\*In addition to this amount, \$4,094,000 receivers' certificates and notes have been issued, for which the A., B. & A. and the two terminal companies are jointly and severally liable. The investment and capitalization figures shown above for the Western Pacific Ry. Co., are those of the date of valuation. On December 31, 1917, the company was reorganized with an investment in road and equipment of \$86,985,845 and a capitalization of \$95,000,000.

## I. C. C. Has Served Valuations on 106 Railroads

THE PRESIDENTS' CONFERENCE COMMITTEE on Federal Valuation of the Railroads has just issued a statement relative to the progress on valuation work up to the present time from which statement the following information and tabulated results have been taken.

Prior to April 5 of the present year the Interstate Commerce Commission had served 55 tentative valuations. As a consequence of the decision of the Supreme Court of the United States in the mandamus action brought by the Kansas City Southern against the Commission, (requiring the latter to report the present costs of condemnation and damages or of purchase of lands used for common carrier purposes in excess of the present value of such lands), it became necessary to prepare supplemental tentative valuations.

On April 5 the Interstate Commerce Commission served such supplemental tentative valuations covering the properties of the Atlanta, Birmingham & Atlantic, the Kansas City Southern System, the Winston-Salem Southbound and the San Pedro, Los Angeles & Salt Lake. At various dates since then supplemental tentative valuations have been served upon the other carriers which heretofore received tentative valuations. Within the last few days, in addition to the above, the Interstate Commerce Commission has served tentative valuations upon 51 other carriers.

These valuations are of significance to the carriers as they are the first submitted by the Commission in which any figure of value or "final value" as it is therein called, is reported, and the first containing any estimate of the present cost of condemnation and damages or of purchase in excess of original cost or present value of lands, as required by the second paragraph of the valuation act and the decision of the United States Supreme Court above mentioned.

The statement made by the Commission in these supplemental valuations as to its finding of "final value" generally is as follows:

"Final Value.—After careful consideration of all the facts submitted in this proceeding, and the cost valuations heretofore made, including the excess cost of the carrier lands, appreciation, depreciation, going-concern value, working capital and materials and supplies, and all other matters which appear to have a bearing upon the values here reported, the values, as that term is used in the Interstate Commerce Act, of the property of the above-named carriers owned and used, but not owned, and owned but not used, devoted by the carrier to common carrier purposes, are found to be as follows:"

The same statement is made in the new tentative valuations, excepting that the following clause is necessarily omitted:

"submitted in this proceeding, and the cost valuations heretofore made"

From an examination of the facts reported in the tentative valuations it would seem that in most instances the figure of final value reported is about the sum of the estimated cost of reproduction less depreciation, the present value of the carrier lands and working capital, including materials and supplies. In some instances where the original cost of carrier lands was in excess of the present value, as reported by the Commission on the acreage basis, the amount of the original cost of carrier lands seems to have been included in the finding of "final value" rather than the sum reported as the present value of the carrier lands. Apparently nothing has been specifically included for the excess cost of carrier lands, appreciation, and going concern value. The present value of the carrier lands which is reported is, generally speaking, merely the acreage or lot value of the adjacent lands applied to the area of the carriers' property. A tabulation has been

prepared and appears below showing the findings of the Commission in the valuation of each of these carriers.

Paragraph "First" of the Valuation Act requires, among other things, that "the Commission shall in like manner ascertain and report separately other values and elements of value, if any, of the property of such common carrier." The tentative valuations first served contained this statement: "No other values or elements of value were found to exist." Both the supplemental and the new tentative valuations make no reference whatever to "other values and elements of value," excepting in so far as these elements may be considered as included in the element of going-concern value, to which the Commission states it has given consideration.

Paragraph "First" of the Act also requires the Commission to report, among other things, "an analysis of the methods of valuation employed and of the reasons for any difference between any such values and each of the foregoing cost values."

Neither the supplemental tentative valuations nor the new tentative valuations contain any analysis of methods other than by reference to the so-called analyses which are contained in and made part of the decision of the Commission in the valuation of the Texas Midland and the supplemental tentative valuation of the Kansas City Southern.

To date 323 preliminary engineering, 247 land and 184 accounting reports have been tendered to the carriers for examination. They are classed as follows:

Class	I	II	III	Lessors	Term. Cos.	Electric Cos.	Tel. Cos.	Steamship Cos.	Not Classified

## New 60-Ton Electric Locomotive for Tidewater Southern

THE TIDEWATER SOUTHERN, a subsidiary of the Western Pacific, has recently placed in operation a 60-ton electric locomotive which embodies several interesting features. The present electrified section of the Tidewater Southern is arranged for 1200-volt operation that will be changed over to 1500 volts in the near future. The new locomotive was designed for operation at the higher voltage in view of the contemplated change in potential and will be used for handling the increased interurban freight traffic in the San Joaquin Valley between Stockton and Thurlock, California.

The locomotive is 37 ft. 4 in. long; 9 ft. 7 in. wide, with a total wheelbase of 25 ft. 5 in. All of its weight is carried on the driving axles. The cab has the sloping end steeple type of construction, extending practically the whole length of the underframe, which consists of four steel channels extending the entire length of the platform tied together by heavy rolled bars for the top and bottom member with cast steel webs of the end frame castings and to the bolster plates on the bottom. The bolsters are built up of 1 in. steel plates, 10 in. in width, riveted to all four longitudinal sills.

The drawhead casings are bolted to the center sills, which are in turn riveted to the end frame. The draft gear consists of MCB couplers with 5 in. by 7 in. shank, standard twin springs and follower plates. The whole platform is floored, and the structural steel frame is stiffened by brace plates and a steel floor which extends the width and length of the locomotive.

The side frames of the two four-wheel trucks are built of

heavy rolled bars for the top and bottom member with cast steel pedestals. The bolster or center transom is bolted rigidly to the side frames, and the entire weight of the truck, as well as that of the superstructure, is carried by semi-elliptic springs hung by links to the double side equalizer bars, which rest on the journal boxes. The journals are of standard design with MCB bearings and wedges. The wheels are of solid rolled steel, 36 in. in diameter, with MCB treads and flanges.

The locomotive is driven by four 750/1500-volt, box frame, forced ventilated railway motors through a single reduction gear of 69.17 ratio. The motors are arranged for shunted field operation, which gives a continuous rating on 1500 volts of 14,500 lb. continuous tractive effort at 22 miles an hour. It will operate at reduced speed on 600 volts. The type M single unit control is used with two master controllers giving ten steps with four motors in series and seven steps with two in series. The motors are permanently connected in groups of two in series.

The motor rheostats, and various parts of the control equipment, are housed under the sloping ends of the cab. Current is collected by two pole trolleys which will operate

Electric Freight Locomotive Designed to Operate from  
1500-Volt Trolley

through a range of from 14 ft. to 22 ft. above the rail. There is a main switch with a magnetic blowout for opening the main circuit in emergency, or for inspection, and a number of auxiliary switches for the control of headlights, cablights, dynamotor blower set, compressor and compressor relay, control circuits, heaters, field shunting and control transfer. Headlights, as well as cablights, control and compressor relay, are operated from the dynamotor, except when the locomotive is being run on 600 volts, when they are operated from the trolley. There are two air compressors with a combined piston displacement of 70 cu. ft. per minute when delivering air at 100 lb. per sq. in. pressure. Air is used for sanders, bell ringer, and control, in addition to the air brakes.

ORDERS HAVE BEEN ISSUED by the Bureau of Valuation of the Interstate Commerce Commission closing the five district offices and consolidating all work in Washington. H. M. Jones, member of the Engineering Board, with headquarters at Chattanooga, has been appointed supervising engineer and T. P. Artaud, supervisor of land appraisals at Washington, has been appointed executive assistant. It is expected that staff positions in district offices will be abolished as the offices are closed.

# I. C. C. Will Not Measure Efficiency of Railroad Labor

## Elements Indeterminable and Carriers' Claims Indefinite—Long and Detailed Dissenting Opinions

**D**IFFERENCES in the cost of labor do not include changes in the quality or effectiveness of labor but only changes in wages, the Interstate Commerce Commission held in a decision handed down on August 6, prescribing the principles to be followed in fixing the maximum amount to be included in the carriers' accounts for operating expenses for maintenance during the guaranty period of six months following the termination of federal control on February 28 last year. Commissioners Daniels and Potter dissented from the opinion of the majority.

In fixing the allowance for maintenance the basis to be used by the commission will be the expenditure of the carriers for maintenance during an average six months of the test period (three years ended June 30, 1917) adjusted to differences in the cost of labor and materials and in the amount and use of the property. The same process will be used computing charges representing depreciations and retirements.

The proviso regarding the cost of labor, in the standard contract, is held not to "open the door to a comparison of the quality or efficiency of labor. To hold otherwise would be contrary to the plain intent of the proviso \* \* \* for it is impossible by resort to the accounts of carriers to determine the relative efficiency of labor at various periods; and the introduction of this indefinite and intangible factor would have relegated the accounting test to the very limbo of con-

trovery and conflict of opinion which it was designed to avoid. Moreover, what the carriers have in mind is really not the cost of labor but cost of accomplishment, an aggregate made up of the cost of labor multiplied by the quantity necessary for a given task. If it had been the intent to include the factor of quality or effectiveness, or efficiency, whatever it may be termed, this would have been done in apt and unmistakable language and not by the strained construction of a phrase susceptible of a simpler interpretation. This view is strongly confirmed by the history of the negotiations.

"A further significant fact is that the proviso permits the director general to fulfill his obligations in two ways—either by actual expenditure upon maintenance or by payment into funds for future use. If the latter method had been selected, obviously any comparison of efficiency of labor would have been out of the question, although a comparison of wages would have been wholly feasible \* \* \*. The insistence of the director general that efficiency of labor should be eliminated from consideration sprang from the conviction that any attempt to weigh and appraise so indefinite a factor could only be productive of endless controversy. The soundness of this conviction and the inconclusive character of such attempts have been confirmed by the claims which the carriers have filed."

The decision is "by the commission" and is numbered 1176 in the Finance Docket. An abstract follows:

### The Commission's Decision

By section 209 of the transportation act, 1920, carriers accepting its provisions were guaranteed relatively the same operating income for the "guaranty period" as had been paid by the government as compensation during the period of federal operation, and the Commission was charged with the duty of determining the amounts payable and was given certain directions governing the method of determination. The Commission was required so far as practicable to apply the rule set forth in paragraph a of section 5 of the "standard contract" between the United States and the carriers. This requires the railroad property to be returned in substantially as good repair and in substantially as complete equipment as it was when taken, and that due allowance be made for any difference that may exist between the cost of labor and materials as between the test period and the period of government control.

Following are the salient features of the decision:

The contention of the director general is that the law recognized the impossibility of determining by any physical comparison the amount of maintenance for which the government was liable and provided instead a simple mathematical or accounting method. The property taken over was so vast that any attempt to ascertain and compare by actual inspection its physical condition at the beginning and at the end of federal control was manifestly out of the question. The maintenance expenditures during the test period were the basic measure, but it was recognized that because of changes in wages and prices and in the amount and use of the property these expenditures would not serve the purpose fairly unless they were equated in accordance with such changes. So far as labor is concerned, the director general confines the equation to the change in wages, including the effect upon wages of reduction in hours of service, and he has already made settlements with a number of important carriers upon that basis. The carriers, however, contend that the equating process should allow, also, for changes in the quality or effectiveness of labor, or they will be unjustly deprived of very large sums of money; that labor was far less effective in the guaranty period than in the test period, because of changes in working rules and conditions and because, also, of a notable reduction of efficiency arising out of changes in personnel and other causes. The controversy centers over the meaning of the words "cost of labor." The director general contends that these words mean only the rates of pay per unit for the recognized varieties of railroad labor, while the carriers con-

tend that the labor must be related to the accomplishment of a given result, and hence that the words include in their meaning quality as well as wages. The original draft of contract proposed by the carriers contained the language: "increases in the cost of material, increases in the price of labor, *decreases in the efficiency of labor*," but the italicized words were eliminated at the instance of the director general. Similarly the carriers lay stress upon the substitution of the words "cost of labor" for "price of labor" and hold that this is inconsistent with any intent to make "cost" synonymous with "price" or rate of pay. It appears, however, that in one of their later drafts the carriers combined reference to "cost of labor" with a provision requiring consideration to be given to "differences in efficiency of labor," thus indicating that the change from "price" to "cost" was not deemed of controlling importance or to make unnecessary specific reference to the matter of efficiency.

We are clear that it was the purpose of the law to provide a simple and easily applied test which would make it possible to measure compliance with the covenant by resort to the accounts of the carriers and without the prolonged controversy which would follow any method involving physical inspection or opinion evidence. \* \* \*. The words "cost of labor" in paragraph c do not, we think, open the door to a comparison of the quality or efficiency of labor and we therefore find that differences in the "cost of labor," as these words are used in paragraph c do not include changes in the quality or effectiveness of labor, but only changes in wages.

All formulae used in the railroads' claim are based upon the theory that changes in the ratio of maintenance expenditures for labor and for materials, so far as they are not accounted for by differences in prices and wages, necessarily reflect changes in the quality or effectiveness of labor. This theory presupposes a degree of similarity, in two given periods, between the kind of work and the conditions under which it is performed which no formula can establish and which the very nature of maintenance makes improbable. The incongruous results which such a formula will produce may easily be shown.

There are also factors affecting the quantity of maintenance labor which have no connection with its quality or efficiency. Such are efficiency or inefficiency of management, changes in standards or methods, weather conditions, the effectiveness of mechanical appliances which may be utilized, and the extent to which repairs

are made under contract in outside shops. The last-named has especial significance in connection with the operations of the guaranty period. \* \* \* That inequity may result if changes in efficiency of labor are not taken into consideration, is far from clear. The government paid most liberal compensation for the use of the railroad properties for war purposes. If there was a decrease in labor efficiency, does it follow that the railroads and their owners were in equity entitled to complete immunity from the burdens which fell upon the country because of the war, or that results would have been in any degree more favorable for them during that period if their properties had remained in private hands?

When the roads were taken over much of their equipment was in poor condition, and \* \* \* we are confronted by claims for undermaintenance during 32 months totaling in the neighborhood of a billion dollars. From this there might well be deduced a present physical condition of the railroads gravely perilous to both life and property. Yet in 1920 these railroads carried relatively more freight and passengers in the aggregate and more freight on the average in each car than at any time in their history.

In the interpretation of statutes the administration of which is committed to such special tribunals as the executive departments, the Supreme Court of the United States has followed the interpretations of the administrative bodies in cases of doubtful meaning, and has deemed a reenactment of any such statute with knowledge of the administrative interpretation, without corrective change, as a congressional sanction or adoption of that interpretation. \* \* \* The transportation act, 1920, which prescribed the contract provision for our guidance, was in every way analogous to the reenactment of a statute with knowledge of an administrative interpretation of it, and these considerations may well influence us in the determination of the issues now before us.

The carriers contend that the obligation of the government was to return the property in as good condition as when taken over; that losses in physical life of property, represented by depreciation, should therefore have been paid for at current values; and that the obligation under the guaranty of section 209 in this respect is the same. But depreciation charges are computed at an annual percentage of the book value and retirement charges take up any remaining portion of this value not accounted for by depreciation or salvage. Upon any unit of property, therefore, these charges do not change as market prices rise or fall; but since new property is taken into the accounts at cost when acquired, the aggregate expenditures for depreciation and retirements are to this extent affected by changes in current price levels. It may be assumed that the bulk of the equipment in use during the guaranty period was bought prior to the test period and was still in use at the close of the guaranty period. Its replacement cost is yet unknown. This is equally true of other property, and it is not proper in determining amounts payable under the guaranty to take into consideration differences in cost of labor and materials which would not have affected the accounts if guaranty-period conditions had been substituted for those of the test period, and neither depreciation nor retirement accounts will be adjusted for such differences.

The guaranty of section 209 was accepted by 667 carriers, and to date they have been paid on account amounts totaling well over \$400,000,000. A balance still to be paid is in controversy, and this report deals with the two major questions which have been in dispute and which were argued before the full Commission last December. Minor questions are appropriately left to be determined as they arise in specific cases. Upon one of these major questions, that which has to do with depreciation and retirements, we are all in agreement. As to the other, there are differences of opinion. It is needless to say that this report is not based upon a distinction between offensive and inoffensive inefficiency. One dissenter goes so far as to state that the carriers make no claim for allowances based on inefficiency. The fact is that the records are filled with their statements as to the alleged expense caused by "inefficiency of labor," with nothing whatever to indicate an intent to limit the expression to any particular species. The carriers claim that various factors, apart from changes in wages or prices, have increased the cost of maintenance work, but they do not undertake a segregation so that we may know what portion is ascribed to any one factor; they ask for a lump sum based upon a formula, revised from time to time, assumed to cover all elements of increased cost whatever they may be. The carriers' adherence to formula has been largely guided by results, and they have yet to accept any without reservations. \* \* \*

Stress is laid upon changes in working conditions. During the guaranty period the Pennsylvania Railroad contracted for the repair of certain locomotives at the Baldwin Locomotive Works. It is significant that in our investigation of this matter the carrier's own witness testified that the cost of repairing a locomotive at the railroad's shops as compared with the cost in the Baldwin shops might be fairly put at a ratio of \$9,453 to \$22,434. This notwithstanding the changes in working conditions. The effect of the "national agreements" is a highly controversial matter, and as yet but one side has been presented to the Senate investigating

committee. If, however, any of these changes in working conditions in effect caused an increase in wages and the amount of the increase can be shown by satisfactory evidence, there is nothing in this report which would preclude an allowance accordingly.

### Commissioner Daniels Dissents

It is agreed that the scales of wages and the prices of materials increased to such an extent that the money expenditures for a given amount of maintenance were substantially greater in the guaranty period than in the test period; not only were the wages per hour or per day increased, but in certain cases the hours of labor per day were reduced, new rates and rules for overtime were established, new working conditions were imposed, and extensive changes in the personnel of shop and other forces incident to the war were experienced. A complete interpretation requires consideration also of differences between the amount of property maintained, and of any difference in use between that of the test period and during the guaranty period which is substantial enough to be considered.

The contentions of the carriers are that they are entitled to be allowed whatever amount was required to accomplish the same amount of physical maintenance that was done during an average six months of the test period; but it has been urged by the director general that if, say, the laying of 100 tons of rail should require 125 hours' work, while in the test period the same amount of work was done in 100 hours, he should pay for only 100 hours in the guaranty period, notwithstanding the fact that the expenditure of such amount during the guaranty period would have resulted in replacing a smaller amount of rail and would have failed to accomplish "the same relative amount, character, and durability of physical repair." One of the curious inconsistencies of this contention seems to be that while it concedes full allowance for whatever changes in the cost of outside labor may be reflected in the higher cost of material, it refuses similarly to allow for the corresponding cost of labor to the carrier in putting the same amount of material in place.

The President in his message to Congress had defined the term "maintenance" as "a guaranty" from the government to the carriers that "their properties will be maintained throughout the period of federal control in as good repair and as complete equipment as at present." It was thus made the duty of the director general, in making contracts with the several carriers, to provide for the maintenance of their properties by the government in such condition as would assure to them the return of their properties, as the President and Congress both declared, "in substantially as good repair and in substantially as complete equipment as it was in at the beginning of federal control." The majority report discusses this matter, but its conclusion is drawn from exceptional cases, where carriers in the test period had undermaintained their properties, and hence overstated their net income. In cases where the director general afforded only the same relative amount of maintenance as the too scant expenditure made by the carrier itself in the test period, it is true that the property at the end of federal control might be in worse condition than at the beginning of such control. But this elevates an exceptional condition into the rule, unless we have ground to believe that American railways generally were undermaintained during the test period. There is nothing whatever to justify the conclusion that it was the purpose or intent of the director general to depart from his instructions or to disregard the act of Congress. There is nothing in the law which would compel us to say that the director general has entered into a contract which does not provide generally for the maintenance of the property in such condition as to assure its return to its owners in substantially as good repair and in substantially as complete equipment as it was at the beginning of federal control.

The majority report says that if the director general had made payment into funds for future use, comparison of efficiency of labor would have been out of the question. I believe that this contention, while plausible, will not stand analysis. The alternative method—of paying money into funds—was to provide for the effectuation of what direct outlay on maintenance would otherwise have secured. Can it be seriously argued that if the dollar currently paid in wage during federal control would have provided more maintenance in actual physical work the director general would have had to pay into funds an amount of money more than sufficient to pay for the maintenance done during the test period? If he would not, how can the conclusion be avoided that he was required, if he elected the alternative method, to pay into funds sufficient to provide for the same amount of work as would have been necessary if the work had been done and paid for outright? While the director general would not agree to the insertion in the contract of the suggested provision as to "inefficiency of labor," neither would the carriers accept the term "price of labor." The contract as finally written rejected both and used the term "cost of labor," and this term we are called upon to construe in the light of its use in the contract, the instructions of the President to the director general, and the requirements of the statute.

It is to be noted that the negotiations respecting the form of the contract were not dealings in the ordinary and usual sense between the parties to the contract. The contract was submitted as standard and was submitted to the individual carrier for its acceptance or rejection. Some carriers refused to sign and others took what was offered in preference to a lawsuit. The rule which we are directed to observe is to be applied "whether or not such contract has been entered into with the carrier whose railway operating income is being computed." The contract is therefore to be interpreted solely in the light of the law which provided for it.

In the face of the duty of the director general as an agent to carry out the instructions of his principal and of his duty to comply with the act of Congress, it is impossible for us to conclude that it was the mere expenditure of money without regard to the result on the maintenance of the property which was in his contemplation or in the contemplation of any of the parties. \* \* \* A comparison of costs of labor without having a unit of labor to deal with is impossible. The units must be comparable units and measurable. A calculation involving only a comparison of the cost of a man's labor at one time with the cost of a woman's labor or a boy's labor at another time would not be a comparison of the cost of labor required to do a particular piece of work. The comparison of the cost of labor necessarily involves dealing with the cost per unit of work done. The purpose in mind was to do as much in the way of maintenance in one period as had been done during another, for presumably the same amount of maintenance would produce the same result in physical repairation. There was no other way to carry the spirit of the act, the proclamation of the President, and even the standard contract into effect. We can not hold that, as used in the contract, cost of labor is synonymous with the price of labor. \* \* \*

The test of the interpretation of the words "cost of labor" is, therefore, to be found in the inquiry as to what changes would have been effected in the accounts showing the expenditures and charges for maintenance during the test period, by substituting for the labor conditions of the test period the labor conditions of the period of federal control or the guaranty period. The adjustments can not be limited to the rate of wages per day or per hour of labor, but must include adjustment for every element of cost of physical repairation or material replacement or restoration, or of what has been referred to as "the labor cost of material in place." The carriers must be required to produce the adequate proof, but on production thereof, they are entitled to its benefit. A greater allowance than this would be unjust to the United States; a less allowance than this would be unjust to the carriers.

## Discussion Should Have Been

### Confined to Specific Cases

Commissioner Potter, dissenting, reviewed the case of the Baltimore & Ohio and cited at length a study of the subject by Colonel W. A. Colston, director of the Commission's division of finance.\* Mr. Potter said in part:

It is the direct command of Congress that due allowance shall be made for *any* difference in the cost of labor and materials. I dissent from the majority report. I concur in that part of the dissenting report by Commissioner Daniels wherein he demonstrates conclusively that the carriers are entitled to "the same relative amount, character, and durability of physical repairation," which can only mean the cost of material in place. The majority report admits that we are charged with the duty of determining the amounts payable by the United States under the guaranty referred to and that we were given certain specific directions governing the method of determination. It neither determines nor tells how to determine allowances for differences in costs of labor and materials, allowances for differences in amounts of property maintained, or allowances for differences in use of property. It deals with a bugbear of inefficiency of labor which is only a man of straw. When the phrase "inefficiency of labor" is used in the offensive sense of slacking or dereliction of labor, implying a falling short of labor in its duty, it means one thing. My contention and I think the contention of the others in the minority is that when not used in the offensive sense, allowance should be made to the carriers for expenditures made under changed terms and conditions. The majority report is not clear as to whether it is intended to deny allowance to the carriers for such portions of their actual expenditures as resulted from such changed terms and conditions. It is chiefly upon the theory that the majority report would refuse to allow expenditures made necessary by such changed terms and conditions or that it fails to pass upon the question that I dissent. As the subject under consideration has been brought before us, we are not called upon to pass upon any claim of the carriers based on the alleged inefficiency of labor, where such phrase is used in the offensive sense referred to. It is obvious that there is much doubt as to whether such a claim would be susceptible of adequate proof. The distinction between the different meanings of the phrase "inefficiency of labor" was drawn to our attention on December 4, 1920 by our director of

finance [Colonel Colston]. His statement, modified to show comparisons of cost per effective hour of labor, is shown in an appendix [not reproduced here]. I have pointed out to my associates voting with the majority that the inefficiency of labor which is made the very gist of their discussion is not in any sense, and certainly not in the offensive sense in which used by them, in issue in this case. I have been unable to secure the correction of the report in this regard and am therefore put to the necessity of showing the real issues by a review at some length of the history of the case. \* \* \*

In compliance with instructions, our director of finance proposed as a basis for our determination of the general principles for the fixing of maintenance charges a report in the case of the Baltimore & Ohio, which involved all of the principles as to which a determination was required, and which was based upon the plan tentatively agreed upon between our bureau of finance and the carriers. I think it is very unfortunate that we did not follow the course thus outlined and render our decision in a concrete case, rather than adopt the practice of making an announcement in the abstract. \* \* \*

The familiar principle announced in the *Hermanos Case* cited in the majority report is not applicable to an interpretation of the standard contract. The necessity for the "long continued" construction of a statute which the majority opinion treats lightly is the very essence of the decision referred to. Not only is "long continued construction" lacking in this case but as a matter of fact there has never been any general acquiescence. The present controversy is due to the fact that the other parties interested do not accept the director general's construction and the general principle involved has never been settled by any administrative body. The principle that the director general, a contracting party, would be permitted to interpret or construe his own contract would be an anomaly in the law.

[Commissioner Potter here went into a detailed examination of those features of the national agreements which enhanced the cost of railroad operation, contending that all these should be considered by the Commission.]

## Dissenting Opinion

### by Commissioner Campbell

Campbell, Commissioner, dissenting, said in part:

The interpretation placed by the majority upon the phrase "cost of labor" is, in my judgment, contrary to the plain and natural significance of these words. If the words of an instrument are plain and unambiguous, as in this case, resort may not be had to extraneous facts in order to ascertain the intent of the parties thereto. A comparison of costs of labor without having a unit of labor to deal with is impossible. The unit must be measurable and the result obtained is the standard by which a unit is to be measured. In other words, the carriers are entitled to be paid for maintenance in place.

Commissioner Hall did not participate in the disposition of this case.

# Canadian Railway Results in Calendar Year 1920

Operating Ratio Was 97 Per Cent—Total Earnings Increased, but  
Net Declined Chiefly Owing to High Labor Costs

By J. L. Payne

Formerly Comptroller of Statistics, Department of Railways and Canals

"ONE OF THE MOST unfavorable years in their history" is the mild but significant statement with which the Dominion Bureau of Statistics commences its preliminary report of operating results on Canadian railways for the calendar year 1920. An analysis of the details which follow would justify the choice of a stronger adjective; for 1920 was really a frightfully disastrous year for the railways of Canada. If it were not for the fact that government is back of lines representing more than 52 per cent of the total operating mileage, another such year might very well mean the stoppage of transportation by rail over a large part of the country. The facts warrant such a gloomy forecast.

Fragmentary information in relation to the Canadian National group, as announced to Parliament several months ago, had prepared the public mind for the full data now given out. In the meantime, the Canadian Pacific report had been issued, and it was avidly accepted as a countervail to the exceedingly discouraging deficit which the Minister of Railways had been compelled to reveal to the country.

Thus the worst and the best were known in advance of the full figures which have now been published. The worst relates to the government system, and yet the Canadian people do not appear to feel any particular sense of uneasiness about the matter. They know that business will go on as usual. Back of that, they also know that the continued operation of the state roads means continued losses, which must fall upon the Dominion treasury; but they have a complacent and quite impersonal way of looking at that aspect of the situation. If taxpayers had not that disposition, the whole business of administration would be immediately and drastically reorganized the world over. As Otto H. Kahn declared recently in his brochure on "Pressing Problems and Some Suggestions," the article that has risen in cost higher than any other has been government. Yet people do not seem to care.

The burden of growing taxes raises no outcry; but a small advance in the freight rates makes everybody vociferous in denunciation. We live in a world full of contrarities.

## Operating Ratio 97 Per Cent

The ratio of operating expenses to gross earnings in 1920 was 97.17 per cent. Within that pregnant statement of fact lies the whole story of trouble. All other figures are merely collateral and explanatory. For 1919 the ratio was 92.2, which must be compared with an average of 71.0 during the period between 1900 and 1917. In some of those eighteen years the railways had experienced hard times. That was notably true of 1914 and 1915, and the cause was not altogether the disorganization which followed the outbreak of war. The shrinkage of traffic had begun very positively before Germany invaded Belgium, and it is reasonable to assume that an indefinite period of stringency had set in when the war came along to create a feverish and unnatural revival of trade. Trade and traffic are synonymous. That revival, however, was accompanied by such wild advances in the cost of labor and materials, and such a violent expansion in resultant operating expenses, that, despite higher rates and swelling receipts, the railways have finally been brought to the verge of absolute bankruptcy.

We shall be able in a moment to identify quite clearly an

outstanding cause for this distressing spectacle of insolvency, notwithstanding that it was accompanied by unprecedented buoyancy in railway earning power. Before doing so, it is well worth while to pause long enough to recognize the important change which has taken place in the attitude of the public mind—for there is such a thing as a public mind—toward railway interests.

It would have been futile three years ago to tell the people at large that the railways were in trouble. Not a trace of sympathy would have been aroused. There might even have been satisfaction. The railways were "corporations" and stood for "big business," separate and aloof. They were harried by vexatious legislation and many other demonstrations of hostility.

Today, for the first time, the situation of the railways is understood, and to the extent that such understanding rests on a clear appreciation of the vital relationship which must always exist between commerce and transportation it represents unreckonable compensation for adversity. It may have needed just such unparalleled tribulation to open the eyes of the people and awaken their conscience.

## Largest Gross—Smallest Net

The railway cataclysm of 1920 was co-incidental, as has been said, with the largest volume of gross earnings on record. Large, however, as were receipts, the flow of expenditures reached proportions beyond all preceding standards. The total of gross revenues was \$491,938,857, as against \$408,598,361 for 1919. Operating cost, on the other hand, rose from \$376,789,093 to \$478,002,823. Thus, while inflow was increasing by 20.4 per cent, outgo increased by 26.7 per cent.

This happened in a year when the trend should have been in the opposite direction if safety was to be assured. A net operating revenue of \$13,936,002, after \$9,553,990 for taxes and \$59,102,979 for interest on funded debt had been paid, left a corporate loss for the year of \$43,088,388. There was a decrease of \$17,873,265 in net operating revenue, and an increase in corporate loss of \$28,159,722. Grave as is this showing, it does not include many millions of fixed charges attaching to the older units of the government system. The bookkeeping of the government in respect of capital account has already been explained in these columns, and it must suffice to say that it excludes everything but the primary outlay for actual construction.

Here again one is impelled to moralize. If the large volume of gross earnings just indicated had come to the railways of Canada under normal conditions as to outgo, what a vital help to them it would have been! The popular notion has hitherto been that transportation agencies wanted big earnings for the sole purpose of paying fat dividends, some of them on diluted capitalization. That they desired to be in a position to reward in a reasonable measure investors in their securities may be admitted without the slightest hesitation. Such a motive was proper and sound from every angle of view. The watered stocks were myths conjured largely by prejudice. But that was far from being their chief purpose. To sane and ambitious railway executives abundant income is associated with reserves for additions and betterments, so that borrowing may be unnecessary.

It is singular that when a bank accumulates a huge re-

serve it is credited with commendable shrewdness and prescience, while if a railway does precisely the same thing it is accused of greed and dishonesty. The aim is the same in both cases, and the means to the end are identical. In the final reckoning, moreover, it is just as important that the transportation agencies of the country should be strong as that the banks should be strong. In the awakening which has now occurred, bringing with it a dispassionate judgment mingled with sympathy, this fundamental truth may be recognized. If it is, it will mean much to the hard pressed railways. The pinch from which they are suffering so acutely will not have been wholly unavailing if that is one of the results.

Swollen earnings grew out of larger traffic and higher rates. During 1920 the railways of the Dominion hauled 127,388,453 tons of freight, which was within a few thousand tons of the record mark of 1918. For the year there was a gain of 15,900,673 tons. Ton-miles had an aggregate of 31,893,182,716, which was the highest ever registered, and showed that business was really good. The number of passengers carried was 51,306,074—also a new high score. Passenger miles, however, did not gain in proportion, solely because the average journey was shortened. That was one of the phenomena of the situation in the United States last year. More people used the trains; but they did not travel as far as they had done in other years. Gains were also made in revenues from mail, express and incidentals. In short, there was activity in all departments, and 1920 would have brought unprecedented prosperity to the railways of Canada, with qualifications as to the government system, if it had not been for the high and quite extraordinary cost of operation. That cost absorbed not only all but 2.83 cents of every dollar which was received during the year, but ate up nearly every trace of profit and left the roads in the weakest state they have ever been in during the seventy odd years of their history.

Of the 56 railways reporting, 31 paid operating expenses and 25 had a deficit. Of the 31 which made one hand wash the other, so far as operating revenues and operating cost were concerned, 19 showed a net corporate income of \$36,581,437. The Canadian Pacific accounted for that credit balance almost wholly. It is an exceedingly strong road, and enjoys unique advantages as to profitable results from outside operations. It paid its usual dividend on common stock, but could scarcely have done so if it had been confined to net railway earnings. To do what it did in 1920 involved exceptional economies, including sweeping reductions in staff and in train mileage. All the railways appear to have cut down on maintenance, which is always a sign of distress, and they only do it when they have to.

### High Expenses Due Mainly to High Labor Costs

Why were operating expenses so high and so destructive in 1920? The Dominion Bureau of Statistics gives the answer in these words: "Over 56 per cent of the increase in operating expenses was in salaries and wages, which increased about 25 per cent, or from \$233,323,074 to \$290,431,221, and about 14 per cent was in the cost of fuel." In all that has thus far been brought to public notice with respect to the railway payroll for last year, only the facts relating to the Canadian National and the Canadian Pacific have been available. It is now possible to sum up the situation for the Dominion as a whole, and when that has been done the full story of what were the consequences of the McAdoo and Chicago awards are brought out graphically. There cannot be any escape from the conclusion, no matter how the figures are set down—so long as they are fairly stated—that the railways were impoverished by the scale of wages they were compelled to pay to their employees. Let the official statistics tell their own tale, as is shown in the following table:

	Number of employees	Total remuneration
1913.....	178,652	\$115,749,825
1915.....	124,142	90,215,727
1917.....	146,175	129,626,187
1918.....	143,493	152,271,953
1919.....	173,728	233,323,074
1920.....	184,934	290,431,221

If these totals of compensation be reduced to averages per employee the result is as follows:

	Average per employee
1913.....	\$648.09
1915.....	727.54
1917.....	887.85
1918.....	1,064.86
1919.....	1,343.25
1920.....	1,570.75

There is something at once significantly suggestive in the fact that, while the volume of salaries and wages increased by 25 per cent in 1920 over 1919, the average per employee gained by but a little over 17 per cent. The explanation is found in the need for more men to do the same amount of work. Although the national agreements did not extend to Canada, there was nevertheless on this side of the line the same lowered efficiency which had been so conspicuous in all industries as the result of the labor situation during the latter stages of the war period. As between 1918 and 1920 the average wage grew by 47.5 per cent, and as compared with 1917 by 76.9 per cent. Going back to the year prior to the outbreak of war, the 1920 average showed an advance of 142.4 per cent.

The rise in the volume of compensation to employees is even more striking than the average. As compared with 1919 the difference in 1920 was 25 per cent. Over the total for 1918 it was 90.8 per cent, and over 1913 it was 152.1 per cent. It may be conceded that 1915 was an abnormal year, and for that reason might be excluded; but it stands in the official record, and shows that the aggregate of compensation to employees in 1920 was 222.2 per cent higher. In fact, it was this swiftly rising total of outgo under the head of salaries and wages which carried operating cost to the point where it seriously threatened to crush the railways beneath its weight. It has all but done that.

This year the expenditure for labor will be lower than it was in 1920. The 12 per cent cut has just gone into effect, after repeated conferences with representatives of the unions and considerable show of resistance. Some of the minor organizations have not yet agreed to the lower scale. They are protesting that it is not justified by the cost of living, and is going to cause great hardship among large groups of workers; but their acquiescence is not of controlling importance after the Big Four have taken the reduction. This much may be said with assurance: Public judgment is absolutely and unqualifiedly on the side of the railways. The attitude of the press makes that abundantly clear. Therefore, while there will be much of complaining and calling for arbitration, it is not probable there will be anything in the nature of a strike. It is somewhat surprising that, while the McAdoo and Chicago awards went into effect in Canada automatically, the jurisdiction of the National Railway Labor Board is now called in question by railway employees on this side of the boundary, and they want the whole matter opened up.

The grounds on which these minor unions are holding out are two in chief: First, that economic conditions do not justify them; and second, that the National Railway Labor Board is without jurisdiction in Canada. The first contention is supported by arguments which merely mean "we need the money," and may therefore be dismissed as unimportant. The second suggests quite sharply the inconsistency and insincerity of these men. They accepted the McAdoo award of 1918, and the Chicago award of 1920, without any compunction or the uttering of a syllable on the score of jurisdiction. The Canadian railways might very well have raised that question; but they did not. They accepted the awards

and their consequences. To appeal now for arbitration, which would involve a repetition of the proceedings at Chicago earlier in the year, would make for an indefinite delay. That is probably the sole purpose in view. In the meantime, there is nothing to show that this action is supported, either morally or otherwise, by the major brotherhoods.

The official figures raise the loss on the government system in 1920 to \$71,909,927, as against the estimate by the Minister of Railways of a little under \$70,000,000 in March last. Since the corporate deficit on 37 roads—which had no share in the net income of \$36,581,437 enjoyed by the 19 roads referred to in a preceding paragraph—was \$79,669,825, it follows that the shortage on lines outside of the government group was \$7,759,898. But the fact must not be overlooked that a very large volume of fixed liability is not charged against the Canadian National, and if the account as to capital were made up on a sound basis the loss for the year would not fall below \$140,000,000. That is to say, there are quite unavoidable and legitimate charges, amounting to about \$70,000,000, which are omitted from the government statement.

In the light of details which the full report for 1920 affords, the causes of this large deficit on the government

## Freight Car Loading

THE LOADINGS of revenue freight for the week ending July 30 totaled 796,570 cars—an increase of 6,222 cars over the week ended July 23, according to the reports of the Car Service Division of the American Railway Association. Loadings of revenue freight during the corresponding week of 1920 totaled 936,366 cars and for the corresponding week of 1919—925,195 cars.

The week showed gains in the loadings of all commodities except coal and ore. Loading of grain and grain products is heavier this year than during either 1920 or 1919. For the week ended July 30, 66,416 cars were loaded, or 26,564 more than were loaded during the corresponding week in 1920 and 9,301 more than the similar period of 1919. Compared by districts, increases over the week before in the number of cars loaded with revenue freight were reported in the Eastern, Southern, Central western and Southwestern regions but decreases in the Allegheny, Pocahontas and Northwestern. All reported decreases compared with the corresponding week last year except the Central western.

The surplus of cars in serviceable condition continues to decline, due principally to the increased demand for grain

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

Summary All Districts: Comparison of Totals This Year, Last Year, Two Years Ago. For Week Ended Saturday, July 23, 1921.

Districts	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Mdse. L.C.L.	Miscellaneous	Total revenue freight loaded			Received from connections		
										This Year 1921	Corresponding Year 1920	Corresponding Year 1919	This Year 1921	Corresponding Year 1920	Corresponding Year 1919
Eastern	1921	10,216	2,517	41,233	806	4,318	2,961	56,081	71,574	189,706	228,161	230,406	187,799	265,047	228,291
	1920	5,607	2,479	56,620	3,280	8,353	9,614	35,783	106,425	157,508	189,129	189,139	104,711	138,274	104,711

system are brought out with unmistakable definiteness. It will not be necessary to go into the matter in this sketch, since a careful analysis was presented in the *Railway Age* of July 16. The more complete data now available serve to accentuate the weak spots which were then exposed. For example, the average trainload of the Canadian Northern, which is the most important in the amalgamation and enjoys favorable grades, was but 354 tons, as compared with 528 for the Canadian Pacific. Going still deeper into the results of management, and considering per passenger mile and ton-mile service combined it cost the Canadian Northern 1.057 cents for labor alone, as against .674 to the Canadian Pacific, or a difference of 56.8 per cent adverse to the state road.

Measured in another way, the total of passenger and ton-miles per employee on the Canadian Northern was 153,019, as against 222,459 on the Canadian Pacific. If operating efficiency be gaged on that basis, then it is completely obvious that the corporate road showed a betterment of 45.4 per cent.

cars in the Central West. The Car Service Division's new figure, "cars temporarily out of service due to business depression" (which figure includes all surplus serviceable cars as well as bad order cars in excess of 7 per cent of the total) shows a decrease of 28,991 cars from the total of 555,168 on July 23 to 526,177 on July 31.

Of the total of 555,168 on July 31—321,781 were serviceable freight cars, while the remaining 204,396 were cars awaiting repairs. On July 23 the surplus of serviceable cars was 350,772. Surplus box cars in good repair at the end of the month numbered 100,207 compared with 119,442 on July 23, or a reduction within that period of 19,235 cars. Reports showed 161,723 surplus coal cars in serviceable condition, which was a reduction of 6,845 cars in a little more than a week.

As a result, mainly, of the demand for grain cars, a shortage in certain sections of the country of 3,905 freight cars was reported by the railroads. This was an increase of 1,137 cars over that on July 23. Of the total, 3,710 consisted of box cars, an increase of 1,207 cars in a week.

# Piece Work Dispute Again Before Labor Board

## Employees' Reply to Carriers' Testimony in National Agreements Case—Hearings to Last Five Days

THE ABROGATION OF RULES, the terms of which prohibit piece work in railroad shops, is again under discussion before the Railroad Labor Board. On August 8 hearings on this subject were begun as a result of the disagreements which have been reached between approximately 70 carriers and representatives of their shop employees. In practically all of the negotiations which have been conducted during the past month between individual carriers and their own employees, the employees have stood firmly for the retention of Rule 1 of the Shop Crafts National Agreement providing for the payment of employees on an hourly basis. This rule prohibits the payment of shop employees on a piece work basis. Because of this universal disagreement, the Board ordered the present hearings. Again, when B. M. Jewell, president of the Railway Employees Department of the American Federation of Labor, finished presentation of his case in the controversy over national agreements, he stated that his testimony was complete except for the submission of data on the subject of piece work. Mr. Jewell was promised at that time an opportunity to complete his case, and these hearings, according to the opening announcement of Vice-Chairman W. E. Hooper, were called in compliance with the request of the employees for opportunity to answer the voluminous testimony on the uneconomical effects of the abolition of piece work presented by the Conference Committee of Managers in the hearings on national agreements.

At the opening session on August 8 Mr. Walber raised the question as to whether the present hearings are a continuation of the hearings on national agreements or whether they are to be considered as separate hearings on disputes filed with the Board as a result of the negotiations between individual carriers and their own employees ordered by the Board in Decision No. 119. Mr. Walber stated that it was the feeling of the carriers that the real question before the Board is whether it is right to deprive officers of the railroads of the right to conduct their systems under a plan which is more economical and more efficient than the plan whereby employees are paid by the hour.

A large portion of the first day's testimony was taken up with a plea by Mr. Jewell for separate hearings on each disagreement certified to the Board during the past few weeks. He contended that the Board should hear testimony from representatives of each carrier and from the representatives of the employees on each road. In stating his position Mr. Jewell outlined the program of the shop men's organization on national agreements, and in this connection maintained that the only instructions issued to local representatives of his organization were that they negotiate an agreement acceptable to them and to the employees whom they represent on each railroad.

In closing the first day's testimony Mr. Walber stated that the carriers intended to rest their case largely on the testimony presented by the Conference Committee of Managers. He formally submitted this testimony in the present case.

On August 9 the Labor Board announced that five days of five hours each would be allowed for the hearings in this case. The first four days are to be devoted to the employees' reply to the piece work testimony of the Conference Committee of Managers and the last day is to be devoted to rebuttal statements by representatives of the carriers. Vice-Chairman Hooper in making the announcement stated that the only question before the Board at this time is whether or not the rule prohibiting piece work should or should not

be continued. After considerable discussion as to the procedure which should be followed the hearing was adjourned until August 10 at Mr. Jewell's request.

Committeemen representing the shop employees on 28 eastern and 26 western carriers involved in the disputes over piece work appeared before the Board on August 10 and vigorously protested the re-establishment of piece work. Practically all of the local committeemen stated that from 95 to 100 per cent of the shop employees represented by them have voted against the re-establishment of piece work on the grounds that this system of pay works a hardship on the employees, constitutes a form of slavery, prevents the payment of punitive overtime and makes impossible the payment of a living wage. Many of the committeemen based their arguments largely on the fact that the re-establishment of piece work would wipe out their punitive overtime to a great extent and the introduction of this argument was protested by Mr. Walber, who called attention to the fact that the present hearings are on the question of piece work. Mr. Jewell replied that the two subjects are so closely allied that they must be considered together. This point was not made an issue and the hearings continued.

## Board Renders Another Decision in Pennsylvania Dispute

A decision in the controversy between the Pennsylvania and the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees over the election of representatives to negotiate new agreements regarding rules and working conditions was announced by the Board late last week. This dispute is to a large extent similar to the dispute between the Pennsylvania and its shop men, described in the *Railway Age* of July 16 (page 115).

The Labor Board in its decision held that:

1. The carrier was within its rights in denying that the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees represented a majority of that class of employees, and requiring evidence of the alleged fact.
2. An election to be freely participated in by all employees of that class, union and non-union, to select representatives to negotiate rules and working conditions was proper and legal.
3. That the carrier was wrong in refusing to allow the name of any organization to go on the ballot. There is nothing in the Transportation Act to justify this course. Said statute recognizes the existence of organizations of railway employees, and the right of the men to belong to such organizations is no longer seriously questioned in any quarter. The railway employees have built up organizations with their money, have put at the head of them the men they consider most competent and trustworthy, and have acquired a vast amount of information, statistical and general, bearing on matters affecting their rules and working conditions. It is unjust and unreasonable to seek by methods, direct or indirect, to deprive them of the efficient representation afforded by these organizations, provided, of course, a majority of them desire to be so represented. On the other hand, if the carrier, by fair and legal methods, can win the support of a majority of its employees to non-union representation in this important statutory conference, it has the undoubted right to do so. Putting the name of an organization on the ballot was equivalent to putting the names of individuals there, because it simply meant that the chosen officers of the organization would represent the employees, if the majority vote authorized.
4. Said organization of employees was wrong in its suggestion that the ballot contain only the names of organizations to the exclusion of individuals. This ignored the rights

of non-union men, and was therefore unjust and unreasonable.

5. The insistence of the carrier that no name should go on the ballot save that of an employee of the carrier is not justified by the statute. The employees had no desire, however, so far as the record shows, to place on the ballot the name of any one not an employee.

6. The carrier had no legal right to adopt a regional division for the purpose of requiring the employees to elect regional representatives. The Transportation Act contemplates that the class of employees directly interested on the entire system shall select their representatives, and even if it did not, the carrier would have no right to make such arrangement without the consent of the other contracting party. Such a power to subdivide into districts could easily degenerate into the process known in politics as gerrymandering.

The carrier had no right to segregate for the purpose of such election, the clerks in the general offices at Philadelphia and Pittsburgh, as the character of their work and the conditions under which it is performed are not so dissimilar from that of the other clerks as to constitute them a distinct class of employees. This action was in disregard of Decision No. 153 of this Board, which is here cited for further direction on this particular matter. For the same reason the carrier did not have the right to otherwise subdivide the clerks for the purpose of said ballot. The groups into which they were divided did not constitute distinct classes of employees.

7. The carrier was correct in its contention that the employees embraced in the membership of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees constitute more than one distinct class of employees within the meaning of the Transportation Act.

The Labor Board holds that, under the Transportation Act, one distinct class of employees cannot negotiate rules for another distinct class. For example, the laborers employed in and around stations, storehouses and warehouses have no right to participate in the election of representatives to negotiate rules for clerks, and vice versa the clerks have no right to participate in the election of representatives to negotiate rules for said laborers.

The fact that these different and distinct classes of employees belong to the same organization does not affect the question under consideration. The organization may admit to its membership as many different classes of employees as it may see fit, but it cannot throw their combined vote and strength to the election of representatives to negotiate, under the Transportation Act, for any one distinct class of employees. The organization may be selected, however, to represent any class of employees that belong to it.

The Labor Board has heretofore held that employees performing work similar in its general characteristics and in the conditions surrounding it belong to the same class, within the meaning of the statute. It now holds the converse of this proposition—namely, that employees performing work dissimilar in its general characteristics and in the conditions surrounding it must be assigned to different classes, within the meaning of the statute.

It is not always easy, however, to classify employees, for there are varying degrees of similarity and dissimilarity in their work and working conditions.

The Board then divided the employees represented by the clerks' organization into three groups: clerks, foremen and storekeepers and office, station, warehouse, storehouse and elevator forces not included in the first two groups.

Continuing, the decision said:

8. When the dispute arose as to the essential preliminary of how the representatives of the employees should be selected, neither party should have proceeded further, until that disagreement was composed either by further conference or by reference to the Labor Board.

The Transportation Act places the carrier and the employees in a contractual relationship as to the negotiation of rules and working conditions, and neither of the parties has the right, either directly or indirectly, to dominate or dictate the other party's selection of its representatives.

The statute expressly says that the employees directly interested shall "designate and authorize" their representatives.

Inasmuch as the law requires the carrier to deal with the representatives of the employees, it necessarily follows that the carrier must know who the duly authorized representatives are. It is therefore proper for the carrier to be kept in close contact with the election and to be represented in the conduct thereof.

In this connection it may be added that all regular labor organizations and the unorganized employees of the carrier should be fairly represented in every step incident to the taking of such a ballot.

The misunderstanding which arose as to the proper method to adopt, for the selection of the representatives of the employees for the conference on rules deprived great numbers of employees, apparently a majority, of their legal right to be represented. This sort of a situation is not conducive to industrial peace. The carrier ought not to be content with it, because it is unjust and un-American.

It cannot be said that this case involves in any sense the question of the open or closed shop. Neither does it involve any attempt to deprive the carrier and the employees of the right to sit down at a conference table and settle their own differences, if any arise, as to rules and working conditions. On the contrary, it is the purpose of this Board by its decision to guarantee both to the carrier and its employees, union and non-union, every right conferred upon them by the law, to the end that there may be the harmonious co-operation essential to the well-being of all parties and the highest service to the public at large.

The election conducted by the Pennsylvania was declared "illegal and void," the rules negotiated by the representatives elected by the company ballot to be "void and of no effect," and another election to determine the choice of a majority of each of the three classes of employees as to their representatives in the negotiation of new rules and working conditions was ordered in the decision. The Board also called a conference on or before August 15 at which the representatives of the carrier, of the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, of any other similar organization and of each group of one hundred or more unorganized employees who desire separate representation to formulate plans for the new election.

#### Board Orders Secret Ballot on Pennsylvania

In an addendum to the Pennsylvania decision announced in the *Railway Age* last week the Labor Board on August 5 ordered a secret ballot to determine representatives to negotiate new agreements regarding rules and working conditions. The decision of the Board in this case directed that each employee voting should show on his ballot his name, craft, place of employment and whether working or furloughed and should then seal and forward the ballot to the proper committee. The attention of the Board was called to the fact that this method of balloting in this instance would be objectionable because there is such conflict of interest. The addendum is the result.

#### Pennsylvania Allowed More Time to Comply

The Pennsylvania Railroad has asked for and been granted 15 days' grace (to August 25) on the order of the Railroad Labor Board requiring the company to confer with representatives of "System Federation No. 90" concerning plans for an election to select members of the committee to deal with the company in the revision of the rules of employment of its shopmen.

Eastern Railway Station at Paris

# Senate Committee Begins Hearing on Funding Bill

Some Senators Opposed to Final Action Before Recess—  
Finance Corporation Director Defends Measure

WASHINGTON, D. C.

HEARINGS began before the Senate Committee on Interstate Commerce on August 9, on the Townsend bill which would enable the War Finance Corporation to purchase obligations of the carriers for the amounts due by them for capital expenditures made by the government during the period of federal control, and to use the proceeds of the sale thereof to advance funds to the carriers for the amounts due them. A similar bill has been introduced in the House by Representative Winslow, as was noted in the *Railway Age* of last week.

Testifying before the committee, Eugene Meyer, Jr., Director of the War Finance Corporation, said that passage of the bill would mean the employment of an additional 1,000,000 men during the coming winter. The bill contemplates only the revival of the powers given the War Finance Corporation during the war, he said. The Corporation would have no direct dealings with the railroads under its provisions. It would simply be enabled to buy such securities as it deemed advisable. No appropriation for this purpose would be necessary or desirable, he added. Purchases of railroad securities by the War Finance Corporation would, in his opinion, have a stimulating effect upon many lines of business.

Senator Townsend asked whether an emergency existed that necessitated passage of the bill. Mr. Meyer thought an emergency did exist, that an emergency existed whenever a million men were out of employment. He was then asked if he were firmly convinced that the bill would restore confidence in railroad securities.

"I have no doubt of it," he replied. "Conditions are working in that direction right now, and I think we can materially accelerate the restoration of confidence. By restoring confidence in the railroads, confidence will be restored in all other lines, and this bill will mark the beginning of the real reconstruction period."

## Alba B. Johnson's Letter to the Committee

Immediate passage of the railroad legislation is essential, the committee was told in a letter written by Alba B. Johnson, president of the Railway Business Association. He asked that no amendments modifying the transportation act be considered by the committee as a part of the pending bill, because of the delay that such amendments would entail.

"Rather than contribute even a half hour to the delay, the Railway Business Association refrains from offering testimony," Mr. Johnson wrote. He called attention to reports that the bill might either be delayed until after a recess or defeated through irrelevant amendments which the majority of the two houses would find unacceptable. Mr. Johnson's letter follows:

Reports persist that the passage of S. 2337 (the Townsend Bill) may either be delayed until after a recess or defeated through irrelevant amendments which Congress would not accept. Hundreds of thousands of men look for work to members of our association, manufacturers of railway equipment, material and supplies. Unemployment among them reaches great proportions. These men, their families and the communities in which they live and trade are waiting for full force or full time. They must wait until the railroads can obtain money with which to pay supply bills and to place new orders.

S. 2337 would give the roads time in which to repay sums advanced by the government during federal control for capital purposes and release for immediate cash remittance balances due the roads from the government on other accounts.

Rather than contribute even a half hour to the delay the Railway Business Association refrains from offering testimony at your hearing appointed for August 9 and requests instead that this letter be inserted in the record.

We urge:

1. Prompt Action. A voluntary vacation for Congress without this enactment would mean an involuntary vacation without pay for hundreds of thousands of industrial employees.

2. Separate Action. We hope you will exclude serious consideration of amendments not essential to clarify the primary purpose of the bill. Congress has no mandate of ascertained public purpose to modify any essential principle of the Transportation Act of 1920. If discussion of general amendments is desired it can be conducted most advantageously on its merits free from confusion with the discharge of a plain governmental obligation, so recognized by the President of the United States, the Secretary of the Treasury, and the Director General of Railroads. If it shall be proposed that Congress at this time abandon its established policy in order to make railway rates by statute instead of through an administrative tribunal created by it, such a reversal of federal method and practice requires in safety to the public a discussion so thorough that postponement of industrial resumption through the debate is unthinkable.

## Opposition to the Bill

The bill was opposed at Wednesday's hearing before the Senate Interstate Commerce Committee by Senator LaFollette and by several Democratic Senators, among whom was Senator Pomerene, of Ohio, who referred to the proposed funding program as a "hand-out." The bill was defended vigorously by Eugene Meyer, director of the War Finance Corporation, who declared that it was a measure for national as well as railroad rehabilitation.

In answer to the questions of Senator LaFollette as to where the bill had originated, Mr. Meyer said he had discussed the question with the President and that the bill had been drawn thereafter by G. C. Henderson, counsel for the War Finance Corporation. Mr. Meyer said he had not attended any conference at which President Harding discussed the legislation with railroad executives and that no one outside the War Finance Corporation had a hand in drafting the bill.

"Did you know that Mr. Hoover was going to New York to confer with railway executives about it?" persisted Senator LaFollette. Mr. Meyer disclaimed such knowledge.

Senator LaFollette referred to loans by the War Finance Corporation to the Brooklyn Rapid Transit Company and a New Orleans street railway company, which, he said, soon afterwards became bankrupt. The Senator said he did that to indicate "how business was transacted." Director Meyer said he regarded the Brooklyn Rapid Transit loan as "eventually good," and said the New Orleans loan had been paid in full.

Senator LaFollette sought to show that the bill really would authorize the War Finance Corporation to fund, or sell, over one billion dollars of railroad securities rather than only \$500,000,000. Mr. Meyer declared that funding of the latter amount only was contemplated or could be reasonably accomplished.

## Director General Davis Testifies

The limit of funding under the bill, Director Davis of the Railroad Administration told the committee would be \$500,000,000 and "probably under." Giving a detailed statement of the railroad debts to the government for additions and betterments—mostly equipment—furnished carriers during the war, Mr. Davis said a total of \$1,144,000,000 had been advanced for that purpose. Of this,

he said, the railroads had given \$310,000,000 in equipment trust notes and \$70,000,000 paid in cash, leaving a balance of \$763,000,000, of which \$61,000,000 already had been funded privately. About \$700,000,000 of the government advances, therefore, he said, have not been funded, but for various reasons, lack of securities, etc., Mr. Davis stated that the bill would require funding of less than \$500,000,000.

No change is proposed by the bill, Mr. Davis added, in the authority given him under the transportation act to settle all claims against the government. Mr. Davis said the bill would be "greatly beneficial." "Its whole purpose," he said, "is to let the public, instead of the government, carry these loans." Examination of Mr. Davis was continued Thursday.

#### Illinois Manufacturers Urge Favorable Action

Chairman Cummins on Wednesday received a letter from Charles A. Livingston, representing the Illinois Manufacturers Association, urging prompt enactment of the bill "in order that the railroads, industries and all shippers may immediately be relieved that transportation troubles may be averted and unemployment be lessened."

Not all of the railroad securities held by the government will be accepted and marketed by the War Finance Corporation, Director Meyer said during his opening testimony on Wednesday. Only the good securities now held by Director Davis of the Railroad Administration will be funded, Mr. Meyer said, explaining that the provisions of the funding bill were permissive and not mandatory upon the War Finance Corporation. The securities which are deemed good by the corporation, Mr. Meyer stated, would have to be marketed gradually.

"Of course, we can't throw hundreds of millions of securities on the market," he said. "We would take them over temporarily and market them later, furnishing funds to enable the director general to adjust accounts with the railroads." Senator Kellogg, of Minnesota, interjected that there was nothing in the funding bill relating to settlement of claims between the railroads and the government. "It simply takes the railroad securities now held by the government and transfers them to another branch of the government to be sold," said Senator Kellogg.

Director Meyer added that in advancing funds to the director general on the railroad securities taken by the corporation the director general then would have funds to proceed with adjustments of accounts.

About \$700,000,000 of the railroads' equipment notes given for loans by the government during the war are held, Mr. Meyer said. "These are frozen credits, and we propose to unfreeze them for the benefit of the government," he said.

#### Postponement of Action Possible

President Harding had expressed the desire that the funding bill should be passed before the recess of Congress which has been set tentatively for August 20, but he was told by the Republican leaders that this would be practically impossible. Tremendous pressure is being brought upon the Executive and upon Congress for quick action on the bill, but there is considerable opposition to it in both Houses. The leaders fear that to attempt to jam it through before the recess would provoke a filibuster that would prevent passage of other essential legislation.

#### The Winslow Bill Referred to Committee

The banking and currency committee of the House voted on Monday to authorize its chairman, in his discretion, to move in the House for rereference of the Winslow railroad funding bill to the banking and currency committee. This bill, like the agricultural relief bill, is in the form of an amendment to the War Finance Corporation act, and is identical with the Townsend bill, the hearings upon which began before the Senate Interstate Commerce Committee on Tuesday. Chairman McFadden said he had not decided whether

an attempt to get jurisdiction of the bill, which at present is in the hands of the interstate and foreign commerce committee, should be made. He said there would be no effort to combine the agricultural relief bill and the Winslow bill, should the latter be referred to this committee by the House.

#### The I. C. C.'s Decision As To

#### Maintenance Allowances in Guaranty Period

Elsewhere in this issue there appears an abstract of a decision by the Interstate Commerce Commission denying the claims of the railroads to include in their allowances for maintenance during the guaranty period, charges to cover the inefficiency of labor. Following this decision, Secretary Mellon of the Treasury Department said that in accepting payment from the government covering the guaranty period the railroads will be expected to relinquish all right to appeal to the courts in the further attempt to secure payment of these claims. Acceptance of final settlements by the railroads reserving the right to receive further payments in the event that the courts uphold their claims for compensation for inefficiency of labor will not be possible under Secretary Mellon's decision. The carriers would either be compelled to sign a waiver relinquishing their rights of appeal to the courts or else have final payments agreed upon held up pending action by the courts on the disputed claims.

The same point of view as expressed by Secretary Mellon regarding payments for the guaranty period is held by Senator Lenroot regarding payments for the period of federal control. He has announced that he would propose an amendment to the Townsend bill now in committee providing that none of the benefits of the bill should extend to roads refusing to relinquish all claims against the government growing out of inefficiency of labor under federal control. The proposal advanced by the senator was endorsed by several of his associates.

Monument Erected by Employees of the Tyrone Division of the Pennsylvania in Memory of Their Fallen Comrades

# General News Department

G. C. Williams has been appointed assistant superintendent of steamers of the Southern Pacific, with headquarters at San Francisco, Cal., effective August 3, succeeding F. A. Fish, retired.

The Illinois Manufacturers' Association, through its president, George R. Meyercord and Secretary John M. Glenn, has appealed to President Harding by letter to hasten the financial settlement with the railroads in order to enable the carriers to carry out their repairs of rolling stock. It is pointed out that unless repairs are made a car shortage will result.

The Southern Railway announces the shortening of the time of eight through passenger trains, to be put into effect on August 14. No. 38, the northbound New York & New Orleans Limited, will arrive at New York 40 minutes earlier than at present and No. 25 and 26, the Memphis Special, will be run through in about two hours, 20 minutes less time than at present. Several other trains will be quickened an average of about one hour each.

A 20 per cent wage reduction applying to all employees of the National Railways of Mexico earning 100 pesos or more a month went into effect on August 1. Following the refusal of the railway directorate to rescind this order for a wage cut, the organized employees issued an ultimatum threatening a general strike if the former scale of compensation was not continued.

The strike of the 302 members of the federated shop crafts on the Cincinnati, Indianapolis & Western, noted in the *Railway Age* of July 30 (page 196), which started on July 22, because the railroad would not pay the men time and one-half for overtime, has been called off, and about half of the men have returned to work. They will be received by the company, however, as new men, having lost their seniority rights by their walk-out. B. A. Worthington, president of the road, states that the new men who were taken on to fill the positions of the strikers will not be discharged to give room for the returning men.

## Congressional Discussions of Tax Problems

The Ways & Means Committee of the House on Wednesday agreed to recommend the repeal of the transportation taxes on freight, passengers, seats and berths, beginning with January 1, 1922. The taxes on express shipments and on pipe lines were retained in the draft of the proposed revenue law. The losses resulting to the Federal Treasury from the proposed changes are estimated as follows: Repeal of freight taxes, \$145,000,000; of passenger taxes, \$100,000,000 and of Pullman taxes, \$8,000,000; total, \$253,000,000. In revising the transportation taxes the committee did not follow the program suggested at the conference on Tuesday between President Harding, Secretary Mellon, the Republican members of the ways and means committee and Representatives Mondell, Madden and Campbell. At that conference the proposal was that the transportation taxes should be reduced 50 per cent next January and the balance on January 1, 1923.

## Committee to Administer Valuation Order No. 3

A committee has been created to consider questions arising under the administration of order No. 3 of the Division of Valuation of the Interstate Commerce Commission. This committee consists of two representatives of the Bureau of Valuation, one of the Bureau of Accounts, and three of the carriers. The following have been named as members of this committee. Morris A. Zook, resident engineer, Bureau of Valuation, Washington, D. C.; William L. Fulton, senior civil engineer, Bureau of Valuation, Washington, D. C.; W. H. Swinney, assistant to director of accounts, Bureau of Accounts, Washington, D. C.; H. L. Ripley, corporate and valuation engineer, New York, New Haven & Hartford, Boston,

Mass.; E. M. Thomas, comptroller, Chesapeake & Ohio, Richmond, Va.; and A. A. Ferguson, mechanical valuation engineer, Missouri Pacific, St. Louis.

## Australians to Investigate

### American Stores Department Methods

Five prominent Australian railway men have arrived at San Francisco, Cal., to make a study of American railroad methods of handling materials and supplies with a view to installing a similar system on the Australian railways which are operated by the government. The visitors are: C. W. J. Coleman, chief storkeeper; H. J. Canny, outdoor superintendent; G. H. Wion, assistant engineer of signals; H. E. Sergeant, stores branch officer, all of the Victorian railways and W. H. Clarke, comptroller of stores, New South Wales government railways.

## Intimidation of Negro Workers

The continued harassment of negro trainmen and workers on the Illinois Central in the southern states has led to the belief that an organized plot exists to intimidate and kill them in an effort to drive the negroes from the line. Two negroes have been ambushed and killed on the Yazoo & Mississippi Valley near Lake Cormorant, Miss.; one has been slain near Raines, Tenn., just out of Memphis, another met death as a train was passing Aberdeen Junction near the same city and two were wounded near Sturgis on the Aberdeen and Durant branch of the road. The last death reported was near Water Valley, Miss., the latter part of July, for which two men were indicted on July 30 at Water Valley, Miss. Special agents of the railroad have been working on the cases for several months and are exerting every effort to protect the negro employees of the road and run down the conspirators.

## Net in June, \$51,778,000

The net railway operating income of the railways in June was \$51,778,000, which was \$14,697,346 more than in May. The figures are those of 202 Class I railroads operating 235,548 miles of line.

The earnings for June, says the statement of the Association of Railway Executives in which the figures are given, on the basis of the tentative valuation fixed by the Interstate Commerce Commission for rate making purposes under the Transportation Act, would be at the annual rate of return of 3.1 per cent compared with 2.4 per cent the previous month. Tabulations show, however, that the railroads fell short \$47,295,000 or 47.7 per cent of earning 6 per cent contemplated by the act. This was, however, the largest amount earned during any one month by the railroads since last November, when their net operating income was \$54,343,793.

The operating ratio in June, 1921, was 82.34 per cent as compared with 85.43 per cent in May. In June, 1920, it was 96.84 per cent, in May, 1920, 95.60 per cent.

Operating revenues in June for the railroads of the United States totaled \$461,127,000, which was a decrease of 6.7 per cent compared with those for the same month last year. Operating expenses were \$379,688,000 or 20.7 per cent less than in June one year ago. The net operating income was \$51,778,000 compared with an operating deficit of \$14,612,000 during the same month in 1920.

From September 1, 1920, when the guaranty period ended, to June 30, last, the net operating income of the rail carriers was \$368,445,000, which, on the basis of their tentative valuation, would be at the annual rate of return of 2.5 per cent. This amount falls short \$516,626,000 of that contemplated to be earned under the rates established by the commission.

## REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JUNE AND SIX MONTHS OF CALENDAR YEAR

Name of road.	Average mileage operated during period.			Operating revenues.			Maintenance of equipment.			Operating expenses.			Net after railway operations.			Net after rentals.

## Traffic News

The Missouri Pacific, the Chicago & Alton and the Wabash have announced round trip excursion rates between Kansas City and St. Louis, Mo., on August 13 of approximately the one way fare.

The Great Northern has announced that new commodity rates on ore and concentrates from Great Northern points to the Bunker Hill smelter at Bradley, Idaho, will become effective August 19.

The St. Louis-San Francisco has opened an office in the United Fruit Company building at New Orleans, La., in charge of F. A. Edmondson, who has been appointed general agent of the freight department.

Repeal of Section 15-a of the transportation act, which prescribes rule for rate-making, was urged before the Commission on Agricultural Inquiry this week by S. H. Cowan, counsel for the American National Livestock Association. He did not "challenge the integrity" of the commissioners but "challenged their judgment" in valuation decisions. If Congress would enact legislation putting railroad rates back where they were when the lines were taken over, and valuation figures were disregarded, the railroads would have a large business.

The Adriatic Mining Company and more than eighty other independent operators in the Lake Superior iron district charged before Examiner Hösmer of the Interstate Commerce Commission, Chicago, on January 24, that the United States Steel Corporation is benefiting by discriminatory rates. The petition, upon which hearings have been started, was filed against the Chicago & North Western, the Chicago, Milwaukee & St. Paul, the Great Northern, the Duluth & Iron Range, the Duluth, Missabe & Northern and four other railroads serving the northern iron mining district.

Freight rates on grain, grain products and grain by-products from Chicago and points taking Chicago rates, to north Atlantic seaboard ports for export, are to be reduced, temporarily, 7½ cents per 100 lb., as a result of conferences held at Chicago, last week, between the railroads and shippers' representatives. Corresponding reductions will be made in the rates from points in Central Freight Association territory east of Illinois. Authority will be sought to make the reduced rates effective on 10 days' notice. The reduced rates are to be in force only until October 1.

Transferring Mail at New York from Ocean Liner to New York Central's Harbor Steamer

To expedite the delivery of foreign mails inbound ocean steamers are now met by a New York Central harbor boat, thus providing for delivery of mails before ocean vessel is released from quarantine.

## Commission and Court News

### Interstate Commerce Commission

The Commission has reopened the railway mail pay proceeding for reexamination and further hearing of the facts and circumstances surrounding the transportation of the mail and the services performed by several "Short Line" carriers in the West who applied for reopening of the case.

The commission has further suspended until September 5, the operation of certain rates on lumber and other forest products from California and Oregon to various points in Minnesota, via the Chicago, St. Paul, Minneapolis & Omaha and the Great Northern, which rates would result in increases varying from 4½ to 9 cents per 100 lb.

Proposed withdrawal of the Chicago, St. Paul, Minneapolis & Omaha and the Great Northern from participation in joint rates on lumber and forest products, in carloads, from points in California and Oregon to Nebraska, Iowa, Minnesota and Wisconsin have been found not justified and the suspended schedules were ordered canceled on or before September 4. Fourth Section relief was denied.

### Court News

#### Practice as to Demurrage Acquiesced in by Shipper Equivalent to Agreement, and Binding

In an action by the Minneapolis, St. Paul & Sault Ste. Marie for demurrage on a car of wheat destined to Minneapolis, it appeared that, while originally it was the practice to observe the tariff rule literally by giving notice to the consignee after arrival of cars in the city, a serious congestion at the terminal about 1906 caused a change, and with the concurrence of the state commission, the Minneapolis Chamber of Commerce and the Northern railroads, the practice was established of stopping the cars of wheat at outlying stations and having samples taken and sent in advance to Minneapolis by passenger trains, manifests being forwarded to the consignee in place of the written notice of arrival. On July 7, 1917, the defendant notified the plaintiff in writing it would no longer observe the practice. The demurrage sued for in this case arose prior to the written notice given by the defendant. The defendant claimed that although he had on previous occasions paid demurrage, that had been on cars of whose actual arrival he had learned personally. The Circuit Court of Appeals, Eighth Circuit, rejects the defendant's contention. "Prior to the letter of July 7, 1917, the road could not lawfully have made defendant an exception to the practice so long as it was willing to receive and receipt for the manifests, and a corresponding disability rested on the defendant. The demurrage rule recognizes the validity of agreements in lieu of written notice. The Interstate Commerce Commission said that the practice existing at Minneapolis as it had for many years 'for the mutual benefit of consignees and carriers, and generally acquiesced in by the former, is tantamount to an agreement.'—Minneapolis T. Assn. v. C. B. & Q., 49 I. C. C. 308, 315. A similar practice was upheld in Berwind-White Co. v. Chicago & Erie, 235 U. S. 371, 35 Sup. Ct. 131, 59 L. Ed. 275. It was held that, although cars billed for reconsignment may not have actually reached the point named as destination, demurrage may attach for the time held after reaching the point convenient to the belt line for transfer, where, under usual practice for many years, cars so billed were held for reconsignment. The court said that the contention that the cars had not reached destination as provided in the demurrage rules was frivolous." Judgment for the defendant was reversed and a new trial ordered.—Minneapolis, St. P. & S. S. M. v. Van Dusen Harrington Co., 272 Fed. 255.

THE RAILROAD COMMISSION of California has given tentative permission to the Southern Pacific to withdraw 18 passenger trains from service in various parts of California. The Commission reserved the right to require the restoration of any part of this service should complaints from patrons be made.

## Foreign Railway News

### Spanish Manufacturers in Market for Car Axles

A combination of Spanish manufacturers which is in the market for a quantity of car axles has supplied Commercial Atchaf Cunningham, Madrid, with blue prints of the material they require. These plans have been sent to the New York office of the Bureau of Foreign and Domestic Commerce where they are open for inspection to American manufacturers interested.

### Electrification of the Victorian Railways

It is reported in the Times (London) Trade Supplement that the Victorian Railways Commissioners (Australia) are about to convert a further 100½ miles of their lines from steam to electric traction and that the work is to be completed by the end of February, 1923. In addition to this electrification, which covers the passenger carrying routes, a number of lines exclusively used for freight traffic are to be converted and the electric system extended over several of the busier sections of the country lines. This work will entail the overhead wiring of considerably over 100 miles of track, the erection of a number of sub-stations additional to those already in use, the replacement of the existing signaling equipment, and the construction of several workshops fully equipped with all types of machine tools. It is proposed that Australian materials shall be used to the fullest extent possible under the local conditions.

### Orient to Resume Construction of Mexican Line

Formal notice was recently conveyed to President Alvaro Obregon by D. J. Hafl of Kansas City, general counsel of the Kansas City, Mexico & Orient Railroad, according to reports from Monterey, Mexico, that the stockholders of that company have voted to resume construction of the main line that will close the gap between Sanchez, state of Chihuahua, and Fuerte, state of Sinaloa, a distance of approximately two hundred miles. The work will be started as soon as the construction forces can be organized, according to Juan F. Trevino, superintendent of the Chihuahua division of the road. With the filling in of this gap the main line of the Kansas City, Mexico & Orient will have been finished from a point about fifty miles south of Presidio, Texas, on the Rio Grande, to the port of Topolobampo, on the Pacific. It is planned to resume the construction of the main line from Alpine, Texas, to a connection with the existing northern terminus of the Mexico division in the near future, it is officially stated. The cost of the construction of the two hundred miles of road between Sanchez and Fuerte will be approximately \$10,000,000, United States money, Mr. Hafl was said to have informed President Obregon.

### International Commerce Chamber

#### Urges Freedom of Transportation

The International Chamber of Commerce at its meeting in London the latter part of June adopted resolutions urging the free movement of freight trains over international borders and the construction of the railway tunnel under English Channel. The resolution reads in part: "The chamber approves the construction of a channel tunnel between the British Isles and the continent of Europe and requests the appropriate national committees to bring this conclusion to the notice of the governments concerned. The chamber also approves the inauguration of regular services of sea-train ferries across the English channel, and across other bodies of water where commercially feasible, and they request the national committees of countries interested in the establishment of such ferries to take promptly practical steps for their establishment and to offer the aid of the chamber in regard thereto.

"The chamber requests that the railway systems take joint measures with a view to establishing, on great international traffic routes, in a manner similar to that adopted

for the conveyance of passengers, connecting services which will ensure rapid transportation of international long distance freight trains, both for express and ordinary goods service. To this end the national committee of countries interested in the respective international traffic routes are requested to take promptly the practical steps to secure the establishment of such routes and to offer the aid of this chamber in any necessary international negotiations. The chamber calls the attention of the railway companies to the importance of the institution of a company for the purpose of providing the public with special rolling stock for such international transportation of goods and for ensuring by proper means of supervision, the security and rapidity of said means of conveyance."

### May Exports of Track Materials

Steel rails valued at \$1,362,473, track spikes valued at \$38,108 and miscellaneous track materials valued at \$388,583 were exported during May. All of these figures are much less than similar totals for the preceding month. The largest buyers of rails during the month were Japan, China, Argentina and the Dutch East Indies. The detailed figures, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Railroad spikes		Rails of steel		Switches, frogs, splice bars, etc.
	Pounds		Tons		
France	.....	.....	.....	.....	\$1,252
Norway	.....	.....	35	\$2,800	11,808
Spain	.....	.....	.....	.....	27,926
Switzerland	.....	.....	.....	.....	70
Turkey in Europe	.....	.....	.....	.....	54
England	.....	.....	.....	.....	669
British Honduras	400	\$19	.....	.....	.....
Canada	72,834	3,762	704	33,447	17,965
Costa Rica	3,000	146	.....	.....	2,957

Total	647,614	\$38,108	23,492	\$1,362,473	\$388,583

### China Notes

Considerable construction work is going on in small jobs. Projects under construction, planned or recently completed, are shown in the accompanying map by a dotted line. Existing railways are shown by a solid line. The earthwork on the Chefoo-Weihsien railway in Shantung has been practically completed during the month as a measure of famine relief. Another measure of famine relief is the earthwork on the Tsangchow-Shihchiachung line, now under way. The western half of this route is nearly finished. Difficulties in land purchase have held up work on the eastern half. The western section was under the direction of the Peking-Hankow line and the eastern section under the Tientsin-Pukow line until about a month ago, when a separate administration was formed for the entire line. The director, Li, was formerly chief engineer of the Peking-Hankow line. On May 1, the section from Fengchen to Suiyuan was opened to traffic. The formal opening will take place June 1, but public goods have been carried on construction trains throughout May. The term Peking-Suiyuan Railway is no longer a misnomer, but may soon become so, for it is intended to continue the line west to Pao Tou Chen. Surveys for additional construction on the Canton-Hankow route

are under way, and tunnel contracts on the westerly portion of the Lung Hai line will be let shortly.

#### MINISTER OF COMMUNICATIONS OUSTED

The present conference of the "war-lords" of North China has resulted in the ousting of Yeh Kung-cho as minister of communications. Mr. Yeh took a strong stand against the use of railway revenues for any purpose outside of immediate promotion of railway interests, although he had agreed to the allocation of some \$200,000 as an emergency matter, to the payment of the arrears in the salaries of the striking teachers. The premier, however, considered that loyalty to the administration required each department to contribute all available funds to the general purposes of the government. Those familiar with the situation consider that Mr. Yeh has cleverly extricated himself from a very difficult situation. It is well known that the Anfu administration last summer "swept the bin" of all loose cash. Very heavy repayments of mortgage loans fall due this year. The rate of exchange for the repayment of such sums, and also for

A Part of China with Recent and Proposed Railway Construction Shown by Dotted Lines

the payment of interest is very adverse. And on top of it all the railways are showing decreasing revenues for the first time in their history. This is due in part to the effects of the famine, and in part to the commandeering of rolling stock by militarists. For the time being the latter is the principal reason, for it is well known that there is still more grain to be moved than the railways are able to handle under present conditions. On the other hand, during the conference at Tientsin and Peking Chang Tso-lin, Tschun of Manchuria, has kept from three to five locomotives constantly under steam awaiting his pleasure. This has continued for over a month. Hence it is likely that Mr. Yeh knew just what he was doing when he defied "the powers." He may be expected back in power within a comparatively short time, for he remains as president of Communications University, and in that position has an excellent opportunity for extending his following among the larger element. In the meantime his interests in the Ministry are being safeguarded by the appointment of Dr. C. C. Wang as director of the Railway Department. Americans will remember Dr. Wang as the man who accompanied Mr. Yeh on his trip through our more important cities. Dr. Wang's place on the Chinese Eastern Railway will be taken by C. S. Liu.

A further step in the welding of the Chinese Government lines into a unified system was taken recently in the Third General Traffic Conference, which legislated for a permanent rate and classification committee to be located in the Ministry of Communications. This committee would be charged with the responsibility of studying through traffic conditions with the special purpose of developing business. It will have charge of the editing of tariffs, interpreting doubtful constructions, and of initiating rates on new commodities. In short, it becomes the rate department of the Chinese Government railways except for purely local business.

A persistent rumor states that the Peking-Suiyuan line is trying to float a large loan for the purchase of additional rolling stock. It is more likely that the proceeds of any loan which may be floated will be used for the Pao Tou Chen extension.

## Equipment and Supplies

### Lehigh Valley Will Have 3,200 Cars Repaired

The Lehigh Valley has awarded contracts for the repair of equipment, as follows:

American Car & Foundry Company.....	1,000 box cars
Major Car Corporation.....	1,000 box cars
Buffalo Steel Car Company.....	500 steel coal cars
American Car & Foundry Company.....	500 steel coal cars
Lehigh Structural Steel Company.....	200 steel coal cars

In making the awards, figures prepared by the Lehigh Valley reveal that these contracts have been let at a saving of over \$308,000 to the company, as compared with the cost of making these repairs in its own shops. This saving is made even in the face of the recent reduction in wages and is due to the rules and working conditions affecting costs in the railroad shops with which the outside contractors do not have to contend.

### Locomotives

THE GREEN BAY & WESTERN has ordered 2 Mogul type locomotives from the American Locomotive Company.

THE ILLINOIS CENTRAL, reported in the *Railway Age* of July 9 as asking for prices on the repair of from 100 to 130 locomotives, has rejected the bids, and may make repairs to some of the locomotives in its own shops.

### Freight Cars

THE CENTRAL OF GEORGIA is having repairs made to 200 box cars, in its own shops.

THE ATLANTIC COAST LINE is having repairs made to 350 box cars, in its own shops.

THE PITTSBURGH & WEST VIRGINIA is having repairs made to 300 hopper cars at the shops of the Koppel Car Repair Company, Koppel, Pa.

### Passenger Cars

THE DELAWARE, LACKAWANNA & WESTERN is inquiring for two 70-ft. steel combination passenger and baggage cars.

### Iron and Steel

MITSUI & Co., New York, received bids on August 12, for 500 tons of splice bars, for 60-lb. rails, for the Japanese Government Railways.

THE ROBERT DOLLAR CORPORATION, 11 Moore street, New York City, has quoted prices on 17,000 tons of 85-lb. rail for the Pekin-Mukden Railway, China.

THE AMERICAN MANGANESE STEEL COMPANY, Chicago, has again made a reduction of 15 per cent in the price of manganese steel castings, of Balkwill articulated cast manganese railroad crossings.

### Signaling

THE CANADIAN NATIONAL has ordered from the General Railway Signal Company of Canada, Ltd., materials for block signaling the line between Painswick Junction and Sackville, N. B., 30 miles. This consists of 55 top-of-mast low-voltage model 2A signals, with necessary relays and other apparatus to be installed by the company's forces; also signal material for installation near Levis, Quebec, consisting of 12 top-of-mast model 2A signals, with relays, etc.

### Miscellaneous

MITSUI & Co., New York, have ordered 20, 4-wheel car trucks from the J. G. Brill Company for the Yokohama Municipal Railway.

THE CHICAGO, BURLINGTON & QUINCY will receive bids until 12 o'clock noon, August 19, for 150 rolled steel wheels for tenders and passenger cars. The company will receive bids until 12 o'clock noon, August 23, for 400 sheets of galvanized steel, grades 24 G and 26 G, and 660 sheets of tank steel.

## Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company contemplates the construction of 10 miles of second track between Florence, Kansas, and Burns, Kansas, at a total cost of approximately \$390,000.

CHICAGO, BURLINGTON & QUINCY.—This company has awarded a contract to the Heine Chimney Company, Chicago, for the construction of a reinforced concrete chimney, 150 ft. high, at Lincoln, Neb.

CHICAGO & NORTH WESTERN.—This company contemplates rebuilding a highway bridge over its tracks and yard at Proviso, Ill., which burned on August 7, with a loss of approximately \$100,000.

CHICAGO, ROCK ISLAND & PACIFIC.—This company is accepting bids for the construction of a new 10-stall roundhouse at Eldon, Mo. The company is also accepting bids for the construction of a new car repair shop at Inver Grove, Minn., with dimensions of 250 ft. by 87 ft.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has rejected all bids submitted for the construction of a new coaling station at McFarland, Kansas, and will accept new bids.

ILLINOIS CENTRAL.—This company is accepting bids for the work of widening the bridge approaching its passenger platforms at the Randolph street station, Chicago.

JACKSON & EASTERN.—This company, which was recently authorized by the Interstate Commerce Commission to construct its proposed line from Sebastopol to Jackson, Miss., a distance of approximately 60 miles, has completed surveys for this project.

KANSAS, OKLAHOMA & GULF.—This company has applied to the Interstate Commerce Commission for authority to extend its line from Baxter Springs, Kansas, to Pittsburg, a distance of 25 miles.

STATE OF NEW YORK.—The superintendent of buildings of the state of New York who was noted in the *Railway Age* of July 23 (page 104) as opening bids for the construction of a terminal freight house at Rochester, New York, and a bridge over the Hudson river at Cohoes, N. Y., has awarded a contract for the former to W. F. Martens, Rochester, N. Y., and for the latter to the Terry & Tench Company, New York City.

## Trade Publications

HEATERS.—Catalog No. 230, designed to suit the needs of all classes interested in heaters and heating, has been issued by the B. F. Sturtevant Company, Hyde Park, Boston, Mass. The first part of the book describes the construction, operation and mechanical details of Sturtevant heaters and is intended for those who are not buying this class of apparatus regularly. The latter part, which gives performance tables, diagrams and dimensions, is for the benefit of engineers, architects and steamfitters, to enable them to choose the heater necessary for any given building. Diagrams showing proper methods of making steam connections and the space occupied by heaters are also included.

CAR DUMPER.—The Wellman-Seaver-Morgan Co., Cleveland, Ohio, in its recently issued bulletin No. 63 presents a detailed description of the construction and operation of the Wellman Revolving Car Dumper which has been developed to meet the demand for a machine of low capacity adaptable to plants where first cost is a governing factor and where efficiency, low operating cost and a minimum of labor is essential. The bulletin is illustrated with photographs, assembly drawings and diagrams showing the machine in progressive stages of the dumping cycle. Diagrammatic information as to the force required to dump railroad cars of high capacities is also included.

## Supply Trade News

The Tuco Products Corporation, New York, has opened an agency at Spokane, Wash., in charge of L. J. McNally.

The Q & C Company of New York, Chicago and St. Louis are now the exclusive agents in the railroad field for Century steel fence posts as manufactured by the Funk Brothers Manufacturing Company, Chicago Heights, Ill.

William S. Murray, formerly chairman of the Superpower Survey, and Henry Flood, Jr., formerly engineer secretary of the Superpower Survey, have formed the firm of Murray & Flood, Grand Central Terminal, New York.

E. A. Woodworth, formerly with the Imperial Belting Company, Chicago, as railroad representative, has left the service of that company to take charge of the southwestern territory for the United States Metallic Packing Company, Philadelphia, Pa., with headquarters in Chicago.

Edward B. Germain, general manager of the Harlan plant, Bethlehem Shipbuilding Corporation, Wilmington, Del., has been appointed manager of sales of the corporation, with office at 111 Broadway, New York. Mr. Germain went to Wilmington in December, 1918, from Elizabeth, N. J., where he held the position of general manager of the Moore plant of the same corporation. Cecil W. Weaver, formerly general superintendent of the marine department succeeds Mr. Germain. The Harlan plant, besides its shipbuilding and ship repair facilities has extensive passenger shops with a capacity of 250 steel passenger coaches a year.

## American Locomotive Shows Good

### Earnings for First Six Months

The American Locomotive Company in the six months ending June 30, 1921, according to the semi-annual report issued early this week, earned a profit available for dividends of \$3,901,043, as compared with \$4,333,927 in the preceding six months ending December 31, 1920. The profit was equivalent to \$12.10 per share on the common stock, after providing for the regular \$3.50 semi-annual dividend requirements on the preferred stock. The gross for the six months ending June 30, 1921, was \$45,114,934. The surplus for the six months, after the payment of dividends, totaled \$2,276,043, compared with \$708,927 for the preceding six months, but the latter figure was after the deduction of \$2,000,000 for reserve for additions and betterments.

In his remarks to stockholders, President Andrew Fletcher says, in part:

The inventory account of materials and supplies on hand and work in progress on June 30, 1921, amounted to \$6,555,331 in comparison with \$15,119,342 as of December 31, 1920.

The total current assets of the company on June 30, 1921, were \$46,666,883 and total current liabilities \$6,838,401; the excess of current assets over current liabilities being \$39,828,482, after providing in current liabilities a reserve of \$2,870,033 to provide for shrinkage and value of notes and bills receivable, discount on Canadian funds and other contingencies and a reserve of \$3,011,367 for United States and Canadian income and profit taxes.

On June 30, 1921 the company had no loans payable and had in its treasury on that date among other securities \$10,750,000 of United States treasury certificates of indebtedness and \$2,000,000 of New York City 6 per cent corporate stock and tax notes.

During the six months ended June 30, 1921, there was expended for additions and betterments to the plants \$564,655, which has been charged to the reserves created from surplus of previous years. There has been no money spent on the proposed new plant in the St. Louis district other than the cost of the land and it is the present intention of the company to withhold active development of that property until general business requirements of the company warrant it.

The total unfilled orders for new locomotives, reconditioning of old locomotives and miscellaneous work on June 30, 1921, was \$4,595,958, of which domestic business was 16.5 per cent and foreign business 83.5 per cent, the foreign business being mostly for Japan, China, and South Africa.

It is difficult to forecast the future business of this company for the next six to twelve months. At the present time there are but few inquiries for new locomotives either for domestic or foreign use, but there is encouragement in the fact that the administration of our government is working on the many difficult problems affecting the prosperity of the country and we are hopeful that the railroad and transportation matters, so vital and far-reaching in effect on the general business of the country and particularly

to the business of the equipment companies, will be adjusted in the near future on a sound business basis.

The condensed income account for the six months was as follows:

	Six months to June 30, 1921	Six months to Dec. 31, 1920
Gross earnings.....	\$25,989,781	\$45,114,934
Manufacturing, maintenance and administrative expenses and depreciation.....	21,390,554	39,409,404
Gross profit.....	\$4,599,227	\$5,705,530
Interest on bonds of constituent companies, etc.....	43,184	45,036
Net profit.....	\$4,556,043	\$5,660,494
Deduct for United States and Canadian income and profits taxes.....	655,000	1,326,567
Available profit.....	\$3,901,043	\$4,333,927
Dividends on preferred stock.....	875,000	875,000
Dividends on common stock.....	750,000	750,000
	\$2,276,043	\$2,708,927
Reserve for additions and betterments.....		2,000,000
Surplus .....	\$2,276,043	\$708,927

## Obituary

**Thomas Madill**, who served for many years in the sales department of the Sherwin-Williams Company, Cleveland, O., died in Los Angeles, Cal., on July 23. He spent practically his entire business life with The Sherwin-Williams Company in its railway trade.

**Henry Carr Ferris**, president of the Railway & Mine Supply Corporation, El Paso, Texas, died in that city on July 25. Mr. Ferris was born in Sandusky, Ohio, March 1, 1865, and graduated from Stevens Institute of Technology in the class of 1888, with the degree of mechanical engineer. The following year he began railroad work with the Toledo & Ohio Central, serving as resident engineer and engineer of maintenance until April, 1902. He subsequently served consecutively as assistant superintendent and superintendent on the Union Pacific, vice-president and general manager of the Pittsburgh, Binghamton & Eastern and as general manager of the Chihuahua & Pacific, now the Mexico Northwestern. In February, 1915, he was appointed receiver of the Missouri, Oklahoma & Gulf. In 1919, when that road was under federal control he served as an official of the Railroad Administration and in February, 1920, was elected vice-president and general manager of the reorganized company, the Kansas, Oklahoma & Gulf, resigning from that position on September 1, 1920, to engage in private business at El Paso, Texas.

**Charles Haines Williams**, first vice-president of the Chicago Railway Equipment Company, died at Chicago on the morning of August 8. Mr. Williams was born in Baltimore, Md., on April 1, 1875, and was educated in the public schools of Baltimore and at the Baltimore Polytechnic Institute, from which institution he graduated in 1893. He later took a special course in mechanical drawing and machine design in the Maryland Institute. After four years as a special apprentice in the Mount Clare shops of the Baltimore & Ohio, where he worked in the machine and locomotive shops, the erecting shop and in the foundry, drafting room and test department, Mr. Williams, on July 6, 1897, left the Baltimore & Ohio to become connected with the Chicago Railway Equipment Company, as mechanical inspector. In 1917, he was elected first vice-president of the company and a director, which positions he occupied at the time of his death.

**W. S. Throop**, CLAIMS ATTORNEY of the Erie Railroad, in an address to locomotive engineers, suggests that where they see a highway traveler approaching a crossing without any apparent indication of stopping, and at excessive speed, the engineer should, in addition to the usual crossing signals, sound a series of short blasts. If the wayfarer pays attention, his life may be saved; and if he persists in his efforts to get over the crossing ahead of the train, the succession of short whistle-blasts will attract the attention of any persons within hearing, and thus may enable the railroad to put up a better defense, in case a lawsuit should follow. Mr. Throop calls attention to the fact that outside witnesses usually tell conflicting stories as to whether the engineer did or did not sound the whistle.

## Railway Financial News

**CANADIAN PACIFIC.—Declares Regular Dividend.**—This company has declared the regular quarterly dividend of  $2\frac{1}{2}$  per cent on common stock and the usual semi-annual dividend of 2 per cent on the preferred stock, both payable October 1 to stock of record September 1.

**CENTRAL VERMONT.—Loan Approved.**—The Interstate Commerce Commission has approved the granting of a loan to this company of \$65,000 for three years, for the purpose of retiring certain equipment notes.

**CHARLES CITY WESTERN.—Authorized to Issue Bonds.**—This company has been granted authority by the Interstate Commerce Commission to issue \$10,400 of 10-year, 6 per cent, first mortgage notes to be dated July 1, 1921, and to be sold at not less than par. This approval is supplementary to authority granted to the company on July 8 to issue \$373,600 of these bonds, making the total to be issued \$384,000.

**CHICAGO, ROCK ISLAND & PACIFIC.—Authorized to Pledge Bonds.**—This company has been authorized by the Interstate Commerce Commission to pledge and repledge from time to time all or any part of \$8,364,000 of first and refunding mortgage gold bonds, now pledged without the authorization of the commission, as collateral security for outstanding shot term notes or for any short term notes which may be issued.

**DENVER & RIO GRANDE.—Bond Interest Not to Be Paid.**—The semi-annual interest amounting to about \$350,000 on the Denver & Rio Grande adjustment, 7 per cent bonds, due October 1, will not be paid, according to an announcement made August 9. The interest is payable, if earned during the period of January 1 to June 30. The principal reason for not paying the interest is understood to have been the Pueblo flood in which the road suffered damage estimated at about \$1,500,000.

The Wall Street Journal says:

With the announcement that the earnings did not warrant the adjustment interest payment it became known that there was another reason why no action could be taken on it. To allow the payment, sanction of the board would be necessary and this is not possible inasmuch as there is no longer a quorum of the old Denver board. Of the eleven original members six have resigned time to time in the past year or so. This, together with the essential fact that the earnings did not cover the interest, led to the announcement of deferment made by an official on behalf of the five remaining board members.

**FLINT BELT RAILROAD.—Authorized to Construct New Line.**—The Interstate Commerce Commission has granted this company a certificate of public convenience and necessity authorizing the construction and operation of a line of railroad in Genesee County, Michigan. The company proposes to build a road  $8\frac{1}{4}$  miles in length, establishing a belt line around the congested district of the city of Flint, Mich. The company expects to complete and to put in operation about  $5\frac{1}{4}$  miles this year and to have the line in complete operation before July 1, 1924.

The commission has further issued an order permitting the company to retain all excess earnings for a period of ten years ending July 1, 1934, as provided in section 15a of the Interstate Commerce Act.

**Authorized to Issue Stock.**—The company has also been granted authority by the commission to sell for cash, at par, \$1,000,000 of capital stock, the proceeds to be used for the construction and equipping of the line. The cost of the line is estimated at \$1,002,411, excluding right-of-way, substantially all of the land having been obtained by donation.

**INTERNATIONAL & GREAT NORTHERN.—Asks Authority to Issue Notes.**—James A. Baker, receiver, has asked authority from the Interstate Commerce Commission to issue 24 notes aggregating \$194,300, exclusive of interest, payable one each month, after date, in part payment for locomotive equipment, the purchase price of which is \$388,600, purchased from the Baldwin Locomotive Works.

**LEAVENWORTH & TOPEKA.—Granted Authority to Issue Bonds.**—The Interstate Commerce Commission granted authority to this company to issue at par \$80,000 of first mortgage 7 per cent bonds, of which \$57,000 are to be delivered to certain persons in

part payment for equitable or contingent interests held by them in the line operated by the applicant; \$3,000 to be sold to reimburse its treasury for a like amount expended in cash in part payment for such equitable or contingent interest, and \$20,000 to be deposited with the Central Trust Company, of Topeka, Kan., for the purpose of creating a sinking fund required by the state laws of Kansas.

**Asks Authority to Increase Capital Stock.**—This company has asked the Interstate Commerce Commission for approval of an increase in its capital stock from \$100,000 to \$152,175. The increase is for the purpose of exchanging the stock of the applicant for \$50,000 of the aid bonds of the Leavenworth & Topeka Railroad Aid Benefit District of Jefferson County, Kan., to aid in the construction, operation and maintenance of its line. The company has also asked authority to renew \$43,274 of short-term notes.

**LOUISVILLE & NASHVILLE.**—**Asks Authority to Issue Stock.**—The Louisville & Nashville has asked authority from the Interstate Commerce Commission to issue \$53,000,000 of capital stock for distribution as a stock dividend pro rata among its stockholders. The applicant also asks authority to execute and deliver its first and refunding mortgage to secure divers series of bonds, to issue Series A of these bonds aggregating \$28,615,000 and to sell \$12,753,000 of this amount outright to J. P. Morgan & Co. at not less than 94½ net to the applicant and to hold the balance in its treasury for future disposition. The bonds to be issued and sold are to bear interest at 6 per cent, payable semi-annually, to mature April 1, 2003, and to be redeemable at the option of the Louisville & Nashville, October 1, 1936, or on any interest date thereafter at 102 per cent of the face amount, together with accrued interest.

The execution of the first and refunding mortgage and the issuance of various series of bonds is for the purpose of reimbursing the applicant's treasury for the refunding of various funded debts and for meeting other present and future financial needs of the company. The company states that a great part of its earnings, which might have been paid to the stockholders in cash, has been used to improve and enlarge its property. The applicant states that \$53,000,000 was determined upon as the amount of the increase because it was decided that the total authorized capital stock of the company should be not less than \$125,000,000, and it is stated that the company's investment of earnings in property has been far in excess of the proposed issue.

As to the mortgage and bond issue the management of the carrier reached the conclusion, according to the application to the Interstate Commerce Commission, that it was essential that some plan be devised at once for the making of one large mortgage through which the company's existing mortgage debts could be refunded as they matured and which would provide for other financial needs of the company.

**MIDLAND VALLEY.**—**Asks Authority to Issue Bonds.**—This company has asked authority from the Interstate Commerce Commission to issue \$363,000 of first mortgage, 5 per cent bonds to reimburse it in part for expenditures from current income on additions and betterments.

**NEW YORK CENTRAL.**—**Authorized to Issue Bonds.**—The New York Central has been granted authority by the Interstate Commerce Commission to issue \$4,425,000 of 4 per cent consolidation mortgage bonds in exchange, par for par, for a like amount of New York Central & Hudson River Railroad Company's 3½ per cent Lake Shore collateral bonds.

**READING COMPANY.**—**Common Stockholders' Committee Granted Right to Appeal.**—Judge Thompson on August 4 granted to the committee of the common stockholders, of which Seward Prosser is chairman, the right to appeal to the United States Supreme Court from the decision of the district court relative to the segregation of the coal and railroad properties in which decision it was held that the common and preferred stockholders had equal rights of participation in the segregation.

**TERMINAL RAILROAD ASSOCIATION OF ST. LOUIS.**—**Asks Authority to Pledge Securities.**—The Terminal Railroad Association of St. Louis has asked authority from the Interstate Commerce Commission to pledge \$439,000 par value, general mortgage, 4 per cent bonds with the Secretary of the Treasury in lieu of \$285,000 now held as collateral security for the performance of the applicant's contract under Section 209 of the Transportation

Act in connection with advances thereunder, to save the applicant the premium it now pays for the surety bonds.

## Guaranty Certificates Issued

The Interstate Commerce Commission has certified partial payments of guaranty to the following roads:

Franklin & Pittsylvania.....	\$30,000
Live Oak, Perry & Gulf.....	10,000
Savannah & Statesboro.....	2,500

The Interstate Commerce Commission has certified to the Treasury partial payment of guaranty as reimbursement for deficits during Federal control to the following roads:

Butler County.....	\$50,000
Moshassuck Valley.....	15,000
Mt. Jewett, Kinross & Ritersville.....	10,131
St. Louis-San Francisco.....	500,000

## Tentative Valuations

The Interstate Commerce Commission has announced the tentative valuation of the used property of the Bangor & Aroostook, Northern Maine Seaport Railroad and the Van Buren Bridge Company, as of 1916, as \$25,350,084. The tentative valuation of the used property of the Seaport Railroad is \$3,850,000, and of the Van Buren Bridge Company, \$77,500, which is included in the foregoing total.

The Interstate Commerce Commission has also announced supplemental tentative valuations of the used property of the following carriers:

Clarendon & Pittsford.....	1917	\$490,212
Kankakee & Seneca.....	1915	825,645
Muncie, Belt.....	1915	62,654
Roscoe, Snyder & Pacific.....	1916	558,393

## Treasury Payments from Revolving Fund

The Treasury announced the payment of loans from the revolving fund to the following carriers:

Akron, Canton & Youngstown.....	\$212,000
Chesapeake & Ohio.....	2,669,000
Seaboard Air Line.....	293,500

The Treasury also announced partial payments of guaranty to the following roads:

Alabama Northern.....	\$3,000
Bristol.....	3,000
Butler County.....	50,000
Georgia Northern.....	1,500
Kentwood & Eastern.....	64,000
Midland Valley.....	63,000
Moshassuck Valley.....	15,000
Penn Yan & Lake Shore receiver.....	15,000
Railway Transfer Company of the City of Minneapolis.....	65,000
St. Louis-San Francisco.....	500,000
Ursina & North Fork.....	20,000

## Dividends Declared

Canadian Pacific.—Common 2½ per cent, quarterly, and preferred, 2 per cent semi-annually, payable October 1 to stockholders of record September 1.

# Annual Report

## Chicago, Burlington & Quincy R. R. Co.—Sixty-seventh Annual Report

Chicago, January 1, 1921.

To the Stockholders of the Chicago, Burlington & Quincy Railroad Company:

Federal control of this Company's transportation system ended on February 29, 1920.

The annual compensation for its use, as provided by the contract of October 8, 1918, between the Director General and this Company was as follows:

Chicago, Burlington & Quincy Railroad Company..... \$33,360,683.11  
Quincy, Omaha & Kansas City Railroad Company..... 29,396.50  
\$33,390,079.61

The compensation which will be allowed for the months of January and February, 1920, is understood to be 60/366 of the annual compensation.

These figures are based on the average railway operating income of the Company for the three year period July 1, 1914, to June 30, 1917, inclusive. They are subject to a revision (not yet completed) by the Interstate Commerce Commission.

The following statement cannot be accepted as a final showing of the income of the Corporation for the year 1920. The final figures will not be known until complete settlements are reached of the Company's claims against the Railroad Administration and for the Guaranty Period under the Transportation Act, 1920.

The Interstate Commerce Commission in its annual report of carriers has called for a table designed to show the income separately for the two months of Federal control, six months of the Guaranty Period and four months of the Corporate Period, and that table is given on pages 28 and 29 of this report.

Beginning with the Guaranty Period, this Company adopted the plan, authorized in the Interstate Commerce Commission's classifications of accounts, of keeping its accounts strictly on the basis of accruals. This change affected but slightly the Corporate Income for the year as payment made subsequent to the end of Federal control on February 29, 1920, but attaching to transactions had during Federal Control Period, were charged or credited to the account of the Director General.

### COMPARATIVE STATEMENT OF CORPORATE INCOME, YEARS ENDED DECEMBER 31

1920	1919
\$5,560,113.85†	Standard return..... \$33,360,683.11

### CAPITAL STOCK AND FUNDED DEBT

On December 31, 1919, the Capitalization outstanding in the hands of the public was:	
Capital Stock.....	\$110,839,100.00
Funded Debt.....	168,050,000.00
Total.....	\$278,889,100.00

During the year 1920 the following changes were made thereto:

By the issuance of Gold Notes for equipment acquired from allocation by the United States Railroad Administration last note maturing Jan. 15, 1935.....	\$6,060,000.00
By the purchase of Sinking Fund Bonds, 1921 (Denver Extension).....	3,000.00
By the purchase of Sinking Fund Bonds, 1922 (Denver Extension).....	68,700.00
Total Addition.....	\$5,988,300.00
And the outstanding on December 31, 1920, was:	
Capital Stock.....	\$110,839,100.00
Funded Debt.....	174,038,300.00
Total.....	\$284,877,400.00

On November 3, 1920, an application was made to the Interstate Commerce Commission for authority to issue additional Capital Stock to the amount of \$60,000,000. This application has been granted and arrangements made to make the issue early in 1921.

During the year the Sinking Fund 4s of 1921 were paid off and the Denver Extension bonds of 1922 were all retired excepting an outstanding balance of \$10,300, which have not yet been presented and for which funds have been deposited with the Trustee and the mortgage released.

### GENERAL OPERATIONS

Revenues:	
Total Operating Revenues for 1920.....	\$186,872,918.07
Total Operating Revenues for 1919.....	154,011,437.62
Increase.....	\$32,861,480.45 or 21.34%
This increase was distributed as follows:	
Freight Revenues.....	\$24,626,944.77—23.01%
Passenger Revenues.....	1,122,980.62—3.18%
Mail Revenues.....	4,074,813.76—165.48%
Miscellaneous Transportation Revenues.....	2,128,594.82—36.61%
Incidental Operating Revenues.....	908,146.48—29.94%
Total.....	\$32,861,480.45—21.34%

The relative tonnage of commodities as compared with year 1919, was, in: Farm products increased..... 28,663 tons—0.34%  
Animal products decreased..... 346,867 tons—10.35%  
Mine products increased..... 6,171,743 tons—42.80%  
Forest products decreased..... 14,373 tons—0.47%  
Manufactured products increased..... 1,115,458 tons—13.15%  
Total carload shipments increased..... 6,954,624 tons—18.39%  
Total L. C. L. shipments increased..... 42,305 tons—1.78%

The tonnage handled in 1919 was restricted by reason of the general business depression which followed the close of the war and the coal strike in the latter part of the year. In comparing with 1918 the revenue tons decreased 31,160 or .066 per cent.

The decrease in tonnage of animal products was due partly to the extreme dry weather on the northwestern lines in 1919, which increased live stock shipments for feeding during that year.

The increase in tonnage of mine products was due to the coal strike in 1919, during which year the decrease in tonnage of bituminous coal as compared with 1918, was 5,730,768 tons. This tonnage carried in 1920 was less than that of 1918 by 721,588, or 4.14 per cent.

Expenditures (Operating)—	
The increase in Operating Expenses was distributed:	
Maintenance of Way and Structures.....	\$8,775,458.42—40.84%
Maintenance of Equipment.....	9,944,573.27—30.67%
Traffic Expense.....	687,859.44—64.62%
Transportation Expense.....	19,657,867.77—32.67%
Miscellaneous Operations.....	509,981.98—28.04%
General Expense.....	1,007,196.09—24.07%
Total Operating Expenses, 1920.....	161,304,686.05
Total Operating Expenses, 1919.....	120,777,801.16
Increase.....	\$40,526,884.89—33.55%

Operating Ratio, 1920.....	86.32%
Operating Ratio, 1919.....	78.42%

Increase.....	7.90%
Operating expenses per revenue train mile, 1920.....	4.13
Operating expenses per revenue train mile, 1919.....	3.35
Increase.....	\$0.78—23.28%

The total payroll increased.....	\$28,920,520.04—37.83%
The total material expense (excluding fuel).....	9,554,628.14—39.77%
The total fuel expense increased.....	5,579,854.99—40.58%

Expenditures (Capital)—	
Expenditures during the year were:	
For Road.....	\$8,516,660.45
For Equipment.....	6,176,944.81
For General.....	43,851.09
Total.....	\$14,737,456.35

Capital Expenditures generally have been directed toward the improvement of existing property, particularly locomotive shops and terminals, yards and station facilities and primarily for increasing efficiency and economy of operation.

There have been few new main lines or extensions built during the year. Substantial progress has been made by the Chicago Union Station Company upon the new Union Station and Terminal project, with consideration of prevailing conditions; the work during the year embracing the completion of the viaducts at Harrison, Taylor and Randolph streets, and progress upon the viaducts at Polk and Canal streets; and Roosevelt Road, and upon the concrete dock wall along the south branch of the Chicago River.

Progress has been made upon the work of rebuilding freight facilities at Harrison and Canal streets made necessary because of the Chicago Union Station project, this work embracing foundations, sewers and track

rearrangements resulting in total expenditures for the year of \$489,078.25, bringing the total cost to date to \$2,173,051.00.

Plans have been completed and approved by the Postmaster General for the new building for handling railway mail to be built in the vicinity of the Union Station, and construction will be undertaken early in 1921.

The elevation of tracks and revision of grades through the City of Aurora, Ill., was continued, and that portion lying west of Broadway was completed. This work embraces the change of alignment of main tracks and the construction of new subways, involving an expenditure for the year of \$388,421.61, bringing the total expenditure to date to \$2,312,961.55.

Additional engine terminal facilities have been constructed at Galesburg, Ill., embracing a 16-stall roundhouse with coal, water and cinder handling facilities. The expenditure for this project amounted to \$163,257.93. This improvement was necessary and will greatly facilitate the handling of power at this important point.

New locomotive facilities at Pacific Junction were constructed, consisting of one 6-stall roundhouse with coal, water and cinder handling facilities, involving an expenditure of \$82,945.99. This likewise was much needed improvement for the purpose of facilitating the handling power.

Locomotive terminal facilities at Denver, Colo., were improved during the year by the installation of improved power plant and coal and water facilities, involving an expenditure of \$67,240.66. There has also been acquired for the purpose of developing a locomotive repair shop, a tract of land of ample size and conveniently located for this purpose.

The construction of second track on the Hardward and St. Joseph Divisions which had been temporarily suspended in 1919, was continued during the year, involving a total expenditure of \$389,255.64. This embraced the completion of six miles of line between Ayres, Ill., and Durley, Ill., and eleven miles between Waldron, Mo., and Beverly, Mo.

The customary program of substituting permanent construction for temporary bridges was continued. An important item of this program was the completion of the Platte River Bridge at North Platte, Neb., placed in service in August, and involving an expenditure during the year of \$22,418.46, bringing the total expenditure for this project to \$294,050.85.

The program of applying automatic block signals to important traffic routes for safety and efficiency of operation was continued during the year. There was undertaken the construction of 300 miles of such signals on the Aurora and Lincoln Divisions. There were placed in operation during the year, 97 miles, and the remainder will be completed early in 1921.

The expenditures for the year were \$448,552.02. The program of laying 90 and 100 pound rail in main line was continued during the year. There were applied a total of 340 miles of new rail and 206 miles of second hand rail, the latter being upon less important lines.

Arrangements were made during the year for the purchase and construction of the following equipment:

15 Switch engines. 31 Freight engines. 500 Stock cars. Substantial deliveries were made upon these undertakings during the year.

Industrial—There were constructed and extended during the year industrial tracks as follows:

	New Tracks	Extensions
On Lines East.....	32	16
On Lines West.....	17	4
<b>Total New Tracks.....</b>	<b>49</b>	<b>20</b>

Industrial activity was not up to normal on account of the reaction following the close of the war, but a number of substantial and important industries have been located. Among the important developments in this

connection were the completion of three beet spurs in the North Platte Valley to serve two new sugar factories, one which has been completed at Mitchell, Neb., and another at Minatare, Neb., not yet completed. These facilities serve a district developing an increased beet acreage in 1920 over 1919 of approximately 10,500 acres.

During the year the oil receipts at refineries served, amounted to 6,673 carloads, and outbound shipments therefrom amounted to 40,908 carloads. The bulk of the inbound oil was transported by pipe lines. In addition, there was a movement of crude oil not banded at refineries, of 521 carloads, making a grand total movement of oil originating in Wyoming of 41,429 carloads. The production of crude oil within the state is constantly increasing, and large additions to important refineries are now under way. A continued growth of this class of tonnage may be anticipated.

There were 3,549 early of immigrants' effects received on the McCook, Alliance, Sterling, Sheridan and Casper Divisions, and a total of 5,692 families located. There were 2,222,389 acres of land homesteaded in Wyoming, and this should cause several thousand new families to come into that state. In addition there were about 10,000 acres of irrigated homesteads taken up divided equally between the Shoshone and North Platte projects which should mean an influx of approximately 150 new families.

#### Agricultural—

Two special agricultural exhibit cars were operated during the year on Lines West; one during March to stimulate increase in acreage and to improve the quality of the potato crop; and another during the fall to stimulate better farming in the semi-arid districts. This effort aroused a great deal of interest, about four thousand farmers inspecting the potato car, and 270 farmers were supplied with certified seed from the car. In field tests this seed proved superior to the native seed.

About 450,000 pounds of improved seed potatoes were purchased through exchange bulletins. The potato acreage was increased about 15 per cent above last year. A poster calling attention to the necessity of providing storage for potatoes and grain resulted in the construction of twenty-five potato storage cellars.

On the "better farming" car, attention was given to the importance of crop rotations for dry lands, adapted seeds, dairying and silos and greater diversification and safer lines of farming. One hundred and thirteen towns were visited, with a total attendance of about 14,000 farmers.

A large number of farmers' meetings have been attended. Several thousand copies of special posters and bulletins have been issued on potato growing, storage, preventing losses in handling potatoes, farm feeds, silos and dairying. Three hundred thousand pounds of miscellaneous seeds, and thirty-nine carloads of cotton cake, corn, hay and alfalfa feeds have been transferred through the marketing service. Three carloads of dairy cows were purchased and shipped to Wyoming farmers. A market was found for four carloads of seed potatoes.

There has been a steady growth in the population and the number of farms in the western territory. Personal letters and advertising booklets were sent to 2,138 persons who inquired for land. These inquiries were a continuation from the year previous, as no colonization advertising was done during the past year. Land values were advanced from 50 to 150 per cent.

There has been a steady increase in the dairy industry in spite of the enormous increase in grain production resulting from the high prices.

Substantial progress has been made in the matter of final settlements with the United States Railroad Administration of matters growing out of Federal control.

By order of the Board of Directors.

HALE HOLDEN,  
President.

### GENERAL BALANCE SHEET

December 31, 1920

## Railway Officers

### Executive

**Samuel M. Russell**, general superintendent of the Toledo, Peoria & Western, with headquarters at Peoria, Ill., has been appointed receiver with the same headquarters, effective August 3, succeeding E. N. Armstrong, deceased. Mr. Russell was born at Bedford, Pa., and was educated at the Sheffield Scientific School of Yale University. He entered railroad service in 1889 as a rodman in the engineering corps of the Pennsylvania lines west of Pittsburgh, and was employed in this work during summer vacations until 1892. On the latter date he was employed on construction work in the engineering department of the Pennsylvania, and two years later was transferred to the freight department at Canton, Ohio. In 1894 and 1895 he served at Canton and in the office of the auditor of freight receipts at Pittsburgh, Pa. In 1895 he was appointed engineer in the maintenance of way department, where he served until December, 1899, when he was promoted to assistant engineer maintenance of way. A year later he was promoted to engineer maintenance of way of the Pennsylvania lines west of Pittsburgh. Mr. Russell entered the service of the Toledo, Peoria & Western in February, 1904, as engineer maintenance of way. He was appointed superintendent a few months later and served in that position until December, 1916, when he was promoted to general superintendent, in which position he was serving at the time of his recent appointment.

S. M. Russell

### Financial, Legal and Accounting

**G. B. Matthews, Jr.**, has been appointed car accountant of the Columbus & Greenville, with headquarters at St. Louis, Missouri, effective August 1. Mr. Matthews succeeds R. B. McAlpin.

**W. J. Bingham**, auditor of through passenger traffic of the Pennsylvania with headquarters at Philadelphia, has retired from active railroad service after 52 years in the service of the company.

**F. G. Middleton**, assistant auditor of the Indiana Harbor Belt with headquarters at Gibson, Indiana, has been appointed auditor of disbursements with the same headquarters. **C. K. Thomas** has been appointed auditor of freight accounts with headquarters at Gibson.

**A. B. Bierck**, assistant secretary of the Philadelphia & Reading, has been appointed comptroller with headquarters at Philadelphia, succeeding **G. H. Parker** who has been appointed general auditor. **W. K. Bean** has been appointed assistant auditor of disbursements. Mr. Bierck will in addition to his new duties retain his former positions as vice president of the Reading Company and assistant secretary of the Philadelphia & Reading.

### Operating

**G. W. Todhunter**, general yardmaster of the Southern Pacific with headquarters at Fresno, California, has been pro-

moted to the position of terminal trainmaster with the same headquarters. **H. A. Kuehn** succeeds Mr. Todhunter as general yardmaster.

**Ernesto O. Y. Llano**, superintendent of the Nacozari Railroad, with headquarters at Sonora, Mexico, has been appointed general manager of the National Railways of Mexico with headquarters at Mexico City.

**R. H. Johnson**, general manager and purchasing agent of the Peoria & Pekin Union, with headquarters at Peoria, Ill., has resigned and the purchasing department has been placed under the jurisdiction of the president's office.

**L. K. Owen**, superintendent of dining cars of the Spokane, Portland & Seattle with headquarters at Portland, Oregon, has been appointed superintendent of dining cars of the Northern Pacific with headquarters at St. Paul, Minnesota, effective August 15, succeeding **G. W. Nelson**, assigned to other duties.

### Traffic

**P. C. McCormick** has been appointed commercial agent of the Baltimore & Ohio, with headquarters at Chicago.

**H. E. Heal** has been appointed Canadian passenger agent of the Pennsylvania, with headquarters at Toronto, Ont.

**W. S. Farnsworth** has been appointed general agent of the Gulf, Colorado & Santa Fe with headquarters at Mexico City, Mexico.

**L. F. Daspit**, traffic manager of the Shreveport, La., Chamber of Commerce, has been appointed assistant general freight agent of the Southern Pacific, Texas and Louisiana lines, with headquarters at Houston, Tex.

**H. M. Jouver**, acting general freight and passenger agent of the Baltimore & Ohio with headquarters at Chicago, has been appointed general freight and passenger agent with the same headquarters, effective August 1.

**J. O. Gill**, has been appointed district freight agent of the Gulf, Mobile & Northern, with headquarters at Memphis, Tennessee, effective August 3. Mr. Gill succeeds **W. H. Askew**, who has been transferred to Kansas City, Missouri.

**C. W. Getty**, special representative, passenger department, of the Pennsylvania with headquarters at Chicago, has been promoted to assistant general passenger agent with the same headquarters, effective August 1, succeeding **W. R. McFarland**, resigned.

**F. A. Edmonson**, formerly commercial agent of the St. Louis-San Francisco, with headquarters at Cincinnati, Ohio, has re-entered railroad service and has been appointed general agent of the same company, with headquarters at New Orleans, La.

**W. M. Brooks**, foreign freight agent of the Atlanta, Birmingham & Atlantic, with headquarters at Atlanta, Ga., has been appointed commercial agent, with headquarters at Cincinnati, Ohio, succeeding **J. J. McCarty**, resigned, and the office of foreign freight agent has been abolished.

**G. F. Kay**, freight traffic representative of the Southern, with headquarters at Dallas, Tex., has been promoted to commercial agent, with the same headquarters, effective August 1, succeeding **C. M. Agnew**, deceased. **H. B. Coogan**, freight traffic representative, with headquarters at Memphis, Tenn., succeeds Mr. Kay.

**A. C. Irons**, formerly general passenger agent of the Chicago Great Western, with headquarters at Chicago, who was incorrectly reported in the *Railway Age* of July 16 (page 144), as having become associated with the D. H. Howland Sugar Company, has become a member of the firm of **F. C. Van Ness & Son**, with headquarters at Toledo, Ohio, instead.

**E. S. Manchester**, traffic representative of the New York, Chicago & St. Louis, with headquarters at Buffalo, N. Y.,

has been promoted to division freight agent, with headquarters at Erie, Pa. **G. B. Merrill**, freight representative, with headquarters at Erie, has been appointed traffic representative with headquarters at Buffalo, succeeding Mr. Manchester. **J. V. Jamieson** succeeds Mr. Merrill. The promotions and appointments were effective August 1.

**E. C. Marks**, traveling freight agent of the Louisville & Nashville, with headquarters at New Orleans, La., has been promoted to commercial agent, with the same headquarters. **J. E. Power**, city freight service agent, with headquarters at New Orleans, Louisiana, succeeds Mr. Marks. **G. W. Kingsmill** succeeds Mr. Power. The promotions were effective August 1.

**A. S. Collins** has been appointed commercial agent of the Chicago, Rock Island & Pacific with headquarters at St. Paul, Minn., succeeding **J. B. Rayn** who has been promoted to division freight agent with headquarters at Des Moines, Ia. Mr. Rayn succeeds **W. S. Williams** who has been transferred as division freight agent to Estherville, Ia., succeeding **M. M. Knapp**, retired. These changes were effective August 6.

**C. T. Mackenson, Jr.**, has been appointed assistant general freight agent of the Central region of the Pennsylvania with headquarters at Pittsburgh, Pa. Mr. Mackenson was born at Harrisburg, Pa., on June 16, 1886, and was educated in the public schools of that city. He entered railway service on April 7, 1903, in the office of the general freight agent of the Cumberland Valley and became chief clerk to the general freight agent of that company on June 1, 1910. He entered the service of the Pennsylvania as chief clerk to the division freight agent at Philadelphia on August 1, 1912. On July 1, 1914, Mr. Mackenson became chief rate clerk in the general freight department of the company and on December 1, 1916, was appointed division freight agent at Altoona, Pa. On November 26, 1917, he entered military service and returned on May 1, 1919, as division freight agent at Uniontown, Pa., and was transferred to Pittsburgh in a similar capacity in September of that year. He was serving in this position on August 1, when his appointment to his new position became effective.

**Claude W. Getty**, special representative passenger department of the Pennsylvania, with headquarters at Chicago, has been promoted to assistant general passenger agent, with the same headquarters, effective August 1. Mr. Getty was born at Norristown, Pa., on January 12, 1890, and was educated at the University of Pennsylvania. He entered railroad service on June 20, 1907, with the Pennsylvania at Philadelphia, Pa., and after 4 years' service in various positions in the operating and transportation departments, he was transferred to the passenger department of the general offices at Philadelphia. He served in various capacities in that department until November 1, 1917, when he was made chief clerk to the passenger traffic manager. When the Northwestern region of the Pennsylvania was created on March 1, 1920, Mr. Getty was transferred to the passenger department at Chicago, as special representative, with special assignment to the developing of dining car service of the lines west of Pittsburgh. He was serving in this position at the time of his recent promotion.

Appointments and promotions in the traffic department of the Pennsylvania have been made effective August 1 as follows: **C. T. Mackenson**, division freight agent, Central region, with headquarters at Pittsburgh, has been promoted to assistant general freight agent, Central region, with the same headquarters, succeeding **R. E. Cook**, resigned. **H. H. Gray**, division freight agent, Central region, with headquarters at Pittsburgh, with jurisdiction over the Lines West has been transferred to the Lines East, succeeding Mr. Mackenson. **F. X. Quinn**, division freight agent, Central region with headquarters at Buffalo, N. Y., has been transferred to Pittsburgh, succeeding Mr. Gray. **S. T. Stackpole** succeeds Mr. Quinn. **E. S. Neilson**, division freight and passenger agent, Eastern region, with headquarters at Chambersburg, Pa., has been appointed division freight agent with headquarters at Baltimore, Md., succeeding Mr. Stackpole. **F. W. Nash**, division freight agent, Central region, with headquarters at Columbus,

O., succeeds Mr. Neilson. **W. R. Cox** succeeds Mr. Nash. **J. M. Steenberg**, division freight agent, Northwestern region, with headquarters at Toledo, O., has been promoted to assistant to the freight traffic manager, Northwestern region, with the same headquarters. **H. C. Oliver**, division freight agent, Northwestern region with headquarters at Richmond, Ind., succeeds Mr. Steenberg. **J. E. Collins** succeeds Mr. Oliver.

### Engineering, Maintenance of Way and Signaling

**E. J. Bayer**, assistant engineer maintenance of way of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Galion, Ohio, has been appointed engineer maintenance of way of the Evansville, Indianapolis & Terre Haute, with new headquarters at Washington, Indiana, effective August 1, 1921.

### Mechanical

**James I. Mailer**, whose promotion to superintendent of motive power of the Fort Smith & Western, with headquarters at Fort Smith, Ark., was announced in the *Railway*

J. I. Mailer

*Age* of July 23 (page 186), was born at Alma, Wis., on April 24, 1877, and entered railroad service in December, 1893, on the Winona & Western. In 1897, he was employed by the Chicago Great Western as a machinist where he served until 1899, when he went with the Great Northern as a fireman. In 1900, after firing on the Northern Pacific and Southern Pacific he returned to the Chicago Great Western as shop foreman. A year later he was appointed general foreman of the Minnesota North, Wisconsin where he served until 1904. Mr. Mailer has been in the service of the Fort Smith & Western continuously since 1904. From 1904 to 1906 he served as general foreman at Fort Smith, and from 1906 until January 1, 1921, he was employed as an engineman. On the latter date he was promoted to master mechanic and was serving in this position at the time of his recent promotion.

### Purchasing and Stores

**H. S. Burr**, general superintendent of stores of the Erie with headquarters at New York, has been appointed assistant to the manager of stores with the same headquarters. **C. K. Reasor** has been appointed to a similar position with the same headquarters. The positions of general superintendent of stores and assistant general superintendent of stores have been abolished. These changes were effective August 1.

### Special

**John R. Leighty**, assistant chief engineer of the Missouri Pacific, has resigned to become group engineer for the western group of the President's Conference Committee on Federal Valuation of the Railroads, with headquarters at Chicago, succeeding to part of the duties of **H. C. Phillips**, resigned to enter private practice. Mr. Leighty was born at Spencer, Ind., on September 16, 1870, and was educated at Rose Polytechnic Institute. He entered railroad service with the Wisconsin Central, now a part of the Minneapolis, St. Paul & Sault Ste Marie, in 1891, as a freight bill clerk. A few months later he went with the Chicago & North Western as a rodman, and later became instrument man and assistant engineer. As assistant engineer, Mr. Leighty had charge of construction work

in the Wood street (Chicago) yard and of the track work in connection with track elevation on the Rockwell street branch to 43rd street, Chicago. Later he became road-master at Sparta, Wis., and at Carroll, Iowa. In 1899, he went with the Union Pacific where he was assigned to duties in connection with track reconstruction and ballasting work in Wyoming. The following year he entered the service of the Baltimore & Ohio as an assistant engineer, with headquarters at Newark, Ohio. Later he was transferred to Winchester, Va., Parkersburg, W. Va., and Cumberland, Md. In 1907 he was appointed engineer maintenance of way of the Western district of the Missouri Pacific with headquarters at Kansas City, Mo. In October, 1918, he was promoted to corporate chief engineer with headquarters at St. Louis, and later was appointed to the position of assistant chief engineer, which position he was holding at the time of his recent appointment.

**H. C. Phillips**, chairman of the western group engineering committee, of the President's Conference Committee on federal valuation of the railroads, has resigned to engage in consulting engineering practice, specializing in the valuation and inspection of railroads, with office at 14 East Jackson boulevard, Chicago. Mr. Phillips has been retained in an advisory capacity by the western group of the President's Conference Committee, but will give a large part of his time to private consulting practice. Mr. Phillips was born in New York, on May 6, 1869, and graduated from Princeton University in 1890. He entered railway service in July of the same year as assistant engineer on the New York & Northern, now a part of the New York Central, at Yonkers, N. Y., and was with that road until February, 1893, when he went with the New York, New Haven & Hartford, as assistant engineer on construction, serving first on four-track work at Milford, Conn., and then on track elevation work in Boston. From October, 1895, to 1898, he was engaged in engineering work in New Mexico, part of the time being engaged on location survey work for the Pecos Valley & Northeastern. In February, 1898, he entered the service of the Atchison, Topeka & Santa Fe, as inspection engineer, serving in New Mexico until October, 1899, when he was placed in charge of building branch lines in Oklahoma. In June, 1901, he was appointed assistant superintendent, with headquarters at Fort Madison, Iowa, and from February, 1903, to June, 1904, he was engineer of the Western Grand division of the Santa Fe at La Junta, Colo., and was then transferred to San Francisco, Cal., to complete the surveys and take charge of construction of the San Francisco & Northeastern, with the title of chief engineer of that line. In September, 1906, he was appointed chief engineer of the Atchison, Topeka & Santa Fe Coast Lines, with headquarters at Los Angeles, and in April, 1912, was appointed valuation engineer of the Santa Fe system, with headquarters at Chicago. He resigned that position in August, 1915, to become assistant general secretary of the President's Conference Committee on federal valuation of the railroads, and on January 1, 1917, was elected general secretary of that organization, with headquarters at Philadelphia, Pa. He resigned as general secretary in May, 1918, to accept an appointment as chairman of the western group of the engineering committee at Chicago, which position he now leaves to enter private practice. **George W. Hand**, assistant to the president of the Chicago & North Western, has been appointed chairman of the western group, engineering committee, and **John R. Leighty**, assistant chief engineer of the Missouri Pacific, has been appointed group engineer for the western group, with headquarters at Chicago.

## Obituary

**J. H. Leyonmarck**, mechanical engineer of the Chicago & Alton with headquarters at Bloomington, Ill., died at his home in that city on August 1.

**James W. Terry**, auditor of the San Antonio & Aransas Pass, died at his home in San Antonio, Tex., on August 1. Mr. Terry had served as the company auditor for more than 25 years.

**Thomas S. Howland**, vice-president, and formerly secretary and treasurer of the Chicago, Burlington & Quincy, died in the Massachusetts General Hospital at Boston, Mass., on

T. S. Howland

August 8. Mr. Howland had served as vice-president of the Burlington since 1907. During most of this time he held the position of secretary and treasurer also, but resigned this office on May 26 of this year. He was born at North Dartmouth, Mass., on February 13, 1844, and was educated at the Lawrence Scientific School of Harvard University. He entered railroad service on March 1, 1868, in the engineering corps of the Burlington & Missouri River, being engaged on location surveys with that road until 1876. In this year he was appointed secretary to the president of the Chicago, Burlington & Quincy road and served in this position until 1883, when he was elected secretary. On December 16, 1901, Mr. Howland was elected assistant secretary and assistant treasurer of the Chicago, Burlington & Quincy Railway, which had leased the Chicago, Burlington & Quincy road. A year later he was promoted to treasurer and assistant secretary of this company, and on June 30, 1907, he was elected vice-president, treasurer and secretary, with headquarters at Chicago. He was serving as vice-president of the Burlington at the time of his death.

THE VALDOSTA, MOULTRIE & WESTERN RAILROAD is being torn up, the business of the line not being sufficient to keep it alive; and one of the problems of the man who is trying to save the material is to keep enemies from burning the trestles. Threats have been made that this means of blocking the road would be adopted in order to prevent the transportation of the material to the eastern end of the line. Armed guards were stationed at the important bridges. This railroad, built about ten years ago, extends from Valdosta, Ga., northwest 42 miles to Moultrie. In its prime it had three locomotives and 19 cars.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free: United States, Mexico and Canada, \$8.00. Foreign Countries (excepting daily editions), \$10.00 £2 0/6. od. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE, that of this issue, 9,000 copies were printed; that of these 9,000 copies, 8,050 were mailed to regular paid subscribers, 53 were provided for counter and news company sales, 343 were mailed to advertisers, 65 were mailed to employees and correspondents, and 480 were provided for new subscriptions, samples, copies lost in the mail and office use; that the total copies printed this year to date were 326,100, an average of 9,700 copies a week.

Ryerson Spring Shop Equipment  
is reducing spring repair costs for this road.

## Saving a Road One-Third of Its Spring Costs

After installing Ryerson Spring Shop equipment one road reduced its locomotive spring costs from \$4.40 to \$3.20 per 100 lbs. and paid for the spring repair equipment in one year.

Such maintenance economies are rapidly reducing the cost of transportation of progressive railroads.

We can tell you what you can save. Ask us!

The communication in this issue on the question of the college man and the railroads is, to say the least, thought-provoking. Heretofore, the question, as discussed in these columns, has centered largely around its application to the graduates of engineering courses—civil, mechanical and electrical.

### College Courses on Transportation

Now comes an operating officer with the pointed suggestion that the colleges might well turn their attention to the development of courses in transportation, thus making a definite start "towards the scientific study of one of the great problems of the day and in the end we should enjoy the same improvement in transportation that we have in medicine, law and engineering."

The development of a transportation system in any locality is contingent on the character of service required. Prior to the war the problem of the railroads of this country was to extend the transportation system sufficiently to keep pace with its extensive development. Roughly speaking, the year 1913 marks the transition from the extensive to the intensive in the development of the country and, as well, from a period of comparatively cheap labor to one of high costs. As a consequence the transportation problem has assumed a new aspect. Under present conditions it is acknowledged that one of the most important factors in the cost of moving freight is that of the cost of handling at transfer points and terminals. It is also conceded that developments in terminal facilities have not kept pace with the advances made in track facilities, in the means of conveying traffic—cars and locomotives—and devices for speeding up operation—modern signal appliances, etc. In other words the terminals, in busy seasons, now act as "the neck of the bottle" in the transportation system, being unable to handle economically the volume of traffic offered or that which could be transported over the line. Investigations into what may be accomplished by properly installed material handling devices towards decreasing costs and increasing capacity should be well worth while.

When smoke and flame have played havoc with property intended for other purposes than the entertainment of those near enough to witness the spectacle, the importance of fire prevention again becomes a subject of absorbing interest. An investigation is held in which directly or indirectly a goodly portion of officialdom participates. Typewriters renew acquaintanceship with dusty files and letters again circulate to refresh memories of forgotten instructions. Fire pails are again restricted to the service of fire. Fire barrels are cleaned of their cinders and refilled. Fire hydrants are again repainted and their locations made known to responsible parties. Pipe lines are flushed, hose and extinguishers inspected, apparatus repaired and fire drills reinaugurated. Thus are preparations made to meet the next emergency. Ostensibly they are

ample. As a matter of fact, such preparations provide no better guarantee against further loss than those made prior to the fire which caused them, unless subsequently the interest in fire prevention is constantly kept alive and vigilance maintained. The fact that within the last few weeks heavy losses have been caused the railroads by fire makes it very evident that the possibility of fire is still present, and since we are in the midst of a summer season characterized by protracted heat and little rain, suggests the appropriateness of again directing attention to means for the prevention of fire. If locomotives have been equipped with apparatus for sprinkling bridges it is an appropriate time to see that they are being used. If terminals have been provided with elaborate and expensive fire apparatus, it is well to make sure that in case of an emergency there will be full knowledge of its proper use. It is unfortunate that a heavy loss should be incurred at any time through inability to find the one man familiar with the working of the pumping machinery, but it would be particularly unfortunate for any railroad to experience interruption of traffic and loss from fire at a time when the need for conserving resources of all kinds is as acute as at present.

One of the troublesome complications encountered in the solution of urban grade separation problems concerns the

### Keep the Future Well in Mind

provision for side tracks to accommodate the industries adjoining the right-of-way. In many cases the volume of business offered the railroad is not sufficient to warrant the additional expenditure to provide the side track on the new grade and under some circumstances the owner of the adjoining property is unable to make the necessary changes in his building to accommodate the new elevation of the service track. As a consequence grade separation not infrequently results in discontinuing side track service to the small shipper. In a few cases, the situation has been met by continuing a service track on the street level, where the slow and infrequent movement of cars and locomotives does not constitute a serious hazard or obstruction to the street traffic. It goes without saying that where this plan has been put into practice, its adoption has been influenced as much if not more by pressure from the shippers as through the influence of the railroad alone. It would seem, however, that such a plan can be justified only in particular cases. It must be borne in mind that the agitation for grade separation arises primarily in cases where the grade crossings constitute a serious obstruction to the traffic as against those cases where the element of hazard alone is present. The rapid increase of motor vehicles is constantly producing new problems in street transportation. There is a very definite tendency toward the establishment of thoroughfare streets with traffic regulations that provide for a minimum of interference from the traffic on the intersecting streets and it is on these very thoroughfare streets that the pressure for grade separation is most urgent. It appears, therefore, that any plan for grade separation on main traffic streets which does not provide for the complete separation of the rail and street traffic may eventually prove unsatisfactory,

Keeping on  
the Look-Out  
for Fires

thereby giving rise to pressure on the part of the public for still further relief in the form of grade separation at other street crossings.

It has always been the policy of the *Railway Age* to advocate the installation of modern high-power railroad shop machinery and equipment wherever the conditions warrant. It is not advisable, however, to install this machinery in every case simply on the ground of its being modern, powerful and provided with all

the latest improvements. In cases where the volume of work is small, it would obviously be poor business judgment to use an expensive, high-production machine and allow it to stand idle a considerable portion of the time with interest charges eating up what profit may have accrued while the machine was in operation. Labor saving devices should be installed in railroad shops and obsolete equipment eliminated, but only after a detailed study of the situation and a careful balancing of costs against possible savings. We cannot state the case more plainly than was recently done by a prominent mechanical department officer who said: "Modern, high-power shop machinery should be selected with extreme care. A time study should be made of machine operations, and machine tools that cannot produce to the capacity of modern tools should be abolished or used only in cases of emergency. The higher capacity tools should be operated on two shifts in order to secure a greater production." It will pay mechanical department officers responsible for shop output to study their machine tool requirements with the same accuracy and thoroughness that an industrial manufacturer would consider necessary. In a particular case a carefully prepared statement, taking into account the possibility of two-shift operation and balancing reduced labor and production costs against higher interest and depreciation charges will show at a glance whether or not it is economical to install a high-production machine. Recommendations can then be made to the higher railroad officers and, in by far the great majority of cases, such recommendations based on facts will receive both prompt and favorable attention.

"That the use of purified or softened water produces great savings in railroad operation is almost universally realized."

#### A Word to the Wise on Water

Thus begins the article "Water Treatment—Intermittent or Continuous," found elsewhere in this issue. This statement may or may not meet with the unqualified approval of the reader; likewise others appearing elsewhere in the discussion. Nor is it so essential in this case that they should if the reader derives a better understanding of an industry which deserves and is acquiring an increasingly prominent place in railway operation. There has been too much misunderstanding of the subject of water treatment for the best interests of the railroads themselves. Persuaded to install a plant at some point in the belief that it would eliminate a troublesome water problem, there has been a tendency at times to regard with suspicion any explanation given of an apparent failure of the installation to effect the expected results; or, having approved the expenditure of a large sum to erect a softening plant at some point, there has been a tendency to discountenance efforts made at a later date to modify the design or to effect extensive alterations, all because water softening has been considered too much of a stereotyped process involving a fixed design and typifying a definite performance rather than the application of scientific principles to problems which in some localities are extremely difficult of solution. Accordingly by discussing the progress which has been made in the design of water softening plants, together with enu-

merating the many factors which enter into the choice of a design and their possible effect upon the performance of the plant, the article referred to serves a valuable purpose by creating a better perspective and a wider appreciation of this subject than many readers may have had before. It is well to point out, however, that the discussion should not be interpreted as one enabling the reader to determine the proper design for any particular location, for it should be remembered that the entire discussion is based upon two extreme types of water softening plants, and that in all cases local conditions should receive careful consideration.

To equip the railways of Great Britain with automatic train stops would cost £2,278,950 (or, roughly, twelve million dollars), and in 1920 the number of collisions which were investigated by the

Ministry of Transport and which, theoretically, would have been prevented by an automatic stop, was six. This is an estimate presented before the July meeting of the Institution of Railway Signal Engineers, at London, in a paper by Mr. Thorrowgood. Looking at these figures we may say that if the six collisions cost \$100,000 each, the amount of money that could be saved by preventing them would be equal to the annual interest on the cost of the stops (at five per cent). In other words, the stops would pay for themselves. In addition, they would save the lives of passengers and trainmen and prevent untold anguish, things which cannot be measured in money. These figures are the result of an exceedingly rough calculation. A dozen other signal engineers could, no doubt, present six statements much more favorable and six much less favorable. But the estimate seems worthy of a moment's notice if only to remind us that a comparison of this sort is not wholly impossible. The American railroad system is many times larger than that of the United Kingdom; but, on the other hand, our collision record is worse than that of the English roads, per unit of traffic. Mr. Thorrowgood's estimate is based on equipping 5,750 distant signals (all there are in the country) and 24,635 locomotives. What would be his basic data for a similar calculation in this country? A collision killing a car full of passengers, like that of February 27 last, may simplify the problem for the road that pays for that collision; but what is the name of the road where the next disaster is going to happen? The sober calculator must consider that question.

An article in the *Railway Age* of July 30, 1921, drew attention to the exceedingly important relation wages paid to labor

#### Mechanical De- vices Provide a Remedy

bear to the cost of transportation under present conditions. It was pointed out that in 1912, 43.1 cents of each dollar of railway revenue was paid to labor. During the six-year period—1912 to 1917 inclusive—there were only slight variations from this proportion, the maximum of 44.1 cents being reached in 1914 while in 1917 only 43.3 cents of each dollar was so expended. The year 1918 marks the beginning of the period of high cost of railway labor. During that year 53.6 cents of each dollar of operating revenue was charged to the labor account or an increase of more than 23 per cent over the preceding year. During the years 1919 and 1920 the proportion of the railway dollar spent for labor increased steadily and in 1920 amounted to 59.9 cents. The true significance of these figures was contained in a recent statement of the American Association of Railway Executives in which concrete examples are cited of instances where the increased labor cost, since 1917, entailed in transporting certain articles exceeds the increases in freight charges which have been put

into effect during the same period. Also it should be borne in mind in considering these figures that, in the report just mentioned, attention is drawn to the fact that the labor cost alone of transporting certain articles at the present time equals or exceeds the amount charged for transporting the same articles between the same points prior to 1918. Such facts and figures certainly point out in no uncertain manner that the need for reducing the labor charge in transportation is imperative. A more general utilization of material handling or labor saving devices in the movement of freight will in many instances do much partially to relieve this situation.

## Which Do Railway Employees Favor?

THERE IS A WIDESPREAD and increasing demand from many classes of the public for reductions in railway rates. The effect this ultimately must have on the employees of the railways should not be overlooked by the employees and their leaders, although it probably will be.

Sooner or later reductions of rates will have to be made. Reductions in rates sufficient to satisfy public sentiment cannot be made unless there are large reductions in operating expenses in addition to those that already have been secured. Since the railroad payroll constitutes almost two-thirds of railway expenses, the bulk of this reduction of expenses must be made in the payroll. The reduction in wages recently granted by the Railroad Labor Board, on the basis of the same number of men that was employed before the big slump in business came, would reduce the payroll only 12 per cent. The employees and their leaders are simply fooling themselves if they believe that this is all the reduction in the payroll that is going to be made. Sooner or later a permanent reduction in the payroll much larger than this must and will be effected. It must and will be effected to enable the railways to earn reasonable net returns and to reduce the rates they charge the public.

A reduction in the payroll does not, however, necessarily mean a reduction in wages. A reduction in the payroll may be secured either by increasing the efficiency and output of each employee, and thereby reducing the number of men that must be employed, or by reducing the wages paid without increasing the average efficiency of the employees or reducing their number. From the standpoint of the employees, the railways and the public, it would be far better to effect the necessary and inevitable reduction of the payroll by increasing the efficiency of each employee than by reducing the wages. The result would be that fewer men would be employed by the railways than when a heavy business was being handled last year; but when general business revives there will be plenty of work for all who want it, and a permanent reduction in the number of railway employees would not mean that any men who have been in the service of the road would actually be unable to get work to do.

Will the employees and the leaders of the labor organizations, then, favor a policy which will tend to increase the average efficiency of each employee and enable the wages to be kept on a relatively high basis, or one which will not increase the average efficiency of each employee and will inevitably make necessary further reductions in wages?

The leaders of the labor organizations thus far have favored relative inefficiency and further reductions in wages. They have not said that they favor this policy, but they are taking a course which, if they persist in following it, will make the adoption of this policy necessary. The leaders of the shop crafts' unions are fighting stubbornly for the retention of all the rules in their national agreement. Many of these rules have had the direct effect of reducing the average efficiency and output per man. If continued in force they will have the same effect in future. Therefore, their inevitable tendency will be to compel the railways to employ

more men than otherwise would be necessary, and to seek reductions in basic wages which might not otherwise be necessary.

This course has not been followed with such persistency by the leaders of other railway labor unions as by those of the shop crafts' unions, but to a greater or less extent it has been followed by most of them. That it is to the interest of a great majority of railway employees to increase their average efficiency and output, and thereby arm themselves with the best possible argument against further and large reductions of their wages, is a fact so plain that it is difficult to understand how they can overlook or disregard it. They bitterly denounce those who advocate reductions of their wages, and yet back their labor union leaders to the limit in fighting for rules and methods of work which tend directly to make it impracticable to pay them high wages. Nothing, it would seem, could be plainer than that low efficiency must result in low wages, and that in the long run only high efficiency can make possible the payment of high wages.

## While the Railways Help Pay the Bill

IN THE LAST ISSUE we pointed out the direct interest which the railways have in the extension of the highway construction program now under way. As property owners and tax payers they have such interest through the large amounts which they are called upon to pay for highway construction in the form of assessments of one kind or another. Because of this fact they have a right to demand that public authorities will expend these funds with the same care which the roads themselves exercise in their expenditures for improvements to their own properties, since all funds for either purpose are derived directly or indirectly from the public in the form of earnings from transportation services. It is therefore pertinent to consider the manner in which these highway funds are being expended today, and to compare the methods used with those employed by the railways.

Before a railway builds a line its officers ascertain the amount and character of the traffic which may be expected to move over it, and then determine the weight of the locomotives which will be required to haul this traffic economically. With this information the engineering department proceeds to design its structures to carry these loads. Its bridges are designed for light or heavy locomotives according to the demands of the operating department. The rail, the amount of ballast and other details of the roadway are selected in like manner to support a specific load.

The amounts which the railways will pay to public authorities for the construction of highways during the next few months will be sufficient to build many miles of railways. Yet these funds are not being spent with anything approaching the same degree of scientific accuracy with which the railroads spend their own money. While it is true that the highways built to date are in general on the routes of heaviest travel, the density of traffic varies widely even on these roads. Yet one generally finds a uniform width of roadway and type of construction without reference to this variation in traffic although much of the highways built during the last year have cost over \$40,000 a mile.

Having determined the amount of traffic which should but usually does not influence the width of roadway provided, the character of the construction should next receive consideration. Yet again little real engineering research work has been done to determine the influence of sub-soil conditions on the character of construction, the most economical form of construction for various classes and densities of traffic, the amount and character of the reinforcement in concrete, etc. Rather one finds that one state or county has adopted a certain design of concrete construction as its standard, and

other brick, another some form of asphaltic macadam, etc., reflecting more directly the relative effectiveness of the local salesmen of these various materials than their merits for the particular local conditions existing.

These methods are used in practically all parts of the country. One of the states which has been most active in the construction of highways is California. It is therefore interesting to know that this subject has become so acute in that state that the California State Automobile Association and the Automobile Club of Southern California joined in retaining several leading engineers to make an exhaustive study of the highway situation to determine whether the highways which were being constructed were giving the service which was expected of them. In the report made early this year there appears the statement that "The commission has lacked foresight and vision by failing to carry out adequate and sufficient experimentation, research and investigation on a broad and comprehensive scale, while it has not taken advantage of the few experiments that it did make. It used practically the same type of construction throughout the state, irrespective of the requirements of the traffic, sub-soil and drainage. Such a policy is economically and structurally unsound and open to grave criticism." The report further states that some of the pavements have broken down in four and a quarter years, practically before the retirement of any of the bonds issued to build them had begun.

Again the report states that "In Southern California field inspections indicate that as high as 30.5 per cent of the concrete pavements are in poor condition, requiring reconstruction either now or at an early date. An additional 19.3 per cent is in only fair condition, serious failure having already begun." \* \* \* \* "Probably \$10,000,000 worth of state and county pavements in Southern California have failed."

Since they have contributed so largely to these funds, the railways have a direct interest in seeing that the moneys which are expended are spent properly. By insisting that their engineering officers satisfy themselves that proper design and construction methods are being employed, they will not only protect the investment which they have in these highways, but will be rendering a service to the public at large.

## Increased Shipments of Farm Products

THE FACTS ABOUT the railway business almost always arise to confute and embarrass those who base their discussions of railway affairs on mere theories as to what the facts are or ought to be. The present freight rates have been widely attacked by theorists on the ground that they are "higher than the traffic can bear." It has been argued that they have prevented the movement of much traffic and that this has been one of the main causes of the prolonged business depression.

The facts regarding the shipments of farm products utterly refute this theory. Railway rates have been advanced as much in proportion on farm products as on other commodities. The prices of farm products have declined more since the rates were advanced than the prices of any other very large group of commodities. Therefore, on this theory the rates on agricultural products should be especially difficult for the traffic to bear and should sharply curtail its movement. A few months ago an extensive propaganda was being carried on which was predicated on the assumption that if the rates were maintained they would greatly restrict the movement of farm products.

The sequel is illuminating. The total traffic of the railways thus far in 1921 has been abnormally small. Paradoxical as it may seem, while the total traffic moving has been abnormally small the shipments of farm products have

been almost unprecedentedly large. Throughout the present year shipments of grain and grain products have been much larger than in 1920 or 1919, before the present freight rates were fixed. In the eight weeks ending July 23 the shipments of grain and grain products were 97,105 cars greater than in the same weeks of 1920, and this is typical of what has been going on throughout the present year.

A very extensive and energetic propaganda was being carried on a few months ago to show that it was and would continue to be impossible for the farmers to ship their fruits and vegetables to market on the present rates. What are the facts? During the season of 1920 up to August 6 the total shipments of fruits and vegetables were 145,316 carloads, while in the season of 1921 up to the same date the total shipments were 171,390 carloads. These are the statistics of the Bureau of Markets of the United States Department of Agriculture.

There has been a corresponding increase in shipments of other kinds of produce. From January 1 to August 6, 1920, shipments of butter were 314,600,000 pounds, while during the same period of 1921 they were 346,800,000 pounds. Shipments of cheese increased from 105,500,000 pounds to 113,600,000 pounds; shipments of dressed poultry from 86,300,000 pounds to 93,800,000 pounds; shipments of eggs from 10,300,000 cases to 11,500,000 cases.

It was said that cantaloupes could not be shipped from the Imperial Valley of California to the eastern market on the present rates. The number and tonnage of cantaloupes shipped were greater than in 1920. It was said that the large peach crop of Southern Georgia could not move to market under the present rates. The Department of Agriculture reports that "shipments of peaches from Southern Georgia during the season just ended were twice as great as during the 1920 season, and growers regard the season as fairly successful despite the lower prices this year. A tabulation of carlot shipments to August 1 shows 9,500 cars shipped from Southern Georgia and about 10,500 cars from the entire state. In 1920 the carlot shipments were 5,500 from the entire state up to August 1."

The *Railway Age* does not contend that the present rates on farm products should be indefinitely continued. They and other rates should be reduced when the operating expenses of the railways have been reduced enough to justify reductions of the rates. But the people who contend that the present rates are protracting the industrial depression by preventing the movement of a large amount of traffic which would move if the rates were reduced are talking nonsense. The present rates are relatively higher, as compared with past years, on farm products than on any other large class of commodities, yet the farm products throughout the year have been moving in larger volume than before the rates were advanced.

It may be said, however, that freight rates are only relatively a small part of the prices of farm products, and that the present rates are restricting the movement of cheaper and more bulky commodities in whose cost to the user the railway rate is a larger factor. There is no class of commodities more bulky or the freight rates on which are relatively higher in proportion to the prices for which they sell than sand, gravel and stone. The shipments of sand, gravel and stone in the seven weeks ending July 16 were 33 $\frac{1}{3}$  per cent more than they were in the same weeks of 1920.

The facts show beyond any rational question that the traffic of all kinds will bear the present rates and that the present small volume of traffic is due to general business conditions and not to the present freight rates. There ought to be reductions in railway rates in the future but they should not be based on false ground and they should not be made until the traffic of the railways has increased and their operating expenses have been reduced enough to enable the railways on lower rates to make a reasonable return.

## Letters to the Editor

### The Chief Clerk and His Responsibilities

COLUMBUS, Ohio.

TO THE EDITOR:

The article by "Chief Clerk" in your issue of July 23 on the duties, responsibilities and salaries of chief clerks, expressed so thoroughly the feeling which exists among chief clerks and officers alike, that it is disappointing, to say the least, to find there is still an operating officer of any standing with the feeling expressed in the article signed "Operating Officer" in your issue of August 6. "Operating Officer's" article is its own best answer, and were it not for the impression it might leave with the uninformed, and the fact that you have recognized the article editorially, I should not consider an answer necessary.

This discussion seems to have developed into one relating particularly to operating department chief clerks and I will endeavor to answer "Operating Officer" with that in mind. From the fact that I have had more or less of the (so-called) outdoor experience and the further fact that my superior is a promoted chief clerk, I feel competent in a small way to make reply.

The fallacy of the theory that operating department chief clerks do not make good operating officers was proven years ago. The best evidence of that fallacy is the large number of prominent and efficient operating officers on the various lines today who have been promoted from chief clerks. One of the more important lines in the eastern territory for years followed the policy of allowing its chief clerks to grow old in that capacity, but in recent years has evidently discovered that its chief clerks provide excellent timber for efficient operating officers, as several of them have been promoted to superintendents.

The lack of outdoor experience, while perhaps constituting a small handicap when first assuming the duties of an official, would to my mind in no way compare with the advantage obtained by the chief clerk because of having associated closely with the higher operating officers, obtaining their opinions and ideas of railroad management and having impressed upon them thoroughly the relation between earnings and expenses. The outdoor man, lacking this association and seldom having access to the reports of operating results, fails to keep abreast of the times during periods of depression and seldom takes action toward keeping the expenses of his particular portion of the property in line with the earnings until his superior gets after him.

It has been stated the chief clerk is handicapped because of his lack of experience in handling men. Is it not true he is obliged to handle all of the men under the supervision of his superior, including officers, and is it not true that supervision of that character requires a greater degree of diplomacy and tact than the handling of the average outdoor worker? (The section foreman may be a good handler of men but would he necessarily also make a good officer?)

I want to take issue with the implication in the letter of "Operating Officer" to the effect that the authority which is now delegated to chief clerks is the cause of lower operating efficiency. If the average intelligence and loyalty of the officers below the general officers was as high as that of the chief clerks to the general officers, I should be willing to lay a small bet that the operating efficiency would be increased rather than lowered.

In regard to curtailing chief clerk's authority: I feel quite

sure if "Operating Officer" were to suggest to his superior that he reduce the authority now delegated to his chief clerk and handle personally more of the work passing through the officer, he would be frankly told his boss already has more than he could do and that when he (Operating Officer) gets a little higher up the ladder he will undoubtedly realize that the chief clerk is the assistant to his superior although (unfortunately for the chief clerk), he has never been able to give him that title nor the salary to go with it.

If the theory advanced by "Operating Officer" is the correct one, why would it not be proper for the vice-president or general manager to say to his subordinates, when leaving the line for anywhere from two days to two months, "Gentlemen, I am going off the line and in my absence it will be necessary for you to use your own judgment in connection with matters which you are accustomed to take up with me"; quite the contrary the operating officer gives his chief clerk to understand he will be held responsible for results in the absence of his superior and the subordinate officers so understand it. They also understand they should take up with that chief clerk for approval matters which should be taken up with the vice-president or general manager, as the case may be, were that officer available.

In this day of labor troubles and various and divers other troubles, when managing officers find themselves overburdened with work and responsibility, it is almost pathetic to suggest they increase their own burdens or that the authority of their immediate subordinates be curtailed.

"CHIEF CLERK TO GENERAL MANAGER."

### Is the College Graduate Properly Equipped for Railroad Work?

CLEVELAND, Ohio.

TO THE EDITOR:

Marion B. Richardson's letter in the *Railway Age* of June 17 asking, "Do the Railroads Want College Men?" and calling attention to the apparent lack of interest of railroad managers in college men and the indifference of the latter to railroading as a career, together with other letters on the subject, revives the problem so many railroad fathers have wrestled with, "Shall I send the boy to college or put him to work?"

In reply to Mr. Richardson's question, I venture to say that never before was the demand, the necessity, or the probable reward for adequate transportation as great as at present, with a corresponding demand for transportation men regardless of where they were trained. And if railroad managers are neglecting the colleges as recruiting fields, or college men are indifferent to railroading as a business, there is some good reason for the mutual lack of interest. In hunting for that reason I have been led to wonder if it was not in some small degree chargeable to the failure of our schools to teach transportation, with the result that college men are not started right and that they and the managers are disappointed and discouraged with the results.

Transportation is the business or service of moving people and commodities from place to place. In supplying it, a great many facilities and tools are used: on sea, by ships and docks; on land, by railroads with their tracks, stations, locomotives, cars, etc. And the prizes go to those who can furnish that service.

Most young men who go to college with the idea of fitting themselves for railroad work take up engineering and finish by specializing in civil, mechanical or electrical engineering; and with the minor exception of a few schools, this is the limit of special instructions available to fit them for their intended work.

After four years in college they must serve some railroad

at least as much longer in what is virtually an apprenticeship at a very small salary, learning the practical side of their specialty, which is limited to building and maintaining some of the facilities or tools used in transportation. At the end of that period they are generally qualified to maintain, and in some cases to build tracks, locomotives, cars, signals, etc., etc. But all they have learned about manufacturing transportation, which is the service the railroads are selling to the public—i. e., moving passengers and freight from point to point—and the service the public is willing and anxious to pay for, they have acquired by contact with the men who are using their tools to move cars. And when a young man's mind is full of the intricacies and possibilities of a modern locomotive, he does not have time to learn much else, with the result that he is delayed in the race for the prizes in the transportation field and frequently discouraged and disappointed by the more rapid advancement of someone in another department.

The Cramps will build ships, and the locomotive companies locomotives in any number and kind ordered. But if the Cramps were asked to take their ships and keep New England supplied with coal, or the locomotive builders were asked to take their locomotives and move five thousand loads a day through Pittsburgh, they would very likely say, "Go get a transportation man." And the young college man, after a total of eight years of school and service, would not ordinarily be as well equipped to do the job as the young man who, on finishing high school, had entered railroad service as a fireman, brakeman, yard clerk, telegraph operator or any of the kindred occupations, where from the start he was engaged in moving cars. The results can be verified by studying the list of railroad executives, most of whom started young in actual service.

Whether or not transportation can be taught in the schools as engineering, medicine and law are taught is an open question. The writer believes, however, that with something of the same support those professions enjoy, it is possible to give a student an appreciation of the whys and wherefores of a railroad, together with an understanding of what is needed to manufacture transportation; an understanding that he would be years learning in actual service and that will reduce some of the handicaps that college men, with an ambition for a career in transportation, are now laboring under.

I believe, for instance, that it is possible to teach a student the theory and requirements of an operating unit such as a division. The business of a division, like the railroad of which it is a part, is to move a certain number of passengers and tons of freight in a stated time. Given this arbitrary requirement with controlling factors, such as grade line, etc., the student can be taught what tracks, main and auxiliary; what engines, passenger, freight and switch; what cars, passenger and freight; what facilities for fuel, water, communicating, signalling, dispatching; what housing or shelter for passengers, freight and railroad property; what machinery and tools for maintenance; what supplies for operation; what records and accounting, and, most important, what men and organization are needed.

This is but a skeleton of the man and material requirements of a division without any instructions as to their use, but as there is nothing mysterious about transportation and plenty of men competent to teach it, some of the fundamentals of good operating practices can be included.

If this is done the graduates who have studied transportation will leave college with such an understanding of the reason for a railroad, of its purposes and functions, and of the fundamentals necessary to serve the public, that they will learn quickly to know whether the facilities and organization at hand are adequate and whether or not the methods in use are proper. The graduate will, in fact, be as well equipped to move cars as the graduates of law, engineering and medical

schools are to practice their professions. All must serve an apprenticeship in the school of experience.

He will also have a long start over the man who confined his studies to engineering and should overtake the one who on leaving high school had to go to work, but most important of all, a definite start will have been made towards the scientific study of one of the great problems of the day and in the end we should enjoy the same improvement in transportation that we have in medicine, law and engineering.

Yes, the railroads want college men. S. ENNES,  
Vice-President, Wheeling & Lake Erie.

## Coach Windows in Hot Weather

MAPLEWOOD, N. J.

TO THE EDITOR:

There is nothing new under the sun! This very sweeping statement must be accepted as a truth of holy writ; but certainly we do now and then meet novel arrangements of old things.

On this my first visit to America for many years, and while sojourning in this quiet hamlet, I have discovered an absolutely startling innovation in railroad operation; the Delaware, Lackawanna & Western arranges its passenger-car windows so that they can be opened in summer; in hot weather, damp weather, or any kind of weather. Not in forty years have I found a road of which this could be said. Even Pullman cars, cared for as well as any cars in the world, frequently arouse the ire of the passenger who wishes to raise a sash at 2 a. m.

And this Lackawanna trick is so simple. They just put two little blocks of wood under the bottom of the sash. This prevents the sash from being completely closed, and prevents it from sticking.

At the approach of cold weather the little block is taken out.

Please print this news on your editorial page.

Only this last week, on two of the most prominent roads in New England, I have found the most obstinate sashes that I ever saw. Even with my patent non-burglarious window-opening jimmy (which you will recall was described and illustrated in your columns some years ago) I was compelled to exert all the muscular energy at my command before I could start those persistently frozen sashes. I should think that they had not been opened since the days of McAdoo.

By the way, how is it that that great reformer did not tackle this troublesome feature of operation?

E. MARJORIBANKS.

## Life of Ties Limited by Mechanical Destruction

BOSTON, Mass.

TO THE EDITOR:

I note an editorial in your issue of June 10, "Why All Roads Do Not Treat Ties." You might have mentioned as one of the reasons, and a very important one, the fact that on roads with heavy traffic the large majority of the ties are not removed on account of decay but because of mechanical destruction and that therefore until such roads get all of their ties tie-plated efficiently it is a waste of money to install treated ties, as they secure no longer service from them owing to the mechanical destruction from rail cutting and spike killing.

F. B. FREEMAN,  
Chief Engineer, Boston & Albany.

## Will the Mechanical Department Make Good?

Some Large and Troublesome Problems Must Be Tackled  
Aggressively and Settled Promptly

WE ATTEMPTED in the *Railway Age* of June 10, 1921, to outline some of the more important problems of the mechanical department which require attention in the interests of improved economy and efficiency. Up to this time we have received in the neighborhood of 150 letters commenting upon these suggestions. Practically all of our suggestions met with almost unanimous approval; if anything the criticisms have been that we should have placed even greater emphasis on some of the points. There is, of course, a rea-

son for this unanimity of opinion. Such suggestions as were made were neither new nor radical. They represented largely ideas or practices which have been tried and have proved effective on one or more roads.

The purpose of this article is to discuss some of these things more at length. The points which are here developed were suggested and inspired by comments of practical railroad officers—executive as well as mechanical—and are not the products of idealists or theorists.

## The Human Element and Management Problems

The mechanical department, more than any other department on a railroad, is concerned with the so-called labor problem. Listen, for instance, to the expressions of one motive power officer: "In the light of my personal experience during the past three and one-half years in the matter of preparing voluminous reports on every conceivable phase of the railroad operating and accounting situation and conferring with committees of employees from every sub-department of the mechanical department, I cannot conceive of anything that would bring about better results than for the employees to get down to business, put the paid chairmen of committees to work and all hands render a fair day's work for a big day's pay, and forget some of their so-called petty grievances so as to give the managing and supervisory forces an opportunity to take stock of their knowledge of railroading (which will otherwise soon become a lost art) and do some actual constructive thinking along these lines. President Harding is credited with saying that 'There should be more business in government and less government in business.' This fits the railroad situation like a glove. Let us do some actual railroading for a few years and cut out a lot of this useless bunk, and the results will astonish the world."

The attitude is a typical one. It is needless here to review the situation or touch upon the factors which have been responsible for it. The present situation must be regarded

as a natural reaction from former conditions, greatly aggravated by developments which took place in the industrial and railway world during and following the war. Conditions were in a bad way prior to the world war; this was due in a large sense to the extremely rapid growth of the industries and railways, the resulting steady advance in the standards of living of the people generally, and a lack of understanding of the principles underlying the proper handling of the human element in industry.

The present situation is intolerable and is seriously injuring the country as a whole, and particularly the employees, the managements and the investors. "If a house be divided against itself, that house cannot stand"—but somehow or other this truth is mighty slow in penetrating. Will it be recognized before it is too late?

Must American railroads, because of a lack of vision on the part of the leaders of the various interests involved, face a situation similar to that in Great Britain which was so strikingly summed up in the following words in a recent cable to the New York Tribune from Hartley Withers, editor of *The Economist* (London): "Labor here is so convinced by its war-time experience that the country is a bottomless purse out of which every one can be made happy if only they shout loud enough—and labor is still so deluded by the promises of the government, made during the general

election just after the armistice—that a long trial of strength, carried out to the bitter end, is probably necessary to bring it back to the facts of life. The amount of suffering inflicted upon innocent people, with no direct interest in this economic contest, is simply appalling, and the infliction of discomfort shows how far we still are from achieving real economic civilization. We can only hope that good will follow in the long run."

A very large responsibility rests upon the mechanical department heads of the railroads in this country. This statement is made in the full knowledge that the Labor Board at present is a controlling factor in the labor question. After all, however, it is not rules or regulations that will settle the problem—they only seem to complicate it and make it worse, especially when the rules are imposed by a third party. The difficulties will only be relieved by the infusion of the right spirit throughout each organization. This means a broadening of attitude on the part of both officers and men. If they cannot undergo this process then the trouble will continue in spite of any possible rules or regulations which may be imposed.

What spirit, then, should dominate the minds of officers and men alike? There is too much foolish, unsound talking being done on all sides—too much superficial thinking—too little of the open-minded attitude. Men must trust and have confidence in each other before the problem can even receive fair consideration. John Leitch, in his book "Man to Man," describes his scheme of industrial democracy which is now being used in many manufacturing establishments with excellent results. But John Leitch behind any scheme of organization would get results because of his abiding faith in his fellowmen. He trusts them, he is not afraid to place responsibility upon them, and they pretty well live up to the faith he has in them. Do we discard our credit systems upon which trade and commerce are based because a few men abuse it? Surely not! Why not have a greater degree of confidence and faith in the men throughout the organization. It is remarkable how a man lives up—or down—to the opinion which others have of him or of the results they expect of him.

W. L. Mackenzie King, for so many years minister of labor in Canada, has recently written a book entitled "Industry and Humanity." He makes this statement in the introduction, "The existing attitude of capital and labor toward each other is too largely one of mistrust born of fear. . . . If industry is to serve humanity, this attitude must be one of trust inspired by faith. An industrial system characterized by antagonism, coercion and resistance

must yield to a new order based upon mutual confidence, real justice and constructive good will." His book, and it is an extensive treatise, deals with ways and means of eliminating this fear which paralyzes industry.

A better condition will not be brought about by rules, or orders, or correspondence. Some managements have already made great strides in the right direction by really getting acquainted with the men, by dealing with them in a patient and broad way and by using great pains to educate them to a realization of their individual importance to the success of organization and to a detail knowledge of its problems.

There are many ways in which the right spirit can be infused into an organization. Some roads already have it to a marked degree, others can make good progress by studying what has been done on other roads and in other industries. If the problem is recognized in its simple form and if the serious danger which confronts the country is realized if it is not corrected, then a long step will have been taken and it will be comparatively easy to solve it.

Incidentally, the foremen and subordinate officers will be a large factor in righting conditions. One of the great mistakes in the mechanical department—

### The Foreman

indeed it is almost a crime—has been the lack of appreciation of the foremen. The *Railway Age* has consistently called attention to the fact that a condition which allowed the foreman with all his responsibility to draw less wages than some of the men under him was all wrong and could not work for real efficiency. Instead of making a big man of the foreman and utilizing him to the full the tendency has been to dwarf and push back into insignificance the very keystone of the arch—and the roads are today paying for it dearly. A few of them are waking up. The foreman, as clearly explained—in the article in the *Railway Age* of June 10, is a most vital factor—he forms the only real contact between the management and the men. If he does not understand how to handle men, if he does not fully appreciate the policies and problems of his company, then how in the world can the men be expected to co-operate fully and intelligently?

Possibly no one thing was commented upon more extensively in the letters we have received than the necessity for frequent get-together meetings for the training and instruction of the foremen. Here is a typical extract from one of the letters:

"Human nature has not changed in the past thirty years. The kind smile and friendly greeting is just as welcome today as it was yesterday, but the smile and greeting are no

longer as evident. Where formerly the workman took his troubles to his immediate supervising officer, satisfied that he would obtain a sympathetic hearing, he now takes them to his committeeman, not because he feels that he cannot obtain justice under present conditions, but because something, someone, somehow has built up an icy wall between them.

"The question therefore is, how can we get back to that old esprit de corps, that spirit of harmonious relationship that formerly prevailed? Here and there a few big men have found the answer and the results are visibly reflected in the operating ratio.

"The small roads have been merged into the large system. The president who formerly had 500 miles of railroad now has 5,000. Obviously, he can no longer call each employee by his given name; equally patent is it that he can no longer give his attention to the minute details as before. Furthermore, his work now keeps him more at headquarters; he cannot make the frequent trips over the property that he once enjoyed; therefore, he loses that intimate knowledge of his subordinate officers that was at one time a major asset.

"What is the answer?" Simply this, "If the Mountain won't come to Mahomet, Mahomet must go to the Mountain."

"The subordinate officers must go to the chief officers—and that there be no embarrassment—on invitation. This means regular meetings monthly, quarterly or semi-annually, as may fit the needs. Let this extend down the line, i. e., the chief officer call in his immediate staff including the chief mechanical officer. The superintendent of motive power meet with his staff, etc. The master mechanic in turn to have regular meetings with his staff, etc. At these meetings let there be full and frank discussion, each group handling such matters only as can properly come before it; make the meetings more nearly concerning the rank and file a general clearing house

#### Frequent Staff Meetings

where suggestions may be brought in covering any improvement in methods, etc., have complaints of the workers adjusted through their immediate foremen, and a spirit of enthusiasm injected that will permeate through the entire rank and file. Such meetings will necessarily throw the foremen into more intimate relationship not only with their immediate superiors, but also with the rank and file, as the call for suggestions will arouse a spirit that calls for effort. The germs of workable ideas usually originate in the ranks, to be developed and made practical by the officers; therefore in the search for germs, the seeker must mingle intimately with the men in order to bring out their best thoughts, and where proper credit is given, this exchange leads to mutual understanding and mutual satisfaction.

"The success of the foreman depends upon his men; the success of the officers upon their staff. Confidence begets confidence. When men see that confidence is reposed in them they will not violate it. Pessimists to the contrary, notwithstanding, the world is getting better."

The war seriously interfered with the splendid work which was being done by a few roads in apprentice training. Post

#### Training and Recruiting

war conditions have not helped the situation. The strength of an organization is in its men. What will happen to the roads if they continue to neglect this vital question? Is it not time that this problem was faced fairly and squarely? Are there not in the mechanical department men of real vision that will lead their fellows to a full appreciation of the problem—or will things just continue to drift along. Is it not high time that not only apprentices, but all new employees—as well as some of the older ones—were taken in hand and really trained for their jobs? Why waste time and effort in using dull tools when so much more can be accomplished with sharp ones?

## A Constructive Motive Power Policy

There is nothing alarming in the present motive power situation. Whatever danger may lie ahead is due primarily to the complacent attitude that naturally arises when over 10 per cent of the power is stored in serviceable condition. There is little operating trouble chargeable to the locomotives and little difficulty in keeping them in repair. But this is no cause for self-congratulation. It is merely the result of the existing conditions. The least efficient locomotives are now

standing idle, the reduced force is made up largely of men who have been long in service. The shop forces are experienced mechanics and the enginemen are skilled in handling the power. Under such conditions there is a minimum of trouble and a natural tendency to rest on the oars which must be combated. The slack season is always the time to prepare for heavy business and the present lull gives an opportunity to survey the situation and organize the opera-

tions to make every move count, should not be overlooked.

One of the first objects of the mechanical department officer should be to avoid the necessity for repairs insofar as possible.

### Avoid the Necessity for Repairs

Too much emphasis cannot be placed on insuring proper operation to avoid damage to the power, as is well brought out in the following comments from a motive power officer.

"Carelessness in the use of the power, met by insufficient discipline in proportion to the expense involved, is a hindrance. Men who have been long in the service of running locomotives will get careless with the result of damage involving considerable money and considerable time with the locomotive out of service. . . . In carrying out the principle of successful management, the responsibility should be centered in the individual involved, if corrections are to be made and the men as a whole educated up to their responsibility individually. Individual responsibility and individual credit will build up more co-operative effort on the part of all concerned, and we must eliminate all discouraging conditions, the greatest of which is the carelessness and abuse of equipment which, without correction or discipline, breeds a like condition in those responsible for its care. Engine failures should be followed up to fix responsibility and the facts in each case should be made known to all having to do with equipment so that engine inspection will become more acute. Failures, the fault of design, will be more readily corrected and in the issuance of instructions and circulars, they should be checked and followed up if they are to be of any use whatever."

There is need for close attention to the reporting of defects, both by the enginemen and the roundhouse inspection forces. The defects covered by the Locomotive Inspection Act usually receive first consideration and if the forces are inadequate, or if a locomotive is needed promptly other work is likely to be done in a hurried and superficial manner. The federal law is intended to place the emphasis on safety and unfortunately it causes minor matters to assume undue importance. The result is that in too many cases, mechanics are required to pack valves in the cab to prevent the least trace of steam leaks when they could be much better employed setting valves or replacing leaky valve or cylinder packing. The authority of the federal inspector is a powerful force in getting the work covered by the inspection rules done. However, there are other matters of far greater importance from the standpoint of economical operation. It is necessary to keep the essentials of efficiency constantly before the men to avoid such work being slighted. The federal inspection rules

should be supplemented with other regulations that will insure the continuous maintenance of the machines at the highest practicable efficiency.

The consistent development of a railroad system requires a well-rounded plan for systematic improvement of the facilities to permit more economical operation. The mechanical department should keep in touch with the plans of the executives and map out the motive power program as far in advance as

### Schedule the Locomotive Program

possible, adapting it to the future operating program to get the maximum benefit both from new and existing locomotives. In this connection a motive power officer wrote "The disposition of existing locomotives should continue to receive careful attention. The size and power of locomotives used on any part of a railroad should be governed by traffic conditions. Main lines and important branch lines on which the hauling capacity of individual locomotives determines the average tonnage handled per train should be provided with locomotives as heavy and powerful as track, bridges and other physical conditions will permit. Less important lines on which the average train load is determined by the volume of business offered for each train should be provided with locomotives large enough to handle the trains offered, with sufficient reserve power to take care of occasional light increases in business without double-heading or running extra trains.

"Some small locomotives are needed for light service on practically every railroad, but these small locomotives in proportion need not be less efficient than larger ones. The use of a locomotive larger than the service requires will result in some loss, as the larger locomotive will consume the same amount of fuel and water pulling the train and more for propelling itself; it will probably cost a little more for its own maintenance, as well as that of track and bridges and may call for an increase in the engine crews' wages."

In the motive power of practically every road there will be found one or more classes of locomotives which, because of inherent defects in design, do not give satisfactory results. There are very few designs that cannot be made satisfactory by the application of modern devices. Oftentimes the application of a single improvement will put a locomotive in condition to handle a heavier train and increase its capacity so that it is made an efficient machine for a class of service in which it could not be utilized before.

Prior to 1910, many railroads built compound locomotives

in an effort to develop a type that would decrease the cost of operation. The resulting fuel economy was often questionable and the additional complication of the machinery increased the maintenance charges so that little if any gain resulted in the majority of cases. About 10 years ago, the introduction of superheating opened the way for remarkable savings in fuel. In commenting on the situation, a prominent designer recently said, "When some great improvement is made which brings about a marked increase in the efficiency of the steam locomotive, we are apt to lessen our efforts in this direction for a while, but progress is bound to be made. I have been associated with the building of steam locomotives for many years and not once have I ever felt that the limit has been reached in any particular, either as to size, economy or durability." Certainly this is no time to slacken activities in improving the locomotive, yet many railroads in buying new power apply superheaters and give little consideration to other devices which, while not yet

well established, give promise of effecting a marked increase in efficiency. Surely economy is quite as important now as it was one or two decades ago when the railroads were devoting so much attention to compounding.

There is need for an open-minded attitude toward all new methods that promise to yield a fair return. The roads should be willing to accept a share of the burden of perfecting such improvements. Precedent is still an important factor in the adoption of new methods and meritorious designs must pass through a long period of trial because of the hesitancy of railroad officers in accepting devices until their value has been established by long periods of actual service. Much of the expense of development work under actual service conditions could be avoided by trying out designs in special testing laboratories. There is evidence of a growing sentiment in favor of a co-operative research bureau such as the Mechanical Division of the American Railway Association has under consideration.

## The Business of Owning Cars

The movement of the grain crop, now approaching its height of this year, has been a perennial source of heated discussions among mechanical department officers of the various sections of the country, over the question of responsibility for the unfit condition of large numbers of the box cars marshaled in the grain producing regions preparatory to the heavy crop movement. The peak of the grain movement seldom if ever exceeds a weekly loading of 75,000 cars out of a total freight loading of 700,000 to 1,000,000 cars, and yet with approximately 1,000,000 box cars in service in the United States there is usually the greatest difficulty in securing enough cars in a state of repair fit for grain loading to meet the temporary demand. This is a striking bit of evidence of the low character of average freight car maintenance standards.

Reference has frequently been made to this situation in these columns and attention has been drawn to the fact that although the condition of the equipment is unusually bad, at the present time this situation differs only in degree from that which periodically follows each cycle of increasing and declining traffic. Why do these conditions persistently recur? Does not the fact that they continue despite all efforts to overcome them in detail, suggest that there may be fundamental

defects in the methods adopted for dealing with them?

Essentially the ownership, operation and maintenance of freight cars is a business proposition involving about 15 per cent of the total investment in railroad property and a maintenance expenditure amounting to nearly as large a proportion of the total operating expenses. These expenditures are made to purchase serviceable car days, the number of which in relation to the maintenance charges and the cost of the capital is the only measure of the efficiency of these expenditures. Serviceable car days is a matter not of days alone but of the degree of serviceability. A car with holes in the floor and a leaky roof may not be shown on the bad order report, but its service value is far from equal to that of a car fit for grain service. A car of wood construction with short draft sills, spending from 40 to 60 days a year on repair tracks and requiring maintenance expenditures in proportion may be an expensive investment to maintain in comparison with a modern composite or steel car which does not appear on the repair track more than 10 to 20 days a year, even though ownership of the latter may involve twice or three times as great an initial investment.

The degree of serviceability and, to a large extent the number of serviceable days is a matter of maintenance standards. Whatever may be the standards of individual roads with respect to their own equipment, it is evident that

with nearly 50 per cent of all freight cars on foreign lines under normal conditions the average standard of maintenance during periods between heavy repairs is largely affected by the conditions surrounding interchange.

Best results require that adequate repairs be made as defects develop. It is generally conceded that in the long run any other policy increases both maintenance expenditures and unserviceable car days. But the attainment of these results depends in a large measure on the foreign line, which is offered a scale of prices for labor and material limited strictly to cost. Certainly no road is to be condemned for a disinclination to pay a rental of a dollar a day for the privilege of repairing at cost a car that will leave its line a few days after the repairs are completed.

Are adequate current repairs to be expected in interchange unless billing prices are fixed at least high enough to compensate the repairing lines for the lost rental service?

Twenty years ago the per diem rate was 20 cents per car per day. Five years ago it was 45 cents. Last year the growing appreciation of the business aspect of car ownership made possible the establishment of the present dollar a day rate. But the increased per diem without at least a co-ordinate development in the standard repair prices is likely to result in a reduced average of car serviceability. Sound business principles, recognizing the duty of the individual road to serve its own interests, would even suggest that the prices be fixed to pay a reasonable profit on the transaction.

By far the most important business aspect of car ownership at the present time is the proper disposition of cars of

#### **Weak Cars Are Money Losers**

weak center construction, particularly those with short draft timbers which has been the subject of discussions before the Master Car Builders' Association and the Mechanical Division since 1914. The steps that have been taken by those organizations to eliminate such cars from interchange have recently been set forth in these columns\* and need not be reviewed at this time. In passing, however, it is worthy of note that the Arbitration Committee in this year's report recommends another year's extension of time before the prohibition on the interchange of these cars becomes effective.

What several years of general discussion and legislation have failed to accomplish for the country as a whole, a careful business analysis of the cost of owning cars of this type, long ago accomplished on a number of railroads.

In one case a thorough canvass of the car situation developed the fact that, by replacing a large number of cars of

inadequate construction and the reinforcement of others, the reduction in maintenance expenditures and loss of service time during the four or five years before the new equipment reached its level of maintenance requirements, would amount to an average return of 16 per cent a year on the entire cost of the new equipment and over 50 per cent a year on the cost of the reinforcements.

There are several hundred thousand cars in service which require an annual maintenance expenditure from two to three and four times as great as would be required by new or rehabilitated equipment, and the service value of the new equipment would be far greater than the existing equipment.

Another factor which enters into the problem of equipment retirements is the proper utilization of the depreciation and retirement accounts. These accounts are too frequently regarded as mere matters of bookkeeping. On the contrary they are important factors in the economics of equipment ownership.

It is a matter of importance in determining the most economical policy of operation to determine the point beyond which an increase in the depreciation rate ceases to effect a greater decrease in the average cost of maintenance over the life of the equipment. Once fixed, nothing should be allowed to interfere with the retirement, or at least the complete rehabilitation of the equipment, when the established age has been reached.

The all-steel car presents a number of problems satisfactory solutions of which have by no means yet been reached.

#### **Is the All- Steel Car Justified?**

Many of these cars are deteriorating much faster than had been expected and the more uniform deterioration of the entire structure as compared with cars of composite or all-wood construction leads to heavy accumulations of repairs at the end of periods ranging from eight to fifteen years. Owing to this characteristic, steel cars require careful watching toward the end of this period to prevent expensive and disastrous failures in service, and make the careful determination of depreciation rates to be applied to these cars a matter of special importance.

Experience with these cars also raises the question whether all-steel construction as a substitute for composite construction has been fully justified. The answer to this question depends largely on local conditions. The more effective protection against decay possible with the composite type of construction is a point strongly in its favor, and directs attention to one of the greatest difficulties in connection

\*See the *Railway Age* for June 10, page 1314.

with the satisfactory maintenance of all-steel equipment.

Another problem which has been created by the present status of the railway shop labor situation involves the determination of the future status of freight car repairs, particularly steel cars. The present restrictive conditions affecting labor output in railroad shops are already showing a marked tendency to drive this work off the railroad and into the contract

### Outside Repairs of Cars

shop. Owing to the comparatively short period during which the steel car has been in extensive use the requisite amount of special facilities for the repair of these cars has not yet been provided. Under these conditions is it not a serious question whether the investment of new capital to provide the additional facilities needed on many roads, is advisable, as long as contract shops are available, operating on a piece work basis and managed for a profit under competitive conditions?

## Organize Shops to Meet Present Conditions

Preceding and during the war, railroad shops were inadequate both in number and equipment. Practically no new shops have been built since to supply this need largely on account of the financial condition of the railroads. The immediate pressing need, however, is for the reorganization of shop forces and methods to bring present locomotive and car equipment up to a satisfactory maintenance standard and enable improvement programs to be successfully carried out.

A new attitude on the part of railroad shop men towards their work is greatly needed and shop reorganization should start at this point. The old adage about making a horse drink applies also to making a man work but there is this difference: in the latter case, the big majority of men are susceptible to reason and argument based on common sense. Many railroad shop men have already seen the inevitable results of curtailing production and are now striving to give a fair day's work for a fair day's pay. These men should be encouraged and afforded an incentive wherever possible in order that others may come around to their way of thinking.

The most practical and easy method of affording this incentive is through the re-establishment of piece work systems for railroad shop repair work. The arguments regarding piece work in railroad shops are summed up in an editorial on page 823 of the April 1, 1921, *Railway Age*, which points out that piece work systems have been used, and with good results, in practically all branches of railroad shop work. The argument that piece work systems tend to produce inferior work is refuted and shown to be without foundation. On the other hand the establishment of a simple, readily understood, piece work system by which men are paid in proportion to their industry and ability to produce will show immediate results in increased shop output. The importance of setting a fair price is emphasized, as is the fact that all

benefits of piece work will be lost if rates are cut as soon as a man begins to make substantially more than his day rate.

The majority of shop men will fall in line with reorganization plans and if they do not voluntarily, some means must be devised to make them. Railroad shop output must be brought up to a high standard and a fair day's work secured from every man even at the expense of employing additional timekeepers to check the time spent on individual jobs. One railroad man says, "When I instituted timekeeping, we found getting the time, in place of allowing the mechanics to make out their own time slips, was a saving to the company, notwithstanding the fact that we put on nine additional timekeepers."

It is self-evident that without accurate knowledge of detailed shop costs, no shop can be efficiently operated. The importance of having simple, reliable cost systems which will show the cost of detailed operations as near as possible to the time they are performed can hardly be overestimated. In this way only can costly practices be eliminated and replaced by efficient ones. A valuable article entitled *Cost Accounting—Key to Cost Control*, was published in the June, 1920, *Railway Mechanical Engineer*, page 374, and should receive the attention of all mechanical department officers interested in shop output and efficient management.

Regarding cost accounting, one railroad man has this to say, "In answer to your request for comment am moved to strongly approve the recommendation of extension of cost accounting in the mechanical department, to include not only material and labor but to consider supervision, overhead and all the details of the burdens properly chargeable to shop costs. The idea would be to provide mechanical supervising and estimating officers with fairly exact data covering finan-

### Abolish Labor Slacking

### Cost Knowledge Determines Shop Policies

cial features of department questions . . . The cost, or money factor, is a composite variable dependent upon so many conditions that generalizing will not adequately cover." Shop policies and practices cannot be intelligently decided upon without accurate cost knowledge. It is also suggested that cost accounting methods be more uniform, at least for different shops on a single system, in order that conclusions may be comparable.

In commenting on the special article in the June 10 issue of the *Railway Age*, favorable mention was made of the paragraph on shop schedules. A schedule

### The Why Of the Shop Schedule

is just as important to a well-regulated shop as an accurate scale is to a machinist. No reorganization of railroad shop work can be completely successful unless consideration is given to the possibilities of increased output by scheduling the work. The importance and indeed necessity of scheduling repair work on various locomotive parts in order that all may be completed at the proper time for application to the locomotive has been demonstrated time and again and needs further comment only for the sake of emphasis. The advisability of scheduling car repair work is not so generally appreciated; since the issue of June 10, a valuable article on Scheduling and Routing Systems for Car Shops was published in the August, 1921, *Railway Mechanical Engineer*, page 502.

A new adjective was used recently by a railroad man to describe many machines now employed in railroad shops and enginehouses. He called them

### Machine Equip- ment Limits Output

"prehistoric." While this term cannot be accurately applied to any machine tool the fact is that much of the machinery now in use was designed in the time of carbon-steel tools and before high-speed steel was introduced. The result is that these machines are absolutely unable to stand up under the heavy cutting feeds and speeds possible with modern high-speed steel tools. In order to speed up the work and save much money that is now being spent in wages, antiquated machines should be retired and replaced by those capable of modern high production.

Besides being deficient from a production standpoint, many of the old machine tools are not equipped with up-to-date time-saving features. For example, the operations of boring and facing a driving box can best be performed on a boring mill equipped with an adjustable, self-centering chuck. This work is being done at one shop as follows: The driving box is first bored on a horizontal boring, drilling and milling machine, after a large amount of time is consumed in setting

up the driving box and as much more in taking the cut. The second operation is to transport the driving box to a 36-in. engine lathe and clamp it to the face-plate for machining the hub face. The difficulty in handling a heavy driving box by means of chain falls, and fastening the box to the lathe face-plate can readily be imagined. Centering the box and adjusting the clamp requires several trips around the lathe and finally the hub is faced off by a tool in the cross slide tool post. These two operations of boring and facing required at least six times as long as should have been necessary, owing to the lack of a modern boring mill. The important point is that this practice is followed not at some small shop but at the largest shop of a trunk line system.

The use of automatic and semi-automatic machinery for the production of duplicate parts in railroad shops was mentioned in the article of June 10 but at least one of our readers did not think sufficient space was allowed for the subject. It is apparent that railroad men more and more appreciate the need for centralized production departments equipped with automatic machinery for the manufacture of duplicate parts. The increased output due to the installation of automatic machinery wherever the volume of work warrants, will pay ample returns on the investment.

The question of what parts can be economically manufactured in railroad shops and what should be purchased from outside manufacturers can be settled

### The Manufacture of Standard Repair Parts

only by an accurate knowledge of the relative costs. This involves finding the detailed costs of manufacturing in railroad shops for comparison with the quotations of outside manufacturers for the work in question. Railroad shops have certain facilities for the repair and maintenance of cars and locomotives but many of them do not have equipment to manufacture store house materials.

In this connection, another railroad man writes, "It is apparently the belief, or has been under former conditions, that it pays a road to manufacture more or less of its repair and maintenance materials, a few having gone to the extent of including locomotives and cars . . . Here again comes in the acid test of shop costs which, owing to labor markets, location relative to material markets, size of road, and quantity production facilities, all have a bearing and prevent the formation of a general rule which will cover.

There is no question of the necessity of manufacturing activity to get railroad equipment into shape if we are to have general trade improvement and movement and whether the manufacturing for the roads is to be done by the roads or by manufacturers, must be worked out on the basis

determined as a desirable policy. The spirit and co-operation of railway supply manufacturers is well known. Being generally specialists, their facilities and costs, are more accurately determined than is possible on a railroad and are reflected in their prices, which if measured against the railroad costs, accurately computed, would place the business where it belongs."

Regarding the need for practical and conservative specifications for railroad material, we cannot do better than quote from a letter recently received as follows: "A uniform practice as to specifications if followed by all railroads, would certainly reduce the cost of the materials and probably could increase the quality of the material appreciably and yet be subject

#### General Material Specifications

to a reduction in cost. At the present time there are too many specifications, and regardless of what they call for, the manufacturer will quote a higher price for specification material than for the materials which we would furnish to his own specifications or to the American Society of Testing Materials' Specifications.

"If all the engineering societies and mechanical organizations could agree to follow some one standard specification, it would probably accomplish the desired result. It does seem foolish to have specifications duplicated, as for example: specification for cast-iron wheels, where the American Railroad Association and the Wheel Manufacturers' Association have old specifications which are the result of years of experience and are probably the best of the kind that can be issued at the present time."

## Terminal Facilities for Modern Locomotives

Owing to the present comparatively small traffic, practically all engine terminals are able to turn the necessary locomotives without difficulty and not so much is heard about terminal needs. It is to be hoped, however, that railroad men will not be like the man who, "Did not shingle his house in fair weather and could not when it rained." Sooner or later there is bound to be a revival of traffic which will once more show up engine terminals as one of the weakest links in the railroad chain.

Past experience has demonstrated that many engine terminals are decidedly inadequate in equipment and unorganized as to methods of handling the work. It is felt that many railroad men fail to appreciate the seriousness of this condition and the vital importance of engine terminals as a factor in efficient railroad operation. Otherwise, how account for the reasoning by which \$65,000 is spent for a modern locomotive and no adequate means provided for taking care of it? Delays to the locomotives will soon cost more than enough to make at least a few of the essential terminal improvements. It has been well said that "There is nothing that will cause as much slowing up on a railroad as a poorly designed engine terminal and expecting to do the work on the modern locomotive in a shed without necessary equipment. It was all right 40 or 50 years ago when the locomotives were small and one man could pick up a main rod or a side rod, but with modern power better facilities

#### Present Terminal Facilities Inadequate

are needed and yet you still find a great many of these old enginehouses being used to take care of modern locomotives."

Except for a relatively few modern terminals, most engine terminals are badly in need of improved coal, ash and sand handling facilities. This fact was strongly pointed out in the article of June 10 and received favorable comment from railroad men. While in most cases money is not available for

#### Improved Enginehouse Equipment Badly Needed

the construction of new engine terminals, the installation of hot water boiler washing and filling equipment together with modern machine tools designed to handle roundhouse work quickly and cheaply can be accomplished at relatively small expense and earn a large return on the investment. The practice of transferring to roundhouses the old machine tools practically worn out and too antiquated for back shop use may be justified in a few special cases but as a rule is false economy. This fact is testified to by many roundhouse foremen who have to get along with the old machines.

One of the important points brought out in connection with engine terminals was the need for greater co-operation between road men and roundhouse forces. To quote from one mechanical officer, "Outside of legacies left by the Railroad Administration during the period of federal control which will excessively handicap the mechanical department until their elim-

#### The Road Men Can Help

ination, one of the greatest obstacles today in the successful administration of the mechanical department is the seemingly non-correctible misuse of equipment by road men. Hundreds of dollars are expended uselessly and hundreds of locomotive out-of-service hours are experienced through either negligence, ignorance or carelessness on the part of the engineer in not placing in the hands of the enginehouse foreman the proper information in connection with the locomotive. It is common to see on reports of enginemen, 'Engine blows left side,' or 'Engine pounds left side.' Embraced in these two complaints are a dozen and one locations where the trouble might occur. This burden is placed entirely on enginehouse forces and their time is expended in locating something that should be stated plainly on the report." While this is a somewhat severe arraignment of the road men and in reality would probably apply to only a few of them, it is felt that there can be a much closer co-operation between road men and roundhouse forces. Railroad men in all branches of the service must be taught that the careful, efficient use of equipment is necessary to increase the ratio of operating income to operating expense. This will benefit in the end not only investors in railroad securities but railroad men and the general public as well.

The designer also has the opportunity to assist in locomotive maintenance by designing locomotive parts requiring roundhouse attention so that they will be as simple, rugged, and accessible as possible. The fact should be remembered that locomotive running repairs are made at terminals where the equipment and machinery is limited as compared to that at back shops. The importance, therefore, of designing parts so that they will be readily accessible can hardly be overestimated. Maintenance expense will be greatly reduced by the simple, rugged design of locomotive parts which should be standardized wherever possible. In cases where parts are made in pairs, it is also a great advantage to have them interchangeable, right and left. This will result in carrying fewer parts in stock and by having these parts always available, many locomotive terminal delays will be prevented.

In reorganizing railroad shops and roundhouses, probably the most essential need is for accurate facts on which to base new policies. To quote from a letter recently received, "There never was a time in railroad history when facts were more necessary than at present to determine policies and practices which shall govern the reorganization of the altogether shot-to-pieces mechanical departments of most of the railroads. The

total disruption brought about by the events of the past few years in morale and the product per man on the railroads, be he laborer, apprentice, mechanic, foreman or big boss, leads one to question whether the effort should be to line up say 'pre-war' on all policies or whether the signs of the times point to departures in practice—what is basically right when the facts are known may be basically wrong if they are not." Here again questions of policy and practice must be decided by what has been so well called, "the acid test of shop costs."

The same writer goes on to say, "I find by my personal contact with the average mechanical department man that he is a progressive fellow and endeavors to render to his company the most economic service that he can. He is continually looking for improvements, asking for them, praying for them, and seeking for them. The greatest trouble is to get the money necessary for these up-to-date labor saving, time saving devices and facilities." The answer to this statement is found in the last paragraph of the article of June 10 which quotes the superintendent of motive power as saying that in his experience recommendations based on facts are usually acted upon both favorably and promptly.

The question is how can a railroad executive differentiate between facts and mere expressions of opinion. It is surprising how wide a diversity of opinion may be found regarding almost any question of railroad shop or roundhouse practice. In a way, however, it is not so surprising since for many minor operations there are several, perhaps equally good ways of performing them. Before any important change in method or installation of new machinery, however, a carefully prepared statement should be made, setting forth the facts and advantages in the case. The care with which this report is prepared and the inclusion of all contributing factors will make evident at once to any railroad manager whether the report is really based on a careful study of the situation or whether it is simply an expression of individual opinion. In the latter case, it should be turned down, and in the former, it will probably receive favorable action.

If necessary certain parts of the statement, selected at random, can be checked for accuracy. For example, before installing a shop turret lathe or water ash-pit, it is possible to balance accurately all details of cost of application against the resultant savings when it becomes a matter of simple arithmetic as to whether or not it will pay to make the installation. If railroad mechanical men are as anxious for needed improvements as would be indicated by the last quoted statement, they should submit the facts in the case to those in authority. "Recommendations based on facts" will in most cases receive prompt and favorable attention.

# Railroad Funding Bill Reported Favorably to Senate

Committee Votes 7 to 2, to Refer Bill to Senate—Refuse  
to Hear Testimony of Labor Leaders

WASHINGTON, D. C.

THE ADMINISTRATION's railroad funding bill was ordered favorably reported to the Senate on August 17 by the Interstate Commerce Committee by a vote of 7 to 2. Senator LaFollette, Republican, of Wisconsin, voted with Senator Stanley, Democrat, of Kentucky, against reporting the bill, while Senator Pomerene, Democrat, of Ohio, voted for it. The amendments agreed upon by the committee on Tuesday were incorporated in the bill, including a provision to extend the life of the War Finance Corporation to July 1, 1922.

The bill would authorize the War Finance Corporation to use no more than \$500,000,000 to purchase the securities of the railroads from the Railroad Administration and to prescribe interest rates upon securities hereafter accepted from the carriers. It developed during consideration of the bill on Wednesday that the War Finance Corporation now is attempting to form a syndicate to purchase government holdings of railroad securities and relieve the government of further railroad funding operations.

Republican leaders in the House predicted on Wednesday that the House would pass the funding bill early next week. Members of the Interstate and Foreign Commerce Committee of the House said the bill would be reported out on Thursday with the expectation that it would be sent to the Senate before the recess of Congress on August 24.

Representative Huddleston, Democrat, of Alabama, a member of the House committee, urged that other witnesses, particularly Secretary of the Treasury Mellon and B. M. Jewell, representing the railway group of the American Federation of Labor, be heard. He charged that the Erie had created a fictitious corporation to handle its shops at Marion, Ohio, for the express purpose of evading the labor section of the Transportation Act. He stated that the carriers generally had evaded orders of the Railroad Labor Board and that the Pennsylvania in particular had refused to comply with the findings of that body.

## Early Recess Expected

The Senate on the motion of Senator Lodge passed a resolution on August 16 calling for a recess from August 24 to September 21. The resolution has been referred to the House for its approval. In view of the opposition to the Townsend bill as it now stands which has been voiced by minority members of the Senate Committee on Interstate Commerce who were not permitted to prolong the hearings by introducing other witnesses, considerable opposition on the floor of the Senate is expected. Under the circumstances, passage of the bill before the recess is not generally expected.

## Committee Refuses to Hear Labor Representatives

Hearings on this bill were held up to August 12 when the failure to secure a quorum brought about their postponement until August 16 on which day they closed. L. E. Sheppard, president of the Order of Railway Conductors, and W. H. Johnston, president of the International Association of Machinists, made an effort to testify at the hearings on August 16, but the committee refused to hear them. The move to admit the testimony of these men was made by Senator LaFollette, whose request that Messrs. McAdoo and Hines be called was likewise rejected. A statement upon the refusal of the committee to hear them was issued by L. E. Sheppard and W. H. Johnston which said in part: "The action today of the majority of the Senate Committee

on Interstate Commerce . . . is a procedure of the most un-American, tyrannical and autocratic nature it has ever been our experience to meet with in appearing before Congressional committees.

"We wish to protest to the American people against this action of these Senators. This is only one more evidence of 'railroad ownership of government,' as contrasted with our demand for public ownership of railroads."

A motion to close the hearings was made by Senator Watson on August 16 and this motion was carried by a vote of 6 to 4. Senators Townsend, Frelinghuysen, Kellogg, McLean, Watson and Poindexter voted for the motion and Senators LaFollette, Pomerene, Pittman and Stanley against it.

## Mellon Urges Favorable Action

Urging early and favorable action by Congress on the bill, Secretary Mellon in a letter to Chairman McFadden of the Banking and Currency Committee of the House on August 11 said that the War Finance Corporation had no available funds at present, except a credit balance of approximately \$400,000,000 with the Treasury. He expressed the belief that the bill offered a helpful and practicable plan for financing the settlement of matters growing out of federal control.

"Withdrawals by the War Finance Corporation," Mr. Mellon stated, "would involve cash expenditures by the Treasury, but it is the understanding between the War Finance Corporation and the Treasury that the corporation will finance its proposed purchases from the Director General of Railroads by the sale of railroad securities to the public, or, if necessary, by the sale of the corporation's own bonds to the public."

"Under this plan withdrawals by the War Finance Corporation would result temporarily in a corresponding draft on the Treasury, but the balance would be replenished by the deposit of proceeds of sale of railroad securities or the corporation's own bonds. I understand that the railroad securities which it is proposed that the War Finance Corporation purchase from the Director General of Railroads and subsequently sell to the public would consist not only of securities resulting from the funding of additions and betterments, but also railroad securities already acquired by the Director General of Railroads under authority of the federal control act, approved November 19, 1919, which provides for the reimbursement of the United States for equipment, and section 207 of the transportation act as amended."

On August 12, after considerable dispute and an unsuccessful attempt to obtain a quorum, the Senate Committee on Interstate Commerce postponed until August 16 further action on the bill. Senator Townsend of Michigan, acting chairman of the Senate committee, told President Harding on August 11 that he did not see how it was possible to pass the bill before the Senate recessed. Senator Townsend said that President Harding had insisted that the bill should not be tabled until the December session, as had been suggested.

## Senator LaFollette Attempts to Extend Hearings

Senator LaFollette said he had ascertained that former Director General McAdoo would be willing to appear before the committee this week and he stated that he had also cabled to Walker D. Hines asking when he would return to this country. He stated that he had received information to the effect that Mr. McAdoo was opposed to the pending legislation. In support of his motion for taking more testi-

mony, Senator LaFollette called attention to the fact that the Interstate Commerce Commission has been taking testimony to discover whether the railroads, since they were returned to private control, had been squandering their resources by paying excessive prices for the repair of their rolling stock and increasing salaries of their officers.

"That inquiry will show," he said, "that at the very time the railroads claim to be reimbursed they were increasing salaries enormously. The New York Central claimed it was not able to meet its shortage of equipment because of lack of funds. When the Interstate Commerce Commission called for the minutes of the meetings of the directors of that road during October and November, 1920, at which the situation was discussed, the road put off complying with that request and finally asked to have stricken from the record that part of the testimony showing that they were in financial straits. At the same time the New York Central was putting up claims for government assistance it was adding \$25,000 a year to the salary of President Smith and also raising the salaries of its other officers. The facts seem to show that since the roads were taken under private control they have squandered their resources.

"In view of the fact that former Directors General McAdoo and Hines have been criticised regarding their management of the roads, their view should be ascertained on these matters. I want to show that the roads have no equitable right, in view of their present management, to seek assistance from the government. If that testimony is not taken here, I will compel its production on the floor of the Senate and that will delay passage of this bill."

Senator LaFollette said that last June the committee had taken testimony of the railroad executives at which they had laid the foundation for their claims against the government and that it had been spread before the country by "organized propaganda." He said that when the railroads had presented their side of the case a recess had been taken and the other side had not been heard. He said that he expected to subject Julius Kruttschnitt, chairman of the board of the Southern Pacific, and some other railroad officers to cross examination on several of the statements which they made at that time.

"I expect to get light also from the records of the Interstate Commerce Commission," said Senator LaFollette, "on the New York Central and disclose some of its nefarious transactions."

Senator McLean suggested that even if all that Senator LaFollette had stated was true, it had no bearing on the present bill. Senators McLean and Kellogg protested against the waste of time in calling McAdoo and Hines. Senator Watson directed attention to the fact that when McAdoo was before the House committee he had admitted that his time was so taken up with his duties as Secretary of the Treasury and in other matters that he had not been able to give all his attention to the railroad directorship. Senator Watson also recalled that Mr. McAdoo had specifically stated at that time that he had no suggestion to offer except to continue government operation of the roads for another five years. It developed that a quorum of the committee could not be obtained and the matter went over until August 16.

### Liquidation of Federal Control

#### Accounts in Sixteen Months

Liquidation of federal control of the railroads will be completed by December 31, 1922. Director General of Railroads Davis testified before the Senate Committee on Interstate Commerce on August 11 when urging the enactment of the railroad funding bill. The settlement of railroad claims growing out of federal control would be completed before that date, he said. The Railroad Administration now has about \$149,000,000 on hand to settle these claims and the Director General estimated that an additional appropriate

tion of \$200,000,000 from Congress would be required to complete the settlements.

### A. H. Smith Calls on the President

A. H. Smith, president of the New York Central, conferred with the President at the White House on Monday, to whom he stated that the transportation situation throughout the country is showing a general improvement. He emphasized, however, that the railroads still are struggling with their financial difficulties.

"There is no doubt that if Congress passes the necessary legislation authorizing the War Finance Corporation to turn over to the railroads \$500,000,000, much will have been accomplished in enabling them to meet their current obligations and thereby speeding them toward a complete recovery."

The decision of the Ways and Means Committee to abolish all transportation taxes no doubt will result in increased travel, said Mr. Smith, and will materially assist the roads through the encouragement of increased travel for pleasure. He urged, however, that Congress should give particular attention to rebuilding of freight traffic, as it is from that source that greater part of the revenue of the carriers is derived.

### Two Roads Adopt Heavier Rail

THE BALTIMORE & OHIO and the Pittsburgh & Lake Erie have purchased heavier-than-100-lb. rail this season for the first time buying 130-lb. and 115-lb. sections respectively for their high speed tracks. The B. & O.'s new rail, of which 12,000 tons have been purchased, is of the R. E. section and is being used to replace 100-lb. A. R. A. on the Philadelphia division between Philadelphia and Baltimore and on the 17-mile grade between Cumberland and Grafton on the Cumberland division. This rail is 63 1/4 in. high, 6 in. wide at the base and 2 1/32 in. thick in the web as compared with the corresponding dimensions of 5 1/4 in., 5 9/64 in. and 9/16 in., for the 100-lb. A. R. A. rail. The difference

The B. & O. 100 lb. and 130 lb. Rails Compared

in the size of the two rail sections is well brought out in the accompanying illustration. Angle bars for the new rail are of the four-hole type as compared with the six-hole standard for the 100-lb. rail and are 25 in. long, this length being three inches less than that of the other bar. A further comparison in the equipment is afforded in the dimensions of the bolt, the 130-lb. rail taking 1 1/16 in. bolts whereas the 100-lb. rail was designed for one inch.

The 115-lb. rail which has been made standard for the Pittsburgh & Lake Erie is of the Dudley section. It is 6 1/2 in. high, has a 5 1/2 in. base, a thickness of web of 3/4 in. and is designed to take a 36-in. six-hole angle bar fitted with one-inch bolts. This rail was adopted by the P. & L. E. in the belief that the 100-lb. American Railway Association series B rail joints were not adequate to support actual loads greater than about 50,000 to 55,000 lb. due largely to the inadequate fishing depth available for the design of suitable anchor bars.

Night View of Yard Illuminated by High Mounted Units

## Correct Illumination for Yards and Scalehouses

Good Lighting Is Not Difficult to Obtain if Lighting Units Are Hung at the Proper Height

By J. H. Kurlander

Lighting Service Department, Edison Lamp Works

AS APPROXIMATELY 75 per cent of the revenue of railroads of the country is derived from the transportation of freight, anything tending to expedite the rapid handling of shipments should receive careful consideration. Operation is continuous and the lighting installation plays no small part as one of the deciding factors in facilitating rapid shipment of freight.

There are two main applications of light; these are the

Fig. 1.—Requirements for Proper Scale Lighting

scalehouse and its immediate vicinity and the classification and receiving yards. Both require careful consideration since the requirements are rather exact.

The tendency today is to use multiple lamps in both cases to avoid running high voltage lines around the yard. The principal requirements for scale lighting are shown diagrammatically in Fig. 1.

### The Scalehouse

In the scalehouse the beam and counterpoise must be clearly visible and at no point should glaring light sources or reflections be present, and particularly from the scale master's stand. The lighting installation of the scalehouse

serves two primary purposes; first, to illuminate the cars as they approach, mount and leave the scale, and second, to light the beam and counterpoise of the scale and the scalehouse itself. Where a slight error in weighing will interrupt the operation of the entire movement of the cars across the scale, it can be easily seen that the lighting installation must be of the first order. In Fig. 2 is shown a method of scale lighting which has worked out satisfactorily in practice and is to be recommended for average conditions. In cases where the scalehouse has no extensions to permit the hanging of units from the side of the house a framework of iron piping could be erected at a very small expense for supporting these units.

The hanging heights of the units shown in this illustration were calculated for the conditions of the scalehouse location and scale length, as shown. Where these dimensions vary greatly from those assumed in this case, it may be necessary, when installing the units, to adjust them as to direction of throw and height to obtain the desired intensity on the sides of the cars during the weighing operation.

For lighting the scale beam and counterpoise a method which has given good results makes use of three low wattage mazda lamps placed in deep bowl metal reflectors, so that the skirt of the reflector entirely shields the lamp from the scalemaster's vision. These units, which are pendant, are hung 7 ft. above the floor and approximately 12 in. to the front of and in a line parallel with the beam. The distance between units is approximately half the length of the scale beam.

### The Yard

The lighting of the yard proper is a problem, the known quantities of which are always variable. No specific set of rules can be given for even its growth is in many cases somewhat difficult to predict. In its infancy it may be a sliding

and as the demands increase it is added to from time to time until a full fledged yard is the result.

Practically every outdoor illuminant has been applied to the lighting of these yards. Some of the factors which have placed the incandescent lamp at the head of the list of available light sources are low maintenance requirements, easy replacement, comparatively fool-proof construction and simple operation, together with its high efficiency.

Two methods of applying the incandescent lamp for yard lighting have been developed; one makes use of refractor

lighting lamps are used in projectors with a spread of approximately 50 deg. The units are spaced 300 ft. apart and should be mounted not less than 30 ft. high. High mounting is always preferable in order to reduce glare to a minimum and keep shadows short. The 500-watt unit is applicable in yards of from 200 ft. to 400 ft. in width. Above 400 ft. the 1,000-watt mazda C multiple lamp should be employed in floodlighting projectors with suitable spacing and mounting height.

Data pertaining to these three types of installation is given

Fig. 2.—Method of Scale Lighting in Common Use

units and the other, floodlighting projectors. Each has its advantages and disadvantages, and each system has its adherents. One of the most serious objections to the use of floodlighting, when not properly employed, is the ever present glare evil. Where these units are mounted high, however, and their direction of throw is with or across the tracks and not opposite to the movements in the yard, their use for lighting large yards is recommended. For small yards the refractor units are to be preferred. In Figs. 3 and 4 are shown two methods of yard lighting. The first makes use of 300-watt mazda C multiple lamps in prismatic glass refractor units mounted not less than 30 ft. high, in the case of narrow yards, and spaced approximately 200 ft. apart. This system is particularly applicable to long, narrow yards whose width does not exceed 200 ft.

Where the width of the yard is greater than this and there is no opening in the center of the yard to permit the placing of another line of similar units, floodlighting projectors should be resorted to in order to secure a desirable intensity. A method of floodlighting employed for the same yard is shown in Fig. 4, the direction of throw of each floodlight being indicated by the arrows. It will be noticed that the units are staggered so that the individual cone of light from each floodlight fits into the neighboring ones, thus covering the entire yard. For this system 500-watt mazda C flood-

lighting projectors. The results from either type are bound to be satisfactory if sufficient light is employed.

### Hanging Height of Lighting Units

One of the most important factors controlling the success of yard lighting installations is the hanging height of units.

Fig. 3.—Plan Showing Method of Lighting Yard with Refractor Units

The two most exacting requirements of yard lighting can be satisfactorily met if the proper hanging height is obtainable. The two requirements referred to are as follows: Illumination of every track, irrespective of the position of adjacent cars, and illumination of every car in the yard.

A chart which shows at a glance the relation between

proper hanging height and width of yard is given in Fig. 6. At the bottom of this diagram is shown probably the worst condition to be met with in yard lighting; a coal car standing approximately in the center of the yard flanked on one side by a box car and on the other side, two tracks away, by

Fig. 4.—Plan Showing Method of Lighting Yard

another box car. By the simple projection of light rays (shown by dotted lines) to these cars from various heights at the side of the yard the correct hanging height at which these cars will all be illuminated can easily be determined.

Another bad condition is that of lighting the area between box cars on adjacent tracks. No direct light from units strung along the sides of the yard can be expected to light this area. However, with a fairly high mounting height, depending upon the width of the yard, direct light striking the upper edge of the box cars will be reflected and some light will

hanging heights for yards up to 28 tracks in width. It is exceedingly doubtful whether yards having greater widths than this will not have openings in them which will permit running another line of units, thus picking up the area not covered by the other units. For example, suppose a 14-track yard (180 ft. in width) is to be illuminated; at half the width, seven tracks (or 90 ft.) will be found a dotted line running to 38 ft.; similarly for a 20-track yard, the height is seen to be 53 ft. These hanging heights will evidently

meet the most extreme conditions and other less exacting requirements will be adequately provided for.

It will be noted from the diagram that narrow yards require hanging heights below 30 ft., but to avoid confusing

Fig. 6.—Chart Showing Correct Hanging Heights of Units for Proper Yard Lighting

reach the ground. These conditions applied to yards of widths ranging from that of four-track yards to twenty-four-track yards are illustrated at the top of the diagram. The equivalent width of yard is given in feet directly below so that in cases where the symmetrical arrangement as shown is not in effect, the yard width can be used directly for determining the correct mounting height of the units. This diagram is directly applicable to yards up to and including a 24-track yard, but for yards exceeding this width lines can be drawn parallel to the ones already shown, thus obtaining

engine-men and also to reduce glare to a minimum, hanging heights of units should, in no case, go below 30 ft.

In cases where mounting heights as shown cannot be obtained, the height nearest to this should be resorted to, but at heights less than those specified, it is evident that some of the worst conditions will not be satisfactorily met. In any event the roofs of all of the box cars must be illuminated to permit riders coming down the yard to distinguish cars and couple them with minimum danger of breakage to either car or cargo. To facilitate this, it is suggested that a narrow

strip be painted in white on each end of the box car, both on the roof and on the end of the car. This simple practice will prevent a considerable amount of breakage.

In one case where special consideration was given to this

Fig. 7.—Night View of Yard Lighted by 600 c. p., 6.6-20 Ampere Series Mazda C Lamps in Dome Reflectors and Rippled Globes, Mounted 22 Ft. High and Spaced Approximately 175 Ft. Apart

problem and the lighting installation was designed to take this into account, a saving of fully 60 per cent was effected in breakage of rolling stock due to bumping of cars with attendant increased safety to workmen.

Fig. 8.—Day View of Yard Illustrated at Beginning of This Article

Night pictures of yards showing the results obtainable with these two methods of lighting are shown in Fig. 7 and in the illustration at the head of this article. In Fig. 7 the

units are mounted very low, about 22 ft., and the resulting glare is naturally objectionable. As has been stated elsewhere, the hanging height should in no case be less than 30 ft.

That high hangings are practical is proven by Fig. 8, which shows a close-up of the poles used for supporting the units used in the first illustration.

## How Henry Can Afford Reduced Rates on His Little Railroad

**I** AM LED to take issue with the press assertions that Mr. Ford in railroad operation has worked a miracle," says a communication from Frank Tiebout of New York which appeared in the New York Tribune of August 17, 1921. "To say that any new-found methods of efficiency in railroad operation, chief of which are reported to be the raising of wages, the reduction of rates and the suspension of all traffic on Sundays, have resulted in turning a deficit into a profit is equivalent to saying that water has been made to run uphill when Ford orders it, and that all the life-long students of railroad operation like myself have been imbeciles or idiots.

"At the present critical juncture in railroad affairs, while the railroads are recovering from the damning effects of war service and government control, confronting motor truck competition which is supported by public taxation, and in a period of acute business depression, it would be a calamity if the general public were to believe the untruth, i.e., that Mr. Ford's experiment with the little Detroit, Toledo & Ironton Railroad had demonstrated inefficiency on the part of the whole army of railroad operators.

"The simple fact is that Mr. Ford has switched all of his own vast tonnage to this 400-mile line from Detroit to Toledo, turning about \$2,000,000 a year into the treasury of this railroad which it never had before, taking this money away from all of the other railroads which previously shared his business. His big shipments arriving at Toledo may be handed over to any one of several competing lines, all of whom are anxious to get it, and he is able to swap this tonnage for a similar large new tonnage for the return trip from Toledo to Detroit.

"Mr. Ford is much bigger as a shipper than as a carrier. His Detroit, Toledo & Ironton Railroad is really a mere plant facility or by-product. He is able to use it as a club to secure return tonnage from even the really great railroads and at the same time make the little 400-mile road show a profit.

"The Detroit-Toledo trip of Ford's vast shipments is but a mere fraction of the mileage of their entire journey, and if he were able, by holding forth that this railroad is a big profit maker with reduced rates, thereby to beat down the freight rates all over the country he could afford to lose a vast sum on his little Detroit, Toledo & Ironton and still be a gainer. His railroad investment would be trifling compared to what he would save on his shipments over the tens of thousands of miles of other roads.

If Mr. Ford had secured ownership of a big trunk line with long hauls he could not have offered a 20 per cent reduction in freight rates without inviting immediate bankruptcy. But with this little road he can handle the play, and apparently he and his publicity men will use it with some success to exalt Mr. Ford.

"Only the ignorant and unlearned will fail to understand the Ford railroad operation if all the facts are given fairly by the public press. But if in the interest of sensationalism the newspapers are willing to picture his simple process and the natural results as something wonderful—a miracle—a great deal of mischief may be done."

# Britain's Plans for Solution of Labor Problems

## An Outline of an Agreed Method Between the Railways and the Unions for Handling Labor Questions After August 15, 1921

L. S. EDSON

IT IS TO BE NOTED in the English Railway Bill which was introduced in Parliament in May (see *Railway Age*, May 27, page 1209) that contrary to expectation, labor was not given representation on the boards of directors of the proposed railway groups. Just prior to the presentation of this bill, the railway labor unions made known their desire not to be included on the boards of directors. They claimed that without complete nationalization of the railways such representation would be of no decided value to them and they said that they did not care to share the responsibility of control and management of the railways unless the lines were nationalized. The labor unions have, however, used the opposition of the railway owners to the government's proposed inclusion of labor representation on the boards of directors to drive a bargain with the railway owners for an agreement by which all labor matters should be handled. Events have shown that labor has given up its representation on the boards in spite of the government's advice to the contrary. Sir Eric Geddes, Minister of Transport, having remarked in Parliament that the government considered labor was making a serious mistake.

Soon after the railway bill had been presented, the railway unions and the railways agreed, in principle, to a method of handling all labor problems which will take effect when the government relinquishes control of the railways. This agreement arrived at between the National Union of Railwaymen (N. U. R.), the Associated Society of Locomotive Engineers and Firemen (A. S. L. E. & F.), and the Railway Clerks' Association (R. C. A.) on the one hand and the railways on the other, involves a national wages board which is a board of final appeal, a central wages board, railway councils, sectional railway councils, and local departmental committees.

The official organ of the N. U. R., the *Railway Review*, has published a draft of a scheme which, although it is not finally agreed to in detail, represents the principle upon which this agreement is based. The following is taken from this article:

The plan is applicable to all employees in the transportation department from stationmasters and freight agents down, also to engineering and signal employees, and rolling stock department inspectors, foremen and employees outside of shops. It does not, however, apply to the shopmen.

### National Wages Board

The National Wages Board is to deal with subjects relating to rates of pay, hours of duty and conditions of service, referred to it by the Central Wages Board when that board has failed to agree. The National Wages Board is to be composed of six representatives of the railway companies, six representatives of the railway employees and four representatives of the users of railways with an independent chairman appointed by the government.

The National Wages Board is called upon to publish the result of any investigation it is working on within 28 days of the time the matter was first referred to it. In the meantime "no withdrawal of labor shall take place nor shall there be any attempt on the part of any section of the employees to hamper the proper working of the railway on account of any unsettled matter falling within the purview of the Central Wages Board before the expiration of one month after such matter has been referred by that board to the National Wages Board."

### Central Wages Board

The function of the Central Wages Board is to deal with subjects relating to salaries, wages, hours of duty and conditions of service, or any question relating to those subjects referred to it by any railway council. This board is to be composed of eight representatives of the railway companies, and eight representatives of the railway employees, four of the latter to be nominated by the N. U. R., two by the A. S. L. E. & F., and two by the R. C. A.

It is upon this board that the heavy work really falls and it is only when a decision cannot be arrived at by agreement between the two sides that the matter will be referred to the National Wages Board. Any question raised by any of the men's unions, such, for instance, as the interpretation of the national agreement, is to be taken up directly with this board.

The expenses of the proceedings of both this and the National Wages Board are to be shared equally by the railway companies and the railwaymen's trade unions.

### Railway Council

A Railway Council is to be established for each railway (or group of railways) composed of not more than 10 representatives each of the employees and the railway (or group of railways) concerned. The employees' representatives are to be composed of two nominated members from each of the five Sectional Councils described below.

The function of the Railway Council is to deal with the undermentioned subjects which are of common interest to the employees in two or more sections, as follows:

- (a) The local application of national agreements relating to salaries, wages, hours of duty and conditions of service of the classes of employees embraced within this scheme, so far as the individual railway (or group of railways) is concerned, apart from subjects to be submitted directly to the National Wages Board.
- (b) Suggestions as to operating, working, and kindred subjects.
- (c) Other matters in which a company and its employees are mutually interested, for example, co-operation with a view to securing increased business, greater efficiency, and economy; the well being of the staff; general principles governing recruitment, discipline, and tenure of service.
- (d) Subjects referred to the Council by a Sectional Council.

### Sectional Railway Councils

Five Sectional Railway Councils are to be formed on each railway (or group of railways) for the consideration of general departmental subjects. Each of these Councils will have not more than 12 representatives of the employees and a like number of officers of the railway concerned. The 12 representatives of the employees shall be divided among the various grades of the employees in each section in proportion to the number of employees in those grades.

These five Sectional Councils are in effect councils made up of groups of grades having a common interest. For instance, one of the councils will represent stationmasters, freight agents, clerical staff, traffic and freight department inspectors and foremen, engineering, signal, locomotive and car inspectors and foremen. Another council will represent enginemmen and firemen, motormen, engine-house foremen etc. A third council will represent signalmen, passenger and

freight conductors, trainmen, porters, car inspectors, etc. A fourth council will represent the freight house employees, yardmen, etc. The fifth council will represent maintenance of way employees, signal and telegraph linemen, etc.

The functions of the Sectional Railway Councils will be to deal with all questions relating to the employees represented in their particular grades. In case of no agreement being obtained, the question is to be referred to the Railway Council and from there, in case of no agreement, to the Central Wages Board.

To facilitate the election of employee members to the Sectional Railway Councils, the railway or group of railways, is to be divided into five electoral districts, the elections to be conducted jointly by representatives nominated by the trade unions and by the railway company concerned. The employees' representatives are to hold office for three years.

### Local Departmental Committees

These committees are to be formed at points at which the number of regular employees in a department exceeds 100. The committee will consist of four elected employees in that department and four representatives of the railway concerned. At smaller points it is the scheme for the employees to discuss local matters with the companies' local officials. The purpose of this local committee is to provide a recognized means of communication between the employees and the local officials of the railway companies, and to give the employees a wider interest in the conditions under which their work is performed.

The matters to be considered by a local committee include the following:

- Suggestions for the satisfactory arrangement of working hours, breaks, time recording, etc.
- Questions of physical welfare (safety appliances, accidents, first aid, staff accommodation, etc.).
- Holiday arrangements.
- Time keeping, publicity in regard to rules, etc.
- Suggestions of improvements in method and organization of work, and labor-saving appliances.
- Investigation of circumstances tending to reduce efficiency or in any way to interfere with the satisfactory working of the railway.
- The correct loading of traffic to insure:
  - Safe transit.
  - Reduction of claims.

A local committee shall not introduce any arrangements inconsistent with the powers or decisions of the Railway and Sectional Railway Councils, or Central and National Wages Boards.

In case any local committee is not able to agree on any question it is to be referred to the Sectional Railway Council.

### Discipline

Matters of discipline are to be governed by the arrangements suggested in the report of the Royal Commission appointed to investigate and report on the working of the Railway and Conciliation and Arbitration Scheme of 1907, which is as follows:

"Offenses Against Discipline, etc.—Men charged with misconduct, neglect of duty or other breaches of discipline, should be permitted to state their defense, to call witnesses, and to advance any extenuating circumstances before their officers, prior to a final decision being arrived at. Where doubts arise, or where serious results to men are likely to follow, the cases should, we think, be placed before the higher officials of the company. Appeals after punishment lead to a difficult position, and the necessity for them should be avoided.

"If after such investigation of a charge against an employee he is adjudged guilty, and is to be punished for the offense, he shall have the right of appeal to a superior officer for a reconsideration of his case, provided that such right of appeal shall not extend to cases of a trivial character. Any such appeal must be made in writing within seven days. If the employee so desires, he may be heard in person, and in that case he may be accompanied at the interview with the superior officer by a spokesman, who may be either a fellow workman or a headquarter's official of the Railwaymen's Trade Union."

It is provided that this scheme shall remain in operation until otherwise determined by 12 months' notice on either side, such notice not to be given before January 1, 1922.

## Freight Car Loading

**A** REDUCTION of 11,789 in the number of cars loaded with revenue freight during the week ending August 6 when compared with the previous week was shown in reports of the Car Service Division of the American Railway Association. The total for the week was 784,781 cars, a decrease of 150,949 when compared with the corresponding week of 1920 and of 87,292 when compared with the corre-

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO, FOR WEEK ENDED SATURDAY, JULY 30, 1921

	1921	1,877	30,418	4,998	19,160	41,734		105,225	128,525			128,489		

L.C.L. merchandise loading figures for 1921 and 1920 are not comparable as some roads are not able to separate their L.C.L. freight and miscellaneous of 1920. Add merchandise and miscellaneous columns to get a fair comparison.

\*Detail for Mich. Cent. not included for 1919.

July 23	1921	64,919	24,689	152,142	3,928	43,126	33,655	208,316	259,574	790,348	928,418	909,682	503,926	673,219	628,308
July 16	1921	56,991	24,802	152,116	3,737	44,037	31,484	208,079	255,006	776,252	942,851	902,296	484,500	681,684	627,841
July 9	1921	38,015	21,067	126,331	3,830	34,356	26,312	180,658	209,129	639,498	796,191	809,845	434,929	633,997	554,129
July 2	1921	40,547	24,923	157,265	4,354	47,542	30,335	215,887	253,955	774,308	891,621	743,226	511,035	651,932	584,396

ponding week of 1920. The decrease was due principally to a falling off in the loading of grain, grain products, coal, merchandise and miscellaneous freight.

The loading of grain and grain products totaled 58,622 cars which was 7,794 cars below the total for the week before, but it was 21,478 cars in excess of that for the corresponding week in 1920. A tapering off in the movement of grain and grain products, however, is to be expected from now on in view of the fact that the harvest season is rapidly drawing to a close in the Middle West.

A reduction of 3,816 cars was also reported in the number loaded with coal during the week compared with the week before the total being 147,273 cars. This was 51,456 cars less than were loaded during the corresponding week last year. Loadings of merchandise and miscellaneous freight were 472,540 cars or 2,241 cars less than were loaded during the previous week and 49,693 cars below the total for the same week in 1920. An increase of 1,252 cars was reported in the loading of live stock which totaled 26,610 cars while coke loadings were 4,218 cars, an increase of 107 cars over the week before. Reports showed 32,058 cars loaded with ore which was an increase within a week of 1,955 cars. A total of 43,460 cars were loaded with forest products, which was a decrease of 1,252 cars compared with the week before.

Except for grain and grain products and live stock, decreases were reported in the number of cars loaded with all classes of commodities during the week compared with the corresponding week in 1920. The Pocahontas and Northwestern districts were the only ones to show an increase in the loading of all commodities compared with the previous week while the Southwestern was the only district to show an increase over the corresponding week last year.

### Car Surpluses and Shortages

A decrease of 13,137 in the number of freight cars temporarily out of service on August 8 because of the business depression (surplus cars plus bad order cars in excess of 7 per cent of the total), compared with the total on July 31, was shown by reports from the railroads of the country just received by the Car Service Division of the American Railway Association. On August 8, 513,040 were reported as being idle compared with 526,177 at the end of last month.

Of the total, 297,784 were serviceable freight cars which

American railroads while on July 15, it was 365,092 or 15.9 per cent.

With a slackening in the demand for grain cars, a reduction in the car shortage which has been reported in certain localities was shown by the reports. The total shortage on August 8 was 3,364 cars which was a decrease of about 540 cars compared with the shortage at the beginning of the month. A reduction within that time of approximately 500 was reported in the shortage of box cars.

Bad order cars on August 1 totaled 376,417 or 16.3 per cent of the total. On July 15, cars in bad order numbered 15.9 per cent of the total.

## Work on Detroit River

### Bridge To Begin in 1922

**A**SSURANCE of the actual construction of a great highway and railway bridge across the Detroit river at Detroit has been presented recently in the form of definite arrangements for the preliminary work. Two corporations have been organized to carry out the project, namely, the American Transit Company of New York City and the Canadian Transit Company, chartered by the Canadian Parliament, and a contract has been signed between them for joint action in financing and building the bridge. The American company has obtained authority from Congress to span the river. Plans for the structure are now assuming definite form and it is expected that actual construction will be started in 1922.

The bridge, which is estimated to cost \$30,000,000, will be a suspension span 1,803 ft. center to center of piers and 110 ft. clear above the water in the river. Provision is made for an upper deck embracing two street car tracks, two 28-ft. roadways and two 7-ft. walks, together with a lower deck providing for four railway tracks and space for public utility cables or conduits. The railway approaches will have 1.5 per cent grades and it is planned to handle trains with 120-ton electric locomotives. About 20 miles of electrified tracks will be required for the bridge, approaches and connections.

The main supporting members will comprise eight cables,

An Artist's Drawing of the Detroit River Bridge

were not needed, however, to meet current freight requirements while the remaining 215,256 were freight cars in need of repairs. Surplus box cars in good order on August 8 numbered 88,593 or a reduction of 11,614 cars since the first of the month while surplus coal cars in good repair, totaled 152,774 or 8,949 less than were reported on July 31. A reduction of 2,130 was reported in the number of surplus stock cars, which brought the total down in slightly more than a week to 12,337 cars.

Reports received by the Car Service Division showed an increase of 11,325 in the number of freight cars needing repairs on August 1 compared with the total on July 15. At the beginning of this month, the total was 376,417 or 16.3 per cent of the total number of freight cars owned by

of which six will be 21 in. in diameter and two 18 in. in diameter, the maximum tension under load in the larger cable being 19,700,000 lb., for which an effective area of 232 sq. in. will be provided. These cables will be arranged in four pairs with one cable of each pair directly below the other, the suspenders from the two cables of each pair to be connected by an equalizer so that each cable will receive its proper proportion of the load.

The approach spans will be carried on viaducts 925 ft. long rather than by the backstays of the cables. This is done to allow the approaches to turn out of the bridge tangent as well as to reduce the live load deflection in the main span. There will be four lines of two-hinged stiffening trusses which will be of the double intersection Warren type. The

two hinged construction has been adopted because it is more economical and also stiffer for railway loading.

The towers will be 330 ft. high and will consist of rockers of four columns each. They are to be hinged at the bottom through the use of curved roller nests. Each column will consist of a double box section containing from 999 to 1,191 sq. in. of sectional area. They will be erected with the use of a temporary erection base or with the aid of struts made of material fabricated for use in the stiffening trusses. The bridge piers will be sunk to a depth of about 100 ft. below water level by the pneumatic process.

One interesting feature of the plans for this bridge is the arrangement whereby it will be possible to build the bridge initially for highway and street car traffic alone if this should

### Cross-Section of the Proposed Bridge at Mid Span

be found necessary because of a failure to perfect arrangements for the use of the bridge by the railways by the time construction is to begin. This will be done by leaving off the lower deck and the lower tier of cables as well as one set of diagonals in the stiffening trusses and some of the metal in the bottom and top chords of these trusses.

The estimated dead load of the bridge is 37,700 lb. per ft. and the designing live load for the railway tracks is Cooper's E 60. The design stresses are given in the table below:

TABLE OF UNIT STRESSES IN LB. PER SQ. IN.

	For D.L. + L.L. + Temp. or D.L. + Temp. + Wind.	For D.L. + Congested L.L. + Temp. or D.L. + L.L. + Temp. + Wind.
Wire—Main cables . . .	85,000	160,000
Suspensers . . .	40,000	50,000
Alloy steel . . . . .	30,000 (—120 1/r)	45,000 (—150 1/r)
Structural steel . . . . .	20,000 (—80 1/r)	20,000 (—80 1/r)

The design and construction of this bridge is under the direction of Charles Evan Fowler, consulting engineer, New York City, who is chief engineer. A board of consulting engineers has also been organized with Mr. Fowler as chairman, the other members being George H. Pegram, chief engineer, Bureau of Rapid Transit Company, New York City; William H. Burr, consulting engineer, New York City; Professor C. R. Young, University of Toronto, and Colonel C. N. Monsarrat, consulting engineer, Ottawa, Ont., who was a member of the Board of Engineers of the Quebec bridge.

## “Get the Safety Habit”

NEARLY FIVE THOUSAND persons were killed or injured in the year 1919, in automobile accidents at highway grade crossings in this country (1,232 killed, 3,558 injured) and it is estimated that the total for 1920, when it comes out, will be close to 8,000. These and other significant statistics were given in an address at Chicago on May 17 by Homer W. Davis, general attorney of the Atchison, Topeka & Santa Fe, before the Chicago Safety Council. The Baltimore & Ohio in the month of April at its Chicago crossings found 550 instances where the driver of an automobile

in crossing the tracks failed entirely to either look, listen or take any precautions.

Continuing Mr. Davis said: "The size of our country and the volume of its railroad traffic require that heavy trains be run at high speed. By law and by common consent and desire, these trains are given the right of way over highway traffic. Grade crossings have been in the past and for a considerable period in the future will be a necessity. There is at least one for every mile of railroad in the United States, and it costs around \$50,000 to construct an underpass. At the present time, railroad treasuries are exhausted and the same condition obtains in connection with the operations of our municipalities and the state and federal governments. Extensions and additions to existing railroad facilities will absorb all surplus revenues for some time to come, and all will agree that their relative importance as compared with grade crossing elimination is such as to make it right and proper that the latter be deferred for the time being. No general campaign of grade crossing elimination can be carried on under existing conditions.

"Large numbers of crossing gates are broken down each year; flagmen are run over and killed or injured. On one railroad, during the last 15 months, 150 automobile accidents occurred of which 48, or about 30 per cent were the result of the automobile running into the side of the engine or train. On all railroads the proportion of the number of cases where the automobile runs into the side of the engine or train is astonishingly large. Railroad engineers are constantly complaining that their nerves are being shattered by near-accidents. One engineer of a large railroad resigned the other day because he said he could not stand the strain any longer. On account of the wide-spread practice of driving cars at a speed of 20 to 25 miles an hour right up to the railroad and then bring them to a sudden stop, the engineer is unable to tell until the last second whether the driver sees the train or not, and great numbers of accidents occur by reason of the fact that the driver tries to beat the train. In fact, our experience is that the great majority of accidents occur at crossings where the view is perfectly open and unobstructed. In accordance with the law of Illinois, the State Public Utilities Commission has designated a large number of crossings as extra hazardous. But every crossing is hazardous. At the crossings so designated "Stop" signs have been erected, and the law provides that upon approaching *any* railroad crossing the person controlling the movement of any self-propelled vehicle shall reduce speed to ten miles an hour and shall stop at points where stop signs are erected. Failure to stop is punishable by fine. If public opinion could be aroused, laws on this subject would be unnecessary, but sympathy is always with the injured person, and local papers seldom explain that the cause of an accident was gross carelessness on the part of the driver.

"There is but one rule to follow when about to pass over a railroad track and that is not to do it unless you are absolutely sure that no train is approaching from either direction or on either track. One does not need a book of instructions as to how to do this, because ordinary common sense shows what to do in any particular case. A railroad track should be a sign of danger to everyone. It should galvanize him into action at once. He should make it a habit to slow down, regardless of how smooth the crossing or how unobstructed the view; and regardless of whether the crossing is protected by gates, or other safety devices; for these may fail to work. Furthermore, the practice of slowing down and looking at the so-called protected crossing helps you to acquire a valuable habit. The Santa Fe slogan, the mandatory phrase 'Get the Safety Habit' has always seemed to me most appropriate. A chain is no stronger than its weakest link and even though you practice habits of safety you cannot be assured of immunity unless others do likewise. Consequently our own personal interests require us to exert our efforts to pass along safety habits to others."

## Should the Railroads Repair Their Equipment?

Because of Accounting Methods, Many Important Factors Are  
Not Taken Into Consideration

THE QUESTION of whether or not a railroad should make heavy repairs to its rolling stock and equipment is attracting much attention. The business of a railroad is to provide transportation and its accounting system is arranged to show the cost of producing transportation rather than to disclose the cost of performing any incidental service. For this reason it is almost impossible to make any fair comparison between the cost of repairing equipment in a railroad shop and in an outside contract shop from the records usually kept by the roads. There are certain contract shops which have been designed to make locomotive and car repairs and it is necessary in order that the railroad management may intelligently decide the question of where the repairs may best be made to have a thorough understanding of the various factors which are involved in a correct determination of the costs. If these factors are known and understood, then undoubtedly, even though it may not be possible to secure detailed costs, a far better approximation of the cost of doing the work in railroad shops can be had than is now possible.

The cost of repairing a piece of equipment includes, (1) the cost of materials used in the work, (2) the cost of the labor performed in doing the work, and (3) the overhead costs or burden, which includes the cost of providing and maintaining an organization and facilities by the use of which the work is done.

It is fairly easy to secure a reasonably accurate distribution of the material and labor costs. The material costs to be strictly accurate must, of course, take into consideration the wastage of material and credits for the recovery of salable scrap material. Even in a manufacturing concern with exceptional facilities for cost accounting there may be great difficulty in securing a proper distribution of some of the detailed costs; this is ordinarily covered by absorbing this part of the materials cost in the overhead and distributing it on such a basis as to secure substantially accurate results.

In a contract shop a large part of the labor can be distributed accurately to the different jobs by the use of time cards or the presence of checkers. In spite of this a large part of the labor including such operations as cleaning the

plant, handling the material, etc., cannot be assigned directly but is included in the overhead and distributed as accurately as possible. Unfortunately, so many different kinds of jobs are ordinarily handled in a railroad shop that many of these indirect labor costs are not even considered or are not given the weight that they should have in determining the cost of any particular job.

### The Surcharge or Overhead Expenses

The greatest difficulty with accounting in the railroad repair shop is that it does not afford any real basis upon which to determine the overhead with even approximate accuracy; on the other hand, a contract shop goes into these details with the greatest degree of accuracy. For instance, repair jobs on a railroad are ordinarily not charged with any of the expense of the executive and administrative officers and offices. Usually no attempt is made to distribute the cost of management and superintendence to individual repair jobs. No part of the cost of maintaining and operating the plant is normally charged to the individual repair job and some of it is even charged to maintenance of way of structures or to the transportation accounts. No attempt is made to charge against individual repair jobs certain losses and costs in the handling of materials and supplies. Labor costs in railroad accounting are normally made up by trades or occupations rather than according to performance and the assignment of such costs is therefore inaccurate. The railroads do not normally charge against the work the full cost of the transportation of materials and fuel over their own lines.

To repair railroad freight cars, for instance, requires an establishment in the form of a plant equipped with much costly machinery, furnaces, air compressors, power generating and distributing machinery and a large investment in consumable tools and in small equipment. To have such machinery and equipment buildings of an extensive character are required. Also large areas must be made available for storage, erection and shipping yards having adequate trackage and other facilities for receiving and handling materials and for the movement of the cars being repaired. Such an establishment is necessary for economical freight car

repair work whether done by a railroad or by a contractor specializing in the field.

If is self-evident that the maintenance of such an establishment entails labor and expense, the benefits of which do not appear directly in the output of the plant. The machinery must be repaired or replaced when worn out, power must be supplied to operate it, and labor must be employed to maintain and keep in repair the buildings, tracks, fences and other facilities, to keep the establishment clean and ship-shape and to receive and handle the materials and supplies incident to the operation of the establishment. Clerks must be employed to record the transactions involved, to keep the time of the labor employed, to maintain proper inventories and to conduct correspondence. Superintendents and foremen must be employed to supervise and direct the work, managers are required to co-ordinate the activities of different departments, purchasing agents are necessary in the procurement of materials and supplies, and other officials and employees are concerned with the fiscal, selling and operating problems of the business. All such elements of cost as these go to make up the total of overhead or operating expense of the concern.

All or many of such expenses or so-called "overhead" would be extravagant and ill-advised were it not for the fact that experience teaches that establishments so organized and so equipped can, because of their superior organization and elaborate labor saving equipment, produce a given output of repair work at a lower net cost than simpler and less efficient establishments which must depend more largely upon manual labor assisted only by more simple tools and machinery. Within certain measurable limits and under normal operating load, therefore, the best equipped establishments, or those having the largest aggregate overhead expenses, are usually the most economical; that is, the overhead arising from the presence of an expensive machine may be less than the cost of the labor it supplants.

### Overhead in a Contract Shop

A contract shop keeps an accurate record of overhead costs, which is usually arranged to include such items as the following:

1. Plant management and superintendence
2. Assistant superintendents and foremen
3. Shop accounting and timekeeping
4. Shop clerical and office expense
5. Engineering and drafting
6. Stores department
7. Depreciation
8. Repairs
9. Replacements
10. Heat, light and power
11. Fuel
12. Lubrication
13. Over, short and damage
14. Shipping freight and express
15. Receiving freight and express
16. Traffic expense
17. Yard switching expense
18. Inspection
19. Fire protection
20. Police protection
21. Employment expense
22. Welfare expense
23. Pensions
24. Safety first expenses
25. Insurance
26. Taxes
27. Unloading and handling material
28. General yard labor
29. Sorting and reclaiming materials
30. Dies and formers
31. Patterns and templates
32. Water
33. Telephone and telegraph
34. Inventory
35. Office supplies
36. Hand tools and shop supplies
37. Scrap
38. Clean-up expense
39. Royalties
40. Rent
41. Miscellaneous shop expense

### ADMINISTRATIVE EXPENSE

1. Salaries and expenses of general officers and general office employees
2. Legal expense—general office
3. Purchasing department
4. Depreciation
5. Repairs
6. Insurance
7. Engineering and estimating

It will be noted that many of these items are made up solely or largely of labor which cannot be assigned directly to any one job.

To secure the best results from any plant it is necessary that it be operated to capacity. It is probably easier to do this with a contract shop which serves a number of railroads than where a plant is operated by a single road. This, of course, will reduce the amount of overhead per job.

With a possible few minor exceptions all of the elements of costs which accrue in the case of a contract shop accrue also in the railroad shop. That the railroad leaves entirely out of consideration many of these items is no reason that they do not exist; they are simply overlooked or not recognized, but the work costs just as much as if they were. It is often said that the administrative overhead does not amount to anything on a railroad. This is begging the question for surely with the amount of repair work which is being done and the many decisions which must be made of problems respecting it, the repair work should carry its proper share of the burden.

Every physical feature of a railroad shop plant like a contract plant is subject to depreciation. In general, it is believed that the rates of depreciation employed by the railroad are much lower than they should be. The instructions of the Interstate Commerce Commission permit accounting for depreciation and other similar items to be made not on a basis of accruals but upon a basis which permits the charging of the ledger values less salvage direct to operating expense at the time the property is retired for replacement. It is obviously impossible, therefore, to determine the expense due to depreciation to any given order or any given class of work.

Then there is the matter of obsolescence. It has been said that this country is dotted with the sites of abandoned railroad shops but the losses have never found their way into the cost of maintaining equipment. When a facility of this type is abandoned its book value is usually written off to operating expense.

Costs of incidental shipping of materials in yards by locomotives in regular switching service is, according to the rules of the Interstate Commerce Commission, chargeable to transportation accounts and therefore does not appear in the shop costs. In like manner the rules of the Interstate Commerce Commission treat the cost of repairing the buildings, tracks, fences and similar structures as an element of the expenses of maintaining the roadway and roadway structures.

The factors above noted do not cover all of those things which might be considered in an article of this sort, but they are sufficient to indicate that greater care must be given by practically all railroads to determine whether it is better to assign heavy repair work to contract shops or to do it themselves. It will be noted that the term heavy repair work has been emphasized throughout this article. For various reasons it will be obvious that the so-called running repairs can best be made by the railroads themselves.

GOVERNOR NATHAN L. MILLER of New York, making a tour of the State Canal, makes speeches along the way, and at Schenectady he said:

"Here is a capital investment of \$165,000,000, with probably ten millions more to be spent in the completion of the terminals and with two millions and more a year required for maintenance, yet the people do not seem to know they have it. We must devise some way of selling this proposition over again."

# Water Treatment---Intermittent or Continuous

## A Discussion of the Comparative Advantages and Disadvantages of Each System

By W. R. Toppan

Manager, Railroad Department, The Graver Corporation, Chicago

THAT THE USE of purified or softened water produces great savings in railroad operation is almost universally realized, but there is not quite such a clear understanding of what is the most economical type of plant for this purpose. Two general types are used—the continuous softener and the intermittent softener. The purpose of this article is to discuss the comparative costs and comparative advantages of these two types, including a study of the operation and maintenance costs and the comparison of the average results obtained from each type.

At the outset it is well to call attention to the fact that in the present stage of water softening no comparison can be

ously and the energy of the flow of the water as it enters the plant is usually utilized to operate mixing applications. On the other hand there are intermittent plants so designed that the water is first passed into the plant without chemical, after which the chemicals are added in a batch and the mixture thereupon agitated for a short period by power furnished from an outside source. There are estimated to be approximately 650 treating plants in railroad service. About 30 per cent of these are of the intermittent type and the greater portion of these in turn conform to the above design. A comparison between the two types of softeners as thus represented therefore is the basis for the study of this subject. As the company represented by the writer handles practically all types of water softening plants or equipment, and practically all companies selling to the railroads handle the continuous type of softener, this article cannot be construed as a criticism of any particular make of machine.

### Ground Space

Naturally, among the first points to be considered in the installation of any water softening plant, are the ground space available and the foundations which are necessary. Too many times these features, especially the foundations, are not thoroughly considered before the design of plant is adopted, and this frequently leads to a higher first cost than was originally figured. Even though there was no choice between the two types of machines, the amount of ground space available for a softening plant many times requires an installation which will take up the least area. This feature becomes of especial importance at locations where large capacity plants are required, such as at division and terminal points. At such points, ground rentals or purchase prices are high. The right of way grounds are valuable and it is very seldom that the railway considers it advisable to purchase space for the installation of a water softening plant. It is of utmost importance, therefore, to have an accurate idea of the comparative amount of ground space necessary for a continuous plant, as compared with an intermittent plant.

A convenient comparison may be made between two plants each of 10,000 gal. treating capacity per hour. The continuous type of plant, designed to afford five hours' settling time and to permit the treated water to flow by gravity to the roadside tank, is provided with a tank 14 ft. in diameter and 35 ft. high. The chemical proportioning tank may be installed on the top of the settling tank, in which case it will require no additional ground space. If it is located on the ground level, it will require housing approximately 12 ft. by 14 ft. for protection to the chemical tank, piping, etc. The entire ground space occupied will be 154 or 322 sq. ft., according to the location of the chemical proportioning outfit.

An intermittent plant of the style represented and of the same hourly capacity will require two tanks, each holding 60,000 gal. This is necessary because about two hours must be allowed for filling and it is generally agreed that four hours should be allowed for the settling process. This means a six-hours' holding capacity for each 10,000 gal. of delivery capacity. A 60,000 gallon tank is 24 ft. in diameter by 20 ft. in height, and two of them are required. Where a filter is used, space approximately 10 ft. in diameter will be required and a chemical tank about 5 ft. in diameter.

A 10,000 Gal. per Hour Continuous Softener

made which will apply exactly in all cases for the reason that much variety exists in plants of the same type. Not only is this true but there is a similarity between some plants of different types now in use to a degree where scarcely nothing remains to distinguish one type from the other, but the fact that in the one, treated water already settled and ready for use is being produced at the discharge end of the plant at the same time as the softening process is being carried on at the inlet end, while in the other, the two operations are carried on at different times.

There are, however, numerous features which though perhaps not limited to, are nevertheless typical of continuous softeners while other features are peculiar to the intermittent type. For instance, in the continuous type a definite quantity of chemical is added to a definite quantity of water while the water is flowing into the plant, the reaction between the chemicals and the water is made to take place continu-

The housing then, in addition to the space occupied by the two tanks, will occupy approximately 18 ft. by 24 ft. The total ground area for the intermittent plant will be about 1228 sq. ft. or three or more times the space required for a continuous plant of the same capacity. The comparative difference between the two designs is clearly shown in the ground plan illustrations.

### The Foundation

Because of the fact that foundations for water softening plants are usually installed by the purchaser, and not by the contractor who puts in the water softener, the comparative costs of foundations are sometimes overlooked, or given only superficial attention. Buyers are sometimes led to purchase plants on the cost of the equipment alone. It requires only a glance at the foundation plans to show that the assumption that the foundation costs of the continuous and intermittent plant will be the same is far from correct. In figuring the cost of the intermittent plant, there must be added the difference in cost of the foundations for the continuous type softener. A single foundation for the settling tank is required and this foundation consists of a panel of concrete one foot larger in diameter than the main settling tank. In the continuous plant a concrete foundation 15 ft. in diameter and 4 ft. deep is the usual practice. The foundation is cored out in the center, the core being about 7 ft. in diameter and 3 ft. deep. The foundation for the main settling tank and for the housing and sludge pit will require about 30 cu. yd. of concrete which, at \$13 per cu. yd., would make the cost of the foundations \$490. Very little form work is required in building these foundations.

The intermittent softener requires two tanks 24 ft. in diameter by 20 ft. high. The practice is to install 12 piers under each of these tanks, each pier being approximately 6 ft. deep with a top 2 ft. square and a bottom 4 ft. square. Two of these tanks will require 24 of these piers and in order that the proper head of water may be obtained it is the practice to elevate this tank high enough to get all of the water out of the settling tanks. This means that it will necessarily have to be several feet above the ground. The foundations for the intermittent softener, therefore, will require approximately 70 cu. yd. of concrete, and, owing to the form work necessary, they will probably cost \$15 per cu. yd. or a total of \$1,050, including foundation for filter and housing. Besides this, there is an additional expense for this foundation work on account of the necessity of using large main sills, which are usually 10 in. by 12 in., and chime joints which are usually 3 in. by 10 in. or 12 in. These additional joints will run the cost of the foundation up another \$500 or \$600. Thus, the cost of the foundation work for the intermittent plant will run between \$1,550 and \$1,660, while the cost of the foundation for the continuous softener of the same capacity will be only \$490.

### The Pumping Equipment

In the case of the intermittent type of plant, two pumps are required where it is necessary to have storage while with the continuous type plant only one pump is required. By the definition of a continuous plant—the admission of water and chemicals at the same rate at which water is withdrawn—the requirement for pumping will be a pump of 10,000 gal. per hour capacity. Water is pumped directly to the top of the settling tank and thence flows by gravity to water cranes or roadside tanks from which locomotives take their supply. In the case of a pumping station already in existence, the same deep well pump would be sufficient to supply a continuous plant. No second pumping is required.

The requirement for the intermittent plant under consideration is a pump of a capacity to fill a 60,000 gal. tank in two hours, or 30,000 gal. an hour. In addition, a pump of 10,000 gal. capacity is required to lift water from the set-

ting tank to the roadside storage tank after the water has been discharged from the larger capacity pump into the settling tank. The storage tank is elevated at a sufficient height so that water flows by gravity to the locomotive tenders. The intermittent plant, therefore, in addition to requiring two 60,000 gal. tanks in place of one 50,000 gal. tank for the continuous plant, also requires two pumps, one of 10,000 gal. hourly capacity in place of the single pump of 10,000 gal. hourly capacity required by the continuous plant. It is also perfectly plain that the amount of piping and valves required will be much greater in the intermittent plant than in the continuous.

In figuring then on the comparative costs of an intermittent and a continuous plant careful consideration should be

Foundation Plan, Intermittent Softener

given to the overhead depreciation and maintenance and operating cost of the additional pump required together with its extra piping, valves, etc. Pumping costs are a never-ending charge against the water softening plant and any excess cost in pumping means a charge which will be multiplied over many years. The following figures furnished by one of our leading Western railroads indicates how these costs may pile up during a short time with an intermittent pumping plant.

1. Pumping—\$400 per month—(necessary for either a continuous or intermittent plant).
2. Pumping—\$300 per month—(Not necessary with a continuous softener).

The cost of \$300 per month is equivalent to \$3,600 per year, which is equivalent to a 10 per cent interest and depreciation charge on a \$36,000 investment. Therefore, a greatly increased capital expenditure would be justified in order to eliminate this extra pumping. Yet with the continuous machine, which does this, the actual cost is lowered.

### Housing

For the intermittent softener with chemical tank and pumping equipment it is evident that a larger housing is required than is necessary for the continuous machine. The intermittent softener housing must contain one or two unit pumping outfit and a chemical tank and ample room must be provided for the operation of all valves and for the storage of chemicals. It is also evident that two roofs are required for the intermittent softener, one over each of the settling tanks, where only one room is required on the continuous softener. In the continuous type the upper housing is made

Foundation Plan, Continuous Softener

just large enough to house the necessary equipment located there. In some cases this requires nothing except a room and a lower housing large enough for a chemical tank with the necessary storage space for lime and soda ash. Thus the expense of the housing and roofs in the intermittent softener is about double that of the continuous softener. Since the railway usually furnishes the buildings and housing it is evident that these figures are not usually included in the contract for a water softener, but it is also perfectly evident that they cost money, and this cost should not be overlooked.

One of the indirect effects upon operation of the greater initial cost of site and construction of the intermittent type of plant, is a tendency to construct a plant adequate only for normal requirements, neglecting the consideration of the effects of extraordinary demands upon the capacity. At railroad terminal points it is not an unusual occurrence for sudden and heavy extra demands to exceed normal consumption. The more closely the capacity of the plant has been proportioned to ordinary demands, the greater is the likelihood of its capacity being frequently overtaxed. In the continuous machine the flow of water is limited only by pump capacity and ordinarily, the plant may be operated for short periods up to considerably above its rated capacity without the probability of causing trouble from foaming. In the case of plants of the intermittent type, this is not the case and the usual recourse in practice is to take water from the second settling tank before the expiration of the time essential for complete reaction and precipitation. This is certain to result in foaming of a more or less serious nature, besides putting the treating plant out of commission temporarily so that no further supply of treated water is available. This also accounts for some of the deposits commonly found in pipe lines leading from intermittent softeners.

### Operating the Plant

A primary requirement of an efficient water softener is that the chemicals shall be accurately proportioned to the water treated. In the continuous softener this is usually

accomplished automatically, where in the intermittent softener under consideration the quantities, both of the water and chemical for each treatment, are measured out by the operator. Theoretically, there should be no practical difficulty in introducing into a tank of water, the amount of chemicals necessary to reduce that water to a certain minimum of degrees of hardness. In practice, however, one cannot always be sure that the reaction chamber of the intermittent plant will always be filled accurately with the number of gallons of water to which the chemical charge has been proportioned. Furthermore, the water is not always drawn off to the same level so that there is always a possibility of a charge of raw water being put into the tank to bring it up to the correct level which is not the exact charge required.

It has sometimes been stated with reference to softeners of the continuous type that there is no absolute measurement of the amount of water going through it nor any absolute measurement of the quantity of chemicals introduced. But this is erroneous as it is not difficult to estimate or control the flow of water through a measured orifice under a given head and the fact that softeners have been operated so as to run with a range of variation of one-half grain for weeks at a time indicates that both water and chemicals were fed and proportioned accurately.

The comparative methods of preparing the chemicals is also an important item in this connection. In the continuous plant under discussion the chemical charge is prepared once in 12 hours. In the intermittent machine a new charge is made every 4 hours. There are, therefore, three times the number of opportunities for error. The indicator of the continuous machine affords information by which a change in charge can be made at any time. In the intermittent plant, once an overcharge is made there is no means of rectifying it, since the water to which the chemicals are added is constantly in a state of agitation. If an undercharge is made, it is, of course, possible to add more lime and soda

A 10,000 Gal. per Hour Intermittent Softener

ash. This, however, necessitates re-agitation and re-settlement of the whole contents of the tank and would ordinarily require from two to three hours time, thus reducing the capacity of the plant 10,000 to 20,000 gal. for this length of time. In the continuous machine, if a test of a sample of water from the settling chamber shows too much or too little of the chemicals, addition or subtraction may be made at once to correct the charge while the plant continues in operation.

Regarding the agitation of chemicals, one well-known authority on water treatment for railroad uses has said:

"I consider the type of machine which adds the chemicals

to a continuous stream as always preferable. One has there the question of agitating 100 gal. as against agitating 100,000 gal. The average continuous machine gives as much agitation to the individual cubic foot of water as any reasonable amount of compressed air could possibly give. Also, if desired, this can be increased easily if the water should demand it by speeding up or adding more paddles, a point often valuable under changing water conditions. Regarding the length of time of contact of water and reagents, this is a matter of design and can be made perfect in a continuous machine by proper engineering skill."

That chemical reaction and precipitation are more complete in continuous systems than in plants of the intermittent type appears to be demonstrated by the frequency with which clogging pipe lines is found associated with the latter systems. An illustration of this is to be found in an article by C. R. Knowles, superintendent of water service of the Illinois Central, which appeared in the May issue of the Railway Maintenance Engineer, inquiry having developed the fact that in both cases of the serious clogging of service lines referred to the water had been treated in an intermittent softening plant.

### The Cost of Maintenance and Operation

Additional features of importance to be considered in the determination of the type of water treating plant to be installed under any given set of conditions are the relative costs of maintenance and attendance. The cost of maintenance of an intermittent plant considered must necessarily be greater than the cost of maintenance of the continuous plant, there being two tanks in the intermittent and only one for the continuous, and thus almost double the exposure of the equipment to the weather. A 10,000 gal. continuous plant similar to that discussed would have 1,540 sq. ft. of surface under exposure to the weather, while the two tanks and appurtenances of the intermittent machine would expose about 3,000 ft., or almost double the amount which would have to be protected by painting.

Furthermore, intermittent plants ordinarily have wooden tanks while the continuous have steel tanks. Whatever might be said in favor of the wood tank it is generally agreed that the life of the steel tank, if painted at the regular intervals at which painting should be required of either type of equipment is practically indefinite. It is the corrosion from the outside which destroys the steel tank, there being no serious corrosion on the inside of a water softener using the lime-soda ash process.

Another item which may readily add to the cost of maintenance is the equipment for agitating the water following the addition of the chemicals. The intermittent type of plant under consideration requires additional power for this purpose. In the continuous plant the power for agitating the water and chemicals may be furnished by the flow of water entering the softener for treatment.

There is also the question of chemicals to consider in any discussion involving the subject of maintenance and operating costs. Theoretically, there should be no difference in the actual cost of chemicals required for treating a given quantity of water between the intermittent and continuous plants. Practically, however, there is often a saving of chemicals in the continuous plant, due to the fact that the chemicals are measured and added automatically, and also because there is a better and more uniform agitation possible in the small mixing chamber of the continuous plant than is possible in the large diameter tank in the intermittent plant where the agitation takes place. The results of adding a definite proportion of chemicals to the water in either type of plant would be the same provided the proper mixture and agitation are obtained.

Finally, there is the important question of attendance to consider and here indeed, attention may well be called to

the fact that little or no additional labor need be required for the operation of a continuous plant over that required for an ordinary pumping station where there is no water treatment. This is because the apparatus of the continuous type of plant is largely automatic in its operation and also because there is not as much apparatus as is required in an intermittent plant. If a continuous water softening plant is installed in connection with a pumping plant or coaling station no additional labor whatever is required. It is necessary to make a chemical charge and discharge the sludge only once in 12 hours and this requires no more than an hour of one man's time. In case of an intermittent plant, practically the entire attention of one man is required for attendance, and as attendance is required night and day, the services of three men eight hours each are essential.

Only when the continuous plant is in an isolated position or located some distance from any other plant on the road, is it necessary to have anything like constant attendance. It is, of course, essential that the man in charge be so situated as to be able to make the charges at the required time, but this is only once in 12 hrs. Most of the continuous softeners used in connection with pumping plants require the services of only one man for all operations.

The above data and information make it possible for the railway officer to decide for himself as to the comparative merits of the intermittent and continuous types of water softeners. It would seem that the facts overwhelmingly favor the continuous type of machine. Certainly, the test of usage has given conclusive evidence in favor of the continuous type of plant for railway use. The percentage of continuous plants in railway use is far above that of the intermittent type and on roads having both types in operation, the continuous type has shown its superiority in records kept over a period of years.

THE RANK-AND-FILE of the American business world have not yet grasped the essential fact that all trade is in the nature of barter. Anyone who offered to exchange a pair of good new boots for a worn-out pair of rubbers would be deemed a fool or a philanthropist, but the average American citizen has not yet realized that to export on credit and to place every obstacle in the way of imports in return is an equally futile proceeding in the case of a creditor nation which has no inclination to make investments abroad.—*Times (London) Trade Supplement.*

# Railroads Complete Testimony on Piece Work

## Labor Board Closes Hearings on Rules—Other Developments in the Labor Problem

HEARINGS before the Railroad Labor Board on the question of piece work in railroad shops, the opening sessions of which were described in the *Railway Age* of August 13 (page 297), were closed on April 12, and the controversy is now in the hands of the Board for decision. The hearings on August 10 and 11 were devoted to the presentation of testimony by general chairman representing the shop employees on the various western and southeastern carriers involved in the dispute and to the presentation of an exhibit by Leland Olds on behalf of the Railway Employees' Department of the American Federation of Labor. This exhibit, entitled "The Problem of Piece Work," dealt at length upon the "fluctuation" in earnings of shop employees under the piece work system of pay. The attempt was made to attribute this "fluctuation" to conditions other than the workers' willingness or ability to produce by reference to disparities in the amounts earned by the same workers during various periods. The exhibit was divided into three parts, the first part of which is devoted to refutation of the evidence presented during the hearings on national agreements by the Conference Committee of Managers; the second part to a description "of what piece work is in railroad shops," and the third part to the "comparative economy possible under the two systems." The exhibit opposed the reestablishment of piece work because of the fact that the employees may not be able to determine what their earnings are going to be at the end of the month, or what they are going to be at the end of the succeeding month. In commenting upon this point Mr. Olds said: "If piece work as a method of payment were strictly interpreted in terms of railroad jobs, the railway employee would lack any sense of security, and psychology today tells us that that is one of the most fundamental things, not only having enough to eat from day to day, but the assurance that tomorrow they will have enough to eat." Mr. Olds, in summarizing the exhibit, pointed out that this "fluctuation" in earnings leads to an effort on the part of the worker to adjust his earnings, developing from this the charge that the piece work system of pay creates dishonesty among the employees. Other charges made against the piece work system in the exhibit are that its existence causes the employee to overwork; that under it it is impossible to establish and maintain adequate wages; that its existence necessitates the creation of "an infinite number" of rates which could not possibly be supervised by the Labor Board in a just and reasonable way; and that it destroys the morale of the employees.

Samuel Higgins, railroad representative on the Board, in questioning Mr. Olds, brought out the fact that although the latter had entire charge of the preparation of this exhibit he is not a graduate of a technical school nor had he had any experience in railroad shops. Mr. Olds stated that he had depended for his experience upon the experience of the railroad employees who had supplied the material and arguments contained in the volume.

### J. G. Walber Opens Railroad's Case

On April 12 John G. Walber, representing the eastern carriers, opened the testimony on behalf of the railroads by telling the Board in substance that if the final decision of the Board in this controversy results in preventing the carriers from doing work in their own shops except at excessive costs they will be forced to give their repair work to outside plants.

Mr. Walber in his opening statement said in part:

The continuation of national agreements by Addendum No. 2 to Decision No. 119 carries with it the obligation to pay only on the hourly basis. This circumscribes the initiative of managements and discourages and impedes progress. The railroads believe that this restriction upon their methods of obtaining results is unwarranted and that, as shown by record of the correspondence of the Railroad Administration filed in the hearings on the national agreements, there is every justification for the belief that if it had not been for the discrimination against piece-workers in the wage orders, the opposition to working piece-work could not have been solidified even during federal control.

The managements alone are charged with the economical and efficient operation of the railroads. Therefore they must select methods for the performance of the work which will yield the best results from the standpoint of economy and proper performance. Should the final decision of the Board result in preventing the railroads from doing the work in any case in their own shops or repair points on account of the cost of such work being excessive as compared with the cost of getting the same work done outside, there will be no alternative for the managements except to arrange for the work to be done outside. The managements would regret such action as deeply as would anyone else, but it simply would be forced upon them. The managements could have no justification whatever for continuing or adopting methods of performance of work which result in excessive costs. No good interest of the employees can be furthered by insistence upon methods which on account of excessive costs would leave but one way open for the managements to pursue.

Of all the charges of abuses and improper conditions under the piece-work system of pay there is none which cannot be corrected, if justified. The frequent charge that it is possible for employees to do inferior work and even fail to do work cannot properly be considered an argument against the system, as such a charge cannot be confined to piece-work and is equally possible under any other system of pay. If employees will neglect their work when paid on the piece-work basis, they will do the same on the hourly system, as the controlling element is the character of the individual.

Whether or not the piece-work system of pay yields proper compensation for the work performed depends primarily upon the prices set for the jobs. With the prices properly set, we are unable to see what sound objection can be made to the system, if employees are willing to render adequate and proper services. The hourly system of pay allows no consideration for the industrious employee. All are on a common basis. It is the ambition of most energetic men to profit by their work; many have the ambition to engage in business for themselves. The piece-work system gives the employee this advantage and the ambitious, energetic employee receives compensation in proportion to his contribution to the output.

After urging the reestablishment of piece work and the revision of piece work rates to conform with changed conditions, Mr. Walber said:

In such revisions, prices should be fixed which shall not impose excessive application of the employees in order to perform the jobs within the time used in fixing the unit prices, but if controversies arise as to the results of the unit prices, and it is not possible to amicably adjust them between the managements and the representatives of the employees, they can be referred to the Labor Board in accordance with the provisions of the Transportation Act. That act has come into existence since the piece-work system of pay was discontinued, so that today the employees have a Board to which they can appeal in the event any complaints against improper results cannot be adjusted on the home roads.

### Carriers Reply to Employees' Witnesses

With reference to the testimony of the employees' witnesses for the eastern railroads, Mr. Walber said in part:

Several witnesses stated that it is not possible to make reliable unit allowances because of the variable conditions, such as the availability of material, tools, facilities, etc. The

railroads deny this statement. In the vast majority of instances reasonably accurate unit prices have been set for specific performances under prevailing conditions, which took into consideration the kinds of jobs, shop equipment, methods, nature and volume of work, availability of material, time lost in changing from one job to another, etc. A comparison of the average hourly piece-work earnings with the hourly rates shows that the average hourly earnings have exceeded the rates from 30 to 60 per cent. With such a pronounced earning capacity under the piece-work system it would appear to be a complete refutation of the charges that employees are compelled to lose time because of these varying conditions, and that they are not compensated therefor.

The objection of several witnesses to piece-work was that it requires over-exertion in order to obtain reasonable earnings. Other witnesses told the Board that under the day-work system the men are today producing a greater output than they did under the piece-work system. We wish to call attention to this contradictory testimony of the witnesses and believe the Board will be just as unable as we are to reconcile such representations.

Several witnesses spoke of the peace and harmony prevailing today in the railroad shops as due to the men working on the hourly system of pay. If the increased output today, upon which the men lay so much stress, is due to this basis of pay, it would appear that the Board is entitled to an explanation as to why there was not this measure of output from the time that the Railroad Administration applied the guaranteed minimum hourly rate to all piece workers, which had the practical effect of placing them on the hourly basis, and also during the period when piece-work was absolutely abolished. If the hourly rate was the panacea for all the ills encountered in the operation of the shops, the question naturally arises as to the reason for its taking so long to take effect.

### The Problem of Piece Work

In the volume entitled "The Problem of Piece Work," submitted in this case by the employees, it is charged that the railroads deliberately hired excessive numbers of men in order to increase the cost of operation and prejudice federal operation of the railroads. When it is considered that the organizations which stand sponsor for these reflections upon operation of the railroads under federal control were instrumental in compelling the payment of journeymen rates to these same employees, who they now admit were inefficient and criticize the federal railroad officials for hiring them, we feel that the charge is positively brazen.

The exhibit also ignores another change made by the Railroad Administration which necessitated increasing the forces—the uniform adoption of the eight-hour day. The compilers of this exhibit apparently would have the Board understand that with the reduction in the hours constituting a day there was no justification for the railroads increasing forces and that it was in fact dishonest to increase the forces to offset the reduced working hours per day, the provisions for arbitrary starting and quitting time, allowance of time for meals under pay, etc.

In this exhibit it is also claimed that the bringing in of these inexperienced men was the cause of the falling off in production. Through the reduction of forces according to the seniority provisions it follows that the junior men have been laid off and that the remaining forces today are in the main composed of experienced men. Is it not a thoroughly reasonable and justifiable assumption, if the deductions in the exhibit are correct, that the explanation for the improvement in the output today is traceable to the fact that the remaining men are the older and more experienced and that the elimination of the volume of work formerly performed by the inexperienced men leaves the output of the experienced men today on practically the same basis as it was when the forces included these inexperienced men?

Referring to conditions on various carriers involved in this dispute, Mr. Walber cited numerous instances showing the falling off in the production of the individual employees following the abolition of piece work.

### Mr. Walber Attacks Testimony of Frank McManamy

Mr. Walber also attacked the testimony of Frank McManamy, formerly assistant director of the Mechanical section of the Railroad Administration, given during the progress of hearings on national agreements, stating in criticism of Mr. McManamy's testimony:

In view of the order of the Director General in December, 1918, to leave the decision as to whether piece-work should be continued or discontinued to the vote of the men, having

been based upon the results of investigations and recommendations of the Mechanical Section of the Railroad Administration, and the further fact that the claims referred to were pending before the Division of Liquidation, now in charge of Mr. McManamy, could it reasonably be expected that he would give any testimony which would reflect upon his recommendation as to piece-work or that might affect to any extent whatever the handling of the claims in his division? With all due respect to Mr. McManamy, he is only human, and we believe that the Board will be able to apply the general rules of the courts for judging as to the disinterestedness of the witness.

In closing his presentation, Mr. Walber said:

We have refrained from mentioning certain developments during this hearing as to what the employees would or would not do under certain circumstances. The railroads for whom I am speaking feel that this tribunal, created by Congress, was intended to be the agency for disposing of all disputes between railroad managements and their employees upon the basis of justness and reasonableness, and that it was the intention of Congress that this tribunal would be uninfluenced by intimidation or any other conditions which would interfere with the orderly and conscientious disposition of controversies upon their merits. We believe when Congress created this tribunal it intended that it should have the dignity and respect commensurate with the magnitude of the problems which the law provides it shall decide. We further believe that the Board will decide these questions without bias or prejudice and strictly upon their merits.

J. W. Higgins, testifying in behalf of the western roads, offered as evidence in this case the testimony presented to the Board by the Conference Committee of Managers during the course of hearings on national agreements. Mr. Higgins also asked for opportunity to reply to the material contained in the employees' exhibit on piece work, and this request was granted. Dr. C. P. Neill, representing the southeastern roads, made a similar presentation.

The hearings were closed with a statement by B. M. Jewell on behalf of the employees in which he summed up the employees' objections to the reestablishment of piece work. He also defended the statements made by the various general chairmen, stating: "I take it that this Board does understand that the employees do not desire to threaten nor to intimidate this Board."

### Pennsylvania Explains Request for 15 Days of Grace

Subsequent to the request of Samuel Rea, president of the Pennsylvania, for an additional 15 days in which to arrange the conference ordered in the Labor Board's recent decision in the Pennsylvania controversy, the following notice was issued by General W. W. Atterbury, vice-president of the Pennsylvania, to its employees:

The purpose of this request was to enable the company to take such steps as may be necessary in the interest of all its employees. Announcement was made on May 20, 1921, that all employees would be given an opportunity to have a voice in the management in matters affecting their welfare through employee representatives of their own selection, whether union or non-union men. A majority of our employees want to deal with the management through employee representatives.

About 175,000 employees are interested in rules covering working conditions. About 117,000 of these employees have expressed a desire to negotiate rules through employee representatives.

The employee representatives who have been elected have acted in good faith with the management. The management has acted in good faith with them. The rights and interests of these representatives and the employees whom they represent must be recognized and protected. Inasmuch, therefore, as this decision (No. 218) of the Labor Board vitally affects the welfare of all our employees, and in accordance with the announcement made by the company on May 20, 1921, the management will confer with representatives of all classes of employees on the Pennsylvania System.

A meeting for this purpose is being arranged for all classes of employees.

### Board Blocks Effort to Continue National Agreements

The effort of labor leaders to bring about indefinite continuation of national agreements by demanding hearings

upon every point upon which the carriers and the employees could not agree in the negotiations being conducted under the Board's Decision No. 119 were blocked by a ruling of the Labor Board which stated that to grant the employees the right again to be heard on each point in dispute "would result in unjustifiable and unnecessary delay and be a great injustice to the parties interested." In special cases where further information is needed the Board announced it will open further hearings.

### Eries Leases Marion Shops and Roundhouse

The Erie on August 15 announced that its local shops and roundhouse at Marion, Ohio, had been leased to the Railway Service Company of Marion, an organization of local manufacturers and capitalists, and that their operation by the new company would begin immediately. The announcement of the new plan which follows was made by W. A. Baldwin, manager of the Ohio region of the Erie:

The Erie Railroad has long been of the opinion that the most favorable result to both the railroad and the community it serves can best be obtained by the fullest co-operation and amalgamation of interests so far as possible. It recognizes that its duty to the public and the communities along its line is that of furnishing transportation and that all the energies of its employees and officers should be directed so far as possible solely to this end.

It has therefore in the past, under favorable conditions, contracted much of the work of maintenance of roadbeds, buildings, structures, etc., as well as the maintenance of its cars, engines and other equipment, to local companies, whose stockholders, officers and employees are citizens of the community, and where favorable results bring profits and assist in the prosperity of the neighborhood.

Local conditions can best be appreciated and most intelligently met by the knowledge and interest of local supervision and support. The Erie Railroad has here shown its appreciation for the interest in its welfare indicated by citizens of Marion, and now that there is opportunity, desires that its activity shall be even more in common with the interests of the citizens.

The Erie has accepted an opportunity to lease its shops and roundhouses to the Railway Service Company, of which the stockholders are all substantial and respected citizens of Marion and whose interests are those of the community. These men, headed by John D. Owens as president, have ample experience in the character of work to be performed, and have made a success of previous undertakings. The railroad feels fortunate in having its work of repairs conducted by such a local company, and the employees of the Railway Service Company are assured of fair treatment in accordance with the practice of the extensive manufacturing concerns of Marion.

A member of the Labor Board, in commenting on the Erie's action, indicated that if this procedure is followed to such an extent as to appear to be an evasion of the Transportation Act, the Board would probably take some action.

The Erie's announcement, together with the announcement that the Indiana Harbor Belt had leased its shops at Gibson, Ind., to the United Boiler Heating and Foundry Company and unconfirmed rumors that similar action would be taken at the Silvis, Ill., shops of the Chicago, Rock Island & Pacific and other points on various railroads created considerable excitement among labor leaders, some of whom stated that this action "looked like a subterfuge to evade the rulings of the Labor Board as to wages and working conditions." It is reported as a result that railroad labor leaders are planning an appeal to the Labor Board.

### President Underwood Explains Erie's Attitude

The Erie is not planning to put all its shops under private management, it was announced on August 17 by President Frederick D. Underwood in a formal statement explaining the action of the company in leasing its shops at Marion, Ohio, to a private concern, the Railway Service Company, organized by local business men to do all repair and other work heretofore done by employees of the railroad. Mr. Underwood explained that the offer at Marion was made

voluntarily and gladly accepted by the railroad, which was not acting in concert with any one as to the carrying out of its local affairs.

Mr. Underwood deplored the "inclination to make a tempest out of a squall," in commenting on the situation growing out of the refusal of some of the men to accept employment under the existing rules, particularly those which required work on Sundays and holidays without penalized overtime.

The entire situation, as described by Mr. Underwood, was given out in the following statement:

It is not now contemplated that the shops as a whole on the Erie Railroad will go under private management. It is a misnomer to call the plant at Marion a shop in the sense that word is commonly used. The actual shop is at Galion, twenty miles east of Marion. Marion is purely a transfer point, with a roundhouse force, which in normal times is over 600 men, and with the reduced business about 400.

At Marion an association of business men voluntarily offered to undertake the work at that point, and their assistance was gladly accepted by the Erie Railroad. The Erie is not acting in concert with any one as to the carrying out of its local affairs.

Under the stress of war and during the period of Federal Administration men were taken on without physical examination and without examination as to their capacity. With the return to normal conditions the Erie reinstated rules requiring certain classes of its employees, including shop crafts, to take a physical examination, and, when necessary, to work Sundays and holidays without penalized overtime.

Some shopmen objected to the conditions and declined to take physical examinations or report for Sunday work without penalized overtime. They were given time to reconsider. When the time given elapsed, their places were filled. Men at Marion failed to respond when called on for Sunday duty for three Sundays last past. Manifestly, so long as the interests of the public require the moving of Sunday passenger trains and continuous service for perishable freight it will be imperative for a small force of men to work Sundays and holidays. Sunday work is generally shifted around the whole force.

### Shop Employees Apparently Expect to Be Given Preferential Treatment

As a comparison, engine and trainmen are called on to run Sunday and holiday trains for the convenience of the public. They respond and make their trips for the same compensation as is paid during ordinary days. Why railway shop men should put themselves in a separate class is not for me to determine. The Sunday and holiday dollar earned by Erie Railroad is no larger than the week-day dollar. Erie Railroad cannot recognize the right of one class of employee to a penalized overtime against others who are not paid it. Every man who enters railway employ fully understands and tacitly agrees that there will be more or less Sunday and holiday work.

The loyal efficient mass of Erie employees have been in its service many years. Those who are inviting the controversy relative to physical examination and penalized overtime are mostly those who have come into the Erie service since Jan. 1, 1918. Every right-minded person will support a plan that will require railway employees to be physically and mentally good. The safety of persons and property is in their hands. This requires a force physically and mentally alert. Railroad men may be compared to men in the paid fire department of a large city, who are required to turn out when an alarm comes in.

### Another "Outlaw" Organization Formed in Chicago

Another "outlaw" organization has been formed in Chicago by W. B. Scales of Gary, Ind., a former member of the Brotherhood of Railroad Trainmen. The new organization, called the "Yard, Engine and Trainmen's Association," is opposed to the attitude and actions of the "Big Four" Brotherhoods on wage reductions and other recent developments in the railroad labor situation. Press reports of the meetings of the new organization indicate that it is developing similarly to the "outlaw" switchmen's union which conducted the "outlaw" strikes of April, 1920. In this connection John Grunau, leader of the last "outlaw" strike and now head of the United Association of Railway Employees

of North America which succeeded the Chicago Yardmen's Association, recently predicted a series of "outlaw" strikes if the recent wage cut is accepted by the older brotherhoods, saying that "a strike is absolutely certain if the Labor Board removes the ban on piece-work and takes away punitive overtime for work after eight hours." Mr. Scales later denied that his organization was contemplating calling a strike, adding that its purpose was to destroy the older brotherhoods which he said constituted a "labor trust for the benefit of national officers."

## A Coaling Station of Pre-Cast Concrete Construction

**I**N RECENT YEARS pre-cast concrete construction has experienced a marked increase not only in the amount of work of this kind undertaken, but also in the scope of its application. That such should be the case is not surprising in the light of the possibilities it has presented along the lines of centralization in production, standardization in equipment, economy in construction and salvagability in materials, etc. These things were much to be desired in many classes of work and once introduced, it was not long before this form of construction became an established one. The railroads in particular have made considerable use of it, the conditions under which much of their work is done falling in a class for which pre-cast methods are peculiarly adapted; so well adapted in fact that the railroads themselves may be said to have been largely responsible for its development. However, they have confined their activities in this direction largely to piling and bridge slab construction of which large quantities are used annually. It is entirely possible, however, that pre-cast methods may be applied advantageously to other railroad work and it is of interest, therefore, to observe the progress which has been made by one railroad in applying such methods to coaling station construction.

In the past few years the Chicago, Burlington & Quincy has built five coaling stations in which pre-cast concrete in the form of slabs or planks constitutes the coal pockets, the remainder of the structure consisting of timber framing.

Detail of a Slab Unit. The Size and Spacing of the Bars Are Variable

Ellsworth, Oxford and Broken Bow, Neb., and Crow Agency, Mont., are stations at which these plants are located, the coaling plant at Broken Bow still being in the process of construction.

The conditions which led to the development of this form of construction were several, chief among which was the need of providing protection in these plants from the effect of spontaneous combustion in the coal, a hazard of considerable prominence where quantities of lignite coal are used. It so happened that the previous coaling stations at these points had burned down wholly or partially, the cause as it appears being spontaneous combustion. Economy in construction was also an important item. The coaling plants for which the pre-cast concrete was designed were also of the knock-down type, permitting ready dismantling or if need be of remodel-

ing the plant to meet new conditions. Thus the element of flexibility also called for some attention.

To meet the several conditions imposed, therefore, it was decided to build timber structures in which the coal pockets were made of pre-cast concrete slabs. The slabs used were made in various sizes, depending upon the position each was to occupy in the structure. All slabs, however, are reinforced with five-in. square rods running lengthwise and separated at equal distances by special reinforcing bars which also serve to strengthen the slabs in the crosswise direction. As shown in the sketch the edges are cast V-shaped, thus securing a comparatively tight joint which prevents rain from beating in or coal dust from sifting out. The slabs are

Precast Concrete Coaling Station at Crow Agency, Mont.

fastened to the studding and floor sills of the structure by means of lag screws which extend through holes provided in the slabs at the time of pouring. They are of a size that can be handled without difficulty and give every evidence of meeting the several conditions encountered at these points satisfactorily.

We are indebted for the above information to W. T. Krausch, engineer of buildings, Chicago, Burlington & Quincy, under whose direction the several coaling plants of this type have been designed and erected and the pre-cast slab construction developed and patented.

ACCORDING TO CUSTOM, a pay clerk of the Great Indian Peninsula Railway, accompanied by a peon, left Bombay on July 20 with the pay chest to pay the staff employed on the various stations of the line. Both men were found dead in a compartment of the train on the following morning with the pay chest missing. The amount of money remaining in the chest after the various payments which had been made en route is not yet known.—*Railway Gazette* (London).

*Erecting Shop of Canadian Pacific, Angus, Montreal*

# No Meeting of Mechanical Division This Year

## Reports of Eight Committees Submitted to Letter Ballot of the Members by General Committee

THE INDEFINITE postponement of the business meeting of Mechanical Division, American Railway Association, to have been held at the Blackstone Hotel, Chicago, June 29 and 30, has been made permanent for this year. This action was taken after the adoption of the following resolution by the Association of Railway Executives at a meeting held at New York on July 1, 1921:

"Whereas, in view of the imperative need for the exercise of all possible economy, it is

"Resolved that annual or special meetings or conventions

of all organizations under the supervision of this body be indefinitely postponed or curtailed in every possible way."

Following the decision of the General Committee of the Mechanical Division not to hold a meeting of the division this year it was decided to submit to a letter ballot of the members the recommendations of the various committees, the reports of which were to have been presented at the meeting of the division. The letter ballot will close at noon, central time, on Tuesday, September 20.

Abstracts of the reports follow.

## Specifications and Tests for Materials

Sub-committees have been appointed and are now actively engaged in work on the subjects assigned.

(a) Co-operation with the Rubber Association of America on the preparation of Specifications for Mechanical Rubber Goods.

(b) Co-operation with the Equipment Painting Section in the preparation of specifications for paint and painting materials.

(c) Specifications for welding wire.

(d) Specifications for water gage and lubricator glasses.

(e) Revision of present specifications for galvanized sheets.

In addition to the above the chairman has had some correspondence with the chairman of the Train Brake and Signal Committee on the subject of tolerances for air brake and signal hose gaskets and gages for gaskets and couplings, with a view to improving present practice in these particulars. Further work should be done on these subjects during the coming year.

### Subjects Referred to the Committee

#### By the General Committee

(a) "The proper fibre stress to be employed in the design of helical springs of different diameters of steel wire from

$\frac{1}{2}$  in. to  $1\frac{1}{2}$  in. in diameter. The original spring table calls for 80,000 lb. per square inch throughout for all sizes, but it is well known that this is not the manufacturers' practice, and, in fact, in many cases it is impossible to obtain a proper spring with the smaller sizes of wire."

A sub-committee was appointed to report on this question, and after investigating the available data on spring design and manufacture, has reported that in its opinion tests should be made to develop information on various grades of steel and different heat treatments. It has not been practicable for your committee to arrange for such tests, nor does it seem at all feasible to make any such arrangements under the present conditions or in the near future. The number of variables affecting spring design, in addition to that of variation in diameter of wire such as quality of steel, workmanship and heat treatment, makes the whole subject a very indefinite one and one that would require long and expensive investigation, probably without satisfactory results.

The committee will keep this matter before it and will take such action as may be possible.

(b) "Heat Treated Axles and Crank Pins. Has the process of heat treatment decreased the number of failures to any appreciable extent?"

The committee feels that it does not have sufficient in-

formation to reply to this question, and is endeavoring to obtain the views of other members of the Association by means of a questionnaire.

(c) "Revision of Specifications for Lumber, if such revision is needed. Representatives of the Purchases and Stores Division to be requested to co-operate with the Committee on Specifications and Tests."

No action has been taken on this subject. The committee desires the benefit of advice from all interested members on: (1) What use, if any, is being made of the present Lumber Specifications? and (2) Suggestions for revising the specifications so that they might be of greater use.

### Co-operation with the Car Construction Committee

In its report to the Association in June, 1920, the Car Construction Committee made certain recommendations regarding the desired quality of steel for forgings and castings for railroad use, and gave an outline of what, in its opinion, constituted certain fundamental requisites for specifications. Chief among these was the requirements of the elastic limit as a base determination and specifying the elongation in 2 in. and the reduction of area to be controlled by the elastic limit and given constants. Other requirements covered chemical composition and annealing and the recommended constants for tensile properties of two grades of steel with 26,000 and 32,000 lb. per sq. in. elastic limits, respectively.

The committee has spent most of its time at recent meetings in the endeavor to satisfactorily carry out these recommendations of the Car Construction Committee, which have been approved by the Association, and regrets that it has not been entirely successful, partly because of the large amount of work involved in revising the specifications, and partly because of differences of opinion that have arisen between members of our committee and representatives of the Car Construction Committee as to the practicability of certain of the latter's recommendations.

The question of standardizing methods of tests so that results obtained in different laboratories will be comparable is one that is engaging the attention of your committee at this time, and will require its best efforts for some time to come, and also the assistance of all members with laboratories who may be willing to help with the work.

### Supplementary Report—Specifications for

#### Chrome Molybdenum Steel Springs

The unsatisfactory condition of Class D bolster springs for trucks of 100,000 lb. capacity cars has been brought to the attention of the Committee on Car Construction, which has prepared designs for alternate springs *L*, *M*, *N* and *O*, to be substituted for present standard springs, classes *B*, *C*, *D* and *H*. The Committee on Car Construction has requested that this committee prepare specifications covering their alternate special springs.

The committee has prepared tentative specifications for chrome molybdenum steel springs, as requested. The committee has not been able to develop any satisfactory information regarding what service may be expected from springs made of chrome molybdenum steel but agrees with the Committee on Car Construction that such springs should be made and tested out in service in order to develop whether they are an improvement over the present carbon steel springs, which have been found to give very unsatisfactory service.

### Recommendations

#### TENTATIVE SPECIFICATIONS

As a result of conferences with representatives of the Car Construction Committee, your committee offers the following specifications and recommendations:

*Exhibit A.*—A revision of the Standard Specifications for Carbon Steel Axles for Cars, Locomotive Tenders and Engine Trucks.

*Exhibit B.*—A revision of the present Specifications for Steel Castings for Cars and Locomotives, combining these two into one specification.

It is recommended that the present Specifications for Axles and Steel Castings be retained without change and that both of the above proposed specifications be printed in the proceedings as tentative specifications until further action is justified by the experience of the members in working to them. Your committee feels that this action is warranted by the newness of the proposed method of expressing physical properties, as shown in the Steel Casting Specifications, and the many changes that have been made in the Axle Specifications, as well as by the necessity of having both the consumers and manufacturers become thoroughly familiar with these specifications before they are made obligatory.

*Supplementary Report, Exhibit D.*—The committee recommends that this specification for Chrome Molybdenum Alloy Steel Helical Springs be adopted as tentative for one year or until further action is recommended by the committee.

### CHANGES IN STANDARD SPECIFICATIONS

*Exhibit C.*—Standard Specifications for Heat Treated Knuckle Pivot Pins to be revised as shown. This increase in the range of both carbon and manganese is recommended to cover the usual grade of steel used for this purpose, as it has been found by experience that the present limits are unnecessarily close.

### RECOMMENDED PRACTICE SPECIFICATIONS

The committee does not recommend advancing any of the present Recommended Practice specifications to Standard, for the reason that some changes may have to be made in a number of these if the proposed changes in the method of expressing tensile test requirements develop satisfactorily.

### LIMITING THE REVISION OF SPECIFICATIONS

The frequent revision of specifications has been severely criticized by both purchasers and manufacturers, and is clearly an undesirable state of affairs. Therefore, it is recommended that the Association should give serious consideration to establishing a definite time limit for revisions of specifications and other standards which will appear in the Manual, this limit to be preferably three years, during which no changes should be allowed except for reasons important to the interest of the Association and then only if the proposed changes receive at least two-thirds vote at the annual meeting of the Division.

The report is signed by F. M. Waring (chairman), Pennsylvania System; J. R. Onderdonk, Baltimore & Ohio; Frank Zeleny, Chicago, Burlington & Quincy; A. H. Fettes, Union Pacific; H. G. Burnham, Northern Pacific; H. E. Smith, New York Central; J. C. Ramage, Southern Railway; J. H. Gibboney, Norfolk & Western; H. P. Hass, New York, New Haven & Hartford, and G. M. Davidson, Chicago & North Western.

### Exhibit A—Proposed Tentative Specifications for Carbon Steel Axles for Cars, Locomotive Tenders and Engine Trucks

1. *Scope.*—Same as Standard Specifications except that paragraph (b), requiring annealing of all axles over 6 in. in diameter at the center, has been omitted.

#### I—MANUFACTURE

2. *Process.*—(a) Steel shall be made by the open hearth or electric process.

(b) All axles over 6 in. in diameter at the center and axles with 0.52 per cent or more carbon shall be annealed by allowing the finished forgings to become cold after forging, then uniformly reheating to the proper temperature to refine the grain and allowing to cool uniformly.

#### II—CHEMICAL PROPERTIES AND TESTS

3. *Chemical Composition.*—The steel shall conform to the following requirements as to chemical composition:

	Per cent
Carbon, maximum .....	0.58
Phosphorus, not over .....	0.05
Sulphur, not over .....	0.05
4. <i>Ladle Analyses</i> —Same as Standard Specifications.	
5. <i>Check Analyses</i> —Same as Standard Specifications.	

### III—PHYSICAL PROPERTIES AND TESTS

#### 6. *Drop Tests*—(a) Same as Standard Specifications.

(b) The permanent set produced by the first blow shall not exceed that given by the following formula, in which  $L$  = length of axle in inches and  $d$  = diameter of axle at center in inches.

$$\frac{L}{1.9d} - \frac{d}{2} + \frac{1}{2} \text{ in.}$$

(c) The requirements for five standard sizes of axles based on the above formula are given in the following table:

Classification of axle	Size of journal, in.	Diameter of axle at center, in.	Length of axle, in.	Height of drop, ft.	Number of blows	Maximum permanent set, in.
A .....	3½ by 7	4¼	83¼	18	5	8¼
B .....	4¼ by 8	4¾	84¼	22½	5	7½
C .....	5 by 9	5½	86¼	29	5	6¾
D .....	5½ by 10	5¾	88¼	34½	5	5½
E .....	6 by 11	6½	90¼	41½	5	4¾

(d) Same as Standard Specifications.

(c) Same as Standard Specifications.

7. *Drop-test Machine*—Same as Standard Specifications.

8. *Number of Tests*—Same as Standard Specifications.

### IV—WORKMANSHIP AND FINISH

9. *Workmanship*—(a) and (b) Same as Standard Specifications.

10. *Finish*—Same as Standard Specifications.

### V—PERMISSIBLE VARIATIONS AND WEIGHTS

11. *Permissible Variation*—Same as Standard Specifications.

### VI—MARKING AND STORING

12. *Marking*—Same as Standard Specifications.

13. *Storing*—Same as Standard Specifications.

### VII—INSPECTION AND REJECTION

14. *Inspection*—(a), (b) and (c) Same as Standard Specifications.

15. *Rejection*—Same as Standard Specifications.

16. *Rehearing*—Samples tested in accordance with Section 5, which represent rejected material, shall be preserved fourteen days from date of test report. In case of dissatisfaction with results of test, the manufacturer may make claim for a rehearing within that time.

## Exhibit B—Proposed Tentative Specifications

### For Carbon Steel Castings

1. *Scope*—(a) These specifications cover annealed and unannealed carbon steel castings for locomotive and car equipment, and for miscellaneous use.

(b) The purposes for which the two grades are generally used are:

*Grade A*, for castings designed for a low stress.

*Grade B*, for castings designed for unit stresses of 12,500 to 16,000 lb. per square inch such as truck side frames, bolsters, couplers and coupler parts, locomotive frames, locomotive driving and trailer wheel centers.

### I—MANUFACTURE

2. *Process*—The steel may be made by the open-hearth or any other process approved by the purchaser.

3. *Annealing*—(a) *Grade A* steel shall be annealed if the carbon content exceeds 0.30 per cent, or if the manganese content exceeds 0.75 per cent. *Grade B* steel shall be annealed if the carbon content exceeds 0.22 per cent, or if the manganese content exceeds 0.65 per cent.

(b) Castings of both Grades "A" and "B" of irregular section, and of less carbon or manganese content than specified in paragraph (a), where shrinkage or other internal stresses may be expected, should be annealed.

(c) Castings that require annealing shall be allowed to become cold. They shall then be uniformly heated to the proper temperature to refine the grain and allowed to cool uniformly.

(d) *Annealing Lugs*.—For the purpose of determining the quality of annealing, at least two and not more than four annealing lugs shall be cast on all castings 150 lb. and over, and on such castings less than 150 lb. as required by the purchaser. The location of the annealing lugs shall be agreed upon by the inspector and the manufacturer. The standard annealing lug shall be 1 in. in height and 1 in. in width and ⅝ in. in thickness where it joins the casting. The inspector may remove one-half and the manufacturer one-half of the number of annealing lugs.

(e) If, in the opinion of the purchaser or his representative, a casting is not properly annealed, he may at his option require the casting to be reannealed.

### II—CHEMICAL PROPERTIES AND TESTS

4. *Chemical Composition*—The steel shall conform to the following requirements as to chemical composition:

Phosphorus, not over .....	0.05 per cent
Sulphur, not over .....	0.05 per cent

5. *Ladle Analyses*—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, silicon, phosphorus and sulphur. This analysis shall be made from drillings taken at least ¼ in. beneath the surface of a test ingot obtained during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, when requested, and shall conform to the requirements specified in Section 4.

6. *Check Analyses*—A check analysis may be made by the purchaser from the broken tension test specimen or from a casting representing each melt. The phosphorus and sulphur thus determined shall conform to the requirements specified in Section 4. *Determination of carbon and manganese should be made as information to ascertain whether the annealing was in accordance with Section 3 (a).* Drillings for the analysis shall be taken not less than ¼ in. beneath the surface, and if from a casting shall be taken in such a manner as not to impair its usefulness.

### III—PHYSICAL PROPERTIES AND TESTS

7. *Tension Tests*—(a) The steel shall conform to the following minimum requirements as to tensile properties:

	Grade A	Grade B
Elastic limit, lb. per sq. in. ....	26,000	32,000
Yield point, lb. per sq. in. ....	29,250	36,000
Product of elastic limit and per cent elongation in 2 in. ....	790,000 (not less than 22%)	850,000 (not less than 18%)
Product of yield point and per cent elongation in 2 in. ....	788,000 (not less than 22%)	956,000 (not less than 18%)
Product of elastic limit and per cent reduction of area .....	975,000 (not less than 33%)	1,200,000 (not less than 27%)
Product of yield point and per cent reduction of area .....	1,100,000 (not less than 33%)	1,350,000 (not less than 27%)

(b) The ultimate tensile strength shall be reported as information.

(c) Either the elastic limit or the yield point, but not both, shall be determined. The elastic limit called for by these specifications shall be determined by an extensometer reading to at least 0.0002 in. The extensometer shall be attached to the specimen at the gage marks and not to the shoulders of the specimen nor to any part of the testing machine. When the specimen is in place and the extensometer attached, the testing machine shall be operated so as to increase the load on the specimen at a uniform rate. The observer shall watch the elongation of the specimen as shown by the extensometer and shall note for this determination the load at which the rate of elongation shows a sudden increase. The extensometer shall then be removed from the specimen, and the test continued to determine the tensile strength.

(d) The yield point, or the elastic limit, shall be determined at a crosshead speed not to exceed ⅛ in. per minute and tensile strength at a speed not to exceed 1½ in. per minute. The yield point shall be determined by the drop of the beam of the testing machine.

8. *Alternative Tests to Destruction*—In the case of orders including only castings not exceeding 150 lb. in weight, a test to destruction on one casting for each 100 castings or smaller lot may, at the option of the purchaser, be substituted for the tension tests. This test shall show the material to be ductile, free from injurious defects, and suitable for the purpose intended. *Castings of minor importance may be accepted on surface inspection.*

9. *Test Specimens*—(a) Same as both Standard Specifications.

(b) An adequate number of test coupons shall be cast with and attached to castings weighing over 150 lb. from each melt when presented for inspection; coupons shall be cast attached to each end of each locomotive frame, to each locomotive cylinder and to each wheel center. If the design of the casting is such that the test coupons cannot be attached, the test bars shall be cast in runners outside of the casting, but attached to it to represent each melt. The location of the test coupons or bars, as well as the method of casting such coupons or bars, shall be subject to mutual agreement by the inspector and manufacturer. In the case of any orders for castings weighing under 150 lb., the physical properties as required in Section 7 may be determined from an extra or spare test bar cast with and attached to some other casting from the same melt.

(c) When sufficient coupons have not been cast, a test specimen

may be cut from a finished casting at a location mutually agreed upon by the inspector and manufacturer.

10. *Grouping Melts*—(a) After 15 consecutive melts, which may contain any of all kinds of castings (*except frames, wheels centers and cylinders*) covered by these specifications on one or more orders, have been tested and accepted, the manufacturer may group the succeeding melts in lots of five melts each, but each lot not to exceed 40 tons; the entire group to be accepted if the test specimen selected from the lot fulfills the chemical and physical requirements herein specified. If this test fails, a rehearing will be granted on the melt that the failed bar represents, and the other four melts of the group shall be tested individually.

(b), (c) and (d) Same as in Standard Specification for Car Castings.

11. *Number of Tests*—(a) One tension test shall be made from each locomotive frame. One tension test may be made from each wheel center and each locomotive cylinder casting, but at least one of each kind of such castings in each melt shall be tested. For miscellaneous castings from melts which do not include frames, wheel centers or cylinders, one tension test shall be made from each melt except as provided in Section 10 (a).

(b) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any tension test specimen is less than that specified in Section 7 (a) and any part of the fracture is more than  $\frac{3}{4}$  in. from the center of the gage length as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

(d) If the results of physical tests do not conform to the requirements specified, the manufacturer may reanneal the castings but not more than twice. A retest shall be made as specified in Section 7.

(e) No part of these specifications shall operate to cause any one tension to apply to more than 40 tons of castings that are offered for inspection.

#### IV—WORKMANSHIP AND FINISH

12. *Workmanship*—Same as both Standard Specifications.

13. *Finish*—(a) and (b) Same as both Standard Specifications.

#### V—MARKING

14. *Marking*—The manufacturer's name or identification mark and the specified pattern number shall be cast on all castings. In addition, the month and the year when made shall be cast on all bolsters, truck sides and similar castings. The location and size of numbers shall be agreed upon by the manufacturer and the inspector. In accordance with the standard practice of the individual foundry, to identify individual castings, a serial number may be cast or the melt number may be stamped on bolsters, truck side and similar castings as agreed upon by the manufacturer and the inspector. The melt number shall be legibly stamped on all other castings weighing over 150 lb.

#### VI—INSPECTION AND REJECTION

15. *Inspection*—Same as both Standard Specifications.

16. *Rejection*—(a), and (b) Same as both Standard Specifications.

17. *Rehearing*—Samples tested in accordance with Section 6, which represent rejected castings, shall be preserved for two weeks from the date of test report. In case of dissatisfaction with the results of tests, the manufacturer may make claim for rehearing within that time.

### Exhibit C

It is recommended that the following changes be made in Section 3 of Standard Specifications of Heat Treated Knuckle Pivot Pins.

3. *Chemical Composition*—The steel shall conform to the following requirements as to chemical composition:

	Present Per cent	Proposed change Per cent
Carbon .....	0.55-0.70	0.55-0.75
Manganese, not over.....	0.60	0.70
Phosphorus, not over.....	0.05	0.05
Sulphur, not over.....	0.05	0.05

### Exhibit D—Proposed Tentative Specifications for Chrome Molybdenum Alloy Steel Helical Springs

(Classes L, M, N and O, to be substituted for present standard classes B, C, D and H.)

#### 1. MANUFACTURE

1. *Process*—The steel may be made by the open-hearth, crucible or electric furnace process.

#### II—CHEMICAL PROPERTIES AND TESTS

2. *Chemical Composition*—The steel shall conform to the following requirements as to chemical composition:

Carbon, per cent.....	.40—.50
Manganese, per cent.....	.40—.60
Chromium, per cent.....	.80—1.10
Molybdenum, per cent.....	.30—.50
Phosphorus, maximum, per cent.....	.04
Sulphur, maximum, per cent.....	.045
Silicon, maximum, per cent.....	.25

3. *Check Analyses*—An analysis may be made by the purchaser from a sample representing each 20,000 lb., or fraction thereof, of each size of spring steel involved. The chemical composition thus determined shall conform to the requirements specified in Section 2.

4. *Sample for Analysis*—(a) If the section is large, a specimen weighing about  $\frac{1}{2}$  lb. shall be cut from any part of the spring, or if the spring is small, the entire spring may be taken. If the sample is cut off hot, it shall be cooled in such a way as not to harden it. The inspector shall stamp the sample with his private mark as soon as it is cut off.

(b) The drillings for check analysis shall be made from the sample so selected; the drill to be approximately one-half the diameter of the wire. The drillings shall be mixed from the total drillings obtained by passing entirely through the section of the wire.

#### III—PHYSICAL PROPERTIES AND TESTS

5. *Physical Tests*—(a) The properties specified in paragraphs (b), (c), (d) and (e), shall be determined in the order specified. The spring shall not be rapped or otherwise disturbed during the test.

(b) *Solid Height*—The solid height is the perpendicular distance between the plates of the testing machine when the spring is compressed solid with a test load of at least one and one-quarter times that necessary to bring all coils in contact. The solid height shall not exceed that specified by more than  $\frac{1}{16}$  in.

(c) *Free Height*—The free height is the height of the spring when the load specified in paragraph (b) has been released, and is determined by placing a straight-edge across the top of the spring and measuring the perpendicular distance from the plate on which the spring stands to the straight-edge at the approximate center of the spring. The free height shall not exceed that specified by more than  $\frac{1}{8}$  in.

(d) *Loaded Height*—The loaded height is the difference between the plates of the testing machine when the specified working load is applied. The loaded height shall not vary more than  $\frac{1}{32}$  in. under that specified.

(e) *Permanent Set*—(1) The permanent set is the difference, if any, between the free height and the height after the spring has been compressed solid three times in rapid succession, with the test load specified in paragraph (b), measured at the same point and in the same manner. The permanent set shall not exceed  $\frac{1}{32}$  in.

(2) If there is any permanent set not exceeding  $\frac{1}{32}$  in. the difference between the free height and the height after the test load of  $\frac{1}{2}$  times the specified working load has been applied and fully released two additional times, shall not be greater than the permanent set first measured.

6. *Number of Tests*—(a) A lot for physical test shall consist of not more than 500 individual coils, regardless of the grouping.

(b) From each lot of springs which has met the requirements of Sections 8 and 9, the purchaser or his representative may select for physical test at least 10 per cent, to be tested in accordance with the requirements of Section 5.

7. *Retests*—If any of the springs representing a lot fail to meet the requirements as to physical properties specified in Section 5, but at least one-half of the springs representing a lot do meet these requirements, each spring of the lot shall be tested, and those which meet the requirements shall be accepted. If more than one-half of the springs representing a lot fail to meet the requirements specified in Section 5, the lot will be rejected.

Footnote—A suggested heat treatment is as follows:

(a) The coiling should be done at temperatures between 1,700 degrees F. and 1,800 degrees F., and the steel shall be cooled slowly in air, not quenched from the coiling heat, until black.

(b) Springs should be reheated after coiling to a temperature of 1,525 degrees F. to 1,575 degrees F., and quenched in oil.

(c) Springs should be removed from the oil when at a temperature of about 300 degrees F. and either allowed to cool slowly in air or immersed immediately in the drawing bath. The springs should be drawn as soon as possible after quenching.

(d) The drawing should be done in a salt bath at a temperature of 940 degrees F. to 960 degrees F., and the springs should be allowed to remain in the bath and at that temperature for at least one hour.

#### IV—PERMISSIBLE VARIATIONS

8. *Bars*—The gage of the bars shall be within the limits as specified in A. R. A. Specifications for Carbon Steel Bars for Railway Springs.

9. *Springs*—The outside dimensions of the springs, excepting the height, shall not vary more than 1/16 in. from that specified.

#### V—WORKMANSHIP

10. *Workmanship*—(a) The springs shall be of a uniform pitch. The ends shall be tapered to present a flat bearing surface of at least two-thirds the circumference, at right angles to the axis of the springs within a tolerance of 1/8 in. to the foot.

(b) The spring bars shall be free from seams, excessive scale, roll marks or scratches which may constitute injurious defects.

#### VI—MARKING

11. *Marking*—(a) The name or brand of the manufacturer, the year and month of manufacture and, if specified, the purchaser's class number, shall be legibly stamped on each spring at a place not detrimental to the life of the spring.

(b) Any stamping by the inspector shall be so placed as not to be detrimental to the life or service of the spring.

#### VII—INSPECTION AND REJECTION

12. *Inspection*—(a) The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the springs

ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities and necessary assistance to satisfy him that the springs are being furnished in accordance with these specifications.

(b) The purchaser may make the tests to govern the acceptance or rejection of the material in his own laboratory or elsewhere. Such tests, however, shall be made at the expense of the purchaser.

(c) All tests and inspection shall be so conducted as not to interfere unnecessarily with the operation of the works.

13. *Rejection*—(a) Material represented by samples which fail to conform to the requirements of these specifications will be rejected.

(b) Individual springs which, subsequent to the above tests at the mills or elsewhere and their acceptance, show defects or imperfection will be rejected and shall be replaced by the manufacturer.

14. *Rehearing*—Samples tested in accordance with Section 3, which represent rejected material, shall be held for two weeks from the date of test report. In case of dissatisfaction with the results of tests, the manufacturer may make claim for a rehearing within that time.

15. *Reworking*—Any springs which fail to meet the requirements of the physical tests or conform to the specified dimensions may be again submitted after being reworked.

## Joint Committee on Joint Inspection of Standard Materials

A joint committee, representing the Mechanical and Purchases and Stores Sections, took up the question of co-operative inspection of standard materials at a meeting in Chicago on February 24, at which two methods of handling such a scheme were brought out: First, a regional plan whereby the roads with inspection forces would handle all inspection for other roads in certain regions; second, a central bureau of inspection organized and operated by the American Railway Association but without testing laboratories.

With either plan the roads interested must necessarily agree on uniform material specifications which would naturally be those of the association covering such standard materials as air-brake and signal hose, air coupling gaskets, couplers and coupler parts, axles, springs, wheels, side frames, bolsters, brake beams and journal bearings.

The majority of the committee is of the opinion that the regional plan of inspection by certain roads for others would not work out satisfactorily, primarily because the sources of material are largely confined to a restricted area and the burden would fall upon a comparatively few roads operating in that area. These roads would have to increase their in-

spection and testing facilities, and, further, such an increase in their work might result in discrimination in favor of their own material under certain conditions of pressure for material.

The central bureau of inspection under the control of the association appears to possess the greatest practical value, provided always that the railroads now purchasing material without inspection can be brought into the organization and made to stand their pro rata share of the expense. The manager of such a bureau should have authority to rule on all disputes between his inspectors and manufacturers, and there should be no appeal from his decision.

The roads now inspecting their own standard parts would have to agree to turn this part of their work over to the central bureau and stand their share of the expense, continuing their own inspection forces on other material. For certain large railroads this would indicate additional expense without benefit, but experience may prove otherwise.

It is recommended that the association sound out its members to ascertain their willingness to co-operate on either of the two plans outlined above.

F. M. Waring was chairman of the committee.

## Report of Arbitration Committee

During the year Cases 1167 to 1183, inclusive, have been decided and copies sent to the members. These decisions are made part of this report. A vote of concurrence is requested.

With the approval of the General Committee, this committee has continued the rendering of interpretations of such questions as have been asked by the members regarding the Rules of Interchange. The more important of these interpretations have been issued to the members in Supplement No. 1 to the 1920 Rules of Interchange.

All recommendations for changes in the Rules of Interchange submitted by members, railroad clubs, private car owners, etc., have been carefully considered by the committee and, where approved, changes have been recommended.

### RECOMMENDED CHANGES IN THE RULES OF INTERCHANGE

#### PREFACE

In order to more clearly indicate the spirit and intent

of the Rules of Interchange the committee recommends that the preface to the rules be modified in accordance with the proposed form shown below:

These rules are formulated as a guide to the fair and proper adjustment of all questions arising between car owners and handling company with the intent of:

1. Making car owners responsible for, and therefore, accountable with the repairs to their cars necessitated by ordinary wear and tear in fair service; by the Safety Requirements and by the Standards of the American Railway Association.

2. Placing responsibility with and providing a means of settlement for damage to any car, occurring through fair usage or improper protection by the handling company.

3. Providing an equitable basis for charging such repairs and damages.

Inspection of freight cars for interchange and method of loading will be in accordance with the Code of Rules and the Specifications for Tank Cars and Loading Rules issued by this Association.

## RULE 2

The committee recommends that the fourth paragraph of Section (b) of this rule be modified in accordance with the proposed form shown below in order more definitely to cover the intent of the requirement:

Cars using lighting outfits operated by engines using inflammable liquids with flash point 80° F. or lower, such as gasoline, motor fuel and alcohol, will not be accepted in interchange. This will not apply to lighting outfits operated by petroleum oils with flash point above 80° F., such as kerosene or illuminating oil.

## RULE 3

The committee recommends that the second paragraph of Section (h) of this rule be eliminated.

The committee recommends that the effective date of Section (i) be extended to October 1, 1923.

The committee recommends that Section (1) be modified to correspond with the Loading Rules for maximum spacing dimension for side stake pockets on flat cars and that the effective date of this requirement be extended to January 1, 1923, as follows:

All flat cars that can be used for twin or triple shipments of lading, built after January 1, 1918, must have side stake pockets spaced minimum 2 ft. 0 in. and maximum 4 ft. After January 1, 1923, no flat car that can be used for twin or triple shipments will be accepted in interchange unless the side pockets are so spaced.

## RULE 9

The committee recommends that the following paragraph be omitted from Rule 9 as this requirement is already provided for in the item of "Air Brakes Cleaned":

When triple valve and cylinder are cleaned, the initial of road and date of last previous cleaning must be shown.

The committee recommends that requirement for showing location be added to item covering metal brake beams R. & R., making this item to read as follows:

Metal brake beams, R. & R... 
 { New or second-hand, applied.  
 If A. R. A., and number of same,  
 or non-A. R. A.  
 Make or name.  
 Cause of removal.  
 Location number (see Rule 14).

## RULE 14

The committee recommends that the following be added to the second paragraph of this rule:

The same order of numbers shall be used for designating corresponding location of brake beams. In any case where a right or left side is designated on defect, billing repair or joint evidence cards for other parts of cars, the same uniform order of location shall govern.

Illustration of Method of Designating the Location of Parts on Car Specified in Rule 14

The committee recommends that the accompanying figure be added to this rule.

## RULE 19

The committee recommends that the following paragraph be added to Rule 19:

Plain cast-iron brake shoes should not be used. New reinforced back brake shoes must be used to justify bill.

## RULE 22

In order to define the intent of this rule more clearly, the committee recommends that the second paragraph be modified to read as follows:

Longitudinal sills may be spliced at both ends; intermediate or side sills on either side of the body bolster. The nearest part of the splice must not be less than 12 in. from edge of body bolster. Intermediate sills, spliced between body bolster and cross-bearer, must be reinforced as per Figs. 11 or 11-A. Intermediate sills, spliced between bolster and end of car, and side sill, spliced on either side of bolster, must be in accordance with Figs. 10 or 10-A, preferably the latter.

## RULE 23

It is evident from the questions referred to the committee that Section IV of this rule is more or less confused. In order to clarify the intent of this rule, the committee recommends that Section IV be modified in accordance with the proposed form shown below:

Welding cracks or fractures will be permitted on the following:

- Car and roof sheets.
- \*Cast steel truck sides.
- \*Pressed and structural steel truck sides, bolsters and transoms.
- \*Cast steel bolsters.
- Draft castings.
- \*Brake beams.
- \*Cast steel coupler yokes.
- Car sills, posts, braces, stakes, carlines, side plates and end plates.

Other car parts subject to compression only, and those not subject to high tension strains, except as otherwise prohibited.

\*Welding is permitted only when the area of the crack is less than two-fifths, or 40 per cent, of the total area through the section at the point of fracture, but it is not permissible to weld any crack located within 6 in. of an old weld.

## RULE 49 (Owners Responsible)

The committee recommends that Rule 49 be modified to read in accordance with the proposed form shown below:

- (1) All steel cars not equipped with cardboard for defect cards and joint evidence cards. Same to be located either on cross tie under car or inside of side sill at end of car, or on center sill of cars equipped with center sills only. Size of card to be not less than 5½ by 9 in.
- (2) All steel cars not equipped with cardboard for Bad Order cards, routing cards, return cards, etc. Same to be located on each side of car, near bottom at left hand end, or on end of end sill, and on center sill on cars equipped with center sills only. Size of cardboard to be not less than 5½ by 9 in.
- (3) Steel box cars not equipped with cardboard for special explosive and other placards, as required by the I. C. C. Same to be located on side doors and both ends of car. Size to be not less than 12 by 12 in.
- (4) All cardboards on steel cars must be secured with rivets or bolts with ends riveted over nuts.

## RULE 56

In view of the fact that cars will not now be accepted in interchange unless equipped with all metal brake beams, it is recommended that Rule 56 be eliminated from the Rules of Interchange.

## RULE 57 (Delivering Company Responsible)

The committee recommends that Rule 57 be modified to read in accordance with the proposed form shown below:

Cars not equipped with A. R. A. standard 1½-in. air brake hose. For label, see page 71.

The use of a rectangular label in addition to the band label is optional with any railroad, providing space, preferably 2 in., is allowed between the two labels.

## RULE 59 (Delivering Company Responsible)

The committee recommends that a new rule be added to the Rules of Interchange to be designated as Rule No. 59 to read as follows:

Cars offered in interchange with missing dirt collectors where cars are stenciled that they are so equipped.

#### RULE 60

The committee recommends that the following be added to the last paragraph of this rule:

The stenciling showing air brakes cleaned must not be changed unless all work is properly performed as required by the standard instructions for Annual Repairs to Air Brakes on Freight Cars.

#### RULE 62

The committee recommends that the second paragraph of Rule 62 be modified to read in accordance with proposed form shown herewith.

#### PROPOSED FORM

In replacing brake shoes on foreign cars, new *reinforced back* shoes must be used to justify bill.

#### RULE 66

The committee recommends that this rule be changed to provide that the expense of periodical repacking of journal boxes shall be assumed by the handling line and that item of lubrication be restored in Rules 1 and 108.

#### RULE 86

The committee recommends that the effective date of fourth paragraph of Section (b) of this rule be extended to October 1, 1922.

#### RULE 87

In order to show clearly the intent of this rule, the committee recommends that reference to Rule 70 be eliminated in the first paragraph and that the second paragraph be changed to read as follows:

*The company making such improper repairs must place upon the car, at the time and place the work is done, an A. R. A. defect card, which card must state the wrong repairs made, and which will be authority for bill for both material and labor for correcting the wrong repairs.*

#### RULE 88

In order to clearly show the intent of this rule, the committee recommends that the first paragraph be modified as shown below:

*In order that repairs of owners' defects may be expedited as fully as possible, foreign or private line cars may be repaired by the handling line by using material from their own stock instead of ordering from owner special material not specified in last paragraph of Rule 122, in which event the repairing line must issue its defect card for the labor only of correcting such improper repairs, and defect card should be so marked.*

#### RULE 112

Upon recommendation from the Committee on Car Construction the Arbitration Committee recommends that a fourth paragraph be added to Class E under the table showing reproduction cost per pound for freight equipment, reading as follows:

All wood, equipped with metal draft arms, extending 24 inches or more beyond center line of body bolster and with body bolster of sufficient strength to transmit buffing and pulling shocks to all longitudinal sills.

The reference to draft arms in Note 1 should be eliminated.

Section (d), which was intended to provide for settlement covering so-called rebuilt cars, has been found to be impracticable of application. The committee recommends the abrogation of this provision and the substitution of a new Section (d) reading as follows:

*If construction of car has been altered to the extent of placing it in a higher class for which a higher rate per pound is allowed under section (b), settlement shall be made at such higher rate per pound and according to the stenciled lightweight on car at date of destruction, and the depreciation shall be figured from date car was originally built at the rate applying to car as destroyed. This provision shall be retroactive in application to unsettled cases under the 1920 Rules.*

All references to rebuilt cars in this rule should be eliminated.

#### RULE 114

In view of the adoption by special letter ballot of the proposition of replacing ends of cars when broken out, the committee recommends that this rule be modified in accordance with proposed form shown below:

If the company on whose line the car is destroyed elects to rebuild the car, the original plan of construction must be followed, and the original kind and quality of materials used, except that metal draft arms extending beyond body bolster, steel draft members extending full length of car, transom draft gear, steel center sills or steel underframe should be applied and be of such design as will meet the recommended practice of the Division for reinforcing existing cars.

*On house cars (other than refrigerator cars) with steel underframes or steel center sills, having a center sill area of not less than 24 sq. in., when an end requires repairs consisting of new posts and braces, the ends shall be replaced with ends specified for new cars, this to be done by or under the direction of the car owner. No allowance shall be made for betterments not authorized by car owner.*

NOTE.—See Per Diem Rule 8.

#### RULE 120

The committee recommends that the following changes and additions be made in this rule:

Add the following item in the table under "Flat Cars," Section (b):

*All steel or steel underframe.....\$150.00*

Change Section (c) to read as follows:

*(c) The owner shall authorize repairs or destruction of car within 30 days from date of notification.*

Add the following paragraph to Section (e):

*At the time of authorizing destruction the owner shall furnish handling line statement showing estimated weights of material in car for which credit is due to assist handling line in arriving at proper credit. Couplers, wheels, axles and journal bearings shall be credited on basis of scrap prices shown in Rule 101 for such items.*

Insert the following paragraph between the present first and second paragraphs of Section (f):

*On house cars (other than refrigerator cars) with steel underframes or steel center sills, having a center sill area of not less than 24 sq. in., when an end requires repairs consisting of new posts and braces, the ends shall be replaced with ends specified for new cars, this to be done by or under the direction of the car owner.*

### PASSENGER CAR RULES

#### RULE 2

The committee recommends that Section (b), Rule 2, be modified as shown below, in order to more clearly define the intent of this requirement:

*Cars, loaded or empty, using lighting outfits operated by engines using inflammable liquids with flash point 80° F. or lower, such as gasoline, motor fuel and alcohol, will not be accepted in interchange. This will not apply to lighting outfits operated by petroleum oils with flash point above 80° F., such as kerosene or illuminating oil.*

#### RULE 12

The committee recommends that Section (b) of this rule be modified as shown below:

The billing repair card must specify for journal bearings applied and removed, whether solid, filled or other kind, length of journal and box number as marked on truck.

The report is signed by T. H. Goodnow (Chairman), Chicago & North Western; J. J. Hennessey, Chicago, Milwaukee & St. Paul; J. Coleman, Grand Trunk; F. W. Brazier, New York Central; J. E. O'Brien, Missouri Pacific; T. W. Demarest, Pennsylvania System, and G. F. Laughlin, Armour Car Lines.

## Prices for Labor and Material

During the past year the committee has made certain investigations, and submits the following report on freight car Rules 101, 107, 111 and 112, and Rules 21 and 22 of the passenger car code.

The material prices set forth in the accompanying recommendations for 1921-22 rules are based on the average prices paid by five large representative roads during 1920, supplemented by numerous current quotations from several large railway supply houses. As in the present code, all material prices include suitable allowances to cover freight transportation charges, direct and indirect store expense, fabricating labor when involved, and interest on stock investment, based on average monthly inventory balance multiplied by interest rate and result divided by total annual material disbursements.

In recommending many of the material prices, due consideration was given to the fact that the roads had stocked up on materials at prices effective before the decline, and therefore the full effect of the recent decline in prices will not be represented in the prices recommended for next year.

In establishing prices for practically all second-hand materials, the same percentage of cost new as prevails in the present rules was used. Scrap materials were averaged and current market prices less transportation charges to scrap plant were set up as credits.

Labor allowances shown in hours and tenths are substantially the same as those in the present code, which were based on time studies in 1915 and 1916, one of the most important exceptions being the fact that certain allowances for sills, bolsters, etc., which in the present code include jacking of the car, have been modified so that the jacking cost is omitted and is to be added as a separate operation where consistent. It is felt that this will be of considerable advantage to bill clerks throughout the country in that there will be removed the necessity for deducting under certain combinations the jacking price heretofore included in two or more of the operations in the combination.

The principal labor rate per hour (Item 172, Rule 101), is recommended at \$1.20; the same as authorized in the existing rules. As noted above, no changes have been made in the labor allowances as a whole nor in the rates per hour, this

for the reason that overhead studies made on six representative roads during October and November, 1920, also investigations made in February and March, 1921, as to actual time consumed on these roads in performing the work as compared to the arbitrary allowances authorized under the rules, indicate that the roads of the country, on the average, are being fairly compensated under the rules for the work performed by them on foreign cars.

The report is signed by A. E. Calkins (chairman), New York Central; Ira Everett, Lehigh Valley; T. J. Boring, Pennsylvania System; I. N. Clark, Grand Trunk; H. G. Griffin, Morris & Company; J. H. Milton, Chicago, Rock Island & Pacific; C. N. Swanson, Atchison, Topeka & Santa Fe; E. H. Weigman, Louisville & Nashville, and A. E. Smith, Union Tank Car Company.

### RULE 101

[The important changes in this rule are increases in most of the prices for air brake material, decreases in the prices for couplers and coupler parts and the discontinuance of price for the periodical repacking of journal boxes.—EDITOR.]

### RULE 107

The committee recommended the change of the first paragraph of Rule 107 to read as follows:

The following table shows the labor charges which may be made for performing the various operations shown. The labor allowances include all work necessary to complete each item of repairs, unless the rules specifically provide that in connection with the operation additional labor may be charged for the R. & R. or R. of any item which must necessarily be R. & R. in connection therewith.

[The changes in time allowances are largely confined to reductions due to not including jacking of the car in operations which generally require the car to be raised.—EDITOR.]

### RULE 111

[The principal change in this rule is the elimination of item 8, tightening cylinder and reservoir when loose.—EDITOR.]

### PASSENGER CAR RULES 21 AND 22

[Item 3A was added to Rule 21, allowing one hour for slackening buffer in order to R. & R. or R. coupler knuckle, lock or pin. A number of adjustments in material prices are shown in Rule 22.—EDITOR.]

## Report of Car Construction Committee

### Salt Water Drippings

Conference has been held with representatives of the principal interests using brine valves and it is the opinion that the various devices now used will, with proper maintenance, perform their functions, that the users of such devices are fully advised as to their necessity and should be notified that they must have all cars with brine tanks equipped by January 1, 1922, and that no further extension of time will be granted after that date. It is recommended that paragraph "F" of Interchange Rule 3 be modified to correspond with the above.

### End Doors for Box Cars

In the report of 1920 the following recommendation was overlooked when preparing the sheet for letter ballot:

In 1913, the Master Car Builders' Association adopted as recommended practice, that end doors must be so constructed that, when closed, they lock automatically by means of a lock accessible from the inside of the car, thus avoiding the necessity of taking seal records. Sheet 30 shows a design of inside fastening which is not automatic, and your committee recommends that recommended practice adopted in 1913 should be advanced to standard, and that the design of inside latch shown on Sheet F should be

removed, and a note substituted that the fastening should lock the door automatically from the inside of the car.

It is recommended that this be now submitted to letter ballot.

### Minimum Thickness for Backs of Journal Bearings

Requests to fix a minimum thickness, because, at times, too much wear is allowed before removal, led to issuing Circular No. S III—108, asking whether such limits are necessary, and, if so, what the limits should be.

According to the majority of replies received, it is desired to fix a standard minimum thickness for backs of journal bearings, as follows:

Class of Bearing	A	B	C	D	E	F
Size of journal, in.	3 3/4 by 7	4 1/4 by 8	5 by 9	5 1/2 by 10	6 by 11	6 1/2 by 12
Min. Thickness of back, in.	1/2	5/8	3/4	7/8	1	1 1/8

It is suggested that this be adopted as recommended practice.

### Gages for Bearings and Wedges

Attention was directed to a growing demand for these

gages and that standards should be provided. The committee's recommendations for such gages are shown in Figs. 1 and 2 and it is suggested that these be adopted as recom-

general use, it is advisable, in order to avoid duplicating reserve stock for repairs, to make the bottom of all dust guards semicircular. Such dust guards can be used in boxes

Fig. 1—Journal Bearing Gage

mended practice, the present separate gages to remain as standard.

Dust Guards

Since pressed or cast steel and malleable iron journal boxes with round bottom dust guard cavities have come into more

with either square or round bottom dust guard cavities.

The committee recommends that the dust guard shown in Fig. 3 be made standard. The dust guards illustrated show the round bottom and otherwise were changed in dimensions to better fit the standard journal boxes.

Fig. 2—Wedge Gage

F	6½ by 12	11	7	6	5	4	3	2	1	1	1	1	1	1

Fig. 4—Proposed Standard C, D, E and F Journal Boxes

## Journal Boxes

To meet various suggestions for change, and to increase uniformity of standards, we submit Fig. 4, showing journal boxes C, D, E and F, recommending that they be substituted for the present standards.

The bottom of dust guard pocket has been made semi-circular, to reduce the cost of box. The angle of lid face has been made the same for all boxes. Various minor, or unimportant, dimensions have been unified. No changes affecting interchangeability, or serviceability, have been made.

## Springs

Complaints relating to the unsatisfactory results from standard springs have been increasing rapidly. The causes

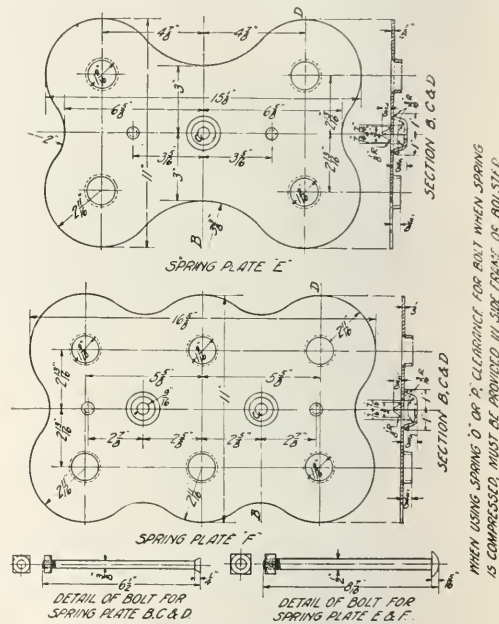

TABLE OF SPRING GROUPS										CAPACITY	
CLASS OF TRUCK SPRING	NO OF COILS	SPRING NO 1	SPRING NO 2	PLATE	FREE	SOLID	PLATES	HEIGHT DELIVERED	NO PLATES	FOR H-7 1/2	FOR H-7 1/2

2F P	6	6	F	6 1/2	6 1/2	6 1/2	6 1/2	6 1/2	6 1/2	113410	56705

Fig. 5—Truck Spring Details

of the trouble, according to the analysis of your committee, are: (1) Unsatisfactory process of manufacture; (2) quality of material; (3) irregular surface of spring ends, and (4) improper application of shims under or over springs to raise the car body to normal height. The result is that many springs either break or take a permanent set.

The remedy recommended is: (1) To improve the method of manufacture by better control of heating and tempering for more uniform results, and to obtain greater uniformity of coiling; (2) to use alloy steel; (3) to grind the ends of the springs to present a flat bearing surface of at least two-thirds the circumference at right angles to the axis of the spring; (4) to prescribe that shims, placed under or over the springs, shall consist of metal plates with parallel surfaces,

and (5) to design the springs for a unit stress, when solid, of close to 100,000 lb. per sq. in., using the present diameters of bars, thereby materially increasing the capacity and range of deflection.

These changes should result in: (1) Material decrease in shock on side frames; (2) increased life of springs, and (3) decrease of maintenance cost and car delay.

It is recommended that the springs classified "L," "M," "N" and "O," as illustrated, in Figs. 5 and 6, be adopted as alternates for springs "B," "C," "D" and "H," and that alternate spring "P" be added for use with 2/F trucks.

The committee requests that railroads try out these springs thoroughly, in order to be in position later to vote on their

The tension and bearing area requirements, but not the shear area requirements, shall be governed by the value of the steel. For bearing area between surfaces of different grades of steel in contact, the value of the lesser grade of steel shall govern. For grade "A" steel, for which the product of elastic limit in pounds multiplied by the elongation in per cent is not less than 700,000, the areas given are required. For grade "B" steel, for which the designated product is not less than 850,000, the given areas may be reduced by 12½ per cent.

It was stated that the adopted height from rail to top of truck side bearings of 27½ in. would prevent the use of roller, ball or rocker side bearings. The dimension given refers only to flat truck side bearings.

The intent of the committee is to make designs that will establish fixed conditions, permitting the use of detail designs standardized by the Association, or the substitution of other parts preferred by the individual railroad, singly or in groups, provided these parts, or group of parts, are the equivalent in strength and safety of, and interchangeable with, the standard part or group of parts replaced. This will permit using any special detail such as top side bearing, which is interchangeable with, and equal in strength to, the side bearing that may be standard, or special top and bottom side bearings, which as a group are similarly interchangeable with the standard top and bottom side bearings as a group.

The standards should be made attractive for use by being as good or better than parts that may be substituted, rather than by making their use compulsory.

### Truck Design

A subcommittee of the Committee on Car Construction, in co-operation with the Truck Committee of the Manufacturers Association, are engaged in the design of cast steel side frames and bolsters. They have considered the limits of dimensions fixed at the last meeting of the Mechanical Division and have given full consideration to the previously recognized dimensions of the M. C. B. Association, and to the designs that were put into effect by the United States Railroad Administration.

The manufacturers' committee has met with the subcommittee on two occasions, each time submitting for consideration designs in detail representing various ideas in view, but up to this time no single design has been brought out that could be presented as a recommendation for standard. It is possible that more than one design will have to be considered, with alternates.

### Standard Car Design

Pending the development of complete A. R. A. car designs, freight cars according to the essential standards of the American Railway Association may be ordered from any car builder according to the following:

Type	U	S	St	N
Single sheath box.....	.....	.....	.....	.....
Steel box.....	.....	.....	.....	.....
55-ton hopper.....	.....	.....	.....	.....
70-ton hopper.....	.....	.....	.....	.....
70-ton gondola.....	.....	.....	.....	.....
50-ton gondola.....	.....	.....	.....	.....
40-ton truck.....	.....	.....	.....	.....
50-ton truck.....	.....	.....	.....	.....
70-ton truck.....	.....	.....	.....	.....

The height of center plates should be specified as 20½ in., as more fully described in American Railway Association, Mechanical Division, Circular S III-189. This increased height of center plate introduces eccentricity as between the line of shock and the axis of the center sill sections, which changes the ratio of stress to end load, to offset which, it is necessary to add two bottom angles to the center sills if the sectional area of the center sill is desired to be 30 sq. in. This would add about 500 lb. to the weight.

The height of sides of car, A. R. A. standard, is 8 ft. 6 in.

Fig. 6—Truck Spring Details

adoption as standard. It is recommended that interchange rules be formulated to protect the alloy steel springs against being replaced with ordinary springs.

The secretary has referred this to the Committee on Specifications and Tests for Materials, requesting preparation of specifications.

### Fundamentals

Inquiry relating to fundamentals, and their meaning, indicated the necessity of describing those pertaining to minimum areas more in detail. The minimum area between rear followers of the center sill construction is the whole area in compression under end force, without deducting for rivet and other holes, which are filled with metal.

In the formulae on which former requirements were based, page 772, 1920 Proceedings, line "c," under heading "For center sills between rear followers," the word "tension" should have been omitted, making it read:

The minimum area = 2.5 T.

minimum inside. In event cars are ordered to the height shown in the drawings (9 ft.) no change in drawings is entailed. For the minimum height of 8 ft. 6 in., dimensions affected by the height, including the dimensions of box car doors, must be changed accordingly.

The report was signed by W. F. Kiesel, Jr. (chairman), Pennsylvania System; A. R. Ayers, New York, Chicago &

St. Louis; C. E. Fuller, Union Pacific; J. C. Fritts, Delaware, Lackawanna & Western; C. L. Meister, Atlantic Coast Line; J. McMullen, Erie; T. H. Goodnow, Chicago & North Western; John Purcell, Atchison, Topeka & Santa Fe; W. O. Moody, Illinois Central; J. A. Pilcher, Norfolk & Western; H. L. Ingersoll, New York Central; W. H. Wilson, Northern Pacific, and F. W. Mahl, Southern Pacific.

## Report of Committee on Loading Rules

During the past year conferences were held with the steel shippers, and also with the stone shippers of the Bedford, Indiana, district to consider suggestions offered by them for changes in the existing rules.

Trial shipments of twin loads of structural steel over five feet in height and having the center binder omitted were sent out at request of the steel shippers to determine the necessity for center binders. The information obtained through these trial shipments was not conclusive and the trial has been further extended.

### General Rules

The following detailed changes in the Loading Rules are submitted for approval:

#### RULE 5

Changed "80,000" to "60,000" in second and third paragraph. Revised table to show 95,000 lb. as total weight of car and lading for cars of 60,000 lb. marked capacity. *Explanation:* Rule changed to provide limits for 60,000 lb. capacity cars on basis of axle capacity, to conform with Interchange Rule 86.

#### RULE 23

Revised to read as follows: "If, in loading cars, it is impossible to clearly ascertain whether the restrictions given in General Instructions under paragraph 8 are complied with, the following table may be used." *Explanation:* Reference to General Rule 9 has been omitted, as this rule refers to twin or triple loads. Rule 23 and the accompanying table pertains to single loads only.

Table of weights revised. *Explanation:* Limits for 100,000 lb. capacity cars revised to make these limiting weights consistent for various lengths of cars. The word "average" added to heading of second column to clarify the meaning. Thirty and 32 ft. cars omitted from the table account of no longer being used. Thirty-six, 38 and 48 ft. cars added to the table to take care of existing cars.

### Group I—Lumber, Logs, Etc.

#### RULE 101

Add the following sentence to end of the rule: "Lumber or timber less than 12 ft. in length should not be loaded on flat cars or above the sides or ends of gondola cars."

### Group II—Structural Material, Castings, Etc.

#### RULE 201

Omit last sentence from the rule, to clarify the meaning.

#### RULE 202

Fourth sentence of third paragraph revised to read as follows: "Short material may be loaded on car floor, if equally distributed over entire floor; total weight of entire lading must not exceed the load weight as per General Rule 5." *Explanation:* Reference to "capacity" changed to "load weight" to conform with reference to "load weight" in third sentence of third paragraph.

#### RULE 213

Third sentence of rule changed to read as follows: "The blocking should never consist of less than one 3-in. plank

set on edge, or its equivalent, and must be secured from shifting by cleats nailed or bolted to the floor." *Explanation:* Revised to omit requirement for more than one plank for end protection.

#### RULE 217

First paragraph of rule changed to read: "When the lading consists of very flexible material, such as plates, no bearing-piece is required on the floor of the car, but blocking as prescribed by Rule 213 must be used to protect the end boards." *Explanation:* Revised to conform with Rule 213 for end protection.

#### RULE 227

Revised to read: "Material loaded on gondola cars with drop ends or on flat cars, as shown in Figs. 62 and 63, must have one hardwood bearing-piece not less than 10 in. by 10 in. for loads up to 65,000 lb. per bearing-piece, and not less than 12 in. by 12 in. for loads exceeding 65,000 lb. per bearing-piece. (See General Rule 31-A for light loads.)" *Explanation:* Requirement for  $\frac{3}{8}$ -in. bolts to secure bearing-pieces has been omitted. Bearing-pieces are secured by  $1\frac{1}{4}$ -in. rods passing through bearing-piece and floor of car.

#### RULE 250

Second paragraph changed to read: "Wrought iron pipe should not be loaded inside of larger sizes of pipe unless below the ends or end gates of car."

#### RULE 260

Insert words "or gondola" after the word "flat" in marginal reference of rule. Insert words "or gondola" after word "flat" in first line of first paragraph.

#### RULE 265

Revised as follows and drawings changed to accord therewith:

"Metal sheets loaded in box cars should be secured in accordance with Figs. 90, 90-A, 91 and 92. Sheets in each pile should be preferably of uniform size and there must be at least two 2 in. by 4 in. uprights secured to inside of car at the end of each pile to provide a uniform bearing surface and to prevent the sheets from cutting through the end lining of car; also upright strips not over one inch thick should be used between the lading and sides of the car.

"The piles must be securely wedged apart at least at two points by braces consisting of 2-in. by 4-in. uprights against the piles, securely wedged apart at top and bottom by 2-in. by 4-in. pieces, as per Figs. 90, 90-A and 91. Each upright piece to be secured by two 2-in. by 4-in. cleats nailed to floor to prevent shifting, and tied together at top by not less than 1-in. by 4-in. longitudinal strips to prevent shifting.

"The bracing at ends of piles toward center of car shall consist of one upright piece 2 in. by 4 in. against end of pile, backed up by one upright piece 2 in. by 8 in. against side of car, both to extend full height of load and be securely nailed to side of car as per Fig. 90; and, in addition, there must be one piece of 2 in. by 4 in. extending across doorway at top of load, securely wedged against bracing of load in opposite end of car, also one piece of 2 in. by 4 in. extending

from upright at end of pile to doorway and securely nailed to side posts and braces as per Fig. 90.

"Where height of load exceeds 30 in. it will be necessary to apply additional longitudinal bracing at center of load.

"Uprights to be secured at bottom by two 2-in. by 4-in.

Fig. 90

pieces extending to doorway, and one piece of 2 in. by 4 in. extending full width of pile, securely nailed to floor as per Fig. 90.

"Wedges at bottom of load are optional; if used, they should conform to Fig. 91, and where width of pile exceeds 28 in. three wedges should be used.

Fig. 90-A

"In all cases, where there is space between ends of sheets and uprights at top of pile, wedges must be used as per Fig. 90-A.

"When oiled sheets are loaded they should be placed on

Fig. 91

suitable strips and heavy paper used to prevent oil stains on the floor of car.

"There may be more than one pile of sheets in each corner of car, provided there are at least two 2-in. by 4-in. pieces between ends of piles, secured in an upright position and extending from car floor to at least 2 in. above top of pile and each pile is braced against side of car.

"Bundled metal sheets loaded in box cars should be loaded in accordance with Fig. 92. After piling of sheets is completed, the center of pile should be compressed solid and top cross-piece X must be nailed and cleated to car sides. This cross-piece must also be further secured by having a

MANNER OF BRACING BUNDLED SHEET STEEL PLATES IN BOX CARS.

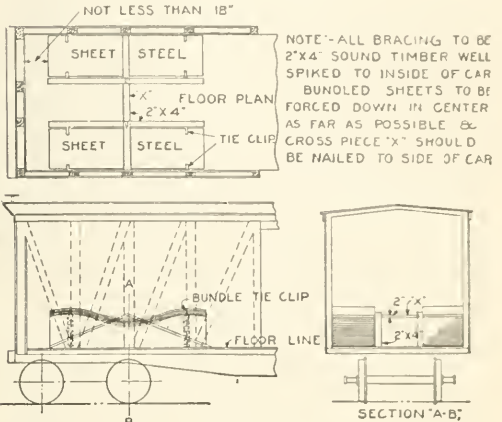

Fig. 92

2 in. by 4 in. placed against side of pile and nailed to floor of car and top of cross-piece.

"All blocking and bracing to be secured by not less than 20-penny nails."

Explanation: Rule and figures revised in conference with shippers to furnish more substantial blocking and bracing for this class of material, to better protect both lading and car.

Group IV—Concrete Culvert Pipe, Brick, Stone, Etc.

The following revisions of the stone loading rules are recommended as the result of conference with the shippers of stone:

RULE 401

Second paragraph revised to read as follows: "Where separating strips to keep lading clear of car floor are referred to in these rules, they should be sound wood, not less than 3 in. wide by 1½ in. thick. Such strips shall extend full width of stone and be placed approximately one-fifth the length of stone from each end. Where more than one strip is used to make the required thickness, the strips should be securely nailed together. In no case is it considered good practice to use more than two bearing-strips per length of stone. Stone longer than 10 ft. should, whenever practicable, be loaded over trucks." Explanation Revised to include increase in size of separating strips; definite location for strips; strips to be nailed together where necessary; not more than two strips per stone; stone over 10 ft. long to be loaded over trucks; sound wood specified in place of soft wood

RULE 405

First paragraph: Insert the following at end of second sentence: "See Rule No. 401 for minimum size of wood strips."

RULE 405

Insert the following paragraphs after second paragraph of rule:

"Where practical, the following method of loading should

be used for flagging, slabs or stone sawed on two sides.

"Slabs  $2\frac{1}{2}$  in. thick and less, shipped in quantities, to be loaded on edge, lengthwise of car. Where a few pieces only of this group of sizes goes on a car, such few pieces may be loaded flat on top of slabs not less than 4 in., but not more than four pieces in any one stack.

"Three-inch slabs shipped in quantities loaded flat should have a slab not less than 4 in. under each pile. There should be no more than eight 3-in. slabs in any one pile, either loaded on a 4-in. slab, or on the floor of a car. Three inch slabs longer than nine ft. must be loaded on edge or flat on a slab not less than 4 in. in thickness or not more than two on top of any shorter stack.

"Four-inch slabs shipped in quantities loaded flat on car to be loaded not more than eight slabs high. Where 4-in. slabs are loaded on slabs 5 in. thick or over, then the same amount may apply on slab as flat on car. Four-inch slabs longer than 10 ft. should, wherever possible, be loaded on slabs thicker than 4 in.

"Five-inch slabs shipped in quantities loaded flat on car to be loaded not more than eight slabs high. Where 5-in. slabs are loaded on slab 6 in. or over, then the same amount may apply on slabs as flat on car. Five-inch slabs longer than 11 ft. should, wherever practicable, be loaded on slabs thicker than 5 in."

*Explanation:* To provide definite rules for piling slab stone.

#### RULE 405

Third paragraph, second sentence, revised to read: "If necessary, to prevent stone from shifting past the end stakes, a standard board should be securely nailed to the inside of the end stakes and extend full width of stone." *Explanation:* Revised to indicate when board protection is required.

#### RULE 408

Marginal reference revised to include "stone sawed on more than two sides." First sentence of first paragraph revised to read: "Curbing and stone sawed on more than two sides when loaded lengthwise of car should have two standard stakes opposite each outside piece." *Explanation:* Rule revised to include stone sawed on more than two sides.

#### RULE 409

Second paragraph, second line, word "soft" changed to "sound." *Explanation:* To permit use of various woods that may be available.

#### RULE 410

The first paragraph revised to read as follows: "Mill block loaded lengthwise or obliquely on car should be protected on the sides and ends by cleats not less than 2 in. by 4 in., in section, extending at least three-fourths of length or width of stone or by not less than two wedges 3 in. by 3 in. on sides and 4 in. by 4 in. on ends, wedges to be not less than 14 in. long and securely nailed to floor of car at right angles to stone. When the width of stone exceeds 3 ft. 6 in., or length of stone exceeds 10 ft., the side and end protection must consist of not less than three wedges. If stone is loaded crosswise of car and width of stone does not exceed 3 ft., only one wedge will be required for side protection. All side and end cleats of wedges must be sound, straight grained lumber secured to floor of car by not less than 40-penny nails. When the stone is loaded close together or wedged apart, cleats or wedges are required on sides and ends of outside stone only. When such stone is loaded in tiers, standard end and side protection must be provided." *Explanation:* Reference to height of stone omitted. Provision included for use of wedges in place of cleats. Sound lumber secured by not less than 40-penny nails is specified for cleats and wedges.

Second paragraph revised to read: "Mill block containing as much as 100 cu. ft. resting on channel or scabbled surface not less than 25 sq. ft. or proportional for increased sizes must be so loaded that the weight of total lading will be uniformly distributed over the floor of the car." *Explanation:* Requirement of a layer of sand, cinders or crushed stone for supporting the stone has been omitted. Not essential for uniform bearing.

Third paragraph revised to read: "Gondola cars are preferable for such shipments, but if flat cars are used, the lading should be placed at least 18 in. back of end of car. When car is equipped with end stake pockets and stone is loaded closer than 18 in. to end, standard stakes 6 in. high should be used. When the stone does not engage both stakes, wedges in addition to stakes must be used. Each block of stone loaded lengthwise, crosswise or obliquely must be protected against creeping as specified in first paragraph of this rule. When two blocks of stone are loaded parallel and close to each other, or wedged apart, they will be considered as one stone as to cleating or wedging." *Explanation:* Provision made for end stake blocking where car is equipped with end stake pockets and stone is loaded closer than 18 in. from end.

Fourth paragraph revised to read: "If stone is placed lengthwise of car and is 4 in. or closer to side of car, two standard side stakes 6 in. in height must be placed opposite such stone in lieu of cleats or wedges on that side of stone. Stone must not be loaded obliquely when it is possible to load it lengthwise or crosswise of car." *Explanation:* Reference made to wedges to conform with change in first paragraph of rule.

Fifth paragraph omitted from rule. *Explanation:* Covered by first paragraph of revised rule.

Sixth paragraph: The following words, "when used," inserted after the word "cleat" in first line. *Explanation:* To conform with first paragraph of rule.

New paragraph added as follows: "In no case shall the height of stone be more than two times the smallest dimension resting on the car floor." *Explanation:* This paragraph establishes a limit for the height of stone in proportion to the base in accordance with the practice which is generally followed in loading large stone.

#### RULE 411

First paragraph, second sentence: Change the words "one and one-half" to "two." *Explanation:* To conform with first paragraph of Rule 410.

### Group V—Automobile Loading

#### RULE 518

Rule revised to read: "The distance between any two vehicles, at the nearest point, loaded on a freight car must not be less than the following limits: 2 in. horizontally, 3 in. vertically with springs compressed and 4 in. vertically without springs compressed." *Explanation:* Revised to permit a 3 in. vertical clearance where cars are shipped with springs compressed.

### End Stake Pockets for Flat Cars

In conference with stone shippers, the sub-committee of the Loading Rules Committee agreed to recommend to the Committee on Car Construction that end stake pockets be required on future flat cars. This subject is, accordingly, hereby referred to that committee.

The report is signed by R. L. Kleine (chairman), Pennsylvania System; J. J. Burch, Norfolk & Western; E. J. Robertson, Soo Line; J. E. Mehan, Chicago, Milwaukee & St. Paul; Samuel Lynn, Pittsburgh & Lake Erie; Ira Everett, Lehigh Valley; T. O. Sechrist, Louisville & Nashville; E. N. Harding, Illinois Central, and G. R. Lovejoy, Detroit Terminal.

## Brake Shoe and Brake Beam Equipment

The 1920 Brake Shoe and Brake Beam Committee in its report presented at the last annual meeting engaged for the 1921 committee to give attention to eight subjects. These subjects have been given careful consideration and are hereinafter reported on as follows:

### Gage for Determining Hanging

#### Heights of Existing Beams

The value of such a gage is insufficient to warrant the expense incident to its development and manufacture for general distribution. The old types of cars on which wide variations of hanging heights exist and which prompted the idea of such a gage are gradually being eliminated. There is an increasing demand and tendency to standardize brake beams and hangings, which will eliminate the necessity for such a gage.

### Code Governing Brake Beam Maintenance Practices

The committee recommends as the first progressive step the early adoption of a standard practice covering the reclamation of brake beams in such a manner that they will meet the standard specifications used in the purchase of new brake beams.

A sub-committee was appointed to submit a tentative standard practice and has submitted one which is deserving of the careful consideration of the association. It is submitted as a progress report and it is recommended that the report be submitted to the members of the association with the request that each submit his criticism to the committee to assist it in the final development of a standard practice that will satisfactorily meet the requirements. See Exhibit A.

### Advisability of Brake Head Strength Test

This subject was referred to a sub-committee of engineers of tests which conducted some laboratory tests on 21 different types and capacities of brake beams representing the products of seven different manufacturers, at the Collinwood laboratory of the New York Central Lines, and submitted the report which is incorporated herein as a progress report. The conclusions reached by the sub-committee read in part as follows:

Tests of brake-beam heads do not appear necessary if the load in service always comes upon the center lugs. However, if in the opinion of the Brake Beam Committee, the load is not always restricted to the center lugs, but is frequently carried principally on the toes, then a standard strength of head, and standard method of test for determining same, is desirable.

The committee believes that all of the stress on brake heads is frequently sustained by the top and bottom lugs and that brake head strength tests are a proper and reasonable requirement and should eventually be incorporated in the specifications. Accurate and practical methods of making such tests are, however, still obscure and will require further careful study and investigation by the committee. See Exhibit B.

### Increasing the Initial Brake Shoe Thickness

In view of the adoption as standards of the association, of brake heads of the A, B and C depths last year to take care of existing brake beam clearance conditions, the committee deems it advisable that no changes be made in the standard brake shoe thickness of  $1\frac{1}{2}$  in. at this time.

### Details of Top and Bottom Head Lugs

This subject refers to the recesses in the top and bottom brake head lugs which receive the top and bottom brake shoe lugs. The standard drawing does not show all of the dimensions and manufacturers were conferred with to determine the practice. It was found that the depth of the recesses is uniformly  $1\frac{1}{4}$  in. from  $17\frac{3}{4}$  in. radial line; the width at the

opening is in practically all cases  $1\frac{3}{8}$  in. and at the bottom varies from  $1\frac{1}{8}$  in. in the majority of cases to  $1\frac{7}{16}$  in.

The committee recommends that Section CC, Sheet M. C. B. 17, be revised to show the dimension  $1\frac{1}{4}$  in. as the width of the bottom of the recesses adjacent to the top and bottom brake head lugs.

### Brake Shoe Key Design and Fit of

#### Shoes, Head Face and Key

This subject was referred to a sub-committee for investigation and its report is submitted as a progress report. The investigation will be continued by the committee. See Exhibit C.

### General Brake Beam Hanging

This subject was referred to a sub-committee for investigation and its report was forwarded to the Committee on Car Construction which has the matter under consideration in connection with standard truck design.

### Reversible Strut

This subject is still under consideration and the committee has nothing to report at this time.

### Standard Depth of Brake Head

Last year there were adopted as standards three depths of brake heads designated as "A," "B" and "C" to meet clearance conditions obtaining on various cars. The committee recommends that heads "B" and "C" be removed from the standards and their use be permitted as alternates where the standard "A" head cannot be applied.

### Status of the No. 2 and No. 2

#### Plus Standard Brake Beam

The status of the No. 2 and No. 2 plus standard brake beams, as regards the weights of cars to which each should be applied, has received special consideration at different times during the year.

The Train Brake and Signal Committee and the Brake Shoe and Brake Beam Equipment Committee were requested by the Car Construction Committee to submit their joint recommendations on this subject. The joint meeting of the two committees referred to was held at New York on April 5, 1921, and the following motion was carried by a majority but not a unanimous vote:

The Brake Shoe and Brake Beam Equipment and the Train Brake and Signal Equipment Committees have considered the matter of No. 2 and No. 2 plus brake beams and recommended that these beams be used on cars of the following weights for four-wheel trucks:

BRAKE BEAM	CAR WEIGHT
2	35,000 to 48,000 lb.
2 plus	48,000 to 58,000 lb.
3	Over 58,000 lb.

In the case of six-wheel trucks, the above weights should be increased 50 per cent for the beams specified.

Report of this action was submitted to the Car Construction Committee.

### Formula for Brake Power on Freight Cars

The Car Construction Committee in its last year's report recommended a new formula for brake power on freight cars.

The association requested the Train Brake and Signal Equipment and the Brake Shoe and Brake Beam Equipment Committees to submit joint recommendations on this subject. The joint meeting was held November 18, 1920, and a proposal to change the brake ratio as suggested was unanimously disapproved. An abstract of the report submitted to the Car Construction Committee follows:

\*The purpose of the proposed change in braking power is to

make the percentage of braking power more uniform on partially loaded cars in which there is a wide range in the ratio of light weight to loaded weight. While the proposed change will accomplish in a small measure the object sought, it will do so only by sacrificing the uniformity of braking power on empty cars. As the factor of retardation is highest when the cars are empty, it is essential that uniform braking power be maintained for empty cars.

The adoption of the proposed braking power formula will

brake head of  $6\frac{1}{2}$  in. and a maximum depth of brake beam of  $7\frac{3}{8}$  in. The committee submits to the association as recommended practice the accompanying drawing showing such a beam of the No. 2 and No. 2 plus capacity.

The report is signed by W. J. Bohan, Northern Pacific; C. B. Young, Chicago, Burlington and Quincy; F. M. Waring, Pennsylvania System; M. H. Haig, Atchison, Topeka &

Brake Beam with Central Head Hangings Only

result in increasing the percentage of braking power on high capacity cars, to a point in excess of the capacity of standard 10-in. freight brake equipment, and for comparatively low capacity tank cars the application of the formula in some cases will reduce the effectiveness of the hand brake. It also provides for a lower percentage of braking power on refrigerator cars weighing approximately 55,000 lb. and having 5 in. by 9 in. journals. Because of the relatively high speed at which these cars are handled and

Beam Number	Rod Diam. A	Beam Capacity	Threading of Rod
* 2	1 7/8"	12,000 Lb.	U. S. Std. 1 7/8", 7 Thds. 2 1/2" Long
* 2+	1 1/4"	15,000 Lb.	U. S. Std. 1 1/4", 7 Thds. 2 1/2" Long

#### Exhibit A—Recommended Practices on Brake Beam Reclamation and Repairs

The reclaiming and repairing of brake beams should be centralized at some convenient place, where there is suitable equipment for doing the work in an economical and safe manner.

##### GENERAL INSPECTION

All defective brake beams that are received at a reclaiming plant should be completely dismantled. After brake beam has been dismantled the various parts should be separated and given a general inspection. Any part of the brake beam that has any of the following defects should be scrapped: Excessive deterioration due to rusting or long life; undue wear; broken or cracked.

The following practices should not be permitted: Building up any part of the brake beam by gas or electric welding; straightening of the strut or brake head by excessive heating; any parts of brake head or strut that cannot be straightened by heating slightly should be scrapped. It is desirable to straighten struts or brake heads cold.

##### DETAIL INSPECTION

The various parts should be very carefully inspected in the following manner:

Fig. 1—Brakehead Gage

the character of their lading, a reduction in braking power is not considered desirable, especially in view of the fact that they are handled in short trains in which a high percentage of braking power is less objectionable than in the case of long trains.

#### Standardization of Brake Beams

##### Having Central Head Hangings

A start should be made to standardize brake beams having central head hangings only and having a maximum depth of

**Brake Heads.**—All heads should be gaged with A. R. A. gage shown in Fig. 1. If the center lugs are worn sufficiently to take maximum center lug *B*, or if the thickness of metal between face of center lugs and part of key slots has worn sufficiently to take the minimum gage slot *D*, or if the toes

Fig. 2—Lever Pin Hole Gage

are badly worn, the brake head should be scrapped. Brake heads with slightly worn toes can be used again. Brake heads should be free of burrs, core sand, dirt or any other foreign matter.

**Struts.**—All struts should be gaged with lever pin hole

Fig. 3—Angle Gage for Strut

gage shown in Fig. 2, and if hole is badly worn so it will take the maximum end of gage it should be scrapped. Any strut having lever slot walls twisted or badly worn should be scrapped. Struts having slots set on an angle should be gaged with angle gages similar to Fig. 3.

Any strut not bearing the proper capacity of the beam it is to fit should be so marked.

**Tension Rods.**—Any tension rod that has been flange cut, badly rusted or threads badly damaged should be scrapped. Tension rods badly bent and twisted can be straightened by heating over their entire length.

**Compression Member.**—Any compression member that has badly worn places due to release spring or any other cause should be scrapped. Compression members badly bent or twisted should be heated uniformly throughout and then

Fig. 4—Tension Rod Bending Machine

straightened. If they are only slightly bent or twisted they can be straightened without heating. All compression members should be straight before reapplying.

#### EQUIPMENT

The following equipment is recommended for use in connection with reclaiming brake beams:

Tension rod bending machine. Fig. 4 shows an air operated machine of this kind.

Assembling benches. Fig. 5 shows a bench of this kind now in use.

Fig. 5—Assembling Rack

Fig. 6—Support Gage

Testing machine. Fig. 7 shows a 50,000-lb. testing machine and Fig. 8 a 75,000-lb. machine.

Suitable bins and racks for storing and caring for repair parts.

Air motor for applying nuts to ends of compression rods. Fig. 5 shows one of these motors in use.

Annealing oven.

Miscellaneous. Hammers, wrenches, etc.

#### ASSEMBLING AND TESTING

Strut should be applied to compression member and properly keyed in place.

Safety clips should then be applied.

If additional support chairs are used they should be applied next, fastening them in proper place, using a gage similar to Fig. 6.

Heads or sleeves should be placed on one end of the com-

Fig. 7—Brake Beam Testing Machine, 50,000 lb. Capacity

pression member, making sure that the top is on the same side of the compression member as the head of the strut key. Some brake heads are right and left and care should be taken to see that they are properly mated. The tension rod should

tension or camber. The beam should be checked for correct camber, using a gage similar to Fig. 9.

The beam should be placed in a proof testing machine similar to that shown in Figs. 7 or 8 and apply a proof

Fig. 8—Brake Beam Testing Machine, 75,000 lb. Capacity

be inserted in the head or sleeve on the compression member, laying the truss rod seat in the end of the strut, and then apply the other head or sleeve.

Nuts should be applied to the ends of the tension rods, screwing them up to a full thread. This places the beam in

Fig. 9—Camber Gage

load of the capacity of the beam, check and adjust the camber. After this a second proof load is to be applied, released, and the camber again checked. The truss rod nuts are adjusted until all four points of the camber gage come in contact with the back of the compression member. The ends of nuts are then riveted over about one-third of the rod circumference.

The beam should be checked for head centers with a gage similar to that shown in Fig. 10, by placing the legs of the gage in the top of the brake shoe key slot opening on the upper center head lug. If the gage goes in, the beam will meet A. R. A. head center requirements. The pin hole location should be checked with a gage similar to that shown in Fig. 11. Beams having rigid heads must be carefully checked

Fig. 10—Head Center Gage

to see that both heads are parallel. Fig. 12 shows a device for straightening these heads.

All beams should be well covered with quick drying metal paint.

### Exhibit B—Brake Beam Head Strength Tests

No. 2, No. 2 plus and No. 3 brake beams complete with brake heads, were furnished by seven manufacturers for test purposes, a number of different styles of brake heads being represented. Tests of the brake heads of these brake beams were made in all cases by applying the load to the strut of the brake beam as under service conditions. The three conditions under which the load might come upon the brake head were considered: (1) center lugs only resting upon the support, (2) brake head cocked, so that one center lug and

one toe rested upon the support, and (3) toes resting upon the support, with center lugs free.

The test results obtained under condition (1) evidenced no set and but slight deflection at the set load called for by the brake beam. Tests under condition (2) were found to be impracticable. It was therefore concluded that test under condition (3) represented the maximum condition of weakness, and this method of supporting the brake head for test

appreciably in excess of the specified deflection load of the brake beam frequently produce distortions and twists in the several brake beam parts, that result in readings so variable and ununiform as to be of little practical value.

In numerous cases the strength of the head is not in proportion to the capacity of the brake beam; that is, for equal loads the brake heads of brake beams of higher capacity show more deflection than heads on brake beams of lower capacity.

Fig. 11—Brake Beam Gage

Although as stated the results are not in all cases uniform, they indicate as a whole that the elastic limit of malleable iron brake heads of the designs tested occurs at approximately  $1/32$  in. deflection of the brake head.

#### CONCLUSIONS

Tests of brake beam heads do not appear necessary if the load in service always comes upon the center lugs. However

was accordingly chosen as adequately covering any possible condition that might be obtained in service.

Tests in each case were accordingly made by mounting the brake beams in the testing machine with the brake heads resting upon the radius blocks illustrated in the photographs, the load being carried upon the toes of the brake head, with the center lugs clear. Deflection of the heads was measured by apparatus designed by G. E. Doke for the New York Central Laboratory, also illustrated in the photographs. The datum bar of the deflection apparatus is clamped to the toes of the brake head, one end of this bar being free to allow the device to adjust itself to longitudinal spreading movement. The recording mechanism, an Anes dial gage reading to one-thousandth of an inch, is clamped to the lower center portion of the brake head, with the movable spindle in contact with the datum bar. This apparatus is self contained, and therefore measures only the deflection within the brake head, independent of any movement between the brake head and the support.

Twenty-one brake beams of various designs were tested by the sub-committee. Readings of deflections and the permanent set obtained upon brake heads were taken at the deflection loads and set loads required by the brake beam specification for No. 2, No. 2 plus and No. 3 brake beams, in addition to which the load and permanent set occurring at  $1/32$  in. and  $1/16$  in. deflection of the brake head were also noted.

#### DISCUSSION OF TESTS—CONDITION NO. 3

The results obtained are not consistently uniform. Loads

Fig. 12—Brakehead Straightening Machine

if in the opinion of the Brake Beam Committee the load is not always restricted to the center lugs, but is frequently carried principally on the toes, then a standard strength of

head and standard method of test for determining same, is desirable. The information obtained indicates that this standard of strength can apparently best be determined under the method of support (3) described above. The elastic limit of malleable iron heads indicates that this standard should be approximately as follows:

When the deflection load specified for a brake beam of given capacity is applied to the brake beam, the brake heads themselves should not show more than 1/32 in. deflection, with no permanent set.

Whether a deflection of  $1/32$  in. of the brake head, which would increase the present permissible deflection of the brake

G. E. Busse, chairman, Mechanical Committee of the Brake Beam Manufacturer's Institute, witnessed the above tests, representing the Brake Beam Manufacturer's Institute.

## Exhibit C—Brake Shoe Key Design and

### Fit of Shoes, Head Faces and Key

The subject of brake shoe key design and details involved in the fit of the shoe, head, face and key was investigated by F. M. Waring who advises that an examination of a large number of freight cars in yards disclosed the almost universal condition of the keys being all the way down and still a loose fit, thus indicating the advisability of a change in the

### Apparatus for Measuring Brake Head Deflection

beam as a whole by that amount, would so disturb existing brake rigging standards as to make it impracticable, must necessarily be decided by the Brake Beam Committee.

It is recognized that 50 per cent or more of present day

key design. The most logical change seems to be to make the key thicker at the center than is now specified. Fig. 2 shows a new design of key that has been tried out and is suggested for consideration.

The proposed key is thinner at the point and has a somewhat greater taper than the standard key, so that it becomes  $\frac{1}{2}$  in. thick at a point 3 15/16 in. from the end instead of just under the head. The drawing shows a tolerance of 1/32 in. in thickness, which is a practical working limit if the key is drop forged or rolled.

A key machined to the exact dimension shown was tried with new brake heads and shoes, which were selected by gaging, so as to give the maximum and minimum opening for the brake shoe key. With the maximum opening the experimental key could be pushed in by hand until the shoulder was within  $\frac{3}{4}$  in. of the brake head. With the minimum opening the key stood out about  $3\frac{1}{8}$  in.

The key was then tried on a number of new brake beams and new shoes taken from stock and on a number of brake beams on cars in repair yards.

The table shows the distance the key protruded from the brake head when applied without being hammered down. When the key protruded several inches, it was found that it could be driven down about 1 in. further.

Proposed Dimensions for Recess in Toes of Brake Head and  
Proposed Design of Brake Shoe Key

designs of brake heads will not meet the above requirements, but if the load is frequently carried principally upon the toes of the brake head, then the sub-committee feels that such a requirement is logical, as otherwise the specification would permit permanent set at a given load in one member of the assembled brake beam, and at the same time require that the brake beam as a whole should show no permanent set at that load.

## FIT OF EXPERIMENTAL BRAKE SHOE KEY

	New brake heads and shoes	Brake heads and shoes on cars in service
Loose when forced all the way in . . .	0	4
All the way in before being tight . . .	0	55
Projecting from 0 in. to 1 in., inclusive . . .	0	2
Projecting from 1 in. to 2 in., inclusive . . .	0	8
Projecting from 2 in. to 3 in., inclusive . . .	13	9
Projecting from 3 in. to 4 in., inclusive . . .	7	8
Projecting from 4 in. to 5 in., inclusive . . .	0	7
Projecting from 5 in. to 6 in., inclusive . . .	0	2
Total . . .	20	95

These figures show the desirability of a thicker key and

they also show that it will be difficult to get a key that will fit old parts as well as new parts. However, the proposed key should be an improvement over the present standard and there will be only a few cases when it will be too large to be used. It is evident from experiments with brake heads or shoes which have been gaged that where the key projected over 4 in. from the brake head, the brake shoe or head is not within the limits of the standard gages.

When trying the proposed key on cars in service, the old

keys removed were measured at a point  $5\frac{3}{8}$  in. from the head. Taking the measurements at a uniform place did not always show the greatest wear. However, 63 per cent of all old keys were only  $5/16$  in. or less. It would appear that a good deal could be accomplished in keeping the brake shoes tight by putting in a limit on the thickness of key which should be allowed to remain in service. We therefore suggest for consideration a limiting thickness of  $\frac{3}{8}$  in. at any place within  $5\frac{3}{8}$  in. of the shoulder.

## Report of Committee on Tank Cars

During the past year the work of the committee has been mainly the continuation of its efforts to secure improvement in certain details of construction, principally the safety valve, bottom discharge valve, dome closure arrangement and anchorage of tank to underframe. In this work the Committee has had the benefit of the co-operation of the Bureau of Explosives, American Petroleum Institute and the National Petroleum Association.

### SAFETY VALVES

Additional tests have been made at Altoona of the experimental designs submitted by manufacturers of locomotive safety valves, which had been modified as the result of the tests referred to in the 1920 report; and also of other modifications of the standard design, including changes in the dimensions of the valve disks, non-corrosive seats, etc. The committee can only report progress for the reason that no valve has proved absolutely tight at pressures at or near the popping point (25 lb.). Observation of the leakage prior to popping has shown that the escape is always on one side, indicating a tendency of the valve disk to cock. Special guides have been tried and special springs have been made in an effort to secure true closure, but so far without success.

Some of the valve manufacturers are willing to make other modifications, but before asking them to do this the committee is endeavoring to get from the oil trade some definite information as to the extent of the losses which can be properly charged to the safety valve. The available data indicates that with straight refinery products the losses are not large; also that with insulated tank cars the loss with casinghead blends is slight, but the question of safety valve leakage assumes importance because the uninsulated car may carry very volatile products, some of which are constantly under pressure.

The tests have shown conclusively the large discharge capacity of the standard valve—about 31,000 lb., equal to 4,800 gallons of gasoline per hour—so that an 8,000-gallon tank with its two safety valves would be discharged in about 50 minutes with very little rise in the pressure. One of the experimental valves gave a discharge capacity of 40,000 lb. per hour.

The committee has approved some slight modifications in the details of the design of the valve to reduce foundry losses and to facilitate machinery. These changes do not affect the functioning of the valve, or the interchangeability of the parts, and the committee recommends that they be incorporated in the standard design of valve.

### BOTTOM DISCHARGE VALVES.

This question has been assigned to a sub-committee of which J. E. Grant, special agent of the Bureau of Explosives, is chairman. This sub-committee is working in close co-operation with a similar committee of the American Petroleum Institute. There have been about twenty-five designs submitted, eleven of which are being tried out under observation in service. It is hoped that another year will demonstrate the correct principles on which satisfactory designs must be based.

Reports show that a large part of the unsatisfactory performance of existing valves is due to failure to keep the tanks and consequently the valve seat clean.

### EXTENSIONS TO BOTTOM DISCHARGE OUTLET

There have been a number of protests against the requirement adopted last year that:

No nipples, valves or other attachments shall project below the bottom outlet cap, except while car is being unloaded.

These protests emphasize the lack of confidence in the present bottom outlet valves, in that it is claimed that the cocks attached to the bottom cap are necessary to enable the consignee to tell whether the outlet valve is closed, and that if the valve is not properly closed the removal of the cap would permit the uncontrollable discharge and loss of the contents of the tank. The trouble is really due to man failure rather than design failure. The regulations of the Interstate Commerce Commission require that the bottom cap shall be removed when the tank is loaded, and if this is done it will insure the valve being properly closed and there will be very little danger of its being unseated in transit. The one exception is where water from gasoline leaks past the valve into the outlet pipe and freezes, which may result in unseating the valve or breaking the outlet pipe, or both. The overcoming of this is one of the features of the problem of a satisfactory valve.

The committee believes a further step should be taken to guard against the danger of breakage of the outlet pipe by limiting the distance which the outlet projects below the sills to that required to operate a wrench in applying and removing the cap. It is, therefore, recommended that:

Effective July 1, 1922, in the case of new cars and of replacements on existing cars, the bottom outlet pipe when applied to tanks of cars having center sills shall not project below the bottom line of sills more than the threaded length necessary to permit the application and removal of the bottom outlet cap.

The presence of a cock on the bottom of the discharge pipe is not necessarily objectionable, provided it complies with the proposed requirement.

[In connection with the bottom outlet, the committee also recommended the elimination of the following sentence from Section 7 (c), first paragraph, of Classes III and IV specifications: "Additional attachments thereto, having threads of other dimensions may be used."—EDITOR.]

### DOMES CLOSURE ARRANGEMENT

The Bureau of Explosives takes strong ground against the ordinary screw type of dome cover, particularly for cars carrying liquid normally under pressure. It was expected that the escape of gas through the vent holes at the top of the screw portion of the cover would give adequate warning to a man of ordinary intelligence that internal pressure existed and that the dome cover should not be removed until this pressure had been relieved. The numerous casualties which have occurred because of the removal of the cover in spite of this warning show that a better form of cover is necessary.

There are also appreciable losses of contents in the form of gas due to lack of tightness of the screw cover, even where soft gaskets are used.

With cars assigned permanently to these very volatile products it would suffice to provide only such cars with another form of cover, but in an emergency, at least, any car may be loaded with these products.

The attention of the car builders has been called to the matter and a number of them are endeavoring to work out satisfactory designs. Two general types meet the requirements, viz.: (1) An internal cover supported by a screw and yoke against an internal flange of the dome ring. Such a cover can not be removed while there is internal pressure. (2) An external cover held in place by a number of hinged bolts, the nuts of which engage lugs on the cover so designed that the cover can not be removed as long as there is internal pressure against it.

It may be necessary, eventually, to require that all new cars shall be equipped with some form of cover which can not be removed until internal pressure is relieved. The committee believes that a beginning should be made with cars carrying casinghead gasoline and its blends, and recommends that paragraph 6 (c) of the Class IV Specification be amended to read:

For cars built after July 1, 1922, the dome cover, if external, shall be secured by bolts; or if internal, by yoke and screw.

The Committee feels that the external cover is preferable because of the greater probability of good workmanship and because its operation is simpler.

#### ANCHORAGES.

The center anchorage for tank cars is the subject of a basic patent which expires in August, 1921. Because of this patent builders have been allowed considerable latitude in their designs of this type of anchorage. Some of these designs have proved unsatisfactory in service, and a number of cases have been reported of tanks going adrift with breakage of outlet pipe and loss of contents. So far these failures have been confined to the bolted anchorage and are traceable to bad design or workmanship, or both. The principal causes have been the use of rough bolts in unreamed holes instead of turned bolts in reamed holes, as required by the specifications; and the use of wooden fillers, prohibited by the specifications, between the anchorage and the underframe, so that the bolts are in flexure instead of in shear. In a number of cases the bolts were threaded so far down that the shearing value was that of the root of the thread instead of the body of the bolt, while the bearing value was but that of the top of the threads.

This matter was taken up with all of the tank car builders, and where it was found desirable to change the designs it was willingly done. The approved designs of all of the builders now provide connections materially in excess of the minimum requirements of the specification and it is believed that no failures of these anchorages will result with any reasonable handling.

#### HEATER PIPES

The Committee can only report progress upon this subject.

#### NUMBER AND CLASS OF TANK CARS

The growth in the number of tank cars is shown by a recent tabulation from Boyd's Tank Car Circular, which shows a total of about 137,000 tank cars in service, of which 125,500 were of private ownership and 13,500 of railroad ownership. This compares with figures for January 1, 1913, given in one of the Interstate Commerce Commission reports, viz.: 30,039 of private ownership and 9,150 of railroad ownership, a total of 39,189.

#### WELDING

In its 1912 report the committee called attention to the desirability of the welded tank, and in 1919 provision was made in the specification to permit the experimental use of welded tanks for Class III cars. Several welding concerns have given the question attention, but so far the cost of tanks welded by the forge welding process has been so high as to be prohibitive. Recently one of the large pipe manufacturing concerns proposed the use of its forge welded pipe for this purpose. If this proposition assumes definite form your committee will be prepared to take up the question of this construction as an alternative to the riveted tank.

Various overtures have been made to permit the use of autogenously welded tanks, but the committee is not prepared to recommend the acceptance of such tanks in advance of definite proof of the reliability of this method of welding. At present there are too many uncertainties as to the character of the welds made by different operators, and particularly as to the ability of such welds to stand the alternating bending stress to which tank cars are subject.

The one exception which has been made is in the case of anchorages on welded Class V tanks. It was originally required that this should be forge welded, and during the War a number of tanks for the United States Government were so welded but the results were unsatisfactory. Owing to the nature of the lading, exposed anchorage rivets are objectionable and the latest construction approved by the committee consists of riveted anchorages with the rivet heads on the inside covered by autogenously welded cup shields.

In this connection the attention of the committee has been called to the fact that in some cases cracked shells have been repaired by autogenous welding and that the result has not been satisfactory. The committee recommends that, for the present at least, repairs to shells of tanks shall not be made by autogenous welding.

#### A. R. A. STANDARDS AND RECOMMENDED PRACTICE

The specifications for Classes III, IV and V tank cars, under the head of Couplers, Brakes and Trucks, prescribe "A. R. A. Standards and Recommended Practice." It has developed that this, in connection with the Rules of Interchange, makes the standards and recommended practice mandatory in the case of tank cars where they are not so in the case of freight cars generally. It was not the intention of the committee to single out tank cars for greater compliance with the standards and recommended practice than is required in the case of other kinds of freight cars, and the committee recommends amending this requirement to read:

A. R. A. Standards and Recommended Practice as in the case of other classes of freight equipment cars.

#### BRAKES

Question has been raised as to the difference in the wording of the brake requirements for Classes I and II cars, reading:

Each car shall be equipped with air brakes of a capacity equal to not less than 70 per cent of the light weight of car, and at least one hand brake operating the brakes of both trucks.

and those for later classes of cars, reading:

A. R. A. Standards and Recommended Practice.

When the general revision of the specification was made in 1916 the committee, in accordance with its policy of avoiding as far as possible retroactive requirements, did not recommend any change in this respect so far as Classes I and II, which were the existing cars, were concerned. The difference is more in form than in substance, the original 70 per cent brake power being based on 60 lb. the pressure due to emergency application, while the 60 per cent is based on the 50 lb. due to equalized service application. As there is so

little difference in the final results it is believed that the situation can be satisfactorily covered by adding, in the case of Classes I and II cars;

When any change is made in the brake arrangement it shall be made to conform to A. R. A. Standards and Recommended Practice.

#### TANK CARS FOR HYDROCHLORIC ACID.

Certain products such as hydrochloric acid, vinegar, etc., because of their chemical reaction can not be successfully handled in the ordinary metallic containers. In the case of hydrochloric acid, which is extremely corrosive, it has been handled in wooden tanks mounted on flat cars. The committee has not, so far, recommended any specification for such cars, but, at the suggestion of the Bureau of Explosives, in view of complaints as to leakage with existing designs of cars,

the question of developing a standard specification has been taken up and a sub-committee of five representatives of the largest acid shippers in co-operation with the Bureau of Explosives is engaged in experiments with steel and wooden tanks with glass and rubber linings, and with wooden tanks enclosed in steel shells insulated by plastic bituminous materials.

The report is signed by A. W. Gibbs, chairman, Pennsylvania System; C. E. Chambers, Central Railroad of New Jersey; S. Lynn, Pittsburgh and Lake Erie; John Purcell, Atchison, Topeka & Santa Fe; George McCormick, Southern Pacific; F. K. Tutt, Missouri, Kansas & Texas; Col. B. W. Dunn, Bureau of Explosives; A. E. Smith, Union Tank Car Company; Geo. Hartley, Semet Solvay Company, and C. W. Owsley, The Texas Company.

## Report on Train Brake and Signal Equipment

### RETAINING VALVES FOR FREIGHT EQUIPMENT

The question of retaining valves for freight equipment cars referred to in this committee's report of last year has been made the subject of a special investigation by a sub-committee, which outlined and arranged for a series of tests on grades ranging from  $1\frac{1}{2}$  to  $3\frac{1}{2}$  per cent, with retaining valves of various capacities. Owing to the serious business depression now generally prevailing, the tests were discontinued before sufficient information had been collected to permit the committee making definite recommendations.

### AUTOMATIC HOSE CONNECTIONS FOR FREIGHT AND PASSENGER EQUIPMENT

The question of automatic hose connectors for freight and passenger equipment was referred to a sub-committee which reports that there were thirty-nine answers to the circular of inquiry sent out February 20, 1920, to all of the railroads in the United States; four railroads reporting experience with automatic connectors. Of these, there is only one which has any considerable number of cars equipped, or which are in any representative service. The committee learned that there were some automatic connectors used in Canada, which were not included in the answers to the circular, and endeavored to find what information could be obtained from this trial; but was unable to get any great amount of information.

The committee is unable to find in the reports a design that would seem to lend itself to general use, and for the lack of such information is, therefore, unable to make any specific recommendations at this time.

### AIR BRAKE CYLINDER PACKING

The committee has further considered the matter of air brake cylinder packing made of leather substitutes. It has also been recently suggested that specifications be prepared for brake cylinder packing. The committee will solicit the assistance and co-operation of the Committee on Specifications and Tests for Materials in preparing suitable specifications, after which it will be in position to submit definite recommendations.

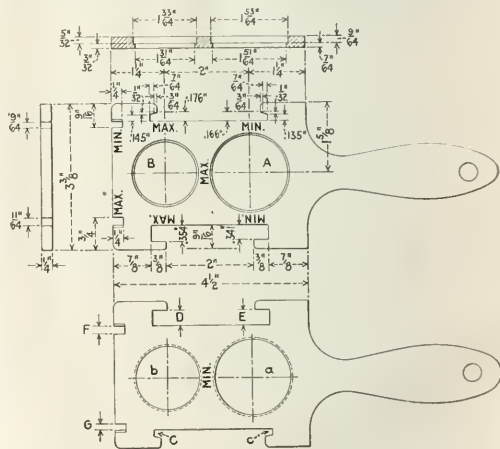

### MECHANICAL SANDERS

The committee has considered the question of connecting mechanical sanders to the engineer's brake valve in a manner that will automatically sand the rails when the brake valve is placed in emergency position. This is a local matter and the committee has no recommendations at this time.

### LIFE OF AIR BRAKE HOSE

This subject has been investigated by a sub-committee which has reviewed all data available. Unless the period

for removal of air hose in service is extended to at least thirty months a large number of hose will be removed which would last for a much longer time; also the fixing of such a period for removal from service would not provide for removing a large number of hose which fail within this period. Instead of establishing a maximum life it would be preferable to consider revising the present specifications to provide a better quality of hose, and it is suggested that

Openings "A" and "a" are for gaging max. and min. (external) diameter of packing ring flange.  
Openings "B" and "b" are for gaging max. and min. (external) diameter of projecting wall or face portion of ring.  
Slots "C" and "c" are for gaging max. and min. thickness of flange and level on surface of flange.  
Slots "D" and "d" are for gaging max. and min. over all depth of ring at face.  
Slots "E" and "e" are for gaging max. and min. thickness of projecting wall or face portion of ring.  
Rings must enter all sections of gage marked "max." and must not enter any section of gage marked "min."

Fig. 1—Tolerance Gage for Air Hose Coupling Packing Rings

this be considered by the Committee on Specifications and Tests for Materials.

The committee again calls attention to the importance of applying the soap suds test as called for in the present rules governing the maintenance of freight brakes.

### EXTRA HEAVY PIPE AND NIPPLES FOR AIR BRAKE TRAIN LINE

A member has requested that consideration be given to

using extra heavy wrought iron pipe and nipples exclusively for repairs to all freight car equipment, regardless of age, and that prices for material be revised accordingly. This practice is in effect on several large roads and while extra heavy wrought iron pipe is unquestionably superior to steel or standard weight pipe, in view of the decided difference in first cost the committee does not feel justified in recommending a change at this time. It is suggested, however, that standard weight nipples be used at the angle cock with either extra heavy or standard weight brake pipe.

#### LOCATION OF ANGLE COCKS ON LOCOMOTIVES

In view of the fact that this subject was investigated during the period of Federal Control by the Railroad Administration's Committee on Standards, assisted by several members of your Committee on Train Brake and Signal Equipment, without being able to develop a solution for the problem, the committee is not now in position to develop anything new on the subject.

#### GAGES FOR AIR BRAKE HOSE COUPLINGS AND PACKING RINGS

The Committee on Specifications and Tests for Materials has recommended that, (a) suitable gages be developed for checking the dimensions of hose couplings when new, (b) consideration be given to changing the form of present standard gage for hose coupling packing rings, and (c) the tolerance dimensions for packing rings be made to conform to the tolerances shown in its

report for 1919, which was printed in Circular S III-23.

With one exception the tolerance dimensions referred to are practically the same as are now provided for in the standard gage for hose coupling packing rings, the exception being that the gage provides for no tolerance in thickness of packing ring flange. The Committee on Train Brake and Signal Equipment now believes it desirable to provide for tolerances for all dimensions, and recommends that the gage drawing be revised to conform to the accompanying Fig. 1.

It is suggested that the question of gages for hose couplings be made the subject of investigation by this or a similar committee during the coming year. The Committee on Specifications and Tests for Materials concurs in this suggestion and has consented to furnish a sub-committee, if necessary, to assist in such an investigation.

#### ADJUSTMENT OF HAND BRAKE POWER ON FREIGHT CARS

On account of the present business depression in railroad service, the test which was scheduled to be made early this spring in connection with the adjustment of hand brake power on freight cars has, with the approval of the General Committee, been indefinitely postponed.

The report is signed by F. L. Burton (Chairman), New York Central; B. P. Flory, New York, Ontario & Western; J. M. Henry, Pennsylvania System; L. P. Stratter, Illinois Central; R. B. Rasbrieger, Philadelphia & Reading; G. H. Wood, Atchison, Topeka & Santa Fe; H. M. Curry, Northern Pacific; W. J. Hatch, Canadian Pacific, and G. C. Bishop, Long Island.

## A Simplified Check for Large Freight Houses

By C. J. Casteel

Traveling Freight Inspector, Wabash Railroad

**A** GENTS IN CHARGE of large freight houses frequently complain that they find it next to impossible to obtain a satisfactory check of all of the freight in their warehouses. Such men will find a desirable check in a system recently adopted by the Wabash which provides a rapid means of adjusting "overs" and "shorts," and at the same time prevents claims arising from irregular deliveries.

Owing to an unusually congested condition which followed a large movement of L.C.I. freight through one of our larger warehouses, we found ourselves confronted with hundreds of articles of freight for which we were unable to locate the billing by which it had moved. In the same way we found large numbers of freight bills for which we could find no corresponding shipments of freight. This condition was due to a number of causes, but principally to the cross delivery of shipments, one of the failures so common to inefficient or careless delivery clerks.

Our efforts to check the warehouse periodically by means of the oldtime tally sheets not only involved a tremendous amount of work, but resulted in considerable delay, together with a conglomeration of written reports to ponder over in the slow process of matching up "overs" and "shorts." In addition to this difficulty, the check sheets were worthless to us, for once being filed they were never referred to afterward.

To overcome these bad features and to reduce the constantly growing volume of "overs" and "shorts," our claim prevention representatives adopted a rather novel plan which has been operated with considerable success in our warehouses. Printed cards, numbered consecutively, have been prepared. These are furnished the clerk in charge of each section of a warehouse with instructions that a separate card is to be filled out for each shipment or portion of a shipment which appeared in the individual section after the expiration

of the free time limit; the free time limit to be determined by the car number and the date of unloading, which is stamped on each article by the unloading clerk as it leaves the car. The card itself is arranged to provide space for data, including the name and address of the consignee, the number of the card, the number of the shipment, the name of the shipper and his address, a brief description of the articles in the shipment and their weight, the car number, date, and the section of the warehouse through which the shipment has moved. These data are filled in by the section clerk, who then turns the card over to the OS&D clerk, who completes the record by adding the date and the OS&D number.

To avoid any possible duplication of these cards the section clerk marks each package reported with a red tag bearing the number of the card and fastened securely to the shipment. When the shipment is delivered this tag is detached and sent to the OS&D clerk, together with all other tags and cards. These are sent in at the close of each day's business and automatically notify the OS&D clerk that he is to close his files on the particular shipment reported. The first duty of the OS&D clerk at the beginning of the day is to check off cards which have been handed him by the section clerk on the previous day, with the bill case in the office of the cashier. All cards which are able to be matched in this way are filed alphabetically with reference to the consignee, in a permanent file. Cards which cannot be matched are filed in a current file box from which the OS&D clerk works constantly. As soon as a card is ready for permanent filing its disposition is noted on the back, and it is then ready for the claim clerk who may need it for reference in checking up possible cases of claims for lost or undelivered packages.

This card system, we find, gives us a perpetual inventory on our warehouses. It places before our OS&D and claim clerks a permanent daily check which relieves them of the necessity for making numerous time-killing trips about the warehouses to identify and compare billing of "over" and "short" shipments. The system protects us against claims for lost packages arising from any possible failure to establish delivery.

# Electrical Communication in Railroad Service\*

## Proper Organization of the Telegraph Department Essential to Obtain Efficiency in All Branches

By H. C. Chace

Superintendent of Telegraph, Atchison, Topeka & Santa Fe, Topeka, Kan.

**A**S THE TELEGRAPH DEPARTMENT is entirely responsible for the operation of the railroad electrical communication, a brief outline of the organization necessary for the proper operation and upkeep of the facilities will serve to illustrate the functioning of the telegraph departments on large railroads.

Adequate facilities are necessary to good service and economical operation. Sufficient force must be provided to render a satisfactory service. Competent supervision is necessary, first, to plan facilities which will meet the requirements of the service and operate them economically, and second, to see that the facilities are properly maintained and used.

The ideal arrangement is to establish general or relay offices under the jurisdiction of one head at convenient points, preferably division and general office headquarters, so that each way office will have access to at least one general or relay office. These offices, forming the backbone of the telegraph service, must have a sufficient force to provide flexibility, and this elasticity makes it possible to economize in the force at the less important offices without seriously impairing the service.

### Organization

In the Santa Fe organization the telegraph department is administered by the superintendent of telegraph, reporting to the operating vice-president. Assistant superintendents of telegraph are located at Topeka, Kan.; Galveston, Tex., and Los Angeles, Cal. A telegraph engineer, a telephone engineer and a construction engineer are also attached to the superintendent of telegraph's staff. A telegraph-telephone supervisor is located on each general manager's territory and is responsible for the maintenance of pole lines, circuits and equipment.

The bulk of the telegraph business is filed during the day hours and usually in such volume that the facilities were overtaxed, while at night those same facilities were practically idle. With the exception of messages marked "rush" and those detected by telegraph office supervisory forces as being important, telegrams were, prior to the introduction of our classified service plan, transmitted in sequence of their filing time. As a consequence, important messages during periods of congestion occasionally were not given the service they deserved while waiting their turn, while less important ones were moved more promptly than was necessary.

In order to correct this condition, distribute the traffic load more evenly and provide a more satisfactory and economical service, we inaugurated a classified service, which in addition to the Pink service provides for: (1) Preferred Service—For the handling of subjects requiring immediate and preferred attention. (2) Day Service—For handling subjects the urgency of which do not require preferred service. (3) Night Service—Where the delivery of the telegram on the morning following will answer the purpose. No one knows the importance of a telegram as well as the sender or writer, upon whom now devolves the responsibility of designating its class, and the excellent co-operation we have had has made the plan an entire success. Such officers as may be designated by

the vice-president are authorized to use what is known as Pink service for extremely urgent telegrams. These messages take precedence over all business except train orders and are given practically instantaneous service.

### Circuits and Circuit Arrangements

In providing and arranging telegraph circuits the object is to furnish each telegraph office with a direct wire to division headquarters and to at least one relay office, preferably and usually the one located at division headquarters, and to connect the relay offices with each other for direct service whenever the volume of traffic warrants. Each relay office is connected by a direct and exclusive circuit to grand division headquarters and to such other relay offices as are warranted by traffic conditions, the object being to avoid manual relay with its attendant delay, expense and hazard of error.

The connecting circuits between relay offices are practically all quadruplex and duplex, the extra channels thus provided obviating the necessity for additional wires on the pole line. The quadruplex is availed of wherever additional facilities are needed and can be thus obtained.

The main lines of the Santa Fe and many of the branches are equipped with telephone train dispatching circuits, and in addition have some independent telephone circuits used exclusively for railroad message work.

If two metallic telephone circuits parallel each other and have been properly transposed, an additional telephone circuit known as a "phantom" can be obtained for operation between terminals. These phantom circuits give entirely satisfactory service. Compositing of trunk telephone circuits, permitting Morse operation of each of the wires, is also practicable between terminals.

### The Printer

When speaking of printer operation it is meant that a prepared tape, when passed through a transmitter at one end of a circuit, operates a typewriter mechanism at the other, thereby printing the message the same as is done by a typewriter manually operated.

When referring to a channel this means that one employee can be sending and one can be receiving at each end of the circuit. By increasing the number of channels over a wire the capacity of that circuit is increased accordingly, with but single channel operation, on which the speed averages from a slight reduction in the speed of each, as compared with 40 to 50 words per min. on each side of the channel. Between points 500 or 600 mi. apart as many as four channels are obtainable, which at 40 words per min. on each side of the channel would give an output of 320 words per min. on the four-channel multiplex-duplex, or eight times the capacity of a single wire. Printer operation is not, of course, confined to circuits of the length above mentioned. Three-channel printers are in daily operation for distances up to 2,500 mi., and since the recent introduction of the rotary repeater two-channel circuits are regularly operated up to 3,500 mi.

### The Carrier System of Wired Wireless

It appears that the greatest field for the future development of electrical communicating systems lies in the use of

\*Abstract from a paper presented before the Western Society of Engineers, Chicago, on April 21, 1921.

ultra-sound frequencies for carrying voice and other signaling currents over existing wires. The Edison Phonoplex in use many years ago on several railroad lines was the beginning of superimposed systems and the pioneer of relatively high frequency signaling systems. However, the frequencies it and some of its successors employed were within the range of audibility and went into the discard with the growth of the telephone system. Means have been found through the use of vacuum tubes of employing frequency so high that they can produce no audible effect in the ordinary telephone receivers or telegraph instruments through which they pass.

Under the most favorable conditions now known, theoretically it seems possible to carry on 60 independent telephone conversations and 6 or more additional telegraph communications with two pairs of wires without interfering with the present method of operation on them. Development work with the carrier system or wired wireless is being carried on by the Signal Corps of the United States Army and by the American Telephone and Telegraph Company, and tests have been made on one or two large railroad systems.

### Train Dispatchers' Loud Speaking Telephone

Train dispatchers find but one objectionable feature that is worthy of note to telephone train dispatching, and that is the necessity for the dispatcher having to wear a headband receiver clamped on the ear continuously during his time on duty, a practice which is irksome to a degree under the best conditions, and particularly painful during lightning storms.

Loud speaking telephones, to be satisfactory in train dispatching service, must be as dependable as the headband receiver, free from maintenance complications, have ample volume which can be readily controlled by the dispatcher, and clear in articulation. Inventors of an electro-dynamic telephone receiver have, with the co-operation and advice of the telegraph and telephone engineers of the Atchison, Topeka & Santa Fe, developed a loud speaker which promises to meet all of the requirements.

### Other Systems

The wireless telegraph does not seem to have been developed to the extent it deserves, as it could be used to bridge over severe wire prostrations to a considerable extent, but even these advantages seem to have been availed of by but few roads. I believe this is a field which should be given intensive development. The wireless telephone also gives some promise of utility on railroads, such as the bridging of interruptions, and communicating with moving trains, but this system also does not seem to have been developed to a point where it is practicable for railroad use.

## The Need for Railroad Statistics

By A. Bonn

**T**HE WORKING FORCES of any railroad are regularly employed in the compilation of statistics. The working foremen must keep accurate records of the labor and material used in the work upon which their forces are engaged. These records form the basis for the necessary periodical accounting and also are called upon to serve as the foundation for important comparisons. The various operating units, such as train dispatchers, train crews, yard forces, etc., are daily recording information which finds its way into the permanent and working records.

The accounting division of a railroad contains forces working on data gathered from different sources and a great deal of this data is set up into statistical records. The traffic division must keep pace with the commercial situation and in order to do so it assembles all available information relating to the subject. The miscellaneous divisions like-

wise must compile for reference the activities or results of their work.

It can readily be seen that considerable time and a large sum of money are devoted annually to railroad statistics. Some of these statistics have been permanent for a long time and for that reason are accepted today without change. Some roads have been living on these records and have never thought it necessary to expand very much beyond them. Other statistics are assembled for special occasions and may only be used once. Then we have the working statistics, which are referred to as temporary records, and do not apply beyond a certain working period. There is a present opportunity to get away from the idea of the temporary nature of the working statistics and make them more of value in the building up of the permanent records. Some duplications of work and avoidance of wrong impressions will result if this change is brought about.

Because of the constant changing of the requirements—national, state, executive, departmental, etc.—the statistics have grown in volume, not always sure of analysis, sometimes misleading, and certainly a great burden upon the time, working energy and patience of the railroad executives and other officials concerned. With tons of statistics brought together each year it would seem that nothing worth while could be missed, yet every day there is evidence of useful data omitted.

In many instances the original data is totaled up by years or other periods to satisfy a special report but no time is taken to set up the basic information in good shape for use in a subsequent report, necessitating lost time, extra expense, perhaps different results, and consequent delay to other work. It is also noticed that certain statistics are compiled to a certain point with the thought that beyond it rarely is it necessary to go.

A sharp line is always drawn between accounting and statistics. For that reason the accounting results are not always used for statistical purposes. The statistician will often go back to the starting point for information for his statement. There must be a closer relation between the accountant and the statistician if the crying need of the hour is going to be heeded. The clerical work of a railroad has increased so decidedly in the last few years until it is felt that the task is almost hopeless unless some order is brought out of the chaos. The accounts are given preference, the statistics are delayed or passed aside, often causing hasty preparation when urgently required. For lack of time on many occasions approximations are resorted to in the use of information which could have been kept in reliable shape by a little time and forethought. A successful approximator or guesser may prevent the necessary preparation of essential records.

It is no doubt true that everyone is trying to reduce to a minimum the tendency to lost motion in the field of railroad statistics. Each department, however, having its own ideas of important data, spends its time on work which may not be valuable beyond a certain office, which may seldom be called for and may be cast aside by changing of officers. Sometimes the different departments are not aware of information already compiled, available for use, and go ahead and work out the same data, reaching different results and confusing those in whose hands the statements are placed.

Those who have spent many years in railroadng and have seen the evolution of the modern railroad and the methods used to keep track of the results accomplished, are easily bewildered as they turn from side to side to study the present-day railroad statistics. It is to them "higher mathematics" compared to the "arithmetic" of their early days.

Some of our executive heads have seen the railroads managed with less stress put upon the tabulated results and,

therefore, take only a passing interest in what may now be done. They are not concerned in the methods used or the time required but only attempt to control the size of the force employed for statistical work. Favorable statistics please their fancy, while less favorable data are frequently brushed aside with the familiar expression, "interesting if true."

The great railroad minds are watching the pendulum swing in these reconstruction days. They have become impressed with the need of co-ordination all along the line. They realize any shortcomings are to be corrected. The best and still the most economical methods of railroading must be adopted. They cannot turn back but must press forward with those who are bent upon re-creating the railroads of the United States.

The slogan of the day is "service." In our efforts to succeed we cannot lose sight of the cost or the economic needs of the property. Our statistics must be effective, quickly read, and not smothered in secondary detail. The executive who is not fortified by reliable information is as much lost in the competition as the manufacturer who attempts to sell his goods blindfolded. The margin of profit in railroading is even closer than in the commercial field.

Again, in recent years the manufacturer has appreciated the necessity of cost statistics, without which he could not exist. Previously it was the accounting totals which gaged his business, now it is the knowledge gained by studies into each step of manufacture which tells him whether he is prospering.

While some emphasis has been laid upon cost statistics in railroading, it is mostly confined to certain railroads and often to certain officers on these roads. There has been no genuine demand, as is common in manufacturing. The opportunity to study the different values entering into the cost of making transportation should always be most interesting to any railroad official. The need of doing so is imperative at this time.

The changed sentiment towards labor certainly must be met by developments not thought necessary previously. If there is going to be successful railroading hereafter there should be co-operation all along the line among the employees of a railroad. The laboring man is intelligent enough to become interested in the results of his work if they are presented to him in the spirit of co-operation. The manufacturer has seen the benefit to his employees of working with them in the development of helpful information.

The payroll of the railroads today has reached an amount which calls for intelligent control. It is not sufficient to work on approximations. There must be inaugurated a definite policy of regulation built up through continuous study of what the forces have done, are doing and can reasonably be expected to do in unit performance. In addition, the employment of labor should follow the receipt of material. Until railroads are willing to anticipate the material requirements and keep their forces fully supplied with the necessary material we will use labor excessively.

The consumption of material is equally important with the labor expense. How often quality is sacrificed for price! The consequences of this short-sighted policy as to quality, too common among the railroads, must now be realized. We cannot afford to use labor to apply inferior material.

The quantity of material required to be applied periodically should be the result of studies into the life expected under the conditions of service. Something more definite must be known about the quantities of the different materials consumed in order to be able to study their economies.

The day is passing when the executive's thoughts will be concentrated on transportation alone. Maintenance expenses are soaring and he must know accurately, by unit values, where he stands in respect to the physical condition of his

property. He cannot alone accept the verdict of a mere physical or casual inspection. He must know what the demands upon his property are, and how they should be met. He cannot do this unless he knows the actual quantity of material needed, the most economical quality to apply and the true labor cost to maintain his property. He needs more than ever cost statistics, prearranged annual programs and defined policies.

The railroad executives are busy in these present months gathering up the loose ends, straightening out the finances, and closing up the period of federal control. They should, however, be giving some thought and preparation to ways to better the railroad statistics, to make them simpler and more effective. They will soon be in full control of their properties and they should commence to think of improvements which are needed to bring about economic results. They should first use the experience and observations of their own men and begin what may be termed as an internal survey. Every branch of railroading should be covered and a co-operative scheme outlined by which no department will be sufficient unto itself.

Now is the time to know what statistics are being kept; what duplications are going on; how much is non-essential; how far the fundamentals are preserved; what interest there is at the present time in the work, without which accuracy cannot be certain. This preliminary work will open many avenues of thought helpful to the problem.

The assembling of railroad information must follow the simplest methods because of its volume. Definite rules tending to simplicity must be in force. Properly trained men should be charged with the responsibility of setting up the data.

The problem, therefore, is to take the mass of details, simplify the records as much as possible and draw off the data which will be most useful to the transportation business. We must study the economic use of materials, analyze our labor costs and be assured that our own cost bases are as sound as they are in the industrial field.

We are all familiar with the operating statistics known as the "deadly parallel." We should have "deadly parallels" in all branches of railroading. The manufacturer and his employees know and are interested in watching the unit costs at the different plants. The railroad executive and his employees know much less about their own accomplishments.

There is also a community of interest among the railroads and the help to be derived through the ability displayed in certain directions by any one of them should be for the benefit of all.

Most of the railroads have already some form of statistical organization working in their several departments. At present there is no co-ordination between the departments, no central head who is keeping in touch with all the departments. There is a great need of a central statistical bureau for every road. This should be an assembling point for all statistics useful for the necessary management of the road. The chief of this bureau should be the general supervising head of the statistical work of the road. He should have a general statistical committee embracing all departments. Through his committee he should study the economic preparation of statistics, be able to keep them within bounds, and as far as humanly possible have the statistics state the facts accurately. This bureau should be in full knowledge of the necessities for information, both inside and outside of the road. It should furnish the essential analyses to the chief executive and others interested. If by chance the new day shall soon appear, we must be ready "to rise on our dead selves" to better railroad statistics. Never again should we allow the old statistical ruts to come.

# General News Department

**The Operation of Freight Trains on Sunday** in the State of Georgia, which has been allowed since 1917 by the Railroad Commission as a war measure, must now be stopped, except in the case of perishable and live freight, the commission having on August 10 revoked the permissive order.

**Dinner at \$1.25**, table d'hôte, is now provided in the dining cars on two prominent trains of the Baltimore & Ohio; No. 6 leaving Chicago for New York at 6:25 p. m. and No. 527 leaving New York for Washington at 4:45 p. m. Meals are served a la carte, also. The new arrangement has proved popular.

**As a Result of the New System** for the classification of cars for the expedition of trains through yards, described in the *Railway Age* of August 6, 1921, page 254, the Baltimore & Ohio accomplished a saving of 61,167 engine hours during the month of June, 1921, as compared with June, 1920. Statistics on the relative number of cars handled during the month of June for the two years is not available for the entire system, but on the Eastern lines the number handled in June, 1920, was 522,113, as compared with 553,991 in June, 1921. The cars handled per engine hour were increased from 6.7 cars in June, 1920, to 8.5 cars in June, 1921, an increase of 27 per cent.

**The Outdoor Athletic Meet of the Pennsylvania Railroad System** will be held at Dennison, Ohio, on Saturday, September 24. Men and women employees, as well as the sons of employees, of the entire System will participate. For men there will be tennis singles and doubles, tug of war, trap shooting, circling the bases against time for baseball players and pitching quoits and horse shoes; also 100-yard, 220-yard, 440-yard and 880-yard dashes, 100-yard, 220-yard, 880-yard swim and plunge, 12 pound shot put and other events. For women there will be a 50-yard dash and tennis singles and doubles. There will be special track events for sons of employees, and, finally the first of three baseball games to be played for the Pennsylvania System championship between the two teams chosen by elimination in the several regions. The members of the general athletic committee are: J. T. Coleman, chairman; C. E. Clay, M. Y. Shuster, E. F. Ewing, M. A. Toomey, C. S. McIntyre and J. D. Zerbe.

## A Correction

Charles M. Lewis, division engineer of the Erie, with headquarters at Susquehanna, Pa., has been transferred to Jersey City, N. J., with jurisdiction over the New York division and side lines, including a part of the New York, Susquehanna & Western division, instead of having jurisdiction over part of the territory of S. J. Malloy, as was incorrectly announced in the *Railway Age* of July 23 (page 186).

## Taxes on Transportation May Be Removed

The revenue bill as amended by the House Ways and Means Committee and reported to the House provides for the repeal of Subdivisions (a), (b), (c), (d) and (e) of Section 500 and Subdivisions (b), (c) and (d) of Section 501 of the Revenue Act of 1918, the provision for taxes on freight and passenger transportation. The repeal under the new bill would be effective on January 1, 1922, and taxes paid on portions of tickets and mileage books unused on that date would be refunded.

## Derailment and Fire at Reaves, La.

By the derailment of eastbound freight train No. 32 on the Gulf Coast Lines, near Reaves, La., on Monday, August 8, the road was blocked for about 36 hours; and the wreck, including

eight vents of a wooden trestle, was destroyed by fire. In the fire a number of trespassers were burned to death, the reports estimating the number of these at from two to 15. The derailment occurred on or at the approach to the bridge and is thought to have been due to a fallen brake beam. Eighteen cars, including one or more cars of oil, fell through to the ravine below, and it is believed that 15 or 20 hoboes were on these cars. The fire burned for 24 hours; two of the trespassers are said to have escaped and two bodies were identified.

## Executives Decline to Comply

### With Brotherhoods' Requests

The Eastern Presidents' Conference at a meeting in New York on August 11 adopted the recommendation of its sub-committee that the executives reject the demands of the brotherhoods that the carriers restore wages to the level in effect on June 30 and pledge themselves against application for further reductions and against the elimination of time and a half pay for overtime. This was telegraphed to the leaders of the brotherhoods at Chicago. Executives in the Western, Southeastern and Southwestern regions rejected similar requests by the unions. It is understood that the New York decision was based upon the requirement of the transportation act that the railroads be managed in an economical and efficient manner; also to the fact that the 12 per cent wage reduction was effected on July 1 by the authorization of the United States Railroad Labor Board in decision No. 147, and that decision No. 119 of the board gave the carriers full authority to negotiate new working rules with their employees.

## I. C. C. Refuses to Authorize Proposed

### New Station at Cleveland

The Interstate Commerce Commission, Division 4, has dismissed the application of the New York Central, the Cleveland, Cincinnati, Chicago & St. Louis and the New York, Chicago & St. Louis for a certificate of public convenience and necessity authorizing them to guarantee the bonds of the Cleveland Union Terminals Company and take other necessary steps to assure the construction of a union station on the public square at Cleveland, Ohio. The New York Central pointed to the present congestion on the lake front and contended that the station at the proposed location would obviate this congestion. In the decision, however, the Commission took the view that much of this congestion on the lake front was caused primarily by the fact that the Pennsylvania and the Cleveland, Cincinnati, Chicago & St. Louis cross the New York Central's line at grade and that for the New York Central's four track line through Cleveland a single track drawbridge is the only means provided for crossing the Cuyahoga river. Some objection was voiced because certain of the air rights of the proposed terminal were not held by the railways. An alternative plan was suggested calling for the construction of a union station on the lake front together with certain other improvements, viz: increasing the main tracks of the Cleveland Short Line, the New York Central's freight line south of the main part of the city, from two to four, building a four track drawbridge to replace the present single track one, etc. This plan, it was estimated would necessitate an expenditure of some \$42,000,000 while the public square project would cost in the neighborhood of \$6,000,000.

A dissenting opinion was given by Commissioner Pettey on the grounds that the Commission was "not warranted in asserting" that its opinion "was of the business questions involved in working out the scheme is sounder than the opinion of the representatives of the carriers who are more familiar with the situation."

## Traffic News

Representative John B. Colton of Utah has introduced in Congress a bill, H. R. 8164, to establish the standard of work and duty for common carriers of freight and to establish uniform rates for the carriage of freight by common carriers between the states.

The National Freight Traffic Golf Association will hold its annual golf tournament at the Flossmoor Country Club, Chicago, on September 20 and 21, in connection with the annual meeting of the American Association of Freight Traffic Managers which will convene at the Drake hotel from September 19 to 24.

Rates on smelter products from Arizona points and Cananea, Mex., to Baltimore and New England points via New Orleans, or Galveston, in connection with the Southern Pacific steamship lines will be reduced September 12; to New England from \$21.10 to \$17.60 a ton and to Baltimore from \$20 to \$16.50.

The Railroad Commissioners of South Dakota have filed a complaint with the Interstate Commerce Commission protesting that the rates on grain from that state to the east by the Chicago & North Western, the Burlington, the St. Paul and the Minneapolis & St. Louis are unreasonable as compared with the rates from points in Iowa, Minnesota and Nebraska.

The Southern Pacific has withdrawn from the consolidated ticket office at Third and Washington streets, Portland, Ore., and has reopened its individual city ticket office in the Lyric Theatre building at Forest and Stark streets, where in connection with the reconstruction of the theatre building an interurban passenger station has been established.

The Interstate Commerce Commission has received arguments both for and against the reductions in freight rates on coal which have been made, and are proposed, by the Detroit, Toledo & Iron-ton, Henry Ford's railroad. The National Rivers & Harbors Congress has filed a brief in support of the tariff making the reduced rates, while the Northern West Virginia Coal Operators' Association and other shipping interests have protested and ask that the new rates be suspended.

From May 27 until the end of the cantaloupe season late in July, 159 cantaloupe trains were moved out of the Imperial Valley by the Southern Pacific and each of the 159 trains arrived at terminal points on time. The trains ran on a 50-hour schedule to El Paso, Tex., a cut of seven hours from the schedule of last year, and 153 hours from Brawley to Chicago, 15 hours shorter than last year. The movement this year amounted to 12,000 carloads as compared with 8,735 cars in 1920.

### Plain Talk

Governor Nathan L. Miller of New York, making a tour of the State Canal, makes speeches along the way, and at Schenectady he said:

"Here is a capital investment of \$165,000,000, with probably ten millions more to be spent in the completion of the terminals and with two millions and more a year required for maintenance, yet the people do not seem to know they have it. We must devise some way of selling this proposition over again."

### New England Freight Rate Divisions

Committees have been appointed to discuss the division of freight rates between the New England roads and the trunk lines west of the Hudson river, in accordance with the suggestion made by the Interstate Commerce Commission in its recent decision on the New England situation. For the trunk lines the committee consists of W. S. Kallman (N. Y. C.), chairman; Golder Shumate (B. & O.); E. T. Campbell (Erie); D. T. Lawrence (D. L. & W.); W. J. Mullin (D. & H.); F. J. Woulfe (L. V.), and F. P. Eysmans (Penn.). The Central Freight Association will be represented by a committee yet to be announced. The committee for the New England lines consists of George S. Hobbs (M. C.); Gerrit Fort (B. & M.);

G. F. Wicks (B. A. R.); George M. Wood (N. Y., N. H. & H.); F. O. Stafford (Rutland), and J. W. Handley (C. V.).

### "Train Jumpers Fined"

This is the heading of a recent news item from Sea Cliff, N. Y. It refers, however, not to the usual train jumper—the tramp or idler who steals a ride, short or long, on a freight car—but to passengers who get off from eastbound passenger trains at Sea Cliff station on the wrong side. The Long Island Railroad, after giving ineffectual warnings, had eight of these passengers tried in court for violation of the law forbidding trespassing on railroad property, and they were punished by fine. There is a fence between the two main tracks at Sea Cliff and these offenders jumped over the fence, landing on the westbound track. By this short cut they were able to reach the street cars more quickly than did those passengers who walked over the bridge provided for passage between the south and the north sides of the railroad. The fines assessed were \$2 for old offenders and \$1 each for the others.

### Reduction in Pacific Coast Export Rates

The trunk lines and transcontinental railroads have agreed to file tariffs, to go into effect on September 1, making reductions of about 10 per cent in 34 commodities when destined for Asia, to be exported from Pacific ports, the reduction to apply from points in official classification territory east of Chicago (Group 1). The southeastern lines did concur in this action. The change will make the rates from points in Group 1 equal to those from points west of Chicago (Group 2). Iron and steel articles are not included. Some of the commodities included are agricultural implements, automobiles, drygoods, plate glass, window glass, machinery, paint, paper, plumbers' goods, railway equipment, roofing, wire rope, steam heating apparatus and tobacco.

The trunk lines propose to reduce, on September 1, rates on iron and steel for export to Atlantic ports, the reduction to be about 25 per cent.

### Anthracite Shipments in July

Shipments of anthracite in July are reported as 5,462,760 gross tons as compared with 6,031,937 tons in the preceding month, and 6,389,100 tons in July, 1920. There is a continued slack demand for pea and steam sizes, which has caused the closing down of a number of individual operations; and there has been considerable idleness from petty strikes in the Lehigh and Wyoming regions. Shipments by originating carriers were as follows:

	July, 1921	June, 1921
P. & R. ....	1,039,078	1,157,738
L. V. ....	946,387	1,069,521
C. of N. I. ....	507,942	571,213
D. L. & W. ....	926,850	1,009,119
D. & H. ....	691,132	763,893
Penna. ....	384,780	441,693
Erie. ....	619,365	555,882
N. Y. O. & W. ....	110,605	163,742
L. & N. E. ....	236,621	299,136
Total. ....	5,462,760	6,031,937

### A Billion Peaches

Ten peaches for every man, woman and child in the United States were handled by the Central of Georgia Railway during the 1921 season which has just closed. This is the estimate of an officer of the road. He says that this movement was accomplished to the entire satisfaction of the growers, and without interruption to regular traffic. Approximately 8,175 cars; 3,892,300 crates of peaches were moved. The largest previous movement was 5,908 cars in 1918. The major portion of the crop moved at the rate of 250 cars a day. The whole crop of Georgia amounted to about 9,500 cars, which brought the growers about \$7,500,000.

At the peak of the movement, during the week of July 9, the operating forces were called upon to put forth extraordinary efforts to replenish the ice and car supply, but the task was successfully accomplished and regular traffic maintained. The largest single day's shipment totaled 541 cars.

POTATOES, 5,000 CRATES, of about 15 carloads, were shipped recently from Vancouver, B. C., to Manila, P. I. This shipment was made on the encouragement afforded by experimental shipments from British Columbia to the Philippines last year.

## Commission and Court News

### Interstate Commerce Commission

The New York Central has filed a petition with the Interstate Commerce Commission for a rehearing and reargument of its application for the construction of a new union passenger station at Cleveland, O., which was denied by the commission August 15.

### Live Stock Rates Should Be Reduced

The carriers should reduce (on five days' notice) all rates on live stock in western territory (except on horses and mules), which are higher than 50 cents per 100 lb.; and rates should be made on the basis of 80 per cent of the present rates, but not less than 50 cents per 100 lb. This is the decision of the Interstate Commerce Commission, issued August 15, on the complaint of the National Live Stock Shippers' League that rates in western and mountain-Pacific territory are unreasonable.

The Commission will not enter an order at this time and the record will be held open.

Commissioner Hall wrote the opinion of the Commission. Commissioner McChord held that the case calls either for a dismissal of the complaint or an order awarding specific relief and he advocated a substantial reduction in the rates. Commissioner Campbell, dissenting, said:

"\* \* \* We should have been fully justified in this case in making an absolute and definite finding of unreasonableness as to both long and short hauls and entering an order requiring a reduction, instead of merely suggesting it . . ."

Attorney Examiner Disque, in a tentative report on this case on July 14, suggested a new rule of rate making to the effect that the rates assailed are not excessive from a strictly transportation standpoint but are unreasonable from an economic standpoint; and the Commission in its opinion says:

"The complainants have made their record and presented their case largely on the basis of economic necessity. Little evidence was introduced by them as to the unreasonableness of specific rates or groups of rates. They do not seriously assail the live stock rate structure, in the main prescribed by us, as it existed prior to the increases made by the Director General under General Order No. 28. They seek removal of that increase, and of the subsequent increase authorized by us under Ex Parte 74, as applied to the pre-existing structure, without distinguishing between its several parts."

The Commission calls attention to the fact that in its opinion under Ex Parte 74 it stated that the general price level is changing from month to month and from day to day, and that it is impracticable at one time to adjust all of the rates on individual commodities; the rates must necessarily be subject to such readjustments as the facts may warrant. Attention is called to the fact that such readjustment between shippers and carriers has not been made in rates on live stock moved to market, and the Commission concludes:

"The importance of stock raising to the general economic situation in the range country lying west of the 100th meridian, has been noted. Because of the long hauls, and for other reasons, rates on live stock from this territory to packing centers in the middle west have always been relatively high. In a general way this is also true of all rates in western territory for the longer hauls. The percentage basis of increase applied in 1920 to the higher rates for the longer hauls resulted in greater increases per unit than in the rates for shorter hauls. It may be that reductions in the higher rates at this time will, as claimed by complainants, benefit the carriers as well as the live-stock industry. Manifestly the higher long-haul rates, such as that on cattle from Helena, Mont., to Chicago, \$1.015 per 100 lb., are of greater importance to and have greater effect upon the transportation and marketing of live stock than the lower short-haul rates, such as those applicable from Des Moines to Chicago, 37 cents on cattle and 40 cents on hogs. Having in mind the present value of live stock, and other factors, it is our view that under present conditions the carriers should themselves reduce all live-stock rates in western territory."

## Foreign Railway News

### British Railways Returned to Owners

The railways of Great Britain were returned to their owners on August 14 after having been under government control since the beginning of hostilities in 1914. Information concerning the details of the final action taken by Parliament on legislation providing for future control of the carriers has not been received as yet. This bill as first introduced was published in the *Railway Age* of May 27 (page 1209). The bill was then referred to committee and a number of amendments were introduced—none of them, however, changing the essential structure of the measure.

### Baldwin Locomotive Works Extend

#### Credit to Mexican National

Credit to the amount of \$5,000,000 has been granted the Mexican government by the Baldwin Locomotive Works according to announcement which comes from the National Railways of Mexico. It is stated that \$4,000,000 of the credit or loan is to be used in the purchase of locomotives and other rolling stock for the government-owned railways, and the \$1,000,000 is to be spent in repairing the tracks and in other needed improvements.

### Electrification of Italian Railways

Work on the electrification of Italian railways is proceeding actively, according to Consul General Osborne at Genoa. At the end of August, 1920, a total of 494 miles had been electrified. From September 1, 1920, to June 30, 1921, a total of 145 miles were electrified and during the current year 269 miles additional will be electrified. The saving in coal resulting from these electrifications amounted, at the end of June, to 160,000 tons. By July 1, 1922, it is calculated, the saving in coal will reach 1,000 tons a day, causing a daily saving of approximately \$14,000,000 a year. At the end of August, 1920, the sole generating plant worked by the railways of the state was that of Mordegno, with a capacity of about 5,000 horsepower and normally working with about 3,800.

### Exports of Locomotives in June

Steam locomotives numbering 136 and valued at \$4,254,474 were exported in June, as against 109, valued at \$2,647,441 in May. Of these engines 66 went to Mexico, 30 to China and 18 to Brazil. The detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Number	Dollars
Canada .....	1	3,770
Honduras .....	1	10,000
Mexico .....	66	1,833,847
Cuba .....	1	31,436
Argentina .....	2	85,290
Brazil .....	18	406,665
Colombia .....	1	28,000
Peru .....	4	49,290
China .....	30	1,585,000
Japan .....	4	38,910
New Zealand .....	1	11,685
Philippine Islands .....	6	170,861
Total .....	136	4,254,474

### Competitors Take Cheer at

#### America's Dwindling Export Trade

That the decrease in our exports which has continued over many months now is not unsatisfactory to our competitors is shown by a recent editorial in the *Times* (London) Foreign Trade Supplement. The monthly tables which are published in these columns showing our exports of railway supplies give ample evidence that America's competitors are regaining their foothold in foreign markets. The *Times* says in part:

"The war-born experimenters in foreign trade are fading out fast. Finance has been their stumbling block, as we anticipated would be the case. Many banks that entered the foreign trade field have quietly written off their losses. America, in short, has decided that foreign trade is not the 'dead easy' business the less informed once thought it. The world-wide organization of Brit-

ish banking and merchant houses cannot be duplicated at will, and without it the difficulties to be encountered are formidable indeed. On the other hand, as our New York correspondent reminds us, Mr. Hoover sees quite clearly that America must find a market for her surplus production, and since she will not listen to suggestions for encouraging imports the question how she is to get payment for her exports remains unsolved."

### June Exports of Car Wheels and Axles

The value of the exports of car wheels and axles in June was \$236,719, or slightly above the May total of \$207,966. Shipments valued at \$61,940 were sent to China and other large shipments to Argentina and Brazil. The detailed figures, as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	
Roumania	\$174
Canada	6,193
Costa Rica	2,150
Guatemala	1,647
Honduras	526
Panama	1,155
Mexico	19,476
Cuba	11,054
French West Indies	2,940
Argentina	51,479
Brazil	53,044
Chile	413
Colombia	218
Ecuador	2,250
Peru	479
China	61,940
Japan	22,521
Total	\$236,719

### Venezuela Invites Railway Construction

With the strengthening of diplomatic and commercial ties between the United States and Venezuela, the improvement of the existing railroads of the latter country and the building of new lines are brought definitely nearer, according to an official statement issued by the Venezuelan Commercial Agency at New York. There are at present twelve railroad systems in Venezuela with a combined length of 600 miles and \$40,000,000 of invested capital. In addition, the building of four new roads is being considered. One of these would connect a fertile cacao region with the coast, the second would run through rich cattle, coffee, cacao and tobacco lands, the third would bring the product of the country's rich oil fields to a deep water port, and the fourth would make it possible to ship machinery to the Yaurari gold mines, which are now being worked only in a primitive way, and at the same time, would tap rich grazing lands and extremely valuable fields of iron ore.

American capital is, according to the statement, welcomed in Venezuela by the government, which is pursuing a very liberal policy toward foreigners. Recent laws guarantee railroad builders against the construction of rival lines paralleling their routes, and against oppressive taxes. Railroads are assured of a fair proportion of unclaimed lands, of the right to erect telegraph and telephone lines and of the exemption of their employees from military service except in the case of international war.

### British Railway Finances

During 1920 the net income of the railways of Great Britain was \$249,318,000, or \$7,290,000 more than in 1913; but while the total receipts, including government compensation, for 1920 was nearly two and one-third times the receipts for 1913, the total expenditures were nearly three and one-third times those of the pre-war year, according to information compiled by the European Division of the Bureau of Foreign and Domestic Commerce. This is indicative of the fact that the increased cost of operation is out of proportion with the receipts, notwithstanding the increase in rates and fares. The revenue, expenditures and net income of the railways for 1913 and 1920 were:

	1913	1920
Total receipts, including government compensation	\$630,342,000	\$1,447,308,000
Total expenditures, including provisions on basis of 1913 plus certain items of maintenance in excess of 1913 and sums in respect of arrears of wages and arrears of maintenance and not properly chargeable to the year	405,810,000	1,218,888,000
Balance	224,532,000	228,420,000
Miscellaneous net receipts	17,496,000	20,898,000
Total net income	\$242,028,000	\$249,318,000

During 1920, 317,877,500 tons of freight were handled, as against 364,162,500 in 1913. Much of this decrease can be laid to the coal strike. Capital expenditures on the railways in 1913 amounted to \$4,860,631,800 and, in 1920, to \$4,935,330,000.

### Remodeled Electric Locomotive on English Railway

Twenty electric locomotives belonging to the Metropolitan Railway (England) are being rebuilt for the purpose of increasing their capacity. The general design of the locomotive is somewhat similar to that used for multiple unit cars, except that the locomotives are shorter, heavier, equipped with more powerful motors and the auxiliary apparatus, such as the vacuum exhaust, air compressor, reservoirs, etc., are located in the cab instead of under it. The locomotives are equipped for multiple unit operation with the "all-electric-automatic" type of control. There are two 4-wheel trucks, on each of which are mounted two 300-hp. series motors geared to the axle by single reduction gearing. Each motor is carried on its axle by suspension bearings, and a portion of the weight is transmitted by a nose on the motor casting, which rests in a yoke which slides vertically up and down in guides fixed to the truck crossbar. A slightly elastic support is obtained by rubber cushions. The principal dimensions of the locomotive are given in the table.

Length over all	39 ft. 6 in.
Width	8 ft.
Height from rail	12 ft. 4½ in.
Distance between truck centers	20 ft. 3 in.
Length of rigid wheel base	9 ft. 3 in.
Total wheel base	29 ft. 6 in.
Diameter of running wheels	43½ in.
Gear ratio	26/54
Total horse power capacity	1,200

A number of special features will be incorporated in the rebuilt locomotives. An electrical interlocking device will make it impossible for the engineman to start the locomotive without first having the brake apparatus ready for immediate application. An automatic window wiper, operated from the inside, will enable the engineman always to have a clear vision in wet weather. The first and last cars of the train will be fitted with contact shoes and main positive and negative feeders carried through the train to the locomotive, thus making it possible for the locomotive to collect its current when the collector shoes on the locomotive are bridging gaps in the conductor rail.

### Operating Improvements on the

#### Paris, Lyons & Mediterranean

The Paris, Lyons & Mediterranean is the longest private-owned railway in Europe, says the Railway Gazette (London), in presenting some interesting information concerning that road. At the end of last year it possessed a total stock of 4,662 locomotives (including those for narrow-gage lines) as compared with 3,571 at the beginning of 1914. Of these, 498 engines were American and 177 German, and during the year there were ordered 80 Pacifics, 120 Mikados and 50 ten-coupled locomotives. An interesting sidelight is thrown on the effects of the eight-hour day by the fact that it became necessary to open four new locomotive shops (a fifth will shortly be opened), and to enlarge six existing ones.

The company has submitted to the Ministry of Public Works a program for the electrification of some 1,800 miles of line, to be operated by hydro-electric power, which will largely be obtained from the Rhone. It is hoped to make a beginning on the Culoz-Modane line, which has very severe gradients and handles a heavy traffic. Like other French railways, the Paris, Lyons & Mediterranean has found it advantageous to make its own arrangements for the maritime transport of locomotive coal and by the end of the current year it hopes to have received delivery of a new fleet of 14 vessels with an aggregate capacity of 100,000 tons, in addition to the seven already acquired.

Another of its activities has been the establishment of a refrigerator car and warehouse company, in co-operation with the Northern and Eastern Railways, which has leased the 550 refrigerator cars fitted up by the Paris, Lyons & Mediterranean for war service, as well as a number left behind by the American Army. Another American legacy, it may be recalled, was the train dispatching system. This has been experimented with between Dijon, Chalons-sur-Saone and Lyons, and the results have been so satisfactory that it is proposed to adopt the system on a much larger scale.

## June Car Exports

Twenty-one passenger cars, valued at \$96,100, and 536 freight cars, valued at \$1,066,256, were exported during June. These figures are somewhat above similar totals for the preceding month. Parts of cars exported totaled \$887,241 in value. Of the freight cars exported 160 were sent to Brazil, 106 to Honduras, 103 to Cuba and 101 to Mexico. The detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Passenger		Freight and other		Parts of cars.
	Number	Dollars	Number	Dollars	
Belgium					1,631
France					8,181
Netherlands					940
Spain					120
England					6,268
Canada	6	17,500	6	3,388	28,252
Costa Rica					16,705
Guatemala					402
Honduras	3	22,600	106	159,902	1,854
Panama					854
Salvador					171
Mexico	12	56,000	301	222,055	20,397
Newfoundland and Labrador					281
Jamaica					50
Trinidad & Tobago					3
Other British West Indies					10,687
Cuba			103	239,369	250
Virgin Islands of U. S.					971
Dutch West Indies					3,875
Dominican Republic					2,246
Bolivia					7,508
Brazil			160	444,167	219,092
Chile					30,287
Peru					7,022

Philippine Islands					1,665
British South Africa					
Portuguese Africa					
Total	21	96,100	536	1,066,256	887,241

## How the Germans Undersell Americans and English

LONDON.

The Review of the American Chamber of Commerce in France states that the reason that the German manufacturer can undersell the Americans and the British is primarily due to the lower costs in raw material, labor, capital overheads, management overheads and profit. The following statistics of wages and living costs were gathered in Germany last fall. They are (in marks) converted into gold on the basis of the dollar exchange:

	WAGES PER WEEK			
	1913	1920	1913	1920
Cabinet makers	43.20	336.00	10.29	5.37
Pattern makers	39.00	228.00	9.28	3.64
Carpenters	44.28	216.00	10.58	3.45
Electricians	39.15	204.00	9.32	3.26
Plumbers	40.50	220.00	9.64	3.57
Bricklayers	44.28	216.00	10.58	3.45
Clerks, etc.	40.00	190.00	9.52	3.04
Female shop help	18.00	155.00	4.28	2.48

The above is for a weekly wage of nine hours a day in 1913 and an eight-hour day in 1920.

	LIVING COSTS			
	1913	1920	1913	1920
Meat, per lb.	1.00	24.00	.24	.38
Eggs, dozen	.65	21.00	.16	.34
Bread, 4-lb. loaf	.45	4.50	.11	.07
Butter, per lb.	1.25	17.00	.30	.27
Potatoes, per 10 lbs.	.50	4.00	.07	.06
Men's suits	80.00	2,000.00	19.05	32.00
Shoes	12.50	300.00	2.97	4.80
Five-room apartment	125.00	150.00	29.75	2.40
Coal, per cwt. (112-lbs.)	1.00	23.50	.24	.38

The comparison of the above paper and gold prices gives the clue to one part of Germany's program. The German government controls prices, and has a bureau in which is combined the control of exports and imports with the control of exchange. The mark in domestic exchange is kept upon a basis of its own, and the foreign trade value of the money is negotiated upon a different basis. From this it is plainly apparent that Germany is employing a subtle new kind of protectionism in her foreign trade.

## Equipment and Supplies

### Locomotives

The SEWELL VALLEY is having 1 Mikado type locomotive repaired at the shops of the Baldwin Locomotive Works.

The SEABOARD AIR LINE is asking for prices on 5 Mountain type, 10 6-wheel switching and 13 Mikado type locomotives.

The IMPERIAL GOVERNMENT OF JAPAN has ordered, through Takata & Company, New York, 2 electric freight locomotives from the Westinghouse Electric International Company. The locomotives will weigh 62 tons and will have 1000 h.p. capacity.

The NATIONAL RAILWAYS OF MEXICO have ordered from the Baldwin Locomotive Works, 10 Pacific type locomotives, 15 Mikado, 20 Consolidated and 20 narrow-gauge. This is in addition to the 18 locomotives ordered from the same builders as was reported in the *Railway Age* of July 16.

### Freight Cars

The PERE MARQUETTE contemplates making inquiry for repairs on 1,000 box cars.

The ERIE has given a contract to the Illinois Car Company, Urbana, Ohio, for the repair of 400 40-ton box cars.

The BUFFALO, ROCHESTER & PITTSBURGH is having repairs made to 500 box cars in its own shops at Du Bois, Pa.

The MEXICAN LIGHT, HEAT & POWER COMPANY, Toronto, Ontario, has ordered one 6,500-gal. tank car from the Pennsylvania Tank Car Company.

The CHICAGO, ROCK ISLAND & PACIFIC is inquiring for 200, 50-ton gondola cars. The company is also asking for prices on repairs to 500 all steel general service cars.

The ATLANTIC FRUIT COMPANY, New York, reported in the *Railway Age* of June 24, as inquiring for 100 cane cars of 20-ton capacity, has ordered this equipment from the Maser Car Company.

The CHICAGO GREAT WESTERN, reported in the *Railway Age* of July 23, as being in the market for repairs on 175 to 200 box cars, is having repairs made to 198 box cars, at the shops of the Ryan Car Company, Chicago.

The FRUIT GROWERS' EXPRESS is having repairs made to some of its refrigerator cars at the shops of the Streets Company, Chicago. This company is also inquiring for prices for heavy repairs on from 100 to 250 refrigerator cars.

### Iron and Steel

The CHICAGO, BURLINGTON & QUINCY will accept bids until 12 o'clock noon, August 20, for one 50 ft deck plate girder and one 60-ft. deck plate girder.

MIITSU & COMPANY, New York, have ordered from the United States Steel Products Corporation, 300 tons of 60-lb. rail and accessories, for a Japanese railway.

### Miscellaneous

MIITSU & COMPANY, New York, are inquiring for 3,000 cast iron pipes to have a diameter of 16 in. and to be 12 ft. long, for shipment to the Far East.

The NEW YORK CENTRAL will receive bids until 12 o'clock noon, August 23, for 1 portable electric arc welding machine and accessories; its shop requirements until October 1, 1921, of Tate or Alco flexible staybolts and parts for same, also of steel wheels for locomotive and passenger car repairs.

The **NORFOLK & WESTERN** will receive bids until 12 o'clock, noon, August 24, 1921, at Norfolk, Va., for: Electrical material, parts for electrical apparatus; repairs to pump; parts for pump; 120 rods wire fencing and approximately 75,000 lb. soft steel bars.

The **LONG ISLAND** will receive bids until 12 o'clock, noon, August 26, for the following oils to be supplied from September 1 to December 1: 400 wooden barrels of 150-deg. kerosene oil for headlights; 80 wooden barrels of long time burning oil for use in the lamps controlled by the signal department; 55 wooden barrels 300-deg. of mineral seal oil; 95 steel barrels motor gasoline, 64 deg.; about 35,000 gal., gas oil for making Pintsch gas for cars.

The **LONG ISLAND** will receive bids until 12 o'clock, noon, August 29, 1921, for the following spikes, bolts and frogs and switches to be supplied from September 1, to December 1: 200 kegs iron track spikes,  $\frac{5}{8}$  in. by  $\frac{5}{2}$  in., 350 kegs of heat treated track bolts of 13/16 in. diameter to consist of 100 kegs of  $\frac{1}{2}$  in. bolts, 100 kegs of  $\frac{3}{4}$  in. bolts, and 50 kegs each of  $\frac{3}{4}$  in., 5 in. and  $\frac{5}{8}$  in. bolts; 63 rigid and 12 hard frogs, 80 lb. open hearth rail; 55 80-lb. switches.

## Railway Construction

**ATCHISON, TOPEKA & SANTA FE.**—This company contemplates extensions and improvements to its Harvey house at Albuquerque, N. M.

**CHICAGO & ALTON.**—This company contemplates the construction of a line from Eldred, Mo., to Reddish, Ill., a distance of approximately 7 miles, at a cost of about \$60,000.

**CHICAGO, BURLINGTON & QUINCY.**—This company, which was noted in the *Railway Age* of July 2 (page 42), as receiving bids for the construction of a new grain elevator at St. Joseph, Mo., has awarded the contract for this work to the Burrill Engineering Company, Chicago.

**CHICAGO, BURLINGTON & QUINCY.**—This company is accepting bids for building the foundation and erecting the structural steel for its new freight house east of Canal street and south of Harrison street, Chicago.

**CHICAGO & NORTH WESTERN.**—This company has awarded a contract to the Ogle Construction Company, Chicago, for the construction of a 100-ton steel coaling station to replace a frame structure recently destroyed by fire at Lick, Ill.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company, which was noted in the *Railway Age* of July 23 (page 184) as accepting bids for the construction of a 100-ton frame coaling station at Pipestone, Minn., has decided to build this structure with company forces.

**CHICAGO UNION STATION.**—This company has awarded a contract to the W. J. Newman Construction Company, Chicago, for widening the second link of Canal street between Jackson boulevard and Van Buren street, Chicago.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of July 23 (page 184), as receiving bids for the construction of a new 1-story brick express building and elevator shaft at Mattoon, Ill., has awarded the contract for this work to the A. Lund Construction Company, Chicago.

**ILLINOIS CENTRAL.**—This company, which was noted in the *Railway Age* of August 13 (page 311), as accepting bids for the work of widening the bridge approaching its passenger platforms at the Randolph street station, Chicago, closed bids for this work on August 19.

**KANSAS, OKLAHOMA & GULF.**—This company and the Missouri, Oklahoma & Gulf have applied to the Interstate Commerce Commission for a certificate authorizing the construction of an extension from Baxter Springs to Pittsburg, Kan., 25.3 miles.

**UNION PACIFIC.**—This company contemplates the construction of a two-story brick freight station at Concordia, Kan., to cost about \$50,000.

## Supply Trade News

**F. A. Hastings** has been appointed assistant sales manager of the **Pittsburgh Bridge & Iron Works**, Pittsburgh. Mr. Hastings was formerly with the American Bridge Company.

The **Glidden Company**, Cleveland, O., and its affiliated companies have been given the manufacturing and distributing rights, in North America, for the Holland enamel paint known as Ripolin.

**John Duncan**, vice-president of the **Wheeling Steel Products Company**, Wheeling, W. Va., has resigned to engage in the operation of coal, coke, iron ore and railroad properties in Illinois.

**Stewart C. Wilson** has been appointed Pittsburgh district sales manager of the **Whiting Corporation**, Chicago, succeeding **Robert S. Hammond**, who has been transferred to the Chicago office.

## Trade Publications

**LOCOMOTIVE TERMINALS.**—Dwight P. Robinson & Company has recently prepared a 33-page booklet describing some of the terminal work which the company has done for railroads. The major part of the booklet is devoted to illustrations and brief descriptions of several of this company's more prominent projects which have been carried out for seven railroads, while the last few pages of the book are devoted to the listing of work done on several additional railroads.

**LOCOMOTIVE CRANES.**—Booklet No. 2-21 entitled "Man-Power Multiplied" and prepared for persons interested in the handling of bulk or heavy materials has been issued recently by the **Brown Hoisting Machinery Company**, Cleveland, Ohio. The booklet describes Brownhoist No. 2 locomotive cranes which are light, all-steel, full-revolving type flexible machines designed particularly for general service. The cranes are built to operate by steam, electricity or gasoline engine and to be mounted on railroad trucks, creeper trucks or traction wheels. The first pages of the booklet are devoted to illustrations showing some of the many purposes for which these cranes are being used. Other pages describe in detail the construction and mechanism of the cranes and the pamphlet is concluded with a table of capacities, weights, wheel loads and clearances.

## Railway Financial News

**AKRON, CANTON & YOUNGSTOWN.—Asks Authority to Issue Equipment Trust Notes.**—This company has asked the Interstate Commerce Commission for authority to enter into an equipment trust agreement and under that to issue \$396,000 in equipment trust notes in part payment for nine ten-wheel freight locomotives secured at a cost of \$411,000 from the New York, Chicago & St. Louis Railroad.

**BOSTON & MAINE.—Stockholders Authorize Issue of Bonds.**—The stockholders at a special meeting voted to authorize an issue of bonds, secured by present mortgage, to the Old Colony Trust Company, to pay or refund \$3,049,000 bonds maturing between now and January 1, 1922, as follows:

	Amount	Maturity date
Fitchburg Railroad .....	\$1,775,000	Oct. 1, 1921
Boston & Maine.....	1,000,000	Nov. 1, 1921
Manchester & Lawrence.....	274,000	Jan. 1, 1922
Total .....	\$3,049,000	

The stockholders also voted to make a contract or lease for the continued operation of the Suncook Valley Railroad. Change of the by-laws to permit the Boston & Maine officials to file tariffs and make regulations in compliance with Canadian laws was authorized.

Among other matters included in the call for the meeting was to take action with reference to authorizing execution of an equipment trust agreement to provide for purchase of 50 locomotives or a less number and to authorize an issue of equipment notes not exceeding \$1,500,000.

The meeting was adjourned until August 23.

**BILLINGS & CENTRAL MONTANA.—Acquisition by Northern Pacific.**—See Northern Pacific.

**LONG FORK.—Authorized to Issue Stock and Bonds.**—This company has been authorized by the Interstate Commerce Commission to issue \$485,000 of capital stock and \$1,347,500 of first mortgage bonds and to deliver these securities to the Baltimore & Ohio in settlement of advances made by that company to the Long Fork for capital purposes.

**MONONGAHELA RAILWAY.—Application for Loan Denied.**—The Interstate Commerce Commission has dismissed the application of this company for a loan of \$1,000,000. The commission tentatively had approved a loan of \$500,000 July 16; on July 19 the commission after further investigation approved a loan of \$250,000 to the applicant on the condition that the latter raise an equal amount. The carrier informed the commission later that it was unable to do so.

**MISSOURI PACIFIC.—Bond Suit Against Texas & Pacific.**—Judge Rufus E. Foster in the Federal District Court at New Orleans, La., on August 13 dismissed the claim of this company against the Texas & Pacific for approximately \$25,000,000, representing about 20 years' unpaid interest on \$23,700,000 of the latter's income bonds owned by the Missouri Pacific. The court ruled, also, that the Texas & Pacific must pay the Missouri Pacific \$2,500,000 on promissory notes together with interest amounting to \$500,000. The Missouri Pacific will appeal to the Circuit Court of Appeals against Judge Foster's decision.

**NORTHERN PACIFIC.—Acquisition of Billings & Central Montana Approved.**—The acquisition of the properties of the Billings & Central Montana Railway has been approved and authorized by the Interstate Commerce Commission, provided that the applicant shall not pay more than \$220,445 and shall not enter any sum in excess of that amount in its cost of roadway and equipment accounts.

**SEABOARD AIR LINE.—Asks Authority to Abandon Line.**—This company has asked the Interstate Commerce Commission for a certificate of public convenience to abandon a line in Manatee County, Fla.

**TENNESSEE, ALABAMA & GEORGIA.—Sale Postponed.**—The sale

of this 96-mile road, extending from Chattanooga to Gadsden, Ala., has been postponed from August 6 until later in the year, on account of an offer made by Prince & Co., Boston bankers, to stand the operating losses until September 15. It is believed at Gadsden that an important railroad company will purchase the road.

**TEXAS & PACIFIC.—Must Pay Missouri Pacific on Promissory Notes.**—See Missouri Pacific.

**WESTERN MARYLAND.—Application for Loan.**—This company has asked the Interstate Commerce Commission for a loan of \$1,000,000 for 10 years from the revolving fund for the construction of additional elevator facilities for export grain at Baltimore. The security offered for the loan is \$1,429,000 of first and refunding mortgage bonds of the applicant.

**WHEELING & LAKE ERIE.—Authorized to Pledge Bonds.**—The Interstate Commerce Commission has authorized this company to pledge \$451,000 of refunding mortgage 6 per cent bonds with the Secretary of the Treasury as partial security for a loan from the revolving fund.

**WYOMING & MISSOURI RIVER.**—This road will be sold at public auction on September 21 to satisfy a judgment of \$348,000 held by Mahlon Kemmer of Pittsburgh, Pa. The company operates a line between Aladdin, Wyo., and Belle Fourche, S. D., a distance of 18 miles.

### Tentative Valuations

The Interstate Commerce Commission has announced the tentative valuation of the used property of the following carriers:

Marion & Rye Valley.....	1916	\$317,177
Mobile & Ohio (including Warrior Southern).....	1915	44,462,440
Warrior Southern .....	1915	770,000

### Dividends Declared

**North Pennsylvania.**—\$1 quarterly, payable August 25 to holders of record August 11.  
**Southern Pacific.**—1½ per cent quarterly, payable October 1 to holders of record August 31.  
**Union Pacific.**—Common, 2½ per cent, quarterly; preferred, 2 per cent, semi-annually; both payable October 1 to holders of record September 1.

### Treasury Payments

The Treasury has announced the payment of a loan of \$25,000 from the revolving fund to the Lake Erie, Franklin & Clarion and partial payments of guaranty as follows:

Franklin & Pittsylvania.....	\$3,000
Gulf, Florida & Alabama.....	12,000
Live Oak, Perry & Gulf.....	10,000
Mt. Jewett, Kinzua & Ritterville.....	16,000
Savannah & Statesboro.....	2,500
St. Paul Bridge & Terminal.....	7,500
Wichita Valley.....	145,000

### Partial Payments of Guaranty

The Interstate Commerce Commission has certified to the Treasury partial payment of guaranty to the following roads

Gulf, Florida & Alabama.....	\$12,000
Paris & Mt. Pleasant.....	5,000
St. Paul Bridge & Terminal.....	7,500
Wichita Valley.....	145,000
American Railway Express Company.....	425,000
Kansas, Oklahoma & Gulf.....	100,000
Missouri Pacific.....	2,000,000

The Commission has also certified the payment of \$500 to the Bonlee & Western as reimbursement for deficits during Federal control.

### Final Settlements with Railroad Administration

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Denver Union Terminal Railway Company.....	\$12,500
Leavenworth Depot & Railroad Company.....	10,500
Louisiana Southern Railway Company.....	90,900
Minnesota & International.....	340,000
Detroit & Mackinac.....	165,000
Interstate Railroad .....	60,000

The payment of these claims in final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the Administration during the 26 months of Federal control.

## Railway Officers

### Operating

**C. A. Plumly**, superintendent of telegraph of the Baltimore & Ohio, has resumed his duties after a long illness.

**R. W. Ellsworth** has been appointed trainmaster of the Ontario division of the New York Central, effective August 12.

**J. F. Lucas** has been appointed passenger trainmaster of the Boston & Albany with jurisdiction over all the company's lines, effective August 1.

**Agnew T. Dice, Jr.**, whose appointment as superintendent of the Wilmington and Columbia division of the Philadelphia & Reading was announced in the *Railway Age* of August 6

(page 273), was born March 17, 1890. He studied engineering at Princeton University and was graduated from that institution in 1912. He entered the service of the Philadelphia & Reading on July 1 of the same year, and remained with that company until October, 1917, when he enlisted for service in the army. He was later commissioned a first lieutenant and was, until mustered out of the service, connected with the Bureau of Air Craft Production of the Air Service as assistant to the chief of production, New York

A. T. Dice, Jr.

district. He re-entered the service of the Philadelphia & Reading on October 20, 1920, as assistant superintendent of the Reading and Harrisburg divisions, which position he held until the time of the present appointment.

**P. S. Lewis**, whose appointment as superintendent of the Atlantic City Railroad (a subsidiary of the Philadelphia & Reading), was announced in the *Railway Age* of August 6, 1921 (page 273), was born in Springfield, Ill., on May 10, 1889. He was graduated from Princeton University in June, 1911, and on July 1, entered the service of the Philadelphia & Reading as a rodman at Williamsport, Pa. In August, 1911, he was appointed inspector of construction work at the St. Clair Yards. On July 1, 1912, he was promoted to general inspector at St. Clair Yards and on August 12 of the same year, assistant supervisor at Harrisburg. In June 5, 1913, he was transferred to Pottstown in a similar capacity. On September 15, 1914, he became signal inspector at Philadelphia and on April 1, 1915, supervisor of the Atlantic City Railroad at Camden, N. J.; on March 23, 1916, he was transferred in a similar capacity to the New

P. S. Lewis

York division of the Philadelphia & Reading with headquarters at Olney, Pa. Mr. Lewis was promoted to passenger trainmaster of the Reading division with headquarters at Reading, Pa., in May, 1917. In September of the same year, he entered military service as a first lieutenant in the Engineers (Light Railway Operating Regiment). In February, 1919, he was commissioned major of engineers, and on June 1, 1919, was appointed chief of the General Troop Movement Bureau at Paris. He was discharged from army on September 1, 1919, and was appointed trainmaster of the Philadelphia division of the Philadelphia & Reading. On April 20, 1920, he was promoted to assistant superintendent of the Atlantic City Railroad, which position he held until the time of the present appointment.

**F. A. Maxwell**, chief dispatcher of the Chicago, Milwaukee & St. Paul, with headquarters at Madison, Wis., has been promoted to trainmaster with the same headquarters, effective August 11. **J. H. Valentine**, succeeds Mr. Maxwell.

**B. L. Pedneau** has been appointed trainmaster of the New River division of the Virginian with headquarters at Princeton, W. Va., succeeding J. W. White, promoted to superintendent. **J. H. Fry** has been appointed assistant train master with headquarters at Elmore, W. Va., succeeding B. W. Williams, assigned to other duties.

### Traffic

**H. R. Whiting**, general agent of the Louisiana & Arkansas, and the Mississippi Central, with headquarters at Alexandria, La., has been transferred to Oklahoma City, Okla. **A. B. Patten**, succeeds Mr. Whiting. **W. S. Cornell** has been appointed general agent with headquarters at Dallas, Tex.

### Engineering, Maintenance of Way and Signaling

**E. I. Rogers**, roadmaster of the Iowa division of the Illinois Central, has been appointed chief engineer of the Peoria & Pekin Union, with headquarters at Peoria, Ill., effective August 20.

**A. M. Smith**, designing engineer in the bridge department of the Canadian National Railways with headquarters at Winnipeg, Canada, has been transferred to Toronto. **C. R. Doull**, **L. A. McKeage** and **J. Whitelaw**, assistant engineers with headquarters at Moncton, N. B., have been transferred to Toronto. **J. A. Ellis**, office engineer with headquarters at Moncton has been appointed assistant engineer of standards in connection with roadway standards with headquarters at Toronto.

**D. O. Lewis**, assistant engineer on the Canadian National Railways with headquarters at Toronto, Canada, has resigned. **E. R. Logie**, assistant engineer in the engineering department with headquarters at Toronto, has been transferred to the operating department with headquarters at Ottawa, Canada. **K. Huffman**, assistant engineer, engineering department, with headquarters at Toronto has been transferred to the operating department at Capreol, Canada. Mr. Logie and Mr. Huffman retain their present titles of assistant engineer.

### Obituary

**M. Flanagan**, general master mechanic on the eastern district of the Great Northern died at St. Paul, Minn., on August 2.

**Henry C. Adams**, professor of economics at the University of Michigan, and formerly statistician of the Interstate Commerce Commission, died at Ann Arbor, Mich., on August 11. Mr. Adams was born at Davenport, Iowa, on December 31, 1851, and was educated at Iowa College, and at Johns Hopkins and Heidelberg universities. He was appointed statistician of the Interstate Commerce Commission in 1887, and served in that position continuously until 1911. In addition to his other duties, he also served as advisor to the Chinese government on standardization of railway accounts from 1913 to 1916, and was the author of numerous books and treatises on railroad and financial matters.

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free: United States, Mexico and Canada, \$8.00. Foreign Countries (excepting daily editions), \$10.00 £2 01s. 0d. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue, 9,000 copies were printed, that of these 9,000 copies, 8,082 were mailed to regular paid subscribers, 34 were provided for counter and news company sales, 345 were mailed to advertisers, 65 were mailed to employees and correspondents, and 434 were provided for new subscriptions, samples, copies lost in the mail and office use; that the total copies printed this year to date was 329,100, an average of 9,679 copies a week.

It will surprise you to learn how Ryerson machinery reduces spring repair costs

## What Are Your Springs Costing?

Repair springs in your own shops with Ryerson Standardized Spring Shop Equipment and

- Save in the cost of repairs
- Reduce the stock of extra springs
- Save freight to and from the manufacturer's plant
- Minimize delays to big, expensive locomotives.

Railroads have found that Ryerson Standardized Spring Shop Equipment quickly pays for itself. Some of the bigger roads have saved the cost of the equipment in the first year.

Ask us what YOU can save.

All railroads have some form of train order signal to indicate to a train crew that orders are being held for delivery, but this equipment is not always designed so that they can make the most efficient use of it to indicate whether a "19" or a "31" order is to be delivered. This slows down operation and increases operating costs whenever a train stops for a "19" order. Unlike automatic signals, the location of a train order signal is fixed at or near the telegraph office without reference to the fact that this location may be at the top of or on a heavy grade or at a point where other physical handicaps make a stop undesirable. Consequently, if no advance information is furnished a train crew, it must of necessity slow down to a speed much lower than would otherwise be required or come to a full stop if the operator should have a "19" order to deliver and fail to get out with it in time. A three-position train order signal, properly used, will enable these unnecessary stops to be eliminated and promote train operation.

### Service from Train Order Signals

During the past few years the railways, as well as other industrial organizations, have been faced, first, with a scarcity of labor and then as a result of the first, with high priced labor. As a consequence of this combination of circumstances, the labor charge per unit of work soon became excessive. In the efforts to control these rising costs, the possibilities of mechanical devices as substitutes for labor have received close attention; there is a vast amount of work on the railways which lends itself readily to the application of such machines. There are certain general principles of application which should be observed as necessary to the success of any material handling installation. One of the most important of these is the training of the actual user of the equipment, not only in the mechanical features of the machine he operates, but particularly in its possibilities. This training is especially important where operating conditions are changing, where no two methods of use are followed by equal results, and in those instances where the new idea originates with the higher officers and the subordinates are apt to be partial to the old methods. Such a policy should end in better results from a particular installation, in overcoming the opposition on the part of the workmen to the introduction of new methods and, if carried to the ultimate conclusion by requiring reports from the trained operators, in many valuable suggestions bearing on the purchases of new equipment.

### Operators of Handling Devices Should be Trained

One of the points which have been stressed in discussions regarding the undermaintenance of tracks during government control, and to some extent since that period, has been the inadequate amount of rail renewals. Even though the railroads have attempted, so far as their financial position would permit, to remedy this condition in recent months it has been only partially met as yet. With this case, it is of distinct interest to the managements of the railroads that rail renewals be handled in the most economical manner. At the present time

### The Managements' Interest in Rail Renewals

One of the points which have been stressed in discussions regarding the undermaintenance of tracks during government control, and to some extent since that period, has been the inadequate amount of rail renewals. Even though the railroads have attempted, so far as their financial position would permit, to remedy this condition in recent months it has been only partially met as yet. With this case, it is of distinct interest to the managements of the railroads that rail renewals be handled in the most economical manner. At the present time

the methods of laying rail vary considerably and what is more to the point, the differences in the costs per mile of laying rail of approximately the same weight under similar traffic conditions are sometimes astonishingly large. One reason for this is that some railroads are employing practically the same methods for laying rail weighing 100 lb. or more per yard that they used for laying 60-lb. to 65-lb. rail. In contrast to this, other roads have developed and put into practice many improvements over the old methods while a few have reduced rail laying to an almost scientific basis. This is not a problem solely for the maintenance of way department to solve but is one the solution of which will only come through the full co-operation of the managements.

The action of the Baldwin Locomotive Works in advancing credits to the extent of \$2,500,000 to the Mexican government with the prospect of the further extension of a similar amount affords the most encouraging evidence of a real understanding of America's position in foreign trade. The first credit will go toward the purchase of 65 locomotives for the National Railways and the loan in prospect will be used for general rehabilitation of the railways. Baldwin's action is encouraging from several points of view. It means an important contract for a railway equipment concern which is welcome in these days when business in general is struggling to return again to activity. It means the recognition by a powerful American concern of the fact that with conditions in the world as they are today, America must extend credit if it wishes to export its products in important quantities. It means a great step toward the rehabilitation of the Mexican railways and incidentally, toward general economic revival in Mexico. The news from Mexico has been increasingly encouraging of late months. Affairs there are rapidly approaching normal and it seems not unlikely that Mexico may before many years be in a much happier condition than ever before. It is gratifying that Americans should play an important part in speeding this revival. Friendship built up in this manner is not destroyed overnight. Far-seeing action such as the Baldwin people have taken is laying a firm foundation for a mutually profitable international trade and for cordial diplomatic relations between this country and Mexico.

### Baldwin and Mexico

The principal purpose of material handling equipment is to serve other machines. For instance, in railway shops the cranes, trucks, tractors, trailers, etc., find their usefulness in working in conjunction with the production machines. In freight handling the analogy is not so marked, still, even in this service it is the function of the handling machines to supplement other equipment. It is evident that mere capability to perform certain operations is not enough to warrant the installation of a particular device for such operations. On the contrary, it is exceedingly important that the entire process of production be given careful consideration in conjunction with the handling problem before a decision is reached, to make sure not only of the selection of the best machine for

### The Function of Material Handling Devices

The principal purpose of material handling equipment is to serve other machines. For instance, in railway shops the cranes, trucks, tractors, trailers, etc., find their usefulness in working in conjunction with the production machines. In freight handling the analogy is not so marked, still, even in this service it is the function of the handling machines to supplement other equipment. It is evident that mere capability to perform certain operations is not enough to warrant the installation of a particular device for such operations. On the contrary, it is exceedingly important that the entire process of production be given careful consideration in conjunction with the handling problem before a decision is reached, to make sure not only of the selection of the best machine for

a particular purpose but to insure the best possible co-ordination between the handling machinery and the other equipment. In this connection it is worthy of notice that reputable manufacturers of handling equipment hold themselves ready and anxious to give purchasers of equipment the benefit of their experience in the carrying on of the necessary preliminary studies and, as well, their co-operation in solving any operating problems that may arise after an installation is made. By availing themselves of this co-operation, purchasers of handling equipment may profit by the mistakes of others, while the manufacturers benefit through increased sales resulting from successful installations.

One of the outstanding features of the operating statistics of large steam roads for June, reported by the Interstate Commerce Commission is the showing made by the Chesapeake & Ohio. This carrier is the only one in the list of 51 roads whose figures are given—those having annual operating revenues in excess of \$25,000,000—that moved as many net ton-miles of freight in June, 1921, as in June, 1920. The larger part of the roads did considerably less business, in some cases 20 or 25 per cent less, in June this year than in June last year. The Chesapeake & Ohio, however, in June, 1921, carried 1,072,786,000 net ton-miles as against 1,039,845,000 in June, 1920. June was the busiest month that the Chesapeake & Ohio has had so far this year and the business handled in June was greater also than that handled in any month in the first half of 1920. The Chesapeake & Ohio suffered severely in February and March this year, when its traffic fell off in rather an alarming fashion; the traffic handled in June was nearly double that handled in February. The recovery in the amount of traffic on the road has naturally been shown in the gross and net earnings. The net railway operating income in June was \$1,944,753. This compared with a net in June, 1920, of \$245,461; it was approximately double that of most of the other months in the first half of either 1921 or 1920. The character of the recovery since the dull period of February will be evidenced by the fact that in February the road had a net operating deficit of \$556,636. Because of the dull months earlier in 1921, however, the net railway operating income for the first six months of 1921 was only \$5,041,319 as compared with \$5,483,768 in the first half of 1920.

The repression of the tramp nuisance on the railroads is a duty of the state rather than the towns and cities; municipal officers are too easy, and the nuisance is not abated. This is a conclusion that was reached by careful students of the question several years ago; but since the advent of war-time conditions the matter has dropped out of sight. Now, however, with increased numbers of men out of work, the same old conditions are returning. A local paper in western Massachusetts, referring evidently to conditions on the Boston & Albany, said recently:

#### Magistrates Do Not Punish Tramps

Industrial depression in the western part of the country is driving men east and they are coming by way of "blind baggage" to such an extent that a toll of them is taken each day by the local police. There will be several arraigned in court to-morrow morning and their plea will be "no work," as has been the cry of the many taken from trains in the past two months. It has been the custom of the court to deal lightly with these offenders, and they are usually passed on to some other municipality that perhaps does the same. During the last industrial depression train riders became so numerous that the court was forced to place a heavy fine on them in order to rid this section and the railroad of their presence. It was found, however, that the charge on the county institutions was too great and that it was cheaper to allow them to go.

On the Gulf Coast Lines in Louisiana, a few weeks ago, an observer counted 20 tramps on an eastbound freight. This was at De Quincy, near the Texas line. An hour later the

train, in which were oil cars, was derailed, took fire and was mostly destroyed in a 24-hour fire; and it was believed that 15 of these men were killed in the flames. "Dealing lightly with offenders," as referred to in the above news item, is a deep seated weakness of government which nobody seems able to cope with, except perhaps for brief periods, in very limited territory. The manager of one big American railroad remarked, not long ago, that attempts at train wrecking were reported to him by his subordinates on an average once every week. Only the most thorough police establishment can have much effect on an evil like that. Read over again the above-quoted paragraph and show it to members of your legislature and other public spirited citizens. To cease punishing law breakers, because the jails are costing too much, is a queer situation; but that idea will be found lodged in many local magistrates' minds.

The annual statement of block-signal mileage issued by the Interstate Commerce Commission, noticed on another page, contains a large amount of valuable data, as interested readers are well aware, but the original purpose of the publication, to show the degree of progress made year by year, in the

#### Problem of Good Manual Block Signaling

introduction of the block system, is of no great interest just now; for there is progress in only a few spots. On the other hand, those features of these elaborate tables which disclose the need of progress, where but little has been accomplished, continue to stand out prominently. For example, the list of manual block signal stations shows in nearly every item a large percentage of stations which are closed a part of each day; the block sections have to be lengthened, wherever and whenever possible, because of the necessity of extreme economy in signalmen's wages. This is not necessarily an evil, per se, but the general situation serves to emphasize the need, to which attention has many times been called, of greatly improving much of our manual block signal practice. Patchwork and half-way measures are tolerated, where a true and complete block system ought to be installed. In this situation two important elements should be kept in mind: first, that the federal government—that is, the Bureau of Safety of the Interstate Commerce Commission—affords the only suitable instrumentality for setting forth the actual conditions, adequately; and second, that the correction of existing dangers and weaknesses of manual block signal operation is largely a question of administration—of the use of brains and energy—rather than of expenditures for plant or apparatus. There is no need of deferring action until the advent of easier money.

#### The Commission's Rate-Making Policy

THE EMBARRASSMENT caused, and the harm done, by regulating railways on principles foreign to sound business methods is illustrated by the opinion rendered by the Interstate Commerce Commission on August 3 in the live stock rate case.

For years after effective government regulation of rates began the railways tried to get the rates based mainly on "what the traffic would bear." What the traffic will bear is measured chiefly by the value of the service rendered to the shipper. The railways contended that rates never should be made higher than the shipper could reasonably afford to pay, but that if they were reasonable in proportion to what he could afford to pay they should not be reduced, even though the railways were making a large profit by charging them. They also maintained that if the traffic could easily bear higher rates, there was no economic or legal reason why the railways should not be allowed to advance the rates, even

though the advance in rates enabled the railways to earn more than the minimum profit which the courts held to be the least return to which they could constitutionally be restricted.

This argument of the railways was for years contested, and successfully contested, by the shippers. Most of them contended that the value of the service rendered to the shipper not only should not be made the principal basis of the regulation of rates, but that it should be treated as a comparatively unimportant factor. A reasonable rate, they claimed, was one based upon the cost incurred by the railways in rendering service to the shipper. The cost incurred by the railways included operating expenses, taxes and a "fair return upon a fair valuation." If the rates charged by a railway were sufficient to cover the cost of the service, as thus defined, there was, according to their view, no justification for an advance in rates.

The Interstate Commerce Commission, in the rate advance cases decided by it down to 1917, accepted this "cost of service" theory of rate-making. In consequence, the average freight rate remained stationary or declined, while prices of all commodities were advancing. The average freight rate per ton per mile of the railways of the country was the same in 1917 as in 1913. Meantime, average wholesale prices of farm products increased 89 per cent, and average wholesale prices of all commodities increased 76 per cent.

The tendencies of railway rates and of the prices of commodities, especially farm products, have been sharply reversed within the last year. The average railway rate per ton per mile is now about 74 per cent higher than in 1913; the average wholesale prices of all commodities about 50 per cent higher, and average prices of farm products about 13 per cent higher. Producers of live stock have been suffering severely from the decline in their prices. They therefore appealed to the Interstate Commerce Commission for a reduction of live stock rates. They contended that the rates should be reduced solely because, owing to the advance in rates and the decline in the prices of live stock, the rates had become relatively so high that the shippers of live stock could not afford to pay them. In other words, they contended that the rates had become excessive in proportion to the value of the service. They did not contend the rates were excessive in proportion to the cost incurred by the railways in rendering the service of transporting live stock. No such contention could have been supported with any evidence. All the evidence showed that, measured by the cost of the service, the rates were too low, not too high.

The Interstate Commerce Commission in its decision frankly recognized the dilemma in which the evidence placed it. It pointed out that in a long series of decisions it had held that "the right of a railroad to charge a certain sum for freight does not depend at all upon the fact whether its customers are making or losing by their business." It pointed out that on the basis of the "cost of the service" there could be no justification for a reduction of live stock rates since, on account of their high expenses of operation, the railways under the present rates had fallen far short of earning enough to cover their operating expenses and taxes and the annual net operating income set as a mark by Congress—and by the Commission itself.

On this reasoning it is difficult to see how the Commission could have reached any conclusion other than that it should not order, or even suggest, that the rates on live stock should be reduced. Nevertheless, without entering any order, the Commission did suggest to the carriers a substantial reduction in these rates. Furthermore, Commissioners McChord and Campbell dissented from the majority opinion and contended that the rates should be ordered reduced, the latter expressly basing his view upon the ground that the rates are too high in proportion to the value of the service rendered.

What action the railways will take is yet to be determined.

The inconsistency of the Commission's suggestion in this case with its decisions in past years is, however, only too plain. It refused in past years to allow the railways to advance their rates when the traffic could bear higher rates, but it now suggests to them that they should reduce the rates because they are too high in proportion to what the traffic can bear. Formerly it refused advances in rates upon the ground that the cost of rendering the service had not increased enough to justify the advances, and now it suggests reductions in rates regardless of the fact that the cost of rendering the service is so high that the railways cannot afford to reduce them.

There are commodities whose prices are so low in proportion to the present railway rates that the rates are relatively high measured by the value of the service rendered in transporting them. This is especially true of the prices of and rates on live stock. There are other commodities whose prices are still so high that they could easily bear further advances in rates. For example, according to the statistics of the Bureau of Labor, the average prices of house furnishings in April were 174 per cent more than in 1913, and the average prices of building materials 103 per cent more. The price of coal at the mouth of the mine at Fairmont, W. Va., on August 1, was 131 per cent more than in 1913. The price of brick was 118 per cent more.

Since the Commission suggests reductions in the rates on live stock because of the low prices of live stock, it would be only consistent for it to authorize advances in the rates on house furnishings, coal, brick and other commodities, the prices of which are still so high relatively that they easily could stand higher rates.

The Commission has express instructions from Congress to so fix rates as to enable the railways to earn an average return of at least 5½ per cent. The railways for almost a year have patiently done the best they could under rates fixed by the Commission which have yielded them an average return of only about 2½ per cent. How does the Commission reconcile its suggestions for reductions in some rates, and its failure to suggest advances in other rates, with the duty given it by Congress to enable the railways to earn an average return of at least 5½ per cent?

Railway expenses are gradually going down. Not only are the prices of some commodities still so high that they could stand much higher rates, but the prices of some commodities which declined lately have recently been advancing, including those of some important farm products. Since the Commission now suggests that, regardless of the high operating costs of the railways and the enormous losses they have been incurring, the railways reduce live stock rates to help the producer of live stock, what attitude is it going to take in the future if there are radical changes in the relations between railway costs and the prices of commodities? Suppose business conditions become such that the railways, without in any instance charging rates that are relatively high in proportion to what the traffic can bear, can make average net earnings which greatly exceed 5½ or 6 per cent. Since the Commission now suggests that they shall reduce certain rates when for almost a year they have been earning only 2½ per cent, will it in future help them to maintain rates which, without exceeding what the traffic can bear, may conceivably enable them to earn an average of, say, 8 or 10 per cent?

The *Railway Age* has no criticism to offer if the Commission intends to change its past policy and in future permit rates to be based on "what the traffic will bear." But the Commission will be guilty of the grossest inconsistency, and lay itself wide open to the most destructive criticism, if it pursues a policy of basing rates on what the traffic will bear when railway costs are high, and of then basing them on the cost of the service when railway costs have been reduced.

## Extraordinary Changes in Freight Business

NOTHING COULD BETTER illustrate the peculiar conditions now existing in general business than the contrast between the facts regarding the movement of freight of various kinds on the railways at present and the facts regarding the movement of the same kinds of freight a year ago. Many people believe there has been a decline in all kinds of freight. This is not true. Throughout the present year there have been increases as compared with last year in the shipments of some kinds of freight and decreases in the shipments of other kinds of freight.

The freight rates which have been the most bitterly attacked are those on farm products. The western state railroad commissions, led by the Kansas commission, have started proceedings for extensive reductions in grain rates before the Interstate Commerce Commission. They claim that the traffic will not bear the rates and that therefore as long as the rates remain in effect the farmers cannot produce grain at a profit. Curiously enough, as has been pointed out in these columns before, grain shipments throughout the present year have shown larger increases than those of any other commodities. In the four weeks ended August 6, the total carloads of grain shipped were 246,938 as compared with 146,440 in the same weeks of 1920, an increase of almost 70 per cent. There has also been loud complaint that the farmers could not ship their live stock under present rates. The shipments of live stock in these same four weeks were 101,159 carloads as compared with 105,022 in the same weeks of 1920, a decrease of less than 4 per cent. There has been a large increase in shipments of merchandise. In the four weeks mentioned they were 836,098 carloads as compared with 753,947 carloads last year, an increase of almost 11 per cent.

Compare the foregoing figures with those regarding shipments of some other commodities. Comparing the four weeks ended August 6, 1921, with the same weeks of 1920, coal shipments declined from 793,536 carloads to 596,620 carloads, or about 25 per cent. Shipments of coke declined from 51,501 carloads to 15,994, or almost 70 per cent. Shipments of forest products declined from 239,287 carloads to 175,335 carloads, or almost 20 per cent. Shipments of ore declined from 308,775 carloads to 127,300 carloads, or over 60 per cent. Shipments of miscellaneous unclassified commodities declined from 1,344,857 carloads to 1,042,197 carloads, or over 30 per cent.

These figures disclose that the present freight traffic of the railways is due to changes as compared with last year varying all the way from an increase of 70 per cent in grain shipments to a decrease of 60 per cent in ore shipments and of 70 per cent in coke shipments.

Many people are trying to convince themselves and others that present business conditions are largely, or even mainly, due to the present railway rates. But the advances in railway rates made since 1917 have been horizontal increases, and therefore have been relatively the same upon all classes of commodities. If the advances in railway rates have produced such an immense effect upon general business, how does it happen that with relatively the same increases in rates upon all commodities, shipments of some commodities are now 70 per cent greater than a year ago while shipments of other commodities are 70 per cent less than they were a year ago?

The wide differences in the changes that have occurred in the shipments of the various classes of commodities show that the present business situation is due in only a small measure to railway rates and mainly to other conditions. Undoubtedly the main reason why the shipments of some kinds of commodities have greatly increased while those of other commodities have greatly declined is that the process

of readjustment has been carried much farther in some lines of industry than in others. The increases in railway rates cannot, however, have materially hastened the process of readjustment in some industries or retarded it in others, simply because the increases in railway rates have been uniform as to all classes of commodities.

With grain shipments 70 per cent greater than they were a year ago and coal shipments 25 per cent less, forest products shipments 20 per cent less, ore shipments 60 per cent less and coke shipments 70 per cent less, it is quite plain that the public must look to other influences than to any possible reduction in railway rates to cause a return of general business activity.

## Protecting the Investment

IN THE LAST TWO ISSUES we have referred to the direct interest which the railways have in the extensive program of highway construction which has been undertaken over the country. This interest arises from the large investment which they have made and are making in these roads through taxation in one form or another. It has been estimated by competent authorities that the amount available for highway construction work this year is approximately \$1,400,000,000 or over six per cent of the total investment in the railways of the entire United States. Once this investment has been made, the railways are interested in seeing that it is protected and that the structures resulting therefrom are used in the manner for which they were designed, and in the way to secure the greatest return from the expenditure.

When a railway constructs a line, its structures are designed by trained engineers to carry the loads which it is desired to move over it. With the completion of the road, the loads are limited rigidly to those for which the structures have been designed. If conditions develop which make it desirable to transport heavier loads or make higher speeds, they are permitted only after the structures have been strengthened accordingly.

In our last issue the lack of engineering design of the highways into which these hundreds of millions of dollars are being poured was referred to. As a result there is little relation between the roads which are built, local conditions under which they are constructed, and the traffic which they are to bear. But this is not all. After the road is completed with public funds little or no attempt is made to limit the loads or the speeds at which they are transported. Any truck operator is at liberty to haul any load he desires and under any conditions which he sees fit to impose, without regard to the effect on the road which has been provided for him free of expense by the railways and other taxpayers. Such a disregard of engineering principles would be suicidal on a railway; and it is equally so on a highway. The result is that this large investment is being dissipated in large measure, for these highways are failing in many instances after only three or four years of service, and frequently after an interval that represents only a fraction of the period for which they are bonded.

In a report made by the automobile clubs of California, it is stated that on 49.8 per cent of the highways in southern California serious failure has already begun or is far advanced. While California is one of the few states which have passed laws limiting the weight of trucks it has quite generally failed to enforce this requirement. The report states that "it is apparent that if truck operators are permitted to use the highways without police supervision a few unreasonable truck drivers or operators will wreck any road system that may be built. Thinking people recognize that such a policy is improper, short-sighted and suicidal. It is equally important that speed regulations should be enforced for trucks, for the speeds at which these heavy loads travel on

public highways produce impact and these shocks are especially destructive to the pavements." The report further states that "we have not only a heritage of bad roads, but an upkeep cost which is prohibitive. In one instance the upkeep after four years has equaled the original cost. The evidence shows that in the rebuilding of one road they (state forces) destroyed with their own trucks more miles than they repaired."

As to the future, the report states that "We must expect enormously increased truck traffic. Wheel loads and speeds will increase unless legislation and larger license fees prevent. The Commission believes that until inspectors are appointed by the state to enforce the law, the highways are bound to suffer from overloading. It seems incredible that in the face of such a record of destruction of the state pavements these persistent, unreasonable and illegal loads should be continuously permitted to traverse our highways. There has been practically no serious attempt made on the part of either state or county authorities to enforce the laws that have been provided by our legislature for the protection of these roads."

If this condition was confined to California it would be serious enough, but it is typical in large measure of conditions which prevail all over the country. It constitutes a serious indictment of the public authorities under whose direction these roads are being built and maintained. The railways, because of their large contribution to these funds, can and should insist on the development of proper standards of construction and, what is even more important, on the limitation of the loads and the speeds to those for which the roads have been designed. Without such limitations the investment will be dissipated very quickly, while those who pay the bills will still have the heritage of large bond issues outstanding and of heavier taxes to meet their interest and maturities.

## St. Louis Southwestern

THE ST. LOUIS SOUTHWESTERN was one of the few railroad companies that declined to accept the government guaranty for the period from March 1 to August 31, 1920. It was one of the still fewer roads declining the guaranty that estimated the possibilities and probabilities of its situation correctly and came out ahead in the struggle against the adverse conditions of railroad operation for which 1920 will be only too well remembered. The factor which enabled it to meet the increased expenses of operation resulting from the high wage scales of Decision No. 2, etc., was an extraordinary expansion of traffic of which with efficient operation the road was able to take advantage to an unusual extent.

The company's decision not to accept the guaranty followed upon a dispute with the Railroad Administration wherein the road contended that the property had been inadequately maintained during the period of federal control. The road's officers felt, on the return of the carrier to private control, that the road was considerably below the proper standard of maintenance, and that large sums must be spent for restoration. Being unable to secure from the Interstate Commerce Commission commitments as to what amount of money would be allowed for maintenance under the provisions of the guaranty, the company decided to go ahead "on its own." The following figures show the road came out ahead in the amount of \$1,900,039, of which \$1,593,285 was devoted to excess maintenance expenditures.

It will be remembered that the increase in wages in Decision No. 2 was announced on July 19 and was made retroactive to May 1. The increase of rates in Ex Parte 74 was not effective until August 26 and not until later in the case of some of the intrastate rates. The St. Louis Southwestern had to contend, therefore, with the increase in wages for

four months of the guaranty period without having the advantage of the higher rates. The wage increase has been estimated by the officers of the St. Louis Southeastern to have added something like \$900,500 to its expenses during the guaranty period. When these circumstances are considered,

Accounts	March 1 to August 31, 1920.	
	On Basis of Non Acceptance of Federal Guaranty	On Basis of Acceptance of Federal Guaranty
Operating revenues .....	\$14,511,930	\$14,511,930
Operating expenses .....	12,077,251	10,483,966*
Net revenue from railway operations..	\$2,434,679	\$4,027,964
Tax accruals and uncollectible railway revenues .....	525,281	525,281
Railway operating income .....	\$1,909,398	\$3,502,683
Non-operating income—net .....	346,369**	346,369**
Gross income .....	\$2,255,767	\$3,849,052
Amount of guaranty .....		1,943,013
Amount that would have reverted to government had the federal guaranty been accepted .....		\$1,900,039
Excess income over amount of guaranty disregarding credit due account maintenance expenditures in excess of estimated federal allowance .....	\$ 306,754	
Excess maintenance expenditures .....	1,593,285	
Total in excess of guaranty .....	\$1,900,039	

\*If the guaranty under the Transportation Act of 1920 had been accepted the company would have been restricted in its expenditures for maintenance of way and structures and maintenance of equipment to an amount set up by the United States Railroad Administration as sufficient. On this basis \$1,593,285 would have been eliminated from operating expenses for the period, March 1 to August 31, 1920, thereby increasing the amount to be turned over to the United States government.

\*\*Excludes corporate non-operating income account not contributing to guaranty income.

the fact that the road came out \$306,754 ahead on its decision after having spent \$1,593,285 for excess maintenance, is nothing less than remarkable.

Referring now to the operations of the year as a whole, it should be noted that the St. Louis Southwestern is again

The St. Louis Southwestern

an exception in that as compared with 1919 it increased its operating revenues in 1920 in greater percentage than its operating expenses. The total operating revenues in 1920 were \$31,020,958, as compared with \$20,661,163 in 1919, an increase of 50.14 per cent. Operating expenses in 1920 were \$25,886,056 as compared with \$18,497,241 in 1919, an increase of 39.95 per cent. For the entire year the road had to meet increased wage costs in the amount of some

\$1,900,000 but in the last four months it also had the advantage of higher rates. In addition, it carried a record traffic throughout most of the year and did not suffer a decline in its traffic until rather later than most roads. Speaking now of the St. Louis Southwestern alone and omitting for the moment the St. Louis Southwestern of Texas, thus taking into consideration 968 miles of the system's total of 1,775, it is interesting to observe that the road's standard return for the period of federal control was \$3,355,749. In 1918, it had a net railway operating income of \$3,628,950,

or including the ties inserted in January and February which brought the total up to 777,612, an increase of 130,111, as compared with 1919. There was \$158,138 spent for tie plates, and there were applied 74,718 cubic yards of ballast. The road spent \$560,581 for application of drain tile, widening cuts, etc. There were laid 75 miles of 85 lb. rail replacing worn 75 lb. rail. Of the total of \$3,271,924 mentioned above \$2,524,823 was spent on maintenance of way and structures and \$747,101 for maintenance of equipment. In addition the road during the year purchased 20 new Consolidation

#### ST. LOUIS SOUTHWESTERN OPERATING RESULTS 1912-1920

Year ended June 30:	Freight revenue	Total operating revenue	Operating expenses	Net operating revenue	Operating ratio	Revenue tons	Revenue ton miles	Average haul	Revenue train load	Revenue car load	Miles per car day
1912	\$8,971,114	\$12,042,543	\$8,419,415	\$3,623,128	69.92	3,408,054	835,722,979	245	292	15.05	26.66
1913	9,864,490	13,296,950	9,215,797	4,081,153	69.31	3,657,964	871,985,756	238	300	15.27	28.22
1914	9,295,143	12,791,906	9,833,801	2,958,104	76.83	3,495,537	830,028,078	237	294	15.37	25.54
1915	7,891,642	10,627,861	8,361,154	2,266,707	78.67	3,181,267	747,474,248	235	304	15.47	19.78
1916	6,183,185	12,224,449	8,406,786	3,817,664	68.77	3,745,130	891,104,359	238	344	15.97	24.83
Year ended Dec. 31:											
1916	10,369,943	13,850,130	9,318,306	4,531,825	67.28	4,009,498	956,572,396	239	351	16.36	30.15
1917	13,062,975	17,309,657	10,896,360	6,412,797	62.95	4,996,813	1,270,829,273	254	431	18.59	34.08
1918	14,365,254	19,588,761	15,846,615	3,748,146	80.87	4,872,201	1,240,619,003	255	450	21.03	22.81
1919	15,821,318	20,661,163	18,497,241	2,163,921	89.53	4,760,216	1,140,459,526	240	463	19.50	22.49
1920	25,280,354	31,030,958	25,886,056	5,134,902	83.45	6,356,708	1,815,775,668	286	523	21.86	30.36

in other words, it exceeded the government rental. In 1919 it had a net of \$3,077,808. In 1920, while operating for 10 months on its own account, it had a net railway operating income of no less than \$6,001,829. Referring again to the St. Louis Southwestern as a system, it will be noted that the corporate income account in 1920 showed a net of \$2,959,837, all of which was appropriated for investment in physical property. The net corporate income in 1919 was \$1,345,909.

It has been noted above that the property was assisted in 1920 by an extraordinary expansion of its traffic. The total revenue tonnage in 1920 was 6,356,708 as compared with 4,760,210 tons carried in 1919 or 4,996,813 carried in 1917, the best previous year. As compared with 1919 there was an increase of 33.54 per cent. The increase in revenue ton mileage, however, was no less than 59.21 per cent. The revenue ton mileage in 1920 was 1,815,775,668. The 1919 figure was 1,140,459,526; the 1917 total was 1,270,829,273. The road's average haul in 1920 was 286 miles; in 1919 it was 240 miles; in 1917, 254 miles.

The St. Louis Southwestern's tonnage is rather diversified. In 1920 products of agriculture constituted 16.24 per cent of the total revenue tonnage; products of animals, 1.05 per cent; products of mines, 21.02 per cent; products of forests, 28.65 per cent, and manufactures, 33.04 per cent. As compared with 1919, the tonnage of products of mines in 1920 showed an increase of 100 per cent. The tonnage of refined petroleum and its products, which in 1920 made up 7.82 per cent of the total tonnage of the road, represented an increase over 1919 of 121.37 per cent.

It is quite natural to expect that with an increase in total revenue tonnage of 33.54 per cent and an increase of 59.21 per cent in revenue ton mileage there should have been compensating increases in revenue train load, revenue car load, etc. The average revenue train load in 1920 was 523 as compared with 463 in 1919, 450 in 1918, 431 in 1917, etc. The average revenue load per loaded car was 21.86 as compared with 19.5 in 1919. The St. Louis Southwestern ranks well with the other roads in its territory in these matters. The progressive increase in the figures, however, is possibly of even greater importance.

In view of the fact that the St. Louis Southwestern spent large sums for the rehabilitation of its property during 1920, it is worth while to see just what work was carried out. The details as given in the annual report, show that between March 1 and December 31 there was spent on major items of maintenance and betterment work the sum of \$3,271,924. This included the purchase and application of 642,505 ties,

freight locomotives, of which 10 were received before the close of the year.

The operating results 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated	1,776	1,755
Freight revenue	\$25,280,354	\$15,821,318
Passenger revenue	4,026,709	3,819,762
Total operating revenue	31,120,958	20,661,163
Maintenance of way expenses	6,326,553	4,127,516
Maintenance of equipment	6,717,152	5,220,162
Traffic expenses	755,704	314,114
Transportation expenses	10,898,597	7,880,833
General expenses	1,109,259	902,261
Total operating expenses	25,886,056	18,497,241
Net operating revenue	5,134,902	2,163,921
Taxes	1,247,677	853,182
Operating income	3,885,448	1,306,557

The corporate income account is as follows:

	1920	1919
Standard return (January and February, 1920, full year 1919)	\$651,819	\$3,910,914
Railway operating income (10 mos.)	3,970,947	656,740
on-operating income	1,534,298	4,570,653
Gross income	6,105,478	2,250,490
Interest on funded debt	2,236,388	3,224,744
Total deductions from gross income	3,145,642	1,345,909
Net income	2,959,837	
Income appropriated for investment in physical property	2,959,837	

## New Books

*The Engineering Index, 1920.* 586 pages, 7 in. by 9½ in. Published by the American Society of Mechanical Engineers, 29 West Thirty-ninth street, New York.

The Engineering Index, which was published from 1892 to 1917, inclusive, by the Engineering Magazine Company and since then by the American Society of Mechanical Engineers, has for many years been recognized as the standard reference index to current engineering literature, and is practically indispensable to those who have frequent occasion to look up articles which have been written on subjects in this field. The completeness of the index is shown by the fact that the volume for the year 1920 covers nearly 14,000 articles from some 700 engineering and technical publications, together with society proceedings. Most of these are in English, but the more important articles in French, German and other languages are included also. The subject matter is arranged in alphabetical order with convenient main and sub-heads and gives a concise description of the substance of each article. The railway field is well covered and includes references to articles on management, operation, construction, maintenance, stations, freight handling, yards, track, maintenance of way, shops, locomotives, cars, etc.

## Letters to the Editor

### Remedies for Wastes in Railway Operation

NEW YORK.

TO THE EDITOR:

Referring to the article by F. J. Lisman under the above title in the *Railway Age* of July 9, 1921.

In some respects there is a distinct difference between the measure of a rate which is satisfactory to the shipper and the measure of a rate which is compensatory to the carrier, and the difficulty which confronts the traffic official is to balance one against the other and to so adjust the rates that the application thereof will result in the maximum volume of business at the maximum net return.

The actual cost of handling a ton of silk is relatively unimportant, but I realize Mr. Lisman has used silk as the extreme at one end of the scale and pig iron at the other end. But with respect to silk it may be interesting to note that the value is so great, the insurance so high and the amount of interest so large that the actual freight rate has practically no bearing, provided the service is given by the ocean and rail carriers and, as a matter of fact, the service is almost the same as passenger train time.

I think you are entirely correct in pointing out that practically all the expenses can be reduced to a formula, but although I have personally wrestled with the problem for a number of years I have yet to find a formula which can be applied from year to year.

Some years ago it was customary to price cotton seed at country stations in dollars per ton equal to the current price in cents per gallon of cotton seed oil. That is, if cotton seed oil was 18 cents per gallon it was assumed cotton seed should be priced at \$18 per ton. It was a good formula and worked successfully until the market prices on cotton seed meal broke it down.

I do not see any special value in basing traffic expenses upon the gross tonnage handled. I have just seen a steel box car, for which the tare weight is 47,400 lb. but as a vehicle for transporting one load it is worth no more to the traffic official than a car of lighter construction which weighs only 35,000 lb. The traffic man does not want to take the credit for the deadweight tonnage of the cars in which the traffic is moved, and, furthermore, he is not responsible for the construction of the cars except as he may suggest the kind of equipment needed to handle the business of the railroad. I think traffic expenses should be based on gross earnings.

Accounting for maintenance of equipment on the basis of gross tonnage would not throw any light on the situation except as to the locomotives, and I agree with you that this would be a more definite basis than mileage.

In the matter of less-than-carload traffic, it so happens that the gross earnings of the Erie Railroad for the first four months of 1921 on less-than-carload traffic amounted to 8 per cent of the total freight earnings; this is lower than it was before 1919, for the reason that in 1919 the Commission changed the method of reporting merchandise freight and threw into the carload column all cars loaded with as much as 10,000 lb., although under the rates and classification the railroads continued to load and unload traffic moving at less-than-carload rates regardless of the quantity. In other words, they continued to incur the extra expense of handling carload traffic in spite of the change in accounting.

In round figures the average freight rate per ton of the

carload traffic handled over the Erie Railroad for the first four months of 1921 was \$2.50, while the average earnings per ton on less-than-carload traffic amounted to \$8.27 for the same period. Assuming that the cost of loading and unloading a ton of freight at point of origin and at destination is \$2.00 each or a total of \$4.00, we have as a comparable figure with the carload tonnage a return of \$4.27 which is nearly twice as much as the rate per ton earned on carload traffic.

The Erie Railroad claims on less-than-carload traffic, with the exception of one or two items such as boots and shoes and tobacco, are not as great proportionately as on a large volume of carload traffic, such as fresh fruits and vegetables, packing house products and fresh meats and on live stock.

The Erie Railroad has definitely taken the position that the so-called short haul l.c.l. traffic, that is to say within a radius of 25 miles of the distributing centers, should be handled by motor trucks or some other system of delivery than the steam railroad. However, the greater responsibility of the steam railroad, as compared with some of the trucks which offer their services, is such that the traffic is forced upon the railroad without solicitation and without any desire to handle it.

As to the car loading of merchandise traffic, it must be remembered that very frequently the cars if not loaded with merchandise would move empty so that quite a substantial portion of the l.c.l. business outside of the 25-mile radius is handled at the lowest cost from a transportation standpoint.

The "sailing day" plan which was so designated during the war was not a new plan but a new phrase was adopted which excited a great amount of prejudice on the part of shippers and was subsequently abandoned. The modern plan, which is in vogue on the Erie Railroad, is to establish certain transfer stations in which all the merchandise is centered, and after being separated according to destination is loaded into solid merchandise cars which are run through from the transfer station to final distributing point.

Not all merchandise traffic is profitable and some of the railroad officials contend that very little is profitable, but that does not permit the carrier to completely ignore the business.

Although in the first four months of 1921 the merchandise tonnage as classified by the Interstate Commission amounted to 2.6 per cent of the tonnage, the revenue amounted to nearly \$2,500,000, or nearly \$1,000,000 gross revenue from each per cent of tonnage. The only other item that equals this is animals and products of animals, on which the rate per ton is slightly in excess of the rate per ton on merchandise, largely because of the longer haul.

T. C. POWELL,  
Vice President, Erie Railroad.

### The Status of the Chief Clerk

TO THE EDITOR:

Commenting on my discussion of the status of the chief clerk, which appeared in *Railway Age* of July 23, page 159, I note in your issue of August 6 an interesting letter signed "Operating Officer" in which the writer advocates the personal handling of more of their own work by railroad officers and says that "to give the chief clerk greater recognition and a definite position in the organization would simply tend to perpetuate and increase what is already one of our greatest weaknesses." He also calls attention to the "limited outdoor experience" of the average chief clerk and asserts that the latter often overrules the recommendations of officers of lower rank than the officer represented by the chief clerk. This operating officer thinks my contentions are reasonable

under the conditions as they exist on the railroads today, but thinks the conditions should be changed.

All the authority that exists or is exercised on the railroads is delegated. It originates, theoretically at least, with the stockholders who are not on the railroad at all, and is delegated by them to the board of directors, who delegate to the president such authority as they think he should have, and so on down the line. Even the section foreman's authority is delegated or relayed to him from the stockholders through a long line of officers.

Nothing but necessity justifies the delegation of duties and responsibilities by anybody but it is a physical impossibility for the average railroad officer to give his personal attention to all his business. He therefore attends personally to as many of the more important matters as the limitations of time will permit. An officer who does not learn to depend on his organization in a general way never gets to the top. The most ignominious failure I ever witnessed was that of a superintendent of motive power on a certain large road, with six or seven divisions in his district, who earnestly endeavored to supervise personally everything that was done in his territory. He had unlimited ambition and enthusiasm and his vitality was remarkable. He worked about 18 hours a day for two or three years but his system was hopeless. The huge number of details with which he struggled single-handed had completely buried him long before he lost his position. His inability to delegate duties and responsibilities was fatal.

When an officer must delegate duties, to whom should they be delegated? Custom makes the chief clerk the recipient in a large measure. If anybody else is better qualified to assume these delegated duties, that person, instead of the chief clerk, should be the recipient; but the chief clerk, by reason of his position, is in close touch with conditions and events and understands the situation better than anybody else excepting the officer he represents. Therefore a multitude of important duties are invariably delegated to him but the recognition that should go with them is withheld.

As to our limited outdoor experience, which is cheerfully admitted, I respectfully submit that the operation of the railroads nowadays is by no means an outdoor problem exclusively. The indoor work that is indispensable represents a large percentage of the total effort required. To be quite frank, how much more does the average officer know about office work than the average chief clerk knows about outdoor work? It is practically impossible for any man to know every phase of railroad work and this fact should not militate against the chief clerk more seriously than against anybody else.

I do not advocate the writing of caustic letters by chief clerks—nor by anybody else. The effect of such letters is nearly always bad. Harmony should be the watchword on the railroads and elsewhere. If the performance of an employee is such that it fails to preserve or promote harmony by promoting the welfare of the railroad, take him off the payroll, but do it pleasantly. The best officers rarely resort to rough tactics.

There is no good reason why the officer in charge should not see a copy of every letter that the chief clerk writes. It has been my practice for years to place on the desk of the officer in charge, each morning, a reading file consisting of carbon copies of all letters written in our office on the previous day. A minimum of his time is required to read these copies and if he finds anything objectionable, necessary action is taken immediately. It would be very indiscreet for me to dictate offensive letters or issue instructions on matters I do not understand, knowing that he would see copies of such letters a few hours after they were written. But his time is valuable and it is my obvious duty to handle as much of the correspondence as I can handle properly so that the maximum amount of his time may be available for his nu-

merous other duties. On my ability to do this and other important work intelligently, I base my claim for recognition, pecuniary and otherwise.

We make mistakes. Everybody does. The chief clerks are far from claiming infallibility but if I should overrule a recommendation of an officer subordinate to my chief and such subordinate officer is confident that I have made a mistake, what prevents his taking the question up with my chief, either orally or by personal letter? I can think of nothing besides a possible suspicion that my chief might have directed me to take that very action. This is really beside the question, however, as the right kind of chief clerk does not approve nor disapprove recommendations of subordinate officers without consulting the officer in charge unless such recommendations involve the violation of rigid instructions from higher officers.

The editorial in the *Railway Age* of July 23 which recites that in the lists of officers of the railways of Great Britain the name of the chief clerk follows that of the officer encourages me to hope that we shall yet be accorded, in this country, the recognition to which I believe we are entitled. Our salaries cannot be compared with the salaries of others on the railroads handling work of equal and less importance and we get no public recognition whatever. We do not ask for a definite place in the organization for we have that—the closest and most confidential relationship with the officers with whom we work. Where is the officer who fails to appreciate the value of a good chief clerk, whether the one he has is good or poor? Why is the chief clerk destined to be appreciated only in private and paid only 50 to 75 per cent of what he is worth to the railroad? I have been asking myself these questions for years. Does anybody know the answers? •

CHIEF CLERK.

GOOD BRAKES are as important as a good motor. "The subway trains of the Interborough Rapid Transit Company (New York), running at full speed, can stop in less than half the distance ordinarily required by the best steam railroad express trains."—*Subway Sun*.

SEVENTY-FOOT mail storage cars having become common, the Postmaster General and the Railway Mail Pay Committee (representing the railroads) have petitioned the Interstate Commerce Commission to approve the use of such cars at a pro rata increase over the rate prescribed for 60-foot cars.

A Derailment in France Caused by Train Wreckers

# Pennsylvania Challenges Authority of Labor Board

Denies Right of Board to Regulate Working Conditions—Has  
Agreed with Two-thirds of Its Men

THE PENNSYLVANIA RAILROAD, on Wednesday, August 24, made answer to the recent order of the United States Railroad Labor Board, in which answer the road declares that the company has a lawful right under the Transportation Act to establish rules and working conditions with its employees, and that the contracts entered into by the management and its employees are now in full force and effect; and it asks the board to "set aside and vacate" its recent decision in the case of the Shop Crafts Union. The railroad declares that:

The Board has no right and power to prescribe principles to govern the railroad and its employees in the making of agreements covering rules and working conditions;

The Board has no power to prescribe an election or any other method by which the railroad may ascertain who are the authorized representatives of its employees;

The Board has no power to compel a conference or to prescribe what representatives of employees the railroad shall confer with; Since the termination of federal control the railroad has endeavored to re-establish with its own employees a contented and harmonious relationship and has offered all classes of employees a voice in matters affecting their welfare through employee representatives of their own selection, whether union or non-union men;

Approximately two-thirds of the employees who are interested in and affected by rules covering working conditions have by vote or otherwise expressed a desire to negotiate rules and working conditions through employee representatives;

Contracts have been entered into between the management and representatives of approximately 150,000 employees;

Since the Board's decision, representatives of the various classes of employees with whom contracts have been made have expressed their satisfaction, not only with the manner of selecting representatives, but also with the rules and working conditions agreed upon;

If the railroad complied with the labor board's decision these contracts would be void "to the great and irreparable injury of the carrier and its employees."

The railroad's application to the labor board follows:

1.—The carrier renews its objections to the jurisdiction which were urged upon the hearing of this cause, and it avers that the board had no power or authority in law (a) to extend the National agreements and (b) after extension and the order of termination as of July 1, 1921, to decide without a hearing on June 27, 1921, upon a further extension. The carrier avers that the National Agreements are as to it and its employees wholly terminated and of no force and effect.

2.—The carrier denies the right and power of the board to prescribe principles, which must in law govern the carrier and its employees in the making of agreements covering working rules and conditions. Notwithstanding this, the carrier has endeavored in negotiations with its employees to adopt and observe such of the said principles as are fundamentally sound and correct.

3.—The carrier notes that the board in this cause decides that it "acquired such jurisdiction" but it declares that "that question is not of prime importance in this case." The board also states, "There is no question of the closed or open shop involved in this dispute and no other real matter of principle. The question involved is merely one of procedure." With these propositions the carrier takes direct issue. If the question is merely one of procedure, the carrier avers that the board has no right or power to set up its judgment or opinion against that of the carrier. Dissatisfaction, whether real or fancied, by certain employees with matters of "mere procedure" should not be tortured into a "dispute" within the purview of Sections 301 and 307 of the Trans-

portation Act. No fear need be entertained of "interruption to the operation of any carrier" because of differences between carrier and employees upon questions of "mere procedure." Disputes under the law, referable to the board, are those of substance and real moment. Reduction of wages, real grievances, unfair, unreasonable, burdensome working rules and conditions are the matters comprehended by the Transportation Act as prolific of "disputes" which might interrupt transportation, to prevent which the Labor Board was created.

4.—The carrier denies the power of the board to prescribe an election, or any other method, by which the carrier may ascertain who are the authorized representatives of its employees; and it avers that it cannot accept as advisory the rules and conditions set forth in the board's decision in this cause. The carrier will, as the occasion requires, accord franchise rights only to its employees in service, or absent upon leave, and will not concede voting qualifications to men who have been laid off or furloughed and who may be engaged in other occupations, or may never return to the service of the carrier. The carrier denies the power of the board to compel a conference or to prescribe what representatives of employees it shall confer with, and it can not accede to the rule prescribed for ascertaining the representative capacity of the spokesmen for unorganized employees.

5.—The carrier states that it has been its policy, since the termination of Federal control, to re-establish with its own employees a contented and harmonious relationship, ever bearing in mind that honest, efficient and economical operation of its lines can be secured only by close and unrestricted co-operation by the management and the employees. With that end in view, it was determined that all classes of employees should have a voice in the administration of matters affecting their welfare, through representatives of their own selection, and that such representatives, whether union or non-union men, should be actual employees. In pursuance of this policy, conferences were held with representatives, duly authorized and designated by the employees in the several crafts.

There are in the service of the carrier at this time approximately 176,000 employees who are interested in and affected by rules covering working conditions, and 117,176 or 66.5 per cent of said employees have by vote or otherwise, as a result of said conferences, expressed a desire to negotiate rules and working conditions through employee representatives. Accordingly, contracts respecting rules and working conditions have been entered into between the carrier and representatives of 149,918 employees, apportioned among the several classes, as follows:

Train and engine service employees.....	41,366
Clerks and other office, station, storeroom, warehouse, and elevator forces, including engine and train crew callies.....	39,598
Maintenance of way and structures and shop laborers.....	40,509
Mechanics, helpers and apprentices, maintenance of equipment and telegraph and telephone.....	24,078
Signal department employees.....	2,061
Marine department employees.....	1,544
Dining car and restaurant employees.....	1,522
	149,918

6.—Since the decision in this cause, the carrier has held conferences with representatives of the several crafts with whom contracts have been made, for the purpose of ascertaining whether or not in the light of the said decision, said employees were satisfied with the manner of selecting representatives and with the rules and working conditions actually agreed to; and as a result of said conferences, the

said employees, through their representatives, manifested their satisfaction not only with the manner of selecting representatives but also with the rules and working conditions embodied in said agreements.

On August 22, a general conference was held with representatives of employees who had been selected by ballot in accordance with the plan of election submitted by the carrier after the publication of the board's decision No. 119. To this conference at least 250 representatives of System Federation 90, of the American Federation of Labor, employed by the carrier, were invited, but, acting under the instructions of the president of System Federation 90, but few of such representatives attended the conference.

In this connection it may be stated that many of said employee representatives are union men, and in the case of several crafts the entire delegation of elected representatives consists of union men. At this conference the employee representatives again signified their approval of and their satisfaction with the plans and purposes of the management and the contracts which had been duly executed.

7.—The carrier states that the contracts between itself and its employees are in full force and effect, and by their terms the parties thereto have acquired mutual rights and assumed mutual obligations; and that if the carrier complied with the decision of the board in this cause, the said contracts will be void and of no effect, to the great and irreparable injury of the carrier and its employees, parties to the said contracts.

8.—The carrier represents to the board that the rights of the employees who are not parties to the said contracts and who do not want to be bound thereby have not been impaired in any manner, for the reason that they may at any time invoke the aid of the board, if they are of opinion that the rules and working conditions contained in the said contracts, now in effect upon the carrier's lines of railroad, are unfair and unreasonable.

9.—Wherefore, the carrier asks that the board vacate and set aside its decision in this cause and find, in pursuance of the Transportation Act (a) that the carrier has the lawful right to establish rules and working conditions in the first instance, either with or without first holding conferences with its employees; and (b) that the contracts respecting rules and working conditions heretofore entered into by the carrier and its employees in the shop crafts are now in full force and effect, without any further action on the part of the carrier and its employees in the said shop crafts.

10.—The carrier hereby makes request of the board for an oral hearing of this application, at which time evidence in support of these allegations of fact will be introduced.

## Block Signal Mileage on January 1, 1921

THE INTERSTATE COMMERCE COMMISSION has issued its annual statement of the block signal mileage of the railroads of the United States, showing, for the whole country on January 1, 1921, a total of 101,883.6 miles of road; this varies less than one mile from the total recorded one year before. The totals are:

	Miles of Road		
	Automatic	Manual	Total
1921 .....	38,543.9	63,339.7	101,883.6
1920 .....	37,968.8	63,915.4	101,884.2
	Inc. 575.1	Dec. 575.7	Dec. 0.6

This change, however, is not quite so simple as it appears. In a number of cases automatic signals have been installed in the place of manual signals and the increase under one head exactly equals the decrease under the other; but that such is not the case in the majority of the items is evident from the following brief statement of notable changes in 1920:

NOTABLE CHANGES IN 1920 (MILES OF ROAD)

Name of Road	Increase		Decrease, n auto-matic
	Automatic	Nonauto-matic	
Atchison, Topeka & Santa Fe .....	29.1	.....	.....
Baltimore & Ohio .....	25.0	.....	20.1
Boston & Maine .....	.....	32.4	.....
Chicago, Burlington & Quincy .....	215.1	.....	216.8
Detroit United .....	1.5	326.7	.....
Grand Trunk .....	10.1	131.3	.....
Missouri, Kansas & Texas; Missouri, Kansas & Texas of Texas; and Wichita Falls & Northwestern .....	93.3	.....	2.7
New York, New Haven & Hartford .....	1.2	19.2	.....
Northern Pacific .....	126.8	.....	4.5
Pennsylvania .....	42.5	.....	45.7
Pere Marquette .....	32.2	.....	.....
Richmond, Fredericksburg & Potomac .....	32.2	.....	.....
Southern Pacific .....	.....	139.0	129.6
Texas & Pacific .....	.....	.....	.....

The totals of these columns are 609.0 and 648.6 increases (total 1255.6), and 419.4 decrease. This makes a net increase of 836.2 miles. The increase in automatic mileage alone is 33.9 miles greater than the net increase shown in the first comparison. There are, however, numerous increases small in amount, to be added to this, and no less than 144 miles decrease in automatics. There is no clear evidence that this indicates the actual discontinuance of any automatic signals; some or all of the items may represent errors in reporting, in one year or the other. Some of these decreases are: C. M. & St. P., 5 miles; Chicago, R. I. & P., 12 miles; C. St. P. M. & O., 4 miles; Empire State Railroad Corporation, 7 miles; Illinois Central, 7 miles; Mahoning & Shenango Railway & Lighting Company, 37 miles; Portland, 38 miles; Washington Southern, 32 miles. The last three names do not appear in the report for 1921.

All of the final totals of the tables issued by the Commission are vitiated by the inclusion of several hundred miles of road twice (or in some cases three times) where long sections are operated jointly. These duplications aggregate, as near as we can make out, 731.9 miles of road.

The net total length of road equipped with automatic block signals seems to be 38,108 miles. This figure is the one of most immediate interest, in any study of progress, for the reason that the non-automatic block system is operated under such varying rules and often applies to such a small part of the trains that no measure of the value of the system is practicable without a study of the train movements and of the volume of traffic.

In the Commission's Table No. 1 the number of items in which a road is recorded as operating all of its passenger lines under the block system is 57, as compared with 74 items on January 1, 1920; but here, again, the retrogression in many cases is more apparent than real. Part of the discrepancy is due to consolidation of items, as where the Chicago, Milwaukee & St. Paul is reduced from five lines to two lines. Some of the changes are small, as the Baltimore & Ohio (eastern lines) from 100 per cent to 98.1 per cent, indicating, perhaps, a correction of clerical errors.

Seven roads report automatic train stops in use, the Chicago, Rock Island & Pacific (22 miles, double track) being added to the six roads published one year previously.

Different kinds of automatic signals in use are reported in table No. 2, as usual. The length of roads signaled by electro-gas signals is 80 miles less than in 1920. The Pennsylvania reports 103 miles of road signaled with position-light signals. The electric train staff is in service on 382 miles of road, 79 miles less than in 1920. The Louisville & Nashville in 1920 reported 68 miles; this year, nothing.

The report gives the usual data concerning methods and apparatus used with the manual block system; practices in connection with block signaling on manually operated lines, etc., and concerning the use of alternating currents, electric lights, etc., in connection with automatic block signals. Automatic block signals are electrically lighted on 8,153 miles of road, 442 miles more than shown in the preceding report. The telephone is used for train orders on 122,022 miles of road, 2,868 miles more than on January 1, 1920.

# The War and Its Effect on French Railway Labor

War Time Increases in Pay Not Great—Railways' Extensive Housing Projects—Co-operative Buying

By Oliver F. Allen

Formerly Major of Engineers, American Expeditionary Force

WHEN FIRST INVESTIGATING the availability of existing manufacturing plants in France as aides to the work of the American army engineers, the writer was surprised to find in a large railway shop at Tours in February, 1918, practically the normal number of apprentices learning their trades just as diligently as if there were no war. It is true that their course was shortened to allow them to start productive work sooner than in the ordinary course but it was, nevertheless, very complete. The managements of the railways realized that trained young men would be needed after the war even more urgently than before. Just as soon as they had a chance to catch their breath after the armistice, railway officers began to study the expansion of their training courses, and at least one of their prominent engineers came to America in 1920 to study intimately our trade schools and apprentice courses.

In the same railway shop at Tours inquiry was made as

mulgated for each department (which corresponds to a state in this country), and in some instances for smaller areas, such as large cities, and posted conspicuously so that working men and women as well as proprietors had free access to them. This protected the working people against underpayment for their work, but its great protection was in guarding the families of men at the front against profiteering not only by the employers of labor but by some workers who stayed at home and sometimes tried to take advantage of the situation for their own greater profit.

In a particular case the local conditions about an American engineering shop were such that some of the employees in a French factory in the same town were disposed to leave it and seek employment with the Americans. As the French factory was manufacturing pumping machinery needed for the water supply of both the French and American armies it was just as important that its production should continue

Plan of the Industrial Community at Roye, Showing Community Features

to migration of workers in quest of different working conditions or higher pay. It was surprising to learn that while the entire plant had the appearance of peace time operation with everyone in civilian clothes it was actually on a military basis. A workman who quit his job in a French railway or other shop doing work essential to the armies during the war was treated as a deserter. When the American engineers established some manufacturing plants for which civilian labor was sought the advantages of this protection was very helpful to the services of supply. The pay for different classes of work throughout the country was standardized and was made the subject of official decrees posted in every community. The base wage was the same throughout the country. It was augmented in certain localities by a surcharge or bonus where essential things cost more at retail than the prices on which base wages were computed. Complete tabulations of the classifications and the base wages and surcharges were pro-

vided for each department (which corresponds to a state in this country), and in some instances for smaller areas, such as large cities, and posted conspicuously so that working men and women as well as proprietors had free access to them. This protected the working people against underpayment for their work, but its great protection was in guarding the families of men at the front against profiteering not only by the employers of labor but by some workers who stayed at home and sometimes tried to take advantage of the situation for their own greater profit.

## French Soldiers Worked While on Leave

The French working man and working woman, realizing that they were all getting a square deal, not only did not fight against this regulation of wages and practical dictatorship over industry during the war, but helped wherever pos-

sible in carrying on the work behind the lines. It would be difficult to imagine the average American soldier as working while on leave, but the majority of the French "poilus" worked ten days out of their fourteen day leaves. So general was this custom that at least one American engineering shop recruited a large part of its civilian employees from French soldiers on leave. Several French merchants and factory managers have told the writer that their businesses were carried on throughout the war largely by their old employees while back on leave.

While the Boches were at the very gates of Paris, and the mass of the people did not know if France could hold on until the Americans arrived, the French railways, as well as other industries, did not simply plan for repairs and the replacement of things destroyed by the war, but made a comprehensive program of extensions and betterments co-ordinating with the anticipated renaissance of French industry and commerce. The items in this program were arranged to be carried out in the order of their importance.

### French Railways a Part of the Army

In organizing the special engineering regiments of the American army, such as those for the railway service, an attempt was made to find both officers and men with experience in the special line of work which the regiment was to do with the army. The French were able to go further. Their extensive military railway engineering organization was largely their peace time railway personnel in uniform operating as military units. Frequently both officers and men were doing substantially what they had done as civilians. The close relations existing between government departments and the railway organizations, the military control of railway

readjusting wages. The pay for common labor went up automatically and that of some higher officers was also raised, but the great intermediate group, the station agents, foremen, more important members of the operating and maintenance crews and the engineers and clerks of the central offices have found the recovery of a pre-war balance between

Front Elevation.

Exterior of Four-Family Houses at Tergnier

income and expenses very slow. Such increases in rates of wages as occurred, either during the war or soon after the railways were freed from military control, were approximately commensurate with the actual higher cost of living and not the result of unrestrained greedy demands. The management, therefore, had the advantage of relatively lower

Ground Floor Plan.

Second Floor Plan.

Floor Plan of Four-Family Houses at Tergnier

operations and this personal element combined not only to facilitate the development of comprehensive plans for reconstruction, but to make the carrying out of those plans thoroughly understood and co-operated in by all.

### Wage Increases Comparatively Small

During the war the pay of railway employees who were kept on a peace time basis, mostly in those parts of the country away from the fighting areas, was either not increased at all or but little compared with the increased cost of living. Those who were in active military service also suffered actual diminution of income. In the first year after the armistice the railway management was perhaps a little too slow in

labor costs than our American railways when returned to private ownership.

Labor turnover has not been as great and with the keeping up of the training of young men the French railroads are perhaps in a better position as to personnel today than the American in spite of their far greater losses due to over four years of the hardest fighting. While there have been a few serious labor disturbances on the French railways since the armistice there has been very little loss of time or waste of energy.

During this period of readjustment there have, naturally, been a few agitators, but they have been discredited by the railway workers themselves. There have been some honest

differences of opinion between the workers and the management as to hours of labor and rates of pay. There has been the real problem of adjusting wages to the actual high cost of living, and sometimes these differences have not been adjusted as quickly as the financial embarrassment of the workers made them feel that it should have been done. Some Frenchmen feel that if the management had recognized the actual needs of the mass of their most efficient and most

French railway personnel has been of the highest order.

The chief difference between the French and American labor troubles since the armistice has perhaps been in the underlying causes. In France it has been mostly a question of real economic requirements and a cry for return to the old purchasing power of income. There has been almost no question of change in relations between the employee and the management nor of trade unionism. There has also been

Living Quarters of Railway Employees Just After the War

Army Huts Utilized as Homes, Market at Lens Before Reconstruction and Temporary Settlement at Tergier Before Permanent Homes Were Started

valuable personnel, those between the classes of the common laborers and the officers, those who were most loyal and did most to keep the wheels going during the war, there would not have been any serious strikes and those same employees would now feel more interest in and affection for their work than they do now. The slowness in recognizing crying needs has sown some seeds of discontent, even in a remarkably loyal and faithful group. Both throughout the war and since the armistice, the loyalty and fine workmanlike spirit of the

little evidence of political propaganda of any kind. Not having accustomed themselves to an extravagant way of living there is little of the trouble which follows contraction of inflated expenditures caused by profiteering incomes.

The terrible losses in killed and permanently injured thinned the ranks of all industrial organizations. This has necessitated the breaking in of new men with consequent loss in efficiency. So many soldiers returned to civilian life thoroughly tired out and unused to normal occupations after

four years in the trenches that there has been some decrease in the output per man. It is doubtful, however, if the breaking in of new men due to war losses over there is any more serious than the breaking in of new men due to the great migration of labor in the United States, or if the loss in productive capacity due to war fatigue is as great as ours due to readjustments following our period of wild extravagance and munition profiteering.

### Efforts to Restore Pre-War Efficiency

Coincident with the study of improvement and expansion of facilities, the French railway managements have studied very carefully how to bring production per man-hour back up to pre-war practice, and what is equally important, how to simplify repair and upkeep operations and raise labor efficiency so as to enable it to exceed pre-war performance with the necessarily reduced personnel resulting from the war losses during the fewer working hours necessitated by the universal tendency to make the eight-hour day, with consequent three shift operation, an established fact.

During the first phase of the reconstruction when the devastated regions were occupied by the allied armies and bridges were being built and tracks laid by military engineers, the entire personnel lived like any other fighting soldiers. In the areas where the front line did not move very much in either direction as in the American Toul sector, there were many railway stations within ten miles of the Roche trenches and from there back to the Spanish frontier the railway personnel lived, as far as the existence of necessary houses permitted, very much as under peace time conditions and were frequently accompanied by their families. It is surprising how many French families continued practically at the front throughout the war, the women working and running the same risks of airplane bombing and long range shelling as the soldiers.

### New Housing for Railway Employees

After demobilization began and the railway personnel changed from their military to their railway uniforms they naturally wanted to change to normal peace time ways of living and have their families with them. A first step in this direction was the utilization of army barracks for temporary homes in the devastated regions. An accompanying illustration shows part of such a settlement on the line of the Northern Railway between Lens and Bethune in the summer of 1919.

While the first essential work was being done by the personnel living in army huts or in temporarily repaired buildings, arrangements were perfected for creating industrial communities which would provide comfortable and permanent homes for the necessary working forces. Due to the necessity of quick action, the scarcity of skilled labor and of materials for construction, and to the fact that considerable lumber was available from army stocks, the first houses in these communities were wooden structures intended for temporary use for four or five years only, after which it is expected that they will be replaced by more permanent buildings. Practically all building done since the early part of 1920 has been of the permanent kind and almost exclusively of concrete. These houses are sometimes built of concrete blocks and sometimes of concrete moulded in place.

A typical industrial community is that at Tergnier. This development comprises 1,400 houses, of which 1,000 have been completed. This community is to serve the transfer yards and shops at Tergnier in the Aisne Valley between Soissons and St. Quentin where lines from Dunkirk, Calais and other channel ports going by way of Amiens meet lines from Belgium going by St. Quentin to Paris and to the south and east by way of Soissons and Laon. Plans of typical houses are also shown in the illustrations. Attention is called to the location of practically every house in the center of a substantial lot midway between streets and with abundant

open space about it. The houses are mostly of the four-family type, each part opening in a different direction.

A little further east on the national highway from Amiens to Paris, in the department of the Somme near Montdidier, is another settlement at Roye, a map of which is shown in one of the accompanying illustrations. This is a smaller community than Tergnier, but the map shows clearly the community features and the careful planning which characterize all of these plans. These community features include a public market, a general assembly hall, or community house as we would call it, and a large athletic field with a race track, open air bowling courts and tennis courts. In the Roye settlement there is a separate section for bachelor's quarters, a large public square and quite a number of two and three-family houses as well as the four-family apartments. They are all on large lots and so situated as to give the maximum of light and air and the minimum appearance of set regularity which makes so many industrial communities drab and depressing in appearance.

The Northern Railway is building many of these industrial communities including one for the Dunkirk-Couderkerque improvement, described in the *Railway Age* of June 3 (page 1265).

They all present a very artistic appearance, the houses are spacious and the rooms have an abundance of light and air. There is a lack of bath rooms surprising from an American point of view, but the Europeans patronize the public baths a great deal more than we do. Each apartment is equipped with running water, gas and electricity. The use of gas for cooking and electricity for lighting is becoming almost universal even among families of comparatively poor people. Fireplaces which have almost disappeared from American homes are being retained, and every family will have a small garden and a cellar in which to store its supplies.

### Co-operative Buying

The industrial communities being built in the devastated regions of the north will cost not less than 200,000,000 francs (\$40,000,000 at normal exchange). To assist the employees in re-establishing themselves without waste of money, the company has in practically every case procured furniture, food and clothing at low prices on a very large scale and furnished all such supplies to the families moving into these settlements.

The purchase of food and clothing on a co-operative basis, either by associations of employees on a purely mutual basis or by the employer without profit is by no means a new development in French industrial life. It is being done not only because of conditions arising during the period of reconstruction, for many French industries have had service of this kind for many years. When the employees of several factories are grouped, as is sometimes done, their combined purchasing power becomes very great and they buy at lowest prices. The service rendered by such co-operatives is so universal that they are able to make regular deliveries. Such an organization in Paris, for instance, furnishes each employee with an order book, has regular collection boxes and a system for getting the orders promptly to headquarters and delivers once or twice a week to all parts of the city and suburbs. Here again we have an illustration of an effective means of combating the high cost of living.

Anyone who has seen the personnel of the French railways actually doing their reconstruction work cannot help remarking on the wonderful spirit of co-operation and determination which is being shown by all. They are all not only trying to help in the rebuilding of France by putting their railroad systems in the best possible condition in the least possible time, but they are working to re-establish a comprehensive railway system in which will be combined first class service to the public and reasonable returns with comfortable, happy living conditions for themselves and their families. It is a spirit which cannot help but win!

# Ford Has Not Wrought Miracle With D., T. & I.

Traffic in Flivvers and Auto Raw Materials as Well as Increased Divisions Real Reason for Expanded Earnings

**W**HEN IS FORD a manufacturer and when is he the chief executive of a public service corporation? Essentially, Mr. Ford is operating the D., T. & I. primarily as an adjunct to his factories and secondly as a common carrier. . . . The spectacular increases in earnings, both in gross and in net, are not the result of Mr. Ford's ability as a railroad traffic manager, but because Mr. Ford as a shipper, has diverted all of the raw materials and finished products to and from his factories over the D., T. & I. . . . This wonderful increase in earnings, therefore, is not the result of making two blades of grass grow where one grew before. It is merely a shifting of tonnage to the D., T. & I. from other roads." These are some of the thoughts expressed in an article in the New York Evening Post of Tuesday last by William J. Cunningham, the James J. Hill Professor of Transportation at Harvard University. Professor Cunningham takes issue with those who hold the view that Henry Ford has worked a miracle with the Detroit, Toledo & Ironton and shows that Ford has secured his improved results by methods not particularly new or original.

The improvements in the earnings of the Detroit, Toledo & Ironton which Ford has made since he acquired the road a little over a year ago have attracted almost as much attention in the press as tax reform or the tariff. The opinion has been expressed on many sides that he has effected a miracle in railway operation that should serve as a lesson or a model to other railway executives. His results have served as arguments for lower rates, higher wages and for suggestions in some quarters that the railroads of the country be turned over to Ford to operate.

On the other hand, this expression of opinion has been met with assertions, of which Professor Cunningham's is one, that Henry Ford has worked no miracle, but that on the contrary he is merely making the D., T. & I. a plant facility and by putting on its rails the enormous traffic of the Ford industries, he is naturally getting different results than were secured when the road was without such traffic. So far is one writer from agreeing that Ford is a miracle man, that he says:

"Railroad men see in Mr. Ford's apparent success in transportation merely the result of his ability to obtain return tonnage on an extremely favorable basis from really great railroads and make his small line show a profit. It is even suggested that sooner or later this question will be investigated with a view to determine whether Mr. Ford has not discovered an ingenious method for evading the transportation laws regarding rebates."

There are given below abstracts of several of the articles which have been written on this subject. First is the article by Professor Cunningham which appeared in the New York Evening Post of August 23. There is also an interview with J. A. Gordon, the former president of the D., T. & I. which appeared in the Wall Street Journal of Wednesday morning.

Expressing rather the idea that Ford has effected a revolution in railway transportation is an article which appeared in the New York Times of August 14, entitled, "Ford's Revolutionary Railroadings," by H. E. Hoagland, Professor of Transportation at Ohio State University. In conclusion, there is given a transcript of an article which appeared on August 27 in the Review, a journal published by the New York brokerage firm of W. J. Wollman & Company.

## Ford Not a Miracle Man as Railroad Operator

W. J. Cunningham in the New York Evening Post

The public appears to be quite willing to believe the press reports which tell of the magical results achieved when the Detroit manufacturer waved his wand over his 400-mile "streak of rust." Deficits have been turned into surpluses, rates have been cut, wages have been increased.

Mr. Ford is said to have dismissed a large part of the railroad trained officials and to have turned over the operation to manufacturing, engineering, and merchandising experts who are successful mainly because they know little of orthodox railroad methods and therefore "have nothing to unlearn." Mr. Ford, then, is credited with "showing up" the railroad managers and of exposing their inefficiency. In some way not clearly explained he has pushed railroad labor leaders off the plank by paying the Ford factory wage scale, by scrapping the national agreements, and by getting eight hours' work for every eight hours' pay.

### Misinterpretation of Facts

In whatever degree these things have been actually accomplished, they are noteworthy, and to Mr. Ford and his lieutenants should go the credit for that part of the achievements which are the result of a superior quality of management. Mr. Ford has made a wonderful record in his own field and undoubtedly can bring to railroad operation ideas which will increase efficiency. The achievements on the D., T. & I., however, are attributable mainly to influences wholly apart from the efficiency of management. The tendency of the writers of the press articles, who in the main are not qualified to pass judgment upon or to interpret results of railroad administration, is to credit everything to the genius of Ford and to make no allowance for the natural operation of economic laws under changed conditions. They have been more anxious to get good stories than to weigh the facts or to go behind the returns.

As a matter of fact the explanation of the extraordinary change on the D., T. & I. is extremely simple; so simple that its telling spoils the story. Before Mr. Ford bought the railroad it could not pay its charges because it could not get traffic. The traffic went to roads which were more advantageously situated and had better service. With the change in ownership came the immense traffic of the Ford Company, millions of tons per year.

### Diversion of Traffic

This increase in business on the D., T. & I. changed the situation almost over night. The spectacular increases in earnings, both in gross and in net, are not the result of Mr. Ford's ability as a railroad traffic manager, but because Mr. Ford, as a shipper, has diverted all of the raw materials and finished products to and from his factories over the D., T. & I., and in addition to that he is securing for that road a large part of the unrouted traffic consigned to other than the Ford Company. He is able to do that by making traffic agreements with other roads that will bind them, in return for the favor of receiving Ford's business from the D., T. & I. to hand to the D., T. & I. all of the unrouted freight in the opposite direction.

This wonderful increase in earnings, therefore, is not the result of making two blades of grass grow where one grew before. It is merely a shifting of tonnage to the D., T. & I. from other roads. These roads, already struggling under the

handicap of reduced business because of the general depression, are that much further embarrassed. This point should be noted by those who acclaim Mr. Ford as the Moses to lead the railroads out of the wilderness. His magic would disappear if his operations were extended. If, as has been seriously suggested, the railroads should again be commandeered by the government and turned over to Mr. Ford as Director General of Railroads, the tonnage to and from his plants now bolstering up the showing of one small road could not be used to serve similar purposes elsewhere. The gain on the D., T. & I. would be offset by the losses suffered by the roads from which the shipments had been diverted.

### No Magic in Results Achieved

It is unnecessary in this article to comment upon the effect of increased traffic on net earnings. Attention is called, however, to the fact that the D., T. & I. had been a road with unusually light traffic and the facilities, although below those of competitors, were adequate to take care of many additional trains. The new traffic which the Ford factories have thrown to it at the expense of other roads can easily be handled with no increase in overhead and with but relatively small increase in operating expenses.

Consequently, with such substantial increases in gross revenue the operating ratio is lowered and net income is earned instead of deficits. There is no magic about it. It is merely the working of the economic law of increasing returns. Any one of the many roads which are now only a few jumps ahead of the sheriff could pack up all of their financial troubles if presented with such increased tonnage.

Only those who have little conception of the effect of wholesale diversions of traffic will be misled by the press reports of Ford legerdemain in railroading. There is danger that the rejuvenation of the D., T. & I. may be regarded as merely the shadow of the personality of an industrial leader, and that similar leadership on all railroads would solve the whole railroad problem. No such delusion, however, is held by organized shippers.

### Reason for Ford's Success

Industrial traffic managers, always on the alert for arguments which will support their efforts for lower rates, are not using Mr. Ford's achievements as a text. Their position is clearly stated in an editorial in the August 6 issue of the Traffic World, their most influential publication. After reciting the facts already dealt with in this article, the editor closes with these words: "All there is to Henry Ford's railroad success is that as a shipper in the railroad business he is able to control his own and other traffic to such an extent that his line profits at the expense of other lines."

It is curious that so little thought is given to this phase of the subject. When is Ford a manufacturer and when is he the chief executive of a public service corporation? Why is it that the public apparently approves of Mr. Ford's control of a railroad when they would strongly object to similar domination of public service by the Steel Corporation, the oil companies, the packers, or the coal mining companies? Essentially Mr. Ford is operating the D., T. & I. primarily as an adjunct to his factories and secondarily as a common carrier. In technical terms he has transformed the D., T. & I. from a railroad into a plant facility. His railroad venture is a side issue in which the interests of the factories, rather than those of public service are dominant.

### An Interview with J. A. Gordon, Formerly President of the D., T. & I. From the Wall Street Journal

An inside light upon the means by which the Detroit, Toledo & Ironton has been able greatly to increase its gross and net earnings since Henry Ford bought control of it has

been obtained, says the Wall Street Journal, in its article Wednesday, from J. A. Gordon, former president of the road and its general manager under federal control. Mr. Gordon refused to take any part in the public discussion of Mr. Ford's railroading until it appeared that a serious injustice was being done to the executives of other roads and that the public was being misled. Mr. Gordon says:

"Today I read an item quoted from the New York World in which after commenting on D., T. & I. earnings for six months this remark was made: 'Perhaps the railroads need financial aid from the Government less than they need five or six Henry Fords to run them intelligently.' This article is unjust and harmful.

"It is said that Ford took four steel private cars from officials and converted them into coaches. The facts are that the D., T. & I. doesn't own a single steel passenger car; that there was but one official car—the 51—in service; that a car numbered 100 had, prior to 1918, been used by officials, but had been out of service for over three years and had been offered for sale.

### That Story of Junk Salvage

"It was stated in a Ford interview given the Detroit Times that Ford gathered up enough junk along the road to pay for it. Just before Ford secured control the old board had purchased 2,200 tons of new 85-pound rail. Ford then bought 10,000 tons of new steel rail. It was the scrap released by these purchases that produced the junk. Ford did retire 1,000 freight cars of 30-ton capacity and great age, also five or six light locomotives. Practically all of this old equipment had been set aside by the federal Administration as not worth repairing; but it was the equipment Ford purchased when he purchased the road. At that its value was less than \$150,000.

"One of the inferences to be drawn is that because Ford did some superior job of repairing an engine, he had been able to cut the time between Detroit and Baimbridge some two hours. Now the D., T. & I. passenger engines were mighty old and poor, but they didn't limit the speed. Track conditions imposed speed limits, for up to the fall of 1920 most of the 220 miles between Detroit and Springfield were laid in 60-pound rail which had been in service over 25 years and was fearfully bent and twisted.

### Where the Earnings Come From

"Coming now to the big thing, namely, that Ford has made a financial success of the road. His formula is not a secret one; it has been known to all railroad men for ages. It prescribes a volume of traffic up to a road's carrying capacity, especially high class carload traffic. Ford has that traffic en route to and from his own plants; he doesn't have to solicit it. While negotiations for the road were still in progress, I was asked by a Ford representative what I thought could be done with it. My reply was that much money would have to be spent to improve it physically and provide it with appropriate equipment so that patrons could rely upon its service; that it was valuable to Detroit as the only road coming in from the South which did not operate through the frequently congested Toledo terminals; that I was convinced it could be converted into a money maker even by other hands, but that so far as the Fords were concerned, they ran no risk at all, since they already had traffic enough of their own to make the road profitable.

"The Ford performance stands out all the more prominently right now because he has been able to double and treble the earnings by means of his own traffic at a time when all other lines are suffering a great diminution of traffic. But imagine, if you please, other railroads of the country enjoying such an increase in high class carload traffic! They would immediately wax so fat that a great reduction in freight rates would quickly ensue. The financial status of

all roads would be revolutionized just as Ford has revolutionized the status of the D., T. & I.

### Federal Control Benefits

"There were some incidentals besides which helped set the stage, as it were, for Ford's successful debut. Just previous to his taking over the road, 15 new engines and 300 new box cars had been purchased from the Railroad Administration. Something over half a million dollars had been expended during federal control on such additions and betterments as heavy rail, a new engine house and machine shop at Napoleon terminal, a coaling station at Jackson terminal, a large number of new shop tools, cinder pits at all terminals (previously there were none), a new 120-ton wrecking outfit, additional yard and passing track, an American ditcher, a Jordan spreader, a clamshell, snowplow, etc. These expenditures are now bearing fruit.

"Then the D., T. & I. was weak and had never been treated fairly by many of its connections in the matter of equitable division of through rates. Ford says: 'Come across with more favorable divisions or no Ford traffic for you,' and he secures the divisions.

"And so Henry Ford is making a profit out of the D., T. & I., and his possession of the traffic necessary to this result enables him to put before the I. C. C. what, at first glance to the unthinking, looks like a most plausible pretext for a reduction of freight rates. Obviously Ford has many millions more to gain out of reduced freight rates than out of any possible profit on the D., T. & I. Fortunately the Transportation Act deals with railroads as a whole or by groups, and it isn't at all likely that the I. C. C. will authorize a reduction at this time, because that body of experts must realize that D., T. & I. profit is at the expense of other roads from which the Ford Motor Company traffic was withdrawn.

"It would be a spectacle for the gods to see Ford struggling with the D., T. & I. if he had no traffic of his own to route over it!

### Scrapping the Older Employees

"It is self-evident that the same ownership control of vast traffic, which has turned the road into a money-maker, also puts Ford in a position to name a wage scale which other roads might find intolerable, and I wonder, therefore, if the Labor Board has taken cognizance of this, as the board should do under terms of the Transportation Act. Personally I think highly of the general policy of paying a liberal rate per day and eliminating the arbitrary and unfair conditions which have grown up in the railroad world. These conditions run into vast sums of money which might better be added, in part or in whole, to the daily rates. Most of the controversies between railroad employer and employee arise out of divergent constructions of the meaning of the working conditions prescribed in wage schedules. But I should hate to see railroads adopt the Ford policy of discarding without pension employees who have grown old and who have worn out their lives in faithful service merely because it was possible to obtain younger and huskier men who could do a bigger day's work. This may be efficiency, but Lord save the industrial world from such efficiency!

### Ford's Revolutionary Railroad

H. E. Hoagland in the New York Times

A look at the map indicates some of the possibilities of the D., T. & I. in the hands of those who can develop them. At the southern end it connects with the Chesapeake & Ohio and through the Big Sandy division of the latter with the Carolina, Clinchfield & Ohio. This gives a fairly direct route from Detroit to the Southeast and affords connections with the coal fields of West Virginia and Kentucky.

The D., T. & I. crosses every trunk line from St. Louis and Chicago to the East. This practically makes the Ford railroad one vast terminal through which coal and the steel products of the Pittsburgh district may move northward in exchange for the profitable traffic in the products of Michigan's and northern Ohio's factories, southward, eastward and westward bound. In a measure, at least, what has heretofore been considered one of the road's greatest sources of weakness—the absence of cities along its route—may, under the Ford control, be a source of great strength. The Toledo "bottle neck," for example, has been one of the first points of congested traffic whenever freight movements became heavy. The D., T. & I. main line avoids this congested area and makes connection with other roads at points less susceptible to concentration of cars.

For less than \$5,000,000 Mr. Ford and son bought the right to realize the possibilities of the above plan through the acquisition of title to the skeleton road called the Detroit, Toledo & Ironton. Already the needed rehabilitation is taking place. To this skeleton is being added the flesh of railroad construction in the form of more and better ballast, the substitution of 85 pound for 56 pound rails, the strengthening of bridges, the improvements of terminals, the reduction of grades, the improvements of shop facilities, and the construction of new mileage to give the road additional strategic connections.

Henry Ford became president of the D., T. & I. in March, 1921. In the short time that has elapsed since he assumed direct control, the changes effected have already become a favorite topic of discussion and conjecture in railroad circles.

### Increased Wages, Decreased Rates

At a time when wage decreases are the order of the day throughout all industry, the D., T. & I. has announced that the minimum wage of \$6 per day for eight hours—now famous in the plants of the Ford Motor Company—will be adhered to for railroad employees. This means a general increase for many classes of railroad labor.

The D., T. & I. has filed a new rate schedule, effective Aug. 20, 1921, calling for a flat decrease of 20 per cent on all rates local to its lines.

Meantime, the road is operating with an effectiveness unprecedented for this company and seldom approached by any company. The operating ratio for June, 1921—the latest figures available—was 53; that is, for every dollar of revenue collected the cost of operation and maintenance was only 53 cents. The corresponding ratio for June, 1920, was 117 and for June, 1919, it was 118.

How are these results being accomplished? The answer is really very simple.

One of Mr. Ford's first acts as president of the D., T. & I. was the dismissal of all but one of the officials and higher-up employees of the old regime. The dismissal was tempered by a bonus of two months' pay. Then he proceeded to turn over the operation of the road to men in the Ford Motor Company's organization. These men are not railroad men in the commonly accepted meaning of that term. And yet, to Mr. Ford, they are better than railroad men. Some of them possess two very decided advantages over the man who knows by long experience the routine work of railroad operation. In the first place, they have no such experience to "unlearn" in their efforts to find new methods; and second, for years they have been studying the weaknesses of existing railroad organization. They have been fortifying themselves against the mistakes of others and are profiting by this preparation. These are the men, imbued with the Ford spirit, who are revolutionizing railroad operation on the D., T. & I. The word revolutionizing has been used advisedly because nothing short of a complete upheaval in the operating plans of a road such as this could have produced in so short a time the results effected by its new organization.

It is in his relations to the employees that Mr. Ford has made the most radical changes in his railroad operation. He believes that a work day longer than eight hours is fundamentally wrong and that a form of industrial organization which supports it has no right to exist. This doctrine is particularly heretical in the railroad industry, where maximum days have been limited to sixteen hours only by the force of law and where much longer work periods were formerly common. In 1916 the railroad brotherhoods received an eight-hour basis of pay in the passage of the Adamson act. Mr. Ford believes that their actual working time should be limited to eight hours a day. As rapidly as possible he is reorganizing the operation of the D., T. & I. so that all employees, even the operators of trains, will have an eight-hour day. At present, where emergency work or difficulties in adjusting the running time of trains necessitate for any particular employee a day longer than eight hours, compensating time off is granted as soon as possible. No employee is permitted to work more than 208 hours a month.

### Full Eight Hours of Work

However, Mr. Ford's day is very materially different from the workday of considerable numbers of railroad employees. When he thinks of eight hours' work he has in mind not only the first two words of this phrase, but also the last. He believes that if the D., T. & I. pays for eight hours of the employee's time it is entitled to the application by the employee of the entire eight hours to the interests of the road. Two things are being done to make this possible—first, the operation of the road is being so organized that a man can do his stint in eight hours and that normally it will take him eight hours to do it; and, second, time-worn title distinctions are being discarded. An employee of the D., T. & I. is expected to work for the interests of the D., T. & I. If ordinarily he is a machinist, but the job at hand most pressing is window washing, he is expected to wash windows.

A corollary to the eight-hour day is the regular rest period, especially the American observance of Sunday. Mr. Ford believes that in this respect railroad operation can be conducted, for the most part, as factory operation. Already he has eliminated all shop, maintenance and office work on Sunday and has cut train operation to the bare necessity of movement of live stock and perishables.

Since the eight-hour day and the observance of Sunday as a rest period afford time for normal family life, Mr. Ford believes that all employees should receive a wage which will make possible the American conception of normal living. He has, therefore, extended to the operation of the D., T. & I. the \$6 a day minimum wage made famous in its application to the employees of the Ford Motor Company. This, of course, is only a minimum, gradations above this varying with duties and responsibilities.

Out of it all Mr. Ford has cut his force of railroad employees from 2,700 to 1,650 in the face of more traffic than the road has ever handled before. Nor are the economies in wages the only ones already effected. Damage claims have been materially reduced because freight is being handled more expeditiously and more carefully. This is shown also by the fact that the usual charge of about \$5,000 a month for clearing wreckage was reduced to \$2,200 in June, 1921. Stationery and printing bills have been more than cut in two. Fuel bills for yard locomotives show a decrease of one-third and for transportation locomotives over one-fifth from June, 1920, to June, 1921, in spite of the very great increase in ton-miles hauled. Even allowing for a decrease in unit costs of fuel, a satisfactory economy remains to be accounted for by more effective use of fuel.

For June, 1921, freight revenues amounted to \$686,355, an increase of \$319,079, or 87 per cent over June, 1920. Expenses for June, 1921, amounted to \$376,383, a decrease of \$102,543, or 21 per cent. In June, 1920, the deficit, after paying taxes and rents amounted to \$135,932; for

June, 1921, the corresponding figure was a net income of \$261,259. Meantime the cost of carrying one ton of freight one mile has been reduced one-third.

## Has Ford Discovered an Ingenuous Method of Rebating?

From W. J. Wollman & Co.'s Review

Practical railroad men have not been as ready as a credulous public to believe that Henry Ford has worked another miracle in the operation of the Detroit, Toledo & Ironton which he acquired about a year ago. Whatever may be conceded about Mr. Ford's success in the automobile business, even in extricating himself from his financial difficulties of last year, railroad experts insist that the stories of his achievement with his new railroad, if taken at their face value, read like the discovery of perpetual motion, or a device to make water run up hill.

For many years the Ford plants in and about Detroit have been served by an important alliance which includes the New York Central, Grand Trunk, Pere Marquette and Wabash, besides the Detroit, Toledo & Ironton. The business was distributed among these carriers with service satisfactory to the shipper. The Detroit, Toledo & Ironton was receiving the least of this tonnage, as it reached no important points. This latter road had been receiving cut divisions of the through rates on business interchanged with its connections, but this failed to yield sufficient revenue to sustain it. The methods of shipping raw materials to, and finished products from the Ford plant normally yield perhaps upward of 500 cars of freight per day.

Mr. Ford bought the D., T. & I. through a purchase of stock and adjustment mortgage bonds of that company. The road had outstanding \$7,628,000 of adjustment bonds, \$5,989,998 preferred and \$6,500,000 common stock in addition to \$2,254,000 of underlying bonds. Mr. Ford is said to have paid \$600 per \$1,000 adjustment bond, \$5 per share for preferred and \$1 per share for common stock. If Mr. Ford had acquired all of the adjustment bonds and stock, his investment would have been \$7,637,000 or \$17,300 per mile against an original capitalization of about \$50,700 per mile for the 411 miles of railroad.

### Meeting Ford's Demands

With the acquisition of the railroad, Mr. Ford concentrated the larger part of the tonnage movement on his new property. He exacted from connecting carriers percentages of division which the other railroads recognized as an excessive burden, but which was yielded by certain lines because the tonnage could be diverted elsewhere. The tariff on this freight has been estimated at \$22,000,000 a year.

Rates cannot be reduced by individual roads without disturbing the entire rate structure served by them but the increased carrier divisions which Mr. Ford has exacted have left the rates nominally undisturbed. However, these increased carrier divisions, which now aggregate over \$500,000 per month, are paid to a road which under normal traffic conditions would not receive them. The result is that the Detroit, Toledo & Ironton is receiving a revenue of about 100 per cent above what it would obtain under ordinary conditions for the service it performs, and out of all proportion to that received by its connecting carriers for similar service or similar hauling.

Railroad men see in Mr. Ford's apparent success in transportation merely the result of his ability to obtain return tonnage on an exceptionally favorable basis from really great railroads and make his small line show a profit. It is even suggested that sooner or later this question will be investigated with a view to determine whether or not Mr. Ford has not discovered an ingenious method for evading the transportation laws prohibiting rebates.

# Regulating Brake Cylinder Piston Travel

## A New Slack Adjuster for Freight and Passenger Cars Gives Direct Control of Shoe Clearance

THE DESIRABILITY of an automatic device which would mechanically compensate for the variations in the brake cylinder piston travel caused by the wear of the brake shoes was realized even in the early stages of the development of the air brake. Many devices have been designed to meet the demands and a number of them have come into more or less extended use. At the present time a considerable portion of the passenger cars in the country are equipped with automatic slack adjusters, but such devices have never been applied to any great extent to freight equip-

Fig. 1—Effect of Piston Travel on Brake Cylinder Pressure

ment, despite the evident safety and economy which would result from a uniform and automatically adjusted brake shoe clearance.

### Brake Cylinder Piston Travel

In order to secure the desired flexibility of control in service braking, the brake cylinder piston travel should be kept at as near 8 in. as possible. With hand adjustment, however, the piston travel is apt to be anywhere from 4 in. to 10 in. and in case of neglect it may even increase to 12 in. and the brake rendered inoperative due to the piston striking the cylinder head. Differences in brake cylinder piston travel mean unequal pressures and consequently unequal force. This is one cause of shocks, damage to freight and broken couplings. The effect of variations in brake cylinder piston travel on the cylinder pressure is evident from the curves shown in Fig. 1, which were plotted from data obtained from tests made on the Swiss Federal Railways. For example, the curves show that a brake pipe reduction which will give 60 lb. cylinder pressure when the piston travel is 4 in. will give only 23 lb. in a cylinder having a 10 in. piston travel. While the results shown differ slightly from those obtained in this country, the general character of the curves does not differ greatly.

Piston travel may be divided into two portions: first, that

necessary to bring the shoes into contact with the wheels and, second, that which takes place afterwards. In taking up the slack and bringing the shoe against the wheel a small portion of the piston travel is required to care for the looseness of the pins in the holes, but most of it is due to the clearance between the shoes and the wheels, being a direct product of the shoe clearance and the total leverage. If the brake shoes are suspended from a point above the truck springs, as is common on passenger equipment, there will be a somewhat greater shoe clearance on loaded than on empty cars, but as the added weight in a loaded passenger coach is comparatively small in relation to the empty weight, the increase in shoe clearance will be slight. On freight cars the shoes are ordinarily hung directly from the truck frame so that the loading does not affect the shoe clearance. The second portion of the piston travel is often referred to as "false piston travel" and is due mainly to the stretch in the rods, the bending of levers, the deflection of brake beams and the drawing down of the shoes under the wheels. This portion of the travel is closely related to the difference which is obtained in standing and in running tests. It is of prime importance that it should be kept as low as possible. The factors controlling its extent are all related to foundation brake rigging design and are therefore matters to be handled by the air brake engineer and the designer and cannot be taken care of by any slack adjuster. In fact, they simply greatly complicate matters relating to the operation of the slack adjuster as ordinarily applied. The total leverage of the brake rigging is controlled by the maximum amount of shoe clearance which is liable to occur in practice and by the amount of false piston travel. An adjuster which will positively maintain a minimum shoe clearance will so fix the most important variable that a relatively large total leverage can be used.

### A New Principle in Slack Adjusters

A slack adjuster constructed along new lines has been developed recently by a Swedish inventor, A. R. Durson. This adjuster, which is applicable to both freight and passenger equipment and has been in service for several years on railroads in Sweden, Norway, Holland, Denmark and Switzer-

Fig. 2—Slack Adjuster Applied to a Passenger Car

land is now being introduced in this country. Instead of attempting to control the slack by limiting the brake cylinder piston travel to a predetermined amount, this adjuster is designed to control directly the clearance between the shoes and the wheels and to keep it at a fixed amount regardless of shoe wear. All adjustments are made during that portion of the piston travel which takes place before the brake shoes are in contact with the wheels and the brake rigging is subject to stresses, consequently the operation is not affected by false piston travel or by any difference between service and emergency piston travel. This is rendered possible by the intro-

duction of an auxiliary yielding device which prevents the adjuster taking up any further slack from the moment tension arises in the brake rigging.

### Operation of Adjuster

A typical installation of the Durson slack adjuster as applied to a passenger car is shown in Fig. 2. Attached to the

While Fig. 2 shows the Durson slack adjuster introduced into one of the top pull rods, it may be a part of the cylinder lever rod or of the bottom rods of the truck as conditions demand. It is designed for use either as a tension or as a compression member.

The construction details of the slack adjuster are shown in Fig. 3. A shaft 5 with a suitable collar 3 adapted for either

Fig. 3—Details of Durson Slack Adjuster Mechanism

piston rod is a roller which travels outward in a slotted cam as the brake is applied. Distance plates on either side of the cam transfer this motion to a second roller which is located at the distance *A* from the point where the second roller starts to change its direction. This distance *A* corresponds to the piston travel required to bring the shoes into contact with the wheels. It will vary with the total leverage

tension or compression revolves in the jaw 1. To the opposite end of the shaft, extended to its proper length by a section of heavy pipe 4, is attached a threaded nut 8. Engaging this nut is a length of shafting 9 which is threaded at one end and which is attached to a jaw at the other end in order to become an integral part of the brake rigging. Welded to the shaft 5 is a collar 18. On either side of the collar 18

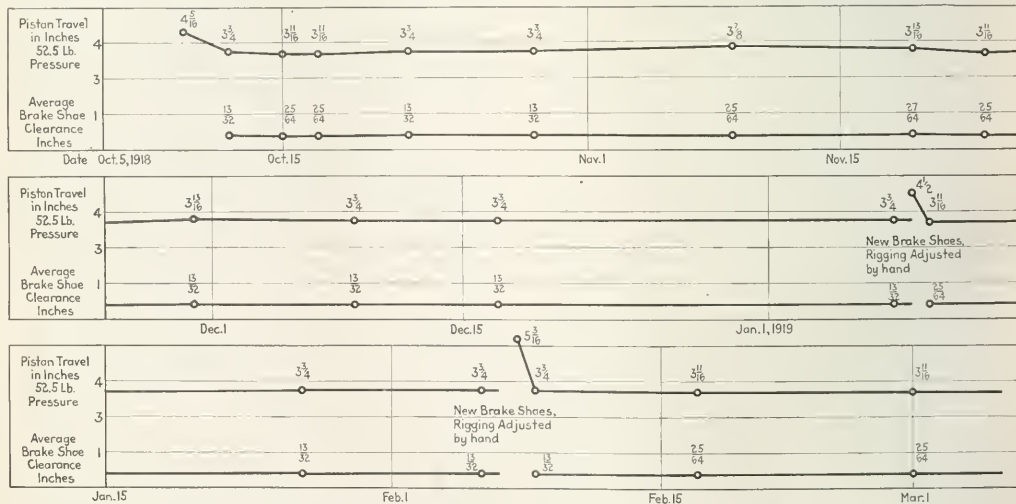

Fig. 4—Diagram Showing Uniform Shoe Clearance and Piston Travel During Five Months' Test

of the brake rigging, but is, however, a constant for each type of car. As the second roller changes its direction, this motion is transmitted by suitable levers to the arm of the slack adjuster. Should there be any additional clearance due to brake shoe wear the adjuster extends itself to compensate for this wear until taken up. When that point is reached further motion in the arm of the adjuster is taken up by a yielding friction mechanism.

are two friction discs 16 which revolve freely about the shaft 5. A circular ratchet 17 revolves about the collar 18 and between the friction discs 16. Three bolts 19 are fitted in holes drilled through the friction discs 16 and the collar 18 and transmit their motion to the latter. Three springs 20 are held in position by lock nuts and maintain a certain friction between the friction discs 16 and the circular ratchet 17. Motion of the ratchet 17 is therefore transmitted through the

friction discs 16 to the collar 18 and shaft 5 and the revolution of the shaft 5 increases the total length of the slack adjuster. The bracket arm 14 is attached to the housing 13. To this housing is also attached the pawl 21 held against the circular ratchet 17 by the spring 23. Motion of the bracket arm 14 in a clockwise direction is transferred through the housing 13, the pawl 21 to the circular ratchet 17 and thence as noted to the shaft 5.

When the transverse motion of the roller, connected by levers to the bracket arm 14 takes place the slack adjuster is lengthened until tension arises in the brake rigging. At this point the friction moment between the nut 8 and the shaft 9 is greater than that between the friction discs 16 and the circular ratchet and further movement is taken up by the sliding of the circular ratchet between these friction discs.

When new brake shoes are applied, the slack adjuster can be reset by releasing the pawl 21 by means of the ring-bolt 22 and revolving the nut 8 by the extended pin 8 in the coupling-nut 7.

It should be noted that all threads are protected by grease-filled housings which prevent any lack of functioning through the action of snow, ice or mud. The tension between the friction discs and the ratchet is fixed at the time of the assembly of the slack adjuster and need never be changed.

### Results of European Tests

As has been stated, Durson slack adjusters have been in service for some time in a number of European countries where their performance is said to have been highly successful, not only from the standpoint of regulation of the brake shoe clearance, but also from the standpoint of maintenance. They have been extensively used on the northernmost railroad in the world, the line carrying ore from Kiruna to Narvik in northern Norway. This line is entirely within the Arctic Circle and although conditions are unusually severe, the adjusters have proven satisfactory in every respect.

In tests made on a number of railroads some valuable data have been obtained. In this connection it will be interesting to note the records on the Swiss Federal Railway as given in Fig. 4. This diagram shows the brake shoe clearance and piston travel during the test period from October 5, 1918, to March 1, 1919. The only breaks in the curve occurred when shoes were renewed and, as will be noted, the clearance was quickly adjusted each time. The piston travel was less than that used in American practice, but the curves show the uniformity in adjustment during a period of five months.

Some of the advantages claimed for the Durson slack adjuster are the following:

Brake shoe clearance kept constant at all times. As a consequence, the piston travel will be maintained within as close limits as the design of the foundation brake rigging will admit.

Hand adjustment eliminated, except when new shoes are applied and inspection costs lowered.

Practically uniform and simultaneous braking power on all cars and consequently a reduction in shocks with a saving in damage to equipment and lading.

No matter how the brakes are applied, the slack cannot be so taken up that the shoes will drag and increase the train resistance.

As the shoe clearance is positive it can be fixed at an amount less than would otherwise be possible. Consequently the maximum total leverage can be employed consistent with the design of the brake rigging and the amount of false piston travel. A higher total leverage than would be practical if slack adjusters were not applied can often be employed with safety.

A saving in air consumption with a resultant increase in safety and a postponement of the time when recharging becomes necessary.

The Durson slack adjuster which is built for the European

market by Aktiebolaget Bromsregulator, Stockholm, Sweden, is being introduced and will be handled in this country by the firm of Hamilton & Hansell, Inc., Park Row Building, New York.

## Leavenworth & Topeka Patrons

### Vote on Tax Levy

RESIDENTS of parts of two counties in Kansas are going to the polls to determine whether passenger and freight service is to continue on the Leavenworth & Topeka Railroad. This is in accordance with the new Kansas state law which permits benefit districts to vote on tax levies at special elections to make railroad service possible. Advance returns, from the ballot, point to the continued operation of the road.

The Leavenworth & Topeka has been operating 44.72 miles of line between Leavenworth and Meriden across the counties of Leavenworth and Jefferson in an east and west direction. The road serves the town of Oskaloosa, the county seat of Jefferson county, and therefore the vote for the tax in this district has been most favorable.

The history of the company since its incorporation has been fraught with financial difficulties. It was incorporated in May, 1918, after the road had been purchased at a receiver's sale from the Leavenworth & Topeka Railway Company. The latter was the successor to the Leavenworth, Topeka & Southwestern, which was incorporated in December, 1899, and was thrown into receivership in April, 1916, by an application of the Union Pacific in the U. S. District Court at Topeka, Kan. At that time W. A. Austin of Leavenworth, Kan., was appointed receiver. In October, 1917, the road was sold to interests headed by F. L. Wells of Chicago, who was elected president, and A. J. Isherwood, secretary and treasurer. An executive committee at that time was formed to plan for the permanent operation of the road, but under the terms of the sale the new owners were not to take over the operation of the road until Judge John C. Pollock, of the Federal Court, ended the receivership. In June, 1918, W. A. Austin, the receiver, filed his final report and was discharged and Charles J. Conlon, Atchison, Kan., was appointed receiver to close up the affairs of the Leavenworth & Topeka Railway Company. Under the terms of the sale to the Wells interests, the purchasing company undertook to operate and maintain the road continuously, furnishing adequate service, and upon its failure to do so the court was again to take action and resell the road, paying to the owners of the Leavenworth & Topeka Railway the difference between \$80,000 which was the upset price and the amount which it had been sold for at that time as junk, which was ascertained to be \$160,000.

The officers of the road, in order that the operation be assured, have now found it necessary to go to the public. Citizens of the territory served by the road confronted with the abandonment of the property, the possible difficulty of the disposition and marketing of their products, the bringing in of commodities necessary to existence, have gone to the new state law devised for just such emergencies. The advance returns on the ballot now being taken show that the voters in the benefit district of Jefferson county have voted 780 to 231 for a tax levy of 2.5 mills to help finance the road. The entire levy will raise approximately \$82,500 and, though the road is of less direct benefit to the citizens in Leavenworth county, confidence is expressed that this amount will be raised and the road will continue in service.

THE NOMINATION of Frederick I. Cux, of New Jersey, to be a member of the Interstate Commerce Commission, was confirmed by the Senate on August 23.

## Cover to Keep Out Snow Complicates Turntable Replacement

A ROUNDHOUSE located in regions subjected to extremely heavy snow-falls such as are encountered in portions of Canada and the Pacific Northwest presents an added problem in the sheltering of the turntable and its pit from complete burial under the heavy snow blanket. In other words where snow conditions are unusually severe, it is found necessary to roof over the turntable and the entire space between the table and the inner wall of the roundhouse. Owing to the fact that no supporting columns can be placed in the turntable pit or between the pit and the roundhouse, the problem of designing the supporting frame for a roof of this kind is by no means simple. By the same token a project to renew a turntable with one of greater length introduces difficulties not experienced where there is no roof to interfere.

A problem of this kind was imposed on the engineers of the Canadian Pacific when it became necessary last year to replace the 70-ft. turntable of the enginehouse at White River, Ont., on the Lake Superior division, with a 90-ft. turntable. This is a 13-stall roundhouse and, therefore,

ing the outer side of the turntable pit. This, of course, involved the moving of all of the interfering columns supporting the roof frame, including the two main columns under the main truss. In other words the roof frame had the "props knocked out from under it." To provide a new main supporting truss 13 ft. longer than the old one would have been expensive in structural steel and entailed an expensive and troublesome erection problem. Lengthening of the existing truss was not desirable because the 13 ft. additional span length would have resulting in over-stressing the main members of the truss. This problem was solved in an ingenious manner. Two inclined struts or jib columns were erected on new concrete pedestals set 6 ft. 6 in. from the loca-

Framing of the Shelter as Revised to Accommodate a 90-ft. Table

occupies less than half the circle so that it was readily possible to design the roof framework with a main or key roof truss 96 ft. long, standing directly over the center of the pit with columns at each end that were well in the clear of the turntable and of the tracks. This main truss served as the support for radial roof trusses extending from alternate door posts of the roundhouse and also for I-beams spanning between posts in the wall, closing in the side of the turntable pit away from the roundhouse.

To replace the 70-ft. table by a 90-ft. table made it necessary to move back the outer wall of the shelter a distance of 6 ft. 6 in. on the five sides of the half octagon enclos-

Framing for the Turntable Roof as Originally Constructed for the 70-ft. Table

tions of the old ones and rigidly connected to the old truss at each end to form a stiff u-frame. Analysis of this construction indicated that it provided for the disposal of the truss reaction at points 6 ft. 6 in. beyond the ends of the truss with no appreciable increase in the stresses. The sketches show how this was accomplished with the minimum difficulty since the arrangement was such that the old columns could be left in place supporting the truss until the new jib columns were erected and riveted connections made, after which the old columns were cut out.

A minor problem was introduced in providing supports for four of the old beams carrying the roof over the outer side of the turntable pit. To avoid the purchase of new beams of greater length and to avoid throwing any more load on the main trusses as would be the case if the span of these beams were increased to reach the new outer wall, an additional girder was introduced in the position of the old wall to take the ends of these four beams. This girder was made long enough so that supporting columns under each end were well clear of the turntable.

We are indebted for the above information to J. M. R. Fairbairn, chief engineer of the Canadian Pacific, Montreal, Que.; P. B. Motley, engineer of bridges, was responsible for design.

FREE COFFEE, before breakfast, is the latest innovation in Baltimore & Ohio dining cars, and, according to the assistant to the senior vice-president, the novelty seems to fill a long-felt need. The practice has been introduced on a few of the through trains and it is the expectation that it will be extended to others.

# Many Roads Considering the Use of Heavier Rail

## Increased Traffic, Heavier Wheel Loads and Prevalence of Failure Focus Attention on this Tendency

**A**LTHOUGH RAILS weighing 105 lb. per yard were the heaviest used by any extent in steam railway service less than ten years ago, at least seven roads are now laying rail weighing 130 lb. or more per yd., some of them this season for the first time. While nearly all the others limit their purchases to sections weighing not more than 100 lb. per yd., and several important western roads still adhere to a maximum of 90 lb., a number of them are now considering the advisability of adopting heavier sections. Opinions regarding the advantage which will accrue from the use of heavier rails are as diversified as the practices, but, considering the complexity of the conditions influencing the service to be obtained from rail, this is not at all surprising.

Because of the seeming lack of uniformity in practice and opinion, a questionnaire was sent to the chief engineers of a number of the principal American railways, requesting them to outline the practices on their roads with respect to rail renewals and to point to any possible tendency toward the use of heavier sections. The questionnaire was as follows:

### Questionnaire on the Adoption of Heavier Rail Sections

1. What weight and section of rail are you now laying on your main line?
2. How long have you been using this weight?
3. Are you contemplating the use of any heavier sections?
4. What effect or benefits have you observed or do you estimate will follow a change to heavier rail on a given line?
  - (a) As to reduced cost of maintaining line and surface?
  - (b) As to possible increase in the life of ties or other portions of the track structure?
  - (c) As to increased economy in rail maintenance or in other words, an increase in the life of a rail sufficient to pay for the extra cost due to the use of the larger sections?
  - (d) As to reductions in rail failure?
  - (e) Any other benefits?
5. Based on such observations have you developed any relationship between traffic and weight of rail which serves as a guide in determining the weight of rail to use?

Replies were received from 24 railroads so distributed geographically as to give a fair representation of the conditions the country over, except that perhaps a larger proportion of the eastern roads are represented.

#### SUMMARY OF TENDENCIES AS TO WEIGHT OF RAIL

	Road	Current sections	Year introduced	Heavier section contemplated?
1	A. T. & S. F.	90-lb.	1909	Considered
2	B. & O.	100-lb.	1913	{ 130-lb. 1921 }
		130-lb. RE	1921	{ 12,000 tons }
3	B. & L. E.	130-lb. PS	1917	No
4	B. & A.	105-lb. Dudley	1913	No
5	C. & O.	130-lb.	1916	No
6	C. & N. W.	100-lb. NW	1909	No
		90-lb. NW		
7	C. B. & Q.	100-lb. ARA-A	1908	
		90-lb. ARA-A	1911	No
8	C. R. I. & P.	100-lb. ARA-A	1911	
		90-lb. ARA-A	1912	No
9	C. C. C. & St. L.	105-lb. Dudley formerly 90-lb.	1920	No
10	D. L. & W.	105-lb.	1914	No
11	Erie	100-lb. ARA-A	1909	No
12	I. C.	90-lb. ARA-A	1909	Yes
13	L. V.	136-lb. LV	1915	No
14	L. & N.	90-lb. ARA-B	1912	Considered
15	M. C.	105-lb. Dudley	1916	No
16	N. Y. C. East	105-lb. Dudley	1913	Discussed
17	N. Y. N. H. & H.	107-lb.	1915	Considered
18	N. & W.	130-lb. PS	1918	{ 130-lb. all }
		100-lb. ARA-B	1911	{ heavy traffic }
		90-lb. ARA-B	1909	Yes—later
19	N. P.	100-lb. PS	1916	Studies made
20	Penna. System	430-lb. PS		
		100-lb. PS		
21	P. & R.	100-lb.	1911 (about)	Yes
			some 130-lb.	
22	P. & L. E.	100-lb. ARA-B	1909	Yes
23	U. P.	100-lb. RE	1917	No
24	West Md.	90-lb. ASCE	1905	No

The present practice of these 24 railroads as regards the sections of rails now being purchased or considered for future use may be summarized as follows:

- Five buy 90-lb. rail exclusively but are considering the use of heavier sections.
- Three buy both 90-lb. rail and 100-lb. and are *not* considering heavier sections.
- Three buy 100-lb. rail exclusively and one of these is considering heavier sections.
- Four buy 100-lb. rail and also some heavier sections (one 115 lb., three—130-lb.)
- Five buy 105-lb. rail and only one is considering heavier sections.
- One buys 107-lb. rail and is considering heavier sections.
- One buys 115-lb. rail in limited quantities.
- Two buy 130-lb. rail exclusively.
- Three buy 130-lb. rail and also some other weights.
- One buys 136-lb. rail exclusively (one road not covered by the questionnaire uses some rail weighing 135 lb. per yd.).

This summary discloses a wide variety of practices. One thing is quite clear, however, that all of the roads now using 90-lb. rail as the maximum, have under consideration the use of some heavier sections, and of those using 100-lb. rail at least 50 per cent are interested in still heavier sections, while of those using 105-lb. rail only one is considering a heavier section. The use of rails weighing more than 100 or 105-lb. per yd. is limited to lines east of Chicago and there seems to be a rather definite feeling that the use of these heavy sections can be justified only in lines of extremely heavy traffic.

### Little Specific Data Available

The replies received demonstrate that the railroads as a whole are in possession of little concrete information regarding the relation of the rail sections to the traffic or cost of maintenance. The presence of other variables and the disturbing influences of varying maintenance policies during the past four or five years would have made it very difficult to arrive at any tangible conclusions, even if attempts had been made to obtain them. However, several roads have developed criteria or formulae to serve as the bases for determining the weights of rail to be used. For instance it has been concluded on the Chicago, Rock Island & Pacific that a traffic of 2,000,000 ton miles, gross, per mile of line, for both passenger and freight traffic warrants the use of 90-lb. rail and that a traffic of 4,500,000 ton miles per mile of line justifies the use of 100-lb. rail. It is suggested by the chief engineer of another road that the 100-lb. A. R. A. type B rail is strong enough to carry the Cooper's E-60 loading, but that he finds that it is impossible to design a satisfactory angle bar that will take care of the joints properly on account of the limited fishing depth to be obtained in the 100-lb. rail. The same general thought is expressed by E. E. Adams, assistant to the president of the Union Pacific system, namely, that the weight on drivers and speeds are more important factors than the density of traffic. He states that the principal arguments which led to the adoption of the 100-lb. rail in place of the 90-lb. on that system were: "(1) Greater girder strength of the rails to sustain wheel loads and thereby minimize rail failures. (2) Giving better riding track, easier to maintain in line and surface."

The relation to loads carried has also been studied by the Baltimore & Ohio officers. Previous to the adoption of the 130-lb. A. R. A. on that road a detailed investigation was conducted covering the relations between engine wheel loads, car wheel loads, weight of rail and greater strength of the

rail, covering a period of 50 years from 1870 to 1920. These studies showed that:

Engine wheel loads increased... 85 per cent from 1889 to 1920  
 Car wheel loads increased.....118 per cent from 1889 to 1920  
 Weight of rail increased..... 15 per cent from 1889 to 1920  
 Strength of rail increased..... 22 per cent from 1889 to 1920

"With the adoption of the 130-lb. rail the increased weight and strength of the rail will more closely approach the increase in wheel load as the increased weight of the rail will be 53 per cent and the increased strength 82 per cent."

Others ascribe the advantage of the heavier rail to its greater wearing qualities, i. e., additional material available which may be worn away before the rail must be taken out of track. Thus J. E. Crawford, chief engineer of the Norfolk & Western, states: "We have found with 85-lb. rail on the low side of a curve the rail goes to pieces very rapidly after it has been in track a few years on our heavy traffic districts. The 100-lb. rail stands the traffic very well until it is worn considerably."

### In Relation to Maintenance

There is a general agreement that increasing the weight of rails tends to decrease the expense of holding tracks to line and surface, but only two replies hazard an estimate as to what this would actually amount to in dollars and cents. It is estimated by officers of the Baltimore & Ohio that the use of 130-lb. instead of the 100-lb. rail results in a saving of 25 per cent in maintaining line and surface. A conclusion based on opinions expressed by supervisors of the Bessemer & Lake Erie, to whom this question was submitted, is that the maintenance of line and surface was cut from 10 to 15 per cent with a change to 130-lb. rail. Another road reports a life of 130-lb. rail  $2\frac{1}{2}$  times that of 100-lb. rail on six degree curves. While not expressed in figures, some of the statements are nevertheless specific. Thus G. L. Moore, engineer maintenance of way of the Lehigh Valley, states "The labor cost for maintaining line and surface is very materially reduced. We have track on 10-deg. curves put up in first-class condition (with 136-lb. rail) in 1916 and 1917 which is now in perfect line and surface, no work having been done since the track was put up four or five years ago, except to transpose the rails or renew the high side rails and transfer the high rail to the low side."

### The Effect on the Ties

With respect to the relation of the weight of rail to the life of the ties, the general feeling is that regardless of the weight of the rail the ties should be adequately protected against wear and crushing by a proper distribution of the load transmitted to them from the rails, through the use of tie plates of ample bearing area. It is not considered consistent with economy to purchase larger rail on account of the better distribution of load to the tie that may be secured by reason of the greater width of rail base. At the same time it is recognized that some benefits do accrue. The greater stiffness of the heavier rail will effect a more uniform distribution of wheel loads. This, together with possibly a wider base, has, of course, resulted in a lessened mechanical depreciation of the ties. Track supervisors on the Bessemer & Lake Erie estimate this saving at 10 per cent, a corresponding saving in the ballast of 20 per cent, and on other miscellaneous items of the track of 10 per cent.

The reply of the Lehigh Valley in this regard is that "The 136-lb. rail provides a greater distribution of the wheel loads on the ties. The moment of inertia of this section is 86.57. Under our heavy traffic the ends of the ties under the low rail on the heavy curves tend to crush or squeeze. With the use of the 136-lb. rail a very noticeable improvement has been observed in this respect."

The testimony of some of the roads using the heavy weights of rail in regard to increased life is as follows:

The Baltimore & Ohio statement is "In heavy traffic ter-

ritory where curvature is heavy and alinement generally unfavorable the life of the 130-lb. rail is considerably more than the life of the 100-lb. rail under the same conditions. On level straight track this would be somewhat reduced. On the average, however, the life of the 130-lb. rail should be at least 50 per cent more than that of 100-lb. rail."

Results on the Chesapeake & Ohio "show that the 130-lb. section is giving approximately two times the length of service, under the same traffic in the same location, that the 100-lb. A. R. A-B section gave."

This is also the case on the Lehigh Valley, the statement being that "The increased life of this section on curves is very noticeable. Our records show more than double the life of the 100-lb. section of rail. On tangents the increased life of the heavy section is noticeable, but not to so great an extent, but the general condition of the track is improved with little or no labor because of the strength of the joint fastenings and rail section."

Anticipations on the Norfolk & Western are stated as follows: "We expect to receive twice the life from 130-lb. rail that we are now getting from 100-lb. rail at locations where heavy rail wear occurs."

### Rail Failures Also an Item

Any discussion of rail failures is almost sure to raise the question of the effect of over-stress as a consequence of using a rail of limited strength. It is therefore of special interest to note the opinions of railway officers on the relation of the increase in the weight, i. e., the girder strength of rails to the prevalence of failures. Judging from the replies received to the question relating to this subject in the questionnaire, it would seem that this point is one of special interest to railway men concerned with track maintenance. That opinions are not all the same may be judged from some of the quotations given below.

G. J. Ray, who has been prominently identified with this subject as the chairman of the Committee on Rail of the American Railway Engineering Association, expressed his opinion as follows:

"Regardless of the size of the section there would be little or no economy in using a greater depth of head than we now have with our 105-lb. section. The width might be increased by  $\frac{1}{4}$  in. but not more with the present rolling stock. As the weight of rail has been increased it has been found that higher carbons must be used in order to secure a rail of equal wearing qualities. On the other hand it has been contended that with the heavier section it is safe to go to a harder rail. As a matter of fact an examination of the rail records covering the heavier sections as compared with the lighter sections, that is, sections of 120-lb. and over compared with the 100 and 105-lb. sections, disclose the fact that we are having very heavy breakage with the heavier rail. While this may be due to the fact that the carbons have been kept excessively high, it is, nevertheless, a plain indication that we are not getting away from rail breakage by the use of heavier rail sections."

Earl Stimson, chief engineer of maintenance of the Baltimore & Ohio, also states: "Since the open hearth process of manufacture has become almost universally used, railroads have been experiencing considerable trouble with the type of rail failure commonly called the transverse fissure. The practical abandonment of the Bessemer process has eliminated very largely a number of web and base rail failures and to a very large extent of slag inclusion head failure generally known as the split head. These failures, which were generally recognized, were usually detected previous to total failure of the rail. The transverse fissure failure is extremely difficult to detect as it is essentially an interior defect. This type has been the subject of considerable study by engineers generally within the past four or five years in order to determine, if possible, the cause of such failure. A number of theories were advanced, probably the most prominent

of which is what is known as the overstressed rail. Quite a large number of engineers are giving serious consideration to this theory and some have accepted it as the cause of the failure.

"If, then, the cause of the failure is overstressed metal, such failure must be due largely to the excessive wheel load, as compared to the strength of the rail. The adoption of the 130-lb. rail should then reduce the failures attributed to the transverse fissures. If the heavier section rail will reduce to any extent this indefinite, dangerous, type of failure, its adoption is surely worthy of serious consideration."

Taken as a whole, the answers on this point are decidedly variant. Of those who gave a definite reply to this question 11 anticipate or experience no reduction in rail failures as a consequence of the use of increased sizes, while 7 are of the opinion that an appreciable reduction in failure has been or should be obtained. The answers from officers of roads that have used the 130-lb. rail or a heavier section are of particular interest in this regard. The reply of the Chesapeake & Ohio states: "No material difference noted in the number of rail failures." That of the Norfolk & Western is: "We do not expect any reduction in rail failure from the heavy rail." The Bessemer & Lake Erie and the Lehigh Valley on the other hand have experienced no little benefit. Thus the statement of the Bessemer & Lake Erie is as follows: "We have had no rail breakages with the 130-lb. section and very few rail failures. In other words, as far as our present

experience goes, rail failures seem to be reduced with the 130-lb. rail sections."

G. L. Moore, engineer maintenance of way of the Lehigh Valley, also testifies to reductions in failures as the result of the use of the 136-lb. rail, but points also to the defective condition of certain rollings of these heavy rail. "We have found that the number of rail failures in any section of rail bears a distinct relation to the conditions at the mill when the rolling was made. In most rollings where general conditions were unsatisfactory, we have found the results reflected by the rails under traffic to be in accordance and generally in proportion to the degree of general unsatisfactory conditions existing during the rolling. Other rollings have proven generally very satisfactory. This is true of 136-lb. sections, as well as any other, and it has been noteworthy in our experience that the rail failures under traffic bear no relation to the average or range of the carbon content in the rollings. Generally in the most satisfactory rollings in every respect the mills have also found it possible to better satisfy our requirements for the range of carbon content sufficiently high to insure a good wearing quality of steel for the section. While the rails from some rollings have not given as good results as those from others, the behavior of the 136-lb. rail, with the exception of such few particular rollings, has been such as to show us conclusively that we are better protected against dangerous rail failures by the heavy section in proportion at least to the general strength of that section over the lighter ones."

## Saving the Railroads for Private Control

Officers Have Large Responsibility in Securing the Right Kind of Co-operation from the Men

By Franklin Snow

THE WRITER has recently had the opportunity of chatting with two employees of railroad operating departments, employed on two different great railway systems. These men were considerably above the average in intelligence. Their ideas, however, were as different as could be imagined. The one, a brakeman on the crack limited train of an eastern line, was an officer of his brotherhood, and despite his apparent opportunity of rising above his fellow-workers, his feeling was that he preferred to remain in his present capacity rather than to give up his union activities with the eventual expectation of becoming trainmaster, with its greater responsibilities and the consequent necessity of giving up his efforts through brotherhood channels, of assisting his friends' "cause." The other man, a yard conductor in a New York terminal, regarded his brotherhood affiliation with pride, but utilized his spare time to a study which he expected would earn him a promotion. The former was far from being in sympathy with his company's policies, while the latter boasted of his friendship with the superintendent.

Least the moral of the above be not obvious, let it be explained that the contrasted attitudes of these two men represents the basis of future railroad failure or success in this country. The one places his loyalty to his union above that to his company. The other has his entire thought devoted to improving his employer's interests. What a pity that the activities of the former in behalf of his brotherhood could not have been utilized jointly with the company's interests.

### Serious Lack of Understanding

It is this lack of understanding—of co-operation between companies and unions and between officials and employees,

which is costing every road many thousands of dollars of unnecessary waste annually. It is a question as to which is the more to blame for this unfortunate state of affairs—the men or their officers.

The writer, during his connection with the United States Railroad Administration, had an opportunity of learning the really true loyalty of the great mass of railroad workers. True, their desire to make a success of government control was partially due to their belief that it would be to their own greater financial advantage to have the roads remain under federal control. Nevertheless, the mass of letters written by trainmen, conductors, dispatchers, and others, pointing out improper operating methods, rang with the true tone of loyalty.

These unsolicited letters (all promising co-operation) certainly indicated a lack of the proper understanding between these men and their immediate superiors, else they would not have gone over their officers' heads with such matters. The charges of near-sabotage against railroad officials, after the war were familiar ones in Washington, and many investigations resulted. Unfortunately, and unwisely, these investigations were referred eventually to the actual superiors of the men making the charges. It is needless to add that men whose idea in writing was merely to save their country money were discharged from service.

That their letters had a basis of fact was indicated by the fact that from all sections of the country came the same cry, "over-tonnage." It was evident, and still is, that many trainmasters, in their desire to make a good showing, load the engine to the last ton, with the result that the train creeps over the division, doubling on hills, failing to make meeting-

points, and eventually is tied up by the 16-hour law. There is little doubt but that an occasional conference between division officers and train and enginemen would obviate many engine failures by pointing out the difference in capacity between locomotives even of the same class and rating.

### Get-Together Meetings

Some railroads, notably the Pennsylvania System, realizing that many new ideas come from the men in the ranks, have organized committees of officers and men to meet regularly in an informal manner for the exchange of thoughts. Such a system cannot fail to prove its merit, even though nothing more tangible than the foundation of a cordial, co-operative spirit between officers and men is produced. The relations established by friendly meetings of this nature, even though nothing more important is discussed than topics of the day, is worth many times the hour spent in such conference.

But it is not only in the transportation and mechanical departments that these joint committees can be developed. Traffic, auditing and other departments can just as profitably, and with less loss of time in assembling the members from their places of duty, have get-together meetings.

The basic principle of the conference, namely, the creation of a friendly atmosphere aimed toward wiping out the present almost hostile attitude which some employees bear toward their superiors who endeavor to establish too great a class distinction—should never be lost sight of. That such distinctions are carried too far is evidenced by the practice of certain officers who expect trainmen, passing through a business car carrying only men, to remove their hats, and who further expect rear flagmen to ride on the platform rather than in the observation parlor, even in inclement weather. The explanation of the remark made by Edward Hungerford, in one of his recent interesting articles, that the railroads are not operated by as loyal employees as formerly can be seen by the foregoing. The loyalty is not brought out in the right way by the exercise of personality by officials in a position to win the affections of their men.

Few executives have the marvellous personality and the hail-fellow-well-met manner which has made Charles M. Schwab so justly famous, but, nevertheless, there is no question but that a man will double his endeavors for a boss with a cheery "Good-morning" and a smile for all. In this way an official, even though he be not blessed with any great amount of personal magnetism, can build up a loyal, industrious organization—one of which he can be proud and which will be proud of him—with no loss to his dignity.

### Biting the Hand That Feeds Them

The purpose of this article, however, is not to make martyrs of railroad employees. Many there are who fall far short of the proper enthusiasm for their work and their employers. A discouraging incident recently came to the writer's attention.

A ticket-seller in the consolidated office of one of our large Middle Western cities sold a ticket and lower berth to New York to a traveller. In accepting the price of the tickets, amounting to between \$30 and \$40, he made the remark that this seemed to be "a mighty high rate for so short a trip," with some additional observations as to his belief that the railroads were misrepresenting their necessities for high charges, and that statements of revenues were being juggled.

Such remarks, to most business men, would be too ridiculous for comment, and in the particular instance the next man in line nailed the true facts to the story by observing that "You fellows behind the counters are getting most of it in too high salaries." However, there is a certain subtleness in such remarks, that if made several times a day by several ticket-sellers, would send the less-informed people to their trains with a bad thought (from a railroad point of view) in their minds. It is matter for congratulation that the great mass of railroad workers are not foolish enough to bite the

hand which feeds them by any such insidious propaganda, whatever may be their personal opinions.

Right here again is where our little committee of co-operation demonstrates its usefulness. Our man, above described, might be one of those chosen to serve on a committee with officers having jurisdiction over consolidated ticket office matters. Gradually, through the interchange of ideas on railroad and extraneous matters, the employee would get the proper point of view, and come to a fuller realization of the problem the companies are up against, with high operating ratios predicated on high wages. Returning to his work, he would educate his companions to a like appreciation of the gravity of the fight which the railroads are making.

### Encourage Initiative and Ideas

All too few officials appreciate the value of encouraging their men to advance ideas and to criticise current methods which they believe can be improved upon. The writer, at the outset of his railroad career at the age of seventeen, was offered a minor position in the auditing department of a certain New England line through acquaintanceship with a high traffic officer of the line. Hearing discussions of the errors of some agents in short-hauling their company, he came to the conclusion from waybills passing through his hands, that his particular company was being short-hauled on a very considerable amount of traffic; gathering the necessary data to confirm his opinions, he called on his official friend, entirely unconscious at the time of the crime of going over his superior's head. The officer visited, in a courteous and kindly manner, pointed out the reason for the routing assigned to this traffic, and explained that the company's proportion of the rate would be the same no matter how this particular freight was routed, the interview closing with the thanks of this gentleman for the interest displayed.

A few days later the chief clerk heard of the matter, when ensued a lively ten minutes, the writer being severely reprimanded (properly, as he now sees) for going over his superior's head, and being cautioned "never again to question anything which did not appear right, leaving such affairs for others to pass judgment on." Let it be said that this man's name had not yet appeared in the "Pocket List," nor does he deserve a title. The moral is obvious, that this man, in a supervisory capacity, should have been broad enough to realize that a young man sufficiently interested to report matters which he thought incorrect, to an official's attention, should be encouraged in every way possible to continue such loyalty toward his employer, and in the particular instance mentioned, a mild rebuke for the entirely unwitting error in going over his superior's head would have sufficed.

It is seldom, in the transportation field, that a man of small capacity, or mind, becomes an official, but any officer who reads these lines and realizes that he has, at any time, been unresponsive to ideas, and has failed to encourage those advancing such suggestions (even though valueless in themselves) for the good of the company—this man must take stock of himself and realize that such failure is a direct act of disloyalty to his company's best interests. In failing to bring out the best in his men he has neglected his duty.

The next year or two will tell the tale forever for our railroads. If they fail this time to make good, the government will seize them for all time. They have every chance in their favor. Never before have so few criticisms of railroad management been offered by the public. Scarcely a person today but wants to see the perpetuation of private control. On every officer, either in an executive position or in a minor supervisory capacity, is now placed the responsibility of getting the best out of his men, by enlisting their co-operation, by encouraging their initiative and ideas, and by being human and courteous in his dealings with them. In this way only can our railroads survive their present near-crisis and pass the turning point to prosperity.

# Railroad Funding Bill Approved in Lower House

Measure Referred to Senate Which Has Taken a Four-Weeks'

Recess—McAdoo Opposed to Bill

WASHINGTON, D. C.

LATE IN THE evening of August 22 the House passed the railroad funding bill by a vote of 214 to 120. Now it awaits passage by the Senate after the recess, which began on Wednesday, before the relief contemplated can be extended to the railroads.

The bill was passed without material change. As it stands, the War Finance Corporation is authorized to purchase from the Railroad Administration securities accepted by the administration from the railroads in settlement of claims of the government against them. The corporation is further authorized to sell the securities in the open market, to use the funds thus obtained to extend not exceeding \$500,000,000 in credit to the carriers.

An amendment offered by Representative Webster, Republican, of Washington, was defeated. It proposed to strike out the section of the bill providing that no claims arising from so-called inefficiency of labor during the period of federal control of the railroads shall be paid out of the money advanced under the terms of the bill, and also that when claims are once paid the roads shall be barred forever from making further claims. The vote was 145 to 17 against the amendment.

Another amendment offered by Representative Moore, Democrat, of Virginia, which would require the War Finance Corporation to pass upon all securities of the railroads accepted by the Railroad Administration, was defeated without a record vote. Democrats in opposition to the bill charged during the debate on the floor of the House that the bill meant that the federal government was embarking upon speculation in railroad securities.

"Under this bill," declared Representative Huddleston, Democrat, of Alabama, "the government is proposing to speculate in Wall Street with the taxpayers' money."

Representative Webster bolted the Republican leadership and attacked the bill. He declared that it meant nothing more than federal loans to the railroads. Democrats charged that the bill was written by President Harding and his advisors and that the Republicans in passing it were carrying out instructions from the White House.

## McAdoo Objects to Funding Bill

A letter written by W. G. McAdoo, formerly director general of railroads, opposing the funding bill, was read in the Senate on August 24 by Senator Stanley, Democrat, of Kentucky, one of the group who wanted Mr. McAdoo called before the Interstate Commerce Committee when hearings were being held and protested when the request was rejected.

Senator LaFollette, representatives of labor and other interests protested against the bill when it was before the committee and alleged that it was being "railroaded" through without giving its opponents a chance to be heard. Senator Stanley referred to these charges in presenting the McAdoo letter, and asserted that to carry out the provisions of the bill would "lick up" the last dollar made available to the War Finance Corporation in thirty days.

"I assert that the fabulous claim of nearly \$800,000,000 now made by the carriers against the government," said Senator Stanley, "is composed principally of claims for 'maintenance of way,' and that from 70 to 75 per cent of that claim is based upon the so-called 'inefficiency of labor,' a claim repudiated by the Interstate Commerce Commission and by the director general of railroads as so speculative and contingent in character as to warrant no consideration whatsoever.

"The alleged inefficiency of labor is denounced by labor as gratuitous and unwarranted, and the representatives of labor day after day clamored for an opportunity to be heard, but, after hearing only those who conceived and created this thing, the seal of silence was placed upon the lips of the ex-director general and of all others who knew anything about this complicated case of stock jugglery, and the doors were shut in the face of labor."

Senator Stanley then presented Mr. McAdoo's letter, which, he said, "threw a flood of light upon this subject."

The government, Mr. McAdoo contended, was "under no obligation whatever" to advance to the railroads money for capital expenditures.

"In fact," he said, "the Federal Control act, approved March 21, 1918, expressly required that in every agreement between the United States and the railroads it should be stipulated that 'the United States may, by deductions from the just compensation (rental to be paid the railroads), or by other proper means and charges, be reimbursed for the cost of any additions, repairs, renewals and betterments to such property (railroad property) not justly chargeable to the United States.'"

Mr. McAdoo cited the standard contract made with various railroads providing for annual rentals to the carriers equal to the average of the net earnings of the best three years of their history, from July 1, 1914, to June 30, 1917, and said concerning them:

"In these contracts (Section 7) it was expressly agreed that the United States should have the right to deduct from such rentals 'all amounts required to reimburse the United States for the cost of additions and betterments made to the property of the company not justly chargeable to the United States, unless such matters are financed or otherwise taken care of by the company to the satisfaction of the director general.' The director general agreed, however, not to deduct for additions and betterments in such a way as to prevent the railroads from paying the fixed charges 'they had theretofore regularly paid.'"

"While I was director general," Mr. McAdoo wrote, "and Walker D. Hines was director general, the railroads were not required to pay for 'additions and betterments' out of the rental due them at the expense of dividends, nor to sell bonds or stocks, as they had heretofore done, to reimburse the government for these expenditures. The cost of such 'additions and betterments' was generously advanced by the United States, so that, on March 1, 1920, when the railroads were returned to private control, they owed (and still owe) the United States the enormous sum of \$1,144,000,000. These 'additions and betterments' include 'motive power and equipment.'"

"These expenditures were not forced upon the railroads. The railroads needed them and were glad to have the Government lend them the money at 6 per cent, which was less than the market rate. Congress had to appropriate this \$1,144,000,000 out of taxes levied on the people, and these very appropriations for loans to the railroads have been used by unfriendly critics as a basis for the charge that Federal control was wasteful of government money, whereas the debt the railroads owe the government on this account is a valuable asset if those charged with the execution of the law insist upon satisfactory security as the law requires.

"Of this vast debt the United States has already extended, for a long period, the time for payment of \$881,000,000, representing new 'locomotives and cars' furnished to the rail-

roads. This leaves now due for 'additions and betterments' the sum of approximately \$763,000,000.

"While it is true that the Transportation act seems to confer upon the President discretion to determine, within certain limitations, how much of the debt the United States owes the railroads may be set off against the debt the railroads owe the United States, nevertheless, the act does not contemplate that none of the debt of the United States shall be set off, but, on the contrary, assumes that it will be; because in express terms it provides for funding only 'the remaining indebtedness of the carriers to the United States.'

#### Says President Was Misled

"At any rate, it is indubitably clear that under the law and the contract between the parties, the United States is not 'morally and legally bound to fund,' as stated by the President in his message, the \$763,000,000 of debt the railroads owe the Treasury for 'additions and betterments.' The President must have been misled into making such a statement. All that the United States is required to do, legally and morally, is to fund for ten years 'any remaining indebtedness of the carriers to the United States' after a balancing of accounts."

"Stripped of confusing non-essentials, what is now proposed is that the government shall wait ten years for \$763,000,000 the railroads owe it for betterments and improvements, and pay immediately \$500,000,000 to the railroads on account of claims for alleged undermaintenance, etc., taking from the 180 or more railroads involved with their varying degrees of financial responsibility such securities as they may be able to provide—securities which in many instances may not be adequate to protect the government against loss.

"This is not a question of 'legal and moral obligation' on the part of the United States to lend the railroads \$500,000,000 more for ten years. It is a question of policy and should be considered from that standpoint only. For the adoption of such a policy the Administration must, of course, take the responsibility, but it should be candid about it. The public mind should not be confused by juggling of figures, manipulation of accounts or securities, or governmental agencies."

#### Railway Business Association Urges Action

Alba B. Johnson, president of the Railway Business Association, sent a telegram to President Harding on August 24 in which he said:

"For immediate passage of the Railroad Refunding bill the Railway Business Association, on behalf of industries whose employees are idle by hundreds of thousands, aggregating, with those in cognate or dependent industries and trade and with railway employees, not less than 1,000,000, as estimated by the managing director of the War Finance Corporation, urges you to exert your potent influence to the utmost.

"This measure was conceived independently in the public interest alone by one government department, the War Finance Corporation, and advocated in the same spirit by another, the Railroad Administration, without suggestion, aid or argument from the railroads or banks. Various factors of the economic situation tend to improvement in business. Remittances and orders from the railroads made possible by this bill, if passed, would furnish the strongest available reinforcement to that tendency.

"We do not address you as President. In that capacity you have already performed fully your constitutional function in causing the state of the nation as affected by this problem to be communicated to Congress through appropriate executives of the government. We address you as leader of the party in power which citizens can address through no other single repository of responsibility to the country. While deeply appreciative of what you have already done as President, and sympathetic with the embarrassment under which you suffer

from confusion in some quarters of your official status as party leader, we urge you to consider the re-employment of a million men, many of whom, owing to seasonal limitations, if not employed immediately will pass both the autumn and winter without wages, as an object justifying your active participation in party councils to assure enactment of this measure, not after recess, but now. Ability, willingness and leadership to grapple effectively and promptly with so plain a business obligation is, in our judgment, a test of capacity to conduct government."

#### LaFollette Presents Minority Report

A voluminous minority report on the railroad refunding bill, written by Senator LaFollette and signed by Senators Stanley and Pittman, was presented to the Senate on August 24. This report gives seven "reasons" purporting to show why the bill should not be passed. These reasons are as follows:

1. The bill was reported by arbitrary action, upon ex parte hearings, after a refusal to permit testimony by critics of the legislation.

2. The bill would put the government into the business of dealing in railway securities. The War Finance Corporation would control an amount of securities probably larger than those of any private interest. The corporation would therefore be a dominant influence on the stock exchanges through its power to withhold or throw millions of dollars in securities on the market. This is not one of the legitimate functions of government, nor should the credit of the government be used for this purpose.

3. The government will lose hundreds of millions, almost certainly, as a result of the purposed transactions. The government accepts the securities on a 6 per cent basis, whereas the best securities are now upon a seven per cent basis, with inferior bonds yielding eight per cent or more. The government will not be able to sell the bonds on a 6 per cent basis to private investors or the banks. It will be obliged either to hold them until the market "by some miracle" is again on a 6 per cent basis, or by some future legislation authorize their sale at market prices. In the latter case the government stands to lose from \$10 to \$20 on every \$100 worth of bonds sold. The government's losses would be increased if the market declined.

4. These transactions are not required to secure a just and speedy settlement of railroad claims. The argument is then made that the government is not "legally or morally" bound to fund the indebtedness of the railroads and a set-off is called for.

5. Imposition of this great problem of disposing of railroad securities taken over will inevitably hamper the War Finance Corporation in the more important function of financing the marketing of agricultural products.

6. No emergency of a character to justify the proposed transaction has been shown to exist. On the contrary, railroad earnings and railroad credits are steadily improving and are likely to improve more rapidly with the increase in traffic during the crop-moving season. The railroads need money, but no more than any other class of individuals and businesses.

7. During the past 18 months the government has paid or loaned the railroads \$1,376,403,024. The people are overburdened with taxes. No reason is apparent why the government "should embark upon this highly speculative venture at this time."

A TOTAL OF 45 new industries, representing an investment of \$4,430,100, were located along the line of the Chicago & Eastern Illinois during the past year, according to W. J. Jackson, receiver. It is estimated that the new industries will furnish employment for 2,109 persons and will give the railroad 11,000 cars of freight yearly.

# Labor Board Settles Overtime Controversy

## Compromise Decision Contains Seven New Rules to Govern Punitive Payments

**S**EVEN NEW RULES, recognizing and continuing the principle of punitive pay for overtime work in railroad shops, have been promulgated by the Railroad Labor Board as the solution of one of the stumbling blocks in the negotiation of new agreements regarding rules and working conditions between many railroads and their shop employees. These new rules, which are effective as of August 16 and are retroactive to July 1, also recognize and sanction the principle of the eight-hour day, the policy of paying time and one-half for work performed on Sundays and holidays except that work which is absolutely essential to continuous operation and the practice of paying an allowance to an employee called but not required to work. On the other hand, the provisions of the seven new rules so change the overtime rules in the Shop Crafts Agreement that several of the wasteful and ridiculous effects brought to the attention of the Board during the hearings on national agreements will not be continued.

The new rules are to take the place of Rules 7, 9, 10, 12, 14 and 15 of the Shop Crafts National Agreement. The changes which have been made are briefly outlined in the following paragraphs. In all other respects the rules have been unchanged.

### RULE 6

Instead of paying all shop employees time and one-half for Sunday and holiday work as was necessary under Rule 6 of the Shop Crafts Agreement, the new rule prepared by the Board provides that "employees necessary to the operation of power houses, mill-wright gangs, heat treating plants, train yards, running repair and inspection forces, who are regularly assigned by bulletin to work Sundays and holidays, will be compensated on the same basis as on week days." The new rule also contains the interesting phrase, "Sunday and holiday work will be required only when absolutely essential to the continuous operation of the railroad."

### RULE 7

Rule 7 of the Shop Crafts Agreement has been changed so that instead of receiving a guarantee of one hour's pay for 40 minutes or less continuous overtime service with the right to go to meals after one hour's work, the shop employee will be paid time and one-half on an actual minute basis with a minimum of one hour, and he can be held for two hours before going to meals. The time then taken for meals will not terminate the employee's continuous service and must be paid for up to 30 minutes.

Again, instead of receiving five hours' pay for three hours and 20 minutes service or less when called to return to work the employee is to be paid a minimum of four hours for two hours and 40 minutes or less work. This four hours' pay must also be paid to employees called but not used.

During the course of hearings on the national agreements the railroads objected particularly to the provision of the old rule which allowed the employee to collect 10 or 15 hours' pay on the ground that, when he had completed the task for which he was called, his assignment to other emergency work constituted a second and sometimes a third call. To offset this the new rule says: "Employees called \* \* \* will be required to do only such work as called for or other emergency work which may have developed after they were called and cannot be performed by the regular force in time to avoid delays to train movement."

The new rule also makes provision for paying employees

time and one-half on an actual minute basis with a minimum of one hour for work performed in advance of the regular working period.

### RULE 9

Rule 9 in the Shop Crafts Agreement gives the employee who works through his lunch period one hour's pay and the opportunity to procure his lunch later without loss of time. The new rule gives him but straight time and the opportunity to procure his lunch later without loss of time up to 30 minutes.

### RULE 10

The railroads protested the provisions of Rule 10 of the Shop Crafts Agreement which enabled shop employees, sent out on the road for emergency service, to receive, under certain conditions, time and one-half for time spent in waiting for trains or in traveling. The new rule prepared by the Board eliminates these provisions, giving the employee on such work straight time for all time waiting or traveling.

The time of the employee sent out for such service was formerly reckoned from the time called until his return, but under the new rule his time begins when he leaves his home station.

Again, when such emergency service kept the employee on the road for several days, including either Sundays or holidays, he was guaranteed eight hours pay for week days and time and one-half for Sundays and holidays. Under the provisions of the new rule he is guaranteed but eight hours pay for each calendar day.

The new rule also provides that when an employee is required to leave his home station during overtime hours he will be allowed one hour's pay as preparatory time.

The following provision for wrecking service employees is added to the new rule:

"Wrecking service employees will be paid under this rule, except that all time working, waiting or traveling on Sundays and holidays will be paid for at rate of time and one-half, and all time working, waiting or traveling on week days after the recognized straight-time hours at home station, will also be paid for at rate of time and one-half."

### RULE 12

Changes similar to those made in Rule 10 are made in Rule 12, the provisions of which apply to employees sent out to fill temporary vacancies at outlying points. The railroads particularly objected to the last paragraph of Rule 12 of the Shop Crafts Agreement, which continued those rules more favorable to the employees in older agreements. The new rule contains no provision for the continuation of these older rules.

### RULE 14

Those shop employees regularly assigned to road work who have been paid, under Rule 14 of the Shop Crafts Agreement, straight-time for their regular hours and time and one-half for all overtime hours whether working, waiting or traveling will, under the revised rule, receive straight time for all hours traveling, waiting or working during regular hours and time and one-half only for work performed during overtime hours.

The new rule also contains the following paragraphs which are not included in the old rule.

"Where meals and lodging are not provided by the company when away from home station, actual expenses will be allowed.

"Where employees are required to use boarding cars, the railroad will furnish sanitary cars and equip them for cooking, heating and lodging; the present practice of furnishing cooks and equipment, and maintaining and operating the cars, shall be continued."

The starting time in both the old and revised rules is set at from 6 a. m. to 8 a. m. However, the following exception is included in the new rule:

"In case where the schedule of trains interferes with the starting time an agreement may be entered into by the superintendent of the department affected and the general chairman of the craft affected."

#### RULE 15

Rule 15 of the Shop Crafts Agreement has been changed to conform to the Board's decision relative to the payment of time and one-half for work performed on Sundays and holidays inasmuch as this rule applies to employees regularly assigned to road work and paid on a monthly basis. Whereas formerly the monthly rate of these employees was determined by dividing 3,156 hours, which includes 59 Sundays and holidays at time and one-half, by 12, their monthly rate is now to be deducted by dividing 2,920 hours, or 365 eight-hour days, by 12.

The new rule also contains the following paragraphs which will eliminate some of the features to which the carriers have strenuously objected:

"The regularly assigned road men under the provisions of this rule may be used, when at home point, to perform shop work in connection with the work of their regular assignments.

"If it is found that this rule does not produce adequate compensation for certain of these positions by reason of the occupants thereof being required to work excessive hours, the salary for these positions may be taken up for adjustment."

#### Board Outlines Its Opinions on

##### the Subject of Overtime

The Board in handing down these new rules said in part:

There was a wide diversity of rules among the numerous railroads of this country prior to the standardization that took place during federal control. It is therefore possible to cite precedents for almost any rule that may be advocated. Such precedents, at best, are persuasive, but not controlling. The fact that a given rule may once have existed by agreement on a road is not conclusive of its reasonableness and justness, for it may have been imposed on the employees by unavoidable necessity or on the carrier by economic pressure. The Board has therefore felt constrained to consider the principles of right and wrong involved in the proposals and counter-proposals submitted to it, in the light of present conditions and industrial history.

Throughout these rules, the soundness of the principle of punitive pay for overtime work has been recognized, but not to the extreme extent embodied in the National Agreement.

The eight-hour day has also been given full recognition. The policy of paying time and one-half for work performed on Sundays and holidays is also approved in Rule 6, but an important exception is provided. Certain kinds of work, which are unavoidably and regularly performed on Sundays and holidays and which are absolutely essential to the continuous operation of the railroad to meet the requirements of the public, are not treated as overtime work. The carrier has no choice as to the performance of this work, and does not arbitrarily require it. It is not just to penalize the carrier for that which it cannot escape. Manufacturing plants can, as a rule, control or eliminate Sunday and holiday work, therefore, a comparison of such plants with a railroad is unfair, except in so far as the "back shop" is concerned, and the method of paying for overtime in the back shop has not been disturbed by these rules.

There are other classes of employment in which Sunday and holiday work is regular and necessary, and those engaged in it are not paid overtime; for example, engineers, firemen, conductors, and trainmen, and, going outside of railroad service, police and fire department employees, and street car conductors and motormen.

The practice of allowing five hours for a call is a relic of the time when ten hours constituted a day's work, and it was thought just and reasonable to allow one-half day, or five hours, for a call. Now that the hours have been reduced to eight, by the same prin-

ciple, it is just and reasonable to make the allowance one-half day or four hours.

Employees usually commence work between 7 a. m. and 7:30 a. m., with a lunch period in the neighborhood of 12 o'clock noon, and finish their regular eight-hour period at 4 p. m. Certainly, there is no hardship in asking employees to continue on to 6 p. m. (if their services are required) before they go to a meal, and in many cases workmen would prefer to work the additional two hours in order to complete their work and go home without having to return.

If men are called after regular hours for some emergency work, it is fair and reasonable to use these men only on other emergency work which may have developed after they were called without being obliged to call them again or to call other men.

When men are sent out on the road for emergency service, or to fill temporary vacancies, it is certainly just and reasonable to pay them straight time for all time traveling or waiting, and for all time worked, straight time for straight-time hours, and overtime for overtime-hours in accordance with the practice at the home station or at the point where they are temporarily employed.

It is just and reasonable that men assigned to road service on a monthly basis should be paid eight hours per day, 365 days per year, without any allowance for overtime.

It is a fact that on many Sundays and holidays these men are not called upon to work, but no deduction is made in their pay. These monthly positions must be desirable because they are usually occupied by the older men, and there is regularity as to the monthly compensation.

The Board has felt impelled, however, to decline many of the modifications of said rules advocated by the carriers, because they appeared to go to an opposite extreme that is unjust and unreasonable. In this case, as so often happens in human experience, there is a point somewhere between the extreme positions of opposing forces where justice and reason may be found.

The rules above set out will become effective August 16, 1921, except that employees who have been paid under a less favorable rate or condition for the period embracing July 1 to August 15, 1921, inclusive, shall be reimbursed under these rules.

#### Dissenting Opinion of A. O. Wharton

For the first time in the history of the Labor Board a dissenting opinion accompanied the decision. A. O. Wharton, labor representative on the Board, in a lengthy argument opposed the decision of the majority on the grounds that "it does not appear either just or reasonable that conditions that have been in effect from 10 to 20 years and even longer, established as a result of negotiation and mutual agreement between employers and employees, and not infrequently established where no organization of employees existed, can now be decided as unjust or unreasonable." In support of this contention Mr. Wharton cited the overtime provisions for the shop employees in effect on approximately 100 carriers prior to December 31, 1917, adding, "No charge was made by the carriers and no evidence submitted to the Board that would justify any statement to the effect that any of the rules resulting from negotiation between 1902 and December, 1917, were the result of an undue exercise of the economic strength of the employees' organizations."

Regarding the majority ruling as to straight time rates for Sunday and holiday work for certain classes of employees whose work is necessary to maintain continuous operation, Mr. Wharton said:

"As a matter of fact and recorded in the public hearings conducted by the Board, with representatives of the carriers present and not challenging the statement, overtime at the rate of time and one-half for Sunday and holiday work, and for work outside of the regular established day, has been in effect for this class of employees for not less than 40 years; it was voluntarily put into effect 20 years prior to the time the shop crafts had organization sufficient to negotiate working conditions."

After making several comparisons regarding practices of public utilities and municipalities regarding punitive payments for Sunday, holiday and overtime work, Mr. Wharton cited a compilation prepared by representatives of the Federated Shop Crafts and showing the overtime practices prevailing in 2,544 firms in practically all states of the union during 1920. This compilation shows that \$69 of these firms paid double time for all overtime, that 2,270 paid time

and one-half or better for all time worked outside of regular hours and that but 49 paid straight time for all overtime.

"The plea that continuous service requirements should be a controlling factor in deciding that employees should be compelled to perform Sunday and holiday service for the same rate paid on week days," Mr. Wharton continued, "or that men should be assigned to work 365 days per year, with millions of workers walking the streets in search of employment is a fallacy not sustained by any recognized authority qualified to pass . . . upon a question . . . associated with the social and moral well-being of the nation's workers."

### The Division of the Board on

#### General Atterbury's Requests

In closing his dissenting opinion, Mr. Wharton quoted the minutes of the Board's executive session on February 9, at which the request of General W. W. Atterbury for immediate abrogation of national agreements, return to the working conditions of December 31, 1917, and the right to pay unskilled labor the prevailing rate in the locality in which they are employed, was under consideration. These minutes, which have heretofore been carefully guarded from public perusal, show that the announcement of the Board on February 10 denying General Atterbury's requests was drawn up by Henry T. Hunt, a member of the public group on the Board at that time. The quotation from the minutes also showed that W. L. Park, member of the railroad group, sought to have the Board terminate national agreements at that time, but was supported only by the other two representatives of the railroads. Five members of the Board, three labor and two public, voted against Mr. Park's resolution. Judge Barton, chairman of the Board and a member of the public group, did not vote. Mr. Hunt's announcement was adopted by the vote of the three labor representatives. Mr. Hunt and G. W. W. Hanger, public representatives, and J. H. Elliott, railroad representative. Mr. Park, Horace Baker and Judge Barton voted against the announcement.

## Freight Car Loading

WASHINGTON, D. C.

**A**N INCREASE OF 24,184 in the number of cars loaded with revenue freight during the week which ended on August 15, as compared with the previous week, was shown by the reports of the Car Service Division of the American Railway Association. The total loadings for the

week were 808,965 cars, which was, however, 162,304 cars less than were loaded during the corresponding week in 1920 and 23,474 cars below the total for the corresponding week in 1919.

Increases in the loading of all commodities were reported. The principal gain was in the loading of coal, the total for the week being 158,260 cars, which was an increase of 10,987 cars over that for the preceding week. It was, however, 63,500 cars less than were loaded during the corresponding week last year.

Tabulations also showed an increase of 7,209 cars compared with the week before in the number loaded with merchandise and miscellaneous freight which includes manufactured products, the total being 479,749 cars. Loadings of grain and grain products were 61,560 cars compared with 38,708 cars during the corresponding week last year and 45,651 cars compared with the same week in 1919. An increase of 225 cars in the number loaded with live stock was also reported, the total being 26,835 cars, which was 261 more than were loaded during the corresponding week last year.

Except for the Southwestern district, increases in the loading of all commodities compared with the week which ended on August 6 were reported in all districts, but in none did the total loadings equal those for the same district for the corresponding week last year.

Due principally to the increased demand for transportation facilities, a further decrease of 13,446 was reported in the number of freight cars temporarily out of service on August 15 because of business conditions (i. e., surplus cars plus bad order cars in excess of 7 per cent of the total), compared with the total on August 8, according to reports of the Car Service Division of the American Railway Association. This total on August 15 was 499,594, compared with 513,040 the week before.

Tabulations showed that of the total, 284,338 were serviceable freight cars while the remaining 215,256 needed repairs. Surplus box cars in good order totaled 84,522 on August 15, which was a decrease within a week of 4,071, while surplus coal cars which could be placed immediately in service if freight conditions warranted numbered 145,072 or 7,702 less than were reported on August 8.

A reduction in the car shortage, which has been reported at certain points, was shown by the reports. On August 15, this shortage was 2,125, or 1,239 below what it was on August 8.

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—All Districts, Comparison of Totals This Year, Last Year, Two Years Ago For Week Ended Saturday, August 13, 1921

Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise L.C.L.	Miscellaneous	Total revenue freight loaded		Received from connections	
										This year 1921	1920	This year 1921	1920

# General News Department

The nomination of Frederick I. Cox, of New Jersey, to be a member of the Interstate Commerce Commission, was confirmed by the Senate on Tuesday, August 23.

The Union Pacific shops at North Platte, Neb., have been reopened after being closed 7 months. Approximately 45 per cent of the former employees have been rehired.

A new organization of railway maintenance supervisory officers was formed in Chicago on August 17 under the name of the "Maintenance of Way Club of Chicago" with an initial membership of 53. The purpose of this club is the holding of meetings from time to time for the discussion of maintenance of way problems. The membership will consist of railway officers and others interested in the maintenance of railway tracks and structures. J. B. Martin, supervisor of track, New York Central, Elkhart, Ind., was elected president.

## Implement Manufacturers Urge Abrogation of All Labor Agreements

W. H. Stackhouse, president of the National Implement and Vehicle Association, has issued a statement setting forth the association's ideas regarding the railroad labor problem. Mr. Stackhouse urges as imperative that the "iniquitous Adamson law" be repealed, and, in addition, that the Labor Board be directed "to abrogate all labor agreements, including the unionization of our great transportation system."

## High Average of On Time Trains on the Pennsylvania

The Pennsylvania Railroad reports that in the Central Region on Tuesday, the 16th of August, 97.1 or 98.8 per cent of the 983 passenger trains operated in that territory arrived at their destinations on time and 98.2 trains or 99.9 per cent maintained schedule or better. The best previous daily record was made on July 25, when 99.7 per cent of the trains maintained schedule. In the month of July 98.9 per cent of the trains made schedule, an improvement of 3 per cent over July, 1920.

## Safety Section—A. R. A.

Safety Section, Operating Division of the American Railway Association will hold its first annual meeting at the Hotel Copley-Plaza, Copley Square, Boston, Mass., on Monday, September 26, beginning at 8:00 a. m. Eastern standard time. It is expected that progress reports will be submitted by the committee of direction; the publicity and educational committee, and the committee on prevention of grade crossing accidents. Hotel reservations should be made direct with the Hotel Management without delay.

## Gasoline Motorbus in Railway Service

The Bennettsville & Cheraw Railroad Company, Bennettsville, S. C., has just had completed by the Charlotte Wagon & Auto Works of Charlotte, N. C., a combination trailer car to be operated in connection with its motorbus passenger car which has been run for some time. Concerning the motorbus car a letter from Superintendent W. J. Fooser to the Manufacturers Record says: "This car was designed by our president, J. J. Heckart, using an ordinary 3-ton Corbett truck chassis. The Corbett Motor Company, Henderson, N. C., built the body, it having a capacity of 31 passengers. This car, having no compartment for baggage and mail, we had the trailer built after determining the power and speed of the original car.

"Our experience has been very satisfactory; while our passenger

traffic is light, the operation of this car has proven to us the value of this kind of equipment for short lines.

"The average cost per mile for operation being 13.5 cents; average mileage per gallon of gas 8.5 miles."

## 150 Cars, Eleven Miles an Hour

On August 7, the Ann Arbor Railroad ran what is said to be the longest freight train ever operated in the State of Michigan. It was from Owosso, Mich., southward to Toledo, Ohio, 104 miles. The train left Owosso at 6:15 a. m., with 53 loads and 97 empties, weighing 3,932 tons, and arrived at Toledo at 4:00 p. m., with 53 loads and 98 empties, weighing 3,951 tons. It was hauled by one locomotive of the Santa Fe type with 70,000-lb. tractive effort, equipped with duplex stokers, except that a pusher was used for four miles out of Owosso.

## "Fuel Economy Month"

September has been designated as Fuel Economy Month by the Illinois Central and the campaign will apply to all departments using coal. The goal for the month has been set at 20 per cent less than the September record in former years. The best previous month's record in freight service was 133 lb. per 1,000 gross ton miles in June, 1918; in passenger service the best month's record was 1,637 lb. per 100 passenger car miles for August, 1916; while in switching service the best record was 117 lb. per switch engine mile in September, 1918. Weekly progress reports will be made by the divisional fuel committees.

## Claims Prevention Campaign on the Southern Pacific

The Southern Pacific, Pacific System, will conduct a freight claim prevention campaign to last during the month of September, to educate employees of the company in methods of handling freight so as to cut down loss, damage and errors. The campaign will be under the general supervision of R. G. Fagin, superintendent of freight protection, under whose jurisdiction special committees have been appointed on each division to direct the campaign. The company plans at the same time to educate shippers to the value of proper marking, packing and loading of their consignments.

## Photographs On Commutation Tickets

The New York Central, following its experimental introduction of a rule requiring holders of season tickets to furnish their portraits to be pasted on the ticket (or its case) announces that this requirement will be put in effect, on September 1, at a large number of stations; all those embraced in zones which, roughly, extend from points 30 miles from New York to those 75 miles distant. The principal stations included in these zones, on the different divisions, are: Hudson River division: Poughkeepsie (73 miles), Beacon, Cold Spring, Garrison, Peekskill, Croton and Ossining.

Putnam division: Brewster (54 miles), Carmel, Mahopac, Yorktown Heights, Briarcliff Manor (27 miles).

Harlem division: Pawling (64 miles), Patterson, Brewster, Croton Falls, Golden's Bridge, Lake Mahopac, Katonah, Mt. Kisco and Pleasantville (31 miles).

West Shore: Highland (73 miles), Newburgh, Cornwall, West Point and Haverstraw (33 miles).

The railroad will furnish the case or pocket in which to carry the ticket, and the buyer must provide a photograph 1 3/4 in. square, the same picture to be used 12 months.

From Poughkeepsie to New York the one-way fare is \$2.63, while the cost of a ride on a monthly ticket is only 31 cents. The announcement says that, at one station, under the experi-

mental introduction of the picture requirement, the sales of commutation tickets decreased 41 per cent the first month; indicating a loss, at that one station, of \$90,000 a year. The company appeals to its commuters to aid in putting a stop to this injustice.

### Magistrates Do Not Punish Tramps

Since the editorial note with above title was written, the following press dispatch from Albany, N. Y., has appeared:

"Railroad officers have asked the State Constabulary to aid them in their effort to drive hoboes off their property and discourage the knights of the road in their efforts to steal train rides and other things. Freight trains are infested by non-paying passengers and some of these characters are vicious. Freight conductors and brakemen have been robbed by thugs. In two instances last week murder was committed. Seasoned railroad men say that never within their recollection has there been such a raft of tramps jumping trains as there are today. They say they are virtually taking their lives in their hands when walking along to inspect the cars of their trains at night. Detectives employed by the railroads are doing their best to cope with the situation, but do not seem to make much headway. It is not unusual for a crew of railroad detectives to apprehend as many as twenty tramps on a single freight train.

"In many instances railroad detectives have been compelled to release their prisoners because they cannot get them juggled. Peace officials of most of the smaller towns situated along railroad lines refuse to jail these tramps, and let them go under suspended sentence, the reason being these towns cannot afford to keep the tramps in their lockups for several days. It is said that one town, where an obliging magistrate developed the habit of sending railroad tramps to the cooler, is about \$2,000 in debt through expenditures incurred in caring for these prisoners."

### Western Roads Refuse Brotherhoods' Demands

The demands of the "Big Four" railway brotherhoods, the Switchmen's Union of North America, and the Order of Railroad Telegraphers to wipe out the recent wage cut, withdraw all further demands for wage decreases, and withdraw all demands for elimination of time and one-half for overtime refused by the railroads last week, as noted in the *Railway Age* of August 20, page 383. The Western roads, in their statement, issued by A. W. Trenholm (C., St. P., M. & O.), chairman, said:

"A proper regard for the public interest in the operation of the railroads does not permit the officers of the railroads to give assurance that such requests for further decreases as have been made will be withdrawn. This committee has no knowledge as to how many railroads have made requests for further decreases, but there is a demand on the part of the public for reductions in freight and passenger rates, and such reductions cannot be made under the present labor costs. There is no assurance that the cost of living will not be decreased within the next few months, and for the railroads to take the position that there would be no requests for decreases in wages, presented in lawful and orderly manner to the board, there could be no justification. As to the elimination of time and one-half for overtime in train and yard service, the railroads, with a proper regard for the public interest and their affairs, cannot give the assurance sought. This committee realizes that many railroads have certain rules in their schedules which are not in keeping with the rulings and principles laid down by the Railroad Labor Board and cannot bind themselves to refrain from asking relief from such burdensome and expensive conditions where they exist."

The demands of the Brotherhoods for the restoration of the rates of pay in effect prior to the recent wage cut was declined, with the following statement: "In their duty to the public as imposed upon them by the Transportation Act, the railroads must perforce put into effect and maintain decreases in wages just as they recognize the authority of the board in giving effect to increases such as were granted by Decision No. 2, which increased the pay of railroad employees approximately \$600,000,000 per annum."

Leaders of the train service brotherhoods met in Cleveland on August 23 to prepare ballots, to be sent out to the whole membership, setting forth the general situation and calling for a vote.

## Commission and Court News

### Interstate Commerce Commission

The Pere Marquette Ry. has asked the Commission for a certificate of public convenience to abandon a line in Claire county, Mich.

Intrastate rates charged by the carriers in Tennessee on stone and gravel, c. l., for use in the construction of public highways and consigned to federal, state, or local authorities, have been found by the Interstate Commerce Commission to result in undue prejudice to shippers of interstate traffic. Rates are prescribed by the commission to relieve such discrimination, to become effective October 13. Rates on common brick and sewer pipe, c. l., were found not unduly preferential.

The commission has amended the regulations governing the transportation of dangerous articles to provide (beginning September 1) that arsenic, Paris Green, arsenate of lead, calcium arsenate, and other strongly poisonous articles must not be offered or accepted for shipment in bulk, but must be packed in strong and tight containers which will prevent sifting or escape of contents in transit, but sintered arsenical flue dust may be shipped between plants in steel gondola cars equipped with suitable covers.

### State Commissions

The Public Utilities Commission of Ohio has sent to the Interstate Commerce Commission a protest against the suspension of the reduced freight rates recently announced by the Detroit, Toledo & Ironton. The Ohio commission declares such action unjust and a usurpation of authority, and conducive to great hardship to the people of Ohio.

THE SECRETARY OF AGRICULTURE, testifying before the Interstate Commerce Commission in its investigation into grain rates, said that he was assured that Argentine wheat could be laid down in Europe or in the Eastern ports of this country cheaper than wheat from Chicago. The re-establishment of the rates which were in force prior to August 26 last year was urged by nearly every witness for the grain shippers at the hearing, which continued before the commission the greater part of last week. Secretary Wallace supported their plea, although he did not claim that the difficulties of the farmers were caused entirely by the increase in freight rates.

American Car Materials Ready at Portland, Ore., for Shipment to China

## Foreign Railway News

### Mexican Locomotive Situation Improves

According to Assistant Trade Commissioner Cornell, 130 locomotives have been purchased in this country by the Mexican government. Of these, 85 were obtained on a rental basis with the view of ultimate purchase and 45 by outright purchase. On these cash payments of from 15 to 20 per cent have already been made. These purchases presumably do not include the recent purchase of 65 locomotives from the Baldwin Locomotive Works.

### American Participation in Electrification in Italy

LONDON.

The electrical technical mission of the Italian government which visited the United States for the purpose of studying the American railways has returned and an official statement was issued from which it appears that a mission of American financiers and representatives of American railway companies will shortly go to Italy in order to arrange for American participation in the electrification of the Italian State Railways.

### South African Railway and Harbor Extensions

LONDON.

According to the estimates of expenditures on capital and betterment works for the year ending March 31, 1922, the new program of expenditure on the South African Railways and Harbors will involve a total amount of £2,778,082 (approximately \$13,501,478 at the normal rate of exchange). Of this it is estimated that additions to railway lines will involve £627,992 (or \$3,052,041) and rolling stock £972,000 (\$4,724,920), while £1,132,090 (\$5,501,957) is estimated for expenditure on harbors.

### Proposed Denationalization of Swiss Railways

There is a strong movement for denationalizing the railways of Switzerland, according to the Railway Gazette (London). It is well known, says the Gazette, that there has been a good deal of dissatisfaction with the working of the Swiss Railways for some time and this has culminated, after 25 years of nationalization, in the agitation for abolition of state ownership and control. An initiated measure is now going the rounds of the citizenry and if 50,000 voters sign it the matter must go to the congress and be submitted to a referendum.

### The Extent of the Railways in Central America

LONDON.

At the present time the railways of the Central American states which propose to form a Federation, are as follows, according to the Economic Trade Review (London):

	Area sq. miles	Number of inhabitants	Railway miles
British Honduras .....	8,270	40,000	349
Costa Rica .....	18,680	45,500	349
Guatemala .....	43,600	1,842,000	614
Honduras .....	44,000	600,000	357
Nicaragua .....	49,400	800,000	171
Salvador .....	13,120	1,350,000	264
Panama .....	33,190	400,000	298
Panama Canal Zone.....	425	30,000	...

### Austrian Railway Situation

LONDON.

Before the war the Austrian State railways owned 1,180 miles of track of which only 462 miles is left to it, according to Engineering Progress (London). There remain only 300 passenger cars and 3,200 freight cars. Repairs are badly in arrears. Piece work, however, has been restored in the railway shops with a resultant increase of 25 per cent in output, and by working ten hours overtime a week this has been improved by a

further 31 per cent. The cost of rolling stock has increased over seven times what it was in December, 1919, and at the present time freight cars cost 80 times as much as they did before the war. Definite results for the year 1920 are not yet at hand, but it is estimated that there will be a deficit of 600,000,000 kronen (\$150,000,000 at normal exchange, \$800,000 at prevailing exchange).

### Railway Tunnel Under Thames Proposed

The river Thames widens rapidly after leaving London on its eastward course and no means is provided of crossing it east of London. Because of this fact railways in the east of England in moving traffic north and south have to move their trains through London, greatly increasing the congestion at that point. Certain capitalists now are seeking governmental sanction to construct a tunnel under the river at Gravesend to provide a railway connection between the north and south. The tunnel proposed would be 2 3/4 miles in length and would cost in the neighborhood of \$25,000,000 (at par exchange). North of the river a new line of railway would be built to connect with the Midland, the Great Eastern, the Great Northern and the London Northwestern. South of the river a connection would be provided with the channel ports over the rails of the Southeastern & Chatham.

### Southern Pacific Claims Against

#### the Mexican Government

According to authoritative information received from the City of Mexico, the Mexican government may not accept the Southern Pacific estimate of damage to its lines in that country. At least, there is a difference of more than \$5,000,000, United States currency, in the figures fixed by the government engineer, Federico M. Torres, and the claim which the Southern Pacific has submitted for payment. Mr. Torres recently finished an investigation of the damage to the Southern Pacific of Mexico, incurred during the revolutionary period, and he has just made a report placing the amount at 14,000,000 pesos, equivalent to \$7,000,000 United States currency. Some time ago the Southern Pacific put in a claim for more than \$12,000,000, to cover the damage to the property. It is reported that the government plans to investigate all of the larger claims for banditry and revolutionist damages that have been or may be submitted to it.

### The Needs of the Rumanian Railways

LONDON.

The Bulletin of Economic Intelligence for May issued by the Banque Marmorosch, Blank et Cie., insists upon the importance of transport as affecting the financial question in Rumania.

M. N. Miclescu, formerly Director-General of the Rumanian railways, attributes all the difficulties of transport not to the want of trucks but to a shortage of locomotives. Before the war there were 1,000 locomotives in good condition for 1,864 miles of railroad, while now there are only 1,000 locomotives in bad condition for 7,457 miles of railroad owned by Greater Rumania. This state of affairs, he says, must be remedied at all costs. The sidings are crowded with thousands of locomotives which cannot be used because there are no means of repairing them. New engines, therefore, must be bought; the old locomotives must be repaired either abroad or within the country; and the railway engineering works must be remodelled and new works erected at various centers. According to published information 635 locomotives have been ordered abroad, 175 of which are for delivery in 1922, and 460 in 1923. Contracts have also been made with the Rumanian and foreign firms for the overhauling and repair of all locomotives put out of service since the war. By the beginning of the year 1923, the number of locomotives running will be equal to the pre-war strength, and after that all locomotives repaired abroad will go to swell the traffic. The position, therefore, is not desperate, but, unfortunately, the present shortage prevents the country profiting from the very high prices obtainable for commodities. There is also another aspect, the government having been forced to negotiate long-term loans abroad in order to obtain the necessary funds to cover the purchase of new rolling stock and the cost of repairs. ||

## Equipment and Supplies

### Locomotives

THE CHICAGO, ROCK ISLAND & PACIFIC is inquiring for 10 Mikado type locomotives.

### Freight Cars

THE GEORGIA RAILWAY is making repairs to 125 box cars, in its shops at Augusta.

THE PEKIN-KALGAN (China) is inquiring through the car builders, for 200 gondola cars, of 40-tons capacity.

THE CHICAGO, ROCK ISLAND & PACIFIC is inquiring for 200 gondola cars and is also asking for bids for the repair of 500 all-steel general service cars.

THE ERIE has entered into a contract with the Greenville Steel Car Company, Greenville, Pa., for the repair of 500 coal cars, of 50 tons capacity.

THE ILLINOIS CENTRAL, in the *Railway Age* of August 6, as inquiring for prices on the repair of 900 miscellaneous box and gondola cars, is now asking for figures on the repair of 1,250 gondola cars.

ARGENTINE STATE RAILWAYS.—The Argentine Ministerio de Obras Publicas, Buenos Aires, is asking for bids until September 2, for 70 broad gage freight cars, of 45 tons capacity, for use on the Port Railways, according to a cablegram from Commercial Attache Edward F. Feely, at Buenos Aires.

### Iron and Steel

ITSUJI & COMPANY, New York, are asking for bids until August 27, for 4,000 tons of 60-lb. rail and 200 tons of splice bars, for the Japanese Government Railways.

THE CHICAGO, BURLINGTON & QUINCY will receive bids until 12 o'clock noon September 2, for 5,250 miscellaneous steel plates; 5,310 miscellaneous steel bars; 330 miscellaneous tank steel plates; 2,190 miscellaneous angle steel bars, and 400 channels.

### Track Specialties

THE CANADIAN NATIONAL RAILWAYS will receive bids at Toronto, Ont., until 12 o'clock, noon, September 17, 1921, for 1,000,000 railway ties.

### Machinery and Tools

THE SOUTH MANCHURIA RAILWAY has ordered one 88 in. lathe, through Frazer & Company, New York.

THE ILLINOIS CENTRAL has ordered from the Niles-Bement-Pond Company one 90-in. heavy driving wheel lathe, also a car axle lathe.

THE PITTSBURGH & LAKE ERIE has ordered from the Niles-Bement-Pond Company a double-end wheel press and a car wheel borer.

THE MISSOURI PACIFIC has ordered from Manning, Maxwell & Moore, Inc., New York, a 42 in. motor-driven drill press, for its Sedalia, Mo., shops and a 23B Greenlee Brothers mortiser for its Dupu, Ill., shops.

### Signaling

The new work on the CHESAPEAKE & OHIO, between Charlottesville, Va., and Staunton, 40 miles, is proceeding satisfactorily. The bonding of the track and the erection of the pole line will

be finished before long. The American Automatic Train Control Corporation, which is installing automatic tram stops on this section, has given to the Union Switch & Signal Company a contract for the roadside apparatus, including color-light signals, three-indication (44 signals), with relays and other apparatus; an aggregate of material amounting to about \$90,000.

### Miscellaneous

THE NEW YORK CENTRAL will receive bids until 12 o'clock noon, September 9, for its present requirements of lead covered cable, switch points, slide plates and braces for repairs to switches, switch levers, tongue switches, tongue slides for repairs to switches, and crossing frogs; and for its shops requirements until October 31, 1921, of black galvanized and blue annealed sheets, driving and truck tires for freight switching and passenger service, seamless steel tubes for repairs to locomotives and stationary boilers, axles for car and locomotive repairs, wire nails and staples, steel bars, steel shapes and steel plates.

### Trade Publications

SUPERHEATERS FOR SMALL LOCOMOTIVES.—The advantages derived from the use of superheated steam are recognized so generally by railroad motive power officers that it would seem hardly necessary again to call attention to them. Gains equivalent to those obtained from the application of superheaters to large railroad locomotives are being realized on small industrial locomotives of 40 ton weight or under such as are used around industrial plants, in quarries, gravel pits, mines, logging operations, construction work, etc., but as the owners of locomotives of these types are usually not so familiar with the details of locomotive design as are railroad motive power officers, superheaters have not been so generally used on their motive power. Bulletin No. 9 of the Superheater Company shows what has already been accomplished in the industrial field and will be of interest to anyone who is responsible for the purchase or operation of small industrial locomotives.

### Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company, which was noted in the *Railway Age* of August 6 (page 270) as having closed bids for additions to its power house at Albuquerque, N. M., to cost approximately \$150,000, has awarded the contract for this work to E. F. Ware, El Paso, Tex.

CHICAGO, ROCK ISLAND & PACIFIC.—This company will construct a new car repair shop at Trenton, Mo., with company forces.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for the construction of an 8-stall roundhouse at Amarillo, Tex. The building will have brick walls and a timber frame and roof, and is estimated to cost about \$35,000.

CHICAGO UNION STATION.—This company is accepting bids for electrical equipment for the substation to be installed in connection with its new railway terminal building, Chicago.

GREAT NORTHERN.—This company contemplates the construction of new ore loading docks at Superior, Wis., to cost about \$1,500,000, replacing wooden structures which are no longer adequate.

ILLINOIS CENTRAL.—This company, which was noted in the *Railway Age* of July 23 (page 184) as accepting bids for the construction of a frame enginehouse, with dimensions of 60 ft. by 200 ft., at Herrin, Ill., has awarded the contract for this work to G. A. Johnson & Son, Chicago. The company has also awarded a contract for widening the bridge approaching its passenger platform at the Randolph street station, Chicago, to the A. Lund Construction Company, Chicago.

MISSOURI PACIFIC.—This company has awarded a contract to Joseph E. Nelson & Sons, Chicago, for the construction of 5 car-repair sheds. These sheds will be of frame construction, 40 ft. wide by 240 ft. long, and will be built at Crane, Mo., Council Bluffs, Sedalia, Jefferson City and Nevada. The total cost of this work is estimated at about \$55,000.

## Supply Trade News

W. G. Ryan has been appointed special representative of the railroad service department of the **Addressograph Company**, with offices at Chicago.

A. Clarke Morre has resigned as assistant to president of the **Globe Seamless Tube Company**, with which he has been connected since November, 1919.

F. C. Severin, New York manager, with office at 50 Church street, of the **Betts Machine Company**, Rochester, N. Y., has resigned to go into other business.

L. M. Waite, formerly sales manager of the National Acme Company, Cleveland, Ohio, and later sales manager of the Springfield Automatic Screw Machine Company, Fitchburg, Mass., has been appointed sales manager of the **Garvin Machine Company**, New York, succeeding Frank A. Power, resigned.

The **Stowell Company**, South Milwaukee, Wis., has effected a merger with the **Pelton Steel Company**, Milwaukee. The Pelton Steel Company name will be retained and the plant will continue to be operated by the same organization, under the direction of the officers and directors of the Stowell Company.

Walter R. Pfisterer, railway sales engineer of the National Carbon Company in the Chicago territory, has resigned, effective September 1, to become sales manager of the newly organized **Direct Sales Company**, with headquarters in the Manhattan building, Chicago. This company will act as a manufacturers' representative, handling railroad accounts in the Chicago district. Mr. Pfisterer was born at California, Pa., on May 30, 1881. His first railway work was on construction in the signal department of the Union Pacific at Omaha. Later he was transferred to the signal engineer's office, where he had charge of all material for the large construction program in 1906 and 1907. Early in 1907 he was appointed chief clerk to the signal engineer and about a year later he entered the signal department of the Southern Pacific in California. In 1908 Mr. Pfisterer entered the service of the Chicago, Rock Island & Pacific as chief clerk to the signal engineer, which position he held until August 15, 1913, when he resigned to enter the railroad sales department of the Yale & Towne Manufacturing Company at New York City. Mr. Pfisterer remained with this company until December 15, 1914, when he resigned to become sales engineer of the National Carbon Company, Cleveland, Ohio, in the railroad sales department.

W. R. Pfisterer

John C. Robinson has resigned as manager of New England sales at Boston, Mass., for William Wharton, Jr., & Co., Inc., Easton, Pa., after 30 years of continuous service. Mr. Robinson will in future devote his time to his interests in the firm of Harrington, Robinson & Co., Boston. The Boston office of the Taylor-Wharton Iron & Steel Company, High Bridge, N. J., and William Wharton, Jr., & Co., Inc., is now at 201 Devonshire street, in charge of Walter H. Allen.

## Railway Financial News

**ARKANSAS HARBOR TERMINAL.**—*Asks Authority to Issue Notes.*—This company has asked authority from the Interstate Commerce Commission to issue \$50,000 of prior lien 5-year 6 per cent gold notes to be pledged with the Secretary of the Treasury as collateral security for a loan of like amount from the revolving fund.

**ATCHISON, TOPEKA & SANTA FE.**—*Authorized to Abandon Branch Line.*—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon a branch line in Kay County, Okla.

**CENTRAL VERMONT.**—*Asks Authority to Issue Bonds.*—This company has asked authority from the Interstate Commerce Commission to issue \$147,000 of refunding mortgage 5 per cent gold bonds dated May 1, 1920, for the purpose of reimbursing its treasury for expenditures from income in payment of a similar amount of certain equipment gold notes.

**CHICAGO & EASTERN ILLINOIS.**—*Annual Report.*—The income account for the year ended December 31, 1920, is as follows:

Railway operating revenue (March 1 to December 31).....	\$31,307,448
Railway operating expenses (March 1 to December 31).....	29,763,451

**EASTLAND, WICHITA FALLS & GULF.—Asks Authority to Issue Stock and Bonds.**—This company has asked authority from the Interstate Commerce Commission to issue to purchasers all stock in the company subscribed and fully paid, not to exceed \$1,000,000; to issue its bonds to the amount of \$551,000 for which the company already has received full payment; and to secure the bond issue by a first mortgage and deed of trust on all property of the carrier.

**GREAT NORTHERN.—Loan Approved.**—The Interstate Commerce Commission has approved a loan of \$586,000 to this company to enable it to provide itself with new equipment. The carrier is required to finance \$588,320.

The Commission has also approved a loan of \$15,000,000 to the Great Northern to enable that railway to meet maturing indebtedness. The loan must be repaid within six months from September 1. It is secured by the pledge of \$18,844,000 of the applicant's general mortgage, series A, 7 per cent gold bonds, due July 1, 1936, executed and delivered by the applicant to the first National Bank of the City of New York, trustee.

**Authorized to Sell Equipment Notes.**—The Great Northern has been granted authority by the Interstate Commerce Commission to sell not more than \$606,000 of equipment gold notes in connection with the procurement of certain equipment under an agreement to be dated August 1, 1921, with the General American Car Company, the vendor, and the First National Bank of New York City, trustee, at an aggregate cost of \$1,145,000. The sale of the notes to the trustee is proposed at a price 9 7/8 per cent of par.

**GULF, MOBILE & NORTHERN.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year, as follows:

	1920	1919

**LOUISVILLE & NASHVILLE.—Application to Issue Capital Stock Amended.**—This company has amended its application to the Interstate Commerce Commission, which asked for authority to issue \$53,000,000 of capital stock for distribution as a stock dividend pro rata among its stockholders. In its original application the carrier also asked authority to execute and deliver its first and refunding mortgage to secure divers series of bonds, to issue series A of these bonds aggregating \$28,615,000, and to sell \$12,753,000 of this amount outright to J. P. Morgan & Co. The applicant now asks authority from the commission to procure the authentication and delivery of it of the entire \$28,615,000 of bonds but to sell only \$12,753,000 of them now.

**LOUISIANA & PACIFIC.—Asks Authority to Abandon Line.**—This company has asked the Interstate Commerce Commission for a certificate of public convenience to abandon a line in Beauregard Parish, La.

**PEARL RIVER VALLEY.—Authorized to Issue Notes.**—The Interstate Commerce Commission has authorized this company to issue from time to time unsecured promissory notes not at any one time to exceed \$27,000 in renewal of certain outstanding notes.

**SALT LAKE & UTAH.—Asks Authority to Issue Stock.**—This company has asked authority from the Interstate Commerce Commission to issue \$500,000 of its 7 per cent cumulative first preferred stock and to pledge the same to secure a loan of \$700,000 from the Treasury revolving fund.

**ST. LOUIS SOUTHWESTERN.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**VALDOSTA, MOULTRIE & WESTERN.—May Not Be Junked.**—A company is being organized by W. J. Vereen, of Moultrie, Ga., to purchase this road from C. L. Jones, its present owner, and operate it as a going concern. The road was sold on April 9, 1921 to Mr. Jones for \$87,000 with the right to dismantle the line. Seven miles of it have been junked already.

**WATERLOO, CEDAR FALLS & NORTHERN.—Authorized to Pledge Bonds and Sell Stock.**—This company has been authorized by the Interstate Commerce Commission to pledge to the United States \$2,200,000 of general mortgage 7 per cent gold bonds, of which \$1,575,000 is for collateral security for a loan from the revolving fund and \$625,000 is collateral for a loan from the Railroad Administration. The applicant has also been authorized to sell at par \$700,000 of common stock and to issue lease warrants aggregating \$132,159 in connection with the procurement of equipment.

**WESTERN PACIFIC.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year as follows:

	1920	1919
Total operating revenue (March 1-Dec. 31).....	\$13,595,790	.....
Total operating expenses (March 1-Dec. 31).....	10,311,410	.....
Net revenue from railway operations.....	3,284,380	.....
Total operating expenses.....	10,311,410	.....
Net revenue from railway operations.....	3,284,380	.....
Railway tax accruals.....	670,079	148,313
Total operating income.....	2,613,487	Def 148,313
Income from lease of road.....	*317,368	1,900,350
Total non-operating income.....	2,056,685	2,370,030
Gross income.....	4,664,171	2,221,717
Interest on funded debt.....	1,302,755	1,213,348
Total deductions from gross income.....	2,247,960	1,495,936
Net income.....	2,416,212	725,781

\*Includes rental due from United States Railroad Administration for January and February, 1920, at \$1,900,350 per annum. Final settlement with the United States Railroad Administration fixing compensation at \$3,200,000 per annum increased this item to \$533,976 and for year 1919 to \$320,000.

The Western Pacific did not accept the government guaranty.

### Partial Payments of Guaranty

The Interstate Commerce Commission has certified to the Treasury partial payments of guaranty to the following roads:

Detroit, Bay City & Western.....	\$4,500
Mississippi Eastern.....	8,500

### Final Settlements with Railroad Administration

The Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Atlantic Coast Line.....	\$5,500,000
Boston Terminal Company.....	75,364

The payment of these claims in final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the Administration during the 26 months of federal control.

### Dividends Declared

Buffalo & Susquehanna.....Common, 1 1/4 per cent, quarterly, payable September 30 to holders of record September 15.  
New Orleans, Texas & Mexico.....1 1/2 per cent, quarterly, payable September 1 to holders of record August 25.

# Annual Report

## St. Louis Southwestern Railway Company—Thirtieth Annual Report

NEW YORK, June 15, 1921.

To the Stockholders of the  
St. Louis Southwestern Railway Company:

Herewith is submitted the Thirtieth annual report of your Company, for the calendar year ended December 31, 1920.

The report of Mr. J. M. Herbert, President, which follows, gives the operating revenues, expenses and operating results, for the two months of Federal control, January and February, and the ten months of Corporate control, March to December, inclusive, as well as the financial and physical condition of the property.

Expenditures were made during the year 1920 for additions and betterments, in the sum of \$1,959,993.47, this representing an increase over similar expenditures for previous year of \$548,393.22. No change was made in the Capital Stock of the Company during the year. The Funded Debt was decreased during the year 1920 in the sum of \$260,000.00 through payment of Equipment Trust Obligations at maturity.

The Board of Directors takes pleasure in expressing thanks to the officers and employees for their cooperative and efficient services during the year.

By Order of the Board of Directors,

EDWIN GOULD,

Chairman.

St. Louis, Mo., June 1, 1921.

MR. EDWIN GOULD,

Chairman of the Board of Directors,  
New York, N. Y.

Dear Sir:—

Herewith is submitted report, for the year ended December 31, 1920, of the operation and affairs of the Company, its financial and physical condition, et cetera, at the close of the year.

In accordance with proclamation issued by the President of the United States under date of December 24, 1919, Federal control and operation of the railroads of the United States terminated February 29, 1920, and the property of the Company was accordingly returned to the Corporate officers for operation and management, effective March 1, 1920.

### GUARANTY PERIOD.

MARCH 1 TO AUGUST 31, 1920, INCLUSIVE.

Under the terms of the Transportation Act, 1920, the law enacted by Congress for the return of the railroads to their owners, there is provided, among other things, a guaranty of net railway operating income for the six months period, March 1 to August 31, 1920, inclusive, equal to one-half the annual compensation, certified by the Interstate Commerce Commission, as due the carriers during Federal control.

Acceptance of the guaranty, as provided in Section 209 of the Act, required the carrier to turn back to the Treasury of the United States, any sums earned in excess of the guaranty. The terms of this section also placed a limit upon expenditures for maintenance of way and structures in operating expenses, in determining the net income. Effort was accordingly made to ascertain from the Commission what its policy would be regarding maintenance expenditures during the guaranty period. No commitment being obtained, there was no means of knowing the amount of money that could be appropriated and used for maintenance work. The Company had been in controversy with the United States Railroad Administration on account of inadequate and inefficient maintenance of its property, and the immediate necessity for large maintenance expenditures, and these conditions, as you know, were fully weighed before decision was reached to not accept the terms of the guaranty under the Transportation Act, and to operate the property upon our own resources and responsibility, effective March 1, 1920.

Comparison of Operating and Income Results, for period March 1 to August 31, 1920, on basis of acceptance and non-acceptance of Federal Guaranty, follows:

March 1 to August 31, 1920.

	On Basis of Non-Acceptance of Federal Guaranty.	On Basis of Acceptance of Federal Guaranty.
Operating Revenues	\$14,511,930.25	\$14,511,930.25
Operating Expenses	12,077,251.16	10,483,965.92*
Net Revenue from Railway Operations— Tax Accruals and Uncollectible Railway Revenues	\$2,434,679.09	\$4,027,964.33
	\$25,281.54	\$25,281.54
Railway Operating Income	\$1,909,397.55	\$3,502,682.79
Nonoperating Income—Net	346,369.08†	346,369.08†
Gross Income	\$2,255,766.63	\$3,849,051.87
Amount of Guaranty	—	1,949,012.88

Amount that would have reverted to Interstate Commerce Commission had the Federal Guaranty been accepted.....

— \$1,900,038.99

Excess Income over Amount of Guaranty disregarding credit due account of Maintenance Expenditures in excess of estimated Federal Allowance.....

\$306,753.75

Excess Maintenance Expenditures.....

1,593,285.24

Total in Excess of Guaranty.....

\$1,900,038.99

\*If the guaranty under the Transportation Act of 1920 had been accepted, the Company would have been restricted in its expenditures for Maintenance of Way and Structures and Maintenance of Equipment to the amount set up by the United States Railroad Administration as sufficient. On this basis \$1,593,285.24 would have been eliminated from operating expenses for the period, March 1 to August 31, 1920, thereby increasing the amount to be turned over to the United States Government.

†Excludes Nonoperating Income account not contributing to Guaranty Income.

The operating results for the guaranty period demonstrated the wisdom of the decision to not accept the guaranty, as well as the earning capacity of the property. During this period a greater volume of traffic was handled than in any corresponding period in the history of the Company, notwithstanding the handicap imposed by the outlaw switchmen's strike, which became effective April 8, and continued in full force and effect until the latter part of June.

The decision of the United States Railroad Labor Board, increasing the rate of pay of all classes of employees approximately 21%, was announced July 19; however, the increases were made retroactive to May 1. This resulted in an additional cost to be absorbed in operating expenses of the guaranty period of approximately \$900,000. Notwithstanding these difficult conditions, the operations for this period produced net railway operating income of \$2,255,766.63, compared with \$1,949,012.88, the amount of income that would have accrued to the Company under the terms of the guaranty, an increase of \$306,753.75.

In addition, there was expended for maintenance of the property during this period a total of \$5,943,725.18, or \$1,593,285.24 in excess of the estimated amount the Company would have been permitted to spend under the terms of the guaranty.

The excess amount produced, \$306,753.75, plus the excess amount expended for maintenance, \$1,593,285.24, produced a total of \$1,900,038.99, net railway operating income earned in excess of the amount the Company would have been permitted to retain if the terms of the guaranty had been accepted; all of which was used for the benefit of the property.

The increase in freight and passenger rates authorized by the Interstate Commerce Commission, did not become effective on interstate traffic until August 26, and the increased rates applying to intrastate traffic, both freight and passenger, were resisted by the various State Commissions, some of which were not in effect until 1921, so the revenues for this period received practically no benefit from the increased rates, whereas the operating expenses include approximately \$900,000, for increased rates of pay to employees; therefore, the net operating income produced for this period is based almost entirely on the old rates for service to the public and the higher wage rates to employees during four months of the period.

Following the termination of Federal control, occasioned by excellent service rendered the public by and through the several departments, this company obtained a large volume of freight traffic.

Owing to the movement of this traffic our revenues did not reflect the general decline in business until the latter part of the year and we, accordingly, continued to make liberal appropriations from current income for maintenance, in order to partially restore the physical condition of the property.

YEAR ENDED DECEMBER 31, 1920.

During the year under review, the track mileage operated was 1775.98 miles as compared with 1754.50 miles for the previous year, the increase in the mileage being due principally to the resumption of operation of our freight trains over the Chicago & Eastern Illinois Railroad between Thebes, Ill., and Olive Branch, Ill., and the Illinois Central Railroad between Olive Branch, Ill., and Cairo, Ill., from March 1 to December 31, 1920, which service was suspended during Federal control.

Immediately following will be found condensed statements showing the financial results from operation for the combined Federal and Corporate periods of the year 1920 compared with 1919.

CORPORATE AND FEDERAL FINANCIAL RESULTS FROM OPERATION—SYSTEM INCOME STATEMENT FOR CALENDAR YEAR.			
ITEM.	YEAR ENDED		+Increase. —Decrease.
	Dec. 31, 1920.	Dec. 31, 1919.

Total	\$10,473,848.08	\$10,303,763.84	+ \$170,084.24

Notwithstanding the heavy maintenance charges to which reference has previously been made, we closed the year with a net income of \$2,959,836.80, all of which was appropriated for investment in physical property.

## OPERATING REVENUES.

The total operating revenues for year 1920 amounted to \$31,020,958.11 as compared with \$30,661,162.63 for previous year, an increase of \$359,795.48, or 1.17%. This net gain in revenue is attributable in some measure to the increase in freight rates and passenger fares granted by the Interstate Commerce Commission, effective August 26, 1920, as to interstate traffic and subsequently extended to intrastate traffic, as more fully explained hereafter, and to the fact that the year was mainly due to a marked increase in the volume of freight traffic handled.

Statement showing comparison of freight and passenger traffic handled during the year 1920 and previous year will be found in the report. It will be interesting to note that the volume of freight traffic handled during the year 1920, amounting to 675,316,142 ton-miles or 59.21%. Passengers carried one mile shows a small decrease.

## OPERATING EXPENSES.

Total operating expenses for the year amounted to \$25,886,055.67 compared with \$18,497,241.15 for the previous year, an increase of \$7,388,814.52, or 39.95%. While the percentage of increase in operating expenses is large, it will be noted it is considerably under the increase in operating revenues. The increase in volume of traffic handled for a large portion of the increased operating expenses, but other unavoidable conditions occasioned no small part of same. In addition to the heavy maintenance charges to which reference has heretofore been made, the operating expenses for the year include approximately \$1,900,000.00, representing the increase in the payrolls for months May to December, 1920, inclusive, growing out of the increases paid, in compliance with order of the United States Railroad Labor Board promulgated July 19, and were also unfavorably affected during the Federal control period of January and February and for a short period thereafter by the payment of large sums for overtime.

Following are some of the major items of maintenance and betterment work accomplished during period of Corporate management, March 1 to December 31, 1920, and cost of same:

Maintenance of Way and Structures—	
Purchase and Application of 642,505 cross ties	\$1,138,993.29
Adding cross ties inserted during two months of Federal control, makes a total of 777,612 ties applied during year, an increase of 130,111 compared with 1919	
Application of 449,181 tie plates to soft wood ties in main line tracks	158,138.14
At beginning of Federal control there were not in our tracks, main lines, branches or side tracks, more than hardwood ties, white oak, red oak, etc. The United States Railroad Administration, during their management, permitted the hardwood tie practically to go out of use and inserted in our tracks, main line and others, 679,035 pine ties, a considerable number of which were untreated and some of which were placed in track without tie plates. At termination of Federal control practically all of the ties on hand were pine and it was, therefore, impossible to revert to exclusive use of hardwood ties until the matter of production could be worked out, which required several months. This made necessary application of tie plates on light traffic branches that would not have been required if sufficient hardwood ties had been available. The quantity of hardwood ties which we were able to secure, has rapidly increased to the extent that for the year 1921 all ties inserted in main lines, including main lines of branchers, are of hardwood.	
Application of 74,718 cubic yards of ballast	139,888.00
Filling and shoring up 9,040 feet of trestle work	143,236.90
Application of drain tile, widening cuts and fills, and ditching	560,580.88
Reconstruction of telegraph lines	30,687.59
Laying of 75.76 miles of new 85-pound rail, replacing worn 75-pound rail	353,298.28
Total	\$2,524,823.08
Maintenance of Equipment—	
Rehabilitation of freight equipment	\$568,216.53
Restoration of 1,358.178 miles in mileage capacity of locomotives, in excess of miles consumed in service	178,884.63
Total	\$747,101.16
Grand Total	\$3,271,924.24

Contract was also made with the Baldwin Locomotive Works for purchase of twenty-one consolidation freight locomotives, ten of which were received and placed in service during year, thereby adding 496,400 pounds tractive power. The total cost of the ten locomotives was \$518,928.48.

The average load in tons per loaded freight car mile and per loaded freight train mile for the past ten years was as follows:

YEAR ENDED	St. L. S.-W. Ry. Co. of Texas.	System.
JUNE 30, 1912	18.02	16.43
1913	18.02	16.43
1914	18.22	16.19
1915	17.95	16.57
1916	18.18	17.40
YEAR ENDED DECEMBER 31, 1920	18.52	17.30
1916	20.89	19.34
1917	24.10	23.34
1918	22.46	19.97
1919	24.69	22.41
1920	24.69	24.10

Average load in tons per train mile, including Company material:

YEAR ENDED	St. L. S.-W. Ry. Co. of Texas.	System.

YEAR ENDED DECEMBER 31, 1920	48.57	250.67
1916	61.62	286.10
1917	67.00	340.75
1918	68.37	299.48
1919	72.87	344.92
1920	72.87	344.92

## RATE SITUATION.

As previously stated, the operating revenues for the past calendar year were favorably affected by increases prescribed in interstate freight rates and passenger fares by the Interstate Commerce Commission's order in Ex parte 74, effective August 26, 1920. The increases in the interstate freight rates varied according to the geographical groups designated in the order. The Western group in which our lines are included was granted increases approximating 35 per cent. Interstate passenger fares were increased to 3.6 cents per mile.

Negotiations were entered into with the State Commissions for increases covering intrastate traffic resulting in increases in intrastate passenger fares to 3.6 cents per mile and increases in freight rates in keeping with the interstate rates authorized by the Interstate Commerce Commission. The effective dates of the increases authorized in the various states were as follows:

Passenger Fares:	Freight Rates:
Missouri, September 1, 1920.	Texas, August 26, 1920
Arkansas, January 1, 1921.	Missouri, September 1, 1920.
Texas, March 14, 1921.	Arkansas, September 1, 1920.
Louisiana, April 6, 1921.	Louisiana, October 1, 1920.

## AGRICULTURAL AND INDUSTRIAL.

Excellent crops generally were produced in the territory traversed by our lines during the year 1920, although the prevailing high cost of labor and materials created an excessive expense. On the other hand a material reduction in prices had taken place by harvest time, resulting in much disappointment to the farmers generally, and in heavy losses to many of them. Cotton production tributary to our line during 1920 was above normal, and in addition thereto, there was a large quantity of cotton carried over from previous year which had been withheld from market in anticipation of higher prices. When the 1920 crop had matured the demand, both domestic and foreign, had greatly diminished and prices had declined accordingly. This reduced demand and the unwillingness of producers to accept the prevailing prices delayed the marketing of cotton in some measure, unfavorably affecting our revenues during latter part of 1920, and first half of 1921. We hope, however, to receive our share of this cotton when moved.

A systematic program of instructions to farmers as to the scientific cultivation of crops, preservation of orchards, eradication and prevention of animal and plant diseases was carried on by this company through practical demonstrations which no doubt contributed to the satisfactory results for the past year from the standpoint of quality as well as quantity of production, and which should be conducive of permanent improvement in the agricultural conditions adjacent to our line.

## NEW EAST ST. LOUIS FREIGHT TERMINAL.

Reference has been made in previous reports to the organization of the Valley Terminal Railway for the purpose of constructing a complete freight terminal at Valley Junction, St. Clair County, Illinois, adjoining East St. Louis. This terminal was completed and taken over for operation by the United States Railroad Administration as of August 1, 1918. At termination of Federal control, it was leased from the Valley Terminal Railway, and since April 1, 1920, has provided our terminal facilities at East St. Louis, the joint terminal arrangement with the Missouri Pacific at DuPont, Illinois, having been discontinued as of that date.

By reason of having our independent terminal facilities at East St. Louis during the period of the outlaw switchmen's strike, which was declared April 1, 1920, and continued in full force and effect until the latter part of June, we were enabled to handle a large volume of traffic through the St. Louis-East St. Louis gateway with practically no delay. Had we been without our separate and exclusive terminal facilities during the acute period of this strike, we would have been deprived of the entire gross revenue accruing on business handled through this terminal during this period. It is conservatively estimated that the revenue thus derived, after deducting the cost of performing the service, was sufficient to cover the entire amount invested in the facilities and leave a margin of profit.

Substantial economy has also been effected in the operating cost compared with the cost under the joint operating arrangement with the Missouri Pacific.

## OPERATION OF FREIGHT TERMINAL AT ILLINOIS, MO.

Effective September 1, 1920, the Missouri Pacific Railroad Company withdrew from participation in the joint operation of the terminal at Illinois and we have accordingly enjoyed the exclusive use of these facilities since that date.

The combined traffic of both companies had outgrown the facilities and their continued use had become impracticable. We accordingly opened negotiations for the extension and enlargement in order to serve both companies. Substantial economy has resulted through our exclusive operation.

## MEMPHIS FREIGHT TRAFFIC

On March 1, 1920, the Missouri Pacific Railroad Company served the required twelve months' written notice cancelling its contract with this company covering the handling of freight traffic between Fair Oaks, Arkansas, and Memphis, Tennessee. Subsequent conferences were held with the officers of that company to negotiate a new agreement upon a fair and equitable basis. No disposition, however, was shown to negotiate a new agreement on a basis that would permit this company to compete for traffic growing through the Memphis gateway.

Use of these facilities for the handling of freight traffic and conferences with their officers, empowered to act, agreements were drawn covering the use of their facilities, the terms of which will provide a substantial saving to this company, compared with the terms offered by the Missouri Pacific and also enabled us to operate our own freight cars out of Memphis, and are therefore definitely established as a Memphis line.

In addition to the operating economies which the new arrangement will bring about, there are other benefits which will accrue to this company through association with above mentioned volume of competitive traffic which we have not heretofore enjoyed.

## Railway Officers

### Executive

**J. C. Murray**, whose appointment as receiver of the Missouri & North Arkansas, with headquarters at Harrison, Ark., was announced in the *Railway Age* of July 23 (page 185), was born at Chicago, on August 21, 1885, and entered railroad service on February 26, 1902, with the Cincinnati, New Orleans & Texas Pacific. He served in various positions in the traffic department of this company until July 20, 1907, when he was employed in the auditing department of the New York, Chicago & St. Louis. A year later he was employed in the traffic department of the New Orleans & North Eastern, and in December, 1909, he took a similar position on the Louisville & Nashville. Mr. Murray entered the service of the Missouri & North Arkansas as a tariff compiler in August, 1911, and served successively as chief clerk in the freight department, general freight agent, general freight and passenger agent, and freight traffic manager. He was serving in the latter position at the time of his appointment as receiver.

### Operating

**T. F. Allen** has been appointed supervisor of transportation of the Northwestern Pacific, with headquarters at San Francisco, effective August 15, with special assignment to the staff of the general manager.

### Traffic

**H. H. Ellis** has been appointed advertising manager of the Chicago, Rock Island & Pacific, with headquarters at Chicago, effective August 1, succeeding **W. D. Braddock**, who has been granted an extended leave of absence.

### Engineering, Maintenance of Way and Signaling

**J. W. Williams**, chief engineer of the Northwestern Pacific, with headquarters at San Francisco, Cal., has been appointed chief engineer of the Western Pacific, with the same headquarters, effective August 15, succeeding **T. J. Wyche**, who has been appointed consulting engineer.

**G. H. Hicks**, principal assistant engineer of the Northwestern Pacific, with headquarters at San Francisco, Cal., has been appointed acting chief engineer, effective August 15, succeeding **J. W. Williams**, resigned to become chief engineer of the Western Pacific.

**J. E. Fanning**, has been appointed roadmaster of the Iowa division of the Illinois Central, with headquarters at Fort Dodge, Iowa, succeeding **E. I. Rodgers**, who has resigned to become chief engineer of the Peoria & Pekin Union, with headquarters at Peoria, Ill., effective August 17.

### Mechanical

**E. J. Brennan** has been appointed superintendent of motive power of the Chicago Great Western, with headquarters at Oelwein, Iowa, effective August 15, succeeding **H. C. Eich**, resigned.

**T. Allison** has been appointed road foreman of engines of the Pasco division of the Northern Pacific, with headquarters at Pasco, Wash., effective August 17, succeeding **R. E. Wilkinson**, who has been granted an extended leave of absence.

**G. C. Seidel**, master mechanic of the Minneapolis & St. Louis, with headquarters at Marshalltown, Iowa, has been appointed mechanical engineer of the Chicago & Alton, with

headquarters at Bloomington, Ill., effective August 13, succeeding **J. H. Leyonmark**, deceased.

### Purchasing and Stores

**C. C. Kyle** has been appointed acting general storekeeper of the Northern Pacific, with headquarters at St. Paul, Minn., effective August 17, succeeding **O. C. Wakefield**, who has

### Obituary

**L. P. A. Weissenbruch**, inspector general of the Belgian State Railways and general secretary of the International Railway Congress, died at Brussels on August 7, after an extended illness.

**Epes Randolph**, president of the Southern Pacific of Mexico and the Arizona Eastern, died at Tucson, Ariz., on August 22. Mr. Randolph was born in Lunenburg County, Va. He entered

Epes Randolph

road service in 1876 in the engineering department of railroads in the eastern part of the United States that were controlled by Collis P. Huntington, and he early became one of Mr. Huntington's most trusted lieutenants. When the Chesapeake & Ohio built into Cincinnati, Mr. Randolph was in charge of the construction of its bridge across the Ohio river. In 1894 it became necessary for him to go to Arizona on account of his health. He was out of railway service for a year and then went with Mr. Huntington on the Southern Pacific.

After Mr. Harriman acquired control of the Southern Pacific, Mr. Randolph maintained much the same relationship to him that he had to Mr. Huntington. Among other things he was made president of the California Development Company, a Southern Pacific enterprise which had much to do with the development of the Imperial valley in California, and was president of this company in 1906, when the entire valley was threatened with desolation by an overflow of the Colorado river. The work done to save that section of the country was carried on under the supervision of Mr. Randolph, whose engineering experience and skill, coupled with his remarkable sagacity for quick action, probably saved the region. Subsequently, when the Southern Pacific decided to extend its lines into Mexico, Mr. Randolph was chosen to handle that work.

Previous to March, 1891, Mr. Randolph was superintendent and chief engineer of the Elizabethtown, Lexington & Big Sandy, the Kentucky & South Atlantic and the Ohio & Big Sandy, all now parts of the Chesapeake & Ohio. For two years from the date mentioned he held the same titles on the Newport News & Mississippi Valley and the Ohio Valley, and in January, 1893, his jurisdiction was extended over the Chesapeake, Ohio & Southwestern, all three of which roads are now parts of the Illinois Central. He was appointed superintendent of the Yuma and Tucson divisions of the Southern Pacific in May, 1895, and was promoted to general manager of the Los Angeles Railway and the Pacific Electric Railway in 1901. In February, 1902, he was elected president of the Gila Valley, Globe & Northern, the Maricopa & Phoenix, the Arizona & Colorado, the Cananea, Yaqui River & Pacific and the Sonora Railway, and since June, 1909, when he was made vice-president of the Southern Pacific Railway of Mexico, he has been general manager also of these lines. In February, 1910, Mr. Randolph was also elected vice-president and general manager of the Arizona Eastern, which absorbed the Gila Valley, Globe & Northern, and in October of the following year, he was elected president of the Southern Pacific and the Arizona Eastern, which position he held at the time of his death.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free: United States, Mexico and Canada, \$8.00. Foreign Countries (excepting daily editions), \$10.00. £2 01s. 0d. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue 5,100 copies were printed; that of these 9,100 copies 8,049 were mailed to regular paid subscribers; 55 were provided for counter and news company sales, 344 were mailed to advertisers; 65 were mailed to employees and correspondents and 587 were provided for new subscriptions, samples, copies lost in the mail and office use, that the total copies printed this year to date were 338,100, an average of 9.66 copies a week.

**Combined Tapering Roll and Swedging Machine**

This machine is constructed so that, after the spring leaves are taper rolled, a swedging attachment forces the metal back to the proper width.

**Hydraulic Spring Stripping Machine**

This machine removes the bands from spring leaves, without heating and without damage to the band or leaves.

**Ryerson-Riegel Universal Spring Forming Machine**

This machine forms elliptic spring leaves of any size and curvature used in ordinary practice, requiring but one spring maker for its operation.

## This Road Saves Over \$21,000 in Spring Repairs

Instead of shipping their locomotive springs hundreds of miles and back some roads repair them at home.

Using Ryerson Spring Shop Equipment one road saved \$21,500 in two and a half years after returning the entire cost of the equipment.

What do **YOUR** spring repairs cost? We'll tell you what they should cost.

**Triple-Pressure Hydraulic Banding Press with Assembling Table**

This machine is of the triple-pressure type, capable of exerting a maximum pressure of 100 tons, and with minimum and intermediate pressures of 33 and 67 tons.

**Combined Shearing and Hot Punching Machine**

This machine is designed for cold shearing spring stock and for hot punching slots for inside hangers as well as notching for outside hangers.

*Send for Standardized Spring Shop Layouts.*

Some eminent historian and student of American government has expressed the opinion that although the Senate is on the whole composed of men of more mature judgment than is the House of Representatives and proposed measures receive much more complete and learned discussion in the higher body, it is nevertheless true that the record of actual accomplishment of the one body is not so much better than that of the other. This is perhaps a weighty manner in which to refer to a measure like the proposed railroad funding bill, but it does nevertheless seem to apply rather aptly. The Senate recessed on August 24 without having come to a vote on the Townsend bill although the House had already voted favorably on its companion Winslow bill. That the Senate should have failed to pass this measure before its recess is—to say it as mildly as possible—unfortunate. The reasons for its failure to secure action are many, but the most striking one is the fact that discussion continued so long as to use up all the time that was available. The strange part is that one of those senators who did most to prevent action is supposed to be a friend of labor. One of the chief arguments in favor of the bill was that by releasing capital at present tied up, the railroads and the companies which sell to them would be permitted to “resume,” in other words, to start the wheels turning, thereby enabling men now laid off to return to work. Love of discussion is doubtless a great thing, but it is rather difficult to see how a professed friend of labor and of the people can justify discussion and expression of his love for “the people as against the interests” while at the same time his actions are hurtful to the very people for whom he essays to speak.

On August 15 when government control ended, the railways of Great Britain embarked upon what promises to be the most interesting period in the history of transportation in that country. The railways have been returned to their owners without government guaranties in spite of decreased earning power and a rate scale so high that general increases are not contemplated. The managements have a difficult problem before them which is complicated, but perhaps also made easier of solution, by the setting up of a tribunal to fix rates sufficiently high to secure fair returns to the companies and by the mandatory consolidation of the roads into four systems, plans for which the carriers must submit by January 1, 1923, or else have the consolidations effected by the government as it sees fit. In the main the system of regulation of rates and services which the government of Great Britain has assumed is not without precedent elsewhere and embodies no features which would be startling to one familiar with the minute details of practice which are regulated by public bodies in this country. The method of settling labor disputes, too, is not a radical departure from precedent. The compulsory consolidation of the railways is the remarkable feature of the new legislation. The amalgamation is on a non-competitive, territorial basis—an entirely different theory from the

voluntary consolidation on the basis of competitive systems provided in our Transportation Act. There are some who expect great economies to be effected by these consolidations. Whether their expectations are justified, time only will show. At any rate, we in America can thank Great Britain for making the experiment, hoping that reliable data may be available from their experience in this direction before any far-reaching steps toward consolidation are taken in this country.

The average citizen of the United States believes that the cost of the fuel for the locomotive together with the wages of the train crew and ticket agent constitutes the major part of the cost of operating a railroad. Other expenses for supplies, maintenance of way and rolling stock are given small consideration in their calculation. However, the expenses of the store, signal, telegraph, engineering and police departments, with whom the public has little or no contact, are only a few of the necessary costs concerning which the public has little conception. Adverse public opinion was a controlling factor in bringing about the present predicament of the railroads and it would therefore seem to be the duty of every railroad officer, employee and stockholder, to help enlighten the general public on a few of the difficulties now being encountered by the railroads. A short instructive talk before the Commercial Club on the function and expense of a certain department by the local representative will have a broad influence in the community. Officers out on the line should be prepared to speak before gatherings of farmers or business men. The opportunity is not limited to rare occasions, for the doctor, lawyer, farmer and the traveling public in general are keenly interested in the railroad and will listen with interest to any conversation explaining some phase of railroad operation. Such local publicity, properly directed all along the line, will exert an extensive influence on future railroad regulation. The management of every railway should take pains to put in the hands of all of their local officers information which will enable them to discuss the railway situation effectively with those with whom they constantly come in contact.

The delivery of cars by the builders in July was greater than the production of the previous month and the number of cars on order and undelivered was reduced, as shown by the Railway Car Manufacturers' Association's monthly statement published elsewhere in this issue. The production of freight cars in July for domestic service as reported by the 26 car building plants was 3,892 and the freight cars on order and undelivered at the end of July was 6,145 cars, as compared with a production of 2,245 and a total of 12,149 on order and undelivered at the end of the previous month. The above figures show that there were 1,647 more cars delivered for domestic service and that the number of cars on order

### Car Orders and Deliveries

cars on order and undelivered was reduced, as shown by the Railway Car Manufacturers' Association's monthly statement published elsewhere in this issue.

was reduced 50 per cent during July as compared with the previous month. The reduction of cars on order is due not to increased output of the shops, but rather to a lack of orders being placed for new equipment. The number of cars to be repaired on order and undelivered increased during July. The figures for deliveries of cars during August are not yet available, but orders placed and inquiries for new equipment and repairs in the equipment record of the *Railway Age* show that orders were placed in August for repairs to 6,423 freight cars and inquiries for prices on repairs were made for a total of 3,000 cars. There were only 101 new freight cars ordered in August. Orders placed during August for locomotives totaled 67 for export and only 2 for domestic service. Equipment business at present continues to be principally in orders for repairs rather than in orders for new cars, but even orders for repairs are apparently being delayed until definite action is taken on the funding bill now in Congress.

The steps which are being taken by the Boston & Maine to meet motor truck competition are noteworthy as being among the few examples wherein a railroad has made a determined effort to hold its traffic against the rivalry of the truck. The action taken by the road is not particularly novel or original. It is in the form of a reduction of some  $33\frac{1}{3}$  to 50 per cent in what are termed the rates on "express matter, miscellaneous shipments of, contents unknown or not stated," applying to cities and towns within a distance of 50 miles from Boston. These express rates are used by industrial concerns and the local express companies, the manner in which they are used by the latter being somewhat as follows: The local express companies pick up the traffic, let us say, in Boston; the freight is loaded into a railroad car and after its rail movement it is distributed by the express company in the local community. The tariff contains a note saying that the rates "will apply only when an individual car is assigned exclusively to this service." The new tariff was filed August 6 and effective September 10, except in the case of some of the rates which have already gone into effect. One of the typical rates is that applying to Lowell, 28 miles out of Boston, wherein a charge is made of 9 cents per 100 lb. with a \$20 per car minimum; a few months ago this rate was  $20\frac{1}{2}$  cents per 100 lb. with a \$15 minimum. The scheme of moving traffic under these miscellaneous express rates is of long standing, but in recent years the motor truck has cut sharply into the business, so that it is estimated that to some of the cities in the local zone 50 per cent and even 80 or 90 per cent has been handled on the highways, the proportion depending in a large measure upon the distance. There seems to be an idea that the Boston & Maine has cut its local less than car-load rates; in view of the manner in which the reduced rates are to be applied this construction of the road's action is hardly correct. It would be a commonplace to say that the progress which may be made under the new rates will be watched with considerable interest.

While it is true that many railroads now have a reserve of serviceable locomotives, the large reduction in shop and enginehouse forces of many other roads has made it difficult to do much more than maintain running repairs, to say nothing of accumulating a surplus. Approximately 60 per cent of railway earnings are spent in wages and when the first order came a few months ago to reduce expenses the most natural step

was to reduce forces and cut labor costs. This policy was logical and to be expected but it has had several serious results. Any reduction of forces below that required for normal shop operation is open to the objection that important repair work must necessarily be put off. This can be classed as deferred maintenance work which, if delayed until business is good, will be extremely costly on account of holding locomotives in repair shops when they should be on the road earning revenue. Additional disadvantages of letting too many men go are the loss of organization and morale and the subsequent expense of hiring new men whose abilities are unknown. As one mechanical officer says: "Too much use is made of the easy way of reducing expenses by making too drastic cuts in the labor force, which results in increased expenses in other ways. For example, a man who was assigned to look after air leaks in a large shop was taken off to save his wages, with the result that the increase in air leaks caused a loss equal to many times his wages in additional coal consumed, wear on air compressors, and low air pressure causing slowing up of the work." It is especially costly when roundhouse forces are cut too much. A broken or defective locomotive part should be replaced or repaired immediately, otherwise it may cause the failure of a far more important and expensive part. If enough men are not left in the roundhouse organization to take the proverbial "stitch in time" the resultant cost due to inadequate maintenance of running repairs will far more than offset possible labor savings.

The stock market two or three weeks ago was apparently trying to reconcile a feeling of pleasure that the June net of the Class I railroads—\$51,641,014—represented a gain of some \$14,000,000 over May with a trace of disappointment that the June net should have been some \$47,000,000, or 47 per cent, below the 6 per cent contemplated in Ex Parte 74. It is now trying similarly to reconcile its pleasure concerning the reports now appearing showing increases in net for July with disappointment over the failure of the Senate to come to a vote on the railroad funding bill and realization that much of the increase in net for both June and July has been in deferred maintenance. At any rate, the improvement that has taken place—even if it has not been as great as was to have been desired—has been something about which it is worth while becoming interested and things to become interested in seem rather rare in stock market circles at present. The gradual improvement in earnings and the progress made on the funding bill have given the railway shares a strength which industrial shares have not had; we speak with due regard to the temporary decline in railway stock prices following the failure of the Senate to vote on the Townsend bill. The prices of industrial stocks have been experiencing a gradual decline which has now extended with brief interruptions since the fall of 1919. This decline has not affected railway shares in like degree, with the result that the railway and industrial stocks are now nearer together in price than they were. The more present point of interest is that during the past few weeks with the exception of the present week the decline in industrials has been especially pronounced, while on the contrary the railroad shares have advanced several points. The sales of railway shares have not been great enough to show that the rails have regained their old-time popularity. The comparative strength in railway shares as contrasted with the lack of it in industrials shows, however, that the stock market has an open mind on the subject at least insofar as concerns the progress which the railways are making towards restoring their net income to normal levels.

### Meeting Motor Truck Competition

### Strength in Railway Securities

### Locomotive Maintenance in Slack Times

## Rates Higher—Railroad

### Service Costs Public Less

IN SPITE of higher railway rates, both passenger and freight, the people of the United States paid almost \$21,000,000 less for railroad transportation in the first six months of 1921, under private operation, than they did in the first six months of 1919, under government operation.

This was due partly to the fact that a smaller amount of railroad service was rendered, but mainly to other causes. The first half of 1919, like the first half of 1921, was a period of business depression. The depression was more severe, however, in the first half of 1921, and the amount of freight service rendered was 7½ per cent less than in the corresponding part of 1919, and the amount of passenger service rendered almost 15 per cent less. But in spite of the smaller traffic handled the total earnings of the railways in the first six months of 1921 were almost \$320,000,000 more than in the first six months of 1919. How, then, it may be asked, can it be that the public paid less for its railroad service than in the first six months of 1919?

The explanation is very simple. In 1919, under government control, the public paid in taxes for part of the transportation service it received because the railways were under government control and incurred a large deficit. In the first half of 1921 the public paid for its transportation entirely in freight and passenger rates because the railways were under private operation.

The total earnings of the railways in the first six months of 1919 from their rates were \$2,356,685,300, but the government in these six months, according to the estimate of Director General Hines, incurred a deficit of \$296,101,654, which made the total amount paid by the public in both rates and taxes \$2,652,786,984. The various governments, especially the state governments, got back from this amount in taxes paid to them by the railroads \$91,663,514. This made the net cost to the public of the railroad service rendered to it \$2,561,123,470.

In the first six months of 1921 the total earnings of the railways were \$2,676,497,252. The amount of taxes paid by the railways to the national and state governments was \$136,120,810. Deducting this from the earnings makes the total net cost to the public of the railroad service it received, \$2,540,376,442, or \$20,747,028 less than the net cost in the first six months of 1919.

The saving made to the public in the total amount paid by it for railway transportation was made at the expense of very heavy losses to the owners of the railways. The net operating income actually earned by the railways in the first six months of 1921 was less than \$142,000,000. This was about one-third of the net return they received in the first half of 1919 under government control, when their net return was guaranteed by the government. It was about \$95,000,000 less than the mere interest on their bonds, since six months' interest on their bonds is about \$237,000,000.

Although the public actually paid almost \$21,000,000 more for its railroad service in the first six months of 1919 than in the first six months of 1921, and although the necessity of paying a given amount of taxes imposes as much of a burden on business as the necessity of paying a given amount of rates, the high cost of transportation in the first six months of 1919 did not prevent a great increase of general business activity and of railway traffic in the last half of the year.

The present cost of railroad transportation undoubtedly is too high, but it is the railway owners rather than the public who have suffered most from it thus far this year, since, while the public actually has paid less for railroad service than it did in 1919 under government control, the owners of the railways have received many millions of dollars less of net return.

## Fire Risks in Sleeping Cars

THE BURNING of a sleeping car, resulting in the death of five passengers, near Walsenburg, Colo., on the Denver & Rio Grande, on March 16, briefly reported in the *Railway Age* of March 25, page 812, was an unusual disaster which apparently must go into the train-accident record under the head of unexplained. The officers of the road made an investigation, at which were present representatives of the Public Utilities Commission of the state, and a coroner also held hearings; but no formal report has been issued by the coroner or by the commission and, so far as appears, the commission is not going to issue any. Thus, all that the public knows about the tragedy is that it is an unsolved mystery.\*

When a problem involving life and death is enveloped in complete darkness the only recourse is to explore all possible sources of danger. The worst fire risks on passenger trains are exceedingly hard to cope with. One well known danger in sleeping cars is the cigarette. Passengers who smoke in their berths are said to be seen quite commonly by porters who are watchful, and this sad accident may well be taken as the occasion for repeating to employees, and through them to the public, the admonition to bear in mind that, in a sleeping car, a fire, once started, has peculiar horrors; and especially so when, late at night, every person in the car may be asleep. An officer of the Canadian Pacific has lately come out in a newspaper statement calling attention to this risk, and appealing to travelers to be more considerate of their fellow passengers' safety—and of their own. He cites a case where a passenger set fire to his bedding, and disastrous consequences were only prevented by the vigilance of the porter. An operating officer of that road informs us that the company's inspectors find large numbers of window ledges scorched by cigarettes which were placed on them by passengers while in the berths. Had the cigarette in any instance fallen into a blanket and been fanned by a draft from an open window, the possible results can be imagined.

Another dangerous practice is the use of liquid fuel lamps and heaters by passengers. The Canadian Pacific has posted in its sleeping cars and coaches the following notice:

#### AVOID DANGER BY FIRE

"In the public interest, the use by passengers on railway trains of wood alcohol or fuel lamps, Theroz Fuel Cakes, Sterno Canned Heat, or other methods of heating is strictly prohibited. These may be heated on the cars by means of the appliances provided by the railway companies."

The notice is, however, ignored by thoughtless and selfish passengers, who use the flame heaters both in wash rooms and in berths. These heaters can be carried in a handbag; and with a locked wash room door, or drawing room door, the passenger can defy the most vigilant porter or trainman. And such passengers are not very likely to realize how easily the sudden stoppage of the train might upset the lamp, set a dressing gown afire and start a panic.

The fire insurance men of the United States at their last convention said that the aggregate of the fire losses in this country in 1920 was \$500,000,000, and the increase in this

\*The train involved in this accident was west-bound passenger No. 155. The accident occurred about 10 miles from the first of five cars, and the fourth car in the train, the sleeping car "Columbia," took fire while the train was moving at about 25 miles an hour. The first three passengers were burnt to death. Two passengers, who were sleeping in window berths, were slightly injured. The other passengers are said to have been asleep at the time of the fire. The train was carrying a large number of passengers. There is evidence that the car had been smoking for some time before the fire broke out. The occupants were taken as they were, before the cars were burned. The fire was first discovered by the conductor of the train who, looking back, observed sparks coming from one of the rear cars; and the train was then stopped. By that time the car was a mass of flame and the trainmen had difficulty in getting a fire to the head of the train and to find it. Apparently the fire, the only employee in the car, was asleep. The Pullman conductor being in the car, the trainman in the car behind. The investigation is held by the railroad company and by the coroner appear to have developed no further information as to the cause of the fire.

huge total year by year sometimes seems to indicate that the universal American vice of carelessness is incurable. This Canadian Pacific poster, however, suggests a simple duty which deserves the attention of all operating officers. To some officers this poster—as indeed do all posters, circulars and other printed matter—will at once suggest what it cannot do; or, in more natural language, will call to mind the lesson of many experiences, that a printed admonition, aimed at everybody in general and at no one in particular, is of value chiefly as a starting point. The main dependence for effective results must be on vigilant, energetic employees.

## Some Facts Bearing on Strike Talk

THERE is much talk at present by railway employees and railway labor leaders regarding strikes. This talk is chiefly due to the 12 per cent reduction in wages ordered by the Railroad Labor Board, effective July 1, and to the Board's recent decision changing the shop crafts' rules regarding overtime. Before any railway employees talk seriously about striking there are certain facts they should carefully weigh.

First, the present situation of railway employees who actually are at work is a very favorable one compared with the situation in which the farmer and other working men find themselves. The average wholesale prices of farm products is only 15 per cent higher than it was in 1913. The average wage per hour of union labor in the United States in the year 1920 was 99 per cent higher than in 1913. Since then wages in almost all other industries, except in the coal mining industry, have been reduced more than in the railroad industry. The average wage per hour of a railway employee is now about 63½ cents, or 125 per cent higher than in 1913. According to the statistics of the Bureau of Labor the average cost of living in the United States in May, 1921, was 80.4 per cent more than in 1913, while the National Industrial Conference Board reported that at that time it was 65.7 per cent more than in July, 1914. It has been declining since then, and the National Industrial Conference Board reported it as being in August only 62 per cent higher than in July, 1914. Therefore, whether we compare his situation with that of the farmer or that of other union working men, or measure it by the changes which have occurred in the cost of living, we are bound to conclude that the present situation of the average railway employee is extremely favorable.

Secondly, there are at present millions of men out of employment in this country and general business continues to be dull. The unemployed include many who have in the past worked on the railways, and who are capable of doing work on the railways again. Seldom has there been a time when it would have been as easy for the railways to have replaced employees who struck as it would be now.

Public sentiment is an important factor in labor troubles. When it is so easy to show that railway employees are very favorably situated with respect to wages and working conditions as it is now, it would be extremely difficult to arouse much public sentiment in favor of railway employees who went on strike. Furthermore, doubtless among the millions who are now unemployed there are not a few who would be glad to accept employment on the railways at even lower wages than those provided for in the Labor Board's recent decision.

The leaders and members of railway labor organizations have at least the average intelligence of the American citizen. They can hardly be unfamiliar with facts such as have been stated in the foregoing, despite all the efforts that radical propagandists have made, and are making, to mislead them. Therefore it does not seem probable that any large class of railway employees will decide that this is an opportune time to strike.

## Chesapeake & Ohio

THE IMPORTANCE of our new export trade in coal, the result mainly of the difficulties of the mine operators in the British Isles, enabled the Chesapeake & Ohio in 1920 to do the largest business in its history, and thereby to increase its net railway operating income over 1919 despite the somewhat formidable increase in operating expenses. The net railway operating income for the year—that is disregarding the compensation for federal operations during January and February, and the guaranty for the guaranty period—was nevertheless not up to the figure reached in 1918, in which year the road's net railway operating income exceeded the standard return; nor was it equal to the standard return itself. The net railway operating income in 1920, as reported in the December monthly report to the Interstate Commerce Commission, was \$11,357,968; this compared with a net in 1919 of \$7,463,955; and a net in 1918 of \$17,103,870. The standard return was \$13,360,000.

In analyzing the operations of the Chesapeake & Ohio for 1920, one is confronted with the fact that although the road for the larger part of the year was probably operated close to its capacity, the directors in May deferred action on the

The Coal Fields on the Chesapeake & Ohio

semi-annual dividend of 2 per cent and at the meetings in June and August still failed to take action. The reason presumably lay not only in the uncertainties of the railway situation, but also in the fact that the Chesapeake & Ohio's traffic, predominately bituminous coal, fell off in rather disastrous fashion in the early part of the year. Another complication was that the Chesapeake & Ohio's corporate income account was kept on a received and not on the accrued basis. The Chesapeake & Ohio has since regained its coal traffic. Comment has already been made in these columns concerning the excellent showing made in June. The road's net railway operating income in the first half of 1921 was \$5,041,319 as compared with \$5,483,768 in the first six months of 1920. In February, which was the low month, there was a deficit of \$556,636; in June, a net of \$1,944,753. It might appear, therefore, as if the directors would be justified in revising their former action in deferring the semi-annual dividend.

The Chesapeake & Ohio in 1920 carried 40,838,116 revenue tons of freight of which 28,625,616 tons, or 70 per cent, was bituminous coal. On this traffic the road secured an average haul of 287 miles. The total ton-mileage for the year was 11,720,030,889 as compared with a figure for 1918, the best previous year, of 10,729,366,446. Much

has been said in these columns of late about the heavy train loads which characterize the operations of the three roads—the Norfolk & Western, the Virginian and the Chesapeake & Ohio—which deliver coal to tidewater at Hampton Roads. In 1920, the Chesapeake & Ohio secured an average revenue train load of 1,131 tons as compared with figures for previous years as follows: 1919, 1,091 tons; 1918, 1,099 tons; 1917, 1,043 tons and 1913, 843 tons. A similarly progressive increase is noted in car loading, the figures being: 1920, 39.1 tons; 1919, 37.7 tons; 1918, 38.2 tons, 1917, 35.6 tons, and 1913, 29.8 tons.

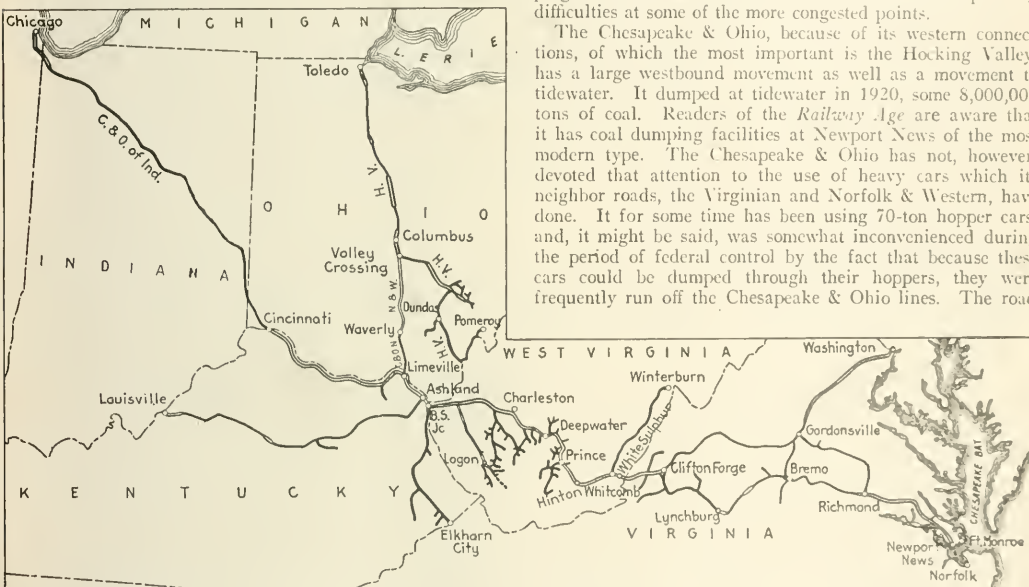

In the sketch of William J. Harahan published in the *Railway Age* of December 10, 1920, at the time of Mr. Harahan's election to the presidency of the Chesapeake & Ohio, considerable was said concerning the characteristics of the property and of the problems which lay before the new president. The opinion was expressed that in the past few years, the development of the Chesapeake & Ohio had been extensive rather than intensive and that the road in the near future would have to devote itself to a program of needed

per cent of the total of the Chesapeake & Ohio's coal traffic.

For many years the Chesapeake & Ohio has had a very open-minded policy in the matter of extending new lines into the coal areas. There is reproduced with this review a map of the lines in the several coal fields served by the Chesapeake & Ohio for the purpose of showing the extensive development which has taken place in recent years. A different symbol is used for those lines which were in existence prior to 1910 and those built since that time. The new construction in the years since 1910 readily indicates why it is that the Chesapeake & Ohio has had such an expansion in its coal traffic as to permit it to carry 17,809,931 tons of coal in the fiscal year ended June 30, 1912, and 28,625,615 tons in 1920.

The Chesapeake & Ohio physically is a high grade road. It cannot be said, however, that it is as yet on a par with the Norfolk & Western which has to meet somewhat similar conditions. The officers of the road would be the last to deny that the property needs more extensive yards and terminals and, in fact, the road now has in contemplation a program which will enable it to overcome some operating difficulties at some of the more congested points.

The Chesapeake & Ohio, because of its western connections, of which the most important is the Hocking Valley, has a large westbound movement as well as a movement to tidewater. It dumped at tidewater in 1920, some 8,000,000 tons of coal. Readers of the *Railway Age* are aware that it has coal dumping facilities at Newport News of the most modern type. The Chesapeake & Ohio has not, however, devoted that attention to the use of heavy cars which its neighbor roads, the Virginian and Norfolk & Western, have done. It for some time has been using 70-ton hopper cars, and, it might be said, was somewhat inconvenienced during the period of federal control by the fact that because these cars could be dumped through their hoppers, they were frequently run off the Chesapeake & Ohio lines. The road

The Chesapeake & Ohio

intensive development. The extensive development referred to included not only the acquisition of the Hocking Valley and the constructions of the Chesapeake & Ohio Northern and the Chesapeake & Ohio of Indiana, but also the manner in which the Chesapeake & Ohio has extended its lines into the coal regions.

The Chesapeake & Ohio receives its coal from four important fields, namely, the New River, the Kanawha, the Logan and the Kentucky. The first supplies a low volatile coal and coal from that region makes up about one-fourth of the total tonnage. Its importance as a source of traffic for the Chesapeake & Ohio has lately been of decreasing importance both actually and relatively to the other fields. The Kanawha and Logan districts supply a high volatile coal. Combined they furnish between 55 and 60 per cent of the Chesapeake & Ohio's total coal tonnage. They are of growing importance and it is in these two districts that the greatest expansion has taken place. The Kentucky field, which also supplies a high volatile coal, makes up about 10

has now adopted the 100-ton gondola car intended primarily for use on the car dumping machines at tidewater and in recent months has been receiving deliveries on an order for 1,000 of these cars.

The Chesapeake & Ohio is fortunate enough not to be confronted by the heavy grades over the Alleghenies which are met with on the Virginian and Norfolk & Western. It does not use power as heavy as the 2-8-8-2 and 2-10-10-2 Mallets which are in use on those roads. On December 31, 1920, however, it owned 193 Mallet locomotives of a total of 571 freight locomotives. These Mallet locomotives had an average tractive effort of 74,350 lb. They made up 21 per cent of the Chesapeake & Ohio's total freight locomotives and 33 per cent of the road's total locomotive tractive power. Thirteen such locomotives were added to the equipment in service during the year. In 1920 the road ordered twenty 2-6-6-2 Mallet locomotives of which, as noted, 13 had been received up to the end of the year. It also had on order five ten-wheel switching locomotives and

the 1,000, 100-ton cars previously mentioned. The financing of this equipment was assisted through a loan from the revolving fund of \$3,759,000.

Referring to the corporate income account for 1920 in which consideration is taken of the standard return for January and February when the road was still under federal control, and the guaranty for the guaranty period, it will be noted that the property had a gross income of \$16,160,773. This includes not the entire sum due on the guaranty but only an advance of \$2,700,000. The gross income for 1919 was \$15,282,362. The net income for 1920, after the deductions of interest, etc., was \$5,986,458 as against \$5,774,169 in 1919. Dividends of 4 per cent on the common stock were paid in both years, totaling \$2,511,264. Enough has been said above to make it appear that as far as the 1920 results were concerned, the Chesapeake & Ohio would have been justified in declaring its semi-annual dividend of 2 per cent this year. It is apparent, however, that the voice of conservatism ruled, it being decided best to keep the finances of the property well in hand until general conditions had taken on better aspects than were then apparent.

Operating results in 1919 and 1920 were as follows:

	1920	1919
Mileage operated	2,519	2,506
Freight revenue	\$72,774,680	\$53,073,002
Passenger revenue	11,776,038	14,158,135
Total operating revenue	90,524,185	71,475,016
Maintenance of way expenses	13,233,153	11,608,515
Maintenance of equipment	25,504,474	18,111,492
Traffic expenses	728,632	471,582
Transportation expenses	38,075,621	38,706,138
General	1,899,489	1,542,271
Total operating expenses	79,859,097	60,878,523
Net from railway operations	10,665,088	10,596,494
Taxes	2,997,230	2,485,078
Railway operating income	7,664,730	8,105,846

The corporate income account is as follows:

	1920	1919
Net income, including compensation for January and February, 1920, and net operating income of company from March to December, 1920, inclusive	14,878,831	14,588,579
Interest from investments and accounts	1,759,489	1,067,568
Gross income, including other	16,160,773	15,282,362
Net income	5,986,458	5,774,169
Dividends, common 4 per cent	2,511,264	2,511,264

## Hocking Valley

THE FACT that nobody seems to want to buy coal any more, partly because with the business depression it is not needed for industrial purposes and partly because those who want it for household purposes are apparently waiting until next winter before they buy it, has made the going rather hard of late for the Hocking Valley, 75 per cent of the tonnage of which is bituminous coal. In the first four months of this year the Hocking Valley carried from one-half to two-thirds as much traffic as it carried in the same four months of 1920, although since that time conditions have considerably improved. From January 1 to June 30, 1921, the road has had, according to the June monthly report to the Interstate Commerce Commission, an operating deficit after taxes and rentals of \$480,365, as against a net railway operating income in the first six months of 1920 of \$868,834. The directors of the Hocking Valley some months ago deferred action on the semi-annual dividend of 2 per cent. Under the conditions existing at the time it is difficult to see how any other procedure would have been advisable.

The Hocking Valley in 1920 was no exception to the general rule of increases in gross, greater increases in expenses and resulting decreases in net. Its revenue freight tonnage in 1920 totaled 15,285,862 and its revenue ton-mileage, 1,974,051,120, increases of 21.5 and 31.4 per cent, respectively, over 1919. The total revenues in 1920 totaled \$17,101,493, an increase of 46.7 per cent over 1919. As against this increase in revenues, there was an increase in expenses of 63.2 per cent. The operating ratio in 1919 was 83.8 per cent; in 1920, 93.2 per cent.

The Hocking Valley is controlled through majority stock ownership by the Chesapeake & Ohio. It does not connect directly with the C. & O. but receives from it large quantities of coal bound for the lakes, this traffic moving over the Chesapeake & Ohio Northern to Waverly, Ohio, and thence over the Norfolk & Western to Valley Crossing. The Hocking Valley itself originates a large tonnage of coal on its own lines from the mines reached in southern Ohio, but the fact remains that it is the most important outlet to the lakes and to the west for the mines in the Kanawha, Logan and Kentucky districts on the Chesapeake & Ohio, outtranking by a considerable margin the importance of the Chesapeake & Ohio of Indiana and other connections at the western end of the Chesapeake & Ohio.

The Hocking Valley in 1920 handled 11,567,593 revenue tons of coal, of which it originated 6,150,246 tons and received 5,417,348 tons from connections. Of this tonnage received from connections the larger part was received from the Chesapeake & Ohio. The Hocking Valley has generally been regarded as of value to the Chesapeake & Ohio more particularly because of the dividends received (up to this year) from the C. & O.'s holdings of Hocking Valley stock; it is not so generally realized how important the Hocking Valley is to the Chesapeake & Ohio because of its being in reality an extension of the Chesapeake & Ohio's lines.

The operations of the Hocking Valley, due to the predominance of coal traffic, might naturally be expected to be characterized by heavy train loading. The road, however, has gone a bit further than that; it has so worked out its problem that its net tons per train in 1920, including both revenue and non-revenue freight, were the highest of any road in the eastern district, with but two exceptions. The road's net tons per train in 1920 averaged 1,474, being exceeded only by the Pittsburgh & Lake Erie, 1,531 tons, and the Bessemer & Lake Erie, 1,764 tons. The Hocking Valley's average exceeded the Chesapeake & Ohio's 1920 figures of 1,204; the Norfolk & Western's of 1,178 and the Clinchfield's of 1,077, the latter three roads, of course, being in other districts. The revenue train load of the Hocking Valley in 1920 was 1,516 tons; this compared with a figure for 1919 of 1,465 tons. The average revenue tons per loaded car in 1920 were 46.4; in 1919, 43.2 tons.

The Hocking Valley of late has been undergoing considerable in the way of development to increase its capacity and make for more efficient operation. The most important feature of this development is the installation of double track on the main line from Columbus to Toledo. During 1920, nine miles of additional second track was placed in service on the Toledo division between Meredith and Owens and construction of 6.7 miles additional between Marion and Morral is under way. During the year the road acquired 20 Mallet and 10 Santa Fe type locomotives and 500 coal cars.

The operating results in 1920 as compared with 1919 were as follows:

	1920	1919
Mileage operated	350	350
Freight revenue	\$14,616,677	\$9,703,937
Passenger revenue	1,159,410	1,228,282
Total operating revenue	17,101,493	11,654,517
Maintenance of way expenses	2,028,221	1,329,868
Maintenance of equipment	6,627,605	3,935,248
Traffic expenses	118,304	72,204
Transportation expenses	6,692,759	4,109,051
General expenses	476,925	322,538
Total operating expenses	15,941,435	9,766,372
Net revenue from operation	1,160,059	1,888,145
Taxes	969,614	722,153
Operating income	188,799	1,161,828
Net railway operating income	1,577,963	1,258,416

The corporate income account is as follows:

Gross income	\$2,140,889	\$2,702,194
Interest on debt	1,733,646	1,460,491
Total deductions from gross income	1,795,093	1,672,326
Net income	345,796	1,029,868
Dividends (4 per cent)	439,980	439,980
Balance to credit of profit and loss	9,689,154	9,940,259

## Letters to the Editor

### Henry Ford, The "Miracle Man"

NEW YORK, N. Y.

TO THE EDITOR:

Why not tell the truth about Henry Ford and his claim of having "worked a miracle" in his six-months' operation of the 400-mile Detroit, Toledo & Ironton Railroad? Which truth is: Mr. Ford has perpetrated a gigantic hoax upon the American public; he has simply executed a very shrewd piece of business buccaneering at great profit to himself of money and self-advertising, but a confidence game that is dangerous to general prosperity and exceedingly costly to other railroads and damaging to the prospect of early rehabilitation of the country's great transportation machine and restoration of the pre-war railroad situation—i. e., for the public the greatest quantity and the best quality of railroad service at the lowest cost ever known anywhere.

In other words, Mr. Ford, by using a colossal international manufacturing concern as a feeder and a club to fatten a tiny 400-mile railroad, threatens serious damage to 250,000 miles of railroad serving the whole country because of the spectacular misrepresentation that, by reducing freight rates, raising wages and shortening hours, together with a few more grandstand plays, he has produced such "efficiency" as to turn a decrepit and losing railroad into a prosperous and popular one within six months. The danger lies in the fact that he is "getting away with it."

The general public today actually believes that Ford has performed a "miracle" (how we love our illusions), despite the explanations of the simple facts. This, because Ford's spectacular affirmative claims "out-punch" the negative explanations, which latter merely prove that there is nothing at all to the story.

Mr. Ford's action in pouring his vast tonnage into his own little line, and then extorting equal or greater tonnage on return trips, from connections which are in competition for this business, is not even new. Andrew Carnegie, a greater business genius, did the same thing 40 years ago when he bought a small railroad which crossed trunk lines and used it as a club to extort differentials from other lines.

If Mr. Ford reduces freight rates 20 per cent on his jerk line, the reduction simply would be turned into the coffers of his own Ford Motor Company and his son's Fordson Tractor Company; if such a reduction by his little line were to precipitate a reduction of even one per cent on all the railroads of the nation, he would profit personally through reduced payments to other lines on his own business.

Approximate figures show that Mr. Ford pays something like \$20,000,000 annually for transportation. About \$5,000,000 of this amount goes to the Detroit, Toledo & Ironton and \$15,000,000 goes to other carriers. A 20 per cent reduction in freight rates would mean a decrease of \$1,000,000 in the earnings of the Detroit, Toledo & Ironton road, but this would not be a loss to Mr. Ford as the amount would remain in his manufacturing business. On the other hand, a 20 per cent reduction on the \$15,000,000 which he pays annually to other carriers would mean a gain of \$3,000,000 to Mr. Ford, as this amount would remain in his industrial enterprises instead of going to the carrier companies which now receive it.

Thus, Henry stands serenely at the receiver's end and gets the money both coming and going, while his publicity propaganda works night and day and the people throw up their hats and marvel at the philanthropic "miracle man."

Radical disturbance of the railroad situation at this critical period of its early convalescence would be a capital crime

against American prosperity. Still, Ford, in his passion for notoriety, is making just these moves calculated to disrupt and retard recovery, confusing the situation and misleading the public.

What Ford's propaganda is calculated to do—if successful in deceiving the public to the fullest extent—is to wreck our entire transportation system, which would precipitate a business calamity.

For this Ford is given a few slaps on the wrist in the form of disputations and explanatory editorials, while the news headlines of our press carry proclamations of his successive new claims.

Ford once had the militant American public all excited about his "one-man submarine" or "undersea flivver" by which he claimed he would make impotent and worthless the millions of dollars put into armor plate and the great guns of the super-dreadnaughts. This vehicle of publicity he soon discarded in exchange for the more tangible "Peace Ship," Oscar II, with which he transported a cargo of "nuts" to "get the boys out of the trenches by Christmas." The super-dreadnaughts are still being built and larger than ever before, while the boys stayed in the trenches, and would have been still longer in them, and perhaps even brave losers to the Central Powers' military machine, had it not been for the food and munitions which they never could have gotten without the ready war-service of the American railroads, built up by the American brains, energy and character which Mr. Henry Ford now challenges and insults.

A RAILROAD VETERAN.

### Epes Randolph, An Appreciation

TO THE EDITOR:

Epes Randolph, president of the Southern Pacific Railroad of Mexico and of the Arizona Eastern, a brilliant field marshal of the Huntingtons and of Harriman, is dead. The unique career of this remarkable man is rich in professional interest and in high-minded inspiration for younger men. Frail of body, but big of brain and warm and stout of heart, he for nearly thirty years worked while fighting off tuberculosis which gripped him in the prime of life. It has been well said that if God Almighty had given him lungs equal to his brains and heart, no railroad men of his generation would have gained wider fame.

Born and reared in Virginia, a descendant of Pocahontas and John Rolfe, marked with the high cheek bones of the Indian, his boyhood and youth fell in the trying period of civil war and reconstruction. His early education was classical before it was professional. His reports and correspondence were models of clear and convincing expression. The great engineer, and America never had a greater, was always blended with the cultivated, modest gentleman, one so truly aristocratic that he was democratic. Magnetic and courtly, he was born to lead, to lead far and to lead well.

His early railway work was as a locating and construction engineer in the south and southwest. In the late seventies when Collis P. Huntington was building the Southern Pacific, Epes Randolph ran the location west from San Antonio while William Hood ran the location east from California. They met at Devil's River, Texas. Soon afterward, Randolph during months of hardship, sought for Huntington a feasible rail line from Texas through Mexico to the Gulf of California.

In the eighties and early nineties Randolph was the Huntingtons' engineering and operating representative in Kentucky, serving with the Chesapeake & Ohio, the Kentucky Central and the Newport News & Mississippi Valley. When Collis P. Huntington was told that the Chesapeake & Ohio could not find a bridge entrance into Cincinnati, he replied, "I have a man who can do it." Randolph built a bridge with a switch back approach. Randolph had become a lead-

ing bridge engineer and built numerous other bridges, including the Louisville-Jeffersonville bridge over the Ohio.

When the Huntingtons and the Vanderbilts some thirty years ago planned a transcontinental system, which never eventuated, Epes Randolph, only turning forty, was selected to head the merged lines. Collis P. Huntington once broke in on a complaint of undue severity toward a subordinate with, "I understand, you mean that I object to these things while I wink at my pet, Epes Randolph, playing poker. Now, when you can do as big work as Epes Randolph you may play poker too."

Unsparring of himself Randolph's health was undermined by hardships in the field and by the air being shut off from a bridge caisson that he was inspecting. One Saturday night the city council of Newport, Ky., passed an ordinance contemplating some speedy track construction by the Louisville & Nashville. Sunday morning at daylight he baffled L. & N. men found Randolph and his gangs on the ground with several hours start. Rain and sleet froze Randolph to his saddle but the track was built.

Taken to California in the early nineties, presumably to die, Randolph lived to make the desert his own and his name a household word in the Southwest and in Mexico. Camped on the desert and nursed by his devoted wife—born Eleanor Taylor of Winchester, Ky., who survives him—sufficient strength returned to warrant acceptance as superintendent of the Tucson division of the Southern Pacific. No executive pronouncement was needed to make him general manager of his division. Whatever his title or wherever his work, Randolph was ever the idol of the rank and file.

The vanishing frontier welcomed his sublime courage and his peerless leadership. His was a charmed life. It was a tenet of his railroad belief that speed never causes an accident, it merely exaggerates the consequences. If other cars went down the bank, his held the rails. If bad men or Indians shot up a town or camp, the cool and smiling Randolph was not hit. He bore one scar from a wound received while a young militia officer repelling a mob in Alabama.

Six busy, happy years as superintendent rolled by and H. E. Huntington, another great developer, took Randolph to Los Angeles to build and operate the Pacific Electric whose 700 miles give the Southern Pacific the greatest trolley traffic feeder in the world.

In two years the "bugs," as Randolph called his germs, again got too busy and back to Tucson went Randolph, this time to handle the side lines, since became the Arizona Eastern. Randolph headed off the Santa Fe from the Phoenix & Eastern and kept the cañon of the Gila River for a low grade line for the Southern Pacific.

Randolph forestalled the acquisition by the Phelps-Dodge interests of the thirty-five miles of railway from Naco on the border to the big copper camp at Cananea, Sonora. Without authorization he bought the road one Saturday afternoon and drew by wire on E. H. Harriman for one million dollars for the initial payment. Harriman, who had succeeded Huntington, found a lieutenant after his own heart and quickly fell in with Randolph's monumental undertaking, the Southern Pacific of Mexico, to be a part of a west coast Pan-American line from Canada to Patagonia. Randolph built nearly a thousand miles of line in Mexico and added it to the old Sonora Railway. Revolutions have left an unconstructed gap of a hundred miles south of Tepic. When stabilization comes to Mexico this longest branch line in the world will become a through route and in earning power a second Atlantic Coast Line.

Great as are these monuments of engineering and executive achievement, Epes Randolph will be longest remembered as the president of the California Development Company, the creator and savior of the Imperial Valley. He it was who built the dam that by forty-eight hours saved the Imperial Valley from the great flood of the Colorado river. Living in his car and suffering from occasional hemorrhages, his in-

domitable spirit drove the work. One day he found his men struggling with a derailed car. "Throw it in, what better filling do you want?" he ordered. "We cannot stop this work just for cars." Years later during a freshet in the Colorado he directed by wire from Tucson the felling of trees to form mattresses which eddied the current away from weak spots in the banks, a remarkable example of long distance engineering.

Epes Randolph as a railway executive had a profound and scientific knowledge of traffic, finance, politics and statesmanship, as well as of operation and engineering. Bred in the Huntington school of political manipulation, he was the first to see and to meet the changed order of things. He was the first to invoke the referendum against full crew and trainmen's qualification laws. He had the highest trait of the executive, the ability to delegate authority and to trust responsible subordinates.

Courage, brains, integrity, humor, cheerfulness, courtliness and consideration are inherent attributes that can be cultivated and made an unusual and invincible combination. Happy and inspiring was their ripe fruition in the knightly Randolph. A FORMER STAFF OFFICER.

## Are Barge Lines Profitable?

St. Louis, Mo.

### TO THE EDITOR:

The following clipping from a St. Louis paper is a good illustration of a half truth, so told as to completely misinform lay readers, and in fact all readers who are not specially interested in the subject matter and do not have more or less complete definite information on the subject.

WASHINGTON, August 9.—The fact that the Mississippi barge line has made \$175,000 profit in the past four months aroused the enthusiasm today of Representative Cleveland A. Newton of St. Louis, one of the foremost inland waterways advocates in Congress and a thorough student of this form of transportation. "This has proved all our arguments," said Newton. "The barge line is making money and the railroads are not, even though the barge line is charging only half what the railroads charge." If the barge line can make this showing, with the difficulty it has in adjusting new machinery, it certainly shows the public what benefit can be gotten from this kind of transportation.

Unquestionably there have been periods and individual trips when the receipts from the operation of the barge lines upon inland rivers have exceeded the out-of-pocket cost of operation, but these figures beyond a question do not take into account the huge overhead expense, insurance of vessels—and possibly cargoes—repairs, depreciation, and all of the other items which a true balance sheet must take into account and show before the man managing the enterprise can determine whether or not it is remunerative. In other words, all statements which I have seen made by the proponents of barge line transportation are unfair to the government and to the taxpayer for the reason that their statement of income and outgo is not complete, accurate and trustworthy.

If the barge lines are profitable when a complete audit of all just and reasonable charges against the business are made, then the government has no business in that business, but it should be turned over to private steamboat companies for their development. If, however, it is unprofitable I am wondering why we should be taxed to take care of the freight which is being transported by certain shippers by barge line to their manifest financial advantage.

It seems to me that the business of transportation should be conducted along the most economical lines. If that can be done by river transportation, then it should be done, although it has seemed to me that river transportation if it is profitable and advisable should be confined to bulky freight which requires a larger amount of space and upon which the time of delivery is not the important factor. If that could be arranged it would relieve railroads of the necessity of transporting those commodities which congest its line and yield a small revenue, enabling them to handle with reasonable expedition, high grade freight, merchandise, etc., which carry the higher rates and in which the time of delivery is most important. S. A. E.

# Electrification Progress on Italian Railways

A Number of Hydro-Electric Plants Are Under Construction, as  
Fuel Is Expensive and Hard to Obtain

By Giovanni B. Santi  
Engineer, Italian State Railways, Rome, Italy

SINCE FUEL OIL is not produced in Italy, the railway companies, particularly the state railways which operate most of the mileage, and all of the lines where the traffic is heavy, have been engaged for some years in substituting electric traction for steam motive power. The electric power

generators. These difficulties, however, were soon overcome to a large extent.

On the Valtelline line the 3-phase system was adopted with a low frequency of 15 cycles and 3,000 volts. The first installation was of an experimental nature and all the details were constructed in a very economical way, particularly as regards the contact line apparatus. Owing to the favorable results of the trial, some parts of the apparatus were strengthened later and at the present time, after a 20-year period of operation, the whole plant is running smoothly. The power is generated at 15 cycles in the power station at Morbegno on the river Adda, close to the electrified line. The copper contact wires are small, conductors having a cross-section of 50 sq. mm. being used for each overhead phase, the third

Line from Lecco to Colico, Showing Wooden Poles Used in 1901 for Supporting the Contact Wires

used for this purpose is secured from a number of hydro-electric power plants, and at the present time this number is being increased.

## The Development of Electric Operation

The first trial of electric traction in Italy was made in 1901 and in that year the Milan-Varese line and the Valtelline line were electrified. The points between which electric operation was begun were La Lecco-Colico-Sondrio and Colico-Chiavenna. The electrification of the Milan-Varese line was carried out with a direct current, third-rail, using 650 volts. This line has a double track and is 36.7 miles long. It is still being worked with the same power plant which was installed in 1901 and enlarged in 1912 to cope with the increase of traffic. The direct current, third-rail system, gave some trouble during the first month of its operation, particularly on account of the overheating in the

The Monza-Lecco-Colico Line, Showing the New Contact Wires Supported by Tubular Poles of the Mannesman Type

phase being formed by the rails. The poles supporting the catenary were made of wood with transversal suspension as shown in one of the illustrations, except on small sections where two longitudinal types of suspension were tried which were proposed by the firms of Ganz and Westinghouse. The wooden poles were later removed and replaced by Mannesman tubular construction, also illustrated.

The transformer stations are of low power and are ar-

Map of Italian Railways, Outlining the Electrification Program

ranged in grades along the line with an average distance of about 6.2 miles between them. In 1901, the time at which the Morbegno plant was fitted up, it fulfilled the conditions of maximum economy on the total costs, consisting of interest and depreciation of the plant and cost of maintenance and operation. These conditions of maximum economy have now

## Recent Installations Applied to Lines

### With Greatest Grades and Traffic

The new installations were made on lines where the traffic was very heavy. Between the year 1910 and the year 1914 the two Giovi lines were electrified. These two lines, which connect the port of Genoa to the inland country across the Apennine mountains, encountering grades of 3.5 per cent, have the largest amount of traffic of all of the Italian roads. The Savona-Ceva line, connecting the port of Savona with the inland country, also crosses the Apennines at 2.5 per cent grade. The Bussoleno-Modane line crosses the Alps. This line has a tunnel 8.45 miles long at an altitude of 4,134 ft. above sea level. It is the chief line of communication between Italy and France.

This group of electrified lines in the last few years has carried four times the amount of the average traffic of all the Italian railways. In the statistical year of 1917-1918, for instance, the average amount of traffic per mile of line on the whole of the State Railway system was about 2,060,000 ton-miles, while on the group of electrified lines mentioned above, the amount was about 8,800,000 ton-miles.

In 1916 the coast line between Savona and Genoa was electrified. This line connects the mountain lines referred above to, namely, from Savona to Ceva and the Giovi lines, and allows better use to be made of the apparatus and rolling stock on these lines.

### Work in Progress

The electrification of the Pinerolo-Bricherasio-Torino Pellice and Bricherasio-Barge lines, 18.6 miles, will also be completed shortly. This is a continuation of the Torino-Pinerolo line, already electrified. The Torino-Chieri line, 13.7 miles, of which eight miles is double track, has been operating by electricity since March, 1921.

The power transmission lines and the electric transformer stations of the Torino-Pinerolo line were designed to supply either the Torino-Bussoleno line or the other lines which start from Torino, and which are at present in process of being electrified. The European war delayed the work of electrification, although it was never stopped completely, and immediately after the declaration of peace the electrification program was actively renewed. It was possible, therefore, to begin the electric service on the Torino-Bussoleno and Bussoleno-Susa line, 33 miles, of which 28 are double track,

Lines Electrified in 1901 from Lecco to Chiavenna and Sondrio

greatly changed, especially on account of the increase of wages and the introduction of the eight-hour day.

The trial on the Valtellina line at once gave satisfactory results. It revealed great advantages in the three-phase trac-

Electrified Line Put in Operation in 1919

tion system, particularly in regard to heavy traffic. This system was adopted, therefore, in the future electrification of the main lines of the State Railways, although alterations were made in all the details in order to render the equipment more technically perfect and more economical, particularly with regard to the maintenance and operating costs.

towards the end of 1919. In this way the Frejus electrified line (Bussoleno-Modane) and the Torino-Pinerolo were linked up awaiting the time when the whole of the electrified lines in Piedmont will be connected to those in Liguria, when the electrification of the Torino-Ronco line is completed, which should be at the end of 1921.

The electrification of the Voghera-Alessandria, Tortona-Nova and Tortona-Arguata lines, which will give access to the Giovi line, and the line from Milan to Chiasso and Switzerland will be completed in the beginning of 1922 at the latest. Nearly all of this work was agreed upon and commenced before the war. It is expected, therefore, that at the end of 1921 the electrified portion of the State Railways (that is the state-owned main lines), will be about 435 miles. As many of the lines have double track, the total length of the electrified section, including junction lines, freight yards, etc., will be about 808 miles. A summary of the more important features of the lines already electrified up to May, 1921, is given in the table.

To these state-owned lines must be added about 124 miles of smaller electrified lines having standard gage track, which are operated by private companies. About 310 miles of narrow gage electrified lines are also operated by private companies.

### Plans for the Future

The new work for extending electric traction in Italy, which was decided upon before the war by the State Railways in agreement with the government provides for the electrification of about 2,800 miles of the State Railways. These lines are shown on the full page map. They have been chosen from those where the most coal is consumed on account of the steep grades and very heavy traffic. The total length of line operated by the State Railways is 8,700 miles and the annual consumption of coal is about 2,500,000 tons.

in Central Italy. There are reservoirs in these hydraulic stations to provide a reserve of water for other stations in

Profile of Electrified Line Between Torino, Italy, and Madane, France

time of water shortage. The power which can be generated in these hydraulic plants is as follows:

Station at Meleze:	26,000,000 kw. hr. per annum
Station at Rochemolles:	40,000,000 kw. hr. per annum
Station at Sagittario:	73,000,000 kw. hr. per annum
Station at Reno and Limentre:	82,000,000 kw. hr. per annum
Total:	221,000,000 kw. hr. per annum

TABLE I—MILEAGE AND CHARACTERISTICS OF THE IMPORTANT ITALIAN ELECTRIFIED RAILWAY LINES AS OF MAY, 1921.

Lines Electrified	Length of Electric Lines				Total	Length of Electrified Track	Maximum Grades (per cent)	Minimum Radius of Curves	Weight of Rail (lb. per yd.)	System Used

Bussoleno—Susa .....	4.7	.....	.....	.....	4.7	5.2	1.0	1,640 ft.	55	3,700	3-phase	16 to 17
Total.....	170.8	82.1	27.0	50.05	329.95	561.4	.....	.....	.....	.....	.....	.....

The electrification of 2,800 miles, decided upon in the May, 1920, program, will permit of a saving of 1,300,000 tons of coal, or nearly half of the total amount required for running the entire system. In its place, 600,000,000 kw. hr. per annum will be consumed and this means that power stations will have to be provided with a capacity of 150,000 kw.

### Most of the Electric Power Will Be Purchased

The power as a rule will be bought from private power distribution companies, but in order to speed up the work the State Railways have already commenced to build large hydro-electric installations, which will operate in parallel with the power stations of the private companies. These hydro-electric installations are those of Meleze and Rochemolles in the upper Piedmont section near Bardonecchia; Suviana and Castrola on the river Reno and Limentre near Bologna; and Anversa on the river Sagittario near Sulmona

It will be possible to generate in the stations at Reno and Limentre, when all the water is used, 127,000,000 kw. hr. more, making a total for all the stations now being built of 221,000,000 plus 127,000,000, or 348,000,000 kw. hr. These figures represent the limit of the annual power available from power stations. Of course, it will not be possible in practice to use this power in full. It must be taken into consideration, however, that the stations will be connected with other industrial power stations, and it will be possible, therefore, to transmit and use the power as it is required. Almost all of these stations are provided with reservoirs of water, and it will be possible to regulate the amount of power taken from individual power stations connected in parallel, so as to make the best use of the entire power system and get a maximum of power with a minimum waste of water. It is expected that the percentage of energy which is available will be about 80 per cent of the total.

# Labor Organizations Again Spread Strike Threats

## Train Service Brotherhoods and Shop Crafts Announce Preliminaries to a Walkout

**P**RESS REPORTS of the activity of railroad labor organizations during the past week have given rise to the wide circulation of strike rumors. What has actually happened may be summarized as follows:

The Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen and Enginemen, the Brotherhood of Railroad Trainmen, the Order of Railway Conductors and the Switchmen's Union of North America asked the carriers, through the Association of Railway Executives, to definitely state their position on three requests: (1) to restore the rate of pay in effect prior to the 12 per cent cut of July 1; (2) to withdraw all requests for further wage decreases, and (3) to withdraw all requests for the elimination of time and one-half for overtime. These demands were all rejected by committees representing the carriers in western, eastern and southeastern territories.

Upon receipt of the answers, brotherhood leaders, in accordance with instructions received from their membership following a meeting in Chicago on July 1, met at Cleveland, Ohio, to draw up a ballot for submission to the men. After several days' conference it developed that, although these five organizations agreed that their policy in the future should be put squarely to the membership of the various organizations by ballot, they did not agree on the form in which the presentation to the men should be made. The reports which emanated from the conference room indicated that the Brotherhood of Railroad Trainmen would not agree on the conservative statements to accompany the ballot. As a result four of the organizations prepared a joint ballot and the Brotherhood of Railroad Trainmen prepared its own.

The joint ballot said if the membership rejected the wage reduction "it is to be understood the men will be permitted to withdraw from the service of their respective companies unless satisfactory settlement can be reached under the laws of the organization."

The statement accompanying the trainmen's ballot reads in part:

"All members and others are hereby notified that if the membership vote is in lawful necessary majority to leave the service rather than continue service under the reduced wages now in effect, they will on any or all lines where such vote is secured (with the sanction of the general grievance committee) be given necessary authority by the president of the grand lodge. The president of the grand lodge will not (with the information given above) undertake to prevent the wishes of the men as expressed in their ballot from being adhered to."

The ballots of these organizations will be sent to the men before September 1, and it has been estimated by union officers that it will require a full month or more thereafter to complete the referendum.

### Federated Shop Crafts Issue Preparedness Bulletin

The Railway Employees' Department of the American Federation of Labor, comprising the Federated Shop Crafts, has already taken a referendum on the recent wage cuts, and although no official announcement has been made of the result of this vote it has been freely intimated that the returns are overwhelmingly in favor of a walk-out. On top of this vote came the order of the Railroad Labor Board providing that railway employees regularly assigned to necessary Sunday and holiday work should not receive punitive overtime on these days. This decision, together with a summary of the

dissenting opinion which was handed down at the same time by A. O. Wharton, member of the labor group on the Board, was outlined in the *Railway Age* of August 27, page 419. Officers of the Federated Shop Crafts were particularly displeased with this decision and after a three-day conference at Chicago issued a letter to the membership of the six crafts declaring "that these organizations were never confronted with a more critical situation." The letter sounds a warning to the men not to "become involved in an unauthorized stoppage of work," and at the same time declares that an unsatisfactory settlement may make it necessary to "use the full power and strength of these organizations in collective action," and the individual members are therefore requested to "prepare for war" by conserving their personal resources. The local, district and system lodges are directed to "conserve finances by carefully guarding expenditures, and increasing funds to the greatest possible extent."

Pointing to the history of the rules negotiations, both before the Board and on the individual roads, the letter says: "Notwithstanding that management's request (to have the negotiation of rules remanded to the individual roads) was granted, there are but three small railroads on which a complete agreement has been negotiated and signed. On the other hand there are great numbers of disputes from practically every railroad, involving some one or all of the rules."

"There are only 136 carriers named in the decision on overtime, while there were 320 carriers specified in the decision on rules and working conditions (Decision 119). As to the remaining 184 carriers, many are still in conference, and these conferences must be completed, results known and acted upon by the Labor Board before final action can be taken by the organization."

### Declare Overtime Decision Not Justified

The recent "middle of the road" decision of the Board recognizing the basic eight-hour day and the principle of punitive pay for overtime with a few modifications from former rules, is declared by the shop crafts to be not justified.

"By no conceivable line of reasoning can Decision 222 be justified, and this body declines to accept it," the report says. "Decision 222 (on overtime) does not give the federated shop crafts even a reasonable basis upon which to approximate the results which will accrue from further decisions of the Railroad Labor Board, as to those rules still in dispute, and which this decision does not dispose of, therefore it would be most unwise at this time to adopt a program looking toward final disposition of only the rules covered by Decision 222, and the federated shop crafts must of necessity defer final action until the Railroad Labor Board has released its decision as to the important rules in dispute."

"This body will take steps to urge the Railroad Labor Board in one decision to finally dispose of all rules which are to be general in their application, in order that the federated shop crafts may have before them at the earliest possible moment the final action of the Railroad Labor Board."

"This body will, therefore, be reconvened at the proper time, and will at that time outline a program for the purpose of securing at the earliest possible moment the position of railroad management on each of the rules decided by the Board that are not acceptable to this body, and the placing of the facts before the membership for vote and final action in compliance with the laws of the organizations."

These developments, together with the direct and implied

threats of labor leaders, have been taken by a large portion of the press as indicating either a general strike or a series of sporadic strikes in which the trainmen and shopmen would be particularly involved.

### Opinions as to Strike Probabilities Vary

Some students of labor conditions argue that there will be no strike in the near future because of (1) the unemployment throughout the country; (2) the weight of public opinion against strikes, especially when a mediatory body is functioning; (3) the present relatively high wages of railway labor, and (4) the recognition of labor leaders of the likelihood of failure in view of these conditions. The present strike talk, they say, is but a repetition of strenuous efforts to use the threat of strike to influence the Labor Board.

On the other hand, it is pointed out that the labor leaders have worked themselves into a position where they must either call a strike in accord with the power placed in their hands by these referendums or repudiate their own statements and position at the risk of disrupting their own organizations and being discredited by their membership. Strike talk and dissatisfaction as the result of the propaganda carried on by the reconstructed "outlaw" organizations have gone too far, those who hold the latter view, argue.

The position of those who believe that railroad labor disturbances are impending is bolstered up by the action of the trainmen's officers in preparing a separate ballot for submission to the membership and by the fact that, despite an "unwritten" agreement among members of the Labor Board that no dissenting opinions would be made, Mr. Wharton not only filed one, but quoted the actions and votes in one of the Board's executive sessions. The action of the trainmen's officers is taken as confirmation of estimates as to the effect of the propaganda being carried on by the old "outlaw" yardmen's association. To offset the dissatisfaction of the trainmen with the manner in which their affairs have been handled, officers of the trainmen's organization are forced to take radical steps toward using their economic power, it is pointed out. The action of Mr. Wharton is taken as indicative of the length to which officers of the shop crafts unions will go to retain the substance at least of their national agreement.

### A Check on Rough Handling of Cars

**R**oad service tests on a device designed to keep a record of the rough handling of cars have been carried to the point which is said to have definitely established the practicability of the device. They have also shown that most of the rough handling to which cars are subjected occurs in yards during the makeup and breakup of trains and not, as has been claimed by some, in the handling of trains on the road as a consequence of slack adjustments. The particular value of this device arises from the possibility of effecting an appreciable reduction in rough handling.

The device is shown in the illustration. It consists of a spring motor or clock which winds a tape or registering chart graduated to 15-min. periods and designed to give a continuous record over a period of 10 days. This tape records the movement of a pencil attached to a weight which moves between suitable guides under the control of two springs. Any sudden impulse or impact given to the device gives the weight a vibratory motion and thus records marks in a crosswise direction on the tape. The length of these lines as indicating the distance that the weight has been moved from the neutral position near the center of the tape is a measure of the amount of impact sustained.

The first problem which it was necessary to settle before a successful test could be inaugurated was that of determining the limit of rough handling in terms of vibration on the chart of the impact register. This was accomplished through

a series of tests conducted with a view of creating actual cases of rough handling and observing the resulting vibration on the chart of the impact register. Both loaded and empty cars were used, with wood and steel underframes. These were allowed to couple at speeds varying from 2 to 10 miles an hour. Each case was considered from the standpoint of possible damage to a car of merchandise and was accordingly adjudged as being a case of rough handling or permissible handling and the limit of rough handling was decided to be

The Impact Recorder

between two and three miles an hour speed at the time of impact.

After the chart graduation test had been completed, a number of machines were put into use in through merchandise cars operated by the Chicago, Milwaukee & St. Paul between Chicago, Kansas City, Milwaukee, Madison, Minneapolis and Mason City. The machines were in cars operated on a regular loading schedule and were handled at destination by the agent in charge. No traveling inspector accompanied the machines, but their records were removed by the receiving agents and mailed to the general office for investigation and tabulation. The movement of the machines was not advertised and train crews did not know at any time when they might be handling the register. Each case of rough handling which resulted was taken up with the superintendent on whose division it occurred and the crew responsible disciplined therefor.

Studies of records made with the increment recorder indicate, as stated in the opening paragraph, that 97 per cent of the rough handling cases actually occur in yards. The question has been raised whether it is within the limits of reason to expect that cars may be handled under the conditions imposed on railway operation without a certain amount of rough handling. In answer to this it is noted from the record obtained in the tests that 27 out of 111 cars under observation moved from origin to destination over an aggregate distance of 10,000 car miles without a single case of rough handling. There are also repeated instances where cars moving over exactly the same route received widely varying treatment. It is, therefore, estimated that if 24 per cent of the cars can be handled properly under present conditions of transportation with no rigid disciplinary measures in effect, the enforcing of proper discipline would enable the handling of at least 70 per cent of the equipment in the same manner. The impact recorders described above were developed and are being manufactured by the Railway Impact Register Company, Belleville, Ill.

# Job Analysis and Job Specification

## Showing Advantages to Be Gained from Close Study of Job and Uses to Which It Can Be Put

By J. C. Clark\*

Assistant to General Manager, Oregon Short Line Railroad Company

THE EFFECTIVENESS with which human labor is applied to railroad operation determines to a large degree the safety and efficiency of the service rendered the public, the financial returns to the owners, and the loyalty and contentment of management and employees. To be effective, human labor must be applied systematically, which means that management must decide what work is necessary to properly operate the property and then divide this work in such a manner that each individual unit of the human organization will have a definite task or job to perform. These tasks or jobs must be so related that each job harmonizes with the others to make a perfect whole.

It is obvious that the content of each job and the relationship existing between the various jobs has a vital bearing on the effectiveness with which human labor can be applied. Job analysis is a systematic study and statement of all the duties and requirements of the job, and the modifying factors which surround it.

### Purposes of Job Analysis

Railroads employ workmen of a large variety of trades, and the forces are scattered over the entire property. This condition may make the work of job analysis somewhat more difficult but all the more necessary. In the mechanical department the work is largely repair work and each locomotive and car may require different handling and different material. In manufacturing concerns where job analysis has been worked out to a considerable extent, the processes are, as a rule, well defined and regular. This condition does not obtain in railroad shops for the reasons stated.

In other departments where employees come in contact with the public, the personality of the employee is a very important item. In all jobs where the employees have to do with the handling of trains, character and judgment necessary for safety are of the utmost importance. The diversified nature of railroad work as a whole, and the dependence of each department on other departments makes job analysis all the more important, especially as to relationship or co-ordination of jobs.

The purpose for which job analysis is needed will determine the extent of the study necessary. The employment office will need sufficient information to draw up a specification only, but this does not require the detailed study necessary if it is intended to estimate a fair day's work. To be complete, however, job analysis should aim at four principal objects:

*First*, determine a fair day's work. We have heard considerable of late concerning "A fair day's work for a fair day's pay." But who can say what a fair day's work is? Most wage negotiations in the past have been conducted on the basis of "How much can I get?" rather than upon the basis of "How much am I worth?" Of course the cost and standard of living will always enter into wage negotiation, but the foundation of any wage agreement should be what the work is worth, and what is a fair day's work. There is a great deal that could be said as to the manner of arriving at an equitable conclusion in these matters, but that cannot be

developed at this time. It is possible, however, to determine a fair day's work and what it is worth from a strictly scientific standpoint.

If the Labor Board in Chicago had before it a classified list of all the jobs on the railroad, properly indexed and cataloged, showing all the details of the job and the conditions surrounding it, and a scientific estimate of a fair day's work in each job, would it not be in a far better position to determine an equitable wage? It may sound like a big undertaking, and it is, but wage controversies will continue with all of their disturbing outgrowths until wages are based on facts concerning the job, instead of the present methods.

*Second*, secure accurate knowledge of the surrounding conditions and the modifying factors. Under this heading would come all the data relative to hours of work, average length of employment, opportunities for promotion, sanitary conditions, and any other matter which affects the job, but is not a part of the job itself.

*Third*, keep in view the improvement of existing tools and machinery and the devising of new methods or machinery with the object of saving labor or increasing efficiency.

*Fourth*, determine the effect of employment on the workers. Railroading as a rule is a pretty healthy occupation. However, it would be worth while to study the effect of irregular working hours on trainmen, enginemen and other irregular workers. The hazards of railroad operation would also come under this head, and it should be possible to make an accurate estimate of the hazards of each job, at the same time pointing out methods of reducing these hazards.

### Value of Job Analysis

There are a great number of ways in which job analysis would benefit the management, the employees and the public. Any study of this question should include the status of railroad work in the community. A few of the chief values of job analysis would be:

*First*, to standardize operation. From the standpoint of management, job analysis is needed to determine the best methods of carrying on a job under existing conditions. It will be found that on the same railroad, different methods of performing an operation are used in different shops. This may be due to an established practice of unknown origin or to the preference of some shop superintendent or master mechanic. No matter how the difference in methods originated, each operation should be studied with a view to adopting the best method under existing conditions.

This may apply to other departments than the mechanical. Operations incident to track work, the make-up of trains, the handling of material in the store department, etc., should all be studied with a view to standardizing them.

Closely allied to the subject of standardization is the study of how to improve an operation. By close questioning of employees actually engaged on the job, it will no doubt be found that many operations can be improved upon, either by adopting different tools or machinery, or using different kinds or classes of material.

*Second*, job analysis will define the responsibilities of each job. At the present time, there may be confusion as to responsibilities connected with a great many jobs and this applies to industry, as well as to railroad operation. This

\*For other articles by Mr. Clark on the personnel problem see *Railway Age*, December 31, 1920, page 1157; February 4, 1921, page 329; and March 18, 1921, page 719.

affects both employer and employee and creates a tendency to shift responsibility. If each and every job was accepted by the employee with a definite knowledge of what the responsibilities were, there would be no chance to shift and get out from under it.

*Third*, a statement of the sequence of operations for a job will be provided. This would apply more particularly to the mechanical department, but would affect to a certain degree employees handling freight in freight houses and material in store houses. It is probable that almost any job is benefited by a statement of this kind, because we all know that it never pays to start a job wrong. There is always a right way to start and that should be plainly indicated, when practical.

*Fourth*, data will be secured with which to draw up a job specification. The job specification should include the physical qualifications necessary in the worker, such as age, height, weight, sex, hearing, vision, etc.; mental qualifications such as education; experience; ability to speak, read or write English, or other languages; also a brief statement as to the type of mind required.

Next in order would come a complete description of the job itself, which should start with the name of the job and a complete description of the operation. Next would come all of the conditions surrounding the job, then length of time to learn, rapidity of advancement, and chances for promotion. Next in order would come terms of employment, stating the rate, average earnings per month or day, and any other condition relating to terms of employment.

If the specification is to be used as a basis for wage negotiation, there should be included a statement or an estimate of a fair day's work on the job and how it was arrived at. There should also be a statement of methods used in measuring individual progress at the job. This subject was covered in an article in the *Railway Age* of March 18, 1921. If this method of individual progress reports were in use, it would in effect be a statement of the qualifications necessary in the worker.

Another value in job analysis would be to secure data on the amount of output produced by workers of different degrees of skill or experience. This would involve a study of actual performance of various classes of workers and should provide valuable information to assist in the estimate of a fair day's work.

Another important value would be the co-ordination of jobs. The analysis should develop a logical succession at jobs and solve problems dealing with co-operation between departments, gaps in responsibilities, inadequate inspection, etc.

### How the Public Would Profit

There are three ways in which job analysis would be of value to the public. The United States Public Health Service, as well as like organizations in the various states and communities, is constantly seeking data on conditions that effect public health. Job analysis should provide definite information on sanitary conditions which affect the occupations and will be of distinct value to the health authorities, and will no doubt be reflected in wise laws governing sanitation and health. This information would also be of value to the various states in administering their employees' compensation laws. Some of these laws are inequitable because based on very meager information. Job analysis would help this situation materially and should result in modification of the compensation laws in some of the states.

The last important value to the public would be to provide data on which to help settle disputes. In a number of cases the public has been called upon to decide labor disputes, and public opinion is always the deciding factor when it comes to a strike or a lockout. Full and unbiased information provided by scientific job analysis would be of immense value in

molding public opinion as to the merits of any controversy and would be of equal value to public representatives on arbitration boards.

### How to Proceed

The next question is, "How can all this data be secured?" It is obvious that a very thorough and detailed study would have to be made, which would include the point of view of the employee, the supervising officer, and the general officers. It might be necessary to get the testimony of representatives of the public. It would seem, therefore, that a general committee should be organized to carry on the work, this committee to be composed of an officer of wide experience and ability from each of the major departments, and an employee from each of the major departments. This committee would secure data by personal investigation on the ground, assisted by officers and employees from each division, shop or department, as the case may be.

The committee, of course, would outline a definite program of procedure which would be approved by the executive officer of the railroad. This would be necessary to give the committee proper standing. After the work of analyzing each job had been completed, it would be necessary to continue at least a part of the committee to keep the analysis and specification up to date. Another plan which might be feasible, would be to charge the personnel department with the duty of keeping analysis and specifications up to date, with a periodic survey by the general committee when deemed advisable.

This work is another field in which a personnel department would be of utmost value, and the head of the personnel department should work with the committee on job analysis and job specification and to a certain extent direct its labors. There is no doubt that the job directly affects personnel, and any change in the job means a change in personnel to some extent. It is therefore important for the personnel manager to be in very close touch with the work.

THE CANADIAN BROTHERHOOD of Railway Employees has been expelled from the Trades and Labor Congress of Canada by a vote of 394 to 151. The action was a climax to a long standing dispute over jurisdictional matters. The brotherhood has from 7,000 to 10,000 members scattered over the Dominion. A. R. Mosher, president of the brotherhood, declared that the vote of those favoring expulsion was largely due to abnormal influence brought to bear by interests in the United States.

# Booster Tests on Temiskaming & Northern Ontario

Freight Tonnage Increased 20 Per Cent by Booster—Rapid  
Acceleration of Passenger Trains

**A**N INTERESTING SERIES of tests was recently made on the Temiskaming & Northern Ontario of locomotive boosters in freight and passenger service in order to determine their value under the conditions existing on that road. At the present time boosters are applied to one Mikado type locomotive which has 25 in. by 30 in. cylinders, weight on drivers 197,000 lb., and a tractive effort of 45,000 lb. without booster, and to three Pacific type locomotives which

tonnage for this grade, with this power, is ordinarily 1,200 adjusted tons, so that the excess loading was 301 adjusted tons. The speed of the train when it reached the foot of the 0.75 per cent grade was 26 miles an hour. The full lines in the left hand portion of the chart show the variations in speed and drawbar pull until the train finally stalled on the 1.25 per cent grade, 528 ft. south of mile 11. The locomotive stalled without slipping, the drawbar pull showing as 45,000 lb. The train was then backed down the hill and on the second test the speed was 9 miles an hour when the booster was cut in 660 ft. south of mile 11. The drawbar pull increased rapidly from 33,000 lb., at which figure it was when the booster was cut in to 50,000 lb., but 528 ft. north of mile 11, after the speed had fallen to 3 miles an hour and then picked up to 4 miles an hour, the locomotive slipped and stalled. On backing down and setting off one load, leaving a train of 1,424 adjusted tons—an excess of 224 tons over normal rating—the grade was got over without difficulty.

The train then proceeded to the grade between miles 15 and 18, the result of the booster being cut in on the 1.25 per cent portion of the grade being shown in the right hand portion of Fig. 1. The speed of the train, when the booster was cut in on the hard pull on a 6 deg. curve, was about 9 miles an hour and drawbar pull showed 38,000 lb. As the speed decreased to 5 miles an hour, the drawbar pull went up to 47,000 lb. When the train had gained the 1 per cent portion of the grade and the speed had been picked up to 8 miles an hour, the booster was cut out. In order to get this excess tonnage over these grades, aggregating three miles in length, it was necessary to operate the booster for less than half a mile. The train was then taken through to Englehart, 138 miles north of North Bay, the booster being used on the

Fig. 1—Booster Test with Mikado Locomotive, Showing Increase in Drawbar Pull

have 23 in. by 28 in. cylinders, weight on drivers 155,000 lb., and a tractive effort of 36,000 lb. without booster.

Dynamometer car 84, belonging to the Canadian National Railways, was used during the tests for obtaining the data. The trial run with the Mikado type locomotive number 150

Fig. 2—Booster Test with Mikado Locomotive, New Liskeard to Cobalt

was made north from North Bay. At the start the train consisted of 21 loaded freight cars, the dynamometer car, two official T. & N. O. cars, Temagami and Whitney, and a caboose.

The actual tonnage of this train was 1,401 tons, 756 contents and 645 tare, the adjusted tonnage with the T. & N. O. allowance being 1,501. The left hand portion of Fig. 1, given herewith, shows the performance of the locomotive with this train between miles 9.2 and 11.1. It was decided to see first what the locomotive could do with this train on the 1.25 per cent grade at mile 11 without the booster cut in. The

stiff pulls, with a degree of success equal to that displayed in its performance in the test between miles 15 and 18.

The next day the same locomotive was started from Englehart south with a train of 32 loaded cars, 4 empties, the dynamometer car, T. & N. O. official car Temagami, and caboose. The actual tonnage was 1,800, contents 957, tare 843 and the adjusted tonnage, T. & N. O. rating 1,995. Fig. 2 shows the results of the tests with this train on the grades from New Liskeard, mile 112.8, to Cobalt, mile 102.7. These grades vary from 0.13 per cent to 1 per cent and the normal rating for a locomotive of this class is 1,000 adjusted tons.

so that the excess loading was 335 adjusted tons. The booster was first cut in 100 ft. south of mile 106, when the speed was slightly under 10 miles an hour and the drawbar pull was 36,000 lb. The drawbar pull quickly increased to 43,000 lb. and speed was maintained at about an average of 8 miles an hour on the 0.8 per cent, 1 per cent and 0.75 per cent portions of the grade until the booster was cut out 0.42 mile south of mile 105. When the booster was cut out, the drawbar pull dropped from 40,000 lb. to an average of 36,000; when the booster was again cut in, 0.42 mile south of mile 104, on the 1 per cent portion of the grade, the drawbar pull increased from 37,000 to 42,000 lb., speed remaining constant for 0.6 mile at 10 miles an hour, but dropping to 9 miles an hour on the 6 deg. 12 min. curve, while drawbar pull increased to 43,000 lb. at this speed. The train was thus handled into Cobalt without difficulty, by making the booster operative twice for short intervals on the hardest pulls.

Throughout the tests there was no difficulty in maintaining a constant steam pressure of 180 lb. This was possible because both the Mikado and Pacific types of locomotives used are remarkably free steamers.

Southbound out of Cobalt another load was switched into the train, making the actual tonnage 1,848 and adjusted tonnage 2,048 tons. Fig. 3 shows the results with this train, between miles 26 and 22. The booster was cut in 0.22 mile south of mile 25 on the 1 per cent grade, when the speed was 9 miles an hour and drawbar pull 39,000 lb. As the speed gradually came down to 4 miles an hour while the train approached the summit, the drawbar pull gradually increased until it reached a maximum of 51,000 lb. The booster was cut in again 0.32 mile south of mile 23, on a 1 per cent grade, but not until the speed had decreased to 7 miles an hour, the drawbar pull being 38,000 lb. As the train topped the summit, the speed had decreased to 3 miles

Fig. 3—Booster Test with Mikado Locomotive, Showing How Train Was Taken Over the Top

an hour and the drawbar pull increased to 52,000 lb. The train then proceeded to North Bay.

The tests with Mikado locomotive 150 amply demonstrated the correctness of the proposition that a largely increased tonnage can be handled over a division without difficulty, if it can be successfully got over the few hard pulls of the division, and they demonstrated the ability of the booster in aiding the locomotive to get it over the hard pulls. The T. & N. O. has a profile marked by several short, steep grades which have acted to limit the tonnage handled in the past. By enabling a locomotive to take a tonnage, increased by 20 per cent, over these grades, the value of the booster applied to the freight hauling units of such a railway is at once evident.

Fig. 4 shows the results obtained by tests of Pacific type locomotive 157 in which the booster was used in starting and accelerating a passenger train of 13 cars. The trains were the Canadian National Railways' transcontinental express No. 1 north from North Bay to Englehart, and No. 2 returning. In both cases the train weighed 942.7 tons.

The left hand portion of the diagram was taken when starting the train out of North Bay station over frogs and switches on a 1 per cent up-grade and a 10 deg. curve, uncompensated. Without booster, the tractive power of the locomotive is 36,600 lb. As will be noted from the diagram, the drawbar pull with the booster cut in was 45,000 lb. at the start, 37,000 lb. in 60 sec. when a speed of 5 miles an hour had been obtained; 28,000 lb. in 120 sec. at a speed of

Fig. 4—Booster Test with Pacific Locomotive, Acceleration Curves When Starting Heavy Trains

12 miles an hour, and 26,000 lb. in 170 sec., when the speed was  $15\frac{1}{2}$  miles an hour. The manner in which the locomotive handled the train under these conditions was highly gratifying and showed the advantage of the booster as an aid in getting trains to road speed quickly when leaving terminals or after station stops.

The right hand portion of diagram, Fig. 4, shows the result of a test designed to determine the acceleration obtainable on level track. The same train of 942.7 tons was handled north out of Tomiko, mile 27.3, from North Bay, the drawbar pull when lifting the train registering as 38,000 lb. This remained practically constant for 10 sec. as a speed of  $3\frac{1}{2}$  miles an hour was being attained; in 30 sec. it registered as 29,000 lb., the speed being 8.5 miles an hour. At the end of one minute, the drawbar pull showed as 23,000 lb. and the speed had increased to 15.5 miles an hour.

Many of the stations and water stops on this road are on grades so that the time saved over the division by the high acceleration of passenger trains obtained by the use of the booster in leaving stations, in addition to that saved on the hills would be large. The T. & N. O. officers have expressed complete satisfaction with the performance of the device and the efficiency shown by it in doing the work for which it was designed.

THREE RIVERS, QUEBEC, announces the arrival there of a vessel bringing 2,000,000 ft. of British Columbia fir, shipped from Vancouver via the Panama Canal. This is the first vessel, it is understood, to make the trip from British Columbia to a Quebec port via the Canal.

AN ITEM FROM SAVANNAH.—Not a day during the month of June did No. 4 (the night express from Atlanta) fail to roll into Savannah on time. No. 4, like No. 3, is manned by crews whose consciousness of duty and knowledge of service have been outstanding factors in the successful operation of these two popular trains. The comfort of travelers in years gone by has been carefully looked after by Chesterfields of the bell cord, while their safety through long, dark, and sometimes stormy nights, has been well guarded by careful hands of men of nerve, who handled the throttle of the giant engines.—*Central of Georgia Railway Magazine.*

# Hearings on Western Grain and Hay Rates

## Grain-Carriers Show How Desired Reductions Would Impoverish Roads; Small Benefit to Farmers

WASINGTON, D. C.

THE TESTIMONY of the railroads in the inquiry which is being conducted by the Interstate Commerce Commission on the request of the farmers for reductions in freight rates on grain and hay was heard last week, beginning on Wednesday, with statements presented by L. E. Wettling, manager of the Statistical Bureau of the Western Lines. He said that even in the face of the wage cut made by the Railroad Labor Board and effective on July 1 last such a reduction in rates would cut the net operating income to a point that would bring the annual return to below two per cent on the roads' tentative valuation. Estimating on the nine months ending May 31, 1921, the net operating income of the railroads in the western district from freight traffic would for 12 months be \$143,887,000, or at the annual rate of return on their tentative valuation of only 1.42 per cent. During the nine months referred to, the earnings of the western roads was at an annual rate of 2.78 per cent. If the Interstate Commerce Commission grants this request, this rate of return would be reduced to approximately 1.67 per cent, of which 1.15 per cent would be from freight.

Mr. Wettling declared that the roads in the western district were hit harder by the traffic slump during the first five months of this year than those in any other part of the country, there having been a decline compared with the same period in 1920 of more than 27 per cent. Despite this, he said their expenses increased 7.69 per cent during the nine months which ended on June 1 compared with the corresponding months one year ago. For transporting one ton of grain and grain products one mile, the roads receive an average of 1.10 cents while for all other traffic they average 1.44 cents.

The farmers ought to seek first relief from other industries concerned with the marketing of grain, whose rate of return is much higher than that of the railroads. According to the findings of the Federal Trade Commission, owners of country grain elevators in the western grain states in 1920 realized net returns ranging from 20 to 57 per cent on their investment. The farmers paid the elevator owners an average profit of eight cents a bushel. In some instances they are paying these elevators more than is paid to the railroad. Investigation by the Federal Trade Commission of 1,091 grain elevators showed that on the grain they handled the net return on their investment amounted to 25.33 per cent. One hundred elevators in North Dakota received an average profit of 11.5 cents a bushel and a net return on their investment of 31.34 per cent, while 63 elevators in South Dakota had a profit of 8.24 cents a bushel and a net return of 54.74 per cent on their investment. Investigation by the commission into the operations of eight elevators in Oklahoma showed that they received a profit of 11.93 cents a bushel and had a net return of 57.65 per cent on the amount invested.

From January 1 to July 23 this year, 3,251,455 cars less were loaded with revenue freight than during the corresponding period in 1920 but the number loaded with grain and grain products was 190,530 cars greater than during that period last year, and 120,643 cars greater than in 1919.

The carriers are saving themselves from having operating deficits by greatly reducing expenditures, particularly for maintenance work; but all of this maintenance work must eventually be done. There is little hope of the roads reducing their expenditures for coal before April 1, 1922, when many of them renew their contracts. While, because of the fact that the carriers are compelled to buy their supplies

from 6 to 18 months in advance, it will be some time yet before they can realize anything from the present drop in the cost of materials and supplies.

Fred C. Maegly, assistant general freight agent of the Atchison, Topeka & Santa Fe, testified concerning rates on grain, pointing out that the cost of transporting this commodity is more than for other commodities because of certain services which the roads have to render.

On Friday, testimony was presented to show that even should the low rates on grain and hay be restored, the saving to the farmer would be small while it would result in the loss of millions to the carriers. A. F. Cleveland, assistant freight traffic manager of the Chicago & North Western, showed that the individual farmer in South Dakota, Iowa, Nebraska and Minnesota would be benefited only from \$9 to \$51 on his annual grain crop; while to require the Chicago & North Western to reduce its revenues on these commodities by the amount advanced a year ago, would cost that road \$4,430,194, at a time when the road is not making operating expenses. Should the request of the western states for a reduction be granted the amount saved would only be approximately 1.9 cents on each bushel of wheat; 2½ cents on corn and 1.13 cents on oats. The fluctuation in the market price of grains is far in excess of these amounts. Mr. Cleveland declared that the rates on grain are not such as to interfere with traffic and that that commodity is now being carried for less than other classes of freight. Loss and damage claims resulting from shipments of grain and grain products are heavier than for any other commodity.

F. B. Houghton, freight traffic manager of the Atchison, Topeka & Santa Fe, said that in his opinion a reduction in the freight rates on alfalfa would not stimulate traffic, declaring that feeders in the east would not buy alfalfa from the west when they could get cheaper feed nearer home.

On Saturday, Mr. Cleveland and Frank B. Townsend, vice-president of the Minneapolis & St. Louis, testified that the proposed reduction would only increase the deficits under which many roads are now operating. A reduction of 25 per cent would cause a loss of \$1,414,611 annually to the Chicago, St. Paul, Minneapolis & Omaha, while the annual revenues of the Chicago Great Western would be reduced by \$1,233,951. During the first six months this year, the Chicago, St. Paul, Minneapolis & Omaha had a net operating income of only \$288,737; and the Minneapolis & St. Louis had an operating deficit of \$584,526.

L. T. Wilcox, assistant to the freight traffic manager of the Union Pacific, testifying on Monday, the 29th, denied the claims of grain men that reductions in freight rates on grain and hay would stimulate movement. These assertions have not been borne out by recent experiences of the Union Pacific. Cuts in freight rates on lumber and hay resulted in no increase in the movement of those commodities. Mr. Wilcox presented data to show that grain and grain products were moving freely over the Union Pacific, but that the movement of other commodities had decreased to a considerable extent. One member of the system, he said, was not making expenses by \$250,000 a year, adding that a reduction of 25 per cent on grain rates would reduce the revenues of the line by \$4,781,366. In response to inquiries by members of the commission, Mr. Wilcox said he believed general business conditions were responsible for the diminution of traffic, but added that constant rumors of rate reductions were in his opinion seriously retarding business. He be-

lieved if general business conditions improved, tonnage would move practically as freely under existing rates as it would under reduced rates.

P. J. McCarthy, assistant general freight agent of the Missouri Pacific, said that the proposed reductions of about 25 per cent would cut the revenues of that road \$2,500,000 a year.

On Tuesday, P. H. Burnham, general freight agent of the Great Northern, testified. He estimated that a 25 per cent reduction would reduce the revenues of the Great Northern from the transportation of grain and hay by \$4,167,846. During the first seven months this year, loading of grain on the Great Northern totaled 30,519 cars, 32.8 per cent more than during the corresponding period in 1920. Grain and grain products are moving freely on the lines of the Great Northern under existing rates.

E. W. Soergel, assistant general freight agent of the Chicago, Milwaukee & St. Paul, testified that that road during the first six months in 1921 had an operating deficit of \$2,815,000. If a 25 per cent reduction in rates is made, he estimated that the St. Paul would lose \$4,775,000 annually.

Henry Blakely, freight traffic manager of the Northern Pacific, estimated that the proposed reductions would have reduced the revenues of that road approximately \$3,000,000 during the first six months this year. The Northern Pacific had an operating deficit of \$1,835,000. During the first six months this year 25,173 cars were loaded with grain on the Northern Pacific compared with 23,039 cars in 1920; the total of grain, grain products and hay during that six months was 44,140 cars compared with 57,822 cars in 1920. Mr. Blakely testified that during the first six months this year the Northern Pacific, because of the reduction of receipts expended \$714,500 less for maintenance of way and structures than was spent during the corresponding period last year and \$811,083 less for the maintenance of equipment.

#### Necessary Prices of Crops If

##### Farmers Paid Railroad Wages

Commissioner Potter has put into the record a statement from M. O. Lorenz, statistician for the commission, prepared in response to his question as to the effect upon the Minnesota farmer's costs of producing grain if he were allowed the same earning per hour for labor as is paid to railroad employees. Dr. Lorenz says in part:

"According to our latest statistics, the average earning per hour of all classes of railroad employees in the first half of this year was 69.9 cents. Deducting 12 per cent on account of the recent reductions authorized by the Labor Board, the present earning per hour may be taken at 61.5 cents.

"According to the exhibit presented by F. W. Peck, it took one hour of man labor to produce a bushel of wheat. The rate paid was 25 cents an hour. To have paid 61.5 cents an hour would have increased the cost per bushel 36.5 cents. The average freight rate paid by Minnesota farmers to the primary markets is not available but it may be estimated as follows:

"A study for April, 1920, indicated that 6,734 carloads of wheat destined to Minnesota paid \$3.30 per ton. Increasing this 35 per cent, the present average freight charge is \$4.455 per ton or 22.27 cents per 100 lb., or 13.36 cents a bushel. To enable the farmer to pay to his labor in producing wheat the average railroad worker's earning per hour by a reduction in freight rates, would require a canceling of the entire freight charge and in addition a bounty from the railroad company to the farmer of 23.14 cents a bushel. If time and a half for overtime were allowed to the farmer, the bounty would have to be larger.

"In the case of corn, 26 hours are required to produce 40 bushels or .65 of an hour per bushel. To pay the average railroad wage would thus require .65 or 36.5 additional or 23.72 cents per bushel. The average freight rate on corn

computed from the same source as above is 18.22 cents per 100 lbs. or 10.93 cents per bushel. In this case the bounty would be 12.79 cents per bushel."

On Wednesday, August 31, statements were presented by C. E. Spens, vice-president of the Chicago, Burlington & Quincy; S. H. Johnson, vice-president of the Chicago, Rock Island & Pacific; J. G. Woolworth, vice-president of the Northern Pacific; Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, and A. C. Johnson, vice-president of the Chicago & North Western. Mr. Speers, answering a question of Commissioner Potter, called attention to the fact that even though railroad operating expenses were reduced by wage cuts or otherwise, the carriers could not be expected to "hand over" to the shippers the entire savings thus effected so long as the carriers fail to earn the 6 per cent return contemplated by the Transportation Act. But, of course, a large saving in expenses would in all probability be followed by a reduction in freight rates. It would be "impolitic and impossible" to increase other rates in order to make up for deficiencies caused by a reduction on grain and hay; any talk relative to such an increase was "purely academic." Our only hope is that the volume of business will increase. The present low prices on grains are due to the large surplus or excessive supply versus demand. If freight rates are reduced, the movement of grain will be stimulated, resulting in increasing the present available supply; then the prices would naturally continue on a downward trend, and the producer would reap little, if any, benefit, while the Transportation Act would be nullified.

## Austria Plans Extensive Electrification

LONDON

**D**URING 1920 Austria imported 4,800,000 tons of coal, and if minimum requirements are to be met in 1921 about 7,000,000 tons will have to be imported, which will cost about 24,000,000,000 Austrian kronen (\$47,500,000 at the present rate of exchange). This coal comes principally from Czecho-Slovakia and Upper Silesia. Austria produces about 20 per cent of its requirements, but the coal is of such a poor quality that but little of it can be used on locomotives. On account of the high price of export coal there is every incentive for railway electrification, particularly so because of the large amount of water power available. It is estimated that there is a potential of 2,500,000 hp. to be developed by hydro-electric plants, of which only 205,000 hp. is now being used. By proper development of this source of energy some 6,000,000 or 7,000,000 tons of coal could be saved.

The present economic and financial conditions in Austria permit of only gradual development. On account of the precarious financial situation the government has reduced the credit already granted for the electrification from 1,200,000,000 to 500,000,000 kronen. This and the prohibitive price of certain materials which, because of lack of coal must be purchased abroad, are hampering the progress of the work. Those lines are to be electrified first which have heavy grades and are located far from the coal supply. Facilities for the production of electric current and traffic conditions are also taken into consideration.

On July 23, 1920, a bill passed the Austrian National Assembly which authorized the electrification within a period of seven years of 405 miles out of the 2,780 miles of railway lines administered by the Austrian government. The lines, which are shown on the accompanying map by a dotted line, are:

Innsbruck-German-Swiss border line.....	146 miles
Salzburg-Schwarzach-Worgl .....	119 miles
Schwarzach-Villach .....	73 miles
Steinach-Attnang .....	67 miles
Total .....	405 miles

The bill provides for the expenditure of a sum not to exceed 5,096,000,000 kronen (about \$10,000,000) to be covered by an Austrian government bond issue repayable within 25 years from date of issue. An effort will be made to enlist foreign capital by mortgaging the railways themselves. So far all expenses have been covered by the government without the issue of a loan and without foreign capital, although negotiations with foreign financial interests are in progress.

The bill further contemplates the electrification in a second period of seven years of the following lines, which are shown on the map by heavy solid lines:

Vienna-Salzburg .....	195 miles
Amstetten-Selzthal .....	114 miles
St. Michael-Villach .....	109 miles
St. Valentin-Kl. Reifling .....	42 miles
St. Veit-Kingenfurt .....	11 miles
Selzthal-Bischofsheim .....	61 miles
Linz-Selzthal .....	65 miles
Hiedlau-Vorderberg .....	22 miles
Wels-Passau .....	50 miles
Wörgl-Innsbruck .....	37 miles
Total .....	706 miles

If this is done, 1,111 miles or 40 per cent of the Austrian State Railway will have been electrified. The remaining lines by reason of the peculiar traffic will probably not be electrified at all.

The electrified lines will operate on single phase current at 16 2/3 cycles per second. Power will be transmitted at

Proposed Electrification in Austria. Dotted Lines Show Work to Be Undertaken First, Heavy Lines Indicate Projects for Future

50,000-110,000 volts and transformed to 15,000 volts for the contact wire. It is to be noted that this is the same system in use in Switzerland.

The total available energy is estimated for the electric operation in question at 357,200,000 kw-hr. per year.

The power stations for the Innsbruck-Swiss-German border line are the Rutz River station near Innsbruck and the Spuller Lake station near Danofen. The sub-stations are to be located at Zirl, Rappen, Flirsch and Danofen. The yearly capacity of the Rutz River power station amounts to 39,000,000 kw-hr.; that of the Spuller Lake power station to 25,000,000 kw-hr. Taking the density of the traffic in 1913 as a basis, the total energy needed from both stations amounts to only 43,000,000 kw-hr., whereby it can be seen that there will be a big reserve for increase of traffic. The Spuller Lake power station is a new plant while the Rutz River station has only to be enlarged.

The Spuller Lake power station, where work was started in September, 1919, will contain 6 units of 8,000 hp. each. At the beginning only 3 units will be used. The hydraulic work is very complicated.

The Rutz River station has at present a capacity of 8,000 hp. and will be enlarged to 16,000 hp. The reconstruction of the Rutz River station will be completed in the spring of 1922. The Spuller Lake power station and the sub-stations

between that place and Innsbruck are to be completed in the summer of 1923. Completion of overhead construction on the line Innsbruck-Telfs is expected for the fall of 1921, that of the line Telfs-Landeck for the winter 1922, Landeck-Bludenz the winter of 1923. By using the energy of Rutz River station electric operation on the Innsbruck-Landeck line is expected to become effective at the beginning of 1923; the electric operation of the Arlberg line between Landeck-Bludenz will probably not be possible before the beginning of 1924.

For the remaining lines to be electrified during the first period, two power stations have been planned, and work has recently been started. These stations are the Stubbach valley power station with 40,000 hp. for supplying the Wörgl-Salzburg line, and the Mallnitz power station with 16,000 hp. for supplying the Schwarzach-Villach line. The sub-stations will be located at Westendorf, Hochfilzen, Bruck Fusch, Bischofsheim, Hallein, Hofgastein and Mallnitz. Work is expected to be completed at the latest by the end of 1926.

The electric energy for the operation of the Attnang-Steinach line will be taken from the existing Steg power station near Hallstatt owned by the firm Stern & Hafferl. The necessary work there is expected to be completed at the beginning of 1923, so that electric operations will then be possible.

Of rolling equipment only locomotives are to be secured. So far 27 locomotives—15 passenger and 12 freight—have been ordered from Austrian factories (Brown Boveri, A.E.G., Union and Siemens-Schuckert). This is about one-eighth of the locomotives needed for operation on all lines to be electrified. The passenger locomotives will be of the 2-6-6-2 type and the 2-6-2 type. The 2-6-6-2 engines will operate at a speed of 31 m.p.h. The capacity of these locomotives is about 25 per cent greater than that of the five driving axle steam locomotives now used. They have a rated horsepower of 1,850 at 30 m.p.h. and an overload capacity of 3,000 hp.

The freight locomotives will be of the 0-10-0 type with a rated capacity of 1,000 hp. at an average speed of 18.5 m.p.h. and an overload capacity of 2,000 hp. The cars to be used in the trains operated by electric locomotives will be the same as used for steam operation.

## Freight Car Loading

WASHINGTON, D. C.

**A**N INCREASE of 7,471 in the number of cars loaded with revenue freight during the week ended August 30 compared with the previous week, was shown in the reports of the Car Service Division of the American Railway Association. The total for the week was 516,436 cars. This was a decrease, however, of 151,667 cars compared with the total for the corresponding week last year and 96,773 cars under that for the corresponding week in 1919.

The principal increase, compared with the week before, was in the loading of merchandise and miscellaneous freight which includes manufactured products, although there was a substantial increase in shipments of livestock. Loadings of both coal and grain and grain products, however, were under those of the previous week.

The total number of cars loaded with merchandise and miscellaneous freight was 491,922, which was 12,173 more than during the week of August 13. It was, however, 43,000 less than were loaded during the corresponding week one year ago.

Loading of livestock amounted to 29,110 cars, or an increase of 2,275 cars over the preceding week and 2,000 cars over the total for the corresponding week in 1920. There was also an increase of 150 cars over the week before the loading of coke, the total being 4,436.

Coal loadings, which during the week of August 13 were

up to 158,260, dropped back to 154,140, or a decrease of 4,120. This was 50,000 under the corresponding week last year. Grain and grain products totaled for the week 59,875 cars, or 1,685 under the week before, but 18,237 cars in excess of the same week in 1920 and 7,900 more than were loaded during the corresponding week in 1919.

Loading of forest products totaled 44,583 cars, or a decrease of 750 cars compared with the previous week while ore decreased 572 cars from the week before to a total of 32,370.

Compared by districts, slight decreases under the week before were reported in the Allegheny, Pocahontas and southern regions while all the others reported increases. All, however, were under the totals for the corresponding week in 1920.

### Car Surpluses and Shortages

Reports from the Car Service Division of the American Railway Association show that on August 23—491,399 freight cars were idle on American railroads owing to business conditions (surplus cars plus bad order cars over 7 per cent of the total), which was, however, a decrease of 8,195 cars compared with the total on August 15.

Of that total 270,024 were serviceable freight cars while

the remaining 221,375 were in need of repairs. Tabulations showed, however, that the former was a decrease in approximately a week of 14,314 cars while the number of cars in bad order was an increase of 6,119 over the last previous figures received up to August 1.

Surplus box cars in good order on August 23 totaled 79,368 which was a reduction of 5,154 within a week while surplus coal cars immediately available to meet current freight requirements, if necessary, numbered 136,981, or a reduction within the same period of 8,091. Surplus stock cars in good order also totaled 10,714 or 1,317 cars less than were reported on the middle of the month. Of the 2,300,929 freight cars on line of American railroads, 382,440 or 16.6 per cent were reported in need of repairs compared with 376,417 or 16.3 per cent on August 1. In computing the number of cars needing repairs but idle due to business conditions an allowance of 7 per cent is made to represent the number regarded as normally out of service.

The car shortage which has been reported in certain localities principally because of increased demand for grain cars is gradually disappearing, the total on August 23 being 1,376 of which 1,275 were box cars compared with a total of 2,125 on August 15.

### REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

SUMMARY—ALL DISTRICTS, COMPARISON OF TOTALS THIS YEAR, LAST YEAR, TWO YEARS AGO. FOR WEEK ENDING SATURDAY, AUGUST 13, 1921

		Total revenue freight loaded										Received from connections			
		This year		Corresponding year		Corresponding year		This year		Corresponding year		Corresponding year		Corresponding year	
		1921		1920		1919		1921		1920		1921		1920	
Districts:	Year	Grain and grain products	Live stock	Coal	Coke	Forest products	Ore	Merchandise	Miscellaneous	1921	1920	1921	1920	1921	1920

# A Large Capacity Locomotive Weighing Plant

Heavy Scale Is Housed in a Special Building with Equipment  
for Determining Wheel Loads

By Carl C. Bailey

Baldwin Locomotive Works, Philadelphia, Pa.

A LOCOMOTIVE weighing plant was recently completed at the Eddystone plant of the Baldwin Locomotive Works, which unquestionably has yet to be surpassed in size and novelty of construction. It is comprised of a platform track scale, 24 individual wheel scales, concrete scale foundations of massive construction, and a specially designed building which covers and protects the scale and its mechanism. The large scale is composed of six sections, each of which is designed to carry a theoretical concentrated load of 150 tons, making a total working capacity of 450 tons.

Locomotive builders and the railroads in general have long felt the lack of some weighing equipment which would

as previously mentioned, of 450 tons, with a platform of sufficient width to permit the use of individual scales under each wheel. A scale of this type would give accurate results and all weights would be determined with the engine in one location.

In designing the scale the stresses as recommended by the specifications of the American Railway Association, as well as those of the United States Bureau of Standards, were taken into consideration. However, the necessity for rigid limitations on deflection in the longer extension levers, resulted in designs which in many instances give unit stresses very much below specification limits. To conform to these speci-

A Locomotive on the Scales with the Portable Wheel Scales in Position

give them accurate weights and wheel loads, and as a move in this direction the New York Central installed a large track scale at Albany, N. Y., in 1915-16. This track scale has a wooden deck but no provision was made for obtaining individual wheel load weights. The Baldwin Locomotive Works heretofore determined the total weight of the locomotive on a track scale, after which the individual wheel loads were obtained by moving the locomotive to a specially constructed track having concrete foundations of sufficient width to allow the placing of individual scales under each wheel. With this method of weighing, it was difficult to avoid and obtain any degree of accuracy when comparing the weight on the platform with the total weights on the individual scales.

After many investigations relative to the assumed loading of the largest locomotive which it would be practical to build, it was decided to construct a scale having a working capacity,

fications, the designers were confronted with the question of producing a knife edge in the main levers of sufficient length to give a unit loading not to exceed 7,000 lb. per lineal inch, and also with the problem of supporting it in a substantial manner to secure an even distribution of the load. These knife edges are 22 in. long and are made of a special alloy steel which, when hardened in oil, has an elastic limit of not less than 160,000 lb., and a tensile strength of not less than 200,000 lb. per sq. in. The entire surface of all pivots and bearings throughout the scale is machined, hardened and ground and set in machined ways. All bearing steels for fulcrum stands are set in removable blocks that may be lifted off the stands. These knife edges are so constructed as to have continuous contact with their bearings and there are no bow loops in this scale except those for counter-balancing or back-balancing the weigh beam.

There are 12 cast steel main levers weighing approximately

1,075 lb. each. They rest upon fulcrum stands at one end and are suspended by a stirrup  $2\frac{1}{4}$  in. in diameter at the other. From these the massive cast steel yokes that carry the platform are suspended by two heavy machine steel stirrups 3 ft. long and  $2\frac{3}{4}$  in. in diameter.

The connection between the middle extension lever and the transverse extension is accomplished by means of two machine steel stirrups  $1\frac{1}{2}$  in. in diameter that pass over bearing blocks which engage the butt pivot of the transverse lever and the end pivot of the middle extension lever. These stirrups are then connected by a 2-in. plate which permits vertical adjustment.

The connection between the middle extension lever and the 3-ft. even lever consists of two machine steel stirrups of  $1\frac{1}{8}$ -in. diameter that pass over the bearing blocks which engage the end pivot of the middle extension lever and end pivot of the even lever. These stirrups are connected by means of two  $1\frac{1}{2}$ -in. plates and two draw bars  $1\frac{1}{4}$  in. in diameter. At the fulcrums of both the even and the extension levers, there is an up-pull. These fulcrums are anchored down to the sub-bases by means of two cast steel anchors in the form of an inverted stirrup, one at each side of the lever. Each stirrup is held down by two  $1\frac{1}{4}$ -in. anchor bolts, making four bolts to a lever.

The connection between the transverse extension lever and the lever under the weigh beam is composed of stirrups, plates, draw bars and bearing blocks, all so arranged that one lever may be leveled independent of the other, that proper swiveling can take place to match the different angles at which the levers hang, and to give vertical adjustment to the levers in unison.

The weigh beam on the platform scale is graduated to 895,000-lb. capacity by 5,000 lb., with an auxiliary beam of 5,000-lb. capacity by 50 lb., giving a total capacity of 900,000 lb. This weigh beam is of "The Standard" type

rocker blocks are made of steel castings and distribute the load uniformly over the entire knife edges.

### Individual Wheel Scales

The individual wheel scales were designed and constructed more substantially than the ones previously used in obtaining individual wheel weights. The entire frame work, with the exception of the levers, knife edges, bearing blocks, and a few minor parts, is of structural steel.

Each individual scale, although weighing 2,310 lb., can

The Scale House Is Largely of Glass

be moved about easily on two rollers or wheels which can be lowered or raised clear of the floor by means of a lever and screw device. These wheels run on roller bearings and enable the scales to be handled with remarkable rapidity.

Each individual scale is so placed that one knife edge is directly under a wheel of the locomotive. It will be noticed that over this knife edge there is a small bearing block which is placed under the tread of the wheel by planing off one

View of the Scale Mechanism on the Lower Level

with a pin recording attachment. This weigh beam, as well as those of the individual scales, is made of high grade cast iron, fitted with steel inserts for the notches.

The main girders that form the weigh bridge for the platform are constructed of 30-in. 200-lb. Bethlehem girder beams with  $\frac{3}{4}$ -in. plates riveted on the top and bottom to increase the section modulus. These girders carry 12-in., 28.5-lb. I-beams placed transversely to form the platform. (It is on this platform that the individual scales are placed to obtain the wheel loads.) The deck is composed of a  $\frac{1}{2}$ -in. steel plate riveted to the I-beams.

The suspension pendulums that carry the weigh bridge upon the lever system are adjustable. The bearing and

side of the rail head flush with the web. This bearing block distributes the load over a knife edge of sufficient length to bring the lineal pressure under full load to 7,000 lb. per in.

The locomotive wheel must be raised clear of the track before the weight can be registered on the weigh beam. To accomplish this, jacks which are raised and lowered by means of ratchets, have been placed on each side of the 8-in. I-beams which form the frame work for the scale. In order that the individual scales may be in alignment at all times, a small level has been placed on the shelf directly under the weigh beam. The capacity of an individual scale is 49,000 lb., increased by an additional 1,000 lb. by 10 lb. on an auxiliary beam, thus giving a total weighing capacity of

50,000 lb. An idea of the accuracy of the wheel scales was obtained in recent tests in which the sum of the wheel loads obtained with the individual scales varied only one-half per cent from the total weight recorded by the platform scales.

For greater convenience, as well as economical maintenance, it was decided to house this equipment in a building specially designed for the purpose and erected on a sloping site which affords entrance from the outside on two levels.

Diagram of the Individual Wheel Scale

The foundations are of concrete, with a concrete mat 110 ft. long, 11 ft. wide and 3 ft. deep, reinforced with 100 lb. rail. In this mat were placed 15-in. 42-lb. I-beams to which the foundation bolts were anchored. The scale-house, as it may be called, measures 122 ft. by 42 ft., and is of hollow tile and steel construction, with steel sash fitted with  $\frac{1}{8}$  factory ribbed glass.

Approaching this building there has been constructed a standard gage track approximately 525 ft. long. The curves

A Close View of One of the Sections

on the track are 16 and 15 deg. respectively, connected by a 40-ft. tangent, which allows the checking up of the clearances on the locomotive when rounding a short degree curve.

Designs for the scale and the complete installation of this equipment were worked out and built under the direction of W. N. Haines and D. L. Daly of the Standard Scale & Sizing Company, Pittsburgh, Pa., and B. T. Converse and the writer, of the Baldwin Locomotive Works.

A MISSOURI, KANSAS & TEXAS train was robbed near Denison, Tex., on the morning of August 25. Two handits boarding the mail car as the train was leaving Bells and immediately covering the mail clerk. They rifled several mail pouches and when near Denison signaled the train to stop and then dropped off. They escaped.

## Twenty Systems in

### I. C. C. Consolidation Plan

NEW YORK papers on Monday and Tuesday last gave in their columns what purported to be an outline of the tentative plan upon which consolidation of the country's railroads may be carried out, as suggested in the report made to the Interstate Commerce Commission by W. Z. Ripley, professor of economics at Harvard University. The Interstate Commerce Commission refused to comment in any way through official channels on the appearance of the supposed plan, but it is understood that an informal investigation is being made to determine the source of the leak. The official report which the Interstate Commerce Commission is directed to make by the Transportation Act—as given in Section 5 of the Interstate Commerce Act—will, it is said, be made public within a short time.

The plan as given in the papers outlines 20 possible systems, but in some cases—notably that numbered 7a—these are alternative. The New England roads apparently presented the most difficult problem of classification. For example, the New Haven is shown as included in the Baltimore & Ohio system and the Boston & Maine in the New York Central system, but a New England system, including all the roads in that region, except the Boston & Albany, is shown; likewise a New England-Great Lakes system which includes the New England roads just mentioned and the Lackawanna, the Delaware & Hudson and the Buffalo, Rochester & Pittsburgh.

No real transcontinental system is made. Northern Pacific and Burlington go together, the Great Northern and the St. Paul, the Union Pacific and the Chicago & North Western, the Southern Pacific and the Rock Island. The outline of the suggested plan of consolidations was given in the Wall Street Journal as follows:

No. 1. New York Central system: New York Central lines, except Lake Erie & Western, Toledo & Ohio Central, Zanesville & Western, Kanawha & Michigan, and Indiana Harbor Belt; Western Maryland, Fonda, Johnstown & Gloversville, Lake Erie & Pittsburgh, Pittsburgh, Chartiers & Youngblood, Monongahela, Boston & Maine, Maine Central, Bangor & Aroostook. Note: Boston & Maine, Maine Central, and Bangor & Aroostook may be included in System No. 7 or in 7a. Professor Ripley rejects trunk line treatment of the New England roads, but the commission presents it alternatively to bring out discussion.

No. 2. Pennsylvania system: Pennsylvania, Panhandle, Toledo, Peoria & Western, Lorain, Ashland & Southern, Lake Erie & Pittsburgh, Central Indiana, Pittsburgh, Chartiers & Youngblood, Monongahela.

No. 3. Baltimore & Ohio system: Baltimore & Ohio, Reading, Central of New Jersey, Cincinnati, Indianapolis & Western, Chicago Indianapolis & Louisville, New York, New Haven & Hartford, Central New England, Lehigh & New England, Lehigh & Hudson. Note: B. & O. Chicago Terminal is reserved for consideration in connection with terminal situations.

No. 4. Erie System: Erie, Delaware & Hudson, Delaware, Lackawanna & Western, Ulster & Delaware, Bessemer & Lake Erie, Buffalo & Susquehanna, Pittsburgh & Shawmut, Pittsburgh, Shawmut & Northern, Lorain, Ashland & Southern, Wabash lines east of Missouri River.

No. 5. Nickel Plate Lehigh Valley system: Lehigh Valley, New York, Chicago & St. Louis, Toledo, St. Louis & West rn, Detroit & Toledo Short Lines, Lake Erie & Western, Wheeling & Lake Erie, Pittsburgh & West Virginia, Bessemer & Lake Erie.

No. 6. Pere Marquette system: Pere Marquette, Detroit & Mackinac, Ann Arbor, Detroit, Toledo & Ironton, Bayne City, Gaylord & Alpena.

### Alternative New England Plans

No. 7. New England system: New Haven, Ontario & Western, Boston & Maine, Maine Central, Bangor & Aroostook, Lehigh & Hudson River, Lehigh & New England.

No. 7a. New England Great Lakes system. Same as above with addition of Delaware & Hudson, Lackawanna, Ulster & Delaware, Buffalo, Rochester & Pittsburgh, Pittsburgh & Shawmut, Pittsburgh, Shawmut & Northern.

No. 8. Chesapeake & Ohio system: Chesapeake & Ohio, Hackling Valley, Virginian.

No. 9. Norfolk & Western system: Norfolk & Western, Toledo & Ohio Central, Kanawha & Michigan.

No. 10. Southern system: Southern Railway and affiliated lines, New Orleans, Great Northern, Alabama & Vicksburg.

No. 11. Atlantic Coast Line-Louisville & Nashville system: Those two roads and subsidiaries, Western Railway of Alabama, Richmond, Fredericksburg & Potomac, Norfolk Southern, Atlanta, Birmingham & Atlantic, Winston-Salem Southbound, Roanoke to Winston-Salem branch of the Norfolk & Western, Florida East Coast, Carolina, Clinchfield & Ohio, Georgia & Florida, Gulf, Mobile & Northern, Mississippi Central.

No. 12. Illinois Central-Seaboard system: Illinois Central, Seaboard Air Line, branch of Norfolk & Western from Lynchburg, Va., to Durham, N. C., Gulf & Ship Island, Tennessee Central, Carolina, Clinchfield & Ohio.

### Big Western Groups

No. 13. Union Pacific North Western system: Union Pacific, Chicago & North Western, Lake Superior & Isheming, Wabash lines west of Missouri River.

No. 14. Burlington, Northern Pacific system: Chicago, Burlington & Quincy, Northern Pacific, Chicago & Gt. Western, Minneapolis & St. Louis, Spokane, Portland & Seattle. (Colorado & Southern may be included in system No. 16.)

No. 15. Milwaukee Great Northern system: Chicago, Milwaukee & St. Paul, Great Northern, Duluth & Iron Range, Duluth, Missabe & Northern, Green Bay & Western, Spokane, Portland & Seattle, Butte, Anaconda & Pacific.

No. 16. Santa Fe system: Atchison, Colorado & Southern, Denver & Rio Grande, Western Pacific, Utah Ry., Northwestern Pacific, Nevada Northern.

No. 17. Southern Pacific, Rock Island system—Southern Pacific, Nevada Northern, Chicago, Rock Island & Pacific, Arizona & New Mexico, El Paso & Southwestern, San Antonio & Aransas Pass, Trinity & Brazos Valley, Midland Valley, Vicksburg, Shreveport & Pacific, Chicago, Peoria & St. Louis.

### New Southwestern Alignment

No. 18. Frisco-Katy-Cotton Belt system: St. Louis-San Francisco, St. Louis Southwestern, Louisiana Ry. and Navigation Co., Chicago & Alton, Missouri, Kansas & Texas, Trinity & Brazos Valley, San Antonio, Uvalde & Gulf. (Note: M. K. & T. may be included in No. 17.)

No. 19. Chicago-Missouri Pacific system: Chicago & Eastern Illinois, Missouri Pacific, Kansas City Southern, Kansas City Mexico & Orient, Kansas, Oklahoma & Gulf, Texas & Pacific, Ft. Smith & Western, Louisiana & Arkansas, Gulf Coast Lines, International & Great Northern. (Gulf Coast Lines indicates the New Orleans, Texas & Mexico, and subsidiaries.)

It will be noted that a number of railroads, particularly minor roads, are mentioned in more than one group, indicating that the Commission believes the assignment of such properties might be one way or another.

Subsidiaries of Canadian roads, such as the Soo line, are not assigned, the Commission remarking that they are portions of through transcontinental Canadian systems in active competition with systems above set forth. Few Class II and Class III roads are dealt with here but will be considered at the hearings. Water carriers controlled by railroads are considered as tentatively included with the controlling road.

### Real Test of Scheme Is Its

#### Ability to Economize in Cost

"After lying dormant for several months," says the Journal of Commerce, in commenting on the plan of consolidations outlined, "the railway consolidation scheme provided for in the Transportation Act of 1920 again reappears as a project of the Interstate Commerce Commission. This time it is in a more fully developed form as the result of work done by an expert, who has been reviewing the whole situation at the request of the commission. The Transportation Act directed the commission to develop plans for the permissive grouping or consolidation of the roads, results to be subjected to public hearing before adoption in any form, and even then to go into effect only as requested by the roads."

Continuing the Journal of Commerce says:

There is thus nothing final in what has been done thus far, and an inspection of the early reports regarding the grouping or rearrangement of the proposed systems of roads does not reveal anything of a very revolutionary character so far as the main outlines are concerned. The apparent consequence of the action proposed or planned by the commission, if followed by the lines, would be that of forcing the surrender of some securities by their present holders and the acceptance of others. Such an interchange

might be called for as the result of the action of large owners of securities and might be inevitable from the standpoint of the small holder unless he were willing to lose his entire investment.

Undoubtedly the time has come for the rank and file of railroad securities holders to consider this merger policy with no little care. The Transportation Act does no more than provide facilities for initiating the new scheme, and considerably more legislation may be needed if the project is eventually to bear fruit. What this legislation should be—whether the community is really ready to submit to the surrender of its ownership of individual railroads and to accept instead ownership in a few systems subject to still closer public control—is a problem of the largest scope. It is offered at a time when the roads are to some extent emerging from the morass of government ownership into which they were plunged during the war, and its immediate effect, should it become practical, might be that of casting still more doubt upon the status of the holdings of those who now own the securities.

The real test of the scheme which is now offered for consideration is its ability to economize in the cost of transportation. If it will save expense it is desirable from the public standpoint, and the effects of it will at least potentially be beneficial to the holders of railroad securities. If there is nothing to be expected on that score there is little use in dabbling further in such experimental plans. Thus far no evidence has been adduced in favor of the consolidation except the assertion, based largely on opinion or conjecture, that savings are feasible. A notable contribution to this phase of the matter is found in the fact that whereas during the war there was close unity and centralization in the operation of the roads, great waste occurred, while since the restoration of the lines to private hands there has been material reduction of expense. Mere consolidation into large units is not likely to bring saving. The basic question, then as now, will be found in quality of management.

From the governmental standpoint it is asserted that the oversight and control of a few large systems would be much easier than the control of the multifarious roads of the present. This is based on the assumption that a change in stock ownership would result in the creation of a few corporate entities, which would be better controllable than a great many independent roads. Probably that is true from the standpoint of mere supervision, but it is not a very strong argument. There is no good reason for remodeling the railroad system of the country merely in order to secure greater ease or efficiency on the part of the Interstate Commerce Commission in the performance of its regular duties.

The whole proposal to fuse the railroad systems has been under discussion for many years, but objections to it have always been so cogent as to defeat it. The scheme went through Congress in a permissive form as a "rider" on the plan for the return of the roads to their owners, but a real and final conclusion regarding it has never been arrived at. Those who in good faith provided for the building of the roads out of their savings and to whom appeal must be made for funds to extend them and keep them up in the future should take the question seriously in hand for decision.

THE DE WITT CLINTON, the old New York Central locomotive, with its train, together with engine No. 999, is being exhibited at the Ohio State Fair, which opened on August 28.

The "Cornwall," London & North Western, 1858—102-Inch Drivers

# Ask Accountant's Help in Increasing Efficiency

Operating Officers Can Find Out Efficiency of Organization  
by Enlisting Accountant's Aid

By John Collins Owers

**M**ORE MILES per dollar! That is the one aim and object of every earnest railway man today. Whether he be a maintenance of way man, an equipment man, or one concerned directly with operating, all his thought is directed toward the one end, of producing more transportation for each dollar spent; and to reach this goal almost anything that promises to reduce expense is being tried.

Old established passenger trains are discontinued, or their schedules radically changed; business hours at stations are shortened and small agencies have been abolished. Switching shifts are omitted; less track work is done; bridge, building and signal programs are reduced, and equipment maintenance has become in arrears. Urgently needed equipment is not purchased; material stocks are allowed to run low, and many unsatisfactory conditions are permitted to exist; all with the primary object of saving money.

There is no doubt that these efforts are accomplishing the desired result. Expenses, especially payrolls, show tremendous reductions. But who knows positively whether all these cuts have produced 100 per cent economies? Or which of them have not been profitable?

Wages and fuel may be saved when fast freight trains are given slow tonnage ratings, but if, as a result, they run late, lose connections or arrive at their destinations too late for markets so that perishable shipments lie over and meats become tainted, or fruit gets too ripe, or the market falls; what is the net saving? Or if at freight houses, the number of delivery clerks is reduced, and to avoid delay, teamsters pick out their own freight and incidentally take packages belonging to someone else; or supposing that receiving clerks have been dropped with the result that improperly marked or packed shipments are accepted and become damaged or lost in transit, have the wage savings been sufficient to offset the claim agent's settlements?

Payrolls may have been reduced by changed train schedules and restricted business hours, but how have the changes affected revenues? Are people satisfied with the new conditions? Is normal traffic being handled, or has competition been stimulated? What is the net profit or loss?

Questions of this sort need the most careful study. In all the history of railroading there has never been a time when accuracy of judgment in matters of detail was so necessary as at present. We need to get rock-bottom facts in all cases; no one can afford to rely on guess work or rule-of-thumb.

## Tell the Accountant

Even if you have never done so before, take the accounting men into your confidence. Let them bring their figures into relationship with your facts, so that you can see in which direction you are traveling and where you are likely to arrive.

The shortest way to get results in this direction is for the operating officers to begin to live in interrogations. Never approve payrolls without demanding to know how much transportation has been produced by the money they have signed away. Refuse to pass statements of expenses without requiring a corresponding statement of what the money has produced, and what each unit of work cost, and how the costs compare with other jobs and the records of other men.

Let them ask the same sort of questions about statements of transportation produced. It is not enough merely to know that passenger mileage or ton mileage has increased, or that the cars or tons handled per locomotive mile are greater than

they were; the officer should insist on knowing whether the traffic has been moved at an economical or profitable figure; and no one should congratulate himself on an apparent good record until it has been put under the acid test of cost and found to be genuine.

Intelligent accounting for expenses and returns will locate specific wastes or uneconomical operations. It will show up inefficient departments, or individuals, and at the same time spur the honest and energetic to still greater effort. This point was interestingly demonstrated recently on a road where a tie installation report was started, on which the results were reduced to the number of ties applied per laborer per day on each section. Each week copies were sent to each foreman. No formal contest was started, nor were "inspiration" circulars used, but a vigorous rivalry immediately developed among the gangs; the low men sought to reach higher places on the list, and the high men to better their positions; so that the tie program, which had been started late, picked up speed and was pushed along at a fine rate, combined with a reduction in cost. Thus a very simple bit of accounting produced returns of a higher order.

Speaking broadly, railroad operations need a generous application of the "factory principle," that Mr. Ford speaks about. The proper measure of a day's work needs to be determined in every department, and for every class of employees and unit of equipment; and where it is not feasible to carry permanent cost systems, irregular "spot" checks should be made, for the purpose of keeping in touch with the results obtained.

## Ask the Accountant

Set the accounting men at work! Show them what you desire to find out; aid and direct their search for information, and you will be surprised (and it may be not wholly pleased) at what you learn. Ask them how much track should be surfaced or tamped per labor day; how many square feet a painter should cover and what various structure maintenance jobs have cost; what ratio exists between travel time and actual work hours. Ask them at what cost per unit the extra gangs are working; how many labor hours are lost by terminal delay or by train operation, and how much the loss amounts to. Then you will be able to tell the dispatcher, or it may be your foreman, what he will have to do in the way of improvement.

Ask how many labor hours are required to clean a locomotive fire, and if one, two or more men can work to better advantage; and what the ratio of fire cleaners' idle time to active time may be. Find out how many cars the yard crews should switch per hour, and under what conditions the number of riders should be increased, or an additional engine employed. Ask what tonnage should be given to your freight trains to secure the lowest possible ton-mile cost.

Ascertain what proportion of revenue earnings may be applied to terminal expenses and if the terminal costs are within that figure. Get the relationship between train operating expenses and revenues, and let them tell you what revenue should be obtained to warrant the operation of a new train.

Go into proposals for the purchase of new cars and locomotives along the same line. There will be fewer expenditure authorities withheld, if executive officers can be satisfied that the investment will realize actual savings. Work of this char-

acter, however, must be thoroughly and carefully done. Every element that bears on the problem must be taken into consideration, and all the items of expense and production properly related in order that accurate judgment may be formed. Incomplete and inconclusive figures are almost valueless.

Because by the use of heavier power, the wages cost of operating per ton-mile is lower than when smaller engines are used, it is not correct to assume that a subtraction of the lower rate from the higher will give the net credit. Many other elements enter the consideration, such as delays to other service caused by the heavier trains, drawbar failures, increased consumption of fuel, higher engine-terminal and maintenance expenses and larger capital investment, all of which add perceptibly to the cost, and therefore should be debited to the operation.

The cost of yard switching, freight trucking and fuel handling will be governed largely by the type and capacity of the equipment used. If, for instance, at one station a tractor-trailer system of trucking is in operation, while at another the freight is moved with hand-operated platform trucks, the cost of trucking at station number one should include the value of the tractor equipment, per ton handled. This can be determined by ascertaining the expenses of operating and maintenance of the tractors, including auxiliary equipment or facilities, and adding thereto a proper amount for depreciation and return on investment. Unless these elements are included, an accurate statement of cost cannot be made, and the degree of economy of one system over the other cannot be stated.

### Educate the Shirkers

It will also be found necessary to exercise sufficient supervision to insure the accuracy of reports made by employees. Few conductors are above the temptation to insert ditto marks in the tonnage columns of wheel reports; and foremen are notably hard to convince that it makes much difference if they fail to state how much, or for what purpose, material has been used. Careful review and analysis are necessary to locate and remedy errors of this character. The men at fault and also the clerks who compute and distribute the report data need to be taught the inner value of accounting. They need to learn that they are recording live facts, of importance to the well being of their company, not merely piling one figure on another for the sake of a day's pay. They should understand the use to which their work is put and how the figures are related and applied; then it will be found that the work is more accurate and proportionately more valuable.

But beyond and above everything else, get the costs. By hook or by crook, by skill or by main force, know what each job costs. This is one of the secrets of success; it is knowledge that is indeed power, for whoever has accurate knowledge of his operating costs, possesses a power to control results that is well nigh absolute.

## The Pennsylvania's Highway Crossing Signals

THE PENNSYLVANIA RAILROAD has put up at a number of road and street crossings in Pennsylvania, New Jersey, Ohio and Virginia a new design of light signal to warn travelers on the highway of the approach of trains, the lights (electric) showing red, both night and day, whenever a train is approaching. The energizing and de-energizing of the light is controlled by the train, in the usual way, through the instrumentality of the track circuit.

The photographic illustrations show two installations, one where the lights are attached to the ordinary highway sign board and the other where they are set on posts in the center of the street, the latter being a view in Haddonfield, N. J.

The lights (two) are fixed, one above the other, about 18 in. apart, center to center, and the lower one is 6 ft. 8 in. above the level of the highway. Mounted on an ordinary 3-in. pipe post, the fixtures are adjustable so that the light may be directed toward the highway no matter at what angle the road crosses the railroad. To provide for situations where it may be desirable to set the post on the left of the highway, the reflector, shown in the front-elevation drawing, is adjust-

Highway Crossing Signal, Pennsylvania Railroad

able, and may be turned horizontally to either side. At Haddonfield, where the lights are in the middle of the street and are used as an auxiliary to gate protection, the reflector is, of course, set in the center.

The circuits and batteries are usually arranged so that each of the two lamps is operated independently, to guard against both of them being out at the same time. A peephole is provided in the doors so that the signal maintainer, riding

Crossing in Haddonfield, New Jersey

on a passing train, can tell whether or not the lamps are lighted.

The lamp is rebased, so that the concentrated filament in each lamp is in the same position, relative to the pins in the base; and as each receptacle is located exactly the same in relation to the lens, the lamps are interchangeable in all signals, without further adjustment.

A 12-volt lamp, consuming about 5½ watts, is sufficient to give a good indication in bright daylight. Each complete

signal consumes only 11 watts, or 22 watts at a crossing. With the reflector properly adjusted, a driver approaching on the highway can see the indication until he is almost opposite the signal.

The standard lettered sign of the Pennsylvania, shown in

Light-Signal for Highway Crossing

the illustration, is of cast iron, with arms 8 ft. long, and is mounted on a 3-in. pipe post. The middle of the sign is 11 ft. above the ground.

## Accident Investigations—

### April, May and June

THE EIGHTH quarterly issue of the summary of train accident investigations, prepared by the Bureau of Safety of the Interstate Commerce Commission, which is for the months of April, May and June, 1921, was issued on August 24. This report covers 18 accidents, as follows:

Deraiment...Cincin.	N. Orleans & Tex. Pac.	New River, Tenn.	April 6.
Deraiment...New Orleans & Northeastern	Moselle, Miss.	April 16.	
Deraiment...Boston & Maine	Woodsville, N. H.	April 25.	
Deraiment...Pennsylvania	Bennington, Pa.	April 27.	
Deraiment...Columbus & Greenville	West Point, Miss.	April 30.	
Collision...Norfolk & Western	Welch, W. Va.	May 3.	
Collision...Washington, Balt. & Annapolis	Ferndale, Md.	May 5.	
Collision...New York Central	Elkhart, Ind.	May 7.	
Deraiment...Missouri Pacific	Almont, Ark.	May 7.	
Deraiment...Chicago, Rock Island & Pacific	Forrest City, Ark.	May 12.	
Deraiment...Texas & Pacific	Eagle Flat, Tex.	May 13.	
Collision...Chicago & Alton	Shirley, Ill.	May 15.	
Deraiment...Louisville & Nashville	Solway, Tenn.	May 19.	
Deraiment...Charleston & Western Carolina	Beech Island, S. C.	May 20.	
Collision...Pennsylvania	Burlington, N. J.	May 29.	
Collision...Louisville & Nashville	Theodore, Ala.	June 2.	
Deraiment...Baltimore & Ohio	Medora, Ind.	June 8.	
Collision...Detroit, Jackson & Chicago	Warsaw, Mich.	June 18.	

Following are abstracts of these reports:

The train derailed at New River, Tenn., on the 6th of April, was the northbound Royal Palm Limited, No. 2. Three coaches were nearly overturned and 5 passengers were killed. Over 70 passengers, one employee and three other persons were injured. The train was moving at about 40 miles an hour on a curve of six degrees when the locomotive was thrown off the track at a point where the outside rail was not properly supported, the track being under repair at the time. Three steel passenger cars were badly damaged by coming in contact with rocks projecting from the bluffs on the outside of the curve. The inspector says that the repair men were putting in new ties and increasing the elevation of the outer rail on the curve; and it appeared that the ties had been properly tamped on the inside of the curve but not under the ends of the ties at the outside. The section foreman was a man of long experience and good record.

The train derailed near Moselle, Miss., on the 16th of April, was the southbound New Orleans Limited, No. 41. Moving at about 15 miles an hour, the locomotive and three cars ran off the track at a point where the roadbed had been washed out by a sudden flood, and the engine and one car were overturned. The train consisted of one locomotive and nine cars. Two coaches and four sleeping cars remained on the track for several minutes, but the roadway was constantly being washed away, and after a short time two of these cars were overturned, fell down about seven feet and were partly submerged. One passenger was killed and two passengers and three trainmen were injured. The inspector finds that

this accident was due to a cloudburst; the evidence given at the inquiry indicating that the rainfall, causing the rising of a small stream, was the greatest ever known at that place. Train No. 55 had passed over the line a few minutes ahead of No. 41. Two drains under the track proved insufficient to relieve the flood.

The train derailed at Woodsville, N. H., on the 25th of April, was a northbound freight. Moving through a cross-over of about 15 deg. at low speed, one of the two engines of the train ran off the track, and the engineman was killed. Three employees were injured. The inspector found that a number of derailments had occurred at the same place, and that the locomotive in question was of such design that it ought not to be operated over curves of more than 10 degrees. There was no speed limit in force, and the condition of the track was only fair.

The train derailed at Bennington, Pa., two miles east of Gallitzin, on the 27th of April, about 10 p. m., was eastbound passenger No. 64. The locomotive was overturned but 9 cars remained upright. The fireman was killed and the engineman fatally injured. All other persons on the train escaped with slight bodily injuries, all of the cars being of steel. The derailment occurred on a curve of 8 deg. 38 min and the inspector found it due to excessive speed. The permissible rate at this point is only 30 miles an hour, while the train was running, probably, at 40 m.p.h. or faster.

The train derailed near West Point, Miss., on the 30th of April, consisted of two locomotives moving backward and eight cars. While running at about 25 miles an hour, down grade, one of the engines was derailed and both locomotives were partially overturned. Two enginemen, one trainman and one ex-employee (classed as a trespasser) were killed and two trainmen were injured. The inspector concluded that the cause was excessive speed on uneven track.

The train involved in the collision at Welch, W. Va., on the 2nd of May, was a local passenger, moving backward. While running at about 15 miles an hour on a curve the train ran over a misplaced switch and collided with a string of coal cars standing on a side track. Two coaches were crushed. Six passengers were killed and 41 passengers and one employee were injured. The switch was left wrong by track repairers. The lookout was inefficient. The report of the inspector on this collision was noticed in the *Railway Age* of June 17, page 1418.

The butting collision on the Washington, Baltimore & Annapolis electric road at Ferndale, Md., on the 5th of May, was between a passenger train and a work train. The motor-man of the work train was killed and 10 passengers and 13 employees were injured. The time-table had been changed a few days before, and the men in charge of the work train, trusting to memory as to the frequency of passenger trains, encroached on the time of passenger train No. 339 without right. The passenger trains had been running every half hour, and some of them were taken off; these men neglected to examine the time-table.

The collision at Elkhart, Ind., on May 7 occurred in the course of switching in the freight yard about 4 a. m., two employees being killed. The inspector found that both of the victims were riding on the footboard of the tender when there was no necessity therefor; and that the conductor had provided no lookout when a car was being pushed by the locomotive.

The train derailed at Almont, Ark., on the night of the 7th of May, was the westbound Sunshine Special, No. 201. Moving at about 30 miles an hour the train was derailed at a facing point switch, misplaced, and the locomotive was overturned. The fireman was killed and four persons were injured. The switch lock had been broken and the switch light covered. The inspector reports the engineman as saying that he temporarily misjudged his location.

The train derailed on the Chicago, Rock Island & Pacific

near Forrest City, Ark., on the 12th of May, was eastbound passenger No. 626 of the St. Louis Southwestern, consisting of a locomotive and six cars. Moving at full speed the locomotive was derailed at a misplaced switch and, with the first two cars, was overturned. The engineman was killed and 12 passengers and two employees were injured. The switch, a facing point, had been left open by track repairers. It had been run through by a westbound passenger train. There was a good view and the failure of the engineman to see the target is unexplained. The inspector reported that possibly the engineman of No. 626 had had his attention diverted by an automobile which was racing with his train.

The train derailed near Eagle Flat, Tex., on the 13th of May, was a westbound freight. Four trespassers were killed and five were injured. The train was moving at about 30 to 40 miles an hour, on uneven track, when the 22d car was derailed, with the consequence just noted. The inspector reported the cause as excessive speed, the limit imposed by the rule being 25 miles an hour.

The train involved in the accident at Shirley, Ill., on the night of the 15th of May, was westbound passenger No. 9. Moving at about 40 miles an hour, it ran over a misplaced switch and collided with freight cars standing on the side track, badly damaging the locomotive and the two cars next behind it. Six passengers and four trainmen were injured. The switch had been maliciously misplaced, the switch lamp having been changed to show all-clear.

The train derailed near Solway, Tenn., on the 19th of May, was northbound passenger No. 32. Moving at about 40 miles an hour the locomotive was derailed and with the first three cars was overturned. The engineman was killed, the fireman fatally injured and two other trainmen less seriously hurt. The derailment occurred at a point where track men were resurfacing and was reported by the inspector as due to the weakened condition of the track. A number of new ties had not been spiked. The track foreman, a man of 17 years' experience, had had a flag out but had called it in, evidently misjudging the strength of the track.

The train derailed on the Charleston & Western Carolina near Beech Island, S. C., on the 20th of May, about 3 a. m., was eastbound express No. 38 of the Atlantic Coast Line. Moving at about 20 miles an hour the locomotive was derailed and overturned, and with the first two cars fell down a bank. The engineman was killed and two passengers and three trainmen were injured. The train was deliberately wrecked, one rail having been taken out.

The trains in collision at Burlington, N. J., on the 29th of May, at about 8.28 p. m., were northbound local passenger No. 2714, which was just starting from the station, and a following extra excursion train, 11 cars, heavily loaded, the excursion train running into the local at about 30 miles an hour. The two rear cars of the local, both wooden coaches, were telescoped into each other. Two passengers, one of them a train dispatcher, and both employees of the Pennsylvania, were killed and 31 passengers were slightly injured. The railroad at this point lies in the street and there was a great uproar, pedestrians, seeing that a collision was impending, shouting wildly. The excursion train had run past a manual block signal, set against it. This collision occurred at a point where the two main tracks converge into a single track. The leading train had been traveling on the left-hand track, and had stopped at the station with a part of the train fouling the switch at the end of the double track. The line is straight for about two miles, and the engineman of the extra said that he had been watching the markers on the other train, which was a short distance ahead of him; and he passed Edgewater Park, two miles back, and a slow board, 1600 ft. back, without being aware of his location. He was running at about 50 miles an hour and did not apply brakes until he came close to the home signal, a short distance back from the point of collision. The light from the

open fire-box door is the only reason given for missing the signals at Edgewater Park; and the engineman said that as he approached Burlington he was still thinking that he was in the vicinity of Edgewater Park. The fireman was equally oblivious to the landmarks. The report of the inspector says that the fireman had made only one trip on this division before this day, and that he had never been examined on the rules; although he had been in the service more than a year. The inspector gives no information about the engineman; but he had been a runner for over three years.

The trains in collision at Theodore, Ala., on the 2d of June, were northbound passenger No. 2 and a preceding freight (No. 78), the passenger running into the rear of the freight at full speed as it was entering a side track. The engineman of the passenger train was killed and the fireman and three other persons were injured. The caboose and three cars of the freight train were wrecked. This collision occurred about 12.20 a. m. The engineman of the passenger train had a good view of the tail lights of the freight for 3,300 ft. and the inspector is unable to find any explanation of how the engineman failed to apply brakes. The primary responsibility is placed on the freight for not providing flag protection and for starting out from the last preceding station with insufficient time to reach Theodore in time to clear the passenger train ten minutes, according to the rule. No block signal system was in use. The flagman of the freight had been in the service 37 years, but it was found that he could neither read nor write, although he said that he could tell the time of trains as shown in the time-table. The inspector found that the flagging and spacing rules were not rigidly observed on that division of the road.

The train derailed at Medora, Ind., on the 8th of June, about 2 a. m., was an eastbound freight, drawn by two locomotives. Both locomotives and 17 cars were wrecked, including seven cars of cattle. Three employees were killed and two were injured. The train was moving at about 35 miles an hour. The derailment was caused by a switch which had been run through in the wrong direction and was loose.

Five persons were killed and 24 injured in the rear collision of westbound interurban cars on the Detroit United Railway at Warsaw, Mich., on June 18. A wooden car was telescoped by a steel car. The inspector found that the motorman of the second train was negligent in controlling speed on a descending grade. The leading train was standing on a side track and the other one, which was the second section on the same schedule, approached at uncontrollable speed. In his service of two years the motorman had a record of numerous cases of disobedience of rules, including one rear collision.

Fence Erected Along Mexican Border as an Impediment to Liquor Smugglers

# Who Pays the Man for Waiting on the Bench?

## Many Railroads Could Effect Economies by Adopting a System of Interviewing Supplymen

By Grant Gibson

**D**OES THE RAILROAD executive show his "bigness" or his "smallness" by practicing procrastination in interviewing salesmen? Who pays the bill by reason of the salesman being put off by that much abused phrase "tied up in conference"? What can and should be done to meet and overcome this condition? These are indeed pointed questions and should be given considerable thought by railroad officers.

### Sales Expenses

One railroad supply concern, doing about \$400,000 business annually, keeps a sales organization of eight men. These men cover the central and eastern railroads and expend approximately \$60,000 for traveling expenses and salaries. Fifteen per cent of the total sales must therefore be given over to the sales department. Who pays this? Why, the railroad! This traveling expense is an overhead and in order that the supply people may live the railroads must pay. Sales expenses should not exceed  $7\frac{1}{2}$  per cent, or, in other words, the railroads purchasing from this small supply concern must pay \$30,000 extra each year to secure its goods. The figure seems small until one stops to think of the thousands of railway supply companies that sell to these same railroads.

Without doubt millions are wasted annually from two principal causes. First, money expended in entertainment. Graft is a harsh word, but when one stops to think even a cigar handed to a prospective customer is graft on a small scale. (The cigar bill for the eight men previously mentioned averaged \$182.65 monthly during 1920.) It appears that the successful salesman handling a line of railway supplies is the man who always hands out the smokes and who says, "How about going out to lunch with me," "Let's go to the ball game this afternoon," or "Bring the madam downtown to dinner and I'll get some tickets for a show." Don't forget the railroad pays these bills.

### Unnecessary Delays Are Costly

The second wasteful practice is making a bench warmer of the salesman and constantly putting him off until tomorrow, day after tomorrow or a week hence. When the official passes out word that the salesman should drop in later there is only one thing for him to do and that is come back at the appointed time. He may be put off again and again, but he dare not fail to show up for fear of incurring the displeasure of the man to whom he wants to sell. The railroad salesman may never put over his proposition and still be in good standing with his concern provided he gets to see his man, but woe to him if he fails to get by the closed door. Therefore, he is going to come back and, if he is a successful salesman, he will keep coming back until he breaks down the barrier that has been keeping him out. But the railroad settles the bill!

Does the man in the private office fear that if he invites the salesman in immediately upon the card being presented that the salesman will assume he has an easy mark? If so, the officer is mistaken. How much better it would be if word were passed to the salesman that although the boss was busy, he (the salesman) could have 10 or 15 minutes' time and if that was not enough it would be well for him to come in some other time. This would give the salesman a chance and should he take advantage of his invitation to come in and

stay over his time limit then he is not due any further courtesy. (It is agreed that a great many salesmen are very much in need of instructions in deportment.)

Another balm which would satisfy the salesman would be for the officer to step out of his private office, shake hands, politely inform the salesman of his inability to give him time and make an engagement for a conference at a later date and then mark this engagement on the calendar, and keep it if at all possible. This gives the salesman an opportunity to handle business in the interim and is a legitimate excuse to his employers as to the necessity of his staying over a day or two. Putting off the inevitable (the salesman) merely wastes time. He is going to come back, and the railroad certainly pays for this.

A certain road department officer has become so imbued with this put-off attitude towards salesmen that it has become a habit with him and even when heads of other departments (lesser lights) are invited into conference at a certain hour they have to join the bench warmers for an hour or two before getting in. This officer was representing his company in entering a contract with an outside engineering contractor to take over certain railroad work. The outside man (one of the biggest) was invited to attend a conference in the officer's office at 9 a. m. on Monday. He travelled 17 hours to keep the appointment and was on hand at the specified time. The private secretary took in the card and came out with the information that it was impossible to see Mr. Contractor that day; make it 9 a. m. tomorrow. Again he showed up and again was requested to come in later. After three appointments he was received on Saturday morning and the business was wound up in less than half an hour. This was not only unfair to the individual but to the railroad as the railroad will pay this bill.

### Little Courtesies Count

One railroad officer does not believe in making his reception room comfortable. Hard benches and dim lights are in vogue. Why? He believes that by making the salesman comfortable he will become a frequent caller. Another never invites the salesman to have a seat when he calls; if he sits down he is liable to stay too long. Still another seldom invites a salesman into his private office but comes out and stands up to the railing to talk business, even though several other salesmen may be present.

Some railway officers are of the opinion that courteous treatment to the man who sells would result in not having any time to conduct the business of the railroad. This condition would actually exist unless the problem were systematized the same as other problems are. System is needed above all. Lack of it is responsible for the statement that the salesman is a necessary evil.

### A Satisfactory Arrangement

One purchasing agent has a well planned system and it is really surprising to note the simplicity with which it works out. Immediately upon entering the reception room one is greeted with a neat placard which reads: "The Purchasing Agent will receive salesmen between the hours of 9 and 12 a. m. (except on Saturdays), unless by appointment." The rule is inflexible. The salesmen come in and are received in the order of arrival. If the calendar for the morning looks

big it is suggested to them that they be as brief as possible.

The purchasing agent personally handles the major dealings and several assistants the minor ones. But the salesman on his first call is invited in to see the big boss. He is given ample time to state his proposition and if the purchasing agent is interested and the proposition is of minor importance the salesman is courteously referred to one of the assistants. Each and every salesman is given his opportunity. Suffice to say, if he is handling an article of merit and his price is right he can sell.

The principal advantages of this system are: First, the purchasing agent is not constantly interrupted throughout the day receiving visitors. Second, his superiors and subordinates are aware of the hours devoted to salesmen and seldom if ever interrupt him. Third, the uniform treatment of all salesmen disarms criticism. It does not take long for the news to travel through the selling fraternity that a certain salesman can always get an audience with Mr. So-and-So. Fourth, the cost of selling to this company is naturally reduced and if every railroad executive would adopt a similar system there is absolutely no reason why prices would not be reduced and the railroads would not have to pay excess baggage.

## A New Ticket Printing and Recording Machine

A NEW DEVICE has recently been perfected by J. W. Hubbard, president of the United States Switch Company, Eau Claire, Wis., for printing and recording local and inter-line tickets as sold on steam and electric railroads, which makes it unnecessary to carry a stock of local ticket forms. Each ticket is produced on safety ticket paper which is inserted in the machine in the form of a roll, the paper being fed forward for the proper space and then cut off automatically as each ticket is produced. The entire printing is done in the machine, the roll being merely a blank strip of safety paper. The ticket turned out in this machine shows on its face the number, date, destination, price, routing, name of the issuing line, the customary statement showing the time within which the ticket must be used, and the name of the general passenger agent of the issuing line. A coupon, which is attached to every ticket, is perforated so that it can be conveniently removed when desired by the first conductor.

In addition to producing the tickets themselves, the machine makes a complete record of each sale. This statement, which is automatically printed on a record sheet, gives data for every ticket, including its number, the exact number of miles from issuing point to destination, routing, rate, war tax and the number of miles and the rate applying to each state through which the passenger travels. The ticket is produced and delivered on a small shelf near the right hand end of the machine and the record is printed near the top of the left hand end on a roll of paper which can be removed at the end of the day's business. A glass door at the upper left hand corner of the machine, through which the record is withdrawn, has a bottom edge which serves as a knife, and on being closed, cuts off the daily record from the roll, which is left in place in the machine.

In making a ticket, the operator takes hold of a small knob fitted into the right end of the machine and by turning in either direction, indexes the machine to the desired destination. When this operation has been performed, it is necessary only to press an electric button in order to produce a ticket with all the customary printing and at the same time to make the complete record and ticket charge distribution. When the machine is to be used in smaller stations where no electric current is provided, the ticket and record are pro-

duced by making one complete turn of a crank fitted into the right hand end of the machine. Tickets are numbered in consecutive order automatically as they are produced and each ticket is dated on its face instead of on the back. When the ticket seller finds it necessary to sell a ticket some days in advance, he can make use of a dating device on the machine which enables him to adjust an individual ticket for any date desired. Trials have proved that tickets can be produced, delivered to the patron, and change made as rapidly by the Hubbard machine as under the old system of ticket racks and windows.

Very few working parts are involved. At the same time the completeness of the device is demonstrated by the fact that when a change in rate is announced, the printing drums can be removed by a simple operation and new drums carry-

The Hubbard Ticket Printing Machine

ing the correct rate can be inserted. The printing drums are light in weight, being of aluminum construction, and are easily handled. The United States Switch Company, which will handle the distribution of the machines, will market them in several different sizes. The smallest machine will carry 50 stations, the next larger 150 stations, a third size 300 stations, and the largest size to be carried in stock will print tickets for 600 destinations although it is possible to secure a machine on special order which will carry any number up to 1,200 stations.

The new device, it is said, will effect large savings for ticket departments by doing away with all local ticket stocks. Its use will also prevent the sale of tickets out of numerical order and will make it impossible to dispense any tickets without a complete record of the transaction, together with the price received. The use of the machine makes such errors as overcharges or undercharges in the price of tickets nearly impossible, since the passenger sees for himself the price, including the war tax, on the face of the ticket. The date is also included on the face instead of on the back as at present, so that the conductor can see at a glance the date when the ticket was sold. The machine is also of advantage to auditing and statistical departments, since the record it produces can be accepted by these departments without checking, not being liable to any errors which an agent might make.

THE UNITED STATES Department of Agriculture has sent west a carload of exhibits to be displayed at state fairs at Sedalia, Mo.; Milwaukee, Wis., and Topeka, Kan.; and at Wichita, Kan., in connection with the international wheat show.

# General News Department

The Telegraph and Telephone Section of the American Railway Association will meet in Cleveland, Ohio, at the Hotel Cleveland on September 21, 22 and 23.

The Southern Pacific is installing telephone train dispatching circuits in Texas and Louisiana; 20 stations on the Louisiana Western, 30 on Morgan's Louisiana & Texas, between Echo, Tex., and New Orleans, La., and 27 stations on the Houston, East and West Texas, between Houston and Shreveport. All are to be equipped with Western Electric apparatus. Telephones are to be installed at a number of blind sidings.

The Bridge and Building Supply Men's Association held a meeting in Chicago on August 25. Arrangements were made to receive applications for membership and space for the exhibit of this association to be held at the Hotel McAlpin in New York City on October 18, 19 and 20, in connection with the convention of the American Railway Bridge and Building Association. A. J. Filkins, 3346 S. Artesian avenue, Chicago, is secretary.

The question of resuming hearings in the general railway investigation before the Senate committee on interstate commerce has been postponed, to be decided at a meeting of the committee following the Congressional recess. There is some sentiment in the committee for discontinuing the hearings, but strong pressure is being brought by others to hear testimony from the labor and other interests not represented at the hearings so far.

The American Association of Railroad Ticket Agents held its annual convention at St. Paul, Minn., last week. A resolution was adopted to the effect that the members believe the Government ought to accord them a higher classification than that of "clerks." The president of the Association for the ensuing year is F. J. Burton and the secretary, W. G. Fershel, both of Chicago. It is intended to hold the next annual convention at Savannah, Ga.

## Chairman Clark Ends Career with Commission

Chairman Clark of the Interstate Commerce Commission completed his work with the commission on August 31 and prepared to engage in his new work in private practice on commerce matters in Washington. His successor on the commission, Frederick I. Cox, was expected to take the oath of office on Thursday and enter upon his duties.

Mr. Clark has given a statement that the speculative rumors that friction between the President and the commission or between the President and himself had anything to do with his resignation have no foundation in fact. He said he was controlled entirely by personal reasons and that the President not only expressed regret that he wanted to retire but asked him to withdraw his resignation and even after he had accepted it gave him an opportunity to withdraw it. He also said the President has not in any way indicated any desire or disposition to dictate to or direct the commission or even to suggest how the commission should act in any matter before it.

## Railway Earnings for July

Preliminary compilations of railway returns for the month of July, the first month since the wage reduction took effect, show an improvement over previous months. The net operating income for 172 roads was \$57,254,000. In June all the Class I roads earned about \$51,000,000. To earn at the rate of 6 per cent, all the Class I roads should earn about \$90,000,000 for July. The total operating revenues of 172 roads show a decrease of 13.1 per cent, while their operating expenses show a decrease of 29 per cent.

For the 10 months since the rates were increased last year Class I roads have earned a net operating income of \$368,093,000, according to a compilation by the Bureau of Railway Economics. This is at the annual rate of 2.5 per cent on the valuation tentatively fixed by the commission for rate-making purposes. For the first six months of 1921 the roads earned \$141,000,000, or 1.8 per cent. For the 10-months period the average under a 6 per cent return was \$516,977,000.

## Franco-Canadian Exhibition Train

To advertise the life and industries of France, a traveling exhibition, occupying eight cars, is now being shown in the principal cities of Canada. The train was at Montreal August 20. Its itinerary includes Three Rivers and Quebec and thence to Toronto. It will complete its journey at Montreal on November 4.

The eight exhibition coaches are assigned as follows: First coach, "La Pensée Française" (The French Thought), which will include some of the finest treasures of French art and literature as well as relics of the wars of France. Second and third coaches: Industrial exhibits, including travel, photography, civil engineering, mines and mineral products, mechanics, etc.

Fourth coach: "La Mode," including dresses, silks, laces, etc. Fifth coach: Leather industries, chemical products, drugs, perfumes, electrical appliances, brushes, toys. Sixth coach: Agricultural, horticultural and alimentary products. Seventh coach: Decorative art, bronzes, watches and clocks, jewelry and cutlery.

## Too Much Regulation

"The fact is that under government regulation, of railroads or of any other business, the power of control is given almost entirely into the hands of men who are ignorant of the practical problems of the enterprise. Some of the regulators have studied books on the subject—law books and theoretical treatises—but few of them know anything about the subjects from practical experience. This applies not merely to the members of the commission, but also to the vast army of advisers and assistants who do the real work of the regulatory body. It would be foolish in the extreme to expect anything like satisfactory results from that kind of regulation; and yet, it is the only kind of regulation that can be had under the power of government.

"To suggest that the Interstate Commerce Commission be abolished would lay one open to the charge of being a 'reactionary'; yet it may be doubted whether the shippers, the government, the railroads, or consumers of commodities would be any worse off if the whole business were wiped off the statute books. They certainly couldn't be much worse off and in some particulars they might be better off.

"In any event, the net beneficial results of government regulation of the railroads, when disadvantages are also taken into consideration, are so slight as to leave the country not in a mood to sanction any extension of the policy of government regulation to other lines of business. President Harding struck a popular chord when he declared for more business in government and less government in business."—*Albany Evening Journal*.

## Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 163 Broadway, New York City. Exhibit by Air Brake Appliance Association.

AIR BRAKE APPLIANCE ASSOCIATION.—Fred W. Venton, 836 So. Michigan Ave., Chicago. Meeting with Air Brake Association.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontius, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

(Continued on page 466)

- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—S. W. Derr, Philadelphia & Reading, Philadelphia, Pa.
- AMERICAN ASSOCIATION OF ENGINEERS.—C. E. Drayer, 29 S. La Salle St., 332 South Michigan Ave., Chicago.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. Ry. of N. J., 143 Liberty St., New York. Annual meeting, November 21 and 22, Carolina Hotel, Pinehurst, N. C.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Room 400, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 3, Atlantic City. Exhibits this year will be omitted.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—C. Borchardt, 202 North Hamlin Ave., Chicago, Ill. Next convention September 12-14, Hotel Sherman, Chicago.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, General Secretary, 75 Church St., New York, N. Y. Next regular meeting, November 16, 1921.
- Division I—Operating.  
Freight Station Section (including former activities of American Association of Freight Agents). K. O. Wells, Freight Agent, Illinois Central Railroad, Chicago, Ill.  
Medical and Surgical Section. J. C. Caviston, 75 Church Street, New York.
- Protective Section (including former activities of the American Railway Club Special Agents and Chiefs of Police Association), J. C. Caviston, 75 Church St., New York, N. Y.
- Telegraph and Telephone Section (including former activities of the Association of Railway Telegraph Superintendents), W. A. Fairbanks, 75 Church St., New York, N. Y.
- Safety Section.—J. C. Caviston, 75 Church St., New York. First annual meeting, Boston, Mass., September 26.
- Division II—Transportation (including former activities of the Association of Transportation and Car Accounting Officers). G. W. Covert, 431 South Dearborn St., Chicago, Ill.
- Division III—Traffic. J. Gottschalk, 143 Liberty St., New York.
- Division IV—Engineering. E. H. Fritch, 431 South Dearborn St., Chicago, Ill.
- Construction and Maintenance Section. E. H. Fritch.
- Electrical Section. E. H. Fritch.
- Signal Section (including former activities of the Railway Signal Association). H. S. Ballet, 75 Church St., New York, N. Y.
- Division V—Painting and Decorating (including former activities of the Master Car Builders' Association and the American Railway Master Mechanics' Association). V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill. No meeting this year.
- Equipment Painters' Section (including former activities of the Master Car and Locomotive Painters' Association), V. R. Hawthorne, 431 South Dearborn St., Chicago, Ill.
- Division VI—Purchases and Stores (including former activities of the Railway Storekeepers' Association). J. J. Murphy, General Storekeeper, New York Central, Collinwood, Ohio.
- Division VII—Freight Claims (including former activities of the Freight Claim Association), Lewis Pilcher, 431 South Dearborn St., Chicago, Ill.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Litchy, C. & N. W. Ry., 319 Waller Ave., Austin Station, Chicago. Next convention, October 18-20, 1921, New York City. Exhibit by Bridge and Building Supply Men's Association.
- AMERICAN RAILWAY DEVELOPMENT ASSOCIATION.—J. F. Jackson, Central of Georgia, Savannah, Ga. Next meeting, November, 1921, Chicago.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(Works in co-operation with the American Railway Association, Division IV.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 14-16, Chicago. Exhibit by National Railway Appliances Association, March 13-16.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railway Association, Division 5.)
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 1145 East Marquette Road, Chicago. Exhibit by Supply Association of the American Railway Tool Foremen's Association.
- AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, Union Trust Bldg., Washington, D. C.
- AMERICAN SOCIETY FOR STEEL TREATING.—W. H. Eismann, 4600 Prospect Ave., Cleveland, Ohio. Next convention, September 19-24, Indianapolis, Ind.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—E. M. Chandler (acting secretary), 33 W. 39th St., New York. Regular meetings, 1st and 3rd Wednesdays in month, except July and August, 33 W. 39th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- AMERICAN TRAIN DISPATCHERS' ASSOCIATION.—C. L. Darling, Northern Pacific Ry., Spokane, Wash.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—George M. Hunt, Chemist, Forest Products Laboratory, Madison, Wis.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—H. D. Morris, Northern Pacific R. R., St. Paul, Minn. Next annual meeting, May 19, 1922, Montreal.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next convention, October 18-21, Hotel La Salle, Chicago. Exhibit by Railway Electrical Supply Manufacturers' Association.
- ASSOCIATION OF RAILWAY EXECUTIVES.—Thomas De Witt Cuyler (chairman), 61 Broadway, New York, N. Y.
- ASSOCIATION OF RAILWAY SUPPLY MEN.—A. W. Clokey, 1658 McCormick Bldg., Chicago. Meeting with International Railway General Foremen's Association.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Division 1.)
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railway Association, Division 2.)
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—A. J. Filkins, Paul Dickinson Company, Chicago. Meeting with convention of American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—W. A. Booth, 131 Charron St., Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.
- CAR FOREMEN'S ASSOCIATION OF ST. LOUIS, MO.—Thomas B. Koneke, St. Louis, Mo. Meetings, first Tuesday in month at the Americana Hotel Annex, St. Louis.
- CENTRAL RAILWAY CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meetings, 2d Thursday in November and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. P. Elliott, Terminal Railroad Association of St. Louis, East St. Louis, Ill. Convention this year has been postponed.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, 34th St. and Artesian Ave., Chicago, Ill. Meeting with Chief Interchange Car Inspectors' and Car Foremen's Association.
- CINCINNATI RAILWAY CLUB.—W. C. Cooder, Union Central Bldg., Cincinnati, Ohio.
- EASTERN RAILROAD ASSOCIATION.—E. N. Bessling, 614 F St., N. W., Washington, D. C.
- FREIGHT CLAIM ASSOCIATION.—(See American Railway Association, Division 7.)
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 322 Grand Central St., Chicago. Regular meetings, Wednesday preceding 3d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—W. J. Mayer, Michigan Central R. R., Detroit, Mich. Exhibit by International Railroad Master Blacksmiths' Supply Men's Association.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' SUPPLY MEN'S ASSOCIATION.—George P. White, 747 Railway Exchange, Chicago. Meeting with International Railroad Master Blacksmiths' Association.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 N. W. Waller Ave., Austin Station, Chicago. Next convention, which was to have been held September 12-15, Hotel Sherman, Chicago, has been postponed.
- MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—E. E. Martin, Union Pacific R. R., Room No. 19, Union Pacific Bldg., Kansas City, Mo. Next convention, which was to have been held October 4-6, 1921, at Buffalo, N. Y., has been canceled.
- MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 26 Cortlandt St., New York.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—(See A. R. A., Division 5.)
- MASTER CAR BUILDERS' ASSOCIATION.—(See A. R. A., Division 5.)
- NATIONAL ASSOCIATION OF RAILWAY TOOL FOREMEN'S ASSOCIATION.—Nixon, Western Tel. Co., 905 S. W. 3rd St., St. Louis, Mo.
- NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Next convention, October 31, Atlanta, Ga.
- NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, People's Gas Bldg., Chicago. Annual exhibition, March 13-16, Chicago, at convention of American Railway Association, Chicago, Ill.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade Jr., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting June, July, August and September.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 26 Cortlandt St., New York. Regular meeting, 3d Friday in month, except June, July and August, at 29 W. 39th St., New York.
- PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting, 2d Thursday in month, alternately in San Francisco and Oakland.
- RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Building, Washington, D. C.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Naxon, 600 Liberty Bldg., Broad and Chestnut Sts., Philadelphia, Pa.
- RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month, except June, July and August, American Club House, Pittsburgh, Pa.
- RAILWAY DEVELOPMENT ASSOCIATION.—(See Am. Ry. Development Assn.)
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.
- RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—R. J. Himmelright, 17 East 42nd St., New York. Meeting with Traveling Engineers' Association.
- RAILWAY FIRE PROTECTION ASSOCIATION.—R. R. Hackett, Baltimore & Ohio R. R., Baltimore, Md. Annual meeting, October 18-20, Hotel Sherman, Chicago.
- RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O. Ry., Richmond, Va.
- RAILWAY SIGNAL ASSOCIATION.—(See A. R. A., Division 4, Signal Section.)
- RAILWAY STOREKEEPERS' ASSOCIATION.—(See A. R. A., Division 6.)
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 30 Church St., New York.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 20-22, 1921, Auditorium Hotel, Chicago. Exhibit by Track Supply Association.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meeting, 2d Friday in month, except June, July and August.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, Sunbeam Electric Manufacturing Company, New York City. Meeting with American Railway Association, Signal Section.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, Commercial Trust Bldg., Philadelphia, Pa.
- SOUTHERN ASSOCIATION OF RAILWAY CLUBS.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.
- SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—C. N. Thulin, 935 Peoples Gas Bldg., Chicago.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramsey Iron Works, Hilburn, N. Y. Meets with Roadmasters' and Maintenance of Way Association.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, 117 East 98th St., Cleveland, Ohio. Business meeting, September 6, Hotel Sherman, Cleveland, Ohio. Meeting with American Railway Equipment Manufacturers' Association has been canceled.
- WESTERN RAILWAY CLUB.—Bruce V. Crandall, 14 E. Jackson Boulevard, Chicago. Meeting third Monday each month except June, July and August.

## Traffic News

### Export Grain via Montreal

The movement of grain through Montreal to Europe this season has been very heavy and it is predicted that all previous records will be exceeded. Wheat, corn and oats have all been moving in large volume. Now, however, there is a decided congestion both at Montreal and at ports on Georgian Bay, and some shippers at Chicago are fearing an embargo. It is said that 17 vessels are now afloat for Georgian Bay ports, and the elevators there are filled. These ports have facilities for unloading only three or four vessels a day. Winnipeg shippers are reported as fearing that the present congestion will interfere with free movement of Canadian wheat, which is expected to begin to move in volume to the Eastern ports early in September.

### To Regulate St. Paul Live Stock Shipments

At a conference recently held at St. Paul, Minn., railway traffic officers met with the representatives of the bureaus of markets of Minnesota, South Dakota and North Dakota, to see if shipments of live stock into this territory could not be distributed more uniformly throughout the week. The railroads deliver 25 per cent of the weekly hog supply on Tuesday, about 34 per cent on Wednesday and comparatively small amounts on other days. The market being flooded, the farmers estimate that they lose about five cents a hundred pounds on all hogs arriving on Wednesday. Similar examples may be found in the other classes of live stock. It is proposed to give the zone system a trial. Under the zone method (as in effect at Chicago), stock originating within 200 miles is accepted on Tuesday and Thursday, and from other territory on Monday and Wednesday; and receipts are thus regulated to the advantage of the farmers, the packers and the railroads. A second conference will be called soon to consider rearrangements of stock train schedules.

### Boston & Maine Competes With Motor Trucks

The Boston & Maine has announced radical reductions—in some cases more than 50 per cent—in its miscellaneous express rates applying to various local points within a radius of 50 miles from Boston. Some of the changes go into effect September 10; others are already in effect. These rates apply to "express matter, miscellaneous shipments of, contents unknown or not stated." They are used by industries and by the local express companies operating to communities out of Boston. The rates apply "only when an individual car is assigned exclusively to this service." The method of handling the traffic under these rates is of many years' standing.

To Amesbury, 43 miles, where the rate has been 36½ cents per lb., the new rate is 13 cents; but the minimum charge per car has been advanced from \$15 to \$20. To Concord, N. H., 73 miles, the rate is 30 cents, minimum \$45 a car. Concord does not appear in the previous tariff. Manchester, 56 miles, and Nashua, 40 miles, are two other New Hampshire towns now appearing in this tariff for the first time. To Springfield, Mass., about 100 miles, the rate, 34½ cents per 100 lb., is not changed. To Lawrence the decrease is from 18 cents to 9 cents; to Lowell, 26 miles, from 20½ cents to 9 cents. To Lynn, ten miles, 7½ cents, there is no change. To Peabody, 18 miles, the reduction is from ten cents to six cents; carload minimum advanced from \$15 to \$20.

It is understood that a further reduction will be made in the rate to Lynn to five cents per 100 lb., and that this rate will apply each day, even if a full carload is not shipped.

Ever since the congestion in railroad freight traffic which was caused by war conditions, freight between Boston and the cities within 50 miles has been carried largely by automobile trucks, until now it is said that probably 80 or 90 per cent of the business between Boston and Lynn has of late been carried in that way. To Salem, 16 miles, the percentage is believed to be about the same.

## Foreign Railway News

### Disastrous Collision Near Rome

Thirty persons killed and over 100 injured is the report following a collision near Magliano, Italy, ten miles north of Rome, on the night of August 27. An excursion train, in which were many children, collided with a freight.

### Railways of Siam Ask Bids on Bridges

Tender forms, including general terms and specifications for the supply of superstructures of eight steel bridges for the Siamese State Railways, have been transmitted to the Department of Commerce, according to a cablegram from Consul James P. Davis, at Bangkok. The total length of these bridges will be about 1950 ft. The arrival and availability of the specifications will be announced later by the Department of Commerce.

### A Short Lived Strike in Ireland

Enginemen on the Great Northern of Ireland went out on a strike at midnight of August 29, but returned to work the following afternoon on the advice of J. H. Thomas, general secretary of the National Union of Railwaymen, according to the New York Times. Mr. Thomas advised the men to go back to work after the company agreed to participate in the Irish railway arbitration now in progress. The Irish railways were returned to their owners on August 15 at the same time as the British railways were returned, but legislation similar to that provided for the roads of Great Britain has not been extended to the Irish railways.

### The Service of the Department of Commerce to Foreign Trade

Commerce Reports, the daily publication of the Department of Commerce, which contains news sent to Washington by cable and by mail from representatives of the government all over the world and which is an important source of information for American concerns who are seeking opportunities to sell their goods abroad, is to be changed to a weekly publication. In this form, it is believed that the information published can be systematized and each item of news shown more nearly in its proper perspective than in the daily publication. "Commodity experts" are being appointed to handle specific information interesting to various industries such as textiles, fuel, chemicals, etc., and it is expected that Commerce Reports in its new form will be of considerably greater value to American business than it formerly has been.

### China Seeking to Free Itself from Foreign Domination of Railways

The extent to which foreign-owned railways dominate the territory they serve is a source of annoyance to the Chinese government, according to a correspondent writing in the Public Ledger (Philadelphia), and an attempt to internationalize these carriers may be expected to feature the disarmament conference to be held at Washington. British, French, Japanese and Russian interests would, it is said, be affected by such a move. The principal foreign-owned railways are the Chinese Eastern, the South Manchurian, the Shantung, the Yunnan and the Hong Kong-Canton.

An example is given of the methods employed by some of these railways: "A few years ago a British group conceived the idea of building a railway in Yunnan. In order to freeze out British competition, the French set up a tariff on railway materials which made it impossible to transport them. The only way the British could have built the proposed railway was to establish steel mills of their own in the region of the line."

### Proposed Subway and Tunnel for Havana, Cuba

Plans for the subway system and tunnel proposed for the city of Havana have been exhibited to a representative of the American consulate general at Havana, Cuba, according to Commerce Reports. Consul General Carlton Bailey Hurst's representative was shown documents indicating that the necessary concessions for the work had been approved by the Cuban Railroad Commission, and that the Cuba North & South Railroad Co., organized to promote this project, had been completed in accordance with Cuban laws governing the organization of companies for railroad construction. A representative of the firm of engineers in charge (Sr. Serafin Sanchez Govin, No. 62 Villegas street, Havana), holding a full power of attorney to act for the Cuba North & South Railroad Co., declared his intention of going to New York in October or November to arrange for the necessary capital and expressed a desire to receive correspondence from persons in the United States who may be interested in either the structural or the investment possibilities of the project.

### The New Railway Regime in Great Britain

The railways of Great Britain were returned to their owners on August 15. Just prior to the return, the Ministry of Transport's Railway Bill (*Railway Age*, May 27, page 1209) as amended was passed by Parliament. The amendments to this bill were not of a fundamental nature, with the exception of the groupings for compulsory consolidation. In the original bill there were six groups; in the bill as passed, four. The principal carriers constituting the groups are as follows:

**SOUTHERN GROUP**.—London & South Western; London, Brighton & South Coast; South Eastern; London, Chatham & Dover; South Eastern & Chatham.

**WESTERN GROUP**.—Great Western; Alexandra Docks & Railway; Barry; Camhrian; Cardiff; Rhymney; Taff Vale.

**NORTHWESTERN GROUP**.—London & North Western; Midland; Lancashire & Yorkshire; North Staffordshire; Furness; Caledonian; Glasgow & South Western; Highland.

**EASTERN GROUP**.—North Eastern; Great Central; Great Eastern; Great Northern; Hull & Barnsley; North British; Great North of Scotland.

### Exports of Track Materials in June

The June exports of steel rails totaled 20,308 tons, valued at \$1,083,344. Track spikes valued at \$79,434 and miscellaneous track materials valued at \$568,134 were the other totals. Detailed figures by countries, as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Railroad spikes		Rails of steel		Switches, frogs, splice bars, etc.
	Pounds		Tons		
France	.....	.....	.....	.....	\$260
Gibraltar	.....	.....	.....	.....	166
Italy	.....	.....	1,219	\$79,635	16,780

## Equipment and Supplies

### Car Orders and Deliveries in July

The number of freight cars delivered for domestic service in July totaled 3,892 and for foreign service 433. The passenger cars delivered totaled 90, all for domestic service. On July 31, the companies had on hand undelivered orders for 6,145 freight and 218 passenger cars for domestic service and 2,088 freight and 46 passenger cars for export. Car repairs were made in July on a total of 2,281 cars for domestic service and at the end of July car repairs on order and undelivered totaled 16,756, all for domestic service, as compared with 13,752 at the end of June.

The July summary as prepared by the Railway Car Manufacturers' Association from the report of 26 car building companies follows:

NEW CARS DELIVERED		
Freight	Domestic	Foreign
Passenger	3,892	433
	90	...
ON ORDER AND UNDELIVERED		
Freight	Domestic	Foreign
Passenger	6,145	2,088
	218	46
CAR REPAIRS		
Delivered—July	2,281	
On order and undelivered, July 31	16,756	

### Freight Cars

THE MATHIESON ALKALI WORKS, 25 West Forty-third street, New York City is inquiring for 20, 30 ton cars for handling tanks.

THE BANGOR & AROOSTOOK has renewed its inquiry for cars and is now asking for 200 single sheathed box cars of 40 tons' capacity.

THE PITTSBURGH STEEL COMPANY, Pittsburgh, Pa., is inquiring for from 15 to 25 all steel gondola cars, of 75 tons capacity.

THE FLEISCHMANN TRANSPORTATION COMPANY, Chicago, is inquiring for from 10 to 20 underframes for tank cars of 50 tons capacity.

THE ERIE has entered into a contract with the Youngstown Steel Car Company, Niles, Ohio, for the repair of 400 coal cars, of 50-ton capacity.

THE BALTIMORE & OHIO, reported in the *Railway Age* of June 17, as inquiring for 500 hopper car bodies, is now inquiring for 1,000 box car bodies of 40 tons' capacity, and for 1,000 hopper car bodies of 50 tons' capacity.

THE NEW YORK CENTRAL has given an order for the repair of 250 steel cars to the Cleveland Car Company, Cleveland, Ohio, and for 500 steel cars to the Ryan Car Company, Chicago. This is in addition to the repairs reported in the *Railway Age* of July 30 and August 6 for a total of 6,500 cars.

THE ILLINOIS CENTRAL, reported in the *Railway Age* of August 27, as asking for price on the repair of 1,250 cars, has placed orders for repairs as follows: 254 ballast cars and 500 box cars with the Pullman Company; 360 gondola cars with the Haskell-Barker Car Company; 500 box cars with the American Car & Foundry Company, and 400 box cars with the Ryan Car Company.

### Iron and Steel

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS has placed orders for 900 tons of steel, of which 200 tons will be used for bridge renewals, and about 700 tons for track elevation work at Indianapolis, Ind.

THE MEIKI ELECTRIC RAILWAYS, of Japan, is asking for bids through Mitsui & Company, New York, for 25 miles of 60-lb. A. S. C. E. rail and accessories. This railway will buy rails later for an additional 29 miles.

## Supply Trade News

The **Interstate Car Company**, Indianapolis, Ind., will build an addition to its foundry in that city, 91 by 126 ft., at an approximate cost of \$25,000.

**H. S. Durant** has been appointed sales agent, and **M. W. Floto** assistant sales agent, at the Detroit office of the **American Steel & Wire Company**, Chicago, to succeed **M. Whaling** and **T. J. Usher, Jr.**, resigned.

The **Western Electric Company**, New York, has re-zoned its sales territory, and a new district, called the Atlantic district, has been established with **R. W. Van Valkenburgh** as manager with headquarters at Philadelphia, Pa. It includes the area covered by the Philadelphia and Pittsburgh houses, which formerly was part of the Western district.

**Robert D. Black** has been appointed manager of the Philadelphia branch office of the **Black & Decker Manufacturing Company** with headquarters at 318 North Broad street. He succeeds **W. C. Allen** who has been appointed special factory representative, with headquarters at the Cleveland branch office, 6225 Carnegie avenue. Mr. Black was formerly assistant sales manager of the company.

**Horace G. Hides**, who for the past 20 years represented **Wm. Jessop & Sons**, Sheffield, England, has been appointed general sales manager in the United States for **Thos. Firth & Sons, Ltd.**, Sheffield. This firm recently terminated its agency arrangement for the sale of sheet steel with **Wheelock Lovejoy & Co.**, of New York and Cambridge. Mr. Hides will have his headquarters in Hartford, Conn., where a joint office has been opened by **Thomas Firth & Sons, Ltd.**, and an associate company, the **Firth-Sterling Steel Company**, New York; **Henry I. Moore** will represent the latter company at Hartford.

## Obituary

**Edward A. Craig**, manager of the export department of the **Westinghouse Air Brake Company**, Pittsburgh, Pa., died on August 28, at his home in Edgewood, Pa. Mr. Craig was

born in January, 1873, at Allegheny City, Pa., and was educated in the public schools of that city. He began work in 1888 with the **Westinghouse Air Brake Company** as a messenger. He subsequently served as secretary to the general superintendent of the works. He later was appointed assistant auditor and then served as auditor and assistant secretary. In 1906, the company established the Southeastern district, with Mr. Craig as manager. He remained in that position until the export department was organized in January,

1920, and since that time he served as manager of the export department.

**Daniel Sellinger** for over 20 years in charge of rail inspection for **Robert W. Hunt & Co.**, at the south works of the **Illinois Steel Company**, Chicago, died on August 24, at the age of 63.

## Railway Construction

**BOSTON & MAINE.**—This company has awarded a contract to the **McClintic Marshall Company**, Pittsburgh, for the construction of a bridge over the **Winnipisseege** river, **Tilton, N. H.** The bridge will have 5 deck plate girder spans averaging 35 ft. in length and will cost approximately \$17,000.

**CANADIAN NATIONAL.**—This company will receive bids until noon September 7 for the construction of the sub-structure for a single track bridge over the **Coffee** river, 41 miles from **Doucet** on the **St. Maurice** division.

**CHICAGO, BURLINGTON & QUINCY.**—This company is accepting bids for structural steel to be used in building a new freight house at **Chicago**.

**CHICAGO, ROCK ISLAND & PACIFIC.**—This company has awarded a contract to **Roberts & Schaefer Company**, Chicago, for the construction of a concrete coaling station at **Morris, Ill.**, and to **Fairbanks, Morse & Co.**, Chicago, for a coaling station at **McFarland, Kan.**

**LOUISIANA & ARKANSAS.**—This company is contemplating the erection of a one-story brick and reinforced concrete locomotive shop at **Stamps, Ark.**, to cost about \$150,000.

**NEW YORK CENTRAL.**—This company has awarded a contract for the construction of a 30-stall roundhouse and annex buildings at **Solvay, N. Y.**, to the **W. M. Ballard Company**, Syracuse, N. Y. Construction was resumed recently on this project. The same company has been awarded a contract for the construction of a 1,000-ton coaling station exclusive of machinery at **Solvay**. The **Walsh Construction Company**, Syracuse, N. Y., has been awarded a contract for the construction of a 400-ton coaling station at **Waynesport, N. Y.** The **Link Belt Company** has been awarded a contract for the machinery of both of these coaling stations and the **Edward Joyce Company**, Syracuse, N. Y., has been awarded the contract for the electric lighting and power wiring of the **Solvay** coaling station.

**PACIFIC GREAT EASTERN.**—On this railroad, owned and operated by the Province of **British Columbia** and which is now in operation to **Williams Lake**, about 300 miles north of **Vancouver**, track has been laid to **Quesnel**, about 50 miles beyond **Williams Lake** and about half the distance thence to **Fort George, B. C.**, the proposed northern terminus, which is on the **Grand Trunk Pacific**. The Minister of Finance of the Province has lately sold bonds to the amount of \$1,000,000 to provide funds for continuing the work of construction north of **Quesnel**. The bonds, running 20 years, and bearing interest at six per cent, are said to have been sold for 93.59.

**TEXAS & PACIFIC.**—This company has revised its plans for the construction of a new passenger station at **Ranger, Tex.**, and has issued another call for bids to be closed on September 15.

**CENTRAL VERMONT.**—This company has awarded a contract to the **Roberts & Schaefer Company**, Chicago, for the construction of a gravity sanding plant and a 300 ton coaling plant equipped with a 30,000 ton drag scraper and a mechanical storage plant at **St. Albans, Vt.**, to cost \$40,000.

**TONOPAH & GOLDFIELD.**—This company has applied to the **Interstate Commerce Commission** for authority to construct an extension 18½ miles long from a point near **Coaldale Station** in **Mineral county, Nevada**, on its main line, to a point in **Fish Lake Valley**, **Esmeralda county, Nevada**. The extension would serve what is believed to be a "potential oil field," according to the application.

**WESTERN MARYLAND.**—This company opened bids on August 25 for the construction of additions to its grain elevator and facilities at **Port Covington, Baltimore, Md.**, to cost approximately \$1,000,000. The additions will be of reinforced concrete construction and will provide storage space for 1,500,000 bushels of grain in addition to the present facilities.

E. A. Craig

## Railway Financial News

**BOSTON & MAINE.—Loan Approved.**—The Interstate Commerce Commission has approved a loan to this company of \$3,049,000 for 15 years from the revolving fund to assist it in meeting maturing indebtedness.

**BULLFROG GOLDFIELD.—Authorized to Issue New First Mortgage Bonds.**—The Interstate Commerce Commission has granted authority to this company to deliver to W. A. Clark not exceeding \$143,000 of new first mortgage 5 per cent bonds, in exchange for par, for a like aggregate amount of first mortgage 6 per cent bonds and second mortgage income bonds now outstanding; and also to deliver not exceeding \$5,000 of new first mortgage 5 per cent bonds, at par, in partial settlement of unpaid interest accrued on outstanding first mortgage bonds.

**CHESAPEAKE & OHIO.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**COWLITZ, CHEHALIS & CASCADE.—Application for Loan.**—This company has applied to the Interstate Commerce Commission for a loan of \$45,500 to meet matured obligations for equipment.

**DELAWARE, LACKAWANNA & WESTERN.—Asks Authority to Lease Road.**—An application has been filed with the Interstate Commerce Commission for authority and approval of the lease to this company of the property of the Sussex Railroad, of which it owns a majority of the capital stock.

**DULUTH, SOUTH SHORE & ATLANTIC.—Annual Report.**—The income account for the year ended December 31, 1920, compares with the preceding year as follows:

	1920	1919
Total operating revenue (Mar. 1 to Dec. 31).....	\$5,142,519	
Total operating expenses (Mar. 1 to Dec. 31).....	4,606,212	
Net operating revenue.....	536,307	
Railway tax accruals.....	250,435	
Net operating income.....	285,865	
Income from lease of road (Jan. and Feb., 1920; year 1919).....	93,725	\$530,059
Estimated amount of government guaranty due (Mar. 1 to Aug. 31).....	281,174	
Due from U. S. Gov't. for deficit incurred in operation of road during guaranty period (Mar. 1 to Aug. 31).....	71,013	596,706
Gross income.....	782,023	875,760
Deduct—Interest on funded debt.....	876,770	1,010,214
Total deductions from gross income.....	1,111,706	1,413,508
Net loss.....	329,683	

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919 as follows:

OPERATING REVENUES			
	1920	1919	
Freight.....	\$3,576,909	\$2,815,493	
Passenger.....	1,369,903	1,235,685

Average receipts per passenger per mile (cents).....	2.937	2.819	
FREIGHT TRAFFIC			
Number of revenue tons carried.....	3,755,912	3,362,297	
Number of tons carried one mile.....	355,596,169	296,982,503	
Average distance haul of one ton (miles).....	94.68	88.33	
Average receipts per ton per mile (cents).....	1.126	1.078	

**ERIE.—Loan Approved.**—The Interstate Commerce Commission has approved a loan of \$1,733,750 from the revolving fund to assist the company in financing additions and betterments, including a considerable amount of work in reconstructing freight cars.

**GEORGIA RAILROAD & BANKING COMPANY.—Bonds Offered.**—Spencer Trask & Co., New York, and William E. Bush & Co., of Augusta, Ga., are offering at 99 and interest \$1,500,000, 30-year, 6 per cent refunding bonds. The bonds will mature October 1, 1951, and are non-callable.

The bonds are being offered subject to the approval of the stockholders, the Interstate Commerce Commission and the Railroad Commission of Georgia. This issue, which ranks equally with the \$1,000,000 4 per cent bonds of 1947, will provide for the retirement of \$300,000 6 per cent bonds and \$1,200,000 5 per cent bonds, maturing January 1, 1922. Upon completion of this financing, the total funded debt of the company will amount to \$2,500,000.

The Georgia Railroad & Banking Company was incorporated in 1833 and owns 315 miles of railroad, including the shortest link (171 miles) connecting the Louisville & Nashville and Atlantic Coast Line railroads operated by either road. All the traffic between the two systems, except that to and from Florida, must pass over this connecting line, which extends from Santa to Augusta, Ga. It is also interested in 247 miles of adjacent lines through security ownership and is practically the sole owner of the Georgia Railroad Bank.

The railroad property is leased jointly to the Louisville & Nashville and Atlantic Coast Line for 99 years from April 1, 1881, and together with the railroad companies in which it is interested, is operated as the "Georgia Railroad" system, which system forms an integral part of both systems.

**GULF PORTS TERMINAL.—Application to Extend Line Denied.**—The Interstate Commerce Commission has denied the application of this company for a certificate to construct an extension of its line in Baldwin County, Ala., to Mobile, approximately 25 miles. The cost of the proposed extension was estimated by the applicant at \$650,000, including \$350,000 for a trestle, 7 miles in length. The commission, in its opinion, stated that the financial success of the proposed loan would depend chiefly upon the ability of the carrier to secure a considerable volume of traffic moved between Pensacola and Mobile. The applicant's plans indicate a line of light construction, heavy grades and inadequate terminals. Any through business which it might obtain obviously would constitute a diversion of traffic from existing transportation facilities.

**HOCKING VALLEY.—Annual Report.**—A review of this company's annual report for 1920 appears on another page of this issue.

**INTERNATIONAL & GREAT NORTHERN.—Authorized to Deliver Equipment Notes and Pledge Receiver's Certificates.**—The Interstate Commerce Commission has authorized the receiver to deliver 24 notes for \$8,601 each, aggregating \$206,444 to the Baldwin Locomotive Works in part payment for eight locomotives; and to pledge receiver's certificates aggregating \$194,300 with the Secretary of the Treasury as security for a loan from the revolving fund.

**MAINE CENTRAL.—Loan Approved.**—The Interstate Commerce Commission has approved a loan of \$400,000 to aid this company in providing itself with equipment and other additions and betterments. The loan will be used in connection with the purchase of eight locomotives and miscellaneous equipment and the rebuilding of 110 rack cars.

**MINERAL RANGE.—Annual Report.**—The income account for the year ended December 31, 1920, compares with the preceding year, as follows:

	1920	1919
Total operating revenue (March 1 to Dec. 31).....	\$562,590	
Total operating expenses (March 1 to Dec. 31).....	717,891	
Net operating revenue.....	155,211	
Railway tax accruals.....	43,336	
Net operating deficit.....	198,570	
Income from lease of road (January and February, 1920; year 1919).....	24,001	\$140,379
Estimated amount of government guaranty due (March 1 to Aug. 31).....	72,003	
Due from U. S. Gov't for deficit incurred in operation of road during guaranty period (March 1 to Aug. 31).....	76,865	
Gross income.....	50,793	150,580
Deduct—Interest on funded debt.....	85,027	88,322
Total deductions from gross income.....	90,047	103,901
Net income or loss.....	Def. 39,253	46,679

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919, as follows:

OPERATING REVENUES			
	1920	1919	
Freight.....	\$327,984	\$316,069	
Passenger.....	3,938	4,490

**NORFOLK & PORTSMOUTH BELT LINE.—***Authority to Issue Notes Granted.*—This company has been granted authority by the Interstate Commerce Commission to issue a 90-day, 6 per cent promissory note for \$35,000, payable to the order of the Merchants & Farmers Bank of Portsmouth, Va., in renewal of a note for a similar amount; and to issue from time to time notes in renewal thereof for like amounts payable to that bank 90 days after date, but not later than August 25, 1922, with interest at 6 per cent.

**PERE MARQUETTE.—***Asks Authority to Abandon Line.*—This company has made application to the Interstate Commerce Commission for permission to discontinue service and take up its tracks between Harrison, Mich., and Leota, a distance of approximately 10 miles. This northerly portion of the Harrison branch was originally built to take care of the lumber business, which is now practically exhausted.

## Final Settlements with the Railroad Administration

The Railroad Administration announced on August 31 that it had made final settlements with the following carriers for the amounts stated:

Carolina & Northeastern.....	\$15,000
Joliet Union Depot Company.....	2,307
Lackawanna & Montrose.....	4,000
Manistique & Lake Superior.....	50,000
Meridian Terminal Company.....	702
New York, Chicago & St. Louis.....	3,000,000
Sussex Railroad.....	26,000

The Ann Arbor has paid the Railroad Administration \$600,000.

## Partial Payments of Guaranty

The Interstate Commerce Commission certified to the Treasury partial payments of guaranty to the following roads:

Terminal R. R. Association of St. Louis.....	\$65,000
Trinity & Brazos Valley.....	35,000

## Treasury Payments

The Treasury has announced the payment of a loan of \$65,000 from the revolving fund to the Central Vermont and partial payments of guaranty to the following roads:

American Railway Express Company.....	\$425,000
Atlantic, Birmingham & Atlantic.....	90,000
Bullfrog Goldfield .....	30,000
Chicago, Indianapolis & Louisville.....	250,000
Kansas, Oklahoma & Gulf.....	130,000
Lorain Railroad .....	5,700
Middle Tennessee .....	41,893
Mineral Point & Northern.....	6,500
Missouri Pacific .....	2,000,000
New York Dock Railroad .....	50,000

The Treasury has also announced a partial payment of \$114,000 to the Atlantic Coast Line and Louisville & Nashville Railroads, joint lessees of the Georgia Railroad.

## Dividends Declared

**Boston & Albany.**—\$2.00, quarterly, payable September 30 to holders of record August 31.  
**New York, Chicago & St. Louis.**—2nd preferred, \$5.00, payable September 16 to holders of record September 3.  
**Pittsburgh, Ft. Wayne & Chicago.**—Common and preferred, 134 per cent, quarterly, payable October 1 to holders of record September 10.

**THE VETERANS** in the service of the Chicago, Milwaukee & St. Paul will hold their annual reunion at Minneapolis on September 15 and 16, at the Curtis Hotel.

**THE CHICAGO GREAT WESTERN** has awarded a contract for the repair of its cars in its Kansas City and St. Paul shops to Hecker & Co., Cleveland, Ohio, who will do the repairing on a piece-work basis. This plan is somewhat similar to that of the Erie, at Marion, Ohio, except that the Great Western retains control over its plant, and only giving out the work to contractors.

## Railway Officers

## Financial, Legal and Accounting

**A. H. Orci** has been appointed general counsel of the National Railways of Mexico with headquarters at Mexico City.

**I. J. Terroba** has been appointed general auditor of the National Railways of Mexico with headquarters at Mexico City. **J. R. Gamez** has been appointed auditor of passenger receipts with the same headquarters.

## Operating

**J. M. Carpio** has been appointed assistant to the general manager of the National Railways of Mexico with headquarters at Mexico City.

**M. T. Vela** has been appointed superintendent of car service of the National Railways of Mexico with headquarters at Mexico City. **C. M. Durazo** has been appointed superintendent of the sleeping car department and **J. M. Del Campo** has been appointed superintendent of telegraph, both with headquarters at Mexico City.

**M. Acosta**, superintendent of the Pacific division of the National Railways of Mexico, has been transferred to a similar position on the Guadalajara division with headquarters at Guadalajara, succeeding P. S. Alvarez. **J. Mejia**, superintendent of the Oaxaca division, succeeds Mr. Acosta and **P. W. Caballero** succeeds Mr. Mejia.

**C. W. Coe**, general superintendent of the Wheeling & Lake Erie, with headquarters at Brewster, Ohio, has been appointed assistant general manager in charge of operation and maintenance with headquarters at Cleveland, succeeding **F. P. Barr**, who has been appointed general traffic manager. The office of general superintendent has been discontinued, effective August 15.

## Traffic

**A. G. Roel** has been appointed traffic manager of the National Railways of Mexico with headquarters at Mexico City.

**S. M. Jackson** has been appointed commercial agent of the Cincinnati, Indianapolis & Western, with headquarters at St. Louis, Mo.

**E. L. Blandford** has been appointed commercial agent of the Louisville & Nashville with headquarters at New York, effective September 1.

**C. A. Swope** has been appointed general Eastern freight agent of the Louisville & Nashville with headquarters at New York, effective September 1.

**F. P. Barr**, assistant general manager in charge of operation and maintenance of the Wheeling & Lake Erie, with headquarters at Cleveland, Ohio, has been promoted to general traffic manager with the same headquarters, effective August 15.

## Obituary

**John Sayer**, formerly secretary and treasurer of the Lehigh & Hudson River, died on August 24, at Warwick, N. Y., at the age of 76 years. Mr. Sayer retired in 1917 after 52 years' active service with the company.

**Frederick U. Adams**, a mechanical engineer and scientific writer, who at one time conducted experiments for the Baltimore & Ohio on the effect of atmospheric resistance on the speed of trains, died at his home at Larchmont, N. Y., on August 28.

F. F. Gaines, formerly superintendent of motive power of the Central of Georgia, died at Washington, D. C., on August 26. Mr. Gaines was born on March 28, 1871, at Hawley, Pa.

He entered railway service in 1888 as a freight and ticket clerk for the Erie. Two years later he resigned to enter Cornell University, at which institution he studied for the following four years. Upon leaving the university he served in the shops of the Erie for a time and in August, 1895, became a draughtsman for the Lehigh Valley and the following year was appointed engineer of tests. In April, 1897, he was promoted to mechanical engineer and in November, 1902, he was appointed master mechanic. Two years later Mr. Gaines became mechanical engineer of the Philadelphia & Reading and in 1906 he went to the Central of Georgia as superintendent of motive power. In 1917 Mr. Gaines resigned as superintendent of motive power on account of ill-health but continued in the service of the company. In July, 1918, he was appointed a member of the committee of standards of the Railroad Administration and the following year was elected chairman of the Board of Wages and Working Conditions. He subsequently served as a member of Railway Board of Adjustment No. 3. Mr. Gaines was president of the American Railway Master Mechanics' Association in 1914 and 1915.

F. F. Gaines

Louis Pierre Alexandre Weissenbruch, General Secretary of the Permanent Commission of the International Railway Association, whose death at Brussels, Belgium, on August 7, was noticed briefly in the *Railway Age* of August 27, had been connected with the International Railway Congress since its first session, in 1885, having begun as a private secretary. He was well known to many railroad men in America, having visited this country in 1904 and 1905 in connection with the seventh session of the Congress, which was held at Washington in the latter year. He was a general inspector of the Belgian State Railways, interested more particularly in signalling; and his

writings have appeared occasionally in the *Railway Age*. The last was in the issue of July 2, 1920, an abstract of an exhaustive article on cab signals in Europe. Since the great war, Mr. Weissenbruch had been engaged in the organization of the International Railway Association (the old organization, the "Congress" having been declared defunct by the Belgian Government) and the preparations for the Ninth Congress, to be held at Rome, Italy, next April, had been well advanced.

Mr. Weissenbruch was 64 years old, and was born at Liege, Belgium. He was graduated from Brussels University and from the military school of Brussels and was breveted sub-lieutenant of engineering in 1879. He served three years with the artificers of engineering at Antwerp, and in July, 1882,

was appointed to a position with the ministry of railroads at Brussels. In a short time he was appointed railroad engineer and private secretary to the Minister, and thence was successively promoted to be engineer; chief engineer in the traction department; specialist in the department of commercial administration; chief of section in the railroad department, and (1901) director of the safety appliances department. Mr. Weissenbruch had been "reporter" for the Congress on various technical subjects, having presented papers to the Congresses of 1885, 1887, 1889, 1892 and later. He is also the author of numerous technical articles in the Bulletin of the Congress and in other publications. As editor of the Bulletin (one of his duties as secretary) he has with marked discretion enriched its pages with many valuable reprints from technical periodicals of all countries. He was one of the editors of the French edition of the History of Russian Railroads down to 1892, which was published by the Russian Government.

One of his friends in England, Mr. T. S. Lascelles, has sent us an appreciation, from which we quote:

"Monsieur Weissenbruch passed out of the Military College with first class rank in the special arms section. In the maintenance of way department of the State Railways, he specialized on signalling questions and was appointed assistant signal engineer in 1898. This position he occupied until 1901 when he became chief signal engineer. In this capacity he executed a complete reformation of the signal system on the State Railways on principles elaborated by himself, after an exhaustive study of the methods in use in every other country. The result was a very sound and efficient system extremely well suited to the conditions of working obtaining in Belgium. A great admirer of English practice he incorporated the best of it with the best German practice, notably the Siemens alternating current lock-and-block apparatus. He adopted the upper quadrant semaphore and the yellow light for the caution indication and extensively employed power distant signals. Under his direction some ten or eleven all-electric interlockings were put in, including large ones at Antwerp, Brussels, Ghent and Louvain. These were Siemens pattern and were specially designed to answer to Belgian requirements, set forth in a specification due to him. Fogs being rather prevalent in many parts of Belgium he gave special attention to the fog-signalling problem and directed numerous experiments with cab-signals. He investigated carefully almost every one that had reached a practical stage. Although no cab signal was adopted by the State Railways he overcame the fog difficulty by installing repeating light-signals on the crowded Brussels-Antwerp main line; and it is interesting to note that the same thing has since been adopted on the London electric lines, in a modified form, with great advantage. Automatic stops also formed the subject of many experiments which he was actively prosecuting when the war broke out. He was one of the founders of the International Railway Association. He understood American methods, many of which he admired.

"When the great war came he and his family had to leave Belgium and he resided at Bexhill, England, on the seacoast about 30 miles east of Brighton, until the liberation of his native country. While there, his time was occupied with studying English signalling and other features of railway operation, upon which he made a report to the Belgian Government. Returning to Belgium after the war he addressed himself energetically to the rehabilitation of the railways and was appointed general inspector. He introduced a special system of absolute block working by telephone to safeguard train operation until the lock-and-block system could be reinstated, much of the apparatus having been destroyed by the Germans. In the midst of these activities death overtook him at the comparatively early age of 64.

"Mr. Weissenbruch was president of the National Railway Schools of Belgium, a member of the Order of Leopold, of the Order of the Crown, Chevalier of the Legion of Honour, a member of some eight or nine foreign orders, honorary member of the Signal Section, American Railway Association, and of the Institution of Railway Signal Engineers in England. He was a man of wide knowledge, a profound student and a capable linguist. His death removes one of the ablest figures in the field of railway signaling."

L. P. A. Weissenbruch

Ryerson-Conradson lathes speed production

## For Roundhouses—the Versatile Lathe

For want of a modern lathe in the roundhouse, light repairs often delay and overload the main shop.

The great variety of work roundhouses are called upon to handle emphasizes the advantage of the unusual versatility of the Ryerson-Conradson Railroad Lathe.

The twelve speed changes and twenty-eight feed changes, made with gears always in mesh, eliminate any chance of gears stripping.

Where work comes in great variety this is an important factor in speeding production.

*Other radical improvements are described in  
Bulletin 1301*

## Mr. Ford's "Railroad Miracle"

THE credulousness of the American public regarding fairy tales about the railways is almost beyond belief. Recently somebody who knew more about miracles than about railroads began attributing to Henry Ford the working of a miracle in the management of the Detroit, Toledo & Ironton Railroad. Wide publicity was given to reports that he had taken a property which was moribund physically and bankrupt financially, waved his magician's wand over it, and within a few weeks, or a few months at the most, converted it into a fine property physically and a highly prosperous property financially. A large part of the public believed these reports. It apparently drew from them the inference not only that Mr. Ford was a genius, but that the managers of most of the railways were incompetents. If they were not incompetents, why did they not do with the other railways what he had done with the Detroit, Toledo & Ironton?

The *Railway Age* had its doubts as to whether even Mr. Ford could strike the stone of railroad operation and make floods of profits immediately burst forth. He has demonstrated in the manufacturing business that in certain ways he is one of the greatest geniuses of the age. His success in the automobile business has been such as to indicate that if there is any man in any other line of business in this country who could step into the railroad business and soon gain extraordinary results, it is Henry Ford. We were somewhat skeptical, however, as to whether it was possible within the short time he had owned the D. T. & I. for even Mr. Ford to work such a miracle as was attributed to him. Therefore, we have made our own investigation of the facts. We sent two of our editors to Detroit to call upon the men Mr. Ford has placed in direct charge of the management of his railroad and asked them what they have done and what results they have obtained. Be it said to their credit that Mr. Ford's representatives of the D. T. & I. were perfectly frank. They answered as well as possible every question asked them.

The results of the investigation made upon the ground and of a study of the official figures regarding the operations of the D. T. & I. are given in an article elsewhere in this issue. The facts show that under the Ford management the financial results of the Detroit, Toledo & Ironton have been very greatly improved. They also show that no miracle has been worked. The results obtained thus far have been due almost entirely to the circumstance that the ownership of the Detroit, Toledo & Ironton has been acquired by one of the largest manufacturers in the country, and that Mr. Ford has used his position as a very large shipper in the country to do things on the D. T. & I. which neither he nor anybody else could have done without being such a large shipper.

The Detroit, Toledo & Ironton now has much the same relationship to the Ford Motor Car Company that the Duluth & Iron Range, the Duluth Missabe & Northern and the Bessemer & Lake Erie have to the United States Steel Corporation. These steel corporation railways have been for many years among the most prosperous railways in America. They have been very well managed, but their prosperity has been largely due to the fact that they have been owned by an industrial concern which controls a vast amount of freight.

The facts about the Detroit, Toledo & Ironton may be summarized as follows: Mr. Ford bought it in August, 1920. He assumed complete control of its operation through men of his own choosing—most of them, men who were connected with his motor car business—in March, 1921, when he himself was elected president. During the four months, September to December, 1920, inclusive, after the present railway freight rates were fixed, the D. T. & I. handled an average of 49,246,000 ton-miles of revenue freight per month and had freight earnings averaging \$493,800 a month. In the months of April, May and June, 1921, the road handled an average freight business of 37,093,000 ton-miles a month and earned from it an average of \$694,203 a month. In other words, its average freight business in these three months was *almost 25 per cent less* than in the last four months of 1920, while its average monthly freight earnings were *over 40 per cent greater*. This large increase in freight earnings, in spite of a big decline in the total freight handled, could have been due to only one cause, and that was an increase in its average rate. And there was a very extraordinary increase in the average rate per ton per mile—a thing to which public attention never has been called before. In the last four months of 1920 its average rate was one cent per ton per mile. The average rate per ton per mile in April, May and June, 1921, was 1.88 cents, *88 per cent greater* than in September, October, November and December, 1920. The average rate of all the railways in the country is only 1.23 cents.

If no change whatever had occurred on the D. T. & I. except this enormous increase in its average rate per ton per mile its financial results would have been revolutionized. To what was this remarkable increase in the average rate per ton per mile due? Chiefly to two things: First, to a great change in the character of the traffic handled. Mr. Ford began giving his railway practically all of his freight business; and the freight handled directly and indirectly for his motor works consists largely of relatively high grade commodities which pay a rate much higher than the average. Meantime, the amount of coal handled by the railroad greatly decreased. Coal being a bulky and cheap commodity, it pays

a rate much smaller than the average. This change in the character of the traffic alone would have caused a large increase in the railway's average rate.

Secondly, the D. T. & I. has been able to use the large volume of traffic originated by the Ford interests to secure larger divisions of the through rates on all traffic hauled partly over its line and partly over other railways, and the great bulk of the D. T. & I.'s business consists of this through traffic. Both the change in the character of the traffic and the larger divisions of the through rates obtained by the D. T. & I. have tended to increase its average rate per ton per mile.

Furthermore, the management of the D. T. & I., in common with all the other railways, was able, partly because of the smaller traffic handled by it and partly owing to other causes, to make large reductions in its operating expenses. A study of these reductions in expenses indicate that in proportion to the reduction in traffic handled they were slightly greater on the D. T. & I., but only slightly greater, than those made on the railways in general.

The only really great change which had been made on the D. T. & I. up to July 1 was in the conditions which determined its average rate per ton per mile. But how about the reduction of 20 per cent in its local rates and the advance in the wages of its employees which have been so widely advertised? Neither of these went into effect until July 1 or later, and therefore neither of them had anything whatever to do with the increases in the railway's net earnings which have been so widely exploited. We shall have to get later data which are now available before anybody can say what is the effect of these changes in important policies.

It may be said, however, that Mr. Ford is so completely convinced of the desirability of a general reduction in rates that he has proposed that a reduction of 20 per cent be made in the rates of all railroads. It is not our purpose to impugn Mr. Ford's motives, but there are certain important facts about this proposed reduction in rates which are pertinent. The freight earnings of the Detroit, Toledo & Ironton are now running at the rate of approximately \$8,000,000 a year. Therefore, other things remaining equal, a reduction of 20 per cent in them would reduce the road's earnings by about \$1,600,000 a year. On the other hand, the freight bills paid by the Ford industries to all the railways amount to from at least \$15,000,000 to \$20,000,000 a year. Therefore, a reduction of 20 per cent in freight rates by all the railways would reduce the freight bills of the Ford Motor Company by \$3,000,000 to \$4,000,000 a year. In other words, Mr. Ford as a shipper would be sure to gain millions of dollars more by a reduction in rates than he could possibly lose as a railroad owner. Most of the other railways of the country are not intimately connected with large manufacturing concerns which would save millions of dollars annually by a reduction of their freight bills.

The *Railway Age* is glad Mr. Ford has entered the railroad business. We are glad to see him try the policies in which he believes on the Detroit, Toledo & Ironton. We wish he would buy a really large railroad system and try them on it. The Detroit, Toledo & Ironton is now practically nothing but a plant facility of the Ford Motor Works and the results obtained by it are no measure of what results would be obtained by the use of the same policies on a large

railroad system. The changes in wages and changes in working conditions Mr. Ford has made on the Detroit, Toledo & Ironton have apparently completely broken the grip of the railroad labor unions on his railroad. We should especially like to see his policies tried on a large railroad system because we should like to see what results he would get in dealing with the labor unions on a large system.

Meantime, no man who is capable of studying the facts about the management and operation of a railroad and drawing rational conclusions from them will say that Mr. Ford has as yet worked a miracle on the Detroit, Toledo & Ironton. Furthermore, his own representatives on the railroad do not claim that he has. He has done little or nothing on it that could not have been done if the Detroit, Toledo & Ironton had acquired the ownership of the Ford Motor works and thereby acquired control of all the traffic of the motor works. The fact that so many newspapers and people have accepted without question stories to the effect that he has worked a "railroad miracle" merely illustrates their willingness to believe any story reflecting upon the efficiency of management of the railways in general which may be irresponsibly put into circulation.

The desirability of using train order Form 19 wherever possible, instead of the time-consuming Form 31, is a question that recurs frequently, and a letter on the subject, printed

### Why Require Signatures to Train Orders?

on another page, reminds us that it is an important one. This matter was quite fully set forth in the *Railway Age* several years ago\* but the discussion did not seem to settle anything. What can be done? For one thing, the facts which go to make up the arguments for and against taking signatures ought to be more generally known; that is to say, ought to be distinctly stated and so clearly set forth that any superintendent or dispatcher could put the whole question before his own mind, easily and quickly; and could study and review the subject as fully and at as much leisure as he might deem desirable. Those dispatchers who have most strongly advocated Form 19 have dealt more with opinion than with facts; at least that is the impression that has been made. Operating officers who realize the need of saving the time of their trains but cannot induce their managements to abolish signatures would do well to form themselves into an investigating committee, *a la* Congress, and, having fully informed themselves by visiting prominent roads which have made the change, get out a convincing report for general circulation. An investigating committee would have the duty of reporting not only opinions, but all of the details of present practice, so far as such details could be learned. For example, a road that allows operators to sign conductors' names to orders is pretending to use a safeguard which in fact is not used. It is necessary to get rid of all false issues if a fair comparison of methods is to be made. Our correspondent makes out a strong case. Who can show the best practice with clearance cards and middle orders?

\*Discussions of Train-Order Form 19 in the *Railway Age*, with names of writers:

In July of this year 30 steam locomotives built in this country were exported for use on foreign railways; in the same month of last year 134 were exported. For the seven months ending July 31, our total exports of steam locomotives totaled 692, as compared with 1,025 for the same period of 1920.

### Our Dwindling Exports

Similarly for freight cars: for the seven months ending the last of July, 5,579 had been sent abroad as compared with 13,708 for the same period of 1920. These figures indicate something more serious than a general business depression, because many foreign railways in spite of decreased traffic are still inadequately equipped and are in the market for equipment. The decrease in our exports reflects not only a less active foreign market but also the successful competition of foreign manufacturers for business which during and immediately following the war was diverted to this country. The exchange situation in most countries is against America and enables foreign competitors in many instances to underbid our manufacturers. Fortunately for America, however, we are in a better position to extend credit to foreign purchasers than almost any other country. The fact of the matter is, nevertheless, that our position in this regard is not taken full advantage of. With practically nothing having been done in the way of extension of the world's railway facilities during the past few years there exists abroad a vast potential market for railway supplies. Foreign manufacturers may underbid Americans in some cases where the prospective customer can give cash or short term notes in payment. Time, with the consequent rise in the value of foreign money, is the only remedy for this situation. If America fails, however, to compete successfully when long term credits, or permanent investments are involved, it will be because of lack of vision and skill in the machinery of finance rather than because of inadequate financial resources.

The reopening of several important railroad repair shops and the gradual building up of shop forces to normal at other points makes the present an opportune time to look into the future and impress upon shop organizations the importance of quality as against quantity output.

### Quality vs. Quantity Shop Output

Under the stress of heavy demands for power and car equipment at various times in the past, there is no question but that the quality of railroad repair shop work has been sacrificed in favor of maximum output. But a locomotive, for example, requires something more than a coat of paint in order to operate efficiently and safely. A defective car sill or draft gear cannot be covered up forever. It is a serious question if, even under the most pressing demands for locomotives and cars, it pays to slight repair work in any important detail. It costs almost as much to do an inferior job which will subsequently give trouble as it would to take a little more time and do the job right in the first place. In addition, there is serious danger of accidents resulting from inferior workmanship and the practical certainty of locomotive failures and costly train delays. If, as is often the case, a locomotive or car has to be returned to the roundhouse or back shop and have repair work done over, the total cost is many times greater than the initial cost of doing the work right. Too much emphasis cannot be placed on the need for painstaking, careful repair and maintenance work in all shop departments. It is surprising how fast the idea will propagate itself among shop men that a railroad wants output and does not care so much for quality. The higher mechanical department officers should make extremely plain to their subordinates and through them to the shop employees the false economy of turning out any but the best work.

On May 27, as told elsewhere in this issue, hot coals from a passing locomotive set fire to a timber trestle on a southern railroad. Under the influence of a high wind the flames were spread over the entire structure, and the fire burned fiercely for some time, then died out practically of its own accord. Yet the

### Are Creosoted Bridges Good Fire Risks?

bridge, far from being destroyed, experienced scarcely more than a thorough scorching. This is an unusual incident when it is recalled that timber trestles, once set fire, have seldom escaped destruction. But more than this, it would seem that the circumstance has about it a significance meriting the close attention of the engineer. It is a well-known fact that, as mentioned in the article in question, much opposition is manifested in some quarters to the use of creosoted timber in railway trestles, largely in the belief that creosoted timber offers very little resistance to fire. But here it seems is a case of a timber trestle which survived a destructive fire for the very reason that its timber was saturated with creosote. This conclusion may or may not meet with the agreement of those who look unfavorably upon the creosoted timber trestles, nor will it necessarily alter the practice in bridge construction. It has, however, operated at least to confirm the favorable opinion of creosoted trestles held by the road upon which the fire, the first in ten years, occurred; in any event it bears evidence to the fact that the question—*are creosoted bridges good fire risks?*—is anything but a dead issue.

## Loss and Damage as a Factor in Transportation Costs

POST-WAR READJUSTMENT has required every manufacturer to place his house in order. Production costs have been investigated with the result that unprofitable lines have been dropped or manufacturing processes have been studied with a view to eliminating waste. As manufacturers of transportation, the railways can well study their operations to make sure that all costs incidental to the handling of the various classes of traffic are taken into account. Although the railroads are not in the fortunate position of the manufacturer, who can cease operation with respect to any product that is found unprofitable, they can at least endeavor to obtain a readjustment of rates with respect to the particular classes of traffic that are being handled at a serious loss.

As the money spent in satisfying claims for loss and damage must justly be considered as a part of the cost of transportation, it would be well to consider the relation between claims arising from the handling of a particular class of traffic to the revenue derived therefrom. As a case in point, an l. c. l. shipment of silk that brought the railroad a gross revenue of \$1.58 was destroyed in transport, giving rise to a claim for \$21,000. A simple operation in division demonstrates that this railroad would have to handle 13,000 similar shipments without loss or damage in order to make up the outlay for the damage claim in this single case without taking into consideration any of the other expenses which must be allocated to the service performed.

If this were a matter which concerned only the transportation of silks and a few other exceptionally high priced commodities, the situation would not be so serious, but unfortunately it concerns the entire l.c.l. traffic. In 1920 the losses incurred by the railroads as a result of loss and damage to l.c.l. freight, including claims, cost of claims investigation, and adjustment amounted to approximately \$52,300,000, while the total revenue derived from l.c.l. freight on the basis of 10 per cent of the total freight revenue was about \$431,000,000. This means that 12 per cent of the entire revenue derived from l.c.l. traffic was expended in satisfying claims for loss and damage to this class of traffic alone.

This is in sharp contrast to the situation with respect to

carload freight wherein the loss and damage amounted to about \$62,000,000 in comparison with a total freight revenue of \$3,880,000,000. In other words, the expenditure for freight claims in the case of carload freight was only 1.6 per cent of the gross revenue.

The problem of loss and damage is not new, although the record of 1919 and 1920 has imposed a problem on the railroads by comparison with which all previous experiences pale to insignificance. The comparison given above, which demonstrates the relationship between freight claims and freight revenues, is not made so much with the idea of suggesting changes in rates which would compensate for the losses as to call attention to the need of concentrating efforts to reduce losses on those items for which they have been the greatest. As another factor to be considered in this regard, it is of special interest to note that practically 70 per cent of total claims arising from l.c.l. traffic are chargeable to shortages, i. e., a moral rather than a physical hazard. The subject is one well worthy of further analysis and attention and into which the question of adequate police surveillance must enter quite largely. These conditions and others which are being developed by the Freight Claim Division of the American Railway Association will be fruitful in indicating those measures that will be most effective in reducing loss and damage.

## Michigan Central

THE MICHIGAN CENTRAL'S location in the busy automobile manufacturing district of southern Michigan enabled that carrier to prove a good money-maker for the government during the period of federal control. The standard return for the road was set originally at \$8,052,127. In 1918 it earned a net railway operating income of \$13,606,480, approximately 50 per cent over the standard return. In 1919 it earned \$16,934,173, double the government rental. In January and February, 1920, the last two months of federal control, it approximated the standard return. This rate of earnings, however, was not continued for long during the remainder of the year. Increased wages, a heavy increase in the cost of fuel and similar increases in cost such as characterized the year 1920, prevented the road from realizing on a heavy traffic, considerably in excess of that carried in 1919. The net railway operating income for 1920, as given in the December, 1920, monthly report to the Interstate Commerce Commission was only \$4,668,280. It happened, however, that this falling off in earnings was compensated for by the guaranty for the months March to August. The net return to the corporation was in excess of that for 1919, as we shall see below.

The Michigan Central at the present time seems to have succeeded to a considerable degree in restoring its earning power—or, in other words, in overcoming the disadvantages with which it was confronted during 1920. At present it is carrying only about two-thirds or three-quarters as much traffic as it was carrying at this time last year. Its net, however, is showing a progressive increase month by month. In June, 1921, the net railway operating income was \$1,459,699, as compared with a deficit in June last year of \$793,062. For the first six months this year its net was \$4,809,464, or more than half the average annual earnings for the period July 1, 1914, to June 30, 1917, on which the standard return was based. The net for the first six months of 1920 was only \$1,000,186. A showing of this kind evidenced in June and the first six months of the present year—a period of comparative industrial inactivity—may be taken as a good indication of the Michigan Central's earning power and of what may be expected when business is again revived.

The Michigan Central total freight revenues in 1920 were \$55,215,123, an increase of \$3,561,213 over 1919. The

total operating revenues were \$87,790,799, an increase over 1919 of \$8,946,414. As against this increase in operating revenues, there was an increase in operating expenses, 1920 over 1919, of \$15,528,435. The total operating expenses were \$77,370,249. The net operating revenues of \$10,420,551 compared with \$21,002,572, a decrease of \$10,582,021 from 1919. This decrease in net with an increase in gross is hardly sufficiently exceptional from the experience of most roads during 1920 to need extended comment.

The tons of revenue freight carried in 1920 were 30,203,776, as compared with 26,578,110 tons in 1919. The largest single factor in this increased business was the increased tonnage of bituminous coal. In 1920 the road moved 181,331 carloads of that commodity and a tonnage of 8,174,625, an increase of 3,712,675 tons over 1919. The Michigan Central also carries a large tonnage of anthracite coal—in 1920, 1,352,354 tons—a large part of which it receives from the anthracite roads reaching the Buffalo district. The total revenue ton-miles of all freight carried in 1920 was 4,824,739,972, the average haul being 160 miles; in 1919, the revenue ton-mileage was 4,718,763,911, the average haul, 178 miles. The Michigan Central has a comparatively high traffic density, the tons of revenue freight carried one mile per mile of road in 1920, being 2,637,363. Another of the distinguishing features of the road's operations is its heavy train load. In 1920, the average revenue train load was 761 tons as compared with 736 tons in 1919.

In the editorial review of the annual report of the New York Central which appeared in these columns a few weeks ago considerable attention was paid to the large amount of new equipment which had been acquired by that road and by the New York Central system as a whole in recent years. The point was made that the New York Central being one of the main arteries to the port of New York had been obliged to expend large sums for new equipment and facilities to keep up with the constantly expanding demands upon it for transportation. The same has been true on a smaller scale of the Michigan Central. That road received from the government 30 of the U. S. R. A. standard locomotives and 2,000 cars. The company is also to receive, or already has received, from the New York Central, 26 locomotives, 38 passenger train cars and 1,950 freight cars, covered by the New York Central's equipment trust of 1920. The estimated cost of this equipment is \$9,356,839. The Michigan Central receives it under a sub-leasing arrangement and as sub-lessee is to assume its pro-rata share of the equipment trust certificates, principal and interest, etc., and at the fulfillment of the trust is to become the owner. The amount of the trust was 75 per cent of the total cost, the other 25 per cent being obtained from the New York Central as a loan, covered by fifteen 6 per cent notes maturing from 1921 to 1935.

The Michigan Central also secured from the New York Central in a similar manner \$613,000 for additions and betterments to way and structures. The result of all this financing was an increase in the funded debt of the Michigan Central from \$57,793,931 on December 31, 1919, to \$72,501,446 at the end of 1920. The interesting manner in which the New York Central secured funds from the revolving fund administered by the Interstate Commerce Commission and then loaned in part to the various subsidiary companies—as here briefly outlined in the case of the Michigan Central—is further detailed in the editorial review of the New York Central heretofore referred to.

Referring now to the corporate income account of the Michigan Central, it will be noted that the total income from railway operations in 1920 was \$10,508,670, including compensation for January and February of \$1,342,021, additional compensation for completed additions and betterments of \$91,063; guaranty for the guaranty period of \$4,162,855 and net railway operating income for the last four months of the year of \$4,912,730. The total of \$10,508,670 com-

pared with the standard return for 1919 of \$8,699,813, an increase of \$1,808,857. The net corporate income for the year 1920 was \$3,805,785; for 1919, but \$67,230. The regular four per cent dividends were paid leaving a surplus for the year of \$3,056,329. The surplus for 1919 was \$67,230, the dividends for that year being paid out of surplus.

The operating results for 1920, as compared with 1919 are as follows:

	1920	1919
Mileage operated	1,866	1,862
Freight revenue	\$55,215,123	\$51,653,910
Passenger revenue	23,557,853	20,070,337
Total operating revenue	87,770,799	78,844,386
Maintenance of way expenses	12,614,090	9,627,843
Maintenance of equipment	22,150,404	15,682,093
Traffic expenses	1,074,701	788,066
Transportation expenses	38,521,215	29,506,855
General expenses	1,737,874	1,459,291
Total operating expenses	77,370,249	57,978,857
Railway tax accruals	4,642,111	2,650,000

The corporate income account follows:

	1920	1919
Compensation, January and February, 1920; full year 1919		
Additional compensation account, completed additions and betterments	\$1,342,021	\$8,052,127
U. S. Government guaranty, March 1 to August 31	91,063	647,685
Net railway operating income, September 1 to December 31	4,162,855	.....
Total (compared with compensation accrued in 1919)	4,912,730	.....
Total other income	10,508,670	8,699,813
Gross income	11,695,993	858,187
Total deductions from gross income	11,695,993	9,538,000
Net corporate income	7,836,499	7,062,567
Dividends declared (4 per cent each year)	3,805,785	67,230
Surplus for the year	749,456	.....
	3,056,329	67,230

\*Dividends in 1919, aggregating 4 per cent charged to accumulated surplus.

## Chicago & Alton

THE CHICAGO & ALTON operates 1,050 miles of road including a line double tracked for almost its entire length between Chicago and St. Louis and a single track line from a point north of St. Louis to Kansas City. The road is thus able to offer direct service between Chicago and St. Louis and Chicago and Kansas City. The route from St. Louis to Kansas City is somewhat roundabout, but is shortened considerably for passenger traffic by a joint service with the

The Chicago & Alton

Chicago, Burlington & Quincy using the tracks of the latter company from Mexico, Mo., to St. Louis.

The greater part of the Alton's main line mileage is laid with 90-lb. rail. Of the remainder there is a considerable mileage laid with 80-lb. rail and some 56 miles of 100-lb. which is being used for renewals. Rock ballast is used for most of the main line roadbed. Of the total tonnage carried in 1920, 53.19 per cent was made up of products of mines. Bituminous coal, received principally from mines in central Illinois, made up 5,258,883 of a total revenue tonnage of 12,070,934.

The Alton is naturally well situated from a point of view of passenger traffic and an efficient traffic department and loyal service on the part of employees have done much to aid it in maintaining its position in spite of adverse conditions, the greatest of which doubtless is an inadequate supply of modern all-steel equipment. The company provides good service between Chicago and St. Louis and also between Kansas City and St. Louis jointly with the Chicago, Burlington & Quincy over the latter's cut-off from Mexico, Mo., to St. Louis. Competition with other shorter and better equipped lines has prevented the same development of the Chicago-Kansas City business, although even on this line the traffic is fairly heavy.

The Chicago & Alton has been rather adversely affected by the recent tendencies in railway operations and earnings. It had a standard return for operations during federal control of \$3,178,315. In 1918 it had a net railway operating income of \$1,776,749, or \$1,400,000 less than the government rental. In 1919, due to a sharp falling off in traffic and to the increased costs of operation in that year, operations resulted in a net deficit for the year of \$299,224; in 1920 there was a net deficit of \$278,319.

The busiest year in the Alton's history was 1917. In that year it carried 12,262,489 tons of revenue freight. In 1918 it carried 11,795,507 tons; in 1919, 10,312,152 tons and in 1920, 12,070,934 tons. The revenue ton-miles in 1920 were 2,252,431,641, and the average haul 187 miles. Considering the percentage of coal carried, the Alton does not secure a heavy train load, although it has been making considerable progress along these lines in the past few years. The revenue train load in 1920 was 539; this compared with 525 tons in 1919 and with 524 tons in 1916. In 1918, however, the figure was 515 tons.

The Alton, because of the very nature of the conditions with which it is confronted, has not been making marked progress in getting on its feet financially. Its corporate income account in 1920—that is, including the standard return for January and February and the guaranty for the guaranty period—showed a deficit for the year's operations of \$634,647. In 1919 the property had a deficit of \$997,469; in 1918, \$1,429,319. The income account for 1918, however, included an item of \$782,240, representing expenses prior to January 1, 1918. The operating results in 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated	1,051	1,051
Freight revenue	\$20,818,536	\$17,330,784
Passenger revenue	6,950,081	6,404,081
Total operating revenue	30,374,934	25,272,334
Maintenance of way expenses	4,582,276	4,287,871
Maintenance of equipment	8,655,184	7,359,875
Traffic expenses	485,296	292,379
Transportation expenses	14,068,980	10,903,752
General expenses	1,709,713	1,645,801
Total operating expenses	28,677,232	23,617,902
Net revenue from operation	1,697,712	1,654,432
Taxes	786,503	743,650
Operating income	900,493	908,184
Net railway operating income	Def. 278,319	Def. 299,224

The corporate income account is as follows:

	1920	1919
Rental from U. S. Railroad Administration	\$3,178,315	\$3,178,315
U. S. Government guaranty period claim	3,105,524	.....
Total income from railroad properties	4,412,748	3,101,409
Net income from railroad properties	3,355,860	2,830,356
Total income from all sources	3,475,116	2,936,181
Deduct—Interest on funded debt, etc.	4,109,763	3,933,691
Net deficit	634,647	997,469

ROCH LANCIOT, a prominent French-Canadian member of the Canadian Parliament, in a recent speech at St. Edouard de Napierville, Quebec, declared that the Government of Canada would be wise to rid itself as soon as possible of the publicly owned railways. "What is the use of adding to an investment that produces nothing but deficits?" asked Mr. Lanciot. "I would prefer to sell the whole thing to the Canadian Pacific for a dollar. The government is not capable of running railways on a business basis; there is too much temptation."

## Letters to the Editor

### A Substitute for the Deraill

LONDON, Eng.

TO THE EDITOR:

In the *Railway Age* of July 16 appeared an article by A. H. Rudd, chief signal engineer, of the Pennsylvania System on "The Elimination of Derails." Mr. Rudd is a recognized authority on signaling matters and no doubt anything he may write will always be given serious attention; I feel that he is absolutely right as to the derail. It is a source of great danger and is directly responsible for great economical loss in railway work, being a costly item to install and maintain, and, at best, it is a menace to safety. It is a relic of bygone days when the only means of stopping a train passing a signal at danger was to throw it from the track. Very true, the train passing the signal at stop was penalized, but at what a cost; not only in damage to the equipment, but also many times to the passengers who were not in any way responsible.

The question that naturally arises after reading Mr. Rudd's article is: What is the remedy? If we eliminate the derail, what shall we substitute? The answer naturally is automatic train control, to prevent a train running past a stop signal. It is quite evident that before a train can stop it must be slowed down, and considering this fact it is quite obvious that the substitute for the derail is a scheme of automatic train control that includes speed control; a system that will impose speed restriction when approaching a stop signal and a stop at a stop signal without a dangerous overrun; a scheme that will control a train in accordance with signal indications and act to prevent accidents, but functioning only when the engineman fails. When the railroads are equipped with a train control of this character, there will be no need for derails at interlocking plants and trains will stop at stop signals without danger of destruction.

The only objection to Mr. Rudd's article is that evidently one paragraph is missing. Perhaps it is the last one, and, like the shortest verse in the Bible, it may be brief but most eloquent: automatic train control.

J. BEAUMONT.

### Stop-and-Proceed Rule Defended

BOSTON, Mass.

TO THE EDITOR:

A. H. Rudd's article in the *Railway Age* of August 6, commences with an excellent abstract defining the purposes which a modern railway signaling system should be made to serve. The main discussion, however, consists of an emphatic denunciation of the stop and proceed rule.

Analysis of some of the points made by the author raises a number of interesting issues which are not readily disposed of, and in several instances it is quite difficult to trace how the facts lead to the conclusions reached. Let us consider Mr. Rudd's contention with the case which is at once simplest and most typical, viz., a double-track line equipped with upper-quadrant three-position automatic block signals.

The author says: "Some of us believe . . . the stop and proceed signals should be eliminated; and stop signals displayed *only where stops are required*," describing this condition as follows: "i.e., when protection is needed against opposing movements, and at grade crossings, junctions and crossovers where side collisions might otherwise occur."

What is the proper point to stop a train which has entered a block occupied by a preceding unit? Safety demands that a sufficient interval be preserved at all times between trains,

and it is generally understood that signals are located with due regard for the efficient performance of this function. It indeed seems incredible that the author intended to exclude the stop signal from the situation that I mention. Surely he does not mean that the only stop signal should be those auxiliary or reserve instruments, torpedoes, flags, and the like. "Let us tell the engineman to stop only where necessary and when we say stop let us mean it. Less variations in stops and all real stops. *Stop-and-Stay*; this because it is *necessary*."

Now both the "real" stop and the stop-and-proceed indication have been barred from our case. Accordingly our three-position signal must become a two-position indicator (proceed slowly prepared to stop short of train or obstruction, or clear), affording less information than it did formerly. And Mr. Rudd has explicitly advocated supplying the engineman with as much knowledge as possible concerning the track ahead.

But suppose that only the stop and proceed rule is eliminated, and we substitute a "stop-and-stay" indication. What is the result? *Hold* trains where they had paused. And yet we are given to understand in definite terms that the stop and proceed rule works against the expediting of traffic.

Continuing, the article points out that the reason for the *stop* in the regulation criticized, is "because it is presupposed that without it, the second requirement (proceed at slow speed prepared to stop short of train or obstruction) may be disregarded." It is my belief, however, that there are other important factors effective. The stop and proceed rule is superior to the proceed at slow speed indication, for:

1. *It makes unmistakable* the requirement that the engineman bring his train under control. There is a fundamental difference between making a stop and reducing speed. The first is a fact incapable of modification; slackening of speed to an estimated rate per hour is an act in which judgment is an important element, and it is well known to what extent judgment varies with individuals.

2. *It compels* the attention of the train crew to an irregularity in the running of the train.

Furthermore a desirable feature of the stop-and-proceed rule is that it automatically tends to space trains as nearly as is consistent with safety. It is to be questioned if the time consumed by the stop could generally be advantageously utilized. For without the stop the train would commonly close up too quickly upon the preceding unit and would summarily be required to halt.

We have now reduced the issue to the question of what is ordinarily the more desirable place for the stop, at block limits or anywhere within the block. The answer seems unmistakable.

Possibly shortening the length of blocks may sometimes be a better means of accomplishing what Mr. Rudd and every other progressive transportation man is seeking, than would abolition of the stop and proceed rule. The advisability of contracting blocks, however, is dependent upon a variety of factors, and often the presence of special operating conditions is decisive. Moreover, expense of re-installation is not always an incidental consideration.

To my mind the stop and proceed rule is at present the method par excellence of keeping trains moving with a maximum of safety where dense traffic conditions prevail. The three indications now in general use I believe satisfy all the requirements which Mr. Rudd sets forth. In brief, the 45-degree indication keeps a train moving when it is safe, the 90-degree indication stops a train when a stop is necessary. It is the *stay* that is useless. Perhaps I may suggest that it would be interesting to know of a collision in which the stop and proceed rule has been at fault.

Given additional precautions, I will not deny that the proceed at slow speed direction as Mr. Rudd would use it, is worthy of experiment. For example, let the engineman approaching a block which is occupied, reduce speed to a

prescribed rate, at the same time whistling for the attention of the conductor, or preferably a regularly appointed brakeman, of his train: Responsibility might be divided between the engineman and the brakeman for the conduct of the train according to special regulations, from the time of passing the entrance of the occupied block until the passing of the first clear signal. Trainmen would be enjoined to respond to engineman's call, with notice to proceed into occupied block only when satisfied that necessary speed reduction had been effected. Also instructions might provide that such brakemen remain upon car platform ready to communicate at once with engineman if the required caution were not being exercised. A further check would be produced if brakeman noted on a special form the time of passing entrance and end of block, noting whether or not block was found occupied.

Doubtless there are logical objections to such an innovation. Particularly radical would be the responsibility accorded the brakeman. Paramount in importance, however, is the insistence that understanding of signals shall be complete. Not only do those in the engine know what is taking place; they know that the train crew in the rear is bound to watch for any exception in the running of the train.

Assurance of proper signal indication observance increases with the number of observers.

But admittedly this plan is rather clumsy. Nevertheless I do think that these principles, of exchanging understandings, and of giving a larger place to the interest of the crew in the operation of the train, offer profitable material for discussion.

In conclusion let us remark that the stop-then-proceed rule has stood the test of years' experience. Let it stand—stop and think (they go together) then proceed—a good rule always.

C. RADFORD SANDS.

## Signatures to Train Orders

CLEVELAND, Ohio.

TO THE EDITOR:

"Signals keep trains moving." This familiar maxim of one of your advertisers is endorsed by everybody. But there are many roads which have not as many signals as they would like, and so they continue to keep trains moving, as best they can, by dispatchers' orders. The dispatcher's office, however, has many handicaps, which it is desirable to do away with, and the problem how to accomplish that important end continues to agitate progressive minds.

The stopping of trains, especially long and heavy freights and heavy and fast passenger expresses, for the single purpose of receiving train orders is a serious element of cost in the operation of a busy railroad; and the use of train order Form No. 31, with which stops are necessary because of the requirement that the conductor shall sign the order before it can be completed, is subject to increasing criticism. A few roads have for a number of years made almost exclusive use of Form 19, requiring no signature, and have thus greatly reduced the number of train stops, promoting celerity and regularity in the movement of trains, and thereby reducing expenses; while at the same time, a satisfactory degree of safety has been maintained. The practice of these few roads has been commended and academically approved, and the advantages of the exclusive use of Form 19 have been discussed in considerable detail; and yet general practice is not much changed. Conservative railroad officers stick to Form 31—either because they believe that signatures are essential to safety or that the saving in delays is not of much value—and so the advocates of the non-signature form continue to address their arguments to deaf ears. Cannot something be done?

The main points of the argument against Form 31 are

pretty clear; but, as already suggested, not a great many dispatchers (or higher officers either) have got them well fixed in their minds. One fact needing to be emphasized is that the delays necessitated by getting signatures are growing worse, year by year, as very long trains are becoming more common. For a freight train of 85 cars it is impossible to take signatures and make delivery in less than 20 minutes, because the conductor, or someone, must walk the length of the train, either from the caboose to the engine or from the engine to the caboose.

The presence of the conductor in the telegraph office is to be regarded as at least a potential safeguard; and in giving up such safeguard, however small it may seem, the careful officer naturally seeks to assure himself that all other possible safeguards are kept in full force. There are two well-known safeguards which are not yet well enough appreciated: (1) the clearance card, to be given to the conductor in every case, bearing the numbers of all of the orders which he is required to receive at that point; and (2), the "middle order"; the placing of meeting orders at the station at which the trains are ordered to meet each other.

If we rigidly enforce the rule requiring clearance cards, every conductor will be constantly trained in habits of carefulness; and by having the cards numbered by the dispatcher, in the same way that he numbers train orders, lazy operators can be prevented from issuing cards carelessly and then claiming, untruthfully, that the dispatcher's approval had been given.

The middle order is universally approved—"if practicable." Why can we not require it invariably? If east-bound train No. 2 and west-bound train No. 1 are to meet at B, the placing of the order at A for No. 2, at C for No. 1, and at B with the operator, makes a combination of safety which many dispatchers regard as almost absolute. This assumes, of course, that the train-order signal at B is so located as to stop the superior train before its locomotive reaches the switch where the inferior train enters the side track.

These two safeguards are well spoken of by all who have used them; and the success of any propaganda for the more general use of Form 19 would seem to depend on a vigorous campaign for their adoption. To advocate the relaxation of the signature rule only on lines having automatic block signals can hardly be expected to lead to any real advance in practice. To insist on the complete abolition of signatures is also a waste of time, for every dispatcher has cases occasionally where he must work at long range—as when sending an order to a train which is remote from the telegraph or telephone station—and cannot do less than get an acknowledgment in writing. This can be done, however, with Form 19. There is no need of two forms.

DISPATCHER

## Revive the M. M. and M. C. B. Associations

TO THE EDITOR:

In the *Railway Age* of August 20, we read that the Association of Railway Executives has decided that "in view of the imperative need for the exercise of all possible economy, annual or special meetings or conventions of all organizations under the supervision of this body should be indefinitely postponed or curtailed in every possible way." The officers of the Mechanical Division of the A. R. A. evidently decided that a convention would not save the roads what it cost and therefore cancelled it. Now the question arises why not make this decision permanent and abolish the conventions indefinitely?

It has always been my understanding that the meetings

of the Master Mechanics' and Master Car Builders' Associations and their so-called successors, Section III or Division V, were held because the men who attended got enough ideas and inspiration to make the meetings a good business proposition for the roads. The Master Mechanics' and Master Car Builders' conventions were certainly worth while, largely because the members were free to act and were interested in the associations and were able to do big things by free and concerted action. The present organization apparently has become a mere rubber stamp for the higher executives and the members have lost interest in it.

At the time Section III, Mechanical, was formed and affiliated with the American Railway Association it was hoped that it would open a wider field of usefulness and enlarge the work instead of curtailing it. It seems, however, that the merger of the old mechanical associations was one of the big mistakes of federal control. That being the case, why should it be perpetuated? The value of the old associations was generally recognized. Their names meant a great deal to the membership who were strongly opposed to having the associations lose their identity. It is generally believed that one man who had conceived an antipathy for one of the organizations used the Railroad Administration as a tool to kill that association. It is generally understood that the Master Car Builders' Association was forced into the merger and never legally became a party to it because the unanimous vote required for such action was not secured until two officers had resigned.

The two grand old associations now have their identity hidden behind a meaningless number. Interest is waning and the work of the committees seems to lack almost entirely the forward looking, constructive viewpoint that marked the work a few years ago. It is pertinent to inquire whether the present organization has justified its existence. I believe those who have followed the earlier work of the mechanical association will answer in the negative.

Fortunately, the spirit of the Master Mechanics' and Master Car Builders' Associations is still alive. The only way to get results seems to be to revive the old associations. There is no reason why they could not make a working arrangement with the American Railway Association just as the American Railway Engineering Association now co-operates with that body, yet still retains its identity. The old associations would be assured of the loyal support of the former members and with a generous influx of new blood, which the present association has not had since it was formed, they would be in a position to get down to business and tackle the big problems confronting the mechanical department that are so often referred to in your columns, but which Division V, Mechanical has not yet waked up to. Let's show the railroad world that the mechanical department is not made up of a lot of dead ones. Let's have a regular convention on the pier next year, with the electric sign flashing as it did in the old days, "Welcome M. M. and M. C. B."

MECHANICAL ENGINEER.

## Value of College Men to Railroads

Boston, Mass.

TO THE EDITOR:

I have read the letter in the *Railway Age* of August 20, 1921, page 323, by Vice-President Ennes of the Wheeling & Lake Erie, on "Is the College Graduate Properly Equipped for Railroad Work?" From the viewpoint of the college man it appears that the article, while it in general shows more generosity toward college men than they have come to expect from the railroads, admits a lack of progressiveness, on the part of the railroad, which has been shown on the part of other industries and suggests a possible weakness in railroad organization.

Whether or not the college can amend its curriculum in such a way as to turn out a finished transportation product is questionable. That it can teach the fundamental elements of railroading, including transportation, the ultimate object of all railroading, as medicine, law, engineering and the other professions are taught, there is no reasonable doubt. It is a long step from the college campus to the position of a successful physician or surgeon, an eminent lawyer or a competent practicing engineer. Why then should the railroads look to the college for a made-to-order transportation or operating man? Moreover, if it is possible that such a ready-made product could be provided by the college, would it not necessarily be at the expense of curtailment of other fundamental knowledge, which, though not an absolute essential to successful transportation as such, would make for well rounded railroad organization and economic proficiency? Should not the railroads, as other corporations have very largely come to do, place some value on a fundamental knowledge of the component parts of its plant; and by definite policy mold the possessors of such knowledge to the ultimate benefit of the entire plant rather than remain so rigidly devoted to departmental caste?

That, under the present railroad attitude, the young college man, after a total of eight years of school and service, would not ordinarily be as well equipped for the service of transportation as would the young man who, on finishing high school, had entered railroad service as a fireman, brakeman, yard clerk, telegraph operator or kindred occupation, is without doubt very true. But is not this condition to the discredit as well as disadvantage of the railroads rather than an indictment against the college man or the college which trains him? It would seem reasonable to believe that a man having intimate knowledge, both by education and experience, of the requirements and underlying technical and business principles making possible the plant which produces the transportation, would develop into as competent a transportation man as would the one who has no fundamental knowledge of the plant which he operates.

Net revenue is the ultimate object of all railroading. Transportation is the product which produces revenue. To furnish transportation in such a way as to produce *net* revenue is the greatest problem at the present time. Could this not be done more readily by the man, college or self-educated, who is not merely a transportation man, but is a railroad man whose right hand knows what his left hand is doing? That the colleges would gladly do their part in furnishing the raw material for such a railroad man, if the railroads would adopt a definite policy for passing him through the school of experience, and thereby create a demand, is a foregone economic conclusion.

I am still of the opinion that the railroads want college men and that when that desire is felt, with sufficient force, by those officials who direct corporation policies to stir them to co-operation with the colleges, and to recognition of the worth of the college training supplemented by a definitely outlined opportunity for practical training, there will be little complaint "that the college man does not come up to expectations in most cases."

F. E. HANSON.

"CHILD HEALTH SPECIAL" is the name of a train that is touring Canada. It is managed by the Child Welfare Association of Montreal and has received the endorsement of the Provincial Red Cross, McGill University and other organizations. It consists of two coaches, equipped with a child welfare exhibit, consisting of posters, panels and various displays. Parents with babies, and children up to 14 years of age, are invited to attend and to have their children examined, weighed and measured by the professional staff aboard, consisting of physicians, nurses and a social worker.

# What Has Henry Ford Done With the D, T. & I.?

Freight Revenues Have Been Increased About 40 Per Cent, with  
Less Revenue Traffic Movement

HENRY FORD's entrance into the field of steam railway transportation, through his acquisition of the Detroit, Toledo & Ironton, has aroused a more intense public interest than any other single recent event in railroad history, not excepting the advent of federal control at the beginning of 1918. His success as a manufacturer in a field in which, through great ability and highly standardized factory methods, he has built up a vast business, has given him an international reputation such that his opinions on any industrial subject are received with great respect by the public.

Mr. Ford has purchased a railroad which never before had demonstrated that its existence as a common carrier was economically justified. He raised the wages of his railway employees when other roads were adopting reduced wage scales. He has made a 20 per cent reduction in local freight rates and has started a movement for a general rate reduction.

In February, 1921, the D. T. & I. produced an operating deficit of \$104,923. Mr. Ford became president on March 4. In April the road produced a net operating revenue of \$301,675, which has increased steadily for the succeeding three months. Hence, when Mr. Ford was asked, "What is the first thing you would do if you were given all the railroads to run?", and he is said to have replied, "Slash rates, boost wages, let a lot of men go," the connection between cause and effect seems to be established and it is not unnatural that Mr. Ford is credited with having worked a miracle in the transportation world.

But a chronological statement of the facts does not justify belief in so simple a relationship between cause and effect. The most talked of Ford policies such as the new wage scale based on a minimum of \$6 a day, the eight-hour day and six-day week in train service and the abolition of off-line traffic agencies, did not become effective until July 1, 1921, and the reduced freight rates became effective still later. The latest published returns for revenues and expenses are for the month of June, 1921. It is evident, therefore, that these policies have not

been a direct factor in the results on which public opinion has been formed.

These policies and the favorable operating results have been made public by the daily press at the same time, giving the erroneous impression of cause and effect.

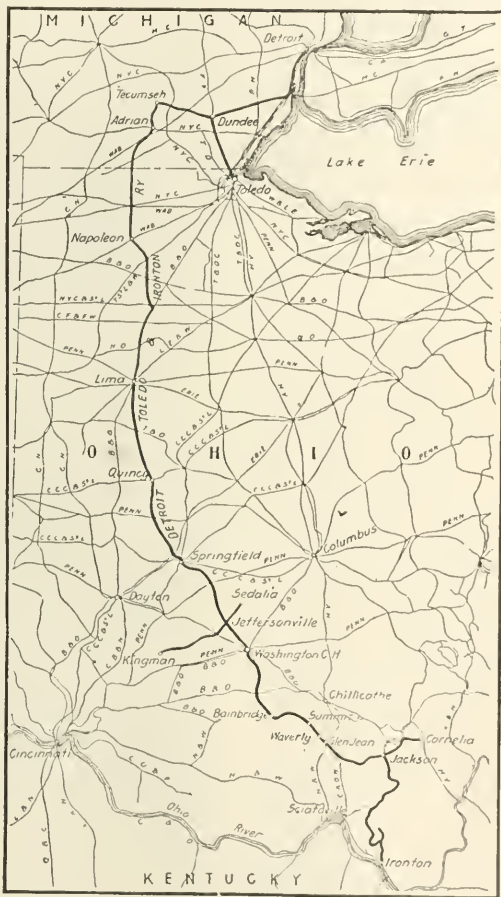

It is not the purpose of this article to speculate on the effect likely to be produced by these policies. Time will make available the facts from which their wisdom may be judged with assurance. With the facts already available, however, it is possible to determine the principal causes for the spectacular improvement in operating results which has so closely followed the assumption of complete control of the railroad by Mr. Ford.

## How Revenues Have Been Increased

From September to December, 1920, inclusive, the Detroit, Toledo & Ironton handled an average of 49,246,000 net ton-miles of revenue freight per month. During this period the freight revenues averaged about \$493,800 a month, giving an average revenue of one cent per revenue ton-mile. During January and February there was a marked falling off in the volume of traffic; the net ton-miles for the latter month scarcely exceeded ten million. In March, following Mr. Ford's accession to the presidency of the road, the traffic movement showed a marked improvement in the face of a pronounced depression on other roads. This increase continued through the months of April and May with a slight falling off in June, which is the latest month for which operating statistics are available. The volume for May, however, is 16.5 per cent below the average for the last four months of 1920.

In April the traffic movement amounted to 31,600,000 revenue ton-miles and freight revenues were \$674,692. The May movement amounted to 41,090,000 revenue ton-miles and the freight revenues for the month were \$721,562. In June revenue ton-miles dropped to 38,589,000 with a freight revenue for the month of \$686,355.

It is evident, therefore, that instead of the one cent per

The Detroit, Toledo & Ironton and Its Connections

ton-mile, received during the last four months of 1920, the D. T. & I. received 2.13 cents in April, 1.76 cents in May and 1.78 cents in June. For the three months the receipts averaged 1.88 cents per ton-mile. During the same period the average revenue per ton-mile for all Class I roads increased only from 1.1 cents to 1.33 cents.

In December, 1920, the Detroit, Toledo & Ironton handled 44,396,000 net ton-miles, for which it received \$470,350. Total operating revenues amounted to \$508,666 and operating expenses to \$686,736, or 134.4 per cent of the total operating revenues. To demonstrate the effect of the increase in revenue per ton-mile on operating results, had these 44,396,000 net ton-miles produced revenue at the same rate as the business handled in June, the freight revenue for the month of December would have amounted to \$790,250 and the total revenues to \$828,550. Instead of 134.4, the operating ratio would then have been 82.5, with no change in operating economy.

### The Traffic Situation

This marked increase in the price received by the railroad for its commodity reflects two conditions. One is a marked increase in the volume of high grade traffic with a simultaneous decrease in the volume of low grade traffic; the other is the strengthened position of the road with respect to through rate divisions.

REVENUE TONS OF FREIGHT HANDLED BY THE D. T. & I., CLASSIFIED BY COMMODITIES

	Net tons loaded and received		
	Average per month, Sept. Oct. and Nov. 1920	April, 1921	May, 1921
Products of agriculture.....	24,271	8,671	7,419
Products of animals.....	986	2,164	2,522
Products of mines.....	308,635	132,374	175,932
Products of forests.....	12,357	9,964	9,973
Manufactures and miscellaneous (total)...	100,662	157,988	232,584
Iron, pig and bloom.....	15,965	9,323	8,524
Bar and sheet iron, structural iron and pipe	8,287	20,920	50,165
Castings, machinery and boilers.....	3,149	15,024	18,554
Chemicals and explosives.....	9,701	3,698	4,724
Arms and auto trucks.....	668	65,691	76,098
Merchandise and l. c. l.....	3,211	4,302	5,813
Other manufactures and miscellaneous....	59,781	39,030	68,706
Total, all commodities.....	446,911	311,161	428,430

One of the tables presents the salient facts relative to the change in the character of the traffic. The large volume of coal traffic moving during the late months of last year has been replaced by a growing volume of high grade semi-finished products and automobiles, largely but not entirely controlled by the Ford Motor Company. At its Highland Park plant alone this company controls a daily movement in and out, of about 300 car loads of freight. Of approximately 6,000 cars a month shipped out of Detroit by all of the Ford industries, more than 5,000 are now being routed via the D. T. & I.

The Detroit, Toledo & Ironton, with its poor location and the meager volume of through traffic originating on its line, had never been in a position to secure what it considered adequate percentages of the through rates in which it participated. The road now has a large and growing volume of high grade traffic at its disposal at a time when traffic is scarce. This complete reversal of conditions undoubtedly is already reflected to some extent in the increased ton-mile revenues, and its complete effect on rate divisions will be a strong factor in maintaining a high average ton-mile revenue when normal business conditions increase the movement of coal and other low grade products.

### Attitude of the New Management

Another factor having more or less effect on the traffic of the D., T. & I. is the purchasing power of the Ford interests. Instances are said to have occurred where Ford Motor Company purchases, either actual or prospective, have been the controlling influence in routing business, other than that

controlled by Mr. Ford, over the rails of the D. T. & I.

While the Ford interests acquired possession of the D. T. & I. in August, 1920, the present management did not assume complete control of the property until March 4, 1921. From that time until July 1, 1921, no marked innovations were inaugurated, although considerable study was given to the operating organization and progress made towards its rearrangement and simplification according to general principles which Mr. Ford believes apply equally as well to railroading as to the conduct of an industry. On July 1 the first real operating innovations, already referred to, went into effect and on July 18 the road filed a freight schedule with the public utilities commission of Ohio providing for a 20 per cent reduction in rates between all points on its own line. None of these changes has been in effect long enough to supply any data relative to their effect on revenues or expenses.

In taking over the active handling of the property Mr. Ford's management has approached the problem with a full appreciation that it has little knowledge of the details of the railroad business and any intention to "show up" other railway managements is disclaimed by it. It is Mr. Ford's belief, however, that through years of development many practices and details of organization have been perpetuated in the railroad business which a close analysis would show to have little to justify them except precedent. Certain records, for instance, once established possible for a special purpose, continue to be compiled long after that purpose has been served and after their usefulness has ceased. In the matter of organization it is his belief that there has been a tendency towards the development of bureaucratic methods with an amount of red tape which tends to stifle the initiative of the man on the ground who is directly responsible for results.

In view of this conception of the situation, a lack of what is commonly termed expert knowledge of the details of the railroad business is considered by Mr. Ford an asset rather than a liability on the part of the new management, which approaches the problems involved in operating the property with a firm conviction that as a business, railroading does not differ essentially from any other industrial venture. The human element is believed to constitute the largest single factor in the operation of a railroad, just as it does in the conduct of an industry, and Mr. Ford believes that the same principles and methods of dealing with men which have led to satisfactory industrial relations in the plants of the Ford Motor Company will produce the same results in dealing with railway employees.

### The Ford Labor Policies

The purpose of the labor policies established by the Ford Motor Company is the development of a stable force of satisfied employees. The advantages of stability with a minimum turnover are generally well recognized. The stability and efficiency of the force depends upon its loyalty; and loyalty, in the opinion of Mr. Ford, is only rightly to be expected from employees who are satisfied with their wages and working conditions.

The policies adopted by the Ford Motor Company with respect to wages and working conditions are founded on the belief that it is better to pay a minimum number of employees a wage high enough to justify the individual in giving to the management his unqualified support and the utmost effort of which he is capable, rather than to spend the same or a larger amount of money to meet a payroll of larger numbers of less satisfied men, who feel justified in giving considerably less than their best efforts. In this connection it is pointed out that the purpose of the restrictive working conditions imposed by labor unions is primarily to increase labor earnings—that they are not an end in themselves. Hence, if the men are satisfied with their wages, these waste-breeding restrictions can be abolished.

These reasons have been considered sufficient to justify the extension of the policies in force in the plants of the Ford Motor Company to the Detroit, Toledo & Ironton. Accordingly, on July 1, instead of putting into effect the reduced wage rates established by the United States Railroad Labor Board, Mr. Ford established the \$6 a day minimum wage scale which had the effect of a general advance in wages. The rates affecting some of the more important classes of employees, compared with those established by the Labor Board, are given in one of the tables. In paying these wages the management has adopted the policy of refusing to hire experienced railroad men who are employed by other roads.

In addition to the increased wage scale, a bonus is to be paid periodically, varying with length of service and rate of pay from \$50 to \$150 a year for employees receiving \$6 a day, and from \$170 to \$270 a year for employees with a rate of \$10.80 a day. The bonus also applies to salaried employees whose salaries do not exceed \$250 a month.

The six-day week with no-train movement from 6 o'clock Saturday night till 6 o'clock Monday morning, except as required by live stock or perishable shipments, has been inaugurated in order that as nearly as possible all employees may have one day of rest in seven, and have it on the same day as men in other lines of work. This has been worked out so that as low as 40 men on the entire line are required to work on Sunday. These include about 10 bill clerks who work a few hours in the morning on shipments received late Saturday, two yard engine crews and the men employed in the operation of joint railroad crossings.

Employees are paid on the basis of eight hours' work per day, 26 days a month, or 208 hours a month. As far as possible, train service employees and others whose duties subject them to call, are laid off at the completion of 208 hours' service, if completed before the end of the month.

During the four months, September to December, 1920, inclusive, after the present railway freight rates were fixed, the D. T. & I. handled an average of 49,246,000 ton-miles of revenue freight per month and had freight earnings averaging \$493,800 a month. In the months of April, May and June, 1921, the road handled an average freight business of 37,093,000 ton-miles a month and earned from it an average of \$694,203 a month. In other words, its average freight business in these three months was *almost 25 per cent less* than in the last four months of 1920, while its average monthly freight earnings were *over 40 per cent greater*.

In reorganizing the forces the central idea has been simplification and the elimination of duplication of effort, closer co-ordination of the different departments and the elimination of as many of the intermediate agencies in the control of the forces as possible. At the time Mr. Ford acquired control of the property in August, 1920, there were 2,723 employees on the road. In March, 1921, the number had been reduced to 1,326. In the rearrangement of runs necessary to provide for the eight-hour day and the six-day week in train service, it was necessary to increase the number of employees. There was also a seasonal increase in the maintenance of way department. There were 1,822 employees in the roll for July.

### Reduction in Maintenance Forces

A classified list of the employees on the road during these three months is shown in one of the tables. It will be noted that the largest decreases were in the maintenance departments. The August, 1920, roll is said to have been about 500 above a normal average, nearly 300 of this number being accounted for in the maintenance of way department, which averaged about 1,000 employees during federal control. The reduction in the number of employees in this department has been effected largely by reducing section gangs to a foreman and two men each, the foreman being required to work with the men. These gangs, however, are not expected to take care of all of the routine maintenance work on their territories the year around, while heavier work is performed with floating gangs of 15 or 20 men which are moved from section to section as conditions require. Considerable work is also accomplished by utilizing the idle

time of such men as crossing watchmen and pumpers on minor track maintenance, such as cutting weeds, repairing road crossings, looking after joint bolts, spikes, etc.

Through the late summer to the end of last year about 3,000 tons of 85-lb. rail was laid on the north end of the line. A considerable amount of 56-lb. and 60-lb. rail further south was replaced with relaying rail, about 200,000

WAGE RATES ON THE D. T. & I., COMPARED WITH LABOR BOARD SCALE

Class of employee	Average daily rates	
	D. T. & I.	Decision 147, U. S. Labor Board
Clerks	\$150—\$225*	\$4.21—\$4.77
Section foremen	6.40—6.80	4.34
Sectionmen	6.00	3.02
Other unskilled laborers	6.00	3.05
Carpenters	7.20	5.03
Crossing flagmen and gatemen	6.00	2.65
Signal maintainers	6.80	5.74
Foremen, mechanical department	220—270*	6.37—9.13
Machinists	7.60	6.18
Boilermakers	7.60	6.25
Blacksmiths	7.20	6.28
Carmen	7.20	5.84
Helpers	6.00—6.40	4.36
Passenger engineers	375*	6.00
Passenger firemen	275*	4.50
Freight engineers	375*	7.05—7.44

Telegraph operators	6.40	4.82

\*Monthly basis for eight-hour day and six-day week.

NUMBER OF EMPLOYEES ON THE D. T. & I. IN AUGUST, 1920, AND MARCH, AND JULY, 1921

	August, 1920	March, 1921	July, 1921
General and accounting	128	135	111
Maintenance of way	1,291	377	646
Mechanical	638	345	466
Station forces	276	210	221
Trainmen	239	167	225
Enginemen	171	122	154
Total	2,723	1,326	1,844

ties were renewed and some ballast inserted. This work was done with three extra gangs of 45 to 60 men each. Since the middle of May this year, four gangs of 15 men each have been renewing ties at the rate of 20,000 a month and putting from 12 to 15 fifty-ton cars of stone ballast a day under the track.

During this same period last year, the Jackson, Ohio, shops averaged a monthly output of four locomotives with heavy repairs. During the past few months with about 60

per cent of last year's force, the output has averaged at the rate of slightly more than four locomotives a month. In comparing the total number of employees in the department during the two periods, however, account must be taken of the fact that an abnormal volume of car repair work was in progress during the earlier period.

### Reorganization of Accounting Department

The accounting department, organized on the divisional system, formerly maintained three offices, one at Jackson, Ohio, the location of the principal repair shops, one at Springfield, Ohio, and one at Detroit, Mich. The work of these three offices has been consolidated successively by moving the Jackson office to Springfield and finally moving the Springfield office to Detroit, where all of the work of the department is now conducted. Centralizing the work of this department has brought to light a number of duplications, the elimination of which has made possible a reduction in the clerical forces from 66 to 50 and the dropping of one supervisor.

All original documents, such as time slips and material slips, are sent direct to the auditor's office for distribution. Instead of making out the usual payrolls, pay checks are made out from the distribution sheets in case of time slips and where time clock cards are used, from them direct. This has made it possible to pay on the fifth of the month following the close of the payroll period, instead of the fifteenth as was the former practice. Also instead of maintaining a rate clerk in the auditor's office to check rates on interline way-bills, this work is now done by the rate clerk in the traffic department, to whom all questions of the correctness of rates or divisions must be referred for settlement in any case. This has saved two rate clerks and a mail boy. In all, 73 monthly reports between the divisional and general offices or between departments, have been found to be duplications and have been eliminated.

### The Station Agent's Opportunity

One of the simplifications of the organization which the new management is developing is the utilization of local station agents in the settlement of freight loss and damage claims. It is believed that the best interests of the road demand that the local agents be among the biggest men in their communities and that all matters affecting the relations of the railroad with the community should be handled by the agent if he is to justify his title. Furthermore, placing this responsibility on the agent is expected to effect a material saving in legal fees, which will be confined as far as possible to cases requiring technical legal advice. It is the belief of the present management that the legal department is too frequently made a dumping ground by other departments for many difficulties which, were they required themselves to settle, they would be more careful to prevent.

Local agents are given complete jurisdiction over their territory. If a small force of car repairers, or an inspector, are employed at an interchange-point where conditions do

not provide enough work to keep them steadily engaged, they are subject to the orders of the agent for warehouse work, or clerical work if they prove adaptable for such duties and as circumstances require.

### No More Off-Line Traffic Agencies

The discontinuance of off-line agencies, effective July 1, is based on the belief of officers of the Ford Motor Company from their own experience, that off-line traffic representatives seldom represent their railroads effectively. Few of such representatives, they believe, have an adequate knowledge of the percentages of through rates accruing to their railroads or of the kind of service their roads can render economically. They are, therefore, neither in a position to serve the best interests of their roads intelligently or to guarantee the performance of the service they will promise

in order to secure the routing of a few car loads of freight over their lines.

Expressing the belief that competition for traffic should aim at the development of a freight movement along natural channels and that solicitation should be based purely on the service which the road can render, the present management proposes to substitute for the frequent calls of a local representative, out of touch with the actual conditions on the property, the less frequent calls of an officer thoroughly conversant with the operation of the road, the class of traffic it is best adapted to handle and the kind of business producing the best revenue—an officer who can represent the company adequately and who knows that the kind of service promised can and will actually be performed. In order to provide close co-operation between the traffic and operating departments, the head of the traffic department has been

made an assistant to the chief operating officer, with duties somewhat similar to those associated with the title of superintendent of transportation.

### OPERATING STATISTICS

Reported by the D. T. & I. January to June, 1920, and 1921, and September to December, 1920

	Passenger miles	Freight miles	Gross ton miles (1,000)	Per cent net to G. T. & I.	Tons per car	Per cent loaded	Gross tons per train	Transportation ex- pense per ton	Transportation ex- pense per train mile (pass. and freight)
1920									
January .....	29,000	56,000	80,102	57.0	42.0	1,422	237,055	\$2.79	
February .....	26,000	54,000	81,542	60.0	40.0	1,510	190,278	\$2.38

\*Some back pay, incidental to the wage award of July 20, 1920, included in this month's accounts.

### What Have the New Policies Accomplished?

There are two distinct possibilities for changes in the net operating return under the new management. The marked improvement in revenues is a matter of business relationships which would not have been essentially different had the D. T. & I. purchased the Ford Motor Company. The effect of the policies of Mr. Ford's management on the cost of operating the property is quite a different matter and must be studied apart from consideration of the revenues. A comprehensive judgment of the effect of the more distinctive Ford policies must await the returns from several months' operation. But the effect of the reductions in the number of employees and changes of organization which have been referred to above should already be reflected in the operating expenses for April, May and June.

Owing to the inability to allocate operating expenses to freight and passenger service and because of the fact that maintenance expenditures over a short period may have little relation to the volume of traffic, it is impossible to compare total operating expenses to determine with any degree of accuracy what effect certain policies may have had on operating costs. A rough comparison of the train mile cost of conducting transportation, however, indicates that there has been a well-defined tendency toward improvement since last October. By referring to the table of operating statistics it will be seen that since October there has been a steady decline in the transportation expense per train mile (passenger and freight) from \$3.01 to \$1.98 in June of this year. This well-marked decrease has been steadily maintained, except for increases in January and March, through a period during which there has been both a sharp decline and a sharp increase in the volume of traffic, and a decrease followed by an increase in the gross tons per train. It is evident that well-defined improvements had been made prior to the time when Mr. Ford assumed active control of the property on March 4, 1921, but the reduction of transportation expense per train mile to \$1.98 in June, as compared with \$2.10 in March and April, 1920, under lower wage scales, marks a distinct accomplishment.

Aside from the effect of the decreased payroll, one of the factors entering into the decreased transportation expense is the fact that a large part of the traffic during recent months has moved over the Northern division, which extends from Detroit to Springfield, Ohio, with a branch from Dundee, Mich., to Toledo, Ohio. During a recent month the total car movement on this division amounted to about 42,000, while that over the Southern division was about 12,400. The greatest improvement in the track has been made on the north end of the line. Furthermore, the nature of the traffic permits the delivery to interchange points of a considerable portion of the movement in train-load lots.

Another important factor is a decrease in unit coal consumption, amounting to about 20 per cent as compared with

the same months last year. This is largely owing to a marked improvement in quality; the freedom from confiscation, generally practiced last year, has also tended to reduce the prices.

The important question with respect to maintenance is not so much the relation of expenditure to volume of traffic as whether or not the property is being currently maintained. An extensive program of track improvement was inaugurated under the former management. J. A. Gordon, the former president of the road, is quoted in the Wall Street Journal to the effect that up to the fall of 1920 most of the 220 miles between Detroit and Springfield, Ohio, was laid with 60-lb. rail over 25 years old. Its rehabilitation to a standard justified by the present prospects of the property has not yet been completed. It is not the policy of the present management to carry out this rehabilitation faster than is justified by the earnings of the property. The railroad must pay its own way.

During 1919 the total maintenance of way expenditures ran at the rate of \$2,490 per mile of line. Last year with a considerable amount of rehabilitation work, they averaged \$4,170 per mile of line, the greater part of which were made after Mr. Ford acquired control. For the four months since Mr. Ford has had active charge of the property, they have run at the rate of \$2,540 a mile per year. Tie renewals and ballasting are being carried on at a rate which, except for that during the last half of last year, is probably a record for the property. Track conditions are improving rather than deteriorating.

Maintenance of equipment expenditures have followed a general course similar to those in the maintenance of way department. A comparison of the Detroit, Toledo & Ironton with all Class I roads shows that the average expenditures for locomotive maintenance have closely approximated the average for all of the Class I roads, indicating a fair average condition. But the expenditures

per unit of freight and passenger car equipment have been decidedly less than the Class I average. Retirements have been especially heavy during the past two years, for, from an ownership of 3,006 freight cars in 1918, the number has now decreased to a total of only about 1,700 in revenue service.

During the four months of the current year since March 1, the expenditures for maintenance of equipment were \$334,479; during the same period of 1920 the amount was \$317,836. During the last four months of 1920 maintenance of equipment expenditures aggregated \$46,314. Here again Mr. Ford has the benefit of an intensive maintenance program of several months' duration, particularly with respect to cars, carried out by the former management, but the amount of work being obtained for the present expenditures is probably meeting current requirements.

While these general conclusions can be drawn on the basis of the data available, no adequate comparison of the effectiveness of maintenance expenditures can be drawn until the

The facts show that under the Ford management the financial results of the Detroit, Toledo & Ironton have been very greatly improved. They also show that no miracle has been worked. The results obtained thus far have been due almost entirely to the circumstance that the ownership of the Detroit, Toledo & Ironton has been acquired by one of the largest manufacturers in the country, and that Mr. Ford has used his position as a very large shipper in the country to do things on the D. T. & I. which neither he nor anybody else could have done without being such a large shipper. \* \* \* Furthermore, the management of the D. T. & I., in common with all the other railways, was able, partly because of the smaller traffic handled by it and partly owing to other causes, to make large reductions in its operating expenses.

maintenance programs of the present management have reached a current level, free from the disturbing influence of much needed rehabilitation.

Traffic expenses during the four months of Mr. Ford's management averaged \$6,942 monthly, as compared with \$8,469 during the last four months of 1920. General expense decreased to an average of \$16,997 a month from \$20,493 a month during the same periods.

### Extent of Improvements in Operating Expenses

Again applying the conditions created by Mr. Ford's management to the operations of the month of December, 1920, a rough idea may be obtained as to the effects on the operating ratio of the operating economies effected by Mr. Ford. An estimate of the effect of the improvement in operating expenses is shown in one of the tables. No allowance has been made for decreased maintenance expenditures, as the present operation of the property is undoubtedly benefiting from the comparatively heavy maintenance program in progress at the close of the year and it is impossible to estimate with any degree of accuracy the extent to which productive efficiency in the maintenance department has increased. Transportation expense is estimated on the basis of June conditions and the reductions in traffic and general expenses, as reflected in the March to June average, are taken at their face value.

OPERATING EXPENSE RATES UNDER THE FORD MANAGEMENT APPLIED TO DECEMBER, 1920, OPERATIONS OF THE D. T. & I.

	Actual	Estimated
Maintenance of way and structures.....	\$185,354	\$185,354
Maintenance of equipment.....	244,676	244,676
Traffic expense.....	8,908	6,942*
Transportation expense.....	224,183	178,200*
General expense.....	20,706	16,997*
Total.....	\$683,827	\$632,169
Revenues.....	508,666	508,666
Operating ratio.....	134	124

\*Four months' average, March to June, 1921, inclusive.  
 †90,000 passenger and freight train miles at \$1.98 per mile.

On this basis credit may be given to the new management for a decrease in the operating ratio from 134 per cent to 124 per cent, without any allowance for legitimate decreases in maintenance expenses of uncertain amount.

### The Public Service of the D. T. & I.

The D. T. & I. has been called a plant facility of the Ford industries in and around Detroit, rather than a common carrier. It is this relationship in a large measure which has made possible the immediate financial success of Mr. Ford's management. The D. T. & I. has always lacked certain essential features of a common carrier. In the first place, it has no terminals in the city of Detroit, the one point on the line offering a large volume of traffic. The service of such terminals cannot be dispensed with although the investment required to provide them is a burden on the remainder of the properties. Mr. Ford's ownership of the D. T. & I. has not provided the city of Detroit with any additional terminal facilities; it has made possible the diversion of traffic to other channels of main line movement.

Again, many of the through routes in which the D. T. & I. is now participating are not the most direct routes. In each case, however, even where the haul exceeds the direct route as much as 100 to 300 miles, a much quicker delivery is claimed. It has been stated this improvement has reduced the average time in transit for the Ford Motor Company from three weeks to two weeks, thereby reducing inventories by approximately \$22,000,000. Typical of the measures by which this has been accomplished is the demand of the D. T. & I. on its connections that transfer tracks must be pulled within 20 minutes of the time of the D. T. & I. delivery. The delivery of traffic in many cases in train load lots is a factor in securing favorable action from connections. It must be remembered that this improved service is being obtained at a time when no road is suffering from congestion.

### The General Application of Ford's Methods

Mr. Ford has applied business methods to his own combined industrial and railroad problem with results mutually advantageous to both businesses. But what is enriching the D. T. & I. has formerly gone into the pockets of competing roads. To the extent that he has been able to increase the intensity with which the D. T. & I. property is utilized, other roads have become idle. Mr. Ford has reduced local rates on the D. T. & I. But a comparatively small proportion of the D. T. & I. traffic originates and terminates on its own line. It is estimated that 60 per cent of the present traffic of the road is controlled by the Ford Motor Company, little of which originates or terminates on its own rails.

Mr. Ford has started a movement for a general rate reduction of 20 per cent, contending that lower rates will do much to stimulate business. The freight bills of the Ford industries are estimated to aggregate from \$15,000,000 to \$20,000,000 a year. At the rate maintained in April, May and June the freight revenues of the D. T. & I. will aggregate \$8,000,000 a year. Although Mr. Ford is said to have been unaware of the obvious effect of this fact until it was called to his attention, it insures him against the consequences of his act in case it should fail to effect the improvement in railroad conditions which he expects.

Consideration of these facts does not encourage the belief that Mr. Ford has discovered a panacea for all railroad ills. His operating policies, however, have so far been marked with a degree of success sufficient to justify the railroad world in watching their continued progress with an open mind. Time alone will demonstrate their wisdom, or otherwise. If they are successful the entire railway industry will profit therefrom; if they fail, the loss will be Mr. Ford's. But in measuring their results, the marked effect on revenues of the business relationship between Mr. Ford the shipper and Mr. Ford the railroad man must be kept clearly in mind.

# Virginian Builds Double Track to Relieve Congestion

Steep Grades and Sharp Curves in  
Mountainous Region Necessitate  
Heavy Construction

*Rounding One of the Many Curves in the Way to Tidewater*

THE VIRGINIAN RAILWAY now has under construction a second track between Elmore, W. Va., and Algonquin or Clark's Gap as it is more commonly called, to relieve the congestion of this section of about 15.5 miles of heavy grades and sharp curvature through the mountains lying to the west of Princeton, W. Va., which section was limiting the capacity of the road. This work has been carried out in three stages, two of which have now been completed, while the third and heaviest, started in 1918, is now nearing completion. The double-tracking of this last section, which totals approximately five miles of line on a grade of 2.07 per cent compensated for curvature includes the widening of five tunnels, and the reconstruction of an equal number of high steel viaducts for an additional track. As this work was carried on under many difficulties, construction methods were developed which are more or less unusual, chief among which is the manner in which a steel shield was developed and utilized in the driving of the tunnel headings for the second track.

The Virginian operates 442 miles of main line between

track line with its heavy grade has proved a serious hindrance to the expansion of the road's business. All eastbound loaded cars from both the main line west of Elmore and the Winding Gulf branch, as well as west-bound empties destined for the coal mines, are received at Elmore yard where they are made up into trains and dispatched. An average of from six to seven heavy "drags" in addition to local and merchandise freights and two passenger trains are dispatched

Profile of a Typical Section of the Clark's Gap Work

Deepwater, W. Va., and tidewater at Sewalls Point near Norfolk, Va., as well as a considerable mileage of branch lines in the section of West Virginia between Deepwater and Elmore. Its traffic consists almost entirely of coal originating in this section.

As the main characteristic of the Virginian's method of operation is its heavy train loading, as described in the *Railway Age* of May 27, page 1201, this section of single

eastward over Clark's Gap hill daily with approximately the same number of trains moving west.

The eastbound coal trains contain from 70 to 80 cars. These are hauled up the mountain to the summit at Clark's Gap by one 2-6-6-0 Mallet at the head end and two 2-10-10-2 Mallets, cut in as helpers, which are released at the summit and return to Elmore. The run up this hill usually takes from 1½ to 2 hrs. for these heavy drags, mak-

ing a slow eastbound movement out of the yard. The return of the helpers further complicates the operating problem, since it adds to the number of west bound movements.

It was in anticipation of the problems that would be imposed by such a traffic that the Virginian started to double track this Elmore-Clark's Gap section several years ago. To date a second track has been completed and is in operation between the junction of the Winding Gulf branch with the main line a short distance west of Elmore and a point about

Setting Up the Concrete Plant at the Micajah Tunnel

two miles east of Herndon, a distance of about 9 miles, as well as between the east end of the Micajah tunnel and the west end of Clark's Gap tunnel, a distance of  $2\frac{1}{2}$  miles. The work of widening the tunnels for second track on the remaining section has been completed except for a short section at one end of the Clark's Gap tunnel where the removal of the bench has not been entirely finished. Track has either been laid or is being laid on the remainder of the work and it is expected that the entire section of double track will be in operation within a short time. Automatic

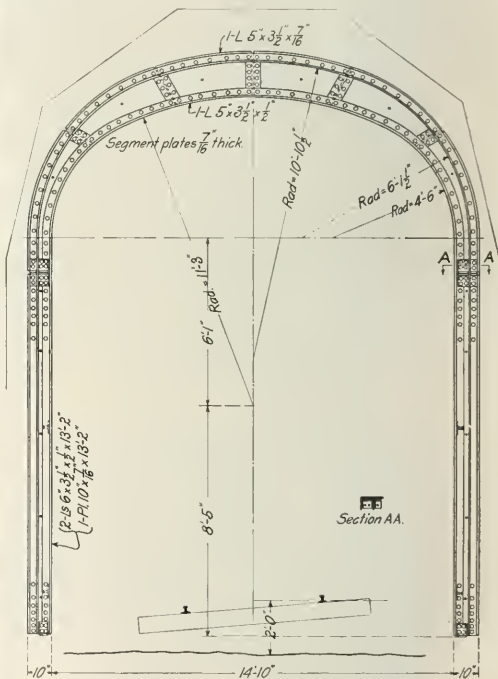

A Pair of the Tunnel Shield Arches Before Applying the Lagging

block signals are being installed between Elmore and Algonquin as a further aid to the movement of traffic over this section.

The work on the lower end, i. e., that part which has been finished between Elmore and Herndon was comparatively light and while it contained a few high trestles and heavy cuts and fills it did not begin to approach in magnitude the remainder of the work on Clark's Gap hill. On this upper section there are five steel viaducts ranging in height from

125 ft. to 150 ft. and with an aggregate length of 2,853 ft.; five tunnels with an aggregate length of 3,680 ft.; one rock fill 110 ft. in height and an almost constant succession of heavy cuts and fills varying in depth or height from 25 ft. to 60 ft. The curves are very sharp and have all been spiralled. The effect of the topography of this country on the alignment is well shown by the fact that in all cases but one the tunnels, either in whole or in part, are on curves most of which are 10 deg. and 12 deg.

In two instances high viaducts lead directly to the portals of the tunnels and this condition was the chief factor in the decision to widen the existing tunnels rather than to drive separate bores. The viaducts had been constructed for double track originally, although only two lines of girders had been placed to carry a single track. This imposed a limiting condition upon the distance which the tracks could be spread

The Frame for the Steel Tunnel Shield

without undue cost of building new viaducts to fit the alignment necessary for separate tunnels. While studies were made covering the construction of double track by using separate tunnels it was finally decided to widen the original ones and use the viaducts as they were.

The five tunnels to be widened vary in length from 347 ft. to 1,252 ft. and are all through rock which is chiefly shale or hard sandstone stratified and often underlain or intermixed with slate and coal seams. It was of course essential to maintain uninterrupted traffic and as the rock required blasting it then became necessary to provide some form of shield to prevent rock, old lining or miscellaneous construction and other materials from falling down or working out on the line. To meet this requirement a sectional shield was developed which could be set up inside the old tunnel without any changes in or disturbance to the old lining and which could be moved ahead quickly as the work progressed. Each section of the shield consisted of two arched ribs

fastened four feet apart and supported by light steel posts. Each arch rib was built up by riveting steel plates, cut to shape, to steel angle bars bent to the desired radii as shown in the drawing. The total inside width is 14 ft. 10 in. and the maximum overhead clearance is about 18 ft. 2 in. from top of rail. The lagging, consisting of 4-in. by 8-in. plank-cut into 4 ft. lengths is bolted to the ribs, thus making unit sections 4 ft. long and completely enclosed over the top and sides.

The old tunnels, which were timber lined, had a clear width inside of 18 ft. and an overhead clearance of 21 ft. 6 in. from top of rail, while the double track tunnel gives a clear width on curves of 32 ft. and on tangents of 30 ft. 6

One of the Many Heavy Cuts Which Had to Be Widened

in. and an overhead clearance of about 24 ft. from the top of rail. The design is that of a three-centered arch of reinforced concrete with a minimum thickness of 2 ft. 2 in., backed up with the usual timber lining consisting of 12-in. by 12-in. posts supporting 12-in. by 12-in. ribs and completely enclosed by 3-in. lagging on the sides and 4-in. over the top. Thus in order to obtain the necessary clearance from the center line of the existing track it was necessary to excavate about 2 ft. of the side wall of the tunnel beyond the limit of its old lining on one side while the remainder of the necessary width for double track was secured by excavation on the opposite side of the center line.

In carrying out the actual work of widening a tunnel, 15 of these steel sections were erected by the aid of a hand derrick mounted on a flat car, inside the regular lining of the old bore. This gave a length of 60 ft. over which the work could be carried on with complete protection to the operating track beneath. With the protective shield in place, the driving of a heading of the necessary double track width was started. On this work the heading was driven through for the entire length of the tunnel before any work was started on the removal of the bench. This plan was followed in order that the excavated material could be hauled out in the most economical way. The work of removing the 2 ft. section on one side, the section over the top of the old arch and approximately 18 ft. on the second track side was carried on simultaneously.

Air drills were used for this work, the lighter or hand-type being employed in preference to the tripod type. From four to six were in operation on each heading. As the rock was very hard in most cases, the material was blasted out, after which it was loaded into narrow-gage dump cars which were operated over a track laid along the bench as excavated. A platform was constructed at the portal on which the cars could be run and their contents were trapped into standard-gage cars. On an average about 22½ cu. yd. of material was removed per lineal ft. of tunnel. Of this about 13 cu.

yd. was from the heading, including the small section on one side and 9½ cu. yd. from the bench. Progress at times was exceedingly slow, long stretches being excavated at a rate of not over one lineal foot per day.

As the removal of the heading was accomplished, the new timbering was erected and one or more sections of the shield moved ahead, the face of the heading being kept approximately three sections behind the forward end of the shield. With the heading driven through, the bench was broken or shaken up by blasting where needed and the material removed with a steam shovel which unloaded it into air dump cars operating on the main line between regular trains. The cuts along the line were widened by blasting where necessary and the material removed with steam shovels and standard-gage dump cars. All the material excavated from the cuts and tunnels, amounting to about 250,000 cu. yd., was used in widening fills for the double track.

The compressed air to operate the various tools as well as the necessary current for the lighting equipment used in the tunnel work and at the camps was furnished by two separate compressor and electric lighting installations, one located to handle the work at the upper end including the Clark's Gap tunnel and a shorter one nearby, and the other to supply the equipment at the Micajah tunnel and two others at the lower end of the work. Air was supplied through a 4-in. main from each of these plant installations, the maximum length of pipe being approximately 1¼ miles.

Three of the tunnels have been lined with concrete and the portals finished while the work of pouring the remaining two at Clark's Gap and Micajah is now under way. Two separate concrete plants have been set up to supply the material for the work at Micajah and at Clark's Gap. Each of these plants has a one-yard mixer and is completely equipped with derricks and cranes to handle the raw material and the mixed product. The concrete for pouring is discharged by the mixer into clamshell buckets which are

The Way the Concrete for the Portals Was Handled

picked up and unloaded on a scaffold car. About two cubic yards are carried into the tunnel at each trip of the scaffold car where it is placed in the forms by hand shoveling after which it is well rammed into the space between the ribs and against the underside of the lagging. The concrete is reinforced with 78-in. rods placed both vertically and horizontally. Locomotive cranes are used for conveying and depositing the material in the forms for the portals, handling the buckets direct from the mixer to the forms.

The work of adding the second track on the viaducts involved no particular difficulties but in some instances called

for careful planning and fast work. Where the old line followed one side of the trestle it was only necessary to place two new lines of girders and lay the decking and rails. In two instances where the old track was located on the center line of the viaduct new girders were placed on each side and connected up. An entire new set of bridge timbers was then cut and framed complete for insertion after which the old track was quickly torn out, the new timbers laid and the track made ready for traffic. In working in this manner there was little or no delay to trains. The new second track is being laid chiefly with 130-lb. rail, a substantial increase over the 100-lb. rail ordinarily used in this section.

The work of double tracking Clark's Gap Hill has been

One of the Few Stretches of Tangent

planned by and the construction has been carried out under the direction of the engineering department of the Virginian Railway, H. Fernstrom, chief engineer; A. M. Traugott, assistant chief engineer, and J. C. Guion, resident engineer in direct charge of the work in the field. The contractors on this work are J. V. Boxley & Co. and Boxley, Goodwin & Bray, subsidiary companies of W. W. Boxley & Co., Roanoke, Va., to whom the original contract was let.

## The Purchase, Inspection and Distribution of Cross Ties \*

PRIOR TO THE RETURN of the railroads to their owners on March 1, 1920, some of them had started toward normalcy in the procurement of their cross-ties by making tentative arrangements along the lines of their former methods of purchase. In not a few instances the practice established during federal control of dealing direct with any producers of ties along a railroad was continued where it had not been in vogue before 1918. All railroads which adopted the sight-draft method of paying for ties during 1918-1919 continued the practice. Most railroads which learned during the war that their local production could be stimulated persisted in keeping in touch with the supply along their lines. Some railroads which got the habit of co-operation while the government insisted on it, found it possible to acquire ties of the groups they did not desire and to transfer them together with their surplus production, to roads which used such ties, and which in return did not compete with the local road for any ties produced along its lines.

Cross-tie buying became normal soon after March 1, 1920, and the strenuous competition which developed in certain

fields during the summer resulted in exorbitant prices. It is now seen, even by the producers who profited thereby, that the prices paid were the result of ruinous competition, were not justified, and were not good for the tie industry. A central purchasing agency could prevent a repetition of this vicious competition for ties among railroads, but the committee regards such an agency as impracticable. It believes that the sentiment against unwise competition is developing steadily and that 1920 saw less of it than might have been expected from past performances under similar conditions of supply and demand.

As practices of general application which have been tried under conditions of control and of freedom, the committee recommends the adoption of the following:

That each railroad adopt all means compatible with its conditions and organization to procure along its own lines as large a portion of its tie requirements as possible.

That each railroad adopt a method of paying cash for its ties, as a means for maintaining production at a maximum.

That each railroad along which ties in excess of its own requirements are produced endeavor to make arrangements with railroads needing such ties for their sale and shipment under conditions which will be mutually satisfactory.

That all railroads purchase cross-ties under the uniform requirements of the standard specification for cross-ties of the American Railway Engineering Association.

The preservative treatment of wood to prevent decay yearly becomes a more important factor in the economical maintenance of railroads. This is especially true in cross-ties.

During 1920 there was less than the usual variation in the inspection of cross-ties by competing railroads. This was undoubtedly the result of the marked change in the manufacture of ties which resulted from nearly two years of adherence to a uniform standard applied everywhere quite consistently. The full benefits of a standard specification are not to be had if the specification ceases to be a standard through lack of uniformity in the application of its requirements by inspectors.

This committee is aware of a well-defined conviction in the minds of some members that only by an American Railway Association control of the inspection of forest products purchased by railroads can the disadvantages to all concerned of the present competitive system be avoided. Undoubtedly a central supervision of inspection would result in greater uniformity in practice, in lower costs through fuller use of fewer inspectors, and in more prompt service for the shippers, and the committee can advance no valid argument against the creation of a Bureau of Forest Products in the American Railway Association, charged with the supervision of inspection and the dissemination of information of value to members in connection with the purchase and storage of forest products, but the committee feels that it is unfair to railroads generally to assume that practical uniformity in cross-tie procurement cannot be had prior to a trial under the new conditions brought about through the existence of a standard specification worked out and adopted by an independent railroad association and agreed to and adopted in all essential respects by the producers' association.

The report is signed by J. H. Waterman (chairman) Chicago, Burlington & Quincy; John Foley, Pennsylvania System; G. H. Jenkins, Grand Trunk, and A. H. Young, Seaboard Air Line.

A minority report, signed by M. J. Collins, Atchison, Topeka & Santa Fe, stated in effect that while there was much in the committee's report that would be of value to roads which had not already developed their own specifications and methods, he did not believe that the Atchison, Topeka & Santa Fe would be benefited by changing from its present specifications and that he could not, therefore, concur in the report as a whole.

\*Abstract of a report presented at the meeting of the Purchases and Stores Section, American Railway Association, at Chicago, June 9, 10 and 11, 1921.

# The Grain Rate Hearings Are Concluded

## Final Argument Before I. C. C.—Relation of Rates and Wages Receives Much Attention

WASHINGTON, D. C.

**H**EARINGS before Commissioner Lewis of the Interstate Commerce Commission on the application of the Western state commissions for a general reduction in the rates on grain, grain products and hay in Western territory were concluded on September 1 and oral arguments were made on September 2 and 3. A number of the other commissioners sat during the hearing of testimony and the argument was held before the full commission. Arguments for the complainants were made by J. E. Benton, solicitor for the National Association of Railway and Utilities Commissioners; Clifford Thorne, representing the American Farm Bureau Federation, and C. M. Reed, chairman of the Kansas Public Utilities Commission, while the railroads were represented by R. H. Widdicombe of the Chicago & North Western and J. N. Davis of the Chicago, Milwaukee & St. Paul.

### J. E. Benton Speaks for Railway and Utilities Commissioners

Mr. Benton argued that the rates on grain as made by the railroads had always been disproportionate to the rates on other commodities and that the relationship of grain rates to other rates has not been greatly changed. This disproportion has been greatly increased, he said, by the increase in the rates on grain at the same time that the farmer's costs have been greatly increased and his prices have fallen. The farmers receive only a small return for their labor and no return on their land, while the railroads ought to encourage the development of agriculture.

Mr. Benton also contended that the commission is free to make reasonable rates in spite of Section 15-a of the Transportation Act, which, he said, does not require a particular percentage of return under all circumstances and at all times because that is impossible. The law merely requires the commission to aim at that percentage "as nearly as may be within the bounds of reason." He thought the reduction in rates would operate as a conservation of revenues rather than tend to reduce them, but in any event it is the commission's duty to reduce them if unreasonable. The railroads have been allowed in the past to earn hundreds of millions of surplus to tide them over such periods of depression.

Two factors entering into the reasonableness of the rates, Mr. Benton said, have changed. The value of the product has been cut in two and consequently one element in the cost to the carriers, the risk of loss and damage claims, has also been reduced. Mr. Benton devoted some time to his argument that the commission is not bound by the action of the Railroad Labor Board, saying that it is its duty to fix reasonable rates regardless of whether wages may be unreasonably high. Neither board, he said, can be bound by the action of the other, although each must give due weight to the findings of the other.

Commissioners Potter and Daniels asked if the commission is not entitled to consider the expenses of operation in fixing rates. Mr. Benton said the commission should not be bound by anything that shocks its sense of justice and neither board should consider the findings of the other as necessarily final, although the findings of either board would only be persuasive. If an order of the commission should require the carriers to make a new request for wage reduction, they would have an opportunity to make such application in view of the new conditions, and if the commission proceeds on the theory that the Labor Board can

make proper orders it can decide rate cases properly. He admitted that if both parties proceeded independently the result might be a miscarriage of justice, but said that it was not to be presumed that they would act in that way. The legal presumption is that a miscarriage of justice will not occur, but that the decision of the two boards will be consistent. Therefore, the commission must form its own judgment as to whether the wages are proper in deciding what are reasonable rates.

Mr. Benton said that shippers were barred from appearing before the Labor Board, which must form its own conclusion as to the amount the carriers should receive from the shippers, whereas the commission has to decide the amount the shippers must pay the carriers and should form its own judgment as to what wages are proper. The carriers, he said, have been subjected by the law to this double standard and the event must prove whether the machinery created by law will work properly.

Commissioner Daniels asked whether the commission was bound by the effect on wages of the Adamson law. Mr. Benton replied in the affirmative on the ground that the commission is bound by the act of Congress, but not by that of a co-ordinate board. Commissioner Potter asked if the commission had a right to reduce rates on the basis of its own conclusion that wages are too high, without hearing the side of labor. To this Mr. Benton replied in the affirmative.

### Clifford Thorne Represents the Farmers

Clifford Thorne said that after each war there has been a substantial decline in prices, which each industry naturally resists. In the past year there has been an unusually precipitous decline in prices, but the agricultural industry was the weakest in resisting declines and its prices have been reduced to pre-war levels, while the railroads have been the strongest in resisting such declines and their freight rates are higher than ever before. The result has been the creation of a panic condition in the agricultural industry, the bulk of which is on the verge of bankruptcy. It is up to the industry, he said, to get its costs down and he did not claim that transportation was the only cost to be considered, but said that it is one of the most important and one which is properly to be presented to the commission.

Mr. Thorne said that the railroads take the position that no reduction in rates can be made without a reduction in wages and that the general economic situation is not an issue to be decided by the commission, but the ability of the shippers to pay is not among the things named in the law which the Labor Board is to consider in fixing wages. He asked whether the result was to be that the government should shield one industry from a development which is being demanded of every other line of business. Mr. Thorne also argued that the 5 1/2 per cent provision of the law is qualified by a proviso giving the commission latitude to prescribe reasonable rates in particular cases.

In conclusion, Mr. Thorne said he wished to submit a proposition to labor and a question to the railroads, in the hope that it might point to a solution. "We are confronted with a dilemma," he said, "because the conditions in the agricultural industry are intolerable and yet the railroads claim they cannot consent to any reduction in rates without a reduction in wages. On the other hand, railroad labor is thoroughly opposed to any reduction in wages." He

lieved that railroad labor might probably oppose any further decrease in wages that would go to the railroad corporations, but he would like to ask what would be its attitude if assured that the entire wage decrease would accrue to the farmer, and he asked, whether if railroad labor should consent to a reduction in wages for the specific purpose of reducing rates on grain, the railroads would consent to the reduction. He pointed out that a 5 per cent reduction in wages on the Western roads would amount approximately to the estimated amount of a 25 per cent reduction in the grain rates, or about \$63,000,000.

In reply to questions by the commissioners, Mr. Thorne said that for the purpose of this proceeding he believed the inquiry should be confined to grain in the Western districts, but if it appears acceptable it could well be enlarged to include livestock and cover the nation. A 7½ per cent reduction in wages, he said, would permit a 25 per cent reduction in the rates on these basic food commodities.

Glenn E. Plumb, who was sitting in the audience, was observed to smile slightly as Mr. Thorne asked his question, but the railroad counsel made no reference to it in their arguments, which followed those of Mr. Thorne. In his closing argument Mr. Thorne returned to the subject, saying that the failure of the railroad counsel to reply to his question laid the foundation for further argument on his part. Asked whether labor had made any reply, Mr. Thorne said he had submitted his proposition to a representative of the labor organizations, who had promised to submit it to his associates. He also said that during the noon hour a vice-president of a prominent Western road had said he would agree to it. Mr. Thorne then made the point that the carriers refrained from answering his question, although it would not affect their net earnings, and added that labor has also refrained from answering it, but that it has really had no opportunity to do so. Commissioner McChord asked why Mr. Thorne criticized the carriers for not answering a mere suggestion on his part when it was hardly to be expected that their counsel would be in a position to answer it, and Commissioner Aitchison asked if they were not there for the purpose of meeting the particular issues in the case.

### The Railroad's Argument

R. H. Widdicombe, in the opening argument for the railroads, said that the difficulty of the producers lies in the fall in the price of grain. There was no complaint, he said, of the grain rates while the farmer was getting what he thought his wheat was worth. The evidence in this case, he said, shows that a reduction in the rates will not increase the movement of the traffic and that the effect on the acreage to be planted next year is purely speculative. The acreage in past years has fluctuated at times when rates were stationary, because it was governed by supply and demand. The reason for the low price of wheat is the lessened demand for it in Europe. Mr. Widdicombe said that what the farmer needs most right now is to be let alone. If he is, he said, he will come out all right. Commissioner Aitchison asked who is bothering the farmer now. Mr. Widdicombe said he meant that the papers the farmers read are overflowing with statements that rates are too high and should be reduced, and that the farmer has been led by such reasoning to believe that a reduction in freight rates would be a remedy for his troubles.

To reduce freight rates on grain, grain products and hay without a reduction in operating expenses would be "disastrous" to the railroads of the United States in view of their present financial condition and would throw "many if not a majority of the western carriers into bankruptcy," while no substantial relief would be afforded the farmers. J. N. Davis, assistant general solicitor of the Chicago, Mil-

waukee & St. Paul, told the commission. Mr. Davis said that if the question of rates is left to traffic officials the problems confronting the farmer will shortly be solved. Mr. Davis said in part:

"The evidence of the railroads shows that at the present time the rate of return to western carriers on freight is but 2.54 per cent, and on passenger 3.43 per cent, or 2.78 per cent total. This per cent is regardless of any question with reference to deferred maintenance or consideration of any saving in operating expenses by the recent wage reduction by the Labor Board. If consideration is given to deferred maintenance and the reduction of operating costs by reason of the Labor Board's decision, the percentage on investment would be 1.15. If consideration is not given to deferred maintenance and only consideration is given to the amount that would be saved in operating expenses by reason of the wage reduction, this percentage would be 3.5.

"Without consideration of deferred maintenance, there was a net for all roads operating in the western district under consideration of 42 million, and if consideration was given to the maintenance that had been deferred and not performed, this 42 million would be wiped out completely.

"The operating ratio for the lines in the western district for the year 1921 was 95.04, which shows conclusively an unhealthy condition, financially speaking of the roads here under consideration.

"These figures conclusively prove, we believe, that there can be no general reduction in the rates. And we believe that there is no one that will contend that under the present conditions, under which the railroads operate, there could be a general reduction in rates.

"There is no evidence to prove that the rates on these commodities are unreasonable, but the carriers have shown that the rates are not unreasonably high.

"Witnesses have also shown that the benefit to the farmer would run from \$8 to \$56 per farmer per annum. No one will contend that this is a substantial aid to the farmer in his present condition, but a 25 per cent reduction in those rates would mean an annual loss in revenues of over \$63,000,000 to the carriers in the western district alone and would cut their annual net return to 1.42 per cent in their tentative valuation as fixed by the Interstate Commerce Commission. Not only would this reduction be disastrous to the roads as a whole, but it would operate to put many if not a majority of the carriers in the western district into the hands of receivers.

"It is contended that a bushel of grain today will not purchase as much transportation as it did in former years, especially prior to the war. This is obvious because of the decline in the price of grain and the increase in freight rates. But, what commodity is not in relatively the same situation as is grain. If what the complainants contend is a justification for a reduction in the rates on grain and grain products, the same would hold equally true in most any other commodity moving in volume.

"They evidently overlook the fact that the railroad dollar does not go as far now as it did prior to the war. Also evidently they overlook the fact that during practically the entire war period their dollar went materially further than did the railroad dollar.

"There are other seats of trouble confronting the farmer than freight rates, that if properly adjusted in relation to the farmers' condition at this time would give some relief.

"We feel that we are not called upon to point out that there rests no power with this commission to reduce rates to enhance the profits of shippers if such rates are not shown to be unreasonable. This of course is the law. The Transportation Act does not delegate such power to the commission, and we know of no case wherein the commission has decided that it would so make rates. The carriers' revenues, as is shown by the evidence in this case, are now inadequate,

and what revenues the carriers receive should not now be diverted to assist an industry.

"The question has been propounded by opposing counsel as to whether the railroads should not forego the 5½ per cent contemplated by the Transportation Act, and give a helping hand to the industry. It is quite obvious that the railroads should not.

"The transportation system not only has its rates regulated, but a major portion of its operating expenses regulated, by governmental agencies, and in no case under the present law can the transportation company earn for itself a greater return than 5½ per cent. Regardless of whether it be a fat year or a lean year this 5½ per cent applies.

"With the farmer no such regulations exist. He can often recoup and offset that which he has lost in the lean year by what he may make in the fat year.

"For this reason alone we believe that the transportation system should not be asked to forego its just earnings to lend aid and help to any industry, whether it be agriculture or otherwise.

"The carriers are not unmindful of the conditions that now exist in the agricultural industry and the traffic manager is wide-awake to the situation, and is not only capable

of dealing with the situation as it exists, but will see that the interest of his company as well as the interest of those patrons of his road are not neglected.

"One of the disturbing elements in this case is one that is wholly beyond the railroads' control. It is a fact that cannot be disputed that the freight rate must necessarily have a direct relationship with the operating expenses, and unless the operating expenses can be curtailed or reduced there is no way that we know of by which rates can be reduced. And when operating expenses are considered it at once is shown that the major portion of the operating expenses of any transportation company is wages.

"This operating expense is by Congress delegated to the Labor Board. At the same time Congress has delegated the regulation of the rates that the transportation companies should receive for the service performed to the Interstate Commerce Commission. We thus have the rates that we are to receive regulated by one governmental body, while the major portion of the operating expense, namely wages, is regulated by another and different governmental body. And it seems to be obvious that a reduction in the rates cannot possibly be made without a reduction in the operating expense."

## Pennsylvania Officer Outlines New Labor Policy

Elisha Lee, Vice-President, Sketches the Gist of the Recent Controversy with the Wage Board

THE PENNSYLVANIA'S VIEW of the authority of the Railroad Labor Board to rule as it has in the recent controversy between that carrier and its shop and clerical forces, was clearly outlined by Elisha Lee, vice-president of the Pennsylvania, in a recent address before the Delaware Bankers' Association at Rehoboth, Del.

Mr. Lee explained in detail the carrier's plan for the peaceful and friendly settlement of labor differences by conferences between the management and elected representatives of the employees. He predicted success for it if it were not blocked by the interference of outside agencies, and said it had the endorsement and support of a great majority of the company's employees.

Mr. Lee criticized the Railroad Labor Board for intervening and declaring void the recent elections held under the plan. He dwelt particularly upon the feature of the board's order directing the carrier to hold new elections and submit to the employees the choice of labor organizations, instead of co-workers only, to represent them in conferences with the management.

In asserting the company's right to insist upon dealing directly with its own employees, Mr. Lee stated that the Pennsylvania had been advised by counsel that the Labor Board had altogether exceeded its authority in denying that right.

Discussing further the Pennsylvania's controversy with the Labor Board, Mr. Lee said:

"The Labor Board's order, in all likelihood, would compel us to conduct our conferences with strangers—with labor union general officers who were not our employees and who might not even be railroad men. It would defeat the very fundamental purpose of employee representation which is based upon the principle of face-to-face discussion between management and men.

"We do not think we can successfully settle the employment questions of the Pennsylvania Railroad with strangers. We do believe that we can adjust them with our own employees, if we are permitted to go ahead, free from gratuitous and unwarranted interference. We are perfectly willing to leave it

to public opinion whether our view or that of the Labor Board is right.

"Our differences with the Labor Board arise out of the fact that while Congress plainly created it as a board of mediation to act in disputes which railroad managers and railroad employees were unable to settle between themselves, the board has gone far beyond that scope and assumed very largely the role of an administrative or managerial body with respect to the labor affairs of the railroads. This, we contend, under the Transportation Act, it has no right to do, and that is the gist of our differences with the board.

"We are not fighting the right of our employees to organize, nor are we trying to destroy the existing unions, as has often been falsely represented; neither is the question of collective bargaining in any way at stake. All we are insisting upon is the right to meet with our own employees and talk over our mutual troubles with them, and we do not think that such a right can fairly be construed as an assault upon unionism or a denial of the right of collective bargaining. In fact, it is a direct affirmation of the right of collective bargaining, as we specifically request our employees to get together and elect their representatives to bargain collectively with us.

### Collective Bargaining and Collective Coercion

"We do insist, however, that there is a very important difference between collective bargaining and collective coercion. In this connection I wish to direct attention to the practice, by certain labor organizations, of three forms of coercion which, we believe, public opinion will not support and will ultimately compel those organizations to repudiate if they are to survive. I refer to: (1) restriction of output; (2) the closed shop; and, (3) the sympathetic strike.

"It is no secret that in the past the Pennsylvania Railroad, while maintaining no unfriendly feeling toward the four train service brotherhoods and certain other independent organizations of railroad workers, always refused to have any official relations with organizations embraced in the American Federation of Labor. Nor is it any secret that we regarded with

the greatest disfavor those policies of the Railroad Administration, during federal control, which resulted, for the first time, in introducing those organizations among our employees. Our objection to the federation has been due simply to the fact that it stands for the three coercive practices to which I have alluded and which we hold to be unjustifiable.

"The fight which we on the Pennsylvania Railroad are carrying on today is largely a fight against domination and virtual management of our employee relationships by the American Federation of Labor. It is not a fight against labor unionism, but only against labor union autocracy.

"We want to establish a truly democratic system of employee representation on the Pennsylvania Railroad, one in which the power and authority of the representatives sent to negotiate with us proceeds from the bottom up and is not imposed from the top down.

"We want to know that they really have been chosen by the workers from their own number, that they have the authority of the workers to speak and negotiate for them, and that when they give us an answer on any question submitted for their consideration, it is the answer and judgment of our own employees and not the dictum of some international labor union president who is not one of our employees, has no personal familiarity with our problems and may not even be a railroad man at all.

"Our labor policies and purposes are an open book. We have nothing to conceal. We welcome inquiry and scrutiny. We think we are engaged in a constructive work promising important results to the whole country, and we gladly submit to public judgment the sincerity and soundness of our plans. In turn we ask public support in the effort to secure for these plans a fair and adequate trial."

#### Committees Representing 120,000

##### Employees Established

In a recent circular the Pennsylvania announced that committees, consisting of equal representation of the employees and of the management, have now been established for the settlement of all controversial questions affecting approximately 120,000 employees.

The groups included in the new arrangement are: (1) Train and engine service; (2) maintenance of way and structures; (3) signal department; (4) mechanics' helpers and apprentices, maintenance of equipment and telegraph and telephone, eastern region; (5) clerical forces, eastern region; (6) miscellaneous station forces, eastern region.

In describing the manner in which these committees will function, the circular said in part: "For each of the first three groups a System Reviewing Committee, constituting a court of review upon all questions that may arise between the management and the employees affected, is now in effect. For each of the three other groups a Regional Reviewing Committee has been established.

"The questions to be taken up by these committees include grievances, rules and working conditions, and the administration of discipline. The votes of all members, whether representatives of the management or of the employees, are of equal power. Not less than two-thirds vote is necessary to reach a decision upon any question presented.

"In all matters except individual discipline cases, the full committee will vote and its decisions will constitute precedents which will be binding equally upon both sides with respect to similar existing or future cases. In discipline cases, which involve a personal element, the representatives of the management and the representatives of the employee directly interested in the case merely act as counsel for the presentation of their respective claims and do not vote on the case.

"A method of appeal to the division superintendent, general superintendent and general manager is provided so that all cases which cannot be settled on the division may receive expeditious attention by the Reviewing Committee. Regular

meeting dates are fixed for the division superintendents, the general superintendents and the general managers, to meet representatives of the employees under their jurisdiction, and appeals may be taken in this order, the employees participating in every step in decisions affecting their interest.

"The formation of these committees carries out the policy announced on May 20, 1921, of giving all employees an opportunity to have a voice in the management in matters affecting their welfare. Following this announcement elections were held throughout the system to determine the employees' choice of representation to formulate new rules and working conditions to take the place of the National Agreements.

"It was announced at that time that it was the hope of the management that these employee representatives would form the nucleus of committees which should frequently confer with the management on all matters concerning the employees. Accordingly, as soon as the new rules were agreed upon, the employee representatives and the management held a series of conferences which resulted in the formation of these committees.

## Freight Car Loading

WASHINGTON, D. C.

**A**N INCREASE of 13,273 in the number of cars loaded with revenue freight during the week ended August 27, compared with the previous week, is shown by reports received by the Car Service Division of the American Railway Association. The total for the week was 829,709 cars. This is the largest week's loading since December 11, 1920, but as compared with the corresponding week of 1920 it shows a loss of 171,599 cars.

The principal increases as compared with the week before were in the loading of merchandise and miscellaneous freight and in coal. The total number of cars loaded with merchandise and miscellaneous freight was 499,421, an increase of nearly 8,000 as compared with the week of August 20, but 35,000 less than for the corresponding week of last year.

Loading of grain and grain products was 59,505, a decrease as compared with the week before of 370, but 13,000 cars more than for the same week in 1920. The loading of live stock amounted to 28,070 cars or a decrease of 1,040 under the preceding week and slightly less than for the corresponding week of 1920.

Coal loading amounted to 161,612, an increase of 7,472 as compared with the week before, but 50,000 cars less than for the corresponding week of 1920. The loading of forest products was 46,460, an increase of 1,877 over the week before, but about 1,000 cars less than the loading for the corresponding week of 1920. The ore loading was 30,035, a decrease as compared with the previous week of 2,355, while the loading of coke was 4,606 cars, an increase of 170.

Compared by districts, there were increases as compared with the week before in all except the Pocahontas and Northwestern districts, but in all districts the loading was below that for the corresponding week of 1920.

THE LONDON & BIRMINGHAM RAILWAY, now a part of the London & North Western, was one of the pioneer railways of the world and the story of its inception and construction—1830-38—is the subject of a sketch of absorbing interest in the Scientific American Monthly for August. It is by Herbert T. Walker, whose historical articles are always accurate and entertaining. One of the terminals, that at Kilsby, cost three times what the engineers had estimated, and numerous other construction problems were as baffling as this; but the fact that the locomotive, in a few short years, increased the speed of passenger travel by two or three hundred per cent sustained the enthusiasts; and the conservatives, who declared that railroads would destroy society, were silenced.

*Mikado Type Locomotive Equipped with Booster*

## New Locomotives for the Missouri Pacific

Harter Circulating Plates Applied to Improve Boiler Capacity—  
Booster Increases Tonnage 13 Per Cent

THE MISSOURI PACIFIC has recently added to its equipment 50 locomotives built by the American Locomotive Company. These include 15 six-wheel switchers (0-6-0 type), 25 Mikado (2-8-2 type), 5 Pacific (4-6-2 type) and 5 Mountain (4-8-2 type) locomotives, none of which types are new on this road. The six-wheel switchers are of the same design as those received about a year ago; the Pacific type engines are practically duplicates of those previously built, while the Mikado and Mountain types are of entirely new design.

### Mikado Type

The Mikado locomotives previously used were of the government light, or U. S. R. A. 2-8-2-A type allocated to the

of application, convenience in maintenance and reduction of fire hazards.

The boilers of the Mikado type as well as the other locomotives are equipped with the Harter circulating plate which, it is estimated, has added 10 per cent to their capacity. This device consists essentially of a horizontal plate, slightly below the center line, extending entirely across the boiler from a point just behind the feedwater inlet to within about six inches of the back tube sheet. Outlets for steam are provided by pipes placed at intervals on either side which lead from below the plate to the steam space at the top of the boiler barrel. On the Mikado locomotives the boiler horsepower is 93.9 per cent of the cylinder horsepower without allowance for the circulating plate and on the Mountain type the rated

*An Efficient Mountain Type Locomotive of Medium Weight*

road during the war. These locomotives are of 54,600 lb. tractive effort, have 26 in. by 30 in. cylinders, the total weight being 290,800 lb., with 221,500 lb. on drivers and 63 in. wheels. The new locomotives have 10 per cent greater tractive effort and an equivalent increase in weight and are handling 10 per cent greater tonnage. Among the special features are floating bushings for the middle connection bearings which are giving much better satisfaction on locomotives of this size than the stationary bushings previously used, also power reverse gear, Duplex type D stokers, Franklin grate shakers and adjustable driving box wedges, Chicago flange lubricators and Jemco unit spark arresters which are said to be an improvement over the Master Mechanics' design in ease

boiler power is even less. All of the locomotives have, however, proved to be free steamers.

Delta trailing trucks, equalized with the drivers and equipped with brakes, are used on all road engines. Of the 25 Mikado locomotives, two are equipped with boosters and provision is made for their future application to the other engines. In actual service it has been found that the locomotives equipped with boosters can handle 13 1/2 per cent more tonnage than the same design without the booster. The booster increases the tractive effort 10,000 lb. and adds 3,500 lb. more weight on the trailing truck, 4,500 lb. more on the drivers and 1,000 lb. less on the front truck.

The ruling grade on the line where the boosters are used

is five miles long so that the demand on the boiler for steam to supply the boosters as well as the locomotive cylinders is severe and prolonged and any lack of capacity would be developed quickly. In actual tests the locomotives have handled full tonnage over the ruling grade at a speed of approximately 10 m.p.h. With the reverse lever in the corner, the booster in operation, the throttle wide open and the injector on, full boiler pressure was maintained.

### Mountain Type

The Missouri Pacific has been using for some time a number of U. S. R. A. 4-8-2-A light Mountain type locomotives

locomotives were to be used necessitated limiting the weight on the drivers to 226,000 lb.

The size of the driving wheels was increased to 73 in. to fit them better for the speeds at which the passenger trains are scheduled and lateral motion driving boxes were applied on the front pair of drivers to lessen the rigid wheel-base and eliminate the trouble with hot bearings. These modifications naturally necessitated a longer boiler, which would tend to increase the weight beyond that allowable. The previous locomotives had a rated boiler horsepower capacity of 97.5 per cent of the cylinder horsepower. In order to keep the weight within the maximum allowable, it was decided to re-

Pacific Type Locomotive of 40,000 lb. Tractive Effort

which have a tractive effort of 53,900 lb., 27 in. by 30 in. cylinders, a total weight of 327,000 lb., 224,500 lb. on drivers and 69 in. wheels. The new locomotives were designed for the same service and to correct some of the troubles which have been experienced with the older ones. In attempting to make pronounced changes in the design, an interesting problem was encountered owing to the fact that the condition of bridges and structures on the section of the road where the

duce the boiler size so that its rated horsepower was only 85.3 per cent of the cylinder horsepower. This it was thought could be done safely by using Harter circulating plates to increase the boiler capacity.

The new Mountain type locomotives are being run in a pool with the older locomotives and consequently both are handling the same trains on the same division. Both designs have the same size cylinders. Despite the smaller boiler,

\*Equivalent heating surface = total evaporative heating surface ÷ 1.5 times the superheating surface. †Weights and ratios for these are for booster

the new locomotives steam just as freely as the older ones, are running with  $\frac{3}{4}$  in. larger exhaust nozzles, are making better fuel records and take the same train 30 miles further for water.

The locomotives are provided with floating bushings in the middle connections and the same attachments furnished on the Mikado type. Boosters were not applied but provision was made for their attachment in the future.

As has been stated, the Pacifics and switch engines are practically the same as previous designs but are provided with Harter circulating plates. The Pacific type locomotives are operating with exhaust nozzles from  $\frac{1}{2}$  in. to  $\frac{3}{4}$  in. larger than was previously possible and are showing an improved fuel record and better performance in general.

A table showing the principal dimensions and ratios of the four types of locomotives is given for comparison with other designs.

## Increasing Locomotive Mileage

By F. P. Roesch

**T**HERE NECESSARILY must be a locomotive terminus at each end of a division, a place where power is turned back. It may be at the end of the line, or it may be an intermediate terminal, but in either case both terminals are not main terminals. The intermediate or minor terminal deserves more attention than is generally given to it, especially where winters are severe.

Standing locomotives earn no revenue. A locomotive requiring terminal attention during the winter months must be housed—repairs cannot be made outdoors; therefore any delay in housing means that much time lost. From this it follows that the track layout leading into the house, including cinder pits, coaling, sanding and watering facilities constitute the neck of the bottle, regardless of housing capacity.

On many railroads facilities insofar as minor terminals are concerned are woefully deficient. In the majority of cases not only is there insufficient house room, but the outside facilities have not kept pace with the growth of power. This means that when repairs are required the locomotive is often held twice as long as would have been the case with proper facilities.

Why make such strenuous efforts to save at one end only to lose time at the other? Furthermore, due to the conditions mentioned, many repairs, if made at all, are only done in a perfunctory manner, "just good enough to take the old mill home," thereby adding another burden to the already overtaxed main terminal.

This is not an argument to bring the minor terminal facilities up to those of the main terminal. On the contrary, the underlying thought is the abolition of the minor terminal entirely or as far as practical, considering the needs of the service.

Habit is a potent factor. Where enginemen report repairs, necessary or fancied, habit prompts them to report something every time they reach a terminal. Were the division twice as long, the locomotive would doubtless negotiate the remaining miles just as satisfactorily as it did the preceding distance, regardless of the real or fancied defect.

### Longer Runs Possible With Modern Power

In the gradual evolution of the locomotive, the weaker or troublesome parts have been almost wholly eliminated so that the present day locomotive can be classed as a thoroughly reliable machine insofar as mechanical road failures are concerned, and where physical conditions of the service are similar, *i. e.*, character of the water, coal, permanent way, etc., there is no reason why the modern locomotive, either

passenger or freight, should not successfully cover from 200 to 400 miles without attention other than that given by the enginemen, such as lubrication, etc.

A close study of the present practice of short runs indicates the following as the controlling factors:

The condition of the fire.

The condition of the water in the boiler.

The effect of long runs on journal temperature.

Assignment of power.

An analysis of the above indicates that where locomotives are hand-fired and especially where they are not equipped with power grate shakers or power-operated fire doors, the physical limitations of the fireman precludes the possibility of maintaining a clean fire with the average locomotive coal when the time on the road exceeds eight or ten hours. The consequence is low steam pressure toward the end of the runs with resultant loss of time, waste of fuel and frequently firebox leakage. Oil-burning locomotives that normally are worked to nearer their maximum capacity than coal-burning locomotives are being successfully operated over two or more divisions.

While there will always be more manual labor required from the fireman on a coal-burning locomotive, the application of stokers and power grate shakers so reduces this labor that the fire can be maintained in a practically perfect condition indefinitely without undue exertion on the part of the fireman. This in turn results in a maintained maximum steam pressure, a maintained speed and better boiler condition. From the above it is clear that the application of the labor saving devices mentioned will practically put the coal-burning locomotive in the oil-burning class.

### Feed Water

On many railroads the character of the water on connecting divisions is radically different. In other words, they cannot safely be mixed. Where such conditions prevail there is, of course, no other remedy except correct water treatment. If the water on any division is bad, treatment is the logical thing, and where it prevents the operation of a locomotive over both divisions, water treatment becomes practically imperative.

Frequently, however, a difference in feed-water is an asset instead of a liability. Instances exist where the water on one division contains a solvent for the scale deposited on another division. In such cases, if the locomotives are operated over both divisions right from the beginning, *i. e.*, after receiving new tubes, etc., the life of the tubes and firebox is extended, and failures due to leakage correspondingly reduced. It is clear that water conditions present no insurmountable difficulties.

### Lubrication

In the past, when small drivers were in vogue, with their attendant high peripheral journal speed and oil lubrication, a locomotive capable of maintaining a fairly high speed for a distance of from 100 to 150 miles, would become heated at the end of this distance to such an extent as to make a further mileage somewhat uncertain unless opportunity were offered for cooling the journals. With modern grease lubrication, floating rod bearings, and radial valve gear, hot bearings can be almost wholly overcome, providing they receive proper attention before the locomotive is dispatched. Therefore, journal friction can also be cast aside as limiting continuous mileage possibilities.

### Assignment of Power

There remains, therefore, only one other factor, *viz.*, assigned locomotives. The assignment of power, or what is generally termed regular engines, has been a much mooted question among mechanical men since pooling of power was introduced. Where locomotives are kept on one division,

good arguments in favor of regular engines can be advanced; arguments that, backed by statistics, cannot be refuted. On roads which already have power pooled, a further pooling cannot prove objectionable and would appear logical by running the locomotives over two divisions at least, changing crews where necessary.

This would result in the following economies: The practical elimination of a number of minor terminals which have become much more expensive to operate since the re-classification of labor; increased mileage per locomotive during a given time, as the locomotives will be making mileage where previously they were standing in the roundhouse; economy

in fuel owing to decreased fire knocking and rebuilding; decreased maintenance expense, especially as regards boiler maintenance; reduction in capital investment as a smaller number of locomotives will be required to move a given tonnage; last but not least, if trains are built up so that crews can be changed on the main line without cutting the locomotive from the train, an accelerated traffic will result with a marked reduction in intermediate switching.

However, in order to realize the full economies to be obtained by extending locomotive mileage, the locomotives must be designed with this end in view and must be equipped with the necessary labor saving devices.

## Present Freight Rates Do Not Restrain Commerce

### Comparison of Transportation Charges with Commodity Prices Shows Complaint Against Rates Unsound

By C. F. Balch

Assistant General Auditor, Chicago & North Western

THERE IS CONSIDERABLE discussion at this time of the effect of the present freight rates upon commerce in the United States. There are many angles from which this subject may be attacked, and much is to be said from the standpoint of the shippers as well as from the side of the carriers. My purpose at this time, however, is to call attention to the ultimate relation, as I understand it, of transportation to the goods transported. This may not be the sole governing factor, but it is certainly pertinent to a correct understanding of the subject.

To introduce my viewpoint let me quote from an address by J. Kruttschnitt, chairman of the board of the Southern Pacific, which he made in the autumn of 1919. Mr. Kruttschnitt at that time said in part:

The cumulative effect of all steam railroad freight charges, which in their remotest ramifications could affect the values of commodities, for the year 1914, which marked the opening of the war, has been weighed, and the same has been done for 1919. As we seek to establish the comparative effect of freight charges on commodity prices in two years six years apart, the commission's methods used in computing tonnage and revenue statistics, and ours in establishing prices being the same in both periods, will not affect the soundness of our conclusions.

Average commodity value per ton of "freight originated".....	\$119.00	\$56.00
Freight charges per ton originated.....	2.80	2.00
Percentage of charges to value.....	2.4%	3.6%
Increase in cost to consumer, 1919 over 1914.....	63.00	...
Increase in freight charges, per ton.....	.80	...
Relation of freight increase to cost increase.....	1.3%	...

In other words, only 80 cents out of 63 dollars, or 1.3 cents out of every dollar of increase in values of commodities in 1919 was caused by increased freight charges: the responsibility for the remaining \$62.20, or 98.7 cents of every dollar, must be sought elsewhere; it was not caused by freight charges.

In order to present a different point of view from that given above, I will use the value of transportation as \$56 and \$119 as given by Mr. Kruttschnitt, and will take the value of \$100 as standard for 1917, and \$84 as a normal in 1921, giving the table shown in the next column.

The idea to be presented in this chart, taking the first illustration, is this: In the year 1914, the average revenue per ton per mile in the United States was 0.733 cents. The market value per ton of miscellaneous freight traffic is given as \$56. At a distance of 25 miles, the freight charges at 0.733 cents would aggregate 18 cents per ton, and if that amount were paid for transportation and the produce sold at \$56, the shipper would net \$55.82. At 250 miles, which is the average haul, the shipper would pay \$1.83 for trans-

portation and net \$54.17 per ton. When the illustration is carried out to a distance of 7,000 miles, the transportation charge would be \$31.31, netting the shipper \$4.69. Beyond this, of course, the produce sold would not pay the transportation charges.

In the year 1917, the average revenue per ton per mile in the United States was 0.715 cents. In the meantime, the average price of goods had increased, and is here shown at \$100 per ton. The illustration shows that under these conditions, the produce could be shipped a distance of 13,000

TYPICAL ILLUSTRATION VALUE OF MISCELLANEOUS FREIGHT TRAFFIC AT VARYING DISTANCES FROM POINT OF PRODUCTION

the average distance of 250 miles has very nearly the same relation to the value of the goods as the transportation charge had in 1914, and, therefore, according to my theory, the freight rates and charges prevailing in December, 1920, would not affect the commerce of the country to any more appreciable extent than did the transportation charges in 1914. In the meantime, during the year 1917, the transportation charge was slightly decreased, giving the shipper a large advantage as compared with 1914. In 1919, the freight rate was advanced over 25 per cent, and yet the shipper enjoyed a condition comparatively better than in 1914. In 1921, the shipper does, and will enjoy an advantage until such time as prices decline to a point where they will be 150 per cent of the value of 1914. Since we have not reached as yet the condition represented by the right hand column of the chart, there is, theoretically, no cause for the shipper to complain of high freight rates, or to declare that he is suffering from the transportation conditions which prevail.

### Advantage on Side of Shipper

Discussing the results at the average point, we find that in 1914, the shipper would realize \$54.17 per ton at the market. Assuming that the cost of production was \$30 per ton, he would then net \$24.17 per ton. Assuming that in December, 1920, the cost of production had increased to \$45 per ton (150 per cent of 1914 costs), he would then net ton in December, 1920, the commodity would net him \$29.98 per ton as compared with \$24.17 per ton in 1914. This \$35.98 per ton as compared with \$24.17 in 1914. But if we suppose that the cost of production had increased to \$60 per result, however, is not the result of the transportation charge, but of the economic conditions connected with production. In fact it is quite probable that much of the present difficulty can be traced to conditions other than transportation. The general public, however, finds that the easy way to seek relief from all of these conditions is by appealing for a reduction in transportation charges. There is, however, no justice in undertaking to adjust through a reduction in transportation charges, economic conditions resulting from causes other than those of transportation.

During the years 1917 and 1919, the shipper enjoyed a distinct advantage which, it is plain, he appropriated for himself. He maintained his prices regardless of the low transportation charges, and it is a natural inference after a contemplation of this chart, that the governing authorities might well have advanced the freight rates to a point where the transportation facilities of the United States would have been self-supporting by placing the burden upon the shipper, who received the benefit, rather than upon the general public. Inasmuch as the average of present prices is considerably above 150 per cent of those prevailing in 1914, the shipper is not now being adversely affected by what are termed the present high freight rates.

There are, of course, many instances where prices have changed in ways not represented by this chart, but for every instance of prices lower than those quoted in December, 1920, there is a corresponding circumstance where the prices are higher, and a close investigation from this point of view will disclose that some of the parties making the most noise are really those who are least hurt.

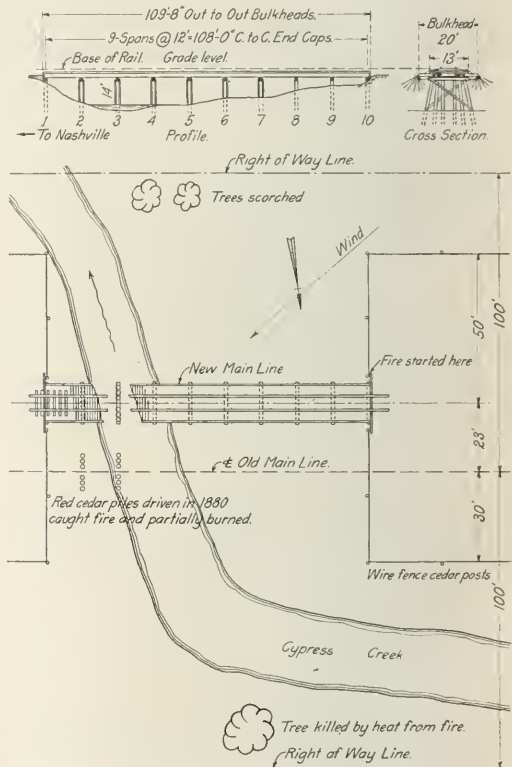

FRAUDULENT AGENTS, professing to be employment agents of road contractors, have been working among the unemployed in Minneapolis, Minn., soliciting labor for railroad work and collecting the railroad fare in advance from men whom they ostensibly employed. When the victims appeared at the railroad station for their transportation, they found neither the transportation nor the employment agent. Solicitors pretending to be obtaining advertising for railroad guide books have also been active in this city, defrauding many small advertisers.

## N. C. & St. L. Creosoted

### Bridge Survives Fire

AN INCIDENT commanding widespread attention for its significance occurred on the afternoon of May 27 when a 108-ft. nine-span creosoted timber ballasted deck trestle on the Nashville, Chattanooga & St. Louis survived a fire which at the time was thought to have completely destroyed it. Starting at one end of the trestle and fanned by a high wind the fire spread over the structure rapidly and burned intensely for some time. Following the fire an examination revealed the fact that with the exception of the charring which the timbers suffered and the burning of a few braces to a degree which necessitated their renewal, the structure was little the worse for its experience.

The incident merits particular attention in view of the fact

Location of the Bridge

that much opposition has been raised in recent years to the use of creosoted timber in trestles and that largely in the belief that creosoted structures are poor fire risks, it has become the established practice on a number of roads to build in reinforced concrete although the cost of this construction is about double that of creosoted timber construction. As a result of the fire it would appear that weaknesses attributed to creosoted timber in its relation to fire have been somewhat exaggerated. At any rate on the Nashville, Chattanooga & St. Louis, on which 35,845 ft. of creosoted trestle have been built since 1910, the incident is interpreted as a confirmation of the opinion to which the company has consistently held

that such structures do not constitute extraordinary fire hazards.

All indications pointed to the conclusion that the fire started at the west end of the structure on the south side from hot coals which had been dropped by a locomotive a short time before and had lodged between the mud sill of the abutment and a post of the right-of-way wing fence. The timber at that point once afire and a high northeast wind blowing, together with the film of creosote oil on the surface of the timber, soon had created a hot blaze.

That the fire burned intensely for a time was borne out by the statement of those who witnessed it and by evidences found after it had died out. Dense smoke formed by the burning oil was seen by farmers 10 miles distant. Leaves on trees about 60 ft. from the trestle on the south side were scorched although the wind was blowing in the opposite direction and the leaves on trees 100 ft. to the north of the trestle were completely killed. Untreated cedar piles standing on the old alignment about 25 ft. to the north were set on

The Piles Suffered Little Loss of Strength

fire and a bucket gang fighting the fire could not approach within 50 ft. until it had in large part died out.

The fire lasted about 2½ hours. During this time practically all parts of the trestle caught fire and all burned portions of the trestle were found charred to a depth of ½ to ¾ in. with the exception of some of the cross-bracing which suffered more severely.

It was plainly evident that the fire had smothered itself, the explanation for this being that as the creosote oil burned it left a residue which accumulated on the surface of the timber to a point where the oxygen necessary to continue the combustion could not reach the unburned wood. This was substantiated by setting on fire a pile of the chips cut from the face of the charred piles when fitting cross-sectional bracing to the bents, a fire which also showed that a sufficient quantity of oil still remained in the structure to preserve it from decay. Repairs cost only \$75.

We are indebted for the information concerning this trestle to Hunter McDonald, chief engineer of the Nashville, Chattanooga & St. Louis, and to the reports of Carter L. Wilson, assistant engineer in charge of bridges, and J. H. Ryan, division engineer.

## Ease of Operation Features

### New Coach Seat

ONE OF THE special features of a coach seat recently developed by the Scarritt Car Seat & Manufacturing Company, St. Louis, Mo., is freedom from jamming and ease of operation. This is secured by carrying the

Fig. 1—View of Coach Seat Operating Mechanism

operating mechanism on four rollers, two on each side, operating in channels in the side plates, as shown in Fig. 1. The double automatic foot rest is designed to afford ample clearance for luggage beneath the seat, and, although it is

Fig. 2—Scarritt Coach Seat with Parts Assembled

mechanically operated, becomes inoperative when obstructed and allows the back to be reversed freely without injury to the seat mechanism or the obstructing baggage. The aisle arm is made of steel and can be enameled in any desired

color and fitted with a wooden arm rest to match the finish of the car interior.

The seat can be equipped with any type of back cushion with or without a headroll. Fig. 2 shows the new type of back cushion with the Scarritt invisible headroll designed to afford maximum comfort to the passengers. The plush is applied without stitching and therefore can be renewed at a nominal labor cost, the elimination of all gimp and seams making this a sanitary type of cushion. The seat cushion is of the full spring type with flexible edges and is designed to meet the most severe service conditions. The hand-stitched upper edge of the curled hair assures maximum life from the plush or other covering material. This seat was designed for first-class coaches and conforms to modern ideas of car equipment.

## New Type of Car Stop

**A** NEW TYPE of car stop has recently been introduced which relies upon sliding friction to prevent cars from passing beyond the ends of stub tracks rather than upon the impact characteristic of the rigid bumping post. The device, called the Breyley bumper, consists of two

A Pair of Breyley Bumpers in Place

cast steel shoes, each of which has a long base capable of sliding on the rail (to which it is held by lugs engaging the rail head) and an upper surface shaped in such a manner that when in place on the rail a wheel striking the shoe mounts it and is prevented from overrunning it or rolling back. With the forward wheels of the moving car thus car-

Breyley Bumper Shown Holding the Car and Abutting the Stop Block

ried on the two shoes (or the entire forward truck, if the large sized shoes are used) the shoes are simply carried along bodily by the moving car until the energy in the movement is absorbed by the friction created by the sliding of the shoes on the rails under the weight imposed upon them.

The principle underlying the design of this type of car stop is, of course, one of stopping cars without the damage that might result if a dead stop should be effected. To permit the sliding movement to take place when a moving car engages the shoes they are placed a distance from the end

of the track varying from 10 ft. to 30 ft., depending upon the conditions, a length of 30 ft. usually being sufficient for all purposes. As an indication of the action that takes place when moving cars strike the shoes it was found that when two 50-ton hopper cars loaded with coal struck the shoes at a speed of eight miles an hour the shoes were moved about 30 ft. while a third car of similar capacity striking these two cars, at a speed of about four miles per hour, moved the shoes an additional 6 ft., all of which was accomplished without damage to cars or car stops.

In order to guarantee a certain stop under all conditions the equipment also includes two stop blocks, which are attached to the ends of each rail, and for cases where more than 30 ft. of rail length is desired for sliding distance, special fish plates are provided for installation at the intervening rail joint to permit of the passage of the lugs which hold each shoe to the rail. Aside from affording a certain stop to moving cars without damage, this type of car stop is said to be of advantage in affording a warning to trainmen before the cars are beyond control inasmuch as a car in mounting the shoes experiences a decided although not injurious shock. About 100 of this type of car stop has now been in service experimentally for periods up to about two years on the Nickel Plate, Baltimore & Ohio, and other roads. It is sold by the Maintenance Equipment Company, Chicago.

## A Flooring for General Railway Service

**A**BOUT FOUR YEARS AGO a new type of flooring was introduced which embodied the advantages of both the wood block and the tongue and groove plank floor. This floor, which is known as Bloxonend, was described in the *Railway Age* of October 20, 1916, page 707, and has since had wide application on railroads under a variety of conditions. This service, together with extended use in other

Bloxonend Floor in the Rutherford Shops of the Philadelphia & Reading

industries, has demonstrated the characteristics and adaptability of this construction to specific purposes.

The flooring consists of blocks of southern yellow pine 2½ in. by 3½ in. by 2 in. deep, dovetailed to a 1-in. board to form a unit 2½ in. deep by 3½ in. face and from 7 to 8 ft. long. Each side of the unit is grooved to receive a spline ¾

in, thick by 11/16 in. wide so that the units may be assembled to make a floor the same way as any tongue and groove floor is constructed. In general this flooring may be used anywhere that a plank flooring may be laid, that is, directly on joists where the spacing is suitable for the loadings to be encountered or on subplanking or on furring strips laid in or on a suitable base such as concrete. These floors have been laid with advantage on top of old floors. This flooring material is available either in the natural state or after being subjected to open tank preservative treatment with carbosota.

The advantages claimed for this flooring include a high resistance to wear obtained by the end fibre exposure, ease of placing either on new or old construction, greater security against buckling or displacement of the blocks and a smooth surface since the blocks are milled after they have been assembled as a unit. It is said that the floor may also be readily taken up to be relaid elsewhere.

A recent improvement in this floor facilitates laying it as a mat floor over a flat surface like concrete, where for any reason the furring strips are not permissible. The floor is assembled in this case by nails driven horizontally into one groove and out through the opposite one so as to connect it through the spline to the adjacent unit. Special nails with flat shanks and chisel points are provided for this purpose,

and have been subjected to rain and snow without serious effect.

Another interesting development has been carried out on the Chicago, Milwaukee & St. Paul in the use of the Bloxon-end in baggage and express cars. Cars so equipped have been in service for three years without damage or repairs to floors and it is now the intention to apply this flooring to mail cars as well. This flooring is handled by the Carter Bloxonend Flooring Company, Chicago.

ADMIRERS OF HENRY FORD who believe that he can convert any weak railroad into a strong one seem at least to have the virtue of sincerity; a party of them have journeyed all the way from Arkansas to Michigan to see if they can get him to revive the Missouri & North Arkansas, a 300-mile road which numerous experts have found beyond their powers. The "committee," said to represent several towns, had to deal with Mr Ford's secretary, the "wizard" himself being absent.

UNITED STATES SENATOR DAVID I. WALSH, of Massachusetts, has written a letter to Governor Channing Cox of that State calling upon him to attack the New England railroad problem. Senator Walsh suggests that the Governor call a conference of the New England Governors to discuss ways and

As a Trucking Floor in the Santa Fe Freight House at Argentine, Kans.

the units being furnished with the nails already in place in holes drilled partially through the strips so that the labor of driving is greatly reduced.

This flooring has been used for a variety of services. Typical railroad installations include the Lang machine shop of the Detroit & Toledo Shore Line where the floor has been in service for 4½ years. A floor of this kind was also laid in July, 1918, in the Philadelphia & Reading's shop at Rutherford, Pa. Freight houses with installations include a Chicago, Milwaukee & St. Paul house at Davenport, Ia.; the Chicago, Rock Island & Pacific house at Little Rock, Ark.; the Illinois Central houses at Kankakee, Ill. and East St. Louis, a Santa Fe house at Argentine, Kan., one on the Michigan Central at Detroit, Mich., and one at Dearborn, and a Pennsylvania freight house at Chicago.

As an indication of the adaptability of this flooring to outside use it is of interest to note that it is being used on the car loading platforms, bridges and galleries of the Armour & Co. plant at South St. Paul, Minn., where it is said that the floors have passed through wide variations of temperature

means for aiding the railroads and make recommendations to Washington for special legislation if necessary. The senator continues:

"Some reports coming to me recently from official government sources indicate an impending crisis in our transportation system. Even in the face of extreme government assistance, the roads seem to be on the verge of economic breakdown. Reputable banking houses have already refused to make further financial advances to at least one of the big New England roads, and so bad apparently is the status that only with reluctance and against the advice of the treasury security expert has the Interstate Commerce Commission authorized a loan. Holders of equipment trust obligations may compel the sale and liquidation of that part of the equipment securing these obligations. . . . Even with greatly increased rates the railroads in New England are not able to hold their own and they have already drawn out of the government revolving fund more than their proportionate share. It is doubtful if the government will advance the more important New England roads any more money in loans."

# General News Department

The American Association of Freight Traffic Officers will hold its annual meeting on September 19, at the Drake Hotel, Chicago.

Oliver H. Shoup, governor of Colorado, on August 30, invited the governors of 16 western states to join Colorado in efforts to reduce railroad rates.

The American Association of Traveling Passenger Agents will hold its annual convention at Salt Lake City, Utah, on September 12, 13, 14 and 15. The Chicago, Milwaukee & St. Paul will furnish a special train leaving Chicago September 8.

Railroads entering the city of Des Moines, Iowa, have signified their willingness to co-operate with the Des Moines Town-Planning Commission in consideration of plans for a new union station. It is believed that no action will be taken until financial conditions improve, although plans will be carefully developed in the meantime.

Eastbound passenger train No. 34 of the Pennsylvania System, was derailed two miles west of Coshocton, Ohio, on the night of September 2, and 13 passengers were injured. The train consisted of two locomotives and 13 cars. The tender of the second locomotive was derailed and six cars were derailed and overturned.

Edgar E. Clark, formerly chairman of the Interstate Commerce Commission, and Wilbur La Roe, Jr., have formed a partnership under the firm name of Clark and La Roe for the handling of matters before the agencies of the government, including the committees of Congress. Their offices will be in the American National Bank Building, Washington, D. C.

Westbound passenger train No. 3, second section, of the Delaware, Lackawanna & Western, was derailed on a curve one mile east of Apalachin, N. Y., on September 3, and the locomotive fell down a bank. Two coaches were badly damaged and two overturned. One passenger, standing in a vestibule, was killed, and 13 were injured. The engineman and fireman were injured.

Trains on time (passenger trains) on the Pennsylvania Railroad in July numbered 94.2 per cent of the total passenger trains operated; and 96.8 per cent made schedule time. This is an improvement of 16.8 per cent and 9.0 per cent respectively over the figures for March, 1920, the first month after the property was returned to the Pennsylvania management. Engine failures and car failures have been reduced.

Passengers riding free on the Central Pennsylvania Division of the Pennsylvania Railroad are liable, if they don't "watch out," to receive from the conductor, when the train is filled, a small card bearing the following inscription and signed by the division superintendent: "PAY PASSENGERS ARE STANDING. It, therefore, seems appropriate to remind the holders of passes of their duty to refrain from occupying seats when pay passengers are standing."

C. L. Bardo, general manager of the New York, New Haven & Hartford, on September 5, sent out a notice to all employees advising that not one employee had been killed during the month of August, and congratulating them on their successful adherence to "safety first" in their work. It appears that once before—in May, 1920—a similar record was made. This road operates about 2,000 miles of lines with about 1,200 locomotives.

The "Suwanee River Special" is advertised to begin running on November 6 between Cincinnati, Ohio, and St. Petersburg, Fla., over the Southern Railway and the Seaboard Air

Line; the first through train to be operated between the Ohio river and the West Coast of Florida. The route via Hampton, Fla., is 552 miles long, approximately 50 miles shorter than any other combination of existing routes. This will be a solid train between Cincinnati and St. Petersburg, with through sleeping cars to and from Chicago, Detroit, Cleveland, Louisville and Cincinnati. Southbound it will leave Cincinnati at 8:10 p. m. It runs via Chattanooga, Atlanta and Macon.

## Welding Society Meeting

The Metropolitan Section of the American Welding Society will hold its first fall meeting in the Engineering Societies' building, 33 West Thirty-ninth street, New York, on Tuesday, September 20. The subject of the evening will be "Practical Applications of the Electric Arc Welding Process," with a paper by E. Wanamaker, electrical engineer of the Chicago, Rock Island & Pacific. Mr. Wanamaker is one of the few who can handle this subject so that it will be understandable and interesting.

## No Alternative Funding Plan Considered

The Railroad Administration and the White House have denied newspaper reports that an alternative plan for financing the settlements with the railroads in place of that represented by the Winslow bill as passed by the House is under consideration. It is proposed to proceed along the lines originally planned and to pass the Townsend bill through the Senate after Congress convenes after the recess. Meanwhile the Railroad Administration continues to make settlements with the railroads without funding, to the extent of its ability, as it had been doing before the funding proposition was formulated.

## September Meeting—New York Railroad Club

A MIGHTY TIMELY SUBJECT!

"WHAT FIXES THE LEVEL OF WAGES?"

A BIG SPEAKER

DR. CHARLES A. EATON

*Why Was He Selected?* Because there is no more important subject before our railroads today. Because Dr. Eaton made a remarkable record during the war in awakening the thousands of men in the Emergency Fleet Corporation to the importance of their work and their patriotic duty.

*Who Is He?* He is one of the country's leading sociologists. He was the head of the National Service Section of the U. S. Shipping Board Emergency Fleet Corporation. He is a man's man with unusual executive ability and magnetic personality—and a forceful orator.

*Where Is the Meeting and When?* Engineering Societies' building, New York City, Friday evening, 8 o'clock, September 16.

## A.S.C.E. Discusses National Port Problems

The American Society of Civil Engineers held this week a series of three meetings at the Engineering Societies Building, New York, to discuss national port problems. The first conference was held on Wednesday evening, the speakers being: F. W. Cowie, chief engineer, Harbor Commissioners, Montreal, Can.; Major General Lansing H. Beach, chief of engineers; F. H. Fay, consulting engineer, Boston, Mass.; and M. A. Long, Baltimore, Md. The speakers on Thursday afternoon were: John Meigs, consulting engineer, Philadelphia, Pa.; W. W. Pagon, consulting engineer, Baltimore,

Md.; E. J. Clapp, New York; and C. R. Thompson, assistant director, Department of Wharves, Docks and Ferries, Philadelphia; while those for the evening session were: J. A. Bessel, consulting engineer, New York; W. J. Wilgus, consulting engineer, New York; B. F. Cresson, chief engineer, the Port of New York Authorities, New York; and H. McL. Harding, designing terminal engineer, New York.

### The Chicago Safety Council

Ten (10) Chicago railroads are now reporting regularly to the Chicago Safety Council notable cases of reckless conduct by automobile drivers at railroad crossings in that city and district, using a blank which is standard with the council. The report is turned in promptly by the crossing attendant; and Secretary H. J. Bell, acting only in the interest of general safety in the Chicago district, at once communicates with the individual who is shown by the report to be at fault. The railroads which have joined in this movement are the Atchison, Topeka & Santa Fe, the Baltimore & Ohio Chicago Terminal, the Belt Railway of Chicago, the Chesapeake & Ohio, the Chicago, Burlington & Quincy, the Chicago Great Western, the Chicago, West Pullman & Southern, the Elgin, Joliet & Eastern, the Illinois Central and the New York Central. The Chicago Safety Council, acting in co-operation with the Chicago Association of Commerce, is endorsed by numerous prominent manufacturers; and it has committees actively at work on general questions connected with safety on the highways and to expedite the movement of congested traffic anywhere in the city. Secretary Bell estimates that the total loss by accidents and fires in the Chicago district in 1920 was twenty-five million dollars.

### Railway Earnings for July

The net railway operating income of the railroads for July makes a more favorable showing than has been reported for any month since last October. Returns from 202 Class I roads, with only one Class I line missing, show a net operating income of \$69,485,000, as compared with a deficit last July of \$11,878,000. The total operating revenues were \$462,953,000, which is a decrease of 12½ per cent as compared with July, 1920, while the operating expenses were \$362,776,000, a decrease of 29.4 per cent. Fifty-seven of the 202 roads had deficits for the month. The preliminary report is as follows:

	1921	1920	Per cent of increase 1921 over 1920
Total operating revenues:			
Eastern District .....	\$208,043,600	\$241,399,000	d 13.8
Southern District .....	71,202,000	79,111,000	d 10.0
Western District .....	183,708,000	208,337,000	d 11.8
United States .....	462,953,000	528,847,000	d 12.5
Total operating expenses:			
Eastern District .....	167,607,000	247,414,000	d 32.5
Southern District .....	58,988,000	79,796,000	d 26.1
Western District .....	136,781,000	186,577,000	d 26.7
United States .....	362,776,000	513,787,000	d 29.4
Net railway operating income:			
Eastern District .....	27,336,000	Def 17,807,000	....
Southern District .....	8,368,000	Def 3,175,000	....
Western District .....	33,781,000	9,104,000	271.1
United States .....	69,485,000	Def 11,878,000	....

### Railroad Administration Establishes

#### Short Line Section

The American Short Line Railroad Association has announced to its members what it considers an important victory in its negotiations with the Railroad Administration. Following the conference of officials of the association with President Harding, after which a long memorandum setting forth their condition was laid before the President, a letter was received in reply from Director General Davis, saying that the President had instructed him to receive and consider the claims of the short line roads for the first six months of 1918, and with that end in view a short line section has been created in the Railroad Administration for the purpose of receiving and considering these claims. The Railroad Administration had taken the position that a large number of the short lines were never actually under federal control for this

period. Mr. Davis' letter said that as at present advised the administration does not expect to consider any claim for compensation by any short line under federal control that did not have a railroad operating income during the test period. In addition, certain short line roads have entered into what is known as the short line form of contract, waiving any claims against the government. Unless the proper court shall decide that there is a liability on the part of the administration notwithstanding this contract, the claims of roads which have entered into contracts of this character will not be considered.

### A Vermiform Appendix

Abolition of the Railroad Labor Board was urged by John M. Glenn, secretary of the Illinois Manufacturers' Association, in a recent address to students of the University of Chicago. Mr. Glenn said:

"The United States Railroad Labor Board is a vermiform appendix that should be removed. It is costing railroads and shippers of this country \$2,000,000 a day for each working day in the year. The railroads asked that the \$700,000,000 wage grab of July 20, 1920, be wiped out. The Board, dominated by the brotherhoods, reluctantly and timorously reduced wages \$400,000,000 a year, leaving \$300,000,000 excess war wages which the railroads—and the public—have to pay. The railroads asked for abrogation of the working conditions, which add another \$300,000,000 in a year to railroad payrolls, most of it squandered for work that is never performed. The Railroad Labor Board has not abolished these burdensome working agreements. Neither has it taken any steps to do away with the basic eight-hour day which is joyously used by the railroad brotherhoods to exact time and a half and double time wage grabs amounting to more millions.

"This daily \$2,000,000 toll for which the Railroad Labor Board is directly responsible, is added to the cost of food, building material and every other commodity for which the consumer has to pay. It is one of the causes for high rents, high fuel, idle factories and general stagnation of business. This useless Board is a political parasite established as a sop to the blustering, bluffing railroad brotherhoods. Its operation is contrary to economic principles. \* \* \*

### The "Port of New York Authority"

Major Elihu C. Church, transportation engineer of the Port of New York Authority, in an address before the Community Leadership Council of the University of Wisconsin at Madison, recently, gave a succinct account of the constitution and purposes of that bi-State establishment.

The Port of New York Authority has the biggest problem of its kind in the world. London and Hamburg have nothing to compare to it. The Island of Manhattan is not the Port of New York. The metropolitan district, with which the Port Authority is concerned, is roughly the area within twenty-five miles of the Statue of Liberty, part in New Jersey, part in New York. The two States have signed a treaty to work together. The district embraces several cities. Its population is about 8,000,000. Within this district are more industrial establishments than in Philadelphia, Chicago, Cleveland and St. Louis combined. The freight cars that enter and leave during a year would fill eight tracks across the continent from New York to San Francisco. An ocean-going ship comes in and one goes out of the harbor about every twenty minutes of daylight every day. The foreign commerce averages over \$10,000,000 a day. The port has 800 miles of shore line.

The Port Authority will have the right to own and operate property, and expects to go into the public money market for the funds necessary to carry on its undertakings. The railroad problem is the principal one. The situation is now so complicated that the roads cannot solve it individually. It is only by an authority that can co-ordinate all their activities that any real betterment can be secured. The solution involves joint use of terminals and other facilities, construction of belt lines and marginal railroads along the deepwater front.

"The motor truck of today," said Major Church, "is at the stage of development that the railroads were two generations ago, and it is quite probable that motor highways radiating out from the port may be constructed on a scale hitherto undreamed of."

## Traffic News

The Southern Pacific has shortened the time of the Sunset Express, between San Francisco and Los Angeles, 1 hr. and 40 min.

The California State Railroad Commission on August 25 denied the application for a reduction in rates on rice grown in the Sacramento Valley in the case of the Pacific Rice Growers' Association against rail and river carriers.

The Baltimore & Ohio announces that it will continue to make the Pennsylvania station at 7th avenue and 32nd street, New York City, the eastern terminus for its passenger trains, having concluded a new contract with the Pennsylvania.

The Central of Georgia reports that in the month of May its passenger trains made a record of 99 per cent on time; that is to say, 2,779 trains out of 2,814 arrived at their destination on time. And in June the same percentage was accomplished.

The Public Service Commission of Alabama has ordered reductions in freight charges on coal, coke, iron ore and limestone, carried to the furnaces of Birmingham, amounting to about 30 per cent, and to go into effect on or before October 1.

The Illinois Central has leased to the War Department an incline and cradle at Cairo, Ill., for a rental of \$25 a year. This incline will be used in the interchange of freight between railroads and the river barges operated by the Government.

The Cincinnati, Indianapolis & Western has put on a new fast freight from Decatur, Ill., to points east. It is train No. 95 and leaves Decatur at 9 p. m., arriving at Indianapolis at 7 a. m. The time from Decatur is 21 hr. to Hamilton, Ohio, and 24 hr. to Cincinnati.

In a referendum conducted by the American Wholesale Lumber Association on the proposed change in demurrage rates, whereby the present sliding rate will be superseded by a flat charge of \$3 a day, 47 out of 55 replies favored, and eight opposed, the change.

A total of 45 new industries, representing an investment of \$4,430,100, were located along the line of the Chicago & Eastern Illinois during the past year, according to W. J. Jackson, receiver. It is estimated that the new industries will furnish employment for 2,109 persons and will give the railroad 11,000 cars of freight yearly.

The trans-continental railroad lines have agreed on the advisability of making important reductions in freight rates on iron and steel products from eastern points of manufacture to the Pacific Coast, and efforts are being made to get the concurrence of lines east of Chicago to the reductions so that they may be put into operation on October 3, when the new westbound trans-continental rates become effective.

The Southern Pacific has adopted uniform terms to designate its freight line between Pacific Coast points and New York, via New Orleans or via Galveston. Hitherto "Sunset Gulf Route," "Southern Pacific-Morgan Lines," "Sunset Gulf Atlantic Steamship Lines," and many other terms have been used rather loosely. Under the new ruling "Sunset Route" will be the designation for all through eastbound business and "Morgan Lines-Sunset Route" for all through westbound business.

In addition to the reductions in transcontinental rates on canned goods, dried fruits and other California products, which took effect August 22, there will be reductions on other products from the Pacific Coast points to eastern destinations ranging as high as 50 per cent on some articles. These reductions will take effect October 1 and will affect cabbage, potash, wild cherry bark, desiccated and frozen shelled eggs, with other eggs and dairy products: vegetables, tallow, malt, oil-well supplies, children's toys and storage batteries.

## Advances in Hudson River Ferry Fares

The Pennsylvania Railroad has advanced its passenger fares between Manhattan (New York) and Jersey City from 3 to 4 cents. The ferry service showed a deficit of \$438,273 for 1920. Children, under the new tariff, must pay 3 cents instead of 2 cents, but adults may purchase 10-trip ferry tickets for 30 cents, which is 5 cents above the present 10-trip rate. Increases in rates for horse-drawn vehicles range from 5 to 24 cents; on four-passenger automobiles the rate is increased from 40 cents to 56 cents; eight-passenger from 75 cents to \$1.05, and automobile trucks from 16 to 28 cents.

## Department of Commerce Creates

### Transportation Division

The Department of Commerce has announced the appointment of E. S. Gregg as chief of the transportation division of the Bureau of Foreign and Domestic Commerce, which has been created by the department to assist American business men in their overseas work insofar as it relates to the movement of freight by land or water. Mr. Gregg, formerly of Galveston, Tex., is a graduate of Austin College, Texas, and also took the graduate course in transportation at the University of Chicago. During the war he was connected with the shipping section of the general staff of the War Department. He has since been associated with the American International Corporation at New York as advisor on shipping conditions. He is the author of numerous articles on shipping subjects.

## Grain Rates to Gulf Ports Reduced

Acting on the carriers applications, the commission on August 31 granted authority for a reduction of 5½ cents per 100 lb. on five days' notice, on grain for export from Missouri river and Mississippi river points; also certain territory between the two rivers and in Illinois, to Gulf ports, Mobile to Galveston, inclusive. Authority was also granted to publish on five days' notice reductions ranging from one cent to 5½ cents per 100 lb. from the territory lying west of the Missouri river in Nebraska, Kansas, Colorado and Oklahoma to Gulf ports. Numerous protests were received against these reductions but after considering all of the facts and arguments the commission thought best to grant the authority. The reduced rates are to apply only during the remainder of the calendar year 1921. The present action does not constitute approval of the relative adjustment of rates either as between the Gulf ports on the one hand and Atlantic ports on the other or with respect to the relative rates from interior western points as compared with Missouri river points.

## A National Perfect Package Campaign

A "perfect package campaign," endorsed by the National Industrial Traffic League, will be inaugurated during the month of November under the auspices of the railroad and express companies and the American Railway Association. This campaign is designed to bring about the co-operation of all concerned for the better handling of freight packages. The plan was carried out on a small scale in St. Paul, Minn., last June, in what was known as "Perfect Package Week," when out of 22,248 express packages handled during that period, only 103 were found faulty; with the assumption that the remainder were perfect packages, the proper packing record for that week was 99.54 per cent.

The campaign is to be managed in co-operation with local chambers of commerce. Each railroad agent will be given printed forms which he is to fill out either daily or weekly and present to the chamber of commerce in his locality. This form contains a report, listing each defective package according to three classes of errors, bill-of-lading, marking, and packing. Railroad agents are to be particularly vigilant, and any imperfection in the railroad transportation service will be traced to its source.

This campaign, when first proposed by the National Industrial Traffic League, was to be confined to the New England states, but with its success in St. Paul, it was decided to place such an educational program on a national basis.

## Commission and Court News

### Interstate Commerce Commission

The commission has reopened the Cleveland passenger terminal case, in which it recently dismissed the application of the New York Central, and has assigned it for rehearing before Commissioner Campbell and Attorney Examiner Clarke at Cleveland on September 20.

The commission has suspended from September 3 until January 1, 1922, the operation of schedules published in a Northern Pacific tariff proposing increases and reductions in rates on cedar poles from certain points in Minnesota to destinations on the Canadian Pacific and Grand Trunk Pacific in Canada.

The commission has suspended from September 5 until January 3, 1922, the operation of schedules published in a Chicago, Rock Island & Pacific tariff which provide that the rates on forest products, from points in Arkansas and Louisiana, to destinations in Central Freight Association territory and Canada, applying through Memphis, Tenn., and Louisville, Ky., will not be subject to transit privileges en route.

The commission has suspended from September 6 until January 3, 1922, schedules which propose reductions in the carload commodity rates on cotton and cotton linters from transcontinental territory on and west of the Mississippi river generally, to Pacific Coast ports for export to points in the Orient. On cotton and cotton linters to Pacific Coast ports it is proposed, if compressed after delivery to carrier, to reduce from \$1.50 to \$1.35, and if compressed before delivery to carrier from \$1.36½ to \$1.21½.

The Interstate Commerce Commission has issued a decision upon reargument of the case involving rail and water rates from Atlantic seaboard territory to Texas points. The commission finds unduly prejudicial class rates from seaboard territory to Houston made by the use of differentials over the rates to Galveston, which are lower than the differentials applied in making rates from Galveston higher than those from Houston to points in Texas. Otherwise proposed reductions in class and commodity rates from Atlantic seaboard territory to Texas points, the commission finds, are not shown to be unjustly discriminatory, unduly prejudicial or otherwise unlawful.

### State Commissions

The Southern Pacific has filed an application with the Public Service Commission of Nevada, asking authority to abandon its Metropolis branch, which extends from Tulasto to Metropolis, in Elko county, a distance of eight miles.

The railroad commission of Georgia has called upon all the railroads of the state to appear on September 13 and show cause why intrastate freight rates should not be revised to eliminate discrimination, due to disregard of the long and short haul rule as described in the federal law.

The California State Commission has ordered the crude oil rates on the Oil City-Parque Branch Line reduced from 5½ cents to 3 cents per 100 lb., with a minimum charge of 15¢ a car. This line runs from Oil City and Ainroff, Cal., to Waits, and is owned jointly by the Southern Pacific and the Santa Fe.

### Personnel of Commissions

Frederick I. Cox, the new member of the Interstate Commerce Commission appointed to succeed Edgar E. Clark, took the oath of office on September 1 and made his first public appearance as a member of the commission at the hearing in the western grain rate case.

## Foreign Railway News

### New Zealand's Premier Favors British Manufacturers

W. F. Massey, prime minister of New Zealand, speaking at Darlington, England, is quoted by the Times (London) Trade Supplement as saying that in his dominion British goods are now given preference and that he hopes that more can be done in that direction in the next few months. He states further that New Zealand is coming to Britain soon to place orders for 2,500 freight cars, 45 locomotives and a quantity of rails.

### Track Material Exports in July

The downward trend of the exports of railway equipment and supplies continues in the July totals for the exports of track materials, when compared with similar totals for June. In July 928,272 lb. of track spikes, valued at \$36,026 were exported as compared with 1,566,050 lb., valued at \$79,434 in June. July exports of steel rails totaled 20,070 tons, valued at \$1,018,859, as against 20,308 tons, valued at \$1,083,344 for the preceding month. Miscellaneous track materials slumped off from \$58,134 in June to \$146,464 in July. Detailed figures by countries as compiled by the Bureau of Foreign and Domestic Commerce, follow:

Countries	Railroad spikes		Rails of steel		Switches, truss, splice bars, etc.
	Pounds	Dollars	Tons	Dollars	Dollars
Norway	.....	.....	.....	.....	1,960
England	.....	.....	30	1,671	4,273
Canada	15,615	739	4,992	285,348	37,284
Costa Rica	11,400	518	.....	.....	1,368

### Reorganization of the Hungarian State Railways

LONDON

The Hungarian State Railways have under their management 4,382 miles of which 1,863 miles are State owned. The present condition of the track is only adequate for the requirements of the reduced traffic; and buildings and bridges are in urgent need of restoration. The total amount needed for this purpose is estimated at \$1,620,000. It is also stated that a sum of about \$5,300,000 will be required for repairing old locomotives and new locomotives. Of the 2,237 locomotives claimed by the Hungarians under the stipulations of the Reparations Commission, only 1,717 have been received and the majority of these are in a worn-out condition and of low efficiency. On June 30, there were only 2,348 passenger cars available out of a total of 8,846, and it is estimated that in order to develop the passenger traffic 1,000 cars will be needed. This coupled with the need for repairs will call for a sum of about \$2,320,000. A similar state of affairs is encountered in the case of freight cars, for which a sum of \$5,550,000 will be required. It will therefore be seen that in order to put the Hungarian railways on a sound basis an estimated total of \$18,000,000 will be needed.

The reorganization of the Hungarian railways depends to a large extent upon the agreements with regard to mutual traffic which are made with contiguous States, such as the settling of

the frontier and terminal stations, upon which the building of water stations and so forth is based. Should the lately designated boundaries be definitely decided upon, it would be necessary to make considerable alterations to the various classes of stations and buildings.

As to general traffic conditions, the great need of coal, freight and passenger cars, and locomotives is the ruling factor. The coal question is especially difficult, so much so that the railways are hardly able to handle their small inland traffic.

### Railway Wages in Great Britain

The average weekly earnings of railway employees in Great Britain prior to the war in 1914 was 25 shillings a week (about \$6 at par exchange). Many increases were granted as living costs rose—at first by granting bonuses and later by making these bonuses a part of the regular weekly wage. By April, 1919, the average weekly rate had been increased to 63 shillings (approximately \$15.75 at par exchange). At this time it was agreed to add one shilling (approximately 25 cents) to the rate for every increase of 5 points in the index of the cost of living and a similar deduction for every decrease of 5 points. Permanent standards or "stop" rates were fixed at a point approximately 100 per cent above pre-war wages. Beyond this "stop" wages may not fall. The average "stop" is 53 shillings (approximately \$13.25).

Under the sliding scale of wages, with increases of one shilling for each increase of 5 points in the cost of living index, wages were increased \$2 a week above the 1919 rate. Since living costs have dropped, wage rates under the sliding scale have been decreased \$2.25 a week. Generally speaking, therefore, wages are now about \$15 a week, or 150 per cent above the pre-war level. "Stop" rates for some occupations are given in the following table. To arrive at the present rates \$2.50 should be added to the "stop" rate.

Guards (Trainmen)	Shunters (Switchmen)
First year .....\$12.50	Class 1 .....\$16.25
Second year .....12.50	Class 2 .....15.00
Third year .....13.75	Class 3 .....13.75
Fourth year .....13.75	Class 4 .....12.50
Fifth year .....15.00	Station Foremen
Sixth year .....15.00	Class 1 .....\$16.25
Seventh year .....15.00	Class 2 .....14.50
Eighth year .....16.25	Porters, Lampmen and Crossing
	Watchmen from \$10.00 to \$12.00
	Ticket Collectors,

NOTE—Shillings to dollars at .25. from \$13.50 to \$15.00

The total wage bill of the British railways in 1920 amounted to \$798,106,000, as compared with \$228,725,000 in 1913, or an increase of 250 per cent. Fifty-two cents of every dollar spent by the railroads in 1920 went for wages, as compared with 35 cents in 1913. The *Railway Age* is indebted to the Bureau of Railway Economics for the data herewith presented.

### Training of Apprentices on the Victorian Railways

The State Railways of Victoria, Australia, have in operation a comprehensive system of training apprentices, according to the Engineer (London). To quote: "Under these regulations it is possible to obtain a very good class of youths who, after a training in technical and practical work, are well prepared to become first class tradesmen, and eventually foremen. In some cases, when the ability of an apprentice is outstanding, he may become a member of the professional staff, and in course of time may be appointed head of his branch, as has occurred quite recently, when one, who joined the service as an apprentice 15 years ago, was appointed chief electrical engineer of the Victoria railways."

Bulletins are posted in various places announcing vacancies in the occupations and applicants apply in writing. When an apprentice is employed he is placed on probation for six months at the end of which time his fitness has been determined. The period of apprenticeship is five years, during which time the apprentice performs duties of the trade he is studying at one of the shops of the system. At the same time he must attend classes in designated trade schools where his tuition is paid. Apprentices are, as a general rule, paid 75 cents a day for the first year, 93 cents the second year, \$1.31 the third year, \$1.68 the fourth year and \$2.25 the fifth year.

The school work required of all first year apprentices is the same, viz.: elementary science, arithmetic and geometry. In the second year the courses are mathematics, drawing and applied

mechanics. Different courses are provided the third year for various crafts. Some of them are algebra, solid geometry, engineering drawing, electricity, steam and design. Various prizes are offered by the company for good school work and of each third year class one student is chosen to study engineering. This student devotes the next two years, full time, to this work and receives \$650 a year in lieu of wages besides his free tuition. If he completes the course satisfactorily he is given the position of engineering assistant at an entrance salary of \$1,125 per annum.

### Bids on Equipment for China

Frank Rhea, trade commissioner at Peking, has prepared an interesting analysis of the recent bids of equipment concerns for cars and locomotives for China. The successful bids were not accepted on a basis of price alone, but also on strict adherence to the specifications. The bids were as follows:

30 PRAIRIE TYPE LOCOMOTIVES			
Nationality		Nationality	
Belgian .....	\$35,610	German .....	\$49,215*
Japanese .....	40,296	British .....	50,878
American .....	44,200*		
6 BRITISH TYPE LOCOMOTIVES			
Belgian .....	34,201	British .....	43,805
American .....	43,230*	German .....	49,540*
3 PACIFIC TYPE LOCOMOTIVES			
American .....	50,880*	British .....	53,348
Japanese .....	39,822	German .....	53,910*
Belgian .....	40,525		
2 MIKADO TYPE LOCOMOTIVES			
American .....	52,000*	British .....	\$5,567
Belgian .....	43,170	German .....	\$7,000*
Japanese .....	47,408		
100 OPEN CARS			
Belgian .....	2,464	Japanese .....	2,844
German .....	2,283	British .....	3,786
American .....	2,550*		
100 COVERED CARS			
Belgian .....	2,674	American .....	2,620*
German .....	2,509	British .....	4,325

Note—Shanghai Taels shown as dollars at .645.

\*Original bid in dollars.

From the above tables it will be noticed that the Belgian and Japanese bids are usually lowest and the British and German the highest with the American bids intermediate. The successful bidders in each case were as follows:

Orders	Successful bidders	Manufacturers
30 Prairie locomotives..	Société Belge pour l'Export. Ind.	Various Belgian manufacturers.
6 British locomotives..	Société Belge pour l'Export. Ind.	Various Belgian manufacturers.
2 Mikado locomotives..	Mitsui Bussan Kaisha.	American Locomotive Company.
3 Pacific locomotives..	Mitsui Bussan Kaisha.	American Locomotive Company.
100 Open cars .....	Fearon, Daniel & Co.	Cie. Général de Construction, Belgium.
100 Covered cars .....	Fearon, Daniel & Co.	Cie. Général de Construction, Belgium.

It will be noted that the greater part of the business went to Belgium, because these bids were in most cases the lowest conforming strictly to specifications. The factor of exchange, of course, enters largely into these bids. According to Mr. Rhea, if the Belgian franc would increase from 8 cents to 10 cents in exchange value the Belgian bids would in most cases cited above have been higher than the American bids.

### Government Ownership Scathingly

#### Denounced in Australia

That the output of primary products in Australia is decreasing is the statement of A. W. Pearce, editor of the *Pastoralists' Review* in an article in the *Railway Gazette* (London). Mr. Pearce lays the blame for this unhealthy condition at the door of the state owned railways. Mr. Pearce says:

"The fact is that when the Australian states determined on a state owned railway system they took the wrong turning, the one that naturally led to stagnation. It meant that the country could only get railways constructed through already populated districts, and then only by political intrigue. It meant centralization at the termini of the one system of railways. It meant cutting off from all country districts their rightful means of tax-

tion, which was needed by them for their local requirements, and it meant that only a very few immigrants would be brought in, and those mostly of poor quality. It further meant a railway monopoly of the worst description, viz., a political one, with the very worst accommodation. In fact, there being no competition, it meant that the public had to put up with anything the government could afford or intended to give them. Further than that it meant that, when all the state's assets were pawned and no more money could be borrowed, railway construction would cease. And, after all these drawbacks, the one reason given, viz., that the railways belonged to the people, is found to be a fallacy, because they are pawned over and over again to the bondholder, and have to be run to produce his interest. There is not one single redeeming feature in state ownership of railways."

Mr. Pearce goes further to compare the Australian railways with the Canadian Pacific. The value of that company to Canada in building up industries and encouraging the immigration of desirable foreigners is compared with the lack of interest of the Australian railways in all such matters. Continuing he says:

"There is another blot against our system. The railways are not liable for robbery, damage, or bad treatment of livestock or anything else. Employees, because they have votes, can almost do as they like, and no one dare 'sack' them. On private railways discipline must reign; and here comes in the main reason why politicians like to own the lines. Discipline and good conduct are abhorrent to a large section, and the votes of that section have to be pandered to."

### Continuous Brakes in Germany

"It is well known," says the *Railway Gazette* (London), "that Germany is one of the countries where prior to the war the Westinghouse air-pressure brake was in general use. During the war conditions suffered a change, inasmuch as the Prussian authorities in their triumphant state of mind decided to introduce something different in detail from the Westinghouse air brake, in order to avoid foreign influence in this line of business and with a view to eliminating as far as possible foreign enterprise in the German territories. To find possible opportunities for alterations in the Westinghouse brake system the patents of this company were carefully studied, with the result that the fundamental idea in one of these patents—which happened to have just expired—was selected and developed into a so-called differential brake by introducing a very complicated new kind of valve."

"Letting alone for the present its technical features, it must be said that the innovation was effected by the Knorr Company in direct co-operation with the railway authorities themselves and their high officials; in fact, the name of the so-called new brake system includes the name of one of these officials. The Prussian government then decided to replace the Westinghouse brake by this newly-prepared system, pushing ahead the introduction of the so-called Kunze-Knorr brake with the greatest energy. Thus a fact was established to compel their enemies (after Germany emerged victorious from the war) to adopt the same kind of innovations that they themselves were going to introduce. The government went ahead so precipitately that as early as 1917 the means necessary to fit up the entire rolling-stock of their goods wagons (i. e. freight cars) with this new brake were afforded by the Prussian Diet. The execution of the program was taken up without delay. As a second step the Prussian government went on to eliminate Westinghouse, assigning to the Knorr company practically the whole of the repairs on cars equipped with the Westinghouse brake proper, the brake parts being provided from the stores of the Knorr company as 'Knorr-West brake parts,' as they were called, and at prices which are fixed in an official catalogue."

"Both England and America think that these peculiar ways are neither in accordance with the aims of the International Commission, which in itself has been shunned by the Prussian authorities, nor with certain stipulations of the Peace Treaty. It would be interesting if the German Government would explain why, in spite of its heavy financial obligations, it is spending such enormous sums for new equipment, which expenditure could not be afforded even by the victorious parties for similar purposes."

## Equipment and Supplies

### Locomotives

THE ARGENTINE STATE RAILWAYS are inquiring through the locomotive builders for prices on 6 locomotives.

THE TOLEDO, ST. LOUIS & WESTERN has ordered 5 Consolidated type locomotives from the Lima Locomotive Works.

### Freight Cars

THE INTERSTATE RAILROAD contemplates having repairs made to 200, 50-ton steel coal cars.

THE DELAWARE, LACKAWANNA & WESTERN is asking for prices on 1,600 steel hopper cars of 50 tons' capacity.

THE WELLMAN-SEEVER-MORGAN COMPANY, Cleveland, Ohio, is inquiring for prices on 2, 50-ton cast steel trucks.

THE PERE MARQUETTE has awarded a contract for the repair of 350 wooden box cars to the International Car Company, Chicago.

THE BALTIMORE & OHIO, reported in the *Railway Age* of September 3, as inquiring for prices on 1,000 box and 1,000 gondola car bodies, is also asking for prices on 400 refrigerator cars, and on the repair of 1,500 box cars, 500 steel gondola cars, 500 hopper cars and 500 coke cars.

THE SOUTHERN PACIFIC, on account of the return of bad order cars to its lines, in larger numbers than could be expeditiously handled by its own forces, is having repairs made to some of these cars at the shops of the Southern Dry Dock & Shipbuilding Company at Orange, Tex. Up to the present time 100 cars have been repaired at these shops.

### Passenger Cars

THE BOLIVAR RAILROAD (Venezuela) is inquiring through the car builders for 5 passenger cars.

THE COLUMBIAN NATIONAL (South America) is inquiring through the car builders for cars for passenger train equipment.

THE TIENSIN-PUKOW, reported in the *Railway Age* of April 22, as inquiring through the car builders for from 30 to 50 passenger cars, has ordered from the Pressed Steel Car Company 10 first-class sleeping cars, 10 second-class sleeping cars, and 10 third-class sleeping cars. 5 dining cars, 5 drawing-room cars, 5 baggage, 5 postal and 3 private cars.

### Iron and Steel

THE NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock, noon, September 21, 1921, for: 75,000 lb. soft steel bars, 71,000 lb. welding steel, and 280,000 lb. steel shapes.

### Miscellaneous

THE BOSTON & ALBANY will receive bids, until 12 o'clock noon September 6, at Boston, Mass., for 1 trailer truck; 1 engine truck; 1 foot plate; 2 steam pipes; 4 steam pipe flanges; 1 pair cylinders for locomotives, and 2 relief valves.

THE PANAMA RAILROAD, 24 State Street, New York, will receive bids until 12 o'clock noon, September 20, for its requirements for one year from October 1, of fuel oil for steamship service. The contract calls for between 400,000 and 500,000 blgs. of oil.

THE NORFOLK & WESTERN will receive bids until 12 o'clock noon September 14 at Roanoke, Va., for 1,000 double coil steel springs;

50 bar special welding steel; 640 rods of wire fencing, and 545 kegs common wire nails, also for parts for electrical apparatus and for repairs to electrical apparatus.

THE NORFOLK & WESTERN will receive bids at Roanoke, Va., until 12 o'clock, noon, September 14, 1921, for 1,000 double coil steel springs, 200 gross special welding steel, 640 rods of wire fencing, 545 kegs common wire nails, repairs to electrical apparatus and parts for electrical apparatus.

THE SOUTH BUFFALO RAILWAY will receive bids until 12 o'clock noon September 12, at Lackawanna, Erie county, New York, for: 200 gross tons 80-lb. rail; 50 gross tons 90-lb. rail; 100 pairs of angle bars for 80-lb. A. S. C. E. rail and 100 pairs of angle bars for 90-lb. rail, also for 50 kegs of track bolts.

THE MISSOURI, KANSAS & TEXAS has concluded a contract with the William Graver Tank Works, Chicago, for the supplying of 55,000-bbl. steel oil storage tanks, 114 ft. 6 in. in diameter by 30 ft. 2 3/4 in. high, together with four 1,000-gal. steel elevated tanks on 24-ft. steel substructures and four 20,000-gal. horizontal tanks to be installed on a 20-ft. substructure. This equipment will be used in connection with the storing and supplying of oil for oil fuel-burning locomotives which the M., K. & T. expects to put into operation on several divisions this fall.

## Railway Construction

CANADIAN NATIONAL.—This company will build a frame freight and passenger station at Barrant, Quebec. The structure will be 21 ft. by 65 ft. and will include a machinery platform 16 ft. by 29 ft.

CENTRAL VERMONT.—This company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the erection of an electric cinder conveyor at St. Albans, Vt.

CHICAGO, ROCK ISLAND & PACIFIC.—This company is contemplating the erection of an ice house at Manly, Iowa, to cost approximately \$10,000.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has awarded a contract to the T. S. Leake Construction Company, Chicago, for the erection of an addition to its roundhouse at Eldon, Mo., to cost about \$40,000.

CHICAGO UNION STATION.—This company, which was noted in the *Railway Age* of August 27 (page 425), as accepting bids for electrical equipment for the sub-station to be installed in connection with its new railway terminal building, Chicago, has awarded the contract for this work to the Allis Chalmers Company, Milwaukee, Wis.

CHICAGO UNION STATION.—This company is accepting bids for the sub-structure for a viaduct at Madison street, Chicago.

TOLEDO, ST. LOUIS & WESTERN.—This company has awarded a contract to the Ogle Construction Company, Chicago, for the construction of a 300-ton steel coaling station at Charleston, Ill.

WICHITA NORTHWESTERN.—This company has applied to the Interstate Commerce Commission for a certificate of public convenience and necessity authorizing the construction of a line from Vaughn to La Crosse, Kans., 14 miles.

EIGHTY-EIGHT ALLEGED violations of the law forbidding railroads to keep train crews on duty longer than sixteen consecutive hours are cited in suits filed against the Philadelphia & Reading in the United States District Court at Philadelphia on August 17.

NEW YORK UNIVERSITY announces that the class in Freight Traffic Management will have its first session at the Wall Street Division of the University on Friday, September 23. The class is conducted by Asa Colton, lecturer on Trade and Transportation in the University. Men who are authorities on various phases of traffic work will address the class. The New York University Transportation Club holds monthly sessions with interesting speakers on various phases of domestic and foreign traffic. The next meeting of the club will be held at the Wall Street Division (90 Trinity Place) on Thursday evening, September 15. Everybody invited.

## Supply Trade News

The Conewanga Car Company, it is reported, will be organized to take over the plant and business of the Allegheny Tank Car Company, Warren, Pa.

J. E. Slimp, formerly with the Ohio Brass Company, and recently with the E. T. Chapin Company, Spokane, Wash., as sales manager with office at Chicago, has resigned.

Thomas H. Greenwood has been appointed factory manager of the McDougall-Burley Co., Inc., Buffalo, N. Y., makers of paint and varnish for railway uses. This company has appointed the Ehrlich Paint Company, Cincinnati, Ohio, as its representative in the Cincinnati district.

F. H. Sauter, formerly associate editor of the Locomotive Dictionary, has accepted a position with Gibbs & Hill, consulting engineers, Pennsylvania Station, New York City.

His work with this firm will have to do with the development of railway electrification. Mr. Sauter was born in Schenectady, N. Y., February 1, 1877, and was educated in the public schools of Schenectady. In 1894, he entered the General Electric Company's factory and completed a mechanical engineering course under private instruction during the factory employment period. In January, 1900, he entered the General Electric Company and in 1903, he joined the drafting department.

F. H. Sauter

Schenectady Railway Company as assistant master mechanic. In the fall of 1904, he served with the Peckham Manufacturing Company, Princeton, N. Y., as electric truck designer. In 1905, he entered the services of the American Locomotive Company, Schenectady, N. Y., and while with this company, he held positions as draftsman and designer of steam locomotives, electric trucks, and electric locomotives, and as electric locomotive and truck estimating engineer. In December, 1917, he entered the employ of the Simmons-Boardman Publishing Company as associate editor of the Locomotive Dictionary. He went to the Crown, Cork & Seal Company, Baltimore, in May, 1918, and in July of that year was made supervisor of Trade Machinery and in April, 1920, assistant manager of the machine erecting department. The duties of this position included adjustment of machine complaints and personal visitation of the trade in the entire territory east of the Mississippi and some of the Western states. On June 1, 1921, he resigned to accept his present position.

The J. G. Brill Company, Philadelphia, Pa., announces the formation of a new company, the Canadian Brill Company, Ltd., organized to build and sell electric and steam railway rolling stock in the Dominion of Canada. The new company has taken over the plant and equipment of the Preston Car & Coach Company, Ltd., Preston, Ontario, and has a number of orders now in process of construction. This plant is a modern car shop, having 1 1/2 acres of ground located on the outskirts of the city. The executives of the new company are: Samuel M. Curwen, president; H. K. Hauck, first vice-president; Alfred Clare, second vice-president; H. D. Scully, general manager and secretary; and E. P. Rawle, treasurer.

Fred A. Poor, Patrick H. Joyce, and Edward N. Roth, have been elected members of the board of directors of

Mudge & Company, Chicago. There has been no change in the control of the company, its management being as heretofore in charge of **Burton Mudge**, president, and **Robert Sinclair**, vice president. The other directors of the company are **Burton Mudge**, **Robert Sinclair**, **Egbert H. Gold** and **Edwin W. Sims**.

**Carl F. Dietz** has resigned as vice-president and general sales manager of the Norton Company, Worcester, Mass., effective October 1, to become president and general manager of the Bridgeport Brass Company, Bridgeport, Conn. Mr. Dietz has been with the Norton Company for ten years, first as plants engineer, then consecutively as assistant sales manager, sales manager of the wheel division and for two years general sales manager of the entire business. **W. LaCoste Neilson**, vice-president, succeeds Mr. Dietz as general sales manager. Mr. Neilson has been with the Norton Company for 14 years. He served for a few years as assistant sales manager, then was in charge of all foreign business, including sales and the management of the foreign plants at Wesseling, Germany, and at La Courneuve, France, with office in London, England. He was appointed a vice-president two years ago and will take charge of general sales at Worcester on October 1. He will also continue to direct the company's foreign affairs for the present.

## Obituary

**Kenneth F. Rushton**, vice-president in charge of engineering of the Baldwin Locomotive Works, died on September 2 at his home at Wynnwood, Pa., at the age of 59.

## Trade Publications

**CHUCKS**.—Prices and code words for the different styles of chucks manufactured by the Cushman Chuck Company, Hartford, Conn., are listed in a 16-page illustrated booklet which the company has recently issued. The booklet is neatly arranged and has an outside cover of transparent celluloid.

**ELECTRICAL EQUIPMENT**.—All Benjamin electrical products are listed and described in catalog No. 23, published by the Benjamin Electrical Manufacturing Company, New York. The catalog is a book with a stiff cover containing 252 pages, and special attention has been given to the grouping of the products listed to add to the convenience of the user.

**SHALLOW PITS AND OTHER COALING PLANTS**.—The Roberts & Schaefer Company, Chicago, have issued bulletin No. 43 dated August 21, 1921, containing 28 pages descriptive of the coaling stations and coaling station equipment manufactured and erected by that company with particular reference to the shallow pit type of station. The bulletin consists primarily of photographs and descriptive captions concerning coaling stations recently built by that company, including the new Tulip street coaling station built for the Philadelphia & Reading at Philadelphia.

**THE TANK CAR**.—An unusually important catalog which will be of interest to owners and users of tank cars has just been issued by the Pennsylvania Tank Line, Sharon, Pa. In addition to illustrations and specifications of cars as made by the Pennsylvania Tank Car Company, the catalog contains considerable general information, such as the A. R. A. standards and specifications for tank cars, interchange rules, mileage, demurrage, car accounting records, regulations for the transportation of inflammable and other dangerous liquids, safety appliance standard, and gauge tables for contents of tank cars.

**RAILWAY CARS FOR EXPORT AND DOMESTIC USE**.—A very complete catalog of railway cars of both export and domestic types has just been issued by the joint export sales offices of the Magor Car Corporation of New York and the National Steel Car Corporation, Ltd., of Hamilton, Ontario, Canada. The book is well illustrated and metric equivalents of all dimensions are given. A private cable code is also included for the convenience of customers. It is planned to issue other editions later in Spanish, Portuguese and French. This catalog contains 155 pages, 9 in. by 13 in., and is well printed and bound.

## Railway Financial News

**ARANSAS HARBOR TERMINAL. Authorized to Issue Notes.**—This company has been authorized by the Interstate Commerce Commission to issue \$50,000 of prior lien five-year gold notes at 6 per cent, to be pledged with the Secretary of the Treasury as security for a loan.

**Loan Approved.**—The commission has also approved a loan of \$50,000 to this company to assist it in reconstructing 6½ miles of its main line that were destroyed by a hurricane.

**BELFAST & MOOSEHEAD LAKE. Acquisition by Maine Central Authorized.**—The Interstate Commerce Commission has approved the acquisition by the Maine Central of control of this company under lease.

**BENNETTSTOWN & CHEFRAW. Authorized to Abandon Line.**—The Interstate Commerce Commission has issued a certificate authorizing this company to abandon the operation of a portion of its railroad from Brownsville to Sellers, S. C., 10.44 miles.

**CAMBRIA & INDIANA. Authorized to Issue Note.**—The Interstate Commerce Commission has granted authority to issue a one-year 7 per cent promissory note for \$500,000, the proceeds to be applied toward the payment of \$800,000 of two-year gold notes, and the company has also been authorized to pledge as collateral security therefor \$750,000 of its 6 per cent general mortgage bonds.

**CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS. Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$3,500,000 of refunding and improvement mortgage 6 per cent bonds to be deposited with the director general of railroads as security for a note for a like amount for additions and betterments which were made during the period of federal control which are to be funded.

**COLORADO & SOUTHERN. Asks Authority to Abandon Line.**—Application has been filed with the Interstate Commerce Commission for a certificate authorizing the abandonment of the line from Buena Vista to Romley, Colo., 29.42 miles, which was built to serve mines that are now closed and which no longer has connection with other parts of the company's line.

**DENVER & RIO GRANDE WESTERN. New Director.**—Bulkeley Wells, of Colorado, has been elected a director.

**EAST ST. LOUIS JUNCTION. Authorized to Issue Promissory Notes.**—The Interstate Commerce Commission has granted authority to issue a demand note to the amount of \$92,000, payable to the St. Louis National Stock Yards with interest at 7 per cent.

**FLINT BELT. Acquisition by Pere Marquette.**—See Pere Marquette.

**GEORGIA RAILROAD & BANKING COMPANY. Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$1,500,000 of 6 per cent debenture bonds dated October 1, 1921, the proceeds to be used to retire \$1,200,000 of 5 per cent bonds and \$300,000 of 6 per cent bonds. Arrangements have been made for the sale of the bonds at 95 to Spencer, Trask & Co. and William E. Bush & Co.

**GRAND TRUNK. Stock Declared Worthless.**—The common and preferred stocks are described as valueless in the opinion of the majority of an arbitration board appointed to determine what the Dominion Government should pay stockholders because of its purchase of the system. The decision, given by Sir Walter Cassels, chairman of the board, and Sir Thomas White, representative of the government was made public on September 7. William H. Taft, the other member of the board, who heard arguments in the matter before becoming Chief Justice of the United States, dissents. He was selected by the company.

Mr. Taft in his minority decision fixed no value for the stock, but said the shareholders were entitled to some con-

sideration. He said the great mistake of the shareholders was the association of the old company with the construction of the Grand Trunk Pacific.

"Had the policy dictated from London been as wise and efficient as the management in Canada," he said, "the fate of the Grand Trunk would have been different."

It is expected that the Grand Trunk will exercise its right of appeal to the Supreme Court or the Privy Council against the award.

Sir Thomas White announced the following as his conclusions:

1. The actual earning power of the Grand Trunk Railway Company before, during and since the war, and so far as can be estimated for the future, does not justify the assumption that any profits would, from the date of the acquisition by the government of the preference and common shares, namely, May, 1920, ever have been available for distribution to the holders thereof, after providing for the contingent liability of the company in respect of Grand Trunk Pacific securities guaranteed by the company and dividends upon the guarantee stock.

2. Having regard to its own continuing heavy deficits, the necessity for making provision for deferred and extraordinary maintenance and the capital construction, and its heavy liabilities in respect of securities of the Grand Trunk Pacific bearing its guarantee, the Grand Trunk Railway, but for the financial support of the government since May, 1920, must have been forced into receivership.

Upon these conclusions I find that the preference and common stock of the Grand Trunk Railway of Canada has no value. Any question as to the compassionate consideration of the shareholders must be for the government and the Parliament of Canada to deal with and not for this board.

**LIBERTY WHITE.**—*Authorized to Abandon Line.*—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of this company's line from Liberty to South McComb in the counties of Pike and Amite, Miss. About 25 miles of the line was abandoned two years ago and the certificate authorizes the abandonment of the remaining portion, on the ground that the company has neither funds nor income with which to pay operating expenses or to meet debts already incurred, and the road has been declared by the Mississippi Railroad Commission unsafe for operation.

**MAINE CENTRAL.**—*Acquisition of Belfast & Mooshead Lake.*—See Belfast & Mooshead Lake.

**MICHIGAN CENTRAL.**—*Annual Report.*—A review of this company's annual report for 1920 appears on another page of this issue.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.**—*Bond Sale.*—Dillon, Read & Co. have sold an issue of \$10,000,000 ten-year 6½ per cent collateral trust bonds at 99½. The bonds are offered subject to the approval of the Interstate Commerce Commission. They are secured by \$12,500,000 25-year first refunding mortgage 6 per cent bonds, series A, which series is limited to \$15,000,000.

**PENNSYLVANIA.**—*Official Statement Concerning Dividend.*—Accompanying the one per cent quarterly dividend checks mailed to the more than 140,000 stockholders is a note from President Samuel Rea, which says:

A check is enclosed herewith for a dividend of 2 per cent (50 cents a share) upon stock registered in your name. This dividend is at the same quarterly rate as that paid three months ago. Prior to that date for a number of years the quarterly rate was 1½ per cent. The decrease in traffic and the unsettled condition of business generally emphasize the policy of the directors in making this reduction. They felt that, although the dividend has not been earned in the present quarter nor in the portion of the year that has elapsed, yet, having regard for the maintenance of the company's credit and, therefore, for the best interests of its stockholders, it was desirable to declare a dividend of 1 per cent for the present quarter.

The company also sent to each stockholder an abstract of the answer made to the Railroad Labor Board, which was published in the *Railway Age* of August 27, 1921, page 399.

**PERE MARQUETTE.**—*Authorized to Acquire Control of Flint Belt.*—The Interstate Commerce Commission has authorized the acquisition by this company of control of the Flint Belt by purchase of its capital stock.

**SANTA FE, RATON & DES MOINES.**—*To Be Sold.*—Special Master Robert Lawrence will offer this road for sale at Raton, N. M., on October 18, to satisfy a mortgage held by the United States Mortgage & Trust Company, as trustee, made March 1, 1906, to secure a bond issue of \$1,000,000.

**SOUTHERN.**—*Hearing on Guaranty for Subsidiaries.*—Hearings were held at Washington on September 1, 2 and 3 before Director Colston, of the Bureau of Finance of the Interstate Commerce Commission, on the question of the eligibility of this com-

pany's subsidiaries to a guaranty for the six months following the termination of federal control, in view of the fact that the Southern Railway, the parent company, filed no application for the guaranty, although the subsidiaries did file written acceptance of the guaranty provisions. H. W. Miller, vice-president, gave testimony to the effect that the subsidiary companies were operated separately.

**TEXAS & NEW ORLEANS.**—*Ask Authority to Lease State Road.*—This company has filed an application with the Interstate Commerce Commission for authority to lease for five years the tracks, facilities and appurtenances of the Texas State Railroad, owned by the state of Texas, which extends from Rusk to Palestine, Texas, 32.6 miles. The state authorities were authorized by recent act of the legislature to sell or lease the road. Under the lease proposed the Texas & New Orleans is to pay the board of managers of the road 50 per cent of the net operating income as rental.

**TEXAS & PACIFIC.**—*Annual Report.*—The corporate income account for the year ended December 31, 1920, compares with the preceding year, as follows:

	1920	1919
Operating revenues (March 1—Dec. 31).....	\$35,112,377	.....
Operating expenses (March 1—Dec. 31).....	31,567,085	.....
Net from railway operations.....	3,545,293	.....
Railway tax accruals.....	1,113,059	.....
Railway operating income.....	2,424,787	.....
U. S. Government—standard return.....	677,749	\$4,107,432
U. S. Government—estimated guaranty, six months to Aug. 31, 1920.....	3,000,000	.....
Gross income.....	6,879,103	4,681,749
Interest on funded debt.....	1,729,870	1,578,180
Total deductions from gross income.....	3,927,188	2,790,868
Net income.....	2,951,915	1,890,881
Appropriated for investment in physical property.....	2,989,564	2,823,250
Income balance.....	Def. 37,649	Def. 932,369

The annual report of the Texas & Pacific will be reviewed editorially in an early issue.

**WESTERN MARYLAND.**—*Asks authority to Issue Bonds.*—Application has been filed with the Interstate Commerce Commission for authority to issue \$1,527,000 of first and refunding mortgage 5 per cent bonds as collateral for a loan of \$1,000,000, for which application has been made to the commission to enable the company to enlarge its elevator facilities at Port Covington, Baltimore.

## Treasury Payments

The Treasury has announced the payment of \$15,000,000 to the Great Northern and \$500 to the Bonlee & Western as partial payments on account of the six months' guaranty and loans from the revolving fund to the following roads:

Charles City Western .....	\$140,000
Great Northern .....	586,000
Main Central .....	400,000
Seaboard Air Line .....	375,000

## Railroad Administration Settlements

The United States Railroad Administration reports the following final settlements, and has paid out to the several roads the following amounts:

Denver & Rio Grande .....	\$800,000.00
El Paso & Southwestern .....	400,000.00
Macon Terminal .....	71,362.94
Fort Worth Union Passenger Station .....	4,529.13
Albany Passenger Terminal .....	5,679.12

The payment of these claims on final settlement is largely made up of balance of compensation due, but includes all other disputed items as between the railroad companies and the administration during the 26 months of federal control.

## Dividends Declared

Fonda, Johnstown & Gloversville.—Preferred 1½ per cent quarterly, payable September 15 to holders of record September 10.  
Mobile & Ohio.—Stock trust certificates, 2 per cent, payable October 1.  
Chicago, St. Paul, Minneapolis & Omaha.—Preferred, 3½ per cent, semi-annually; common, 2½ per cent, semi-annually; both payable September 20 to holders of record September 12.  
New York Central.—1½ per cent, quarterly, payable October 1 to holders of record September 30.  
St. Louis, Rocky Mountain & Pacific.—Common, 1 per cent, quarterly; preferred, 1½ per cent, quarterly; both payable September 30 to holders of record September 19.  
Cleveland, Cincinnati, Chicago & St. Louis.—Preferred, 1½ per cent, quarterly, payable October 20 to holders of record September 30.  
Lehigh Valley.—Common, 1½ per cent, quarterly; preferred, 2½ per cent, quarterly; both payable October 1 to holders of record September 17.  
St. Joseph, South Bend & Southern.—Common, 1 per cent, semi-annually; preferred, 2½ per cent, semi-annually; both payable September 15 to holders of record September 10.

# Annual Report

## Michigan Central Railroad Company—Seventy-fifth Annual Report

To the Stockholders of

### THE MICHIGAN CENTRAL RAILROAD COMPANY

The Board of Directors herewith submits its report for the year ended December 31, 1920, with statements showing the income account for the year and the financial condition of the company.

The operation and maintenance of the company's road were continued under federal control until 12:01 o'clock a. m. of the first day of March, 1920, at which time the company resumed the operation of its railroad property. The Board of Directors at its meeting of March 10, 1920, authorized the acceptance on behalf of the company of the guaranty provision of Section 209 of the Transportation Act, approved February 28, 1920, and such acceptance was filed with the Interstate Commerce Commission before March 15, 1920, as provided by the Act. The effect of this was a railway operating income not less than one-half the amount named in its contract with the Government as annual compensation.

The Interstate Commerce Commission by its order of July 29, 1920, granted an increase, effective August 26, 1920, in freight rates in eastern group territory of 40 per cent and of 33 1/3 per cent between points in eastern group territory and other territories. It also granted an increase in passenger rates of 20 per cent, with a surcharge on Pullman fares of 50 per cent accruing to the carriers. These increases were not immediately allowed by several of the States as to intrastate rates, so that the full effect of the advance was not measured by the percentages for interstate traffic, although, in most instances, they were subsequently allowed under further orders of the Commission.

For the full year 1920 the freight and passenger revenues showed marked advances over the previous year. The return, however, was not as great as the greater part of the tonnage increase was due to the fact that the principal source of additional tonnage was carried at relatively low rates, and while the increase in total tonnage carried was 3,626,000 tons. There was a falling off in the shipments of grain, products of agriculture, live stock, fresh meats and packing house products, and of products of animals, aggregating approximately 1,200,000 tons, while there were increases in manufactures and miscellaneous commodities of 1,900,000 tons.

The number of passengers carried during the year increased \$10,219, this increase being almost entirely in local passengers. There were 8,314 more passengers than in 1919 and 89,175 fewer commutator passengers. This is reflected in the decrease of 2.85 miles in the average distance each passenger was carried. The advance in passenger rates, however, under order of the Interstate Commerce Commission, increased the average receipts per passenger per mile from 2.848 cents to 3.179 cents.

before the Interstate Commerce Commission for so long time, an order was entered by the Commission in January, 1920, establishing increased rates from November 1, 1916, which, under the same order, were increased 25 per cent on January 1, 1919. Under this order the company received as additional compensation for the period November 1, 1916, to December 31, 1917, approximately \$160,000, while the Railroad Administration received, as its share for the period of federal control, \$485,000.

The substantial increases in pay and the changes in working conditions during and since federal control have created a situation which is giving the company grave concern. Besides the actual increase in wages granted by the Director General or ordered by the Labor Board there have been reclassifications of employees and special allowances which entail additional expense without compensating return in labor performed.

Under rule 60 of the Shop Crafts Agreement which provided that employees who are required to check in and out on their own time will be paid one hour extra at the close of each week, and under rule 3 in the same agreement, which provides that twenty minutes without loss of pay for lunch, this company incurs a substantial additional annual expense. The abolition of piece work in the shops of the company has also been the cause of heavy additional expense.

The condition of the company's equipment at the end of federal control has caused an unusual outlay for repairs, during federal control.

There was a substantial increase in the cost of fuel. Final settlement of accounts with the Railroad Administration for the period of federal control has not been effected, but the company is actively engaged in the preparation of the data necessary for use in connection with the making of such a settlement.

The settlement with the United States Government for the guaranty period—six months, March to August, 1920—in connection with the guaranty provision of the Transportation Act, is progressing.

The following is a comparative table of the mileage operated:

	1920	1919	Increase
Miles	Miles	Miles	
Main line and branches owned.....	1,186.80	1,182.97	3.83
Line jointly owned.....	71	71	...
Leased lines.....	578.35	578.35	...
Lines operated under trackage rights.....	100.03	100.03	...
Total road operated.....	1,865.89	1,862.06	3.83

The increase in mileage was on the Air Line Branch in connection with the construction of a cut-off from Air Line Junction to the east end of the northern terminal yard at Niles.

Provision was made for financing the cost of 2,000 freight-train cars and 30 locomotives allotted to the company by the Director General of Railroads, all of which have been delivered, through equipment trust agreements dated January 15, 1920, providing for the payment of 75 per cent of the cost of the equipment in the company's 6 per cent equipment notes, dated January 15, 1920, maturing in equal annual installments over a period of 15 years, the balance, pursuant to an agreement, to be deducted from the equipment depreciation and retirement credits comprising in the company's favor under the standard contract with the Director General. The total cost of the equipment will amount to \$7,025,283. The amount of notes issued is \$5,118,000.

In addition to the equipment allocated to it by and acquired from the Director General of Railroads, the company is to receive from the New York Central Railroad Company, under sub-lease, 26 locomotives, 38 passenger cars, 1,950 freight-train cars covered by that company's equipment trust agreement of 1920. The estimated cost of this equipment is \$9,356,838.80 and the sub-lease provides that the sub-lessee shall assume its pro rata share of the equipment trust certificates, principal and interest, and expenses of

the trust and shall pay that part of the cost of the sub-let equipment which is not financed through the trust, and that it shall, upon the fulfillment of the trust, become the owner of the equipment sublet to it. Under this arrangement the company's share of the cost of the certificates issued, under the trust, 7,014,971.25. The remainder of the cost, approximately 25 per cent, was obtained from the New York Central Railroad Company as a loan, for which this company issued its fifteen 6 per cent notes, maturing in equal installments, December 23, 1921-35, aggregating \$3,930,000.

On its ten-year 6 per cent promissory note dated December 23, 1920, given to the New York Central Railroad Company, this company borrowed, for additions and betterments to way and structures, \$613,000.

The changes in the funded debt of the company are shown in the following statement:

The funded debt outstanding on December 31, 1919, was.....	\$57,793,931.13
It has been increased during the year as follows:	
M. C. R. R. Co. Equipment Trust of January 15, 1920, notes.....	\$5,118,000.00
M. C. R. R. Co. proportion of N. Y. C. R. R. Co. Equipment Trust of April 15, 1920, certificates.....	7,014,971.25
15 promissory notes of the M. C. R. R. Co. dated December 23, 1920, given to the N. Y. C. R. R. Co., due serially at intervals of one year.....	3,930,000.00
Ten-year promissory note of the M. C. R. R. Co. dated December 23, 1920, given to the N. Y. C. R. R. Co.....	613,000.00
	16,675,971.35

It has been decreased during the year by payment of installments on account of equipment trusts as follows:

N. Y. C. Lines Trust of 1907, due November 1, 1920.....	\$269,425.45
N. Y. C. Lines Trust of 1910, due January 1, 1921.....	393,960.44
N. Y. C. Lines Trust of 1912, due January 1, 1921.....	151,710.90
N. Y. C. Lines Trust of 1913, due January 1, 1921.....	262,359.54
M. C. R. R. Trust of 1915, due October 1, 1920.....	300,000.00
M. C. R. R. Trust of 1917, due March 1, 1920.....	600,000.00
	1,968,456.33
leaving the funded debt outstanding on December 31, 1920.....	\$72,501,446.05

There were nominally issued during the year and pledged as collateral in connection with the ten-year promissory note given to the New York Central Railroad Company for \$613,000, this company's refunding and improvement mortgage 6 per cent bonds, series B, for a principal amount of \$507,000.

In addition to the funded debt outstanding on December 31, 1920, the loans and bills payable appearing on the balance sheet are:

Director General of Railroads.....	\$3,050,000
New York Central Railroad Co.....	5,000,000
Total.....	\$8,050,000

The capital stock of the Detroit Toledo & Milwaukee Railroad Company is owned, one-half each, by the Michigan Central Railroad Company and the New York Central Railroad Company. The road of the Detroit, Toledo & Milwaukee Railroad Company, originally extended from Dundee, Michigan, to Allegan, Michigan, a distance of 133.14 miles, and was completed between January 1, 1905, provision was made for the operation of an agreement between the Michigan Central Railroad Company and the Detroit Toledo & Milwaukee Railroad Company, a distance of 39 miles, was sold to a traction company, and the Michigan Central Railroad Company so that the portion assigned to the Michigan Central Railroad Company was the line between Moscow and Battle Creek, a distance of 47.17 miles, and the portion assigned to the Lake Shore & Michigan Southern Railroad Company was the line between Dundee and Moscow. As the original agreement of January 1, 1905, had not been modified, the Michigan Central Railroad Company and the New York Central Railroad Company executed during the year 1920 an agreement with the Detroit Toledo & Milwaukee Railroad Company, effective September 1, 1913, for the operation of the road based on the new division of mileage.

The old drawbridge across the River Rouge was found to be insufficient in strength and capacity to carry the heavy freight and passenger trains of the Michigan Central Railroad (Toledo Division) and the New York Central Railroad (Detroit Branch) and has been replaced by a double-track Strauss bascule lift bridge of 145-foot span.

Expenditures during the year for improvements on property were as follows:

Improvements on owned property used in operation.....	\$1,584,897.52
Equipment purchased and acquired less equipment retired.....	3,968,898.16
Improvements on leased property.....	155,611.03
Improvements in miscellaneous physical property.....	\$5,709,496.71
Less sale of Detroit lands, etc.....	\$42,269.20
	\$8,406,332.22
A net credit of.....	48,067.12
The net increase in property investment during the year 1920 was.....	\$5,663,329.59

In the operation of the Pension Department 53 employees were retired and placed upon the pension rolls. Of these retirements, 36 were authorized because of the attainment of seventy years of age, and 17 because of permanent physical disability. The number of pensioners who died during 1920 was 48. The number of retiree employees upon the pension rolls at the close of the year was 374. The average monthly pension allowance of these is \$7.20. The total amount paid in pensions during the year was \$2,126,901.21.

## SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

	Year ended Dec. 31, 1920	Year ended Dec. 31, 1919	Increase
Compensation accrued for the possession, use and control of the property of this company and its leased lines, as stated in contract with the Director General of Railroads—January 1 to February 29, inclusive .....	\$1,342,021.26		
Additional compensation accrued account completed additions and betterments—January 1 to February 29, inclusive.....	91,062.93		
Guaranteed net railway operating income under section 209 of Transportation Act of 1920 March 1 to August 31, inclusive .....	\$4,318,626.16		
Less operating income items audited March 1 to August 31, inclusive, applicable to the period prior to January 1, 1918 .....	\$155,770.78	4,162,855.38	
Net railway operating income—corporate account—September 1 to December 31, inclusive..	4,912,730.18		
TOTAL (compared with compensation accrued in 1919 under contract with Director General of Railroads) .....	\$10,508,669.75	\$8,699,812.56	\$1,808,857.19
MISCELLANEOUS OPERATIONS			
Revenues .....	\$139,827.63		\$139,827.63
Expenses .....	82,338.15		82,338.15
NET INCOME .....	\$57,489.48		\$57,489.48
OTHER INCOME			
Income from lease of road.....	\$151.25	\$3,380.34	—\$3,229.09
Miscellaneous rent income.....	5,845.61	14,161.59	—8,315.98
Miscellaneous non-operating physical property .....	5,095.85	5,341.01	—245.16
Dividend income .....	498,305.04	497,218.28	1,086.76
Income from funded securities.....	54,064.68	54,937.86	—873.18
Income from unfunded securities and accounts.....	563,495.98	279,355.10	284,140.88
Miscellaneous income .....	2,875.05	3,793.00	—917.95
TOTAL OTHER INCOME .....	\$1,129,833.46	\$858,187.18	\$271,646.28
GROSS INCOME .....	\$11,698,503.21	\$9,557,999.74	\$2,140,503.47
DEDUCTIONS FROM GROSS INCOME			
Rent for leased roads.....	\$2,774,791.59	\$2,783,598.46	—\$8,806.87
Miscellaneous rents .....	4,119.35	8,113.86	—3,994.51

Unrefundable overcharges .....			9,839.77
Road property retired by United States Government and not replaced, originally charged to operating expenses.....			17,198.87
DEDUCTIONS:			
Depreciation prior to July 1, 1907, on equipment retired during 1920.....			\$151,533.99
Road property abandoned .....			35,721.26
Various adjustments of accounts (net)....			8,111.83
			195,367.08
BALANCE TO CREDIT OF PROFIT AND LOSS, DECEMBER 31, 1920 .....			\$20,831,976.62

In order to preserve continuity of comparisons, operating revenues, operating expenses and other statistics have been separately shown in detail elsewhere in this report for the full calendar year 1920 regardless of federal control, guaranty period or corporate operation.

The income to the corporation, arrived at by the addition of compensation received under federal control, the guaranteed net railway operating income under Section 209 of the Transportation Act of 1920, and the net railway operating income for the four months September to December, 1920, inclusive, was more by \$1,808,857.19 than that received as compensation from the United States Government during the federal control year 1919.

During 1920 the results of operation of the stockyards at East Buffalo were included in miscellaneous operations while in 1919 they were included in the operating revenue and expense accounts. This is the cause of the increase shown in miscellaneous operations.

The increase of \$284,140.88 in the income from unfunded securities and accounts is largely due to interest received from temporary investment, in United States Treasury Certificates and other securities, of cash from the sale of equipment trust certificates of April 15, 1920, until such time as the funds were required to pay for new equipment.

Largely contributing to the increase of \$74,860.51 in charges for loss in connection with separately operated properties is this company's proportion of an increased deficit from operation of the Indiana Harbor Belt Railroad.

The increase of \$669,410.87 in interest on funded debt is due to the increase of such debt as noted elsewhere in this report, while the increase of \$53,301.20 in interest on unfunded debt is mainly in connection with United States Government accounts.

The increase of \$91,280.41 in war taxes is due to the accrual of the company's proportion of federal income tax on the taxable income of the company for the eight months of 1920 ending August 31. This tax for the last four months of the year was included in railway tax accruals. The net income of the company was not taxable in the year 1919.

The corporate general expenses shown for 1920 represent only those for the months of January and February, during which the property was under federal control, expenditures of this character for the remainder of the year being included in operating expenses. This accounts for the decrease of \$117,630.14, as shown.

Appreciative acknowledgment is made to all officers and employees of their loyal and efficient cooperation and service.

For the Board of Directors,  
ALFRED H. SMITH, President.

## Railway Officers

### Executive

**J. G. Torian**, supervisor of wages of Morgan's Louisiana & Texas, has been appointed assistant to the vice-president and general manager with headquarters at Houston, Texas. Mr. Torian will continue in the same duties as heretofore and the position of supervisor of wages has been abolished.

### Financial, Legal and Accounting

**G. A. Godfrey**, assistant auditor of revenues of the Grand Trunk, Canadian lines, with headquarters at Montreal, has been appointed acting auditor of revenues of the Grand Trunk, Western lines, with headquarters at Detroit, Mich.

**J. E. Murphy** has been appointed auditor of equipment service accounts of the New York, New Haven & Hartford with headquarters at New Haven, Conn., with jurisdiction over all car accounting and M. C. B. matters, succeeding G. H. Stachle, car accountant, deceased.

### Operating

**Harry T. Kinney**, trainmaster of the Susquehanna and Tioga divisions of the Erie, with office at Elmira, N. Y., has been appointed superintendent of the Wyoming division and of the Wilkes-Barre & Eastern Railroad, with headquarters at Dunmore, Pa., succeeding A. D. Parsons, resigned. **Paul W. Johnson** succeeds Mr. Kinney as trainmaster of the Susquehanna and Tioga divisions.

**C. W. Coe**, whose appointment as assistant general manager of the Wheeling & Lake Erie, with headquarters at Cleveland, Ohio, was announced in the *Railway Age* of September 3 (page 471), was born at Norwalk, Ohio, August 6, 1867. He entered railroad service in June, 1887, as a fireman for the Wheeling & Lake Erie. He was promoted to locomotive engineer in April, 1891, which position he held until February 1903, when he was advanced to road foreman of engines. In September, 1904, he was promoted to trainmaster, and one year later to assistant superintendent, serving in that position until 1906, when he was appointed superintendent of the Toledo division, being transferred later to the Toledo and the Cleveland divisions. In April, 1919, he was promoted to general superintendent of the Wheeling & Lake Erie, which position he held until August 15, 1921, when his recent promotion to assistant general manager became effective.

**Ernesto O. Y. Llano**, whose promotion to general manager of the National Railways of Mexico, with headquarters at Mexico City, was announced in the *Railway Age* of August 13 (page 316), was born at Ahualulco, Mexico, on October 28, 1880. He entered railway service in June, 1898, with the Mexican Central which company he served as operator and station agent until 1900, when he entered the employment of the Chihuahua & Pacific as an operator and station agent. From 1902 to 1905 he held the positions of chief dispatcher, and chief clerk to the superintendent of the Chihuahua & Pacific. In November, 1905, he entered the service of the Nacozari Railroad at Nacozari, Sonora, as chief dispatcher and in 1907 was promoted to train master and acting superintendent. He remained as acting superintendent until August, 1912, when he was promoted to general superintendent in which position he was serving at the time of his recent appointment.

### Traffic

**W. H. Cobb** has been appointed commercial agent of the Atlantic Coast Line, with headquarters at Fayetteville, N. C., and **H. H. Elliott** has been appointed commercial agent, with headquarters at Wilmington, N. C.

**W. J. Murray** has been appointed commercial agent of the Erie with headquarters at New Haven, Conn., effective September 1.

**C. A. Swope** has been appointed general eastern freight agent of the Louisville & Nashville, with headquarters at New York, effective September 1.

**R. D. McGrath** has been appointed commercial agent of the Louisiana & Arkansas, with headquarters at Kansas City, Mo., succeeding L. W. Gent, resigned.

**B. Levy** has been appointed assistant general freight agent of the Atchison, Topeka & Santa Fe, with headquarters at San Francisco, Cal., effective September 1.

**G. B. Bush**, formerly general traffic manager of the Raleigh Coal & Coke Company, Cincinnati, O., has been appointed coal service agent of the Chesapeake & Ohio.

**T. S. Davant, Jr.**, has been appointed soliciting freight agent of the Winston-Salem Southbound, with headquarters at Winston-Salem, N. C., effective September 1.

**S. H. Cummings**, coal service agent, has been promoted to assistant coal freight agent, in charge of west-bound coal and coke traffic, with headquarters at Cincinnati, Ohio.

**E. L. Blanford**, traveling freight agent of the Louisville & Nashville, with headquarters at Pittsburgh, has been promoted to commercial agent of the same road, with headquarters at New York, effective September 1.

**O. E. Lowry** has been appointed assistant general freight agent of the Chesapeake & Ohio, in charge of the tariff bureau, with headquarters at Richmond, Va., succeeding **H. S. Smith**, who has been appointed coal freight agent in charge of all coal and coke traffic, with headquarters at Richmond.

**C. D. Thomas** has been appointed assistant general freight agent of the Southern with headquarters at Cincinnati, Ohio, effective September 1. **F. E. Godfrey**, assistant general freight agent, will henceforth perform the duties hitherto assigned to **C. H. Pearson**, assistant general freight agent, who has been appointed a member of the Southern Freight Rate Committee.

**Frank P. Barr**, whose appointment as general traffic manager of the Wheeling & Lake Erie was announced in the *Railway Age* of September 3 (page 471), was born on April 5, 1878, at Canton, Ohio, and was educated in the public schools of that city. He entered railroad service on July 1, 1895, as a clerk in the car record office of the Cleveland, Canton & Southern, which road was absorbed four years later by the Wheeling & Lake Erie. Mr. Barr was appointed chief clerk in the car record office of the Wheeling & Lake Erie in February, 1906, and was promoted to car accountant in May, 1907. He was next promoted to superintendent of car service in July, 1908, in which position he served for four years, when on May 1, 1912, he was promoted to superintendent of transportation. In February, 1918, he was appointed assistant to the general manager, and he served as assistant to the federal manager during federal control. On March 1, 1920, he was appointed assistant general manager, which position he held until the time of his recent promotion.

**E. L. Hukill**, traveling representative of the assistant general manager of the New York Central, has been appointed traffic manager of the Cleveland, Southwestern & Columbus, with headquarters at Cleveland, Ohio. Mr. Hukill was born at Newark, Ohio, on August 8, 1889, and entered railroad service in March, 1906, as a yard clerk on the Baltimore & Ohio at Sandusky, Ohio. In August, 1907, he was employed by the Lake Shore & Michigan Southern in the accounting department at Chicago, and in November of the following year he returned to Sandusky as a clerk in the local freight office. He was promoted to chief clerk to the terminal yard master at Toledo, Ohio in June, 1913, and in September, 1914, he was appointed soliciting freight agent of the New York Central with the same headquarters. From September, 1918, to March, 1921, he served as traveling representative of the general superintendent. On the latter date he was appointed traveling representative of the assistant general manager and

was serving in this position at the time of his recent appointment.

### Mechanical

**S. T. Depue** has been appointed master mechanic of the Kent division of the Erie, succeeding R. V. Bloeker, resigned. Mr. Depue has been succeeded as shop superintendent at Galion, O., by **H. W. Sasser**.

**B. A. Orland** has been appointed master mechanic of the Mobile & Ohio with headquarters at Murphysboro, Ill., effective September 1. Mr. Orland's jurisdiction will extend from East St. Louis, Ill., to Tamms, Ill.

**J. C. Nolan**, superintendent of the Texas division of the Gulf Coast Lines with headquarters at Kingsville, Tex., has been appointed mechanical superintendent with the same headquarters, succeeding J. L. Lavallee, resigned. **J. E. Callahan**, superintendent of the Louisiana division with headquarters at De Quincy, La., has succeeded Mr. Nolan as superintendent of the Texas division and **G. C. Kennedy** has succeeded Mr. Callahan as superintendent of the Louisiana division.

### Engineering, Maintenance of Way and Signaling

**W. C. Kelly**, electrical foreman on the St. Louis division of the Illinois Central, with headquarters at Centralia, Ill., has resigned to become assistant electrical engineer of the Central of Georgia, with headquarters at Macon, Ga.

**E. I. Rogers**, whose appointment as chief engineer of the Peoria & Pekin Union, with headquarters at Peoria, Ill., was announced in the *Railway Age* of August 20 (page 390), was born at St. Joseph, Mo., on August 3, 1876, and entered railway service as a track apprentice on the Illinois Central in 1897. From January, 1898, to June, 1903, he served as an instrumentman on the Tennessee division of the Illinois Central, and on the latter date was promoted to assistant engineer, with headquarters at Memphis, Tenn. He served in this position until October, 1911, when he was promoted to roadmaster, with headquarters at Vicksburg, Miss. A year later, Mr. Rogers left the service of the Illinois Central to become chief engineer of the Muskogee, Oklahoma & Gulf, with headquarters at Muskogee, Okla., and later became associated with the Lorimer & Gallaher Construction Company. From August, 1914, to February, 1916, he served as chief engineer of the Texas City Transit Company, and in July of that year he returned to the Illinois Central as an engineer in the valuation department. He was appointed assistant roadmaster, with headquarters at Fort Dodge, Ia., later in the same month, and in October, 1916, he was promoted to roadmaster, with the same headquarters. He was serving in this position at the time of his recent appointment.

**E. J. Bayer**, whose appointment as engineer maintenance of way of the Evansville, Indianapolis & Terre Haute, with headquarters at Washington, Ind., was announced in the *Railway Age* of August 13 (page 317), was born at Cincinnati, Ohio, on April 1, 1888. He was educated at Purdue University and entered railroad service on July 5, 1910, with the Cleveland, Cincinnati, Chicago & St. Louis at Mt. Carmel, Ill. His entire railroad career has been spent in the service of this

company. From 1911 to 1914 he served as an assistant in the engineering corps at Indianapolis, Ind., Mattoon, Ill., and Galion, Ohio. He was promoted to assistant engineer maintenance of way with headquarters at Indianapolis on October 15, 1914, and also served in that position at Wabash, Ind., and Galion, Ohio, until June 24, 1918. On the latter date he was appointed acting engineer maintenance of way of the Cairo division, with headquarters at Mt. Carmel, Ill. He was transferred to Galion as assistant engineer maintenance of way of the Cleveland-Indianapolis division on August 1, 1919, and was serving in that position at the time of his recent appointment.

**J. W. Williams**, whose appointment as chief engineer of the Western Pacific, with headquarters at San Francisco, Cal., was announced in the *Railway Age* of August 27 (page 430), was born at Milan, Ohio, in 1879. He entered railroad service in 1897 as a stakeman on an engineering corps of the Albuquerque Eastern, on location surveys in New Mexico. He was employed by this company on location and construction work until April, 1903, when he entered the employ of the Atchison, Topeka & Santa Fe as a transitman on location surveys. He was later promoted to assistant engineer in charge of location surveys and construction in Northern California, where he remained until 1906,

when he was appointed acting chief engineer of the San Francisco & Northwestern, with headquarters at San Francisco, Cal. In 1907, when the Northwestern Pacific was formed, Mr. Williams was appointed assistant chief engineer, having charge of field work on the construction of a line through the Eel river canyon, which position he held until July, 1914, when he was promoted to chief engineer of construction of the Northwestern Pacific to succeed W. D. Edes. During the war he served as major of the first battalion, Eighteenth Engineers, and was in France for nearly two years, later being commissioned lieutenant colonel. Upon discharge from military service in July, 1919, he re-entered the service of the Northwestern Pacific, as chief engineer in charge of construction and maintenance and held this position until August 15, 1921, when he was appointed chief engineer of the Western Pacific.

J. W. Williams

E. I. Rogers

### Purchasing and Stores

**J. M. Velasco**, assistant general purchasing agent of the National Railways of Mexico, with headquarters at New York, has been appointed purchasing agent with headquarters at Mexico City. **W. L. Wibel** succeeds Mr. Velasco at New York.

### Obituary

**George L. Connor**, formerly passenger traffic manager of the New York, New Haven & Hartford, died at New Haven, Conn., on September 3. Mr. Connor was born on August 23, 1846, in Brooklyn, N. Y. He entered traffic work in 1868 as a clerk in the treasurer's office of the Narragansett Steamship Company and served in various positions in the traffic department of steamship companies until 1893, when he resigned as general passenger agent of the Old Colony Steamboat Company and the Old Colony Railroad (now a part of the New Haven) to become passenger traffic manager of the New York, New Haven & Hartford, in which position he served until the time of his retirement in 1908.

Selective Head Engine Lathe

Multispeed Planer

## Save Roundhouse Time

Machinist's time is more valuable in a roundhouse than in the back shop, because usually the work is wanted in a hurry.

Because of their ample capacity and wide range of utility Ryerson-Conradson Railroad machine tools speed up roundhouse work and shorten the time locomotives are held for repairs.

Each tool is designed for railroad work, driven direct by motor, with liberally designed parts and bearings to take the gruelling jobs typical of railroad emergencies.

Know about these latest developments in machine tool design. Ask us.

When considering the approval of estimates for signal improvements, railroad officers should take into consideration that the problem of an efficient signal power supply is changing constantly.

### Power Supply for Automatic Block Signals

The signal engineer must keep informed as to the fluctuating prices of commercial power, primary battery renewals and storage batteries, together with the cost of labor required with each of the three systems. Because of the completion of a new transmission line, that offers an excellent power supply for an alternating current system of signals, it may be desirable to revise plans for a project that had been previously developed as a straight direct current proposition. On a certain proposed installation the original estimate called for alternating current apparatus, but during the past season it was found that the local hydro-electric power company could not offer continuous service. As a result, a direct current system is being considered as the most reliable. Because the circumstances are changing from time to time it would seem advisable that the signal engineer be allowed to reconsider any estimate for a proposed signal installation that has been held up for six months or longer.

A large part of the traffic moved by the railways consists of loose bulk materials, such as sand, stone, coal, ore, grain, etc. The importance of handling such

### Portable Equipment for Handling Bulk Material

materials into and out of cars in a minimum of time is fully recognized. As a result suitable loading and unloading devices are, as a rule, provided in localities where such commodities are handled in large quantities. There are numerous other localities, however, where the amounts of bulk materials handled are too small to warrant the installation of expensive special fixed equipment. As a consequence inefficient means are often employed in the loading and unloading of cars at these less important points. Under such conditions portable loading and unloading devices which may be easily moved from place to place have proved advantageous in many instances. Such apparatus can be employed more or less constantly and in a number of ways. Probably one of the most widely used of such machines is the locomotive crane. It loads or unloads open-top equipment with equal facility and when the occasion for such service is temporarily past it readily can be utilized in other ways. While the locomotive crane is perhaps more easily adapted to general service than certain other portable loaders and unloaders, all such apparatus offers important advantages which should not be lost sight of in the choice of equipment for such localities.

How many officers are there who, having had called to their attention some incident or obligation in connecting with the performance, operation or upkeep of

### Does Water Softening Pay?

water softening plants which savors more of expense than of economy or benefit, have not asked themselves the question—does water softening pay? The storekeeper encounters a multitude of requisitions calling for expensive chemicals in car-load lots and, as has oc-

curred in not a few cases, he notes the increased demand upon a stock which, following the introduction of water softening, he had supposed would be needed less—the boiler compound. The superintendent has perhaps had called to his attention the amount of labor involved in keeping the plant stocked with supplies and the expense of operation and repair. He has perhaps encountered a vexing problem of sludge disposal at some points, or has been confronted with the necessity of removing accumulated sediment from one or more of his wayside tanks, or perhaps even of removing the incrustation from an entire underground piping system. Again local officers of the mechanical department unacquainted with pre-softening days or irritated by the restrictions placed upon their use of this or that water, continue to find cause for complaint about water, and finally the higher officer, hearing all this cannot but ask himself whether or not the water softening pays. It is a fair question which merits a fair answer. What then of the report appearing elsewhere in this issue that in one year water softening netted one railroad a saving of 190 per cent on the investment, and another railroad 120 per cent on an investment of more than \$200,000? Manifestly this is a performance which if true, or even partially true, supplies an eloquent answer at least to the question—can water softening pay—and thereby makes it a matter seemingly largely dependent on the railroad itself whether or not the process does pay.

A recent investigation of a concrete building failure disclosed the remarkable fact that it is apparently impossible to produce a concrete of a greater strength than 1,000 lb. per sq. in. at 28 days with the materials used because of wide variation in the results secured with the concrete materials available in

### Securing Good Results With Concrete

railroad work. Railway bridge engineers as a rule are inclined to be more conservative in their designs than are the engineers engaged in concrete building construction. They realize that good results in concrete work demand definite compliance with certain established requirements. Until within the last 10 or 15 years, failures or defects in concrete structures were commonly ascribed to poor cement and there is no denying that the cement was sometimes responsible. But it is now definitely established that nearly all objectionable conditions may be correctly explained by defects in the workmanship or in the materials other than the cement. The requisites for good results are now being established rapidly. They concern the quality of the materials, the proportions including the amount of water used, the thoroughness of the mixing and the protection afforded the concrete after it has been placed in the forms. Nearly all of these conditions are well under the control of the engineer with the possible exception of the selection of materials in which the questions of cost, length of haul, location on company's line and traffic considerations may sometimes enter with varying degrees of influence. Engineers responsible for concrete construction should impress their superiors with the fact that concrete structures in most cases are justified only through their high degree of permanence and that the problem is not one of obtaining permanence in 90 per cent of the structures built, but in a proportion that is as nearly 100 per cent as reasonable expenditures will make possible.

Some roads have made a practice of obtaining a large proportion of their requirements for switch engines by rebuilding old freight locomotives. Other roads

### Converting Road Engines to Switchers

have tried to keep locomotives in freight service until they are worn out and buy whatever new switching power they need. While the amount of local service will be a factor in determining which practice is advisable, the rebuilding of old power into switchers apparently has numerous advantages. A six-wheel switch engine costs about two-thirds as much as a Mikado locomotive. If a road, instead of buying switchers, spends the same amount for Mikados, these locomotives should release from freight service about as many locomotives as could have been bought new had the money been spent for switching power. If the locomotives to be converted were ready for retirement, the real cost of the Mikados in effect, therefore, would be only the cost of conversion. It would therefore pay to spend a considerable amount to make a thoroughly good switch engine from the old power. Under certain conditions it may be advisable to convert locomotives that are still good for a number of years in road service. This provides an opportunity for getting rid of locomotives that are poor steamers or have troublesome mechanical defects and, furthermore, enables the road to acquire efficient locomotives for road service more rapidly than would otherwise be possible.

Of the many failures in small business enterprises there is no question but that a very large proportion are the result of unbusinesslike methods—of deliveries behind time, goods not up to sample, inaccurate rendering of bills and a reluctance to adjust differences promptly. It is also clear that the same conditions have been responsible for much of the unfavorable attitude of the public towards the railroads and other utility companies. In view of the efforts being made by the railroads at the present time to gain the sympathy and respect of the public, it is unfortunate, to say the least, if some railroads are guilty of unbusinesslike practices in their relations to the shipper and traveler. One grievance in this connection which has been brought to our notice arises from frequent inaccuracies in freight bills and the difficulty which the shipper encounters in securing adjustments of overcharges. This condition has been sufficiently prevalent to cause the formation of freight rate adjustment agencies to handle such cases for the shipper, who is charged very large commissions on all recoveries made. Surely this condition is not conducive to good will. In the first place, the billing by the railroad companies should be so accurate as to give rise to very few complaints, and in the second place, any proper claims should be speedily adjusted. When one considers the wonderful success obtained by some of the large department stores which have been operated on the principle that "the customer is always right," it would seem that the railroads should carefully review their present practices in regard to billing and adjustments for inaccuracies.

The Bureau of Foreign and Domestic Commerce is being reorganized by Secretary Hoover on a commodity basis and

### Mr. Hoover and Railway Supplies

American concerns interested in foreign commerce in iron and steel, lumber, industrial machinery, electrical equipment and supplies, foodstuffs, automotive equipment, fuels, textiles, shoes and leather products, agricultural implements

and vehicles and rubber products. Each of these divisions is expected to keep in close touch with trade associations in its branch of industry and to extend every legitimate aid toward the development of our foreign commerce in that commodity. There can be no question of the soundness of such plans. Mr. Hoover is to be congratulated upon the manner in which he has undertaken to make his department of real service to the business community. It is to be hoped that more and more of these commodity divisions will be opened from time to time. To be more specific, when will a division of railway equipment and supplies be organized? Foreign sales of these commodities in 1920 ranked high in the list of our most important exports. The decrease in our exports of these materials during the current year shows that there is a genuine need for such assistance as Mr. Hoover is in a position to give. The trade associations in the industry would doubtless give their hearty co-operation and could assist in obtaining a well-equipped personnel for the new division. There should be no unnecessary delay in extending this service to the railway equipment industry.

The successful operation and low maintenance cost of the third-rail contact system used on the Northwestern Pacific, as described in an article in this issue, is useful information. Actual operating experiences, including mistakes as well as successes, are told in a straightforward manner with no attempt at coloring the facts. Costs are given which are very low. In justice to other contact systems, however, it should be stated that the third-rail will probably be used to a very limited extent on railroads in the United States that will adopt electric operation in the future. Its use will doubtless be limited to certain tunnel operations and to private right-of-way where traffic conditions make 600-volt direct current power the most desirable. Direct current at 3,000 volts or alternating current at 11,000 volts can meet the requirements of hauling heavy trains long distances, but it is not a practicable possibility to collect such power from a third rail. The French Commission on Electric Traction has decided on 1,500-volt direct current for the French State Railways, but it is suitable only for comparatively light traffic and a 1,500-volt third-rail, discounting insulation difficulties, should not be used even on a private right-of-way because of its danger to life. Furthermore, danger to life and danger of personal injury are not due only to the high voltage. A big freight yard full of third-rails in which switchmen get on and off of moving cars is something to stagger the imagination.

At the time steel cars were first introduced, the prediction was made that they would have an indefinitely long life. Experience has shown that this is not the case. The plates have failed after comparatively short service due to corrosion, necessitating costly repairs and in some cases complete rebuilding of the car body. Rapid deterioration due to rust is not confined to railroad equipment and engineers have given the subject attention for some time. An investigation which sheds new light on this matter has been conducted by a committee of the American Society for Testing Materials. This committee started a series of tests of sheets of various chemical compositions in 1916. Plates were exposed in three characters of atmosphere: in the industrial air of Pittsburgh, Pa., the pure air of an inland district at Fort Sheridan, Ill., and the salt air at Annapolis, Md. Practically all classes of iron and steel were included in the tests, which have now progressed to a point that enables definite conclusions to be drawn. It has been found that the presence of copper in

### Rust-Resisting Plates for Cars

amounts as low as one-tenth of one per cent causes a marked decrease in the rate of corrosion. These tests are sufficiently conclusive to warrant the expectation of much longer life from copper bearing sheets than from plain sheets used in car construction. The increase in cost is said to be comparatively small. The work already done is valuable and should go a long way toward a correct solution of the problem. However, the expenditures for equipment are so great that thorough investigation should be carried on and every promising method of reducing corrosion tried until the most economical material is found.

With the grouping of all the railways of Great Britain into four large systems, changes in organization will doubtless be

### Reorganizing the Railways of Britain

necessary. The present organization of the companies is departmental, centralized in the general manager to whom the heads of the various departments—operating, traffic, mechanical, engineering, etc.—report. There is no question but that this form of organization has in the past proved highly successful and probably no one would venture to suggest a change were it not that with greatly enlarged systems the general managers will not be able to give the same attention to detail as heretofore. The eight principal railways which go to make up the North Western group, for instance, aggregate 7,326 miles of main line,—a good sized railway even from an American point of view. The average length of the constituent railways, however, is now only a little more than 900 miles. Obviously the enlarged systems cannot reasonably expect the same accomplishment from a highly centralized management that the smaller companies can. The Railway Gazette (London) suggests as a possible solution the adoption, with certain modifications, of the form of organization in use in this country. The plan proposed provides for a president and, reporting to him, three vice-presidents. The first of these would be the "manufacturer of transport," and would be in charge of the operating, mechanical and engineering departments; the second, the "seller of transport," would be in charge of freight and passenger traffic; and the third, the "financial controller," would direct the affairs of the financial, legal, accounting and real estate departments. Some such plan as the one proposed will probably be adopted eventually and the study of this problem is quite as important as many others which the British railways must solve. American experience in railway organization will doubtless be of great value to those who are undertaking this task.

### Record Breaking Grain Traffic

THE RAILROADS have made a wonderful record during the past few weeks in the handling of the grain movement, which has exceeded in volume that for the corresponding period of any previous year. For the eight weeks ending August 27 the loading of grain and grain products was 465,839 cars, as compared with 302,623 in the corresponding period of 1920 and 381,736 in 1919, and from January 1 to August 27 this year 1,486,954 cars were loaded with grain and grain products, as compared with 1,195,485 in the corresponding period of 1920 and 1,424,416 in 1919.

The fact that this heavy early movement has been handled practically without complaint of car shortage is due not only to the lessened demand for box cars for other kinds of traffic this year, but more particularly to the careful plans made to avoid a car shortage which it was feared might develop because so large a percentage of the cars are in bad order. On August 15 there were 16.6 per cent of all the freight cars in bad order and 18.2 per cent of the box cars. The plan of campaign adopted was to exert unusual efforts to confine the

cars that were fit for grain in the grain traffic and to keep them from being diverted to other traffic, which might necessitate re-coopering, if not more extensive repairs, before they could be used again for grain. Officials and inspectors both of the Car Service Division of the American Railway Association and of the Service Bureau of the Interstate Commerce Commission have been stationed at the principal centers of grain traffic and by persistent efforts to bring about an adherence to car service rules, have managed to accomplish practically a shuttle service between the grain fields and the elevators, which has enabled the record-breaking traffic to be moved with unusual expedition.

In addition to the fact that the crop in the southwest ripened this year a little earlier than usual, it is understood that the grain producers have been hurrying their shipments to market to realize the cash as early as possible. Secretary Hoover of the Department of Commerce is quoted as saying that the unprecedented exports of wheat during August should react favorably on agricultural and business conditions throughout the country, and should particularly ease the credit situation in the grain territory. The movement so early of so large a portion of the year's crop should also relieve to a very considerable extent the strain which is usually felt by the railroads during the fall months. On August 31 they still had a surplus of 68,938 servicable grain cars and in eight months of this year the roads have moved 81 per cent of the amount of grain they moved in 12 months of 1920.

### English Bridge Engineers Consider American Practices

THE DESIGN and construction of railway bridges in America and Europe have followed independent courses. Differences in the loading requirements on the two continents and marked diversity in the relations between the costs of labor and material have no doubt caused the American and European bridge engineers to feel that they had little in common and that, therefore, they could gain nothing from the study of each other's work outside the realm of pure mathematics. Because of this fact, which is well-known among American railway bridge engineers, they will learn with some elation that English engineers are now seriously considering the adoption of one American design practice which differs in a marked way from that which is now in common use in their country. This refers to the method employed in making allowance for the impact of rapidly moving loads.

While American engineers have now accomplished almost a complete transition from the old Cooper method of separate dead load and live load stresses to the use of a proportional increment in the live load, English bridge designers are governed by certain long-established Board of Trade rules founded on arbitrary rather than scientific considerations. Canadian practice has followed closely that of the United States. In fact, except for minor differences in official specifications the practices may be said to be identical. What is of even greater interest is the fact that the railways of India have been using the Pencoyd impact formula for a number of years and have taken steps from time to time to keep closely in touch with the latest developments in American bridge design practices.

No doubt, it was the advanced practice by the two colonies which eventually influenced the engineers of the mother country to review their own methods of allowing for impact in the design of railway bridges. English railway engineers are now studying the results of tests made during the past year on 20 English railway bridges with a view to the establishment of an impact formula suitable to English railway conditions but which will be applied along lines similar to those prevailing in this country. In this connection, it is

of special interest to note that the Railway Engineers' Association (English) has definitely recommended the adoption of the Pencoyd or Schneider formula, which was the established standard of the A. R. E. A. until it was abandoned in 1917 in favor of the new

$$\frac{300}{300 + 100} 1.2$$

Major A. Mount, inspecting officer of the Minister of Transport, who prepared a report on the tests, pointed to the exorbitant allowance for long span bridges under the Pencoyd formula, but opposes the adoption of the new A. R. E. A. formula in favor of one of his own selection which gives values of more than unity for spans less than 30 ft. long. The justification for this is that tests made on the English bridges gave very high values for certain floor members; it is entirely possible that English bridge loading details are such that the actual impact formula adopted cannot consistently coincide with that now the standard in this country. It is, however, a matter of no little satisfaction to American bridge engineers that the methods which they were instrumental in effecting for use in this country are gradually finding application elsewhere.

## Improve the Quality of Repair Work

THE IMPORTANCE of emphasizing quality vs. quantity shop output was pointed out in an editorial in last week's *Railway Age*. The question naturally arises: How is it possible to obtain a better grade of railroad repair shop work and raise maintenance standards to the desired point? Probably the most important step to this end would be in the further development of able, conscientious inspection forces for both repair shops and roundhouses. It is absolutely essential that locomotives and cars be carefully and periodically inspected to discover which parts are subject to undue wear and which show evidences of possible failure.

After inspection, the next step is to get reported defects corrected promptly and properly. An adequate number of competent repairmen must be available for this purpose and as far as possible the work should be assigned, each man being held individually responsible for the correct performance of his particular assignment. It is only in this way that work of the best quality can be assured and equipment released from the shops in condition to make the stipulated mileage before coming in again for heavy repairs. If, due to inferior workmanship, the required mileage is not made there is a serious reduction in revenue-earning hours.

Good inspectors are needed and capable shopmen, all of whom should be made to feel that the managements expect a reasonable amount of high quality work, with emphasis on the quality. The idea which workmen have regarding executive officers is determined largely by personal contact with the foremen, but the foremen themselves can never impart an enthusiastic desire for good workmanship unless that desire is in turn transmitted to them from the higher mechanical department officers. The latter must start the ball rolling.

There is nothing so conducive to interest as competition. Why not start a competition between the various shop foremen to determine which one turns out the best work, or, at least, which one goes the longest without a failure chargeable to his department? This would provide a valuable incentive for careful work. Then again, personal pride in good workmanship may be encouraged and thus help raise the standard of locomotive and car maintenance. Very often, for example, a gang foreman becomes noted for turning out "smart locomotives," meaning by that locomotives which get up speed quickly, have square valves

with clear-cut, even exhausts and show no evidence of the "lazy" action sometimes found. Both gang foreman and repairmen take pride in the care and workmanship which make engineers praise the locomotives they have repaired. If other foremen in all departments could be imbued with the same spirit, it would be hard to estimate the number of accidents prevented, the increase in revenue-earning hours of equipment and the reduction in maintenance expense.

## Robbing Peter to Pay Paul

WE HAVE REFERRED editorially in recent issues\* to the direct interest of the railways in the extensive highway construction program now underway and have urged them to give more direct attention to the manner in which the money they are paying in taxes is being spent for the construction and maintenance of these roads. There are other phases of this highway construction program which demand equally serious attention. When the "good roads" movement was in its infancy, the support of the railways was solicited and given freely. The action of the railway executives in pointing out the value of improved roads to the farmer as an aid to him in bringing his products to the railway for shipment to market, independent of the weather, did much to create a favorable public sentiment.

Once this sentiment for improved roads was aroused, however, highway development has been carried on largely parallel to and in competition with the railways, rather than supplemental to them. The result is that this new avenue of transportation is of little aid to the farmer remote from the railway and most in need of relief. Also in return for their earlier co-operation and support the railways find the effect of the highway construction program is, in large measure, detrimental rather than otherwise.

Unmindful of this, the highway construction advocates were among the most active in their criticism of the railways for their inability to furnish cars for the moving of the large quantities of road-building materials last year. They have likewise been active in agitating for the reduction of rates on materials used in this work. Quoting from the Litchfield County (Conn.) Leader, "It seems a bit like irony for the convention of the American Road Builders' Association at Chicago, to demand that the railroads lower the price of transportation on all materials, cement, crushed stone, etc., used to build highways. The same highways, of course, are designed to make more efficient and economical the use of trucks which are fast taking away the business of the railroads. Isn't it 'crowding the mourners?'"

The direction which the highway construction program has taken also raises another question regarding the extent to which the railways should be required to contribute to the building of these thoroughfares over which other agencies can divert a large amount of the traffic now handled by the railways. This question has already been raised in the courts in a number of instances. In a decision handed down by the United States Supreme Court on June 6, 1921, on a petition brought by the Kansas City Southern against a road improvement district in Arkansas the court stated that "It is doubtful whether any substantial appreciation in value of the railway property within the district will result from the improvement." Obviously if no benefit is obtained, an assessment against the railroad based on benefits to it in common with other property owners within the district, can not be sustained. In view of the changes in the form which the highway construction program is now taking, it is to be expected that the relation of the railways to this program will be modified greatly. This subject is worthy of the most serious attention of railway officers for it has many far-reaching ramifications.

## Letters to the Editor

### A Question

NEW YORK.

TO THE EDITOR:

The rumors which are in the air at the present time about the large railroad bridge to be built across the Hudson brought back to me a short article in a French magazine (title of article and magazine forgotten) which I had read some time ago. It came back much as a tune we heard somewhere will come back a few weeks or months later to haunt us and set us wondering what it is and when and where we heard it. Though I cannot truthfully say that the article is haunting me, yet it makes me dream once in a while, and just as the dreamer, when he wakes, feels the urge to tell his dream to somebody else, so do I feel the need of unburdening myself. This is the dream:

There are now in existence certain alloys which compare in strength with mild steel, such steel as is used for structural work. These alloys weigh only about one-third as much as steel, volume for volume. Let us see how these two metals compare when we make a bar of each of them and lay them on supports such a distance apart that the bar is about to break by its own weight. Let the distance between supports be  $l$  inches; let the bar be of square section with a side  $a$  for the steel bar and  $a_1$  for the alloy bar; let the weight of a cubic inch of steel be  $w$  and of a cubic inch of alloy  $w_1 = \frac{1}{3}w$ .

This bar of steel will weigh  $l a^2 w$ , and as this is the load which is evenly distributed over a length  $l$ , the bending moment will be

$$M_b = \frac{1}{8} l^2 a^2 w$$

If the fiber stress caused by this moment is  $S$ , we find

$$\frac{1}{8} l^2 a^2 w = \frac{1}{6} S a^3$$

$$a = \frac{l}{S} \times w$$

Similarly we find

$$a_1 = \frac{l}{S} \times w_1 = \frac{l}{S} \times \frac{1}{3}w = \frac{1}{3}a$$

We see, then, that the side of the section of the alloy bar will be  $\frac{1}{3}$  of that of the steel bar, so that the area of the section will be  $\frac{1}{9}$  of that of the steel bar and, as both bars have the same length, its volume will be  $\frac{1}{9}$  of that of the steel bar. Remembering that its specific gravity is  $\frac{1}{3}$  that of steel, we see that the weight of the alloy bar will be  $\frac{1}{27}$  of that of the steel bar.

If we were confronted with the problem of laying such a bar across a long span (let us say the Hudson river), we would investigate the prices of the two kinds of material and we would come to the conclusion that the alloy is cheaper so long as it costs less than 27 times as much per pound as steel. If we had to provide the supports also we would naturally consider that they can be made much lighter and do not require such costly foundations if the alloy is used, and we would not forget that the trouble and expense of putting the bar in place would be very much less; all which factors are in favor of the alloy even if it should cost 27 times as much per pound as steel.

As nobody has ever indicated a desire to lay a bar of steel across the Hudson river, it might well be asked what this is all about. The answer is this: that a long span bridge is, in many respects, a bar laid on two supports and loaded with its own weight. But what about the live load? The heavy trains crossing the bridge? It has been remarked that the presence of a train on a long span bridge may be compared to a fly

sitting on the washline. The fly does add to the load, but not very much. There are, however, various other things which do add materially to the load, such as the roadway, the tracks, the bracing for wind pressure, etc.

Granting that there are such disturbing factors, the question remains: Does not a long span bridge resemble a bar laid on supports sufficiently to make it worth while investigating whether there are not conditions under which the lighter, though higher priced, alloys can be used to advantage? Of course, this much remains certain: That unless a very large portion of the load is the weight of the structural material itself the cheaper material is bound to win out. It might well be, however, that the proportion of load caused by the weight of the structural material is so large that lighter materials might be used to advantage.

A. L. DELEEUW

### The Mechanical Association

NEW YORK.

TO THE EDITOR:

The railroad officer who signs himself "Mechanical Engineer" and who wrote the letter entitled "Revive the M. M. and M. C. B. Associations," which was published in your September 10 issue, page 479, was a mighty poor diagnostician. The trouble is not with the present organization of Division V—Mechanical, A. R. A. The fault lies much deeper than that and was just as true when the M. M. and M. C. B. Associations were in existence as it is today.

The fundamental trouble, in my opinion, is that the officers of these associations were lacking in vision when they laid out the programs and assigned the committee work. With a few exceptions, which stand out in bold relief, the reports and papers read before the mechanical associations have concerned themselves with details of design and construction, or in the development of recommended practices for operation and details of maintenance.

These are important, so far as they go. They are more or less in line also with the kind of reports and papers which in past years have been presented before our national engineering and technical associations. Times have changed, however, and even men in the strictly engineering professions have come to realize that after all, improved and more economic production requires a knowledge of the principles of good management and understanding of how to deal with men. The mechanical department has in its control large numbers of men working in various and widely different capacities. The problem before the railroads today is that of men and how to handle them, and yet where have the mechanical associations ever really shown a realization of this problem? The American Railway Engineering Association has a standing committee on the economics of labor. Is it not even more important that our mechanical associations should at least go as far as has this sister organization?

Then there is the great field of operation. Is the mechanical department entirely disinterested in indicating how to get the best results from a locomotive or how to determine what class of power should be ordered? Has it no interest in understanding, and in helping other departments to understand, the economics of operation? What have the mechanical associations ever done to throw real light on the larger problems such as these? Have mechanical department officers, like the ostrich, got their heads buried in sand?

The *Railway Age* had a long article in its issue of June 10 entitled "Mechanical Department Must Tackle Big Program," and a similar one in the issue of August 20 entitled "Will the Mechanical Department Make Good?" You tried to show what were the really big problems before the railroad mechanical world today. Did you intend to throw into bold contrast the fact that the program of Division V—Mechanical

cal hardly touches in even the remotest way upon the most important of these problems? Nor have the M. M. or M. C. B. Associations ever shown any real interest in them.

No, the trouble is not that the M. M. and M. C. B. Associations have lost their identity; the real trouble is that these associations and their successor, although they have done remarkably fine work in certain directions, have never even scratched the surface of some of the larger mechanical department problems. Is it not time that something was at least started in this direction?

WEE GA.

## Keeping Turntable Open in Winter

DETROIT, Mich

TO THE EDITOR:

The article entitled "Cover to Keep Out Snow Complicates Turntable Replacement," which appeared in your issue of August 27, page 412, suggests the importance of a positive and suitable method of eliminating heavy snowfalls from turntable pits and roundhouse tracks. Railroadng under cover is expensive, although necessary, in such extreme cases as that described at White River, Ontario.

A comparatively inexpensive expedient is an arrangement for holding and heating a considerable depth of water in the turntable pit for the purpose of melting the snow. There are two locomotive terminals so equipped in Calumet, Michigan, where the annual snow-fall frequently reaches 112 in. and where winter winds and temperatures are especially severe.

The turntable pit is of ample depth, the concave floor being of concrete and draining into a 10 in. sewer through a vertical flanged cast-iron pipe on which an extra length of pipe is coupled for winter use. The top of this inlet extension is placed at an elevation only slightly below the base of the turntable center to protect it against overflow. At the beginning of winter the extension pipe is put in use, the pit is filled with water which is heated and kept continuously hot through the use of exhaust steam from a line in the roundhouse. Any snow which falls between the turntable and the roundhouse melts readily when shovelled into the pit. This arrangement has proved so economical and has given such un-failing service under all emergency conditions that it would seem applicable in all but the most extreme climates. The chief points to be observed are the arrangements for a suitable depth of water below the turntable center and the continuous application of heat. Almost any existing turntable pit with a concrete floor can be inexpensively fitted for winter operation as described.

E. R. LEWIS.

## Unnecessary Transferring of Loaded Cars

GREENVILLE, TEXAS.

TO THE EDITOR:

Transferring of loaded cars at interchange points is one of the most abused and unnecessary practices imposed upon common carriers by the American Railway Association rules. The railroads of this country pay out millions of dollars each year for labor in unnecessarily transferring loads. This delays traffic, causes damage claims and runs up the per diem, because some narrow-minded car inspector or disinterested car foreman or bureau of interchange inspector is too technical in applying the A. R. A. rules.

Lading is transferred for slight defects to the cars that could be repaired in fifteen or twenty man-hours or less, or in many cases they could be run with perfect safety. I have found that at points where interchange bureaus are

operated this practice is more pronounced than at points where the lines interchange with their own inspectors. Cars will be carded for transfer and the receiving line pays the per diem, the delivering line paying for the labor of transferring the lading; both participate in the claims arising from such transfers and, incidentally, the shipment is delayed. I have found cars passing through the interchange which were carded by the inspector to transfer the loads; these transfers were made by the receiving line and the cars were returned empty to the delivering line; the empties were then loaded without any repairs being made to the cars and such cars have passed from three to four interchange points in the next 30 days without any exceptions being noted.

There should be a rule that all cars that could be repaired within 24 man-hours should either be run or repaired at the receiving line's expense. Of course, if a car is not safe to run it must be repaired and if it cannot be repaired within less than 24 man-hours, the load should be transferred and the delivering line billed as per A. R. A. rules 2 and 14.

There are more pernicious practices growing out of the technical application of the A. R. A. rule applying to this matter than to any other three rules in the code. This results in delayed equipment, increased per diem expense, labor expense for making the transfer, claims arising from the transfer, and delay to the commodities. Inspectors, transfer contractors, contractor laborers, etc., are, in a great many instances, vitally interested in the transfer of cars. The number of the cars transferred fluctuates with the car situation; when cars are scarce the ratio of the number of transfers to the number of cars handled decreases, but when equipment is plentiful the inspection is more critical and a more technical application of the A. R. A. rule is followed. The flash-light is then brought into use at some points.

I am sure a reasonable remedy can be found without forfeiting any of the precepts of safety.

R. R. FARMER,  
Superintendent, M. K. & T.

## Railroads as Manufacturers

NEW YORK.

TO THE EDITOR:

When in railroad service I found greatest difficulty in doing a bit of manufacturing because my plans went awry. Material was ready but the men were not. The men were ready and material was not. The cost was scandalous. I am not proud of the real cost of the standard parts I ordered but I was never called to account, because the officers I reported to wanted the road to make everything that it could make. It seemed economical; but was it?

Even in these times railroads are asking manufacturers for drawings of locomotive parts the patents for which have expired. Even in these times they are making these themselves. It is and always will be a financial mistake for anybody whose time is valuable in his particular line to deviate from that line and try to play the part of some one else. An artist on the harp seldom can be also an artist on the slide trombone. The business of the railroad is to transport. To manufacture is foreign to its ideals and also to its possibilities. Every railroad job—particularly as applied to the mechanical department—is an emergency. It is necessary to get this engine or that engine back into service as quickly and as cheaply as possible. Engines cost money. Every moment they lose in the shop or at the roundhouse increases the cost of transportation. To interfere with the repair program of locomotives or car equipment is a mistake and a costly one.

Railroad labor is high in cost. It is higher than railroad history has ever known. Railroad labor is not gifted in manufacturing. It is accustomed to work on this job or that, different work for every emergency that every day brings. It is really too much to ask repair forces or men allied with

repair work to manufacture anything on a proper cost basis. To be successful, manufacturers must get volume of work. No railroad shop can have sufficient volume to keep men steadily employed on specialties to make any money out of them. When you build fifty locomotives all alike the cost per engine is less than when you build two or three.

Manufacturers deal in volume. Naturally they can reduce costs by fitting up to use automatic machinery, to study out the cheapest methods of doing the work; and they can manufacture at less cost than anybody but specialists can reach. Time is required to find blue prints, to get material, to set up the machinery, to put the work in the machines. Time and money are required to make gages, fixtures, jigs and templates. All this goes into the "overhead" of the railroad that attempts manufacturing; but unfortunately it is concealed and the actual cost of railroad manufacturing is never known. Manufacturers must know these elements of cost or they go "broke."

Of all times this is the time for the roads to reduce the cost of transportation. It can best be done by applying every effort to reduce the cost of maintenance of equipment and by leaving manufacturing to those who are equipped with machinery, who have experience and knowledge of every detail of manufacturing. How would the railroads make good in the manufacture of rail or of bridge material? How will they make good in manufacturing anything else except transportation, which is their real problem?

This communication is called forth by your comments on page 332 of your impression of August 20, 1921, under the heading—"The Manufacture of Standard Repair Parts."

It is the subscriber's belief that no railroad can afford to make any standard repair part that it can buy. Every time railroads do any manufacturing of things they can better buy they cost their stockholders money that those stockholders cannot afford to lose, especially now.

G. M. BASFORD.

## Railroad Opportunities as Seen by a College Student

PROGRESS, Pa.

TO THE EDITOR:

As an undergraduate in the transportation engineering option of civil engineering at the Massachusetts Institute of Technology, I have been very much interested by the current discussion in your columns in regard to the railroads and college men. So far as I know, the railroads are not getting men from M. I. T.; they are not trying to get them. Other industries are getting our men; but they come after them. To me, that means railroads either do not want college-trained men, or, at best, they are satisfied with an inferior grade. If railroads do want college men, in order to get them they must make an effort equal to that of other industries. Except, perhaps, in this rather unusual year, graduates from the country's best technical schools are not out looking for a job, in which, if there is any future at all, it is doubtful and remotely placed with respect to time. This is not because the college man has an exaggerated estimation of his worth, but because for a day's work he feels entitled to a day's pay.

M. I. T. is one of the institutions which do not overspecialize on the technical ends. In its course of railroad transportation, including such subjects as economics, railroad design, railroad operation, etc., it would seem that the ideal expressed by Vice-president Ennes, of the Wheeling & Lake Erie (*Railway Age*, August 20, 1921, page 323) were reached as nearly as possible. Yet railroads do not recruit from M. I. T.

The reason railroads shun college men is apparently that they prefer to stagger along with less highly trained, less expensive, yet often inefficient help, blinding themselves to the

progress of other industries employing college trained men in responsible positions with the time-worn statement that railroading is specialized work, and that it can be learned only if you had no specialized training at the start and by years of monotonous routine at some inconspicuous job. Personally, I cannot believe that the transportation industry is so much different from the hundreds of others, which wait outside the doors of our universities and technical institutions each June to pick their future leaders.

The sooner the railroads get away from the old idea that because they always have done so and so they always will, and as the last big industry to turn the corner, find that the trained and disciplined mind, as represented by the best college graduate, can do for them what it has for the steel and manufacturing industries and construction corporations, the better it will be, both for them and for the country at large. A recruiting system as outlined by Mr. Hanson in "How Sincerely Do Railroads Want College Men" (*Railway Age*, July 16, 1921, page 121), would be a big step in this direction.

A. P. R. R. "SUMMER-CHAIRMAN."

## Non-Interlocked Railroad Crossings

ST. PAUL, MINN.

TO THE EDITOR:

On page 1165 of the *Railway Age* of May 20, 1921, appears an article entitled "Non-Interlocking, No-Stop Railroad Crossing." I was of the opinion that this arrangement was more or less common throughout the country but it seems that there are many who think it is new and that it needs to be tried out. It will therefore, no doubt, be interesting to your readers to know that on the Northern Pacific there are 2½ junctions of branch lines and foreign main lines connecting to the main line, 6 of which are double-track junctions, which are protected in a manner similar to that outlined in the article above referred to.

With reference to automatic signal arrangements at crossings in lieu of interlocking; while we do not have crossings of exactly this nature, we do have gauntlet tracks over three different bridges which introduce practically the same conditions as exist at crossings. The most important of these is our gauntlet over the Yellowstone river bridge at Billings, Mont., which is used by the main line trains of the Chicago, Burlington & Quincy and the Northern Pacific. There are also a great number of switching movements over this bridge. The movement of trains over the gauntlet is treated as single track operation. The normal position of the distant signals on both the eastward and westward tracks is "Caution." The normal position of the home signals is "Stop." The circuits are so arranged that the clearing of one home signal holds the other at block, but after the train using the cleared route has passed out of the track circuits involved in the gauntlet operation, a second home signal will clear if there is a train on its preliminary section.

We have never had the slightest trouble or any near accidents with this signaling arrangement. There is no difficulty in designing a circuit that will take care of any railroad crossing and that will work at all times. In fact, it is not quite so difficult as a great many of the absolute-permissive-block circuits for single track, and as far as safety is concerned, I consider a railroad crossing automatically signaled safer than a piece of single track automatically signaled. On a single track automatically signaled, if two trains should get away from stations at the same time, heading towards each other, they would be stopped by intermediate signals and one of them would have to back up to a siding to let the other pass. At a railroad crossing, or a gauntlet track, if two trains should strike the preliminary or clearing section at the same time, the signals for one train only would

clear and after that train had gone the other route would clear and no flagging would be necessary.

It is my opinion that for automatic signaling at a crossing, the signaling should be arranged so that a distant signal would show "Stop" if the home signal were at "Stop," and be a permissive signal to permit trains to stop and then proceed with caution to the home signal. The train would then proceed over the crossing when the home signal cleared or would have to flag over if there was a signal failure. It will be seen that under a good system of automatic crossing signaling, trains could get out of each other's way much quicker and with more safety than they can when they meet between sidings on single track.

In 1899 the Rowell-Potter Signal Company installed an automatic interlocking at a crossing of the Peoria, Decatur & Evansville with the St. Louis, Peoria & Northern at Hawley, Ill. This interlocking was in full operation for some time and I believe was approved by the Railroad Commission of Illinois.

In the earlier days of signal devices on railroads, when the discipline among the trainmen was very poor, it was necessary to install derails to enforce the observance of signals, but today with good discipline on the majority of roads, there is no more need of installing derails to enforce the observance of home signals at interlocking plants than there would be to install a derail back of every automatic block signal and particularly on single track.

C. A. CHRISTOFFERSON,  
Signal Engineer, Northern Pacific.

## The Protection of Highway Crossings

BALTIMORE, Md.

### TO THE EDITOR:

Various means have been devised to educate the motorist to exercise caution when approaching a railroad crossing. At all highway crossings signs are displayed, and in many cases a watchman or automatic signal is provided to give warning. Although many crossings are protected by watchmen, the highway crossing signal has been widely adopted because of its comparatively low cost.

The most universal form of highway crossing signal is the audible alarm, commonly known as the crossing bell, consisting of an electric bell mounted on a post and connected through a relay to a track circuit. Such a device has two serious drawbacks. The first (not of much importance 25 years ago) is that it is sometimes impossible to hear the bell when riding in a closed automobile or when driving a car with a noisy engine. The second objection to the audible signals in use is the fundamental principle upon which they are operated, namely, that it takes energy for the signal to display its restrictive indication; should the source of energy fail, the signal would give no indication that it is out of order. In other words, it would fail on the side of danger.

In view of the drawbacks to the audible signal, a number of railroads are replacing this type of warning with a signal that will give a visual indication. There are four principal types of visual crossing signals: (1) the swinging disk, operating on an open circuit; (2) the three-aspect swinging disk giving a failure indication; (3) the flashing light signal, and (4) the strictly closed circuit position-signal, its restrictive indication being displayed by a banner released by gravity and a flashing light.

Due to the importance of the function which the crossing signal must perform, it must be more than mechanically perfect. It must be psychologically perfect. That is, it must be of such a design as to attract the attention of the most careless motorist. The light signal, though on the open circuit principle, is, because of the absence of moving parts, mechanically perfect. But is it psychologically perfect? Will the motorist, driving at forty miles an hour, observe this red light? How will he construe it, especially at night?

A moving or a flashing light attracts the eye, but a crossing signal should do more than merely attract attention. It should convey a definite meaning—*stop*. The flashing or moving light is a bait to attract the motorist's attention. But it must do more. It must awaken him to the seriousness of the occasion; and this can be done only by utilizing the English language; by displaying a banner lettered with the word "STOP."

A crossing signal of this nature, combining the effectiveness of the flashing light and the definite warning as expressed by a banner displaying "stop" on the approach of a train, is both mechanically and psychologically perfect. The operation of an arrangement of this sort is very simple. The flashing light, necessarily operating on an open circuit, is connected to its electrical source through the back contact of a track relay; while the banner mechanism, operating on a closed circuit so as to display the warning by gravity, is connected to the same electrical source through the front contact of the track relay. An approaching train, de-energizing the relay, will cause the stop banner to be displayed by cutting off the current from the banner mechanism, and at the same time displays the flashing light by making a connection from the electrical source to the lamp by means of the back contact of the relay. In this arrangement we have a device that lives up to the three requisites of a crossing signal, namely: the flashing light to attract attention, the definite warning, "stop," and the closed-circuit banner mechanism which, in the event of a failure of any part of the device, will cause the display of the stop indication.

The railroads in installing highway crossing signals are spending large sums of money solely for the benefit of the public. And yet it is a known fact that many motorists willfully disregard crossing signals. If an accident occurs the railroads are usually blamed, when in reality it is the result of carelessness on the part of the motorist. The public should be made to realize what is being done for its protection by the railroads. The motorist should be made to obey crossing signals as he is made to obey police-operated traffic signals in city streets. Let the various state legislatures take it upon themselves to co-operate with the railroads. It is their duty to inspire the officers of the law with the energy, vigilance and courage necessary to enforce the law requiring proper observance of highway crossing signals; do this and the number of accidents at such crossings will be very greatly reduced.

CHARLES ADLER, JR.,

Signal Engineer, Maryland & Pennsylvania R. R.

## Are Derails Necessary?

LONDON, Eng.

### TO THE EDITOR:

In his article in the issue of the *Railway Age* for July 16, page 112, A. H. Rudd raises a question about the utility of derails which is interesting to English readers, since in this country we have, for a long time, been in the position he suggests, that is, without derails on passenger tracks, although they are used in certain circumstances on freight tracks. We find it better so to arrange our signals and block working that trains are kept back a safe distance from fouling or crossing movements and to do without the derail, which, as Mr. Rudd observes, may easily lead to a worse accident than the one it is supposed to prevent; or may actually cause one where none would have happened. There seems no reason to suppose that, with proper attention to the subject, the same thing could not be carried out in the United States. There are circumstances, indeed, in which a derail is useful in a passenger track. It should, however, not be a derail as it is ordinarily understood in America, but a proper catch siding with a reasonable degree of over-run.

*Portable Concrete Mixing and Placing Apparatus*

## Lining the Canadian Pacific's Five-Mile Tunnel

Highly Interesting Equipment and Method Furnish Effective Treatment of Huge Undertaking

**T**HE CONNAUGHT tunnel of the Canadian Pacific is located on the main line at Glacier, B. C., about 420 miles east of Vancouver, where it pierces the Selkirk mountains and replaces the old high line over Rogers Pass. The old line had curvature amounting to about seven complete circles, long and heavy grades, a succession of snow-

It was opened for traffic in December, 1916, after extraordinarily rapid construction made possible largely by the use of small pioneer tunnels. The later system consisted of small tunnels driven parallel to and 50 ft. distant from the line of the main tunnel with cross tunnels at intervals of 1,500 ft., from each of which headings were driven each way on the main tunnel line. Materials for the various headings and spoil from the main tunnel were handled effectively through the pioneer tunnels, as described in the *Railway Age* of December 11, 1914, page 1083.

When the tunnel was put into operation the construction had been carried only to the point of lining a limited portion, particularly that near the entrances, and of installing a powerful crude oil driven ventilating fan system at the west portal, it being the desire to realize the advantages of the work with the least delay. Meanwhile consideration was given to lining the balance of the tunnel, about 18,000 ft., in order to effect complete and permanent construction and to avoid any possible danger of falling rock. The south track of the tunnel was set apart for lining operations and except in this respect it was required that the lining work should interfere in no way with train movement.

The first consideration therefore was that of providing plant and equipment for installing a concrete lining extending over the entire side walls and tunnel arch and reinforced with steel, both longitudinally and at right angles to the tunnel section. It was estimated that approximately three cubic yards of concrete would be required per tunnel foot. At the same time all equipment was to be designed to provide an unobstructed passage for trains, minimize fire and other hazards, permit normal operation of signals and to furnish enough light and power in the working places for rapid and economical construction.

Various combinations of air and electric apparatus were considered, both along the lines of entirely portable, self-contained plants, mounted on cars and of a stationary plant located outside of the tunnel. It was ultimately concluded that conditions would best be met by a stationary central electric plant located outside the tunnel, adapted to supply

**Blow Form Ready for Blowing. Completed Tunnel in Background**

sheds aggregating about five miles in length and an elevation at the summit of about 4,300 ft. The tunnel reduces the summit elevation by about 500 ft., eliminates all of the curvature and snowsheds and reduces grades to one per cent against westbound traffic. In a country where the annual snowfall averages around 40 ft. in depth, the advantages arising from the existence of the tunnel are apparent without much study.

The tunnel itself is a double track-tangent five miles long.

power to a portable concrete mixing and placing apparatus operating inside the tunnel.

Accordingly, a 300 kw. power house was located near the west portal, in which are employed locomotive type coal burning boilers equipped with the necessary breeching, individual stacks and blowers. Coal is delivered from standard coal cars running on an overhead trestle. Storage for several hundred tons of coal for use during the winter months is provided. Feed water for the boilers is obtained from a nearby mountain stream, the delivery being accomplished by gravity or, in an emergency, by pumps.

Two direct-connected units of 150 kw. capacity each deliver power through a simple switchboard from which the power is conducted in two three-phase circuits of 2,300 volts over a wooden pole line up to the entrance of the pioneer tunnel. The power is then carried through the pioneer tunnel for about 9,000 ft. on bare wire. As the

A phase of the lighting problem equally important to that of providing adequate light in the presence of smoke was that of arranging the system so that the intensity of the light could be reduced as the smoke cleared away, thus avoiding the blinding effect of excessive light on the workmen. The lights have largely cut down the time which would otherwise be lost in waiting for smoke to clear. With approximately 125 men working, this loss of time would be a very considerable item.

The actual mixing and placing of concrete is accomplished by two 75-ton pit flat cars coupled together. On one car there is a 1,290 ft. motor-driven compressor, while on the other car is a motor-driven concrete mixer emptying into a pneumatic placer from which successive charges of concrete are shot by air under about 80 lb. pressure into the forms. These cars also carry sand and gravel, water and about 450 bags of cement. All storage of materials on the cars is cal-

West Portal of Tunnel, Showing Fan House and Fans; Selkirks Mountains in the Background

pioneer tunnels are entirely separated from the main tunnel they provide an ideal space for the stringing of these high tension lines and have made it possible to effect material savings over the cost of lead covered cables. From the last or sixth crosscut between the pioneer and main tunnel, the transmission line is carried in cable along the side of the main tunnel for about 3,600 ft. to the first working zone. Here the power is lowered by transformers set in niches in the side wall to 110 volts for light and 550 volts for power. This low tension distribution system is provided with outlets every 100 ft. to which the power and light apparatus can be attached readily.

After numerous experiments had been conducted in connection with the lighting of the working areas and particularly with a view to overcoming the effect of the smoke following the passage of trains, flood lights of 500 watts capacity each were installed. These lights are portable and can be arranged singly or in batteries as may be desired.

culated on a basis of blowing one complete form or 21 ft. 6 in. of completed tunnel without going outside the tunnel for recharging.

In operation, the cars are spotted under the form to be blown, electrical connections made with the power line and flexible hose projected into the form, after which the power is turned on and mixing and blowing begun. A 200 hp. motor is used to drive the compressor but no difficulty has been encountered from vibration or rocking of the cars in spite of the large capacities of the apparatus placed upon them. A 27-ton gasoline locomotive is used to handle the cars in and out of the tunnel and to do a variety of switching of material cars from the main line to the various storage bins. This gas locomotive is supplemented at times by a steam locomotive, particularly during the winter under snow conditions.

The concrete is blown into collapsible steel forms, there being six of these units, each giving 21 ft. 6 in. of completed

tunnel at one setting. These units are set up, filled, collapsed and rolled forward to their new position in rotation, the schedule calling for one complete form to be blown every day. These forms clear all traffic. Each form is preceded by a so-called pioneer form, or movable platform, spanning both tracks from which all advance work is done, including a considerable amount of overhead work arising from roof scaling, the completing of false forms where the tunnel section is over-broken, the packing of the space behind these false forms with lagging and finally the placing of reinforcing preparatory to concreting.

Outside the tunnel a camp has been built, complete in all details, as the work is in the heart of the mountains and has to be entirely self-contained. Bungalows have been erected

View Showing Pioneer Form, also Mixing Apparatus Ready for Placing Concrete

for sleeping quarters, subdivided into units of four men each. Separate small houses have been built for the married men and there are also provided a community dining room, bath house and laundry, kitchen and storehouses—in all about 55 buildings. All quarters are electrically lighted and provided with water, and the camp includes a drainage system and a septic tank.

Near the power house there is a small motor-driven machine shop and blacksmith shop in addition to sheds for the storage of cement, reinforcing steel, lagging and lumber. These are particularly necessary on account of the heavy snowfall which buries everything deeply during the winter. A 5,000 yd. gravel bunker handling its material by gravity is also installed. Steam heat is provided to prevent the gravel from freezing.

This work is being done under the direction of W. A. James, assistant chief engineer; Frank Lee, engineer maintenance of way, and H. Rindal, district engineer of the Canadian Pacific, Mr. James having previously represented the railway on the ground as engineer of construction in charge of the driving of the tunnel. The Sydney E. Jenkins Company, Ltd., Winnipeg and Vancouver, is doing the construction work. We are indebted to the latter company for this article.

DAN SMITH, colored station porter of the Southern Railway at Wagoner, S. C., aged 35, recently established a record for fast work by loading sixty 500-lb. barrels of rosin into a freight car in forty minutes. Each barrel was rolled from the platform into the car and placed on end.

## Tentative Valuation of the Chicago, Rock Island & Pacific

WASHINGTON, D. C.

THE first tentative valuation report to be served by the Interstate Commerce Commission in the case of one of the larger railroad systems was made public on September 10, covering the Chicago, Rock Island & Pacific and its subsidiary and affiliated lines. The used property devoted to common carrier purposes is given a "final value" of \$322,277,596 as of the valuation date, June 30, 1915. This represents a total main track mileage of 7,218 against which the company had issued securities which were outstanding in the hands of the public to the amount of \$307,637,422. The property which is valued at \$322,277,596 does not, however, include the affiliated Chicago, Rock Island & Gulf, 455 miles, which is given a final value of \$13,212,667. While the fact that the commission has found a value greater than the amount of the securities held by the public may come as a surprise to those whose ideas of the Rock Island capitalization were based on the total of the securities issued by the railway company and its two holding companies which controlled the operating company, it is to be noted that the capitalization of the Chicago, Rock Island & Pacific Railway was not affected by that of the Chicago, Rock Island & Pacific Railroad Company of Iowa, which owned most of the railway stock, nor of that of the Rock Island Company of New Jersey that held the stock of the Iowa company. The report of the commission is as of a date while the railway company was in the receivership which preceded its reorganization and during which the holding companies were wiped out.

The total outstanding capitalization of the Chicago, Rock Island & Pacific Railway on June 30, 1915, is stated in the report as \$377,395,738, of which \$69,758,315 was held by or for the carrier and \$307,637,422 was held by the public.

The commission, in its tentative valuation reports, does not show how its final value is made up. The report says that "after careful consideration of all the facts herein contained, including the excess cost of the carrier lands, appreciation, depreciation, going concern value, working capital, including material and supplies, and all other matters which appear to have a bearing upon the values here reported, the values, as that term is used in the Interstate Commerce Act, of the property of the carrier, owned and used, used but not owned, and owned but not used, devoted to common carrier purposes, are found to be as follows:"

The final value includes \$251,809,983 for the property wholly owned and used, and \$70,467,613 for the property used but not owned, leased from the Improvement Company, the Iowa Company, the White & Black River Valley, the Peoria & Bureau Valley, the Rock Island Memphis Terminal, the Stuttgart & Southern, the Rock Island & Dardanelle, the St. Paul & Kansas City Short Line, the Rock Island, Arkansas & Louisiana, the Choctaw, Oklahoma & Gulf, the Keokuk & Des Moines, and from other railroads and private parties. There is also property to the amount of \$252,937 owned but leased to other companies, so that the final value of the total owned property, 5,355 miles, is given as \$252,062,920.

It is stated that there is included in the value above stated as wholly owned and used the sum of \$8,809,983 on account of working capital, including material and supplies. The total assets stated by the carrier on its general balance sheet on date of valuation were \$318,215,217, and the investment in road and equipment, including land, was stated in the books of the carrier to be \$235,867,019. The report gives a number of readjustments in this account but says it is impossible to state one sum, in terms of cash, as representing the carrier's investment in road and equipment.

As in most of the tentative valuations, the report says, the original cost to date of each piece of common-carrier property

cannot be ascertained, but that the recorded outlay for the property as a whole appears to have been approximately \$207,445,244 in recorded money outlay and an outlay in securities of a par value of \$26,486,003. These figures do not include certain expenditures made by predecessor companies.

The cost of reproduction new and the cost of reproduction less depreciation of the common carrier property other than land are given as follows:

	New	Less Depreciation
Wholly owned and used, including carrier's portion of jointly owned property.....	\$254,164,621	\$199,974,141
Total used.....	\$246,367,674	\$260,255,674
Total owned.....	\$59,200,169	\$199,992,235

The present value of carrier lands owned is given as \$37,-160,008 and the excess cost of acquisition as \$29,927,514 and of the carrier lands used, \$43,656,245 and the excess cost of acquisition \$35,068,446. The carrier also owned non-carrier lands, which, with the improvements, are given a value of \$4,156,056, and securities of other companies of a par value of \$161,027,447 carried on the books at a value of \$60,463,584.

The value of materials and supplies on hand was shown by the carrier's records to have been \$5,605,310.

Separate figures are given for the various subsidiary companies whose property is used under lease, and whose values are included in that given for property used.

The Chicago, Rock Island & Gulf, which owns 456 miles of first main track, but uses only 455 miles, is not included under the figures for the Chicago, Rock Island & Pacific, although its stocks and bonds are held by the latter or its subsidiaries. The outstanding capital liabilities of the Gulf company were \$17,248,372. Its investment in road and equipment was stated in its books at \$17,374,563. The cost of reproduction new of the property used is given as \$14,-679,021 and the cost less depreciation as \$11,735,613. The present value of carrier lands is given as \$370,669 and the final value of the carrier property used as \$13,212,667.

The carrier has 30 days in which to file a protest.

## Freight Car Loading

WASHINGTON, D. C.

**A**N INCREASE of 892 in the number of cars loaded with revenue freight during the week ended September 3, compared with the previous week, is shown by reports received by the Car Service Division of the American Railway Association. The total for the week was 830,601 cars. This is the largest week's loading since December 11, 1920, and represents the fifth consecutive week of increase, but as com-

pared with the corresponding week of 1920 it shows a loss of 131,032 cars.

The total number of cars loaded with merchandise and miscellaneous freight was 505,425, an increase of nearly 6,004 as compared with the week of August 27, but 30,000 less than for the corresponding week of last year.

Loading of grain and grain products was 60,632, an increase as compared with the week before of 1,127, but 18,000 cars more than for the same week of 1920. The loading of live stock amounted to 27,539 cars or a decrease of 1,531 under the preceding week and slightly less than for the corresponding week of 1920.

Coal loading amounted to 155,816, a decrease of 5,796 as compared with the week before, but 43,000 cars less than for the corresponding week of 1920. The loading of forest products was 45,419, a decrease of 1,059 over the week before, but about 17,000 cars less than the loading for the corresponding week of 1920. The ore loading was 31,112, an increase as compared with the previous week of 1,077, while the loading of coke was 4,658 cars, an increase of 48.

The number of surplus serviceable freight cars for the week ending August 31 was 246,440, a decrease of 23,584 cars as compared with the week before. This included 68,938 surplus box cars, a reduction of over 10,000 within a week and 130,596 surplus coal cars, a reduction of 6,385. Shortages were also reported from certain districts amounting, however, to only 739, of which 641 were box cars.

IF MONEY TALKS in America, it screams in Europe. And the secret of getting through a sojourn there at a moderate cost lies in judicious tipping. In England, for instance, before the war a railway porter was quite happy with a two-penny tip. But only "white money" goes in these days—nothing less than sixpence, and if a porter has to handle a trunk he will want more. The prevailing custom among guests of English and Continental hotels is to do the tipping in one operation on the day of departure. In the event of a prolonged stay, the servants expect to be remembered once a week. At a first-class English hotel you should count on at least a pound a week for regular tips, apportioned approximately as follows: porter, five shillings; chambermaid, five shillings; floor waiter, five shillings; boots, half a crown; bellhop, half a crown. In France you should give three francs at least where you would give two shillings in England. It must be borne in mind that in Europe it is safe to offer a tip to anybody short of a cabinet minister. In England, if you yearn for a comfortable compartment on a train look up the conductor and tell him so—say it with silver, and he will work wonders.

—Gordon Stiles in Leslie's.

## REVENUE FREIGHT LOADED AND RECEIVED FROM CONNECTIONS

# Post Office Seeks to Co-operate With Railroads

## Evidences of Changed Attitude on the Part of the Department Under New Administration

WASHINGTON, D. C.

A NEW POLICY in the Post Office Department governing its relation with the railroads has been made evident since the change in the office of postmaster general which took place on March 4. Not only is the new postmaster general, Will H. Hays, a man of a different type from his predecessor, A. S. Burleson, but he announced at the outset that he proposed to select an experienced railroad man for the office of second assistant postmaster general in charge of the railway mail service. Col. E. H. Shaughnessy, of the Chicago & North Western and later with the Transportation Corps of the A. E. F., was appointed to succeed Otto Praeger, who was formerly a newspaper man.

One of the first steps taken by Col. Shaughnessy was an effort to create an atmosphere of harmony and co-operation between the department and the railroads in the furnishing of mail service to the public. For many years there had been a series of controversies between the roads and the department. Not only was the latter constantly endeavoring to reduce the compensation paid to the railroads, which they had been contending was already too low, but there was a constant succession of disputes as to the interpretation of the postal laws and regulations regarding both service and compensation, which are so voluminous and complex as to afford a wide opportunity for controversy over technical points.

The big question of rates for the transportation of mails by railroad had been settled by the Interstate Commerce Commission in its decision in the mail pay case in January, 1920, which resulted in a large increase in the rates, but this decision still left open a considerable number of questions of interpretation.

With a view to placing the relations between the department and the railroads on a new basis, Col. Shaughnessy on April 13 wrote to Ralph Peters, chairman of the committee on railway mail pay, inviting his committee to meet with representatives of the department to discuss the question of making the biennial test to determine the number of sacks of mail and outside parcels that would be considered as equivalent to the three-foot unit of space, and such other questions as they might care to bring before the department for consideration. Representatives of the American Short Line Association and the American Electric Railway Association were also invited and participated in the conference.

The first meeting was held on May 2 and the proposed arrangement for making a test being quickly disposed of, the railroad committee asked for a postponement of about 30 days to make the necessary preparation in connection with questions they desired to submit. Another meeting was held on June 6, at which the railroad committee through a sub-committee presented a docket of 18 subjects which they desired to discuss. The items were fully discussed in frequent meetings following that date, the sub-committee calling in various railroad representatives to assist.

Tentative understandings were arrived at and when the docket had been completely covered Col. Shaughnessy requested that the ideas set forth by the sub-committee be reduced to definite written requests to which replies could be made, thus properly laying the foundation upon which to build for future reference and guidance. After the time necessary for consideration the replies of the department were given in written form as an agreement of principles in the outlining of policy, the necessary administrative orders to follow in due course. In a large number of the cases agreements were readily reached on a compromise basis and in

others it was agreed to present joint petitions to the Interstate Commerce Commission for decision.

Following these conferences with the officers designated by the railroads to handle railway mail matters, Col. Shaughnessy sent a report of the conferences and of the questions and replies to the railroad executives, saying he thought the matter was important enough to be given serious consideration by the railroad organizations. He said in the letter that while the subjects treated were perhaps in themselves not of great consequence, he thought the idea of getting together and arriving at mutually satisfactory understandings, especially to the extent of presenting joint petitions to the Interstate Commerce Commission, was of great importance to every one concerned, marking the first step in a really constructive program. He said that a serious effort was being made in the department to avoid controversial technicalities and that he would like to bespeak a like attitude on the part of the railroads, feeling that the department and the railroads are dependent upon each other and must work harmoniously if they are to provide the right sort of mail service to the public. It was also suggested that it might be well for the roads to go over the mail situation with their operating organizations.

Col. Shaughnessy has received letters from the railroad executives expressing a hearty appreciation of the attitude taken by the department and expressing a willingness to meet it half-way. The idea of holding joint conferences for the purpose of settling questions in dispute as promptly as possible was especially appreciated and many of the letters commended the businesslike attitude of the department in this respect.

Col. Shaughnessy has just issued a decision in one of the important cases which was discussed at the conferences, which had been a source of controversy since September 1, 1920. This involved the question as to whether the department or the railroads should bear the expense of handling mail between the Union Station in St. Louis and the St. Louis city post office, which is located across the street from the railroad station, but is connected with it by a subway built under the street by the government, which is under the direction and control of the Post Office Department. For several years the railroads have delivered the mail at the entrance to the subway and the messenger, who trucked it through the subway into the post office building, was paid by the Post Office Department \$42,000 a year.

The Interstate Commerce Commission held that the railroads were required to perform this kind of messenger service free only when the post office was "contiguous." In 1920 Second Assistant Postmaster General Praeger issued a ruling that in this case the post office was contiguous and that after September 1 the expense of trucking the mails through the subway should be borne by the railroads. The railroads protested on the ground that by delivering the mail from trains to the entrance to the subway they were delivering them to the post office property. There was a large sign at the entrance to the subway "For Post Office Employees Only." However, the amount of the messenger expense was thereafter deducted each month from the pay of the 16 railroads involved and the railroads protested each month against the deduction.

Col. Shaughnessy suggested that any legal steps be postponed until he had an opportunity to examine the case, and, after a very careful consideration of the facts he has now

decided that the Post Office Department should take over the mail messenger service between the sub-basement of the post office and the Union Station via the subway, reverting to the practice in effect prior to September 1, 1920, and that refund should be made to the railroad companies of all deductions made since that date for the service.

One of the subjects discussed at the joint conferences was the standardization of mail cars. President Aishton, of the American Railway Association, has appointed a committee of motive power officers, consisting of J. T. Wallis, H. L. Ingersoll, C. E. Chambers and G. H. Emerson, to confer with representatives of the department regarding the standardization of R. P. O. and apartment cars to conform to the latest plans of the department.

One of the questions discussed has arisen from the decision of the commission stating space rates of pay for "separately operated" railroads. The commission has given a definition of the term "separately operated" which has been construed by the comptroller of the Treasury in a manner which the railroads consider out of harmony with the intent of the commission. It appears to be the view of the comptroller of the Treasury that if the officers of a controlling and a subsidiary line are the same, such a situation prevents the subsidiary line from being a separately operated road, while the railroads consider that a road which publishes separate tariffs in its own name and files separate reports with the commission is a separately operated road, although the officers may be the same as the officers of the controlling company. The department agreed to re-submit this question to the comptroller of the Treasury for a review.

Another question arose as to changes in authorizations by the Post Office Department en route at points where it is not practicable for the railroads to make a change in cars. In many instances the railroad committee said the points had been selected by the department on technical rather than practical grounds. The reply was that the department would accept railway passenger and freight division points to be established division terminals.

Announcement has been made by the postmaster general that after October 1 the former practice of shipping periodical mail in mail cars instead of by freight will be restored. The change will expedite the delivery of this kind of mail. The practice of sending such mail by freight was adopted by the former post office administration in order to reduce expense at a time when the railroads were compensated for the transportation of mails on a weight basis. The basis of compensation now is the amount of space authorized to be used in cars and where the authorization exceeds the usual volume of mail it will be possible to carry magazines that formerly went by freight without additional expense.

## Railroad Administration Begins Sale of Equipment Trusts

WASHINGTON, D. C.

THE DIRECTOR GENERAL of railroads announced on September 12 that he had, with the approval of the President, confirmed the sale, at par plus accrued interest, of \$7,500,000 par value of the railroad equipment trust certificates now held by the government. The purchasers are Messrs. Kuhn, Loeb & Co. The offer for the purchase of these securities was received from Messrs. Kuhn, Loeb & Co. by Eugene Meyer, Jr., managing director of the War Finance Corporation, and transmitted by him to the director general of railroads.

The equipment trust certificates bear interest at 6 per cent and mature serially from 1928 to 1935, inclusive. The securities sold are of the following railroad companies:

Atchison, Topeka & Santa Fe.....	\$1,500,000
Central Railroad of New Jersey.....	1,500,000
Chicago, Burlington & Quincy.....	1,500,000
Norfolk & Western Railroad.....	1,500,000
Southern Pacific .....	1,500,000

The Railroad Administration holds about \$381,000,000 of these certificates given by the railroads in payment for the cars and locomotives ordered by the Railroad Administration in 1918 and allocated to the various railroad companies. Under the plan proposed by the President for settling the accounts between the railroads and the government, it was proposed to authorize the War Finance Corporation to purchase these certificates as well as additional securities which would be given by the railroads to the Railroad Administration in connection with the funding of additions and betterments other than equipment made by the Railroad Administration during the period of federal control. It was the expectation that the War Finance Corporation could place cash with which to settle with the railroads at the disposal of the Railroad Administration by selling its own obligations pending the time when it would be possible for it to sell the railroad securities in the open market.

The bill authorizing the War Finance Corporation to itself acquire these securities has been passed by the House of Representatives, but is still pending in the Senate. Meanwhile the sale of some of the certificates is understood to represent a test of the market and a sort of public demonstration that the railroad securities held by the government will be salable as the market improves. Under the law the Railroad Administration cannot sell the certificates for less than par and accrued interest and it is understood that it does not consider that the certificates issued by some of the roads can be sold on that basis at the present time, but it is hoped to be able to sell possibly \$200,000,000 worth. These which were sold were issued by some of the railroads whose credit is of the highest and it is expected to be able gradually to market an additional amount of these securities. It has been officially stated that the government has received several offers for the car trust certificates, but it was not stated at what prices or for what amounts the offers had been made. The funds received by the Railroad Administration will increase the amount it will have available to make settlements.

The railroad situation was the subject of a conference on September 8 between President Harding and Alfred P. Thom, general counsel for the Association of Railway Executives, who said he had called upon the President to emphasize the necessity for early financial assistance to the carriers.

Spanish Troops Leaving Melilla, Spain, for the War in Morocco

THE PROVINCIAL GOVERNMENT of Manitoba has been asked to finance the construction of a railroad to extend from The Pas to the mining district in the northern part of that province in order that the natural resources of that section may be developed.

# Northwestern Pacific's Experience With Third-Rail\*

Five Men Maintain 37 Miles of Contact System at an Annual Cost of From \$87 to \$145 Per Mile

OUR ENTIRE operation is over a private right-of-way, and therefore we will not enter into any lengthy discussion as to why the third-rail system was chosen instead of the overhead trolley. Those of us who today (after 18 years of service) have the responsibility for the up-keep of this system go to bed nights, yes stormy, windy nights, too, and sleep just as soundly as those men did who first installed it. Could you say the same for a man on a trolley system? I am afraid not.

The present system consists of six miles of single-track and 15½ miles of double-track, or a total of 37 miles of electrified

At that time the present style of support block was designed and put into service and our troubles were nearly over. This type block has proven very satisfactory so far as the Northwestern Pacific lines are concerned. Every sixth tie in the track is one foot longer than the standard tie. On this extra length the support for the contact rail is placed. This support consists of a redwood block 5 in. square and 6½ in. or 7 in. long. The length depends on the size of rail in track. This block is treated with two coats of insulating paint by dipping. There is a ¾ in. through bolt at the base holding to small angle irons which in turn are lagged to the tie. On top of the block is placed a cast-iron cap upon which the rail rests. The cap is so constructed as to form an apron over the block and give a space of nearly 2 in. on the block that is always dry even in the worst rain storms. This cast-iron cap has a channel in which the rail rests, the channel running parallel with the track. The rail is not clamped or fastened to the block in any way, but is free to move with the expansion and contraction.

One of the questions that probably comes to the minds of some is that this is not adequate and the contact rail should be held down. I am free to admit that we have had the contact rail try to crawl all over the right-of-way at times, but it generally landed on the running rail and the result was fire-works and a shut-down. When this buckling has occurred

Map of Southern Part of Northwestern Pacific, Showing Electrified Sections

track. All stations carry 600 volts at the switchboard and that statement establishes our layout as a 600-volt system.

The over-running contact rail as used on the Northwestern Pacific is all regular common "T" rail and nearly all of it is either 60-lb. steel or 50-lb. iron. As an electrical conductor these two kinds of rail are considered equal, and for practical calculations are equal in conductivity of 600,000 circular mil copper, nearly three times the ordinary trolley.

In the first installation the rail was supported mainly on a large block of wood spiked to the tie and the contact rail was spiked to the block. These were continually breaking off and did not last very long. Then some patent granite blocks were tried. These were put in at the Sausalito terminal and through the Corte Madera tunnel. The leakage over them was excessive and the aura at night was at times brilliant. It was decided that the object to be obtained was a support for the contact rail and not a means of illumination. The granite blocks therefore found their way out.

Soldering Bonds on the Running Rail. Third Rail Is Shown in Foreground

it is simply a case of breaking a joint, allowing the rail to straighten out and dropping the overlapped ends to allow safe travel of the collecting shoe on cars. This has always happened during the warm hours of the day and by morning the men could go out and place the rails back on the blocks and bolt them together. To overcome this trouble, about twice a year men go over the line and hammer the joints and pour oil around the angle bars and over a large proportion of the support block caps. When this has been properly done, the buckling feature has been eliminated. As an illustration of how successful this is, we have several sections of 3,000 ft. and one section of over 4,000 ft. of continuous run of power rail.

At road crossings and intervals in front of stations, the rail

\*Abstract of a paper read at the Pacific Railway Club's fifth annual electrical night by C. E. Hatch, electrical engineer at San Francisco, August 11, 1921.

is opened and the ends protected by approach blocks. These blocks are pieces of rail equal in cross-section to the contact rail, but with one end heated and hammered, thus allowing the contact shoes on the cars to ride up onto the rail easily. At these openings there is constructed an underground box with at least one 1,000,000 circular mil cable in it, the ends of which are soldered to the ends of the contact rail, thereby making the continuous circuit.

These undergrounds, as we call them, are constructed of one inch redwood and are made four inches square inside. The cable is supported in the box, clear of the wood by porcelain cleats every two feet. The box is then filled with an asphaltum insulating pitch. The pitch is heated and is poured slowly to avoid blow holes and the cover of the box is nailed on while the pitch is still hot. Properly installed this type of box has proved very satisfactory and has the most excellent moisture resisting qualities. Many of these boxes after years of service have had the cables disconnected and careful tests showed not the slightest leak.

In the original installation there was used a feeder placed in the web of the rail from Sausalito to San Anselmo with the exception of the section through the Corte Madera tunnel. This feeder was a 1 3/8 in. aluminum rod in 30 ft. lengths, but it proved unsatisfactory. We now have good connections to the rail and a good joint in our feeder every 1,000 ft. where before we had a poor joint every 30 ft.

One great advantage in the third-rail construction, both mechanically and financially, is our method of carrying feeders. From Sausalito to Alto power house, a distance of 4 1/2 miles, we have two one million circular mil cables on each rail, or four cables in all and the only additional expense for feeder support is the small iron clamp used to hold the cable in the web of the rail. There are at advantageous points switches so that the system can be sectionalized if necessary and in case of trouble one section be eliminated entirely. We also carry an overhead jumper on pole line over Corte Madera tunnel, and have switches installed so that the tunnel section alone can be cut out without interference with any other section.

At the stations in the double-track territory, there used to be a platform over both power rails. These center platforms have now all been discarded and platforms constructed on the outside. As a protection in lieu of the center platform there is placed a wooden guard over the power rail and a fence between them. This wooden guard is a piece of 2 in. X 8 in. pine fastened to and supported by the power rail itself. This guard rail is used also in yards and other places where employees and others are liable to stumble over the power rail.

The use of a third rail system, of course, can only be justified where, like the Northwestern Pacific, the operations are entirely over private right-of-way. There have been several cases where people struck by train have been thrown against the power rail and burned. There is but one case of human life lost that I can find, directly traceable to contact with the third rail.

There can be naturally not much argument as to maintenance between the overhead trolley and the third rail system. It will probably sound rather fishy to some trolley men to hear that for the past ten years our regular third rail maintenance crew has not exceeded at any time five men. And these five men also find time to do part of the construction work of what extensions have been made during that time.

Our maintenance costs after 13 years of service show the following averages:

For 1916.....	\$87.00 per mile
1917.....	95.00 per mile
1918.....	145.00 per mile

The differences in these costs do not reflect any change in the condition of the rails, but rather a decided change in labor and material cost. At present we are maintaining the entire

system with a crew of five men, three of whom only devote one half day to power rail work. This crew also does all track bonding.

The costs previously given take care of all track bonding. All joints on the running rail are bonded with a 300,000 circular mil soldered bond with a "T" head, soldered directly to the rail. We admit that we are without doubt cranks on solder. All joints of whatever nature, bonds, feeder cable, cross cables, are soldered direct to the rail, using half and half solder. Our results from this operation are entirely satisfactory and we make in our cable connections but one joint, where, on the other hand, with the lug method there are two joints, one where the cable is soldered into the lug and another where the lug is bolted to the rail. This method, moreover, gives a much better electrical connection between rail and copper cable.

The gage of our rail is 26 1/2 in. out from the gage line of track and top of power rail 6 in. above top of running rail. For total clearance we ask 12 in. above top of running rail, 22 in. out or more.

One of the main difficulties is in the winter from high water. Several times at certain points the water was up over the power rail, but it was fresh water and we were able to keep power on the rail and keep trains moving. When the extreme high tides come in the winter along the shores of Richardson bay with a good southwester behind them and the salt water begins to get up around the power rail, why, then we quit. This was particularly bad during one storm in the winter 1918-1919, and our traffic out of Sausalito was stopped for about three hours.

## Short Line Association to Hold Regional Meetings

WASHINGTON, D. C.

OFFICERS of the American Short Line Railroad Association are planning to leave Washington shortly for a trip of nearly a month to cover the country generally for a series of regional meetings with the officers of short line roads in various parts of the country for discussion of the present railroad situation as it affects both the short lines and the trunk lines, in an effort to bring about a more general understanding of the situation and to formulate plans for meeting it. The list of subjects to be discussed includes rates as they affect the movement of traffic and the short lines; divisions of interline rates, whether they are generally just and reasonable as between strong and weak roads; labor; valuations and consolidation; settlements with the government; the consolidated purchasing agency for short line railroads; the issuance of securities; Section 10 of the Clayton act; effect of automobile transportation on the railroads; authority of the Interstate Commerce Commission over new construction and abandonment of existing roads, and new legislation.

The officers of the association, who will make the trip in an official car so that they may take with them many of their office files, will include Bird M. Robinson, president; Ben B. Cain, vice-president and general counsel; T. F. Whittelsey, secretary-treasurer; F. C. Reilly, traffic manager, Western classification territory; J. W. Cain, manager of purchases; I. T. Hanson, manager tariff bureau, and in addition, members of the executive board will join the meetings at various points. The itinerary covers the following meeting dates: Chicago, October 4; St. Louis, October 5; Kansas City, October 6; Denver, October 8; Salt Lake City, October 10; Portland, Oregon, October 12; Seattle, October 13; San Francisco, October 17; Los Angeles, October 18; Houston, Texas, October 24; New Orleans, October 25; Atlanta, Georgia, October 27.

# Informal Meeting of Traveling Engineers

## Hiring of Firemen, Conservation of Supplies and Operation of Locomotive Devices Discussed

THE TRAVELING ENGINEERS' ASSOCIATION held an informal meeting on September 7 and 8, 1921, at the Hotel Sherman, Chicago. At this meeting, which took the place of the regular annual convention of the association, postponed on account of prevailing business conditions, the reports of a number of the committees which were to have been presented before the regular convention were read and discussed and officers were elected for the ensuing year.

In calling the meeting to order the president, W. E. Preston, Southern Railway, spoke in part as follows:

### President Preston's Address

Have you watched the sea in a great storm and noted the waves, mountain high, as they dash against the shore? And have you noted that for hours after the storm has passed and the sky is clear and the wind has ceased to blow, the waves still roll quite as high? The storm has passed, but the effects of the storm still remain.

For four years 40,000,000 men quit peaceful occupations and undertook to destroy each other, together with all the property they could reach. For those who did not go to war was assigned the great task of feeding and clothing those who fought and supplying the implements of warfare. No one has yet even guessed the cost of the conflict. We know that millions of lives were lost, and that the accumulated savings of centuries of industry were wiped away. The conflict is past, but we are left with waves of unrest, with our social and industrial life impaired, with the wreckage of a great storm to clear away.

Civilization is expensive. It costs effort and economy to create the wealth that will support modern life. The world problem is to replace that which was destroyed, that the comfort and security of civilization may be passed on to future generations. There is but one way to meet this cost. That which was destroyed was the product of labor of hands and brains, and was saved through centuries of economy. It is our task to work and save, simple virtues, but real wealth is only created when men work and save.

The contribution of the members of the Traveling Engineers' Association is to supply at minimum cost an article which the modern world stands in great need of—transportation. The world is far short of its demands. Ocean transportation was nearly swept from the seas by the great war. Transportation by highways is growing by leaps and bounds, but will never replace the service that was rendered by the railroads. During the past ten years our population has increased more than 15 per cent, but from the day the world was plunged into war the railroads have been unable to increase terminals, to better their road beds or to improve roll-

ing stock. Members of our organization occupy key positions in supplying this sorely needed commodity—transportation. We are always on the firing line, in the front line trenches. But back of us is a great army of loyal engineers and firemen, trained for their jobs, strong, ready, capable.

The great world need is that men in all walks of life shall work harder and save more of what they produce. The world needs that every locomotive shall work to its full capacity the maximum number of hours each year, at the minimum cost of operation. Not alone for this year, but for years to come, must we contribute our big share to replace what has been destroyed.

Now is the time to stick close to the rigid rules of common honesty, to remember the ten commandments and keep them. The honest man will not accept a day's pay until he has done a day's work. There must be the same honesty in dealing with the corporation as with the individual. The world needs the spirit of Christianity permeating the lives and actions of men. The measure of a man must be not how much wealth has he taken into his own safety vaults, but how much has he done in his generation to quiet the unrest, to put right the wrong, to house and feed and give comfort to a world whose civilization has been strained near the breaking point.

The world looks to us in America to safeguard the sacred right of man to own property, secure against all interference except by due process of law. It is the law that makes us free. Can you picture a railroad whose trains ran at random, at the mere whim of the engineer, who might claim that because this is a free country he had the liberty to run his train how, when and where he pleased? It is because he and all engineers obey the law that he becomes a free man. He has the freedom of the road when all obey the law.

### New Officers Elected

The report of the secretary showed a membership of 1,540, representing a gain of 87 members during the year. The following officers were elected: President, J. H. DeSalis, New York Central; first vice-president, Frederick Kerby, B. & O.; second vice-president, T. F. Howley, Erie; third vice-president, W. J. Fee, Grand Trunk; fourth vice-president, J. N. Clark, Southern Pacific; fifth vice-president, J. B. Hurley, Wabash; secretary, W. O. Thompson, New York Central, and treasurer, David Meadows, Michigan Central. No change was made in the membership of the executive committee except the addition of W. E. Preston, Southern, the retiring president.

Abstracts of two of the reports and discussions follow. Others will appear in later issues.

## Conservation of Supplies and in Operation of Locomotive Apparatenances

The subject of the conservation of supplies is logically divided into two parts; First, the conservation at the terminal, and second, conservation on the road.

A suitable building located at the point where all engines arrive and depart, materially affects the conservation of supplies at the terminal. This is where all equipment is kept to supply engines for service. The equipment is checked to the engine crews prior to their departure, and checked in again upon their arrival. This facilitates the keeping of a complete record at all times and enables the party in charge

of equipment to account for it if any should be lost or destroyed. If the engine crews know they will be held responsible for the use of supplies upon their arrival at terminals, it will act as an incentive for them to take better care of the equipment.

Where the engines are in pool service, the engineer going out should have an opportunity of seeing the work reported by the incoming engineer. This will give the outgoing man the information that is essential for the proper care of any work that has been done. He will also have a knowledge

of defects that have been reported, which the shop forces were unable to attend to and he will thus be able to protect himself and the company from injury.

The adequate supply of lubricant for the trip should be considered highly essential to the conservation of machinery and appurtenances on the engine. Worn cylinders and valve bushings can often be charged to improper lubrication. However, this is seldom due to the fact that an insufficient amount of oil has been furnished. It is more often caused by defects that have not been reported or defects that have been reported and repairs not made. Also, instructions are not always carefully followed as to the right method of lubricating the machine, or perhaps the man in charge is indifferent.

In order to conserve supplies on the road it is imperative that engines be equipped with proper receptacles so that the different articles, such as oil, waste, lanterns, flags, water glasses, fuses and torpedoes, will not be wasted and damaged if not used. If all concerned were advised as to the cost of supplies or the enormous amount of money involved, it would be an incentive to all concerned for their judicious use and care. The co-operation of the employees is paramount. Carry no equipment on the engine that is not required. All surplus equipment should be promptly reported and removed at the home terminal.

Overloaded tenders are dangerous and extravagant, and overflowing tanks at water plugs are wasteful and expensive, for in freezing weather the water often overflows the tracks, which is very dangerous indeed, as well as expensive to clear away.

Enginemen should make intelligent reports as to locomotive conditions; that is, reports by means of which the enginehouse organization is capable of locating the precise defects. Reporting defects in a general way should not be tolerated, and enginemen should be encouraged to make proper reports by having the work done promptly or if the work cannot be done on this trip the engineman should be so advised and the work followed up and done for the next trip. This will encourage enginemen not to grow lax in making detailed reports.

### Power Reverse Gears

We wish to note particularly the air losses of the power reverse gear. In many instances adequate forces have not been furnished to maintain this appliance and there are heavy air losses as a result of improper care. With the necessary care this device would result in a saving of fuel and water, as the engineer can adjust the cut-off with so much less exertion. However, with heavy air losses around the rotary and by the cylinder packing, it is next to impossible to regulate the cut-off at short valve travel, which results in the engine being worked at a longer cut-off, with a corresponding excess of consumption of fuel.

Once the steam has been used instead of the air for operating the gear it is of no more use until the piston is repacked.

Piston packing rings improperly cut, and failing to lap properly cause creeping. Also, if they are too tight and hardened, the rubber having lost its resiliency they will not keep tight contact with the cylinder wall.

Hardened packing in the piston gland, scored rod or worn parts—any blow here will cause creeping.

Leaky drain cocks or cylinder oil cups will cause creeping.

On some gears there are cone-shaped valves for the distribution of air to the power reverse and these valves cause considerable trouble because of leaks, which will cause creeping when the reverse lever is hooked up. Leaky rotary valve will also cause this trouble; however, this seldom gives any trouble. Cases have been found where the stop pin is broken off and wedged between the rotary faces, damaging them; but under ordinary wear the rotary stands up well.

When the reverse gear valve assembly is changed, it is ab-

solutely necessary to check the length of the long connection rod to the cylinder lapping lever. In some cases it had to be changed in length as much as 1½ in. Failing to do this the links will touch bottom at one end and have too short maximum cut-off in the other end.

Lost motion in pins and connecting rods of the reverse should not be tolerated.

Owing to the fact that the gear receives most of its wear in hooked-up position, in time the cylinder increases in diameter at that part of the stroke and the piston rod decreases in diameter at the corresponding place. A gear that is worn this way will be a constant source of trouble from creeping and jumping.

Rotary, cylinder and connecting rod pins should be well oiled. Make sure that the steam shut-off valve is not leaking condensation into the reverse.

Cases have been found where the long connecting rod had several bends in it. This rod should be of sufficient size to avoid bending.

### Locomotive Headlight Equipment

Any engineer operating locomotives equipped with electric headlights should make this a part of his study, in connection with his other duties. He should see before leaving the terminal that the dynamo has been well oiled and cared for and that his headlight is equipped with incandescent globes, also that he has sufficient lights placed in proper position in the cab, in order to furnish light to all the equipment he has to handle. He should bear in mind that the dynamo is the most vital part of the equipment and that he should pay particular attention to the condition of this machine at all times, keeping constantly in mind that all the bearings should be kept oiled. The governor will get out of order once in a while and will not control the speed of the machine as it should. When this condition develops, if the engineer does not take notice, it will result in the cab lights being burned out, especially if the headlight is cut out from the switch in the cab. In order to handle this situation, the engineer should throttle the machine down by the throttle in the cab. The engineer should bear in mind that if his hours are long in making the run over the division, at night, the machine should be lubricated between terminals. He should also see that his headlight is properly focused. There is no one who has a better opportunity of keeping the headlight properly focused than the engineer. After completing the trip, if there are any conditions about this equipment causing it not to function properly, he should make an intelligent report and have conditions properly cared for at the terminal before the engine is allowed to go out again.

### The Superheater

Enginemen should be taught the disastrous effects of carrying high water with this device. It not only converts the appliance into a steam dryer, but is very apt to cause the unit joints to leak and also to form a coat of lime or sediment on the inside of the tube, which substantially affects the degree of superheat obtained. It has been discovered that in extreme cases of carrying water too high in the boiler the superheat units have become completely clogged. Moreover, superheater headers have been broken, due to an excessive amount of water or filling the boiler too full while the engine was laying up at terminals.

Enginemen should receive instructions to closely observe the operation of the damper, for if the damper does not close when the throttle is closed, the superheater units will become overheated and will not only cause the unit joints to leak, but will have a tendency to crack the return bends and thus cause a complete engine failure.

The committee deems it best to place an independent lubricator on the locomotive for the purpose of lubricating the

stoker engine or motor, placing it convenient to the fireman. We do not wish to relieve the engineer of the responsibility of caring for this machine when on the line of road, but the fireman should be held responsible by the engineer for the proper care of this machine. It will in a measure fit him for greater responsibilities in the future. The fireman should see that all parts are lubricated while on the line of road, and where the coal is not prepared he should watch closely for any foreign matter which would be liable to cause a stoker failure. The engine crew should see that the conveyor hopper is empty on arrival at the terminal and all slides closed. This will prevent the conveyor being overloaded or clogged when the engine is coaled.

The report is signed by J. P. Russell (chairman), Southern; J. A. Mitchell, N. Y., N. H. & H.; W. J. Fee, Grand Trunk; H. E. Reynolds, C. R. I. & P., and E. Von Bergen, Illinois Central.

### Discussion

The discussion of this report was confined almost entirely to the methods of handling locomotive supplies and tool equipment. E. Von Bergen (Illinois Central) described a monthly report which is being made up to show the amount of supplies issued to various engine crews, from which any cases of excessive issues may readily be determined and in-

vestigation made to learn the cause and apply corrective measures. The discussion disclosed a lack of uniformity in the methods of checking supplies on and off locomotives. In some cases they are checked both at the outgoing and the incoming terminal. In other cases they are checked out and in at the home terminal only. The use of individual tool boxes of convenient size which can be handled by the enginemen has met with considerable success in conserving the small tools required on locomotives, the engine crews showing considerable interest in taking care of this equipment. In any case the greatest trouble is experienced in looking after the tools while the engines are in the terminal. This is particularly true where the tools are assigned to the locomotive and are taken off after the crew leaves the engine by the supply room attendant.

One advantage which has developed from providing private tool boxes for the enginemen is the incentive which this provides each engineman to accumulate a few tools of his own with which he will make repairs on the road that otherwise would not be made.

The greatest difficulty is experienced in conserving the issues of torpedoes and fuses, one reason being that it is difficult to determine closely the number of occasions arising which actually require their use as intended.

## Self-Adjusting Wedge, Feed Water Heater and Booster

The present standard wedge is of the manually adjusted style. It is designed to take up the wear between the driving boxes and the shoes and wedges brought about by the up and down movement between the frame and the boxes. This wear, if not taken up, results in undue freedom of the box between the shoe and wedge. This lost motion is the cause of the so-called "box pound" due to the movement of the box backward and forward between the shoe and the wedge. This brings about a side wear of the crown brasses and a tendency to break these bearings. The hammer-like blows struck against the shoe and wedge by this backward and forward movement of a loose box may result in broken shoes and wedges, and these blows become a prolific cause of broken frames. This lost motion of the boxes, which usually affects the different wheels unequally, tends to cause a variation from the distance intended in the locomotive design in the distance between the centers of the rod bearings. The main driving boxes, due to the greater thrust brought to bear upon them, as a rule, develop the most wear. This wear of the main driving boxes throws undue strain on the side rod bearings, tending to cause rod pounds, broken side rod bushings and brasses, and possibly bent and broken side rods.

Lost motion in connection with main wheel driving boxes tends to increase the steam piston stroke and shorten the steam cylinder clearance space at the end of stroke, and when allowed to become extreme may bring about cylinder knocks due to the steam piston striking the cylinder heads with a tendency to knock them out. Lost motion of the main driving boxes is taken up by the steam piston at the beginning of its stroke and live steam is thereby permitted at any given valve cut-off to follow the piston further than intended, thus causing a loss in expansion value of the steam, and a loss of fuel.

The taking up of lost motion existing in main driving box parts through steam piston pressure moves the main driving wheels bodily back and forward to the extent of such lost motion, thus setting up a tendency for the wheels to slip during this movement. This is claimed to be a most common cause of wheel slipping and of troubles in that connection in moving heavy trains, especially where the rails are bad or conditions adverse.

That these results of failure to prevent undue lost motion

of the driving boxes in the frame are frequently the cause of locomotive failures and always a source of increased maintenance cost is too well known to require further comment.

The engineman has always been held responsible for allowing any such undue lost motion, and until within the past few years usually attended personally to the setting up of the adjusting wedges. The most that is expected of him today is that he shall report any looseness or pounding of the driving box parts, the actual work of setting up the wedges, devolving on the roundhouse forces. This condition has not brought about a change for the better.

When the engineman himself took care of this work, it was his practice to so spot the locomotive that the driving boxes were forced up against the shoes, thus giving all possible free play between the driving boxes and the wedges and permitting the wedges to be forced up to the extent necessary to eliminate all lost motion; the wedge was then slightly pulled down to provide the required freedom of movement of the box and to prevent its sticking. It is now not uncommon practice in roundhouses for employees assigned to do this work upon report of the engineman to undertake to adjust the wedges without moving the locomotive at all, thus frequently not fully accomplishing the object desired and thereby permitting the locomotive to return to service in a condition detrimental to itself and the railroad.

The value of a self-adjusting wedge, simple in its design and non-erratic in its action, will readily appeal to all who have to do with either the handling of the locomotive or its maintenance. To the engineman it would mean a more efficient and satisfying machine, to the mechanical department an incalculable benefit in the savings effected in maintenance cost through the tendency to prevent the many troubles herein mentioned as arising through failure to properly keep up the wedges and through the reduction of locomotive failures due to these causes as well as a very considerable saving in the cost of roundhouse labor now required to do the adjusting of wedges, and doing it none too efficiently. In which direction the savings would lay, would, of course, depend largely upon the previously existing conditions.

At first glance, the designing of such a wedge seems quite simple and easily brought about through the placing of a suitably arranged spring underneath the adjusting wedge

and operating on it in such manner as to gradually force up the wedge as lost motion develops in the driving box parts. It is understood that this method, without any change in the adjusting wedge other than adding to it of such a spring and the small parts necessary to give the required spring tension, has been tried out on at least one large railroad. In giving this method a second thought, however, we are likely to look for what we understand actually occurs, that of the wedge being gradually tightened until it grips the box, causing a hard riding locomotive and possible rough usage of the rail as a consequence. This, of course, means the curing of one evil at the expense of acquiring another one practically as bad.

A method of preventing this gripping of the box has been brought forward in a self-adjusting wedge now being used to an increasing extent on many of our railroads. In this device the adjusting wedge is made in two parts which might appropriately be referred to as an adjustable wedge and a floating wedge. The adjustable wedge is tapered on one side to suit the taper of the frame jaw with a reverse taper on its opposite face. The floating member is also tapered, its thickest part being at its upper end, and it fits between the adjusting wedge and the driving box. A wedge bolt, attached to the adjusting wedge as usual, passes down through the pedestal binder and has attached to it below the binder the adjusting spring and the parts necessary to give this spring the required tension. The floating wedge is made of such length that when fitted into the driving box jaw, there is not less than  $3/16$  in. nor more than  $5/16$  in. clearance or play for it to move up and down between the pedestal binder and the frame. With this arrangement, if the driving box should move up in the frame jaw, there would be a tendency for it to carry the floating wedge with it in case there was any clearance between the top of the floating wedge and the top of the frame jaw. On account of the tapers of the two wedge parts this would tend to bring about a loosening of the driving box between the shoe and wedge. Before this could be effected, however, the small clearance given the floating wedge between the pedestal binder and the top of the frame jaw would bring the top of the floating wedge up against the top of the jaw, checking any further tendency to cause undue freedom of the box as the floating wedge would then be held stationary even if the box continued to rise in the frame jaw. If the driving box should move down in the frame jaw the tendency would be to carry the floating wedge with it and at the same time there would be a tendency to force down the adjusting wedge against the spring tension. This would bring about a loosening of the driving box between the shoe and wedge. The limited clearance space of the floating wedge in the frame jaw, however, would cause the lower end of the floating wedge to strike the binder and prevent further tendency to cause undue freedom of the box, as the floating wedge would then be held stationary even if the box continued its downward movement.

Reports from several of our members located on roads having this device in use and who have had actual experience with it, as well as from several mechanical superintendents on roads having it in use, state that it gives excellent results.

While any type of self-adjusting wedge is supposedly automatic in its action, it must be remembered that none are automatic in maintenance. Like all mechanical devices they require a certain amount of attention, the labor required, for such attention being, of course, considerably less than is necessary for looking after manually adjusted wedges. The principal attention to self-adjusting wedges should be for regular lubrication, absolutely necessary with any type of wedge, and the adjustment of the adjusting spring.

It is impossible to give accurate figures on the savings in cost of upkeep of the frame, box parts and runnings gears

as between engines having manually adjusted wedges and ones with self-adjusting wedges for the reason that many troubles with these parts which could be caused by poorly maintained driving box parts might also be due to other causes. However, a table prepared by an eastern railroad shows in a general way results obtained from locomotives of same type with self-adjusted wedges of the type just referred to.

[The table gave in detail the amount of rod work required on 20 locomotives of the 2-10-2 type equipped with the self-adjusting wedges, from July 18, 1920, to January 31, 1921, during which period the engines aggregated 408,447 miles, or slightly more than 20,000 miles each. Four engines, aggregating 83,800 miles, received no rod work whatever. Eight engines, aggregating 161,865 miles, received complete rod work. On the remaining eight locomotives 12 No. 3 brasses, 8 No. 2 brasses, and one set of main bushings were renewed. No crown bearing or wedge material was used. —EDITOR.]

### Feed Water Heaters

From 55 per cent to 58 per cent of all heat generated in the firebox is lost in exhaust steam. This great loss of heat is due to the necessity of exhausting steam from the steam cylinders while still in its gaseous form and to the fact that it requires about 970 heat units simply to hold water in the form of steam, all of which, together with such additional heat units as may be in the exhaust steam, is allowed to pass out of the locomotive stack without doing any additional work other than acting as a draft on the fire.

Considerable success has been achieved in heating feed water for boiler use by means of exhaust steam. It is our understanding that this practice has long been successfully made use of in connection with stationary boilers; also, that it is used to a considerable extent in European countries on locomotives. Germany alone is said to have 10,000 locomotives equipped and to be adding this equipment at the rate of 2,000 feed water heaters per year. That this method has not received more consideration in this country in the past has probably been due to cheap fuel and lack of an efficiently developed device for the object in view.

Generally speaking, feed water heaters making use of exhaust steam are of two kinds known as the closed type and the open type. In the open type the exhaust steam either goes directly into the feed water, and in condensing gives up its heat to the water or goes through tubes surrounded by the feed water, heating this water while being itself condensed in the tubes. When it goes directly into the water it is found advisable to pass the exhaust steam through an oil separator enroute to the feed water heater to prevent lubricating oil contained in exhaust steam from entering the locomotive boiler. In this type the heater is open to atmospheric pressure and the pump is placed between the heater and the boiler check. In the closed type the water is forced through tubes in an enclosed heater, these tubes being surrounded with exhaust steam which heats the water as it passes through the tubes. In this type the heater is between the pump and the boiler check and is subject to boiler pressure.

In the open type on account of the heater being open to atmospheric pressure the feed water can be heated only to the normal boiler temperature of 212 deg. F. In the closed type it is possible to heat the water to within 10 to 15 deg. of the temperature of the exhaust steam, which may run as high as 250 deg. F.

About one-sixth or 15 per cent of the exhaust steam which would ordinarily go out through the locomotive stack is diverted to the use of the feed water heater.

One type of heater which has been applied to probably one-half of the American locomotives so far equipped has an arrangement whereby after the exhaust steam going to

the heater has been condensed, this water can be filtered, freeing it of any lubricating oils that it may contain, and be returned either to the locomotive tender or into the suction pipe of the pump carrying the feed water to the heater. By this means it is claimed that the tender water capacity is in effect increased 10 per cent to 15 per cent.

That a large fuel saving and actual increase in boiler efficiency will result from such installation seems to be generally believed. The economical results obtained are due not only to the fact that a large amount of the heat from the exhaust steam is reclaimed, but also because the rate at which the fuel is burned on the grate is reduced.

Our information is that some eighteen of our American railroads are today using or experimenting with feed water heaters, although not to exceed seventy-five locomotives all told are equipped, and that five different types of feed water heaters are being tried out. Owing to the limited number in use and the time used, reliable figures as to the average cost of maintenance of such devices are not available, but it is believed it will be well within the bounds of reason as compared to the savings which it is believed can be brought about by their use.

A summary of a number of runs made with a freight locomotive on the New York division of the Erie Railroad equipped with a feed water heater of the closed type heater, as compared with the same number of runs using the injector, is shown in one of the tables. A summary of nine runs with feed water heater and nine with the injector, in passenger service with a locomotive on the D. L. & W., equipped with the same type of feed water heater, is also shown.

SUMMARY OF ERIE RAILROAD FEED WATER HEATER TESTS

Direction of runs	Water Heater Tests			
	West	Injector	East	Injector
Length of runs—miles.....	88.3	88.59	89.22	89.44
Actual running time—dec. hours.....	4.75	5.436	5.658	5.699

### The Locomotive Booster

The locomotive booster is designed to assist in starting such standing trains as the locomotive is capable of hauling on a level track when once in motion without the aid of such device, but which it would otherwise be unable to start without assistance of some kind and for helping it to haul

such trains over ordinary grades encountered between terminals; to assist in starting trains out of places where stops are necessary, as at stations, towers, water plugs, switches, etc., or where made necessary by locomotive or train troubles, and which, on account of curvature or grade, are bad places to start from and ordinarily would require the taking of the train slack, perhaps backing up to a place from which a start could be made, setting off of cars, doubling of grade, or obtaining the assistance of another locomotive.

While the addition of a booster increases the tractive effort of the locomotive and thereby makes possible the starting of additional cars and to that extent serves to increase the tonnage which can be hauled under normal conditions or serves to assist in getting heavy trains over the road without delays on grades and at bad starting places, it is in no sense intended as an aid in permitting the overloading of the locomotive to a point beyond what its normal capacity would be when in motion on a level track without this device, as this would make additional aid again necessary in starting from terminals, bad starting places enroute and on ascending grades.

The method of operation is simple. The engineman decides that he needs the booster, he raises the booster latch, which makes contact with the control valve, and the booster is automatically engaged. The booster cuts out automatically when the reverse lever is moved back from the corner, which is at a speed of approximately 12 to 15 miles an hour, or it may be cut out instantly by the engineman knocking the booster latch down, which is similar to knocking out an electric switch.

The claims made for the booster are that it puts any locomotive with trailing wheels into the next class above in starting effort, because the trailing wheels act as an additional pair of drivers; that on freight trains this means more tons handled annually because of greater starting effort and acceleration, and avoids damage to machinery and equipment because of a smooth, steady start; that on passenger trains it means smooth starting and quick acceleration to road speed, protects the equipment from damage and renders schedules more easily maintained by avoiding delays in starting; that it reduces by one-half the time required to get trains to road speed and that it pays its own fixed and maintenance charges several times in doing this through reduced wear and tear on rods, pins, cross-head keys, tires and other parts of the machinery of the locomotive that would ordinarily be caused by slipping in the effort to start, and that when the train is up to road speed it has no more effect on the locomotive's operation than so much coal on the tender.

The following record of a run made on the West Shore line will give a good general idea of the benefits claimed for the booster as shown in actual performance. Engine 3149 left Ravena with a crew that had no previous experience with the booster and the intention was to determine whether or not the full tonnage of 2,582 to 2,600 could be taken through to Weehawken without the usual reduction to 2,100 tons at Newburgh. The booster was used on all starts as well as on grades at speed.

The first test was at Catskill where water was taken, the water plug being located at the bottom of two grades, the ascending one being about .39 per cent. The usual practice was to leave the train at the top of the west grade, cut off and run for water, then come back, hook up and make a run for the other grade. This practice was disregarded and the train was hauled down to the water plug. After taking water the booster was cut in and the train carried over the grade at satisfactory speed. With the booster cut in, 5 miles per hour was quickly gained with the draw-bar pull showing 41,067 lb., and for a distance of 580 ft. the speed increased from 5 to 8½ miles per hour. The booster was then disengaged and the locomotive required to take the load entirely and the draw-bar pull dropped to 33,497 lb., or a difference of

7,570 lb. in favor of the booster. This represented 22 per cent increase in draw-bar pull. The throttle and reverse lever were not touched.

The train continued on to Kingston and at each stop the booster was cut in for starting and showed rapid acceleration. The ruling grade is at Haverstraw, six miles long and an average of .47 per cent. A stop was made for water and the train started with the booster. When the grade was reached the speed was 33 miles an hour. On the grade the first mile showed a speed of  $28\frac{1}{2}$  miles an hour; the second mile a speed of 19 miles an hour, the third mile a speed of 12 miles an hour, the fourth mile a speed of 8 miles an hour, and the fifth mile a speed of  $7\frac{1}{2}$  miles an hour.

Speed was falling very rapidly and at the end of the fifth mile the draw-bar pull registered 36,441 lb. The booster was then engaged where the grade was .52 per cent and in 432 ft. the speed was 8 miles an hour and the draw-bar pull 42,900 lb., a difference of 6,459 lb. or 17 per cent increase with the booster. The speed then gradually rose and reached 10 miles an hour in the next  $\frac{3}{4}$  mile and with tonnage of 22.6 per cent over the previous capacity of the locomotive. One and five-eighths miles of grade yet remained and when the train passed over the top the draw-bar pull showed 45,080 lb. The booster was then cut out and the train arrived at Weehawken with the original tonnage of 22.6 per cent more than this class engine had ever before taken through. A day or so later the regular crew caught engine 3,149 and, not to be outdone by the test just related, brought through 2,618 tons, representing an increase of 24.6 per cent over the ruling tonnage.

The report is signed by T. F. Howley (chairman), Eric; Frederick Kerby, B. & O.; J. P. Stewart, A. T. & S. F.; John Draney, D. L. & W., and J. A. Talty, Franklin Railway Supply Company.

### Discussion

The discussion of the self-adjusting wedge indicated that there had been little experience with locomotives having complete installations of the device among the members present. In most cases mentioned the wedges were applied on the main drivers only. The opinion was expressed, however, that to get the full benefit of the device it must be applied on all boxes and this general application seems now to be the tendency. In caring for self-adjusting wedges the most important point, according to the experience on the New York Central, was stated by J. H. De Salis to be the proper attention to the adjustment of the springs. If these are too loose the piston force at full stroke is sufficient to force the wedge down against the spring. If the spring is too tight a stuck wedge results. These difficulties are avoided by keeping the spring adjusted to a height of  $1\frac{1}{2}$  in. from the jam nut to the binder. The experience of those taking part in the discussion indicates a material increase in the mileage obtained from driving boxes and better rod conditions than have been obtained with the manually adjusted wedges.

In discussing the feed water heater, J. N. Clark (Southern Pacific) stated that this company has two open type and two closed type heaters in service, one each in a bad water district and one each in a good water district. The results obtained from these installations are, however, not yet available.

In the discussion of the locomotive booster, a number of installations of this device were mentioned, all of which have demonstrated their ability to effect considerable improvement in the handling of heavy trains. W. H. Corbett stated that the Michigan Central has three boosters in service on passenger locomotives, which have eliminated jerking and the necessity for taking slack in starting heavy passenger trains and have materially increased the rate of acceleration in starting these trains. The booster is used up to about eight miles an hour.

A trial on the Chicago & Eastern Illinois was referred to

in which a 4,383 ton train was taken over a grade, over which, without the booster with the same locomotive it was required to reduce the tonnage to 3,976. With the booster the heavier train was pulled up the grade in 19 minutes, while the light train without the booster required 23 minutes to move over the same distance.

### New Design of Position-Light Signal

THE PENNSYLVANIA Railroad now has in service nearly two thousand signals of the position-light type—925 high signals and 1,038 dwarfs; and with recent improvements and simplifications the cost of installation and maintenance of the signals has been so reduced that further and stronger claims are made for economy of operation as compared with semaphore signals. These signals, the invention of A. H. Rudd, chief signal engineer of the road, and Dr. William Churchill, of the Corning Glass Works, give their indications by uncolored electric lights, both night and day; and they have now been in use over six years. Their

Construction of the New Position-Light Signal

development has been recorded in the *Railway Age* in numerous articles, particularly those of January 8, 1915; July 21, 1916, and July 26, 1918 (page 177).

The latest improvement is a simplified and symmetrical frame and background; and with this arrangement a row (or rows) of not more than three lights in a row, now serves to give any and all indications. From a statement prepared by Mr. Rudd we take the following descriptive matter:

The position-light signal was originally designed for the purpose of signaling a portion of the four-track main line, electrified for local passenger service, while retaining the steam trains for freight and through passenger service. The experimental signals carried five lights in a row—those first installed had two rows of four lights each; the bottom row normally horizontal, so that, if the top lights were extinguished, the bottom row would indicate stop. Eight lights were, therefore, displayed at all times. The large background was, therefore, displayed at all times. The large background was no detriment on bridge signals, but on account of the

surface exposed to wind pressure ground masts had to be 7 in. or 8 in. in diameter.

### The New Design

The illustrations show a new design which has been developed and the aspects which may be displayed. The line drawing shows the details of construction and the half-tone photographic perspective the appearance of an automatic block signal. It will be noted that in the latter the platforms are smaller than in the drawing, this change having been adopted since the drawing was made.

The indications of the aspects are in accordance with the Standard Code, as follows:

- 1—Stop.
- 2—Stop, then proceed. (Rule 509, Standard Code.)
- 3—Proceed at slow speed prepared to stop.
- 4—Proceed with caution prepared to stop short of train or obstruction.
- 5—Proceed at slow speed prepared to stop short of train or obstruction.
- 6—Proceed at restricted speed.
- 7—Approach next signal prepared to stop.
- 8—Approach next signal at restricted speed.
- 9—Proceed.
- 11—Approach home signal with caution.

Number 4 is the manual permissive block signal. No. 5 is to be used as the up-grade signal which may be accepted by tonnage freight trains without stopping, while other trains

Aspects.										
1	2	3	4	5	6	7	8	9	10	11
•••	•••	•••	•••	•••	•••	•••	•••	•••	•••	•••

Position-Light Signal Aspects, Pennsylvania Railroad

stop before proceeding. No. 11 is the distant switch signal. It will be noted it is similar to No. 4, which, under the rules, may not be accepted by a passenger train without stopping. The addition of the bottom light permits passenger trains to

Position-Light Signal with Circular Background

accept it. If, at some future time, the stop requirement in Rule 509 should be eliminated, aspects Nos. 3 and 5 would be eliminated, and No. 2 substituted for aspect No. 5.

Dwarf signals may be four-position:

- (a) Horizontal for indication No. 1.
- (b) 45 deg. upper right hand quadrant for indication No. 3.

(c) 45 deg. lower right hand quadrant for indication No. 5.

(d) Vertical for indication No. 10, proceed at slow speed.

Aspect b being displayed in terminals, with track clear but next signal at stop.

Aspect c with track occupied, and,

Aspect d with track clear and next signal clear and a and b, and rarely c, being used out on the road.

It will be noted that a background is provided for the lower row vertical only, this being a restricted speed signal (restricted speed is one-half the authorized speed) but not for the diagonal rows or the single light, as these are slow speed signals and long range is unnecessary. The reduced size of the background and wind pressure area eliminates the necessity for the large masts. Signals can be installed on existing masts, and they need less clearance than a semaphore.

Experience shows that these signals, lighted six hours a day, cost no more to operate and maintain than semaphores. Assuming the cost of current from primary batteries at \$5 per k.w.h., the signals could be lighted 24 hours and still compete if their power could be obtained for \$1.25 per k.w.h. It is claimed that it can be furnished by farm lighting outfits for 5 cents, but even if it cost 10 cents, the saving would be \$1.15 per k.w.h.

The lamps used in the high signals are 12-volt, 6 watt, burned under voltage, so that the total energy required for the three lights is 15 watts, and for the three lights and marker (aspect No. 2) 15 watts when the signal is at caution or clear and 20 watts when at stop. The dwarf signal requires two 12 watt lamps burned under voltage, with an actual watt consumption of 16 for the two lights.

Given then, even the same cost for installation as for semaphores, but less cost of operation and maintenance in all cases, it seems that the logical procedure is to install these signals everywhere instead of motor- as an economic proposition.

### Advantages of the Position-Light Signal

The advantages of any light signal, displaying the same aspects day and night and without moving parts and their incidental failures, are so obvious and have been so frequently set forth that comparison with the semaphore in this respect appears unnecessary. A color-blind man can read a position-light signal accurately. The lights penetrate fogs better than colored lights. Two lights must fail before the signal ceases to be displayed effectively. Four positions *without combination* are available and used, as against three positions of the semaphore and three colors which may be seen distinctively at a distance; and this additional position gives the greatest flexibility.

If two lights are extinguished on the bottom row, either diagonal or vertical, with the top row horizontal, the aspect "Stop and Proceed" is displayed; if all lights are extinguished on these rows, the indication is "Stop." In general, the more lights extinguished, the more restrictive the indication. False clear indications due to faults in these signals have been eliminated, and the day of experimentation is past.

A CHICAGO GREAT WESTERN passenger train was derailed near Marshalltown, Iowa, on September 9, and the two rear cars were overturned and later were destroyed by fire. Thirteen persons were injured, none seriously.

ANTI-RAILWAY PROPAGANDA IN ITALY. An Italian report is reported as estimating that if the 200,000 railway workers of that country were each employed in driving 10-ton trucks 8 hours a day for 300 days a year, five times as many ton miles would be carried as by the Italian railways now. The number of employees necessary for repairing trucks and for loading and unloading freight are not mentioned.

## Two Roads Secure Excellent Results from Water Treatment

REPORTS which have been prepared by the Missouri Pacific and Illinois Central on the operation of their respective systems of water softening for 1920 indicate that water treatment on both of these roads is being attended with highly profitable results. As will be noted in the tabulation for each road, the Missouri Pacific reports a saving for the year of \$481,129 through the use of treated water, a figure representing a return of 197 per cent on the total amount invested in treating facilities, while the Illinois Central reports a saving for the year of \$292,456, or about 120 per cent on the total investment.

### CONDENSED REPORT OF RESULTS OF WATER TREATING FOR 1920

Number of Plants	Amount Invested in Treating Facilities	Quantity of Water Treated in Gallons	Scaling Solids Removed in Pound	Gross Annual Saving	Cost of Treating Process	Net Annual Saving
67	\$244,201	1,617,360,000	4,517,883	\$624,708	\$143,579	\$481,129
20	247,801	1,149,370,000	2,547,609	382,684	69,684	292,456

Although the savings as reported constitute attractive figures in themselves it is worthy of note that in both cases they are intended to represent only the value of the reductions effected in the amount of fuel required by the locomotives, the flue renewals, the amount of flue calking and other running boiler repairs and the time lost by locomotives while undergoing boiler and firebox repairs, less the cost of treatment, no consideration having been given to such items as the improvement of train schedules, the reduction in the number of engine failures, increased power, etc., as are frequently mentioned in connection with water treatment.

In each case the gross saving from water treatment was arrived at by taking 15 cents as the aggregate saving in the above items effected for each pound of scaling matter removed by the treating process and prevented from entering the boiler, from which the net saving was obtained by subtracting the interest and depreciation of the treating plant, the cost of chemicals, and the cost of operation, maintenance and superintendence. The value of 15 cents was taken as the equivalent for the year 1920 of the value of 7 cents derived in 1911 and incorporated in the report of the Water Service Committee of the A. R. E. A. for 1914.

The Missouri Pacific water treating system includes 67 plants, 20 of which are new, 13 having been built in 1920 and the remaining 7 completed early in 1921. As a result of the operation of these plants 28.8 per cent of the 5,616,565,000 gal. of water used for steaming purposes was treated. The total consumption of water on the system during 1920 was 6,526,826,000 gal. and the average cost of treatment in 1920, including operation, 10 per cent on the investment in treating facilities and the cost of supervision was 8.87 cents per thousand gallons. This is compared to 8.72 cents in 1919, 6.57 cents in 1918, and 4.71 cents in 1917, the increase in cost being attributed to the increased cost of chemicals and labor. On the Illinois Central there are 20 treating plants which during the year treated 1,149,370,000 gal. of water at a cost of approximately 8 cents per thousand gallons.

As an additional item of interest in connection with the water softening on the Missouri Pacific the following is quoted from the report:

"It is estimated that a saving of at least 60,000 tons of coal was effected due to the removal of the scale-forming material which would otherwise have been deposited in the boilers. The 4,517,883 pounds of scale removed, averaged into the 750 engines using this water, and assuming only 25 per cent adhered to the tubes and sheets, would amount to 1,505 lb. per engine, which quantity would form an insulating coating about 3/16 in. thick. Experiments have shown

that fuel wasted to heat through this thickness of scale insulation varies from 20 per cent to 30 per cent. It is safe to assume that the 1,123,000 tons of coal necessary to evaporate the 1,617,360,000 gal. of water would have been increased at least five per cent by using untreated water. At a number of stations where the supply is secured from creeks or rivers, a very large quantity of mud and silt was also removed from the water, the saving from which is not included in the above figures. There is also the large saving in boiler repairs and loss of engine time which would have been caused by this large scale accumulation."

### "For Politics Only"

FOLLOWING is a portion of a letter written to Congressman Carl Hayden at Washington, D. C., by Epes Randolph, late president of the Arizona Eastern and the Southern Pacific of Mexico on August 18, 1921, four days before his death and printed in the Los Angeles Times of August 23. It is probably his last written expression on important public questions and is of such direct interest to railway men that it is reprinted herewith.

"There is an insect in certain parts of Mexico called the alacran. The female of this species gives birth once in her lifetime to a dozen or more infant alacrans who immediately climb upon the body of the mother and subsist upon her until she is no more. When Socialism first blossomed in this country the railroads belonged, for the most part, to a few men. The demagogue politician thought it a fine scheme to imitate the baby alacrans, jump on the Huntingtons and Hills and suck the life blood out of the railroads because these wicked fellows had dared amass fortunes. The work was quickly done, but the doers forgot to stop when railroads no longer represented individual fortunes.

"The late E. H. Harriman induced the investment of several hundred million dollars in the Southern Pacific and other western roads, and thus gave to the people of this country the best transportation system the world has ever seen, and at the lowest rates for service. Mr. Harriman's ownership in the Southern Pacific, as shown by the company books, was 1,100 shares of stock, par value \$100. His efforts caused the country to prosper as it had never prospered before, and incidentally earned modest dividends for the 34,000 owners of the company's securities, many of whom were widows and orphans. Mr. McAdoo, in one year only, put this great transportation system, which it required 35 years of brain and energy to create, 'on the bum,' and your very constituents are today crying out for relief. Why did McAdoo do this? The answer is, 'For politics only,' and he didn't get the job at that.

"The rancher today gets all the labor he wants for 15 cents an hour and others stand by begging to work at the same rate. The railway company is forced by law to pay the same type of labor, engaged just across the fence from the farmer, 34 cents an hour. Why is this? 'For politics only.'

"When will you lawmakers give your constituents proper relief? My guess is you will do so when the reason shall become 'for politics only' and not before. In other words, when the great mass of voters wake up and learn that railroad headquarters are located in the Capitol at Washington and not in San Francisco, Tucson or elsewhere as they now believe to be the case. A governmental agency today fixes freight rates; another governmental agency fixes railroad wage rates, but no governmental agency guarantees that the holder of a railroad security shall have one dollar's interest on his investment, yet a governmental agency does provide that he shall not have more than 5 per cent.

"Union labor today, to a very large extent, dominates the politics of this country. For eight years the White House doors swung open to one Samuel Gompers, a foreign-born individual of great skill in the art of creating industrial unrest.

This same creature has, on occasions, stood on the public rostrum, side by side with the President of the United States, and poured insidious poison into the ears of an unthinking audience. A foreign-born individual with a union-labor card in his pocket this day holds a Cabinet portfolio. Can there be any reason for these things except 'for politics only'?

"I once spent a night on the desert and was kept awake by coyote howls uttered from a mesquite thicket. It sounded like there were a million of them. At daylight next morning I took my shotgun, went out to the thicket and was disgusted to find there only an old female coyote with two pups. No doubt you have had like experience. Labor-union leaders are in the thicket and their howl is intimidating the American statesman. If he would inspect the thicket he would find there more howl than votes.

"The people, who, by the sweat of their brows, created this country, own it and it is to be hoped that the time is not far distant when they will control it. The people who count are beginning to wake up. Two years ago in your very town of Phoenix, a brick mason received \$10 a day and was allowed by grace of the 'walking delegate' to lay 700 brick only. Today he still receives his \$10, but he lays 2,500 brick with no more effort than he put forth to lay the 700. Then Phoenix was a 'closed shop' town; today Phoenix is an 'open-shop' town.

"Transportation is the most important industrial institution of this country. When will the government loosen its strangle hold and let the railroads become 'open shop'? The answer to that question is very much more important than the question of whether we shall have a Democratic administration or a Republican administration.

"For forty-five years I have labored. The laboring man, whoever he may be and however he may labor, with head or hands, has my sincerest sympathy and utmost good will. The labor leader who organizes his subjects and rules them with a despotism comparable only to that of the erstwhile Kaiser Bill, that he may wax fat on the proceeds of their labor (which he does) should find no lodgment in this republic. He should be sent along to join his brother, Bill Haywood, in Russia, and will be. Sam Gompers, backed by his full eight years of prestige and power, was not able to saddle upon this country as its President the man who bore the stamp of Woodrow Wilson's approval. The brush was beaten, all right, and to a finish, but the coyotes were not there and the howl didn't register in ballots."

## Labor Board Hears New York Central Dispute

**H**EARINGS BEFORE the Railroad Labor Board on a small but significant dispute between the New York Central and the Railway Employees' Department of the American Federation of Labor were opened on September 13. The dispute in this case arose from the action of the New York Central in transferring skilled and unskilled employees engaged in the construction and maintenance of telegraph lines along the New York Central right-of-way from its payroll to the payroll of the Western Union Telegraph Company. This change was made on April 15 and the employees, through the Railway Employees' Department, protested to the Board, asserting that the move was a "mere subterfuge" to avoid payment of wages fixed by the Railroad Labor Board. In the employees' submission to the Board they stated that the rates of pay and working conditions of the telegraph company (supposed to be less favorable to the employees) were applied to the men so transferred and cited as a precedent the Board's Decision No. 120, issued as a result of the controversy between the St. Louis-Southwestern and certain of its maintenance-of-way employees regarding the substitution of certain employees by employees of an outside contracting

organization. This decision was described in the *Railway Age* of April 22, page 990.

The railroad, in its submission to the Board, explained that a contract or agreement between the Western Union Telegraph Company and the New York Central and its subsidiaries was made in 1907. This contract provided that, in return for the acquisition by the telegraph company of the telegraph facilities owned by the carrier and for the use of the carrier's right-of-way for the telegraph company's lines, the Western Union would furnish the railroad telegraph service up to 40 per cent of its total wire mileage. The telegraph company was to provide for the skilled labor and the carrier for the unskilled labor used in the erection and repair of all telegraph wires. By the terms of a supplemental agreement made in 1910 the New York Central agreed to carry both the skilled and unskilled labor employed in this work on its own payrolls, billing the Western Union for 100 per cent of the amount paid to station linemen and 50 per cent of the amount paid for unskilled gang labor when on construction work.

During federal control, the railroad explained, the Western Union took exception to the increases in wages granted by the director general and refused to honor the bills presented to it by the carrier. By the end of federal control the director general held unpaid bills of the New York Central against the Western Union totaling \$1,171,074. This attitude of the telegraph company continued after federal control and as a result an additional claim totaling over \$200,000 was run up by the railroad company against the Western Union. After being called upon by the director general to settle these accounts the New York Central reached an agreement with the Western Union whereby the latter paid 60 per cent of the bill for labor under this agreement during federal control, and between 75 and 80 per cent of the amount which has accrued since the end of federal control.

### Henry T. Hunt Represents A. F. of L.

Henry T. Hunt, formerly a representative of the public on the Labor Board, appeared before that body for the first time as a legal representative of the Railway Employees' Department of the American Federation of Labor. Mr. Hunt's argument against the action of the company was based largely on legal citations showing that the employer is not necessarily the party which pays the employee, but that party which directs the employee's work and has the power to hire, discharge and make substitutions. Employees in this case, Mr. Hunt contended, are joint employees because they are directed by the joint superintendent, an employee of both the New York Central and the Western Union, even though they are paid by the telegraph company. He then developed the argument that joint employees of this character properly come under the labor provisions of the Transportation Act. Carrying out this thought, Mr. Hunt said that should the position of the carrier be upheld it would only be necessary for the railroads to get someone else to pay their employees to evade all of the labor provisions of the Transportation Act.

Jacob Aronson presented the carrier's case. After calling attention to the fact that the contract with the Western Union was made in 1907, fourteen years prior to the passage of the Transportation Act, he stated that if the Board ruled against the railroad in this case it would have to conclude that the railroad had enough foresight fourteen years ago to make the preparations necessary to avoid the provisions of the Transportation Act now. The defense of the New York Central, as outlined by Mr. Aronson, was based largely on the fact that the action taken by that carrier in transferring these employees from its payroll to the Western Union payroll was taken in accordance with the provisions of the supplemental agreement of 1910, and that by ruling against the railroad in any manner in this case the Board would be taking from the carrier the right of contract. Mr. Aronson called attention to the fact that this agreement is nothing more or less than

the lease of the small amount of wire mileage owned by the New York Central and of the right to use the carrier's right-of-way for the lines of the Western Union. In return for this the Western Union paid the carrier in service instead of in money, he added. The whole matter, Mr. Aronson said in closing, is therefore entirely outside the Board's jurisdiction.

The hearings were closed on the same day, the Labor Board taking the case under advisement.

During the past week the Labor Board has been busy in hearing a large number of smaller disputes through the agency of its three bureaus composed of three members each, the New York Central case being the first case which has been heard by the full Board for some time.

## A Heavy Duty Trailer

THE MOVEMENT of heavy concentrated loads such as large castings, etc., constitutes an important handling problem in railway freight stations, warehouses and transfer stations. In such work, cranes, trucks, tractors and trailers and various other material handling devices are being increasingly used. For such work the Sharon Pressed Steel Company, Sharon, Pa., has developed a trailer specially designed for heavy duty service with tractors.

The trailer frame consists of four  $\frac{3}{8}$ -in. channel sections which are pressed from  $\frac{1}{8}$ -in. hot rolled open-hearth steel and riveted into one-piece channel section corner pieces pressed to a 6-in. radius. By varying the length of the side and the end rails, the trailer can be made in any length up to 72 in. and in any width up to 50 in. Two additional members, of 3-in. pressed steel channel, run lengthwise be-

Under Platform View Showing Construction Details

neath the floor and are riveted to the end rails and braced, laterally, to the frame with front and rear pressed steel "V" braces which take the pull of the  $\frac{3}{8}$ -in. steel forged coupler. Either one or two couplers can be used.

The rear wheel and front caster supports are 3-in. pressed steel channels riveted to the side rails and the longitudinal members of the frame. The rear wheel brackets are pressed from  $\frac{1}{4}$ -in. steel with two stiffening ribs on each side. The rear wheels are of malleable iron with six double-web spokes and  $3\frac{1}{2}$ -in. face and are equipped with 3-in. Hyatt roller bearings on a hardened and ground 1-in. shaft.

The front casters are of heavy-duty type, ball and roller bearing equipped, bolted to a  $\frac{1}{2}$ -in. steel plate which is riveted to the frame. The floor of the trailer is  $1\frac{1}{4}$ -in. oak recessed flush in the side and end rails. All frame members are flush on the bottom, thus affording an even support when the trailer is used in connection with a lift truck.

The trailer was recently given a severe test with a load of 8,000 lb., indicating its adaptability to exacting service.

## Flexible Metallic Packing

AN UNUSUAL and interesting rod packing, said to combine the adjustment features of non-metallic packing with the wear-resisting qualities of metallic ring packing, is "V" Pilot Packing, made by the Pilot Packing Company, Inc., Chicago. The packing takes its name from the patented contour of the metal which is shaped like a "V" to insure an entirely metallic surface on the rod at the

Fig. 1—Cross Section of a Set of "V" Pilot Packing

slightest pressure of the gland. The face of the metal, as shown in Fig. 1, is slotted, the slots being staggered to prevent the escape of steam down the rod. The slots serve another useful purpose by retaining oil for the lubrication of the rod.

A hasty glance at Fig. 1 may give the impression that there are two pieces of metal instead of one, but on closer examination the V-shape of the solid, white metal bar is apparent.

"V" Pilot Packing has a resilient, pliable back, fitting it for many uses for which purely metallic packing is not

Fig. 2—View Showing Flexibility of New Packing

adapted. Its extreme flexibility, as shown in Fig. 2, permits its use on small rods and provides easy and quick adjustment. This packing has successfully passed the experimental stage and demonstrated its value by extended tests under actual working conditions, having shown unusually long life and resultant economy. It has a wide range of application and is used by railroads for air pumps, boiler feed pumps (steam and water ends), valve stems, throttle stems, power reverse gear rods, stationary air compressors, steam engines, hot and cold water pumps, ammonia pumps, roundhouse washout pumps, power plant feed water pumps, pumping station (steam or water glands), steam hammers and many other purposes.

"V" Pilot Packing is supplied boxed and ready for immediate service and is applied in the same manner as ordinary fibrous packing.

# General News Department

The Canadian Ticket Agents' Association will hold its thirty-fifth annual meeting at Ottawa, Ontario, on October 11, instead of September 20, as had been planned.

A fire in the roundhouse and local shops of the Erie Railroad at Jersey City, N. J., on September 11, destroyed one building, partly destroyed another one and damaged 18 locomotives; estimated total loss \$100,000.

The Executive Board of the Master Boiler Makers' Association, will meet at the Sherman Hotel, Chicago, Ill., on the morning of September 24, to decide on a place for the next annual convention to be held in May, 1922.

"A Shipper's View of the Evolution of Transportation, and Its Effect on Steam Railways" will be the subject of a paper by George C. Conn, director of traffic of the Buick Motor Company, at the next meeting of the Western Railway Club, on September 19, at the Great Northern Hotel, Chicago.

Four masked men held up passenger train No. 2 on the Kansas City Southern between Bloomburg, Tex., and Texarkana on the night of September 6 and robbed the mail car. The bandits (who had concealed themselves on the train), entered the cab of the engine and ordered the mail car uncoupled; they forced the engineer then to run to the outskirts of Texarkana where the actual robbery occurred.

The Joint Committee on Automatic Train Control of the I. C. C. and the A. R. A. will hold a meeting at the office of the American Railway Association, Manhattan building, Chicago, on September 27, to consider the reports of the I. C. C. and A. R. A. inspectors covering performance records of the train control systems which have been inspected on the Chicago & Eastern Illinois and the Chicago, Rock Island & Pacific. At present the inspectors are on the Chesapeake & Ohio installation.

The Los Angeles Limited, train No. 7, of the Oregon Short Line, was held up by two masked and armed robbers on August 31, near Clearfield, Utah, 9 miles south of Ogden. The train was stopped by an automatic block signal and the two robbers, entering the observation car, proceeded to hold up the men only. While one gathered loot in the observation car the other proceeded to the other cars. They then made the conductor start the train and in the outskirts of Salt Lake City, they dropped off.

## Railway Electrical Engineers Will Not Meet

The 1921 annual convention of the Association of Railway Electrical Engineers has been postponed indefinitely. This action was taken by its board of directors as a result of a suggestion made recently by the Association of Railway Executives that the various sections of the American Railway Association postpone indefinitely all conventions or curtail them as much as possible. The Association of Railway Electrical Engineers is not officially connected with the American Railway Association, but has applied for membership.

## Chief Engineers' Night

The Western Society of Engineers plans a chief engineers' night on September 26, at which prominent engineers on several of the larger railways at Chicago will speak briefly on some of their earlier experiences which they now look back on as turning points in their professional careers. This is the first of a series of inspirational programs designed particularly for the encouragement of the younger men of the society. The speakers will include C. A. Morse, chief engineer, C. R. I. & P.; A. S. Baldwin, vice-president and formerly chief engineer, Illinois Central; H. R. Safford, assistant to

president, C. B. & Q., and formerly chief engineer of the Grand Trunk; C. F. Loweth, chief engineer, C. M. & St. P., and E. H. Lee, vice-president and chief engineer of the Chicago & Western Indiana.

## No More Mail on Freight Trains

The former practice of shipping monthly, semi-monthly and weekly periodicals by mail, instead of by freight, will be re-established October 1. The change, it is expected, will save the government approximately \$268,000 annually in labor, rent and cartage. Nearly 1,000 publications will be affected.

At the time the freight-shipment plan was adopted in 1911, mails were transported by rail entirely on the weight basis, and the difference in the cost of transportation by freight and passenger trains was material. Since the adoption of payment by space, and the general increase in freight rates, conditions are the reverse of what they were; there is little difference in the cost of transportation between freight trains and mail trains.

## Some Unit Costs Show Reduction

The Interstate Commerce Commission's monthly bulletin of freight and passenger train service unit costs for the month of June shows a further reduction in some of the unit costs of railroad operation. The cost per freight train mile for selected accounts used by the commission was \$1.753 for the month as compared with \$1.89 last year and the average cost per passenger train mile, selected accounts, was 98.4 cents as compared with \$1.03 last year. For the first six months of 1921, however, the average cost per freight train mile was \$1.95 as compared with \$1.85 last year and per passenger train mile was \$1.07 as compared with \$1.01 last year.

## Annual Meeting of the Telegraph and Telephone Section

The annual meeting of the Telegraph and Telephone section of the operating division of the American Railway Association will be held at Cleveland, Ohio, on September 21, 22 and 23. A number of important reports relative to telegraph and telephone development and operation, including those relating to the handling of message traffic, the application of radio telegraphy and telephony to railway work and proper systems of education of employees, will be presented for discussion and action. The March meeting of this section was cancelled and the annual meeting is the first and only one to be held this year.

## Protests Against Valuations

Many protests against the tentative valuations which have recently been served by the Interstate Commerce Commission are being received by the commission, objecting on the ground that the commission has either left out or not given sufficient consideration to various elements of value. Most of the protests also object because the commission has not analyzed the methods by which it has made up its figure for final value. A brief filed this week by the Los Angeles & Salt Lake says that the method adopted by the Bureau of Valuation is wrong in principle and results in naming an inadequate figure for the value. It says the bureau has recognized that the figure it has reported does not represent the real value of the property "but a mere rate basis, a term which it uses interchangeably with valuation for rate-making purposes." It is also stated that the bureau method ignores factors of controlling importance. Whereas the commission places a final value of \$45,871,093 on this road, R. S. Lovett, chairman of the board, had testified that the property was worth \$82,000,000 after approximately \$10,000,000 had been added since the valuation date

### Mail Car Robberies Reduced

Postmaster-General Hays is quoted as saying that the wave of post office and mail train robberies had been broken by the order issued last April that all post office clerks engaged in the transportation of mail arm themselves. There has been a slump in the losses since the clerks began carrying pistols and shotguns in mail cars, wagons and post offices. In 1920, the Post Office Department lost \$6,300,000 because of robberies, but in the five months from April 7, when arming was ordered, until September 7, only \$88,580 was stolen.

### The Equipment Quarterly

A list of traffic representatives of large shippers is a prominent feature of the August issue of the "Railway Equipment Quarterly," the 185-page supplement to the Railway Equipment Register. This list fills 34 pages, and information is given from 44 states, together with a few items from Canada. The list has been compiled primarily to show names of shippers and receivers of carload freight in large quantities. An idea of the detail included may be gained from the statement that New York fills nearly five pages. This includes, however, under New York City, the National Wholesale Lumber Dealers' Association, in which there are over 500 members, and the names and addresses of all these members are given. The Fisk Rubber Company, of Chicopee Falls, Mass., has branches in over 100 cities, all of which are named.

The classification of freight cars, which is a main feature of the Quarterly, has been greatly enlarged and now contains an enormous mass of details. A new section has been added, Part IV, Private Cars, filling seven pages. This gives the names of manufacturers, merchants and other shippers who own cars, with the figures distributed in 20 columns to show the kinds of cars. This list shows a total of 190,422 cars; which indicates that the total number of such cars in the country must be well above 200,000; for some prominent owners, like the American Refrigerator Transit Company, Morris & Company and Swift & Company, have given no information as to the number of cars owned by them.

The total number of tank cars recorded in this list is 124,479; refrigerators 36,306 and hopper (coal) cars 18,039.

### National Safety Council at Boston

The National Safety Council, headquarters 168 North Michigan avenue, Chicago, announces the tenth annual congress of the Council, to be held at Boston, Mass., in the State House, beginning Monday, September 26, and continuing five days. The general business meeting will be held on Monday morning, C. P. Colman, president of the National Safety Council, presiding. The section meetings will be held on the following days, the more important ones in the forenoon.

The steam railroad section, T. H. Carrow (Penn.), chairman, will hold its first session on Tuesday morning, in room 436. The speakers named in the program are John F. Moore (Y. M. C. A.), Rev. Walt Holcomb, C. W. Galloway (B. & O.), and E. L. Bair, Benefit Association of Railway Employees, Chicago.

The second session, Wednesday morning, will discuss bulletin No. 78 of the Interstate Commerce Commission, containing statistics of railroad accidents of the last quarter of 1920. Train accidents will be discussed by F. R. Mitchell (N. Y., N. H. & H.), S. G. Watkins (B. & M.), and T. R. McCampbell (C. C. & St. L.); train service accidents by C. L. La Fontaine (G. N.), W. J. Orr (T. H. & B.), D. E. Satterfield (C. & O.), and E. M. Harris (N. Y., N. H. & H.); non-train accidents by W. H. Ganzert (C. & O.), E. S. Chapin (Penn.), H. E. Astley (N. Y., N. H. & H.), and J. T. Pratt (P. & R.).

The third session will be a joint meeting with the Electric Railway Section, on Thursday morning, with John T. Broderick (B. & O.) in the chair. The discussion will be on highway grade crossing accidents, and the following are the speakers: J. E. Long (D. & H.), F. M. Metcalfe (N. P.), T. P. Brennan (L. I.), F. Whittemore (N. C. & St. L.), Arthur Ridgeway (D. & R. G. W.), D. L. Cease ("The Railroad Trainman"), and L. F. Shedd (C. R. I. & P.).

On Friday morning there will be an address by F. M. Metcalfe (N. P.) on the substitution of superintendents' staff meetings for the customary safety committee meetings. Other speakers on

Friday will be D. G. Phillips (Wabash), Harry A. Adams (U. P.), F. H. Babcock (P. & L. E.), and E. R. Cott (H. V.).

### Disastrous Floods in Texas

Heavy rains in southern Texas on September 9 and 10, featured by a cloudburst near San Antonio, caused serious loss of life and extensive damage to property in the city of San Antonio and vicinity. There also was considerable damage to railroad property. Bridge approaches have been washed out at many points.

The Missouri, Kansas & Texas lost approximately 500 ft. of bridge approaches between Temple and Taylor, and the line between Austin and Ranger was closed many days. Between Ranger and Georgetown this road lost approaches to 14 or 15 bridges, while at three or four points as many as 10 to 20 panels were washed away. In the immediate vicinity of San Antonio the damage to the railroads was not so great. The Southern Pacific had a few washouts. Several small washouts occurred on that road between Austin and Elgin. Other damage is reported on the Llano & Austin branch, and some damage to trestle bridges and the San Gabriel river bridge on the Llano branch. Heavy rains have occurred on the watershed of the Little river which joins the Brazos north of Herne, and in that vicinity water was over the track in numerous places. Heavy rains fell farther south, and the Texas-Mexican, between Corpus Christi and Laredo, suffered heavy damage. The waters receded rapidly and it is expected that all train service will be restored by the end of this week. Until that time it will be necessary for the Missouri, Kansas & Texas to run trains to San Antonio by way of Houston.

### Railway Returns for July

The net railway operating income for July of the 202 class I railroads of the United States amounted to \$69,485,000, which is a larger sum than they have earned in any month since last October, according to the reports filed with the Interstate Commerce Commission. It also represents an increase of \$17,000,000 as compared with June.

The earnings for July, on the basis of the tentative valuation fixed by the Interstate Commerce Commission for rate-making purposes under the transportation act, would be at the annual rate of return of 4½ per cent. This is \$23,782,000 for the month less than the roads should have earned as the normal July proportion of a 6 per cent return, which would be \$93,267,000. Fifty-seven of the roads failed to earn their operating expenses and taxes for the month. In June, 72 of the roads failed to earn expenses and taxes.

The total operating revenues for July amounted to \$462,953,000, which was a decrease of \$66,000,000, or 12½ per cent, as compared with July, 1920, although the rates are now on a higher basis. Operating expenses were \$362,776,000, a reduction of \$151,000,000, or 29.4 per cent. The net operating income compares with a deficit of \$11,878,000 for July, 1920.

The large reduction in expenses is attributable to several factors. It reflects the effect of the reduction in wages ordered by the Railroad Labor Board, effective on July 1, but it also represents the effect of the drastic curtailment of maintenance expenditures, and it is to be borne in mind that the figures for last July, with which comparison is made, included some back wage payments.

For the 11 months since September 1, 1920, when the guaranty period expired, the net operating income of the class I roads has been \$438,000,000, which on the basis of the tentative valuation would be at the annual rate of return of 2.6 per cent, or \$570,000,000 less than a 6 per cent return.

For the roads of the Eastern district for July the operating revenues were \$208,043,000, a decrease of 13.8 per cent, while the expenses were \$167,007,000, a decrease of 32.5 per cent. The net operating income of the Eastern roads was \$27,336,000, as compared with a deficit last year.

The Southern roads had operating revenues amounting to \$71,202,000, a decrease of 10 per cent; their expenses were \$58,988,000, a decrease of 26.1 per cent, and their net operating income was \$8,368,000, as compared with a deficit last year.

For the Western district the operating revenues were \$183,708,000, a decrease of 11.8 per cent; the operating expenses were \$136,781,000, a decrease of 26.7 per cent, and the net operating income was \$33,781,000, as compared with \$9,104,000 in July, 1920.

## Traffic News

Nearly 7,000,000 more bushels of grain passed down the Lachine Canal in August than during the same month last year, according to figures issued by the Lachine Canal office. Wheat totalled 5,361,846 bushels gain; 6,662,592 bushels in August, 1921, against 1,300,747 bushels in August, 1920. Corn showed 2,918,266 bushels coming down last month, against 116,946 bushels last year. Oats, rye and flaxseed also record increases.

The Pennsylvania Railroad announces that beginning September 15, the extra fare of \$7.78 (including war tax) between Washington and Chicago on the Broadway Limited will be discontinued. Beginning September 25 a through sleeping car from Chicago to Washington will be run on train No. 136, leaving Chicago at 11:30 p. m., and one from Washington to Chicago on the train leaving Washington at 10:30 p. m. These changes are to meet the competition of the Baltimore and Ohio, which has put on a new train between Washington and Chicago, competing with the Broadway Limited in time, but charging no extra fare.

### Rates on Building Materials Reduced

The Interstate Commerce Commission on September 10 approved heavy reductions, on five days' notice, in interstate freight rates on sand, gravel and crushed stone between practically all points in trunk line territory, including Pennsylvania, New Jersey, Delaware, Maryland and portions of West Virginia and Virginia. The new rates will go into effect on October 1 and will be approximately 15 per cent higher than the rates in effect prior to the general increase of August, 1920, thus substituting a 15 per cent increase for a 40 per cent increase. Builders of roads, buildings, etc., will have the benefit of an annual reduction in transportation charges much in excess of a million dollars.

### Western Livestock Rates To Be Reduced

The Interstate Commerce Commission on September 13 granted the western carriers authority to waive the usual tariff rules requiring publication of specific rates in order to permit reduced rates on livestock in the west to become effective September 20. In its opinion the commission recommended that c. l. rates on cattle, hogs and sheep, west of the Mississippi river and Chicago, now higher than 50 cents per 100 lb., be reduced by 20 per cent, except that no rates need be reduced below 50 cents. Practically all rates from points west of the Missouri river to Chicago and from west of the Rocky Mountains to the Missouri river will be reduced in amounts ranging from 1 to 25 cents per 100 lb. In many cases the entire increase made in August, 1920, will be eliminated. The amount of reduction in the carriers' annual revenue which will result is not definitely known, but has been estimated to be upwards of \$10,000,000, the commission's announcement said.

### Anthracite Shipments, August, 1921

Shipments of anthracite for August, as reported to the Anthracite Bureau of Information, in Philadelphia, amounted to 5,575,115 gross tons, as compared with 5,462,760 tons in the preceding month, and with 6,207,653 tons in August, 1920. The decrease from August, 1920, was due chiefly to continued light demand for all sizes except stove, and to a continuance of scattered colliery suspensions caused by market conditions and petty strikes.

Shipments by originating carriers were:

	August, 1921	July, 1921
P. & R. R. W.	1,116,844	1,039,078

	5,575,115	5,462,760

## Commission and Court News

### Interstate Commerce Commission

The commission has announced the reopening of the Kansas intrastate rate case for further hearing with reference to specific intrastate rates in Kansas that may be higher than interstate rates to and from Kansas points.

The commission has suspended from September 15 until January 13, 1922, the operation of schedules which propose increased commodity rates on fresh fruits, melons and vegetables, in carloads, from points in Arkansas, Louisiana, Missouri, Oklahoma and Texas to destinations in Central Freight Association and Trunk Line Territories.

The commission has further suspended until October 29, the operation of certain schedules which propose to increase rates on lumber and other commodities between El Paso, Tex., and points in Oregon, Washington, Utah and Idaho, the operation of which was suspended until September 29 by an order previously entered.

The commission has suspended until January 11, 1922, the operation of certain schedules published by the Lehigh Valley, which propose the cancellation of the existing commodity rate of 12½ cents per 100 lb. on lumber from North Tonawanda, N. Y., to Canandaigua, leaving applicable instead the existing sixth-class rate of 14½ cents.

The commission has suspended until January 24, 1922, the operation of certain schedules published by the Southern Pacific which propose the cancellation of certain exceptions to the Western Classification applicable on fresh fruit and vegetables on interstate traffic between points in Arizona, New Mexico and Texas, resulting in the application of first, second and third class rates on apples, first class on bananas, melons, oranges, and third class on potatoes, 1 c. l., fifth class on apples, third class on bananas and oranges, and Class C rates on melons and potatoes, c. l., in lieu of the existing ratings of fourth class, 1 c. l., and Class C on carloads.

The commission has suspended from September 10 until January 8, 1922, the operation of certain schedules published in Agent R. H. Countiss' trans-continental east bound tariff which propose the cancellation of routing on lumber and other forest products from points on the South Bend (Washington) Branch of the Chicago, Milwaukee & St. Paul, via Marengo, Wash., to destinations on the Union Pacific System in Southern Idaho, Utah and Western Wyoming, resulting in the application of combination of locals. For example, the present through rate from Duly, Wash., to Nampa, Idaho, is 52½ cents, while the combination rate proposed to apply is 56½ cents.

The commission has suspended from September 15 until January 13, 1922, the operation of certain schedules published by R. H. Countiss, agent. The suspended schedules in Supplement No. 1 to the tariff propose to restrict the routing on lumber and articles taking same rates destined to eastern points so as not to apply via any junction in connection with the Atchison, Topeka & Santa Fe, Gulf, Colorado & Santa Fe or Pan-Handle & Santa Fe, from points in California, Nevada and Utah in the Hawley and Truckee groups, leaving applicable instead combination rates, and Supplement No. 2 to the tariff proposes to substitute for the combinations proposed to apply, the coast group rates from points in the Hawley and Truckee groups.

### State Commissions

The Baltimore & Ohio has filed an application with the Illinois State Commission for permission to close four stations in that state, the stations being Lakewood, Moccasin, Bluff Springs and Berry.

## Foreign Railway News

### Simplon Tunnel Widening Completed

The excavation work on the second Simplon tunnel in Switzerland, parallel to the first, was completed on September 13, according to cable dispatches from Geneva. The masonry work on the new tunnel is said to be well advanced and it is expected that it will be open for traffic by the first of the year.

### Disastrous Accident on French Railway

Twenty-five persons are reported to have been killed and 60 injured when an express train bound from Lyons to Strassbourg was derailed 9 miles from Lyons, on September 10. Four cars carrying third class passengers were overturned. Passengers in these cars were for the most part soldiers returning for duty to Alsace.

### Electrification of the Argentine Transandine

The directors of the Argentine Transandine Railway have asked authority to increase the capital of the company from 2,500,000 to 4,000,000 gold pesos, according to Commerce Reports. The additional funds to be used in covering the expense of electrifying the line. Plans are said to be under way providing for the joint operation of the Chilean Transandine with the Argentine Transandine.

### Belgians Underbid Americans in China

Bids by Belgian concerns on steel rails for the Peking-Mukden Railway are equivalent to \$41 a ton, according to Commerce Reports. These bids are from \$7 to \$32 lower than bids by American concerns. The Belgian bids were the lowest and two French concerns came second and third. The Yellow River Bridge Commission has recommended the awarding of the business to the Belgians.

### Purchasing Department Changes on

#### Japanese Government Railways

The financial and purchasing department of the Japanese Government Railways has organized a new section for the purpose of making extensive purchases of modern labor-saving machinery for the mechanical and engineering departments. This section, which will be under the direction of Shinji Sogo, will also arrange for the purchase and installation of modern equipment for the railway's offices.

### South African Railway Electrification

#### May Be Postponed

The latest reports regarding the proposals for the electrification of certain sections of the government railways of the Union of South Africa are to the effect that no bids have as yet been accepted, and that it is possible that the program may not be carried through at this time to the full extent planned for, according to Commerce Reports. It is reported that uncertain business conditions may influence the government to defer this work.

### Improved Railway Service for Rumania

Representatives from the ministry of railways of Rumania recently met in Prague to discuss the means of establishing rapid train service between Czechoslovakia, Rumania, and other southeastern European countries, says a report from Consul C. S. Winans, Prague, Czechoslovakia. A general conference on this question is to be held at Prague in October. The negotiations recently held at Budapest between Czechoslovakia and Hungary regarding the rates to be charged on merchandise sent to Rumania by way of Hungary are said to have reached a favorable conclusion.

## Equipment and Supplies

### Locomotives

THE CHILEAN STATE RAILWAYS, reported in the *Railway Age* of April 24, as inquiring for 30 Mikado type locomotives, has ordered 10 Mikado type locomotives from the Baldwin Locomotive Works, and 20 Mikado type locomotives from the American Locomotive Company.

### Freight Cars

THE BINGHAM & GARFIELD is asking for prices on 25 to 75 ore cars of 60 tons' capacity.

THE ATLANTIC FRUIT COMPANY, New York, has ordered 4 flat cars of 20-ton capacity from the Magor Car Corporation.

THE DENVER & RIO GRANDE WESTERN is inquiring for 1,000, 50-ton flat bottom gondola cars, also for 1,000, 70-ton flat bottom gondola cars.

THE WARASH has given an order to the Western Steel Car & Foundry Company, for making repairs to 200 to 250 all steel hopper cars, of 40-ton capacity.

THE VIRGINIAN contemplates having repairs made on from 1,000 to 4,000 freight cars. 100 freight cars are now being repaired at the shops of the Mt. Vernon Car Manufacturing Company.

THE BANGOR & ARDOSTOOK, reported in the *Railway Age* of September 3, as inquiring for 200 single sheathed box cars of 40-ton capacity, has ordered these cars from the Standard Steel Car Company.

THE CHICAGO, ROCK ISLAND & PACIFIC, reported in the *Railway Age* of August 27, as inquiring for 200 gondola cars and also asking for bids for the repair of 500 all steel general service cars, has ordered 200 composite gondola cars of 50-tons capacity from the General American Car Company and is having repairs made to 125 general service gondola cars of 50-ton capacity at the shops of the Western Steel Car & Foundry Co.

### Iron and Steel

THE CANADIAN PACIFIC has ordered 25,000 tons of rail, from the Algoma Steel Corporation.

THE EVANSVILLE, INDIANAPOLIS & TERRE HAUTE has ordered from the Mt. Vernon Bridge Company, Mt. Vernon, Ill., 200 tons of steel for its Eel river bridge in Indiana.

THE MEIKI RAILWAY, Osaka, Japan, is inquiring through Mitsui & Company, New York, for 1,900 tons of 60-lb. rail; Mitsui & Co. are also inquiring for about 1,000 tons additional of 30-lb. and 60-lb. rail for export to Japan.

### Miscellaneous

THE MISSOURI KANSAS & TEXAS has awarded a contract to the National Boiler Washing Company, Chicago, for unloading and delivery facilities, pumps, oil columns, pipe lines, etc., for use with oil tanks the orders for which were noted in the *Railway Age* of September 10 (page 510).

THE NEW YORK CENTRAL will receive bids until 12 o'clock, noon, September 29, for its present requirements on rolled steel gears, fence wire, track bolts, volt cable and parts for installing same, bottom plates for crossing frogs, manganese frogs; its requirements of fuel oil for locomotive service during whatever period of time during the month of October, 1921, it is required to burn same and its requirements until October 31, 1921, on steel billets and steel wheels for locomotive, passenger car and tender repairs.

## Supply Trade News

**R. I. Baird**, who was from 1909 to 1917 connected with the sales department of the Electric Storage Battery Company, Philadelphia, Pa., has returned to the service of that

**R. I. Baird**

company and is now in charge in the western district of sales of Exide batteries for railway car lighting, industrial trucks, etc. Mr. Baird's headquarters will be at the Chicago office of the company, in the Marquette building. The railway signal work is in charge of **H. B. Crantford**, who formerly was in the service of the Chicago, Milwaukee & St. Paul. Mr. Baird was educated at the Armour Institute of Technology, Chicago, and has been connected with the Automatic Electric Com-

pany and the Bryant Zinc Company. He was also in railroad work, having served in the signal department of the Illinois Central. Since 1917, he has represented the Delco Light Company, in Montana.

**Charles B. Seger**, president of the United States Rubber Company, New York, has been elected also chairman of the board, succeeding as chairman Col. Samuel P. Colt, deceased.

**C. B. Seger**

Mr. Seger was born on August 29, 1867, at New Orleans, La., and was for many years in railway service, having begun work as an office boy with Morgan's Louisiana & Texas Railroad & Steamship Company, now a part of the Southern Pacific. He subsequently served as a clerk until 1887, when he was appointed steamship auditor. He was then auditor and later clerk to the chief auditor until 1893, when he was appointed auditor and secretary of the Galveston, Harrisburg & San Antonio, the Texas & New Orleans and the Direct Navigation Company. In January, 1900, he was appointed also auditor and secretary of the Galveston, Houston & Northern. On November 1, 1904, he was appointed auditor of the Southern Pacific—Pacific system, with office at San Francisco, Cal., and six years later became general auditor of the Southern Pacific—Union Pacific systems, later serving as deputy controller until the separation by the courts of the Southern and Union Pacific systems in 1913, when Mr. Seger became vice-president and controller of the Union Pacific and from March to December, 1918, served as acting chairman of the executive committee and as president. Since January 1, 1919, he has been president of the United States Rubber Company and now becomes also chairman of the board as above noted.

The Pennsylvania Car Company has been incorporated under the laws of Delaware, with a capital of \$1,000,000 to engage in the building of railroad cars. The incorporators are: J. H. Van Moss, James H. Durbin, L. B. Coppinger, and the Corporation Trust Company of Delaware. Plants equipped with latest improved machinery will be constructed at Sharon, Pa., at Argentine station, Kansas City, Kan., and at Houston, Texas. This company is affiliated with the interests that control the Pennsylvania Tank Car Company and the Pennsylvania Tank Line, Sharon, Pa., and the present plans call for the development of one of the largest organizations of its kind in the country.

The Railroad Accessories Corporation, manufacturer of and dealer in general railway supplies, particularly those used by the signal departments, with offices at 50 Church street, New York, and factory at Boonton, N. J., has succeeded to the rights and property of the Eastern Signal & Supply Company, 50 Church street, New York, the Railroad Accessories Corporation, the Duplex Channel-Pin Company, and the Lenorr Concrete Products Company, all of 30 Church street, New York. The officers of the Railroad Accessories Corporation are **F. C. Lavarack**, president; **E. M. Deems**, vice-president and treasurer; **J. M. Mercer**, secretary, and **W. W. Lavarack**, manager. **F. C. Lavarack** has been connected with the railroad and supply field for the past 21 years, **E. M. Deems** with the supply field for the past 24 years, **J. A. Mercer** for the past 13 years, and **W. W. Lavarack** with the railroad and supply field for the past 40 years.

## Obituary

**Fred A. Dexter**, president of the Leavitt Machine Company, Orange, Mass., died on August 26.

**Silas C. Linbarger**, ceramic engineer for the Carborundum Company, Niagara Falls, N. Y., died at his home in that city on September 10.

## Trade Publications

**COALING STATION.**—The Howlett Construction Company, Moline, Ill., recently issued a pamphlet illustrating by diagram and photograph the small locomotive coaling station of the balance bucket type which this company has recently developed for railway service. The installations illustrated in the pamphlet include those for the Great Northern at Bellingham and Rockport, Wash., and for the Chicago, Memphis & Gulf. The pamphlet also devotes some space to illustrating its larger type coaling plants and to the listing of the work done by the company in 1920.

## Railway Financial News

**ASHERTON & GULF.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$436,000 of first mortgage, 30-year gold bonds.

**CENTRAL NEW ENGLAND.—Authorized to Abandon Line.**—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of a line of 1.87 miles in Hampden County, Mass.

**CENTRAL VERMONT.—Asks Loan from Revolving Fund.**—This company has applied to the Interstate Commerce Commission for a loan of \$128,000 for five years.

**CHESAPEAKE & OHIO.—Asks Authority to Lease Road.**—This company has applied to the Interstate Commerce Commission for authority to lease the property of the Chesapeake & Ohio of Indiana.

**CHICAGO JUNCTION.—Acquisition by New York Central.**—See New York Central.

**COLORADO & SOUTHERN.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year, as follows:

	1920	1919
Standard return (January and February, 1920; year 1919)	\$413,535	\$2,481,212
Total railway operating revenues	13,816,741	13,816,741
Total railway operating expenses	1,142,899	80,25
Net from railway operations	2,887,377	2,430,960
Railway tax accruals	784,225	
Railway operating income and standard return	2,099,993	2,430,960
Estimated amount due for guaranty period (March 1 to August 31)	959,688	
Total non-operating income	2,998,552	1,775,727
Gross income	5,098,544	4,206,687
Interest on funded debt	2,140,438	2,105,093
Total deductions from gross income	2,492,478	2,422,740
Net income	2,606,066	1,783,946
Dividends	680,000	680,000
Income balance transferred to profit and loss	1,926,066	1,103,946

The annual report of the Colorado & Southern will be reviewed editorially in an early issue.

**DENVER & RIO GRANDE.—Appeal Allowed.**—Judge Lewis of the Federal Court at Denver, Col., has allowed the stockholders an appeal from the order confirming the sale of the Denver & Rio Grande to the Western Pacific interests.

**FORT WORTH & DENVER CITY.—Annual Report.**—The corporate income for the year ended December 31 compares with the previous year, as follows:

	1920	1919
Standard return (January and February, 1920; year 1919)	\$315,231	\$1,891,386
Total railway operating revenues	11,196,885	12,875,713
Total railway operating expenses	10,383,618	18,121
Net from railway operations	1,128,498	1,873,266
Railway tax accruals	353,161	
Railway operating income and standard return	792,275	1,873,266
Estimated amount due for guaranty period (March 1-August 31)	1,113,733	
Total non-operating income	1,527,335	128,713
Gross income	2,319,610	2,002,018
Interest on funded debt	534,511	534,716
Total deductions from gross income	843,560	686,540
Net income	1,476,050	1,315,477
Dividends	639,152	639,152
Income balance transferred to profit and loss	836,898	676,325

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919, as follows:

Operating Revenues		
	1920	1919
Freight	\$8,434,056	\$7,112,886
Passenger	4,086,611	3,615,777
Total railway operating revenues	13,251,946	11,162,302
Operating Expenses		
	1920	1919
Maintenance of way and structures	\$2,033,334	\$1,100,537
Maintenance of equipment	2,985,747	2,188,479
Traffic	1,646,188	54,669
Transportation	5,972,814	4,068,432
General	440,692	316,953
Total railway operating expenses	11,660,759	7,267,354
Net revenue from railway operations	1,646,188	3,394,948
Railway tax accruals	376,961	257,541
Railway operating income	1,265,743	3,135,900
Net railway operating income	923,319	2,826,466

Passenger Traffic		
Number of revenue passengers carried	1,328,753	1,210,992
Number of passengers carried one mile	143,932,860	129,426,288
Average distance carried (miles)	108.32	106.88
Average revenue per passenger mile	2.839	2.794
Freight Traffic		
Number of revenue tons carried	3,441,773	3,180,448
Number of tons carried one mile	598,260,765	563,068,979
Average miles hauled—revenue freight	173.82	177.04
Average revenue per ton mile of freight (cents)	1.409	1.263

**MIDDLE TENNESSEE.—Sold.**—John H. Carpenter, of Nashville, Tenn., purchased this road, September 10, on a bid of \$300,000. The Middle Tennessee extended from Franklin, Tenn., to Mt. Pleasant, 45 miles. It has not been operated for some time.

**MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—Asks Authority to Issue Notes.**—This company has applied to the Interstate Commerce Commission for authority to issue \$10,000,000 of ten-year, 6½ per cent collateral trust gold notes, the proceeds to be used to discharge indebtedness for current liabilities, and also to issue \$15,000,000 of first mortgage refunding 6 per cent bonds, of which it is proposed that \$12,500,000 shall be pledged as security for the note issue. The notes have been sold subject to the commission's approval to Dillon, Read & Co., at 97½.

**MISSISSIPPI CENTRAL.—Authorized to Abandon Line.**—The Interstate Commerce Commission has issued a certificate authorizing the abandonment of a branch line extending 11.74 miles from Hattiesburg, Miss. The commission has also authorized the company to acquire by lease the control of a branch line of the Gulf, Mobile & Northern from Beaumont to Hattiesburg, Miss., 26 miles.

**NEW YORK CENTRAL.—Commission's Examiner Recommends Authority to Take Over Chicago Junction.**—The Interstate Commerce Commission has made public a tentative report proposed by Attorney-Examiner Clarke recommending that the commission issue a certificate authorizing the New York Central to purchase the entire capital stock of the Chicago River & Indiana at not exceeding \$750,000 and that the Chicago River & Indiana lease from the Chicago Junction all of its properties at an annual rental of \$2,000,000, provided that the right to prescribe the terms, methods and character of securities which may be employed to effectuate the purpose be reserved to the commission, and that, as an express condition, the consummation of the transactions shall be taken as conclusive evidence of the acceptance by the carriers of an agreement to abide by 17 conditions enumerated in the report, which are intended to preserve the rights of shippers and of the competing lines which protested against the authority being granted. The recommendation of the examiner is made on the assumption that the commission has jurisdiction to grant the certificate under paragraphs 18 to 22, Section 1, of the interstate commerce act, although the commission has promulgated a conference ruling holding that these provisions apply only to applications for authority to construct or put in operation new lines of railroad. If the commission should be of the opinion that no modification of the conference ruling of April 8 can be made, it is recommended that the entire application be dismissed because it is stated that denial of all jurisdiction must result in eliminating any practical method of attaching such conditions as will prove effective in safeguarding the public interest.

**NEW YORK CENTRAL.—Asks Authority to Issue Bonds.**—Application has been filed with the Interstate Commerce Commission asking authority to issue \$19,500,000 of refunding and improvement mortgage bonds at 6 per cent, to be pledged with the director general of railroads as security for a demand promissory note dated August 21, given to the director general in payment of the company's indebtedness to him for additions and betterments for the period of federal control.

**NEW YORK, CHICAGO & ST. LOUIS.—To Pay 1918-19 Dividends.**—President J. J. Bernet, in a letter dated September 8 to the stockholders, says:

Your Board of Directors has approved a settlement with the United States Railroad Administration, whereby the company accepted a cash payment of \$3,000,000 in settlement of all claims and accounts theretofore existing between the company and the Railroad Administration. The making of this settlement has enabled your directors this day to declare the following dividends, payable on September 30, 1921, to stockholders of record September 19, 1921, out of the earnings of the years 1918 and 1919:

Year	Class of Stock	Per Cent	Amount
1918	First preferred	5	\$249,895
	Second preferred	5	\$49,990
1919	Second preferred	2½	274,995
	Common	5	699,480

The accounting for the proceeds of the settlement will be had during the year 1921, in accordance with the rulings of the Interstate Commerce Commission. The company's income allocated to the federal control period on the basis of the settlement made is as follows:

	1918	1919	Jan. and Feb., 1920	Total
Total operating income (after railway taxes), deficit.....	\$236,618	\$169,920	\$30,732	\$437,270
Total non-operating income (includes compensation).....	4,282,015	4,558,917	712,935	9,553,867
Gross income.....	\$4,045,397	\$4,388,997	\$682,203	\$9,116,597
Total deductions from gross income (includes interest and miscellaneous income charges).....	3,030,507	2,376,834	296,955	5,704,296
Net increase.....	\$1,014,890	\$2,012,163	\$385,248	\$3,412,301
Dividends previously paid.....				
First Preferred, 5 per cent.....				
Second Preferred, 2½ per cent.....		\$24,890		\$24,890
Remainder available for dividends.....	\$1,014,890	\$1,487,273	\$385,248	\$2,887,411
Dividends now declared.....				
First Preferred, 5 per cent.....				
Second Preferred, 1918, 5 per cent.....		799,885	974,475	1,774,360
Second Preferred, 1919, 2½ per cent.....				
Common, 1919, 5%.....				
Surplus.....	\$215,005	\$512,798	\$385,248	\$1,113,051

The payment of dividends during the federal control period was partially interrupted, and such payments were made at irregular intervals because an agreement had not been reached with the government regarding the amount of "just compensation" to which the company was entitled, and because of other matters in dispute growing out of the federal control. The dividends paid out of the earnings of given years and the dates paid since the present management assumed control of the company's affairs are as follows:

Out of earnings of year	Class of stock	Per Cent	Amount	Paid
1916	First Preferred	5	\$125,000	Jan. 2, 1917
	First Preferred	5	125,000	July 2, 1917
	Second Preferred	5	275,000	Jan. 2, 1917
	Second Preferred	5	274,995	July 2, 1917
	Total.....		\$799,995	
1917	First Preferred	5	\$124,947.50	Jan. 2, 1918
	First Preferred	5	124,947.50	July 1, 1918
	Second Preferred	5	274,995	Jan. 2, 1918
	Second Preferred	5	274,995	July 22, 1919
	Total.....		\$799,885	
1918	First Preferred	5	\$249,895	Declared payable Sept. 30, 1921
	Second Preferred	5	\$249,990	Declared payable Sept. 30, 1921
	Total.....		\$799,885	
1919	First Preferred	5	\$249,895	Jan. 23, 1920
	Second Preferred	5	274,995	May 1, 1920
	Second Preferred	5	274,995	Declared payable Sept. 30, 1921
	Common	5	699,480	Declared payable Sept. 30, 1921
	Total.....		\$1,499,365	
1920	First Preferred	5	\$249,895	July 12, 1920
	Second Preferred	5	\$249,990	Aug. 6, 1920
	Common	5	699,480	Jan. 15, 1921
	Total.....		\$1,499,365	
1921	First Preferred	5	\$249,895	July 2, 1921
	Second Preferred	5	\$249,990	Sept. 16, 1921

The management proposes to maintain the present first class physical condition of the company's property. The management also desires and intends, so long as the present favorable earnings continue and financial conditions justify, to declare and pay dividends on all of the classes of stock of the company at regular intervals.

**SOUTHERN.—Dividend Action Again Deferred.**—The directors at their meeting on September 8 failed to take action on the regular semi-annual dividend of 2½ per cent on the preferred stock, ordinarily paid June 30. Action on this dividend was also deferred at the May meeting.

President Fairfax Harrison issued the following statement in regard to the situation in the South:

As to the situation in the South, there is every indication that the corner has been turned. The advance in cotton was the breath of wind for which the Southern states have been waiting. It has been true in the past that good cotton prices affect all industries and increase the buying power, which means improved business. Goods purchased by the South will mean better earnings for the roads. Improvement will of course be gradual, but much is gained when sentiment changes.

All of our roads show better revenue in August than in any month since December, 1920. Our power is all in excellent condition. Of course, we have not taken up as yet to any extent repair of freight cars. Our settlement with the government has been concluded and will be explained in detail in our next annual report.

**ST. LOUIS-SAN FRANCISCO.—Asks Authority to Issue Bonds.**—This company has applied to the Interstate Commerce Commission for authority to issue \$4,578,000 of prior lien mortgage 6 per cent gold bonds and to pledge any part of them as security for short term notes from time to time.

**Asks Authority to Purchase Belt Line.**—Application has been filed with the Interstate Commerce Commission for authority to purchase the property of the Miami Mineral Belt, 14 miles.

**WESTERN MARYLAND.—Loan Approved.**—The Interstate Commerce Commission has approved a loan of \$1,000,000 to this company to aid it in enlarging its elevator facilities at Port Covington, near Baltimore.

**WICHITA VALLEY.—Annual Report.**—The corporate income account for the year ended December 31, 1920, compares with the previous year, as follows:

Standard return (January and February, 1920; year 1919)	1920	1919
Total railway operating revenues.....	\$58,728	\$352,367
Total railway operating expenses.....	1,526,432	1,372,327
Net from railway operations.....	212,833	350,364
Railway tax accruals.....	57,120	
Estimated amount due for guaranty period (March 1—August 31).....	270,738	
Total non-operating income.....	249,824	117,762
Gross income.....	404,983	362,126
Interest on funded debt.....	38,450	38,450
Total deductions from gross income.....	261,596	243,718
Income balance transferred to profit and loss.....	143,886	118,407

The operating revenues and expenses in detail and the principal traffic statistics for 1920 compare with 1919, as follows:

Operating Revenues		
	1920	1919
Freight.....	\$1,232,615	\$781,980
Passenger.....	523,144	384,824
Total operating revenues.....	\$1,858,543	\$1,227,501
Operating Expenses		
	1920	1919
Maintenance of way and structures.....	\$363,760	\$186,089
Maintenance of equipment.....	185,816	116,108
Traffic.....	1,537	3,950
Transportation.....	882,145	556,929
General.....	24,921	49,706
Total operating expenses.....	\$1,458,296	\$912,423
Net revenue from railway operations.....	\$400,247	\$315,078
Railway tax accruals.....	67,292	60,307
Railway operating income.....	\$332,399	\$254,348
Net railway operating income.....	\$142,849	\$185,552
Passenger Traffic		
Average number of revenue passengers carried.....	357,973	277,076
Number of passengers carried one mile.....	18,339,174	13,669,006
Average distance carried (miles).....	51.23	49.33
Average revenue per passenger per mile (cents).....	2.852	2.815
Freight Traffic		
Number of revenue tons carried.....	472,020	356,065
Number of tons carried one mile.....	41,618,705	31,031,897
Average miles hauled—revenue freight.....	92.41	87.17
Average revenue per ton mile of freight (cents).....	2.962	2.520

**WYOMING.—Asks Loan from Revolving Fund.**—This company has applied to the Interstate Commerce Commission for a loan of \$209,579 for 15 years from the revolving fund to enable it to improve its property and pay some outstanding debts.

### Guaranty Payments

The Treasury Department has announced the following payments to railroads on account of the six months' guaranty for 1920: Bartlett Western, \$7,500; Louisiana Railway & Navigation Co., \$100,000; Mississippi Eastern, \$8,500.

### Railroad Administration Settlements

The United States Railroad Administration has announced that it has made settlements covering the period of Federal control and has paid to the various carriers the following amounts: Chicago, Burlington & Quincy, \$8,000,000; Virginian, \$2,100,000; Alabama Great Southern, \$1,530,000; Mobile & Ohio, \$700,000; Chicago, New York & Boston Refrigerator Company, \$375,000; Marsh Refrigerator Service Company, \$21,000; Goldsboro Union Station Company, \$167,13; Durham Union Station Company, \$2,190.57. The Union Freight Railroad paid the Railroad Administration \$8,750.

### Dividends Declared

Atchison, Topeka & Santa Fe.—Common, 1½ per cent, quarterly, payable December 1 to holders of record October 28.  
Great Northern.—Preferred, 1½ per cent, quarterly, payable November 1 to holders of record September 24.  
Kansas City, Ft. Scott & Memphis.—Preferred, 1 per cent, quarterly, payable October 1 to holders of record September 24.  
New York, Chicago & St. Louis.—Common, 5 per cent, first and second preferred, 5 per cent (from 1918 income); second preferred, 2½ per cent (from 1919 income); all payable September 30 to holders of record September 19.  
Pittsburgh, Bessemer & Lake Erie.—Common, 1½ per cent, semi-annual, payable October 1 to holders of record September 15.

## Railway Officers

### Operating

**E. W. Cameron** has been appointed assistant superintendent of the Canadian National, Western Lines, with headquarters at Népawa, Man., succeeding J. H. McDiarmid, who has been transferred, effective September 9.

**R. G. Murchison** has been appointed trainmaster of the Atlantic Coast Line with headquarters at Pinners Point, Va., and **C. L. Porter** has been appointed to a similar position at Tarboro, N. C. **C. G. Sibley** has been appointed superintendent of the Fayetteville district with headquarters at Rocky Mount, N. C., and **W. H. Newell, Jr.**, to a similar position on the Wilmington district with headquarters at Wilmington, N. C. **E. H. Powell** has been appointed terminal trainmaster with headquarters at Rocky Mount, N. C., and **J. A. Archer**, trainmaster with headquarters at Lakeland, Fla. **L. P. Broadfield**, trainmaster of the Jacksonville district, having resigned, **F. B. Langley**, also trainmaster of that district, has had his jurisdiction extended to cover the entire district. These appointments were effective September 1.

**H. T. Kinney**, whose appointment as superintendent of the Erie with headquarters at Dunmore, Pa., was announced in the *Railway Age* of September 10, (page 515), was born at Mansfield, Pa., on July 1, 1887. He was educated at the Mansfield State Normal School and Pennsylvania State College, at which institution he studied civil engineering. Mr. Kinney's first railroad work was from June, 1910, to March, 1911, when he was engaged in engineering work on the Key West extension of the Florida East Coast. He then returned to college where he remained until he had completed his course in July, 1913, when he went with the J. G. White Engineering Corporation, assisting in the appraisal of the Atlantic Coast Line. In June of the following year he became an assistant engineer for the Erie at Rochester, N. Y. On February 1, 1916, he was appointed supervisor of the Greenwood Lake and Newark branches and in October of the same year he was promoted to division engineer of the Allegheny and Bradford divisions with headquarters at Salamanca, N. Y. In May of the following year he became assistant division engineer of the Buffalo, Allegheny and Bradford divisions and in August, 1918, was appointed trainmaster of the Buffalo division. In April, 1920, he was transferred in a similar capacity to the Susquehanna division with headquarters at Elmira, N. Y., which position he was holding at the time of his recent appointment.

### Mechanical

**J. A. Carney**, superintendent of shops of the Chicago, Burlington & Quincy, at Aurora, Ill., has been appointed supervisor of fuel economy, with headquarters at Chicago, effective September 1. **H. Modaff**, master mechanic of the Ottumwa division, with headquarters at Ottumwa, Iowa, will succeed Mr. Carney as superintendent of shops at Aurora. **H. C. Turner** will succeed Mr. Modaff as master mechanic of the Ottumwa division.

### Traffic

**H. I. Norris** has been appointed export and import agent of the Erie with headquarters at New York, effective September 15.

**E. M. Snell** has been appointed general agent of the Erie with headquarters at Toronto, Ontario, effective September 15.

**S. H. Cummings** has been appointed assistant coal freight agent of the Chesapeake & Ohio with headquarters at Cincinnati, O. Through a typographical error the railroad with which Mr. Cummings is connected was omitted from an an-

nouncement of his appointment in the *Railway Age* of September 10 (page 515).

**H. R. White** has been appointed general agent, traffic department, of the Maine Central with headquarters at Eastport, Me., effective August 22.

**B. H. Taylor**, general agent of the Gulf Coast Lines, with headquarters at Houston, Tex., has been promoted to assistant general freight agent, with the same headquarters, effective September 5. **T. H. Mercer** will succeed Mr. Taylor as general agent, effective September 10.

**L. F. Daspit**, whose appointment as assistant general freight agent, of the Southern Pacific Lines in Texas, with headquarters at Houston, was announced in the *Railway Age*

L. F. Daspit

of August 13 (page 316), was born at New Orleans, La., on August 10, 1885, and was educated in the public schools of that city. He entered railroad service in 1901 as messenger boy in the freight claim department of the Morgan's Louisiana & Texas and served in various positions including that of chief overcharge claim clerk and statistician. Mr. Daspit resigned in 1907 to enter commercial work. He re-entered the service of the M. L. & T. in July, 1909, and was promoted to compiler and chief

wage clerk, holding that position for about five years when he again resigned on January 1, 1917, to become assistant traffic manager of the Shreveport Chamber of Commerce. On July 15, 1918, he was appointed traffic manager of the Shreveport Chamber of Commerce, which position he held until his recent appointment as assistant general freight agent of the Southern Pacific Lines in Texas.

**E. W. Clapp**, general freight agent of the Southern Pacific, with headquarters at San Francisco, Cal., and **H. A. Hinshaw**, general freight agent, with headquarters at Portland, Ore., have been promoted to assistant freight traffic managers, with headquarters at San Francisco, succeeding **T. A. Graham** who has resigned to become general manager of the Pacific Mail Steamship Company. **J. Saunders**, assistant general freight agent, with headquarters at San Francisco, has been promoted to general freight agent with headquarters at Los Angeles, Cal. **J. H. Mulchay**, assistant general freight agent, with headquarters at San Francisco, has been promoted to general freight agent, with headquarters at Portland, Ore. **M. A. Cummings**, assistant general freight agent, with headquarters at San Francisco, will assume the duties formerly performed by Mr. Mulchay, with the same headquarters. **H. C. Hallmark**, general freight agent, with headquarters at Los Angeles, has been transferred to San Francisco. **G. J. Blech**, assistant general freight agent, with headquarters at Los Angeles, has been transferred to San Francisco. **L. C. Zimmerman**, division freight agent, with headquarters at San Francisco, has been promoted to assistant general freight agent, with headquarters at Los Angeles. **H. W. Klein**, foreign freight agent, with headquarters at San Francisco, has been promoted to assistant general freight agent, with the same headquarters. The changes were effective September 1.

### Purchasing and Stores

**J. D. McCarthy** has been appointed purchasing agent of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., succeeding **W. E. Manchester**, resigned, effective September 1.

Entered at the Post Office of New York, N. Y., as mail matter of the second class.

The Railway Age is a member of the Associated Business Papers (A. B. P.) and of the Audit Bureau of Circulations (A. B. C.)

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free, United States, Mexico and Canada, \$6.00 Foreign Countries (excepting daily editions), \$8.00. Foreign subscriptions may be paid through our London office in £ s. d. Single copies, 25 cents each.

WE GUARANTEE that of this issue 9,000 copies were printed, that of these 9,000 copies, 8,032 were mailed to regular paid subscribers, 52 were provided for counter and news company sales, 336 were mailed to advertisers, 65 were mailed to employees and correspondents and 512 were provided for new subscriptions, samples, copies lost in the mail and office use; that the total copies printed this year to date were 365,100, an average of 9,008 copies a week.

Ryerson-Conradson Railroad Machine Tools are abreast of the big powerful locomotive. Their use means more locomotive revenue hours.

## More Power at the Tool

The direct motor drive of the Ryerson-Conradson Railroad Radial delivers more power at the tool with a lower horsepower consumption.

One motor is used solely for elevating.

The second motor drives the spindle and feed mechanism. This provides straight line drive, avoids the use of bevel gears, eliminates half the gears of the usual radial and reduces power consumption 40%.

Ryerson-Conradson Railroad Radials are good for heavier work than similar sized machines usually take. You could use this capacity.

The question of standards for electric traction equipment is one that will demand attention in this country in the not far distant future. At present there are few things in a sufficiently advanced state of development to warrant standardization, but it may now be possible to define certain limits to which standardization may properly be carried. In an article in this issue George Gibbs, chief engineer of electric traction for the Long Island, points out many of the factors which govern and limit standardization and offers a number of suggestions. The letter is written to the Electrification of Railways Advisory Committee in England, and speaks specifically of British railways, but the statements as set forth apply equally well to railroads in the United States. An earnest and intelligent effort to outline standards for this equipment may not immediately produce tangible results, but it will aid materially in crystalizing the information at hand and will give the railroad operator a more definite idea of the possibilities and limitations of electric traction.

### Electric Traction Standards

The passage of the railroad funding bill, which is expected when the Senate convenes after its recess, has been regarded

### The Conference on Unemployment

in many quarters as the stimulus which, added to the already hopeful business outlook, would bring eventually a return to normal economic conditions. If the "thawing" of the railways' and the equipment companies' "frozen credits" is likely to be of any such general benefit as this, then it would seem that the carriers and supply concerns should play an important part in the President's conference on unemployment to be held in Washington on Monday. From the preliminary list of delegates, the very opposite is apparently to be the case. One delegate has been announced to represent the railroads but none to represent the supply interests. The prominence and ability of the delegates chosen so far cannot be questioned. They are men and women who are leaders in many fields of activity all over the United States. Still, in view of the admitted importance of the railroads and the equipment concerns in the industrial fabric of the country, it would seem that special attention to means of promoting their activity would be one of the most potentially fruitful subjects to which the President's conference could devote its attention.

The activities of the Railway Accounting Officers' Association have in recent months been the subject of considerable

### A Digest of Labor Decisions

favorable comment in the columns of the *Railway Age*. The reason has been that the R. A. O. A. is showing itself to be at present one of the liveliest organizations—some would say the liveliest organization—in the railway field. Because of the calibre of the association's membership and the ability of its official staff, the association has been able to realize in rather praise-

worthy fashion on the increasing importance of the railway accounting officer. Another evidence of its enterprise is in the booklet, a review of which appears on another page of this issue, published this week by the association and entitled, "Index-Digest of Decisions of United States Labor Board." The booklet of 88 pages is a digest of the Labor Board decisions to September 1, 1921, namely Nos. 1 to 222. The digest has been compiled by the Bureau of Information of the Southeastern Railways. It is given circulation by the Railway Accounting Officers' Association, for the use of accounting officers, but there will be very few railway officers in all departments who will not be assisted measurably by the service which has been rendered by the publication of the digest.

Harry W. Forman, writing in response to our editorial of September 10, presents what political orators would call a

### Why Require Signatures to Train Orders?

ringing argument for the general use of train-order Form 19. To those who do not know Mr. Forman, it is proper to say that his 40 years' experience in train dispatching is somewhat different from ordinary experience in that he has constantly had to justify his utterances. Both his findings of fact and his opinions concerning probabilities can be fully accepted as having survived all possible criticism. If he has ever misinterpreted the facts of experience or has ever proposed anything for the future without keeping his feet firmly set on the ground, he has been through whatever fires were necessary to expose his error. In our editorial, we suggested that those operating officers who wish to promote the more general use of Form 19 would do well carefully to gather up the experience of roads all over the United States. The present letter suggests that this process might well begin at the far end of the country! That would give, as it were, a flying start. The heading on Mr. Forman's letter was put on by the editor, and the use of "universal" may perhaps be criticized by some. But are not the necessary exceptions to the use of Form 19 really very rare? A dispatcher who counts the orders that he has issued by the hundreds of thousands should be listened to with care.

The Roadmasters' convention held in Chicago this week was in every way a success and serves as a fitting milestone for the steady progress which this organization has made during the last decade.

### The Roadmasters' Convention

The attendance has increased, the membership has grown and the character of the program and calibre of papers and reports presented bear emphatic evidence that the destiny of this association has been in skilled hands. It is a curious fact that the train of extraordinary times which have been visited upon the railroads of this country during the past five years have in no case interrupted or seriously interfered with the work of the three great associations of maintenance of way officers. The conventions of the Ameri-

can Railway Engineering Association, the Roadmasters' and Maintenance of Way Association and the American Railway Bridge and Building Association have taken place without break during this period and with practically no modification from established customs. Perhaps this may be ascribed largely to the businesslike procedure which has characterized the conventions of these three associations—two and one-half to three solid days of technical discussion followed perhaps by a half day's inspection trip to work of specific interest to the men in question. Entertainment and recreation have played but little part in these meetings. It is also possible that the unbroken success of the conventions may be explained by the happy faculty of those in charge to suit the program each year to the particular need of the times, a fact that was appreciated in no small measure by the United States Railroad Administration, which availed itself, particularly in the case of the Roadmasters', of the opportunity to bring home a message of conservation and economy so imperative at that time. Of still greater importance is the attitude which has been generally taken by the railway managements who on the whole have encouraged attendance at the meetings on the part of their officers. Nor is it out of place to refer to the work done by the railway supply associations which have not only served as a guiding hand in directing the efforts of the supply manufacturers along legitimate channels, but have, moreover, exerted no small degree of influence in the administration of the association affairs.

For the first time in a year the railroads now report a reduction in the number of bad order freight cars. This is shown by the semi-monthly report compiled by the Car Service Division of the American Railway Association for the period ending September 1, when the number of cars needing repairs was 374,087, or 16.2 per cent of the total, as compared with 16.6 per cent, or 382,440, on August 15. Of the box cars the percentage needing repairs on September 1 was 17.8 per cent, as compared with 18.2 per cent on August 15. There was also a reduction in the number of bad order coal cars. The recent increases in the volume of traffic handled, particularly grain, has made it necessary to put more cars in service while giving the carriers some increase in revenue with which to do so, and the reduction in wages which went into effect on July 1 has also increased the ability of the roads to increase their repair forces. The bad order car situation is not one to brag about particularly, for the decrease in cars needing repairs in two weeks was less than the decrease in serviceable surplus cars in one week, but the fact that an improvement is being shown at last is a source of satisfaction. For the week ending September 8 there were 237,972 surplus cars in serviceable condition. For the first seven months of 1921 for which the Interstate Commerce Commission has reported the railroad earnings and expenses, the railroads expended \$737,000,000 for maintenance of equipment, which was \$111,000,000 less than they had expended on this account in the corresponding period of 1920. For the same period there was a reduction of \$113,000,000 in expenditures for maintenance of way. Part of the reduction in expenses represents, as would naturally be expected, real economy in maintenance and a part of it, too, represents the lessened volume of business, but the extent to which the railroads have been obliged to curtail and even defer maintenance work is indicated by the fact that the reductions made in these accounts amount to more than the \$213,000,000 net operating income which the railroads of the country had to show for their operations during the first seven months of the current year.

## Pressing Problems of Management

THE RAILWAYS are approaching normal in respect to net operating income. Their net operating income of \$69,-485,000 in July is the largest they have made under the present rates except in September, 1920, when they earned \$75,310,000, and in October, 1920, when they earned \$86,-500,000. It represents a return at the annual rate of 4.50 per cent, which has been exceeded under the present rates only in October, when the return was on an annual basis of 4.6 per cent.

While the results of operation in July are encouraging, the greatest mistake which could be made in interpreting them would be to infer they mean that the railroad problem is anywhere near solved. The net operating income obtained was chiefly the result of a reduction in operating expenses, as compared with July, 1920, of 29.50 per cent. This bespeaks a marked increase in operating efficiency, but it also bespeaks a very large amount of deferred maintenance. Before the railroad problem can be solved the existing physical properties must be rehabilitated by largely increased expenditures for maintenance. This will involve a large increase in operating expenses, and these increased expenditures for maintenance ought to be made as rapidly as the financial condition of the individual carriers makes practicable. To postpone increased expenditures for maintenance longer than is necessary would be artificially to increase the net operating income and give to those who are demanding general reductions of rates a strong but fallacious argument.

In addition to taking up deferred maintenance as rapidly as practicable, planning should be begun for expanding the capacity of the properties. The revival of general business may be slow, but conditions indicate that it is not only sure to come, but already has begun. General business began sharply to decline in the early spring of 1920 and continued rapidly downward until May, 1921. It was then practically stationary for about two months, and recently it has been increasing. With allowance for the ordinary seasonal changes, the increase in general business activity, if we may judge by past experience, will continue at an accelerating rate. One of the effects will be a corresponding increase in railway traffic. Other things being equal, the railways make the largest profits when they are able to handle all the business offered without congestions and delays. The managements should spare no reasonable effort to get their organizations and properties in shape satisfactorily to handle a large traffic when it comes.

No less important than the problems of administration and operation which must be solved to get the railways ready to handle a larger business are those presented by their public relations. They are confronted with nation-wide demands for reductions of rates. The charge so often heard that the present rates are stifling business and preventing increase in railway traffic and earnings are refuted by the facts regarding the current movement of traffic. It is beyond question, however, that there are at present many bad adjustments of rates and many rates that are excessive. Readjustments to remedy these conditions should be made with the greatest practicable facility as a matter of railroad policy and of public policy. They are needed both to increase the gross and net earnings of the railroads, and to improve public opinion by meeting reasonable public demands.

There is a real and manifest danger, however, that public opinion and public authorities will insist upon reductions of rates being made faster than would be fair to the railways or beneficial to the public. The prime necessity of the situation is the restoration of railroad earning capacity and railroad credit. This can be done only by bringing about and maintaining a relationship between railway expenses and earnings which will enable the carriers to earn an adequate net return. It is the function and duty of the managements to make the

utmost efforts to get and keep the operating expenses on a reasonable basis. But this will not restore earning capacity and credit unless rates and total earnings can be made to provide a reasonable margin between expenses and earnings.

There is but one way to insure that the total earnings of the railways will not be unreasonably reduced, and that is to educate public opinion regarding the railroad situation. There is but one way to educate public opinion, and that is to present the facts about the railroad situation to the public throughout the country so energetically, skillfully and persistently that the public cannot evade or misunderstand them.

We greatly fear many high railway officers are today as far from understanding the public sentiment of the country in regard to the railroads as the public is from understanding the railroad situation. The cold truth is that a large part, if not a majority, of the more intelligent people of the country believe the following about the railroad situation:

(1) That present railway rates, both passenger and freight, are excessive and that extensive reductions ought to be made in the near future.

(2) That many of the managers of the railways have lost their "punch" and the roads are not being as efficiently and economically operated as they should be; that the managers have begun to run to Congress, the Interstate Commerce Commission and other government bodies for relief which they could get themselves if they would show the same initiative and energy as earlier generations of railway managers.

(3) That the railways have some kind of "guarantee" from the government and have not been participating in the losses suffered during the present depression by other classes of business concerns.

(4) That, while the railway managers admit that many maladjustments of rates now exist and that many rates are excessive, they are not making efforts rapidly to change the rate structure to make it meet present business needs.

These are but a few things a large part of the public believes in regard to the present railroad situation, which show a widespread spirit of mistrust. Eighteen months ago, when the railways were returned to private operation, public sentiment toward them was favorable. Today it is not favorable. This is a fact which it is not pleasant to contemplate, but which the railway managers should frankly recognize and act accordingly. Why does this public sentiment exist? First, because, whether reasonably or otherwise, the public believes the present railway rates are too high and in a spirit of resentment has become willing to believe almost anything unfavorable it is told about the managements. Secondly, because the railways never have done, and are not now doing, what they should have done and should be doing to educate public opinion. They have done a great deal of effective public relations' work through the Association of Railway Executives. The main thing which always has been needed, however, is skillful and effective work by the managements of the individual railways in dealing with public opinion in their own territories.

So long as the public regulates the railways the results of railway management will be largely determined by the way the railways are regulated. The public will determine how they will be regulated. Therefore it is just as essential a part of railway management to educate public opinion regarding the railroad situation as it is to run trains. Unfortunately, there are not more than a dozen of the large railways whose managements have recognized this fact and established and maintained departments especially to handle their public relations. It is as much a part of the duty of the railway managers to defend the railways as it is to operate them, and the railway problem will never be solved until this duty is more fully and adequately recognized.

The railways are entering a new period in their history.

The successful management of the properties will require in

future as much administrative ability and energy as in the past, and more statesmanship and diplomacy in dealing with public opinion than ever have been shown. The future of the railways is in the hands of their present managers. If they cannot be successfully operated and developed under the present system of regulation, then it is the duty of their managers to so deal with public opinion and public authorities that the present system of regulation will be changed.

## Why Are Railway Employees Thus Lied To?

A STATEMENT appearing in "Labor" for September 17 with regard to the tentative valuation of the Chicago, Rock Island & Pacific contains such gross misstatements that they cannot go unchallenged. This is not a matter of error in the interpretation of complex analyses but an absolute disregard of facts which may be verified by anyone who has access to the valuation statement made by the Interstate Commerce Commission and the annual report of the Rock Island for 1920. The statement in "Labor" is as follows:

"Interstate Commerce Commission engineers have completed their evaluation of the Rock Island Railroad and find, even under the preposterous methods employed by the commission to determine value, that there is no property back of \$216,492,826 of the road's outstanding obligations.

"To replace the Rock Island new, at inflated after-the-war prices, would cost, according to a report just published, a cost of \$322,277,596.

"There is outstanding capital stock with a face value of \$397,637,422, in addition to which the road holds \$68,758,315 not yet in the hands of the public. The funded debt in the hands of the public amounts to \$231,633,000. The road owes the Federal government \$17,429,000 for various loans which are secured by a portion of its unauthorized stock.

"The valuation figure placed by the Interstate Commerce Commission is to be used for rate-making purposes. It covers all stock outstanding, which means that the public will be required to pay a return on the quarter of a billion dollars of water ploughed into the carrier."

The process of logic pursued in the first and last paragraphs is both novel and ingenious. The first paragraph states that the outstanding securities of the Rock Island are \$216,000,000 in excess of the valuation. In the last paragraph we find that "the valuation covers all stock outstanding." How can the valuation both exclude and include the alleged water? The second paragraph, however, must be given the palm for plain and fancy prevarication. It characterizes the commission's "final value" as the cost "to replace . . . new at inflated, after-the-war prices." In the first place the commission has not seen fit to throw any light on the process by which the "final value" was ascertained other than to say that it was obtained "after careful consideration of all the facts herein contained, including the excess cost of the carrier lands, appreciation, depreciation, going concern value, working capital, including material and supplies, and all other matters which appear to have a bearing upon the values here reported."

In view of this no one has a right to say that the "final value" as given is a "cost to replace." Furthermore, in view of the fact the data at the disposal of the commission included "cost less depreciation," it is a wide guess to presume that the final value was the value of a "new" property. But the prize lie is the "after-the-war prices," in the face of the commission's statement that the valuation is "as of valuation date of June 30, 1915." The prices used were 1914 prices.

The third paragraph attempts a statement of the outstanding securities, but leads the author into such deep water that

he had to beat a retreat without getting very far. What are the facts? How does the valuation compare with the outstanding securities of the road at the present time?

The final value of the Chicago, Rock Island & Pacific, plus that of the Chicago, Rock Island & Gulf, and a minor subsidiary, total \$335,639,013. Adding to this the expenditure for additions and betterments from the valuation date to December 31, 1920, or \$34,715,482, we get a grand total of \$370,354,595 as the total valuation to date. This is to be compared with the capital liabilities as of December 31, 1920, which total \$359,329,782. This statement will be made more clear by a study of the summary below.

#### FINAL TENTATIVE VALUATION

Final Value C. R. I. & P.	\$322,277,596
Final Value C. R. I. & G.	13,312,667
Morris Terminal	48,750

Total J. C. C. Valuation as of June 30, 1915	\$335,639,013
Additions and Betterments June 30, 1915, to December 31, 1920	34,715,482

Valuation for Rate Making Purposes December 31, 1920.	\$370,354,595
---	---------------

#### CAPITAL LIABILITIES ON DECEMBER 31, 1920

Capital stock outstanding	\$129,040,511.50
Funded debt	229,975,796.51
Debt to affiliated companies	313,564.09
Total capital liabilities December 31, 1920.	\$359,329,872.10

Comparing the final valuation for rate making purposes with the total capital liabilities, we find a difference of \$11,024,723 in favor of the valuation. This sum is subject to more or less adjustment as a consequence of pending settlements with the United States government, but there is every reason to believe that the ultimate difference would be small. The important fact to remember is that the valuation which the commission has given to the Rock Island exceeds its present capital liabilities.

The big question which arises in the minds of the readers concerns the motive back of the gross misrepresentation of the Rock Island's valuation which "Labor" disseminates among railway employees. The answer is that it comprises but a single detail of a deep-seated plot to discredit the railroads in the eyes of their employees. More specifically in this case, the object is to enlist the employees in a campaign for lower rates. But lower rates means decreased earnings for the railroads which in turn mean smaller expenditures for operation and that spells lower wages or fewer employees or both. If there is anything that will militate against the interests of all the employees it is lower rates. But this is no concern of the wrecking crew responsible for the propaganda dispensed in the pages of "Labor," for they would not only sacrifice the railway employees, but the railway stockholders, the shippers, in fact the very business life of the country, on the altar which they have erected to the Plumb Plan.

## Colorado & Southern

THE COLORADO & SOUTHERN, like various of its sister roads in the southwest, experienced in 1920 a rather satisfactory year. Further than that, it fared rather better than the other Hill roads. The company's corporate income account, in which consideration is given to the standard return for federal operation in January and February and to the amount accrued for the guaranty period, March 1 to August 31, showed for 1920 a net income available for dividends of \$2,606,066 as compared with \$1,783,946 in 1919 or \$1,376,371 in 1918. Dividends paid in each of these years totaled \$680,000, this including payments of 4 per cent on the first and second preferred stocks. No dividends are paid on the common stock. In 1920, the balance after the payment of the dividends on the preferred stock was \$1,926,066.

The net railway operating income of the Colorado & Southern in 1920 showed an increase over the previous year similar to that shown by the corporate net income. The figure

for the year was \$2,771,383. This compared with \$1,588,473 earned for the government in 1919. The standard return for the property while it was under federal control was \$2,481,212. In 1918, the first year of government operation, the net which the Colorado & Southern earned for the Railroad Administration was some \$300,000 in excess of the government rental.

The Colorado & Southern, thus far in 1921, to bring the figures up to date, has been carrying slightly less traffic than it was carrying in the early part of last year. In June this year, the falling off in business was especially noticeable. The net railway operating income for the first seven months of 1921, however, totaled, despite a poor showing for June and only a fair showing in July, \$832,741, which is an improvement when compared with \$838,191 in the first seven months of 1920.

The Colorado & Southern is tied into the Hill system

The Colorado & Southern Lines

through its control by the Burlington, which owns some \$1,130,000 of its \$8,500,000 first preferred, \$6,078,700 of its \$8,500,000 second preferred and \$23,667,500 of the \$31,000,000 common stock. The Colorado & Southern system totals 1,809 miles of line, of which 1,099 are operated by the Colorado & Southern itself; 454 by the Fort Worth & Denver City, and 256 by the Wichita Valley. The figures which have been given above are those for the Colorado & Southern itself. The lines operated by this group of carriers extend from a connection with the Burlington at Orin Junction, Wyo., southward across Colorado through Denver, Pueblo, Trinidad, etc., with branches to Leadville, Greeley, etc., thence across the Texas panhandle and to Fort Worth. Operation over the Trinity & Brazos Valley gives the system access to the increasingly important jobbing center and port of Houston, Tex.

The system's traffic is predominantly products of mines. In 1920 the total of 6,789,747 tons of revenue freight carried on the Colorado & Southern, 4,689,543 tons or 69.06 per cent were products of mines, of which 3,768,487 tons, or 55.50 per cent of the road's total tonnage, was bituminous

coal. Products of agriculture made up but 11.35 per cent; refined petroleum and its products but 2.51 per cent. The Fort Worth & Denver City carried in 1920 a total of 3,441,773 tons of revenue freight, of which 21.78 per cent was bituminous coal or 35.41 per cent products of mines. The Fort Worth & Denver City had also a large proportion of products of agriculture—25.17 per cent—and refined petroleum and its products made up 13.40 per cent. The Wichita Valley's freight traffic totaled 472,020 tons, of which tonnage 23.09 per cent was products of mines, 36.40 per cent products of agriculture and 14.39 per cent petroleum and its products.

The total tonnage of revenue freight carried by the Colorado & Southern in 1920, as above noted, 6,789,747 tons, compared with 5,697,261 tons in 1919. The revenue ton-mileage in 1920 was 882,016,336 as against 805,616,645 in 1919. The average haul in 1920 was 129.90 miles; in 1919, 141.40 miles. The freight revenues in 1920 totaled \$11,986,502; the total operating revenues to \$16,271,658. The latter figure represented an increase of \$3,295,014 over 1919. The Colorado & Southern was unusual in that its operating revenues increased in greater amount in 1920 as compared with 1919 than its operating expenses. The operating expenses in 1920 were \$12,773,845, an increase of \$2,062,328. The net operating revenue of \$3,497,813 was an increase of \$1,232,686 over 1919.

The operating ratio in 1920 was 78.50; in 1919, 82.54 per cent.

The Colorado & Southern has been making a special effort to encourage agriculture in its territory. In 1920 its agricultural department operated two demonstration cars and a better-farming exhibit car. It has also issued bulletins on various agricultural subjects, has arranged to have addresses at various farmers' meetings, has assisted farmers in ordering feed, seed and stock, and has helped to organize farmers' co-operative shipping and marketing associations. The effect of these various efforts are shown by a rapid increase, particularly in dairy production. In 1917, the system handled 1,932,526 tons of agricultural, live stock, forest and farm implement products; in 1919, 2,512,505 tons, an increase of 30 per cent. The number of carloads of live stock handled into the Denver Union Stock Yards by the Colorado & Southern in 1910 was 3,953 cars; in 1920, 10,046 cars, an increase of 154 per cent.

The operating results in 1920 as compared with 1919 are as follows:

	1920	1919
Mileage operated .....	1,099	1,100
Freight revenue .....	\$11,986,502	\$9,701,857
Passenger revenue .....	3,028,085	2,510,935
Total operating revenue .....	16,271,658	12,976,644
Maintenance of way expenses .....	2,626,425	2,092,587
Maintenance of equipment .....	3,477,596	3,108,389
Traffic expenses .....	146,120	104,019
Transportation expenses .....	5,789,036	4,855,575
General expenses .....	609,555	462,155
Total operating expenses .....	12,773,845	10,711,517
Net operating revenue .....	3,497,813	2,265,127
Railway tax accruals .....	886,205	567,628
Railway operating income .....	2,607,492	1,692,906
Net railway operating income .....	2,771,382	1,588,473

The corporate income account is as follows:

Standard return (January and February, 1920; full year 1919) .....	413,535	2,481,212
Estimated amount due for guaranty period, March 1 to August 31 .....	959,688	.....
Railway operating income and standard return .....	2,099,093	2,430,960
Dividends and miscellaneous interest .....	1,352,530	1,430,821
Total non-operating income .....	2,998,552	1,775,727
Gross income .....	5,098,544	4,206,687
Interest on funded debt .....	2,140,438	2,105,095
Total deductions from gross income .....	2,492,478	2,422,740
Net income .....	2,606,066	1,783,946
Dividends .....	680,000	680,000
Income balance .....	1,926,066	1,103,946

## New Books

*Index-Digest of Decision of United States Railroad Labor Board.* Compiled by Bureau of Information of the South-eastern Railways. Published by Railway Accounting Officers Association, 1116 Woodward Building, Washington. 88 pages; 6 in. by 9 in.; bound in paper.

This book, as its title indicates, is a digest of the decisions of the United States Railroad Labor Board. It includes the decisions up to September 1, 1921—Nos. 1 to 222. The subject matter is arranged in alphabetical or indexed order, whence the name index-digest is derived. The publication gives all that anyone would need to know—for practical purposes—regarding any decision made by the Labor Board. In each case reference is made to the decision in which the finding was given, so that the additional details may be easily obtained where necessary. The use of the index-digest, however, eliminates the time and labor of reading through the full text of the decision. The book does not give rates of wages but the complete references will assist measurably in the finding of the rates relating to the several classes of employment in the decisions themselves. The value of the book is considerably enhanced by elaborate cross indexing.

The publication has been issued by the Railway Accounting Officers Association primarily because of the desirability of placing information of this sort in convenient form in the hands of the accounting officers who must be able to obtain expeditiously and accurately such information in connection with auditing payrolls, etc. It is self-evident that the publication should be of equally great value to executives, operating officers, shop accountants, time keepers, etc., and in general to officers in all departments of railway work. The value of the compilation will further be emphasized when it is realized how much ground has been covered in the many decisions of the Labor Board, and when attention is drawn to the fact that the Labor Board's own digest covers only the decisions up to January 1, 1921, namely, decisions 1 to 41.

The R. A. O. A. contemplates the issuance of future editions at such intervals as may be necessary to provide a reasonably up-to-date index-digest.

The Railway Accounting Officers Association has performed a real service to the entire railway field in taking it upon itself to issue a publication of this kind. The fact that the book issued this week includes the decisions up to as recent a date as September 1 is also noteworthy.

*Material Handling Cyclopedica.* Edited by Roy V. Wright and John G. Little. Bound in cloth and leather; 850 pages, 1500 illustrations, 1½ in. by 8½ in. Published by the Simmons-Boardman Publishing Company, Woolworth Building, New York City. Price, cloth \$10.00, leather, \$15.00.

This is the latest addition to the library of transportation literature published by the Simmons-Boardman Publishing Company. The volume is a companion book to the Car Builders' Dictionary and Cyclopedica, the Locomotive Dictionary and Cyclopedica, the Shipbuilding Cyclopedica and the Maintenance of Way Cyclopedica.

The purpose of this cyclopedica has been to bring together in a single volume complete, practical working information about the many types of material handling devices used in industry. The purpose has been to make the contents of interest and value alike to the executive interested in reducing handling costs and to the operating man who is seeking information as to the types of material handling machines best suited for his needs, how they operate and where they may be obtained.

The Definition Section in addition to its purpose as a dictionary of material handling terms, methods and devices serves as an index to other sections of the book. Following

the definition of each device receiving further treatment in the book is a reference to the page in the Text Section or Catalog Section on which the additional information appears. Thus, from the definition the reader is referred not only to the detail description, method of operation, and illustration of the device given in the Text Section, but as well to the page in the Catalog Section where the device which he has selected as best suited for his needs is described authoritatively by the manufacturers.

The Illustrated Text Section, which directly follows the Definition Section, has been sub-divided into divisions corresponding to the general classification of machines. Thus the text contains separate sections devoted to Hoisting Machinery; Conveyors; Elevators; Industrial and Motor Trucks, Tractors and Trailers; Industrial Rail Transportation Track, Cars and Locomotives, and Handling Systems. Each section of the editorial portion of the book has been prepared by a specialist particularly fitted for the work undertaken. In this way the experience of eleven specialists in material handling methods and appliances is made available under one cover. Each section is fully illustrated, the illustrations showing typical applications of the various machines as well as their general characteristics and appearances.

A Catalog Section of 150 pages supplements the information shown elsewhere in the book. In it the manufacturers of machines present detail descriptions and illustrations of particular devices referred to in the other sections of the book.

A General Subject Index covering the entire contents of the book is an additional help in making the information readily available.

*Saward's Annual Statistical Review of the Coal Trade.* 254 pages, including advertising, 6 in. by 8 in. Published by Frederick W. Saward, 15 Park Row, New York.

To men who are connected with the purchase or use of coal, a compilation of data regarding the operation of previous years is of value. This book provides information not otherwise readily available, giving in very complete form statistics of production and shipment with considerable information pertaining to the consumption of fuel. Sufficient comment on conditions in the industry are given to aid in interpreting the figures presented. The situation existing in 1920 is reviewed for the country as a whole and also for the principal producing districts and market centers. Production of both anthracite and bituminous is given for many of the principal companies, as well as for the various fields and for all the states. A large amount of data regarding prices is given, including quotations as early as 1834. The wage rates and the texts of the wage awards for both bituminous and anthracite are quoted. The tonnage shipped over various railroads is given, as well as the amount carried by water, the receipt at the lakes and the amount exported. In addition to the data regarding coal, figures are given for the production and consumption of petroleum.

PASSENGERS TRAVELING BY AIRPLANE are not so numerous as they were, according to a press despatch from Paris. Agents of the lines report a decrease of 50 per cent. The change is attributed to the ZR-2 disaster, several minor accidents in Europe and the smash-up of a Strasbourg-Paris passenger plane recently when all on board were killed. Several planes have been taken off the channel service and only two are now flying between Paris and London. This is said to be the first time that accidents have frightened the public. The airplane concerns are apprehensive and have announced that they will enforce the maximum degree of safety, and they think the lull will only be of brief duration.

## Letters to the Editor

### Experience Justifies the Universal Use of Non-Signature Train-Orders

SAN FRANCISCO, Calif.

TO THE EDITOR:

Your editorial of September 10, with the letter attached, serves to call to mind the fact that the railroad world is not yet educated up to that condition of mind which would adopt a general agreement on the total abolition of the 31 train-order form. Large bodies move slowly; and, what is more to the point, just here, large numbers of men scattered through 48 States often do not move in unison at all—without much skillful pushing and steering. Form 31 will not stir from its entrenched position. But it does seem as if a somewhat less radical change might be brought about at this time if persistent missionary work and hammering could be kept up by those most vitally interested—the dispatchers and division officers.

Experience during the past 40 years with the 19 form of order on a number of large roads has fully convinced me that while, under certain combinations of circumstances, signatures must be obtained, any operating officer who desires to do so may permit his trains to be handled as outlined below, without fear as to the results:

1. There must be clearance cards delivered with all train-orders, showing the individual number of each order, and these numbers must be checked by the men concerned. Before clearing a train in this manner, the operator must obtain permission from the dispatcher, indicating to the dispatcher by the several order numbers, previously endorsed on the clearance card, on what orders the train is being cleared. The dispatcher must not give O. K. to such clearance until he has checked his own record. If wires fail, the operator may clear trains without the O. K. from the dispatcher, provided all orders affecting the trains to be cleared have been completed by the dispatcher.

2. Three copies of all orders should be delivered to freight trains; one for the engineman, one for the fireman and one for the conductor. Four copies should be delivered to passenger trains; for engineman, for fireman, for conductor and for the flagman. It is unreasonable to assume that firemen and flagmen can always remember the contents of long train orders handed them to read, when the order must be immediately returned to the engineman or conductor. Anyone doubting this statement is invited to try to keep in mind the several "run-late" or 10 or 15 "wait" times to be found in many orders.

3. The 19 order may be used for any movement when the trains affected are moving in the same direction.

4. It may be used to meet trains, provided a copy of the order is sent to the operator at the place of meeting and copies are sent to all trains concerned before their arrival at the meeting point, with this exception: this cannot be regarded as safe practice if (a) the superior train is directed to take siding, or (b) if it must pass the switch where the inferior train takes siding before it reaches the telegraph office where the "middle order" is to be delivered.

I have made several hundred thousand such meets and have yet to hear of a collision or any accident thereunder which could be charged to the use of the 19 order in thus fixing meeting points.

5. In-time doubtless it will be universally conceded that the unsigned form of order may be safely depended on except in such cases as taking away from a crew an order which

the dispatcher must know is surrendered; or securing signatures at blind sidings; or when the order-signal will not hold a train at an open office.

Only one form of train order is needed; when necessary to secure signatures, they may be endorsed on this form. A code signal may be used to indicate when signatures must be obtained.

When only one order is awaiting a train at a station, and it is known that the order-signal is displayed at stop for such order, it is an up-hill argument to contend that a 31 would be safer than a 19, as in either case a collision might result if there should be a failure in delivery and the operator is as likely to overlook the 31 as the 19. The 31 in no way adds to the safety of such handling.

I have known more accidents under the use of 31 orders than would have occurred had the 19 form been used. The explanation is quite simple: The 19 is hung up where the operator can see it; the 31 is left lying on his table (possibly covered by other orders or a paper) until it is signed by the conductor.

When signatures must be obtained, why cannot the engineer first sign the order and obtain complete, and then move his train forward until the caboose is near the office so that the conductor may also sign? This would save the delay incident to the conductor having to walk 85 car lengths.

The most ridiculous feature of the present practice is the almost universal custom of delivering to a train one or more 31 orders affecting its rights at a point some 50 or 75 miles distant, without using the middle order at such point. Or, perhaps, it may be a non-telegraph station; or an office which is closed. Doing this while bugging to ourselves the delusion that this is safe train dispatching, because we have the signature of the conductor of the restricted train, is an example of narrow minded short sightedness well worthy of study. Some do this with a virtuous attitude of conservatism and yet forbid, or frown upon, the use of the 19 form addressed to the operator at the place of meeting and to all trains affected within a reasonable distance from such meeting point. So many things occur to distract conductors and engineers; and so frequent are serious delays which cause the lapse of from four to six hours from the time the order is delivered until it must be called to mind and executed, that it is surprising that more collisions do not occur when trains are dispatched in this manner.

H. W. FORMAN.

## Ford and the Mechanical Department

LOS ANGELES, Calif.

### TO THE EDITOR:

I hold no brief for Henry Ford, but in his efforts to re-vamp the Detroit, Toledo & Ironton into a successful railroad, he has the sympathy of the public at large. However much we may criticize his six dollar minimum wage day, his wholesale reduction in freight rates, and his Sunday day of rest, those of us who are technical people are watching with keen interest every move he makes in mechanical matters.

It is said that Mr. Ford observed a freight train delayed with a hot car journal. Personal investigation disclosed the crew going through the usual performance of carrying water and robbing crank pin grease from the locomotive. And it is said Mr. Ford made some remark about axles being as "big around as your head." Truly the waste-packed journal box is an heirloom that has promoted more train delays than, I dare say, all other causes combined. There is no reason why a journal could not be designed to run several years without attention of any kind, or at least until wheel tread or flanges demand attention. European experiments have demonstrated that roller bearings are not impracticable. But for the high journal pressures employed in America, a long slender bearing with loose lubricating rings, such as is common on

dynamis, might be equally effective. With a substantial and tight housing, a journal might be depended upon to run years without repair.

No one is satisfied that car construction is perfect. With massive complex steel castings and electric welding developed as they are, there is no reason why the sills, bolsters, frames and purlines could not be fabricated into one piece. This piece could be standardized. Instead of the thousands of different designs scattered over the land, there might be three or four accepted designs, each interchangeable with its own kind. Further increase in car capacity is improbable. The average merchant finds 50 tons is an economical unit to purchase and transport. Larger capacity cars would involve more I.C.I. shipping and increased difficulty in stowage. It is reasonable, then, to suppose that the modern car is adequate in size and capacity for many years to come. The problem is to design the lightest and most efficient structure that will handle the standard load. If Mr. Ford's engineering department devotes as much energy to devising a feather-weight freight car, as to creating his little automobile, even the most cautious among us will venture that the new car will revolutionize railroading.

The steam locomotive has been in a constant stage of development, but the final limiting weight appears to be 200 or 250 tons. Mr. Ford proposes to build a 75-ton locomotive equally powerful. With the coefficient of adhesion between drivers and rails approximately  $4\frac{1}{2}$ , the only way the proposed locomotive could develop adequate tractive power is by employing the adhesive weight of engine truck and trailer wheels, and, perhaps, the temporary use of magnetic pull on rail to hold the wheels down when starting. With the train under way the problem is simply to develop the existing machine into one having sustaining power to handle a capacity-train long distances.

Mr. Ford's experience with pulverized fuel in his manufacturing plant may recommend a similar system for locomotives. The boiler would be redesigned to suit the fuel, and in place of the standard small firebox, there might be a larger one with unusually long combustion chamber, or corrugated or water tube arrangement. Steam pressures of 300 lb. or 400 lb. condenser and forced draft would not be scoffed at. The general use of heat-treated steel and "I" sections instead of rectangular shapes would reduce the dynamic augment, and permit doubling the static wheel load on the rail. Grease lubrication, with its tremendous internal friction, might give place to automatic oil lubrication for all driving journals. Instead of crown brasses, there might be main bearings completely surrounding the main axle so as to withstand the thrust of the rods.

Considering the present development of worm drives, which survive most exacting service in automobile trucks, a similar system might be incorporated in the new locomotive. The development and perfection of a 75-ton locomotive that will equal the 250-ton machine is a feat worthy of the best engineering talent the country affords. In our locomotive works and railroad offices much detail design is entrusted to poorly paid draftsmen, and the hatches they perpetrate survive for generations. Every part, no matter how trivial, should receive the best technical attention. Mr. Ford has drawn into his automobile organization engineering talent of the first order. With these men turned loose on a standard locomotive, no one doubts the result.

Dare we hope that Mr. Ford will undertake a saving of the entire mechanical situation? The present equipment is fundamentally the same as it was 50 or 75 years ago, and aside from increasing the thickness of sections, enlarging the parts, and hanging on appurtenances such as power reverse gears, feed water heaters, and boosters, there has been no great outstanding radical improvement. In other words, there has been a glaring lack of originality. Designers for the most part have resembled weather vanes and never dared

head across the wind. What is needed is a vigorous and prompt return to the fundamental problem, namely, to design the most powerful and efficient machine consistent with existing track and clearances.

Let the designer assume that no previous equipment is in existence whence to borrow ideas. Let him build from the ground up utilizing what we know today regarding kinematics and thermo-dynamics. Radicalism should be encouraged. Considering the present state of science, is steam the best available working medium? And is the reciprocating engine the best agency for utilizing it? One of the painful things about the proceedings of many of our engineering societies is the caution with which each new idea is advanced, and the criticism and storm of protest or skepticism manifested from all sides. Many nebulous ideas have been consigned to the waste basket for fear of scorn. There has been too much standing aside waiting for illumination from the few acknowledged leaders of the profession. Meanwhile the efficiency of conversion of heat content of fuel into useful work remains seven per cent. Perhaps Mr. Ford will raise it.

STOCKHOLDER.

## The Official Goats

SOMEWHERE-ON-THE-ROAD.

TO THE EDITOR:

In all the eddying whirlpool of railroad labor trouble, there remains but one quiet spot—the secretaries. All other employees have been recognized as having a place under the sun; even the chief clerks are gaining some much deserved recognition. But not so the secretary. He still remains the official goat. He is kicked at so much that he is sick of kicking and does not kick.

Nine years ago, as a plain stenographer, I looked with envious eyes at the secretary, thinking only of the pleasures of riding around in the official car, seeing the sights and having a good time generally, but I failed to notice the worried, harassed look that seems characteristic of all secretaries. Yes, the job seemed attractive enough to me nine years ago, but looking back now in the light of those nine years' experience as a secretary, I find that the glamor has faded. Nine years of acting as a buffer between the boss and the world! Nine years of taking the blame for everything that happened on the railroad!

Sometimes I wonder how I have retained even those shreds of self-respect that are left to me, after acting as a safety valve for the temper and sullenness of the three officers I have worked for in that period. And yet these three officers were not martinets. All of them were pretty good fellows, but there wasn't one of them who didn't jump on the secretary whenever anything went wrong. Of course, it is only human to vent one's rage on the object closest at hand, but I want to say, after nine years of taking it, that it is mighty unfair to the secretary.

It may seem far-fetched, but it has been my observation that there are very, very few railroad officials in this country who treat their secretaries as white men. I can hear the angry protests of every railroad official in the country, but ask the secretaries and you will find that they are unanimous in agreeing that they are needlessly bullied and blamed for all sorts of things over which they have not the slightest control nor any connection whatever. After all, the secretary is human, even if it is the fashion for his boss to consider him as a soulless target to hurl cuss words at.

Any secretary who reads this will readily recognize the following as a typical day's bawling out. The boss gets up and comes to the breakfast table. He is feeling rotten. He has eaten too much the day before or he has not eaten enough, or just naturally feels mean. His eyes roam about restlessly; the secretary recognizes the look and sighs, for

he knows what that means. The boss is looking for something to fuss about. Presently the boss almost smiles, for he has found something about which he can ride the secretary and feels better.

"Where's my morning reports?"

Now, everybody on the railroad knows the GM wants his morning reports the first thing in the morning and they all try to get them to him. The secretary rolls out first thing in the morning, rushes madly to the telegraph office to get them, but they are not there. Sometimes somebody does slip up, and the wires are down or the operators are asleep on the job, but does the GM blame the telegraph department or whoever else may be at fault? Not a bit of it. By the time he sees the superintendent of telegraph he will have forgotten about it; but he is mad now, the secretary is right at hand so the goat sits at the breakfast table and listens to a long harangue.

Having thus started the day right, the GM, or any of the other officials for that matter, continues throughout the day, about as follows:

"Don't see why you don't have the cook get better ham. This is like shoe leather. What's the matter with the coffee this morning? Why does it always rain in this town? Did you tell Smith to meet me with his auto at nine? What's the matter with the mail? Maybe if you would look for it instead of sitting there like a bump on a log, you would find it. Why didn't you have the car put in a quieter place? Why is that guy switching us around just when we are eating? Wish you wouldn't throw ashes all over the floor. Why don't you eat cabbage? Have you got those letters ready yet? Takes you all day to do anything. Why did this fool write me this letter? What's he talking about any how? Have you got the file on the car? I told you I wanted that file. No, you can't go uptown tonight. I want to write some mail. Wait up for me."

All this monologue was liberally interlarded with cuss words, of course. It is an exact verbatim transcription of what the GM said, for I took it down for that special purpose. To read it over one would think that I was the worst secretary in the business, yet I have been with the GM nearly four years. But it isn't that I am not giving satisfaction. At least, I get by all right, but it's always open season for swearing at secretaries. It's so nice to have somebody around to relieve one's rage upon, but I can say from bitter experience that it's not so nice for the "relievee."

The injustice of it is that those very secretaries who are treated in this fashion are usually bright, ambitious young chaps or they wouldn't be picked to go on the road. To them is intrusted every sort of responsibility, personal and private. For pitifully small wage, these boys work day and night (for the secretary knows no hours). They keep the bosses' correspondence secret and inviolate. They leave home on a moment's notice ready for a long trip. They deal with everybody on the railroad, act as grand vizier for the boss, alternating as his adviser, valet, physician and target for his abuse. They take the bosses' unjust criticisms philosophically.

And why do they put up with all this? Because they are loyal. They belong to no union; the eight-hour day is a myth so far as they are concerned, but they stick to their guns amid volleys of needless abuse and lack of appreciation because they love the rolling road; the roar of the Mountain type through the cañons and the softer purr of the Pacific type across the plains is music to their ears. The railroad is in their blood.

They make no demands; they ask for nothing. Shorter hours and more pay are agreeable words, but they are merely empty words for the secretary for he knows that his loyalty will be rewarded by a total lack of consideration on the part of the management. He knows that when increases are being passed out he will be the last one considered, if he is considered at all, and he knows that when cuts are in

order his name will head the list, but he takes it all without resentment, much as one overlooks the faults of an unjust parent whom one loves nevertheless; but he would like to be treated as a human being.

All he asks is that you officials who have secretaries realize that the average secretary has sensibilities and that his intelligence is sufficient to perceive lack of appreciation for work well done. In short, stop venting your own general cantankerousness on the secretary.

Above all, keep this thought in mind—your secretary is human, he is faithful and loyal and merits decent treatment. Did you ever try being human to your secretary? Try it some time and see how he brightens and expands under such treatment. If you do, you will be in the class with some of the brightest officials in the country (unfortunately few) who do not consider their secretaries as the "Official Goats."

ONE OF THEM.

## Reducing Road Freight Overtime

OWOSSO, MICH.

TO THE EDITOR:

I believe that it is now important to consider the question of road freight overtime for train and engine crews. With this thought in mind I will describe the method of dealing with this on the Ann Arbor railroad and the results obtained. I also feel that the time is proper to show what is being done towards economical operation in view of recent statements made before the Labor Board at Chicago pertaining to the waste and particularly that waste which can be found by examining the train sheets of the different railroads. When overtime is reduced to a minimum the greatest waste that can possibly be found from checking train sheets has been eliminated.

Overtime on the Ann Arbor railroad is watched probably more closely than any other individual item of expense. This intensified supervision in itself increases the miles per hour of all locomotives, increases the miles per day of all cars, decreases the per diem expense, adds more locomotives without increasing the units, avoids yard congestion, improves the handling of the freight over the railroad as a whole, and means a corresponding saving in coal, oil and other supplies, based on the percentage of reduction. In reducing the overtime there has been no sacrifice in the line of service or lowering of tonnage rating in order to accomplish the result. Whatever reduction has been made has been made through the education or the solicitation of the co-operation of each employee connected with the handling of trains, from the call boy to the train dispatcher. The result has been that there are any number of these men on the Ann Arbor railroad, who feel just as bad about making overtime on a trip as do the officers.

The plan of education has been along the lines of a daily check of the performance of each train operated. This check is made from both the delay report furnished by the conductor and the train sheet. Any delay, which on the face of it appears excessive or unnecessary, is taken up. If it appears that an engineer has made an unnecessary water stop, was too long taking coal and water, consumed too much time in dumping ashpan at different points where this is considered necessary, failed to make the average run between given points taking into consideration the tonnage on the train, weather conditions, etc., such delays are referred to the road foreman of engines to handle with the engineer, with a view of reducing all necessary delays to a minimum and entirely eliminating all unnecessary delays.

Where conductors put in too much time picking up or doing other work, fail to properly inspect train which later results in a delay, etc., these matters are taken up with them by the trainmasters. Delays which seem excessive, due to the

train dispatchers, are handled with them through the chief dispatcher. Delays caused by any mechanical defect are referred to the mechanical department. Delays caused by the roadway department employees, such as section men taking out rails without getting a line-up on trains, etc., are referred to the head of the roadway department. The manner in which the men as a whole have co-operated is surprising and the general chairmen of the four brotherhoods of train service employees have rendered every possible aid in bringing about the results for which we have been striving.

On the part of the management, sufficient supervisory force has been furnished so that the trainmasters, road foreman of engines and traveling fireman can spend the greater portion of their time on the road, riding freight trains and keeping in close personal touch with all the employees, for without keeping in close personal touch with your employees, you cannot hope to obtain results. Another feature which has brought about a great saving in overtime is the use of the 19 order for restricting the superiority of trains, which has been in successful operation for upwards of a year; and all of the train service employees, as well as the other employees on the road, endorse its use.

Due consideration is given to the starting of trains to avoid congestion, meeting points at short sidings, and trains are never run so close together that the trains in the same direction interfere with the movement of one another. In other words, trains are never run in fleets, which can be done on a small road as well as a larger road because there are always conditions which necessarily cause one to have several engines at one terminal.

As a result of the above mentioned efforts, the low record for the amount of total overtime on the Ann Arbor railroad was made on March 10. This road is 292 miles long. There were operated on this date 15 freight crews, handling a total of 403 loads and 155 empties. These 15 crews made a total overtime of 1 hr. and 46 min. Over 166 miles of the railroad, where the majority of the freight trains are operated, there are four first-class trains in each direction every 24 hours; on 62 miles there are three first-class trains in each direction, and on the remaining 64 miles there is one first-class train in each direction. The percentage of overtime loads and 192 empties per day, with an average of 13.2 crews to total time for these 15 crews March 10 was 1.4; this percentage having been cut down from 25 per cent. For the first 15 days in March we have handled an average of 441 per day and a percentage of overtime to total time of 8.3.

V. PARVIN,  
Division Superintendent

## Permanent Remedy for Railway Labor Troubles

NEW YORK

TO THE EDITOR:

The foregoing is one of the optimistic subheads in the very ingenious and suggestive article on the great country-wide railroad problem, from the pen of F. J. Lisman, which was published in your paper on July 9. And Mr. Lisman hits the bullseye with unerring aim: the labor leaders will object to his plan most strenuously, but a majority of their constituents would favor it, freely, if they could have a chance to vote on it. Nobody can tell how soon the world is going to see the genius who can convert these labor chiefs into broad-minded public-spirited leaders, or when the rank and file of railroad employees will rouse themselves to the extent of becoming free and courageous citizens; strong men with the courage to vote as their own mature judgment dictates; but it will be useful right now, regardless of how long our hopes may be deferred, to think over some of Mr. Lisman's proposals. I wish to suggest one point. It is in con-

nection with his proposed article Number 1, under which the government would lay down rules for the election of officers of the labor unions.

This is a vital feature. The selfishness and short-sightedness of the leaders is the real cause of most of the labor unions' mistakes and misfortunes. After 40 years, the railroad employees of the country are still without any satisfactory means of picking out their wisest men for leaders. Here, as in municipal politics, self-seeking busy-bodies get into office while conservative and honorable men carelessly remain asleep. It will be a great thing if the government can lay down election rules which shall tend to repress the selfish and encourage the right-minded.

And for the substance of a rule for selection of leaders we have instructive examples all around us. How is a suitable judge found for one of our high courts? By seeking a lawyer of good *character and experience*. Those two words mean that the man has been well known to his fellow citizens for a number of years. Usually they mean, also, that he is favorably known. Why should any conservative engineman, conductor or mechanic vote for any man for leader without first having such a guarantee of his honesty and efficiency? Never vote for a man for chairman of your local committee unless you know that, *for a period of years*, he has been trustworthy, broad-minded and human. Is there anything unreasonable or impracticable in such a requirement? By putting their best men, best-known men, long-tried men, in places of leadership, the employees' brotherhoods would only be following the example of all associations of wise and level-headed men everywhere. Today, as Mr. Lisman observes, the best men in these brotherhoods allow themselves to be led around by the nose on the order of a few young hot-heads.

And it would do no harm if there were a property requirement; if a candidate for leader should be required to have some financial interest. Such a requirement might not mean a great deal at first, but the principle would be educative. A citizen cannot go into court and take up the time of the judge and the court officers with a doubtful lawsuit without giving bonds to cover the costs; but railroad grievance committees can keep up costly conferences for weeks at a time with no limit on the expense except the railroads' easygoing generosity. Something ought to be done to make such committees realize their responsibility. Much has been said about capital's unfairness to labor; but one of the outstanding examples of unfairness in the railroad world is the liberality of the officers in allowing committees to grieve by the month at the company's expense. Such practice is unfair to the stockholders and to the great mass of employees who are not constantly grieving.

B. R. B.

## Some Fundamentals of Labor Unionism

NEW YORK.

TO THE EDITOR:

Many railroad officers in this country are Christian gentlemen; but there is one prominent Christian principle which they seem with fatal persistence to neglect. It is found in the Bible—the book of Christian principles—Epistle of St. Paul to the Christians at Rome, 12th Chapter, last verse; “Overcome evil with good.”

Why do we not apply this to our ever present labor-union problem? The way to kill off a pernicious union is to form a rival union which shall be so much of an improvement that men of reasonable motives and purposes will change their allegiance. This principle is recognized by wise men in other walks of life. To kill weeds and then neglect to plant good seed in the ground to take their place is the height of fatuity. What politician would be so foolish as to denounce

the opposite party and yet make no effort to put up, and to praise, a strong candidate on his own side!

The most heartening thing that has occurred in the railroad labor field for many years is the action of the Pennsylvania Railroad in encouraging large numbers of its employees to organize themselves for collective bargaining independently of the “national” and “international” brotherhoods. This can be said without any reflection on the principles of the large brotherhoods, and even without any reflection on their present leaders, for there are two fundamental principles which constantly tend to weaken these large brotherhoods: (1) National leaders cannot deal adequately with local problems. All they can do is to fight forever for uniformity, which means that all railroads must give the highest pay and the easiest conditions that cunning “grand chiefs” (always aiming at one objective) can extort from the easiest mark among the railroad presidents; and (2) these national leaders, even though they were angels from heaven, are under the constant temptation to magnify their own offices; to act from the narrowest selfish and personal motives. They are human, like the rest of us. To really serve the best interests of their constituents they must often take their official lives in their hands; and who has the courage to do that?

Why should not every large road follow the Pennsylvania's example? It is a difficult proposition, I know; but what can be more difficult and discouraging than the present situation?

It will be said that the employer cannot with safety do what the Pennsylvania is doing; that he, like the labor leader, will consider, not the employee's interest, but his own. *But it is this, or nothing!* The great majority of the men classed as “labor” lack wisdom; they must be led by wiser men; men of big brains and consciences. It is the employer's duty—aye, his interest—to provide the needed brains and conscience.

An employer can advise and aid his employees unselfishly; the only question is, are there enough of us actually to do it, and do it with sufficient force and enthusiasm to “start something” all along the line? Small employers have done this; shall we say that the railroads are so big that they are powerless to do it? It would even pay to hire some outside individuals—priests, lawyers, or female welfare workers—to begin some plan for breaking the ice, if there are not enough big Christian men in the railroad world to assume the task.

I have said that “reasonable” employees would be amenable to right teaching or leading. How many of your employees are in that class? This, of course, is the crux of the question. How shall weak-minded or short-sighted men be made thoughtful and far-sighted? Educating men to be reasonable—that is, intelligent, well-informed, considerate of others and truly public spirited—is, however, a highly useful work, whether you ever show any tangible results or not! It is well worth while for “capital” to thus do good work for “labor” whether the reward comes in this life or the next.

Complete publicity is the one essential pre-requisite to any tangible accomplishment in the line that I have suggested. Mistakes will be made, and wrong motives will creep in; much tedious traversing of old ground will be necessary before any progress will be visible; but complete frankness and honesty would be the antidote for all sorts of troubles. Publicity compels honesty!

H. G. W.

WHILE IN COBLENZ I asked one of our American boys stationed there if he was not anxious to get back home. His answer was “No! I don't want to leave here as long as my \$30 a month produces over 2,000 marks on which I can live like a prince.” But this exchange question is a double-edged sword which cuts both ways. While we are busy building our tariff wall higher and higher this premium on our dollar tends to keep our goods out of foreign markets far more effectively than any protective tariff which the other nations might enforce against us.—Journal of the American Bankers' Association.

Chesapeake & Ohio Gondola Coal Car of 100 Tons Capacity

## 100-Ton Coal Cars for the Chesapeake & Ohio

High Capacity Cars Adopted for Handling Export Coal—Drop Doors Provided for Emergency Unloading

**T**HE CHESAPEAKE & OHIO handles a very large amount of export coal from the West Virginia and eastern Kentucky fields. The total tonnage which this road dumped at Newport News in 1920 was 7,264,000 tons, which was exceeded only by the Norfolk & Western. The pier is

preventing these cars from being loaded for interchange points.

To facilitate the handling of tidewater traffic, the Chesapeake & Ohio last year ordered 1,000 cars of 100 tons capacity, of which 500 were built by the Pressed Steel Car Company and 500 by the Standard Steel Car Company. These cars are of the flat-bottom, high-side, gondola type and ordinarily will be unloaded by car dumpers. They are provided, however, with four drop doors which permit them to be unloaded in case of emergency at points where dumpers are not installed.

Of the three large roads which deliver coal to points on Hampton Roads, the Chesapeake & Ohio and the Norfolk & Western recently have adopted cars of 100 tons capacity, while the Virginian is using cars of 120 tons capacity. Both of these designs have been described in previous issues of the *Railway Age*.

### Construction of the New Cars

The inside dimensions of the new 100 ton capacity cars are 43 ft. 3 in. long, 10 ft. 1½ in. wide and 7 ft. 5½ in. deep. This gives a coal space of 3,212 cu. ft. when level full, or 3,703 cu. ft. when heaped at an angle of 30 deg. Using a factor of 54 lb. per cu. ft., the heaped load would weigh 200,000 lb. The cars, however, are stenciled as of 182,000 lb. capacity to provide for a 10 per cent overload. The length over striking castings is 44 ft. 7½ in.; the maximum outside width is 10 ft. 3½ in., and the height from top of rail to top of sides is 11 ft. The distance from center to center of the trucks is 30 ft. 7½ in. and the trucks, which are of the Lewis six-wheel type, have a wheelbase of 9 ft. The light weight of the car is 68,300 lb. and the weight on each axle with the car loaded is 44,717 lb.

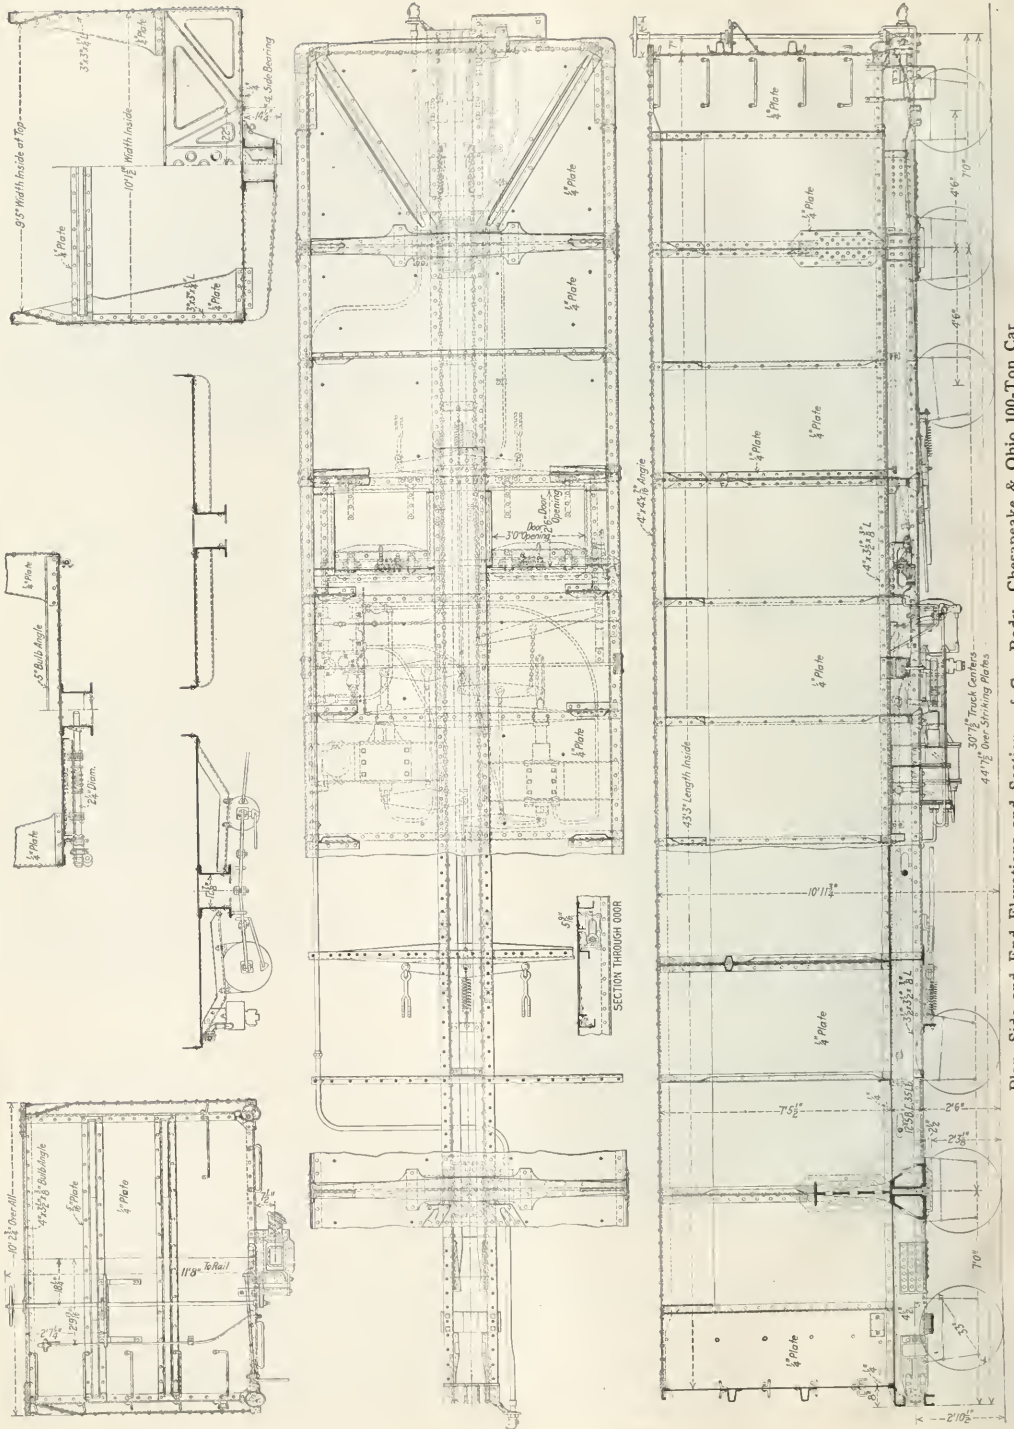

The center sills are made up of two 12-in., 35-lb. channels with flanges facing out and reinforced at the bottom by 3½ in. by 3½ in. by ¾-in. angles, extending between the draft gears, and at the top by the ¼-in. floor plates. There is

Lewis Truck with Clasp Brake

equipped with a pair of stationary turn-over car dumpers, each of which is capable of handling all sizes of cars up to those of 100 tons capacity at a rate of 30 cars an hour. The coal is dumped from the road cars into special transfer hopper cars which are lifted by an elevator, run along the pier and dumped into pockets. A large part of the export coal has been handled hitherto in hopper bottom cars of 70 tons capacity, but there has been considerable difficulty in

Plan, Side and End Elevations and Sections of Car Body—Chesapeake & Ohio 100-Ton Car

9.3 lb. bulb angles on top of the floor next to the body bolsters—and a diagonal brace to each corner of  $\frac{1}{4}$  in. pressed steel riveted to the top of the floor. The floor is made of  $\frac{1}{4}$  in. open-hearth steel sheets.

The large capacity coal cars used on the Norfolk & Western and on the Virginian are not provided with bottom doors, it being assumed that they would always be emptied by car dumpers. The Chesapeake & Ohio cars have flush bottoms but are equipped with emergency drop doors which can be used when necessary to unload the car at a point where car dumpers are not available. The four drop doors, each with an opening of 2 ft. 6 in. by 3 ft., are located as shown on the drawings. They are operated in two sets. Part of the cars are equipped with door operating mechanism designed by the Pressed Steel Car Company and part from the design of the Standard Steel Car Company.

The trucks are of the Lewis, six-wheel type with cast steel side frames and bolsters designed and furnished by the American Steel Foundries. The wheelbase is 9 ft. and the journals are  $5\frac{1}{2}$  in. by 10 in., M.C.B. standard dimensions. The wheels are of wrought steel, part of them furnished by the Carnegie Steel Company and part by the Forged Steel Wheel Company. The side bearings consist of pockets cast integral with the truck bolster with cast steel filler blocks and three  $3/16$  in. shims in each pocket for adjusting the side bearing clearance to the nominal amount of  $\frac{1}{4}$  in. The journal boxes are of pressed steel, Kensington type, manu-

cheek has 27  $\frac{7}{8}$ -in. rivets; the front ones have 15 rivets. The draft sill tie is 8 in. by  $\frac{3}{4}$  in. The couplers are A.R.A. type D with 6 in. by 8 in. shanks, connected by keys to cast steel yokes. The striking irons are of cast steel, the coupler carrier iron being cast integral with the striking casting.

In addition to the usual safety devices, the cars are provided with an inside ladder at each end.

The accompanying table gives the principal dimensions and other data of these cars and in addition similar information in regard to the large capacity coal cars used on the Norfolk & Western and on the Virginian.

Railroad	Chesapeake & Ohio	Norfolk & Western	Virginian
Capacity, stencilled..	182,000 lb.	200,000 lb.	218,000 lb.
Capacity, heaped 30 degrees .....	200,000 lb.	200,000 lb.	240,000 lb.
Cubic capacity level..	3,212 cu. ft.	3,122.5 cu. ft.	3,850 cu. ft.
Cubic capacity, heaped 30 degrees .....	3,703 cu. ft.	3,636 cu. ft.	4,450 cu. ft.
Estimated density of load .....	54 lb. per cu. ft.	55 lb. per cu. ft.	54 lb. per cu. ft.
Length over striking plates .....	44 ft. 7 $\frac{1}{2}$ in.	43 ft. 9 in.	50 ft. 8 $\frac{3}{4}$ in.
Coupled length .....	47 ft. 1 in.	46 ft. 2 in.	53 ft. 3 $\frac{1}{2}$ in.
Truck centers .....	30 ft. 7 $\frac{1}{2}$ in.	31 ft. 8 in.	36 ft. 10 $\frac{3}{4}$ in.
Truck wheelbase....	9 ft. 0 in.	8 ft. 6 in.	8 ft. 8 in.
Height, rail to top of car side .....	11 ft. 0 in.	11 ft. 0 in.	11 ft. 0 in.
Length, inside .....	43 ft. 3 in.	42 ft. 7 in.	49 ft. 6 in.
Width, inside .....	10 ft. 1 $\frac{1}{2}$ in.	9 ft. 6 in.	10 ft. 2 $\frac{3}{4}$ in.
Depth, inside, center.	7 ft. 5 $\frac{1}{2}$ in.	8 ft. 6 $\frac{1}{4}$ in.	8 ft. 5 $\frac{1}{2}$ in.
Depth inside, ends..	7 ft. 5 $\frac{1}{2}$ in.	7 ft. 5 $\frac{3}{4}$ in.	7 ft. 4 $\frac{1}{4}$ in.
Width outside, extreme .....	10 ft. 3 $\frac{3}{4}$ in.	10 ft. 1 $\frac{1}{4}$ in.	10 ft. 3 $\frac{1}{2}$ in.
Weight of car body .....	41,100 lb.	29,020 lb.	43,200 lb.
Weight of two trucks .....	27,200 lb.	24,480 lb.	35,700 lb.
Weight of empty car .....	68,300 lb.	53,500 lb.	78,900 lb.
Weight loaded .....	268,300 lb.	253,500 lb.	318,900 lb.
Per cent revenue load of total weight....	74.6 per cent	78.9 per cent	75.3 per cent
Rail load per axle, loaded car .....	44,717 lb.	42,250 lb.	53,100 lb.
Weight loaded per foot coupled length .....	5,695 lb.	5,490 lb.	5,985 lb.

Interior of Car Body, Showing Bolster, Gusset Side Stakes and Crossbraces

factured by the Union Spring & Manufacturing Company.

The cars are equipped with Westinghouse empty and load brakes, schedule KDE-4-10-16, having a 4-in. take-up cylinder, a 10-in. cylinder for use when the car is empty and an additional 16-in. cylinder for use when the car is loaded. The brakes are of the same type as those used on the Virginian as described in the *Railway Age* of June 17, 1921. Retaining valves are of the 10-20 lb. spring type.

The brake rigging is designed to give a braking effort of 40 per cent on the empty car and also 40 per cent on the loaded car. The trucks are equipped with clasp brakes having vertical levers. The brake beams are of 4-in., 10 $\frac{1}{2}$ -lb. I-beams with two sets of open-hearth forged steel brake beam fulcrums spaced on 3 ft. 10 in. centers and substantial malleable iron brake heads. The hand brake is of the geared and multiplying type. The wheel load is 5,692 lb. on the empty car and 22,358 lb. on the loaded car. The nominal brake shoe pressures are 2,277 lb. on the empty car and 8,943 lb. on the loaded car.

The draft gear is of the Miner A-18-S friction type with 2 $\frac{3}{4}$  in. clearance between the coupler horn and the striking castings. The cheek castings are of cast steel; each rear

"ONE HUNDRED PERSONS KILLED" is the heading of a press despatch of September 15 reporting the derailment of a heavily convoyed grain train at Fastov, near Kieff, Ukraine. The wreck was caused by the removal of rails at a point where the train, made up of 61 cars, was running down grade. The grain was being carried to the Donetz basin to be distributed to miners.

Troops Leaving Camp Dix, N. J., for West Virginia Coal Fields

# Roadmasters Hold Annual Meeting at Chicago

Thirty-ninth Convention of the Association Characterized by  
Good Reports, Active Discussion and Interest in Exhibits

THE THIRTY-NINTH convention of the Roadmasters' and Maintenance of Way Association and the tenth annual exhibit of the Track Supply Association were held at the Auditorium Hotel, Chicago, on September 20-22, inclusive, with an attendance of 500. The program and character of the reports and papers presented, in line with those of recent years, mark a steady advancement in the work of the association. The proceedings this year included the presentation, and discussion of the reports of five committees and three individual papers, abstracts of which follow:

P. F. McManus, general superintendent of the Elgin, Joliet & Eastern, Joliet, Ill., addressed the convention at its opening, outlining many of the advantages which could be had by close attention to the papers and also by active participation in the discussion. In the course of his remarks he offered as the ideal toward which all railroad men should strive, the furnishing of adequate transportation to the public at a reasonable cost. In the attainment of this ideal he emphasized the importance of the position which the Roadmasters' and Maintenance of Way Association now holds. He pointed out the many possibilities for economy which could be secured by a loyal endeavor on the part of the roadmasters and supervisors to develop their present methods in the handling of labor and materials. He also spoke of the exhibit of maintenance of way appliances and urged that every advantage be taken of such an opportunity to study the design and application of modern equipment.

## The President's Address

In his address, President Wiltsee made mention of the fact that the association is not only one of the oldest associations of railroad men, but it is the oldest organization from the point of view of never having had a break in its activities. During this period there have been many changes in the track structure and in the methods of carrying out the work. The railroads are now passing through a severe and trying time of readjustment and for that reason there is all the greater need for economical maintenance, especially in the handling of labor and the conserving of materials. In outlining the advantages of participating at the meetings of the association, he stated that it was a poor man who could not derive some good from a convention where topics in which he is vitally interested are discussed thoroughly. Active participation in committee work was urged strongly by President Wiltsee as one of the best means to advance the standing of the association through making its papers and work an authority on maintenance of way matters. He dwelt particularly upon the benefits which would accrue to the members themselves since, by taking an active interest in committee work, the general knowledge of the men themselves was broadened greatly and their circle of acquaintances was increased, all of which contributes much towards a successful life.

## Address by L. W. Baldwin

L. W. Baldwin, vice-president of the Illinois Central, Chicago, addressed the convention on the opportunities for effecting economies in maintenance of way work. In his opinion there was a need for two prime aids in the conduct of the work, the establishment of an effective measure of the results obtained and the general application of mechanical devices to increase production. The unit of measure is particularly important as an incentive for increased production by the

forces. It is his experience that few men do their best work unless it is noticed by those above them in rank. There is no satisfaction in working unless one knows what he is accomplishing. This subject now has a new significance because of the relatively higher wages being paid by the railroads, affording them an opportunity for selecting more intelligent, reliable and efficient men. This can be accomplished effectively only through some means of measuring their output. Records of work done also serve as a stimulus for rivalry among the forces.

Mr. Baldwin presented a long list of devices which have demonstrated their value in effecting economies in maintenance of way work. He also pointed to the need of improvement in many of these equipments and to the opportunities for further development. In closing he pointed to the gradual improvement in the general railway situation, calling attention to the fact that whereas the roads earned an actual deficit during January and February, the earnings for the other four months of the half year were enough to show an appreciable return. The present danger, he said, lay in the assumption of a viewpoint that was too optimistic as a result of which there is agitation for lower rates. In this connection he showed that the railway men can play an important part, saying "Railway men of all grades need to realize this and to exert their influence in such a way that the public will be led into a correct attitude."

## The Budget System as

## Applied to Track Work

By C. A. Morse

Chief Engineer, Chicago, Rock Island and Pacific Chicago

The question before the railroads today is how to reduce their cost of operation, and at the same time keep the property from deteriorating. About 20 per cent of the cost of operation of a railroad is for the maintenance of way and structures, and about two-thirds of that 20 per cent is spent on roadbed and track. If, therefore, you can, by better maintenance methods, reduce the cost of your work 10 per cent, you will be reducing the cost of transportation on your road 1 1/3 per cent.

## Where to Economize

Let us see how we should proceed to enable us to make a saving in maintenance of way as a whole, two-thirds of which would be in the track department. Maintenance of way work is composed of a great variety of classes of work, scattered over the entire railroad. Some of it must be done to keep the railroad safe for the operation of trains, other portions of the work are done in replacing parts that are worn out, or so nearly worn out that they will not continue to serve their purpose, while still other expenditures are made to retard deterioration or to avoid large expenses in the near future on the principle that "a stitch in time saves nine."

In addition to the class of expenditures named, there are those that are made to prevent damage claims, among which are the upkeep of right of way fences. Another class is that which makes for neatness in the general appearance of the property and tends to encourage the employees to do good work and to take a pride in the property. This is generally referred to as standardization, which simply means that the

work is performed in the same way on all portions of the railroad and not in a "bit or miss" manner.

In addition to these classes of work there is the work chargeable to maintenance of way in connection with additions and betterments to the property. On the average well maintained railroad the expenditures for additions and betterments on roadway and structures will amount to about one-fourth of the total maintenance of way expenses, and in carrying out this addition and betterment work, there will be maintenance charges about equal to the addition and betterment charges; so that about one-fourth of the maintenance of way charges are in connection with addition and betterment authorities. Of the remaining three-fourths of the maintenance of way expenses about one-half are required for ordinary upkeep, the other half, or three-eighths of the whole, are expended on the class of work that I have referred to as desirable and in many cases necessary, but which, if deferred, will not interfere with the safety of train service.

It is this three-eighths or 37.5 per cent of the total maintenance of way expenses that is deferred in times of business depression and done in greater quantity when earnings permit of the expenditures. It is this 37.5 per cent which covers the deferred maintenance, if there is any, on the railroad but it is also where there is the greatest opportunity for careful supervision and good judgment to see that it is expended on the parts of the railroad where it will earn a proper return, and not where it is of no real benefit to the property as a whole.

There is no real difference between this money and that required for "A. & B." work—it is only a matter of accounting. Revisions of the accounting methods have in recent years caused much that was formerly charged to maintenance of way to now be charged to additions and betterments.

### Need for a Budget

We are all loud in our praise of the decision of Congress to put a budget system into effect in connection with our national expenses, and feel that it will help to keep down expenses and reduce our taxes. The same thing applies, only on a smaller scale, to the expenditures on the railroads, not only on the comparatively small amount charged to additions and betterments, but to the much larger part charged to operating expenses. If the budget is made in the detail that it should be, it can be either authorized as a whole or "A. F. E.'s" made to cover the separate items.

There will be many cases where other items will be submitted with a request that they be substituted for some item in the budget, in which cases an "A. F. E." should be required in order that the necessity or desirability of the substitution can be investigated carefully and decided by the head of the department.

The total amount of money covered by the budget should be apportioned over the different months to insure a fairly uniform rate of expenditure during the year. This need have no reference to the items that go to make up the monthly expenditure—the local officers are best qualified to decide what work they will do at any particular time and should not be interfered with in carrying out their own plans for doing the work.

To facilitate the working out of a budget for maintenance of way work the different portions of the railroad should be classified, and certain classes of work should only be permitted on the more important portions of the road—others only on certain parts. In this way the matter of considering expenditures would be simplified, as it would be known that certain standards or certain classes of work would not be permitted on unimportant branch lines. Many economies could be worked out with a careful classification of the railroad as to maintenance of way work.

Now, with our budget system worked out and in force we come to the economies that may be secured in carrying out

the work. The authority for the expenditure of money on a piece of work should carry with it the authority to order the material direct from the store department, and the authority to put on the necessary men to carry out the work in accordance with the judgment of the local officer in charge of the work. It should not be necessary to have any signature but his own on a requisition, but the requisition should show the item on the budget, or the "A. F. E." number where "A. F. E.'s" are issued, for which material is being ordered. The same should apply to any additional help that is required to perform the work. A sheet accompanying the pay roll should show that any new names appearing on that roll are employed on work authorized by "A. F. E. (No. —)," or "item (No. —)" of the approved budget, it being understood that when their services are no longer needed on that work that they will be dropped or transferred to some other authorized work.

The cost of doing work is increased immensely by the "red tape" on many roads, connected with ordering of material and getting authority for the help, which in the judgment of the man in charge is necessary to handle the work in an economical way.

Many officers seem to fear to give their subordinates a free hand in the performance of authorized work, but with a proper system of checking up completion reports and with proper cost statistics compiled on the railroad, there will be a check on the performance of each man who has charge of work, and the man will take pride in making a good showing if he is furnished, as he should be, with statistics that show what others are performing similar work for. Such data are also necessary in order to estimate work properly that is being planned.

### Cost Data Sadly Lacking

It is a peculiar thing, but a fact, that practically all of the cost data that are kept in the maintenance of way department are the result of individual effort, and made up by the individual, because he finds that he must have some such data to enable him to estimate work. There are very elaborate and detailed statistics of cost of everything in the transportation department, but the only thing that is furnished in regard to maintenance of way is the cost of maintenance of way per mile of road, and the cost per 1,000 gross ton miles; and these are of no value in comparing one division with another, as the variation in class of railroad and in density of traffic changes the results to such an extent as to nullify any apparent comparison.

Maintenance of way and maintenance of equipment make up about 45 per cent of the total operating expenses of a railroad and transportation makes up about 50 per cent. As stated above, elaborate and detailed statistics are kept and published, showing various items that go to make up this 50 per cent of the total operating expenses, and absolutely nothing of any value is kept or published as to items that go to make up 45 per cent of the operating costs on the majority of the railroads of this country.

From the viewpoint of the transportation officer, good track, good power and rolling stock are essential to reduced transportation expenses and good service, and are cheap at any cost. This is true, but there is no reason why the same careful study should not be given to furnishing these essentials at a minimum cost, as there has been given to conducting transportation at a minimum cost.

If we are going to do this we must have cost data statistics covering maintenance of way and maintenance of equipment; we must have these kept in a uniform way on all railroads, and we must have them published so that each road and each division on a road may know what it is costing to perform these items on the other road, or on the other division. Also in the case of maintenance of way they should be kept on each roadmasters' territory so that the superinten-

dent may be able to see what each roadmaster is doing in the way of keeping down costs on his division.

A large or a small improvement program on a division makes a decided difference in the figures. A roadmaster and a section foreman are judged by the track they have, regardless of the amount of money they spend in getting it. Anyone can do maintenance of way work if he has money enough, but what is there to it—nothing to awaken any competition, nothing to make a man plan how he can do his work the cheapest.

In the majority of cases force is allowed on the basis of so much to the mile of main line, regardless of sidings and turnouts. Some roads have a method of track equation by which track is equalized as to different things that take extra labor. All roads should do this in order to distribute forces equally.

### Need Standard Basis

Possibly one of the reasons why nothing has been done in the way of keeping maintenance of way statistics is that there must be some concerted action in defining the units, so that the data will be comparable. One of the first things necessary is to agree on a classification of the different portions of a railroad. The cost of laying rail on a track having 20 trains over it in working hours will be much in excess of the cost on a piece of road having but 10 trains over it during working hours. The cost of inserting ties will vary with the class of ballast, and between ties put in without raising the track and those put in while lifting the track out of face for a new lift of ballast. Track work in large yards should be shown separately, also track work on passing and side tracks. Classes of ballast should be made so that work on ballasted track could be compared with similar work and work on lines ballasted with similar classes of ballast could be compared.

The Roadmasters' Association is well fitted to study this matter, and I would like to see the association appoint a committee to report next year, to classify the different types of track and recommend certain cost data forms for collecting and reporting the cost of doing certain units of work on each class of track.

### Classification and Distribution of Second Hand Rail

The term second hand rail includes all rail which has been used in actual service and which has been removed from track for any reason whatever. The only practical reason for having a classification of second-hand rail is to have a basis for utilizing such rail in track that will tend to increase the service without unduly increasing the expense of items of work which are necessary to maintain track properly, and in this manner contribute to more economical track maintenance.

The practical result of applying a classification of used rail to actual maintenance work should be: 1. To reduce to a minimum the amount of new rail purchased from year to year. 2. To secure a minimum annual expense for labor and material consumed in connection with rail renewals without unduly increasing other items of expense necessary to maintain track properly. 3. By securing minimum expense for the purchase of new rail and also minimum expense for labor and material used in connection with rail renewals, at the same time avoiding increased expense for other items of work necessary to maintain track properly, a second-hand rail classification is an effective means toward securing more economical track maintenance.

The supply of second-hand rail during any year depends on the amount of new rail which the management of a railroad may decide to buy for renewal purposes. The amount of rail purchased is not necessarily determined on the basis of the quantity needed in order to secure the most economical track maintenance, but primarily depends on the amount of

money available, and as long as railroad corporations must adjust their expenses to their revenues, variations in the amount of rail purchased from year to year must be expected.

On account of variations in the supply of used rail depending on elements which have but little influence on the demand, it is not possible to match the supply and demand of second-hand rail, and this inability to match supply and demand makes necessary a flexibility in any standard or measure that may be fixed for assigning used rail to a particular service. The result of these changes in relationship of supply and demand is to make it necessary to assign used rail of varying quality or standard to similar services during different periods.

In addition to this variation between the supply and demand of used rail, there are also other variables which must be considered. The relationship between branch line requirements and main line requirements varies from time to time. The relationship between the length of main line service and the length of branch line service which will result in greatest rail return varies from time to time. There is a variation in the cost of making rail renewals on main tracks and in branch tracks which influences the manner in which rail should be utilized, the high cost of main line renewals, together with the difficulty with which the work is accomplished under certain circumstances, being almost equal in importance to the cost of the rail itself.

In order to secure the maximum utilization of all rail in track and having in mind the principles and details involved, the following classification of second-hand rail has been prepared:

#### CLASS NO. 1.—MAIN LINE RELAYER RAIL

Class No. 1.—Main line relayer rail shall include rail removed from track which, either in the condition as taken out of track or after receiving preparatory work, is suitable for use in main line running tracks. Rail for this purpose shall meet the following conditions:

First—Rail for use in tangents shall be rail which was previously used only on tangent track. If uniformly curved, rail which was previously used in curves may again be used in curves of not greater radius than the one where it was previously used.

Second—Rails shall be straight in line and surface, except that rails for use in curves may be uniformly curved to not less radius than that of the curve in which they are to be used.

Third—No driver-kinked, twisted or distorted rail shall be included in this class.

Fourth—No broken or defective rail removed from track shall be included in this class.

Fifth—Rail shall not be less than 24 ft. in length.

#### CLASS NO. 2.—SECONDARY MAIN TRACK AND HEAVY TRAFFIC BRANCH LINE TRACK RELAYER RAIL

Class No. 2.—Secondary main track and heavy traffic branch line track relayer rail shall include rail removed from track which, either in the condition as taken out of track or after receiving preparatory work, is suitable for use in secondary main and heavy traffic branch line running tracks. Rail for this purpose shall meet the following conditions:

First—Rail for use in tangents shall be rail which was previously used only in tangent track. Curved rail may again be used in curves of a radius not greater than where previously used.

Second, third, fourth and fifth requirements same as for Class No. 1.

#### CLASS NO. 3.—LIGHT TRAFFIC BRANCH LINE RELAYER RAIL

Class No. 3.—Light traffic branch line relayer rail shall include rail removed from track which, either in the condition as taken out of track or after receiving preparatory work, is suitable for use in running tracks of light traffic branch lines. Rail for this purpose shall meet the following conditions:

First—Rail for use in tangents shall be rail which was previously used only in tangent track. Curved rail may again be used in curves of a radius not greater than where previously used.

Second, third, fourth and fifth requirements same as for Class No. 1.

which has previously been used in curves may again be used in curves of not less degree than where originally used.

Second—Rails shall be straight in line and surface, except that rails for use in curves may be uniformly curved to not less radius than that of the curve in which they are to be used. They shall be free from driver links which cannot be removed without cracking or otherwise damaging the rail. They shall also be free from twist or distortions which prevent an even bedding of the rail throughout its length.

Third—Same as fourth requirement Class No. 1.

Fourth—Same as fifth requirement Class No. 1.

#### CLASS NO. 4—SIDE TRACK RAIL

Class No. 4—Side track rail shall include rail removed from track which, either in the condition as taken out of track or after receiving preparatory work, is suitable for use in side tracks over which traffic passes at slow speed.

Rail for this purpose shall be any rail removed from track which cannot be made to comply with the requirements of Class 1, 2 or 3, except as to length, but which is suitable for use in slow speed tracks, and shall meet the following conditions:

First—No rail removed from track on account of a defect shall be included in this class.

Second—Parts of broken rails removed from track, which are otherwise satisfactory, shall be included in this class, provided the break did not result from a defect.

Third—Rail shall not be less than 15 ft. in length.

#### CLASS NO. 5—FROG AND SWITCH REPAIR RAIL

Class No. 5—Frog and switch repair rail shall include rail removed from track which, either in the condition as taken out of track or after receiving preparatory work, is suitable for use in frog and switch work. Rail for this purpose shall meet the following conditions:

First—It shall be suitable, in all respects except as to length, for use as Class 1, 2 or 3 second hand rail.

Second—It may be of any length less than 24 ft.

Rail classed as frog and switch repair rail shall be subdivided into Class 1, Class 2 or Class 3, according to what its classification would be if it were 24 ft. or more in length.

#### CLASS NO. 6—SCRAP

Class No. 6—Scrap shall include all rail removed from track, which, because of defects, lack of strength, length, crooks, or for any other reason, cannot be classified in any of the above classes.

### The Maintenance and Construction of Railroad Crossings

The committee recommended the use of manganese construction for crossings in main lines carrying heavy traffic and high speed trains. On double tracks it was recommended that one rail only be used between joints, doing away with center joints between crossings. The placing of timbers under the rails of the track carrying the heaviest traffic was favored at a square crossing instead of placing the ties diagonally, as it was believed that a better opportunity is afforded to tamp the timbers and to give them a more equal bearing than with ties. The use of ties was under diagonal crossings.

The committee recommend the use of a plate extending the full length of the crossing under those sides carrying the heaviest traffic, in place of corner plates. Experience has shown that in tamping under the timbers or ties under the corners of crossings where corner plates are used it is difficult to secure a solid foundation, as the plates are ordinarily too wide.

On all high speed main line crossings, where there is no likelihood of track changes, the committee recommended that a reinforced concrete slab be placed under the crossing at a sufficient depth below the rail to enable 8 to 10 in. of ballast to be inserted above the slab with cross ties to carry the rails. The use of rail anchors in all tracks about crossings as far back as the derail in each line was favored because a crossing should be placed in position and then anchored to hold it there. By anchoring each track as far back as the derail this result will be accomplished.

D. O'Hern, chairman, roadmaster, E. J. & E., Joliet, Ill.

### Methods of Stimulating Friendly

#### Rivalry Among Track Forces

Rivalry is created among track forces by the application of one or more of the following methods, practices or systems:

One method that is in common use on several railroads requires an inspection in the spring and in the fall. In the spring the roadmaster or other maintenance officers go over the division with the purpose of making a program of the season's work and at the same time taking notes of the conditions on each section. In the fall an inspection is made and each section foreman is provided with a copy of each section record, in order to give him an idea of the progress that the other foremen have made in the season's work. Cash prizes, medals, sign posts, and also division prizes, are awarded to the best sections, and also to the division showing the most efficient work done during the year. In connection with the premium system the committee recommended that a foreman who receives this prize for two consecutive years be offered an inducement to keep his section in advance of the others by allowing him a higher rate of pay.

The following practice is in effect on several railroads and is conducive to higher efficiency and to the stimulation of friendly rivalry among the track forces: After information for the entire division has been obtained and a program decided upon and each foreman is given a chart showing the program as it applies to all sections on the division or subdivision. This is followed each month with a percentage chart, by sections, showing the percentage of work done, in ties, line, surface, etc., and an analysis of the figures showing who is making the best record with the allotted number of men, so that each foreman is familiar with what the other foremen are doing.

One of the best ways to develop rivalry among the foremen and also among the men is to assemble them at meetings for the discussion of their common problems. These meetings not only broaden the views and interest of the men, but tend to create enthusiasm and a desire to excel. If possible, the higher officers should attend, and address the meetings.

A supervisor should establish a continuous personal contact with his foremen and make an effort to instill a live interest among them in their work at all times throughout the year. There is no better way to accomplish this than for the supervisor to visit the men and talk over their work and conditions with them on the ground, for this gives a foreman confidence and an exact idea of what is wanted. A verbal comparison of his work with that of the foreman on each side of him will start a "friendly rivalry" that will spread over the entire division.

Committee: George Koontz, chairman, roadmaster, D. & H., Carbondale, Pa.

### The Track Supply Association

The exhibit of the Track Supply Association included individual displays by 58 manufacturers of materials and supplies relating to track maintenance, this being one of the largest exhibits ever held by the association. The location of the exhibit in a room adjacent to the meeting hall added greatly to its value to those attending the convention. A list of the firms exhibiting, the materials and devices exhibited and the names of the representatives in attendance, is given below.

Addressograph Company, Chicago; addressographs and graphotype machines: W. G. Ryan, J. E. Miles and E. F. Steffen.

Air Reduction Sales Company, New York; welding and cutting torches, acetylene, oxygen, samples of welded switch points and welded rail ends; H. H. Melville, A. W. Brown, Edward L. Fiddymant and A. B. Brown.

American Chain Company (Reading Specialties Division), New York; rail clamps, derailleurs, rail benders: A. H. Weston and J. J. O'Connell.

American Hoist & Derrick Company, St. Paul, Minn.; photographs of ditches; W. B. Maurer and Miss H. Haller.

American Steel & Wire Company, Chicago; fence posts and woven wire fencing; L. P. Shanahan, M. E. Evans, D. H. Waterman and John Collins. American Valve & Meter Company, The, Cincinnati, Ohio; switch stands and track appliances; J. T. McGarry, F. C. Anderson and Dan J. Higgins.

Balkwill Manganese Crossing Company, Cleveland, Ohio; model manganese crossing; S. Balkwill.

Bethlehem Steel Company, Bethlehem, Pa.; switch stands; Neil E. Salsich, R. W. Gillispie, E. H. Gambart, R. E. Belknap and J. F. Hennessy.

Bueyria Company, South Milwaukee, Wis.; moving pictures of spreader plow and other excavating machinery; E. G. Lewis, H. M. Swigart, H. L. Palmer, G. A. Morrison, M. J. Woodhull and Morgan Bogart.

Carbic Manufacturing Company, Duluth, Minn.; acetylene lights, welding generator, welding and cutting equipment and motor car light; A. D. Guthrie, D. C. Duncan and C. H. Bolinder.

Chicago Malleable Castings Company, Chicago; rail anchor tie plate, tie plate with key and rail clips; Warren Osborn, J. S. Llewellyn, A. R. Anderson and W. L. Beandway.

Chicago Manufacturing & Distributing Company, Chicago; ratchet track bolt wrench, ratchet screw spike wrench and other ratchet wrenches; J. A. Slater, B. W. Conlin, J. D. Hiatt, H. I. Hiatt and R. J. McKee.

Creechbeck Company, The, Hoboken, N. J.; rail anchors; P. E. Browne and John T. Reagan.

Crerar, Adams, & Company, Chicago; bonding drill, track drill, rail saw, die starters, jacks, snow brooms, shovels, etc.; Russell Wallace, G. D. Bassett, E. C. Pochler, W. I. Clock, J. A. Martin and C. W. Gregory, E. Mahlike.

Duff Manufacturing Company, The, Pittsburgh, Pa.; jacks; C. N. Thulin and E. E. Thulin.

Elliot, Frog & Switch Company, East St. Louis, Ill.; guard rail clamps, switch stands and switch rods; H. J. Elliot and W. J. Fairback.

Emulsified Asphalt Company, Indianapolis, Ind.; C. E. Jefferson.

Fairbanks, Morse & Co., Chicago; spike puller, track wrench; A. A. Taylor, B. S. Spaulding, L. H. Matthews, E. C. Golladay, F. J. Lee, F. M. Condit, G. W. Lewis, H. L. Hilleary and P. H. Gilleland.

Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.; gas engine for motor cars; H. E. Wade, W. F. Kasper, W. D. Brooks.

Frictionless Rail Company, Boston, Mass.; models and photographs of frictionless rail; S. W. Simons, John W. McManama.

Hauck Manufacturing Company, Brooklyn, N. Y.; thawing outfits, kerosene torches, circular flame burners, blue flame oil burners and syphon type furnace burners; Willis C. Squire and G. A. Nelson.

Hayes Track Appliance Company, Richmond, Ind.; model derail; H. J. Mayer, S. W. Hayes, O. M. Kendall, H. H. Jenkins and R. H. Gnasepohl.

Headley Good Roads Company, Philadelphia, Pa.; bituminous railroad crossing; F. X. Kern.

Ingersoll-Rand Company, New York; tie tamper and air tools for track work; W. H. Armstrong, J. N. Thorp and J. P. Gillies.

Kalamazoo Railway Supply Company, Kalamazoo, Mich.; light inspection motor car; J. McKinnon, F. E. McAllister, W. E. Winters and H. R. Miller.

Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio; photographs of automatic air dump cars with apron attachment; Jay N. Markel.

Lundie Engineering Corporation, The, New York; tie plates; W. S. Boyce and W. Brooke Moore.

Maintenance Equipment Company, Chicago; friction car stop, fence posts, derail, rail layer, power ballast screen and switch; H. C. Holloway, J. A. Roche and Ray Downey.

McVicker Safety Tie Plate Company, Milwaukee, Wis.; E. M. McVicker and A. W. Tabert.

Mudge & Company, Chicago; railway motor car; Karl J. Eklund, Clyde P. Benning, John H. Mullin, Burton Mudge.

National Lock Washer Company, The, Newark, N. J.; nut lock; J. Howard Horn, R. L. Cairncross and A. T. Thompson.

National Malleable Castings Company, Cleveland, O.; wrecking hook, iron washers, rail braces and tie plates; J. A. Slater, G. R. Rasmussen, C. H. Krakau and L. S. Wright.

North Western Motor Company, Eau Claire, Wis.; railway motor car and model engine; F. W. Anderson, R. R. Rosholt and A. H. Nelson.

Oxweld Railroad Service Company, The, Chicago; welding and cutting appliances; W. H. Kolmehl, L. C. Ryan and C. M. Marshall.

P. & M. Company, The, Chicago; rail anchors and anti-creeper; S. M. Clancy, G. E. Johnson, P. V. Samuelson, D. T. Hallberg, J. J. Gallagher and J. E. Mahoney.

Pocket List of Railroad Officials, The, New York; Charles L. Dinsmore.

Positive Rail Anchor Company, Marion, Ind.; guard rail, rail anchors, rail braces, guard rail plates and braces and tie plates; A. H. Told and L. C. Ferguson.

Q & C Company, The, New York; rolled steel compromise joint, rail joint, electric snow smelter for switches, guard rail clamp, rail bender, derail and steel fence posts; R. J. McComb, J. L. Terry, L. Thomas and F. G. Peterson.

Rail Joint Company, The, New York; insulated joints, compromise and standard joints; Alex. Chapman, G. H. Larson, G. T. Willard, C. B. Griffin, Charles Jenkinson, R. W. Payne and Thomas Ryan.

Railroad Supply Company, The, Chicago; tie plates and derails; A. H. Smith, E. P. Gowing, G. W. Nibbe and M. J. Fox.

Railway Review, Chicago; copies of paper; Harold A. Smith, W. M. Camp, Arthur E. Hooven and C. L. Bates.

Ramapo Iron Works, Hillburn, N. Y.; switch stand, double shoulder switch plates, manganese switch point; W. C. Kidd, R. J. Davidson, Jr., J. B. Snow, J. B. Strong and T. E. Akers.

Reade Manufacturing Company, Jersey City, N. J.; photographs of chemical weed killing machines; R. H. Bozle and W. L. Gegugus.

Reliance Manufacturing Company, The, Massillon, Ohio, nut locks; H. C. Mull and H. J. McGuinn.

Safety Guard Rail Lock Company, Orlando, Fla.; model safety guard rail lock; W. L. Daugherty.

Sellers Manufacturing Company, Chicago; tie plates; G. M. Hogan, T. D. Crowley and R. A. Van Houten.

Simmons-Boardman Publishing Company, New York; copies of papers and cyclopedias; L. B. Sherman, E. T. Howson, F. H. Thompson, B. J. Wilson, F. C. Koch, W. S. Lacher, D. A. Steel and J. M. Rutherford, Milburn Moore, R. H. Smith, James Currie.

Superior Supply Company, Chicago; John B. Seymour, C. A. Giesels, J. H. Erby and W. R. Sotheim.

Templeton, Kenly & Co., Ltd., Chicago; track jacks, car jacks, pole jacks and emergency jacks; W. D. Templeton, L. E. Allen, S. A. Nelson and A. C. Lewis.

Track Specialties Company, New York; spikes, insulated bolts, guard rail clamps, rail brace, compromise joint, rail joint, anchor plate, insulated joint, tie plate, derail, car stop, car replacer, etc.; John A. Bodkin.

Union Switch & Signal Company, Swissvale, Pa.; insulated rail joint; J. J. Cozens and George Marloff.

Verona Tool Works, Pittsburgh, Pa.; track tools, nut locks, and rail joint springs; E. Woodings, W. W. Glosser, P. L. Laughlin, A. T. Richardson, F. B. Nimmo and J. S. Wincranz.

Warren Tool & Forge Company, The, Warren, Ohio; track tools; H. C. Mull and George Konold.

Werner Machine Company, Inc., West Allis, Wis.; spike shaper; E. J. Wind and F. A. Gardner.

William Pharten, Jr., & Co., Inc., Easton, Pa.; manganese steel one-piece guard rail, photographs of manganese steel frogs; H. F. McDermott, S. G. Llewellyn, Victor Angerer, George R. Lyman, J. H. Hock and F. H. Lehecka.

Wetley Machine Company, Minneapolis, Minn.; gas engine for motor cars; H. E. Woodery.

Wyoming Shovel Works, The, Wyoming, Pa.; track shovels, spades, scuffle hoes and picks; H. T. Potter, Stanley H. Smith, G. E. Geer and E. L. Ruby.

Wood Shovel & Tool Company, Piqua, Ohio; shovels, spades and scoops; C. L. Butts and M. H. Lytle.

## Other Features of the Program

J. H. Waterman, superintendent of timber preservation, Chicago, Burlington & Quincy, gave an illustrated lecture on the results obtained from the use of treated ties. This consisted largely of an object lesson based on the test tie sections which have been maintained by the Chicago, Burlington & Quincy for the last 12 years or more. By means of photographs and tables he demonstrated how much greater the life of treated ties is as compared with even the best species of wood used untreated. He was particularly emphatic in pointing out that white oak untreated ties do not give as good service as treated ties of what are termed some of the "inferior woods" when properly protected against mechanical wear.

Other features of the program included a paper by H. L. Pierce, supervisor, Pennsylvania System, Cresson, Pa., on "The String Lining of Curves," comprising a detailed exposition of several methods by which curves may be lined without the use of surveying instruments. The committee report presented by E. P. Hawkins, division engineer, Missouri Pacific, Wichita, Kan., covering "The Most Economical Method of Renewing Cross and Switch Ties," contained explicit instructions on the methods of determining the allotment of ties, methods of handling and the program for carrying on the renewals in the most expeditious manner. A committee on Records and Accounts presented a number of forms for use by the foreman and supervisor and a digest of the practice on several roads.

## L. F. Loree Speaks at Annual Dinner

The annual dinner was held in the Auditorium Hotel on Wednesday evening. L. F. Loree, president of the Delaware & Hudson, was the speaker of the evening. He said in part: "I think it may be taken as a general proposition that the foundation of good railroading is good track and that the foundation of good track is good drainage. It is in this latter respect that our practice falls far short of European standards. In other respects, our maintenance practice is fully as good and in many respects much better.

"What the transportation officer has a right to look for is track in proper surface, alignment, gage and curve compensation, resting upon a minimum of 10 in. of ballast that will readily dispose of storm water and melting snow, upon a roadbed properly drained, free from soft spots, of sufficient width to support the track, and with suitable runways ahead of the switch points to enable their safe and convenient

handling. No effort should be spared to see that these requisites receive adequate attention.

"But however interesting it might be to take up these matters and, in detail, the means of handling them, they are not the most important things that press for attention at the moment. What we have to do is to rescue these properties, from which close to ten millions of people get their living, from the deplorable state of demoralization in both the personnel and the upkeep to which they were reduced by the administration of the director general.

"There are three ways to improve the character of the personnel: (1) employ a better class of men; (2) educate those kept; and (3) discharge the inefficient and incompetent.

"The greatest difficulty in securing competent help, and in honest, capable workers securing positions of trust, exists in the very limited number who may be known intimately by anyone employing others in positions of responsibility. Many are in need of faithful and efficient help. Many deserving workers need employment. The ordinary employment agency but illy stops a portion of the gap. We ought all to address ourselves to the building up of better means of handling this important question. If the employee is selected carefully and, on physical examination, is found to be free from the common defects and is reasonably intelligent, no effort should be spared to explain to him both the reasons and the methods governing the work in which he is engaged and to bring him as rapidly as possible into a position not only to perform the work but to do it with a full appreciation of the results to be attained and the underlying reasons therefor.

"Control of the men can only be maintained by supervision and by discipline. Such is the constitution of man that there is always a small but turbulent minority against whom we hold our properties, our lives and our religion itself at the price of the jail, the penitentiary and the gallows. Like bad order cars, bad order men should be kept down to about 4 per cent of the total. If they were allowed to run up to 12 per cent they would ruin us. Railroad employment is to a marked degree regarded as a protected service. Once a man's name gets on the payroll, he is hedged about by constant and numerous artificial restraints as a permanent fixture. In gardening it is not sufficient that the soil be good and well sustained by fertilizers and the seed the best. The resulting crop depends largely upon cultivation and weeding out, and, similarly, in the railroad business carefully selected men, education and training will not suffice. To them must be added systematic and unwearied weeding. You must know your men and those that, from whatever cause, are palpable misfits you should eliminate at once.

"When you have brought the track to its proper condition and the men to the old relation of loyalty to the company and fidelity to the work with which they are entrusted, you will doubtless remain disturbed by the problems confronting us involving the economic conditions of the immediate future. I am sorry to say that I do not come to you with any message of optimism. On the contrary, I believe we are faced with conditions of such a trying character that they can only be surmounted, let alone shortened, by strenuous effort and self-denying frugality.

"Employment of the men annually added to the ranks of labor is conditioned upon additional capital investment, and the failure not only to maintain but to increase our savings for investment, while embarrassing to all, will work its greatest hardship upon labor. These capital investments are very large. For every man on the railroad payrolls, there is a capital investment of \$10,000. Where are you under present conditions to look for the savings that alone make possible additions to the ranks of labor?

"While we as a people exalt knowledge, its value is apt to be exaggerated. It is, after all, a kind of raw material, collected from various sources and retained largely through feats of memory. The significant thing is intelligence, the poten-

tiality of the human machine, the ability to learn, to think quickly and accurately, to analyze a situation, to maintain a state of mental alertness and to comprehend and follow instructions. It is not because you men have education but because you have intelligence that you occupy administrative positions of authority, and it is to the extent that you exercise this intelligence in the conduct of the affairs entrusted to you that we count with hope on overcoming the difficulties with which we are beset. What we look to find in you is a great fund of common sense, a power of knowing or hitting the mark as to things and ideas, the impression of the real, cautious, critical, shrewd and well-balanced, a sort of curb and correction of the errors that education and history so often produce."

Following the adjournment of the convention on Thursday the members and others visiting the convention made a detailed inspection of the Santa Fe's reclamation plant located in the Chicago terminal district, for which a special train was provided. This excursion included a stop at the Clearing yard of the Belt Railway of Chicago.

## Train Order Deliverer Eliminates Unnecessary Stops

**A**S A FURTHER STEP in eliminating unnecessary stops and expediting traffic, the Northern Pacific has installed for test a train order deliverer device over the entire second subdivision of its Idaho division between Spokane, Wash., and Kootenai, Idaho, a distance of 78 miles. The device was designed to eliminate unnecessary stops, slowdowns and accidents, which arise out of the use of hoops in delivering "19" orders. Ten machines were erected and first placed in service on April 26, 1921, and all passenger and freight engines and train crews on the Second subdivision are equipped with the catcher. This subdivision consists of a single track line equipped with automatic signals over which an average of 12 scheduled trains and 4 extras each way operate daily and on which an average of 37 orders are issued every 24 hours.

### How the Machine Operates

The deliverer at present in use consists of a square post 13 ft. 6 in. high and having 6 in. sides and is set 6 ft. 6 in. from gage. Four angle irons are used on which a sheet metal covering is placed. A movable carrier 6 ft. long and to which the arms are attached between which the train orders are fastened, moving in a grooved guide, is raised and lowered by means of a ratchet and chain contained inside the post. The carrier is equipped with three sets of arms spaced 24 in. center to center, thus providing means for delivering three copies of an order to a train when this is necessary in connection with double-heading. The carrier when in position for delivering orders places the center line of the top rope 12 ft. 2 in. above top of rail; the middle rope 10 ft. 2 in. and the lower rope 8 ft. 2 in. above top of rail. This height can be made to meet conditions on any road. The arms consist of  $\frac{1}{2}$  in. by  $\frac{1}{2}$  in. square steel, the top pair being 27 in. long; the intermediate set 28 in. and the bottom ones 29 in. This variation in length is to prevent interference after the rope containing the train order has been caught and the arms have returned to their normal position, the top arm of each pair being raised to a vertical position by means of a spring attached inside the post, while the bottom arm of a pair drops down by gravity. The movable carrier, when not in use, is lowered to the bottom of the post which brings the arms low enough for the operator to reach for loading, after which it is raised to the proper height for delivery of orders to trains. The operator can then remove the handle to prevent tampering and pro-

ceed about his other work. The illustration will show the principles of its operation.

The cord to which the train order is attached consists of a 2-ft. piece of sash cord to the ends of which are attached spring clips for fastening over the hooks of the carrier arms. At one end of the rope carrier is attached a waterproof canvas bag 2 in. by 3 in. in size, somewhat similar to a tobacco pouch, in which the order is placed.

The catcher which is carried on the engines and as part of the way car or flagman's equipment consists of a  $\frac{3}{8}$  in. by  $\frac{3}{8}$  in. cold rolled steel bar 38 in. long, having a handle and guide stop on one end. At the other end for a distance of 14 in. is attached by means of rivets, the rope catching apparatus, which consists of a flat piece of medium hard steel  $\frac{3}{32}$  in. by  $\frac{3}{8}$  in. formed in the shape of a number of inverted Vs, the points projecting outward. Over these points is fastened a V-shaped spring which acts as a guard to prevent the rope from dropping out after once having

Results so far obtained would indicate that from an economic standpoint the use of this machine to replace the hoop system of train order delivery will result in considerable savings. For example, from a check made of the train sheets over a 90 day period, it was found that on the Idaho division 33 unnecessary stops were made because orders were missed under the hoop system. With this as a basis it was estimated that approximately 1,800 unnecessary stops under the hoop system were being made on the Northern Pacific system. These stops work a hardship on motive power and efficiency of train operation. If the enginemen fail to get the order the train is stopped and backed up, or, as it often happens, the conductor uses the emergency air valve, which causes severe shocks to the equipment and not infrequently a break in two, with consequent serious delays.

Better running time is made because it is unnecessary for a train to slow down in picking up the orders and because of the schedule, dispatchers often would not put out an order ("19" orders only are used on the Northern Pacific) to certain trains because of the chance that the train crew might miss it. Since the installation of the train order deliverer device on the Second subdivision, the dispatchers

The Deliverer Empty, Being Loaded, in Position, Order Caught by Engine and Train Crew

passed into the space provided for it between the adjacent teeth.

### Operating Results

The catcher device is light enough not to be cumbersome or unwieldy and at the same time strong enough to operate properly. The guide casting used on the engines is attached to a square piece of steel of about  $\frac{1}{2}$  in. by  $\frac{1}{2}$  in. section, mounted vertically but a few inches from the front end of the side window of the cab. This can be moved up to a point for catching the order on the top carrier arm (in case of double-heading), or it can be left in the lower position just above the window sill, which corresponds to the position of the middle set of carrier arms. This guide casting can be fastened in position by a set screw and is arranged with a slot on top into which the catcher device is placed which, when being pushed out to the proper operative position, has a stop which fits in a slot on the back side of the guide casting. The design of this casting is such that it takes but an instant to drop the catcher device in place or to remove it. In double-heading, should a small engine be used, it would pick up the order at the 10 ft. 2 in. level, while a large engine would use the 12 ft. 2 in. level and the train crew would catch the order at the 8 ft. 2 in. level.

are putting out orders at points where they had previously refused to do so with the assurance that the order will be picked up, thus saving from 50 min. to an hour and a half on the running time.

Another item of economy is in connection with the saving on hoops and the assurance that an order or important message may not go under the train instead of being caught. The Northern Pacific uses 20,000 hoops a year, and from the test to date it would appear that one rope carrier will outlast about 200 hoops, or the equivalent of 10 cents against \$44.

It is expected that this device will eliminate many of the minor and fatal injuries due to the use of the hoop system. In cold climates the footing on station platforms and on engine and car steps is often insecure because of ice and snow. It removes the danger of an operator being struck by falling coal or by projecting stakes or timbers or swinging car doors. Minor accidents are caused by train and enginemen striking their hands against the hoops in catching them. The train order deliverer device was developed and patented by James A. Blair, dispatcher in the Spokane, Washington, office of the Northern Pacific, and is being used by the Blair Train Order Deliverer Company, Spokane, Washington.

## Freight Car Loading

WASHINGTON, D. C.

OBSERVANCE of the Labor Day holiday resulted in a reduction in the number of cars loaded with revenue freight during the week ended on September 10, as compared with the previous week, according to the reports of the Car Service Division of the American Railway Association. The total for the week was 748,118 cars or 82,483 less than the preceding week and 135,297 cars under the corresponding week last year. It also was 198,852 cars less than were loaded during the corresponding week in 1919. Had it not been for the observance of Labor Day, loadings during the week would have shown an increase over the week before, the average number of cars loaded daily during the week of September 10 having been approximately 143,870 as compared with 138,433 during the preceding week.

Decreases compared with the week before were reported in the loading of all commodities. Loading of grain and grain products amounted to 54,457 cars as compared with 60,632 during the previous week. A total of 25,108 cars were loaded with livestock, which was 2,431 less than during the previous week, while coal loadings totaled 142,049 or 13,767 less than during the week of September 3. Coke loadings fell off 59 cars to a total of 4,599 and forest products dropped 3,274 cars which brought the total for the week to 142,145.

Except for grain and grain products, loadings of all com-

modities were less during the week than during the corresponding week in 1920. Reductions compared with the previous week were reported in all districts except the Poca-hontas, where there was an increase of approximately 3,000 in the number of freight cars loaded.

The summary is given in the table below:

A further decrease of 8,768 in the number of surplus serviceable freight cars is shown by the report of the Car Service Division for the period September 1 to 8. The total surplus was 237,972, including 65,858 box cars.

The number of bad order freight cars showed a reduction for the first time in a year in the report for September 1. On that date the number of bad order cars was 374,087, or 16.2 per cent, as compared with 382,440, or 16.6 per cent on August 15. Of the box cars 17.8 per cent were in bad order as compared with 18.2 per cent on August 15.

The summary for the week of September 3 is given in the table at the bottom of the page.

THE ASSOCIATION OF RAILWAY EXECUTIVES will adopt the methods of the American Railway Association as to the voting power of the member roads. This allows to each road one vote for each 1,000 miles of line. Hitherto each road has been entitled to one vote regardless of its size. Henceforth assessments will be based on the gross revenues of each road from September 1, 1920, when the Federal guaranty ended, to August 31, 1921. The basis of assessments has hitherto been on the "standard return."

# Labor Board Defines Its Power and Legal Status

## Attitude of Various Carriers Causes Tribunal to Defend Its Rulings and Present Position

THE RAILROAD LABOR BOARD, faced with the necessity of justifying its recent orders regarding rules and working conditions and outlining its interpretation of the labor provisions of the Transportation Act, has handed down two decisions which describe at length the views of the Board on the intent of the Act, the authority and jurisdiction delegated to the Board, and the reasons for rendering those decisions which have met with opposition on the part of some carriers, and particularly the Pennsylvania.

The most important of these two decisions grants the petition of the Pennsylvania for further oral hearings in its recent controversy with the Railway Employees' Department of the American Federation of Labor and the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees. The progress of this controversy has been described in the *Railway Age* of July 16 (page 115), August 6 (page 257), August 13 (page 297), August 20 (page 352), August 27 (page 399) and September 10 (page 493). Subsequently the Pennsylvania filed a petition with the Labor Board which, according to the analysis in this decision, attacks the action of the Board in extending indefinitely the national agreements and asks the Board to set aside its decision of July 26, described in the *Railway Age* of August 6 (page 257), and to hold further oral hearings in this controversy. In granting the Pennsylvania's request for further hearings the Board specifically confines the carrier's additional testimony to

1—The question as to what employees, if any, not in the actual and active service of the carrier, such as men laid off, furloughed, or absent upon leave, shall be permitted to vote in the election of representatives to negotiate agreements on rules and working conditions.

2—The question of how the representative capacity of the spokesmen of unorganized employees shall be ascertained.

3—The carrier will be permitted to offer such evidence as it may see fit of the adoption or ratification of its shop craft rules by the representatives of said crafts fairly selected by a majority of the employees of that class.

Testimony on other points raised by the Pennsylvania will not be heard by the Board, according to this decision. The hearings are set for 10 a. m. September 26.

### Board Interprets Transportation Act

The Board in this decision recognizes that a clear and detailed statement of its position and interpretation of the labor provisions of the Transportation Act have become necessary and accordingly the decision says in part:

The obvious and declared purpose of Congress in adopting the labor section and title of the Transportation Act was to preserve, protect and promote uninterrupted traffic and transportation, and to avoid any interruption to the operation of any carrier growing out of disputes between the carrier and its employees and subordinate officials. It faced and knew the history of the country; knew such interruptions had repeatedly occurred growing out of such disputes; and it knew that even more general and disastrous interruptions then threatened. It undertook to establish a tribunal or tribunals to settle such disputes, to indicate means and methods of settlement, and, if possible, to prohibit and prevent such interruptions. It created the Labor Board and directed the methods by which such disputes should be settled, and how and when they might be brought before the Board.

After quoting Sections 301 and 307 of the Act, the decision continues:

It is plain that Congress intended to demand and require that if possible there should be no interruption of traffic by reason of these disputes between carriers and their employees; that it should be the positive duty of the parties interested to confer through

their representatives and settle such disputes if possible, but it did not stop there. It directed that if they could not be or were not thus settled, then the parties should refer them to the proper board for decision. If not thus settled, either because a conference was held and they did not agree or because one of the parties refused to enter such a conference, then either party could bring it before the Labor Board, and it was made the positive duty of this Board to receive for hearings and to decide any such dispute which had not been so decided or settled.

### How National Agreements Came Before the Board

The question of national agreements properly comes before the Board, according to this decision, because the requests of the organizations for conferences on rules and working conditions were refused by the carriers on the grounds "that the matter had already been referred to the Labor Board for decision." The organizations subsequently brought this controversy before the Board in accordance with the Board's interpretation of Sections 301 and 307 outlined above. The continuance of national agreements by the terms of Decision No. 2 was purely a "modus vivendi" and, the decision continues:

This decision was accepted, acquiesced in, and acted under, so far as we are informed, by practically all the parties before the Board. The dispute as to the adoption and continuance of the national agreements was before the Board on the applications filed by the representatives of the employees for an adoption or continuation of the national agreements. The Board could not render its final decision for the reasons stated at the time Decision No. 2 was rendered, and, as they were the rules and working conditions then in force, obviously they could not be well terminated without a decision or bringing on an industrial war which Congress had sought to prohibit.

The plea of General W. W. Atterbury, vice-president of the Pennsylvania, for immediate abrogation of national agreements and return to the rules and working conditions of December 31, 1917, made during subsequent hearings on national agreements, was interpreted by the Board as follows:

There was a clear recognition—if any were needed—that the Board had jurisdiction and was dealing with the subject of rules and working conditions, and the Board was requested by the representatives of the carriers, including the Pennsylvania System, to put in force rules existing prior to December 31, 1917, as a basis for negotiation, from which it appears that the carriers also realized there must be some authorized set of rules in existence and in force to govern the parties until new rules could be adopted, either by agreement or a decision of the Board.

After outlining the provisions of Decision No. 119 which ordered national agreements terminated on July 1, 1921, the decision continues:

The Board was then assuming that all the parties would in good faith endeavor to meet and confer as the Board had directed, and as the Transportation Act enacted by Congress required. It assumed that this would be done promptly, and the matters of difference submitted to the Board. The Board retained jurisdiction of the whole matter and proceeded with the hearings, and further evidence and arguments were submitted by all the parties to the dispute.

### Board Defends Rulings on Rules

#### and Working Conditions

Defending the later order continuing national agreements until negotiations between the individual railroads and their own employees were completed and approved by the Board, the decision says:

It was the judgment of the Board that this was proper and necessary, especially in view of the fact that in many instances, on account of disagreement of the parties as to how and with whom such conferences should be held, no such conferences had

been held as the statute required and as the Board had directed. It was thought necessary in the interest of industrial peace that the Board should make this extension and give the parties additional time in which to comply with the orders of the Board and provisions of the statute.

Similarly "Principle 15" regarding the right of the majority of any craft or class of employees to determine what organization shall represent the members of such craft or class (one of the "16 principles" contained in Decision No. 119 and which were to be incorporated into the new agreements regarding rules and working conditions) is defended in the decision as necessary and reasonable.

### Pennsylvania Charged With Misrepresentation

The decision then recites the history of the Pennsylvania controversy and in commenting on the request of that carrier for a 15 day extension of time in which to carry out the Board's orders, said:

It appears, however, that the time so granted had not been used for the purpose intended, that the conference directed had not been held, and that no steps had been taken to enable the employees to select their representatives as required by the law and ordered by the Board. On the contrary, the entire 30 days has been consumed by the carrier in the active promulgation of propaganda, at an enormous expense to its stockholders, in which the issues involved in this controversy have been misstated and the action and position of the Labor Board grossly misrepresented.

In the application to the Board to vacate and set aside Decision No. 218, the carrier says, in effect, and in its outside propaganda in express words, that it will not abide by the decision of the Board in this matter, unless said decision sets the seal of its approval on the carrier's conduct.

The open attacks of the carrier on the Labor Board and on the law which created it, shall, in no wise, affect the Board in its effort to give calm and just consideration to the carrier's petition, because matters of great moment to the public and to the carriers are involved.

It may be as well to state in this connection, once for all, that the Labor Board cannot be swerved from what it considers a just and legal course by the hostile printed propaganda of dissatisfied carriers or by the continued threats of labor strikes that are made before it.

In closing this portion of the decision the Board said in part:

The Transportation Act is regarded by thoughtful men as the greatest forward step that has ever been taken in any country to preserve industrial peace. The plain, primary purpose of Congress was to protect the public from the financial disaster, physical suffering and general demoralization that would result from the interruption of railroad traffic and transportation. Secondly, the Act was intended to save both labor and capital from such calamities.

That the time has come when the complex industrial and social system of this great and populous country must be guaranteed all the immunity possible from traffic and transportation disturbances, is beyond all question. If the Transportation Act does not provide such a guaranty, the public will find means, legal and constitutional, that will.

The Labor Board has been gratified by the cooperation it has received, as a rule, from both carriers and employees in its difficult task of aiding the transition of the country's great transportation systems from a war basis to one of peace, with the least possible conflict.

The Board, however, recognizes the right of any party to a controversy before it to take such legal measures as it may deem desirable to protect itself from any injustice that might be imposed by the action of the Board.

### Board Discusses Questions Raised by the Pennsylvania

In discussing the points raised by the Pennsylvania in the last hearings in this case several important principles are dealt with by the Board. The following quotations give in substance the Board's views on the questions indicated.

*The right of the Board to adopt the principles set out in Decision No. 119 and in other decisions, for the guidance of carriers and employees, is questioned.*

It is a settled principle of law that under a remedial act, as this is, even where not expressly given, sufficient powers are implied to enable the purposes of the act to be accomplished. But in this instance the power is expressly given in the language of the statute—namely, "The Labor Board may make regulations

necessary for the efficient execution of the functions vested in it by this title."

In the adoption of the rules promulgated in these several decisions, the Board was making "regulations necessary for the efficient execution of the functions vested in it"—regulations to accomplish the purposes of the Act, to promote and make practicable, if possible, the proper conferences provided for in the Act, and to establish regulations and conditions that would lead to a settlement of disputes and prevent the interruption of traffic.

*An attack of criticism is made on the statement in the decision that "there is no question of the closed or open shop involved in this dispute and no other real matter of principle. The question involved is merely one of procedure."*

The petitioner loses sight of the fact that the Transportation Act provides that any and all disputes between the carrier and its employees shall be brought before his Board for settlement, unless otherwise adjusted. Questions of procedure are not excluded.

It certainly was a very acute dispute, and the position of the carrier practically was that it had the sole right to proceed in its own way in the selection of the delegates who were to represent the employees; that it, and it alone, had the right to prescribe the plans and conduct the proceedings and be the sole judge of the results; and that any judgment, opinion, direction or regulation by the Board was an uncalled for and unauthorized interference with the prerogatives of the carrier. The mere statement of its position would seem to carry its own answer. It must be evident to every one that if this practice should prevail, there would be no real conferences, no liberty of action left to the employees, and that there could be no real negotiation and settlement of matters in dispute.

*The carrier asserts the right to limit the representatives to be selected by the employees to persons who are in the actual employment of the carrier.*

The Transportation Act does not prescribe any such limitation. We know of no law in this country which prevents or limits a man in selecting his own representative, and this Board has certainly no power to prescribe a limitation which the law does not, and has no disposition to do so.

The organizations are repeatedly and expressly recognized in the act and shown to have the right to represent the employees in these matters.

Of the hundreds of disputes brought before this Board probably less than five have been brought by and for unorganized employees. It seems useless and even stupid to argue and discuss this phase. But we want to make it plain that Congress contemplated that the organizations would largely represent the employees, and made it the imperative duty of the Board to hear them.

This presents the real crux of the controversy in this case. Here was an organization to which many, if not a majority, of the employees in the shop craft class of this company belonged. It is strongly insisted that a majority of this class on this road desired and had authorized this organization to represent them in the conferences and negotiations to be held. For reasons and motives that are immaterial to this Board, it is evident that the management was not willing, if it could be avoided, that this organization, its officials, agents and committees should represent these men, and it evidently formed its plans to prevent this if it could. Anyway, it was unwilling to agree, or did not agree, with this organization on a plan to fairly ascertain the wishes of this class of employees on the road. Both of the contending parties adopted and carried out their own separate plans, both of which were held by this Board to be faulty and unfair. The Board endeavored to prescribe a plan and method that would fairly obtain and accurately express the wishes of the majority of the employees of this class. This decision the carrier rejects and refuses to abide by, and arrogates to itself the sole function and power to decide these matters. If a majority of this class of employees on this road has an absolute right under the law to select their own representatives—and this is the clearly expressed will of Congress—this Board in its proceedings and decisions must obey the mandate of Congress. If the carrier refuses, it is an attack not so much on this Board as on Congress. It is nothing more or less than a denial and repudiation of the sovereign will of the United States as expressed by Congress.

If the members of any class wish to join a union they have that right. If they desire to remain out or leave such a union at any time, they have that right. If they or a majority of any class want a union or its officers to represent them, they have that right. If they, whether union men or not, want other individuals to represent them, they have that right. Neither this board nor the management of the Pennsylvania System has the right by any kind of plan or movement to dictate as to who shall be their representatives. Any attempt to do so—is an unauthorized assumption of power.

*The carrier suggests that the employees who are not parties to the alleged contracts and who do not want to be bound by them may invoke the aid of the board.*

The carrier in this suggestion ignores the statutory right of the employees in the first instance to a voice in the making of said agreements.

On the question as to the legal right of the carrier to establish rules and working conditions, the board refers to its discussion of this subject as contained in Decision No. 224 (an abstract of which follows). We think that opinion demonstrates that it is the duty of the board to prescribe what are fair, just and reasonable rules and working conditions for the parties without regard to their strict legal rights, and that if each party is allowed to insist upon its strict legal rights, as defined by the decisions of the Supreme Court of the United States prior to the enactment of the Transportation Act, it would be impossible for them to reach agreements, except the agreement to disagree and separate and thus, in effect, demoralize the transportation system of the country.

The purpose of the Transportation Act was to enable the parties to meet in conference, and when unable to compose their differences, for the Labor Board to prescribe conditions under which they should act. It is pointed out in the decision above referred to that there are two possible views as to the present state of the law on this subject: One is that the decisions of this board are merely persuasive with only a moral obligation resting upon the parties. The other is that Congress in the exercise of paramount police power necessary for the preservation, safety, and progress of the country, has, as to these common carriers and their employees, for the benefit of the public, limited the exercise of their hitherto unquestioned legal rights in such matters. But, as stated in that decision, whatever view may be taken, the duty of the Labor Board remains the same; that is, to decide what is just, fair and reasonable as between the parties and the public.

### Constitutional Rights of Railroads Analyzed by Board

A second decision rendered in an unimportant case becomes significant because of the discussion of the principles which accompany it. This decision orders the reinstatement of two section foremen discharged by the Butler County Railroad mainly because they belonged to the same union as the men who worked under their direction. The decision also gives the men full pay for all time lost less the amount earned since the date of their dismissal. The company contended that it was within its legal right to discharge these men.

The Board, in this decision said in part:

The principle invoked of the legal rights of the management in their dealing with employees has cast some confusion and shadow over every action and decision of the board. The board understands that it is its duty to follow the law, and its membership has been sworn to support and maintain the principles of the Constitution of the United States, which obligation the members will faithfully observe.

Congress, when the Transportation Act was passed, was fully informed of the constitutional and legal rights of all the parties and interests to be affected. It must be assumed to have had these rights in mind and legislated accordingly. Among the conditions confronting Congress were these: (1) The great transportation systems of the country being conducted and maintained by many carriers all under private ownership and control; (2) the employment by these carriers of vast numbers of employees more or less especially experienced and trained and fitted for this business, who had generally made this service a life occupation and who were largely dependent on it for their continued existence and welfare. These transportation systems more vitally affected all classes of people and every line of business and endeavor than any other agency of our civilization and life. In fact, the general progress and, indeed, the well-being and almost the existence of most of our people are vitally dependent on the continued and proper functioning of these transportation systems. Anything seriously interrupting or interfering with these systems of transportation and traffic could only and would necessarily result in tremendous financial loss and untold human suffering. Capital, labor, civilization, are dependent on them. The employees in the service of these corporations who, as we say, were largely dependent on them for continuous employment and welfare had, to a great extent, in the protection and upbuilding of their interests, as they had a right to do, joined various unions or organizations, just as the holders and managers of large combinations of capital had done.

These organizations and managerial groups were called upon to deal with each other. From the very nature of things there were conflicts of interests and differing views in regard to the matters of their several interests and rights. Frequent conflicts had in the past arisen, and at the time of the passage of the Transportation Act more serious and general conflicts were threatening, growing to some extent out of post-war conditions. It was

apparent that if these were not prevented the most serious and lamentable results would follow.

It was and is intolerable from a public point of view that strikes or lockouts of any serious character, especially those of a general nature with far-reaching and disastrous effect, should occur. Without regard as to which party is primarily to blame, the effect is the same and the helpless and innocent public is the principal sufferer. These transportation interests from their very nature and from governmental grants acquire great and special privileges and are affected with a public use and owe a public duty. This duty is imposed both on the management and the employees. The public pays the bill and on the public both sides are dependent for their existence. Moved by these conditions and considerations, Congress passed the Transportation Act, created the United States Railroad Labor Board, and prescribed in a general way its functions; the clear purpose being to provide an impartial tribunal, which, looking to justice, equity and fair dealing between the carriers and their employees and the greater and dominating interests of the public, would be able to settle all conflicts and disputes and prevent any interruption of traffic.

The duty is imposed on the Board of deciding disputes as to wages or working conditions on the basis of establishing such as are in the opinion of the Board just and reasonable—not according to the strict legal rights in all instances of either party, for one party might have a legal right to prescribe a wage for which the other party would have a legal right to refuse to work; or, the carrier might have a legal right to impose a rule or working condition under which the employees would have a legal right to decline to serve.

Here the decision outlines in detail the varying views as to the intent of Congress in framing this part of the Transportation Act which are briefly mentioned in the closing paragraphs of the Pennsylvania ruling. Regardless of these views, the duty of the Board remains the same, the decision holds, namely to decide disputes to the best interests of the parties directly interested and of the public. Continuing, the decision says in part:

It must be evident to all and beyond doubt or controversy, from the very nature of things and the character of the disputes that cause the friction between carriers and their employees which lead to interruption of traffic, that Congress did not intend or expect to limit the Labor Board to deciding these disputes according to the strict legal rights of the parties, because if it did, and both parties relied strictly and fully on their legal rights, the disputes never could be solved. If the carrier has, as contended, unlimited freedom in establishing rules and working conditions and is going to do so regardless of this Board's opinion and decision as to what is just and reasonable, there can be no practicable use or sensible reason for the Board hearing the dispute and expressing an opinion or rendering a decision. Likewise, if the employees are going to ignore the Board's opinion and decision and rely on their legal rights to determine for themselves the rules under which they will work, as some of them have been indicating they will do, it is equally useless for the Board to hear and decide the matter. It was doubtless because of a recognition of this conflict in strictly legal rights that Congress, in the interests of the public and to prevent interruption of traffic and the operation of the carriers, created this Board and directed it to decide what, in view of all the facts, was and is just and reasonable in each case.

The Board in its previous decisions has endeavored to be governed by these principles. It has constantly in view the public interest and the rights of the public to demand prompt, efficient, and economical transportation. It recognizes the necessity for discipline and control by management, and it hesitates to interfere by its decision with the management's freedom and discretion in these matters. It has required a clear showing of obvious wrong or a plain violation of contract of employment before granting relief, as its numerous decisions in discipline cases demonstrate. But it must and does recognize that employees have interests that must be given consideration if disturbance is to be avoided and a loyal, cheerful, and efficient service obtained.

The individual importance of this particular case is small, but the principle involved is momentous, and the Board has felt that in the public interest its position should be made clear and its views and reasons set out so they could be understood. It has found reasons for this in the very emphatic position taken by the carrier in this case, indicating a purpose to carry out its policy with unlimited freedom, possibly without regard to the decisions of the Board, and recent happenings in other cases where disregard of the decisions of the Board has been indicated by announcements from both carriers and employees.

It is to be hoped that the effect of this decision will not be misrepresented or misunderstood. Much propaganda has been published and circulated which purposely or ignorantly misrepresents the purpose and effect of the decisions of the Board.

to the effect that the tendency, if not the purpose of its decisions, is to establish a unionized closed shop. Such statements have no foundation in fact. No such proposition has been submitted and no action taken by this Board tending to establish such conditions.

If Congress should enact a law prohibiting recognition of labor organizations of railway employees, or authorizing carriers to establish rules in the interest of the public prohibiting railroad employees from belonging to such unions, this Board would obey the law. But on the contrary, Congress has recognized as lawful and directed this Board to recognize them in the railway service, and this Board in this decision is only obeying the obvious direction of Congress. Its decisions on this subject do not tend to a closed shop and have no bearing whatever on the very bitterly debated question of the open and closed shops in other industries. Any representations or statements to the contrary are not only misleading, but can only work public harm.

This Board can only to the best of its ability decide the disputes brought before it according to the provisions, purposes and spirit of the Transportation Act, seeking to do all it reasonably can to secure industrial peace along these lines and to prevent an interruption of traffic so disastrous to public interests. If either party to such disputes sees proper to disregard its decisions and thus contribute to or cause the public misfortune which Congress sought to prevent, the responsibility is with those guilty of such action.

While the Board regrets such action, not so much because it is an attack more or less direct on the power and effectiveness of the Board, but because it, in the opinion of the Board, is in effect a deliberate attempt to ignore the power and defeat the will and purpose of Congress plainly expressed, and Congress in these matters represents the dignity, power and sovereignty of the United States. The remedy lies with the public, or possibly with Congress or the courts.

## Some Remarkable Labor Turn-Over Statistics

By William S. Wollner

ON APRIL 1, 1920, a western railroad inaugurated a plan for collecting statistics reflecting the maintenance of way labor turn-over, and the information thus obtained during the nine months ending December 31, 1920, is of remarkable interest as indicating the extremely short duration of average employment during a period of labor shortage. These statistics cover only men employed through the employment bureau of this road, no data having been collected concerning the men picked up by foremen in the localities in which they were working. As the period which these figures cover was one of extreme labor shortage in the territory this road serves, the number of men employed in this way was very small, it being doubtful if as much as one per cent of the total number of men hired during this period was secured through other means than the employment bureau.

Maintenance forces have been divided, for the purpose of this report, into extra gang laborers, section gang laborers, carpenters and carpenter helpers, and a summary of these statistics as applied to extra gang laborers and section gang laborers is given below.

### LABOR TURN-OVER STATISTICS, APRIL 1, 1920, TO DECEMBER 31, 1920 EXTRA GANG LABORERS

Total number employed during period.....	890
Did not report for work or did not work after reporting.....	579
Total number employed during period who gave service.....	311
Total number of man-days service given.....	7,187
Average number of man-days service based on number of men employed.....	8,075
Average number of man-days service based on number of men who actually gave service.....	23.10
DURATION OF STAY BY PERIODS	
Did not work.....	579
1 to 10 days.....	108
11 to 20 days.....	78
21 to 31 days.....	48
1 to 2 months.....	60
2 to 3 months.....	9
Over 3 months.....	8
Total.....	311

Of the men in the above statement, the following were still in the service December 31, 1920:

Less than 1 month service.....	3
1 to 2 months' service.....	7
2 to 3 months' service.....	2
3 to 4 months' service.....	2
4 to 5 months' service.....	4
Total.....	18

### SECTION GANG LABORERS

Total number employed during period.....	401
Did not report for work or did not work after reporting.....	247
Total number employed during period who gave service.....	154
Total number of man-days service given.....	4,172
Average number of man-days service based on number of men employed.....	10.40
Average number of man-days service based on number of men who actually gave service.....	27.09

### DURATION OF STAY BY PERIODS

1 to 10 days.....	62
11 to 20 days.....	32
21 to 30 days.....	22
1 to 2 months.....	21
2 to 3 months.....	8
3 to 4 months.....	5
Over 4 months.....	4
Total.....	154

Of the men in the above statement, the following were still in service December 31, 1920:

Less than 1 month.....	3
1 to 2 months.....	3
2 to 3 months.....	5
3 to 4 months.....	4
Over 4 months.....	3
Total.....	18

One of the primary purposes of this labor turn-over survey was to determine the principal causes for men leaving the railroad's service so that, if practicable, the conditions responsible for the heavy turn-over could be corrected or modified. Of the 1,513 men hired by the employment bureau during the nine months' period which figures cover, 937 gave no service. Of these 937, 744 did not report on the job and foreman failed to give reasons why 306 of the others quit. It is possible, therefore, to show reasons for only 463 men leaving the service. These reasons as given by the foreman for the classes of employees covered by these statistics (extra gang laborers, section gang laborers, carpenters, carpenter helpers) are tabulated as follows:

### REASONS FOR LEAVING

Did not report on job.....	744
Gave no reason.....	306
Wanted to move on.....	182
Discharged.....	73
Weather conditions.....	31
Reduction of forces.....	30
Had another job.....	26
Quarters.....	23
Rate of pay.....	23
Could not mix in gang.....	20
Disatisfied with food.....	17
Work was too hard.....	11
Sickness.....	8
Had no blankets.....	7
Reduction to working hours.....	7
Had no rainclothes.....	5
Insufficient earnings.....	5
Hours.....	3
Charge for board.....	2
Claimed there was not enough to eat.....	2
Insane.....	1
Poison cake.....	1
Not feeling well.....	1
No mattress.....	1
Sickness in family.....	1
Did not like railroad work.....	1
Had no funds for board at hotel.....	1
Epileptic fits.....	1
Dissatisfied with job.....	1
Total.....	1513

The period which these figures cover was one of acute railroad labor shortage, whereas, the period immediately following has been one in which labor conditions have made available many more men than could be used in railroad maintenance service. Additional statistics will, therefore, be compiled at a later date so that comparison of data for the two periods may be used to reflect turn-over conditions during time of shortage and oversupply, and a consolidation of the data used to reflect average conditions.

OF THE TOTAL RAILWAY MILEAGE in the United States rather over 1 per cent is operated electrically as against about 4 per cent in Britain.—*South African Railways & Harbors Magazine.*

# Standards for Railroad Electrification

## Power Should Be Developed at 25 Cycles and Use of Both Alternating and Direct Current on Trolley Continued

**I**N AN EFFORT to establish standards for electric traction equipment, the Electrification of Railways Advisory Committee in England appealed to George Gibbs, chief engineer of electric traction, Long Island, for an expression of opinion. The recommendations by the committee that power should be developed as three-phase alternating-current at the frequency which is in general use in the district and that 1,500 volts direct-current be used as a standard trolley voltage have given rise to much comment. Mr. Gibbs' letter was subsequently published in the *Engineer*, London, substantially as follows:

### The Question of System

I am not of opinion that at the present time one system of traction at a suitable pressure should be applied as a standard to meet all requirements of railway traffic. Admitting the advantages of standardization in general, yet I believe the establishment of any one system of electrification as standard for British railways would be a mistake at the present time, because:

(1) It is too early in the state of the art to determine and fix the features of any system to the extent required for the purposes of complete standardization, and yet not restrict the future and desirable development of the system selected.

(2) There does not exist sufficient and comparable operating data from which to conclude as to the relative advantages and disadvantages for the future of the two radically different systems most prominently before the railways today, *i. e.*, the "direct-current" and the "alternating-current." Both systems are workable and in use; each has its advocate in important manufacturing interests, and able professional men differ as to which system should prevail. This competition of diverse minds in the development of these different systems is an important factor in ensuring the future determination of the best system; it should not be discouraged by the premature exclusion of either system from trial in the present development period.

(3) Neither system, as now developed and applied to a typical general case, differs greatly in first operating and upkeep costs; therefore, railways will not be greatly penalized, except by hampering interchange, by being allowed to work out for the time being the full possibilities of the different systems.

*Per contra*, I am in favor of certain exclusions and the fixing of certain general requirements of any permitted traction system; thus—

(1) I recommend standardizing the location and clearances of third rail and overhead working conductors. Standards for these have been established for American railways by the American Railway Association. The figures will, of course, differ for British railways. Standardization of this kind will permit the continued development of both the alternating-current and direct-current systems of traction and will ensure interchangeability of running requirements between roads using the same character of traction system.

(2) Standardization suitable and safe limits for voltages in each of the two types of working conductors. These should be as follows:

For third rail 600 volts (nominal) direct-current is recommended. A higher voltage than the above is, in my opinion,

inadvisable for general railway usage, because employees or others who have access to the right-of-way cannot be effectively safeguarded from accidental contact with it. Contact with voltages of 1,200 to 1,500 is generally fatal.

The recommended voltage for overhead conductors is 11,000 for the alternating-current system and 3,000 for the direct-current.

In the case of the alternating-current system the maximum is determined by the practical limit in maintaining insulation; 11,000 volts (nominal) is below this point, but experience indicates it is high enough for the heaviest kind of traction and is suitable for any class. A collector system carrying it can be installed and maintained properly and economically within close permanent way and rolling equipment clearances. It should be noted, however, that in an overhead wire system such as the three-phase, which requires two contact wires, insulated from each other and from earth, and two current collectors of different polarity, the practical voltage limit is considerably lower than 11,000.

In case of a direct-current system maximum voltage is limited by other considerations than that of insulation of the working conductor. The demands of economy in distribution and the problem of successful collection of current for heavy trains suggest the highest possible voltage; on the other hand, the limitations in respect of its utilization in the train control and motors point to the desirability of low working voltage. For the general case I am of the opinion that 3,000 volts is the minimum requirement from the standpoint of economy and successful current collection, and is the present maximum allowable for the other considerations.

### Frequency

Current frequency should be standardized for traction systems in accordance with the requirements of such purpose and not by a compromise with the conflicting requirements of another service. A frequency of 25 cycles per second is the best for both systems of traction recommended for trial, and should, therefore, be made the standard for traction generating plants.

### Power Generation

High-pressure three-phase generation is suitable for both alternating-current and direct-current traction systems, and may be made standard.

The voltage at the generating plant may depend upon the local situation; it is quite immaterial for standardization purposes what this actually is, as the voltage is transformed for secondary distribution, and various primary voltages may be utilized in the traction installation of one railway.

A consideration of "frequency" is highly important and no

standard should be proposed which will exclude, materially complicate, or hamper the development of either of the two systems suggested.

One of the features making for simplification in the single-phase alternating-current system is that current from the generating plant is used in the working conductors without change, except, if desirable, by altering the voltage in a transformer. It is essential, however, that the "frequency" employed in the working conductors shall not exceed 25 cycles per second. If a higher generating frequency than the above is standardized it would complicate the alternating-current system; thus to utilize 50 cycles it would be necessary either to employ "frequency changers" or to install in the central station separate 25-cycle generators for railway purposes. The latter plan is employed to some extent in America, and it is found practicable for electric supply companies to install in the same station high-frequency generators for commercial purposes and 25-cycle generators for railway work and provide one or two large motor units for interchange of power between the two parts of the station.

With the direct-current system which employs alternating-current generation and transformation and conversion in sub-stations any desired frequency from 25 to 50 (or more) cycles may be used. Twenty-five cycles is, however, not only a suitable standard for the direct current, but is from some considerations better than a higher frequency. Therefore:

(1) Three-phase, 25-cycle generation at any desired voltage or voltages should be specified as a requirement to allow the flexible development of electric traction systems.

(2) Commercial power plants, which employ other frequencies, may be utilized for railway power purposes either directly in case of direct-current traction or by the installation of separate generators and motor generator tie-in sets, or frequency changers for alternating-current traction.

#### Costs

The investigation of the Chicago Association of Commerce is probably the best source of information which has appeared to date regarding the details of first and operating costs of electric systems. This report was completed in 1915. It covers a minute investigation of a great railway problem within a compact area of 428 square miles in and around a very large city. Within this area thirty-nine different railway companies operate dense passenger, freight and switching services over a network of tracks comprising an aggregate mileage of 4,500. The net first cost of the equipment required to operate this entire system electrically was estimated and analyzed with great care for three different systems and gave the following results: Direct current, 600 volts, third rail, \$188,132,314; direct current, 2,400 volts, overhead, \$181,891,122; single-phase alternating current, 11,000 volts, overhead, \$178,127,230. In other words, the first cost was substantially the same for all three systems. This conclusion is, of course, for short-haul conditions; for long-distance haulage the showing for the high-tension system, as compared with the third rail, would be better. For average conditions estimates I have made on important projects indicate a first cost difference of 15 to 20 per cent in favor of the high-tension overhead alternating-current or direct-current trolley systems as compared with the direct-current third rail, and of the two high-tension systems the alternating current appears in every case to cost less than direct current.

As to operating costs, the Chicago report showed for items affected, a substantial saving per train mile as compared with steam. The saving was least in case of the 600-volt third-rail system and greatest for the 11,000-volt alternating-current system, but there was not a very great difference between the latter and the 2,400-volt "overhead" system. The conditions, however, in the Chicago district are somewhat peculiar; for the average railway condition, estimates indicate differences of 10 to 16 per cent in favor of the high-tension trolley systems as compared with the 600-volt direct-current third

rail and the high-tension alternating current appears to be more economical than the high-tension direct current.

#### Factors Affecting the Selection of a System

The important considerations governing the selection of a system are:

(1) Adaptability to all physical conditions of the railways.

(2) Economy in first and operating costs.

(3) Flexibility as regards conducting varying kinds and volumes of traffic.

(4) Suitability for extension.

(5) Possibilities as regards future advance in the art and improvements in details.

I would work, as far as consistent with the above, towards the elimination of systems which are applicable to special cases only. This, as before indicated, would narrow the selection to the adoption of one of the high-tension overhead conductor systems. The 600-volt third-rail direct-current system would only be considered for extensions to existing installations or for very special cases.

The 1,500-volt direct-current system could only be adopted with an overhead conductor and for light traffic requirements; 1,500-volt third rail cannot be used generally because of its danger to life. The 1,500-volt system is an interim development only. Higher voltage direct-current systems, such as the 3,000-volt system, have promise for the future and their development should be allowed to continue unhampered. The 11,000-volt alternating-current system likewise has a broad field of usefulness and promises well for future development.

The selection, therefore, of a proper system for general use appears to lie between the 3,000-volt direct current and the 11,000-volt alternating current. I have referred to the existing difference of opinion as to these two systems, and since I am not recommending the elimination of either from adoption at present, it is unnecessary for me to indicate my preference. I should approach any concrete problem upon its merits along the lines laid down, having regard to the latest experience and facts as to the state of the art when decision is to be made.

#### Report of French Commission Not Well Founded

I have looked through the voluminous report of the French Commission on Electric Traction, and, frankly, its conclusions do not seem to be well founded on the data presented. Perhaps the commission has arrived at a correct conclusion, having regard to the particular conditions in France, but the reasons given for condemning the single-phase system seem inadequate and largely the results of a "scare" as regards the inductive interference question. The commission seems to have been dominated by telephone and telegraph experts. It also seems to have been greatly influenced by reports of the high cost of maintenance of the alternating current, which, they state, is at least double that of direct current, a conclusion which is absurd. No effort seems to have been made to equate operating conditions in comparing systems, and I doubt if the commission really had any accurate figures of cost of maintenance of the alternating current. It does not seem to have attached much importance to the future trend of development and possibilities in connection with both alternating-current and direct-current traction.

I was interested, and disappointed, in reading the Interim Report of the Advisory Committee on Electrification of Railways. It would be valuable to know what reasons led the committee to the adoption of the 1,500-volt direct current as standard. I think a mistake has been made, even if it should prove to be the eventual system, because the adoption of any standard now is going to put the development of electric traction in a straight jacket. The development of both the alternating-current and the direct-current systems should continue in order to get the best results.

# Telegraph and Telephone Section Hold Annual Meeting

## Radio and Wired Wireless in Railroad Work, Message Traffic and Technical Training Discussed

THE ADAPTABILITY and the application of radio and wired wireless to railroad work, the reasons why employees of the telegraph and telephone department should be technically trained and the use of automatic telephony systems for intercommunication between the various offices of a railroad were among the important subjects considered at the annual meeting of the Telegraph and Telephone Section, Division I—Operating, American Railway Association, which was held at the Hotel Cleveland, Cleveland, Ohio, on September 21, 22 and 23. Chairman H. Hulatt (Grand Trunk), presided. There was a total attendance of about 275. This meeting is the first held since the annual meeting at Winnipeg, Man., last September, as the March meeting which was scheduled for Atlanta, Ga., was cancelled, in line with the wishes of the A. R. A., because of business conditions existing at that time.

Of the 13 regular committees, 11 submitted reports. In addition a paper was read on "Some Phases of Railroad Telegraph and Telephone Engineering" by Stanley Rhoads, telegraph and telephone engineer, New York Central Lines, which was discussed by A. W. Douglas (C. R. I. & P.), I. C. Forshee (P. R. R.) and J. L. Niesse (C. C. & St. L.). At the opening session on Wednesday, September 21, Dr. Dayton C. Miller, professor of physics, Case School of Applied Science, delivered an address on "Electric Wave Motions and Applied Scientific Phenomena" in which he discussed many scientific principles affecting the development of the telegraph and telephone.

After the opening of the first session on Wednesday morning the members were welcomed on behalf of the city by Mr. Metcalfe, director of finances. A letter was then read from R. N. Aishton, president of the American Railway Association, in which he called attention to the many advances made in the methods of communication during the last few years, while Mr. Hulatt, in his opening address, emphasized the important educational advantages to be derived from taking part in the activities of the association. At the opening of the afternoon session on Wednesday, J. Marshall, special representative of the Freight Claim Division of the A. R. A., talked on freight claim prevention.

Thomas A. Edison personally sent a message of greeting over a special wire from his laboratory in Orange, N. J., to the members of the section during the informal banquet held on Thursday evening in which he said, "It is with great pleasure and some pride that I am still able to send readable Morse, that I extend my kindest felicitations and congratulate you upon the able manner in which you are carrying on the work begun by the railway telegraph superintendents in 1882. This occasion brings back to me pleasant recollections of the old days when I was a regular and probably a better operator. I hope some of my comrades are there to-night. To all I extend my '73'." The message was answered by Charles A. Seldon, general inspector of transportation Baltimore & Ohio.

### Radio and Wired Wireless

J. D. Jones (P. R. R.), chairman of Committee No. 12—Radio and Wired Wireless, in presenting the report, explained that the committee had been asked to keep in touch with various manufacturers of wireless apparatus with a view to considering the adaptability to railroad use of any new developments in the field of wireless telegraphy, wireless telephony and wired wireless and to negotiate with one

or more manufacturers of wireless equipment to arrange for the development and practical demonstration of radio (telegraph and telephone) and wired wireless equipment to meet various railroad conditions. In connection with this work, data were obtained from the various railroads as to what has been done regarding the application of radio and the possibilities of its use in railroad work. In this connection C. A. Worst, superintendent telegraph, C. B. & Q., suggested that the following points be considered in the application of radio in any form for practical use in railroad service.

- (a) Necessity and advantages as a reserve means of communication.
- (b) Necessity and advantages as a regular means of communication.
- (c) Cost of original installation per station.
- (d) Number of stations to be installed.
- (e) Cost per station for operation.

E. C. Keenan, general superintendent telegraph, New York Central Lines, in speaking of wired wireless stated that "apparently there is no question that this method of obtaining multiple communication will be available within a short time, and will give additional trunk line connections between switchboards and adjacent cities, so that almost unlimited communication can be given to the railroad officers and subordinates, which will do away with some of the restrictions now imposed. If these carrier circuits can be obtained at reasonable expense, it would seem to be our aim to establish sufficient long distance communication by applying them to our present lines so that prompt connection can be given upon any legitimate request for service." Mr. Keenan also thought that there was a need for wireless on the Great Lakes for railroads which maintain their own boat lines and that wireless telephony could be used to advantage if satisfactory communication could be maintained continuously between some central stations and various tug boats operated by the railroads.

It was the feeling of H. A. Shepard, superintendent of telegraph, N. Y., N. H. & H., that the radio telephone could undoubtedly be used to advantage between the engine and caboose in freight service provided that a suitable signaling system is devised to enable one station to signal the other when desiring to talk.

J. A. Jones, superintendent of telegraph, Southern Railway, Lines East, is of the opinion that there is a good field for radio in railroad service and he is looking forward to the day when every train will be an open office. This would be of particular advantage when the high officers of a railway, when en route on the line, could get in communication directly with their subordinates.

Regarding the application of small portable wireless sets for the use of maintenance of way forces or wrecking crews in communicating with the division headquarters, the committee stated that this had been carefully considered and, after a conference with engineers of radio companies, it was learned that portable sets were available but that the complete equipment so far constructed, because of its weight, would require several men to handle. It was the feeling that small outfits capable of being handled by one man would not be available for some time, but that portable outfits now constructed could be placed on hand cars or wreck trains and would enable the working parties to keep in communication with headquarters.

In connection with this entire subject the committee also presented (1) Information as to the meaning of the terms "Radio and Wired Wireless," as applied to railroad operation; (2) Suggestions as to what particular conditions in
