our men combined have served the public for two and a quarter centuries. One man now working every day has been continuously on the job for over 41 years. When your baggage or express shipment is intrusted to such men as these you are reasonably sure that it will arrive at its destination promptly and in good condition. \* \* \*

The campaign "The Right Way Plan" has made a wonderful saving for the shipper and the express company by lessons in packing, handling and marking. Careless employees are looking for other jobs and insecurely packed or wrapped shipments are refused until they are properly prepared for shipment. One district in the East showed a decrease in claims for loss and damage of 79 per cent in July and 82 per cent in August. By teaching the public to pack properly and insisting on their men handling carefully the express company and its patrons have saved much money and annoyance. \* \* \*

A claim paid for damage does not recompense the buyer for his delay and inconvenience, but as long as we are human, accidents will happen and baggage will go astray or become lost. Unless stolen it will come back to you, Mr. Owner, if you will permanently place on the inside thereof your full name and permanent address. Many trunks and suit cases still bear old express labels. Suppose that while traveling as baggage the check becomes torn off; the man in the baggage car cannot remember whether that particular piece was baggage or express, but seeing no check and finding an express label he uses his best judgment and labels the article to address shown on label. Remove the old express labels on baggage.

## REVENUES AND EXPENSES OF RAILWAYS

MONTH OF AUGUST AND EIGHT MONTHS OF CALENDAR YEAR 1921

Name of road.	Average mileage operated during period.	Operating revenue (Total)				Operating expenses				Net from operations. (loss).	Net after rentals, 1920.

## Traffic News

J. A. MacDonald, of Valleyfield, Que., has been chosen president of the Canadian Ticket Agents' Association.

The New York, Chicago & St. Louis will withdraw from the consolidated ticket office at Cleveland, Ohio, on October 31, and will re-open a separate city ticket office at 2010 East Ninth street in the Schofield building.

During the month of September, 1,928 cars of grapes moved in solid trains over the Southern Pacific from Lodi, Cal., to Roseville, where the cars are placed in the fruit block and sent out quickly to the East. The schedule for grape and green fruit trains from Roseville to Chicago has been reduced to 154 hours.

The movement of bituminous coal over the Philadelphia & Reading in August, amounted to 1,290,104 tons, a reduction of 665,461 tons from the quantity carried during the same month last year. The bituminous tonnage for August of this year, however, is the largest since last March, when the total was 1,308,947 tons.

On recommendation of its traffic committee the Alton (Ill.) Chamber of Commerce has adopted a resolution in support of that by the National Industrial Traffic League calling for "immediate action toward a reduction in operating costs (of the railways) and a corresponding horizontal reduction in transportation costs to the public."

Shipments of grain over the Canadian Pacific from points in the Calgary district are now averaging 500,000 bushels a day. The indications are that the present crop will be sent to the head of the lakes in record time. Samples of wheat arriving at the office of the Dominion grain inspector continue to be up to the excellent average set by those of last year.

The executive committee of the Yellow Pine Wholesalers' Association held a meeting at Cincinnati, Ohio, on October 5, and adopted a resolution approving the action taken a week previously by the executive committee of the National Industrial Traffic League in urging the abrogation of the labor agreements, and the reduction of the wages of railway employees, together with the reduction of freight rates.

The Atlanta, Birmingham & Atlantic announces that its night passenger trains, taken off during the strike of last spring, and kept out of service (after daylight service had been resumed) because of malicious tampering with the tracks, are again running. Sleeping cars now leave Atlanta for Waycross at 9:25 p. m.; Waycross for Atlanta at 8:40 p. m.; Atlanta for Thomasville 9:25 p. m.; Thomasville for Atlanta 8:15 p. m.

The Senate committee on interstate commerce has decided to begin hearings on October 24 on the bill introduced by Senator Capper to amend the transportation act to restore some of the powers of state commissions to change intrastate rates which have been interfered with by the construction put on the new law by the Interstate Commerce Commission. The bill also involves an amendment to the general rate-making rule in Section 15-2.

The dates for the Interstate Commerce Commission's hearings on proposed reductions in transcontinental rates which carriers are seeking for the purpose of meeting competition with the Panama Canal route, have been changed by the Commission. The application of the Southwestern railroads to reduce rates via Galveston, Tex., between Pacific coast terminals and New York will be heard at San Francisco, Cal., on December 8, at Phoenix, Ariz., on December 17, and at New Orleans, La., on January 11, 1922.

A bulletin giving the names of the coal mines, operating companies, locations and production figures of the coal properties on its lines has been issued by the Chicago & Eastern Illinois to 6,000 retail coal dealers and industrial consumers in the territory

it serves. The circular anticipates the possible shortage of coal during the winter because of the depression in the present coal market and the failure of consumers to lay in winter supplies and presents subject matter outlining the probable coal situation should this condition continue.

Arguments for freight rate reductions applying to specific commodities have been advanced; but these indicate that even in the minds of the interested shippers, the results of such reductions are purely speculative, not only as to increased volume of traffic, but also as to the time when an increased volume might be expected. The carriers are in no position to enter the field of uncertain experimentation involving their revenues; disappointment in the experiment would result in serious consequences to the public—*B. R. & P. Circular*.

A bill to amend the interstate commerce law to permit railroads to put into effect reduced rates on hay, grain, potatoes, livestock, fruits, vegetables, eggs, milk, cream and other perishable food products, coal and building materials, immediately upon the filing of tariffs, has been introduced in the House by Representative Jefferies of Nebraska. The bill also provides that the rates so promulgated shall not be increased during a specified period of time and that the Interstate Commerce Commission shall have no jurisdiction to fix a minimum rate on the commodities mentioned.

Heavy shipments of grapes to the eastern market and the failure of consignees to return refrigerator cars promptly, have led to a critical situation which is causing a shortage of refrigerator cars to move a record crop of grapes from California. In the 27 days previous to October 6, 10,486 cars of grapes were reported shipped out of California as against 7,248 for the corresponding period of last season. Commissioner H. Stanley Benedict, who is handling the situation for the California State Railroad Commission, while expressing the view that most of the trouble is at the eastern end, urged, on October 6, that shippers and carriers co-operate in loading and moving cars as promptly as possible.

The Pennsylvania Railroad announces that it is to apply to the Interstate Commerce Commission for permission to place in effect a temporary reduction of 28 per cent, in the freight rates on iron ore from both the Great Lakes and the Seaboard to the furnaces in the Pittsburgh and Youngstown districts, the Schuylkill Valley and other districts. The reduction would remain in effect only until Dec. 31, 1921. The purpose of the reduction will be to assist the iron and steel producers in accumulating a supply of ore before winter closes navigation on the Great Lakes or compels the shutdown of the Northern mines; also to try out experimentally whether a materially lower level of rates will stimulate the iron and steel markets.

### Coal Production Increasing

The production of soft coal continued to improve during the first week of October, according to the weekly bulletin of the Geological Survey, and for the first time since January passed the 9,000,000 ton mark. The output for the week is estimated at 9,105,000 net tons, an increase of 2½ per cent when compared with the week preceding. Production is still, however, far below the normal for this season of the year. With industry active and a normal export business, production in October ordinarily runs at least 11,000,000 tons a week.

### Open Saginaw Million Dollar Terminal

Pere Marquette officials and members of the Saginaw Board of Commerce formally opened the new million dollar terminal at Saginaw, Mich., on October 11. The dedication of the new buildings, followed by congratulatory speeches by members of the Saginaw Chamber of Commerce, marked the opening. The new work consists of a thirty-stall engine house, a machine shop, a power house having a 1,000-horsepower capacity, a 100-ft. turntable, a 500-ton coal dock, a cinder conveyor with electrically-operated ash handling equipment, two water tanks, a storehouse, and a general service building.

## To Prevent Ticket Scalping at Legion Convention

Railroads are taking every precaution to prevent ticket scalping at the national convention of the American Legion, which will be held in Kansas City the latter part of this month. The exceedingly low rates which will be offered to the members of the legion usually attract a large number of railroad ticket scalpers, especially where so large a convention attendance is expected. The Railroad Ticket Protective Bureau, representing all the passenger-carrying railroads in the United States, will be in charge of this work, and has been promised the full co-operation of the convention executive committee in its effort to eliminate any ticket manipulation. Tickets will be issued in signature form, making them worthless if transferred. The same plan for the protection of tickets was carried on successfully at the Grand Army of the Republic convention, in Indianapolis, the first of this month, and it was reported that scalping was entirely checked in that city.

## Salt Rates Discussed at Chicago

The entire salt rate structure of the country was discussed at a hearing at Chicago on October 12 and 13, when the applications of railroads serving the Louisiana salt mines for reductions in the rates on salt to Chicago from 26½ cents to 21 cents, and to St. Louis, Mo., from 23 to 21 cents came up for hearing before an examiner for the Interstate Commerce Commission. Shippers and carriers from the New York state salt district, the Kansas district and the Detroit (Mich.) district were grouped against those from the south, and opposed the reduction. The packing interests of Chicago sided with the roads which had proposed the lower Louisiana rates. Morris & Company, which owns the Kansas Rock Salt Company, protested, however, and pointed to the fact that it would benefit by the lower Louisiana rates because in spite of the ownership of the Kansas mines, it bought much salt in Louisiana. The Central Freight Association and Trunk Lines opposed the reductions which they alleged would be a case of capturing the salt tonnage were the proposed tariffs allowed to go into effect.

## Anthracite Shipments in September

Shipments of anthracite for September as reported to the Anthracite Bureau of Information, amounted to 5,519,412 gross tons, against 5,575,115 tons in August. The loss in production due to the shutting down of some mines in the Scranton district that cannot be operated under the provisions of the Kohler act, was something over 200,000 tons, about three-fourths of which loss was made up by increased shipments from other districts. The total shipments for the coal year beginning April 1, have amounted to 34,350,584 tons, as compared with 33,479,753 tons for the corresponding period in 1920, a gain of 870,831 tons.

Shipments by the initial carriers were as follows:

	September, 1921	August, 1921
P. & R. ....	1,081,085	1,116,844
L. V. ....	966,600	924,649
C. of N. J. ....	576,875	544,007
D. L. & W. ....	736,571	953,014
D. & H. ....	711,199	756,982
Penna. ....	426,344	360,817
Erie. ....	631,882	638,280
N. Y. O. & W. ....	123,742	98,355
t. & N. E. ....	265,114	192,167
	5,519,412	5,575,115

## Who Pays?

The Buffalo, Rochester & Pittsburgh in a recent bulletin appealed to shippers to aid in reducing claims for loss by better packing; and called attention to the enormous total of the amounts paid out in 1920 by class I railroads (\$104,388,930). In its latest bulletin it appeals to its own employees. Following are extracts:

"Who Pays?" Why, you do and I do, for such expense is an economic waste on the country at large, and we all share alike in it.

That the railroads collectively paid this staggering amount interests us only indirectly, but we must be interested individually and directly. Claims of this nature cost the Buffalo, Rochester & Pittsburgh \$112,955. Our station, yard and road men make it a point of pride to give freight prompt handling, to work their classification yard with dispatch, and to get over the road. Which is fine and to be commended; but don't overlook the fact that "rapid handling" may become "careless handling." It is not how far anything drops, or how fast it moves, but how quickly it stops, that causes damage.

Apply this law when handling individual packages and in moving cars; so that through your care they start and stop easily. In the pride of rapid handling do not forget that in unnecessary haste you are creating damage and spending somebody's money. "Who Pays?"

At home you carelessly drop a glass and it is broken. You resolve to be more careful in the future. You know the cause and pay for the damage. In the station, yard or run you seldom see the damage done and never pay the bill, at least not directly; but, who pays? This is a loss that comes home to every one of us.

## Federal Traffic Board

General Charles G. Dawes, director of the budget bureau, has announced the appointment of a Federal Traffic Board consisting of representatives of the various government departments and bureaus for the purpose of co-ordinating and systematizing the handling of the government's freight shipments. It was announced that R. C. Caples, who has been making a study of the situation for the budget bureau, has estimated that the government transportation bill annually is \$200,000,000, and that many economies could be effected. After the board is formed a committee of railroad men is to be invited to confer with the government's representatives regarding the changes to be made.

The Federal Traffic Board is to make a complete study of the traffic problems confronting the various departments and independent establishments of the government, and in co-operation with representatives of the Interstate Commerce Commission and the carriers, to establish uniform classifications for all commodities shipped by the government. The board will draw up plans for improving and standardizing methods of making shipments, and for the settlement of accounts. These plans will be submitted to the chief co-ordinator, general supply, who will take the necessary action in each case.

"The classification of commodities and the instructions governing shipments and methods of settling transportation accounts that are adopted by the board and approved by the co-ordinator for traffic shall, as far as applicable and in conformity with law, be binding upon and govern all departments, bureaus, agencies and offices of the government in all shipments made by them.

"All questions pertaining to the classification of materials or terminal, switching or freight rates, etc., which require the application of remedial measures will be submitted to the co-ordinator for traffic, either for adjustment with the classification committees representing the carrier or for the presentation of a complaint with the Interstate Commerce Commission.

"In the event of disagreement . . . the case will be submitted to the chief co-ordinator. . . ."

Commander Chester G. Mayo, of the Supply Corps of the U. S. Navy, has been appointed chief co-ordinator for traffic in the budget bureau.

ATTORNEY GENERAL DAUGHERTY has issued a statement to the effect that the government considers it inadvisable to take any steps in carrying out the plan of dissolution of the Reading System under decree entered in the anti-trust suit until the appeal taken to the Supreme Court has been decided. Mr. Daugherty says that the appeal entered by the stockholders of the Reading Company does not constitute a stay of proceedings, but further steps by the department might later cause embarrassment or delay if the plans should be materially modified by the Supreme Court.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended from October 25 and later dates until February 22, 1922, the operation of certain schedules which propose a reduction of 28½ cents per ton on bituminous coal, lump and slack, from mines on the Chicago & Alton, Kansas City Southern, Missouri, Kansas & Texas and St. Louis-San Francisco in Kansas, Missouri, Arkansas and Oklahoma, and on slack, only, from Springfield, Ill., to Kansas City, Kan., Kansas City, Mo., and contiguous points.

### State Commissions

The State Railroad Commission of California, upon application of the Southern Pacific, the Atchison, Topeka & Santa Fe., the Los Angeles & Salt Lake, and the Pacific Electric, has granted a rehearing in the Los Angeles terminal cases. On April 26, of this year, the commission rendered a decision providing for an extensive system of grade crossing elimination and the unification of terminal facilities of all the railroads entering Los Angeles.

### Street Car or "Jitney"

The motor car on the highway is declared to be chiefly responsible for the low earnings of the Pacific Electric Railway, a subsidiary of the Southern Pacific, in a report just completed by the engineering division of the State Railroad Commission of California. This report, consisting of two large volumes, has been introduced as evidence at a hearing on the application of the Pacific Electric for authority to increase transportation rates which opened at Los Angeles before the commission on October 11. As showing the effect of automobile competition, the report calls attention to the fact that while the traction territory has doubled its population and, according to an accepted estimate, travel has quadrupled, the electric lines carried fewer passengers in 1920 than in 1914. The report states that the choice whether the railway or the jitney shall go rests ultimately with the people. Another cause of the company's plight is given as abnormal operating costs traceable to the war. Operating costs increased from 80 to 100 per cent, while increases in rates have averaged less than 40 per cent.

### Court News

#### Shipper Cannot Recover Under Sherman Act Without Showing Damage

Under section 7 of the Sherman anti-trust law those who may sue for threefold damages by virtue of its terms are limited to those "who shall be injured in his business or property," and if a recovery is permitted it must be limited to the damages "by him sustained." The mere fact that a railroad might have been subject to prosecution by the government is otherwise of no avail to a litigant. Therefore a shipper cannot, the Circuit Court of Appeals, Seventh Circuit, holds, recover treble damages from railroads when the only damage alleged was the payment of a higher rate than would have been exacted but for a combination. The rate paid had been held reasonable by the Interstate Commerce Commission, so that in law the railroads were required to collect it and the shipper to pay it.—Keogh v. C. & N. W., 271 Fed., 444.

### United States Supreme Court

The United States Supreme Court on October 19 and 20 heard arguments in the New York intrastate passenger fare case, in which the state authorities are trying to overturn the decision of the Interstate Commerce Commission ordering increases in New York intrastate fares to correspond to those applied to interstate traffic.

## Foreign Railway News

### "Industrial India"

The Tata Publicity Corporation, Ltd., of London and Bombay, has begun the publication of a monthly magazine known as "Industrial India." The purpose of the new journal will be, according to its publishers, "to support and record any movement which seeks to encourage the development of India's resources and industries." Various subjects covered in one of the first numbers include the cotton industry, industrial accidents, manufacturing, coal washing, the manufacture of railway cars, the Indian railway problem, material handling and kindred subjects.

### Argentina Railways Disagree

#### With Government on Rates

Rate increases which were put into effect on the British-owned railways of Argentina have been declared null and void in a decree of President Yrigoyen. These rates, according to press reports, were increased without the sanction of the government. The roads, however, contended that they had the right to raise rates and the government assessed heavy fines against the carriers. Under the president's decree these fines are to be remitted if the rates are lowered to the former level.

### Concessions Granted for Construction

#### of New Railroads in Spain

During the first half of 1921 the following concessions were made for standard gage track in Spain, according to Commerce Reports:

	Miles		Miles
Norte .....	2,300	Medina to Salamanca .....	47
Madrid-Zaragoza-Alicante .....	2,272	West Galicia .....	45
Andaluces and South of Spain .....	1,000	Alcantarilla to Lora .....	34
Madrid-Caceres and Portugal .....	480	Sevilla-Alcala and Carmona .....	26
Central of Aragon .....	184	Local Railways of Andalucia .....	12
Medina-Zamora-Orense-Vigo .....	182	Valencia to Aragon .....	20
Salamanca to the Portuguese frontier .....	125	Aragamilla to Torrellosa .....	22
Zafra to Huelva .....	111	Bilhao to Portugalete .....	11
Great Southern .....	104	Railways and Tramways .....	8
Soria .....	58	Provincial Deputation of Vizcaya .....	7

### British Railway Wage Boards

Under the British Railways Bill which has now become a law, the Central Wages Board, which has jurisdiction over wage disputes will have 16 members, eight of whom will represent the carriers, four the National Union of Railwaymen, two the Associated Society of Locomotive Engineers and Firemen and two the Railway Clerks' Association. The National Wages Board (which has final jurisdiction) has been increased to include six representatives of the railway companies, two representatives of the National Union of Railwaymen, two representatives of the Associated Society of Locomotive Engineers and Firemen, two representatives of the Railway Clerks' Association and four representatives of the users of railways, with an independent chairman nominated by the Minister of Labor.

### Signals for Air Brake Inspectors

Luminous fixed signals—letters showing on the front of a box—for use of air brake inspectors, at night, in signaling between the front end and the rear end of a train standing at a station, are in use at Magdeburg, Germany, according to a note in the September number of the Bulletin of the International Railway Association, the data having been taken from a German paper. The letters, composed of dots formed by small electric lights, are energized through a circuit with push buttons (for closing the circuit and illuminating the signal) distributed along the platform in positions convenient for use with trains of different lengths. The letters are only three: F for applying brakes (Festlegen); L for releasing (Lösen); E for finished (Erledigt). The arrangement is similar to that used at theatres and other

public places for calling carriages by displaying numbers, different combinations of lights being shown to form different letters.

### Activity of the Krupp Works

According to press dispatches, W. T. Daugherty, trade commissioner at Berlin, has made the following report concerning the activity of the Krupp Works:

"In June, 1921, the combined Krupp plants had about 99,000 employees, working eight hours a day, while the production had passed from the pre-war mass manufacturing stage to refining production. Today, instead of manufacturing parts for locomotives, for instance, Krupp is manufacturing the locomotive entire.

"It is pertinent to note, in this connection, that among other finished goods of varied description, Krupp's Essen plant is now turning out a locomotive and a train of eight steel 15-ton freight cars for each working day of the year.

"Production is organized vertically, Krupp products being finished refined, from the crude raw materials, while all intermediate stages between the raw material and finished production are combined in this enterprise. A selling organization exists in addition."

### South Manchuria Railway Prospering

According to press reports, the South Manchuria Railway, which is owned in Japan, enjoyed a thriving business during the fiscal year ended March 31, 1921. Net profits were \$13,500,000 and dividends of 10 per cent were authorized. This company operates from Changchun, Manchuria, where it connects with the Chinese Eastern (the eastern end of the Trans-Siberian), southward to Mukden, where the line branches, one branch going southward to Dairen and the other southeastward to Eusan, in Korea. The company also operates steamers between Dairen, Shanghai, and Tsingtao.

The company has recently published several booklets in English describing the country and cities served by its lines, the character of the inhabitants, the places of interest, hotel accommodations, industrial opportunities and the equipment and service offered by the carrier. These booklets are well illustrated and provide interesting and instructive reading for the prospective tourist or business man.

### Electrification of Japanese Railways

LONDON.

The Journal of the Yokohama Chamber of Commerce states that the Japanese railways are to be electrified according to a plan now being worked out by the Department of Railways. First the entire Tokaido line and then a part of the Central line will be fitted up for electrification, the work extending in due course to all other lines. As soon as the department's plan is completed it will be presented through the cabinet to the Diet at its next session.

Traffic on the Tokaido line is increasing greatly each year and adequate accommodation is lacking for the transportation of passengers and freight. To expedite the service, automatic signals have been installed, but it is anticipated, however, that in a short time the traffic capacity of the railways will be found inadequate to meet the needs of the increasing business.

The first lines to be electrified will be the entire Tokaido line from Tokio to Kobe and a part of the Central line between Utsunomiya station in Tokio and Kofu where many tunnels make transportation slow.

### Railway Education in Britain

The London School of Economics, in co-operation with the railways radiating from London, offers an interesting array of lecture courses on railway subjects for the benefit of railway employees, according to information published in the Railway Gazette (London). Each course embraces a series of from 10 to 30 lectures which are held in the evening.

Some of the subjects covered by the lectures are Commercial Railway Economics, Railway Operating Economics, General Economics with Special Reference to Transport, Railway Statistics, Principal Factors in Train Operation, the Railway in Relation to the State, Railway Law and Economics of Transport.

At the end of each course of lectures examinations are held to which only those students who have attended regularly and who have done adequate outside study are admitted. Certificates are given to the students who pass the examinations successfully and various medals and prizes are awarded for exceptional performance.

### Powers of British Rates Tribunal

The British Railways Bill as finally passed by both houses of Parliament gives the Railway Rates Tribunal authority to determine any question brought before it in regard to the following:

- (a) The alteration of the classification of merchandise or of any article or the classification of any article not at the time classified, or any question as to the class in which any article is classified.
- (b) The variation or cancellation of through rates.
- (c) The institution of new, and the continuance, modification, or cancellation of existing group rates.
- (d) The variation of any toll payable by a shipper.
- (e) The amount to be allowed for any terminal services not performed at a station, or for accommodation and services in connection with a private siding not provided or performed at that siding.
- (f) The reasonableness or otherwise of any charge made by a railway company for any services or accommodation for which no authorized charge is applicable.
- (g) The reasonableness or otherwise of any conditions as to packing of articles specially liable to damage in transit or liable to cause damage to other merchandise.
- (h) The articles and things that may be conveyed as passengers' luggage.
- (i) The constitution of local joint committees and their functions and the centres at which they are to be established.

As regards the basis upon which the rates are to be levied, the more general plan as originally defined in the bill has been retained. There is, however, some alteration respecting exceptional (i. e. below the usual) charges. At the time the new schedule of standard charges are put into effect all exceptional rates shall cease to operate with the exception of those rates which are not less than 5 per cent below the standard rates promulgated and which have been continued by agreement between the railway company and the shipper concerned, or until the Rates Tribunal rules otherwise. Permission is given to grant new exceptional rates under the approval of the minister provided that they shall not be less than 5 per cent or more than 40 per cent below the standard rate chargeable.

### English Railway Bill Becomes a Law

LONDON.

After a discussion extending over some three months, the English Railway Bill was passed by both houses of Parliament and became a law. A resume of this bill was published in the *Railway Age* of May 27, on page 1209. A number of changes were made, however, in the bill before its final adoption.

It will be remembered that six distinct groups were proposed in the original draft of the bill which included two distinct groups for the Scottish railways. The Scottish railways did not at all agree with this plan of the Minister of Transport, primarily on account of the impossibility of applying the same general conditions (wages and rates) to Scottish railways as were applied to English railways on account of the fact that the nature and extent of business in Scotland was in no way comparable with the business and conditions as they exist in England. It was therefore decided to group the Scottish railways on a north and south basis with the English railways. Thus the Northwestern Group was enlarged to include the West Scottish Group, the railways in this particular group being the London & Northwestern, the Midland, the Lancashire & Yorkshire, the North Staffordshire, the Furness, the Caledonian, the Glasgow & South Western and the Highland. Likewise the Northeastern Group was extended to include the East Scottish Group, this group now being made up of the North Eastern, the Great Central, the Great Eastern, the Great Northern, the Hull & Barnsley, the North British and the Great North of Scotland railways.

The final bill extended the time for voluntary amalgamation on the part of the constituent companies in each group till January 1, 1923, after which time the amalgamation tribunal will act if such voluntary amalgamation has not been established. Likewise the time at which every amalgamation scheme is to be put into effect has been extended to July 1, 1923, or such earlier or later date as the amalgamation tribunal may elect.

The requirement that four members of the board of directors should be important shippers in the amalgamated constituent territory which was demanded in the bill as presented was eliminated in the final bill.

## Equipment and Supplies

### Locomotives

THE W. T. SMITH LUMBER COMPANY, Chapman, Ala., is inquiring for 1, 60-ton geared locomotive.

THE DAYTON, GOOSE CREEK has ordered 1 Mogul type locomotive from the Baldwin Locomotive Works.

THE TENNESSEE STAVE & LUMBER COMPANY, Oneida, Tenn., is inquiring for 1, 17 to 35-ton geared locomotive.

THE YEUE HAN RAILWAY (China), expects to order in the near future, through Mitsui & Co., New York, 2 Mogul type locomotives from the American Locomotive Company.

THE LACROSSE & SOUTHEASTERN has ordered 1, 10-wheel type locomotive from the American Locomotive Company. This locomotive will have a total weight of 67-tons in working order.

DELAWARE, LACKAWANNA & WESTERN.—The Elvin Mechanical Stoker Company, New York, has been given an order by the Delaware, Lackawanna & Western for 49 Elvin mechanical stokers for installation on its Mikado type locomotives.

THE ARGENTINE STATE RAILWAYS have ordered 50 Mountain type and 25 Pacific type locomotives from the Baldwin Locomotive Works. These locomotives will all be of meter gage and will be equipped to use either wood or oil for fuel. The Mountain type locomotives are to be used for mixed service and will have 19 by 24 in. cylinders, 50 in. driving wheels and a total weight in working order of 170,000 lb. The Pacific type will be used for passenger service and will have 20 by 28 in. cylinder, 57 in. driving wheels and a total weight in working order of 173,000 lb. A sample Mountain type locomotive was built by the Baldwin Works about two months ago for the same roads.

### Passenger Cars

THE CANADIAN PACIFIC is inquiring for prices on 15 steel passenger cars.

THE CENTRAL RAILWAY OF BRAZIL is inquiring through the car builders for 10 first class and 10 second-class passenger coaches.

### Freight Cars

THE MOBILE & OHIO is inquiring for prices on the repair of 1,000 box cars.

THE MAINE CENTRAL is having repairs made to about 800 box cars at the shops of the Laconia Car Company, Laconia, N. H.

THE ERIE has entered into a contract with the Greenville Steel Car Company, Greenville, Pa., for the repair of 1,000 steel coal cars of 50-ton capacity. This is in addition to the repairs on 1,000 cars previously let to the same company.

THE CHILEAN STATE RAILWAYS reported in the *Railway Age* of April 29, as inquiring for 620 cars, have ordered 100 general service gondola cars of 50-ton capacity, from the Pressed Steel Car Company; 200 box cars from the American Car & Foundry Company, and 100 flat cars from Belgian builders.

THE SEABOARD AIR LINE is inquiring for prices on 1,000 ventilated box cars, 700 flat cars and 300 phosphate cars. The company also is inquiring for alternate bids on 500 ventilated box cars, 30 and 40 ton capacity; 500 plain box cars, 40-ton capacity, and 1,000 low side gondola cars, 40-ton capacity.

THE ARGENTINE STATE RAILWAYS, according to a press dispatch from Buenos Aires, dated October 18, have entered into

a contract, subject to the approval of President Yrigoyen, with the Middletown Car Company for the delivery of 2,000 freight cars. Payment for the equipment is to be made in Argentine 6 per cent treasury notes maturing in five years.

### Iron and Steel

THE WARASH is inquiring for 325 tons of steel for a bridge at Attica, Ind.

THE ST. LOUIS SOUTHWESTERN is inquiring for 10,000 tons of rails for 1922 delivery.

THE GREAT NORTHERN has awarded a contract for 500 tons of steel for bridges to the Wisconsin Bridge & Iron Company.

MITSUMI & Co., New York, is inquiring for about 1,700 tons of 75-lb. rail and accessories and is also inquiring for an alternative of 1,400 tons of 60-lb. rail, for the Tokio Electric Railway of Japan.

### Machinery and Tools

THE MISSOURI, KANSAS & TEXAS is inquiring for shop tools to cost about \$100,000.

THE DELAWARE, LACKAWANNA & WESTERN has compiled a list of about 40 machine tools to be purchased as required for its shops; the tools include 2 vertical punch and shears, double end, 18-in. throat; 1, 20-in. vertical drilling machine; 1, 30-in. vertical drilling machine; 2, 500-ton double-end car wheel presses; 1, 48-in. vertical car wheel boring machine; 1, 54-in., 1, 30-in., 1, 26-in., 2, 20-in. and 5, 18-in. engine lathes; 2, 36-in. and 1, 30-in. Morton new type heavy duty draw cut shaper; 1, 24-in. Dill slotter; 1 Gould & Eberhardt heavy duty 32-in. shaper; 1, 60-in. heavy duty radial drill; 1 Sellers vertical special driving box boring machine; 1 horizontal boring and drilling machine, 4½-in. spindle; 2 Bullard 42-in. vertical turret lathes; 1 universal grinder, 12-in. swing; 1 plain horizontal heavy duty milling machine; 2 Bullard 54-in. vertical turret lathes; 1 Morton 60-in. combination cylinder planing and boring machine; 1 McCabe pneumatic cold flanging machine; 2 centering machines, 4-in. capacity, Whiton preferred; 1 power hack saw, motor driven; 1 reverse motor drive for Sellers planer, 48 in. by 48 in.; 2 reverse motor drives for Niles-Bement-Pond planers, 42 in. by 42 in.; 1 reverse motor drive for Sellers planers, 36 in. by 36 in.; 1 gap engine lathe, 25 to 29 in. swing; a No. 1 J. A. Fay & Egan improved variety saw, and electrical equipment for operating the machines, many of which will be motor driven.

### Miscellaneous

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, November 4, for its present requirements of manganese frogs; electric arc welding set; and for its requirements until December 31, of black, galvanized and blue annealed sheets; driving and truck tires for freight, switching and passenger service; seamless steel tubes for repairs to locomotive and stationery boilers; axles for car and locomotive repairs; wire nails and staples; steel bars, shapes and plates; steel billets and steel wheels for locomotive, passenger car and tender repairs.

### Signaling

MISSOURI PACIFIC.—This company has awarded a contract to the General Railway Signal Company, Rochester, N. Y., for one 12-lever Saxby & Farmer interlocking machine to be installed at Harviell, Mo.

### Trade Publications

CUTTING THE UNRECKONED COSTS.—A ten-page illustrated booklet has been recently issued by R. D. Skinner & Co., Inc., New York, descriptive of the belting manufactured by that company. The text discusses the various features of the belt such as the special weave, the internal lubrication and the results which have been attained in numerous competitive tests with other types of belting.

## Supply Trade News

The Lakewood Engineering Company, Cleveland, Ohio, has moved its Philadelphia, Pa., office, from the Widener building to the Franklin Trust building.

George A. Barden has been appointed railway sales representative with headquarters at 4631 York road, Philadelphia, Pa., of the Lowe Brothers Company, Dayton, Ohio.

The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., will establish a branch in charge of V. D. Clark, at 316 Thirteenth street, Huntington, W. Va.

The Superior Supply Company, Chicago, has been appointed the direct factory representative of the Novo Engine Company, Lansing, Mich., and will handle the sale of the Novo line of portable power driven outfits, including pumps, hoists, compressors, saw rigs, etc.

G. R. Watson, formerly electrical supervisor for the Pullman Company at Chicago and later representative of the Crouse-Hines Company at Cincinnati, Ohio, has been appointed general sales manager of the Wadsworth Electric Manufacturing Company, Inc., with headquarters at Covington, Ky.

A. Clarke Moore, formerly assistant to the president of the Globe Seamless Tube Company, has been appointed vice-president of the Chicago Railway Equipment Company, effective October 1, succeeding the late C. Haines Williams, deceased. Mr. Moore has been actively engaged in the railway supply business for the past 22 years. In July, 1899, he entered the service of the Safety Car Heating & Lighting Company, which company he served until November, 1919, with the exception of a year and one-half in 1906 and 1907, when he was with the Western Steel Car & Foundry Company and McCord & Company. During this time he filled various positions, serving for the last six years as vice-president, and for the two years prior to that time as general manager. During the war, Mr. Moore was commissioned a major in the Air Service department, with headquarters at New York, having charge of the production of air craft in the eastern territory. In November, 1919, he became associated with the Globe Seamless Steel Tube Company of Chicago as assistant to the president, from which position he resigned in August, 1921. As vice-president of the Chicago Railway Equipment Company, Mr. Moore will have general supervision of the manufacturing and selling departments.

George L. Sawyer, formerly sales manager of material handling machinery for the Barber-Greene Company, Aurora, Ill., has been appointed representative of the Universal Crane Co., Elyria, Ohio, for the sale of its Universal cranes in the New York field, with office at the Allied Machinery Center, 141 Center street, New York City.

James A. Slater, manager of sales of the National Malleable Castings Company at Chicago, has been appointed assistant sales manager with headquarters at the company's general offices in Cleveland, Ohio, succeeding J. H. Redhead, whose

appointment as manager of the Reliance Company at Cleveland was noted in the *Railway Age* of October 15 (page 739).

T. E. Cocker has been appointed district manager of the Chain Belt Company, in the Buffalo territory, with headquarters at Buffalo, N. Y. Mr. Cocker is a graduate of the Rensselaer Polytechnic Institute, class of 1907, civil engineering. From 1907 to 1917 he served in the engineering department of the New York Central at Buffalo, holding the position of assistant engineer at the time he left the service of that railroad. For the past five years he has been handling elevating and conveying equipment.

W. H. Rastall has been appointed chief of the Industrial Machinery Division of the Bureau of Foreign and Domestic Commerce and in this position will have charge of the government's activities in furthering American foreign trade in railway equipment and supplies. Mr. Rastall was born in 1879. He was educated in the public schools of Chicago, the Hebron Academy (Maine), the University of Maine and Cornell University, from which institution he was graduated in 1904. Before completing his education, Mr. Rastall served as a draftsman for the Latrobe Steel & Coupler Company, Melrose Park, Ill., and for several shipbuilding companies. From 1904 to 1911 he was resident engineer of the American Trading Company at Kobe, Japan. This company was the Japanese agent for various important American concerns engaged in the manufacture of machinery. From 1913 to 1917 he was sales engineer for the Worthington Pump & Machinery Corporation. In the latter year he entered the service of the Bureau of Aircraft Production as an aeronautical mechanical engineer. In October, 1918, he left this position to investigate the markets for American industrial machinery in the Far East in behalf of the Department of Commerce. He was occupied on this mission, which included a visit to almost every port in Asia, until the summer of this year, when he returned to this country to take up his new duties.

## Trade Publications

**METAL SPRAYING.**—The Metals Coating Company of America, Philadelphia, Pa., has issued a 16-page, illustrated booklet descriptive of the metal spraying device manufactured by that company. The process of coating various materials with metals in order to secure non-corrosive surfaces is explained in detail as well as the mechanical construction of the apparatus. In addition, another type of apparatus for the application of a coating at a higher rate for large flat surfaces by the use of metal dust is also described. The illustrations show the different classes of work which can be performed and the construction of the apparatus.

**LONG LIFE FOR WOOD.**—The Barrett Company, New York City has recently issued a 16-page, illustrated booklet descriptive of the various uses for which that company's timber preservatives are adaptable. The text discusses the many classes of timbers which can be treated advantageously, the structures or parts of structures which should be of treated timber and the method of application of the preservative, such as the open tank, the surface, the brush and other methods. The illustrations cover a wide range of subjects from the effects or results of moisture on untreated woods and the decay resulting therefrom, up to a plan for an open-tank process plant.

**INDUSTRIAL TRACTORS.**—The Baker R & I. Company, Cleveland, Ohio, has published a catalogue and several bulletins on its line of electrically operated industrial tractors and trucks. Its new catalogue is a 32-page booklet illustrating and describing the details of manufacture and the operating advantages of the four and three-wheel tractors, its locomotive tractor and the several types of general utility platform trucks. The description of these several devices is accompanied by complete and detailed specifications with respect to dimensions, weights, power, etc. An interesting feature of the catalogue lies in the many illustrations given of the different types of these tractors and trucks and the variety of the material-handling service for which they are adapted. Bulletins No. 12, 13, 14 and 15, are devoted to a description of special types of the Baker trucks and to the electrical equipment for direct and alternating current.

A. C. Moore

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company contemplates the erection of a hospital at Albuquerque, N. M., to cost approximately \$300,000.

**ATCHISON, TOPEKA & SANTA FE.**—This company will construct additional yard tracks at Chillicothe, Ill., the work to cost about \$51,000. The same company will also construct an interchange track in connection with the Sand Springs Railway, at Tulsa, Okla.

**ATCHISON, TOPEKA & SANTA FE.**—This company will construct several extensions to its machine shops at San Bernardino, Cal., at an estimated cost of \$224,000. It will also install a boiler washing plant in connection with its shops at this place. The same company will construct an industry track at Dallas, Tex., to cost about \$21,000; a blow-off line in the roundhouse at Cleburn, Tex., and a similar one in its roundhouse at Temple, Tex., to cost about \$11,000 each; a dike for protection against floods will be constructed in the rear of its engine house at La Junta, Colo.; estimated to cost about \$17,000; and a similar protection against floods will be constructed at Canadian, Tex., to cost about \$25,000.

**CHESAPEAKE & OHIO.**—This company is asking for bids for the construction of a passenger station at Logan, W. Va. This building will be 30 ft. by 100 ft. of red brick construction, trimmed with terra cotta and with a slate roof. The platforms will be covered. The company will at the same time construct a 30 ft. by 100 ft. frame baggage and express building at Logan. The estimated cost of this work is \$80,000.

**CHESAPEAKE & OHIO.**—This company has awarded a contract to J. J. Craig, Covington, Ky., for the construction of a passenger station, 135 ft. by 38 ft., at Covington. The building will be of red pressed brick with terra cotta trim and tile roof. Platforms with butterfly sheds at both eastbound and westbound main tracks will be erected.

**THE CHICAGO, BURLINGTON & QUINCY.**—This company has awarded a contract for the construction of a ten-stall brick roundhouse and a 100-ft. turntable at Centralia, Ill., to Jos. E. Nelson & Sons, Chicago.

**CHICAGO & NORTH WESTERN.**—This company has awarded a contract to White & Duffy, Milwaukee, Wis., for the construction of a subway at Fourth street, Clinton, Iowa, to cost about \$100,000.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company will replace the storage house at Pratt, Kansas, which was destroyed by fire on October 6 with a total property loss estimated at \$20,000.

**ILLINOIS CENTRAL.**—This company will re-construct its depot at Marissa, Ill., which was recently destroyed by fire. The work will cost about \$10,000.

**ILLINOIS CENTRAL.**—This company has awarded a contract for the construction of a section foreman's house and three section labor housing buildings at Clinton, Ill., to Joseph E. Nelson & Sons, Chicago, to cost approximately \$12,000.

**KANSAS & OKLAHOMA.**—This company has applied to the Interstate Commerce Commission for a certificate authorizing the completion of the construction of a line of 65 miles from Caney, Kan., to Vinita, Okla., of which the first 37 miles was built some time ago.

**KANSAS CITY SOUTHERN.**—This company contemplates the construction of a bridge across the Arkansas river below Ft. Smith, Arkansas.

**MCCLELLANSVILLE & SANTEE.** This company has applied to the Interstate Commerce Commission for certificate authorizing the construction of a line from Jamestown and McClellansville, S. C., 20 miles.

**MISSOURI PACIFIC.**—This company contemplates the construc-

tion of about 25 miles of second main track on its line between St. Louis, Mo., and Jefferson City, at an estimated cost of \$2,000,000. Bids will be requested for either the whole, or part of this work when surveys have been completed. This same company will soon request bids for the construction of two car repair sheds, 46 ft. by 500 ft., at St. Louis, at an estimated cost of \$80,000; one car repair shed at Kansas City, Mo., 120 ft. by 500 ft., to cost \$82,000; and a 70 ft. by 200 ft. addition to its present sheds at Sedalia, Mo., which will cost about \$31,500.

**NEW YORK CENTRAL.**—This company has awarded a contract to the Roberts and Schaefer Company, Chicago, for the installation of an electric cinder conveyor at Wayneport.

**NORTHERN PACIFIC.**—This company has awarded a contract to H. C. Struchen, St. Paul, Minn., for the construction of a steel bridge over Trout creek, about 30 miles west of Missoula, Mont. This bridge is a single track structure, 238 ft. long and 45 ft. high, consisting of a 145-ft. deck pin connected truss with approach spans 40 and 50 ft. long at the ends.

**OREGON-WASHINGTON.**—This company, in conjunction with the city of Seattle, Wash., and other railroads entering that city, contemplates the construction of a permanent bridge across the Seattle freight yards.

**PHILADELPHIA & READING.**—This company has awarded a contract to F. W. Van Loon, Philadelphia, for the construction of a freight house and office building at Coatesville, Pa. The office building will be 22 ft. by 40 ft. and will include an extension 30 ft. by 98 ft. to be built for office use over the freight house. The work will be of brick supported on steel and concrete foundations. The freight house will be 196 ft. long with a platform 10 ft. wide on the track side and an open platform 31 ft. by 38 ft. The freight house will be of steel frame construction and the open platform will have a wooden floor supported on concrete masonry walls and piers. New concrete driveways and approaches will be added later.

**ST. LOUIS-SAN FRANCISCO.**—This company will receive bids until October 17 for the construction of a one story station, 24 ft. by 106 ft., at St. Clair, Mo.

**ST. LOUIS-SAN FRANCISCO.**—This company will receive bids until October 27, for the construction of a coaling station at Newburg, Mo.

**TEMISKAMING & NORTHERN ONTARIO.**—This company will soon commence work on a 70-mile extension, northward from Cochrane to Smoky Falls. The estimated cost of the extension is \$3,500,000.

**UTAH.**—This company has been given permission by the Interstate Commerce Commission to construct extensions to its lines totaling 25 miles

## Railway Financial News

**ATCHISON, TOPEKA & SANTA FE.**—*Authorized to Lease California Southern.*—The Interstate Commerce Commission has given its authority for the acquisition of control of the California Southern by lease for 10 years.

**CALIFORNIA SOUTHERN.**—*Acquisition by Lease.*—See Atchison, Topeka & Santa Fe.

**CHICAGO, ROCK ISLAND & PACIFIC.**—*Authorized to Issue Bonds.*—The Interstate Commerce Commission has granted the joint application of this company and the Burlington, Cedar Rapids & Northern, authorizing the latter to sell \$1,905,000 of consolidated first mortgage bonds at par and accrued interest to the Chicago, Rock Island & Pacific, and also authorizing the Chicago, Rock Island & Pacific to procure authentication and delivery to its treasurer of a like amount of first and refunding mortgage bonds to be pledged from time to time as collateral for short term notes.

*Authorized to Assume Obligation as Guarantor.*—This company has been authorized by the Interstate Commerce Commission to assume obligation or liability as guarantor by endorsement in respect of the payment of the principal and interest of \$619,000 of first mortgage gold bonds of the St. Paul & Kansas City Short Line, and the latter was authorized to issue the bonds and deliver them to the Rock Island in reimbursement of advances for additions and betterments.

**KNOXVILLE, SEVIERVILLE & EASTERN.**—*Sold.*—This 30-mile road was sold at auction on October 5 to W. B. Townsend, for \$30,000. Mr. Townsend is president of the Little River Railroad with office at Townsend, Tenn. He said he was representing a syndicate that would put the road in good operating condition, if the sale was confirmed.

**LAKE ERIE & WESTERN.**—*Annual Report.*—The income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Compensation (January and February).....	\$258,690	.....
Additional compensation account completed, additions and betterments.....	5,842	.....
U. S. Government guaranty, March 1 to August 31.....	787,287	.....
Net railway operating income, September 1 to December 31.....	23,904	.....
Total (compared with compensation accrued in 1919).....	1,075,123	\$1,597,045
Total other income.....	130,621	127,827
Gross income.....	1,205,745	1,689,918
Interest on funded debt.....	672,041	639,594
Total deductions from gross income.....	969,504	977,967
Add: revenues and expenses applicable to January 1, 1918, settled by U. S. R. A.....	153,488	*204,574
Surplus for the year.....	389,729	507,378

\*Debit balance.

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919 as follows:

Operating Revenues		1920	1919
Freight.....		\$10,463,360	\$8,518,048
Passenger.....		829,045	805,534
Total operating revenues.....		\$11,970,928	\$9,784,826
Operating Expenses		1920	1919
Maintenance of way and structures.....		\$1,577,545	\$1,738,553
Maintenance of equipment.....		4,112,010	2,731,710
Traffic.....		203,669	147,408
Transportation.....		5,303,376	4,346,856
General.....		341,250	312,635
Total railway operating expenses.....		11,530,804	9,272,661
Net revenue from railway operation.....		440,924	512,165
Passenger Traffic		1920	1919
Number of revenue passengers carried.....		836,148	857,914
Number of revenue passengers carried one mile.....		29,024,216	28,969,495

**WHEELING & LAKE ERIE.**—*Authorized to Pledge Bonds.*—This company has been authorized by the Interstate Commerce Commission to repledge \$924,000 of refunding mortgage bonds as collateral security for short term notes and to issue \$125,000 of refunding bonds to be pledged with the Secretary of the Treasury as partial security for a loan.

**WESTERN PACIFIC.**—*Asks Authority to Issue Bonds.*—This company has applied to the Interstate Commerce Commission for authority to issue \$3,000,000 of first mortgage 6 per cent bonds maturing July 1, 1946, and redeemable at any interest date at 102½, the proceeds to be used for the payment of outstanding equipment trust notes.

**WESTERN MARYLAND.**—*Loan from Revolving Fund.*—The Treasury Department has announced the payment of \$150,000 to this company on certificate of the Interstate Commerce Commission as a loan from the revolving fund.

### Railroad Administration Settlement

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Philadelphia Belt Line Railroad Co.....	\$2,931.05
Savannah Union Station Company.....	1.00
Wilmington Railway Bridge Co.....	No cash payment
Short Line Railroads	
Fourche River Valley & Indian Territory Railway Company.....	\$20,600
Dayton, Toledo & Chicago Railway Co.....	29,000.00

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

### Dividends Declared

Central of New Jersey.—\$1 quarterly, payable November 1 to holders of record October 8.  
 Pullman Company.—Two regular dividends, \$1 per share, payable November 15 to holders of record October 31, and \$1 per share, payable November 15 to holders of record January 31.  
 Reading Company.—First referred, 1 cent per share, payable December 8 to holders of record November 22.

## Railway Officers

### Executive

**T. A. Hynes** was on October 12 elected president of the New Jersey, Indiana & Illinois. Mr. Hynes was born at Damascus, Wayne County, Pa., on September 17, 1879, and was graduated from the Union Academy, Damascus, in June, 1899. He entered railroad service with the Erie in 1900 as a telegraph operator and served in various positions with that company until 1913, when he entered the service of the New Jersey, Indiana & Illinois. Prior to his election as president of this company he served consecutively as general freight agent, traffic manager, treasurer and vice-president.

### Financial, Legal and Accounting

**R. P. Crutchfield**, chief clerk to the auditor of the Union Railway, with headquarters at Memphis, Tenn., has been elected treasurer with the same headquarters, succeeding S. S. Billings.

### Operating

**A. W. Thompson** has been appointed car accountant of the Louisville & Nashville, with headquarters at Louisville, Ky., succeeding E. L. Hill, deceased.

**F. M. Donegan**, superintendent of the Algoma Eastern, with headquarters at Sudbury, Ont., has been appointed chief dispatcher, with the same headquarters.

**R. W. Brown**, superintendent of the Ohio division of the Baltimore & Ohio with headquarters at Chillicothe, Ohio, has been transferred in a similar capacity to the Connellsville division, succeeding W. J. Brady, resigned.

**J. Gallagher** has been appointed acting deputy minister of railways and telephones for Alberta, and general manager of the Alberta & Great Waterways, with headquarters at Edmonton, Alta., succeeding H. A. Warner, resigned.

### Traffic

**Gordon L. Oliver**, whose appointment as traffic manager of the Fort Smith & Western, with headquarters at Fort Smith, Ark., was announced in the *Railway Age* of October 15 (page 743), was born at Roxburghshire, Scotland, on May 4, 1886, and was educated at St. Mary's Preparatory School, Melrose, Scotland, and at Loretto College, Edinburgh. He came to America in March, 1905, and entered railroad service at once as an office boy in the traffic department of the Chicago, Rock Island & Pacific. After five years of service with this road, he left to accept a position in the Star Wall Paper Mills, Joliet, Ill. He remained with that company for about one year, and in the spring of 1912, re-entered railroad service in the traffic department of the St. Louis-San Francisco, where he remained until the spring of 1913, when he was appointed chief clerk to the general freight agent of the Fort Smith & Western, with headquarters at Fort Smith. He was promoted to assistant gen-

G. L. Oliver

eral freight agent in 1915, and to general freight agent on September 15, 1917, with the same headquarters, which position he was holding at the time of his recent promotion.

**H. A. Hinshaw**, whose appointment as assistant freight traffic manager of the Southern Pacific, with headquarters at San Francisco, Cal., was announced in the *Railway Age* of September 17 (page 556), was born at Winchester, Ind., in 1871. He entered railroad service in 1890 as an agent of the Southern Pacific. He was promoted to traveling freight agent in 1906, which position he held until 1911, when he left to become assistant general manager of the Salem, Falls City & Western. He returned to the service of the Southern Pacific in 1912 as general freight agent, with headquarters at Portland, Oregon, which position he was holding at the time of his recent appointment.

H. A. Hinshaw

### Mechanical

**F. S. Wilcoxon** has been appointed fuel supervisor of the Chicago Great Western, with headquarters at Chicago.

**J. Gibson**, master mechanic of the Canadian Pacific, with headquarters at Moose Jaw, Sask., has been appointed general foreman, with headquarters at Revelstock, B. C. **W. G. McPherson**, master mechanic, with headquarters at Regina, Sask., succeeds Mr. Gibson at Moose Jaw.

### Engineering, Maintenance of Way and Signaling

**E. F. Kultchar**, whose appointment as district engineer, maintenance of way, of the Illinois district of the Chicago, Burlington & Quincy, with headquarters at Galesburg, Ill., was announced in the *Railway Age* of October 15 (page 774), was born at Chicago in 1885. He entered railroad service in June, 1903, as a rodman on the Chicago, Burlington & Quincy, alternating for three years between summer work on the Burlington and attendance at the University of Illinois. He permanently entered the service of the Burlington in 1906. The greater part of his service from 1903 to 1916 was in the engineering department and consisted of location and construction work, maintenance inspection and drafting. In March, 1916, he was promoted to roadmaster, and in June, 1917, he was promoted to trainmaster, with headquarters at St. Joseph, Mo., which position he held at the time of his recent promotion.

### Obituary

**Harry C. Meloy**, supervisor of electrical appliances, New York Central, lines west of Buffalo, died suddenly on Thursday, October 13, while on business in Chicago.

**J. W. Terry**, auditor of the San Antonio & Aransas Pass, with headquarters at San Antonio, Tex., died recently at his home in that city. Mr. Terry began his railroad career in October, 1881, as a clerk in the auditor's office of the Louisville & Nashville, which position he held until July, 1885, when he was promoted to bookkeeper. In August, 1886, he left to become assistant auditor of the Ohio Valley. He was appointed assistant auditor of the Newport News & Mississippi Valley in May, 1891, and remained with that company until December, 1892, when he left to become assistant auditor of the San Antonio & Aransas Pass. He was promoted to auditor in 1892, which position he was holding at the time of his death.

With Ryerson Standardized Flue Shop machinery, erecting shop work never waits for flues.

## Flue Costs Cut in Half

Low first cost is only a start. After that comes the cost of maintenance, probably the biggest factor in flue cost.

Railroads buy carefully. They should watch maintenance costs just as carefully.

In better repair work at lower cost lies their best opportunity to reduce the total of their flue bill.

Ryerson Standardized Flue Shop equipment has reduced flue repair costs for every railroad that has an installation.

It will cost nothing to investigate and there is no obligation.

Let us give you the facts.

## Facts About the Threatened Strike

THE TESTIMONY of the heads of the railway labor brotherhoods before the Railroad Labor Board on Wednesday did not settle the question whether there will be a strike. It did, however, seem to make clear certain points. One of these is that the Railroad Labor Board cannot prevent a strike and that nothing can prevent it except intervention by some other federal government official or authority. Another thing made clear is that if the members of the brotherhoods strike the only tangible ground for their action will be the reduction of wages authorized by the Railroad Labor Board and put into effect by the railways on July 1.

The questioning of the heads of the labor organizations was done mainly by Ben W. Hooper, one of the public members of the Board. Mr. Hooper has been much criticised for the plan for a prevention of the strike which was issued by him in Washington. Whatever may be said about the suggestions he has offered for preventing the strike, it cannot be gainsaid that his conduct of the hearing on Wednesday was a masterly piece of work. It showed that whatever mistakes he may make, the Board has in this new public member a skillful lawyer and an able man. W. G. Lee, president of the Brotherhood of Railroad Trainmen, in his testimony stated unequivocally that the members of his brotherhood were proposing to strike solely because of the wage reduction of July 1. He also left the impression, although he did not say so, that he did not think there was sufficient ground for the strike and was really opposed to it. The heads of the other brotherhoods made statements indicating that the strike had been authorized not only because of the wage reduction July 1, but because of other things the railways had done or proposed to do, such as making a further reduction of wages, but under Mr. Hooper's skillful questioning they were forced to make plain that while other matters had been mentioned in communications sent by them to their members and had influenced the result of the strike vote, the brotherhoods had no tangible ground whatever for striking except the wage reduction authorized by the Labor Board.

The Board having made it plain by the answers it got to its questions that the only question directly involved, or which could by any possibility be settled by a strike, is the wage reduction made effective on July 1, asked the brotherhood leaders another series of questions as to how the strike

could be averted. The brotherhood chiefs all answered these questions to the effect that the strike could not be averted unless a settlement was reached which was satisfactory to them and their executive committees. In response to the Board's inquiries as to whether a strike could be averted by a finding of the Board that it was unfair and unjustifiable and an order by the Board that the strike should not occur, the brotherhood chiefs made answers which either evaded the direct issue raised or explicitly indicated that no such finding and order by the Board would have any effect. One stated that the order would be fruitless; another that the men would not obey the order and two positively stated that such a finding and order by the Board would have no effect. Nothing, they indicated, could prevent a strike except a settlement which was satisfactory, not to the Board, but to the heads of the brotherhoods and their executive committees.

Some other facts were established by the evidence which have a very important bearing on the question of whether if the strike comes it will be successful. It was shown that on a number of railways the members of the Brotherhood of Railroad Trainmen had voted against a strike and that on a still larger number of roads the conductors had voted against it. The number of roads on which the men failed to vote for a strike varied from three or four for the firemen to about 23 for the conductors and the railways on which the conductors voted against a strike include several of the largest systems in the country.

The man who at the time this editorial is written can predict with any confidence whether a strike will actually come has an extraordinary confidence in his own prescience. It is plain, however, that if it does come it will be ineffective on a substantial number of railways. It is also plain that it will be a strike against a decision of the Railroad Labor Board and a strike which the Board has clearly indicated will be unfair and unjustifiable. While the railways will have to bear the brunt of the struggle, and it will be a strike against the public and against a federal tribunal established by a federal law, it will manifestly be the duty of the railways to spare no effort to win it. But in the circumstances, however, it will be even more plainly the duty of the public and of the United States government to adopt and carry out measures which will make its failure certain.

## How Railroad Wages Should Be Readjusted

WHETHER A STRIKE comes or not, the railways should in a short time be before the Railroad Labor Board seeking extensive changes in the wages now paid by them. The policy of the Interstate Commerce Commission, as indicated in its decision ordering general reductions in grain rates, makes this even more necessary than it was before this decision was rendered.

The railways should not, however, ask merely for reductions of wages. They should present to the Railroad Labor Board a definite plan for so readjusting present wage scales that justice will be done as between the different employees, as well as between the railways and the employees. The present payroll is too large. It is not, however, too large because all employees are being overpaid. The real trouble is that many employees are being greatly overpaid, while some are not being much overpaid and some are not being overpaid at all. The managements for months have criticised the maladjustments in wages which have resulted from the advances granted by the Railroad Administration and the Railroad Labor Board. The managements should show their consistency, their fairness and their wisdom by proposing a definite plan for correcting the bad adjustments of which they have complained.

Among the points which ought to be considered in making up such a plan as is needed are the following:

First, for years many supervisory officers have not been paid as much in proportion as a great majority of employees, and as a class they have not received as large advances in proportion as most employees. The railways need loyal and able men in these supervisory positions, and they should show much more willingness than most of them have in the past to pay such men what they are reasonably worth.

Second, the railways should attack with all the force they can the standardization of the wages of each class of employees throughout the country which now prevails. The cost of living in large cities was much higher than in small cities and towns when the wages were standardized. Therefore, it was entirely wrong at that time to fix the same wages for every employee of each class throughout the country. The decline in the cost of living which has occurred within the last year has taken place very irregularly and has been much greater in the small cities and towns than in the large cities. This has greatly increased the inequity of paying a clerk who lives in Chicago, for example, no more than is paid to a clerk doing similar work and living at Topeka, Kan. Why should a man employed in the shops in Macon, Ga., for example, be paid as much per hour as a mechanic working in shops located in Chicago? Why should a conductor whose run requires him to live at Pittsburgh be paid no more than one whose run requires him to live at Herington, Kan.?

The resolution recently adopted by the Association of Railway Executives contemplates a reduction of about 10 per cent in the wages of train service employees and authorization of the payment to other employees of wages corresponding to those paid in other industries in the various communities. Before the Labor Board could literally carry out this plan it would be necessary to investigate the wages paid in other in-

dustries in every community in the United States, which is impracticable. If wages are to continue to be fixed by the Labor Board, and at the same time the present system of standardization is to be broken down, there must be worked out some plan for establishing differentials between the wages of employees doing the same class of work in different communities, these differentials to be based mainly on the differences between the living conditions in large centers of population and smaller places.

Third, full consideration should be given to the fact that the advances in wages which have been received by the employees in train service have been relatively less than the advances which have been given to many other classes of employees. The differences between the wages of train service employees and of many unorganized employees prior to government control were too great, and there should be no attempt to restore most of the old differentials. On the other hand, the fact should be recognized that men directly concerned with the operation of trains, including train dispatchers, are almost the only employees who are distinctively railroad men. If a mechanic does not like the conditions of his work on a railroad he can leave and go into a factory. On the other hand, a conductor or locomotive engineer requires special knowledge and training to fit him for railway service which do not fit him for anything else. The railways need a high grade of men for train service, and since they can hardly get such men from any other industry there must always be paid in train service wages high enough to insure that the railways will get a sufficient number of good men.

Fourth, the changes in wages which have occurred in recent years, and especially those made under government control, have resulted in many cases in unskilled, or practically unskilled, workmen receiving such disproportionately large increases in their pay that they are receiving almost as much as skilled workmen. This is especially true among the shop crafts employees. It is unjust to the men and impairs efficiency. Unless men are paid substantially more for work requiring skill and experience than is paid to the unskilled, the incentive to become really skilled workmen is destroyed.

One of the principal reasons for the continuance of such unsatisfactory labor conditions on the railways has been that the railways have not worked out and advocated any definite, understandable and clearly defensible program for improving the conditions. The result is they have helped the labor leaders in their efforts to convince the employees that all the railways want is to drive down wages regardless of the rights or interests of the employees. While a majority of the railway executives have believed it was desirable for all labor negotiations to be carried on between the individual managements and their own employees, this has not been and is not now any good reason why the railways should not have a definite general program which could be presented to the employees and the public and the reasonableness and fairness of which would appeal to them.

The railways some months ago adopted a program under which each railway was to treat with its own employees regarding wages as well as working conditions. The result was

almost no concert of action between the railways in presenting their case for reductions in wages to the Labor Board and the presentation of their cases in different ways and upon different grounds. The experience of recent months has shown that there is such a thing as individual action by the railways in dealing with labor problems developing into something closely resembling anarchy. It is to be hoped that when the railways appear before the Labor Board again for reductions in wages they will be better prepared than they were in the last wage hearings to tell the Labor Board, their employees and the public exactly what they want and why they want it.

The action of the Senate on October 4 in adopting an amendment to the pending tax bill providing for a repeal of the

### Transportation Taxes to Be Repealed

transportation taxes effective on January 1, which corresponds to a provision in the bill already passed by the House, practically assures the shippers and passengers of the country a reduction in the cost of transportation for next year of approximately \$250,000,000. While the amount of the tax, 3 per cent, is comparatively small on freight transportation when compared with the increases in freight rates themselves that have resulted from the effects of the war, it is no inconsiderable item to a large shipper and adds to the grievance felt on account of the rate increases. The taxes on passenger and Pullman accommodation tickets, 8 and 10 per cent, not only represent an appreciable addition to the expense of travel, but as they are added separately to the rates received by the railroads they have constituted a source of much irritation. It is somewhat interesting to railroad men to observe that, although many high officials of the government and particularly members of Congress have long been insisting upon reductions in railroad rates, the government itself has been somewhat slow in acting to sacrifice its revenue for the purpose of reducing transportation costs.

It is true that the labor problem overshadows all others at the present time and yet railroad men are giving considerable attention to shop equipment needs as evidenced by the recent increase in machine tool purchases. Several rather large orders have been placed by eastern railroads and other orders are about to be closed. It is reported that in some cases orders are being held for further price reductions and in this connection, a word of caution may well be uttered. While no manufacturer should be allowed to charge exorbitant prices, it is certainly possible to carry the policy of beating down prices to too great an extreme. In the first place, if a machine is needed in a railroad shop for certain work, every day that the shop is compelled to forego the use of this machine costs the railroad just so much money, which in the end may more than equal the saving due to price reduction. Then again, if manufacturers are forced to sell machinery below prices affording a reasonable profit, the inevitable result will be the production of cheaper, less reliable machines to meet those reduced prices. Inefficient, worn-out machinery in railroad shops should be replaced as fast as possible. A case has come to our attention in which a modern production machine was installed recently in a large locomotive repair shop and readily handled the work formerly performed on four machines. It is evident

that the resulting large reduction in labor cost and greater speed of producing locomotive parts made the investment in this machine a most profitable one. Progressive railroads are following the example cited and have adopted the sound policy of installing modern labor-saving machinery in shops and enginehouses as fast as the necessary funds can be obtained. It is only in this way that the possibilities of efficiency in shop operation can be realized and made to assist in helping to increase the gap between railroad revenues and expenses.

There are many factors in the present business situation that point to better times ahead. Railroad men who follow

### The Business Situation

the figures on car loadings and earnings know that the position of the railroads is improving. There remains yet, of course, a labor problem and a rate problem to be solved before the carriers can feel that their difficulties are behind them. Other lines of business, where the managers are untrammelled in the conduct of their enterprises along legitimate lines, are looking forward to an early resumption of normal business activity. Capital is available for their undertakings at favorable rates and they are finding it easier to interest the banks in financing their activities. The buying public is once more in the market for commodities which it refused to purchase at higher price levels. Many basic industries reflect the prevailing optimism in their increased production. All the signs point to better times as the present year draws to a close and when the present acute problems of the railways are solved the railroads should, with the co-operation of the public, be in a position to join with other business and other industries in normal activity, normal returns on investment and normal programs for needed additions and betterments.

The subject of organized labor with its ramifications is the momentary sovereign of railway thought. That is self-evident. However preemptorily ushered in and however little its presence is to

### Backing up the R. F. P. A.

be desired, the fact remains that it constitutes an immediate concern in office and shop, originating conjecture, animating discussion, demanding and getting audience. And from its nature and its significance it is well that having precipitated itself upon thought, that thought should be concentrated upon it. But with all that there are subjects incident to the operation of railroads which, though capable of being subordinated momentarily to the predominating concern, should not be allowed to suffer from neglect or even exclusion and the subject of fire prevention is among these. Last week 150 men from 77 roads devoted three days to serious consideration of means for protecting railway property from fire. This week they are back within their several jurisdictions pledged to the work of reducing the enormous, the unnecessary and preventable losses from fire which railroads experience annually. In convention they sounded an appeal for the co-operation of the railway managements and operating officers. They need that support on the part of those who are in actual charge of the management of the railroads in carrying out this important work. Furthermore, they must have it and while many officers find themselves almost submerged by the subjects seemingly of more immediate concern, it is hoped that they will not neglect to contribute their support to movement and work potential of such salutary results as fire prevention.

### Buying Machine Tools

## The Important Grain Rate Decision

THE DECISION rendered by the Interstate Commerce Commission last week holding that the rates of the western railroads on hay, grain and grain products should be substantially reduced is epoch making in some important respects. While it is probably justifiable in the circumstances existing, it is based on novel principles and is inconsistent with opinions previously rendered by the commission in important rate cases.

Throughout the history of rate regulation there has been contention between those who have believed that rates should be based mainly on the value to the shipper of the service rendered to him by the carrier, and those who have believed that they should be based mainly on the cost incurred by the railway in rendering that service. The chief measure of the value of the service to the shipper always must be the difference between the cost of his commodity to him and the price he can get for it at the place to which it is shipped. If the freight rate on grain from a point in Iowa to Chicago exceeds the difference between the cost of producing the grain in Iowa and the price that can be got for it in Chicago, then the freight rate exceeds the value to the farmer of the service rendered in transporting the grain to Chicago.

For many years the rates charged by the railways were so much less than the value of the services rendered by them that shippers as a class, and their attorneys for them, attacked and resisted every effort of the railways to base schedules of rates upon the value of the service. The commission in its recent opinion shows that the price of wheat increased from 78.4 cents per bushel in 1913 to \$2 in 1917, or over 105 per cent. The value of the service rendered by the railways in transporting the wheat necessarily increased in much the same proportion, and therefore on this principle it would have been justifiable for the railways to have made large advances in their rates on wheat. Meantime, as the commission points out, railway rates on wheat stood practically still. Similarly the value of most other commodities advanced unprecedentedly while the railway rates on them stood still. Everybody knows that the railways more than once tried to advance their rates during this period. They were prevented because the commission, in conformity with the arguments and insistence of shippers and their attorneys, rigidly applied in the regulation of rates the "cost of service" principle.

On the cost of the service principle as then advocated and applied, railways are entitled to rates which will enable them to earn enough to pay their operating expenses and taxes and a reasonable return on the value of their property. It was argued that while they should not be restricted to any less than this they should not be allowed to have anything more. The result was that while because of great increases in their prices the farmers and other producers in the United States made unprecedentedly large profits the average net return earned by the railways in the three years ended with 1917 was only 5.2 per cent. In the next three years—1918, 1919 and 1920—during most of which time they were under government control, the railways were guaranteed only the same net return as they had earned in the three years before, while the prices and profits in other industries mounted to even greater heights.

Toward the end of 1920 the guarantees to the railways were withdrawn and they were thrown on their own financial responsibility under new legislation which was based almost entirely on the cost of service principle of rate-making. It was naturally assumed that thereafter the value of the service would receive little recognition in the making of entire schedules of rates—that the rates as a whole would be based on the cost incurred by the railways, including a fair return.

Experience speedily showed that economic laws are more powerful than any act of legislation or order of a commis-

sion. An unprecedented slump in traffic rendered it impossible throughout the first year the new rates were in effect for the railways, in spite of the most drastic retrenchments, to earn one-half of the net return authorized by law. The average advance in rates from before the war up to 1920 was hardly one-half as great as the average advance which had taken place in wholesale prices. But within a few months prices in general declined so much that many of them became relatively lower, and some of them much lower, especially those of farm products, than railway rates.

The result was a widespread demand, which was pressed with the utmost force by the farmers and their representatives, for reductions of rates. This demand was based almost entirely on the ground that the rates were higher than the shippers could afford to pay—in other words, exceeded the value of the service rendered to them.

It was extremely difficult to see how, in view of its previous decisions, the provisions of law under which it was acting and the railroad conditions existing, the commission could find a way to hold that the rates on large and important classes of commodities should be reduced. It has, however, ordered hay, grain and grain products rates reduced upon two grounds.

The first, and plainly the controlling, consideration, is that the rates are excessive in proportion to the value of the service rendered to the shipper—in other words, that the prices the farmer gets for his products have declined so much that he cannot afford to pay the rates. This finding is justified by the facts. It must, however, be recalled that in previous cases when the railways introduced or sought to introduce evidence regarding advances in prices which had occurred and large profits which were being made in other industries to show that these other industries could afford to pay higher rates, the commission practically dismissed such considerations upon the ground that the rates which other industries could afford to pay had little or nothing to do with the question of what rates the railways should be allowed to charge. It is unreasonable to hold in one case that the fact that the profits being made in an industry are large should be given no weight in considering whether the rates charged it should be increased, and to hold in another case that the fact that an industry is making little or no profit is a reason why the rates charged it should be reduced.

The second ground upon which the commission holds the rates should be reduced is that the operating costs of the railways are going to be lower in future. It concedes that there cannot be found in the present operating costs or net return any justification for a reduction of rates. The commission derives its powers from a law which requires that until March 1, 1922, it shall allow the railways to charge rates which under efficient and economical management will enable them to earn a return averaging at least 5½ per cent per annum. In the first eight months of this year the railways earned at the rate of only 2.6 per cent, and if not a single rate were reduced the net return earned during the entire year 1921, in spite of the improved showing now being made, would hardly exceed 3 per cent. How could the commission conclude from the facts and the law that it should order a large reduction of rates?

It reached this conclusion by expressly disregarding both the past and the present and looking only to the future. Referring to the rate-making provisions of the Transportation Act, it says "the duty cast upon us by Section 15a is a continuing duty and looks to the future. It does not constitute a guarantee to the carriers, nor is the obligation cumulative. We are not restricted by past or present statistics of operation and earnings. They are serviceable only as they illuminate the future. What is contemplated by the law is that in this exercise of our rate-making power the results shall reflect our best judgment as to the basis which may

reasonably be expected for the future to yield a prescribed return." The provision of the Transportation Act specifying that the railways should be allowed to earn a return of 5½ per cent runs only to March 1, 1922, and it is evident the entire two years which it covers will expire without it ever having been given any real effect.

Furthermore, there is no certainty that the operating costs of the railways will be in future what the commission anticipates, and this for a reason which is made quite plain by Commissioner Potter in his concurring opinion. The majority opinion, which was written by Commissioner Aitchison, while it is predicated largely upon future developments, has very little to say concerning the changes which are essential to causing these future developments. Commissioner Potter goes boldly to the root of the matter. He agrees with his colleagues that the rates are too high and should be reduced. He makes clear, however, not only that the present operating costs of the railroads do not justify any reductions in rates, but that their future operating costs will not justify any substantial reductions of rates unless and until there have been further reductions of wages. He then states a principle which must be recognized and acted upon by the Railroad Labor Board if our present system of government regulation of rates and wages by two different bodies is not completely to break down. He says: "In considering what railway employees should receive, regard should be had for what shippers can afford to pay. The record in this case shows the Labor Board has declined to give consideration to this broad basic question." Commissioner Potter draws the logical conclusion from his proposition, adding, "If the broad economic question as to how much shippers can afford to pay is a question to be determined by us (the Interstate Commerce Commission) when we fix fair and reasonable rates, it will follow that the Labor Board in considering wages would regard our finding as one of the relevant circumstances to be taken into consideration in fixing rates."

The commission holds that the present grain rates are excessive and that the present high operating costs of the railways are no ground for maintaining them in view of the future reductions in operating costs which it expects to occur. This is clearly equivalent to finding that a continuance of the present high operating costs would be unreasonable—a conclusion which is implicit in the opinion of the majority of the commission and is explicitly stated in Commissioner Potter's concurring opinion. But suppose the Labor Board does not permit the reductions in the payroll which are prerequisite to the reductions in operating costs which the commission recognizes as necessary to justify the reductions in rates it has ordered? Obviously, if the commission is to order rates reduced on the ground that they are too high for the shippers to pay, and the Labor Board is to refuse to reduce wages on the ground that they are no higher than labor ought to receive, the railways are not going to earn the net return which the law makes it the duty of the commission, assuming economical and efficient management, to enable the railways to earn. But the law makes it just as much the commission's duty to see that the railways are given a reasonable opportunity to earn a fair return as to protect the shippers from excessive rates.

It seems probable that if the railways should appeal to the courts from this decision they would hold that it disregards both the Transportation Act and the constitutional prohibition of confiscation. Nevertheless, it is difficult seriously to criticise the commission either for its findings of fact or for the decision reached by it. It deserves commendation for the weight it has now given to the principle of the value of the service, although it is rather remarkable that it should have given it such full recognition in this case and so little recognition in previous cases when it would have operated to the advantage of the railways. There can be no just criticism of the commission for having ordered rates

reduced in anticipation of large future reductions in operating costs, if that anticipation is reasonable. Since, however, the law puts upon it the duty, not only of reducing rates which are excessive, but also of seeing that the railways are economically operated and are given opportunity to earn a fair return, does it not now become its plain duty actively to help the railways secure the reductions in operating costs without which they cannot earn a fair return under the reduced rates?

## Impact Effects of American and Foreign Locomotives

IN THE EDITORIAL "Are American Locomotive Harder on Bridges," which appeared in the issue of October 15, a brief reference was made to the effect of the dynamic augment due to the counterbalance on bridge stresses. Inasmuch as European engineers have repeatedly made the statement that American locomotives produce greater impact stresses than the European engines, it may be well to give further attention to this aspect of the subject.

The counterbalance is applied to locomotive driving wheels primarily for two reasons; first, to balance the rotating weights, such as the crank pin and side rod, and, second, to counteract to some extent the longitudinal inertia forces caused by the reciprocating parts at the end of the stroke. The revolving parts can be balanced perfectly for all speeds and for every position of the wheels. The counterbalancing of the reciprocating parts, however, is always a compromise between two conflicting requirements. In order to make the locomotive ride smoothly, it is desirable to counterbalance the entire reciprocating weight at the end of the stroke; on the other hand, if the dynamic augment or impact stresses set up by the locomotive are to be minimized, the reciprocating weights should not be balanced at all. Assuming that the design has been made as light as possible, considering the material and the stresses involved, the percentage of the weight of the reciprocating parts to be balanced is a matter of judgment in deciding between the permissible vibrations of the locomotive and the dynamic augment that can safely be borne by the track.

Engineers in this country have investigated the effect of practice now generally observed is as follows. The weight of the reciprocating parts on one side of the locomotive is various methods of counterbalancing and as a result the limited to 1/160 of the total weight of the engine in working order and from 50 to 66 per cent of the reciprocating weight is balanced. The excess pressure due to the counterbalance is not permitted to exceed 50 per cent of the static wheel load when the speed in miles per hour is equal to the diameter of the drivers in inches.

The practice followed in counterbalancing locomotives in England is similar to that in this country. In the European countries, however, the practice is quite different. In France it is customary to specify the maximum load for a given speed and weights only sufficient to produce this result are added to the counterbalance, irrespective of the effect on the engine. In Germany a government ruling requires that the blow on the rail at the highest speed shall not exceed 15 per cent of the wheel load. The proportion of reciprocating weights balanced to conform to this rule varies from 15 to 60 per cent.

Any method which balances less than 50 per cent of the reciprocating masses for two-cylinder locomotives will inevitably result in a rough riding engine, producing shocks and vibrations especially when much lost motion exists in the bearings of the main axle. Generally speaking, American and English practice favor the locomotive and presuppose fairly good bridges and track while the French

and German practices favor the track. If American locomotives require somewhat heavier and more costly bridges, the fixed charges on the additional investment are no doubt offset by the decrease in maintenance cost of the locomotive itself resulting from the superior balancing of the reciprocating parts.

It is evident from the foregoing that the only reason why locomotives built in this country should produce greater impact than European locomotives is the difference in the method of counterbalancing. There is no question but what the American practice is good for the locomotive though it is not as favorable to light bridges and light track as some of the European rules. If American builders desire to sacrifice riding qualities in order to reduce the stress on track, they can construct locomotives that will produce no more impact than the foreign locomotive.

## Railway Stock More Widely Distributed Than Formerly

THE INTERSTATE COMMERCE COMMISSION has again called attention to the wide distribution of the ownership of railroad securities by including in its preliminary abstract of statistics of common carriers for the calendar year 1920 a statement giving the number of stockholders of Class I roads as 709,795, of which 324,514 held stock in railways of the Eastern district, 67,495 in railways of the Southern district, and 317,786 in railways of the Western district. The average holding was 10,269. A special report on the distribution of railroad security holdings issued by the commission in 1919 gave the number of stockholders of Class I roads and their non-operating subsidiaries as of December 31, 1917, as 627,950. There has, therefore, been an increase in three years of more than the 81,865 difference between the two figures.

While the report contains no comment or analysis, it confirms the indication made by the large increases which have been shown each year recently in the number of stockholders of some of the larger roads that, like the Pennsylvania, regularly publish the number of their stockholders, and under the circumstances it is particularly significant. It is apparent that many of the larger holders of railroad stocks have been selling some of their holdings and that they have been purchased, in smaller average lots, by a larger number of buyers. It is well known that many large investors have transferred their holdings from taxable securities to tax-exempt securities for the purpose of avoiding the heavy sur-tax rates of the income tax law, but it is also very probable that many holders of railroad stocks have preferred to get out of a business in which the possible returns hardly warrant the risks required and that what they have sold has been taken over by smaller investors who have thus distributed the risk over a larger number of persons.

A prominent member of a Congressional committee that has held many hearings during the last five years on various aspects of the railroad problem was in the habit of remark-

ing frequently that in view of the conditions depicted by the railroad witnesses he could not see why the owners of the railroads did not sell out. Of course, if they did, there would be a new set of owners to be considered and the statistics indicate that that is just what has happened. Many of the owners of the railroads have been selling their stock—at a loss—but the lower prices of stocks have attracted more to take their places. These figures, of course, take no account of the holdings of railroad bonds and other securities which are much more widely distributed than stocks.

## Southern Railway

THE SOUTHERN RAILWAY'S income statement for 1920, given in the annual report issued recently, showed a balance of income over charges of \$1,716,149, as compared with \$5,141,567 in 1919. There were charged against the 1920 net, dividends of 2½ per cent, or \$1,500,000, on the preferred stock. The balance carried to the credit of profit and loss was but \$113,714. In 1919, the dividends charged against income totaled \$3,000,000, or 5 per cent on the preferred, and the balance carried to profit and loss was \$2,137,260.

The Southern Railway in 1920 did the largest business in its history. Increased costs of operation, however, prevented it from realizing on the gross income resulting from the business handled. The road, it will be remembered, decided not to accept the guaranty for operations from March 1 to August 31, 1920. The operating results for the six months justified this decision. While it is true that the Southern Railway itself fell \$700,000 short of earning as much as its guaranty would have been, the system as a whole, including the Cincinnati, New Orleans & Texas Pacific, the Alabama Great Southern and the New Orleans & Northwestern, had a net railway operating income about \$600,000 in excess of what the guaranty would have amounted to. The difficulty with the Southern was its small net return in the latter part of the year; during the last four months of 1920 the road had operating ratios of from 88 to 94 per cent. The Southern report gives some interesting comparisons of the costs of operation in 1920 as compared with 1917. A selection of the figures shown gives the following details:

	1920 compared with 1917	
	Per cent increase	Per cent decrease
Gross revenue	68.46	.....
Expenses and taxes	111.44	.....
Operating income	\$2,470	36.00
Tons of revenue freight hauled	15.82	.....
Average receipts per ton per mile	35.79	.....
Average wages paid	85.76	.....
Wages per dollar of revenue	23.75	.....
Average cost of fuel coal per ton	94.18	.....
Average cost of cross ties	137.29	.....

"So long as traffic continued at high tide," the report says, "as it did during the first six months after the end of federal control, these costs could be endured, but they were economically unsound, nevertheless, as was evident the moment the stimulus of traffic was withdrawn. Management, regulated in its every act except that of meeting the payroll, was then

SOUTHERN RAILWAY OPERATING RESULTS, 1912-1920

deprived of the power to apply the remedies which alone can save a business in such conditions."

The Southern experienced the decline in traffic beginning in November. The recovery in traffic so far in 1921 has been slow; in July the net ton-miles of freight were only 554,415,000 as compared with 807,930,000 in July last year. Since July, however, conditions have gradually begun to show improvement. Because of the drastic economies, the net railway operating income has gradually increased month by month thus far in 1921. Whereas in January and February, 1921, there were deficits, in August the net was \$1,282,276. The net railway operating income for the first eight months of 1921 was \$4,989,231. As an assistance in comparison, it may be stated that the standard return for the property as based on the earnings for the three years ending June 30, 1917, was \$18,653,893. This would seem to make evident the reason for the action of the Southern directors in passing the preferred dividends.

"The Southern Serves the South." Anyone who has traveled over the Southern Railway lines in recent months will appreciate that this motto is more than a phrase for use in

of 1919, the southern farmers produced a crop of 13,270,970 bales of cotton. Only about one-half this crop, however, was sold, the other half being held because of the declining prices and the hope that the high price would be restored. The result of this condition of affairs and its effect on the buying power of the South can easily be imagined.

The 1921 crop of cotton is expected to be about 6,000,000 bales. The hold-over of the 1920 crop, however has gradually been brought to market in recent months. Considering the change in conditions, it is not surprising that business in the South is rather more optimistic than it seems to be in most other parts of the country. Mr. Harrison further points out in his annual report that, "While estimates of the cost of producing the cotton crop of 1920 have ranged from 27 cents to 33 cents a pound, the crop of 1921 probably has been made at the lowest per pound cost in years, notwithstanding the small crop. Little fertilizer has been used and labor has been plentiful and cheap, conditions which afford reasonable assurance of a fair profit at the prevailing prices."

The railroads in the South have been making intensive efforts over a term of years to get the South away from its dependence on cotton. While it is true that the attention paid to cotton in 1920 and the low prices for agricultural products in general in 1921 have acted as a handicap, the progress that has been made, nevertheless, is considerable. The ravages of the boll weevil have proved a most serious factor in southern agriculture. The gradual northward march of the weevil, however, has not been without a certain compensating measure of advantage in that it has pointedly brought to the farmer the undesirability of relying on cotton as his single crop and has induced him to try his hand also at other things.

The Southern Railway now has a double track line from Washington to Atlanta of fairly easy grades, good alignment, etc. The Southern, except insofar as concerns this line, is in a state of transition. It has many branch lines; it still lacks yards and terminals. The improvement in the Southern lines in recent years, however, has been

The Southern Railway System

advertising. The service rendered is contained not only in the transportation service, but also in the efforts the Southern has been making over a term of years to educate the South to higher standards of agriculture, more particularly with reference to diversification of crops, the acquirement of live-stock, etc. In traveling through the South, one is impressed also by the interest the employees of the road seem to take in these things. The Southern Railway morale seems to be of extremely high standard. This is indicated in many ways; one of them is the manner in which the efforts of the traffic department are ably seconded by the operating department officers and men in the solicitation of freight.

Cotton, undoubtedly, is the most important single commodity carried over the Southern's rails. The tonnage of cotton carried in 1920 was 598,428 tons or 1.39 per cent of the road's total tonnage. The importance of cotton to the railroad consists not of the earnings received for moving the cotton, but the buying power which the cotton crop represents to the southern territory. In 1920, influenced by the high prices resulting from the abnormal demand and small crop

great. The progressive increase in the average revenue train load from 250 tons in 1912 to 461 tons in 1920, as shown in the table, is noteworthy. Over the line between Atlanta and Washington, the road is operating Santa Fe and Mountain type locomotives. A feature of the operation of this line is the manner in which freight traffic is concentrated on Potomac Yard. The train ratings out of Atlanta northbound are 2,300 tons for ordinary freight and 2,250 for carded or manifest freight. These are filled out at Toccoa, Ga., again at Greenville, N. C., etc. The Southern is giving a high grade freight service and is well regarded in shipping circles. One of its best trains is No. 52 or the Potomac Special. This train operates from New Orleans to Potomac Yard and has a running time of about 72 hours. "Carded" trains, as a whole, are allowed 36 hours from New Orleans to Atlanta and 52 hours from Atlanta to Potomac Yard.

SEVEN HUNDRED MEN returned to work after a long lay-off when the Chicago Great Western shops at Oelwein, Iowa, were opened on October 16.

## Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

### Unnecessary Transferring of Loaded Cars

New York.

TO THE EDITOR:

Referring to the articles in the September 17 and October 8 issues of the *Railway Age* on "Unnecessary Transferring of Loaded Cars." This question has been discussed for years and no real action taken to stop the large number of cars from being transferred. The remedy I would suggest is one that would cut down at least 50 per cent of the so-called transfers, if it could be put into effect.

It is not the fault of the car inspector who cuts out a loaded car for transfer that in his judgment is unsafe to run. Furthermore, I do not think any railroad today would stand for a vindictive car inspector cutting out cars unnecessarily. Our operating officials were greatly alarmed over the large number of cars that were being cut out for this purpose and wanted me personally to inspect cars at different points to see if the inspectors were justified in cutting them out. In almost all the cases I found the condition of the cars was such that the inspectors were justified in doing so. My greatest surprise was in many cases that the cars ever reached our terminals in such bad condition, being not only unsafe to run but unsafe for the lading.

I could go into considerable detail but will simply give the following figures taken recently from our records for a period of 30 days: Cars cut out numbered 803; of these 750 were foreign cars. Of these cars 157 were all-steel or steel underframe with defective underframes and sills. Of the remainder, 502 cars had wooden sills, broken draft timbers, burst ends, etc., and the balance of the defects were broken hoppers, bulged ends and defective trucks. A large percentage of the cars were of light construction and must have been in bad order when they were loaded.

The remedy is that no car should be loaded at a terminal that is not first inspected by a competent car inspector as to its fitness for the lading intended to be carried in it; it should also be inspected for the condition of the running parts.

Some few years ago the MCB Association proposed that all cars should be inspected and carded for the kind of lading they were intended to carry, but no final action was taken as it required the co-operation of the transportation department. If the railroads would take some action to this end it would soon bring out the fact that there are many thousands of cars not fit to carry ordinary freight unless they are repaired before loading.

It is true, as stated in the article in your September 17 issue that cars have been known to be transferred and sent back to the receiving line; that no repairs were made and the cars were again loaded with freight and sent forward by a different road. Many cases have been brought to our attention where we have been offered the same car on which no repairs had been made; these we have rejected and cut out the second time. Then again in some cases on the first transfer of the car it was loaded with grain and in such a condition that it could not be repaired; it was transferred and sent back to the receiving line, where it could be loaded with lumber or bricks and be safe for that class of lading.

The A. R. A. rules have defined what class of repairs

should be made to cars under load so as to save the expense of liability of damage to freight in transfer, but it is utterly impossible in many cases to carry out A. R. A. rules and make repairs to cars under load, and consequently transfers must be made to save delay.

Another point that should not be overlooked is that during federal control where cars were home on any railroad, we had a great many light capacity cars running over the system that never should have been allowed away from their home road. Until such time as the railroads can get their cars in first class condition and take more care in inspection before loading, we will continue to have numerous cases of transferring of loads. As suggested above, however, proper inspection of equipment before it is loaded will stop 50 per cent of the transfers.

F. W. BRAZIER.

### Derails and the Stop-and-Proceed Rule

AUBURN, Cal.

TO THE EDITOR:

The *Railway Age* lately has published many arguments pro and con (mostly con) about the main track derail and the stop required at the stop-and-proceed automatic signal. But first let us look to the possible criticism that the signal men are doing all the talking.

With reference to the stop at automatic signals, at least one man who claims ample experience in the operating department has spoken in no uncertain terms. A. M. Burt, now assistant to the vice-president, operating department, Northern Pacific, in the issue of December 28, 1917, page 1158, wrote on this subject. Everyone interested should turn back and read his letter. In this connection after giving a number of reasons for abolishing the stop and proceed rule he said: "The stop and proceed indication should be put in the scrap heap, and in its place there should be a permissive indication. Under such a plan the three aspects of a permissive signal would be 'clear,' 'caution' and 'extreme caution.' No changes in present signals would be necessary.

"The efforts that have been made to pull the teeth of the 'stop and proceed' signal by using 'grade' or 'tonnage' permissive signals does not go far enough. The 'stop and proceed' signal should be done away with altogether, except possibly in some very unusual locations."

The two subjects pertaining to derails and stops at automatic signals may very well be discussed together because the main point in both cases is the observance of signal indications. Although the statistics called for by Mr. Rudd's series of unanswered questions in the issue of July 16, page 112, do not seem to be available, two things, I believe, are absolutely known: (1) That the derail sometimes derails a train which would have caused no damage if it had passed the stop signal—consequently there is a derailment when otherwise it would have been a case for discipline; (2) a derailment does not always prevent fouling of the "protected" track and a collision, if another train arrives at that time. The last point will recall the collision at Porter, Ind., last February, where the derail was only 311 ft. from the crossing. It must be admitted, however, that with the present customary distance of 500 ft. there is no certainty whatever that fouling of the "protected" track will never occur. Even without statistics, therefore, we seem fully justified in saying that the derail is an extremely crude and undependable device as a physical protection.

There remains, then, the "moral" effect—the old standby in defense of the derail. The belief (or it may have been a known fact) that the mere presence of derails had an important effect in enforcing observance of stop signals, dates back to the time when signal observance was possibly even more crude and undependable than is the physical protection

afforded by the derail. It is the writer's belief that this has all been changed by the general use of efficiency tests and the better understanding of signals in relation to safety which has grown up. If it were found that interlocking signals on a well conducted railroad, were better observed than block signals, there would still be a question as to how much credit should be given the derails for this condition. However, it appears that the general good observance of signals at the present time has made the "moral" effect of the derail so slight as to be far outweighed by its uncertain and unsatisfactory effect as a physical protection when a signal is disregarded.

The stop at an automatic signal has practically the same purpose as the derail. It is supposed to provide a certain physical protection in that, under ordinary conditions, a train is not likely to get as far above a safe speed in the block as it might if it entered without stopping. The stop also is supposed to have some influence as to the train proceeding through the block with caution. The stop itself is an observance of the signal and must be enforced by still other means; but the act of making a stop may be supposed to put the engineman in a frame of mind favorable to careful running in accordance with the rule, after the signal is passed.

As in the case of the derail, however, it is believed that present day signal observance is so good that any additional efficiency or protection due to the stop is too small to be considered. And, as in the case of the derail, the protection secured is crude and uncertain, depending as it does upon the weight of train, grade, etc., while the "moral" effect is probably even less certain than that of the derail. Indeed, it may well be that an engineman sometimes runs faster and less carefully after stopping than he would otherwise, because of his irritation at having to make what seems to be an unnecessary stop, his trouble in getting started again, and the resulting loss of time. The stop is, of course, a somewhat more definite thing, more easily checked than a prescribed limit of speed. There may be a tendency to take the easy course, make efficiency tests on the stop at automatic signals, and let it go at that. The important thing is the proper handling of the train in an obstructed block; and this is a matter for supervision quite as much as is observance of signals in other respects.

If the line of reasoning followed out above is correct, main track derails and the stops at automatic signals are unnecessary, and the derails are a possible cause of damage and death. Unnecessary things that impede operation or may cause "accidents" should be eliminated. It may be said, however, that there is at least one glaring weakness in this reasoning; that observance of signals is not so good and efficiency tests and other supervision are not so well carried out on some roads as on others. The answer is that the authorities now prescribing derails or, as in the case of the rules of the American Railway Association, throwing great weight on the stop at automatic signals, could do nothing better in the interest of safety than to prescribe the measures necessary to bring about the best attainable observance of signals.

C. C. ANTHONY.

## A Chemist in a Freight Car

SCRANTON, Pa.

### TO THE EDITOR:

Of the enormous total bill for loss and damage of freight on the railroads of the country—over 100 millions of dollars yearly—an appreciable percentage is due to large losses on merchandise which is damaged by coming in contact with chemicals and acids. Many carloads of sugar, flour, coffee and other similar commodities have been seriously damaged by being loaded into cars in which the floors were contaminated by various kinds of acids. In some cases not only

were the lower layers of bags eaten or damaged, but also those on the side of the car were eaten and the contents of the bags spilled over the floor.

Strong alkalis of which the drums have been broken open or leaked have produced similar results.

Machinery with parts nickel plated or galvanized have been badly corroded by the fumes of muriatic acid which had penetrated the floors. Rugs, carpets, cotton goods in rolls, etc., have been in many cases eaten 1 or 2 inches, thereby practically ruining the entire roll.

Cars which are contaminated with acid can be very easily detected. An acid car will in practically every case have the appearance of being oil-soaked or wet. Cars which are thoroughly dry or dusty have been found to be free of acid in nearly all cases. Blue litmus paper when placed in contact with acid will at once turn red; place a few drops of water upon the floor and lay the blue paper on the damp or wet place. In case the paper should not assume a reddish appearance red litmus paper should then be placed upon the floor. If the car is soaked with alkali the red paper will turn blue. Cars of this kind should be placarded "BAD ORDER," "ACID CAR" or "ALKALI CAR" and should in no case be used for loading any commodities which could be injured or damaged by acid.

If there is no reaction to either the blue or the red paper the car is probably contaminated with oil, and should not be used for sugar, coffee, flour, dry goods, etc.

Cars which are badly contaminated by acid need a new floor or a new lining. Where only slightly damaged the acid can be removed by washing well with a hose and sprinkling with baking soda.

On the Lackawanna, careful inspection for acids and alkalis has eliminated damage claims of this class.

Vegetables, such as potatoes, cabbage, onions, etc., have been found to be badly damaged on the lower layers when loaded in cars contaminated with salt. Great care should be exercised in the selection of cars for food stuffs and no cars should be loaded with these products which are contaminated with acids, alkalis or salt.

Covering the floor of the car with paper or sawdust will have little effect when the car is badly contaminated with acids or alkalis.

H. J. FORCE,

Chemist and Engineer in Tests, Delaware, Lackawanna & Western.

## Bad Order Car Situation

NEW YORK.

### TO THE EDITOR:

In your October 15 issue, under the caption of "Bad Order Car Situation Presents Serious Problem," M. J. Gormley, chairman of the Car Service Division of the American Railway Association, stated that on September 15, 1921, there were in the country 374,431 freight cars in bad order. This was divided, 183,486 box, 153,275 coal and 37,670 miscellaneous types, or 16 per cent of the total ownership. This should, based on liberal allowance, be not over about 160,000 cars or 7 per cent. In other words, we now have over 210,000 freight cars in bad order which, under proper conditions of maintenance, should be in good order.

Mr. Gormley further said that the problem now before the railroads is to repair these cars, replace with new cars those that cannot be economically repaired or rebuilt, and make other necessary additions to the equipment to take care of business up to the maximum of the past.

During the past two years I have had opportunity personally to examine many freight cars at various large terminal and heavy tonnage movement points in the territory lying east of Kansas City. Never in my 30 years of railroad experience have I seen freight cars generally in a more dilapidated condition, due to lack of proper upkeep. This

situation is the result of several years of improper distribution, handling and use of cars, coupled with the making of costly repeated light repairs to keep them moving, whether loaded or empty, instead of making the ultimately less expensive substantial repairs, renewals and improvements at the time needed, in order to keep them in sound, safe and economical working order.

The downward trend of the freight car situation commenced when the U. S. R. A. Circular No. 7, issued June 8, 1918, promulgated modified Rule No. 2 of the A. R. A. Code of Rules Governing the Condition of and Repairs to Freight Cars for the Interchange of Traffic. This changed the instructions in effect as follows: "Empty cars offered in interchange, if in safe and serviceable condition, *must be accepted*," was substituted for "Empty cars offered in interchange must be accepted if in safe and serviceable condition, *the receiving road to be the judge*." Also "Loaded cars offered in interchange (except those having defective safety appliances) *must be accepted* by the receiving line, which may either run, repair or transfer lading from car," was substituted for "Loaded cars offered in interchange must be accepted, *with the following exceptions, (a) to (e) inclusive*."

Following this modification the U. S. R. A. also suspended the use of M. C. B. defect cards for the period October 1, 1918, to May 14, 1919, thereby waiving any and all responsibility for defects for which the owners were not responsible during that period.

In addition, U. S. R. A. Circular No. 20 issued September 25, 1918 and revised November 25, 1918, established a limit of cost for making repairs to all wooden freight cars in need of general repairs. This stopped the making of repairs in kind, whenever the established limit cost was exceeded, regardless as to the variation of labor and material unit prices, and resulted in a large amount of deferred maintenance, or otherwise in the retirement of equipment which it would have been more economical to repair and continue in service.

The pooling of freight equipment, which was introduced during federal control, was partially abandoned about three months before the return of the roads to their owners, due to the fact that the cars had become badly scattered, from the standpoint of both the needs of traffic and of ownership, and the inadequacy of maintenance of the pooled equipment having become quite manifest during 1918. For example, when the roads were taken over on January 1, 1918, 44 per cent of the cars were on their home lines; when the roads were returned on March 1, 1920, only 21.9 per cent were on home lines. At the same time coal cars for loading on ownership lines in the East were held empty on foreign lines in the West; and box cars needed on ownership lines for loading in the West, were held empty on foreign lines in the East. Since then home cars have been gradually gotten back to the owner's lines and during the past six months' period—April 1 to September 30, 1921—the situation has averaged from 70 to 74 per cent ownership cars on home lines each month.

Until the cars reached their owners their general condition was not of much consequence, the principal idea being to keep them moving with the least delay and cost for upkeep. However, with the elimination of pooling and their return to home lines it has not required much of an inventory of their condition to determine their deferred maintenance condition.

A review of the foregoing will readily show why the railroads today have on their hands the 375,000 bad order freight cars referred to by Mr. Gornley.

My observations have led me to believe that the freight car situation offers one of the most costly propositions that the railroads are up against, both from a capital and operating expense standpoint, and that the cause for this is the lack of proper upkeep and the misuse of equipment during the federal control period; the neglect of preservation and resulting deterioration of metal in the car bodies and underframes

due to corrosion, and the damage to underframes and superstructures because of deficient and defective draft gear and attachments. This latter item is something that is giving all of the railroads a great deal of concern, as when, for example in all-steel equipment, the strength of the underframes is reduced through corrosion of the floor and other plates. If the cars are permitted to run without any cushioning resistance for the buffing and pulling shocks, it does not require much rough yard handling or heavy train service to destroy the center sill and underframe structure, more particularly between the body bolsters and end sills. The fact that cars have been permitted to run without proper draft gear renewals and maintenance during the federal control period, and which practice is being continued at the present time, is due largely to the re-establishment by the U. S. R. A., and by various representative railroads, of the long since discarded transverse key type of coupler and coupler yoke connection, which couples the coupler with the center sills and enables the running of cars in road service without draft gear.

It can be readily understood what shocks the underframes of cars are subjected to, both buffing and pulling, when they are operated in this condition. Until the A. R. A. eliminates the use of such a device and restores the use of an arrangement which *couples the coupler to the draft gear only*, and requires the maintenance of the latter, the existing conditions will not only continue but become more aggravated. The use of the coupler center sill key attachment is also resulting in extraordinary damage to couplers. Even the latest A. R. A. heavy "D" type couplers have been found with not only various parts cracked and broken, but also with the shanks between the coupler head and the butt stoved up as much as from  $\frac{5}{8}$  in. to 1 in., due to extraordinary buffing shocks in combination with being run without draft gear in proper condition. Furthermore, the neglect to maintain draft gear and attachments, in combination with the many useless so-called "friction" types of draft gears that have been applied during the past 20 years, is responsible for much extraordinary center and end sill, draft arm and lug, body bolster, coupler and coupler yoke damage that otherwise would not have occurred.

The modern freight car with its increasing ton-miles per day's work, in longer and heavier trains, requires *actual* maintenance to keep it in serviceable condition and the issuance of instructions to reduce the number of cars in bad order condition so that they will not exceed 4 per cent of the total; the establishment of a freight car depreciation account in the maintenance of equipment expenses to provide money for an equipment reserve fund, which money should properly be put into applied labor and material for the upkeep of existing equipment; the application to cars of defect cards to cover repairs needed for which the owners are not responsible will never take the place of needed actual repair and renewal work on existing equipment.

The Interstate Commerce Commission—Account 315—Freight Train Cars—Depreciation figures for the Class I roads under federal control in 1918 show an amount of \$61,722,302 as compared with a total expense of \$384,507,575 for Account 314—Freight Train Cars Repairs. The expenditure of the amount charged to depreciation in these maintenance of equipment expenses for actual labor and material for upkeep, would have done much to overcome the present freight car condition.

JOHN E. MUELFELD.

PAUL HUBNER, landscape gardener of the Philadelphia & Reading, has this month completed 31 years of service with the road. He has in charge 200 flower beds at 110 different points on the system. Along the right of way he has 5,000 evergreens and many miles of hedge. About 150,000 plants are used each year in the beds.

Visitors at Automatic Train Control Demonstration, Near Rochester, N. Y.

## Automatic Train Control Demonstrated on B., R. & P.

Test of System in Which No Physical Contact Is Made Between  
Engine Apparatus and Roadway

**A** DEMONSTRATION and test of an automatic train control device, which has been developed by the General Railway Signal Company, was made on October 24 on the Buffalo, Rochester & Pittsburgh, near Rochester, N. Y., before a party of railroad men and others interested in safety developments. A locomotive equipped

is of the intermittent contact type, using an inert or non-acting road-side element and is so designed as to cause the automatic application of the brakes on a moving train in case the right action is not taken by the engineman in passing a caution signal. The device is developed to work in conjunction with the automatic block signal system and to supplement the visual signal indications. The apparatus, which is the result of development work extending over a number of years, is of a simple and rugged type and can be easily and quickly installed.

As here installed the device operates in connection with the caution indication as well as the stop indication; but if the engineman is alert he can prevent the operation of the stop and the control of the train is thus left in his hands without automatic interference.

### The Track Equipment

The track equipment consists of a laminated iron structure about 5 in. high and 2 ft. across made in the form of a wide, shallow letter U, with large pole pieces resting on the top of each leg of the U. The top surfaces of these pole pieces are level with the top of the rail. On each of the legs is a coil of insulated wire, the coils being connected together and in turn connected through a contact of the signal relays. If the block ahead is occupied and the track relay open, the circuit to the track element is opened and this puts it in a position to stop a train. When the block is unoccupied and this circuit is closed, the apparatus is in condition to allow a train to proceed.

### Engine Equipment

The track equipment is protected from things dragging and all mechanical injury by a housing or shell resembling somewhat in appearance the back of a turtle. One of these road-side elements is located at each visual signal. It has no moving parts and the construction is such that even if submerged in water or covered with snow, ice, earth, or anything its proper performance is not affected. It is placed between

G. R. S. Automatic Train Control—Track Member

with the control instruments and one car was used in the experiment which was conducted between Rochester and Scottsville, 12 miles south, the track elements being placed at certain automatic signal locations between these stations. Caution, stop and clear signal indications were given and the train was operated at various speeds in both directions, the apparatus acting to stop the train when a caution or stop indication was received. The engineman and fireman, acting in conjunction, can prevent the application of the brakes by devices installed on the engine for this purpose.

The train control apparatus as developed by this company

the rails, avoiding the clearance problems connected with structures outside the rails.

The locomotive equipment consists of a storage battery; a receiving element; an audion amplifier; an electro-magnetic contacting device, or engine relay; and an electro-pneumatic valve; a piston and cylinder arrangement for operating the engineman's brake valve and certain auxiliary devices known as the engineman's hold-by device, the firemen's hold-by device and the reset button. The audion amplifier, the engine relay and the electro-pneumatic valve constitute the translating apparatus that converts an electric impulse into a powerful mechanical force.

The receiving element on the engine consists of a U-shaped laminated iron structure, similar to the one fixed on the track, except that it is inverted. The lower surface of the pole pieces move directly over, and pass from three to four inches above the tops of the pole pieces on the track. Each of the vertical legs of the engine equipment carries a coil of insulated wire. One of these coils is supplied with energy from a storage battery placed in a box located con-

will act as choke coils, not allowing the magnetic flux to pass down and pass up through the engine receiving coil; thus there is no actuation of the brake control on the engine and the train proceeds without restriction.

The audion amplifier, familiar to those interested in wireless telegraphy, is a simple device for magnifying an electrical impulse. With this device it is not necessary to use an unduly sensitive engine relay. This system makes use of the regular air brake equipment, simply moving the engineman's brake handle in exactly the same way that an engineman would move it in stopping the train. A strong pressure is maintained on the brake lever until the reset button, on the outside of the locomotive, is operated; this relieves pressure and restores the brake apparatus to normal condition.

In the development of this device the General Railway Signal Company has not interfered with the requirement that the engineman observe all signals, nor has it encouraged him to relax vigilance. Anything which might tend to make him careless in this respect would be a step backward. A device is, therefore, provided for the engineman in the cab which, if operated in due season as each caution signal is passed, will prevent automatic application of the brakes. If the engineman does not act, the train will be caused to make an unnecessary stop; and either the engineman or the fireman must then get out of the cab and operate the reset button to release the brake handle so that the train may again proceed. This naturally will prove to be a strong incentive to the engineman to watch the caution signal, so that he may avoid the discredit of having the train stop improperly and of having to get out to reset the apparatus. It is optional with the road to require both the engineman and the fireman to operate the reset apparatus simultaneously. With this arrangement the responsibility for taking appropriate action in passing a caution signal is put upon two men instead of one. This is in line with the present rule on most roads that the fireman shall call the signals to the engineman.

This type of train control does not require other energy than that already in existence in connection with automatic block signals. The roadside element requires no battery or other source of electrical energy for its operation, hence the name "inert track element." The only source of energy used is in connection with the engine apparatus, namely, the storage battery carried on the engine.

G. R. S. Automatic Train Control—Brake Valve Attachment

veniently on the engine, thereby producing a strong magnetic field. The other coil is connected with the battery and to the translating apparatus in such a way as to keep air pressure on the brake-operating cylinder, which in turn leaves the brake handle free to be put in any position by the engineman.

Whenever the engine equipment passes over a track element while a stop condition exists, the magnetic field, which is produced as previously described, will pass down to, across and up from the track equipment, producing a magnetic flux through the other leg of the engine equipment, thereby producing an electrical impulse in its receiving coil. This impulse in the receiving coil is then converted by the translating apparatus to a power that will cause the operating cylinder to actuate the brake lever, pushing it over to the same position that the engineman would have pushed it if he had intended to stop the train.

In case, however, the circuit to the track equipment is closed, as the train passes, the coils on the track element

# Labor Board Opens Inquiry Into Threatened Strike

Brotherhood Leaders and Executives Before Board—Employees on Several Roads Against Strike

THE RAILROAD LABOR BOARD'S attempt to avert the threatened strike of train service employees set for October 30, reached its climax, when, in response to a call issued by the Board, the general chairmen representing the train service employees and telegraphers on all of the larger carriers, executives of the train service brotherhoods and the telegraphers organization, and executives or representatives of the various Class I carriers came before the Board on October 26. Because of the large number of interested parties present at the hearing it was necessary to obtain the use of the Coliseum Annex for the meeting and even this large meeting room was crowded.

After considerable time had been taken up with the roll call which showed that whereas representatives of almost every railroad were present but few of the general chairmen called by the Board put in their appearance, the meeting was opened with the reading of a statement by R. M. Barton, chairman of the Board, which outlined the nature of the hearing, the testimony which the Board would deem relevant, and the reasons for the calling of the meeting.

Mr. Barton said in part:

## Chairman Barton Opens Meeting

This proceeding is not a case brought to the Board by either employee or carrier, but one initiated by the Board on its own motion, it being principally moved thereto by the threatened interruption to commerce. It is an official governmental inquiry ordered and to be conducted by the Board. It is based on two provisions of the Transportation Act. One, Section 313, which provides that when the Board has reason to believe that any decision by the Board has been violated by any carrier or employee or subordinate official or organization thereof, it may, on its own motion, after due notice and hearing to all persons directly interested in such violation, determine whether in its opinion such violation has occurred and make public its decisions in such manner as it may determine. The other is the provision in Section 307, the emergency provision, which authorized the Board to act when a dispute is likely to substantially interrupt commerce.

The Board wishes all parties to bear these things clearly in mind and thoroughly understand the limits of this inquiry and conform thereto. The inquiry will be conducted wholly under the directions of the Board, as it is not a suit or application of either of the parties.

## Defines Scope of Hearing

On the first point, whether there is a threatened withdrawal from service of the several carriers in opposition to and in violation of Decision No. 147 and whether the parties have violated or are violating this decision and the law; the inquiry will be limited strictly to this question.

The merits of that decision or any other decision of the Board are not at this time in question and no discussion in regard thereto will be in order. The question is simply: Has there been a violation or is one threatened?

On the second subject of inquiry as to what other causes exist that are causing or liable to cause an interruption of traffic, the inquiry will be what either side has done or is doing or threatening to do that may lead to a stoppage of work, and, particularly, the nature of the exchange of proposals that occurred between the railway executives and the executives of the labor organizations at their conference at Chicago, October 14, 1921; what disputes resulted therefrom, and to what extent said disputes are the occasion of the threatened interruption. The Board will further inquire as to what, if any, wage reductions have been made or are in contemplation by the carriers without first securing the approval of this Board in a legal way.

The inquiry on behalf of the Board will be conducted by the chairman of the judiciary committee, Ben W. Hooper, but questions will be permitted by other members of the Board and either party or their representatives or any of the representatives of any of the parties directly interested may be allowed to ask questions and make statements that may bring out the real facts on the issues above indicated.

## W. G. Lee Questioned

After this outline, B. W. Hooper, a member of the public group of the Board began a quiz of W. G. Lee, president of the Brotherhood of Railway Trainmen, by a series of questions regarding identity, etc., and culminating in a request for a definite statement of the developments which led to the strike vote and orders and concerning the position of the organizations now regarding the threatened strike. In reply Mr. Lee outlined his view of the manner in which the present controversy developed the facts recited by Mr. Lee have in general been described in previous issues of the *Railway Age*. Coming to the actual preparation of the strike ballots in accordance with the resolutions adopted by those representing the men, Mr. Lee described in detail the reasons for his refusal to join with the other four train service organizations in a joint ballot because of the fact that the ballot they proposed contained a reference to "questions" he did not believe were involved.

"For once," he said, "I decided I was going to tell the men the truth. I didn't intend to camouflage the east. Let criticism fall where it may."

Leading questions from Mr. Hooper brought out the fact that the difference between the trainmen's ballot and that of the other organizations was in the statement of grievances over which the strike vote was taken. Mr. Lee frankly admitted that in his opinion the only grievance over which the men could strike at this time was the wage reduction ordered by the Labor Board in Decision No. 147. There followed a detailed description of how the trainmen's organization prepared the ballots, took the strike vote and counted the returns. The result, Mr. Lee said showed that 88 per cent of his organization preferred to strike rather than to work under the rates of pay fixed by the board. In presenting these figures Mr. Lee admitted that the two-thirds majority of strike votes had not been recorded for some carriers. As such carriers, he named the Belt Railway of Chicago, the Chicago & Western Indiana, the Chicago Junction, the Chicago River & Indiana, the Toledo, Peoria & Western, the Elgin, Joliet & Eastern, the Indianapolis Union, the Louisville & Jeffersonville Bridge, the Pennsylvania Lines East, the Pittsburgh & Lake Erie, the East St. Louis Connecting, the Lake Erie & Eastern, the Wiggins Ferry Company and the Central Indiana.

L. E. Shepard listed the following roads on which the necessary majority of the conductors failed to ratify the proposed strike: Bangor & Aroostook; Boston & Maine; Central of New Jersey; Cincinnati Northern; Detroit & Mackinac; Evansville, Indianapolis & Terre Haute; New York, Susquehanna & Western; Peoria & Pekin Union; Toledo, Peoria & Western; Zanesville & Western; Dayton & Union; Pennsylvania, Lines East and West; Pittsburgh & Lake Erie; Duluth & Iron Range; Duluth, Missabe & Northern; Philadelphia & Reading; Duluth, South Shore & Atlantic; St. Louis Terminal Association; Peoria Railway Terminal; Texas Midland; Trinity & Brazos Valley; and Arizona & Eastern. Mr. Carter listed the Pittsburgh & Lake Erie, the Duluth & Iron Range and the Indiana Central as the lines on which the firemen voted not to strike.

To show the manner in which the trainmen had been presented with the facts prior to and after the vote, Mr. Lee read portions of circulars sent to the membership in which warning to the men concerning the folly of a strike at this time was but thinly veiled. Reverting again to the difference

between the trainmen's ballot and the joint ballot of the other organizations, Mr. Lee said in reply to his questioners:

"I believe that we should incorporate in the ballot a statement showing the different conditions existing today. In the old days, we reported the result of a ballot to the officers of the roads and negotiations were begun anew. I believe that we should call attention to the difference now that the federal law was in effect and that we did not go back to the officers, saying that we were voting on the question of accepting or rejecting the wage cut of the Board. Time-and-one-half for overtime and future wage reductions were not considered."

#### Afternoon Session

The afternoon session opened with Mr. Hooper still interrogating Mr. Lee and attempting to establish that the inclusion of references to future wage cuts and overtime changes in the statement accompanying the trainmen's ballot was for the purpose of influencing the men to vote for a strike. Mr. Lee's reply was vague, frequent references being made to other sections of the statement which he said "murdered" these references. The quiz of Mr. Lee closed with a discussion of his power to call off the strike on the International & Great Northern. After giving a history of his part in this walkout, Lee denied that he has the power to call off the strike or could have prevented it.

The examination of Mr. Lee developed the fact that (1) the strike of the trainmen is in the hands of the men because of the manner in which the developments have been handled by him, in other words he has passed the buck to the men after giving them the best advice possible under the circumstances; (2) the trainmen's strike is solely a protest against the wage cut of last July and (3) only "satisfactory settlement" can bring about a recall of the strike orders.

#### L. E. Sheppard on Stand

L. E. Sheppard, president of the Order of Railway Conductors followed on the stand, opening his testimony with an outline of the laws of his organization regarding the strike. The vote polled by the conductors, Mr. Sheppard said, showed that 68 per cent of the men in eastern territory voted to reject the wage cut, 88 in southern territory and 87 in western territory. In support of his argument that there are other questions over which the men might strike, Mr. Sheppard charged that 19 carriers had filed applications with the Board for general revisions of schedules with the conductors, 54 for partial revision of the schedules, including the abolition of time-and-one-half for overtime, 12 for elimination of punitive overtime and 25 for material changes in the schedules. As with Mr. Lee, Mr. Hooper by skillful questions tried to bring out the fact that statements regarding overtime and future wage cuts were included in the strike ballots to influence the men. At one point, Mr. Hooper asked Mr. Sheppard if he thought it was fair to ask the carriers to make a promise to ask for no further wage cuts when relevant factors cited in the Transportation Act are changing so rapidly. To this question Mr. Sheppard replied that they were merely following precedent in so doing. Changes in wages or working conditions usually stand for at least one year he said. Mr. Hooper asked Mr. Sheppard if it was not unfair to "place an 'inflammatory' statement" in the statement accompanying the ballot. Mr. Sheppard took exception to the terms used and said, "Some of the men probably did not read the statement with the ballot."

#### W. S. Stone Has Argument

W. S. Stone, chief of the Brotherhood of Locomotive Engineers followed on the stand but at the start of his testimony, he was interrupted by Judge Barton on the grounds that his remarks were not relevant to the case. Mr. Stone wanted to submit a list of roads that he alleged had violated orders of the Labor Board but upon being stopped by Judge Barton said, "I will bow to your decision. If we cannot find redress in this Board I want to know where 80,000 engineers

can find relief. If I am prohibited from explaining the feelings of our men, then I do not see that there is anything more for me to say." Mr. Stone then refused to give the Board a list of the roads whose engineers had failed to poll a two-thirds strike majority, but upon the specific request of W. L. McMenimen a member of the labor group on the Board, promised to file the list later.

T. C. Cashen president of the Switchmen's Union of North America then told the Board that 85 per cent of his members had voted to strike and that a constitutional majority was polled on every carrier party to the dispute.

#### W. S. Carter Questioned

W. S. Carter, head of the Brotherhood of Locomotive Firemen and Enginemen, the next witness examined, told the Board that if the strike was to be called off, it would be necessary in his organization to take another referendum. Questions by Mr. Hooper were similar to those asked the other labor leaders and to a large extent the answers were similar. Employees on three roads, Mr. Carter said had voted to accept the lower wage scales.

#### Real Climax of Hearing

The real climax of the hearing came at the close of the afternoon session when Chairman Barton asked each of the five leaders to answer four vital questions. They were in substance: (1) What organization or individual can call off a strike? (2) Suppose you as the executive of a labor organization or your executive committee issued an order or a statement that the strike would not occur what would the men do? (3) If this board issued an order stating that the strike is not justified, would the men obey the order? and (4) If the Board declared a strike unjustified will you use all your power and efforts to see that it is obeyed?

The answer of the labor leaders spelled failure of the effort of Board if they accurately represent the feeling of the men. To the first question all answered that power lies either in their hands or in the executive committee or both. The second question brought forth the reply that if an order is so issued it would have little or no effect on the strike. The third question brought either an evasion or a statement that such an order would not be obeyed by the men. The fourth question likewise was either evaded or the statement was frankly made that the leaders would not co-operate unless a "satisfactory settlement was reached."

#### Executives Quizzed at Evening Session

The evening session was devoted to a quiz of the executives. It was opened by Thomas De Witt Cuyler, chairman of the Association of Railway Executives, who presented a statement reviewing the development of the present controversy and the action taken by the executives. In reply to a question asked by Mr. Hooper, Mr. Cuyler stated that it was not the purpose of any carrier to make reductions in wages without first holding conferences with the men and submitting the case to the Board for ruling. Mr. Hooper then brought out by a series of questions, directed at the executives in general, the actual position of the roads at the present time and their willingness to abide by rulings of the board.

Mr. Stone was finally allowed to read a list of 33 roads which he charged had violated the Board's orders in reducing wages without sanction, but the roads proved to be all short lines, many of which were not parties to the case. Answers were made on behalf of three of these roads. In each case the statement showed the willingness of the carrier to obey the Board's orders.

The case was finally brought to a sudden close with the announcement by the chairman of a probable decision within the next few days.

#### Board Confers Previous to Meeting

Previous to the opening of the meeting, members of the Board conferred with representatives of the employees and

of the carriers as to the procedure to be followed. Subsequently two statements were issued, one by the Board and the other by T. De Witt Cuyler, chairman of the Association of Railway Executives. The Board's announcement practically set forth its views as to the present situation and the disclosure of the compromise plan which it believed might meet the irreducible demands of the brotherhood chiefs.

Attributed to Mr. Hooper, the statement says in part:

1. Friction has arisen between practically all the Class I carriers of the United States and their train and engine employees and telegraphers represented by the following organizations:

Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen and Enginemen, Brotherhood of Railroad Train-

From the Birmingham Age-Herald

Cold Iron

men, Order of Railway Conductors, Switchmen's Union of North America, Order of Railway Telegraphers.

2. One of the principal causes of this trouble lies in the fact that said carriers have notified certain of the executives of said organizations that it is the purpose of the carriers to apply to the Labor Board for a further reduction in wages additional to that ordered July 1, 1921.

3. The proper consideration of the conditions surrounding the matters now pending before the Labor Board should remove any immediate occasion for strike between the carriers and said organizations of employees growing out of a possible reduction in wages by the Labor Board. The conditions referred to are as follows:

Since the organization of the Board a little more than 18 months ago more than 2,000 cases involving disputes between carriers and employees have been filed with the Board. More than 700 of these disputes have been disposed of and many others have been heard and not decided. The Board has been deluged with cases involving minor grievances which would not have been sent here to congest its dockets had the carriers and their employees co-operated in the establishment of adjustment boards as provided in the Transportation Act.

Three questions of paramount importance have been before the Board, the wage increase of 1920, the wage reduction of 1921, and the adoption of new rules and working conditions. Each of these matters has necessarily consumed a great amount of time. Each of them involved all the Class I carriers and every individual of every class of their employees in the United States.

The two wage controversies have been disposed of, but during the entire pendency of both, the revision of rules and working conditions have been pending and is now only well begun. The Board has been justly urged by the carriers to complete its consideration of the rules and hand down its decision. The Board's unavoidable delay in disposing of this question has subjected it to criticism by the public and restive complaint upon the part of the carriers.

## Defines Board's Position

The Board has heretofore issued two decisions embracing shop craft rules. The remainder of the shop craft rules are still pending and the disputed rules of other classes of employees have not yet been touched.

No more difficult and complex question can ever arise before this Board than that of the revision of the rules governing the working conditions of any class of railway employees. It requires an immense amount of time and painstaking work. It is the judgment of the Board that, as a matter of procedure it would be unwise, and as a matter of policy, unjust, to discontinue the consideration of rules and working conditions and enter into a prolonged hearing of an application to reduce wages at this time.

It is not within the province of the Labor Board to shut the door in the face of either carrier or employee desiring to submit a dispute to the Board, or to dictate the time when such dispute shall be fixed. It is, however, within the discretion of the Board to fix the order in which it will take up and consider the numerous matters submitted to it.

In this aspect of the matter, it should be of material help to the carriers and their employees to understand that the status of the Board's work, as above set out and its plans with regard thereto.

It will thus become apparent that the employees, who are protesting against a further wage cut, are crossing bridges long before they can possibly get to them and that carriers cannot hasten a wage reduction by applying for it at this time.

The attitude of the Board in this matter must not be misunderstood. It is not affected by the threat of a strike. It had adopted

From the Memphis Commercial Appeal

The "Vaudevillians!"

several weeks ago the policy of making everything else secondary to the consideration of the controversies over rules and working conditions, but, with the ordinary number of unavoidable digressions, and even with the greatest diligence, it will require considerable time to complete the decision of rules.

Another factor that demands the highest consideration is the fact recognized by both carriers and employees that the question of wages and working rules are inextricably interwoven. Many of the rules and working conditions governing the employees have a money value and it would be difficult to give satisfactory consideration to the question of wages until the rules and working conditions to which the wages would apply are definitely fixed and known.

In view of the foregoing considerations, it is the purpose of

the Labor Board that the submissions of carriers and employees on rules and working conditions shall be completely disposed of as to any particular class of employees before a hearing is had on any question of wages affecting said class of employees on any carrier covered by Decision No. 147.

The rules governing any class of employees will be deemed to have been completely disposed of when the Board has passed upon all the submissions affecting said class either by a decision of disputed rules or by referring them back to a conference of the carrier and employees.

### Dispute Is With Board

The statement of Mr. Cuyler, issued immediately after, said in part:

The railroad executives are not aware of any present dispute between them and their employees. The strike vote and order is solely against a decision of the Railroad Labor Board reducing wages by 12 per cent as of last July 1.

The railroads have in fact determined to seek to reduce rates, and as a means to that end, to further reduce wages. But the carriers have expressly decided to proceed in accordance with the law requiring conferences with employees prior to taking such action, and to put no such reduction in wages into effect until it has been passed on by the Railroad Labor Board.

Any proposal to strike, therefore, is purely concerning a past decision of the Labor Board or against what the Railroad Labor Board might do.

The railroads wish it to be clearly understood that they would deprecate a strike, but that their first obligation is to the public to render adequate service at reasonable rates. Present rates are in many cases high and steps must be taken to reduce them. That reduction can only be effected by reducing costs, and of the costs by far the largest element is the wages of labor.

The issue is very clear. If present wages are to be continued, rates cannot be reduced. If rates are to be reduced, the present wages cannot be paid. The railroads are powerless to take any other position.

### Labor Board's First Effort at Mediation Fails

The events preceding this meeting and following the close of the report in last week's *Railway Age* are many and significant and may be summarized as follows:

The conference between members of the Railroad Labor Board and leaders of the five train service organizations which have issued strike orders, the call for which was reported in the *Railway Age* of October 22 (page 758), proved a complete failure. Representatives of the brotherhood, on leaving the conference, stated that the Labor Board had offered them no definite plan for the settlement of the controversy, and that consequently they were unable to take any action toward calling off the scheduled walkout. Members of the Board likewise stated that little had been achieved at the meeting except a "frank interchange of views."

Following the conference the brotherhood leaders again returned to Cleveland, where they divided their time between working on strike plans and issuing statements justifying their position in so far as it can be justified with nothing but a comparatively small cut in basic wages against which to strike.

"With regard to the position of the employees at this time," Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, said in one of these statements, "I can only say that their representatives are patiently waiting for any development that would appear to offer a solution."

"We are not now nor have we been desirous of being a party to precipitating a strike, but when it is quite apparent that the railroads propose not only to reduce wages, but to take from the employees practically all the conditions of service that have been obtained for many years, and the Railroad Labor Board is unable or fails to give us any assurance that the interests of the employees will be protected from such onslaught of the interests that control the transportation lines of our country, nothing is left for our employees but to stand upon their constitutional rights and retire from the service of these carriers."

\* Concerning these charges, R. M. Barton, chairman of the

Board and representative of the public group, said that he is "willing to let the public decide who is to blame if there is a strike."

"But," he added, "you may say this for me, as emphatically as you wish: Whether the Labor Board is to be blamed for anything or not, these men cannot justify their action on that ground. They can't thus excuse their throwing the country into such a terrific industrial crisis as a general railroad strike will bring about."

### Ten Organizations Decide to Withhold Strike Orders

The following days witnessed the withdrawal one by one of ten of the units in the "associated standard recognized railroad labor organizations." The latest reports indicate that the various railroad unions have aligned as follows:

The Brotherhood of Railroad Trainmen, the Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen and Enginemen, the Order of Railway Conductors, the Switchmen's Union of North America and the Order of Railroad Telegraphers have announced their intention to strike or have issued strike orders.

The six organizations comprising the Federated Shop Crafts, the United Brotherhood of Maintenance of Way Employees and Railroad Shop Laborers, the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, the Brotherhood of Railroad Signalmen of America, the Brotherhood of Stationary Firemen and Oilers have indicated their intention to await further action by the Labor Board before actually calling their memberships out.

In this connection an announcement by the Federated Shop Crafts said in part:

"It develops that the four transportation organizations would not be bound to strike after they had received a settlement acceptable to them, even though those who had assisted them in making their strike successful had received no settlement and were still on strike."

"It must therefore be clearly evident to all the the membership of any of the four transportation organizations on any railroad, cannot and will not co-operate with any other class of employees. The above are indisputable facts, and the membership of the Federated Shops Crafts are entitled to know these facts."

"There is no hope for co-operation with the four transportation organizations. Therefore the Shops Crafts must outline and adhere to their own plan of action in so far as those organizations are concerned. It is recommended that the Shops Crafts await rulings by the Labor Board on general working rules, decision on which has been withheld."

### Telegraphers to Walk Out

The most unexpected development was the announcement by E. J. Manion, president of the Order of Railroad Telegraphers, that his organization would walk out in conjunction with the brotherhoods, following the same program as to the roads designated in the various groups. Up to that time it had been expected that the eleven "standard" unions, which recently split with the "big five" brotherhoods, would act in unison in whatever course was decided upon.

"Our general chairmen have concluded their deliberations," Mr. Manion said, "and are returning to their respective headquarters to complete their preparations for making the strike effective on the same railroads and dates named in the strike order of the other transportation organizations."

### Labor Board's Call to October 26 Conference

Closely following these developments came the order of the Labor Board for the conference which began on October 26. The Board's order said in part:

Whereas, it has come to the knowledge of the United States

Railroad Labor Board that a dispute exists between carriers and organizations of their employees; and,

*Whereas*, information has come to this board that a conference was held in Chicago on the fourteenth day of October, 1921, between certain of the executives of said carriers, and certain executives of said organizations of said employees, relative to the matters in dispute, at which conference no agreement was reached; and,

*Whereas*, immediately following said conference it was announced through the public press that the executives of said organizations of railway employees had issued and sent out to the members thereof orders or written authorities to strike, and that a strike vote had been taken on the lines of the said carriers; and,

*Whereas*, the board's information is to the effect that said strike is threatened on two grounds: First, in opposition to the wage award in decision No. 147 of the board, and, second, on account of an unsettled dispute both as to wages and working conditions; *be it therefore*,

*Resolved*, by the United States Railroad Labor Board:

1. That, in so far this threatened strike is in opposition to and in violation of decision No. 147 of this board, the said labor organizations on each of said carriers be and are hereby cited to appear before this board for hearing as to the question whether or not they have violated, or are violating, decision No. 147, and,

2. That in so far as said threatened strike is the result of a dispute between said carriers and their organizations of employees concerning wages and rules and working conditions, this board hereby assumes jurisdiction of said dispute on the statutory ground that it "is likely substantially to interrupt commerce," and said carriers and said organizations of employees are hereby cited to appear before this board at Chicago, Ill., for the hearing of said dispute.

*Be it further resolved* that both parties to said dispute are hereby directed to maintain the status quo on the properties of the said carriers until said hearing and decision.

#### Brotherhood Leaders Meet

Interest shifted from the Labor Board to a meeting of the Brotherhood chiefs and their respective chairmen on October 27. The situation on October 27 was substantially as follows: the inquiry conducted by the Labor Board on October 26, developed that with the exception of the trainmen, a strike has been voted for and ordered as a protest against the July wage reduction, against the announcement of the carriers that further wage decreases are to be sought and

against the proposed efforts of the railroads to bring about the abolition of punitive overtime. The trainmen's strike is based wholly on the July wage reduction.

A statement of the Board made on October 25, stated definitely that no further reductions for any group of any employees would be considered by the Board until rules and working conditions for that group were disposed of. As to overtime pay, the Board pointed out that in cases of the shop crafts rules already promulgated, overtime provisions were retained to a large extent. Furthermore, Mr. Cuyler had informed the Board that none of the carriers had any intention of making further changes in wages or working conditions without submitting controversies to the Board. These facts are pointed out as constituting what might be taken as a "satisfactory settlement" by the leaders of the labor organizations.

## International & Great Northern Trainmen Strike

TRAINMEN on the International & Great Northern, members of the Brotherhood of Railway Trainmen, went on strike on October 22 as the widely heralded "opening gun" of the threatened national walkout. The strike was put into effect despite instructions from the Labor Board ordering the men to remain at their posts until after the meeting between the union leaders and railroad chiefs in Chicago on October 26. The walkout of the men was quiet and without any demonstration. Union men who were on trains when the strike became effective had received instructions to finish their runs before walking out.

Referring to the strike W. G. Lee, president of the Brotherhood of Railroad Trainmen, said:

"The men and committee of the brotherhood on that railroad have voted to withdraw from the service, and authority, as vested in our constitution has been given them. The matter is entirely out of my hands."

From the Chicago News

Preparing for the Big Railroad Strike Melodrama

With reference to the progress of the strike on the International & Great Northern, Thornwell Fay, executive officer for the receiver has advised the *Railway Age* in response to a telegram as follows:

Strike trainmen took place noon Saturday 22. Every passenger train on road has been operating on schedule since strike. Did not attempt to operate freights until Monday when we operated freights on every division and increased number on Tuesday and further increase today (Wednesday). Also doing considerable switching. Every point conditions improving daily. Trainmen demanded that we restore wages in effect June 30, 1920, hence strike is against Labor Board, which should have publicly denounced this strike as being against its orders and against the law, but am not advised that they took any action whatever about this particular strike.

#### Mr. Lee Asked About I. & G. N. Walkout

Action by the Labor Board was taken at the Chicago meeting on Thursday, when Mr. Lee, president of the Brotherhood of Railway Trainmen was asked about the strike on this road in connection with his other testimony. Mr. Lee read telegrams explaining that the Texas men voted to quit work in advance and by so doing forfeited their right to general strike benefits. Mr. Lee was asked by Mr. Hooper: "What action was taken to hold the men in service in accordance with the Board's order to preserve the status quo?" "None whatever," was Mr. Lee's reply. Mr. Hooper continued, "You understood there was to be no strike on any road until after this hearing?" In reply to this question, Mr. Lee said, "I understood that was the intention of this Board, and of course, we had our own ideas as to just how far this Board's intention was binding on us."

### Pennsylvania Again Before Labor Board

IN RESPONSE to a call issued by the Railroad Labor Board the Pennsylvania Railroad appeared before the Board on October 20 and again outlined its views of the Board's jurisdiction and explained its action in carrying on its own negotiations with its employees regardless of the Board's instructions as to the procedure to be followed. Representatives of the carrier told the Board in part that:

1. The carrier has informed the Board in its several pleadings filed in this case that it could not accept as a lawful decision the declaration of the Board that the election under which its employee representatives were chosen was illegal and that the rules and working conditions agreed upon by such employee representatives and the management were void and of no effect. This position was taken and is sustained by the carrier because it was and is of the opinion that the Board had no jurisdiction over the matter which was the subject of the decision.

The Board has said that "the question involved is merely one of procedure," and the carrier is advised that questions of procedure and the method and manner of selecting employee representatives are matters within the control of its management and its employees and wholly without the jurisdiction of the Board.

2. Disputes which are cognizable by the Board are, in the opinion of the carrier, those which threaten "an interruption to the operation of any carrier" and which involves or grow out of real grievances in connection with wages or working rules and conditions.

Working rules and conditions have been made the subject of agreements by and between the carrier and its shop craft employees, and those rules and conditions are subject to the jurisdiction of the Board and its decision thereon under the provisions and in accordance with the procedure of the Transportation Act.

3. The carrier states that it has not "violated" any decision of the Labor Board in the sense that it has set at naught and refused to comply with a lawful pronouncement of the Board; neither has it violated any provision of the Transportation Act, nor "defied" the Labor Board or the Congress which created it. To the contrary, the carrier has conceded the jurisdiction of the Labor Board to hear and decide such disputes as fall within the purview of the Transportation Act, and it is a willing party to several submissions now pending before the Board in the matter of wages and working rules and conditions.

4. The carrier further states that it is its opinion the Board, in

its said Decision No. 218, has without warrant of law exercised the functions of an administrative or regulatory body, and as such has assumed to invade the domain of management and to assert jurisdiction over matters solely referable to the functions of railway management.

5. The carrier represents to the Board that in denying its jurisdiction over the subject matter of Decision No. 218 it does so with all due courtesy and with no lack of respect for the Board's decisions on matters within its mediatory jurisdiction of real disputes affecting the wages and the working conditions of its employees.

6. The carrier is convinced that the power sought to be exercised by the Board in this proceeding has not been conferred upon it by Congress, and consequently the order or decision which it has made is entirely beyond the scope and authority of the Board.

The carrier strongly deprecates any controversy with the Board with respect to the extent of the powers or jurisdiction conferred upon it by the Transportation Act, and, in compliance with the decision had involved no serious consequences, the carrier in order to avoid any controversy on the subject would have submitted to the decision notwithstanding its belief that the Board had assumed a jurisdiction not conferred upon it by Congress. But the carrier, in the consideration of the question as to whether the directions of the decision should be observed, was obliged to determine whether the system of employee representation which it had inaugurated was to be impaired and its usefulness and value largely destroyed, or whether in order to avoid non-compliance with the decision it should, in considering and determining what rules governing working conditions should be established, consult with an organization which, the carrier believes, advocates (a) the closed shop, (b) the sympathetic strike and (c) limitation of output, and which had been largely instrumental in framing rules governing the operation of the shops during the period of Federal control. The carrier asserts that these rules had reduced the efficiency of shop labor on its lines to the extent of at least 35 per cent.

Following the presentation of this statement B. W. Hooper, public member of the Board, started the cross examination of the legal representatives of the Pennsylvania who were present. However, the latter rested their replies largely upon the statement which they had just presented and the cross examination did not bring out any points in this controversy other than those which have been apparent for some time.

Somebody Will Give Us a Lift

# Railroads Prepare Against Strike Possibility

Loyalty Poll, Volunteers and Schools, Features; Loss of Seniority, Pensions, etc., Threatened

**A**LTHOUGH the general impression seemed to prevail that the general conference called by the Railroad Labor Board on Thursday as well as other factors in the situation would be likely to result in the withdrawal of the strike order of the train service brotherhoods, the railroads in all parts of the country have spent the last two weeks in bending every effort towards meeting the strike if it should occur.

The railroads around New York have co-ordinated their work through the general managers' committee, of which E. M. Rine, vice-president and general manager of the Delaware, Lackawanna & Western is chairman. Each of these roads has asked its employees to consider carefully any decision to leave the service. The employees have been warned that if they leave the service, they will lose not only their jobs but their seniority rights and pension privileges. Ralph Peters, president of the Long Island, in his letter to employees of that road, further asks the question, "Can you

schools have been established at various points by the different roads.

## Appeal to Employees' Loyalty

A letter typical of those which have been addressed to the train service employees is that signed by William H. Truesdale, president of the Delaware, Lackawanna & Western. Mr. Truesdale's letter was dated October 20 and read as follows:

To all employees in engine, train and yard service:

Although the Delaware, Lackawanna & Western has not received notice from its employees in engine, train and yard service of such intention, the newspapers contain apparently authentic information to the effect that a strike of such employees has been ordered to take place on November 1, 1921.

It is stated the strike has been ordered as a protest against a reduction in wages authorized by the United States Railroad Labor Board in Decision No. 147, effective July 1, 1921.

Therefore, the proposed strike is directed, not against this company, but against the United States Railroad Labor Board, created by an Act of the Congress of the United States of America, and is in defiance of an overwhelming public sentiment.

Misleading information is being disseminated as to the intention of the railroads to arbitrarily further reduce wages. Under the law this can only be accomplished through agreement with employees or by order of the United States Railroad Labor Board.

Facing, as you do, at this time a very important crisis in your lives, and one that will in its outcome cause you and your families serious and permanent loss, the management of the company feels that it is justified, for many reasons, in making this personal appeal to you to give careful thought and consideration to the question of obeying the order you have received to leave the service of the company on November 1.

Many of you have been in the company's employ for years, during which you have worked your way up to the positions of priority you now hold and which are of much value to you. You should not, in justice to yourselves, voluntarily sacrifice such rights without being sure of getting full value in return.

You, each and all, we are sure, are fair enough to recognize that this company, since the United States Railroad Labor Board was established has complied fully with every order issued by that Board governing wages and working conditions of railroad employees.

We earnestly urge each one of you, before taking a step which you cannot retrace and one which may involve you and your families in loss and possible suffering for many years to come, most carefully to weigh and consider the wisdom and justification of obeying the order for cessation of work on the date above mentioned.

## Company Will Take Over Insurance

Will you not answer to your own satisfaction the following questions:

Am I justified in giving up my position and seniority rights for which I have worked all the years I have been connected with the company?

Will I obtain anything that will compensate me for the pension benefits which I will lose by giving up my position?

Am I sure of getting, in return for the sacrifice of lifelong friends, associates and surroundings for myself and family, anything that will justify the risks I am taking by now giving up my position?

The company realizes that in remaining loyal to it at this critical time many of you may sacrifice certain insurance protection you now have for your families through the organizations with which you are connected. It is not desired that you shall suffer loss in this way, and in event therefore, of your being forced to give up these insurance benefits as result of your loyalty continuing at work, or if, for any reason, you should desire to withdraw from the organizations which now provide this insurance for you, the company will take over same and guarantee, on equal terms as to premiums, etc., with those you now pay, to carry it for you. In doing this it will arrange with one or more actuaries of leading life insurance companies to work out in

## Loyalty Poll Ballot

secure another position where your experience will count and where steady work can be secured at equally remunerative wages?"

A feature of the steps taken by the roads represented in the general managers' committee has been the taking of a so-called loyalty poll, in which each employee has been asked pointedly whether he will stay on the job or walk out. Announcement was made after a meeting of the committee on Tuesday that a majority of the men questioned by supervisory officers had signified their intention of remaining loyal in case of a strike.

The roads have announced their intention of taking care of the employees who stay with them during the emergency. Various of them, including the Delaware, Lackawanna & Western, the New Haven, the Long Island, etc., have advised their intention of taking care of the insurance of any employees who may lose their insurance in the brotherhood organizations by remaining loyal to the road.

When the strike call was first announced, several of the roads inserted advertisements in the daily papers asking for men to take the place of those who may walk out in response to the strike order. The response to such advertisements was in a number of cases so great that the advertising was discontinued within a few days. Volunteers have also come forward. The colleges in particular have taken the lead in this respect. To train the new employees and volunteers,

tial plan of insurance that will fully and fairly protect you and your families.

We earnestly hope you may decide upon your course cautiously and wisely.

The New Haven, which addressed a similar letter to its employees, enclosed a reprint of editorials, from a number of leading newspapers, intended to show how public opinion was expressing itself in connection with the strike call.

### Training Schools Established

Among the roads that have announced the establishment of training schools for volunteers is the Long Island. "The Long Island Railroad has no quarrel with its men," says a circular addressed by that road "To the people of Long Island and the patrons of the Long Island." The circular says in part:

The management and the men have complied with all the orders and regulations of the Labor Board, a body duly authorized to handle all such matters under the Transportation Act of 1920. If the threatened strike takes place and a majority of the men on the Long Island Railroad obey the order of their leaders it will seriously affect train service and cause great inconvenience to the public. To prepare against this eventuality the management asks the co-operation of its patrons, and calls for volunteers who, with such men as remain in the service, may operate the trains necessary to meet the daily requirements.

We will need men who can be trained to perform duty as engineers, firemen, motormen, conductors, trainmen, yardmen, switchmen, etc.

Schools of instruction will be opened at once at Jamaica and Morris Park Shops, where an organization for training men for this service has been provided. All volunteers and applicants for employment to fill the places of such men who may leave the service are requested to present themselves to the assistant general superintendent at his office at Jamaica, room 210, where they will be classified and instructed between the hours of 8.00 a. m. and 10.00 p. m. daily until their services are required.

The intention is not to employ professional strikebreakers, and the railroad company guarantees that those who enter its employ will not be discriminated against as to the permanence of their employment.

### Volunteers

Volunteers to man trains are presenting themselves in many quarters. In the suburban zone around New York, many communities have formulated plans for manning the suburban trains. Mayor Charles H. Martens of East Orange, N. J., who played an important part in the outlaw strike of April, 1920, is perfecting an organization to assist the Lackawanna and Erie. Among other things, he has sent out a questionnaire to the persons who have volunteered asking each whether he can qualify as a locomotive engineer, fireman, trainman, clerk or motor truck driver.

Dean George E. Hodges of Williams College, Williams-town, Mass., has announced that his institution has decided to place the student body at the service of the Boston & Maine. Some 700 students have volunteered at Harvard and a school has been established near the college grounds to instruct men. The work is in the hands of an undergraduate committee, the college not having taken any official action. News concerning the volunteering of college men is also received in connection with Stevens Institute, Hoboken, N. J.; Lehigh University, South Bethlehem, Pa.; Trinity College, etc.

### State Officials Take Action

Several of the states have taken official action relative to the calling of the strike. Each of the governors of the New England States has established a general emergency committee to provide food and fuel for the people. These committees are co-operating with each other and each has made or is making a survey of the food and fuel situation throughout its state. In so far as possible, they are arranging for transportation by motor truck, water and air in case of a railroad tie-up.

Probably the most decisive step, however, has been made

in Kansas. Governor Henry J. Allen has advised the New York Times in response to a telegram that Kansas will act in the situation as follows:

The Industrial Court act of Kansas prohibits any men engaged in transportation from conspiring to deprive the public of this essential utility. It prohibits the railroad managers from closing down their transportation lines or from entering into any conspiracy to deprive the public of this utility. It prohibits the employees from entering into a conspiracy to deprive the public of transportation. The Kansas law provides that all controversies between the railroads and their employees relating to wages or working conditions shall be adjudicated in the Court of Industrial Relations. In the meantime the lines shall continue to function.

This law will be enforced in Kansas, just as it was during the outlaw switchmen's strike, when the few who violated it were arrested and prosecuted for the violation. The executive office is now receiving and listing the names of volunteers who are capable of working in railroad industries. The law gives the state the power to take over the railroads and to operate them in behalf of the public. In case of the failure of the railroads to operate their lines, the state will take over those which are necessary to the public welfare. It is possible that the strike will not be made applicable to Kansas. When the general strike was ordered something over a year ago by the International Brotherhood of Stationary Firemen and Oilers, the executive committee specifically exempted Kansas from the provisions of the strike on the ground that a railway strike in Kansas is a strike against the law of the state.

### Lee Endeavors to Explain Strike Cause

CAUSES for the strike of the train service men were explained by W. G. Lee, president of the Brotherhood of Railroad Trainmen, in a statement given to the Associated Press October 22. The statement was issued, Mr. Lee explained, because "the public is rather confused" as to its causes.

Three causes were ascribed by Mr. Lee:

- (1) The wage reduction of July 1.
- (2) Proposed further reductions.
- (3) Proposed elimination of rules, which would mean still further reductions.

Mr. Lee's statement as to the causes of the strike said in part:

The public is rather confused as to the causes for the railway strike. There is a belief on the part of some that the strike is for higher wages, and is not understood to be a demonstration against a wage reduction, to which have been added propositions further to reduce wages and eliminate rules which would mean still further reductions.

Railroad transportation employees, even when peak wages were paid, did not receive advanced wages in keeping with the increased living costs. The daily rate paid transportation men was fixed for all classes in the United States in 1913 and, regardless of the increased costs of living, there were no increased wages for these employees until January 1, 1918, and only then after a most searching investigation had been made by the Lane Commission to determine what should be the reasonableness of wages paid transportation employees. This commission reported that wages were inadequate and, contrary to public opinion, did not measure up with wages paid in other classes of service.

The rate of a freight brakeman between Chicago and New York was \$2.67 a day, which was referred to by the railways in their publicity campaigns as a princely wage, and the public naturally supposing that a business representing so much as the railway business would tell the truth, accepted the railway statement without question. It does not take long to determine how much could be earned in a month of thirty days at a rate of \$2.67 per day. Until January 1, 1918, \$80.10 was the princely wage some fifty-odd thousand railroad men received in what is known as the Eastern territory. Other wages were in proportion to the wages of the freight brakemen.

With the reduction in wages of July 1, 1921, the present wage of this employee is \$134.40 for thirty days in the month, and he is fortunate indeed if he is able to make every day in the month. The hazards of the service, exposure to the weather and very many other reasons all contribute their share towards making him an intermittent, as well as a piece worker. Transportation employees are not paid by the month, but by the day, or trip.

# Administration Strike Policy More Conciliatory

President Leaves Labor Situation in Hands of the Labor Board  
and Departs on Four-Day Trip

By Harold F. Lane

WASHINGTON, D. C.

THE suggestion of the Railroad Labor Board that proposed requests for further reductions in wages be deferred for several months came as somewhat of a surprise in view of the uncompromising attitude heretofore displayed by the administration and in view of the well-known desire of the President to meet the public demand for rate reductions.

The President and his advisers had failed to display any fear of a strike and had let it appear that they were relying mainly on the manifest fact that public opinion would not lend any support for a strike against the orders of the Labor Board, while proceeding rather calmly and deliberately to prepare for an emergency if it came. It had been assumed since the statement issued by the public group of the Labor Board in Washington on October 16, that the actual presentation to the board of the new requests for wage reductions might be temporarily delayed until after the Interstate Commerce Commission should have rendered its decision reducing grain rates and possibly in other cases, in order that an opportunity might be afforded to demonstrate that the proposed wage reductions are intended not for the benefit of the railroads but to make rate reductions possible and in order to allow a "cooling-off" period. It was also understood that in the ordinary course of procedure the Labor Board would hardly be able to reach a decision in a new wage reduction case without allowing some time to elapse, but it was not expected that the wage case would be postponed indefinitely or be expected to wait until next July for a decision, particularly as the Interstate Commerce Commission has discounted further reductions in expenses in order to find a ground for reducing the grain rates. It can hardly be doubted that the action of the Labor Board was taken with the knowledge of the President, since he has so plainly been trying to co-ordinate both the Labor Board and the commission with an administrative policy, but it has been suggested that the Labor Board may have stretched to unexpected lengths the period of time implied in the suggestion that the wage requests be deferred temporarily.

## Possibility of Postponing Issue

The idea of postponing the issue until next July seems to suggest that the opposition of the government to a compromise applied particularly to a compromise of the wage reduction already made which is the technical basis for the strike threat, but if the new wage case is to be long postponed the brotherhoods would have attained what is understood to have been all along their real purpose, that is, to head off further encroachments upon the advantages they had gained during the war period. A settlement upon that basis also would apparently limit for some time the fulfillment of the general desire for rate reductions to those which may still be made out of the 12 per cent wage reduction, although the decision in the grain rate case has apparently been a signal to many other shippers to demand rate reductions. The American Wholesale Coal Association has already got its complaint in and others are to follow.

The administration continues to act as if it were not in the least afraid of a railroad strike. The policy of President Harding was revealed to some extent in Chicago on October 21 when the Railroad Labor Board, following an informal conference with the labor leaders the day before, issued its formal order calling upon both the labor organi-

zations and the railroads to maintain the status quo pending an appearance before the board on Wednesday of this week. Another phase of the policy was manifested in the report of the Interstate Commerce Commission reducing Western grain rates. The order issued by the board on Friday indicated that the meeting was in line with the purpose as announced at the White House last week of "definitely ascertaining whether we have created a futile agency" in the Labor Board and of using the board as the legally constituted authority to inform the organizations that have threatened a strike in protest against its former wage reduction order that such a strike would place them squarely in violation of an order of the board, if not of the "toothless" law, and that under such circumstances those responsible for such a step could only be regarded as enemies of the society that has set up the board as an impartial tribunal to decide just such controversies. The suggestion that a new wage issue now be postponed appeared a plan to make it easy for the brotherhoods to acquiesce.

## President Directs Policy

The President's determination to deal with the situation, through the properly constituted authorities of the government instead of handling it directly himself is in accordance with the policy he has previously announced on several occasions not to "go over any one's heads." After he had declared in his message to Congress last April that rates and the cost of transportation must come down, an impression was created in many quarters that he was about to order the Interstate Commerce Commission and the Labor Board to take the necessary steps. It was stated at the White House, however, that the President clearly recognized that rate-making and wage-fixing were the functions of the two bodies and that he had neither the authority nor the intention to assume either of those functions. That did not mean, however, that he should not confer with members of the commission and of the board and let his desires be known, while receiving from them information and advice as to the practical and technical questions involved.

The President conferred shortly after his message to Congress with the chairmen of the Interstate Commerce Commission and of the Labor Board and later with railway executives and representatives of labor, the shippers, the security owners and other interests involved. He called on the Interstate Commerce commissioners personally and recently he has had several conferences with the chairman of the Interstate Commerce Commission as well as his recent meeting with the public group of the Labor Board and the commission. Undoubtedly some of the ideas the President started with have been modified to some extent by these conferences and possibly he was able to stiffen the attitude of both organizations by letting them know that action of a certain kind would be regarded as fulfilling policies of the administration and would, therefore, have its support.

At any rate, after the President had made it clear that the handling of the strike threat situation was the job of the Labor Board, which has heretofore had some doubt as to whether it had any powers except those represented by its influence on public opinion, it issued an order which indicated all the confidence of any public authority which states the mandate of Uncle Sam, and on the following day

the Interstate Commerce Commission, which was recently so doubtful of its authority to reduce rates under present conditions that it recommended instead of ordered a reduction in live stock rates, came out with a decision reducing western grain rates and also indicating its view of the necessity of effecting further reductions in railroad operating costs. Both actions were those of the respective bodies themselves and within the province of each, yet they had been made a part of a specific policy of the Executive after consultation with him.

### Grain Decision Expedited

The commission's rate decision, although it had been made in a formal proceeding entirely independent of the recent developments in the labor situation, was undoubtedly expedited and made public at the time it was for the purpose of fitting in with the policy formulated for dealing with the present situation. It serves to call the attention of the public and of the railroad employees themselves to the fact that wage reductions have been made and are proposed not merely for the benefit of the railroad companies but for the purpose of making rate reductions possible. When the grain rate decision is considered in connection with the reductions that have already been made by the railroads voluntarily in recent months and the reduction in live stock rates they made on the recommendation of the commission, it will be seen that a very large proportion of the wage reduction ordered by the Board effective July 1 has already been passed on to the public and other decisions of the commission in formal cases are in prospect.

An explanatory statement from either the White House or the Interstate Commerce Commission to the public to this effect would easily demonstrate, if Commissioner Potter's opinion in the grain rate decision has not already done so, that any extensive further reductions in rates can hardly be expected without a further reduction in wages.

The President has thus far shown no indication of following the suggestion that he summon the brotherhood chiefs or the railroad executives to Washington for the purpose of mediation. He is leaving the strike matter in the hands of the Labor Board until it is clearly demonstrated that the law which governs its actions is not strong enough to accomplish the purpose. If that should turn out to be the case it would be incumbent upon him to act, by calling upon Congress for more drastic legislation or in other ways.

The fact that the date set for the appearance of the brotherhood leaders and the railroad representatives before the Labor Board is so close to that set for the strike gave an impression of confidence on the part of the administration that a plain statement of its position through the medium of the board would be sufficient to persuade the brotherhood leaders, as the leaders of most of the other railroad unions have already been persuaded, that the times are not propitious for a strike in defiance of the government.

### War-Time Power to Take Over

#### Roads Not Relied Upon

Meanwhile the President has made another move in letting it be known authoritatively that no consideration is being given to the various proposals, most frequently suggested from the side of the union leaders, that the war time powers of the federal government be invoked to handle the situation. The fact that the United States is still technically at war and will retain that status legally until formal exchange of the ratifications of the peace treaties is not to be relied upon and the announcement of this fact is likely to have considerable weight in the councils of the labor leaders if the theory is correct, as there are many grounds for believing that one of their chief motives was to induce the government to take over the railroads.

Under the law the President is authorized in time of war

to take over the railroads, as President Wilson did in 1917. As soon as the peace treaties are ratified he would not have such power and there are other powers in the national defense act that would likewise expire. The announcement that he is not considering taking advantage of a technical possibility, therefore, means that he sees no necessity for and has no intention of trying to avert the threatened strike by taking over the roads. He has plenty of authority for the use of troops to protect the mails and can declare martial law if necessary to deal with violence.

If one of the purposes of organized labor was to try to throw the railroad payroll again onto the backs of the taxpayers rather than the rate-payers in the hope of repeating the era of frenzied wage increasing that marked the McAdoo-Hines administration of the roads, they have now been given ample warning that there is "nothing doing" in that direction. It is somewhat difficult to imagine why they should desire a repetition of that performance, for which the present administration is still struggling to pay the bills, in view of the fact that railroad wages are now higher than they were when the government relinquished the roads.

President Wilson in 1917 commandeered the roads on the theory that it was necessary to the prosecution of the war, although it was generally recognized that one of the reasons was the fear of the consequences of a labor controversy then developing. He also not only retained the war time control of the roads for nearly a year and four months after the armistice but the technical state of war was taken advantage of after that date to commandeer rails and coal for which the owners asked higher prices than the government desired to pay.

President Harding, however, has gone so far as to indicate that as soon as the treaty ratifications have been made he will issue a formal proclamation of peace, in order to make it certain that war time laws are not to be used three years after the war was ended.

### Preparations for Emergency

Among the preparations being made are those of the post office department for handling the mails, and those of the war department for preserving peace if necessary and also for manning trains with such of the men in service as have had railroad training. Secretary Hoover has also announced that the plans of his department for the mobilization of food supplies, coal and other necessities in case of a walk-out on the railroads had been completed.

The governors of all states have been communicated with by the department, which will act as a clearing house of information and advice. Food and fuel are being concentrated at strategic points to make possible quick distribution. Preparations have been made for the massing, if necessary, of fleets of motor trucks and automobiles to move commodities. One estimate puts the number of machines quickly available at 1,000,000. Transportation service by water carriers and airplanes also will be expanded to supplement the motor vehicles and such trains as can be operated.

Some industries, it is said, have been preparing for weeks to face a strike emergency. Under the plans devised the governors would direct the emergency work, with the Department of Commerce helping to co-ordinate effort. In disputes concerning the distribution of foodstuffs or fuel the department would be prepared to act as arbiter. The department is well equipped to direct and co-ordinate such work because of the conferences with representatives of various industries which Secretary Hoover has held since taking office. Plans have included a survey of motor transportation facilities to make possible the rapid requisition of motor trucks and automobiles.

The Department of Justice is also making preparations for any activities that may fall to its share if the brotherhoods do actually go so far as to make it necessary. Attorney

General Daugherty, after conference with the President, summoned to Washington for a conference on Monday the United States district attorneys from five cities, New York, Chicago, Cleveland, Buffalo and Indianapolis, to arrange for "concerted action and harmony of effort." Following their conference instructions were also sent to other district attorneys. Mr. Daugherty gave a statement to the press indicating that if necessary the department is prepared to act with vigor. He said:

#### District Attorneys Confer

I asked the district attorneys to come here in order to have a conference and understanding in any event and any emergency. I still doubt that there will be any strike, but it is the duty of the Department of Justice to be prepared for any emergency, and it is necessary that there be uniformity of proceedings and policy determined in any event. So I called these gentlemen here, and have discussed with them fully the various plans of the department, if there should be a strike. They will be here tomorrow and we will have another conference.

We did not discuss the merits or the matters in dispute between the railroads and the employees who have threatened to strike. With the merits of that controversy the Department of Justice takes the position that it has nothing to do, and the merits probably will not be entered into at any time.

We probably would concede that the men have the right to strike—that means quitting their employment. They may strike in groups. I don't say they can strike in groups scattered broadcast over the country without violating a conspiracy law when it comes to antagonizing the government of the United States.

I would say that, peacefully doing so in a lawful manner men may quit their employment and stop. But I do say that when it comes to the government's interest, they cannot strike at that.

When it comes to these facilities the government has the power, right and duty to see that the owners of the railroads give the American people the service they are entitled to. Many, many more American people are interested in these facilities, in seeing that they serve the public, than in the controversy between the railroad operators and employees, regardless of who is right or who is wrong.

The conference has been held for the purpose of bringing concerted action and harmony of effort, to the end that the railroads may continue to give this service with the least interruption possible, and as soon as possible without interruption, so that the public may be served. There is involved the accommodation of people who travel, and the providing of the people with coal as winter approaches, and food, which cannot be distributed without these facilities.

The government has the power and ample authority, and it will be as just and reasonable as it can be, but these arteries of commerce must continue to serve the people, property must be preserved, life protected, law enforced and order maintained. The government is big enough and strong enough to see that this is accomplished.

The district attorneys at the conference were selected from railroad centres, Mr. Daugherty said, and because the headquarters of many of the railroad labor unions were located in their districts. It was inferred that if legal action were taken it would probably be started in one or all of these districts.

President Harding himself apparently feels so little apprehension or at least has his plans so well in hand that he absented himself from Washington for nearly four days this week, from Tuesday to Friday, on a trip to the South, and there was no cabinet meeting on Tuesday.

#### Department of Justice Busy

The Department of Justice, through its representatives located throughout the United States, has been gathering from the most authoritative sources information as to the probable effect upon the various sections of the country of the threatened railroad strike.

"This information is being gathered primarily to enable the public agencies which will be called upon to co-ordinate and govern the transportation and distribution of necessities in the event of a strike to function in the light of accurate knowledge of conditions. Copies of all reports are now being furnished to Secretary Hoover, who has undertaken work of this character. Enough information has already been obtained

to make it clear that even if the strike should take place as threatened, there is no danger that any part of the country will suffer any serious hardship from lack of food or fuel for a period of at least two weeks after a general tie-up.

"All parts of the country report an abundance of food supplies with the exception of fresh meats, for which most of the large communities depend upon frequent shipments from the packers in the Middle West. Grain supplies, canned goods and other provisions are plentiful, and there appears to be no danger that any one will starve.

"However, a note of warning is sounded by many public officials and others interviewed by department operatives against the hoarding of food-stuffs and fuel. Their optimistic statements are based upon the assumption that the American people will be judicious in their purchases and will not buy in excess of their daily needs. A sure way to cause a shortage, with its attendant ills, would be for the American households to begin an orgy of buying and hoarding.

#### Public Organized

"One item to which the department is giving special attention is the milk supply. Small communities and the large cities of the West expect but little inconvenience in this regard, since their milk supplies are largely brought in by wagon or motor truck. In the large Eastern cities, however, this presents a serious problem, but active steps are being taken by municipal and civic organizations to meet it.

"The fuel supply appears to be normal for this time of year except to the Northwest. There the scarcity appears to be due mainly to faulty distribution, since ample supplies are reported to be in storage at lake ports. Lighting plants and other public utilities generally report that their fuel supplies will last from two to six weeks without replenishing.

"An especially reassuring feature disclosed by the investigation is the extent to which the public is organized for its protection. Under the leadership of the Mayor or other public official, practically every city has formed an organization to cope with the situation which would result from a general railroad strike. Inventories are being made of the available supplies of necessities, and steps are being taken to insure an efficient distribution. Also a count is being made of all available wagons, motor trucks and other transportation facilities, and plans are being made to use them to the best advantage.

"In the course of its investigation the department has sought to obtain from railroad officials in various parts of the country expressions of opinions as to the extent to which their respective lines would be able to operate in the event that a strike is called, as now threatened. The estimates thus gathered vary widely, and, of course, cannot be given out in detail. The officials interviewed are unanimous in saying that there will be some men, particularly those having seniority and pension rights, who will remain loyal, and that they will be able to call in pensioners and others, thus forming a nucleus of trained men. With these and any experienced men who may volunteer the officials predict that they will be able to maintain at least a partial service, which will improve in efficiency and volume as the strike continues."

The President, Mr. Daugherty said, would no doubt "say what he had to say when the time came," and the people throughout the country would know what the government's policy comprised. Those responsible for the situation would have to take the consequences, the attorney general added.

While maintaining his disbelief that a general strike would materialize, Mr. Daugherty declared the Justice Department was prepared to act "judiciously within the law" to prevent a tie-up of the country's transportation facilities. He did not discuss specifically the department plans, explaining that the government might use one method in one section, adopt another course of action in another, and use all of its legal weapons in a third locality.

## State Versus Interstate Rate Regulation

WASHINGTON, D. C.

WHILE THE HEARINGS before the Senate committee on interstate commerce in the general railroad inquiry have been temporarily suspended (it is said for the purpose of heading off a general debate on the strike situation), the committee on Monday, October 24, began hearings on the bill introduced by Senator Capper of Kansas and supported by the agricultural "bloc," or "block" as it is now sometimes called, to restore the power of the states to reduce railroad rates without too much regard for the effect on interstate commerce. Incidentally the bill proposes to repeal Section 15a of the act to regulate commerce as amended by the transportation act, because the fact that the unwillingness of some states to allow rates which would contribute sufficiently to the provision of a 6 per cent return for the roads was taken by the federal commission as one ground for ordering intrastate rates advanced.

The agricultural bloc also held a caucus at the Capitol last week and adopted a program on the railroad situation which calls for the repeal of Section 15a on the ground that it constitutes a guaranty to the carriers, this reasoning being based apparently on the fact that although the rates established by the commission under its authority actually produced a return of less than 3 per cent for a year, the rates which the farmers and other shippers have been paying during the year were intended to produce a 6 per cent return. They are, therefore, just as objectionable to many shippers as if they were high enough to make 6 per cent. The caucus also declared for a reduction in the rates on agricultural products. Whether the action of the commission in reducing grain rates in spite of the law will lead to any change in the program has not yet been stated. Senator Cummins is not yet recognized as a member of the agricultural bloc, but he is understood to have swung around to their way of thinking to some extent as to state rates.

### Supreme Court Orders Rehearing

in Wisconsin Rate Case

The question of the constitutionality of the provisions of the transportation act relating to jurisdiction over state discriminations against interstate commerce, or the legality of the Interstate Commerce Commission's interpretation of the law in its various orders increasing state rates is destined to remain unsettled by the highest court for several months yet. Presumably because ex-President Taft has succeeded the late Chief Justice White, the court on October 24 ordered a reargument on December 5 of the Wisconsin rate case, the first of the cases growing out of the commission's orders under the new law to reach the court. Many people had looked for a decision this fall. The court also set for argument on January 3 the petition of the state of North Dakota to file an original bill attacking the commission's order advancing the state rates in that state.

### Contents I. C. C. Has Misinterpreted Act

John E. Benton, solicitor of the National Association of Railway and Utilities Commissioners, was the first witness before the Senate committee on the Capper bill. He did not exactly support the provisions of that bill but presented resolutions adopted at the recent Atlanta convention of the association. Setting forth its objections to the "centralization of authority in Washington" Mr. Benton argued that the commission has misinterpreted the law and that "chaos" in regulation had resulted.

### Roads Wrecked by Government Control

Solicitor General Beck, in presenting the argument in the Supreme Court in support of the Interstate Commerce Commission's order in the New York intrastate passenger rate

case, in which the state rates were ordered increased by the amount of the interstate increase, declared that the government, having "wrecked the railroads to win the war" now is attempting to rehabilitate the carriers under the provisions of the Transportation Act. He said that the wreck of the roads by government control was exceeded in its disastrous effects only by the government's merchant marine venture, where, he stated, the result has been a great deal worse. The object of the government would be destroyed, he contended, if the various states should be allowed to refuse to advance rates sufficient to allow the railroads a fair return.

## Railroad Securities Bill Reported by Senate Committee

WASHINGTON, D. C.

THE SENATE COMMITTEE on Interstate Commerce at a meeting on October 22 ordered a favorable report on the bill to authorize the War Finance Corporation to purchase railroad securities from the Railroad Administration for the purpose of providing funds with which to settle the accounts of the railroads against the government. Instead of reporting the Townsend bill, which as introduced in the Senate differed somewhat from the Winslow bill as passed by the House, the committee reported the bill as passed by the House with a number of amendments, the principal of which provides that in making settlements with the carriers under the Transportation Act no payments or allowances shall be made to any carrier on account of so-called inefficiency of labor during the period of federal control and no final settlements between the United States and any carrier shall be made which does not forever bar such carrier from setting up any further claim, right or demand of any kind or character against the United States growing out of or connected with the possession, use or operation of such carrier's property by the United States during federal control, except certain claims specified.

The language of the House bill as passed has been interpreted as barring any railroad against seeking a settlement in court after failing to settle with the Railroad Administration. Another amendment authorizes the President to sell any bonds, notes or other securities acquired by him under the provisions of the transportation and federal control acts without the use of the War Finance Corporation as an agency and the proceeds shall be a fund to be used by the President in settling the accounts, any balances to be paid into the Treasury of the United States as miscellaneous receipts. Any such sales must be at a price which will save the United States from loss in the transaction. To the provision authorizing the War Finance Corporation to purchase railroad securities and to carry them pending final disposition is added a provision that no purchase shall be made by the corporation under this section which will interfere with the corporation in granting the fullest aid for financing the handling and exporting of agricultural products. It is the intention that this section shall be so construed and administered as to give the preference to such financing and exporting of agricultural products.

AT A TIME when every effort should be made to build up our foreign trade, the United States Senate has struck one of its hardest blows to injure it. This was done last week when, by a vote of 36 to 30, in which 11 Republicans joined 25 Democrats, the section of the tax bill defining traders and foreign trade corporations was stricken out. . . . This country's policy evidently is to tax its foreign trade out of existence. To escape the heavy taxation now facing it under the revenue bill, it will follow the line of least resistance and incorporate under foreign laws.—*N. Y. Commercial.*

# Grade Separation Report Takes a Broad Stand

Plans for the Beaumont, Tex., Problem Propose Minimum Interference with the Present Layout

"THERE IS A CERTAIN relation between the city and the railroads that is to the mutual advantage of both to maintain and this relation should be carefully considered before a plan is adopted that is so radical as to destroy facilities that have been established and in use for many years." The foregoing statement may be said to constitute the basic principle underlying the recommendations

Beaumont is a city of 45,000 people and as outlined in the report and shown in the map, it presents conditions not unlike those encountered in many other cities of this country. The area is relatively large for the population; the industrial territories bordering the railroads which pass through the central part of the town serve to divide the residential district into several sections. The retail district is

The Railway Occupancy in the Heart of Beaumont, Texas

made to the city of Beaumont, Tex., by Louis R. Ash of Harrington, Howard & Ash, consulting engineers of Kansas City, Mo., who were retained by the municipality to report on plans for the elimination of grade crossings of streets and railroads. On the basis of this conclusion the report of the engineers favors elevation for the tracks of the Southern Pacific in their present location, together with the construction of two overhead street viaducts crossing the tracks of the Kansas City Southern, the facilities of the railroads in each case to remain substantially in their present form. No changes are proposed for the tracks of the Santa Fe or the Gulf Coast Lines.

restricted to a few streets on which the traffic is interrupted frequently by trains on intersecting railway tracks. Commenting further on the relation of the industrial area to the welfare of the city, the report states: "This industrial area is so well established that if its present relation to the railroads were destroyed it would cause a very serious loss, not only to the industries themselves but to allied interests to say nothing of the complete demoralization of real estate values."

"Easy accessibility to freight terminals and passenger stations is a condition to be desired, and the removal of these facilities to a considerable distance from the retail and busi-

ness centers imposes a perpetual tax upon the handling of commodities which may hamper the business and industrial development of the city, and the ultimate growth and prosperity of a community is intimately associated with the development of its retail, jobbing and manufacturing industries."

On the other hand, the report points definitely to the desirability of a city plan which can be set up as a guide for future development of the city, its industries and the railroads. With the aid of such a plan, the report states that the city, "will have avoided many disturbing conditions when it shall have doubled its present population."

### Tunnel and Detour Plans Impractical

Two plans are outlined in the report as alternative to the one recommended. One of these proposes a tunnel under the Neches river as a necessary feature of the depression of the tracks of the Southern Pacific below the grades of the street, but this is considered out of the question because of the prohibitive cost, \$10,000,000, and the hazards of flooding the tunnel and other obstacles. Another plan involves the detouring of the tracks of the Southern Pacific and the Kansas City Southern so as to avoid the passage of trains across the main streets in the heart of the city. This plan, however, would add five miles to the distance of trains on the Southern Pacific to enter the present passenger station and a distance of four miles for the movement of freight trains through the city. However, the plan was rejected primarily as a violation of the general principles outlined in the foregoing.

### Proposed Track Elevation of the Southern Pacific

In proposing track elevation as the most feasible plan for grade separation of the Southern Pacific tracks, the report points to the difficulty arising from the grade crossings now obtaining. An abstract of the plan follows: "If neither the tunnel plan nor the detour plan is adopted there remains nothing except to separate grades at principal thoroughfares by means of either viaducts or underhead crossings. In studying this plan for the Southern Pacific one method is to secure the necessary headroom, in part by elevating the tracks and in part by depression of street grades. According to this plan, the Southern Pacific will start on an upgrade about 3,000 ft. east of the Neches river bridge, continuing to an apex at Pearl street, thence on a downgrade to a point 3,000 ft. west of Pearl street. This grade has been taken at 0.411 per cent, being the same grade now in use on the approach to the Neches river bridge. This results in raising the tracks about 7 ft. above their present elevation at the bridge and about 11 ft. above their present elevation at Pearl street. Orleans, Main, Pearl, Travis and Cypress streets will be depressed on an average of about 3 ft. below the general street level, or approximately 6 ft. below present track levels, thus providing a clear headroom of 13.5 ft. at Orleans and Pearl streets, 12 ft. at Main street, 11 ft. at Travis street and 10 ft. at Cypress street. These tracks are to be carried on a reinforced concrete viaduct from the river to a point near the Southern Pacific depot where the construction will be changed to retaining wall and fill.

### Provision for Switch Tracks

"Provision is made for maintaining switch tracks at street grade reaching all the industries that are now served by the Southern Pacific. In this way an uninterrupted roadway is secured at Orleans, Pearl, Main and Travis streets except for the very infrequent switching to industries and no doubt this switching can be done at hours that will but slightly interfere with street traffic.

"In connection with this scheme, it is proposed to construct a viaduct over the Southern Pacific yards starting at Magnolia and Liberty streets and landing at Crockett and Neches streets. This viaduct probably would not be needed

at this time but it is shown as illustrating a means for taking care of future traffic requirements. The plans also include a viaduct over the tracks at Mariposa from South street to Cedar street.

"A second method of elevating the tracks is to put them high enough to obviate the necessity for depressing streets below the general level. In this plan the only interference with present street grades will be to remove the 2 ft. or 3 ft. elevation that is found at present at the railway crossings. This plan involves the extension of the raised portion of the main railway track about 800 ft. further in either direction than that mentioned in the first plan. Service tracks and other connections can be cared for with this additional elevation in practically the same manner as described above. This additional elevation will cost about \$100,000 more than where the streets are depressed to secure a part of the height. This additional cost will be reduced, however, at least in part, by the decrease of possible damages to property resulting from depressing the streets. By either plan of elevation, conditions at the passenger station remain unchanged except that the track platforms will be elevated and broad stairways or ramps will lead from the waiting rooms to the platforms. The new elevation of tracks at the passenger station above that at present will be about 7.5 ft. if the tracks are partially elevated, or about 11 ft. if they are sufficiently elevated to permit street grades to remain as they are. This plan for the Southern Pacific involves fewer changes in present conditions and, therefore, interferes less with the operations of the railway than any other plan that can be devised. It is also possible, by the construction of viaducts, further to increase traffic facilities over the Southern Pacific properties, as they may become necessary in the future. All switching service now rendered by the Southern Pacific will remain undisturbed and the use of valuable railroad properties may be continued."

### Track Elevation Not Practicable for K. C. S.

In dealing with the Kansas City Southern, because of the shorter distance from the river to the passenger station and to connection with yards, it is not possible to elevate the tracks as has been suggested for the Southern Pacific and get down to ground without interfering with yard layouts. Therefore, the plan suggested for the Kansas City Southern is to build viaducts over the tracks on those streets where conditions demand an improvement in traffic facilities. The drawing shows a viaduct at Pearl street and one at Park street. These structures start at Wall street on the north and land at Franklin street on the south, and it is suggested that they be made the full width of the street so that abutting property can be developed in such way as to treat the viaduct surface the same as an ordinary street surface. This is frequently done and the result has been very satisfactory, in fact, after the viaduct reaches a certain height from the ground property abutting on either side has the advantage of two street levels.

The cost of elevating the Southern Pacific tracks without depressing the streets is estimated at \$1,360,000 while the plan involving partial depression costs about \$100,000 less. Both of these estimates assume that no new superstructure will be necessary for the Neches river bridge. The cost of two viaducts over the tracks of the Kansas City Southern, is estimated at \$700,000.

A LONE MASKED BANDIT held up the express messenger on a train of the Canadian Pacific between Swift Current, Sask., and Moose Jaw recently and robbed the safe of about \$5,000 in currency. The robber entered the car, tied and gagged the messenger, went through the open safe and then dropped off the train unobserved. The messenger was found and released when the train reached Moose Jaw.

# Commission Reduces Western Grain Rates

Looks to Future as to Effect on Railroad Revenues—Present Rates  
Declared Obstacle to Returning Prosperity

WASH., D. C., Oct. 22

**R**EDUCTIONS in the rates on wheat and hay between points in the Western and mountain-Pacific groups of roads to the extent of one-half of the increases authorized last year in Ex Parte 74 and in the rates on coarse grains to 10 per cent less than the wheat rates, were directed by the Interstate Commerce Commission in a report made public on October 22, in the case initiated by petitions filed by the western state commissioners and various shippers' organizations. The increases last year were 35 per cent in the western group, 25 per cent in the mountain-Pacific group and 33½ per cent interterritorial. Rates on grain products are to be reduced to the extent that they exceed rates that would be made by continuing the relationships that now exist, except that differentials subjected to the percentage increases are to be reduced proportionately with the rates.

The commission did not issue a formal order, but it did not confine itself to recommendations as it did in the western livestock case. It declared the present rates unjust and unreasonable for the future to the extent shown and stated that an order will be entered in accordance with the findings if that becomes necessary and that it will expect the reductions to be made as soon as practicable and not later than November 20. It is also stated that the reductions required may make desirable some reductions in rates east of the western district, particularly interstate in Illinois, and it is expected that certain readjustments to equalize the through rates to competitive markets in accordance with the usual practice will be made.

The report, by Commissioner Aitchison, attempts to conform with the requirements of Section 15-a, the new rate-making rule of the Transportation Act, by stating that the commission is "not restricted by past or present statistics of operation and earnings" and that its conclusions "look to the future." While it is shown that the carriers have not yet earned the statutory rate of return under the new rates, the opinion says that neither the diminished cost of labor nor the diminished prices of materials and supplies have yet been reflected as completely in operating expenditures as must occur and that lower future costs are reasonably to be expected. Also traffic seems to be increasing. There is no specific prediction that the rate reductions will so stimulate traffic as to increase revenues but the report is based on the idea that rate reductions will help toward the return of normal traffic and that as to the commodities involved they are vitally necessary to the agricultural industry.

## Western Farmers Suffering

Although the decision is based on a proceeding of investigation ordered by the commission early in the summer and submitted to the commission on hearings and arguments on September 3, it was expedited and made public at a time to make it part of the administration's policy in meeting the strike threat situation. It was discussed at the recent joint conferences of the public group of the Railroad Labor Board and the Interstate Commerce Commission, during which the public group recommended an immediate general rate reduction to the extent of the wage reductions made in July, and the fact that it was forthcoming had been intimated unofficially at the White House. It is understood also that it was discussed in conferences between Chairman McChord and the President. The printed report says it was decided October 20, and it was given out on the morning of October 22, much sooner than most commission decisions emerge from the government printing office.

In discussing the evidence presented, the commission says that the western farmers are suffering from severe readjustments and, generally speaking, are operating at a loss or without profit. Among the causes for this condition, the various elements of the post-war readjustment are referred to. It is stated there is evidence of reduction in demand for coarse grains and hay, although the wheat movement in July and August, 1921, has been almost unprecedented. Prices of some grains have fallen from war to pre-war and in some instances to lower than pre-war levels. There was testimony strongly tending to show that if present conditions are continued the less fertile farms will not be cultivated next year or the acreage of grains will be curtailed and reorganization of farming must follow along lines less favorable to society and to the railroads.

It is said that the large movement to market this year does not show that the farmer can continue to operate under present production and distribution costs, as it is the result of forced marketing regardless of prices or freight rates. The weight of the evidence, the commission says, indicates that a continuance of the existing burdens must result in diminishing production. Prices and other conditions affecting the condition of the agricultural industry are discussed at length and the report says that so far as increased loss and damage claims on account of the movement of these commodities constitute a partial basis for the increases of 1918 and 1920, that basis no longer exists to the same degree.

The report refers to the contention of petitioners that a reduction in the freight rates would give the producers an increased purchasing power which would favorably react on the railroads through increased inbound freight, although it is pointed out that the railroads denied that such a reduction would stimulate demand, on the ground that it would probably not reduce prices to the consumer.

While the railroads consistently opposed any reduction in the rates on hay and grain, they took the position that the relief sought was wholly insufficient in amount to yield any real relief to the average individual. It was calculated that the annual savings per farm resulting from a 25 per cent reduction in the rates would range in round figures from \$10 to \$50 and that such a change would be less per bushel than frequent daily fluctuations in market prices. The report says, however, that the facts disclosed make it appear that grain and grain products and hay on the whole are bearing a share of transportation charges which is disproportionate.

The financial circumstances of the carriers were also discussed and reference is made to the evidence of the railroads that equating to a full year the results for the nine months commencing September 1, 1920, the net railway operating income of the western, Class I roads yielded a return of only 2.78 per cent. It was also claimed that the actual results were even less favorable because of undermaintenance estimated at the rate of \$188,000,000 per annum.

## General Conclusions

The general conclusions of the report are as follows:

Since our decision in Ex Parte No. 74 the wages and working conditions of the employees have been considered by the Railroad Labor Board, and many questions relating thereto have been determined by that body. On July 1, 1921, there became effective reductions estimated to average about 12 per cent in wages, and certain changes in labor rules and working conditions have also been accomplished which have lessened expense. For the entire country and upon the basis of a

normal number of employees it is estimated that these reductions in wages and changes in conditions now in effect will produce a saving of about \$425,000,000 per year, and that of this amount about \$160,000,000 will accrue in the western and mountain-Pacific groups.

The cost of important commodities which enter largely into the operating expense accounts of the carriers has also decreased. With some important commodities, as, for instance, coal, the change is not yet marked as to some carriers—others have for several months shown noticeably decreased fuel costs. Many other commodities have receded to price levels approaching those of pre-war times.

Neither the diminished cost of labor nor the diminished prices of materials and supplies have yet been reflected as completely in operating expenditures as must occur. Certain of the readjustments of labor rules and working conditions which have been made possible by orders of the Railroad Labor Board have not yet become fully effective. Term contracts for supplies, entered into at high price levels, still are holding the operating expenses of various carriers to levels which must be accepted as abnormal. With the expiration of these contracts, lower future costs are reasonably to be expected.

There is also every indication that the volume of traffic is on an increasing curve. This is evidenced by the steady increase in the number of carloads of revenue freight and the reduction in the number of surplus cars.

We are to administer, and, so far as possible, give force and life to all the provisions of the interstate commerce act. Section 1 requires that no more than just and reasonable rates for transportation be exacted, and in determining what is just and reasonable it has always been recognized that, among other factors, not only the cost of the service, but its value to the user, must be considered. In the exercise of our power to prescribe such rates, however, we are now required by section 15a to initiate, modify, establish, or adjust rates (as that term is defined in the section) so that carriers as a whole or in designated rate groups will, under proper standards of operation, earn an aggregate annual net railway operating income equal, as nearly as may be, to a fair return upon the aggregate value of the railway property of such carriers held for and used in the service of transportation.

Summarizing the situation before us, petitioners speak for a basic industry which the evidence shows is in a state of financial prostration, receiving for its products prices which approach and in some cases have fallen below pre-war levels, but paying transportation costs many of which are still at the war-time peak. On the other hand, the evidence shows with equal clarity that respondents are likewise suffering from financial depression and that their net earnings have been far below the standard which has been fixed by the law, although the tendency is now upward. It becomes necessary to consider whether rate reductions may be made on grain, grain products, and hay in western and mountain-Pacific territory which will be fair and lawful so far as the carriers are concerned.

The purpose of section 15a was undoubtedly to better stabilize the credit of railroads, reassure investors, and attract capital to the railroad industry. It is plainly our duty to do everything in our power to carry out this purpose. The experience of the past 12 months, however, has shown the limitations which surround in actual practice the operation of this provision of the law. The increases of 1920 were intended to give the carriers the specified return, and no doubt they would have done so if the volume of traffic had remained normal. Instead, it fell off sharply, and net earnings failed by a considerable margin to reach the desired mark. Nevertheless, when it became apparent that this would be the case, carriers and shippers alike agreed that it was not our duty, under section 15a, to raise rates to still higher

levels. To have done this would clearly have been a vain thing, harmful alike to the country and to the carriers. The rate adjustment cannot with advantage be made dependent upon fluctuations in traffic.

It is also to be noted that the duty cast upon us by section 15a is a continuing duty and looks to the future. It does not constitute a guaranty to the carriers, nor is the obligation cumulative. We are not restricted by past or present statistics of operation and earnings. These are serviceable only as they illuminate the future. What is contemplated by the law is that in this exercise of our rate-making power the result shall reflect our best judgment as to the basis which may reasonably be expected for the future to yield the prescribed return.

The conditions with which we are called upon to deal are extraordinary and unique, since they are the aftermath of a world catastrophe. The sufferings of the western farmers may be ascribed to that fact. The prostration of agriculture in this country is the product of world-wide forces. The high level of freight rates has been an obvious and tangible circumstance which has quite naturally been a target of dissatisfaction, but we are not persuaded that it has been more than a minor factor in bringing about distress.

The important thing at present, however, is not the source of the disease but the means of recovery. Whatever part freight rates may have played at the outset, many qualified to form an opinion entertain the view that the present level of these rates is one of the obstacles in the way of returning prosperity and likewise one of the obstacles to substantial reduction in the cost of living. The facts that many railroad charges are still levied at the war-time peak and the cost of living in some respects has not fallen far below it are alike the cause of discouragement to the producer who has been unable to maintain his own prices and to the employee who has experienced a reduction of wages.

The really vital concern of the carriers, in this situation, is to promote the return of what may be deemed normal traffic, and anything which will help toward this end is greatly to their benefit. So far as a tendency downward in their rates can be induced, and so far as the reductions in wages and prices which have already been made effective can be converted into rate reductions, we are assured that the full return of prosperity will be hastened for both industry and labor. The carriers have, we feel, themselves manifested a realization of this fact in the substantial reductions in rates which, from time to time in recent months they have voluntarily made.

The case before us relates only to certain basic commodities. Necessarily our findings and orders will be so confined. In reaching our conclusions we have taken into consideration, among other things, the facts of record in regard to the present status of these commodities and of their production and marketing, the vital importance of the industry which they represent to the country as a whole, the reductions in operating expense which respondents have experienced since our decision in Ex Parte No. 74, and the present trend of traffic. They are, in brief, conclusions which look to the future, in accordance with the intent of section 15a, and which are based upon our best judgment as to what will produce the best results for all concerned, including the carriers.

#### Commissioner Potter's Opinion

Commissioner Potter, in a concurring opinion, strongly emphasized the necessity for further wage reductions. He said in part:

I concur in the majority report although in my opinion there is uncertainty as to whether we are doing the right thing. The report does not recite all of the considerations which influence my vote. This fact, coupled with the fact that we are dealing with fundamentals which go far beyond

this particular case, prompts me to file a separate expression of my views.

At a time when our railways are charging lower rates and paying higher wages than carriers of other countries, it takes a lot to explain an order requiring a rate reduction when the earnings of the carriers are much less than the minimum fair return which the law prescribes.

I have the keenest appreciation that we must be watchful and alert to see whether our action is beneficial or harmful. Our action will be wrong and will need prompt correction, if the results of recent and further needed readjustments respecting operating costs do not strengthen the carriers. So far for the current year net earnings have been insufficient to compensate the carriers for their services, in the amount which the law has fixed as a fair return upon the value of their properties used in the public service of transportation. If future operating results are no better than those of the past nine months, the carriers will be unable to maintain their efficiency and render the service which is vital to the public welfare—ignoring entirely the element of common justice to the owners in the way of a fair return upon their investments. In the public interest, as well as in fairness to the carriers, there must be done without delay whatever is necessary to so improve their operating showing as to protect their credit, restore confidence, and attract new money to make betterments for which there is urgent need. To require a rate reduction under such circumstances is for us to assume a grave responsibility. Notwithstanding the risk involved, we must be guided by our best judgment, and I am convinced that a reduction should be made.

It is not clear to me that the savings made in the matter of wages and other costs since we decided *Ex Parte 74* have been sufficient to justify the present reduction in its entirety, but those savings, with further prospective savings do, in my opinion, justify our findings. The prospective future reduction of wages and other operating costs are, perhaps, more essential to justify the rate decreases than the reductions that already have been realized. I am led to concur in the report by a firm conviction that the transportation burden on the industry and commerce of the country is too heavy and must be reduced, and that, as a part of a needed general readjustment, it can be reduced with increase of net earnings. I believe increase in traffic and a reduction of operating costs may be expected, and that increased net earnings to the carriers may be looked for.

Practically everyone admits that rates are too high. Rates too high are unjust and unreasonable and under the law must be reduced. Those who justify present rates regard them as a necessary evil—something that must be tolerated because high costs of operation prevent their reduction. That is no justification. If operating costs are holding rates at a level too high, the thing to do is to reduce the costs.

#### Reduction of Production Costs Necessary

Almost everything has been too high. The fundamental trouble with the industrial and commercial affairs of the country is that there is insufficient production and costs are too high. The latter is the cause of the former. Production in this country at the present time is far below normal needs. If normal conditions could be brought about, the industries of the country could operate normally for a long period to take care of the markets of this country, to say nothing of the markets in other countries. Normal operation of the country's industries would furnish employment to labor generally, revive markets, and increase the general buying power which the country needs. A reduction of production costs is essential to this result.

Freight rates are an important element of manufacturing and production costs. In a large country like ours, with its long hauls and wide distribution of producing industries, it is obvious that the freight burden in its relation to other

cost factors must be stable. Until within the last few years the tendency of the factor of transportation cost in relation to other factors has been downward. Recently it has been upward, and it is now out of proper relation to other factors. Rates must be gotten back to the proper relation to other things. They must come down, and whatever is necessary to bring them down must be done.

Many of the cost factors of railway operation which forced higher rates have been substantially reduced within the last year. The most important item of cost is labor. The carriers tell us that they are now paying extravagantly high wages. If we may rely upon their statement in this regard, they are not operating their properties economically and efficiently and, therefore, operating costs may further be reduced. We have no jurisdiction over wage controversies, but we may take note of the admission of the carriers and require them to find out whether their wage scales are too high, and to lower them if they can.

If upon the presentation of the facts as the law requires, the Labor Board decides that wages are not too high, those using transportation will have to pay the bill of the organized railway employees. The shippers of the country and labor generally are entitled to their day in court, and the carriers are the ones to present their case, for carriers, shippers, and laborers employed in all of the country's industries which use the carriers are interested in this issue. It is true that the wage burden has increased enormously during the last few years. For the calendar year 1916 it was, for Class I railroads, \$1,468,576,394, which was the largest amount paid for any year in the history of the railroads to that date. Following the year 1916, increases, all of which were made through government agencies, beginning with the Adamson act, followed by orders of the Railroad Administration during 1918, 1919, and the first two months of 1920, and finally the decision in July, 1920, by the Railroad Labor Board, resulted in bringing up the total compensation bill of these railroads for the year 1920, based on the last eight months of the year, to an amount exceeding \$3,900,000,000. They have been reduced by the wage board as of July 1, last, by 10 or 12 per cent.

The significance of these wage increases was brought out upon the hearing in this case where it was testified that if the wage burden, as it rests after the decrease of approximately \$400,000,000, as of July 1, were to be reduced by an additional \$1,000,000,000, it would be possible for the carriers to reduce freight rates approximately 18 per cent and still earn the return upon the investment in their property which the transportation act contemplates. Such a reduction, of course, would be reestablish railway credit, enable carriers to secure the moneys urgently needed to maintain adequate service, and relieve the distress of disappointed multitudes of investors in railway securities. It was further testified that after such a reduction the organized railway employees would still enjoy an increase which compares favorably with the increase which organized labor in other industries has enjoyed and, of course, far in excess of increases enjoyed by labor generally. It was further testified that such an increase would be in harmony with the increase of the cost of living which has taken place.

#### Carriers Should Reduce Costs

The right and power to reduce wages rests initially with the carriers. They have no excuse for maintaining the wage levels which they say are too high. If they believe them to be too high, they should take steps to reduce them. Until they make the effort they are not entitled to refer to wages as excusing high rates. The Labor Board was created to determine such questions and shippers have the right to require carriers to resort to that tribunal. Until they have the protection of an award made under existing conditions by the Labor Board, they cannot justify the present rates. On the

face of things, there is nothing in the wage situation to justify a rate level entirely abnormal and which is menacing the country's welfare. The carriers should bring the general economic situation to the attention of the Labor Board.

Some urge that we must take wage conditions as we find them, and not contemplate further wage reductions in dealing with rates. On the argument it was pointed out to us by the representatives of the petitioners that such is not the law. They urged upon us that it was the duty of the commission to consider the broad economic question as to what rates the industry of the country could stand, and that our finding in this regard should be taken into consideration in the fixing of wages. I am inclined to the view that the opinion thus urged upon us by counsel for the petitioners is sound, although it was new to me. It seems to me there is warrant for their view in action which the Labor Board has heretofore taken.

The transportation machine of the country is being used for the benefit of the shippers and railway employees, and the owners of the machine are receiving much less for its use than the law says they are entitled to. In considering what railway employees should receive, regard should be had for what the shippers can afford to pay. The record in this case shows that the Labor Board has declined to give consideration to this broad basic question, and has refused to hear shippers while considering wage controversies. The question as to what rates are fair and reasonable is with us. If the broad economic question as to how much shippers can afford to pay is a question to be determined by us when we fix fair and reasonable rates, it will follow that the Labor Board, in considering wages, would regard our finding as one of the relevant circumstances to be taken into consideration in fixing wages. In this aspect of the case there apparently is necessity for a determination by us as to the proper rate level, and we are authorized to order a rate reduction without waiting for wages to be reduced, to a point where the carriers can prosper under the rate level which we prescribe.

## Brooklyn-Richmond Freight and Passenger Tunnel

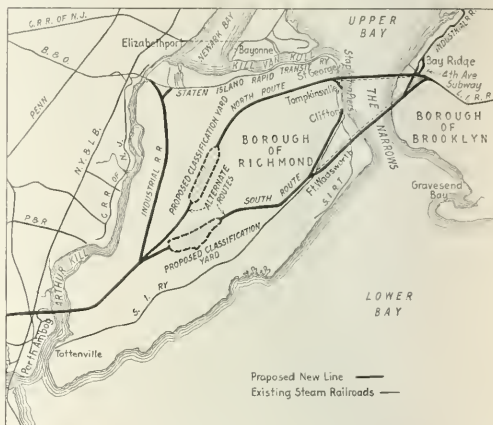

THE BOARD OF ESTIMATE AND APPORTIONMENT of the City of New York has recently submitted its preliminary report on the construction of a tunnel or tunnels to connect Staten Island with Brooklyn. The general plan which has been submitted includes in addition a system of belt lines, industrial tracks and other facilities necessary to create a greater unification of the present steam railroad and electric traction lines leading in and out of New York City.

It is proposed to construct an outer belt line, somewhat similar to the outer belt line suggested in the report of the New York-New Jersey Commission, intersecting all the New Jersey roads and running from Haworth, N. J., on the north, via Paterson, N. J., the Passaic river, Short Hills-Summit, Scotch Plains and Metuchen to Perth Amboy on the south. Crossing Arthur Kill on a high level viaduct, the line bisects Staten Island from south to north for its entire length and connects with the proposed tunnel under the Narrows. Two locations have been submitted for the freight tunnels across the Narrows as well as for two classification yards and tracks in the north half of Staten Island. These are shown in the illustration. The plan includes connections on the Island with the existing Staten Island Rapid Transit Railway for access to the new Stapleton piers, and for purposes of passenger business.

Passing under the Narrows the line descends on one and two per cent grades with the latter as a maximum, passes under the channel and rises on a two per cent grade into Bay

Ridge, Brooklyn, and to connections with the Long Island Railroad, over which access can be had to the Jamaica Bay development, to points in Long Island, the Bronx and New England, and to a proposed industrial railway along the Brooklyn waterfront.

The operation of the plan includes the idea of having the New Jersey roads make suitable classifications at divisional yards, dispatching freight destined for Long Island in solid trains. Any further classification can be handled at the yard on Staten Island. Steam power will be used in the west, but east of the Staten Island yard, or Richmond yard as it is called, the line will be electrified. To complete the unifica-

Map of Staten Island, Showing the Alternate Locations of the Proposed Line, Tunnels and Connections

tion of the railroad facilities it is proposed to connect the New York Central and the New York, New Haven & Hartford by a double track tunnel about 3.7 miles long running from a point approximately opposite West 168th street in Manhattan, under the Harlem river to about Longwood avenue in the Bronx, where the tracks would be arranged so as to permit of a head-on connection with the New York Connecting Railroad over the Hell Gate bridge, or to the New Haven's yards at Oak Point. A connection on the east side of the Harlem river will provide direct rail service to the proposed municipal terminal market and permit of the development of a marginal belt line railroad in the Bronx, upon which jointly operated stations could be located at points convenient to the existing bridges, thereby serving both Manhattan and the Bronx.

The decision as to the location of the tunnel across the Narrows hinges on the question of the relative costs and practicability of the trench method and the shield method of tunnel construction, one site being favorable only to the shield method while the other is as yet doubtful, though the belief is that the trench method can be used. To meet the local traffic needs of Staten Island, it is expected to start shortly with the construction of a passenger tunnel to connect into the Fourth Avenue subway in Brooklyn, with terminals in Staten Island and connections with that Island's transit facilities.

The total cost of the project has been estimated at \$141,000,000, subdivided as follows: Cost of the belt line and classification yard, \$42,000,000; freight and passenger tunnels and connections, \$51,000,000; elevated industrial railroad along Brooklyn water front, \$25,000,000; and the tunnel or connecting link between the New York Central and the New Haven, with all connections, \$23,000,000.

## Fire Protection Association Meets in Chicago

Annual Meeting Included Numerous Papers and Lively Discussion  
of Means of Reducing Losses

**T**HE Railway Fire Prevention Association opened its eighth annual convention at Chicago on the morning of October 18. Meetings were held at the Hotel Sherman and continued for three days with W. F. Hickey (N. Y., N. H. & H.) presiding and about 150 members and visitors present. The gathering was addressed at the opening session by J. E. McDonald, chief of the Chicago Fire Prevention Bureau, the association thereafter applying itself diligently to the consideration and discussion of the numerous reports and papers presented.

### President Speaks on Problems of the Association

In his opening message Mr. Hickey, president, discussed the progress of the organization and the problems confronting it during the past year, calling attention particularly to the importance of co-operation on the part of the managements and of enthusiastic interest on the part of the members in the work of fire prevention.

"The past fiscal year," he began, "has been a very successful one for the Railway Fire Protection Association, notwithstanding the critical period through which railroads generally have been passing. We have kept our membership intact although some of the smaller lines have felt it necessary to withdraw temporarily on account of curtailment of expenses, but the resignations have been offset to a large extent by new members and now that railroad executives are appreciating more and more what the Railway Fire Protection Association is accomplishing and the necessity for an organization of this kind, it is confidently expected that the next year will show a still larger membership roll."

Speaking of the problems confronting the organization and the railroads at the present time and the most effective method of meeting them, Mr. Hickey said: "Railroad owners will not be satisfied unless the present waste is reduced and, of course, they have a duty in providing fire resistive structures and fire fighting appliances, but until the general financial conditions improve and those things can be provided wherever needed, we must exert every effort to make the best of existing facilities and conditions. However," he went on to say, "we should not defer an improvement where the condition is acute and many features of improvement can be taken care of as ordinary maintenance items. In any event, we should endeavor to have our managements provide im-

proved facilities gradually and it is suggested that if not already being done, each railroad prepare a budget of fire protection items each year, stressing the most urgent and important and work toward the accomplishment of the budget. The fact that the number of fires was reduced but the amount of loss showed an increase in 1920 as compared with 1919 may indicate that better facilities and more efficient means of fire extinguishing would have reduced the loss. It is our work to endeavor to improve our construction, have adequate water lines, piping, fire pumps, sprinkler systems, and other features of protection provided, and at the same time bring maintenance and house-keeping conditions up to the highest standards so as to eliminate the causes of fires."

"This work," said Mr. Hickey, "can be done better and with more facility as an association than by the individual members working on their own lines, but it means co-operation and co-ordination among the members of the Railway Fire Protection Association. To that end," he said, "let us continue to give our best efforts to the association, meet more frequently during the year—take an enthusiastic interest in the work of the association and enlist as many new members as possible."

### Resolutions Adopted

Following the president's address and the report of the secretary and that of the executive committee (when it was learned that the association now has a membership of 210, representing 77 roads) three sets of resolutions were adopted by the organization. One, presented by Robert Scott (A. C. L.), after directing attention to the fact that a very considerable part of the \$0 per cent of fire loss in the country attributable to carelessness is the direct result of the smoking habit, recommended that it be recognized as "a moral obligation of all manufacturers or packers of tobacco to enclose with their product fire hazard warnings."

A second resolution, presented by G. L. Ball (St. L.-S. F.), after reciting the hazard from oil on water in harbors recommended that railroads support the passage of legislation to eliminate it, while the third, presented by E. B. Berry, (Sou.), after dwelling upon the enormity of losses by fire on railroads, the importance of its reduction and the indispensability of co-operation, addressed itself to the attention

of railroad executives in 10 expressions, one of which requests that "executives make manifest and proclaim their interest in fire prevention and protection, give active support and direction to enforcement and acceptance of individual responsibilities as a matter of daily duty and encourage the inauguration of a system of education to develop comprehensive interest in fire prevention;" and a second of which recommended "that all fire prevention activities on each railroad be co-ordinated through a central administrative officer for the promulgation of rules and regulations for the protection of property and guidance of officers and employees."

The resolution concerning the oil hazard in harbors gave rise to a lively controversy as to the actual danger presented from this source. W. F. Steffens (N. Y. C.) opened the discussion by making a detailed recitation of his experience and study with the oil scum found on water in New York harbor and contending that such oil was more of a fire retardant than a fire hazard. J. B. Lalor (Lalor Fuel Oil System, Baltimore), however, contended that the experience which Mr. Steffens had with piling in salt water was anything but a criterion of what might happen in fresh water and stated very emphatically that the sample of oil which Mr. Steffens exhibited would burn as readily as gasoline, once the temperature had reached 600 deg. William McGrath (D. L. & W.) stated that timbers in the very condition described by Mr. Steffens had burned at the recent pier fire at Hoboken. On the other hand J. R. Richards (S. P.) spoke of finding conditions on the Southern Pacific comparable to those described by Mr. Steffens but distinguished between new oil and old oil. Owing to the evident diversity of opinion among the members, therefore, together with the importance of the subject, it was decided to make the investigation of the subject the work of a special committee.

#### Reduction in Number of Railway Fires

G. R. Hurd (I. C.) presented the statistical report. This consisted of the presentation of an elaborate collection of figures and information on railway fires obtained from 75 roads, together with the classification of fires and a suggestion as to the method of prevention in each case. According to this report, 7,975 fires, representing a loss of \$10,563,914, occurred during 1920 as compared with 9,144 fires and the attendant loss of \$8,516,473 during the year 1919. "A total of 442 of these fires reported for 1920," the report went on to say, "were caused by the spreading of fire from adjacent property." This figure and the loss of \$594,706 which it represents is compared with 457 fires and \$1,158,860 loss in 1919. Electric wiring was reported as having caused 108 fires in 1920 with an aggregate loss of \$253,895 as compared with 81 fires and a loss of \$159,709 in 1919. Forest fires gave rise to 32 railroad fires in 1920 as compared with 27 in 1919, a comparison of the losses showing an increase of \$66,292 during 1920 over 1919.

Friction, hot boxes, brake shoes, etc., were reported as having caused 113 fires in 1920 with a loss of \$135,815 as compared with 84 fires and a loss of \$206,324 in 1919. Heating appliances and flues were reported as having caused 854 fires with a loss of \$547,097 in 1920 as compared with 840 fires and a loss of \$811,378 in 1919; and a total of 114 fires representing a loss of \$288,915 were reported as having resulted in 1920 from incendiary causes as compared with 92 fires and a loss of \$145,951 in 1919. Lightning was reported to have caused 55 fires in 1920 as compared with 64 in 1919; sparks from locomotives caused 1,821 fires to railroad property in 1920 with an attendant loss of \$1,085,758 as compared with 3,080 fires in 1919, while hot coals from locomotives caused 390 fires with an attendant loss of \$299,253.

Smoking resulted in 223 fires with a property loss of \$128,301 for 1920 as compared with 233 fires in 1919 and spontaneous combustion was reported as having caused 218 fires with a loss of \$1,927,856 as compared with 178 fires

and an attendant loss of \$162,352 in 1919. As to the other causes of fire, torches were reported to have caused 135 fires in 1920, tramps 172, and wrecks 100, while 1,538 fires were reported to have resulted from unknown causes. Referring to the report in his address, President Hickey placed emphasis upon the fact that the number of fires was reduced from 9,194 in 1919 to 7,975 in 1920, rather than upon the fact that the total losses increased from \$8,500,000 in 1919 to \$10,500,000 in 1920, his contention being that the number of fires is a fairer test of accomplishment in prevention work than the actual fire losses inasmuch as all fires have small beginnings.

#### Extensive Report on Shop Protection

The most elaborate report presented at the convention was that of the Shop Committee, of which J. R. Peters (Pennsylvania) is chairman. This treated of all phases of shop fire prevention and the protection of shop units and was prepared with a view to its incorporation in a handbook contemplated by the association. The first part of the report dealing with locomotives was presented last year, so that the convention directed its attention this year only to that portion dealing with freight and passenger car shops, paint shops, woodworking buildings, upholstering shops, bumping and lacquering shops, battery-recharging buildings, tanks, reclamation plants, chemical laboratories and outside fire protection.

#### Standardizing Hose Couplings

The question of standardizing hose couplings was discussed somewhat during the consideration of the report of the Shop Committee, following the contention raised by E. W. Osborne (N. P.) that a conflict existed between a previous year's report, which advocated the National Standard coupling for all railroad fire connections, and the statement in the report under consideration which advocated the interchangeability of hose couplings with local fire department standards. The subject assumed a position of particular prominence when later on in the convention a paper on Recent Progress in the Standardization of Hose Couplings was presented by E. R. Townsend of the National Board of Fire Underwriters.

In his talk Mr. Townsend endeavored to impress upon the railroads the importance of standardization in fire connections and pointed out the influential position they occupy in many sections of the country and urged them to lend their support to this movement. He stated that there are in use throughout the country 30 or more different size couplings as a result of which conflagrations occur regularly where the equipment of one city or industry is useless to the other.

F. H. Elmore (Hutchinson, Rivinus & Co., Philadelphia) called attention to the fact that while the Association had approved the National Standard, many of the roads were hesitating about standardizing both because of their dependence in many places upon towns using other standards and the objections to using adapters. This position of some of the railroads was given added emphasis when S. B. Pollard (S. P.), stated that all Pacific coast cities used a Coast Standard of coupling, and when W. F. Steffens (N. Y. C.) showed the futility of adopting the National Standard in New York City until that city had also adopted it. It developed, however, that many railroads do use the National Standard and a keen interest was taken in tools exhibited by Mr. Townsend whereby a large proportion of existing hose couplings may be adapted inexpensively and speedily to take the National Standard thread.

#### Handbook on Handling Explosives Prepared

One of the most valuable contributions presented at the convention was the report made on the handling of explosives and other dangerous articles. This report, prepared in hand-

book form by W. F. Topping, of the Bureau of Explosives, presented concise and authoritative instructions covering the packing, storing, shipping, inspecting and otherwise handling of explosives and all other dangerous material, together with a description and an enumeration of the characteristics of such materials and the proper methods of meeting situations precipitated by wrecks, fires, etc.

### Fire Prevention and Protection at Coaling Stations

W. E. Cathcart (Pennsylvania) read the report of the Committee on Fire Prevention and Protection at Coaling Stations. It was in the nature of a revision of the 1915 specifications in view of their incorporation in the Association handbook. The report addressed itself decidedly in favor of electricity for power purposes, reinforced concrete construction, the thorough cleaning of coal bins at least once a month; and also the installation of automatic dry pipe sprinklers, as against open head sprinklers or perforated pipe systems. The report also provided a form of inspection record which it recommended to be made out weekly to cover the condition of the sprinkling system.

Considerable discussion ensued upon the reading of this report, the greater portion of which referred to sprinkling systems in these structures and upon which a lively controversy developed. Taking objection to the stand of the committee in that open head sprinklers or perforated pipe systems are not to be recommended, E. W. Reilly (Erie) contended that open head sprinklers are entirely satisfactory for fires below the roof, while another member supported the system of perforated pipe and A. Murphy (M. R. & B. T.) approved of manually controlled systems at isolated points. In support of the committee, of which he is a member, W. H. Klin-sick (C. B. & Q.) and also J. R. Peters (Pennsylvania) emphatically condemned the open head and perforated sprinklers as presenting a severe drain on water supplies and reducing the effectiveness of streams when they are needed. W. F. Hickey (N. Y., N. H. & H.) called attention to the fact that the Underwriters do not approve of open systems. Mr. Hickey said that the difference in cost between an automatic and an open sprinkling system was negligible.

### Fire Prevention on Foreign Roads

In a paper on the practices of foreign roads L. E. Wilcox (John Page & Co.) pointed out the relatively small losses suffered from fire in foreign countries and attributed this largely to the little wood work and combustible material used, the abundance of rainfall and the greater vigilance customary by individuals. A detailed description of the prescribed system of fire protection and prevention on one of the typical English railroads indicated that although the equipment and methods differ somewhat from those in this country and might even be considered antiquated in some respects, the instruction in fire prevention is comprehensive and exact and responsibility is fixed to a high degree.

### Protecting Tunnels From Fire

S. B. Howatt's (S. P.) paper on the fire protection and prevention in tunnels was especially instructive and interesting. "Tunnel protection and prevention," he said, "is in a class by itself. We have not the room to combat the flames. They can only be approached from the two ends and usually one end, and sometimes both are so hot that it is a very difficult task to work near them." Mr. Howatt then went on to state the difficulties in the way of putting out fires in tunnels—owing to the chimney-like form of construction and the facility of air to gain access to the tunnel through crevices and cracks in sufficient amount to maintain a hot fire, even when the ends have been blocked. He also pointed out the practical impossibility of putting out a fire in a tunnel after it had once reached the tons of loose material and timber that are often placed behind the lagging in timber tunnels to fill the pockets occurring at the time of the construction.

and emphasized his statements by describing several fires which had occurred on his road.

Mr. Howatt condemned the practice of placing any reliance in such instrumentalities as sprinkling systems and fire-proof paint, however adaptable they are to other kinds of fire prevention. The problem, he said in effect, is rather one of preventing fire from entering the tunnel from an outside source, of preventing wrecks from occurring in the tunnel, and of eliminating man carelessness. Singular though it is, Mr. Howatt stated that no tunnel fires, in his knowledge, had arisen on the Southern Pacific from locomotives. Clearing away all brush for a distance 100 ft. back of the entrance, whitewashing wood portals and 50 ft. or more of the barrel, establishing an adequate water supply and piping it into the tunnel when possible, excluding all open lights from the tunnel wherever electricity is available and insisting upon the close inspection of tunnels by all parties having occasion to work inside of them, are some of the suggestions which Mr. Howatt made to prevent fires.

While such preparations would afford a reasonable protection against tunnel fires, Mr. Howatt emphasized the desirability of replacing timber with concrete as the only sure protection. On the Southern Pacific 6½ miles of tunnel, Mr. Howatt stated, have been concreted in the last 15 years, the plan being to concrete the portal and the first 50 ft. of the barrel of the most hazardous tunnels, also to apply concrete to the bad spots inside the barrel. The section inside the tunnels, Mr. Howatt pointed out, serve a valuable purpose from a fire protection standpoint inasmuch as they act as fire walls. During the discussion this report was commended as an unusual contribution to both fire prevention and construction engineers.

### Motor Truck and Locomotive Hazards

Other reports read before the convention included one of a committee on the Storage and Handling of Gasoline and Electric Motor Trucks in Freight Depots and Terminals and one from the committee on Locomotive Hazards. E. J. Reilly (Erie) presented the report on electric and gasoline trucks. It favored the use of electric trucks for all interior work owing to the tendency of gasoline equipment to drop oil and to backfire. In discussing this report J. P. Clear (I. C.), in reply to an inquiry as to whether fires have ever arisen from the use of trucks, told of two fires started in cotton by electric trucks, the wiring of which had become abraded sufficiently to cause a short circuit. In discussing the advisability of permitting gasoline trucks to operate inside of buildings, W. F. Hickey (N. Y. H. & H.), among others, emphasized the fact that where such trucks are permitted to enter buildings, operators should not be allowed to stop the engine, thus reducing oil dripping and back-firing to a minimum.

E. N. Floyd (C. C. C. & St. L.) read the report on locomotive fire hazards. It comprised a comprehensive discussion of the mechanical features of locomotives with respect to their connection with the fires attributed to locomotives and directed particular attention to the consideration of front end screens, ash pans, fire doors and combustion tubes. The report also discussed comprehensively the fire hazard of the fuel oil burning locomotives.

The report elicited considerable controversy by prescribing screens or wire mesh in the place of perforated plates on front ends. E. A. Ryder (B. & M.) stated that experience on the Boston & Maine had proved the perforated plate to be much superior to wire mesh from a standpoint of wear as well as draft and it is considered satisfactory from a fire prevention standpoint. Referring to the position of the committee and the statement of A. Murphy (M. R. & B. T.) that the perforated plate presented altogether too large an opening to sparks, E. W. Reilly (Erie) stated that in Canada, where railroads are required to secure permits before using perforated netting, the netting adopted by the Erie was

passed upon favorably. On the other hand, J. D. Lodge (Railroad Insurance Association) directed the attention of the supporters of perforated plate to the fact that the Master Mechanics' standard front end arrangement calls for wire netting in the place of perforated plates and H. B. Pollard (S. P.) emphasized the importance of being on the conservative side, owing to the importance of reducing the number of fires attributed to locomotive sparks.

### Discussion of Several Subjects

Pursuant to the plan of the organization to institute a general discussion of special subjects at each convention, a portion of Wednesday was set apart for this purpose and papers were read on the following subjects: Organization of employee fire brigades; fire fighting equipment recommended at outlying points; methods and difficulties of enforcing Bureau of Explosive regulation on safe handling of inflammables; locomotive sparks as fire hazards; methods of securing co-operation of foremen and employees in fire prevention, and what an inspector should look for in sprinkler installations. This session was presided over by Z. B. Claypool (St. L.-S. F.) in the absence of the chairman, J. L. Walsh (M. K. & T.).

Of the several discussions instituted, that on the organization of fire brigades stood out prominently as the most spirited discussion of the convention. Initiating this discussion W. F. Barnard (Wabash) stated that the three largest shop units of the Wabash were provided with fire brigades, the members of which were paid extra compensation in the way of an extra day's time each week. The Erie, E. W. Reilly pointed out, had a very extensive and effective organization until two years ago. This organization was instituted 15 years ago, and the interest was maintained by the holding of annual athletic tournaments and issuing annual passes over the road to the members of the brigades. It is expected that the holding of tournaments on the Erie will be resumed next year.

On the Rock Island L. F. Shedd stated that no difficulty was encountered in keeping up an efficient fire fighting organization at the shops. This road also compensates the men for their membership in the organization by issuing annual passes and allowing and extra hour's time a week, except at Silvis where a department is maintained exclusively for fire protection service. C. A. Hayes stated that the success of the U. S. Steel Corporation in maintaining efficient fire brigades was to be attributed largely to the fact that each member was given a badge to identify his connection with the department, to which Mr. Reilly responded with the statement that the Erie also furnished badges. During the discussion, it was brought out that regardless of the efficiency of the local shop fire brigade, it should only be considered in the light of a first aid remedy—not to the exclusion of the municipal fire department.

R. R. Hackett (B. & O.) started the discussion on fire fighting equipment and its care at points where no organized employee fire brigade is maintained. Mr. Hackett called attention principally to the importance of devoting special study to each condition, owing to the variety of conditions met on railroads and to the importance of efficient inspection by competent inspectors of all fire fighting equipment and property subject to fire hazards. The discussion developed the fact that the barrel and bucket still furnish the most effective fire fighting equipment at many outlying points, although in some localities it has been necessary to use fire extinguishers in place of water barrels for sanitary reasons.

James Scott (M. K. & T.) initiated the discussion on methods and difficulties in enforcing Bureau of Explosive regulations for the safe handling of gasoline and other inflammable materials. Mr. Scott stated that the various refineries and loading racks along the M. K. & T. always invited inspection of their property, but that about 10 per cent

of them are somewhat lax in carrying out regulations. As a result of the negligence found on the part of casinghead plants in some places and of other conditions, Mr. Scott cautioned against permitting any switching by train crews at night, owing to the possibility of fires from sparks and open flame lanterns.

### Locomotives Only Partially to

#### Blame for Right-of-Way Fires

On the subject of locomotive spark fire hazards and their relation to right-of-way fires, wooden trestle fires, etc., a particularly interesting discussion developed, of which J. R. Richards' (S. P.) paper was the most prominent feature. Referring to conditions on the Southern Pacific, Mr. Richards endeavored to show, among other things, that the popular conception that locomotives are to blame for 90 per cent of the fires along the right-of-way is not well founded and to this end he told of his experiences with cigarettes, greasy sacks, the carelessness of trespassers, the carelessness of trainmen in handling fires in cabooses, the burning of old ties and the disposition of waste from journal boxes, also the relation to these fires of motor cars and incendiary practices.

One of the most interesting developments of this discussion was reference to the survival of a creosoted bridge on the Nashville, Chattanooga & St. Louis, as described in the *Railway Age* of September 10. W. F. Hickey (New Haven) stated that he was given to understand by Dr. Von Schrenk that there was an increase in the inflammability of creosoted timber over untreated timber during the first six months, after which the inflammability decreased. S. B. Howatt (S. P.) supported this statement but recalled instances where creosoted bridges had burned to the ground and F. H. Elmore, skeptical of the value of creosote, stated that during a certain test made of fire-proof paint, neither the fire-proof painted specimen nor the creosoted specimen showed themselves immune from the test fire. W. F. Steffens referred to the incident as an important one in the light of its bearing on bridge construction and stated that the New York Central laboratory is now making a study of creosoted timber from this standpoint.

On the subject of the method of securing co-operation of foremen and employees in maintaining clean premises and removing fire hazards, A. Murphy (M. R. & B. T.) stated that the co-operation of the officers was of primary importance, after which was to be remembered the necessity of thoroughness of inspection, of fair play with the men in charge of the properties inspected, the constant remembrance that the fire inspector's position is one of advising rather than one of criticising; also the importance of cultivating a pleasing personality and the importance of dressing for the occasion.

J. H. Wilde (Railroad Insurance Association) presented a paper on what an inspector should look for in automatic sprinkler installations. He referred to the necessity of proper installation of the equipment, the importance of an ample volume of water under reliable pressure and the constant inspection of the system against the effects of time and of the carelessness of the workmen in buildings.

### The Election of Officers

At the annual election on Thursday afternoon the following were selected: G. L. Ball (St. L.-S. F.), president; E. A. Ryder (B. & M.), vice-president; and R. R. Hackett (B. & O.), secretary and treasurer. B. F. Mace (B. & O.) was elected an honorary member and such vacancies were filled as to make membership of the Executive Committee consist of the following: R. H. Newbern (Pennsylvania) G. R. Hurd (I. C.), Robert Scott (A. C. L.), E. B. Berry (Sou.), W. F. Hickey (N. Y., N. H. & H.), W. S. Wollner (N. W. P.), and W. S. Topping (Bureau of Explosives).

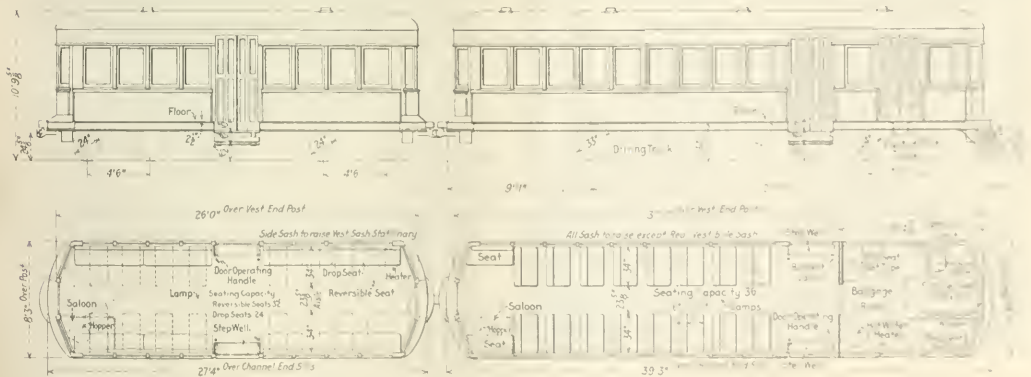

One of Three Bowen Motor Cars Recently Delivered to the Pittsburg & Shawmut

## Bowen Gasoline Motor Driven Passenger Car

### Arrangement of Power Transmission System and Rear Truck Are Features of Design

A GASOLINE MOTOR driven passenger car particularly adapted for use on branch or short line steam railways, which involves a unique combination of standard automobile practice with the essential features of railway rolling stock design, has recently been developed by the Bowen Motor Railways Corporation, St. Louis, Mo. The car shown in the illustration is one of three for the Pitts-

burg & Shawmut, the construction of which was recently completed by the Barney & Smith Car Company. The features of construction of particular interest in this car are the arrangement of the power transmission system and the design of the rear truck, through which the power is transmitted to the rail.

Elevation and Floor Plan of Motor Car and Trailer

burg & Shawmut, the construction of which was recently completed by the Barney & Smith Car Company. The features of construction of particular interest in this car are the arrangement of the power transmission system and the design of the rear truck, through which the power is transmitted to the rail.

The power plant is a four-cylinder automobile motor with 4½-in. by 6-in. cylinders, capable of developing 62 brake horsepower at 1,600 revolutions per minute, which is attached directly to the underframe. From the motor clutch, which follows the lines of automobile practice, power is transmitted

motion and of 1,085 to 1 in reverse. From this transmission to the rear axle gear case power is again transmitted by a longitudinal shaft.

The cast steel gear housing of the rear axle is built in two sections to permit easy inspection and repair of all gears and pinions. This construction makes it unnecessary to disassemble the truck in case any gears are to be removed. The arrangement of the combination bevel and spur gears is such that the gear ratio of the drive and, therefore, the car speed can be changed at any time by replacing the bevel gear set by another of a different ratio. From the motor to

the rear axle gear case the transmission devices and shaft connections throughout follow standard automobile practice, the details conforming to the standards of the Society of Automotive Engineers.

Compressed air to operate the brakes is provided by an air compressor mechanically driven by a longitudinal shaft from a power take-off located at the main transmission.

The two-wheel driving truck under the rear end of the car is of unique construction, combining the requirements of a fixed angular relationship between the center line of the axle and the center line of the car with a complete unity of construction which permits the rear axle with the brake rigging and gear case to be removed from the car intact. This truck is built up of cast steel side frames which are joined at the ends with cast steel cross pieces of I-section. The side frames are provided with pedestals for standard M. C. B. journal boxes. The gear case which surrounds the center of the axle is rigidly supported by two longitudinal members of rolled channel section, bolted to the underside of the truck frame end pieces. Lugs on the truck frame provide for the support of two brake beams, one in front and one at the rear of the driving wheels, which are fitted with M. C. B. standard brake heads and brake shoes. These are

The weight of the car body is transmitted to this truck frame through four semi-elliptic springs the center bands of which rest in suitable pockets in the truck frame and the ends of which bear against small flanged wearing shoes riveted to the underside of the car body underframe. The longitudinal distance between the front and back truck spring pockets is 4 ft. 7½ in., which is great enough to provide considerable transverse torsional stability to the gear case without sacrificing the complete freedom of the truck from attachment to the car body.

The engine is located under a hood at the front end of the car with the radiator let into the end wall just under the

Details of Rear Axle and Truck

front window. The hood is asbestos lined in order to permit the space over the engine to be filled with small baggage or express packages, thus conserving baggage room floor space.

With a 10-ft. 4¾-in. baggage compartment and 36-in.

Interior View of Passenger Compartment

connected with simple clasp brake rigging, operated by Westinghouse semi-automatic air brake equipment.

The alinement of the truck with respect to the car body is maintained by four column castings bolted to the underside of the car underframe. These castings are provided with vertical wearing shoes on their inside transverse faces and outside longitudinal faces which bear against corresponding wearing shoes secured to the end pieces of the truck frame and to projections from the side frames. Lateral alinement is thus maintained at four points on the truck frame and the driving thrust in either direction is transmitted to the car body at two points through these shoes, which are free to move vertically with respect to each other.

#### DETAILS OF OPERATION OF THE BOWEN MOTOR CAR

Month	March	April	May
Days operated .....	31	30	31
Total miles .....	3,987	3,960	4,092
Passengers carried .....	4,240	3,721	2,780

Net earnings per mile .....	.190	.194	.114

The population on the line of above road is 175 per mile.

door openings at the sides of the passenger compartment, the car has a seating capacity of 36 persons. Other arrangements can be used seating as many as 43 passengers. The power plant is considered large enough to handle a trailer on grades not exceeding three per cent and a design has been developed for such a car 27 ft. 4 in. long over the channel undersills, which may be provided either with reversible seats or longitudinal drop seats. In the former case a seating capacity of 32 may be provided while in the latter case the seating capacity is 24. With the exception of the interior finish, the entire construction is of steel, the underframe or chassis, the longitudinal members of which are 6

ft. I-beams, being completely standardized. Changes in the body construction and arrangement may be made to suit local requirements. The car illustrated weighs 28,000 lb. complete.

The first car built by the Bowen Motor Railways Corporation was placed in service about three years ago. It has now operated over 175,000 miles and is still in service. Its performance was carefully analyzed and while no fundamental defects developed, it was considered advisable to change the later design by making changes in the size and design of the car body.

Records of the operation of these cars indicate that they can be run at a cost of about 18 cents per train mile where

the railroad train service wage scale is in effect, or 12 cents per mile under non-union conditions. Further details of the cost of operation of a Bowen motor car on the Westfield Railroad are given in a tabulation herewith.

While this car is designed particularly for handling passengers, express, mail and baggage on short and branch line steam railways, it was also adapted for use on suburban electric lines where the cost of power is excessive. In new construction, the gasoline motor cars have important advantages over electric cars, eliminating the necessity for overhead wiring and the extra cost for the installation and maintenance of power stations.

## Freight Car Loading Highest Since Last November

### Greatest Gain in Coal Loading—Car Service Division Issues Bulletin of Current Statistics

WASHINGTON, D. C.

REPORTS RECEIVED by the Car Service Division of the American Railway Association show that 906,034 cars were loaded with revenue freight during the week ended on October 15, an increase of 10,294 cars over the week before. This was the largest number of cars loaded during any one week since November 13, 1920, but was

112,505 cars less than were loaded during the corresponding week last year and 66,044 cars below the total for the corresponding week in 1919.

The biggest gain was in the loading of coal, which totaled 191,506 cars during the week or an increase of 11,167 cars over the week before. This was 35,165 cars under the total

number loaded during the corresponding week in 1920 and 25,910 cars less than during the corresponding week in 1919.

Loading of merchandise and miscellaneous freight, which includes manufactured products, increased 4,659 cars over the previous week, the total being 550,808. During the same week last year, the total was 563,483 cars. Shipments of forest products amounted to 53,017 cars or a gain over the week before of 3,558 cars while livestock totaled 36,210 cars, an increase of 2,137 cars compared with the week of October 8. Coke loadings increased 278 cars to a total of 6,332 cars but ore fell off 5,913 within a week to a total of 19,789 cars.

Reports also showed a decline in the loading of grain and grain products compared with the week before, the total being 48,372 cars or 5,592 cars less than the total for the week of October 8. Comparisons show, however, that shipments of grain and grain products continue to run ahead of those of last year and also 1919, the total for the week of October 15, being 7,562 cars in excess of the corresponding week in 1920 and 5,555 cars greater than during the corresponding week in 1919.

Except for livestock, which showed a gain of 1,154 cars and grain and grain products, loading of all commodities was below that for the corresponding week in 1920. Compared by districts, increases over the previous week in the loading of all classes of freight were reported from all except

the northwestern. The central western was the only one to show an increase over the corresponding week last year.

The summary for the week of October 8 is given in the table on the preceding page.

The Car Service Division has compiled an information bulletin dealing with car statistics which makes the following comments on the showing up to October 8.

Comparing with the previous week the number of cars loaded fell below for all commodities enumerated except livestock and coal. The loading during corresponding week in October, 1920,—1,011,666 cars,—was the heaviest weekly loading of which there is record. While for the week grain and grain products loading fell off about 3,000 cars the total loadings of grain and grain products, June 1 to October 8, inclusive, were 1,002,085 cars, which is an increase of 275,118 cars over the corresponding period of 1920.

Lumber loading appears to be about on the level with the previous week and does not yet reflect the increase anticipated by reason of increased demands for equipment on the part of the lumber loading roads. Forest products loading is now about 15 per cent below that of last year. There is brisk demand for cars for increased loading of cotton, tobacco and general merchandise.

Coke and ore loading are at an extremely low ebb due to the continued inactivity of the steel mills.

The heavy demand for refrigerators is general. Loading is particularly heavy in California, Washington, Oregon,

representatives of the railroads have been called together in two groups—one at Washington and one at Chicago, representing the Eastern, Southeastern and Southwestern railroads. These conferences have resulted in an immediate movement of 5,500 railroad refrigerator cars into the territory of greatest demand.

There is a most unusual movement of potatoes coming out of the Northwest this season which up to the present is being handled in box cars. It will soon be necessary to provide protection against frost for this movement, which,

with the beginning of the citrus movement from California and Florida in the immediate future will make demands for refrigerator cars continuous.

The load per car for refrigerators is less than for any previous season. For the three months ended June 30 the average load per refrigerator car was 13.5 tons. This compares with 14.5 for the corresponding period in 1920 and with 15.7 tons per car when compared with what has been done heretofore, taking refrigerator loading as a whole. In the citrus movement the loading from Southern territory is considerably lower than that from the West. During the Fall months of 1920 the loading from the Florida section averaged 15.1 tons per car while the western loading of the same commodity was 17.8 tons per car. If the transportation requirements are to be met satisfactorily this factor of heavier loading of cars available must have attention on the part of shippers and receivers and their co-operation given to the best possible use of equipment.

Records recently compiled of loading of flour and mill stuffs at one of the largest milling centers indicate that the loading of flour for the month of August, 1921, averaged 29 tons per car, whereas during the same month in 1920 the loading was 35.7 tons per car. Mill stuffs loaded at the same terminal for the same period showed 23.9 tons per car as against 30.6 tons per car last year. This means that on

Idaho and Colorado with large increase in loading over previous records. For fruit and vegetables there was recorded a loading for the season up to October 1 of 261,210 cars, which is an increase of 28,843 cars over previous year for the same period. Recent weekly records of loading indicate a higher percentage of increase with prospects of 30 to 40 per cent increase during the next few weeks over the corresponding period of a year ago. To meet this situation rep-

\* Grain and total figures revised due to correction on D. L. & W. reports.

the basis of current loading of flour for every six cars dispatched there was one more car used than was necessary.

Reports for July, 1921, show an average loading per car for all commodities of 27.5 tons. The corresponding figure for the same month in 1920 was 29.5 tons per car. Assuming that there was a total of 3,363,000 cars loaded during the month of July, 1921, had the same tonnage per car been loaded this year as was loaded last year, there would have been 228,000 less cars loaded during the month,—one of the cures for coal shortages.

Since Labor Day there has been a marked upward tendency in total coal loading. In the anthracite fields the production is remaining fairly constant with supply of equipment equal to the demands.

Advance figures indicate a continued reduction of surplus so that by or prior to November 1 the surplus of equipment of gondola and hopper cars will be exhausted. There are indications of sectional shortage, the total shortages as of October 1 being approximately 3,300 cars.

The total number box cars in bad order, October 1, was 175,551, of which 144,078 were awaiting heavy repairs. It will be noted that the turn in this condition came during the early part of August, since which there has been a reduction of total box cars awaiting repairs of approximately 15,000 and a reduction in the heavy repair cars of approximately 5,000. It may be assumed that 7 per cent of the total box cars owned would represent the number normally in bad order under present conditions. This equals approximately 73,000 cars. Excess over normal is therefore 102,500 cars.

There has been little change in the total number of bad order open top cars comparing August 15 and October 1. The increase has apparently been stopped and advance indications are there will be a downward tendency dating from October 1. The number of open top cars awaiting repair August 15, were 153,406 while on October 1 this figure stood at 152,768. Figures of bad order open top cars as divided between hoppers and gondolas are not available. It may be assumed that 7 per cent of the open cars owned would represent the number normally in bad order under present conditions. This equals approximately 68,500 cars. Excess over normal is therefore 84,000.

The freight car surplus showed a further reduction during the week ending October 15 to 121,944, of which 36,882 were box cars and 69,558 were coal cars. There were shortages amounting to 3,683 cars, of which 1,098 were refrigerator cars.

## High Surtaxes Kill Sale of Equipment Trusts

WASHINGTON, D. C.

**A**N EXPLANATION of why the sales of the railroad equipment trust certificates taken by the Railroad Administration in payment for the standard equipment allocated to the railroads were suddenly stopped recently after the War Finance Corporation had disposed of some \$94,000,000 of them in two or three weeks, is afforded by a letter written by Eugene Meyer, Jr., managing director of the corporation, to Chairman Fordney of the House ways and means committee.

The proceeds of the sales increased the funds of the Railroad Administration available to make its settlements with the roads. Mr. Meyer says that upon the discussion in the Senate of an increase in the maximum surtaxes in the revenue bill from 32 per cent as provided in the House bill, to 50 per cent, which was forced upon the Senate leaders by the "agricultural bloc" all sales of these securities immediately ceased. They bear interest at the rate of 6 per cent and the higher the rate of surtax of the income tax law, the greater

is the inducement for large investors to put their funds into lower rated tax-exempt securities.

The letter recalled Mr. Meyer's testimony before Congressional committees in connection with the railroad funding bill, in which he stated the opinion that the funds used by the corporation in carrying out the provisions of the bill would be recovered through the sale of securities before June 30, 1922.

"I based that estimate on the ability to sell gradually the securities which we would probably take from the director general of railroads," Mr. Meyer said. "I based my confident expression of opinion, however, upon certain facts and conditions, as you will remember. The facts were:

"1. Improving gross and net earnings of the railroads, due to the improvement in business, and especially the improvement in the general business of the country that I expected would follow the passage of the bill itself, through the increased purchasing power of the railroads in connection with maintenance and repair work.

"2. The increasing ease in the money market and the prospect of an improved investment demand.

"Both of these conditions have been emphasized since I appeared before your committee.

"There was one other condition upon which my expectation with reference to the sale of securities was based, and that was the enactment into law of the recommendations of the Secretary of the Treasury with regard to the reduction of the upper brackets of the income taxes. This latter condition was also made clear in my testimony on the railroad funding bill before the interstate and foreign commerce committees of the Senate and the House.

"Following the adoption by the House of Representatives of the reduction of the maximum surtax to 32 per cent, I was able, acting informally by authority of the President and the director general of railroads, to arrange the sale in September of about \$100,000,000, par value, of the railroad equipment trust certificates held by the government, at exact cost to the United States government with accrued interest.

"Immediately upon the assembling of the Congress and the discussion of an increase in the surtax to a maximum of 50 per cent, all sales of these securities immediately ceased. It is fair to assume that the discussion of the increased surtaxes was intimately related to the termination of the market for railroad equipments. The sales did not cease because of the exhaustion of the supply of desirable securities of the good roads, as the government now holds \$54,000,000 par value of the equipment trust certificates of the same roads of which a considerable part already has been actually disposed of.

"The tax situation is intimately related to the marketing of railroad and industrial securities on a reasonable basis, and in view of my previous statement, I am writing you this letter because I am not willing to be responsible for any plans based upon the expectation of marketing railroad securities on a 6 per cent basis, if the surtaxes are to be raised above the House schedule."

THE INTERSTATE COMMERCE COMMISSION is receiving many applications from railroads and individual officers and directors for authority to retain the position of officer and director of more than one company after December 31. Among the latest applications received are the following: From M. L. Bell for authority to retain the office of director, vice-president and general counsel of the Chicago, Rock Island & Pacific, while also holding office with various subsidiary companies and the Minneapolis & St. Louis; from the Chicago & Western Indiana for authority for its officers to hold similar positions on the Belt Railroad of Chicago; from C. A. Peabody for authority to retain the position of director of the Illinois Central, the Union Pacific, Delaware & Hudson, the Baltimore & Ohio, the Pittsburgh, Fort Wayne & Chicago and various subsidiaries.

## Morrison's Flashlight Signal for Highway Crossings

THE NEW YORK, NEW HAVEN & HARTFORD has recently put up at a number of highway grade crossings in Massachusetts, Rhode Island and Connecticut a new style of light signal (with no bell) to give indications both day and night. The new signal is attached to the post of the ordinary crossing sign and the light is controlled electrically by approaching trains, by means of track circuits actuated by the moving trains, as in the ordinary audible crossing signal. The light is a standard Edison, incandescent. The red roundel, eight inches in diameter, is surrounded by an illuminated disk which, to the wayfarer, says "WHEN RED, STOP." The letters (white) stand out prominently, especially at night. The light is of the same general design as that used in the automatic block signals on the New York division of the road, which were described in the *Railway Age* of April 27, 1917. The reflector is 24 in. in diameter and the drum carrying the lens is 8 in. in diameter. The Edison socket of the lamp is held in place by an adjusting device so arranged that, within certain limits, it can be centered at any point in both

100 to 200 per cent. It is calculated that, thus operated, the bulbs will last at least a year; and by renewing the bulbs at regular periods, well within the time limit, a high factor of safety will be obtained.

Photometer readings indicate that when the lamp is properly focused in the reflector, the projected beam through the red roundel is about 6,000 c. p. at one degree from the axis of the beam.

The bracket, B, by which the lamp is fixed to the post, is fitted with set screws by which the lamp may be adjusted in both the horizontal and the vertical planes. A double slow-releasing relay, so designed that one member reacts upon the

Morrison's Red Light Day and Night Signal for Highway Crossings

other, automatically opens and closes the contacts for flashing the light. This relay is so adjusted that the time between the pick-up and release of one pair of magnets is different from that of the other; this provides the proper time element for the energizing and de-energizing of the lamp filament. The apparatus is adjusted to give 30 flashes a minute, which is believed to be the most suitable arrangement. The relay is so adjusted that in each cycle the lamp is alive 75 per cent of the time and 25 per cent of the time it is dark.

The circuit arrangement is such that practically all abnormal conditions will produce a constant red light, except failure of the track circuit, in which case a flashing red light will be displayed.

Energy is provided from an eight-volt storage battery having a capacity of 56 ampere hours, under intermittent service. The storage battery is slowly charged by floating across a primary battery. It is proposed to use the storage battery for all installations; but at certain points where commercial current is available the accumulator is charged direct from the commercial source rather than by the primary battery. As shown in the perspective illustration, a light signal is provided on each side of the railroad.

These signals have proved so satisfactory that the railroad has been allowed to install them, in some cases, in place of watchmen, resulting in a substantial saving in operating expenses.

These signals are in service at Titicut, Mass.; Norton, Mass.; Cranston, R. I.; Andover, Conn.; New Britain, Conn.; Hamden, Connecticut, and Derby, Connecticut. Three of them are now being put up at crossings in New York State.

Red Light Crossing Signals at Andover, Connecticut

the horizontal and the vertical planes. The parabolic reflector is of mirrored glass, and it is permanently fastened to the lantern.

The electric light bulb is a G-18½, 40-watt, 8-volt. It is a 1000-hour lamp designed especially for the signals of the New Haven road. The filament is a horizontal spiral with a focal distance of 15/16 in. with an allowance for variation of not more than 3/32 in. The lamp has a standard Edison medium screw base. The filament is of such shape that it gives a spread of 12 deg. of high intensity light, that is, six degrees on either side of the axis of the beam. The lamp is rated at 1,000 hour at normal voltage, but is operated at about 15 per cent below normal, thus increasing the life of the lamp

# General News Department

## Mechanical Convention at Atlantic City

The Executive Committee of the Railway Supply Manufacturers' Association met at the Waldorf-Astoria Hotel, New York City, October 26, 1921. The situation was thoroughly discussed regarding the meeting and exhibits of the Association for 1922. The letter ballot as to the preference of all members indicated a three-to-one vote in favor of the meeting and exhibits. The letter ballot and reports from the various members of the committee, representing all parts of the United States, showed also that the members were decidedly in favor of going to Atlantic City for the meeting and exhibits. A formal vote was taken and it was unanimously decided to hold the 1922 meeting and exhibits in Atlantic City.

The General Committee of Division 5—Mechanical, American Railway Association, held a meeting in New York City on the afternoon of October 6, and decided unanimously to hold its annual convention at Atlantic City, June 11 to 21, 1922. Division 3, American Railway Association (Purchases and Stores) will be invited to hold its annual meeting at the same time and place.

The American Railway Chief Surgeons' Association held its semi-annual meeting at the Hotel Sherman, Chicago, on October 17. The principal topic under discussion was the proposed vaccination of all employees against smallpox and typhoid fever.

A sleeping car line 785 miles in length is now in operation in Great Britain. It extends from Aberdeen, Scotland, to Penzance, in the southwest part of England, not far from Land's End. The route is over the Caledonian, the North British, the North Eastern, and the Great Central to Banbury, and thence by the Great Western.

## Meals at One Dollar on the Pennsylvania

Meals at one dollar, a luncheon or a dinner, can now be had on the dining cars of the Pennsylvania Railroad, special combination lunches and dinners being served at this price, on all cars throughout the System. This convenience is in addition to the usual a la carte features. During a brief experimental period about thirty different combinations have been tried. Others are being added, and changes are to be made frequently, in order to afford variety of choice as well as to determine those which are most popular. Each special combination consists of either meat or fish, two vegetables, rolls and coffee, tea or milk.

## Conference on Railroad Tie Specifications

A conference on the proposed unification of specifications for railroad cross ties and switch ties, called by the American Engineering Standards Committee, was held at Washington on October 25 at the office of the United States Forest Service. The conference decided unanimously that such unification should be undertaken, but as to the question as to the scope of the work it was thought best to confine the work to unifying the existing specifications as to size and quality and not to consider the matter of treating ties. The Forest Service and the American Railway Engineering Association were appointed as sponsors for the organization of the work and committees will be formed including representatives of the lumber industry and other interests. John Foley, forester of the Pennsylvania, represented the American Railway En-

gineering Association at the conference. The National Association of Railroad Tie Producers was represented by W. C. Nixon. Representatives were also present of the National Hardwood Lumber Association, the National Lumber Manufacturers' Association, the West Coast Forest Products Bureau, the American Society for Testing Materials, the American Electric Railway Association, the Forest Service and the Bureau of Standards.

## Machine Tool Builders' Convention

The twentieth annual convention of the National Machine Tool Builders' Association was held October 18, 19 and 20 at the Hotel Astor, New York. A considerable proportion of the membership was in attendance at the opening session, when H. Tuechter, president of the association, read his opening address. He discussed the possibilities in the way of standardization of tools, improved standard methods of cost accounting and the value of the statistical service being developed by E. F. Du Brul, general manager of the association. It was proposed to make this statistical service a business barometer to guide the members of the association. The president's address was followed in the afternoon by addresses by Charles L. Underhill, Congressman from Massachusetts, on "How Present Political Policies Affect Business", Professor Jordan, of New York University, on "Business Cycles," and C. L. Cameron and E. F. Du Brul, on "What Things Should Machine Tool Builders Do and What Should They Avoid at Various Stages of the Cycle?" The second day of the convention was devoted to committee meetings, and the third to addresses of general interest followed by an executive session. Officers of the association for the year 1921 were re-elected for 1922, the only change being in the election of Howard W. Dunbar, Norton Company, Worcester, Mass., as secretary.

## Valuation Bureau Reorganization

The Bureau of Valuation of the Interstate Commerce Commission is undergoing an extensive reorganization affecting the engineering, accounting and land sections, which involves some reduction of the force, as the field work has been practically completed, and the principal remaining work consists of compilation and the preparation of tentative reports. The work is now being centralized in Washington and the district offices are to be closed and the engineering board abolished. In place of the board, H. M. Jones, who was district engineer at Chattanooga, has been appointed supervising engineer at Washington and will have a staff similar to the staffs maintained by the district engineers. The Chicago office is to be maintained until November 30, but the Kansas City and San Francisco offices were closed on October 26 and the Chattanooga office has already been closed. Approximately 300 employees of the district offices will be moved to Washington, but many of them, particularly from the more distant offices, did not care to move and in some instances this will mean that others will be taken on at Washington to fill their places. A considerable number of men will remain in the field closing up their work until the end of the year. C. C. Witt, district engineer at Kansas City, has been appointed assistant supervising engineer at Washington. R. A. Thompson and Edwin F. Wendi, district engineers at San Francisco and Washington, have resigned effective on October 30, and the resignation of W. D. Penon, district engineer at Chicago, becomes effective on November 30. Similarly the land section is to be centralized at Washington and the service of the valuation attorneys is to be terminated on November 15.

## Operating Statistics of Large Steam Roads—Selected Items for the Month of August, 1921,

Region, road and year	Average miles of road operated	Locomotive-miles		Loaded (thousands)	Empty (thousands)	Per cent loaded	Per cent		Ton-miles (thousands)		Average number of locomotives on line daily					
		Principal and helper	Light				Gross	Net	Service-able	Un-service-able	Per cent stored

### International Commerce Body to Meet at Rome

The second annual meeting of the International Chamber will be held in Rome, Italy, beginning September 18, 1922. At the first annual meeting held last June in London more than 200 American business men, representing virtually every industry in the United States, attended. Among the subjects which are to be studied by international committees are: Export credits, foreign exchange, reciprocal treatment of foreign banks, bills of exchange, economy of fuel, international bureau of statistics, international commercial arbitration, international protection of industrial prosperity, unification of tariff nomenclature, reciprocal treatment of commercial travelers, reform of the calendar, through freight trains on great international traffic routes, uniformity of ships' tonnage measurement, combined rail and ship bill of lading, uniform ocean bills of lading, uniform interpretation of meaning of trade terms, and uniform passport regulations.

### American Railway Association

The regular meeting of the American Railway Association will be held at The Waldorf-Astoria, New York City, on Wednesday, November 16. Reports of divisions of the association are expected to be presented as follows:

*Division I.*—Operating; Freight Station Section; Medical and Surgical Section; Protective Section; Safety Section; Telegraph and Telephone Section.

*Division II.*—Transportation.

*Division III.*—Traffic.

*Division IV.*—Engineering; Construction and Maintenance Section; Electrical Section; Signal Section.

*Division V.*—Mechanical; Equipment Painting Section.

*Division VI.*—Purchases and Stores.

*Division VII.*—Freight Claims; Car Service Division; Joint Committee on Fuel Conservation; Joint Committee on Automatic Train Control; Conference Committee on Grain.

Copies of the reports will be forwarded to members in advance of the meeting.

## Traffic News

The New England Traffic League, at a meeting in Boston last week voted approval of the action of the Boston & Maine in reducing freight rates to meet auto truck competition.

J. L. Neely, for the past eight years assistant traffic manager of the American Sheet & Tin Plate Company, has been promoted to traffic manager succeeding the late Andrew G. Young. Mr. Neely has been in the traffic department of the company for the past 20 years.

The Chicago Shippers' Conference Association will hold its annual meeting at the Hotel La Salle, Chicago, on November 1. Numerous traffic problems will be brought up, and the annual election of officers will be held. The chairman of the convention committee is R. J. Wallace, traffic manager of the Jaques Manufacturing Company.

The Pennsylvania has announced the restoration of its winter Florida passenger train, the "Southland," between Chicago and Jacksonville, Fla. It will make its first trip from Chicago at 8:30 p. m. on November 14. This train will be operated daily over the Pennsylvania to Cincinnati, Ohio; from there to Atlanta, Ga., over the Louisville & Nashville, from Atlanta to Albany, Ga., over the Central of Georgia, and from Albany to Jacksonville, on the Atlantic Coast Line.

Grain for export, shipped east from Buffalo, N. Y., by rail amounted, in one day last week, to 2,000,000 bushels, the largest total yet recorded this year and about double a normal day's movement. It is estimated that about 60 per cent of this grain goes to Philadelphia. The chief reason for this heavy movement is believed to be the threat of a strike by the brotherhoods. It is estimated that there are approximately 15,000,000 bushels of grain now in elevators at Buffalo.

The Interstate Commerce Commission has issued sixth section permission orders authorizing the railroads to put into effect on one day's notice special tariffs which will give practically free transportation for Marshal Foch and other representatives of foreign governments for their trips by special train to Kansas City for the convention of the American Legion. The rate provided for was \$1 for the train for each stage of the journey between New York and Washington, and between Washington or New York and Chicago and between Chicago and Kansas City.

### Coal Production

The production of soft coal increased slightly during the week ended October 15, according to the weekly bulletin of the Geological Survey. The total output is estimated at 9,696,000 tons, an increase of 573 tons over the week preceding.

### Coal Association Asks Rate Reduction

The American Wholesale Coal Association has filed a petition with the Interstate Commerce Commission requesting it to institute an investigation into the reasonableness and propriety of the general level of interstate rates on coal and coke throughout the United States, and also into the reasonableness and propriety of the charges for reconsignment, diversion and detention of coal cars. The petition says that transportation costs cannot continue to be unaffected by conditions which affect every other item of cost and that railroads which depend upon the nation's industries for their revenues cannot continue to exact charges on a basis which prevents or tends to prevent industries from returning to normal conditions. A reduction in the rates on coal, it says, would reduce costs in nearly every line of industry and would stimulate and encourage industry to a larger extent than would a reduction in rates on any other commodity. The petitioner does not desire investigation of individual rates or relationships, but expresses the conviction that the

Copyright 1921, by the Chicago Tribune

On the Road to Normalcy

commission should work toward a restoration of the rates and relationships which existed in 1917. Reference is made to the investigations already instituted by the commission into the rates on livestock, grain and lumber. It is asked that the coal investigation be assigned for hearing at an early date and that it be expedited. The petition was filed by Wilbur La Roe, Jr., who has recently formed a partnership with former Chairman Clark of the Interstate Commerce Commission.

George H. Cushing, representing the Coal Association, has also filed a formal complaint with the commission asking it to suspend on one day's notice all charges with respect to the detention, diversion, reconsignment or other charges or penalties affecting the transportation and delivery of coal and coke in carload lots except the ordinary transportation charge, in order to encourage the shipment of coal to meet a possible railroad strike situation. The complaint says that if the shippers should ship to market in anticipation of needs that will become most urgent in the case of a strike, in excess of current demands, they would be charged with demurrage and reconsignment and other charges which would more than absorb their entire gross margin.

### Traffic Statistics for July

Revenue traffic statistics compiled by the Interstate Commerce Commission for July, and for seven months of 1921, covering 167 Class I roads, show only 24,990,000,000 ton miles of revenue freight for the month as compared with 37,075,000,000 for July last year. The freight revenue for the month was \$313,441,273 as compared with \$356,072,338. The total of passenger miles was 3,637,499,000, as compared with 4,801,015,000, and the passenger revenue was \$108,652,164, as compared with \$122,969,456. For the seven months' period the ton miles were 170,806,000,000, as compared with 227,772,000,000, and the freight revenues were \$2,177,314,692 as compared with \$2,210,199,657. The average revenue per ton mile was 1.275 cents. The number of passengers carried one mile for the seven months were 22,019,876,000 as compared with 26,580,007,000 in 1920, and the passenger revenue \$683,341,005 as compared with \$688,900,560. The average journey was slightly less than last year and the average number of revenue passengers per car was 16.67 as compared with 19.84.

The commission has added to its report on revenue traffic statistics certain data regarding commutation traffic for July, 1921, which shows the following:

District and region	Commutation traffic			Miles per passenger per month		Revenue per passenger-month	
	Revenue passengers carried (thousands)	Revenue passengers carried one mile (thousands)	Passenger revenue	Commutation	Other than commutation	Commutation	Other than commutation
Eastern District:							
New Eng. Region	4,559	72,425	\$713,323	15.80	27.56	0.999	3.426
Great Lakes Region	6,432	111,909	1,115,866	17.40	69.74	0.997	3.287
Ohio-Indiana-Allegheny Region	11,893	202,169	2,018,134	17.00	34.98	0.998	3.166

THE EXECUTIVE COMMITTEE of the Railway Supply Manufacturers' Association met at the Waldorf-Astoria Hotel, New York City, October 26, 1921. The situation was thoroughly discussed regarding the meeting and exhibits of the Association for 1922. The letter ballot as to the preference of all members indicated a three-to-one vote in favor of the meeting and exhibits. The letter ballot and reports from the various members of the committee, representing all parts of the United States, showed also that the members were decidedly in favor of going to Atlantic City for the meeting and exhibits. A formal vote was taken and it was unanimously decided to hold the 1922 meeting and exhibits in Atlantic City, New Jersey.

## Commission and Court News

### Interstate Commerce Commission

The commission has suspended until February 22, the operation of certain schedules published by the Atlantic Coast Line which propose increased commodity rates on lumber from various points in the Carolinas to Newport News, Va.

The members of the Interstate Commerce Commission on October 22 presented their former chairman, Edgar E. Clark, with a silver tea service. Mr. Clark was called to the hearing room of the commission on some pretext and Chairman McChord made the presentation speech.

### Personnel of Commissions

R. A. Thompson, in charge of the Pacific district of the Bureau of Valuation, Interstate Commerce Commission, has resigned, the district offices having nearly closed up their business. Mr. Thompson is going to Wichita Falls, Tex., where he will be chief engineer in charge of the construction of dams for the Wichita County Water Improvement District.

### Court News

#### Hours of Service Act—Telegraph Operators

The Circuit Court of Appeals, First Circuit, holds that a telegraph operator, who was paid for about 12 hours' service out of 24-hour periods, but was in actual service only 5 or 6 hours, being released from time to time for periods of 1 to 2 hours by the train dispatcher, was not on duty for a longer period than 9 hours in violation of Section 2 of the Hours of Service Act.—United States v. New York, N. H. & H., 274 Fed. 321.

#### Concealed Damage Discovered After Three Months

The consignee of a shipment of plate glass accepted it as in good order and kept it crated for three months. When it was then uncrated it was found broken. In an action against the railroad the South Carolina Supreme Court holds that recovery could not be based on the presumption that the glass was broken when delivered and the further presumption that the terminal carrier caused the breakage since this would be to mount a presumption upon a presumption. The plaintiff must first show that the glass, when delivered to him, was in a damaged condition.—Nimmer v Northwestern (S. Car.), 107 S. E. 479.

#### Violation of New York Fencing Law

##### Not Negligence as to Child

The New York Court of Appeals holds that where a child strayed on a railroad track and was killed by a train, the fact that the railroad had not fenced the road according to New York Railroad Law, §52, requiring fences to keep out live stock, was no basis for any claim of negligence against the company, the absence of a fence being no breach of a statutory duty owing to the deceased. The court states that there seems to be no prior decision in New York State on the point. Elsewhere under somewhat similar statutes the results conflict. In Massachusetts, Maine, New Hampshire, Ohio, Illinois, Indiana, and Iowa, it is said that the object of the Legislature is solely to prevent the straying of cattle. The contrary, at least so far as children are concerned, is the rule in Wisconsin, Missouri, Minnesota, Nebraska, and Michigan. The Supreme Court of the United States does not seem to have had a similar statute before it for construction.—Di Caprio v. New York Central (N. Y.) 131 N. E. 746.

## Railroads' Right to Abandon Road Operated at a Loss

The Minnesota Supreme Court holds that, unless a railroad company has contracted to keep its road in operation, it has the constitutional right to abandon it if the line can no longer be operated except at a loss; but apparently the Railroad and Warehouse Commission has no power to authorize an abandonment on this ground, since the statute limits its power to allow abandonment if it "will not result in substantial injury to the public."—*In re Duluth & N. M.* (Minn.), 184 N. W. 186.

## Driver of Truck Held Negligent at Crossing Though Motor Fails

The Pennsylvania Supreme Court holds that where the driver of a motor truck, without stopping, looking, or listening, drove on a crossing and was killed by a train, he was guilty of contributory negligence as a matter of law, even though the accident would not have happened had the engine of the motor truck not stopped, the tendency of such an engine to stall if driven at low speed being well known to all drivers. In undertaking to calculate his chances on crossing the track ahead of the train the deceased was held bound to foresee and take into consideration this additional danger.—*Fendale v. Hines* (Pa.) 114 Atl. 497.

## Insufficient Evidence of Flooding by Filling in Trestle

In an action against a railroad for damages to growing crops caused by obstructing the flood waters of a stream by filling in a trestle, the testimony showed that there was an excessive rainfall and several extraordinary overflows, which flooded the entire valley of the stream, both above and below the railroad embankment. The Mississippi Supreme Court reversed a judgment for the plaintiff because there was no testimony to enable the jury to separate the damages attributable to the wrongful act of the railroad company from that caused by the excessive rains on the crops and the consequent flooding of the land independent of the trestle.—*Davis v. Hambrick* (Miss.) Co. 88, 511.

## Not Liable for Derailment

### Caused by Transverse Fissure

In an action for personal injuries resulting from the derailment of a passenger train between Rahway and Elizabeth, N. J., the undisputed evidence showed that it was due to the breaking of a rail, caused by an internal transverse fissure not discoverable by the naked eye, and that no other test than the actual breaking of the rail would have revealed the defect. The rail was made by a reputable manufacturer, and had been in use about five years, about one-third of the normal life of such a rail; and the track was inspected daily. The Circuit Court of Appeals for the Third Circuit holds that the railroad was not liable, and judgment for the defendant was affirmed.—*Holland v. Director General*, 273 Fed., 928.

## Railroad Not Liable for Shortage in Weight of Package Freight

The District Court for the Northern District of Georgia holds that under Section 20 of the Bills of Lading Act of 1916, where a railroad loads package freight (cotton in bales) it is required only to state the number of packages and such marks or description as will identify them. A further statement, in an order bill for baled cotton, of the weight of the shipment is voluntary and gratuitous, and where it is qualified by the words "subject to correction" does not render the railroad liable to the holder of the bill, under Section 22, for a shortage in weights, and the qualification is not forbidden by law. The court adds: "It is appreciated that since cotton is not bought and sold by the package, but by the pound, this conclusion militates greatly against the attainment of one of the aims of the Bills of Lading Act; but the liability cannot be extended beyond the plain words of the act."—*Leigh Ellis & Co. v. Payne*, 274 Fed. 443.

# Foreign Railway News

## South Manchuria to Buy Supplies Here

The South Manchuria Railway plans to spend approximately \$20,000,000 annually in the United States, during the next few years for railway equipment and supplies, according to the New York Evening Post, which ascribes the statement to Yozo Tamura, an officer of the company, who recently arrived from Japan.

## Spain Finances Harbor and Railway Improvement

Important construction projects reported recently by the American embassy in Spain include the issue of government bonds to the value of \$1,100,000 to finance improvements at the port of Ceuta; also extension of credits to the Northern Railway and to the Madrid, Zaragoza & Alicante Railway for the purchase of railway material provided for in the royal decree of October 15, 1920.

## Extent of Depression in Great Britain

The business depression in Great Britain, as shown by traffic statistics of the railways, is severe. In July of this year passenger traffic, as shown by total passengers carried (exclusive of season ticket holders), had fallen 32.8 per cent from the figure for July, 1920, to a total of 101,450,975. Freight traffic declined 36.5 per cent to 1,088,443,125 ton-miles. Average receipts per ton-mile were 2.074 pence (about 4 cents). The average car load was 5.12 long tons and the average train load 123.52 long tons, as compared with 5.45 and 133 for the same period in 1920.

## Important Railway for State of Matto Grosso, Brazil

A third railway in the Brazilian state of Matto Grosso, which will undoubtedly have the greatest influence on the future development of this rich section of Brazil, has been initiated, according to Commerce Reports. The first railway connects the two navigable stretches of the Madeira river, while the other, a more extensive line, crosses the southern part of the state, connecting the Parana and Paraguay rivers. While both lines have been important in the development of Matto Grosso, the present line, if carried to a successful completion, will be much more important. The proposed line is to commence at the Agua Clara station on the Northwest of Brazil Railway and, with an extension of approximately 620 miles, will reach Cuyaba, after having passed by Bahu, Santa Rita do Araguaia, and the thriving village of Rondonopolis. The commission of engineers is now making the last definite studies of the proposed railway line.

According to the plans, this railway should form the trunk line of a system of future railways along the margins of the Madeira river and other large tributaries of the Amazon.

## Argentine Railway Dividends

Compared with last year's distribution the dividends recommended by three leading Argentine railways are disappointing, though they are in accordance with expectations in view of present conditions, according to the Railway Gazette (London). For the fiscal year 1920-1921 the Buenos Aires Great Southern, the Buenos Aires Western and the Central Argentine are each paying 4 per cent, whereas for the previous year the Great Southern and the Western each paid 7 per cent and the Central Argentine 6 per cent. The position of these three companies was strengthened last year by the transference to reserve of exceptional profits accruing from the high exchange value of the Argentine dollar.

For the financial year just ended, however, the Gazette continues, no such windfall can be expected and the traffic returns have been discouraging. In the 52 weeks the gross income of the Great Southern had fallen by \$4,125,000 and the net returns by as much as \$8,575,000. Similarly, the Western gross returns

were lower by \$5,750,000 and the net figures by \$6,350,000. The Central Argentine does not publish net returns, but its gross figures for the 52 weeks showed an increase of only \$75,000. To pay this year's reduced dividend the Great Southern will admittedly have to take \$2,750,000 and the Western \$2,500,000 from reserve.

### Railroad Fosters "Good Roads"

#### Campaign in Argentina

The Buenos Aires & Pacific has begun an active campaign to arouse interest among farmers and landowners in the improvement of roads leading to the railway, according to Commerce Reports. Motion pictures have been prepared showing the present state of the roads together with pictures of good roads in the United States and methods of road building. These pictures have been well received in the country districts. The railroad company announces that it will assist in the organization of local committees, the loan of road-building machinery, and offers the services of its surveyors.

### Australian Railway Gauge Conversion

A uniform railway gauge for Australia, which has been under discussion for many years, is now brought a step nearer realization by the recent report of the commission appointed by the federal government in December, 1920, to investigate the subject, according to the Railway Gazette (London). As had been anticipated, the commission recommends the adoption of the 4 ft. 8½ in. gauge, which has been in use from the first on the New South Wales Government Railways, and was deliberately adopted for the Trans-continental railway of the federal government from Kalgoorlie to Port Augusta, which was opened in 1917. The estimated cost in 1913 of the general conversion of the Australian railways to the 4 ft. 8½ in. gauge was \$115,000,000, but at the conference last December of the chief civil engineers of the different state railways, the estimate for the conversion of the whole of the existing railways was put at \$468,000,000.

In view of this very heavy cost it is proposed, as a first step, that the gauge be made uniform between the five state capitals. This, at present prices, has been estimated to cost \$132,500,000. The main difficulty now is the question of finance, which has to be arranged with the premiers of the different states. Mr. Hughes, the federal prime minister, who has always been a strong advocate of gauge uniformity from the point of view of national defense, is understood to be ready to discuss with the conference of state premiers the practicability of taking action to begin a gradual conversion.

### French Railways and the State

The paramount problem awaiting solution in France is, according to a special dispatch to the New York Tribune, the reorganization of the railroads. Before the war the railroads averaged enough to pay fixed charges, the dispatch continues. Stocks and bonds of the railroads are guaranteed by the government through an agreement by which the railroads will gradually pass under state ownership in 1980. Public opinion is strongly opposed to an extension of state activity now and it would not be surprising if public monopolies are abandoned as unprofitable. During the war the railroads were greatly overworked and in the zone of German occupation were systematically destroyed. Now the pre-war status has been restored. Of the 600 bridges destroyed, 565 have been rebuilt, while locomotives number more than 1,000 above the pre-war total. Recently an American signaling system has been installed at great expense. Plans for electrification are being rapidly pushed and it is estimated that within six years 5,000 miles will have been completed.

To cover these productive expenditures the Chamber of Deputies is now preparing to ratify a bill already passed by the Senate for a large increase in rates, amounts of which are left to the discretion of the railroads. These may reach 180 per cent for freight and baggage and 100 per cent for passengers. They are to continue until 1926. The railroad deficit last year of \$600,000,000 was said to be due to adoption of the eight-hour day and to reconstruction improvements. Now conditions are rapidly improving as a result of lower coal prices and the termination of reconstruction.

### Railway Conditions in Soviet Russia

The following observations on railway conditions in Siberia and European Russia are from a source which the Bureau of Foreign and Domestic Commerce considers reliable and are of recent experience:

"On the main line of the Trans-Siberian Railway the roadbed seemed to be in good condition all the way. Section hands and trackmen employed under the old régime have remained at their posts, despite arrears in their pay, and have made the necessary repairs in track ballast. Telegraph lines are also in good condition, and fully half the poles have been renewed during the last two years, according to the date marks on them. A number of stops were made en route on account of delays in transportation.

"The rolling stock of the railways is in a very unsatisfactory condition, chiefly due to lack of spare parts for repairs. This is especially true of locomotives. The yards in practically every terminal were filled with locomotives that had been junked. There seems to be a large supply of box and gondola cars, although many of them have been requisitioned on sidetracks to house soldiers and in some cases refugees. There is great shortage of passenger cars, and all of them are in bad condition. Hot boxes were very frequent all along the lines on account of worn-out bearings and inferior oil.

"Trains are running regularly three times a week from Irkutsk to Omsk, taking four days for the journey, and to both Petrograd and Moscow, requiring from four to five days each. A large number of the passengers on these trains are soviet officials, as it is exceedingly difficult for civilians to secure permission from the authorities to travel. A large number of civilians, however, were traveling with their possessions in freight cars in both directions.

"The north route to Perm and the routes from Moscow to Petrograd, Reval, and Riga are in fair condition, but the southern routes to the Urals and many of the others in central and southern Russia have been partially or completely abandoned.

"A German commission is in Moscow negotiating for the operation of some of the railway lines."

from the New York Tribune

Well, They Can't Say the Signal Wasn't Working

## Equipment and Supplies

### Freight Cars

THE ILLINOIS CENTRAL is inquiring for 1,000 40-ton refrigerator cars.

THE VIRGINIAN RAILWAY is inquiring from the car builders, for prices on the repair of 4,000 freight cars.

THE DELAWARE, LACKAWANNA & WESTERN is inquiring for 500 steel underframe box cars of 40-ton capacity.

THE CENTRAL OF NEW JERSEY has ordered 125, 50-ton coal cars and 85, 40-ton box cars from the Standard Steel Car Company.

THE GRAND TRUNK is inquiring for 200 refrigerator cars for the Chicago, New York & Boston Refrigerator Company, which is controlled by the Grand Trunk.

THE CANADIAN NATIONAL RAILWAYS this week let contracts to the Canadian Car & Foundry Company and the Eastern Car Company for the repair of 3,000 box cars with wood underframes.

THE CHICAGO, MILWAUKEE & ST. PAUL, reported in the *Railway Age* of October 8 as inquiring for 2,500 composite gondola cars of 50-ton capacity, is now inquiring for 1,000 general service cars and 2,000 gondola cars.

THE TOLEDO & OHIO CENTRAL, reported in the *Railway Age* of October 22, as asking for prices on the repair of a number of freight cars, has entered into a contract with the Ralston Steel Car Company for the repair of about 360 cars, for this road and the Kanawha & Michigan. A contract has also been given by the Toledo & Ohio Central to the Hamilton Car Company, Newark, Ohio, for the repair of 200 box cars.

### Iron and Steel

THE CHICAGO, BURLINGTON & QUINCY is inquiring for bids on 1,500 tons of plates for car repairs.

THE PHILADELPHIA & READING recently received bids on 28,000 tons of fabricated steel for use on nine bridges.

THE CHICAGO, BURLINGTON & QUINCY has awarded a contract for three 55-ft. girder spans, 100 tons, to the McClintic-Marshall Company, Chicago.

THE CHICAGO & ALTON has awarded a contract for 201 tons of steel for approaches to a freight house at Chicago to the American Bridge Company, Chicago.

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS are receiving bids at Tokio, November 4, through Mitsui & Company, New York, for 1,800 tons of 60-lb. rail and 4,700 tons of 75-lb. rail.

THE UNITED STATES STEEL CORPORATION announces a reduction in the price of open hearth steel rails, from \$47 to \$40 a ton. Orders have already been placed for 100,000 tons of rail at the new price.

THE IMPERIAL JAPANESE GOVERNMENT RAILWAYS, through Suzuki & Company, New York, have ordered 200 tons of 100-lb. rail and 5,000 tons of 75-lb. rail, from the U. S. Steel Products Company.

THE CANADIAN PACIFIC has ordered 32,000 tons of rail from the Algoma Steel Corporation. This is in addition to the 25,000 tons ordered from the same company, as reported in the *Railway Age* of September 17.

THE GREAT NORTHERN has let a contract for 485 tons of steel for a drawbridge at Delta, Wash., to the Milwaukee Bridge Company, Milwaukee, Wis., and not the Wisconsin Bridge & Iron Company as incorrectly reported in the *Railway Age* of October 22 (p. 802).

THE MITSUI & COMPANY is inquiring for 2,050 tons of 60-lb. rail for export to Japan; also for 100 tons of galvanized steel wire. Bids are also wanted on 7,000 tons of steel tower material for the Formosa Electric Power Company.

### Miscellaneous

NICHOLSON THERMIC SYPHONS have been ordered from the Locomotive Fire Box Company, Chicago, for the 14 Mikado locomotives ordered from the American Locomotive Company by the Chicago, Rock Island & Pacific.

THE ATCHISON, TOPEKA & SANTA FE has awarded a contract for one 55,000 bbl. steel tank, 115 ft. in diameter and 30 ft. high, and one 152,000 gal. tank, 24 ft. in diameter by 40 ft. high, to the Graver Corporation, Chicago, to be erected at Clovis, New Mexico. Both tanks are for the storage of fuel oil for oil-burning locomotives.

THE GREAT NORTHERN is asking for prices on 1 heavy-duty, all-steel, No. 3, industrial pile-driver, capable of handling concrete piles weighing 8,000 lb., driving radius not less than 20 ft., and equipped with locomotive type boiler, with steam hammer and 4,000-lb. drop hammer, Pyle electric headlight and air brake and to be self-propelling.

THE NORFOLK & WESTERN will receive bids until 12 o'clock noon, November 2, 1921, at Roanoke, Va., for electrical material; 300 rods wire fencing; 2,500 steel ties; 10 steel ship building channels; 200 bars reinforcing steel; 90,000 lb. welding and threading steel; its requirements of locomotive driving wheel and truck tires, for the months October to December, 1921, and 7,500 steel switch plates.

### Railway Construction

CHICAGO & ALTON.—This company has awarded a contract to I. D. Lain & Company, Bloomington, Ill., for extensive grade separation work at Division street, Bloomington. The same company will also build a second track from Godfrey, Ill., to Brighton Park, a distance of 6 miles, at an estimated cost of \$256,000, and from Roodhouse, Ill., to Manchester, a distance of 5 miles, at an estimated cost of \$96,000.

GREAT NORTHERN.—This company, in conjunction with the Northern Pacific, is negotiating with the city of Minneapolis, Minn., for extensive grade separation work.

ILLINOIS CENTRAL.—This company, which was noted in the *Railway Age* of October 22 (page 804) as accepting bids for the reconstruction of a depot at Marissa, Ill., which was recently destroyed by fire, has awarded a contract for this work to the Ellington-Miller Construction Company, Chicago.

MISSOURI, KANSAS & TEXAS.—This company is planning the construction of a freight house at Oklahoma City, Okla.

ST. LOUIS-SAN FRANCISCO.—This company will soon accept bids for the construction of a station at Francis, Okla.

YAZOO & MISSISSIPPI VALLEY.—This company has filed an application with the Louisiana Public Service Commission for permission to erect a new passenger station at Baton Rouge, La.

THE SECOND ANNUAL MEETING of the International Chamber will be held in Rome, Italy, beginning September 18, 1922. At the first annual meeting held last June in London more than 200 American business men, representing virtually every industry in the United States, attended. Among the numerous subjects which are to be studied by international committees are: Export credits, foreign exchange, reciprocal treatment of foreign banks, bills of exchange, economy of fuel, international bureau of statistics, international commercial arbitration, international protection of industrial prosperity, unification of tariff nomenclature, reciprocal treatment of commercial travelers, reform of the calendar, through freight trains on great international traffic routes, uniformity of ships' tonnage measurement, combined rail and ship bill of lading, uniform ocean bills of lading, uniform interpretation of meaning of trade terms, and uniform passport regulations.

## Supply Trade News

The **H. K. Ferguson Company**, Cleveland, Ohio, has taken over the exclusive sales rights for the Shoemaker gap crane and other products of the **Morgan Engineering Company**, Alliance, Ohio, in the railway field.

**W. H. Snedaker**, formerly in the Tacoma, Wash., office of the **Griffin Wheel Company**, Chicago, has been appointed manager of sales at the office established by the company in the Rialto building, San Francisco, Cal.

The **Reilly-Peabody Fuel Company**, Pittsburgh, Pa., announces a change in name to **Peabody Fuel Company** with the following officers: **F. E. Peabody**, president; **R. E. Peabody**, vice-president; **W. Russel Carr**, vice-president; **C. M. Rhoads**, secretary and treasurer, and **T. J. Atchison**, general sales manager. All these also are officers of the American Coke Corporation, with the same titles. **F. E. Peabody** has resigned as treasurer of the Eastern Fuel Company and severed all his connection with that company and its subsidiary, the Georges Creek Coal Mining Company.

**Press G. Kennett**, formerly representative of the Flint Varnish & Color Works, with headquarters at St. Louis, Mo., in charge of sales in the south and southwest, has

been appointed manager of the railway sales of the **Chicago Varnish Works**, with headquarters at Chicago. Mr. Kennett has been with the Flint Varnish & Color Works for the past 12 years, and when the Du Pont interests took over the company he was appointed representative at St. Louis. Prior to going with the Flint concern, he was connected with the purchasing and supply departments of several railroads in the south and southwest, serving as general storekeeper for Illinois Southern

in 1905 and in the same capacity for the Southern Indiana in 1906 and 1907.

### Inland Steel Company Enters Rail Market

The Inland Steel Company is making arrangements to manufacture steel rails at its Indiana Harbor works and will be in a position to offer standard section rails for delivery beginning in March, 1922. The decision of the company to engage in rail production is based on the fact that the demand for rails is anticipated to be one of the most important branches of the steel industry in 1922, and that another producer in the west is needed. Work has been started on a new building, 100 ft. by 800 ft., at the Indiana Harbor works of the company, in which the rail finishing equipment will be housed. The entire plant will have a capacity of 2,000 tons of finished rails daily and consists of a 28-in. mill, 3 high and 3 stands of rolls, served by a 32-in. roughing mill, which in itself is served by a 40-in. blooming mill, all electrically driven and the most recent installation of its kind. Four large heating furnaces are necessary as it is the intention of the company to re-heat the blooms before rolling the rails. The 28-in. mill referred to has heretofore been used chiefly in the manufacture of heavy structural material, the demand for which in the Chicago territory is not engaging the full capacity of the mill under present conditions.

### Rumored Pullman and

### Haskell & Barker Will Combine

There is persistent rumor at Chicago that the Pullman Company is about to absorb the Haskell & Barker Car Company, this rumor going so far as to name the head of the consolidated company. The plan, it is said, calls for a meeting of the directors of the two companies in the next week or ten days, when details will be discussed. It is reported that the officers of the two companies involved have already discussed the plan informally and that John S. Runnels, president of the Pullman Company, is to become chairman of the board of directors of the new company and Edward F. Carry, president of Haskell & Barker, is to become president. The merger would bring together the Pullman Company, with a capitalization of \$173,000,000, and with plants at Pullman, Ill., St. Louis, Mo., Wilmington, Del., Buffalo, N. Y., and Richmond, Cal., and with a capitalization of \$36,000,000, the Haskell & Barker Car Company, with a plant at Michigan City, Ind., with an annual capacity of 22,500 freight cars.

## Obituary

**George R. Henderson**, formerly consulting engineer of the Baldwin Locomotive Works, died on October 19, at Media, Pa. He was born on January 14, 1861, at Philadelphia, Pa., and graduated from Lauderback Academy, Philadelphia, in 1876. Two years later he began railway work, serving consecutively to 1887, as apprentice, draftsman and assistant chief draftsman of the Pennsylvania Railroad. He was then to March, 1899, with the Norfolk & Western as assistant superintendent of the Roanoke shop and mechanical engineer. From March to July, 1899, he was with the Schenectady Locomotive Works, and from July of that year to June, 1901, served as assistant superintendent of motive power and machinery of the Chicago & North Western. He was then assistant superintendent of machinery and superintendent of motive power of the Atchison, Topeka & Santa Fe until August, 1903. The following year he became a consulting mechanical engineer at New York and in 1910 went to Brazil, serving for two years on the railways of Brazil. He then returned to the United States to become consulting engineer of the Baldwin Locomotive Works. During the war Mr. Henderson was consulting engineer to the Federal Fuel Administration in the Philadelphia district. He was the author of several books on engineering, also of a number of articles published in the *Railway Age*.

## Trade Publications

**MATERIAL HANDLING SYSTEMS.**—The Stearns Conveyor Company, Cleveland, Ohio, has issued a 16-page booklet—bulletin No. 100—in which ten pages are devoted to belt conveyors, two pages to traveling bucket hoists, and one page each to wall winches and car movers. The booklet is amply illustrated with photographs and line drawings and includes engineering data of value covering the design of belt conveyors.

**TELESCOPIC HOISTS.**—Gillis & Geoghegan, New York, have issued a new 20-page, two-color catalog descriptive of its telescopic hoists and the various uses to which they may be put. The booklet is illustrated with photographs of actual installations for handling ash cans, barrels, trays and other loads. It contains two forms of specification for each model, one of which describes the various parts of a complete telescopic hoist installation.

**MEALS AT ONE DOLLAR**, a luncheon or a dinner, can now be had on the dining cars of the Pennsylvania Railroad, special combination luncheon and dinners being served at this price on all cars throughout the System. This convenience is in addition to the usual a la carte features. During a brief experimental period about thirty different combinations have been tried. Others are being added, and changes are to be made frequently in order to afford variety of choice as well as to determine those which are most popular. Each special combination consists of either meat or fish, two vegetables, rolls and coffee, tea or milk.

## Railway Financial News

**ALABAMA & MISSISSIPPI.—Authorized to Abandon Line.**—The Interstate Commerce Commission has issued a certificate authorizing the receiver of the Alabama & Mississippi railroad companies of Alabama and Mississippi to abandon their lines of railroad extending from Vinegar Point, Ala., to Pascagoula, Miss., 67 miles.

**ALABAMA GREAT SOUTHERN.—Annual Report.**—The income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues (March 1 to Dec. 31).....	\$9,805,561	.....
Operating expenses (March 1 to Dec. 31).....	7,661,510	.....
Net revenue from operations.....	2,144,051	.....
Taxes.....	283,053	.....
Operating income (March 1 to Dec. 31).....	2,057,518	.....
Standard return (January and February, 1920, full year 1919).....	283,863	\$1,703,180
Total non-operating income.....	236,193	180,973
Gross income.....	2,577,574	1,884,153
Interest on funded debt.....	465,239	461,617
Total deductions from gross income.....	918,406	637,972
Balance of income over charges.....	1,659,168	1,246,180
Dividends:		
7 per cent on preferred stock.....	236,625	236,625
7 per cent on ordinary stock.....	548,100	548,100
Balance carried to profit and loss.....	873,350	461,456

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with the previous year as follows:

	1920	1919
<b>OPERATING REVENUES</b>		
Freight.....	\$8,345,701	\$7,470,847
Passenger.....	2,507,383	2,476,753
Total operating revenues.....	\$11,703,433	\$10,249,739
<b>OPERATING EXPENSES</b>		
Maintenance of way and structures.....	\$1,325,738	\$1,513,344
Maintenance of equipment.....	2,675,990	2,587,465
Traffic.....	252,359	160,372
Transportation.....	4,655,846	3,906,049
General.....	305,706	223,998
Total operating expenses.....	\$9,313,423	\$8,463,777
Net revenue from operations.....	2,390,010	2,065,963
Taxes.....	331,740	285,014
Operating income.....	2,056,964	1,779,530
<b>PASSENGER TRAFFIC</b>		
Number of passengers carried.....	1,173,303	1,235,036
Number of passengers carried one mile.....	81,387,423	93,468,232
Average distance hauled per passenger (miles).....	69.37	75.63
Average receipts per passenger per mile (cents).....	3.08	2.68
<b>FREIGHT TRAFFIC</b>		
Number of revenue tons carried.....	5,702,772	5,463,638
Number of revenue tons carried one mile.....	928,543,723	838,745,409
Average distance hauled per ton (miles).....	162.82	153.51
Average receipts per ton per mile (cents).....	0.90	0.89

**AIHUKINI TERMINAL & RAILWAY.—Authorized to Issue Stock.**—The Interstate Commerce Commission has authorized this company to issue for cash at not less than par \$620,000 of capital stock, the proceeds to be used in constructing and equipping its proposed line on the Island of Kauai, Territory of Hawaii.

**CALIFORNIA SOUTHERN.—Bond Issue.**—This road, which was taken over recently by the Atchison, Topeka & Santa Fe, was authorized by the Railroad Commission of the State of California, on October 3, to sell at not less than face value \$35,000 of first mortgage bonds to pay for rails used in extending the line. The order provides that none of the bonds shall be delivered until a note for a like amount and for which the bonds have been pledged shall have been paid.

**CANADIAN NATIONAL RAILWAYS.—Resignation of Director.**—E. C. Cantley has resigned as director having accepted a nomination for the Canadian House of Commons.

**DENVER & SALT LAKE.—Petition Court to Close Road.**—The Bankers Trust Company of New York, trustee for the bondholders, filed a petition in the United States District Court at Brighton, Colo., on October 26, asking that the court either order the railroad closed or issue an order that wages or operating costs be reduced so that the road can operate at a profit. The court set November 3 next for hearing on the petition. The Denver & Salt Lake operates between Denver, Colo.,

and Craig, 255 miles. It has been in the hands of receivers since August 16, 1917.

**FORT WORTH & DENVER CITY.**—This company has applied to the Interstate Commerce Commission for authority for the extension of \$8,176,000 of its 6 per cent first mortgage bonds for 40 years from December 1 at 5½ per cent.

**GEORGIA, SOUTHERN & FLORIDA.—Annual Report.**—The income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Operating revenues (March 1 to December 31).....	\$4,281,953	.....
Operating expenses (March 1 to December 31).....	4,457,031	.....
Net revenue from operations.....	Def. 175,078	.....
Taxes.....	158,423	.....
Operating income (March 1 to December 31).....	Def. 360,377	.....
Standard return (January and February, 1920; full year 1919).....	85,243	\$511,457
*From U. S. Government account guaranty, March 1 to August 31.....	130,000	.....
Total non-operating income.....	216,912	13,246

**NEW YORK, NEW HAVEN & HARTFORD.—Authorized to Sell Equipment Notes.**—This company having heretofore been authorized by the Interstate Commerce Commission to pledge \$2,000,000 of its equipment trust notes as collateral security for loans evidenced by promissory notes, has now been authorized by the commission to sell the equipment trust notes to the amount of \$1,602,000 on a basis of 7½ per cent.

**PERE MARQUETTE.—Authorized to Abandon Branch Line.**—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of the branch line from Harrison to Leota, Mich., 9.88 miles.

**SAVANNAH & ATLANTA.—Foreclosure Action Allowed.**—An order allowing the filing of foreclosure proceedings against this company has been signed by Judge Evans, on the application of the Farmers Loan and Trust Company, of New York, trustee for

the bondholders. The Savannah & Atlanta has been in the hands of receivers since March 4, 1921.

**SOUTHERN.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to sell \$5,655,000 of first consolidated mortgage 5 per cent gold bonds to provide funds for the retirement of an equal amount of the first mortgage bonds of the Georgia-Pacific which mature January 1.

**Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**ST. LOUIS-SAN FRANCISCO.—Authorized to Issue Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$4,578,000 of prior lien mortgage bonds, to be pledged and re-pledged from time to time as collateral security for short term notes.

## Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several companies the following amounts:

Fullman Company.....	\$7,250,000
Danville & Western.....	260,000
Hartwell.....	24,500
Carolina & Tennessee Southern.....	5,000
Asheville & Craggy Mountain.....	5,500
Denison & Pacific Suburban.....	13,000
Weatherford, Mineral Wells & Northwestern.....	36,000
Birmingham & Northwestern.....	10,000

## SHORT LINE RAILROADS

Middle Tennessee.....	5,000
-----------------------	-------

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

## Dividends Declared

Delaware & Hudson.—2¼ per cent, quarterly, payable December 20 to holders of record November 26.

Illinois Central.—1¼ per cent, quarterly, payable December 1 to holders of record November 4.

Norfolk & Western.—Common, \$1.75, quarterly, payable December 19 to holders of record November 30.

Pennsylvania Railroad.—1 per cent, quarterly, payable November 30 to holders of record November 1.

From the Providence Journal

Go Ahead, Mr. Engineer—Damn the Signals

## Railway Officers

### Financial, Legal and Accounting

**M. B. McBride** has been appointed auditor of the Cowlitz, Chehalis & Cascade with headquarters at Seattle, Wash., effective September 1.

**R. P. Crutchfield**, whose appointment as treasurer of the Union Railway with headquarters at Memphis, Tenn., was announced in the *Railway Age* of October 22 (page 806), was born at Paris, Tenn., on July 24, 1893, and was educated in the public schools. He entered railroad service on July 5, 1911, as utility clerk in the master mechanic's office of the Louisville & Nashville, and was promoted to timekeeper in May of the following year. He left that road in February, 1915, to become accountant in the auditor's office of the Union Railway, with headquarters at Memphis, Tenn., and was promoted to chief clerk to the auditor on June 1, 1915, which position he was holding at the time of his recent promotion.

### Operating

**O. F. Ohlson**, trainmaster of the Northern Pacific, with headquarters at East Grand Forks, Minn., has been transferred to Mandan, N. D., succeeding C. T. Sponsel, who has been granted a three months' leave of absence. **F. W. Lyons** will succeed Mr. Ohlson as trainmaster at East Grand Forks.

### Traffic

**G. G. Early**, general agent of the Wabash, with headquarters at Philadelphia, Pa., has been promoted to assistant general freight agent, with headquarters at St. Louis, Mo. **R. A. Walton** will succeed Mr. Early at Philadelphia.

**A. Brostedt** has been appointed general traffic agent of the Canadian National with headquarters at Shanghai, China. Mr. Brostedt will have supervision of the company's freight and passenger traffic interests in China, Japan, the Straits Settlements and the Philippines.

**J. W. Williams**, general agent of the freight department of the Gulf Coast Lines, with headquarters at Beaumont, Tex., has been promoted to general agent, with headquarters at Birmingham, Ala., succeeding W. W. Stine, deceased. **F. W. Nason** will succeed Mr. Williams as general agent of the freight department at Beaumont.

### Engineering, Maintenance of Way and Signaling

**J. S. Lemond**, chief engineer maintenance of way and structures of the Southern, Lines East, with headquarters at Charlotte, N. C., will retire from active service on November 1 at the age of 70 after having served the Southern for 39 years. He will continue in service in an advisory capacity as assistant chief engineer maintenance of way and structures, and **J. B. Akers**, engineer maintenance of way with headquarters at Knoxville, Tenn., will succeed him as chief engineer maintenance of way and structures. **J. A. Killian** will succeed Mr. Akers.

**H. S. Clarke**, division engineer of the Delaware & Hudson with headquarters at Carbondale, Pa., has been promoted to engineer, maintenance of way, with headquarters at Albany, N. Y., succeeding **W. B. Leonard**, assigned to other duties. **H. S. Rogers**, division engineer with headquarters at Oneonta, N. Y., has been transferred to Carbondale, succeeding Mr. Clarke. **C. D. Hughey**, division engineer at Plattsburg, N. Y., has been transferred to Oneonta, succeeding Mr. Rogers, and **F. P. Gutelius, Jr.**, assistant engineer with headquarters at Albany, has been promoted to division engineer with headquarters at Plattsburg, succeeding Mr. Hughey.

### Purchasing and Stores

**B. T. Jellison**, general purchasing agent of the Chesapeake & Ohio, has been appointed special agent, handling special matters assigned, and the position of general purchasing agent has been abolished, effective November 1.

**C. W. Dearworth** has been appointed division storekeeper of the Erie with headquarters at Huntington, Ind., and **R. H. Pauling** has been appointed to a similar position with headquarters at Marion, O., effective October 1.

**C. K. Reasor** has been appointed assistant manager of stores of the Erie with headquarters at New York. **F. J. Talbot** has been appointed superintendent of stores of the New York and Hornell regions with headquarters at Hornell, N. Y., and **J. H. Sweeney** has been appointed to a similar position for the Ohio and Chicago regions, with headquarters at Meadville, Pa.

### Obituary

**J. S. Browne**, assistant engineer maintenance of way of the New York, New Haven & Hartford, died October 22.

**Edward L. Hill**, car accountant of the Louisville & Nashville with headquarters at Louisville, Ky., died October 17 at the age of 68 at Louisville. Mr. Hill had been in the service of the Louisville & Nashville for 45 years.

**Harry C. Meloy**, supervisor of electrical appliances, New York Central lines west of Buffalo, whose death was noted in last week's issue of the *Railway Age*, was born on February

16, 1865, in Bedford, Pa. After completing a high school education in Bedford, Mr. Meloy entered the railway shops of the Pennsylvania at Altoona, Pa., and served an apprenticeship course there. After completing the apprenticeship course he was employed for a short time at the Swissvale plant of the Union Switch & Signal Company, after which he accepted a position as chief electrician of the Norfolk & Western at Roanoke, Va., which position he held for ten years. In April, 1902, he left the serv-

H. C. Meloy

ices of the Norfolk & Western to accept a position on the Lake Shore & Michigan Southern as chief electrician in charge of car lighting. In 1910 he was promoted to supervisor of electrical appliances and in 1914 the Lake Shore was consolidated with the New York Central. After the consolidation Mr. Meloy continued to hold the title of supervisor of electrical appliances on lines west of Buffalo, which position he held until the time of his death. Mr. Meloy was a charter member of the Association of Railway Electrical Engineers. He was president of the association in 1908 and from the time of its organization.

**Albert Sartiaux**, formerly and for many years general manager and chief engineer of the Northern Railway of France, died recently at his home in Paris, at the age of 72. Mr. Sartiaux was one of the best known railroad officers of Europe. He was a life-long advocate of a tunnel beneath the Channel to England.

**T. S. Walton**, freight claim agent of the Missouri Pacific, with headquarters at St. Louis, Mo., died suddenly at his home in that city on October 20. Mr. Walton had been in the service of the Missouri Pacific for several years and was a member of the general committee of the Freight Claim division of the American Railway Association.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulation (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free; United States, Mexico and Canada, \$6.00; Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid in our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE, that of this issue, 8,000 copies were printed; that of these 8,000 copies, 7,880 were mailed to regular subscribers, 54 were provided for counter and news company sales, 338 were mailed to advertisers, 65 were mailed to employees and correspondents, and 462 were provided for new subscriptions, samples, copies lost in the mail and office use; that the total copies printed this year to date were 417,950, an average of 9,493 copies a week.

Piston rods turned on Ryerson-Conradson Lathes have the accuracy and smoothness essential to successful operation.

## Piston Rods

Piston rods must be accurate in size and smooth. A rough or untrue piston rod is destructive to packing and returns a locomotive to the shop before its time.

Ryerson-Conradson Lathes are good tools to have in the shop when idle locomotives are waiting for accurate, smooth piston rods, and other parts that are turned on lathes.

In the operating statistics of large steam roads for August—those having annual operating revenues above \$25,000,-

### More Business Than Last Year

000—shown in last week's *Railway Age*, only three roads handled more net ton-miles of freight than in August last year. These roads are the Chicago, Rock Island & Pacific, the Long Island and the Gulf, Colorado & Santa Fe. The Rock Island in August this year handled \$33,384,000 net ton-miles of freight, revenue and non-revenue, as compared with 789,196,000 in August, 1920. Naturally with this increased business, there has been a pronounced betterment in earnings. The road in August, 1921, had a net railway operating income of \$2,365,961. For the first eight months of 1921 the net railway operating income was \$8,690,907, as compared with a deficit in the first eight months of 1920 of \$2,390,599. For purposes of comparison, it may be noted that the standard return, based on the three years ending June 30, 1917, was \$14,912,379. The increased traffic has enabled the road to make some interesting improvements in its operating statistics. The net tons per train in August, 1921, were 550 as compared with 536 in August, 1920, or 505 for the full year 1920. The car load of 26.4 tons in August this year compared with 25 in August of last year and 24.5 for all of 1920. The miles per car per day were 29.4 as compared with 30.5 in August, 1920, and 26.6 for the entire year. We are informed that the Rock Island has been favored with a considerably improved morale in recent months. It is apparent, on the whole, that the showing it is making is another of the many reasons for feeling optimistic about what future months are going to bring forth.

One important recommendation made by the Transportation Committee of the Unemployment Conference recently

### The Railroads Can Help

held in Washington was that the conference "urge upon the public the policy of immediate general buying as a patriotic duty," the idea being that as long as there is a buyers' strike, from whatever cause, there can be no general resumption of business and alleviation of unemployment. The railroads themselves, being one of the largest buyers of equipment and supplies in the country, are convinced of the wisdom of this policy and are buying materials as fast as finances will permit. Orders for steel, machinery, building material, etc., are being placed and, other opinions to the contrary notwithstanding, the fact remains that the railroads are going out of their way to place orders and thus help improve general business conditions. For example, on October 4 the Delaware, Lackawana & Western issued a request for bids on approximately \$200,000 worth of machine tools and accompanied this request with the following note: "We desire to state that we are not in immediate need of these machines, but if sufficiently attractive prices are quoted, we are ready to place orders and pay for same upon terms agreed upon, in the hope that it will help the general business and labor situation at this time." There is no evidence that the expression "sufficiently attractive prices" means anything more than the absence of war-time inflation and in fact the manu-

facturers were helped in every possible, practical way to ascertain the machine requirements and submit bids. Is not this an example of the kind of intelligent co-operation and readiness to help which, if followed by all railroads and all industries, will soon build up business, reduce unemployment and bring the country once more to a condition of normal prosperity?

In England several of the larger railway lines make a practice of building their locomotives in their own shops. It has

### Foreign Trade a Stabilizer

been argued that these roads should alter this practice so that a part of their requirements at least would be supplied by private builders. These domestic orders are needed by the private builders, it is said, to provide a nucleus which will assure a continuity of operation for them when foreign business is slack. The converse might be said to be true in this country, where the domestic market for railway equipment and supplies is the more important—that is to say, a foreign market should be maintained so that, even when domestic business is light, enough foreign orders are received to insure at least the continuity of operation so essential to the efficient conduct of a business. At a time, then, when the domestic market leaves much to be desired, it is an encouraging sign to see an American concern, the Baldwin Locomotive Works, secure an order for 85 locomotives from the Argentine State Railways. This is doubtless one of the largest single orders. domestic or foreign, which have been placed this year. Baldwin has studied the foreign field and knows how to meet its requirements. Aggressive activity in foreign markets and careful attention to orders when received, even when domestic business is booming, offers a very definite reward to manufacturers of railway equipment and supplies and the subject merits their careful attention.

Somewhat over a decade ago there occurred a remarkable development of electric interurban lines. Many of the routes

### Developing Branch Line Traffic

paralleled existing branches of steam roads and railroad managers, scanning the receipts from local trains running between the same points, predicted that the traffic would not be sufficient to make the operation of the electric roads profitable. But the interurban demonstrated that by establishing a regular schedule, with trains at frequent intervals, the passenger traffic could be increased greatly over that which the steam railroad secured with its few daily trains. At the present time a similar situation exists, but the competitor now is the motor bus. It is time for railroad officers to analyze the situation and decide whether they will passively allow an outside agency to step in and develop the potential traffic along their lines, or whether they will inaugurate rail motor car service and secure the business themselves. The railroad has several important advantages over busses operating even on improved roads. The grades and curves on the railroad are usually less severe than on the highways and the riding is notably smoother. Furthermore the cost of upkeep

vehicles running on rails is lower and heavier loads can be hauled with the same power. It seems that the only condition under which busses on the highways have a decided advantage is where the railroads are located some distance from the centers of population along the route.

In the attempt to interest shippers and employees in the importance of secure packing of goods and careful handling

### Packing and Handling in Movies

in transit, the New York Central has had prepared two reels of motion picture films which show in an interesting manner the lesson it is endeavoring to teach. The two reels make up a connected narrative and the audience is taken to various points on the New York Central lines where the results of improper packing and handling are shown, together with instances of unavoidable conditions, such as sudden stops, which make careful packing and stowing necessary. This picture should prove a decided success, because it brings home its lesson in such an interesting way and without seeming to preach. The average railroad man or shipper can look at it with considerably more unforced interest than he does at some of the motion pictures which he pays to see. When the New York Central has shown the good results obtainable by this sort of venture, it is to be hoped that the idea will spread to other carriers, for there is ample opportunity for vast improvement in the matters touched upon in the picture.

Discussion of the action of the feedwater heater is usually based on the effect of the device on the boiler alone. While

### An Ideal Saving

this is the primary effect, the heater also influences to some extent the action of the cylinders. When the heater is in use about 12 per cent of the exhaust steam is diverted to it, thereby lessening the amount discharged from the exhaust nozzle and reducing the back pressure. This improves the efficiency of the cylinders. On the other hand, the reduction in the rate of combustion for a given rate of steam generation results in lower flue gas temperatures and lower superheat, which tends to decrease the cylinder efficiency. To ascertain the effect of each of these modifications on the action of the engine, tests were recently conducted with the injector and with the feedwater heater under identical conditions of speed and cut-off. The indicator cards taken on these tests showed that the reduction of back pressure due to the heater increased the power of the cylinders from three to six per cent, depending on the speed. This increase in power was accompanied by a decrease of about 22 deg. in the superheat which would increase the steam consumption per horsepower two per cent. The net effect, therefore, is to increase the power obtained from a given weight of steam about four per cent. This gain in the overall efficiency of the cylinders is in addition to the direct effect of the heater on the boiler.

One interesting commentary on the recent reduction in the price of rails is to be found in the fact that Judge Gary's statement mentions but a single figure as the selling price for "standard rails." In other words, Bessemer rail has become such a small factor in the rail market that it is not worth while to state a separate figure for it and the term "standard rail" as used by Judge Gary is to be understood to designate only open-hearth rail. While most of the manufacturers are in

a position to roll the Bessemer product if it is desired, only a few of them have rolled it recently. Of the 2,604,116 tons of rail rolled in 1920, only 142,899 tons, or 5.5 per cent, was Bessemer rail as compared with practically 100 per cent in 1899. When it is considered that in 1920 nearly 500,000 tons of rails were rolled in sections weighing less than 45 lb., it is safe to assume that a very large proportion of the 1920 Bessemer tonnage was utilized for industrial purposes and very little of it was applied to standard railway requirements. Thus, the tendency of the times clearly indicates that the Bessemer rail will soon be as rare as iron and will, therefore, concern the railway officer only in connection with relayers and scrap. This is the answer to those who, during stress of war conditions, sought to force the railroads to return to the use of Bessemer steel.

No better illustration of the wholesome effect of price readjustment is to be had than that noted with the recent

### New Rail Price Brings Out Orders

cut in the price of standard rails from \$47 to \$40. This reduction in prices was announced by Judge E. H. Gary on October 25 with the statement that it applied alike on new orders and all tonnages due on unfilled orders, and had the immediate effect of releasing requisitions for 100,000 tons of rail. This statement is not made without a due regard for the fact that a number of inquiries for rail were made before the price cut was announced, nor does it overlook the increased interest in the market for track spikes, bolts and other fastenings observed in recent weeks. However, the announcement of the cut served to bring out a number of definite orders and others are expected shortly. This renewed interest in this country, coming simultaneously with orders by the Canadian roads for 87,000 tons of rail, has given the rail industry a genuine impetus. Another development which points to a restored demand for this important requisite to good railway track is the recent announcement of the Inland Steel Company of its decision to enter the field of rail manufacture in March, 1922. Aside from the increased capacity thus afforded, the potential competition involved should have a wholesome effect.

Prof William Starr Myers of Princeton is reported in the newspapers to have made the statement that a railroad strike,

### Wanted—Better Labor Leaders

sooner or later, is inevitable because union heads want the government to take over the lines. In his opinion, however, the threatened strike would have failed in two or three days because "no strike was ever won when the public was opposed to it. The strike," he said, "would have brought about the emancipation of American labor itself, for labor would then choose new and responsible leaders." There are many who believe that with the failure of great railroad strikes in Great Britain and France and with the calling off of the proposed strike in this country, the day of extensive railroad strikes has passed. After all, the public is the principal sufferer from such strikes. Recent years have brought it to a full realization of this and it will not tolerate tying up of the traffic in the future. It is undoubtedly true that some of the labor leaders have deliberately used every means within their power to discredit the railroads and weaken them to a point where government ownership would be imperative. It ought not to require a strike, however, to bring about a change of attitude on the part of these leaders. Undoubtedly they have already seen the handwriting on the wall. The great mass of railroad workers in this country are far too intelligent and sensible to stand much longer, for this sort of

leadership. Moreover, if the railroad executives will further exert themselves to bring about the right sort of understandings with the men this question of false leadership will be settled in a hurry. "Whom the gods would destroy, they first make mad." The action of some of the labor leaders at the recent conferences in Chicago would indicate that they are in a fair way to destruction.

During the first decade of the last century an eminent American statesman predicted that not until 300 years had elapsed would this entire country be settled. Yet, after little more than a century, a growth has taken place in population and economic power which puts to shame many of the countries of

### Railroads and National Progress

Europe. The obvious cause for a great part of this improvement is the enthusiasm shown by the people up to the last decade in the development and expansion of the railroads. Something more definite, however, regarding the influence of the railroads on our economic development is given by Dr. J. M. Goldstein in an article appearing elsewhere in this issue. There it is shown in what striking fashion population and production have followed railroad expansion and how such improvement has been the most pronounced where and when railroad construction was greatest. Dr. Goldstein is a Russian who has served as an economic adviser to various branches of his government. He was attached to Kerensky's railway mission to this country. Coming as he does from a country where the policy toward railway expansion has been the antithesis of ours and where failure to recognize the importance of modern methods of transportation caused the defeat at arms, the triumph of the Bolsheviks and economic disaster, Dr. Goldstein is in a position to appreciate wherein lies the economic strength of the United States. Consequently his conclusion—that the practical cessation of railroad extension in this country during recent years is a matter worthy of considerable concern—is, to say the least, thought provoking.

## A Fundamental Weakness of the Transportation Act

THE WAY IN WHICH the strike of the train service employees was prevented forcibly calls attention to a vital weakness of the Transportation Act. It was plain the labor leaders were desperately afraid of the outcome of a strike. They wanted some assurance or concession from the Labor Board or the railways which they could tell their members afforded the basis of "a satisfactory settlement." The railways gave public assurance that they would not make any further reductions of wages except under an award from the Labor Board. This is being mentioned as one of the bases of a settlement, but it doesn't mean anything. Everybody directly concerned knew the railways intended to make no further reductions of wages not authorized by the board.

The thing that really afforded the labor leaders a substantial basis for announcing "a satisfactory settlement" was a statement made by the Labor Board to both the railway executives and the labor leaders. Apparently this statement subsequently was interpreted and amplified by Ben W. Hooper, one of the public members, in a conference with the labor leaders. This statement was, in effect, that the board had pending before it many cases involving rules and working conditions; that it intended to hear and dispose of these cases as to each class of employees before it heard any case involving their wages; and that, therefore, it would necessarily be a long time before an award in any new case involving wages could be made. The board did not speci-

fically mention any length of time that it thought would elapse before any new case involving wages would be settled. Newspaper reports credited Mr. Hooper with having mentioned nine or ten months, and even as much as a year, in his conference with the labor leaders. The board is best qualified to say what its statement meant. In view of the fact that it was largely because of it the labor leaders canceled the strike order there can be no doubt as to the interpretation they gave to it.

Acting, both of them, under provisions of the Transportation Act, the Interstate Commerce Commission regulates railway rates and the Labor Board railway wages. It is an open secret, or rather no secret at all, that the Commission has been subjected to heavy pressure by high officials in Washington to bring about reductions in rates. For the Commission to order substantial reductions of rates while railway labor and other costs continue as high as at present seems in direct disregard of the rate-making provisions of the Transportation Act and of the Constitutional prohibition of confiscation. The Commission in the recent grain rate case based its order for reductions of rates on the assumption that the operating expenses of the railways were to be substantially reduced. The largest part of their expenses is within the control of the Railroad Labor Board. The interpretation naturally placed by most people on the statement issued by the board in the strike negotiations is that it intends deliberately to block a further substantial reduction of wages for a long time.

If the administration and the Interstate Commerce Commission are going to persist in their efforts to reduce rates and the Railroad Labor Board is going to carry out a policy of long delaying reductions of wages, the railways will be presented with two very unpleasant alternatives. One will be to resist all future efforts to reduce rates, even to the extent of carrying the matter to the highest courts. The other will be to yield in the matter of rates, go on earning entirely inadequate net returns, and continue to postpone all rehabilitation and expansion of their properties. Acceptance of the latter alternative will ruin some railways, prevent an increase in purchases by all of them, and thereby help to protract the industrial depression. It will prevent the railways from getting ready to handle a large traffic when business revives and pave the way for congestions of traffic and car shortages which will cause the public heavy losses and exasperate public opinion.

The vital defect in the Transportation Act which this situation discloses is the utter want of relationship between the body that regulates the rates and the body that regulates the wages. No industry can function properly under a system of regulation which results in one body forcing its prices or rates down on the theory that its operating costs will be reduced and another body preventing reductions of its operating costs. The Transportation Act must be changed. The best policy that could be adopted would be to vest the regulation of rates and the regulation of wages and working conditions of the employees in the same body—preferably the Interstate Commerce Commission. If this is not to be done the regulation of wages and working conditions should be given to some body subordinate to the Interstate Commerce Commission. It is manifestly absurd to have two government regulating bodies working at cross purposes as the Commission and the Labor Board are now. If they persist in working at cross purposes as they are now, the results produced will be transferred from the domain of the absurd to that of the outrageous and disastrous.

Meantime there is only one course for the railways to follow. First, they must put to the test at the earliest possible time the question of how long the Labor Board really intends to postpone any further reduction of wages. Secondly, they should resist all efforts to bring about reductions in the rates which would continue to make them unreasonably

low in proportion to their present operating costs. The Interstate Commerce Commission and the Railroad Labor Board are both government bodies which represent the public. The public has no right, moral or legal, to insist through one government body that the railways shall maintain the present wages and through another that they shall make reductions in rates, which if present wages are to be maintained, will be disastrous to the railways financially and render them incapable of putting their properties in shape to handle the larger traffic that is bound to come.

Doubtless if the railways resist to the limit all general reductions of rates while present wages are maintained they will arouse a hostile public sentiment. That will be unfortunate. If, however, by yielding now to utterly unreasonable demands from the government and the public, they temporarily placate public sentiment, they will be doing the very thing which is best adapted to raise against them later an overwhelming public sentiment. In other words, they will be doing the thing best adapted to render them unable to handle the commerce of the country when business revives, and all the most serious outbursts of public sentiment against railways in the past have been caused by acute traffic congestions and huge car shortages.

Ever since the present rates were fixed reductions in them have been made to correct unfair discriminations or to remove rates which really were so excessive that they interfered with the movement of traffic. Such changes should and will be continued. On the other hand there should be no yielding to the outcry for general reductions in rates unless there are to be made simultaneously corresponding reductions in labor costs.

## The Superpower Survey

A BRIEF ABSTRACT of that part of the so-called superpower survey report which deals with electrification of heavy-traction railroads is published elsewhere in this issue. The purpose of the survey is unquestionably a good one. By consolidating the power supply in the large districts in question, power could be produced and delivered at a lower cost than is now possible, a much better load factor could be obtained, less coal would have to be moved and a number of other savings could be made. It is unfortunate that those who prepared the report should in their enthusiasm show a spirit of partisanship.

For example, it is assumed in the report that 7.5 lb. of coal are required by a steam locomotive to do work at the rim of the drivers equal to one kilowatt hour. A value of 7.56 lb. was obtained by tests made on the C. M. & St. P. in 1910 on locomotives not equipped with fuel saving devices. Even if the value of 7.5 lb. is correct for the average steam locomotive now operating in the zone in question, it will not be true of steam locomotives in operation in 1925 or 1930, at which time it is proposed to have the superpower system in operation.

The report states: "The inherent wastefulness of the steam locomotive is proved by its own advocates in their claim that 40 per cent of the coal can be saved by the careful use of these auxiliary devices. Then why be skeptical of a saving of 60 per cent by a modern power station, which has all the devices in greater completeness and, in addition, has brains to use them?" Perhaps, as suggested, a saving of 60 per cent can be effected by a power plant, but why call it 60 per cent if steam locomotives can be improved in such a fashion as to save 40 per cent? The only really important economy device applied to power plants that has not been applied to locomotives is the condenser, and power line transmission losses have no bearing on the steam locomotives.

The report also states that no more skill is required to operate an electric locomotive than is demanded of an ordinary chauffeur. The railroad man who has taken a long freight train over a grade will be afforded a smile when he reads this.

A steam locomotive equipped with economy devices is spoken of in the report as a "full-jeweled movement." It is true that many engineers speak of the devices applied to steam locomotives as jewelry, but to use the expression "full-jewelled movement" in a report of this character savors of partisanship.

Unfortunately, because of such statements, the data presented must be accepted with reservations. The use of electric traction is practically certain to develop rapidly during the next decade in the district in question. Much of the data presented in the report will be valuable to those roads considering electrification; but in using the report as a guide it would appear that it must be done with discretion.

## Have Railway Managers Become Mere "Lobbyists?"

THE COLUMNS of a railway paper should be open to criticisms of railway management if they evidently are intended to improve the transportation situation and are made by persons who really know something about the railroad business. It is for this reason that we publish elsewhere an article by George N. Brown in which he makes severe and rather sweeping criticisms of the attitude and conduct of railway officers within recent years. Mr. Brown was for some time chief examiner of the Interstate Commerce Commission. In that capacity he dealt with many railway officers in Washington, and also came in contact with them while conducting hearings in important rate cases throughout the country.

Mr. Brown criticises the higher railway officers because, as he charges, they spend too much time in Washington trying to get favors from Congress and the Interstate Commerce Commission, when they ought to be at home administering the properties in their charge. He says that "the managing heads have lost their initiative"; that "they are not and have not been engaged in railroad business" but "have become expert lobbyists and put in their time seeking concessions from constituted authorities."

To a large part of Mr. Brown's indictment the managing heads of the railways must plead guilty. They are even more painfully conscious than he is that for years they have been spending more and more of their time in conferences and hearings relative to regulation and less and less of it in struggling with the problems of actual railroad development and operation. They must also plead guilty to the charge that they are exercising much less initiative regarding railroad management in all its phases than they or their predecessors formerly did. They must agree that all this is very bad for the railways and worse for the public.

While the railway managers cannot, however, evade a substantial part of the responsibility for these conditions, they cannot in fairness be held mainly responsible for them or their results. For years railway heads have opposed increases in government regulations on the very grounds, among others, that they would transfer from the managers to public authorities a large part of the authority which should reside in and be exercised by the managers of every business, and that if this were done the managers, instead of being able freely to exercise their initiative, would perforce become largely lobbyists and expert witnesses.

Almost every extension of government regulation which the railway managers have opposed has been made. Regulating bodies today fix the rates they may charge and the wages and working conditions of their employees; are empowered to

dictate in periods of emergency the operation of their terminals, locomotives and cars; tell them how many men they must have in a train crew, and so on ad infinitum.

The unavoidable result has been that the functions of the railway managers have been changed. Prior to about eleven years ago railway managers could and did stay at home, as Mr. Brown suggests, and direct the development and operation of the properties, the making of their rates and the work of their employees, as the managers of any other business can. The most important result of the increase in government regulation has been that no matter how well a railway manager may perform those functions which he has been left free to exercise, his railway may be entirely deprived of all the fruits of his efforts by the regulation to which it is subjected. Consequently it has become imperative that the heads of the railways, either personally or through other appropriate officers, shall devote a very large part of their time and energy to conferences with each other and to what Mr. Brown calls "lobbying" with public authorities regarding the great and vital problems of regulation.

Mr. Brown is right in saying the situation is most unfortunate. It is impossible, however, to agree with him as to the cause or the remedy. The main cause is unfair and excessive regulation, and the only remedy is to remove the cause. He says "continued waiting about Washington for government favors can lead to but one thing, and that is government ownership and control." This, he believes, "would end in disaster and would be destructive of all advancement in our transportation facilities." He is undoubtedly right in this. But the danger of government ownership is not due to railway managers hanging around Washington. It is due to a system of regulation which makes it necessary for them to hang around Washington. Railway managers have no more desire than other business men to hang around Washington. There is no atmosphere on earth that is so distasteful to most of them as that of Washington and no place they would so gladly stay away from.

We all know what the government has done to the railways within the last ten years in spite of the fact that their high officers spend so much time in Washington as to call forth Mr. Brown's protest. God only knows what the government would have done to them if the railway managers had gone to Washington less!

## The Mechanical Convention

IT IS GOOD news to learn that Division V, Mechanical, American Railway Association, has decided, as announced in last week's *Railway Age*, to hold its convention next June with exhibits. Never were the problems confronting the mechanical departments of our railroads so serious and so complicated. It is a matter of vital necessity for the officers and other subordinates to get together and counsel about these problems at as early a date as practicable.

If the Mechanical Division is to stand on its own feet and merit approval of the American Railway Association and the higher executive officers, it must assert itself and do something more than drift at a time when every effort should be made to improve the efficiency of operation. It will be necessary to make some radical additions to the committee assignments. Time will not permit going into this in detail, but the *Railway Age* has already made extensive and detailed suggestions in special articles on this question in its issues of June 10, 1921, and August 20, 1921.

This much we may say, however, in the way of emphasis. President Smith of the New York Central made the statement at a hearing before the Interstate Commerce Committee of the Senate that "95 per cent of railroading is human." The mechanical department, more than any other department,

is an employer of labor and yet, strange to say, this has hardly been recognized in its proceedings; nor have important questions of operation, in the discussion of which the mechanical department officers ought to participate. Why, for instance, is it not of just as much or of more importance that the mechanical department consider the economics of labor and the economics of operation as it is for the engineering officers to consider these questions? More than this, our great industries employing men of the same degree of skill as those employed in the mechanical department but with their entire forces concentrated in single plants find it necessary to give much thought and consideration to problems involving the human element in the operation of their plants. Is it not more important that the mechanical department, with large forces concentrated at some plants and smaller forces scattered over much territory should give even more thought and attention to these things? Truly the Mechanical Division has a big problem on its hands and now is the time, if ever, that these matters should be tackled intensively. The convention next year should be the largest and the most important in the history of the organization.

It is important that the meetings should be made as businesslike as possible and that nothing should be allowed to interfere with them. It is also advisable that they be attended by large numbers of the subordinate officers, for part of the time at least, in order that they may get some of the inspiration of the meetings and at the same time have an opportunity of visiting the exhibits. The wonderful educational effect of these exhibits is not generally understood. The latest improvements in mechanical equipment are shown and, generally speaking, the exhibits are in the hands of experts who can thoroughly explain the advantages and workings of the devices and at the same time answer questions or furnish information to those who may have used the devices and who may not have secured the best results because of misunderstandings as to the application or workings of the apparatus.

## New Books

*Wage Statistics Inquiries*, November, 1921, Edition., 38 pages, 6 in. by 9 in. in size. Bound in paper. Published by the Railway Accounting Officers' Association, 1116 Woodward Building, Washington, D. C. Price 10 cents.

This pamphlet has been compiled by the Railway Accounting Officers' Association in collaboration with the Bureau of Statistics of the Interstate Commerce Commission. It is intended as an assistance in the uniform interpretation and filling of the Commission's order for the compilation of wage statistics and embodies the principles of all interpretations or instructions issued in this connection by the Bureau of Statistics.

The Interstate Commerce Commission has prescribed the form of wage statistics that shall be reported to the Commission, these same statistics being also furnished to the Railroad Labor Board. The compilation of statistics of such a highly technical nature naturally involves questions of one sort or another. These questions are submitted to the Bureau of Statistics and the latter gives the carrier submitting the inquiry an interpretation on the specific point involved. This pamphlet is a compilation of these interpretations as given to the various carriers. In the pamphlet duplicate inquiries are eliminated as are also those portions of the inquiry or answer which are not essential to an understanding of the interpretation given. A complete index adds considerably to the book's value. The pamphlet is indispensable for a comprehensive understanding of the basis underlying the wage statistics. It will presumably have a large circulation among those interested in or concerned in the compilation, interpretation or application of such statistics.

## Letters to the Editor

[The RAILWAY AGE welcomes letters from its readers and especially those containing constructive suggestions for improvements in the railway field. Short letters—about 250 words—are particularly appreciated.]

### Watch for the Good

BREWSTER, Ohio.

#### TO THE EDITOR:

With the confidence born of the performance in the past, we have waited patiently for the *Railway Age* to analyze the operation of the D., T. & I. under the Ford regime, which was admirably done in the issue of September 10. Nearly all of the comments written, particularly by men of railroad experience, have carried an air of criticism and ridicule. In fact, some have gone so far as to be personally abusive. There is a lesson to be drawn from every calamity, famine or miracle, and it may be that a review of the occurrences on the D., T. & I. for the past six months will show some principles of practice that would be beneficial to all of the railroads.

The public should know what has actually transpired on Mr. Ford's railroad. Surely it has had sufficient publicity, and as has been correctly stated, no miracle has been performed. What has happened is that by shrewd business foresight Ford acquired the D., T. & I. as an adjunct to his manufacturing business, and has, by virtue of this combination, put the property on a paying basis, so that in place of the property being a notorious failure it is now a success. That should be one factor in his favor.

Why not review the situation with the thought of getting what good there is out of it? Ford, as a manufacturer and business man, is a success. His principle of standardization of practice has rewarded his efforts well, financially. Apparently, he has started the policy on the D., T. & I. of "More business in railroading, and less railroading in business," which, if applied systematically, should result in economy.

Standardization of materials used in railroad maintenance, both mechanical and way, is one of the fields where strides for economy are possible, but it is only by the approval and support of the executives that results can be obtained. The re-organization of the accounting system on the D., T. & I. as outlined in the *Railway Age*, is well worth studying, in particular on railroads where the distance to headquarters is not great. Duplication of accounting is not infrequent, and possibly the so-called "shop organization" may fit into railroad service to the benefit of all concerned.

The making of the station agent a "general manager" of his territory is a novel idea, and a good one. Review the conditions on many of the railroads and see if it is not true that many locations can be recalled where such a plan would save labor and money. Of course, there are many who will say the agents are not qualified. This condition, however, can be overcome.

By far the most important feature of the Ford organization at the present moment seems to be his "labor policies." Say what you will, the satisfied employee is an asset. Theorize as you may, the best employee is one satisfied with his wages and working conditions, and it is this condition that Ford has developed on the D., T. & I. Pay men well, so well in fact, that they cannot afford to lose their jobs, and we may feel assured of the results.

So, therefore, granting all that has been written as true about Ford and the D., T. & I., would it not be well to

study the good points of his organization and standardization, and apply them, if by so doing we can bring about economies so necessary at this time? Give the man a chance, and if he wins we should all profit by his experience. If he does not, then only Ford loses.

JOHN SESSER.

### Elimination of Rough Handling

GREENVILLE, TEXAS.

#### TO THE EDITOR:

The Interstate Commerce Commission defines rough handling as improper handling of cars in a train, or in switching. The figures given for damage to freight by the American Railway Association, Freight Claim Division, run into many millions of dollars each year, not taking into consideration damage to equipment, delays to freight and the additional per diem on cars.

Recently there has been a campaign started to reduce rough handling. The question is how badly do we want to reduce it. Plans and suggestions have been proposed that will not entirely eliminate rough handling but will materially decrease it. The idea has been advanced that we should reduce the speed of cars at point of impact while switching to two-and-one-half or three miles per hour. A great many practical trainmen and yardmen will agree at once that such a speed is impractical and that it is not possible to switch cars at a speed of two-and-one-half to three miles an hour without materially slowing down the switch movement. They invariably overlook the point that the handling speed and the speed at instant of impact are not the same. In some yards or leads it requires a switching speed of six or seven miles an hour to get a car home or at point of impact at two-and-one-half or three miles an hour. At other leads it only requires a speed of three miles an hour. In some gravity yards or humps only the slack is necessary to get the pin.

This question of switching speed should be worked out for each individual yard or lead. The only way that rough handling in yards—where 95 per cent of the rough handling occurs—can be eliminated will be by the conscientious and painstaking efforts of those handling equipment and constant and intelligent supervision.

There is nothing revolutionary in this but it will require courage, perseverance and continued efforts. It will to some extent, but not to any serious extent, slow up yard work, especially in flat yards; it will increase to some extent the cost of car handling, and will reduce the number of cars handled per engine hour. This will depend upon the physical characteristics of the yard and lead, and the personnel of the yard forces.

At a small yard where we handled from 30,000 to 35,000 cars a month, a campaign to educate the men was started in June. On a lead at one end of a flat yard which is practically level, and a classification track of approximately 3.47 of one per cent ascending grade, to get cars home at a distance of 420 ft. (ten car lengths or 15.25 rail lengths) at an impact of no greater speed than two miles per hour, required that they be turned loose on the lead at a speed of eight miles an hour, or one rail length in 2.75 seconds. The curvature in the turn-out and the ascending grade reduced the speed for each rail length the car rolled; as the distance increased the car slowed up to a speed of one rail length in nine seconds. This brought the speed down to approximately two-and-one-half miles per hour at point of impact.

I will not go into the details of making these tests, as the average engine foreman or switchman or engineer should be able to distinguish the speed at which he is handling cars after a thorough training by the proper supervising official. These instructions should cover a period of at least 15 days.

It is not the cannon that makes the loudest report that is

the most effective—the same applies to our yard operation. We may be able to handle an average of 20 to 25 cars per engine hour, probably reducing our operating expense one engine day; this will amount to about \$60 per day, or \$1,800 in 30 days. It will require switching the cars from five to 15 miles per hour and letting them strike at point of impact from five to ten miles per hour, thus damaging equipment and lading, which will require the cars to be transferred and placed on the rip track with consequent delay to traffic. By doing this we have saved \$1,800 in operation, but have spent from \$3,000 to \$5,000 in claims and to repairs to cars on the rip track, to say nothing of the loss of business due to inability to move the cars on schedule time.

During the period that we were making this test in our yard we were able to handle from 18 to 22 cars per engine hour without any damage to equipment or lading. We entirely eliminated excessive speed at the point of impact.

B. J. BLAIR,  
Yardmaster, M., K. & T.

## Universities Need Co-operation From Railways

COLUMBUS, Ohio.

### TO THE EDITOR:

The discussion now going on as to the worth of college graduates in the field of transportation would seem to indicate that the universities are not taking any active part in meeting the needs of the situation. The truth is that those universities which have a College of Commerce offer work in transportation as a matter of course. Such universities are Chicago, Yale, Leland Stanford, Illinois, Wisconsin, Harvard, and a host of others. The university which I attend is an example of the sort of thing which is being done. After two years of preliminary college work the student may take up the study of transportation and continue in that group for two more years, making a four-year course.

I am not taking the transportation group but I am this year electing a railway subject, railroad economics. Perhaps the eyes of some of the oldtime railroad men would open if they were to see the kind of work done in this course. No attempt is made in it to represent the railroads as an enemy of the public. The university library contains no end of literature upon the railway question, including bound copies of all the speeches of railway executives which have been given in the last 20 years. The next few paragraphs are taken from the university catalogue.

"The courses in Transportation and subjects closely related thereto which are offered in this group will be of value to those who will sometime occupy administrative posts in the railway business and who will be responsible both to railway investors and to the public. The work offered in Public Utilities is intended for those who will occupy positions with utility companies or serve in some capacity in the government regulation of utilities.

"The extreme specialization of a modern railway system makes it difficult for a young man entering this field to bridge the gap between mere routine work and positions of responsibility. There is an increasing number of positions in the traffic, finance and statistical departments of railway and steamship companies, but without previous knowledge of the system as a whole, one entering such work is unable to see much beyond his own department and to appreciate the organic relations between it and the other departments.

"Many difficult problems affecting rate making, the railway security market, and railway administration await solution. The extent to which these problems are solved will in a great measure depend upon the special training and breadth of mind of those who administer the railroads."

The required courses in this group, while concerned in the main with railroad matters, are expected to give an insight into businesses closely allied to the railway. A student may elect additional courses in subjects in which he is particularly

interested. The required courses are as follows: Transportation Economics, Business Law, Corporation Economics, Principles of Accounting, Public Utilities, Traffic Management, Geography and Commerce of the United States, Public Utility Accounts and Statistics, Railway Accounts and Statistics, Marketing, Labor Legislation, Railway Organization and Finance, and Industrial Relations.

The universities need more co-operation from the railways. The young man does not want to be hampered by an ancient system of seniority. I have a chum who may be chief clerk in a small office in about 30 years. With such examples, coupled with those of family favoritism—I live in a small shop town where this is carried out—the young man is scarcely liable to seek railroad work.

OHIO STATE UNIVERSITY STUDENT.

## In the Interest of Better Convention Programs

CHICAGO

### TO THE EDITOR:

In your review of the convention of the Roadmasters' Association, held at Chicago on September 20, 21 and 22, you commend the executive committee for suiting the program each year to "the particular need of the times" and you accord warm praise for the things that were done and said. This is all right, I guess; every editor must be an optimist, and it may be that I am unreasonably impatient; but how often it was necessary in the course of the roadmasters' discussion to note that the things left out were the matters of most importance! Are our technical associations like rivers in level countries, which wear their channels to a level and cease thereafter to manifest any power, except as it is transmitted to them by the perfunctory flowing of the tides?

Everybody was talking of the same old problems which have been, or ought to have been, put out of the way years ago; problems which are no nearer settlement than they were when they were discussed by the now forgotten New England Roadmasters' Association and the American Society of Railroad Superintendents when it was steered by Waterman Stone and Charles A. Hammond.

It seems to be difficult for the members to grasp the idea that "old times have changed, old manners gone"; that what is needed today is maintenance of track by contract and work done by power-operated tools; that the only rivalry among track forces is the rivalry among themselves for paid places in the union, and that a new rivalry in knowledge must be substituted, or we must go to smash.

As the meeting progressed I jotted down these *if's* (I crave the forgiveness of Kipling) which are, as it appeared to me just what was not intended to be brought out.

If you can think, think, think, and keep thinking on a problem, and not rush into it regardless of consequences.

If you can say "No," with emphasis and "Yes," with good reason, regardless of what you know to be the questioner's own view.

If you are prepared to obey all reasonable orders.

If you can handle an emergency without losing nerve, or going to pieces when the bottom falls out.

If you can talk or write to a subordinate in a way that will elevate him, rather than cause him to lose his self-respect.

If you are not one of that class of talking "live wires"; if you have learned the difference between cleverness and economy.

Then you're in a fair way to become a really big man in a railroad—a roadmaster.

Most railroads today are running wild on labor, while doing nothing in the way of backing it up by materials. Where labor absorbs more than its percent of the cost of maintenance, it is certain that the track work is not being efficiently done. Mr. Editor, if you have a roadmaster on your staff, let him show up some of the facts bearing on this feature.

W. L. DERR.

## Locomotive Runners' Working Conditions

TRENTON, N. J.

TO THE EDITOR:

Your editorial of October 29, setting forth, in detail, what to do to revise railroad employees' wages, opens up a good many avenues of possible progress. Not the least in importance of the questions now before us is that raised by Professor Cunningham, namely, how to restore the normal difference between the pay of an experienced locomotive runner and that of a comparatively unskilled track laborer or shopwork helper. Our paternalistic government advanced wages in war time on the basis of an arbitrary standard of living; a man who was getting \$45 a month was advanced to a level with others who had been receiving \$75; this on the theory that both ought to be enabled to live on the same scale of expenditure. This is beautiful, as socialism; but in real life the sober fact is that the track laborer, because of lesser abilities, must live in a poorer house and wear cheaper clothes than does the engineman. And the economist must recognize this fact. We can wish that it were otherwise; but there is no use in fighting immutable laws. The law of supply and demand will, sooner or later, reduce the trackman or advance the engineman; but it is the duty of the employer, howsoever benevolent he may be, to recognize this law frankly every day rather than waiting to be driven by it.

But in readjusting the engineman's wages, it is important to get rid of all false conditions. If he deserves ten dollars a day because of his skill and experience, well and good; but do not pay him two dollars a day more than he is worth just because he, or the company, is wasting that much money.

An engineman of a large Eastern road, writing recently to a local paper in justification of the present rates of pay, said that some enginemen have to move their home with every change of time-table. There, so far as the statement is true, is a serious waste; but the engineman is not responsible for it (except as his brotherhood committee bulldozes the superintendent into making all sorts of petty rules about seniority). In the same letter this engineman says that one-third of the enginemen are on the extra list. In that situation, of course, they earn irregular pay, except when business is rushing. The query arises whether the earnings of these part-time men are fairly stated when included in published exhibits of average personal incomes. A man on the extra list ought to have work on a farm, or somewhere, to fill in the time when he is not running. This again is a cold fact which the socialist and the philanthropist do not like to acknowledge; but the honest economist *must* acknowledge it.

Another waste, for which the railroads and the enginemen (and trainmen) are both to blame, is the great amount of deadheading. Those runners who are required to move their headquarters when their runs are changed by the absurd seniority rules, evade the issue by riding in passenger cars 50 to 100 miles before and after each trip. This was brought out in the investigation of a collision at Stamford, Conn., a few years ago, where a passenger engineman rode 40 miles to and from his work. It is a duty to the public, in the interest of safety, incumbent on both the roads and the brotherhoods, to put a stop to such useless expenditure of energy. The Ivanhoe and the South Byron collisions, two years ago, exposed discreditable conditions somewhat similar to this.

Now is the time, if enginemen's wages or working conditions are to be readjusted, to start a general movement to make our safety arguments and our wage arguments consistent, one with the other.

NEW JERSEY

## Do Railroads Want College Men?

MOBILE, Alabama.

TO THE EDITOR:

The railroads want, and need, college men, but what the college man wants, and needs, before he should consider himself qualified to handle the position for which he has taken four years training, is a first-hand knowledge in handling the most intricate element in the transportation machine—that is, the human element.

It will be a bold graduate from any of the engineering schools who will expect to fill an executive, or semi-executive position—if I may use the term—in the maintenance, mechanical or transportation department the day after he graduates.

A. R. A. Clerk says in the *Railway Age* of October 8, 1921, page 661: "When a college graduate is out of school he is mature, and can't earn his salt as a call boy." True he could not and keep up the appearance that the monthly allowance "Dad" has given him for four years has permitted, but he could "pioneer" in the sense that our forefathers did in settling this country, always keeping a lookout for the job ahead, no matter what it is. If he kept his eyes and ears open he would begin to get a first-hand knowledge of the "human element" when he went to call an engineman or a conductor for "Second thirty-two, leaving at 6-10 a. m.," and the man called had been out to a dance most of the night, or had been up with a sick child, or had not made a trip for a week.

The common carriers of the country, with very few exceptions—with special reference to the mechanical department—are the least progressive of any of our larger manufacturing concerns, and there is a good and valid reason for it. Their revenues are limited by a government body, and about 60 per cent of their expenses are fixed by organizations, which at times seemed as strong, if not stronger, than the government. Many of the carriers have frequently been compelled, much against the best judgment of those in charge, to "Do as you've always done," to again quote from the A. R. A. Clerk.

The engineering department has always preferred college men, but we could not make division engineers nor supervisors out of them the day after they were graduated. They must first go to school again and learn to read—read human nature.

A college man has an advantage over his less fortunate fellow. In his four years of college work, his analytical and technical training have been such that it is not necessary for him to "spend a lifetime" in mastering his assigned duties, before he is ready for advancement. But he must understand that advancement is no more rapid—and no more slow—in the railroad business than in any other line of endeavor. Much, as may well be expected, depends upon the man and his personality.

The railroads want and need college men, but the seniority rule which applies with so much force in the mechanical and transportation departments will not permit of their being employed immediately after graduation in either of these, except as an apprentice or in some very humble capacity which they feel they cannot take.

The most open road to positions of trust and responsibility in the railroad business is through the engineering or maintenance of way department, and that road is necessarily a narrow one.

There is no business which so much needs scientific treatment as the manufacture of transportation, and I will venture the assertion—the truth of it may never be proven—that if the carriers had the same freedom of action as other manufacturing concerns, the college men for the railroad business would be at a premium.

H. S. JONES,  
Chief Engineer, Gulf, Mobile & Northern.

# Proposed Modification of Stop-and-Proceed Rule

## Details of Practice on Fourteen Roads Using "Tonnage" Signals, Relaxing the Stop-and-Proceed Rule

THE PAPER by A. H. Rudd, on the Stop-and-Proceed rule, criticising its use as usually employed in automatic block signal practice, which was printed in the *Railway Age* of August 6, page 247, was promptly responded to by F. P. Patenall, signal engineer of the Baltimore & Ohio, whose signal for permitting a train to pass a stop signal without stopping is illustrated in Fig. 1. Since then we have received information from 14 other roads (besides some from roads which have not considered this question) and we give below some notes concerning practice in this detail on these roads.

Mr. Rudd's position is that it is unnecessary to stop a

Fig. 1. Baltimore & Ohio Automatic Block Signal with Auxiliary Arm

train when the engineman can see a clear road a considerable distance ahead, and that the non-stop rule, as practiced quite extensively on steep ascending grades (where oftentimes the starting of a train is slow and difficult) ought to be made universal, regardless of grades. Those who have expressed opinions agreeing in substance with him are F. P. Patenall (B. & O.); T. F. Brennan (B. R. & P.); C. A. Christofferson (Nor. Pac.); and W. J. Eck (Southern). Most of the roads replying to our inquiries have, however, given us no definite expression of opinion on this point. Four have expressed definitely adverse opinions, namely: Central of New Jersey; Chicago & North Western; Great Northern; Louisville & Nashville.

Fourteen roads using these special signals are listed in our table.

The Baltimore & Ohio has in use 78 block signals arranged for this use, an auxiliary arm being used to convey to trains the indication that when the principal arm is horizontal (indicating that the block ahead is occupied)

they need not stop, provided the way is seen to be clear. Rule 501 AA, requiring that a train encountering a stop signal shall stop, and then proceed under control, is suspended, and instead the train is to be governed by Rule 501 G: "Proceed at slow speed, prepared to stop short of train or obstruction."

This rule applies to both passenger and freight trains. The main arm and the auxiliary each have an independent operating mechanism. No colored light indications are given with the lower arm; the blade is made visible at night by the rays of the light (uncolored) of the lamp fixed on a bracket near it.

These signals will be found on five different divisions of the Baltimore & Ohio, as follows: Baltimore 21, Cumberland 23, Connellsville 21, Pittsburgh 12, Toledo 1. The locations are largely on ascending grades where, of course, the avoidance of unnecessary stops is particularly desirable.

Many of these signals have been in service eight years and their use is reported as highly satisfactory. F. P. Patenall, signal engineer, sees no objection to making Rule 501 G universal with automatic signals; which is to say, the auxiliary arm is unnecessary.

Supplementing the information given in the table and in the illustrations, we quote from letters from other roads, as follows:

*Chicago & North Western.*—Those who believe that the relaxation of the stop-and-proceed rule is unwise base their argument on the likelihood of failure of discipline; and this is most concisely expressed by the Chicago & North Western's reply, which says: "Operating officers find it difficult to administer discipline when there is any question about the

Fig. 2—Lchigh Valley.—Arms colored red; lights, red or green as indicated.

action of the engineman; and in disciplining him for disobedience of automatic signals, there is very often a question, as between the observer and the man who is to be disciplined, as to what happened. Actual stoppage of the train eliminates any possibility of question of speed."

*Chicago, Burlington & Quincy.* Signals are distinguished by having blades painted yellow and the addition of a purple light fixed to post below blade.

*Chesapeake & Ohio.*—Uses a yellow fixed light. Between Charlottesville and Staunton, 40 miles, where light signals, three-indication, are now being installed, the regulations will permit all trains to proceed at low speed in an occupied

block; but in connection with the automatic train-control apparatus being installed on that section of the road, it is planned to limit the speed, in all such cases, to 12 miles an hour.

**Central of New Jersey.**—This road has considered the matter carefully, but has decided to use none of these signals. On the Central of New Jersey lines, where grades are steep, the road is in a mountainous country, with many curves. In a few cases, the block sections have been shortened to overcome the trouble from too frequent stops.

**Cleveland, Cincinnati, Chicago & St. Louis.**—On this road the double-track lines are, in many cases, signaled so that trains can be run in either direction on either track; and the special permissive signals, when introduced, will have to be arranged as on a single-track line; the connections being arranged so that the shorter arm cannot be displayed in the proceed position when a train is coming in that section from the opposite direction.

**Delaware, Lackawanna & Western.**—The signals on this road are lower quadrant, home and distant. Both blades are painted yellow. The night indication for the top arm is given by a yellow light, the same as for the lower arm. These signals will be found on three different divisions, as follows: Morris & Essex, 4; Scranton 44; Buffalo 18. The signals on the Scranton division have been in service 16 years; service highly satisfactory.

**Delaware & Hudson.**—Same style of signal as on the Lackawanna.

**Erie.**—The auxiliary arm is attached to the post 6 ft. 6 in. below the principal arm. The letter "G" denotes "grade." The fixed position of the lower arm is 45 deg. upward.

Fig. 3A—B. R. & P.—Arms colored red; lights, red and yellow, as indicated.

Fig. 3B—D. L. & W.—Both arms and both lights yellow.

Fig. 3C—Erie.—Arms yellow; lights, red and yellow, as indicated (lower arm fixed).

These signals are to be found on two divisions; the Kent division between Kent and Marion, 11 eastbound and 16 westbound, and the Delaware division, 10 eastbound and 8 westbound.

**Great Northern.**—This company planned to introduce some of these signals in Minnesota several years ago, but the State Railroad Commission would not consent to their use.

**Illinois Central.**—On this road the rule permits all trains to take advantage of the signal to omit the stop, but passenger trains are not so heavily loaded as to make it necessary, and in practice the rule is applicable only to freight trains. These signals are located on five divisions, as follows: Illinois, 13; St. Louis, 6; Wisconsin, 3; Tennessee, 8; Louisiana, 1. The auxiliary indicator is a yellow disk. The letter "T" on the disk (meaning tonnage) is illuminated at night by a lamp fixed behind it. These indicators have been in use about four years, with satisfactory results.

**Lehigh Valley.**—Of the signals on this road, 25 are on the New Jersey division, 23 miles; 27 on the Wyoming division, 33 miles; eight on the Seneca division, 12 miles; and ten on the Buffalo division, 22 miles. On double-track the small arms are mechanically operated by a connection from the upper arm; but on single-track they are operated by motor and are so controlled as to stand at stop when a train is moving in that block from the opposite direction. In the position shown at A Fig. 2 the short arm is illuminated as on the Baltimore & Ohio. Signals in use 16 years with very satisfactory results.

**Louisville & Nashville.**—Signals similar to those of the Baltimore & Ohio.

**New York Central.**—On the Eastern lines the signal ar-

Fig. 4—Illinois Central.—On the left a lower quadrant signal; on the right, an upper quadrant.

angement is similar to that of the Baltimore & Ohio, except that the lower arm, which is of standard size, has a standard lamp. This light, staggered, in relation to the

#### USE OF AUTOMATIC BLOCK SIGNALS

WITH SPECIAL ARRANGEMENTS TO OBLIVATE STOPPING HEAVY TRAINS WHEN ROAD IS CLEAR FOR SOME DISTANCE AHEAD

Road	Number of Signals in use, how used, etc.
Ach., T. & Santa Fe.....	On 60 miles of road; on all grades of 1½ per cent or over; all trains.
Baltimore & Ohio.....	78; mostly on grades; all trains; some on single track.
Buff., R. & Pitts.....	10; on grades; same as B. & O., but with yellow (or green) light at night. All trains.
Ches. & Ohio.....	6; others in contemplation; used on grades for heavy freights.
Chi. & N. W.....	5; at entrance to large freight yards.
Chi. B. & Q.....	10; on grades; for heavy freights only. In use seven years.
C. C. & St. L.....	Will install two.
Del., L. & W.....	66; all trains; on grades of busy freight and suburban passenger lines.
Del. & Hudson.....	12; on grades; all freight trains.
Erie.....	27; on grades; heavy freights. The arm is fixed.
Great Northern.....	Proposed to use in Minnesota, but was forbidden.
Ill. Central.....	31; on grades; heavy freights.
Lehigh Valley.....	70; on grades; all trains.
Louisville & W.....	19; mostly on grades; all trains.
N. Y. Central (East).....	55; on grades; all trains.
N. Y. Central (West).....	152; on grades; for heavy freights.
Nor. Pac.....	None.
Southern.....	5; on grades; yellow disk 15 in. diameter, for heavy freights only.

main light, shows yellow when the other shows red. The instructions contain an illustration of a three-position up-quadrant signal with blades (pointed) painted red. On the Western lines automatic block signals are arranged for this function by the addition of a yellow disk, as on the

Illinois Central; but instead of *T* for tonnage, the disk shows *G*, for grade.

**Northern Pacific.**—Four of these were installed in 1915, but, as in the case of the Great Northern, the State Railroad Commission of Minnesota refused to permit the special signals to be used.

**Southern.**—The signal used by this company is similar to that of the Illinois Central, shown in the engraving, except that the letter is "G" for grade, instead of "T" for tonnage.

The letter is illuminated by an electric light when the signal arm goes to the stop position. These signals have been in use on the Southern for about seven years. The disk is 15 in. in diameter and painted yellow. The notes in the second column of the table are intended to show whether the signals with auxiliary arms are provided for the benefit of (a) all trains; or (b) heavy trains or (c) only heavy freight trains. In all cases, the signals referred to in the table are on double-track lines, unless otherwise noted.

# Freight Rate Reductions Made Since Ex Parte 74

## Traffic Bureau of Commission Prepares Memorandum of Principal Readjustments

WASHINGTON, D. C.

**A** MEMORANDUM prepared by the Traffic Bureau of the Interstate Commerce Commission showing the principal reductions and readjustments in freight rates made since the increase of August 26, 1921, mainly by voluntary action of the carriers, has been printed as a public document by order of the House of Representatives at the request of Representative E. E. Sanders of Indiana. The compilation was furnished to Congressman Sanders by Commissioner Lewis with the following letter:

### Letter of Explanation

In accordance with your request I am sending you herewith a list of the rate reductions which have been made since August 26, 1920, by the carriers with the approval of the commission.

The first seven pages are intended to show the more general reductions, while those following, consisting of over 100 type-written pages, show reductions of varying extent on specific commodities. The attached list does not by any means cover the total number of reductions which have been made. During the year ended June 30, 1920, there were filed with the commission 135,426 tariff schedules containing changes in freight, express, and pipe-line rates and passenger fares, of which more than three-fourths covered freight. All of these schedules contained a number of changes in rates, some of them carrying as many as 3,000, and it would be safe to say that during the year which has passed since the general increase following Ex parte 74 at least a million changes in individual rates have been filed with the commission. Many of those changes, which because of lack of time it has been impossible to include, are minor in character, consisting of the establishment of commodity rates in lieu of class rates, correction of errors, opening of new stations, and numerous changes of a more or less routine character. A mere enumeration of a number of these rate changes that consisted of reductions and the number that consisted of advances would afford very little basis for determination of the extent to which transportation charges in the aggregate have been advanced or reduced. Some of the individual reductions mean a loss of many millions in revenue to the carriers. The reduction in western grain, grain products, and hay rates alone, it is estimated, amounts to \$35,000,000 to \$40,000,000.

The list is necessarily incomplete, because the time in which it was prepared—one week—was insufficient to admit of a complete check of the files of the commission in an attempt to gather data on all of the reductions. The compilation of a statement showing all the reductions made would require several months.

The more general reductions mentioned are as follows:

1. Reduction of 7 cents per 100 pounds in rates on lumber and other forest products from California and the Northwest (Washington, Oregon, Idaho and Montana) to Chicago, the Missouri River, and territory east thereof, and including Pittsburgh and Buffalo. A very large movement is affected by this reduction.

2. Rates on grain from Buffalo and Lake Erie ports, both export and domestic, to points in the Atlantic seaboard States, applicable on grain moved from the West by lake.

3. Withdrawal of the entire increase of 1920 as to rates on range cattle and other live stock from points in the Southwest (Texas, New Mexico, etc.) to feeding grounds in the Middle West and Northwest, and including Montana. Ordinarily there is a heavy movement during the summer months of stock

cattle between the points affected; therefore the reduced rates would, under ordinary circumstances, cover a very heavy movement of traffic. So far as is known, however, the movement this year has been lighter than usual and there is little ground to believe that the reduction in rates stimulated the movement to any material extent beyond that which would have taken place without the reduction.

4. Reductions in rates on hay (prairie and alfalfa) from Idaho, Wyoming, and Utah to the Missouri River and points beyond. This reduction amounted to nearly 40 per cent, but there was only a small movement under the reduced rates.

### 20 Per Cent on Raw Sugar

5. Reduction of about 20 per cent in rates on raw sugar from the Atlantic seaboard to sugar refineries in the Middle West.

6. General reductions amounting to 15 to 25 per cent in rates on hay from Colorado, New Mexico, Arizona, Utah, western Texas, and western Oklahoma to the Missouri River, Chicago, Mississippi River points, and the territory beyond. Ordinarily there is a very heavy movement of hay on these rates.

7. General reductions in rates on sand, gravel, crushed rock, and other road-building materials in New England.

8. Reductions amounting to 25 to 35 per cent in the rates on blackstrap molasses from Gulf ports and other southern producing points to points in the Mississippi Valley, the Southeast, Missouri River points, and the Northern States generally. Blackstrap molasses moves in large volume from and to the points affected for use in the manufacture of stock feeds.

9. Reductions in the rates on grain and grain products from points on the Mississippi River and west to the Rocky Mountains, including the Northwest, to Atlantic ports for export. These reductions cover very heavy movement of traffic and range from 3 to 4 cents per 100 pounds, the principal purpose thereof being to readjust the rates to the Atlantic ports as compared with Gulf ports.

### 28 Cents on Coal for Lake Movement

10. Reduction of 28 cents per ton on coal from Pennsylvania, West Virginia, Ohio, Kentucky, and other eastern producing points to ports on Lake Erie when destined for movement by lake to Wisconsin, Minnesota, the Dakotas, and the Northwest generally. Annually there is a heavy movement of this coal and the reduction as made will probably affect 10,000,000 tons. The purposes of this reduction were to avoid coal shortage in the Northwest during the coming winter and to readjust the rates on eastern coal as compared with Illinois and Indiana coal in the northwestern territory.

11. Reduction of 3 cents per 100 pounds in the rates on grain products from Buffalo and other New York mills to Atlantic ports for export, applicable in connection with grain transported from the West by lake.

12. Reduction of 25 per cent in the rates on molasses, the refuse of sugar factories in Colorado, Idaho and Utah, to middle western and southeastern points. This commodity is used in the manufacture of feed for live stock and the reduction is for the purpose of assisting in the sale not only of the commodity itself but of the products of alfalfa produced in the Middle West to the farmers and stock raisers of the Middle West and the Southeast.

13. General reductions in the rates on alfalfa meal and other products of alfalfa from Colorado and New Mexico to eastern destinations. The purpose of this reduction was the same as

that made upon molasses from the West, viz., to assist in marketing the products of alfalfa raised in western territory.

14. Reduction of 5 cents per 100 pounds in the rates on corn, wheat, and rye and 3 cents per 100 pounds on oats and barley ex-lake from Buffalo and other lake ports to seaboard for export.

15. Reductions varying from 4 cents to 10 cents per 100 pounds in rates on potatoes from points in eastern Oregon, Idaho, and Montana to points east of the Rocky Mountains and west of Mississippi River, but including Chicago, Peoria, and other Illinois points, as well as St. Paul and Minneapolis.

#### Reductions on California Cantaloupes

16. Reductions varying from  $8\frac{1}{2}$  cents to  $33\frac{1}{2}$  cents per 100 pounds in rates on vegetables and cantaloupes from California producing points to points east of Chicago.

17. Reduction of 3 cents per 100 pounds in rates on grain from Illinois points to Atlantic seaboard with corresponding reductions in rates from the same territory to Gulf ports.

18. Reductions of  $16\frac{1}{2}$  cents per 100 pounds in rates on fresh apples from points in the Pacific Northwest to points east of the Rocky Mountains.

19. Reductions varying from  $15\frac{1}{2}$  cents to 55 cents per 100 pounds in rates on canned goods, dried fruits, and beans from Pacific coast to points east of Rocky Mountains.

20. Reductions varying from  $14\frac{1}{2}$  cents to  $21\frac{1}{2}$  cents per 100 pounds in rates on canned salmon from North Pacific coast points to points east of the Rocky Mountains.

21. Reductions varying from 8 cents to  $15\frac{1}{2}$  cents per 100 pounds on condensed or evaporated milk and buttermilk from North Pacific coast points to points east of the Rockies.

22. Reductions in rates varying from  $8\frac{1}{2}$  cents to  $25\frac{1}{2}$  cents per 100 pounds on rice from North Pacific coast points to eastern seaboard points.

23. Reductions varying from  $\$1.98\frac{1}{2}$  to  $\$7.25\frac{1}{2}$  per ton in rates on smelter products (copper, lead, etc.) from Colorado, Wyoming, Utah, and New Mexico to points in Central Freight Association territory east of Chicago, eastern trunk-line points, including a few points in eastern Canada.

24. Reduction of 28 cents per ton on coal from Pennsylvania, West Virginia, Ohio, and other eastern producing points, which was limited to ports on Lake Erie when destined for movement by lake to Wisconsin, Montana, the Dakotas, and Northwest generally, was extended to apply on lake cargo coal to ports on Lake Erie when destined to ports on Lakes Michigan or Huron, regardless of whether the coal was for local consumption at those ports or destined to points beyond. This affects an additional movement of about 3,000,000 tons of coal.

25. Reduction of  $7\frac{1}{2}$  cents per 100 pounds on grain and grain products from Chicago, Mississippi River crossings, and points in Illinois, Indiana, and other Eastern States to Atlantic ports for export.

26. Reduction of 5 cents per 100 pounds in export rates on flour from Buffalo to Atlantic points when manufactured from grain brought into Buffalo by lake.

27. Reduction of  $5\frac{1}{2}$  cents per 100 pounds on grain and grain products for export from the Missouri River and Mississippi River points, also territory between the two rivers and in Illinois to Gulf ports, Mobile to Galveston, inclusive. Also reductions ranging from 1 cent to  $5\frac{1}{2}$  cents per 100 pounds from the territory lying west of the Mississippi River in Nebraska, Kansas, Colorado, and Oklahoma to Gulf ports.

28.—Reduction of  $4\frac{1}{2}$  cents per 100 lbs. on domestic grain, grain products and by-products from Mississippi River, Chicago, etc., to eastern points with relative adjustment from other points in Central Freight Association territory to same destinations.

29. Reduction of 20 per cent in long-haul rates on cattle, hogs and sheep in the territory on and west of the Mississippi River and Chicago. The amount of reduction in carriers' annual revenue which will result is not definitely known, but has been estimated to be upward of  $\$10,000,000$ .

30. Reduction in rates on sand and gravel and crushed stone between practically all points in trunk-line territory, including Pennsylvania, New Jersey, Delaware, Maryland, and portions of West Virginia and Virginia. The basis employed in constructing the reduced rates is 15 per cent higher than the rates in effect prior to the general increase of August, 1920, thus substituting a 15 per cent increase for a 40 per cent increase. It is expected that the annual reduction in transportation charges on the commodities affected will be much in excess of  $\$10,000,000$ .

31. Reduction of 25 per cent in rates on export iron and steel from Chicago and Central Freight Association points to eastern seaboard, with relative adjustments to South Atlantic coast ports.

32. Reduction of about 50 per cent in rates on munition lint from points in the Southwest to points east of the Rockies.

33. Reductions in rates amounting to from  $\$5$  to  $\$10$  per car on stock cattle from points in Tennessee to points in Virginia.

34. Reduction of 7 cents per 100 pounds on rates on barrels and kegs, Gulf ports to Ohio River crossings and Central Freight Association points.

35. Reduction of about 63 cents per 100 pounds in rates on orchard heaters from eastern territory to Pacific coast territory.

36. Reduction of about  $12\frac{1}{2}$  per cent in rates on domestic grain and grain products between points in eastern trunk-line territory and New England.

37. Reductions in all rates on iron ore throughout the so-called eastern territory, including generally points east of the Mississippi and north of the Potomac and Ohio Rivers, including, of course, ex-Lake ore moving from Lake Erie ports. These reductions will eliminate all increases effected under Ex parte 74, and it is conservatively estimated the amount will reach in round figures  $\$5,000,000$  per year.

#### Various Other Readjustments

A number of other reductions and readjustments involving a considerable number of points of origin and destination and a considerable traffic, but in most cases not quite as important in extent as the ones above outlined, are as follows:

*Pig iron.*—From southern producing points to Pacific coast territory.

*Iron pipe.*—From southern producing points to Pacific coast territory.  
*Iron and steel articles.*—From central freight territory, including Chicago, to transcontinental territory.

*Smelter products.*—From Utah and other smelters to Pacific coast.

*Vinegar.*—From Pacific coast to Missouri River, Mississippi River crossings, Chicago, and points between.

*Ore.*—A large number of reductions have been made from producing points to numerous smelter points in western territory.

*Salt.*—From Utah producing territory to Pacific coast.

*Sugar.*—Pacific coast to Chicago, Mississippi River, and west thereof.

*Road-building material.*—A general readjustment in several States.

*Ground limestone from Michigan.*—To all New York destinations.

*Sulphur.*—From all Texas producing points to destinations in all State east of Colorado territory and to and including Atlantic seaboard and south-eastern territory.

*Grain minimums.*—General readjustment of minimum carload weights, resulting in reductions (entire United States).

*Copper products.*—From upper Michigan producing points to Atlantic ports, iron and steel articles, bars, and rods from Alabama, Tennessee, and Kentucky producing points to Gulf ports on traffic destined to Pacific coast via Panama Canal.

*Commodities of all descriptions.*—From interior Atlantic seaboard territory to Mobiles Bay, Ala., and points beyond. Restoration of the rail and lake differential under the all-rail between eastern trunk line territory and western points, also restoration of the rail and water differential via coastwise steamers between trunk-line territory, Missouri River, Colorado, and Utah common points, including points west of the Mississippi River.

*Brick rates.*—There has been considerable readjustment of brick rates in the various parts of the country.

*Cotton export.*—From eastern producing points to Pacific coast ports.

*Commodities for export.*—Practically all commodities for export from points west of the Indiana-Illinois State line and south of the Ohio River to Pacific coast ports, including agricultural implements, canned goods, cooperage, dry goods, glassware, iron and steel machinery, pig lead, oil (lubricating), petroleum and its products, paints, paper and articles thereof, roofing material, rope, soap, heating apparatus, tires, tobacco and articles manufactured therefrom, vehicles of all kinds, wood pulp and wood-pulp board.

*Ice.*—Emergency ice rates applying generally throughout western trunk line territory.

*Apples.*—From Texas producing points to St. Louis, Kansas City, Chicago, Milwaukee, Fox River, Memphis, Louisville, Cincinnati, Omaha, Davenport, and Little Rock, Fort Smith territories.

*Coal.*—From Illinois mines to Michigan points. From Canon City district, Colorado, to Colorado, Kansas, and Nebraska destinations. From Montana to approximately 150 destinations in Montana.

*Copper wire and cable.*—From Montana points to transcontinental territory.

*Sugar for export.*—From Sugarland, Tex., to Gulf ports.

*Nut coal.*—From points in New Mexico to points in Colorado.

*Fruits and vegetables.*—From El Paso and Deming, N. Mex., to Arizona and New Mexico points.

*Copper and lead bullion and smelter products.*—From Pacific coast points and Montana smelters to points in New York, New Jersey, Ohio, Pennsylvania, Minnesota, Michigan, and other States.

*Asphalt.*—From Gulf ports to points in various States in the South and to Ohio and Mississippi River crossings and points basing thereon.

*Lumber.*—From Virginia to eastern cities, Canadian points, trunk-line and New England territories.
